

# VSE/VSAM

## advanced functions

z/VM, VSE, and Linux on zSeries Tech Conference  
Miami Beach - Oct 7 - 10th

*Wilhelm Mild*  
IBM Germany  
Boeblingen Laboratory  
mildw@de.ibm.com

**IBM @server.** For the next generation of e-business.

# Agenda

---

## VSAM advanced functions for a modern IT:

- Hardware Compression
- Extralarge KSDS files (XXL)
- Buffer hashing
- VSAM redirector
- VSAM 24X7 availability
- Snapshot/Flashcopy
- Virtual tape in VSAM Space
- VSAM access via JAVA and the VSE e-business connectors

# Hardware Compression

---

## Characteristics:

- to avoid 4GB limit size
- transparent for all applications
- using dynamic Compression Dictionary  
(build at load mode time - Sampling)
  - max 64 KB uncompressed data
  - each record is sampled separately and can be stored at disc compressed or uncompressed
- compression dictionary unique per VSAM cluster - CAR (Compression Attribute Record)
  - stored in CCDS (Compression Control Data Set)
  - Catalog defined in IUI will define CCDS (one per catalog)
- LISTCAT shows CAR and compression status
- IKQCPRED -Compression prediction tool

# Extralarge KSDS

---

## Characteristics:

- ✦ avoids 4 GB limitation
- ✦ file size up to Terra Bytes
  - ✦ 4.2 billions Control intervals = 140 TB
  - ✦ depends on physical disk architecture
    - ✦ 3390-9 approx 1.2 TB for a VSAM data set
- ✦ for KSDS with keyed access only  
(no RBA and CNV access)
- ✦ transparent for all applications
- ✦ easy switch from traditional to XXL KSDS using  
redefine of KSDS and REPRO for data
- ✦ LISTCAT shows XXL KSDS type

