## Installation and Documentation

---

- ❑ Installed first in z/OS V1R2
  - Enabling APAR/PTF - OW50850 / UW82925
  - Coding APAR/PTF - OW51563 / UW83377
- ❑ The support for OS/390 V2R10 and z/OS V1R1 is provided by APAR OW51780
- ❑ z/OS Distributed File Service zSeries Administration, SC24-5989 - (Standard documentation)

© Copyright IBM Corp. 2005. All rights reserved.

## zFS Redbooks

---

z/OS Distributed File Service zSeries File System Implementation, SG24-6580-00 - (z/OS V1R3) Publication - September 2002

z/OS Distributed File Service zSeries File System Implementation, SG24-6580-01 - (z/OS V1R6) Publication - April 2005

z/OS Distributed File Service zSeries File System Implementation, SG24-6580-02 - (z/OS V1R7) Publication - 4Q 2005

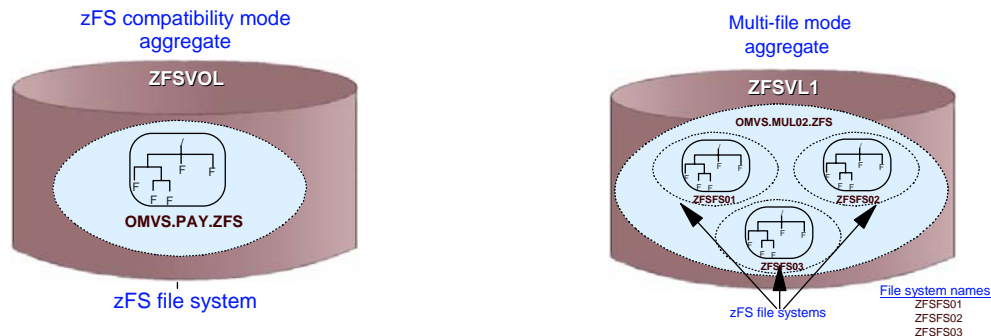

© Copyright IBM Corp. 2005. All rights reserved.

## zFS File Systems

- ❑ An **aggregate** is a VSAM linear data set (LDS)
  - ❑ An aggregate contains one or more zFS file systems
  - ❑ Two types of aggregates:
    - HFS compatibility mode - contains 1 zFS file system
    - Multiple file system mode - contains 1 or more zFS file systems
- Space sharing between file systems in same aggregate

© Copyright IBM Corp. 2005. All rights reserved.

## zFS and Multi-file Mode Aggregates

- ❑ In February 2005, IBM announced:
  - z/OS V1R7 is planned to be the last release to allow mounting zSeries File System (zFS) file systems contained in multi-file system aggregates that are to be shared across systems in a sysplex
  - IBM has previously recommended that these multi-file system aggregates not be shared in a sysplex environment. Once this support has been removed, attempts to mount zFS file systems contained in multi-file system aggregates will fail in a z/OS UNIX System Services shared file system environment
  - Mounting zFS compatibility mode aggregates, which have a single file system per data set, will continue to be supported in all environments

© Copyright IBM Corp. 2005. All rights reserved.

## zFS and a Future Release

---

- ❑ In a future release, IBM plans to withdraw support for zFS multi-file system aggregates
- ❑ When this support is withdrawn, only zFS compatibility mode aggregates will be supported
  - A zFS compatibility mode aggregate has a single file system per data set

## zFS with z/OS V1R7

---

- ❑ With completion of zFS EOM support zFS being now the preferred z/OS UNIX file system
- ❑ Sysplex awareness of APIs and the zfsadm command interface
- ❑ Various new zfsadm commands and options
- ❑ Removal of zFS aggregate and file system name restrictions
- ❑ Further enhancements to LFS support for zFS
- ❑ New directory cache parameter
- ❑ New performance monitoring APIs

## zFS with z/OS V1R7

---

- ❑ zFS is the preferred file system
- ❑ Continued use of HFS will be discouraged
- ❑ Significant effort is needed to migrate data from HFS file systems to zFS file systems
- ❑ Tools to help with migration are needed

© Copyright IBM Corp. 2005. All rights reserved.

