Note

Before using this information and the product it supports, be sure to read the information in "Notices," on page 33.

Sixth Edition (February 2006)

This edition applies to version 5, release 4, modification 0 of IBM i5/OS (product number 5722-SS1) and to all subsequent releases and modifications until otherwise indicated in new editions. This version does not run on all reduced instruction set computer (RISC) models nor does it run on CISC models.

User Function Registration APIs

The user function registration APIs manage the registration and usage information for functions. To help you manage your systems, the user function registration APIs provide a mechanism for registering functions and controlling which users are allowed to use those functions. The control of user functions, however, is not a replacement for securing resources. Users who are not allowed to use a particular function are not prevented from accessing a resource through another interface.

The user function registration APIs are:

- **“Change Function Usage Information (QSYCHFUI, QsyChangeFunctionUsageInfo) API” (QSYCHFUI, QsyChangeFunctionUsageInfo)** changes the usage information for a function, such as which user profiles are allowed to use a function.
- **“Check User Function Usage (QSYCKUFU, QsyCheckUserFunctionUsage) API” on page 4 (QSYCKUFU, QsyCheckUserFunctionUsage)** whether a user is allowed to use the specified function and returns an indication of whether the user is allowed to use the function.
- **“Deregister Function (QSYDRGFN, QsyDeregisterFunction) API” on page 6 (QSYDRGFN, QsyDeregisterFunction)** removes a function and all associated usage information from the registration facility.
- **“Register Function (QSYRGFN, QsyRegisterFunction) API” on page 7 (QSYRGFN, QsyRegisterFunction)** registers a function with the registration facility.
- **“Retrieve Function Information (QSYRTVFI, QsyRetrieveFunctionInformation) API” on page 13 (QSYRTVFI, QsyRetrieveFunctionInformation)** retrieves information about one or more functions.
- **“Retrieve Function Usage Information (QSYRTFUI, QsyRetrieveFunctionUsageInfo) API” on page 21 (QSYRTFUI, QsyRetrieveFunctionUsageInfo)** retrieves usage information for a function.
- **“Retrieve User Function Information (QSYRTUFI, QsyRetrieveUserFunctionInfo) API” on page 24 (QSYRTUFI, QsyRetrieveUserFunctionInfo)** retrieves usage settings for a specified user profile for one or more functions.

© Copyright IBM Corp. 1998, 2006
Syntax for QsyChangeFunctionUsageInfo:

```c
#include <qsyfnusg.h>

void QsyChangeFunctionUsageInfo
.getFile( char Function_ID[30],
    char Format_name[8],
    void *Function_usage_information,
    int *Length_of_function_usage_information,
    void *Error_code);
```

Service Program: QSYFNUSG
Default Public Authority: *USE
Threadsafe: Yes

The Change Function Usage Information (OPM, QSYCHFUI; ILE, QsyChangeFunctionUsageInfo) API changes the usage information for a function. The usage information for a function indicates which user profiles are allowed or not allowed to use a function.

The usage information is stored with the user profile. To save and restore the usage information, you must use the same methods as with other user profile information (Save Security Data (SAVSECDTA) command, Restore User Profiles (RSTUSRPRF) command, Restore Authority (RSTAUT) command).

**Authorities and Locks**

**API Public Authority**

*USE

**Authority Required**

*SECADM special authority

**Usage Information Lock**

*EXCL

**Required Parameter Group**

**Function ID**

INPUT; CHAR(30)

The ID of the function for which usage information is being changed.

**Format name**

INPUT; CHAR(8)

The format of the function usage information.

The valid value is:

"CFUI0100 Format" on page 3  Function usage information

**Function usage information**

INPUT; CHAR(*)

The usage information that is being changed for the specified function. See "CFUI0100 Format" on page 3 for the definition of the fields for this parameter.

**Length of function usage information**

INPUT; BINARY(4)

The length of the function usage information. This area must be as large as the format specified.
Error code

I/O; CHAR(*)

The structure in which to return error information. For the format of the structure, see Error Code Parameter.

CFUI0100 Format

The following table shows the information that must be specified in the function usage information parameter when format CFUI0100 is specified. For a detailed description of each field, see Field Descriptions.

<table>
<thead>
<tr>
<th>Offset</th>
<th>Dec</th>
<th>Hex</th>
<th>Type</th>
<th>Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
<td>BINARY(4)</td>
<td>Number of usage information entries</td>
</tr>
</tbody>
</table>

Usage information entry. These fields are repeated for each usage information entry returned.

<table>
<thead>
<tr>
<th></th>
<th>CHAR(10)</th>
<th>User profile name</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>CHAR(1)</td>
<td>Usage setting</td>
</tr>
</tbody>
</table>

Field Descriptions

Number of usage information entries. The total number of usage information entries. This value must be greater than 0.

Usage information entries. The entries that contain the usage information.

Usage setting. Whether the user is allowed to use the function or not.

The following values can be specified:

0        The user’s previous setting is removed.
1        The user is not allowed to use the function.
2        The user is allowed to use the function.

User profile name. The name of the user profile whose usage setting is being changed. The user profile must exist.

Error Messages

Message ID    Error Message Text
CPF2225 E     Not able to allocate internal system object.
CPF222E E     &1 special authority is required.
CPF228A E     Function &1 not registered.
CPF229B E     Operation not allowed for function &1.
CPF229C E     Not all usage information changed for function &1.
CPF3C21 E     Format name &1 is not valid.
CPF3C3C E     Value for parameter &1 not valid.
CPF3C36 E     Number of parameters, &1, entered for this API was not valid.
CPF3CD9 E     Requested function cannot be performed at this time.
CPF3CDA E     Registration facility repository not available for use.
CPF3CF1 E     Error code parameter not valid.
CPF3CF2 E     Error(s) occurred during running of &1 API.
CPF3C90 E     Literal value cannot be changed.
The Check User Function Usage (OPM, QSYCKUFU; ILE, QsyCheckUserFunctionUsage) API checks to see if a user is allowed to use the specified function, and returns an indication of whether the user is allowed to use the function. When the check is made, the usage setting for the user, its group, the default usage value, and the allow *ALLOBJ indicator for the function are taken into account. Following are the steps the system takes to determine the usage indicator for the user to the function:

1. Is the *ALLOBJ indicator for the function set to 1 and does the group have *ALLOBJ special authority? If yes to both, set the returned usage indicator to usage allowed and return. Otherwise, continue with step 2.