# Buffer Hashing

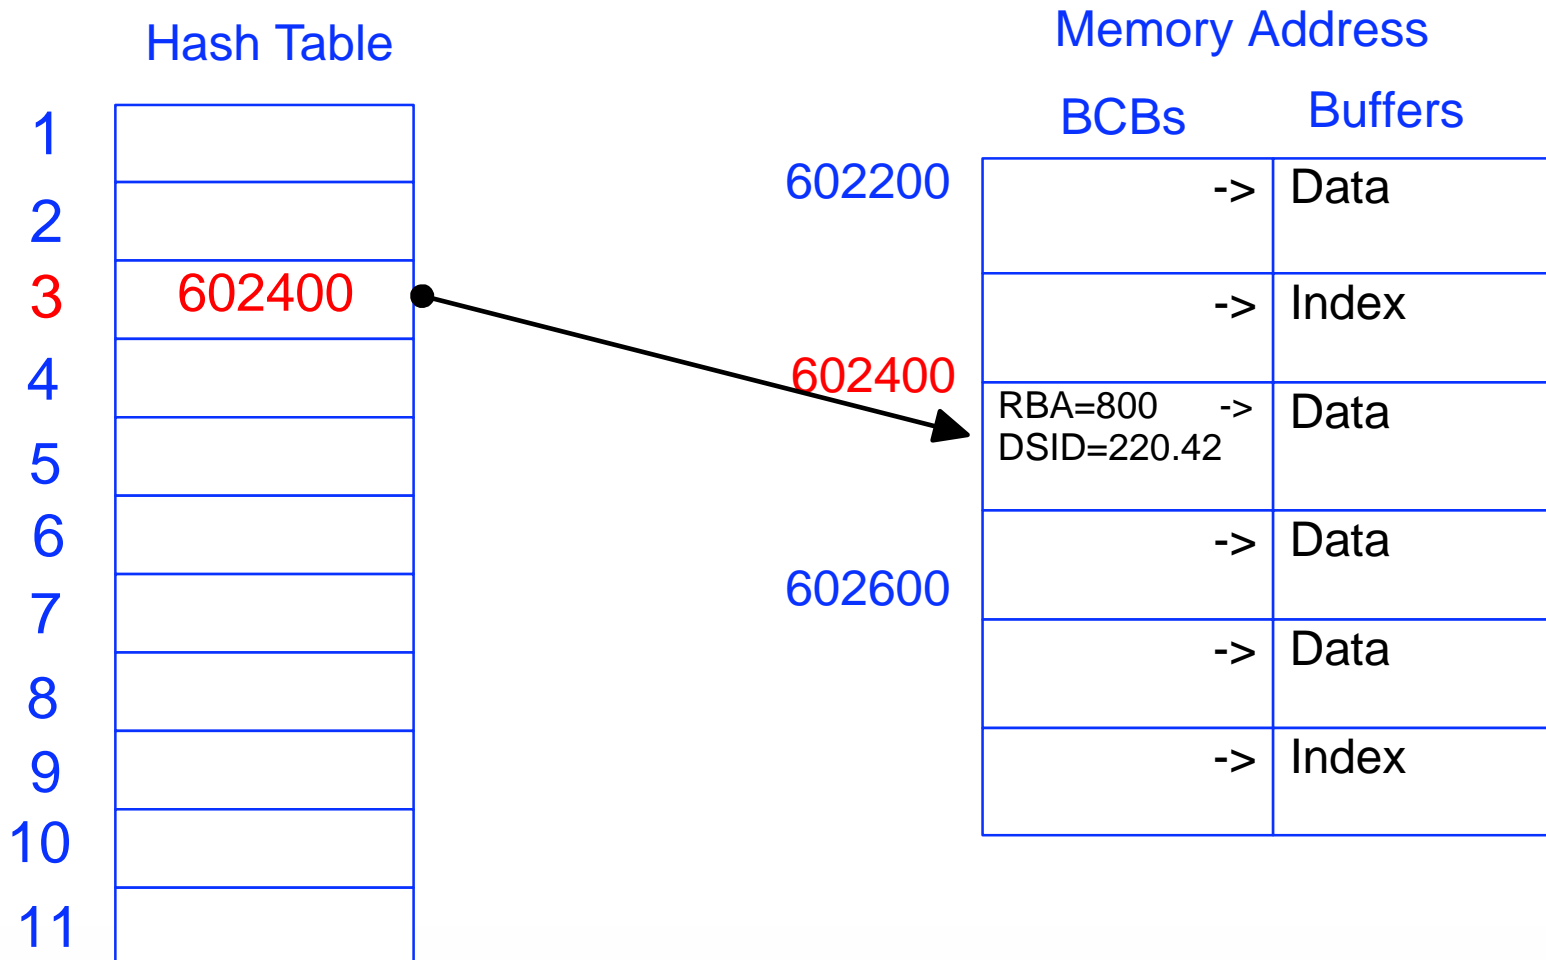

---

## Characteristics:

- ▶ new technique, to replace the current buffer management for applications using the *LSR (Local Shared Resource)* option.
- ▶ No more sequential search through the buffer pool.
- ▶ allocated/deleted by VSAM with the VSAM LSR pool allocation
- ▶ The dimension of the hash table is calculated from the number of buffers.
- ▶ The new technique means:  
direct buffer access using a hashing algorithm.