## zFS Enhancements for z/OS V1R7

---

- ❑ New LFS support enhancements for zFS
- ❑ HFS compatibility
  - zfsadm command forwarding/pfsctl to another system
  - Addition of valid aggregate/file system name characters (@ # \$)
  - UNQUIESCE MODIFY command
  - Performance Monitoring APIs – Phase 2
  - zFS End of Memory (EOM) support
- ❑ Additions to the pax command
- ❑ zFS migration support
  - BPXWH2Z tool - ISPF based

© Copyright IBM Corp. 2005. All rights reserved.

# zFS Sysplex Enhancements

## Redbooks

International Technical Support Organization

© Copyright IBM Corp. 2005. All rights reserved.

## zFS Sysplex Support

- BPXPRMxx SYSPLEX option**
  - SYSPLEX(YES) must be specified for this to take effect

SC63

SC64

SC65

BPXPRMxx  
SYSPLEX=YES

© Copyright IBM Corp. 2005. All rights reserved.

## **zfsadm Command Changes for Sysplex**

- ❑ Previously, zfsadm commands (and the pfscctl APIs) could only display or change information that is located or owned on the current member of the sysplex
  - Only issued from the owning system
- ❑ When DFSMS is used to backup a zFS aggregate, the aggregate is quiesced by DFSMS before the backup
  - In order for this quiesce to be successful, it must be issued on the system that owns the aggregate

© Copyright IBM Corp. 2005. All rights reserved.

## **zfsadm Command Changes for Sysplex**

- ❑ In z/OS V1R7, if you are in a shared file system environment, zfsadm commands and zFS pfscctl APIs generally work across the sysplex
- ❑ There are two main changes:
  - The zfsadm commands act globally and report or modify all zFS objects across the sysplex
  - They support a new `-system` option that limits output to zFS objects on a single system or sends a request to a single system

© Copyright IBM Corp. 2005. All rights reserved.

## New zfsadm Commands Changes

- ❑ **zfsadm configquery command options**
  - -group, -sysplex\_state
  - -system system\_name
- ❑ **Option, -long shows more details**

```
$> zfsadm lsfs OMVS.HERING.TEST.ZFS -long
IOEZ00129I Total of 1 file systems found for aggregate
OMVS.HERING.TEST.ZFS
OMVS.HERING.TEST.ZFS 100005,,5 RW (Mounted R/W)      states 0x10010005
On-line
    4294967232 K alloc limit;      10847 K alloc usage
      11375 K quota limit;      10847 K quota usage
          112 K Filesystem Inode Table      21 file requests
```

© Copyright IBM Corp. 2005. All rights reserved.

## Configuration Options New - z/OS V1R7

- ❑ **-system system\_name**
  - Specifies the name of the system the report request will be sent to, to retrieve the data requested
- ❑ **-group**
  - Displays the XCF group used by ZFS for communication between sysplex members
    - Default Value: IOEZFS
    - Expected Value: 1 to 8 characters
    - Example group: IOEZFS1

```
$> zfsadm configquery -group
IOEZ00317I The value for configuration option -group is IOEZFS.
```

© Copyright IBM Corp. 2005. All rights reserved.

## zFS Starts and Joins the XCF group

```
IEF403I ZFS - STARTED - TIME=18.59.13 - ASID=008F - SC70
...
IOEZ00052I zFS kernel: Initializing z/OS      zSeries File System
Version 01.07.00 Service Level 0000000 - HZFS370.
Created on Mon Apr  4 16:06:17 EDT 2005.
...
IOEZ00350I Successfully joined group IOEZFS
*IOEZ00525I Starting initialization with SC65
IOEZ00529I Preparing for initialization with SC70. <===== SC65
IOEZ00530I Ready to initialize with SC70. <===== SC65
*IOEZ00526I Requesting aggregate information from SC65
IOEZ00532I Sending aggregate information to SC70. <===== SC65
...
IOEZ00528I Initialization with SC65 complete.
IOEZ00533I Done initializing with SC70. <===== SC65
...
IOEZ00055I zFS kernel: initialization complete.
```

© Copyright IBM Corp. 2005. All rights reserved.

## Configuration Options New - z/OS V1R7

- ❑ `-sysplex_state`
  - Displays the sysplex state of ZFS. Zero (0) indicates that ZFS is not in a shared file system environment. One (1) indicates that ZFS is in a shared file system environment

```
$> zfsadm configquery -sysplex_state
IOEZ00317I The value for configuration option -sysplex_state is 1.
```

© Copyright IBM Corp. 2005. All rights reserved.

