Summary of changes

This revision reflects changes to the Development stream for libica Version 2.1.0.

Updates for libica Version 2.1.0

This revision reflects changes related to Version 2.1.0 of libica.

New information
- Support for IBM® zEnterprise™ 196 has been added.
- New APIs have been added. See [Chapter 3, “libica Version 2.1.0 Application Programming Interfaces (APIs),” on page 5.](#)
- New examples have been added. See [Chapter 5, “Examples,” on page 65.](#)
- New defines and structs have been added. See [Chapter 4, “libica defines, typedefs, structs and return codes,” on page 61.](#)

Changed information
- The example makefile has been updated. See [“Makefile example” on page 141.](#)

This revision also includes maintenance and editorial changes.

Deleted information
- The following functions are deprecated in libica Version 2.1.0, and no longer documented in this book. They are, however, still available in this version of libica. For documentation on these functions, see the Version 2.0 libica Programmer’s Reference.
  - ica_des_encrypt
  - ica_des_decrypt
  - ica_3des_encrypt
  - ica_3des_decrypt
  - ica_aes_encrypt
  - ica_aes_decrypt
About this document

This document describes how to install and use Version 2.1.0 of the Library for IBM Cryptographic Architecture (libica). Libica Version 2.1.0 is a library of cryptographic functions used to write cryptographic applications on IBM System z®, both with and without cryptographic hardware.

Unless stated otherwise, the tools described in this book are available for the 64-bit architecture and 31-bit architectures with version 2.6 of the Linux kernel.

You can find the latest version of this document on the developerWorks® Web site at:

How this document is organized

Chapter 1, “General information about libica,” on page 1 has general information about libica Version 2.1.0.

Chapter 3, “libica Version 2.1.0 Application Programming Interfaces (APIs),” on page 5 describes the libica Version 2.1.0 APIs.

Chapter 4, “libica defines, typedefs, structs and return codes,” on page 61 lists the defines, typedefs, structs, and return codes for libica Version 2.1.0.

Chapter 5, “Examples,” on page 65 is a set of programming examples that use the libica Version 2.1.0 APIs.

Who should read this document

This document is intended for C programmers that want to access IBM System z hardware support for cryptographic methods. In particular, this document addresses programmers who write hardware-specific plug-ins for cryptographic libraries such as openssl and OpenCryptoki.

Assumptions

The following general assumptions are made about your background knowledge:

- You have an understanding of basic computer architecture, operating systems, and programs.
- You have an understanding of Linux and IBM System z terminology.
- You have knowledge about cryptographic applications and solution design, as well as the required cryptographic functions and algorithms.

Distribution independence

This book does not provide information that is specific to a particular Linux distribution. The tools it describes are distribution independent.
Conventions used in this book

This section informs you on the styles, highlighting, and assumptions used throughout the book.

**Terminology**

In this book, the term *booting* is used for running boot loader code that loads the Linux operating system. *IPL* is used for issuing an IPL command or to load boot-loader code.

In this book, the term **Required hardware support** refers to specific processor instructions that must be available on the processor in order for the function to benefit from hardware support. Functions will fail on systems that do not provide the required hardware support, unless a software fallback is available as indicated in [Table 2 on page 5](#). An example is that the *ica_des_cbc* function has KMC-DEA listed under **Required hardware support**. This function cannot benefit from hardware support unless the processor has the KMC-DEA instruction. However, *ica_des_cbc* will work on all processors because according to [Table 2 on page 5](#) there is a software fallback for this function.

For more information, see:

- *The z/Architecture® Principles of Operation*, SA22-7832-06
- the IBM Redbooks® publication *System z Cryptographic Services and z/OS® PKI Services*, SG24-7470-00

IBM systems mentioned in this book have both long names and short names. They correspond as follows:

<table>
<thead>
<tr>
<th>Long name</th>
<th>Short name</th>
</tr>
</thead>
<tbody>
<tr>
<td>IBM eServer™ zSeries® 990</td>
<td>z990</td>
</tr>
<tr>
<td>IBM System z9®</td>
<td>z9</td>
</tr>
<tr>
<td>IBM System z10®</td>
<td>z10™</td>
</tr>
<tr>
<td>IBM System z196</td>
<td>z196</td>
</tr>
</tbody>
</table>

**Highlighting**

This book uses the following highlighting styles:

- Paths and URLs are highlighted in monospace.
- Variables are highlighted in *italics*.
- Commands in text are highlighted in **bold**.
- Input and output as normally seen on a computer screen is shown within a screen frame.
- Prompts are shown as number signs: #

**Finding IBM books**

The PDF version of this book contains URL links to much of the referenced literature.
For some of the referenced IBM books, links have been omitted to avoid pointing to
a particular edition of a book. You can locate the latest versions of the referenced
IBM books through the IBM Publications Center at:

http://www.ibm.com/shop/publications/order
Chapter 1. General information about libica

The libica library provides hardware support for cryptographic functions. The cryptographic adapters are used for asymmetric encryption and decryption. The CPACF instructions are used for symmetric encryption and decryption, pseudo random number generation, message authentication, and Secure Hashing. For some of these functions, if the hardware is not available or has failed, libica will use the low-level cryptographic functions of OpenSSL, if available.

This product includes software developed by the OpenSSL Project for use in the OpenSSL Toolkit [http://www.openssl.org]. This product includes cryptographic software written by Eric Young (eay@cryptsoft.com).

The libica library is part of the openCryptoki project in SourceForge. It is primarily used by OpenSSL through the IBM OpenSSL CA engine or by OpenCryptoki through the ica_s390 token. A higher level of security will be achieved by using it through the PKCS11 API implemented by OpenCryptoki.

The libica library works only on IBM System z hardware.

IBM reserves the right to change or modify this API at any time. However, an effort is made to keep the API upward compatible within a major release.

The icasstats command, described in Linux on System z: Device Driver, Features, and Commands, is used to obtain statistics about cryptographic processes. The icasstats command shows whether libica is using cryptographic hardware or software fallback for each specific libica function.

libica examples

There is a list of sample programs in the libica source for each API, as well as instructions about how to use the functions. You can find the Open Source version of libica at:

http://sourceforge.net/projects/opencryptoki

Sample programs are also in Chapter 5, “Examples,” on page 65.
Chapter 2. Installing and using libica Version 2.1.0

Installing libica Version 2.1.0

You can obtain the libica Version 2.1.0 library from the SourceForge Web site at:

http://sourceforge.net/projects/opencryptoki

Follow the installation instructions on this Web site to download the libica Version 2.1.0 package. This package has a file named INSTALL that contains installation instructions.

Using libica Version 2.1.0

The function prototypes are provided in the header file, include/ica_api.h. Applications using these functions must link libica and libcrypto. The libcrypto library is available from the OpenSSL package. You must have OpenSSL in order to run libica Version 2.1.0 programs.

Libica Version 1, Version 2, and Version 2.1.0 coexistence

Some of the libica Version 1 APIs are available in libica Version 2 and libica Version 2.1.0. Some of them, such as those that work with an environment other than Linux on IBM System z, have been removed and are not present in libica Version 2 or libica Version 2.1.0. If your application program has calls to libica Version 1 APIs, check to see if these APIs appear in libica Version 2.1.0. If they do, these API calls should still work. However, we suggest that you convert your application to use the equivalent libica Version 2.1.0 functions. See Chapter 3, “Libica Version 2.1.0 Application Programming Interfaces (APIs),” on page 5.

Libica key generation is restricted to the limits imposed by the OpenSSL implementation. Thus, the value of a public exponent passed to libica cannot be greater than the maximum value that would fit in an unsigned long integer.

Open and close adapter functions

These are functions to open or close the crypto adapter. It is recommended to open the crypto adapter before using any of the libica crypto functions, and to close it after the last usage of the libica crypto functions. However, in this version of the libica only the RSA related functions ica_rsa_mod_expo and ica_rsa_crt require a valid adapter handle as input. A pointer to the value DRIVER_NOT_LOADED indicates an invalid adapter handle. The parameter ica_adapter_handle_t is a redefine of int.

These functions are included in: include/ica_api.h.
ica_open_adapter

Purpose
Opens an adapter.

Format
unsigned int ica_open_adapter(ica_adapter_handle_t *adapter_handle);

Parameters
ica_adapter_handle_t *adapter_handle
  Pointer to the file descriptor for the adapter or to DRIVER_NOT_LOADED if
  opening the crypto adapter failed.

  Opening an adapter will succeed if a cryptographic device is accessible for
  reading and writing. By default, cryptographic access must be available with
  one of the following path names: /udev/z90crypt, /dev/z90crypt or /dev/zcrypt for
  the adapter open request to succeed. If the environment variable
  LIBICA_CRYPT_DEVICE is set to a valid path name of an accessible
  cryptographic device, accessing the device with that path name takes
  precedence over the default path names.

Return codes
0  Success

For return codes indicating exceptions, see "Return codes" on page 63.
ica_close_adapter

**Purpose**
Closes an adapter.

**Comments**
This API closes a device handle.

**Format**

```c
unsigned int ica_close_adapter(ica_adapter_handle_t adapter_handle);
```

**Parameters**

- `ica_adapter_handle_t adapter_handle`
  Pointer to a previously-opened device handle.

**Return codes**

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Success</td>
</tr>
</tbody>
</table>

For return codes indicating exceptions, see "Return codes" on page 63.
Secure hash operations

These functions are included in: `include/ica_api.h`.

These functions perform secure hash on input data using the chosen algorithm of SHA-1, SHA-224, SHA-256, SHA-384, or SHA-512.

SHA context structs contain information about how much of the actual work has already been performed. Also, it contains the part of the hash that has already been produced. For the user it is only interesting in cases where the message is not hashed at once, for then the context is needed for further operations.
ica_sha1

Purpose
Performs a secure hash operation on the input data using the SHA-1 algorithm.

Format
unsigned int ica_sha1(unsigned int message_part,
unsigned int input_length,
unsigned char *input_data,
sha_context_t *sha_context,
unsigned char *output_data);

Required hardware support
KIMD-SHA-1, or KLMD-SHA-1

Parameters
unsigned int message_part
The message chaining state. This must be one of the following values:

- SHA_MSG_PART_ONLY  A single hash operation
- SHA_MSG_PART_FIRST  The first part
- SHA_MSG_PART_MIDDLE  The middle part
- SHA_MSG_PART_FINAL  The last part

unsigned int input_length
Length in bytes of the input data to be hashed using the SHA-1 algorithm. This value must be greater than zero.

unsigned char *input_data
Pointer to the input data to be hashed.

sha_context_t *sha_context
Pointer to the SHA-1 context structure used to store intermediate values needed when chaining is used. The contents are ignored for message part

SHA_MSG_PART_ONLY and SHA_MSG_PART_FIRST. This structure must contain the returned value of the preceding call to ica_sha1 for message part
SHA_MSG_PART_MIDDLE and SHA_MSG_PART_FINAL. For message part
SHA_MSG_PART_FIRST and SHA_MSG_PART_FINAL, the returned value can be used for a chained call of ica_sha1. Therefore, the application must not modify the contents of this structure in between chained calls.

unsigned char *output_data
Pointer to the buffer to contain the resulting hash data. The resulting output data will have a length of SHA_HASH_LENGTH. Make sure that the buffer is at least this size.