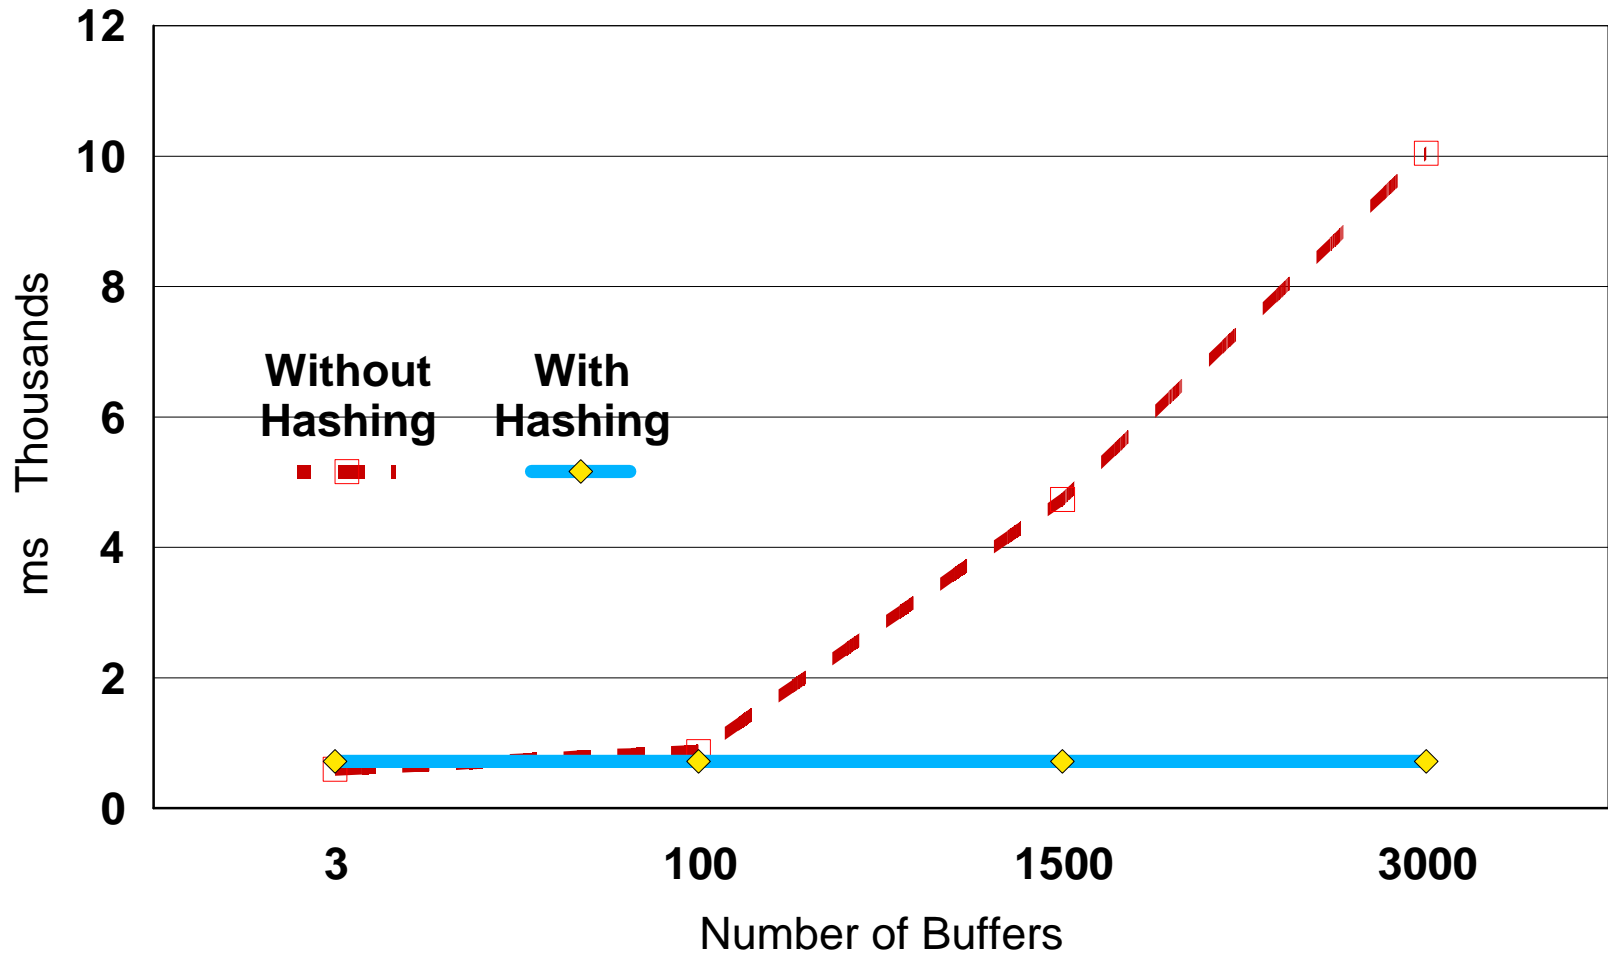

# Example

Third entry in the hash table points to the requested Buffer Control Block

# Simplified Performance Measurement

Runtime when Executing 10,000 Reads \*

\* Data in Memory

# VSE/VSAM Redirector - functional view

Java platform  
( Linux on zSeries )

VSE/ESA V2.6

- ▶ Redirector Components:
- ▶ Generic Exit is based on VSAM Data Access Exit (VDA)
- ▶ Config phase - redirection properties
- ▶ Redirector client
- ▶ Redirector server
- ▶ Handler

# Customer - Benefits

---

- ▶ **VSE access to** various remote file systems without changing the programs
  - ▶ OWNER = REDIRECTOR
- ▶ **migration** of VSAM data to another file system
  - ▶ OWNER = REDIRECTOR and REPRO to redirected cluster
- ▶ **synchronization** of VSAM data with data on another platform (independent of file organizations)
  - ▶ OWNER = VSAM
- ▶ **transparent** for CICS or Batch

# VSAM 24 X 7

---

✗ inhibitors of online processing time

➤ backup-window

➤ batch-window

# ✓ Eliminate the Backup-window

VSAM backup using  
FlashCopy (ESS)  
SnapShot (RVA)

# What is "FlashCopy" and "SnapShot"?

---

- ▶ The DASD architectures *RAMAC Virtual Array Storage (RVA)* and *Shark (ESS)* allow copy of DASD's with the utilities "*SnapShot*" respectively "*FlashCopy*" .
- ▶ The COPY process takes few seconds instead of hours !
- ▶ From OP system view the copy is a real copy of data.
- ▶ From the DASD controller view it is a virtual copy of data.

# **VSAM-Restrictions in a VSE system**

---

- ▶ **Duplicate VOLIDs (DASD names) not allowed on a VSE System !**
  
- ▶ **Duplicate VSAM Catalog names not allowed on a VSE System !**

# Difficulties in using FlashCopy or SnapShot for VSAM Datasets

FlashCopy / SnapShot for VSAM Datasets would mean: .....

▶ .... duplicate VOLID'S and/or duplicate VSAM Catalog names on the system ....

➔ unpredictable Results!

# Difficulties in using FlashCopy or SnapShot for VSAM Datasets

- ▶ ..... or many changes required in the copied VSAM catalog regarding new VOLID'S (i.e. volume list for each dataset) and Catalog names.