2. Does the user have a usage setting for the function? If yes, set the returned usage indicator to the usage indicator for the user and return. Otherwise, continue with step 3.

3. Does the user have any groups? If yes, continue with step 3a. Otherwise, go to step 4.

   a. Repeat the following steps for each group:

      1) Is the *ALLOBJ indicator for the function set to 1 and does the group have *ALLOBJ special authority? If yes to both, set the returned usage indicator to usage allowed and return. Otherwise, go to step 3a2.
2) Does the group have a usage setting for the function? If yes, go to step 3a2a. Otherwise, go look at the next group, starting over with step 3a1.
   a) Does the group’s usage setting allow usage of the function? If yes, set the returned usage indicator to usage allowed and return. Otherwise, set a flag that indicates a group usage setting is found and go look at the next group, starting over with step 3a1.
   b) Is the group usage setting found flag set on? If yes, set the returned usage indicator to usage not allowed and return. Otherwise, continue with step 4.

4. Set the returned usage indicator to the default usage value and return.

Authorities and Locks

API Public Authority
   *USE

Function Registration Lock
   *SHRNUP

Required Parameter Group

Usage indicator
   OUTPUT; CHAR(1)
   Whether the user is allowed to use the specified function.
   This parameter contains one of the following values:

1   The user is not allowed to use the specified function.
2   The user is allowed to use the specified function.

Function ID
   INPUT; CHAR(30)
   The ID of the function to check usage information for.

User profile name
   INPUT; CHAR(10)
   The name of the user to check for usage to the specified function.
   You can specify the following special value:
   *CURRENT     The usage check is made for the user currently running.

Error code
   I/O; CHAR(*)
   The structure in which to return error information. For the format of the structure, see Error Code Parameter.

Error Messages

<table>
<thead>
<tr>
<th>Message ID</th>

</tr>
<tr>
<td>CPF3CD9 E</td>
<td>Requested function cannot be performed at this time.</td>
</tr>
<tr>
<td>CPF3CDA E</td>
<td>Registration facility repository not available for use.</td>
</tr>
</tbody>
</table>
Message ID       Error Message Text
CPF3CF1 E        Error code parameter not valid.
CPF3CF2 E        Error(s) occurred during running of &1 API.
CPF8100 E        All CPF81xx messages could be returned. xx is from 01 to FF.
CPF9810 E        Library &1 not found.
CPF9872 E        Program or service program &1 in library &2 ended. Reason code &3.

API introduced: V4R3

Deregister Function (QSYDRGFDN, QsyDeregisterFunction) API

Required Parameter Group for QSYRGFDN:

1  Function ID         Input    Char(30)
2  Error code          I/O      Char(*)

Default Public Authority: *USE
Threadsafe: Yes

Syntax for QsyDeregisterFunction:
#include <qsyrgfn1.h>

void QsyDeregisterFunction
   (char Function_ID[30],
    void *Error_code);

Service Program: QSYRGFDN1
Default Public Authority: *USE
Threadsafe: Yes

The Deregister Function (OPM, QSYDRGFDN; ILE, QsyDeregisterFunction) API removes a function and all associated usage information from the registration facility.

Authorities and Locks

API Public Authority
   *USE

Authority Required
   *SECADM special authority

Function Registration Lock
   *EXCL

Required Parameter Group

Function ID
   INPUT; CHAR(30)
   The function ID for the function being removed.
The following can be specified for the function ID:
generic* All functions IDs that have IDs beginning with the generic string.

function ID Specific function ID.

Error code
I/O; CHAR(*)
   The structure in which to return error information. For the format of the structure, see Error Code Parameter.

Error Messages

Message ID    Error Message Text
CPF222E E    &1 special authority is required.
CPF228A E    Function &1 not registered.
CPF228B E    Function &1 cannot be removed from the registry.
CPF3C36 E    Number of parameters, &1, entered for this API was not valid.
CPF3C90 E    Literal value cannot be changed.
CPF3CD9 E    Requested function cannot be performed at this time.
CPF3CDA E    Registration facility repository not available for use.
CPF3CF1 E    Error code parameter not valid.
CPF3CF2 E    Error(s) occurred during running of &1 API.
CPF8100 E    All CPF81xx messages could be returned. xx is from 01 to FF.
CPF9810 E    Library &1 not found.
CPF9811 E    Program &1 in library &2 not found.
CPF9872 E    Program or service program &1 in library &2 ended. Reason code &3.

API introduced: V4R3

Register Function (QSYRGFN, QsyRegisterFunction) API

Required Parameter Group for QSYRGFN:

1   Function ID   Input    Char(30)
2   Function controls   Input    Char(*)
3   Error Code    I/O    Char(*)

Default Public Authority: *USE
Threadsafe: Yes

Syntax for QsyRegisterFunction:
#include <qsyrgfn1.h>

void QsyRegisterFunction
(char Function_ID[30],
Qsy_Func_Controls_T *Function_contROLS,
void *Error_code);

Service Program: QSYRGFN1
Default Public Authority: *USE
Threadsafe: Yes
The Register Function (OPM, QSYRGFN; ILE, QsyRegisterFunction) API registers a function with the registration facility. The function controls provide information to help manage and control the use of the function.

You can update a function entry by reregistering the function (using the replace control key) with new values for the function control keys. The registration facility will update the control keys and maintain the current list of usage settings that are associated with the function. The following conditions apply to updating the function control keys:

- Function category: This control key is set the first time the function is registered and cannot be changed.
- Function type: This control key is set the first time the function is registered and cannot be changed.