Return codes
0  Success

For return codes indicating exceptions, see "Return codes" on page 63.
ica_sha224

Purpose
Performs a secure hash operation on the input data using the SHA-224 algorithm.

Format
unsigned int ica_sha224(unsigned int message_part,
unsigned int input_length,
unsigned char *input_data,
sha256_context_t *sha256_context,
unsigned char *output_data);

Required hardware support
KIMD-SHA-256, or KLMD-SHA-256

Parameters
unsigned int message_part
The message chaining state. This must be one of the following values:

SHA_MSG_PART_ONLY A single hash operation
SHA_MSG_PART_FIRST The first part
SHA_MSG_PART_MIDDLE The middle part
SHA_MSG_PART_FINAL The last part

unsigned int input_length
Length in bytes of the input data to be hashed using the SHA-224 algorithm. This value must be greater than zero.

unsigned char *input_data
Pointer to the input data to be hashed.

sha256_context_t *sha256_context
Pointer to the SHA-256 context structure used to store intermediate values needed when chaining is used. The contents are ignored for message part SHA_MSG_PART_ONLY and SHA_MSG_PART_FIRST. This structure must contain the returned value of the preceding call to ica_sha224 for message part SHA_MSG_PART_MIDDLE and SHA_MSG_PART_FINAL. For message parts SHA_MSG_PART_FIRST and SHA_MSG_PART_FINAL, the returned value can be used for a chained call of ica_sha224. Therefore, the application must not modify the contents of this structure in between chained calls.

Note: Due to the algorithm used by SHA-224, a SHA-256 context must be used.

unsigned char *output_data
Pointer to the buffer to contain the resulting hash data. The resulting output data will have a length of SHA224_HASH_LENGTH. Make sure that the buffer has is at least this size.

Return codes
0 Success

For return codes indicating exceptions, see "Return codes" on page 63.
ica_sha256

Purpose
Performs a secure hash on the input data using the SHA-256 algorithm.

Format

```c
unsigned int ica_sha256(unsigned int message_part,
                        unsigned int input_length,
                        unsigned char *input_data,
                        sha256_context_t *sha256_context,
                        unsigned char *output_data);
```

Required hardware support
KIMD-SHA-256, or KLMD-SHA-256

Parameters

unsigned int message_part
The message chaining state. This must be one of the following values:

- `SHA_MSG_PART_ONLY` A single hash operation
- `SHA_MSG_PART_FIRST` The first part
- `SHA_MSG_PART_MIDDLE` The middle part
- `SHA_MSG_PART_FINAL` The last part

unsigned int input_length
Length in bytes of the input data to be hashed using the SHA-256 algorithm.
This value must be greater than zero.

unsigned char *input_data
Pointer to the input data to be hashed.

sha256_context_t *sha256_context
Pointer to the SHA-256 context structure used to store intermediate values
needed when chaining is used. The contents are ignored for message part
`SHA_MSG_PART_ONLY` and `SHA_MSG_PART_FIRST`. This structure must
contain the returned value of the preceding call to `ica_sha256` for message part
`SHA_MSG_PART_MIDDLE` and `SHA_MSG_PART_FINAL`. For message part
`SHA_MSG_PART_FIRST` and `SHA_MSG_PART_FINAL`, the returned value can
be used for a chained call of `ica_sha256`. Therefore, the application must not
modify the contents of this structure in between chained calls.

unsigned char *output_data
Pointer to the buffer to contain the resulting hash data. The resulting output
data will have a length of `SHA256_HASH_LENGTH`. Make sure that the buffer
has is at least this size.

Return codes

0 Success

For return codes indicating exceptions, see "Return codes" on page 63.
ica_sha384

Purpose
Performs a secure hash on the input data using the SHA-384 algorithm.

Format
unsigned int ica_sha384(unsigned int message_part,
    uint64_t input_length,
    unsigned char *input_data,
    sha512_context_t *sha512_context,
    unsigned char *output_data);

Required hardware support
KIMD-SHA-512, or KLMD-SHA-512

Parameters

unsigned int message_part
   The message chaining state. This must be one of the following values:
   SHA_MSG_PART_ONLY        A single hash operation
   SHA_MSG_PART_FIRST       The first part
   SHA_MSG_PART_MIDDLE      The middle part
   SHA_MSG_PART_FINAL       The last part

uint64_t input_length
   Length in bytes of the input data to be hashed using the SHA-384 algorithm.
   This value must be greater than zero.

unsigned char *input_data
   Pointer to the input data to be hashed.

sha512_context_t *sha512_context
   Pointer to the SHA-512 context structure used to store intermediate values
   needed when chaining is used. The contents are ignored for message part
   SHA_MSG_PART_ONLY and SHA_MSG_PART_FIRST. This structure must
   contain the returned value of the preceding call to ica_sha384 for message part
   SHA_MSG_PART_MIDDLE and SHA_MSG_PART_FINAL. For message part
   SHA_MSG_PART_FIRST and SHA_MSG_PART_FINAL, the returned value can
   be used for a chained call of ica_sha384. Therefore, the application must not
   modify the contents of this structure in between chained calls.

   Note: Due to the algorithm used by SHA-384, a SHA-512 context must be
   used.

unsigned char *output_data
   Pointer to the buffer to contain the resulting hash data. The resulting output
   data will have a length of SHA384_HASH_LENGTH. Make sure that the buffer
   is at least this size.

Return codes
0  Success

For return codes indicating exceptions, see "Return codes" on page 63.
ica_sha512

Purpose
Performs a secure hash operation on input data using the SHA-512 algorithm.

Format
unsigned int ica_sha512(unsigned int message_part,
    uint64_t input_length,
    unsigned char *input_data,
    sha512_context_t *sha512_context,
    unsigned char *output_data);

Required hardware support
KIMD-SHA-512, or KLMD-SHA-512

Parameters
unsigned int message_part
    The message chaining state. This must be one of the following values:
    SHA_MSG_PART_ONLY  A single hash operation
    SHA_MSG_PART_FIRST  The first part
    SHA_MSG_PART_MIDDLE The middle part
    SHA_MSG_PART_FINAL  The last part

uint64_t input_length
    Length in bytes of the input data to be hashed using the SHA-512 algorithm.
    This value must be greater than zero.

unsigned char *input_data
    Pointer to the input data to be hashed.

sha512_context_t *sha512_context
    Pointer to the SHA-512 context structure used to store intermediate values
    needed when chaining is used. The contents are ignored for message part
    SHA_MSG_PART_ONLY and SHA_MSG_PART_FIRST. This structure must
    contain the returned value of the preceding call to ica_sha512 for message part
    SHA_MSG_PART_MIDDLE and SHA_MSG_PART_FINAL. For message part
    SHA_MSG_PART_FIRST and SHA_MSG_PART_FINAL, the returned value can
    be used for a chained call of ica_sha512. Therefore, the application must not
    modify the contents of this structure in between chained calls.

unsigned char *output_data
    Pointer to the buffer to contain the resulting hash data. The resulting output
    data will have a length of SHA512_HASH_LENGTH. Make sure that the buffer
    is at least this size.

Return codes
0  Success

For return codes indicating exceptions, see “Return codes” on page 63.
Pseudo random number generation function

This function is included in: include/ica_api.h.

This function generates pseudo random data. Parameter *output_data is a pointer to a buffer of byte length output_length. output_length number of bytes of pseudo random data will be filled into the buffer pointed to by output_data.

libica initialization tries to seed the CPACF random generator. To get the seed, device /dev/hwrng is opened. Device /dev/hwrng provides true random data from crypto adapters over the crypto device driver (module name z90crypt). If that fails, the initialization mechanism uses device /dev/urandom. Within the initialization, a byte counter s390_byte_count is set to 0. If the CPACF pseudo random generator is available, after 4096 bytes of the pseudo random number are generated, the random number generator will be seeded again. If the CPACF pseudo random generator is not available, random numbers are read from /dev/urandom.
ica_random_number_generate

Purpose
Generates a pseudo random number.

Format
unsigned int ica_random_number_generate(unsigned int output_length,
                                          unsigned char *output_data);

Required hardware support
KMC-PRNG

Parameters
unsigned int output_length
    Length in bytes of the output_data buffer, and the desired length of the
generated pseudo random number.

unsigned char *output_data
    Pointer to the buffer to receive the generated pseudo random number.

Return codes
0  Success

For return codes indicating exceptions, see “Return codes” on page 63.
RSA key generation functions

These functions are included in: include/ica_api.h.

These functions generate an RSA public/private key pair. These functions are performed using software through OpenSSL. Hardware is not used.
ica_rsa_key_generate_mod_expo

Purpose
Generates RSA keys in modulus/exponent format.

Comments
For specific information about some of these parameters, see the considerations in "Structs" on page 62.

Format
unsigned int ica_rsa_key_generate_mod_expo(ica_adapter_handle_t adapter_handle,
                                           unsigned int modulus_bit_length,
                                           ica_rsa_key_mod_expo_t *public_key,
                                           ica_rsa_key_mod_expo_t *private_key);

Parameters
ica_adapter_handle_t adapter_handle
   Pointer to a previously-opened device handle.

unsigned int modulus_bit_length
   Length in bits of the modulus. This value should comply with the length of the keys (in bytes), according to this calculation
   key_length = (modulus_bits + 7) / 8

ica_rsa_key_mod_expo_t *public_key
   Pointer to where the generated public key is to be placed. If the exponent element in the public key is not set, it will be randomly generated. A poorly chosen exponent could result in the program looping endlessly. Common public exponents are 3 and 65537.

ica_rsa_key_mod_expo_t *private_key
   Pointer to where the generated private key in modulus/exponent format is to be placed. The length of both the private and public keys should be set in bytes. This value should comply with the length of the keys (in bytes), according to this calculation
   key_length = (modulus_bits + 7) / 8

Return codes
0  Success

For return codes indicating exceptions, see "Return codes" on page 63.
ica_rsa_key_generate_crt

**Purpose**
Generates RSA keys in Chinese-Remainder Theorem (CRT) format.

**Comments**
For specific information about some of these parameters, see the considerations in “Structs” on page 62.

**Format**

```c
unsigned int ica_rsa_key_generate_crt(ica_adapter_handle_t adapter_handle,
                                  unsigned int modulus_bit_length,
                                  ica_rsa_key_mod_expo_t *public_key,
                                  ica_rsa_key_crt_t *private_key);
```

**Parameters**

- **ica_adapter_handle_t adapter_handle**
  Pointer to a previously opened device handle.