- ➔ performance
- ➔ increased error risk
- ➔ possible lose of data

# Support for FlashCopy / SnapShot for VSAM Datasets

**1. IDCAMS SNAP Utility**

**2. IDCAMS "Synonym" BACKUP**

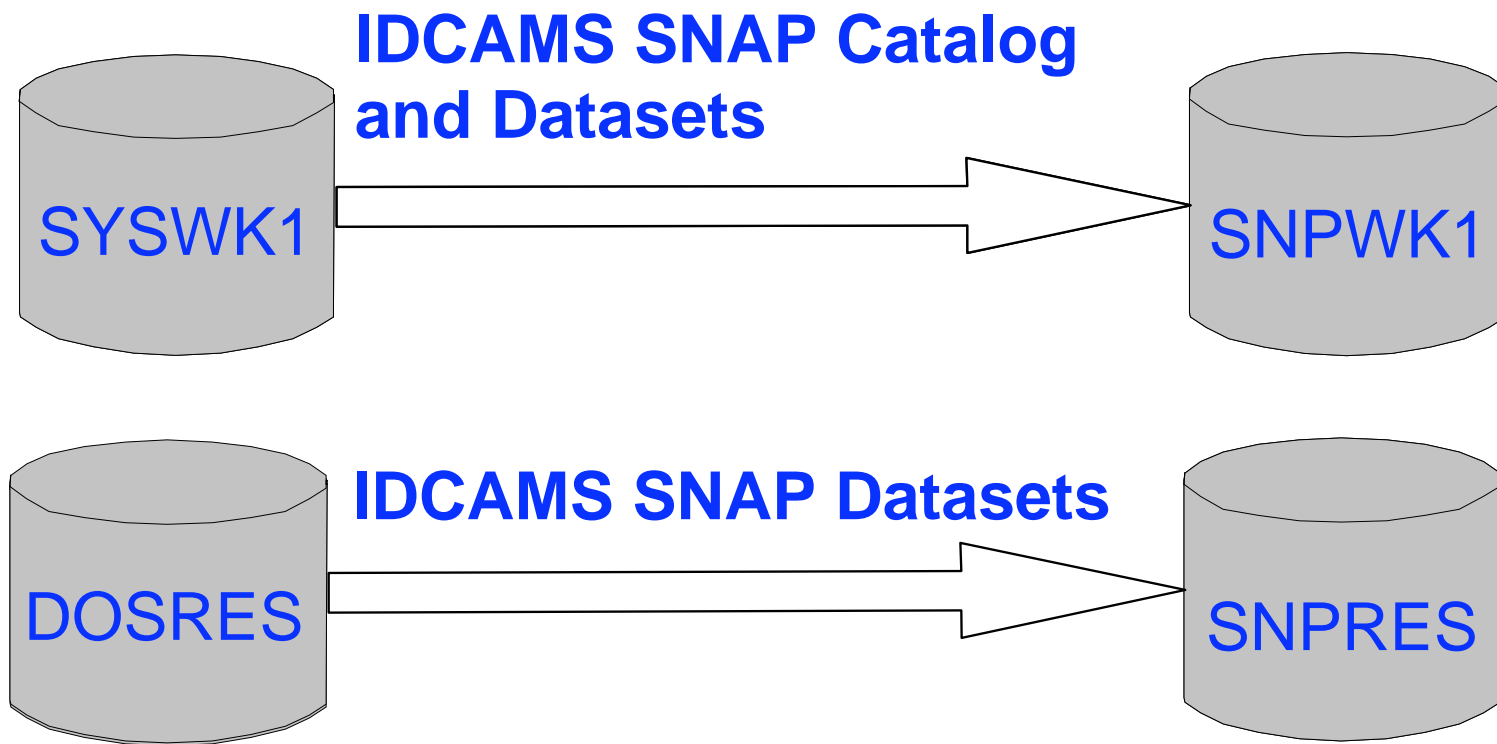

# 1. IDCAMS SNAP Utility Program

---

- ▶ IDCAMS SNAP makes copies of entire DASD volumes (VSAM catalog- and VSAM data- volumes).
- ▶ IDCAMS SNAP changes the names of the copied volumes (VOLID).
- ▶ After IDCAMS SNAP all copied volumes are **ONLINE** available for backup!

## Step 1: IDCAMS SNAP - copy all DASD's and give new Volid's

---

After Step 1, the DASD's and catalogs copied are identical, but cannot be used.

## Few seconds later:

---

- IDCAMS SNAP finished.
- Online applications can be restarted (CICS).
- The catalog and the datasets on the snaped (copied) volumes are identical with the original volumes (only VOLID's are different),  
➔ but the copied datasets can not be used, because .....

# VSAM-Restrictions in a VSE system

---

- ▶ Duplicate VOLIDs (DASD names) not allowed on a VSE System !
  - SNAP changed the VOLID'S
- ▶ Duplicate VSAM Catalog names not allowed on a VSE System !

## Step 2: IMPORT CONNECT a new catalog name

---

The catalog on the snaped volume needs a new name.

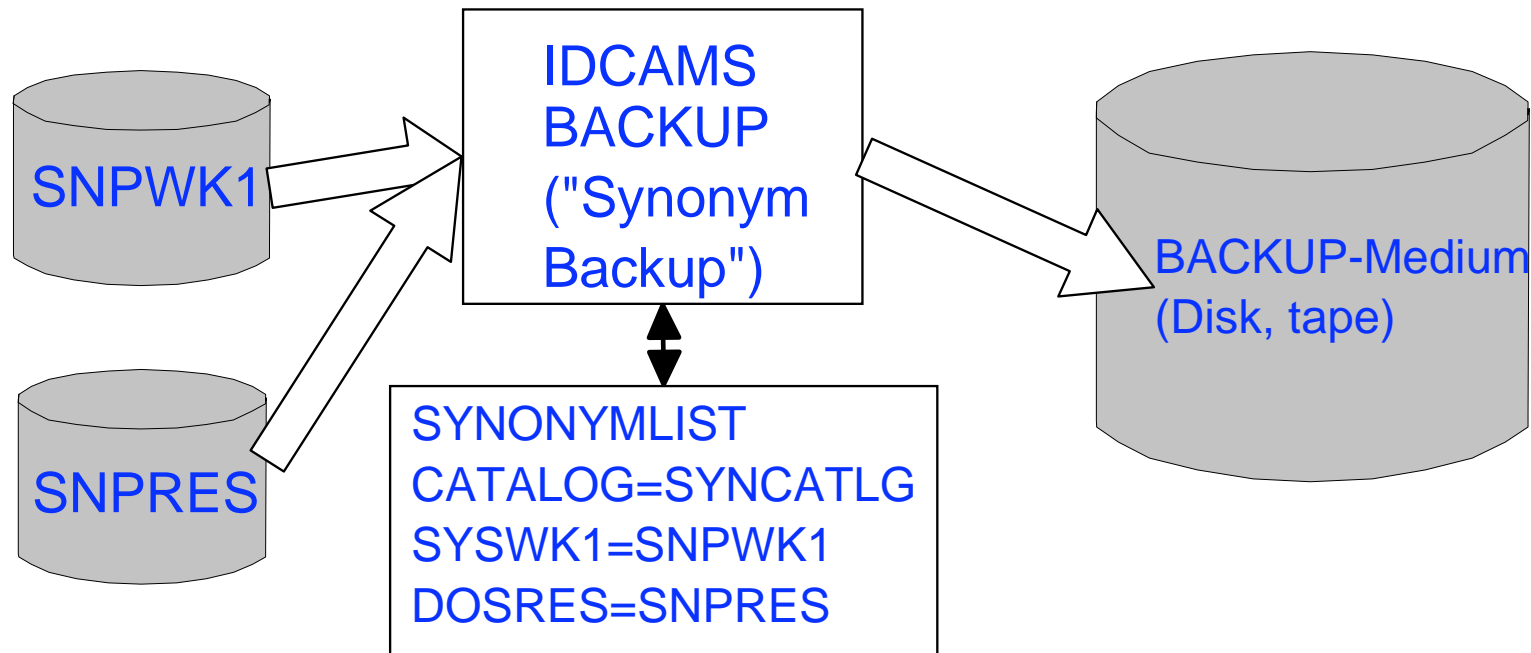

➔ we simulate a new catalog name with IDCAMS IMPORT CONNECT ,

➔ *a synonym catalog name.*

## Step 3: Backup VSAM datasets from snapped volumes (the VSE system is online)

---

**only "Synonym Backup" can read VSAM data from SNPWK1 and SNPRES !**

**After Step3: a "normal Backup medium" was created**

# What is "Synonym Backup"? (1)

---

-  a synonym list is used, to redirect VSAM to the snaped volumes (with the synonym catalog name) and execute the BACKUP from the copied Datasets.
- VSAM controls the "synonym connection" to the snaped (renamed) catalog and datasets.
  - Only "Synonym Backup" can read the VSAM datasets from the copied volumes.