When a function is registered, the registration information is stored using the Exit Point Registration Facility. Each function is registered as an exit program within an exit point. The exit point that the function is registered in depends on the category of the function:

- Locally managed client functions within iSeries Navigator are registered in the QIBM_QSY_OPNAVCLIENT exit point.
- Locally managed client functions that are not within iSeries Navigator are registered in the QIBM_QSY_OTHERCLIENT exit point.
- Host functions are registered in the QIBM_QSY_HOSTFUNC exit point.
- Centrally managed client functions within iSeries Navigator are registered in the QIBM_QSY_OPNAVCENTRL exit point.
- Centrally managed client functions that are not within iSeries Navigator are registered in the QIBM_QSY_OTHERCENTRL exit point.

The Exit Point Registration Facility is used only for storing the function registration information. The exit programs within these exit points are never called, so the formats associated with these exit points (FCNR0100 and FCNR0200) are never used or documented.

**Note:** You must use this API and the Deregister Function (QSYDRGFN, QsyDeregisterFunction) API to manage the function registration entries. If the Exit Point Registration Facility APIs are used, the results will be unpredictable.

### Authorities and Locks

**API Public Authority**

*USE

**Authority Required**

*SECADM special authority

**Function Registration Lock**

*EXCL

### Required Parameter Group

**Function ID**

INPUT; CHAR(30)

The function ID to register. IBM functions are named QIBM_Qccc_name, where _Qccc is the component qualifier and ccc is the component identifier, or are named QIBM_wcccc_name, where _wcccc is the component qualifier, w is a character A through I, and ccc is the component identifier. The component qualifier is included in IBM function IDs if the function is associated with a specific component. Otherwise, IBM function IDs will not contain the component qualifier.
User-supplied function IDs should not preface their function ID with QIBM. User-supplied function IDs should start with the company name to eliminate most problems that involve unique names.

The first character of the function ID must be one of the following:

A-Z Uppercase A-Z

The remaining characters in the function ID must be made up of the following characters:

A-Z Uppercase A-Z
0-9 Digits 0-9
_ Period
_ Underscore

Function controls
INPUT; CHAR(*)

The function control fields for managing the function. Any field not specified will be given the default value. Refer to “Function Control Keys” on page 10 for more information.

The information must be in the following format:

Number of variable length records BINARY(4) The total number of all of the variable length records.
Variable length records The fields of the function controls to set. Refer to “Format for Variable Length Record” for more information.

Error code
I/O; CHAR(*)

The structure in which to return error information. For the format of the structure, see Error Code Parameter.

Format for Variable Length Record

The following table shows the layout of the variable length record. For a detailed description of each field, see “Field Descriptions” on page 10.

<table>
<thead>
<tr>
<th>Offset</th>
<th>Dec</th>
<th>Hex</th>
<th>Type</th>
<th>Field</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td>BINARY(4)</td>
<td>Length of variable length record</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
<td>BINARY(4)</td>
<td>Function control key</td>
</tr>
<tr>
<td>4</td>
<td>4</td>
<td>4</td>
<td>BINARY(4)</td>
<td>Length of data</td>
</tr>
<tr>
<td>8</td>
<td>8</td>
<td>8</td>
<td>CHAR(*)</td>
<td>Data</td>
</tr>
<tr>
<td>12</td>
<td>C</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

If the length of the data is longer than the key field’s data length, the data is truncated at the right. No message is issued.

If the length of the data is shorter than the key field’s data length and the key contains binary data, an error message is issued. If the key does not contain binary data, the field is padded with blanks.

It is not an error to specify a key more than once. If duplicate keys are specified, the last specified value for that key is used.
Each variable length record must be 4-byte aligned. If not, unpredictable results may occur.

**Field Descriptions**

*Data.* The value to which a specific function control is to be set.

*Function control key.* The function control to be set. Refer to “Function Control Keys” for more information.

*Length of data.* The length of the function control value.

*Length of variable length record.* The length of the record including this field.

**Function Control Keys**
The following table shows the valid function control keys for the key field area of the variable length record. For a detailed description of each field, see “Field Descriptions.”

<table>
<thead>
<tr>
<th>Key</th>

</tr>
<tr>
<td>12</td>
<td>CHAR(1)</td>
<td>*ALLOBJ indicator</td>
</tr>
<tr>
<td>13</td>
<td>CHAR(1)</td>
<td>Replace</td>
</tr>
</tbody>
</table>

**Field Descriptions**

*ALLOBJ indicator.*

Whether a user with *ALLOBJ special authority can use the function. The default value is 1. This key can be specified only if the function type control key is set to 3 (administrable function).

0   For a user with *ALLOBJ special authority to use the function, the usage information specified for the function must indicate that the user is allowed to use the function for one of the following reasons:
   1. the user is allowed usage,
   2. one of its groups is allowed usage, or
   3. the default setting is to allow usage.
1   A user with *ALLOBJ special authority is always allowed to use the function.

**Default usage.** The default usage for the function. The default usage is used if the user or one of its groups does not have a specific usage setting. This key can be specified only if the function type control key is set to 3 (administrable function). The default value is 2.
The default usage is to not allow usage of the function.

The default usage is to allow usage of the function.

**Function category.** The category of the function. This control is set when the function is registered and cannot be changed. The default value is 3.

1 The function is a locally managed client function within iSeries Navigator. The function defines code that runs on the client, is locally managed, and is included in the iSeries Navigator tree structure.
2 The function is a locally managed client function, not within iSeries Navigator. The function defines code that runs on the client and is locally managed, but is not included in the iSeries Navigator tree structure.
3 The function is a host function. The function defines code that runs on the server.
4 The function is a centrally managed client function within iSeries Navigator. The function defines code that runs on the client, is centrally managed, and is included in the iSeries Navigator tree structure.
5 The function is a centrally managed client function, not within iSeries Navigator. The function defines code that runs on the client and is centrally managed, but is not included in the iSeries Navigator tree structure.