## zFS Sysplex Command Support

- ❑ z/OS V1R7 - Ability to issue zFS filesystem commands from anywhere within a sysplex
  - Allow quiesce of zFS from any LPAR in a sysplex
- ❑ zfsadm commands are global to sysplex
  - aggrinfo - clonesys - lsaggr - lsfs
- ❑ zfsadm commands “go” to the correct system
  - aggrinfo, clone, create, delete, grow, lsfs, lsquota, quiesce, rename, setquota, unquiesce
- ❑ zfsadm commands can be limited/directed to a system
  - aggrinfo, attach, clonesys, config, configquery, define, detach, format, lsaggr, lsfs, query

© Copyright IBM Corp. 2005. All rights reserved.

## Command Forwarding Support

- ❑ zfsadm commands will now display and work with zFS aggregates and file systems across the sysplex
- ❑ This enhancement is exploited by:
  - DFSMS backup (ADRDSSU)
    - Backups can now be issued from any member of the sysplex when all members are at z/OS V1R7 regardless of which member owns the file system
  - ISHELL
  - zFS administrators

© Copyright IBM Corp. 2005. All rights reserved.

## New zfsadm Command Examples

### ❑ zfsadm lssys - Shows the members in a sysplex

```
ROGERS @ SC65:/u/rogers>zfsadm lssys
IOEZ00361I A total of 2 systems are in the XCF group for zFS
SC65
SC70
ROGERS @ SC65:/u/rogers>
```

### ❑ zfsadm sysplex command example using

➤ -system *system\_name*

```
ROGERS @ SC65:/u/rogers>zfsadm aggrinfo -system SC70
IOEZ00368I A total of 2 aggregates are attached to system SC70.
OMVS.TEST.MULTIFS.ZFS (R/O MULT): 20597 K free out of total 20880
OMVS.HERING.TEST.ZFS (R/O COMP): 454 K free out of total 11520
ROGERS @ SC65:/u/rogers>
```

## zFS Fast Mount

# Redbooks

International Technical Support Organization

© Copyright IBM Corp. 2005. All rights reserved.

## zFS Fast Mount - Performance Improvement

---

- ❑ Implemented with APAR OA12519
  - Toleration APAR OA11573 for prior releases
    - Apply to Z/OS Versions V1R4, V1R5, V1R6, V1R7
    - **Note: Apply to V1R7 before OA12519**
- ❑ Resolves the following problem:
  - Dead system recovery caused zFS file systems to move to another system
  - zFS file system had tens of millions of files
  - Mount during move took 30 minutes to complete
  - System (USS) unavailable during this time

© Copyright IBM Corp. 2005. All rights reserved.

## zFS Fast Mount - Performance Improvement

---

- ❑ To support this improvement, the first time that a zFS aggregate is mounted on z/OS V1R7 after APAR OA12519 is applied
  - It is converted to a new on-disk format (called version 1.4)
  - Additional information for mount processing can be recorded in the aggregate
  - All existing aggregates are version 1.3 aggregates
- ❑ After conversion, subsequent mount processing will occur more quickly
  - APAR OA11573 supplies the code to process the new format (version 1.4)
- ❑ Only works for compatibility mode aggregates

© Copyright IBM Corp. 2005. All rights reserved.

ibm.com

# Addition of valid aggregate/file system name characters (@ # \$)

## Redbooks

International Technical Support Organization

© Copyright IBM Corp. 2005. All rights reserved.

## Special Characters in zFS Aggregates

- ❑ Previously, you could not have a zFS aggregate or file system name that contained special characters

➤ (@ # \$)

```
# zfsadm define -aggr OMVS.HERING.@TEST.ZFS -volumes CFC000 -cyl 10  
IOEZ00248E VSAM linear datase PLEX.JMS.AGGR#06.LDS0006 successfully  
created.
```

```
# zfsadm format -aggr OMVS.HERING.@TEST.ZFS -compat  
IOEZ00077I HFS-compatibility aggregate OMVS.HERING.@TEST.ZFS has been  
successfully created
```

ibm.com

e-business

# UNQUIESCE Modify Command

## Redbooks

International Technical Support Organization

© Copyright IBM Corp. 2005. All rights reserved.