- **unsigned int modulus_bit_length**
  Length in bits of the modulus part of the key. This value should comply with the length of the keys (in bytes), according to this calculation
  
  ```
  key_length = (modulus_bits + 7) / 8
  ```

- **ica_rsa_key_mod_expo_t *public_key**
  Pointer to where the generated public key is to be placed. If the exponent element in the public key is not set, it will be randomly generated. A poorly chosen exponent can result in the program looping endlessly. Common public exponents are 3 and 65537.

- **ica_rsa_key_crt_t *private_key**
  Pointer to where the generated private key in CRT format is to be placed. Length of both private and public keys should be set in bytes. This value should comply with the length of the keys (in bytes), according to this calculation
  
  ```
  key_length = (modulus_bits + 7) / 8
  ```

**Return codes**

- **0** Success

For return codes indicating exceptions, see “Return codes” on page 63.
RSA encrypt and decrypt operations

These functions are included in: include/ica_api.h.

These functions perform a modulus/exponent operation using an RSA key whose type is either ica_rsa_key_mod_expo_t or ica_rsa_key_crt_t.
ica_rsa_mod_expo

Purpose
Performs an RSA encryption or decryption operation using a key in modulus/exponent format.

Comments
Make sure that your message is padded before using this function.

Format
unsigned int ica_rsa_mod_expo(ica_adapter_handle_t adapter_handle,
                             unsigned char *input_data,
                             ica_rsa_key_mod_expo_t *rsa_key,
                             unsigned char *output_data);

Parameters
ica_adapter_handle_t adapter_handle
    Pointer to a previously-opened device handle.

unsigned char *input_data
    Pointer to the input data to be encrypted or decrypted. This data must be in big endian format. Make sure that the input data is not longer than the bit length of the key. The byte length for the input data and the key must be the same. Right justify the input data inside the data block.

ica_rsa_key_mod_expo_t *rsa_key
    Pointer to the key to be used, in modulus/exponent format.

unsigned char *output_data
    Pointer to the location where the output results are to be placed. This buffer has to be at least the same size as input_data and therefore at least the same size as the size of the modulus.

Return codes
0    Success

For return codes indicating exceptions, see "Return codes" on page 63.
ica_rsa_crt

**Purpose**
Performs an RSA encryption or decryption operation using a key in CRT format.

**Comments**
Make sure that your message is padded before using this function.

**Format**

```c
unsigned int ica_rsa_crt(ica_adapter_handle_t adapter_handle,
                          unsigned char *input_data,
                          ica_rsa_key_crt_t *rsa_key,
                          unsigned char *output_data);
```

**Parameters**

- `ica_adapter_handle_t adapter_handle`
  Pointer to a previously-opened device handle.

- `unsigned char *input_data`
  Pointer to the input data to be encrypted or decrypted. This data must be in big endian format. Make sure that the input data is not longer than the bit length of the key. The byte length for the input data and the key must be the same. Right justify the input data inside the data block.

- `ica_rsa_key_crt_t *rsa_key`
  Pointer to the key to be used, in CRT format.

- `unsigned char *output_data`
  Pointer to the location where the output results are to be placed. This buffer must be as large as the `input_data`, and as large as the length of the `modulus` specified in `rsa_key`.

**Return codes**

- `0` Success

For return codes indicating exceptions, see "Return codes" on page 63.
DES functions

These functions are included in: include/ica_api.h.

These functions perform encryption and decryption and computation or verification of message authentication codes using a DES (DEA) key. A DES key has a size of 8 bytes. Note that each byte of a DES key contains one parity bit, such that each 64-bit DES key contains only 56 security-relevant bits. The cipher block size for DES is 8 bytes.

To securely apply DES encryption to messages that are longer than the cipher block size, modes of operation can be used to chain multiple encryption, decryption, or authentication operations. Most modes of operation require an initialization vector as additional input. As long as the messages are encrypted or decrypted using such a mode of operation, and have a size that is a multiple of a particular block size (mostly the cipher block size), the functions encrypting or decrypting according to a mode of operation also compute an output vector. This output vector can be used as the initialization vector of a chained encryption or decryption operation in the same mode with the same block size and the same key.

When decrypting a cipher text, these values used for the decryption function must match the corresponding settings of the encryption function that transformed the plain text into the cipher text:

- The mode of operation
- The key
- The initialization vector (if applicable)
- For the ica_des_cfb function, the lcfb parameter
ica_des_cbc

Purpose
Encrypt or decrypt data with a DES key using Cipher Block Chaining (CBC) mode as described in NIST Special Publication 800-38A Chapter 6.2.

Format
unsigned int ica_des_cbc(const unsigned char *in_data,
    unsigned char *out_data,
    unsigned long data_length,
    const unsigned char *key,
    unsigned char *iv,
    unsigned int direction);

Required hardware support
KMC-DEA

Parameters

unsigned char *in_data
    Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is data_length. This buffer must be at least as large as data_length.

unsigned char *out_data
    Pointer to a writable buffer that will contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as data_length.

unsigned long data_length
    Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of in_data. data_length must be a multiple of the cipher block size (a multiple of 8 bytes for DES).

unsigned char *key
    Pointer to a valid DES key of 8 bytes in length.

unsigned char *iv
    Pointer to a valid initialization vector of cipher block size number of bytes (8 bytes for DES). This vector is overwritten by this function. The result value in iv can be used as the initialization vector for a chained ica_des_cbc call with the same key.

unsigned int direction
    0 Use the decrypt function.
    1 Use the encrypt function.

Return codes

0 Success

For return codes indicating exceptions, see "Return codes" on page 63.
ica_des_cfb

**Purpose**
Encrypt or decrypt data with a DES key using Cipher Feedback (CFB) mode as described in NIST Special Publication 800-38A Chapter 6.3.

**Format**

```c
unsigned int ica_des_cfb(const unsigned char *in_data,
 unsigned char *out_data,
 unsigned long data_length,
 const unsigned char *key,
 unsigned char *iv,
 unsigned int lcfb,
 unsigned int direction);
```

**Required hardware support**

KMF-DEA

**Parameters**

- **unsigned char *in_data**
  - Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is `data_length`. The size of this buffer must be at least as large as the `data_length` parameter.

- **unsigned char *out_data**
  - Pointer to a writable buffer that will contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as the `data_length` parameter.

- **unsigned long data_length**
  - Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of `in_data`.

- **unsigned char *key**
  - Pointer to a valid DES key of 8 bytes in length.

- **unsigned char *iv**
  - Pointer to a valid initialization vector of cipher block size bytes (8 bytes for DES). This vector will be overwritten during the function. The result value in `iv` can be used as the initialization vector for a chained `ica_des_cfb` call with the same key, if `data_length` in the preceding call is a multiple of the `lcfb` parameter.

- **unsigned int lcfb**
  - Length in bytes of the cipher feedback, which is a value greater than or equal to 1 and less than or equal to the cipher block size (8 bytes for DES).

- **unsigned int direction**
  - 0 Use the decrypt function.
  - 1 Use the encrypt function.

**Return codes**

- 0 Success

For return codes indicating exceptions, see "Return codes" on page 63.
ica_des_ctr

Purpose
Encrypt or decrypt data with a DES key using Counter (CTR) mode, as described in NIST Special Publication 800-38A Chapter 6.5. With the counter mode, each message block of the same size as the cipher block (8 bytes for DES) is combined with a counter value of the same size during encryption and decryption.

Starting with an initial counter value to be combined with the first message block, subsequent counter values to be combined with subsequent message blocks will be derived from preceding counter values by an increment function. The increment function used in ica_des_ctr is an arithmetic increment without carry on the M least significant bytes in the counter, where M is a parameter to ica_des_ctr.

Format
unsigned int ica_des_ctr(const unsigned char *in_data,
    unsigned char *out_data,
    unsigned long data_length,
    const unsigned char *key,
    unsigned char *ctr,
    unsigned int ctr_width,
    unsigned int direction);

Required hardware support
KMCTR-DEA

Parameters
const unsigned char *in_data
    Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is data_length. The size of this buffer must be at least as large as data_length.

unsigned char *out_data
    Pointer to a writable buffer that will contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as data_length.

unsigned long data_length
    Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of in_data.

unsigned char *key
    Pointer to a valid DES key of 8 bytes in length.

unsigned char *ctr
    Pointer to a readable and writable buffer of the same size as the cipher block in bytes. ctr contains an initialization value for a counter function, and it will be replaced by a new value. That new value can be used as the initialization value for a counter function in a chained ica_des_ctr call with the same key, if the data_length used in the preceding call is a multiple of the cipher block size.

unsigned int ctr_width
    A number M between 1 and the cipher block size. This value is used by the counter increment function, which increments a counter value by incrementing without carry the least significant M bytes of the counter value.

unsigned int direction
    0 Use the decrypt function.
    1 Use the encrypt function.
**Return codes**

0  Success

For return codes indicating exceptions, see "Return codes" on page 63.
**ica_des_ctrlist**

**Purpose**
Encrypt or decrypt data with a DES key using Counter (CTR) mode as described in NIST Special Publication 800-38A, Chapter 6.5. With the counter mode, each message block of the same size as the cipher block is combined with a counter value of the same size during encryption and decryption.

The **ica_des_ctrlist** function assumes that a list $n$ of precomputed counter values is provided, where $n$ is the smallest integer that is less than or equal to the message size divided by the cipher block size. This function is used to optimally utilize IBM System z hardware support for non-standard counter functions.

**Format**
```c
unsigned int ica_des_ctrlist(const unsigned char *in_data,
   unsigned char *out_data,
   unsigned long data_length,
   const unsigned char *key,
   const unsigned char *ctrlist,
   unsigned int direction);
```

**Required hardware support**
KMCTR-DEA

**Parameters**

**unsigned char *in_data**
Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is `data_length`. The size of this buffer must be at least as large as `data_length`.

**unsigned char *out_data**
Pointer to a writable buffer that will contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as `data_length`.

**unsigned long data_length**
Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of `in_data`.

Calls to **ica_des_ctrlist** with the same key can be chained if:
- The `data_length` used is a multiple of the cipher block size.
- The `ctrlist` argument of the chained call contains a list of counters that follows the counters used in the first call.
- The `data_length` used in the preceding call is a multiple of the cipher block size.

**unsigned char *key**
Pointer to a valid DES key of 8 bytes in length.

**unsigned char *ctrlist**
Pointer to a readable buffer of a size greater than or equal to `data_length`, and a multiple of the cipher block size (8 bytes for DES). `ctrlist` should contain a list of precomputed counter values, each of the same size as the cipher block.

**unsigned int direction**

- 0 Use the decrypt function.
- 1 Use the encrypt function.
Return codes

0  Success

For return codes indicating exceptions, see “Return codes” on page 63.
ica_des_ecb

Purpose
Encrypt or decrypt data with a DES key using Electronic Cook Book (ECB) mode,
as described in NIST Special Publication 800-38A Chapter 6.1.

