IBM posts leadership score for Oracle E-Business Applications 11*i* (11.5.10) Benchmark

July 14, 2006 ... The IBM® System x^{TM} 3850 server has delivered a score of 1,000 concurrent users on the Oracle® E-Business Applications 11*i* eBS benchmark for Applications Release 11.5.10. This is the highest score published to date for Intel® processor-based servers and for servers using the Linux® operating system.

The benchmark test was run on two x3850 servers, each using four Dual Core Intel Xeon® Processors 7040 at 3.00GHz with 2MB L2 cache per core (4 processors/8 cores/16 threads) and 32GB of memory, and running Oracle Database 10*g* and Red Hat Enterprise Linux Server 3.0 (Update 6). One server was used as the Oracle Forms and Apache application Web server and the second was the Oracle 10*g* database and Concurrent Manager server.

This latest result by the IBM System x3850 continues an xSeries® history of achieving leading results on Intel processor-based servers running Oracle E-Business Applications Benchmark (eBS), which includes Oracle9*i*-based OASB versions 11.5.6 (Clustered) and 11.5.3 (SMP).

Results referenced are current as of July 14, 2006.

The benchmark performance results for IBM systems as presented in this document were obtained in a rigorously controlled environment. The extent to which a customer can achieve similar results is highly dependent on how closely the benchmark approximates the customer's application. The relative performance of systems derived from this benchmark does not necessarily hold for other workloads or environments. Extrapolations to any other environment are not recommended.

Benchmark results are highly dependent upon workload, specific application requirements, and systems design and implementation. Relative system performance will vary as a result of these and other factors. Therefore, these benchmark results should not be for making critical capacity planning and/or product evaluation decisions for a specific customer application.