## What is "Synonym Backup"? (2)

- ▶ With the exception of using the new synonym list, the backup process is unchanged.
- ▶ That means, all functions of IDCAMS BACKUP can be used
- ▶ IDCAMS BACKUP produces a normal Backup-Medium for IDCAMS RESTORE.

# Backup with synonym list

---

EXEC IDCAMS

BACKUP ( ..... ) -

SYNONYMLIST -

(SOURCEVOLUMES (SYSWK1 , DOSRES) -

TARGETVOLUMES (SNPWK1 , SNPRES) -

-

CATALOG (VSESP . USER . CATALOG) -

SYNCAT (VSESP . SNAP . CATALOG) )

# Sample job: SNAP AND VSAM BACKUP

---

```
// JOB SNAP AND BACKUP FROM SNAPPED VOLUMES
// ASSGN SYS005,180
// DLBL IJSYSUC,'VSESP.SNAP.CATALOG',,VSAM
// EXEC IDCAMS,SIZE=AUTO
/* STEP 1: DO THE SNAPSHOT */ -
  SNAP -
    SOURCEVOLUMES (SYSWK1,DOSRES) -
    TARGETVOLUMES (SNPWK1,SNPRES)
/* AFTER STEP 1 THE ONLINE SYSTEM MAY BE STARTED */
/* STEP 2: SYNONYM NAME FOR THE SNAPPED CATALOG */-
  IMPORT CONNECT OBJECTS ((VSESP.SNAP.CATALOG -
    VOLUMES (SNPWK1) DEVT (3390)) -
    CATALOG (VSAM.MASTER.CATALOG)
/* STEP 3: BACKUP FROM SNAPPED VOLUMES */ -
  BACKUP (*) -
    SYNONYMLIST ( -
    SOURCEVOLUMES (SYSWK1,DOSRES) -
    TARGETVOLUMES (SNPWK1,SNPRES) -
    CATALOG (VSESP.USER.CATALOG) -
    SYNONYMCATALOG (VSESP.SNAP.CATALOG) )
/*
/ &
```

# Conclusion FlashCopy/Snapshot

## Steps for online VSAM Backup using FlashCopy/Snapshot

- ▶ **Close online applications (shutdown CICS)**
- ▶ **FlashCopy the DASD's (datasets/databases, catalogs)**
  - ▶ eventually run batch job streams
- ▶ **restart CICS and the online applications**
- ▶ **Backup your VSAM data during Production**