## New UNQUIESCE Command

- ❑ Previously, if a zFS aggregate was quiesced and the job failed to unquiesce it, you would need to use OMVS - zfsadm unquiesce command
  - Not possible to unquiesce from operator console
  - z/OS V1R7 new command to issue unquiesce
    - F ZFS,UNQUIESCE,OMVS.HERING.@TEST.ZFS
    - Must be issued from owning system
- ❑ This command only works on z/OS V1R7
  - It must be issued from the owning system
  - This command does not forward requests to other members of the sysplex

ibm.com

e-business

# Performance Monitoring APIs

## Redbooks

International Technical Support Organization

© Copyright IBM Corp. 2005. All rights reserved.

## Performance APIs

- Previously, certain zFS performance counters could only be retrieved via operator console command
  - Data could not easily be retrieved by an application
  - Provide an API to obtain statistics on zFS activity
- Now, all zFS performance counters can be retrieved by an application
  - pfsctl API (BPX1PCT)
- Now, zfsadm command can be used to display/reset performance counters
  - zfsadm query -metadata
- Administrative application programs can use this function
- RMF exploits this function in z/OS V1R7

# Performance Monitoring APIs - z/OS V1R6

- ❑ zFS provides six new pfsctl APIs to retrieve performance counters
  - Locks
  - Storage
  - User data cache
  - iocounts
  - iobyaggr
  - iobydasd
- ❑ zFS provides a new zfsadm command (query) to query/reset the performance counters

f zfs,query,all

```
zfsadm query [-locking ] [-storage ] [-usercache ] [-iocounts]  
[-iobyaggregate ] [-iobydasd] [-reset]
```

© Copyright IBM Corp. 2005. All rights reserved.

## zfsadm query Command

- ❑ zfsadm query command now supports additional options
  - knpfs, -metadata, -dircache, -vnodecache, -logcache, -trancache

```
zfsadm query -dircache
```

Directory Backing Caching Statistics

Buffers	(K bytes)	Requests	Hits	Ratio	Discards
256	2048	1216679	1216628	99.9%	50

© Copyright IBM Corp. 2005. All rights reserved.

## Directory Cache (dircache)

- ❑ In z/OS V1R7 a new zFS IOEPRMxx parameter file statement is available to set the directory cache size
  - dir\_cache\_size - Size of the directory buffer cache
    - Example: dir\_cache\_size=4M
  - The minimum and default size is 2M, the maximum value that can be set is 512M
  - Changing this cache size may be useful if you expect situations with many file creates or deletes
  - This is available via APAR OA10136 and PTFs:
    - UA16125 for z/OS V1R4
    - UA16123 for z/OS V1R5
    - UA16124 for z/OS V1R6

© Copyright IBM Corp. 2005. All rights reserved.

ibm.com

## zFS EOM Enhancements

# Redbooks

International Technical Support Organization

© Copyright IBM Corp. 2005. All rights reserved.

## zFS EOM Support

---

- ❑ Previously, an End of Memory condition while executing in zFS could cause zFS to go down
  - When zFS goes down, all zFS file systems are unmounted
- ❑ Now, End of Memory conditions are recovered by zFS
  - zFS does not go down
  - No zFS file systems are unmounted
- ❑ z/OS V1R7 zFS will recover for EOM, earlier releases will not

© Copyright IBM Corp. 2005. All rights reserved.

## zFS EOM Support

---

- ❑ zFS End of Memory (EOM) support is invoked by:
  - A calling application going to End of Memory while executing in zFS
- ❑ Called by:
  - Operator action when a job is forced (did not respond to cancel)
- ❑ Changed external output
  - zFS does not go down/zFS file systems do not need to be remounted

© Copyright IBM Corp. 2005. All rights reserved.

