

Showing a Selected Activity's Items

This procedure describes how to choose an activity and hide all the items (products and other items, including manufacturing assembly) and resources in the 3D viewer except those that are assigned to the activity and its children activities. This command shows the input items assigned; not the output items.

You can also select a resource or a TSA. For a resource all the behaviors and TSAs of the resource or any of its children are taken into account. As a consequence, all the products, resources or manufacturing assemblies assigned to any behavior or TSA under the selected resource is shown, while others are hidden. The resources under the selected resource remain visible regardless of whether they are assigned to a behavior or TSA or whether they are not assigned.

The user can save a state of visualized items (products and other items including manufacturing assembly) and resources. The user can also always restore the view.

1. Select an activity, resource behavior, or TSA.

You can use the **Shift** key to select more than one item.

2. Click **Show Selected Activity's Items**.

The items and resources assigned to that activity and the manufacturing assemblies associated to the activity and its children activities are highlighted. The **Show Object's Items** dialog box appears.

The **Save** button retains the current state of visibility.

The **Restore** button restores the previously saved state of visibility.

The **Apply** button makes the items and resources of the activity tree visible while all the rest are hidden. Once you select an activity, the items and resources of the activity (and its tree) are highlighted. The visibility will be applied only when **Apply** button is pressed.

This command works for only one process document at a time. To work with other process documents, restore all activities using the **Restore** button.

If there is not any activity used by this command, **Restore** button is not be available for selection.

3. Click the button you want. The table below provides the options.

Button	Value
Save	The current state of hiding or showing for the unassigned items is maintained, and the dialog box exits.
Restore	The previously saved state of visibility returns. If there is no previously saved state of visibility, Restore is not available. The command only works on one process document at a time to work with other process documents, restore those documents activities using Restore .
Apply	The items and resource of the activity tree are visible while all the rest are hidden. Once you select an activity, the items and resources of the activity (and its tree) are highlighted. The visibility is applied only when you click Apply .
OK	The dialog box exits with all changes maintained.
Cancel	The dialog box exits with no changes maintained.