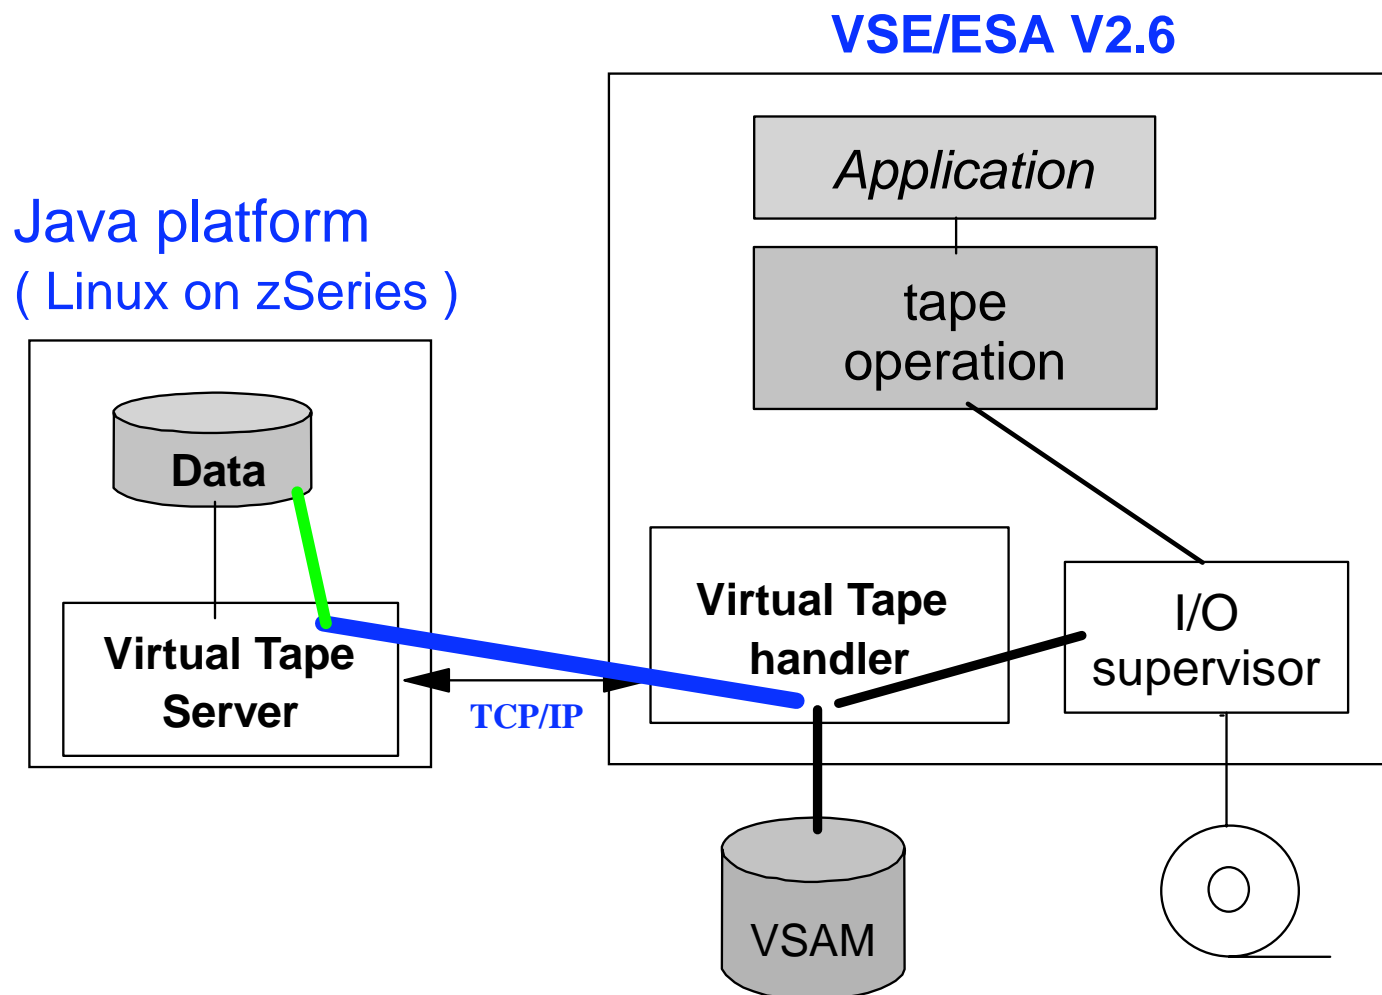

# VSAM Backup and Online system in paralel with VSE/ESA 2.5 and 2.6

# ✓ Integrate VSE Backups in standard processes

Use of VSE/ESA 2.6 Virtual tape support to integrate VSE Backup media into general, automatic Backup processes

# Virtual Tape support

- ▶ simulates a real tape (tape operation supported)
- ▶ transparent for applications