# RMF Monitor Support for zFS

## Redbooks

International Technical Support Organization

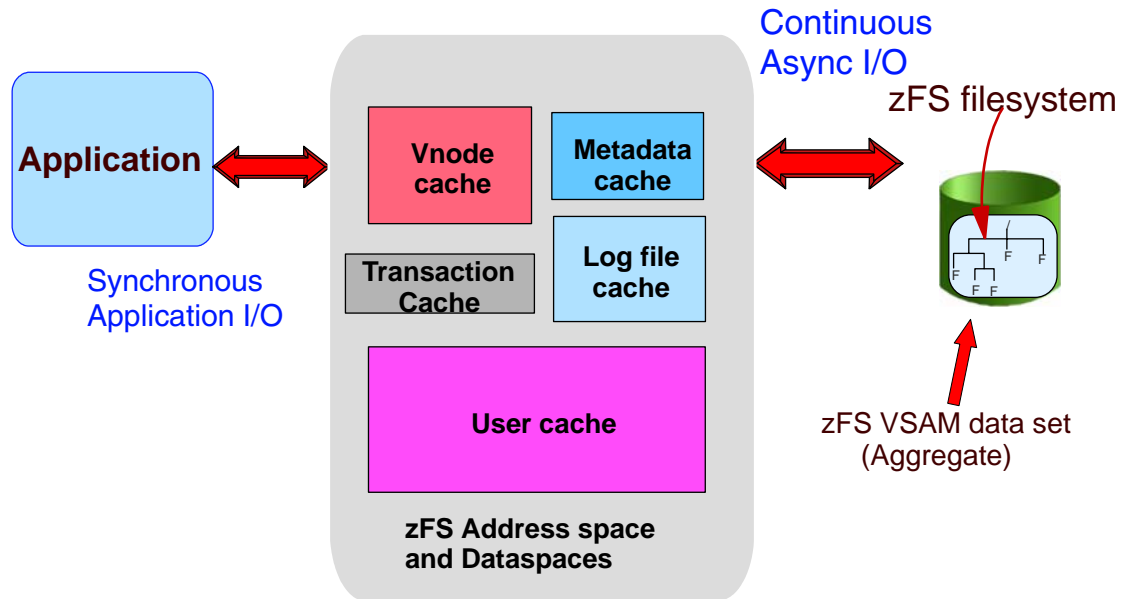

© Copyright IBM Corp. 2005. All rights reserved.

## RMF Monitor III Support for zFS

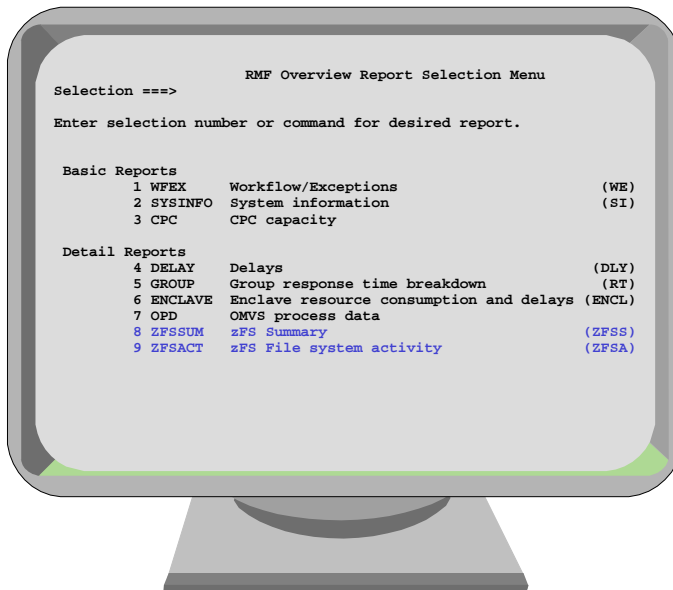

- New Monitor III zFS reports provides data on:**
  - zFS response time / wait times
  - zFS cache activity
  - zFS activity / capacity by aggregate
  - zFS activity / capacity by filesystem
- Data helps to control the zFS environment for:**
  - Cache sizes
  - I/O balancing
  - Capacity control for zFS aggregates

# RMF Support for zFS

© Copyright IBM Corp. 2005. All rights reserved.