Format
unsigned int ica_des_ecb(const unsigned char *in_data,
unsigned char *out_data,
unsigned long data_length,
const unsigned char *key,
unsigned int direction);

Required hardware support
KM-DEA-192

Parameters
unsigned char *in_data
    Pointer to a readable buffer that contains the message to be encrypted or
decrypted. The size of the message in bytes is data_length. The size of this
buffer must be at least as large as data_length.

unsigned char *out_data
    Pointer to a writeable buffer that will contain the resulting encrypted or
decrypted message. The size of this buffer in bytes must be at least as large as
data_length.

unsigned long data_length
    Length in bytes of the message to be encrypted or decrypted, which resides at
the beginning of in_data. data_length must be a multiple of the cipher block size
(8 bytes for DES).

unsigned char *key
    Pointer to a valid DES key of 8 bytes in length.

unsigned int direction
    0 Use the decrypt function.
    1 Use the encrypt function.

Return codes
    0 Success

For return codes indicating exceptions, see "Return codes" on page 63.
ica_des_ofb

Purpose
Encrypt or decrypt data with a DES key using Output Feedback (OFB) mode, as described in NIST Special Publication 800-38A Chapter 6.4.

Format
unsigned int ica_des_ofb(const unsigned char *in_data,
unsigned char *out_data,
unsigned long data_length,
const unsigned char *key,
unsigned int key_length,
unsigned char *iv,
unsigned int direction);

Required hardware support
KMO-DEA

Parameters
unsigned char *in_data
Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is data_length. The size of this buffer must be at least as large as data_length.

unsigned char *out_data
Pointer to a writable buffer that contains the resulting encrypted or decrypted message. The size of this must be at least as large as data_length.

unsigned long data_length
Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of in_data.

unsigned char *key
Pointer to a valid DES key of 8 bytes in length.

unsigned char *iv
Pointer to a valid initialization vector of the same size as the cipher block in bytes (8 bytes for DES). This vector will be overwritten during the function. If data_length is a multiple of the cipher block size (8 bytes for DES), the result value in iv can be used as the initialization vector for a chained ica_des_ofb call with the same key.

unsigned int direction
0 Use the decrypt function.
1 Use the encrypt function.

Return codes
0 Success

For return codes indicating exceptions, see "Return codes" on page 63.
 Compatibility with earlier versions

In order to stay compatible with earlier versions of libica, the following DES interfaces remain supported:

```c
unsigned int ica_des_encrypt(unsigned int mode,
   unsigned int data_length, unsigned char *input_data,
   ica_des_vector_t *iv, ica_des_key_single_t *des_key,
   unsigned char *output_data);
```

```c
unsigned int ica_des_decrypt(unsigned int mode,
   unsigned int data_length, unsigned char *input_data,
   ica_des_vector_t *iv, ica_des_key_single_t *des_key,
   unsigned char *output_data);
```

**Table 3** shows libica Version 2.0 DES functions calls, and their corresponding libica Version 2.1.0 DES function calls.

<table>
<thead>
<tr>
<th>Calling this libica Version 2.0 DES function</th>
<th>Corresponds to calling this libica Version 2.1.0 DES function</th>
</tr>
</thead>
<tbody>
<tr>
<td>ica_des_encrypt(MODE_ECB, data_length,in_data,NULL, key, out_data);</td>
<td>ica_des_ecb(in_data,out_data,(long)data_length, key,1);</td>
</tr>
<tr>
<td>ica_des_encrypt(MODE_CBC,data_length,in_data,iv, key,out_data);</td>
<td>ica_des_cbc(in_data,out_data,(long)data_length, key,iv,1);</td>
</tr>
<tr>
<td>ica_des_decrypt(MODE_ECB,data_length,in_data,NULL, key,out_data);</td>
<td>ica_des_ecb(in_data,out_data,(long)data_length, key,0);</td>
</tr>
<tr>
<td>ica_des_decrypt(MODE_CBC,data_length,in_data,iv, key,out_data);</td>
<td>ica_des_cbc(in_data,out_data,(long)data_length, key,iv,0);</td>
</tr>
</tbody>
</table>

The functions **ica_des_encrypt** and **ica_des_decrypt** remain supported, but their use is discouraged in favor of **ica_des_ecb** and **ica_des_cbc**.

For a detailed description of the earlier APIs, see *libica Programmer’s Reference Version 2.0*.

### TDES/3DES functions

These functions are included in: include/ica_api.h.

These functions perform encryption and decryption or computation and verification of message authentication codes using a triple-DES (3DES or TDEA) key. A 3DES key consists of a concatenation of three DES keys, each of which has a size of 8 bytes. Note that each byte of a DES key contains one parity bit, such that each 64-bit DES key contains only 56 security-relevant bits. The cipher block size for 3DES is 8 bytes.

3DES is known in two variants: a 2 key variant and a 3 key variant. This library implements only the 3 key variant. The 2 key variant can be derived from functions for the 3 key variant by using the same key as the first and third key.

To securely apply 3DES encryption to messages that are longer than the cipher block size, modes of operation can be used to chain multiple encryption, decryption or authentication operations. Most modes of operation require an initialization vector as additional input. As long as the messages are encrypted or decrypted using such a mode of operation and have a size that is a multiple of a particular block size (mostly the cipher block size), the functions encrypting or decryption according to that mode of operation also compute an output vector that can be used as the
initialization vector of a chained encryption or decryption operation in the same
mode with the same block size and the same key.

Note that when decrypting a cipher text, the mode of operation, the key, the
initialization vector (if applicable), and for ica_3des_cfb the lcfb value used for the
decryption function must match the corresponding settings of the encryption
function that was used to transform the plain text into the cipher text.
**Purpose**
Encrypt or decrypt data with an 3DES key using Cipher Block Chaining (CBC) mode as described in NIST Special Publication 800-38A Chapter 6.2.

**Format**
```c
unsigned int ica_3des_cbc(const unsigned char *in_data,
    unsigned char *out_data,
    unsigned long data_length,
    const unsigned char *key,
    unsigned char *iv,
    unsigned int *direction);
```

**Required hardware support**
KMC-TDEA-192

**Parameters**
- **unsigned char *in_data**
  Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is `data_length`. The size of this buffer must be at least as large as `data_length`.
- **unsigned char *out_data**
  Pointer to a writable buffer that will contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as `data_length`.
- **unsigned long data_length**
  Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of `in_data`. `data_length` must be a multiple of the cipher block size (8 bytes for 3DES).
- **unsigned char *key**
  Pointer to a valid 3DES key of 24 bytes in length.
- **unsigned char *iv**
  Pointer to a valid initialization vector of cipher block size number of bytes. This vector will be overwritten during the function. The result value in `iv` can be used as the initialization vector for a chained `ica_3des_cbc` call with the same key.
- **unsigned int *direction**
  - 0 Use the decrypt function.
  - 1 Use the encrypt function.

**Return codes**
- 0 Success

For return codes indicating exceptions, see "Return codes" on page 63.
ica_3des_cfb

Purpose
Encrypt or decrypt data with a 3DES key using Cipher Feedback (CFB) mode, as described in NIST Special Publication 800-38A Chapter 6.3.

Format

unsigned int ica_3des_cfb(const unsigned char *in_data,
unsigned char *out_data,
unsigned long data_length,
const unsigned char *key,
unsigned char *iv,
unsigned int lcfb,
unsigned int direction);

Required hardware support
KMF-TDEA-192

Parameters

unsigned char *in_data
  Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is data_length. The size of this buffer must be at least as large as data_length.

unsigned char *out_data
  Pointer to a writable buffer that will contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as data_length.

unsigned long data_length
  Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of in_data.

unsigned char *key
  Pointer to a valid 3DES key of 24 bytes in length.

unsigned char *iv
  Pointer to a valid initialization vector of cipher block size number of bytes (8 bytes for 3DES). This vector will be overwritten during the function. The result value in iv can be used as the initialization vector for a chained ica_3des_cfb call with the same key, if the data_length in the preceding call is a multiple of lcfb.

unsigned int lcfb
  Length in bytes of the cipher feedback, which is a value greater than or equal to 1 and less than or equal to the cipher block size (8 bytes for 3DES).

unsigned int direction
  0  Use the decrypt function.
  1  Use the encrypt function.

Return codes

0  Success

For return codes indicating exceptions, see "Return codes on page 63."
ica_3des_ctr

**Purpose**
Encrypt or decrypt data with a triple-length DES key using Counter (CTR) mode, as described in NIST Special Publication 800-38A Chapter 6.5. With the counter mode, each message block of size cipher block size (8 bytes for 3DES) is combined with a counter value of the same size during encryption and decryption.

Starting with an initial counter value to be combined with the first message block, subsequent counter values to be combined with subsequent message blocks will be derived from preceding counter values by an increment function. The increment function used in ica_3des_ctr is an arithmetic increment without carry on the $M$ least significant bytes in the counter, where $M$ is a parameter to ica_3des_ctr.

**Format**

```c
unsigned int ica_3des_ctr(const unsigned char *in_data,
  unsigned char *out_data,
  unsigned long data_length,
  const unsigned char *key,
  unsigned char *ctr,
  unsigned int ctr_width,
  unsigned int direction);
```

**Required hardware support**
KMCTR-TDEA-192

**Parameters**

- `const unsigned char *in_data`
  Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is `data_length`. The size of this buffer must be at least as large as `data_length`.

- `unsigned char *out_data`
  Pointer to a writable buffer that will contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as `data_length`.

- `unsigned long data_length`
  Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of `in_data`.

- `unsigned char *key`
  Pointer to a valid 3DES key of 24 bytes in length.

- `unsigned char *ctr`
  Pointer to a readable and writable buffer of the same size as the cipher block in bytes. `ctr` contains an initialization value for a counter function that will be replaced by a new value. The new value can be used as an initialization value for a counter function in a chained ica_3des_ctr call with the same key, if the `data_length` used in the preceding call is a multiple of the cipher block size.

- `unsigned int ctr_width`
  A number $M$ between 1 and the cipher block size. The value is used by the counter increment function, which increments a counter value by incrementing without carry the least significant $M$ bytes of the counter value.

- `unsigned int direction`
  0 Use the decrypt function.
  1 Use the encrypt function.
Return codes

0  Success

For return codes indicating exceptions, see “Return codes” on page 63.
**ica_3des_ctrlist**

**Purpose**
Encrypt or decrypt data with an 3DES key using Counter (CTR) mode, as described in NIST Special Publication 800-38A, Chapter 6.5. With the counter mode, each message block of the same size as the cipher block is combined with a counter value of the same size during encryption and decryption.

The `ica_3des_ctrlist` function assumes that a list `n` of precomputed counter values is provided where `n` is the smallest integer that is less than or equal to the message size divided by the cipher block size. This function is used to optimally utilize IBM System z hardware support for non-standard counter functions.