# Virtual tape in VSAM Space

---

## Characteristics

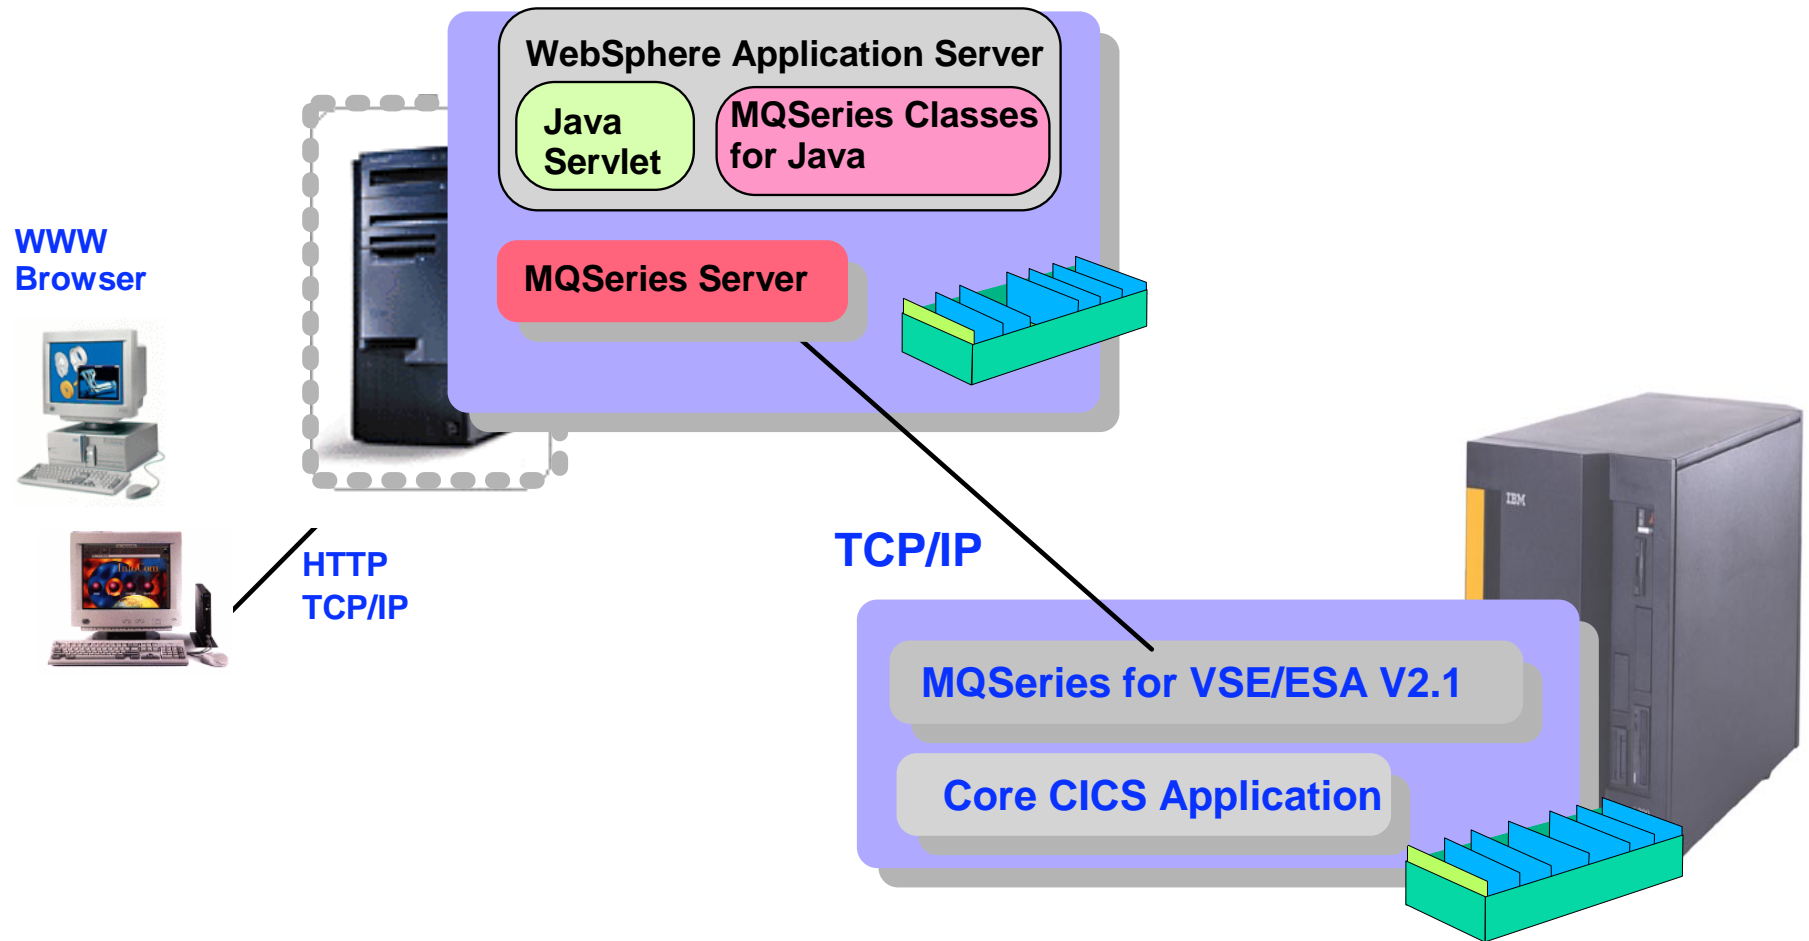

- ▶ VSE Virtual Tape support is part of VSE/ESA 2.6
- ▶ NOT: Virtual Tape Server (VTS) Hardware
- ▶ Emulates a tape with multiple tape files
- ▶ Uses a tape image file instead of a physical tape
- ▶ Tape image file can reside in
  - ▶ VSAM ESDS
  - ▶ Remote file (e.g. on a workstation)
- ▶ Tape Image file has AWSTAPE format known from P/390, R/390, Flex-ES
- ▶ A tape CUU can be switched to virtual with:  
VTAPE START,UNIT=cuu ...  
VTAPE STOP,UNIT=cuu

## ✓ Batch-window solutions

Use of MQ Series and  
the new e-business connectors  
to avoid Production downtime