# RMF Overview Report Selection Menu

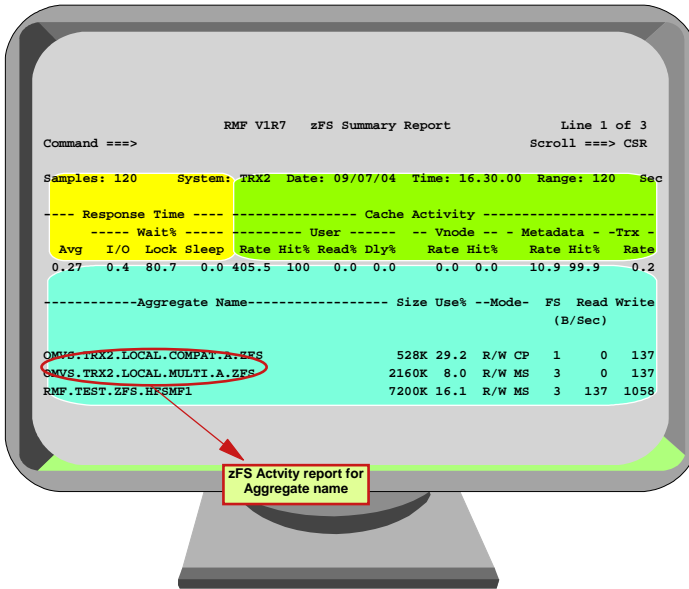

- RMF Overview Report Selection Menu (Detail reports)
- Command interface
  - > **ZFSSUM** or **ZFSS**:
    - zFS summary report
  - > **ZFSACT** or **ZFSA**:
    - zFS activity report
- Gatherer options:
  - > Option **NOZFS** | **ZFS**

## zFS Redbook - SG24-6580 Download Material

# Redbooks

International Technical Support Organization

© Copyright IBM Corp. 2005. All rights reserved.

## Download of REXX execs and JCL

---

Attention: The sample REXX procedures are available in softcopy on the Internet from the Redbooks Web server

Point your browser to:

<ftp://www.redbooks.ibm.com/redbooks/SG246580/>

Note: SG246580 must be uppercase (the SG part)

Alternatively, you can go to:

<http://www.redbooks.ibm.com>

and select Redbooks Online, and then Additional Materials

© Copyright IBM Corp. 2005. All rights reserved.

## HFS to zFS Migration

---

- ❑ Input: List of source data sets (HFS data sets)
  - Tool (REXX) creates a list of HFS data sets with
  - Suggested settings for the target zFS aggregates
    - You may change settings (storage group, size, etc.)
- ❑ Tool provides a final input data set for a job that performs the migration process
- ❑ Tool has option to determine whether you want to replace the old HFS with the new zFS if HFS is currently mounted

© Copyright IBM Corp. 2005. All rights reserved.

## Using pax in copy mode - (COPYPAX)

- ❑ Without an intermediate archive is a more efficient way of copying an HFS file system to a zFS file system
  - REXX procedure COPYPAX allows the user to use the pax command in copy mode - can be used from the TSO foreground but use in a TSO batch job
- ❑ Benefits of COPYPAX
  - A test is done to verify that the source and the target structure are located in different file systems
  - A test is done to verify that the target directory is empty
  - Uses option -X to avoid skipping over mount point boundaries
  - Invalid file descriptor files are corrected when pax has finished its copy processing

© Copyright IBM Corp. 2005. All rights reserved.

## Batch Job for COPYPAX

```
//ZFSJOB JOB , 'COPYPAX',NOTIFY=&SYSUID.,REGION=0M
/* -----
/* Use pax to copy source directory structure to target directory
/* Property of IBM (C) Copyright IBM Corp. 2002
/* -----
// SET SOURCED='/u/hering' <=== Source directory
// SET TARGETD='/u/zfs/m01' <=== Target directory
/* -----
// SET TIMEOUT=0 <=== Timeout value in seconds, 0=no timeout
// SET REXXLIB=HERING.ZFS.REXX.EXEC <=== SYSEXEC library
/* -----
//ZFSADM EXEC PGM=IKJEFT01,PARM='COPYPAX &TIMEOUT &SOURCED &TARGETD'
//SYSEXEC DD DSNAME=&REXXLIB.,DISP=SHR
//SYSTSIN DD DUMMY
//SYSTSPRT DD SYSOUT=*,LRECL=136,RECFM=V
/*
```

© Copyright IBM Corp. 2005. All rights reserved.

## Use COPYPAX for Copy of Root

```
//ZFSJOB JOB , 'COPYPAX', NOTIFY=&SYSUID., REGION=0M
//* -----
//* Use pax to copy source directory structure to target directory
//* Property of IBM (C) Copyright IBM Corp. 2002
//* -----
// SET SOURCED='/' <=== Source directory
// SET TARGETD='/u/zfs/zfsroot' <=== Target directory
//* -----
// SET TIMEOUT=0 <=== Timeout value in seconds, 0=no timeout
// SET REXXLIB=HERING.ZFS.REXX.EXEC <=== SYSEXEC library
//* -----
//ZFSADM EXEC PGM=IKJEFT01, PARM='COPYPAX &TIMEOUT &SOURCED &TARGETD'
//SYSEXEC DD DSNAME=&REXXLIB., DISP=SHR
//SYSTSIN DD DUMMY
//SYSTSPRT DD SYSOUT=*, LRECL=136, RECFM=V
//*
```

© Copyright IBM Corp. 2005. All rights reserved.