Only client based applications should use category 1, 2, 4, or 5. See [Application Administration Concepts](#) in the iSeries Navigator topic for more information on the difference between locally managed and centrally managed client functions.

**Function description.** The text for the function description. The default value is blanks.

**Function description CCSID.** The CCSID value associated with the function description. The default value is 0.

0 The current job default CCSID value is associated with the function description.
CCSID The CCSID value associated with the function description. The CCSID value must be from 1 to 65535. If 65535 is specified, then the data will not be converted to the desired CCSID when the function is retrieved.

**Function group ID.** The ID of the function group with which this function will be grouped. The function group must exist, have a function type of function group (2), and have the same category as the function being registered. If a value of *NONE* is specified, then the function is not grouped under a function group. The default value is *NONE*. This key cannot be specified if the function type control key is set to 1 (function product).

**Function name.** The text name for the function ID. The function name will be used to identify the function when using the iSeries Navigator Application Administration support. If this control is not specified, the function ID will be used to identify the function.

**Function name CCSID.** The CCSID value associated with the function name. The default value is 0.

0 The current job default CCSID value is associated with the function name.
CCSID The CCSID value associated with the function name. The CCSID value must be from 1 to 65535. If 65535 is specified, then the data will not be converted to the desired CCSID when the function is retrieved.

**Function product ID.** The ID of the product for which the function is being registered. This key cannot be specified if the function type control key is set to 1 (function product). This key must be specified if the function type control key is set to 2 (function group) or 3 (administrable function).

**Function type.** The type of function. This control is set when the function is registered and cannot be changed. The default value is 3.
The function is a function product. No usage information is stored for function products. The purpose is to group functions under a product when the functions are being administered by the iSeries Navigator Application Administration support.

The function is a function group. No usage information is stored for function groups. The purpose is to group functions within a product when the functions are being administered by the iSeries Navigator Application Administration support.

The function is an administrable function. Usage information can be stored and checked for this function.

**Qualified message file name and message identifier for function description.** A message file and message identifier that contains the function description. The message file and message identifier do not have to exist at the time of registration. The default value is blanks. Refer to “Qualified Message File Format” for the format of this field.

**Qualified message file name and message identifier for function name.** A message file and message identifier that contains the function name. The message file and message identifier do not have to exist at the time of registration. The default value is blanks. Refer to “Qualified Message File Format” for the format of this field.

**Replace.** Whether to replace an existing registered function. The default value is 0.

- **0** Do not replace an existing registered function. If this value is specified and the function is already registered, the request will fail.
- **1** Replace an existing registered function. If this value is specified and the function is not already registered, the function will be registered. If the function is already registered, only the function control keys that are specified on this call are replaced. Any other function control keys that were previously specified will keep their values.
- **2** Replace an existing registered function, but do not replace function control keys that are controlled by a system administrator. If this value is specified and the function is not already registered, the function will be registered. If the function is already registered, only the function control keys that are specified on this call are replaced. Any other function control keys that were previously specified will keep their values. Function control keys that are controlled by a system administrator are not replaced, even if they are specified on this call. These function control keys include:
  - *ALLOBJ indicator
  - Default usage

This value should be used by install exit programs to ensure that values set by the system administrators are not replaced by the install exit program.

**Qualified Message File Format**

The following table shows the layout of the qualified message file name and message identifier for the function name and function description fields. For a detailed description of each field, see “Field Descriptions” on page 13.

<table>
<thead>
<tr>
<th>Offset</th>
<th>Hex</th>
<th>Type</th>
<th>Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>CHAR(10)</td>
<td>Message file name</td>
</tr>
<tr>
<td>10</td>
<td>A</td>
<td>CHAR(10)</td>
<td>Message file library name</td>

</tbody>
</table>
**Field Descriptions**

Message file library name.

The library name in which the message file resides. No special values are supported.

Message file name. The name of the message file that contains the function name or function description.

Message identifier. The message identifier for the function name or function description.

**Error Messages**

<table>
<thead>
<tr>
<th>Message ID</th>

<td>Error code</td>
<td>I/O</td>
</tr>
</tbody>
</table>
The Retrieve Function Information (OPM, QSYRTVFI; ILE, QsyRetrieveFunctionInformation) API retrieves information about one or more functions.

**Authorities and Locks**

*API Public Authority*

*USE

*Function Registration Lock*

*SHRNUP

**Required Parameter Group**

**Continuation handle**

INPUT; CHAR(20)

The value returned to the user in the receiver variable when only partial exit information is returned. This parameter must be set to blanks on the first call to this API. This parameter is used when more information is available to return than what could fit in the receiver variable. When you specify a continuation handle for this parameter, all other parameters must have the same values as the call to the API that generated the continuation handle. Failure to do so may result in incomplete or inaccurate information.

Entries are only returned in their entirety; the API never returns anything less. If there is not enough space for the entire entry, the continuation handle is set to something other than blanks.

**Receiver variable**

OUTPUT; CHAR(*)

The variable that is to receive the function information requested.

**Length of receiver variable**

INPUT; BINARY(4)

The length of the receiver variable. If the length is larger than the size of the receiver variable, the results may not be predictable. The minimum length is 8 bytes.

**Format name**

INPUT; CHAR(8)

The format of the function information to be returned.
You must use the following format name:

"FCNI0100 Format" Function information

**Function selection criteria**  
INPUT; CHAR(*)

The selection criteria to be used when selecting which functions are returned. No CCSID normalization is performed. It is recommended that you use characters from the invariant character set for the comparison data.

The information must be in the following format:

- **Number of selection criteria** BINARY(4)  
  The total number of selection criteria. Specify 0 if no selection criteria are specified. The maximum value for this field is 1.

- **Selection criteria array** CHAR(*)  
  The selection criteria. Refer to "Format for Function Selection Criteria" on page 19 for more information.

**Desired CCSID**  
INPUT; BINARY(4)

The CCSID the returned text fields should be converted to. The text fields will be returned in this CCSID even if data loss occurs. If you want to ensure that data loss does not occur, you may specify 65535 or 13488 (UCS-2).

