S51 Convert Your DL/I Batch to BMP

Karen Tischer

Batch Message Processing allows your batch workload to execute concurrently with your on-line IMS systems (IMS TM/DB, DBCTL, and DCCTL). CICS users migrating to DBCTL, anyone moving to 24x7 operations and anyone considering converting batch to BMP will find this session of interest. Topics include the differences between batch and BMP, BMP implementation, performance and tuning issues, checkpoint/restart facilities, limitations, N-Way data sharing issues and XRF considerations.