**Format**

```c
unsigned int ica_3des_ctrlist(const unsigned char *in_data,
                            unsigned char *out_data,
                            unsigned long data_length,
                            const unsigned char *key,
                            const unsigned char *ctrlist,
                            unsigned int direction);
```

**Required hardware support**
KMCTR-TDEA-192

**Parameters**

- **unsigned char *in_data**
  Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is `data_length`. The size of this buffer must be at least as large as `data_length`.

- **unsigned char *out_data**
  Pointer to a writable buffer that will contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as `data_length`.

- **unsigned long data_length**
  Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of `in_data`.

  Calls to `ica_3des_ctrlist` with the same key can be chained if:
  - The `data_length` used is a multiple of the cipher block size.
  - The `ctrlist` argument of the chained call contains a list of counters that follows the counters used in the first call.
  - The `data_length` used in the preceding call is a multiple of the cipher block size.

- **unsigned char *key**
  Pointer to a valid TDES key of 24 bytes in length.

- **unsigned char *ctrlist**
  Pointer to a readable buffer that is both of size greater than or equal to `data_length`, and a multiple of the cipher block size (8 bytes for TDES). `ctrlist` should contain a list of precomputed counter values, each of the same size as the cipher block.

- **unsigned int direction**
  - 0 Use the decrypt function.
  - 1 Use the encrypt function.
Return codes

0  Success

For return codes indicating exceptions, see “Return codes” on page 63.
Purpose
Encrypt or decrypt data with an 3DES key using Electronic Cook Book (ECB) mode, as described in NIST Special Publication 800-38A Chapter 6.1.

Format
unsigned int ica_3des_ecb(const unsigned char *in_data,
unsigned char *out_data,
unsigned long data_length,
const unsigned char *key,
unsigned int direction);

Required hardware support
KM-DEA-192

Parameters
unsigned char *in_data
   Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is data_length. The size of this buffer must be at least as large as data_length.

unsigned char *out_data
   Pointer to a writeable buffer that will contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as data_length.

unsigned long data_length
   Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of in_data. data_length must be a multiple of the cipher block size (8 bytes for 3DES).

unsigned char *key
   Pointer to a valid 3DES key of 24 bytes in length.

unsigned int direction
   0 Use the decrypt function.
   1 Use the encrypt function.

Return codes
0 Success

For return codes indicating exceptions, see "Return codes" on page 63.
ica_3des_ofb

Purpose
Encrypt or decrypt data with an 3DES key using Output Feedback (OFB) mode, as described in NIST Special Publication 800-38A Chapter 6.4.

Format
unsigned int ica_3des_ofb(const unsigned char *in_data,
unsigned char *out_data,
unsigned long data_length,
const unsigned char *key,
unsigned int key_length,
unsigned char *iv,
unsigned int direction);

Required hardware support
KMO-TDEA-192

Parameters
unsigned char *in_data
Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is data_length. The size of this buffer must be at least as large as data_length.

unsigned char *out_data
Pointer to a writable buffer that contains the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as data_length.

unsigned long data_length
Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of in_data.

unsigned char *key
Pointer to a valid 3DES key of 24 bytes in length.

unsigned char *iv
Pointer to a valid initialization vector of the same size as the cipher block in bytes (8 bytes for TDES). This vector will be overwritten during the function. If data_length is a multiple of the cipher block size (a multiple of 8 for 3DES), the result value in iv can be used as the initialization vector for a chained ica_3des_ofb call with the same key.

unsigned int direction
0 Use the decrypt function.
1 Use the encrypt function.

Return codes
0 Success

For return codes indicating exceptions, see "Return codes" on page 63.
## Compatibility with earlier versions

In order to stay compatible with earlier versions of libica, the following TDES interfaces remain supported:

```c
unsigned int ica_3des_encrypt(unsigned int mode,
    unsigned int data_length, unsigned char *input_data,
    ica_des_vector_t *iv, ica_des_key_triple_t *des_key,
    unsigned char *output_data);
```

```c
unsigned int ica_3des_decrypt(unsigned int mode,
    unsigned int data_length, unsigned char *input_data,
    ica_des_vector_t *iv, ica_des_key_triple_t *des_key,
    unsigned char *output_data);
```

**Table 4** shows libica Version 2.0 TDES functions calls, and their corresponding libica Version 2.1.0 TDES function calls.

<table>
<thead>
<tr>
<th>Calling this libica Version 2.0 TDES function</th>
<th>Corresponds to calling this libica Version 2.1.0 TDES function</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ica_3des_encrypt(MODE_ECB, data_length,in_data,NULL, key, out_data);</code></td>
<td><code>ica_3des_ecb(in_data,out_data,(long)data_length, key,1);</code></td>
</tr>
<tr>
<td><code>ica_3des_encrypt(MODE_CBC,data_length,in_data,iv, key,out_data);</code></td>
<td><code>ica_3des_cbc(in_data,out_data,(long)data_length, key,1);</code></td>
</tr>
<tr>
<td><code>ica_3des_decrypt(MODE_ECB,data_length,in_data,NULL, key,out_data);</code></td>
<td><code>ica_3des_ecb(in_data,out_data,(long)data_length, key,0);</code></td>
</tr>
<tr>
<td><code>ica_3des_decrypt(MODE_CBC,data_length,in_data,iv, key,out_data);</code></td>
<td><code>ica_3des_cbc(in_data,out_data,(long)data_length, key,0);</code></td>
</tr>
</tbody>
</table>

The functions `ica_3des_encrypt` and `ica_3des_decrypt` remain supported, but their use is discouraged in favor of `ica_3des_ecb` and `ica_3des_cbc`.

For a detailed description of the earlier APIs, see *libica Programmer’s Reference Version 2.0*.

## AES functions

These functions are included in: `include/ica_api.h`.

These functions perform encryption and decryption or computation or verification of message authentication codes using an AES key. Supported key lengths are 16, 24 or 32 bytes for AES-128, AES-192 and AES-256 respectively. The cipher block size for AES is 16 bytes.

To securely apply AES encryption to messages that are longer than the cipher block size, modes of operation can be used to chain multiple encryption, decryption, or authentication operations. Most modes of operation require an initialization vector as additional input.

As long as the messages are encrypted or decrypted using such a mode of operation, have a size that is a multiple of a particular block size (mostly the cipher block size), the functions encrypting or decryption according to a mode of operation also compute an output vector. The output vector can be used as the initialization vector of a chained encryption or decryption operation in the same mode with the same block size and the same key.
Note that when decrypting a cipher text the mode of operation, the key, the initialization vector (if applicable), and for ica_aes_cfb the lcfb value used for the decryption function must match the corresponding settings of the encryption function that transformed the plain text into the cipher text.
ica_aes_cbc

Purpose
Encrypt or decrypt data with an AES key using Cipher Block Chaining (CBC) mode, as described in NIST Special Publication 800-38A Chapter 6.2.

Format
unsigned int ica_aes_cbc(const unsigned char *in_data,
unsigned char *out_data,
unsigned long data_length,
const unsigned char *key,
unsigned int key_length,
unsigned char *iv,
unsigned int direction);

Required hardware support
KMC-AES-128, KMC-AES-192, or KMC-AES-256

Parameters
unsigned char *in_data
Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is data_length. The size of this buffer must be at least as large as data_length.

unsigned char *out_data
Pointer to a writable buffer that will contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as data_length.

unsigned long data_length
Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of in_data. data_length must be a multiple of the cipher block size (a multiple of 16 for AES).

unsigned char *key
Pointer to a valid AES key.

unsigned int key_length
Length in bytes of the AES key. Supported sizes are 16, 24, and 32, for AES-128, AES-192, and AES-256 respectively. Therefore, you can use the definitions: AES_KEY_LEN128, AES_KEY_LEN192, and AES_KEY_LEN256.

unsigned char *iv
Pointer to a valid initialization vector of the same size as the cipher block in bytes. This vector will be overwritten during the function. The result value in iv can be used as the initialization vector for a chained ica_aes_cbc call with the same key.

unsigned int direction
0 Use the decrypt function.
1 Use the encrypt function.

Return codes
0 Success

For return codes indicating exceptions, see “Return codes” on page 63.
**ica_aes_cfb**

**Purpose**
Encrypt or decrypt data with an AES key using Cipher Feedback (CFB) mode, as described in NIST Special Publication 800-38A Chapter 6.3.

**Format**
```c
unsigned int ica_aes_cfb(const unsigned char *in_data,
                        unsigned char *out_data,
                        unsigned long data_length,
                        const unsigned char *key,
                        unsigned int key_length,
                        unsigned char *iv,
                        unsigned int lcfb,
                        unsigned int direction);
```

**Required hardware support**
KMF-AES-128, KMF-AES-192, or KMF-AES-256

**Parameters**
- **unsigned char *in_data**
  Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is `data_length`. The size of this buffer must be at least as large as `data_length`.

- **unsigned char *out_data**
  Pointer to a writable buffer that will contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as `data_length`.

- **unsigned long data_length**
  Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of `in_data`.

- **unsigned char *key**
  Pointer to a valid AES key.

- **unsigned int key_length**
  Length in bytes of the AES key. Supported sizes are 16, 24, and 32, for AES-128, AES-192, and AES-256 respectively. Therefore, you can use the definitions: `AES_KEY_LEN128`, `AES_KEY_LEN192`, and `AES_KEY_LEN256`.

- **unsigned char *iv**
  Pointer to a valid initialization vector of the same size as the cipher block in bytes (16 bytes for AES). This vector will be overwritten during the function. The result value in `iv` can be used as the initialization vector for a chained `ica_aes_cfb` call with the same key, if the `data_length` in the preceding call is a multiple of `lcfb`.

- **unsigned int lcfb**
  Length in bytes of the cipher feedback, which is a value greater than or equal to 1 and less than or equal to the cipher block size (16 bytes for AES).

- **unsigned int direction**
  0 Use the decrypt function.
  1 Use the encrypt function.
Return codes

0  Success

For return codes indicating exceptions, see "Return codes" on page 63.
ica_aes_cmac

Purpose
Authenticate data or verify the authenticity of data with an AES key using the Block Cipher Based Message Authentication Code (CMAC) mode, as described in NIST Special Publication 800-38B. ica_aes_cmac can be used to authenticate or verify the authenticity of a complete message.

Format
unsigned int ica_aes_cmac(const unsigned char *message,
    unsigned long message_length,
    unsigned char *mac,
    unsigned int mac_length,
    const unsigned char *key,
    unsigned int key_length,
    unsigned int direction);

Required hardware support
    KMAC-AES-128, KMAC-AES-192 or KMAC-AES-256

Parameters
unsigned char *message
    Pointer to a readable buffer of size greater than or equal to message_length bytes. This buffer contains a message to be authenticated, or of which the authenticity shall be verified.

unsigned long message_length
    Length in bytes of the message to be authenticated or verified.

unsigned char *mac
    Pointer to a buffer of size greater than or equal to mac_length bytes. If direction is equal to 1, the buffer must be writable and a message authentication code for the message in message of size mac_length bytes will be written to this buffer. If direction is equal to 0, this buffer must be readable and contain a message authentication code that will be verified against the message in message.

unsigned int mac_length
    Length in bytes of the message authentication code mac in bytes, which is less than or equal to the cipher block size (16 bytes for AES). It is recommended to use values greater than or equal to 8.

unsigned char *key
    Pointer to a valid AES key.

unsigned int key_length
    Length in bytes of the AES key. Supported sizes are 16, 24, and 32 for AES-128, AES-192, and AES-256 respectively. Therefore, you can use the definitions: AES_KEY_LEN128, AES_KEY_LEN192, and AES_KEY_LEN256.

unsigned int direction
    0 Verify message authentication code.
    1 Compute message authentication code for the message.