The following can be specified for the desired CCSID:

- **0** The text fields will be converted to the default CCSID for the job.
- **CCSID** The text fields will be converted to the specified CCSID. The CCSID value must be from 1 to 65535. If 65535 is specified, then no CCSID conversion will be done on the text.

**Error code**  
I/O; CHAR(*)

The structure in which to return error information. For the format of the structure, see Error Code Parameter.

**FCNI0100 Format**  
The following information is returned for the FCNI0100 format. This format provides information on a function. For a detailed description of each field, see Field Descriptions" on page 16.

<table>
<thead>
<tr>
<th>Offset</th>
<th>Type</th>
<th>Field</th>
</tr>
</thead>
<tbody>
<tr>

### Field Descriptions

**ALLOBJ indicator.** Whether a user with *ALLOBJ* special authority can use the function. If this is not an administrable function, then this field is blank.

The possible values follow:

0  The user, its groups, or default must allow usage of the function.
1  A user with *ALLOBJ* special authority is always allowed to use the function.

**Bytes available.** The number of bytes of data available to be returned. All available data is returned if enough space is provided.

If the continuation handle is set to a value other than blanks, this field contains an approximation of the total bytes available. At a minimum, this field contains the actual number of bytes available.
Bytes returned. The number of bytes of data returned.

Continuation handle. The handle that is returned when more data is available to return, but the receiver variable is not large enough. The handle indicates the point in the repository that the retrieval stopped. If the handle is used on the next call to the API, the API returns more data starting at the point that the handle indicates. This field is set to blanks when all information is returned.

Default usage. The default usage for the function. The default usage is used if the user or one of its groups does not have a specific usage setting. If this is not an administrable function, then this field is blank.

The possible values follow:

1 The default usage does not allow usage of the function.
2 The default usage allows usage of the function.

Function category. Whether the function is a client or host function.

The possible values follow:

1 The function is a locally managed client function within iSeries Navigator.
2 The function is a locally managed client function, not within iSeries Navigator.
3 The function is a host function.
4 The function is a centrally managed client function within iSeries Navigator.
5 The function is a centrally managed client function, not within iSeries Navigator.

Function description. The text for the function description. This value is converted to the CCSID value specified in the desired CCSID parameter.

Function description CCSID. The CCSID value that is associated with the function description in the registration facility.

Function-description message-file name. The name of the message file that contains the function description. If no message file name is specified, this field contains blanks.

Function-description message-file library name. The name of the library in which the function description message file resides. If no message file name is specified, this field contains blanks.

Function-description message ID. The message identifier for the function description. If no message file name is specified, this field contains blanks.

Function-description message text. The first-level text for the function-description message ID. This value is converted to the CCSID value specified in the desired CCSID parameter.

When the message text is retrieved from the message file, the message file library is added to the product portion of the library list, and *LIBL is specified for the library name. If the library cannot be added to the product portion of the library list, then *LIBL is still used to search for the message. If the message is not found, then the message file library is searched for the message.

If no message file name is specified, this field contains blanks.

Function-description message-text CCSID. The CCSID value that the function-description message text is stored in.
**Function group ID.** The ID of the function group that the function is grouped with. If the function is not grouped with a function group, this field is set to *NONE.

**Function ID.** The function ID.

**Function name.** The text for the function name. This value is converted to the CCSID value specified in the desired CCSID parameter.

**Function name CCSID.** The CCSID value that is associated with the function name in the registration facility.

**Function-name message-file name.** The name of the message file that contains the function name. If no message file name is specified, this field contains blanks.

**Function-name message-file library name.** The name of the library in which the function name message file resides. If no message file name is specified, this field contains blanks.

**Function-name message ID.** The message identifier for the function name. If no message file name is specified, this field contains blanks.

**Function-name message text.** The first-level text for the function-name message ID. This value is converted to the CCSID value specified in the desired CCSID parameter.

When the message text is retrieved from the message file, the message file library is added to the product portion of the library list, and *LIBL is specified for the library name. If the library cannot be added to the product portion of the library list, then *LIBL is still used to search for the message. If the message is not found, then the message file library is searched for the message.

If no message file name is specified, this field contains blanks.

**Function-name message-text CCSID.** The CCSID value that the function-name message text is stored in.

**Function product ID.** The ID of the product that the function is registered for.

**Function type.** The type of function.

The possible values follow:

1 The function is a function product.
2 The function is a function group.
3 The function is an administrable function.

**Length of function entry.** The length of a function entry that is returned. This value should be used in determining the displacement to the next function entry.

**Number of function entries returned.** The number of function entries returned. If the receiver variable is not large enough to hold all of the information, this number contains only the number of function entries actually returned.

**Offset to first function entry.** The offset to the first function entry returned. The offset is from the beginning of the structure. If no entries are returned, the offset is set to zero.

**Reserved.** An ignored field.
**Usage information indicator.** Whether there is usage information defined for the function. Usage information is the list of users and groups that have a specific usage setting specified for the function. Usage information is set using the Change Function Usage Information (OPM, QSYCHFUI; ILE, QsyChangeFunctionUsageInfo) API. If this is not an administrable function, then this field is blank.

The possible values follow:

0  There is no usage information defined for the function.
1  There is usage information defined for the function.

**Format for Function Selection Criteria**

This table shows the format for the function selection criteria parameter. For a detailed description of each field, see “Field Descriptions.”

<table>
<thead>
<tr>
<th>Type</th>
<th>Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>BINARY(4)</td>
<td>Size of criteria entry</td>
</tr>
<tr>
<td>BINARY(4)</td>
<td>Comparison operator</td>
</tr>
<tr>
<td>BINARY(4)</td>
<td>Function control key</td>
</tr>
<tr>
<td>BINARY(4)</td>
<td>Length of comparison data</td>
</tr>
<tr>
<td>CHAR(*)</td>
<td>Comparison data</td>
</tr>
</tbody>
</table>

**Field Descriptions**

**Comparison data.** The data to compare to the function information.

**Comparison operator.** The comparison value to be used when comparing the function information with the comparison data.