## REXX Procedure ADDMNTPS

### ❑ To recreate missing directories

#### ➤ REXX exec ADDMNTPS

```
//ZFSJOB JOB , 'ADDMNTPS', NOTIFY=&SYSUID., REGION=0M
//* -----
//* Add missing mount point directories after clone process
//* Property of IBM (C) Copyright IBM Corp. 2002
//* -----
// SET SOURCED='/' <=== Source directory
// SET TARGETD='/u/zfs/zfsroot' <=== Target directory
//* -----
// SET TIMEOUT=0 <=== Timeout value in seconds, 0=no timeout
// SET REXXLIB=HERING.ZFS.REXX.EXEC <=== SYSEXEC library
//* -----
//ZFSADM EXEC PGM=IKJEFT01, PARM='ADDMNTPS &TIMEOUT &SOURCED &TARGETD'
//SYSEXEC DD DSNAME=&REXXLIB., DISP=SHR
//SYSTSIN DD DUMMY
//SYSTSPRT DD SYSOUT=*, LRECL=136, RECFM=V
//*
```

© Copyright IBM Corp. 2005. All rights reserved.

## ADDMNTPS .....

- ❑ It looks for all mount points of all the file systems mounted in the system
- ❑ If the file system is the source file system or the mount point is the root ( / ), no action is taken
- ❑ If the parent directory of the mount point belongs to the source file system, then this mount point is one of the mount point directories that needs to exist in the target structure
- ❑ A test is done to determine whether the corresponding directory in the target file system is already there (it could have been defined in the meantime). If it does not exist, it is created with owner UID 0 and permission bits set to 700

© Copyright IBM Corp. 2005. All rights reserved.

## HFS or zFS Data Sets

- ❑ You can choose whether each filesystem is to be an HFS or a zFS:
  - On the data set attributes panels
  - With the new CHange DSNTYPE command
- ❑ Exception: The root file system must be an HFS
- ❑ New data set types in the installation dialog:
  - HFS, zFS, PDS, PDSE, SEQ, and VSAM

```
>---+--- CHANGE ---+---+--- DSNTYPE ---+---+--- PDS PDSE ---+---<
|   |   |   |   |   |   |   |   |   |
+--- CH -----+ +--- TYPE -----+ +--- PDSE PDS ----+
|   |   |   |   |   |   |   |   |   |
+--- T -----+ +--- HFS ZFS ----+

## Set Data Set Type

```
CPPP605D ----- Modify System Layout ( R0150026 ) -----  
COMMAND ==> _
```

### Data Set Modification - Attributes

```
Data set Name ==> OMVSZ15.RL000006.OMVS.ETC  
  Shipped      : OMVS.ETC  
  
Placement      : C          (DLIB, Target, Catalog, or User-Defined)  
  
Data Set Type ==> HFS      (HFS, PDS, PDSE, SEQ, VSAM, or ZFS)  
  Shipped      : HFS  
  
SMS-Managed   ==> NO      (Yes or No)  
SMS-Eligible   : YES  
SMS-Required   : NO  
  
Logical Volume ==> HLB002  Shipped   : CAT001  
Physical Volume : T6Z5H1  
Storage Class  :
```

## HFS versus zFS

- HFS data set vs. VSAM LDS (aggregate) for zFS
- zFS aggregate must be preformatted
- Different FILESYSTYPES used in BPXPRMxx
  - FILESYSTYPE TYPE(ZFS) ENTRYPOINT(IOEFSCM)  
ASNAME(ZFS)
- Different operands on MOUNT command
- Different security system setup
- NONVSAM versus VSAM catalog entry
- CICS, DB2, and IMS ServerPacs assume that any necessary zFS setup has been done

## ServerPac Changes if using zFS

---

- ❑ ALLOCDS job formats zFS data sets you define
- ❑ RACFDRV and RACFTGT Jobs in z/OS orders:
  - Add group for DFS setup
  - Add user ID for ZFS address space
- ❑ RESTFS Job:
  - Uses appropriate TYPE on MOUNT commands depending on filesystem type
  - Puts appropriate TYPE on MOUNT parameters in BPXPRMFS
  - Add FILESYSTYPE for zFS to BPXPRMFS if needed