Return codes
0  Success
EFAULT

If `direction` is equal to 0 and the verification of the message authentication code fails.

For return codes indicating exceptions, see “Return codes” on page 63.
**ica_aes_ctr**

**Purpose**
Encrypt or decrypt data with an AES key using Counter (CTR) mode, as described in NIST Special Publication 800-38A Chapter 6.5. With the counter mode, each message block of size cipher block size (16 bytes for AES) is combined with a counter value of the same size during encryption and decryption.

Starting with an initial counter value to be combined with the first message block, subsequent counter values to be combined with subsequent message blocks will be derived from preceding counter values by an increment function. The increment function used in ica_aes_ctr is an arithmetic increment without carry on the $M$ least significant bytes in the counter where $M$ is a parameter to ica_aes_ctr.

**Format**
```
unsigned int ica_aes_ctr(const unsigned char *in_data,
    unsigned char *out_data,
    unsigned long data_length,
    const unsigned char *key,
    unsigned int key_length,
    unsigned char *ctr,
    unsigned int ctr_width,
    unsigned int direction);
```

**Required hardware support**
KMCTR-AES-128, KMCTR-AES-192, or KMCTR-AES-256

**Parameters**
- **const unsigned char *in_data**
  Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is `data_length`. The size of this buffer must be at least as large as `data_length`.

- **unsigned char *out_data**
  Pointer to a writable buffer that will contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as `data_length`.

- **unsigned long data_length**
  Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of `in_data`.

- **unsigned char *key**
  Pointer to a valid AES key.

- **unsigned int key_length**
  Length in bytes of the AES key. Supported sizes are 16, 24, and 32 for AES-128, AES-192, and AES-256 respectively. Therefore, you can use the definitions: **AES_KEY_LEN128**, **AES_KEY_LEN192**, and **AES_KEY_LEN256**.

- **unsigned char *ctr**
  Pointer to a readable and writable buffer of the same size as the cipher block in bytes. `ctr` contains an initialization value for a counter function, and it will be replaced by a new value. That new value can be used as an initialization value for a counter function in a chained ica_aes_ctr call with the same key, if the `data_length` used in the preceding call is a multiple of the cipher block size.

- **unsigned int ctr_width**
  A number $M$ between 1 and the cipher block size. The value is used by the
counter increment function, which increments a counter value by incrementing without carry the least significant $M$ bytes of the counter value.

unsigned int direction

0 Use the decrypt function.
1 Use the encrypt function.

**Return codes**

0 Success

For return codes indicating exceptions, see "Return codes" on page 63.
ica_aes_ctrlist

Purpose
Encrypt or decrypt data with an AES key using Counter (CTR) mode, as described in NIST Special Publication 800-38A, Chapter 6.5. With the counter mode, each message block of the same size as the cipher block in bytes is combined with a counter value of the same size during encryption and decryption.

The ica_aes_ctrlist function assumes that a list n of precomputed counter values is provided, where n is the smallest integer that is less than or equal to the message size divided by the cipher block size. This function optimally utilizes IBM System z hardware support for non-standard counter functions.

Format
unsigned int ica_aes_ctrlist(const unsigned char *in_data,
              unsigned char *out_data,
              unsigned long data_length,
              const unsigned char *key,
              unsigned int key_length,
              const unsigned char *ctrlist,
              unsigned int direction);

Required hardware support
KMCTR-DEAKMCTR-AES-128, KMCTR-AES-192, or KMCTR-AES-256

Parameters
unsigned char *in_data
Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is data_length. The size of this buffer must be at least as large as data_length.

unsigned char *out_data
Pointer to a writable buffer that will contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as data_length.

unsigned long data_length
Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of in_data.

Calls to ica_aes_ctrlist with the same key can be chained if:
• The data_length used is a multiple of the cipher block size.
• The ctrlist argument of the chained call contains a list of counters that follows the counters used in the first call.
• The data_length used in the preceding call is a multiple of the cipher block size.

unsigned char *key
Pointer to a valid AES key.

unsigned int key_length
Length in bytes of the AES key. Supported sizes are 16, 24, and 32 for AES-128, AES-192, and AES-256 respectively. Therefore, you can use the definitions: AES_KEY_LEN128, AES_KEY_LEN192, and AES_KEY_LEN256.

unsigned char *ctrlist
Pointer to a readable buffer that is both of a size greater than or equal to
data_length, and a multiple of the cipher block size (16 bytes for AES). ctrlist
should contain a list of precomputed counter values, each of the same size as
the cipher block.
signed int direction
  0 Use the decrypt function.
  1 Use the encrypt function.

Return codes
  0 Success

For return codes indicating exceptions, see "Return codes" on page 63.
ica_aes_ecb

Purpose
Encrypt or decrypt data with an AES key using Electronic Cook Book (ECB) mode, as described in NIST Special Publication 800-38A Chapter 6.1.

Format

```c
unsigned int ica_aes_ecb(const unsigned char *data,
                         unsigned char *output,
                         unsigned int data_length,
                         const unsigned char *key,
                         unsigned int key_length,
                         unsigned int direction);
```

Required hardware support
KM-AES-128, KM-AES-192, or KM-AES-256

Parameters

- **unsigned char *in_data**
  - Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is `data_length`. The size of this buffer must be at least as large as `data_length`.

- **unsigned char *out_data**
  - Pointer to a writable buffer that will contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as `data_length`.

- **unsigned long data_length**
  - Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of `in_data`. `data_length` must be a multiple of the cipher block size (a multiple of 16 for AES).

- **unsigned char *key**
  - Pointer to a valid AES key.

- **unsigned int key_length**
  - Length in bytes of the AES key. Supported sizes are 16, 24, and 32 for AES-128, AES-192, and AES-256 respectively. Therefore, you can use the definitions: `AES_KEY_LEN128`, `AES_KEY_LEN192`, and `AES_KEY_LEN256`.

- **unsigned int direction**
  - 0 Use the decrypt function.
  - 1 Use the encrypt function.

Return codes

- 0 Success

For return codes indicating exceptions, see “Return codes” on page 63.
ica_aes_ofb

Purpose
Encrypt or decrypt data with an AES key using Output Feedback (OFB) mode, as described in NIST Special Publication 800-38A Chapter 6.4.

Format
```c
unsigned int ica_aes_ofb(const unsigned char *in_data,
                          unsigned char *out_data,
                          unsigned long data_length,
                          const unsigned char *key,
                          unsigned int key_length,
                          unsigned char *iv,
                          unsigned int direction);
```

Required hardware support
KMO-AES-128, KMO-AES-192, or KMO-AES-256

Parameters
- `unsigned char *in_data`  
  Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is `data_length`. The size of this buffer must be at least as large as `data_length`.
- `unsigned char *out_data`  
  Pointer to a writable buffer that will contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as `data_length`.
- `unsigned long data_length`  
  Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of `in_data`.
- `unsigned char *key`  
  Pointer to a valid AES key.
- `unsigned int key_length`  
  Length in bytes of the AES key. Supported sizes are 16, 24, and 32 for AES-128, AES-192, and AES-256 respectively. Therefore, you can use the definitions: `AES_KEY_LEN128`, `AES_KEY_LEN192`, and `AES_KEY_LEN256`.
- `unsigned char *iv`  
  Pointer to a valid initialization vector of the same size as the cipher block, in bytes (16 bytes for AES). This vector will be overwritten during the function. If `data_length` is a multiple of the cipher block size (16 bytes for AES), the result value in `iv` can be used as the initialization vector for a chained `ica_aes_ofb` call with the same key.
- `unsigned int direction`  
  0 Use the decrypt function.
  1 Use the encrypt function.

Return codes
0  Success

For return codes indicating exceptions, see  "Return codes" on page 63.
ica_aes_xts

Purpose
Encrypt or decrypt data with an AES key using the XEX Tweakable Block Cipher with Ciphertext Stealing (XTS) mode, as described in NIST Special Publication 800-38E and IEEE standard 1619-2007.

Format
unsigned int ica_aes_xts(const unsigned char *in_data,
                         unsigned char *out_data,
                         unsigned long data_length,
                         const unsigned char *key1,
                         const unsigned char *key2,
                         unsigned int key_length,
                         unsigned char *tweak,
                         unsigned int direction);

Required hardware support
KM-XTS-AES-128, or KM-XTS-AES-256
PCC-Compute-XTS-Parameter-Using-AES-128, or PCC-Compute-XTS-Parameter-Using-AES-256

Parameters
unsigned char *in_data
Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is data_length. The size of this buffer must be at least as large as data_length.

unsigned char *out_data
Pointer to a writable buffer that will contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as data_length.

unsigned long data_length
Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of in_data. The minimal value of data_length is 16.

unsigned char *key1
Pointer to a buffer containing a valid AES key. key1 is used for the actual encryption of the message buffer, combined with some vector computed from the tweak value (Key1 in IEEE Std 1619-2007).

unsigned char *key2
Pointer to a buffer containing a valid AES key key2 is used to encrypt the tweak (Key2 in IEEE Std 1619-2007).

unsigned int key_length
The length in bytes of the AES key. XTS supported AES key sizes are 16 and 32, for AES-128 and AES-256 respectively. Therefore, you can use:

2 * AES_KEY_LEN128 and 2 * AES_KEY_LEN256.

unsigned char *tweak
Pointer to a valid 16-byte tweak value (as in IEEE standard 1619-2007). This tweak will be overwritten during the function. If data_length is a multiple of the cipher block size (a multiple of 16 for AES), the result value in tweak can be used as the tweak value for a chained ica_aes_xts call with the same key pair.

unsigned int direction
0 Use the decrypt function.
1 Use the encrypt function.

**Return codes**

- 0 Success

For return codes indicating exceptions, see “Return codes” on page 63.
Compatibility with earlier versions

In order to stay compatible with earlier versions of libica, the following AES interfaces remain supported:

```c
unsigned int ica_aes_encrypt(unsigned int mode,
  unsigned int data_length, unsigned char *input_data,
  icaaes_vector_t *iv, unsigned int key_length, unsigned char *aes_key,
  unsigned char *output_data);
```

```c
unsigned int ica_aes_decrypt(unsigned int mode,
  unsigned int data_length, unsigned char *input_data,
  icaaes_vector_t *iv, unsigned int key_length, unsigned char *aes_key,
  unsigned char *output_data);
```

Table 5 shows libica Version 2.0 AES functions calls, and their corresponding libica Version 2.1.0 AES function calls.