The following value can be specified:

1  The comparison data equals the function information

**Function control key.** The function control to be compared. Refer to “Function Control Keys” for more information.

**Length of comparison data.** The length of the data to compare to the function information. The length of the comparison data must be valid for the function control key that is specified.

**Size of criteria entry.** The size of the selection criteria entry, including this field.

**Function Control Keys**

The following table shows the valid function control keys for the key field area of the selection control record. For a detailed description of each field, see “Field Descriptions” on page 20.

<table>
<thead>
<tr>
<th>Key</th>
<th>Type</th>
<th>Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>CHAR(1)</td>
<td>Function category</td>
</tr>
<tr>
<td>2</td>

<td>Function type</td>
</tr>
<tr>
<td>3</td>
<td>CHAR(30)</td>
<td>Function product ID</td>
</tr>
<tr>
<td>4</td>
<td>CHAR(30)</td>
<td>Function group ID</td>
</tr>
</tbody>
</table>
### Field Descriptions

**Function category.** The category of the function.

The possible values are:

1. Locally managed client functions within iSeries Navigator are selected.
2. Locally managed client functions not within iSeries Navigator are selected.
3. Host functions are selected.
4. Centrally managed client functions within iSeries Navigator are selected.
5. Centrally managed client functions not within iSeries Navigator are selected.
7. All locally managed client functions are selected. This includes all functions in categories 1 and 2.
8. All centrally managed client functions are selected. This includes all functions in categories 4 and 5.
9. All client functions are selected. This includes all functions in categories 1, 2, 4, and 5.

**Function group ID.** All functions that have this function group are selected. The special value of *NONE* can be specified to select functions that do not have a function group specified.

**Function ID.** The name of the functions to select.

The following can be specified for the function ID:

- `generic*` All function IDs that begin with the generic string are selected.
- `function ID` The specific function ID is selected.

**Function product ID.** All functions that have this function product are selected.

**Function type.** The type of function.

The possible values are:

1. Function products are selected.
2. Function groups are selected.
3. Administrable functions are selected.

### Error Messages

<table>
<thead>
<tr>

Retrieve Function Usage Information (QSYRTFUI, QsyRetrieveFunctionUsageInfo) API

Required Parameter Group for QSYRTFUI:

1. Receiver variable  
   Output  
   Char(*)
2. Length of receiver variable  
   Input  
   Binary(4)
3. Format name  
   Input  
   Char(8)
4. Function ID  
   Input  
   Char(30)
5. Error code  
   I/O  
   Char(*)

Default Public Authority: *USE
Threadsafe: Yes

Syntax for QsyRetrieveFunctionUsageInfo:

```
#include <qsyfnusg.h>
void QsyRetrieveFunctionUsageInfo
   (void *Receiver_variable,
    int *Length_of_receiver_variable,
    char *Format_name[8],
    char *Function_ID[30],
    void *Error_code);
```

Service Program: QSYFNUSG
Default Public Authority: *USE
Threadsafe: Yes

The Retrieve Function Usage Information (OPM, QSYRTFUI; ILE, QsyRetrieveFunctionUsageInfo) API retrieves usage information for a function.

Authorities and Locks

*USE
**Authority Required**  
*SECADM special authority*

**Usage Information Lock**  
*SHRNUP*

## Required Parameter Group

**Receiver variable**  
OUTPUT; CHAR(*)

The variable that is to receive the function usage information.

**Length of receiver variable**  
INPUT; BINARY(4)

The length of the receiver variable. If the length is larger than the size of the receiver variable, the results may not be predictable. The minimum length is 8 bytes.

**Format name**  
INPUT; CHAR(8)

The format of the function usage information to be returned.

You must use the following format name:

<table>
<thead>
<tr>
<th>Format name</th>
<th>Function usage information</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;FNUI0100 Format&quot;</td>
<td></td>
</tr>
</tbody>
</table>

**Function ID**  
INPUT; CHAR(30)

The ID of the function for which usage information is being retrieved.

**Error code**  
I/O; CHAR(*)

The structure in which to return error information. For the format of the structure, see Error Code Parameter.

## FNUI0100 Format

The following information is returned for the FNUI0100 format. This format provides usage information for a function. For a detailed description of each field, see *Field Descriptions* on page 23.

**Offset**

<table>
<thead>
<tr>
<th>Offset</th>
<th>Type</th>
<th>Field</th>
</tr>
</thead>
<tbody>
<tr>

<td>CHAR(*) Reserved</td>
</tr>
</tbody>
</table>

Function usage entry information. These fields are repeated for each function usage entry returned.

- CHAR(10) User profile name
- CHAR(1) Usage setting
- CHAR(1) User profile type
- CHAR(*) Reserved
Field Descriptions

**Bytes available.** The number of bytes of data available to be returned. All available data is returned if enough space is provided.

**Bytes returned.** The number of bytes of data returned.

**Length of function usage entry.** The length of a function usage entry that is returned. This value should be used in determining the displacement to the next function usage entry.

**Number of function usage entries returned.** The number of function usage entries returned. If the receiver variable is not large enough to hold all of the information, this number contains only the number of function usage entries actually returned.

**Offset to first function usage entry.** The offset to the first function usage entry returned. The offset is from the beginning of the structure. If no entries are returned, the offset is set to zero.

**Reserved.** An ignored field.

**Usage setting.** Whether the user profile is allowed to use the function or not.

The possible values follow:

1. The user profile is not allowed to use the function.
2. The user profile is allowed to use the function.

**User profile name.** The name of the user profile that has a usage setting for this function.

**User profile type.** Whether the user profile is a user or a group.

The possible values follow:

0. The user type is unknown. This value is returned if an error occurred while determining the type of user.
1. The user profile is a user (does not have a GID value).
2. The user profile is a group (has a GID value).