<table>
<thead>
<tr>
<th>Calling this libica Version 2.0 AES function</th>
<th>Corresponds to calling this libica Version 2.1.0 AES function</th>
</tr>
</thead>
<tbody>
<tr>
<td>ica_aes_encrypt(MODE_ECB, data_length, in_data, NULL, key_length, key, out_data);</td>
<td>ica_aes_ecb(in_data, out_data, (long)data_length, key, key_length, 1);</td>
</tr>
<tr>
<td>ica_aes_encrypt(MODE_CBC, data_length, in_data, iv, key_length, key, out_data);</td>
<td>ica_des_cbc(in_data, out_data, (long)data_length, key, key_length, iv, 1);</td>
</tr>
<tr>
<td>ica_aes_decrypt(MODE_ECB, data_length, in_data, NULL, key_length, key, out_data);</td>
<td>ica_aes_ecb(in_data, out_data, (long)data_length, key, key_length, 0);</td>
</tr>
<tr>
<td>ica_aes_decrypt(MODE_CBC, data_length, in_data, iv, key_length, key, out_data);</td>
<td>ica_aes_cbc(in_data, out_data, (long)data_length, key, key_length, iv, 0);</td>
</tr>
</tbody>
</table>

The functions ica_aes_encrypt and ica_aes_decrypt remain supported, but their use is discouraged in favor of ica_aes_ecb and ica_aes_cbc.

For a detailed description of the earlier APIs, see libica Programmer's Reference Version 2.0.

Information retrieval function

This function is included in: include/ica_api.h.

This function return information about the libica version.
ica_get_version

**Purpose**

Return libica version information.

**Format**

```c
unsigned int ica_get_version(libica_version_info *version_info);
```

**Parameters**

`libica_version_info *version_info`

Pointer to a `libica_version_info` structure. The structure will be filled with the current libica version information.

**Return codes**

0  Success

For return codes indicating exceptions, see "Return codes" on page 63.
Chapter 4. libica defines, typedefs, structs and return codes

These are the defines, typedefs, structs, and return codes used when programming with the libica Version 2.1.0 APIs in Chapter 3, “libica Version 2.1.0 Application Programming Interfaces (APIs),” on page 5. To use them, include ica_api.h in your programs.

Defines

These are defines that are new with libica Version 2.1.0 or have been changed from libica Version 1 or libica Version 2. Use these defines instead of the equivalent libica Version 1 defines. There is no difference in their values.

#define ica_adapter_handle_t int
#define SHA_HASH_LENGTH 20
#define SHA1_HASH_LENGTH SHA_HASH_LENGTH
#define SHA224_HASH_LENGTH 28
#define SHA256_HASH_LENGTH 32
#define SHA384_HASH_LENGTH 48
#define SHA512_HASH_LENGTH 64
#define ica_aes_key_t ica_key_t
#define ICA_ENCRYPT 1
#define ICA_DECRYPT 0

Typedefs

The following typedefs are available to ensure compatibility with libica Version 1 types.

typedef ica_des_vector_t ICA_DES VECTOR;
typedef ica_des_key_single_t ICA_KEY DES SINGLE;
typedef ica_des_key_triple_t ICA_KEY DES TRIPLE;
typedef ica_aes_vector_t ICA_AES VECTOR;
typedef ica_aes_key_single_t ICA_KEY AES SINGLE;
typedef ica_aes_key_len_128_t ICA KEY AES LEN128;
typedef ica_aes_key_len_192_t ICA KEY AES LEN192;
typedef ica_aes_key_len_256_t ICA KEY AES LEN256;
typedef sha_context_t SHA CONTEXT;
typedef sha256_context_t SHA256 CONTEXT;
typedef sha512_context_t SHA512 CONTEXT;
typedef unsigned char ica_des_vector_t[8];
typedef unsigned char ica_des_key_single_t[8];
typedef unsigned char ica_key_t[8];
typedef unsigned char ica_aes_vector_t[16];
typedef unsigned char ica_aes_key_single_t[8];
typedef unsigned char ica_aes_key_len_128_t[16];
typedef unsigned char ica_aes_key_len_192_t[24];
typedef unsigned char ica_aes_key_len_256_t[32];
The following structs are used in the API of libica Version 2.1.0. For the definitions of older functions, see previous versions of this book. The older functions are no longer recommended for use, but they are supported.

```c
typedef struct {
    unsigned int key_length;
    unsigned char* modulus;
    unsigned char* exponent;
} ica_rsa_key_mod_exp_t;

typedef struct {
    unsigned int key_length;
    unsigned char* p;
    unsigned char* q;
    unsigned char* dp;
    unsigned char* dq;
    unsigned char* qInverse;
} ica_rsa_key_crt_t;
```

Take note of these considerations:

- The buffers pointed to by members of type `unsigned char *` must be manually allocated and deallocated by the user.
- Key parts must always be right justified in their fields.
- All buffers pointed to by members `modulus` and `exponent` in struct `ica_rsa_key_mod_exp_t` must be of length `key_length`.
- All buffers pointed to by members `p`, `q`, `dp`, `dq`, and `qInverse` in struct `ica_rsa_key_crt_t` must be of size `key_length / 2` or larger.
- In the struct `ica_rsa_key_crt_t`, the buffers `p`, `dp` and `qInverse` must contain 8 bytes of zero padding in front of the actual values.
- If an exponent is set in struct `ica_rsa_key_mod_exp_t` as part of a public key for key generation, be aware that due to a restriction in OpenSSL, the public exponent cannot be larger than a size of unsigned long. Therefore, you must have zeroes left padded in the buffer pointed to by `exponent` in the struct `ica_rsa_key_mod_exp_t` struct. Be aware that this buffer also must be of size `key_length`.
- This `key_length` value should be calculated from the length of the modulus in bits, according to this calculation

```
key_length = (modulus_bits + 7) / 8
```

```c
typedef struct {
    uint64_t runningLength;
    unsigned char shaHash[LENGTH_SHA_HASH];
} sha_context_t;

typedef struct {
    uint64_t runningLength;
    unsigned char sha256Hash[LENGTH_SHA256_HASH];
} sha256_context_t;

typedef struct {
    uint64_t runningLengthHigh;
    uint64_t runningLengthLow;
    unsigned char sha512Hash[LENGTH_SHA512_HASH];
} sha512_context_t;

typedef struct {
    unsigned int major_version;
    unsigned int minor_version;
    unsigned int fixpack_version;
} libica_version_info;
```
Return codes

The libica Version 2 and libica Version 2.1.0 functions use these standard Linux return codes:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Success</td>
</tr>
<tr>
<td>EFAULT</td>
<td>The message authentication failed.</td>
</tr>
<tr>
<td>EINVAL</td>
<td>Incorrect parameter</td>
</tr>
<tr>
<td>EIO</td>
<td>I/O error</td>
</tr>
<tr>
<td>EPERM</td>
<td>Operation not permitted by Hardware (CPACF).</td>
</tr>
<tr>
<td>ENODEV</td>
<td>No such device</td>
</tr>
<tr>
<td>ENOMEM</td>
<td>Not enough memory</td>
</tr>
<tr>
<td>errno</td>
<td>When libica calls open, close, begin_sigill_section, or OpenSSL function RSA_generate_key, the error codes of these programs are returned.</td>
</tr>
</tbody>
</table>
Chapter 5. Examples

These are sample program segments used to illustrate the libica Version 2.1.0 APIs. These sample programs are from the libica Version 2.1.0 RPM, and they have been enhanced to use the libica Version 2.1.0 APIs.

These examples are released under the Common Public License - V1.0, which is stated in full at the end of this chapter. See "Common Public License - V1.0" on page 142.

Table 6 lists the examples for libica, and the makefile used to create the library.

DES with ECB mode example

The following program prints the version of libica and then encrypts the contents of a character array (plain_data[]) using DES in ECE mode and a key stored in another character array (des_key[]). The program then decrypts the result and prints it as a string. Intermediate results are written as hex dumps.

Pseudo random number generation example

This is an example of the old (libica Version 1) API. Examples for using the new (libica Version 2.1.0) API for random number generation are located in other examples, such as the DES with CTR mode example.

```c
#include <fcntl.h>
#include <sys/errno.h>
#include <stdio.h>
#include "ica_api.h"

unsigned char R[512];

extern int errno;

void dump_array(unsigned char *ptr, unsigned int size)
{
    unsigned char *ptr_end;
    unsigned char *h;
    int i = 1;

    h = ptr;
    ptr_end = ptr + size;
    while (h < (unsigned char *)ptr_end) {
        printf("0x%02x", (unsigned char) *h);
        h++;
        if (i == 8) {
            printf("\n");
            i = 1;
        } else {
            ++i;
        }
    }
    printf("\n");
}

int main(int ac, char **av)
{
    int rc;
    ICA_ADAPTER_HANDLE adapter_handle;

    rc = icaOpenAdapter(0, &adapter_handle);
    if (rc != 0) {
        printf("icaOpenAdapter failed and returned %d (0x%x).\n", rc, rc);
    }

    rc = icaRandomNumberGenerate(adapter_handle, sizeof R, R);
    if (rc != 0) {
        printf("icaRandomNumberGenerate failed and returned %d (0x%x).\n", rc, rc);
    } else {
        printf("Here it is:\n");
    }

dump_array(R, sizeof R);
```

Chapter 5. Examples 75

Common Public License - V1.0

THE ACCOMPANYING PROGRAM IS PROVIDED UNDER THE TERMS OF THIS COMMON PUBLIC LICENSE ("AGREEMENT"). ANY USE, REPRODUCTION OR DISTRIBUTION OF THE PROGRAM CONSTITUTES RECIPIENT'S ACCEPTANCE OF THIS AGREEMENT.

1. DEFINITIONS

"Contribution" means:
1. in the case of the initial Contributor, the initial code and documentation distributed under this Agreement, and
2. in the case of each subsequent Contributor:
   1. changes to the Program, and
   2. additions to the Program;

where such changes and/or additions to the Program originate from and are distributed by that particular Contributor. A Contribution 'originates' from a Contributor if it was added to the Program by such Contributor itself or anyone acting on such Contributor's behalf. Contributions do not include additions to the Program which: (i) are separate modules of software distributed in conjunction with the Program under their own license agreement, and (ii) are not derivative works of the Program.

"Contributor" means any person or entity that distributes the Program.

"Licensed Patents" mean patent claims licensable by a Contributor which are necessarily infringed by the use or sale of its Contribution alone or when combined with the Program.

"Program" means the Contributions distributed in accordance with this Agreement.

"Recipient" means anyone who receives the Program under this Agreement, including all Contributors.

2. GRANT OF RIGHTS

1. Subject to the terms of this Agreement, each Contributor hereby grants Recipient a non-exclusive, worldwide, royalty-free copyright license to reproduce, prepare derivative works of, publicly display, publicly perform, distribute and sublicense the Contribution of such Contributor, if any, and such derivative works, in source code and object code form.

2. Subject to the terms of this Agreement, each Contributor hereby grants Recipient a non-exclusive, worldwide, royalty-free patent license under Licensed Patents to make, use, sell, offer to sell, import and otherwise transfer the Contribution of such Contributor, if any, in source code and object code form. This patent license shall apply to the combination of the Contribution and the Program if, at the time the Contribution is added by the Contributor, such addition of the Contribution causes such combination to be covered by the Licensed Patents. The patent license shall not apply to any other combinations which include the Contribution. No hardware per se is licensed hereunder.

3. Recipient understands that although each Contributor grants the licenses to its Contributions set forth herein, no assurances are provided by any Contributor that the Program does not infringe the patent or other intellectual property...
rights of any other entity. Each Contributor disclaims any liability to Recipient for claims brought by any other entity based on infringement of intellectual property rights or otherwise. As a condition to exercising the rights and licenses granted hereunder, each Recipient hereby assumes sole responsibility to secure any other intellectual property rights needed, if any. For example, if a third party patent license is required to allow Recipient to distribute the Program, it is Recipient's responsibility to acquire that license before distributing the Program.

4. Each Contributor represents that to its knowledge it has sufficient copyright rights in its Contribution, if any, to grant the copyright license set forth in this Agreement.

3. REQUIREMENTS

A Contributor may choose to distribute the Program in object code form under its own license agreement, provided that:

1. it complies with the terms and conditions of this Agreement; and

2. its license agreement:
   1. effectively disclaims on behalf of all Contributors all warranties and conditions, express and implied, including warranties or conditions of title and non-infringement, and implied warranties or conditions of merchantability and fitness for a particular purpose;

   2. effectively excludes on behalf of all Contributors all liability for damages, including direct, indirect, special, incidental and consequential damages, such as lost profits;

   3. states that any provisions which differ from this Agreement are offered by that Contributor alone and not by any other party; and

   4. states that source code for the Program is available from such Contributor, and informs licensees how to obtain it in a reasonable manner on or through a medium customarily used for software exchange.

When the Program is made available in source code form:

1. it must be made available under this Agreement; and

   2. a copy of this Agreement must be included with each copy of the Program.

Contributors may not remove or alter any copyright notices contained within the Program.

Each Contributor must identify itself as the originator of its Contribution, if any, in a manner that reasonably allows subsequent Recipients to identify the originator of the Contribution.

4. COMMERCIAL DISTRIBUTION

Commercial distributors of software may accept certain responsibilities with respect to end users, business partners and the like. While this license is intended to facilitate the commercial use of the Program, the Contributor who includes the Program in a commercial product offering should do so in a manner which does not create potential liability for other Contributors. Therefore, if a Contributor includes
the Program in a commercial product offering, such Contributor
("Commercial Contributor") hereby agrees to defend and indemnify every
other Contributor ("Indemnified Contributor") against any losses,
damages and costs (collectively "Losses") arising from claims, lawsuits
and other legal actions brought by a third party against the
Indemnified Contributor to the extent caused by the acts or omissions
of such Commercial Contributor in connection with its distribution of
the Program in a commercial product offering. The obligations in this
section do not apply to any claims or Losses relating to any actual or
alleged intellectual property infringement. In order to qualify, an
Indemnified Contributor must: a) promptly notify the Commercial
Contributor in writing of such claim, and b) allow the Commercial
Contributor to control, and cooperate with the Commercial Contributor
in, the defense and any related settlement negotiations. The
Indemnified Contributor may participate in any such claim at its own
expense.

For example, a Contributor might include the Program in a commercial
product offering, Product X. That Contributor is then a Commercial
Contributor. If that Commercial Contributor then makes performance
claims, or offers warranties related to Product X, those performance
claims and warranties are such Commercial Contributor's responsibility
alone. Under this section, the Commercial Contributor would have to
defend claims against the other Contributors related to those
performance claims and warranties, and if a court requires any other
Contributor to pay any damages as a result, the Commercial Contributor
must pay those damages.

5. NO WARRANTY

EXCEPT AS EXPRESSLY SET FORTH IN THIS AGREEMENT, THE PROGRAM IS
PROVIDED ON AN "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY
KIND, EITHER EXPRESS OR IMPLIED INCLUDING, WITHOUT LIMITATION, ANY
WARRANTIES OR CONDITIONS OF TITLE, NON-INFRINGEMENT, MERCHANTABILITY OR
FITNESS FOR A PARTICULAR PURPOSE. Each Recipient is solely responsible
for determining the appropriateness of using and distributing the
Program and assumes all risks associated with its exercise of rights
under this Agreement, including but not limited to the risks and costs
of program errors, compliance with applicable laws, damage to or loss
of data, programs or equipment, and unavailability or interruption of
operations.

6. DISCLAIMER OF LIABILITY

EXCEPT AS EXPRESSLY SET FORTH IN THIS AGREEMENT, NEITHER RECIPIENT NOR
ANY CONTRIBUTORS SHALL HAVE ANY LIABILITY FOR ANY DIRECT, INDIRECT,
INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING
WITHOUT LIMITATION LOST PROFITS), HOWEVER CAUSED AND ON ANY THEORY OF
LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING
NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OR
DISTRIBUTION OF THE PROGRAM OR THE EXERCISE OF ANY RIGHTS GRANTED
HEREUNDER, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

7. GENERAL

If any provision of this Agreement is invalid or unenforceable under
applicable law, it shall not affect the validity or enforceability of
the remainder of the terms of this Agreement, and without further
action by the parties hereto, such provision shall be reformed to the
minimum extent necessary to make such provision valid and enforceable.

If Recipient institutes patent litigation against a Contributor with
respect to a patent applicable to software (including a cross-claim or
counterclaim in a lawsuit), then any patent licenses granted by that
Contributor to such Recipient under this Agreement shall terminate as of the date such litigation is filed. In addition, if Recipient institutes patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Program itself (excluding combinations of the Program with other software or hardware) infringes such Recipient's patent(s), then such Recipient's rights granted under Section 2(b) shall terminate as of the date such litigation is filed.

All Recipient's rights under this Agreement shall terminate if it fails to comply with any of the material terms or conditions of this Agreement and does not cure such failure in a reasonable period of time after becoming aware of such noncompliance. If all Recipient's rights under this Agreement terminate, Recipient agrees to cease use and distribution of the Program as soon as reasonably practicable. However, Recipient's obligations under this Agreement and any licenses granted by Recipient relating to the Program shall continue and survive.

Everyone is permitted to copy and distribute copies of this Agreement, but in order to avoid inconsistency the Agreement is copyrighted and may only be modified in the following manner. The Agreement Steward reserves the right to publish new versions (including revisions) of this Agreement from time to time. No one other than the Agreement Steward has the right to modify this Agreement. IBM is the initial Agreement Steward. IBM may assign the responsibility to serve as the Agreement Steward to a suitable separate entity. Each new version of the Agreement will be given a distinguishing version number. The Program (including Contributions) may always be distributed subject to the version of the Agreement under which it was received. In addition, after a new version of the Agreement is published, Contributor may elect to distribute the Program (including its Contributions) under the new version. Except as expressly stated in Sections 2(a) and 2(b) above, Recipient receives no rights or licenses to the intellectual property of any Contributor under this Agreement, whether expressly, by implication, estoppel or otherwise. All rights in the Program not expressly granted under this Agreement are reserved.

This Agreement is governed by the laws of the State of New York and the intellectual property laws of the United States of America. No party to this Agreement will bring a legal action under this Agreement more than one year after the cause of action arose. Each party waives its rights to a jury trial in any resulting litigation.
This information was developed for products and services offered in the U.S.A.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user's responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not grant you any license to these patents. You can send license inquiries, in writing, to:

IBM Director of Licensing
IBM Corporation
North Castle Drive
Armonk, NY 10504-1785

Glossary

Central Processor Assist for Cryptographic Function (CPACF). Hardware that provides support for symmetric ciphers and secure hash algorithms (SHA) on every central processor. Hence the potential encryption/decryption throughput scales with the number of central processors in the system.

Chinese-Remainder Theorem (CRT). A mathematical problem described by Sun Tzu Suan-Ching using the remainder from a division operation.

Cipher Block Chaining (CBC). A method of reducing repetitive patterns in ciphertext by performing an exclusive-OR operation on each 8-byte block of data with the previously encrypted 8-byte block before it is encrypted.

Cipher block length. The length of a block that can be encrypted or decrypted by a symmetric cipher. Each symmetric cipher has a specific cipher block length.

CPACF instructions. Instruction set for the CPACF hardware.

Crypto Express2 (CEX2). The two PCI-X adapters on a CEX2 feature can be configured in two ways: Either as cryptographic Coprocessor (CEX2C) for secure key encrypted transactions, or as cryptographic Accelerator (CEX2A) for Secure Sockets Layer (SSL) acceleration. A CEX2A works only in clear key mode. Both adapters can be of the same type, or you can configure one adapter as CEX2A and the other as CEX2C.

Crypto Express3 (CEX3). Successor to the Crypto Express2 feature. The two PCI-X adapters on a CEX3 feature can be configured in two ways: Either as cryptographic Coprocessor (CEX3C) for secure key encrypted transactions, or as cryptographic Accelerator (CEX3A) for Secure Sockets Layer (SSL) acceleration. A CEX3A works only in clear key mode. Both adapters can be of the same type, or you can configure one adapter as CEX3A and the other as CEX3C.

electronic code book mode (ECB mode). A method of enciphering and deciphering data in address spaces or data spaces. Each 64-bit block of plaintext is separately enciphered and each block of the ciphertext is separately deciphered.

Ilibca. Library for IBM Cryptographic Architecture.

I Mode of operation. A schema describing how to apply a symmetric cipher to encrypt or decrypt a message that is longer than the cipher block length. The goal of most modes of operation is to keep the security level of the cipher by avoiding the situation where blocks that occur more than once will always be translated to the same value. Some modes of operations allow handling messages of arbitrary lengths.

modulus-exponent (Mod-Expo). A type of exponentiation performed using a modulus.

Rivest-Shamir-Adleman (RSA). An algorithm used in public key cryptography. These are the surnames of the three researchers responsible for creating this asymmetric or public/private key algorithm.

Secure Hash Algorithm (SHA). An encryption method in which data is encrypted in a way that is mathematically impossible to reverse. Different data can possibly produce the same hash value, but there is no way to use the hash value to determine the original data.

symmetric cipher. An encryption method that uses the same key for encryption and decryption. Keys of symmetric ciphers are private keys.

z90crypt. Linux device driver for cryptographic adapters of IBM System z. The Ilibca Version 2 and Ilibca Version 2.1.0 libraries interact directly with the z90crypt device driver.