Default Public Authority: *USE
Threadsafe: Yes

Syntax for QsyRetrieveUserFunctionInfo:

```c
#include <qsyfnusg.h>

void QsyRetrieveUserFunctionInfo
  (char Continuation_handle[20],
   void *Receiver_variable,
   int *Length_of_receiver_variable,
   char Format_name[8],
   char User_profile_name[10],
   Qsy_Selcrtr_T *Function_selection_criteria,
   int *Desired_CCSID,
   void *Error_code);
```

Service Program: QSYFNUSG
Default Public Authority: *USE
Threadsafe: Yes

The Retrieve User Function Information (OPM, QSYRTUFI; ILE, QsyRetrieveUserFunctionInfo) API retrieves usage settings for a specified user profile for one or more functions.

Authorities and Locks

**API Public Authority**

*USE

**Authority Required (if user profile name is not *CURRENT)**

*SECADM special authority or
Function Registration and Usage Information Lock
*SHRNUP

**Required Parameter Group**

**Continuation handle**

**INPUT; CHAR(20)**

The value returned to the user in the receiver variable when only partial exit information is returned. This parameter must be set to blanks on the first call to this API. This parameter is used when more information is available to return than what could fit in the receiver variable. When you specify a continuation handle for this parameter, all other parameters must have the same values as the call to the API that generated the continuation handle. Failure to do so may result in incomplete or inaccurate information.

Entries are only returned in their entirety; the API never returns anything less. If there is not enough space for the entire entry, the continuation handle is set to something other than blanks.

**Receiver variable**

**OUTPUT; CHAR(*)**

The variable that is to receive the usage information requested.

**Length of receiver variable**

**INPUT; BINARY(4)**

The length of the receiver variable. If the length is larger than the size of the receiver variable, the results may not be predictable. The minimum length is 8 bytes.

**Format name**

**INPUT; CHAR(8)**

The format of the usage information to be returned.

You must use one of the following format names:

* "UFNI0100 Format” on page 26 User function usage information
  The same information as UFNI0100, plus an indicator of where the user’s usage setting comes from, the function name information, the function group ID, and the function product ID.
  The same information as UFNI0200, plus additional indicators of where the user’s usage setting and source come from if the *ALLOBJ authority is ignored, and where the user’s usage setting and source come from if the *ALLOBJ and specific usage setting are ignored.

* "UFNI0200 Format” on page 27

* "UFNI0300 Format” on page 27

**User profile name**

**INPUT; CHAR(10)**

The name of the user profile to retrieve function usage information for.

You may specify the following special value.

* CURRENT The usage information for the user currently running is returned.

**Function selection criteria**

**INPUT; CHAR(*)**

The selection criteria to be used when selecting which functions to return usage information for. No CCSID normalization is performed. It is recommended that you use characters from the invariant character set for the comparison data.
The information must be in the following format:

**Number of selection criteria**  BINARY(4)

The total number of selection criteria. Specify 0 if no selection criteria are specified. If 0 is specified, usage information for all registered functions will be returned. The maximum value for this field is 1.

**Selection criteria array**  CHAR(*)

The selection criteria. Refer to "Format for Function Selection Criteria" on page 30 for more information.

**Desired CCSID**

**INPUT; BINARY(4)**

The CCSID that the returned text fields should be converted to. The text fields will be returned in this CCSID even if data loss occurs. If you want to ensure that data loss does not occur, you may specify 65535 or 13488 (UCS-2).

The following can be specified for the desired CCSID:

0  The text fields are converted to the default CCSID for the job.
CCSID  The text fields are converted to the specified CCSID. The CCSID value must be from 1 to 65535. If 65535 is specified, then no CCSID conversion is done on the text.

**Error code**

**I/O; CHAR(*)**

The structure in which to return error information. For the format of the structure, see Error Code Parameter.

**UFNI0100 Format**

The following information is returned for the UFNI0100 format. This format provides function usage information for a user profile. For a detailed description of each field, see “Field Descriptions” on page 28.

<table>
<thead>
<tr>
<th>Offset</th>
<th>Type</th>
<th>Field</th>
</tr>
</thead>
<tbody>
<tr>

<td>CHAR(*)</td>
</tr>
</tbody>
</table>

Function entry information. These fields are repeated for each function entry returned.
UFNI0200 Format

The following information is returned for the UFNI0200 format. This format provides function usage information for a user profile, plus the usage source indicator, function name information, function group ID, and function product ID. For a detailed description of each field, see “Field Descriptions” on page 28.

<table>
<thead>
<tr>
<th>Offset</th>
<th>Type</th>
<th>Field</th>

</tbody>
</table>

UFNI0300 Format

The following information is returned for the UFNI0300 format. This format returns the same information as format UFNI0200, plus where the user’s usage setting and usage source come from if the *ALLOBJ authority is ignored, and where the user’s usage setting and usage source come from if the *ALLOBJ authority and specific usage setting are ignored. For a detailed description of each field, see “Field Descriptions” on page 28.

<table>

- CHAR(1) Usage source ignoring *ALLOBJ
- CHAR(1) Usage indicator ignoring *ALLOBJ and ignoring specific usage setting
- CHAR(1) Usage source ignoring *ALLOBJ and ignoring specific usage setting
- CHAR(*) Reserved

**Field Descriptions**

**Bytes available.** The number of bytes of data available to be returned. All available data is returned if enough space is provided.

If the continuation handle is set to a value other than blanks, this field contains an approximation of the total bytes available. At a minimum, this field contains the actual number of bytes available.

**Bytes returned.** The number of bytes of data returned.

**Continuation handle.** The handle that is returned when more data is available to return, but the receiver variable is not large enough. The handle indicates the point in the repository that the retrieval stopped. If the handle is used on the next call to the API, the API returns more data starting at the point that the handle indicates. This field is set to blanks when all information is returned.

**Function group ID.** The ID of the function group that the function is grouped with. If the function is not grouped with a function group, this field is set to *NONE.

**Function ID.** The ID of the function.
**Function name.** The text for the function name. This value is converted to the CCSID value specified in the desired CCSID parameter.

**Function name CCSID.** The CCSID value that is associated with the function name in the function registration facility.

**Function-name message-file name.** The name of the message file that contains the function name. If no message file name is specified, this field contains blanks.

**Function-name message-file library name.** The name of the library in which the function name message file resides. If no message file name is specified, this field contains blanks.

**Function-name message ID.** The message identifier for the function name. If no message file name is specified, this field contains blanks.

**Function-name message text.** The first-level text for the function-name message ID. This value is converted to the CCSID value specified in the desired CCSID parameter.

When the message text is retrieved from the message file, the message file library is added to the product portion of the library list, and *LIBL is specified for the library name. If the library cannot be added to the product portion of the library list, then *LIBL is still used to search for the message. If the message is not found, then the message file library is searched for the message.

If no message file name is specified, this field contains blanks.

**Function-name message-text CCSID.** The CCSID value that the function-name message text is stored in.

**Function product ID.** The ID of the product that the function is registered for.

**Length of function entry.** The length of a function entry that is returned. This value should be used in determining the displacement to the next function entry.

**Number of function entries returned.** The number of function entries returned. If the receiver variable is not large enough to hold all of the information, this number contains only the number of function entries actually returned.

**Offset to first function entry.** The offset to the first function entry returned. The offset is from the beginning of the structure. If no entries are returned, the offset is set to zero.

**Reserved.** An ignored field.

**Usage indicator.** Whether the user is allowed to use the function.

This parameter contains one of the following values:

1  The user is not allowed to use the function.
2  The user is allowed to use the function.

**Usage indicator ignoring *ALLOBJ.** Whether the user is allowed to use the function if this API ignores the *ALLOBJ authority.

This parameter contains one of the following values:

1  The user is not allowed to use the function.
2  The user is allowed to use the function.
Usage indicator ignoring *ALLOBJ and ignoring specific usage setting. Whether the user is allowed to use the function if this API ignores the *ALLOBJ authority and his specific usage setting.

This parameter contains one of the following values:

1. The user is not allowed to use the function.
2. The user is allowed to use the function.

Usage source. An indicator as to why the user is allowed or is not allowed to use the function.

This parameter contains one of the following values:

1. The user has *ALLOBJ special authority.
2. The user has a specific usage setting for the function.
3. One of the user’s groups has *ALLOBJ special authority.
4. One of the user’s groups has a specific usage setting for the function.
5. The default usage setting for the function was used.
9. The usage source could not be determined.

Usage source ignoring *ALLOBJ. An indicator as to why the user is allowed or is not allowed to use the function if this API ignores the *ALLOBJ authority.

This parameter contains one of the following values:

2. The user has a specific usage setting for the function.
3. One of the user’s groups has *ALLOBJ special authority.
4. One of the user’s groups has a specific usage setting for the function.
5. The default usage setting for the function was used.
9. The usage source could not be determined.

Usage source ignoring *ALLOBJ and ignoring specific usage setting. An indicator as to why the user is allowed or is not allowed to use the function if this API ignores the *ALLOBJ authority and specific usage setting.

This parameter contains one of the following values:

3. One of the user’s groups has *ALLOBJ special authority.
4. One of the user’s groups has a specific usage setting for the function.
5. The default usage setting for the function was used.
9. The usage source could not be determined.

Format for Function Selection Criteria
This table shows the format for the function selection criteria parameter. For a detailed description of each field, see “Field Descriptions” on page 31.

<table>
<thead>
<tr>
<th>Type</th>
<th>Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>BINARY(4)</td>
<td>Size of criteria entry</td>
</tr>
<tr>
<td>BINARY(4)</td>
<td>Comparison operator</td>
</tr>
<tr>
<td>BINARY(4)</td>
<td>Function control key</td>
</tr>
<tr>
<td>BINARY(4)</td>
<td>Length of comparison data</td>
</tr>
<tr>
<td>CHAR(*)</td>
<td>Comparison data</td>
</tr>
</tbody>
</table>
**Field Descriptions**

**Comparison data.** The data to compare to the function information.

**Comparison operator.** The comparison value to be used when comparing the function information with the comparison data.

The following value can be specified:

1. The comparison data equals the function information

**Function control key.** The function control to be compared. Refer to [“Function Control Keys”](#) for more information.

**Length of comparison data.** The length of the data to compare to the function information. The length of the comparison data must be valid for the function control key that is specified.

**Size of criteria entry.** The size of the selection criteria entry, including this field.

### Function Control Keys

The following table shows the valid function control keys for the key field area of the selection control record. For a detailed description of each field, see [“Field Descriptions.”](#)

<table>
<thead>
<tr>
<th>Key</th>
<th>Type</th>
<th>Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>CHAR(1)</td>
<td>Function category</td>
</tr>
<tr>
<td>3</td>
<td>CHAR(30)</td>
<td>Function product ID</td>
</tr>
<tr>
<td>4</td>
<td>CHAR(30)</td>
<td>Function group ID</td>
</tr>
<tr>
<td>5</td>
<td>CHAR(30)</td>
<td>Function ID</td>
</tr>
</tbody>
</table>

**Field Descriptions**

**Function category.** The category of the function.

The possible values are:

1. Locally managed client functions within iSeries Navigator are selected.
2. Locally managed client functions not within iSeries Navigator are selected.
3. Host functions are selected.
4. Centrally managed client functions within iSeries Navigator are selected.
5. Centrally managed client functions not within iSeries Navigator are selected.
6. All locally managed client functions are selected. This includes all functions in categories 1 and 2.
7. All centrally managed client functions are selected. This includes all functions in categories 4 and 5.
8. All client functions are selected. This includes all functions in categories 1, 2, 4, and 5.

**Function group ID.** All functions that have this function group are selected. The special value of *NONE* can be specified to select functions that do not have a function group specified.

**Function ID.** The ID of the functions to be selected.

The following can be specified for the function ID:
**generic**

All function IDs that begin with the generic string are selected.

**function ID**

The specific function ID are selected.

**Function product ID.** All functions that have this function product are selected.

## Error Messages