# Asynchronous work with MQSeries

# MQSeries and MQSeries Clients

## Servers

 Server with Client support

## MQI Channel

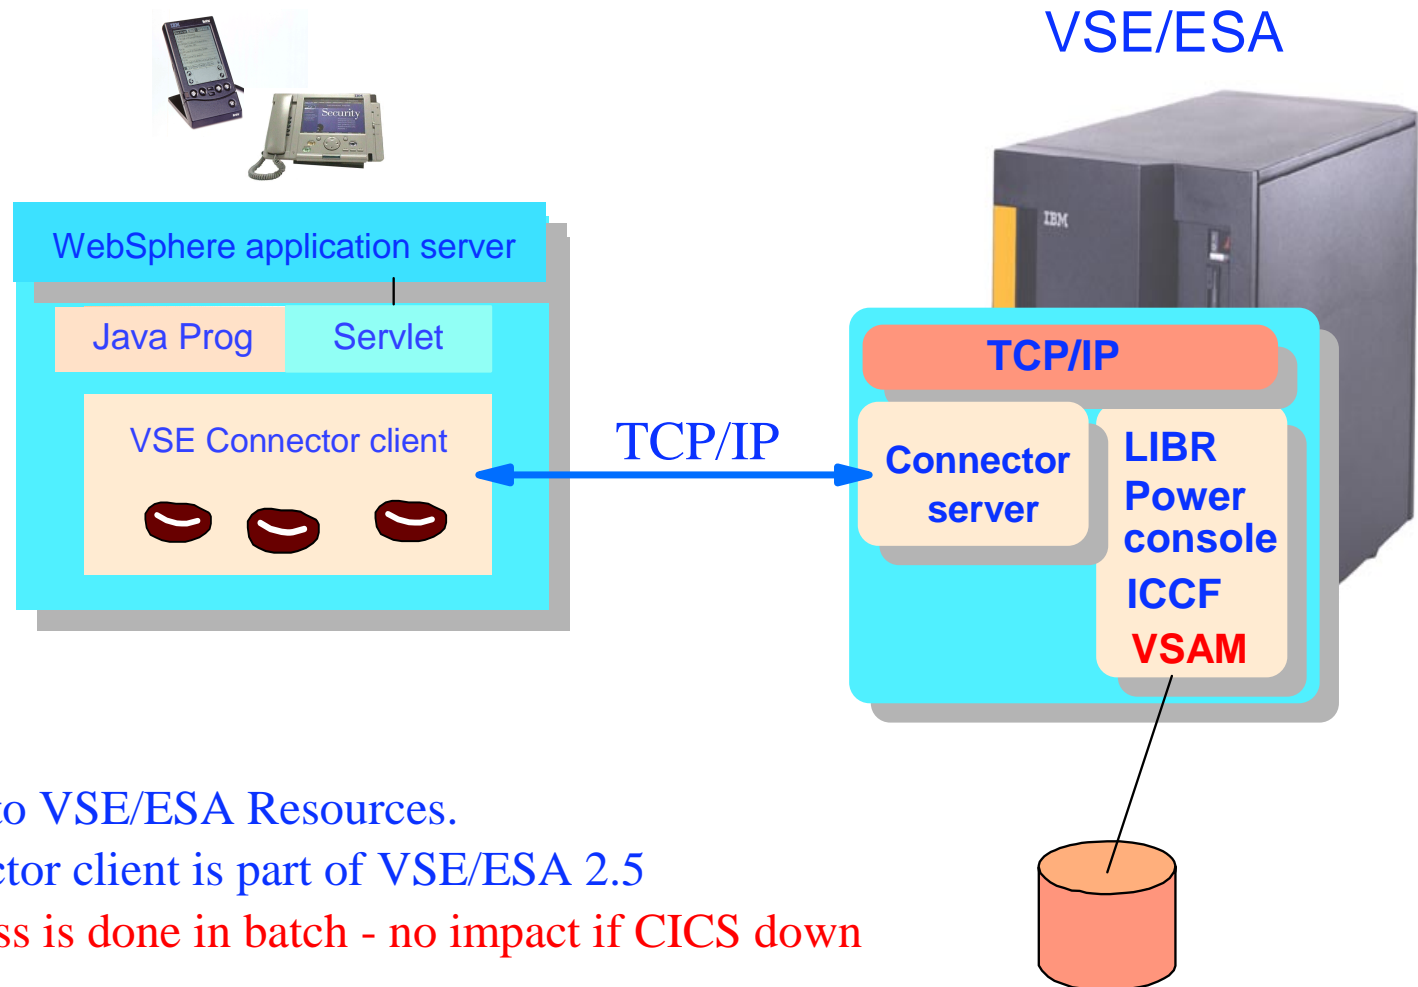

## Clients

**IBM @server.** For the next generation of e-business.

# Java-based Connector

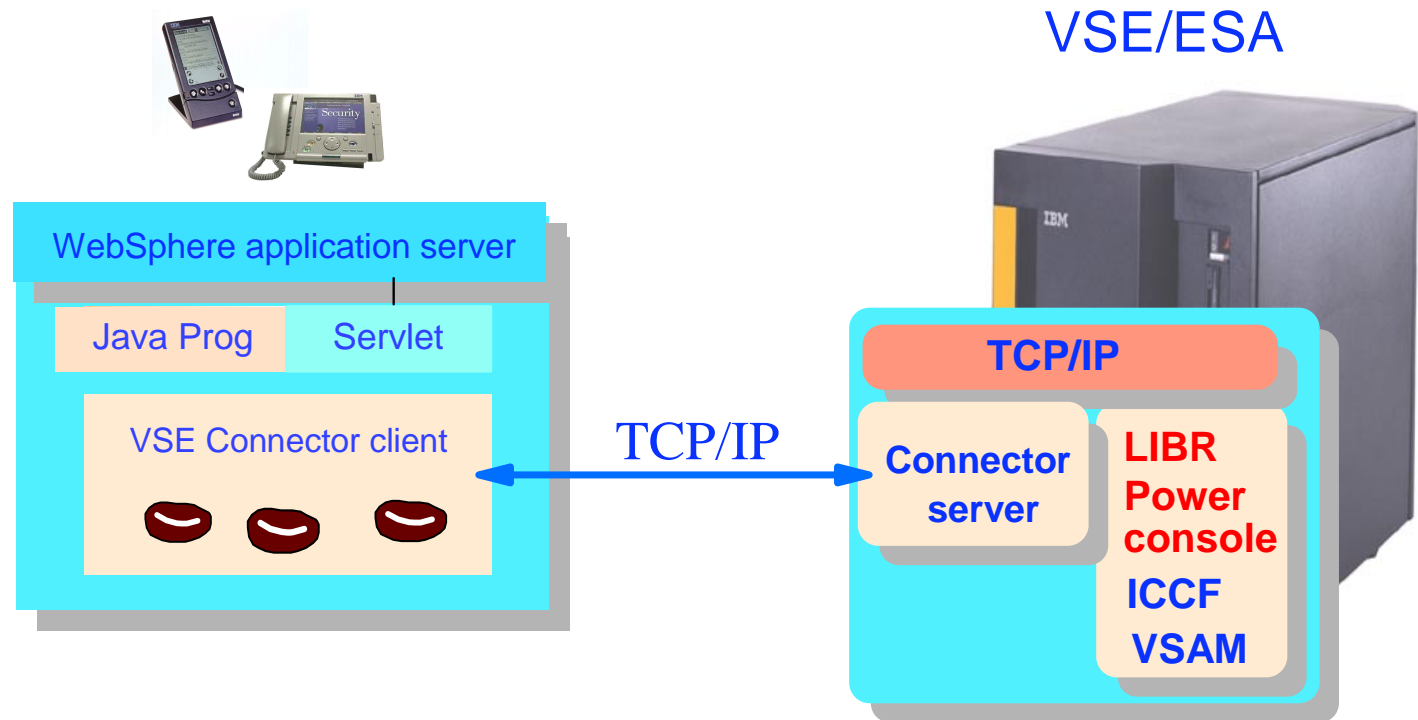

- ▶ Java access to VSE/ESA Resources.
- ▶ VSE Connector client is part of VSE/ESA 2.5
- ▶ VSAM access is done in batch - no impact if CICS down

## ✓ Automation and remote control

Use the new e-business connectors  
for automation and remote system  
management

# Java-based Connector

---

- ▶ Java access to VSE/ESA Resources.
- ▶ VSE Connector client is part of VSE/ESA 2.5

# Java-based Console support tool for VSE/ESA (JConVSE)

```

# JConVSE Overview

---

**The application reacts on VSE messages and additionally, has a time controlled component.**

*This solution helps you, automate the VSE environment and integrate the VSE system with other platforms such as Linux for zSeries.*

# JConVSE Benefits

---

- ➔ Reduce your operating time
- ➔ Eliminates complex client software
- ➔ Easy to use
- ➔ Platform independent
- ➔ Protects the investment in mainframe-based systems

# JConVSE major control

---

**Message controlled**

**Event controlled (on schedule)**

# JConVSE Panel

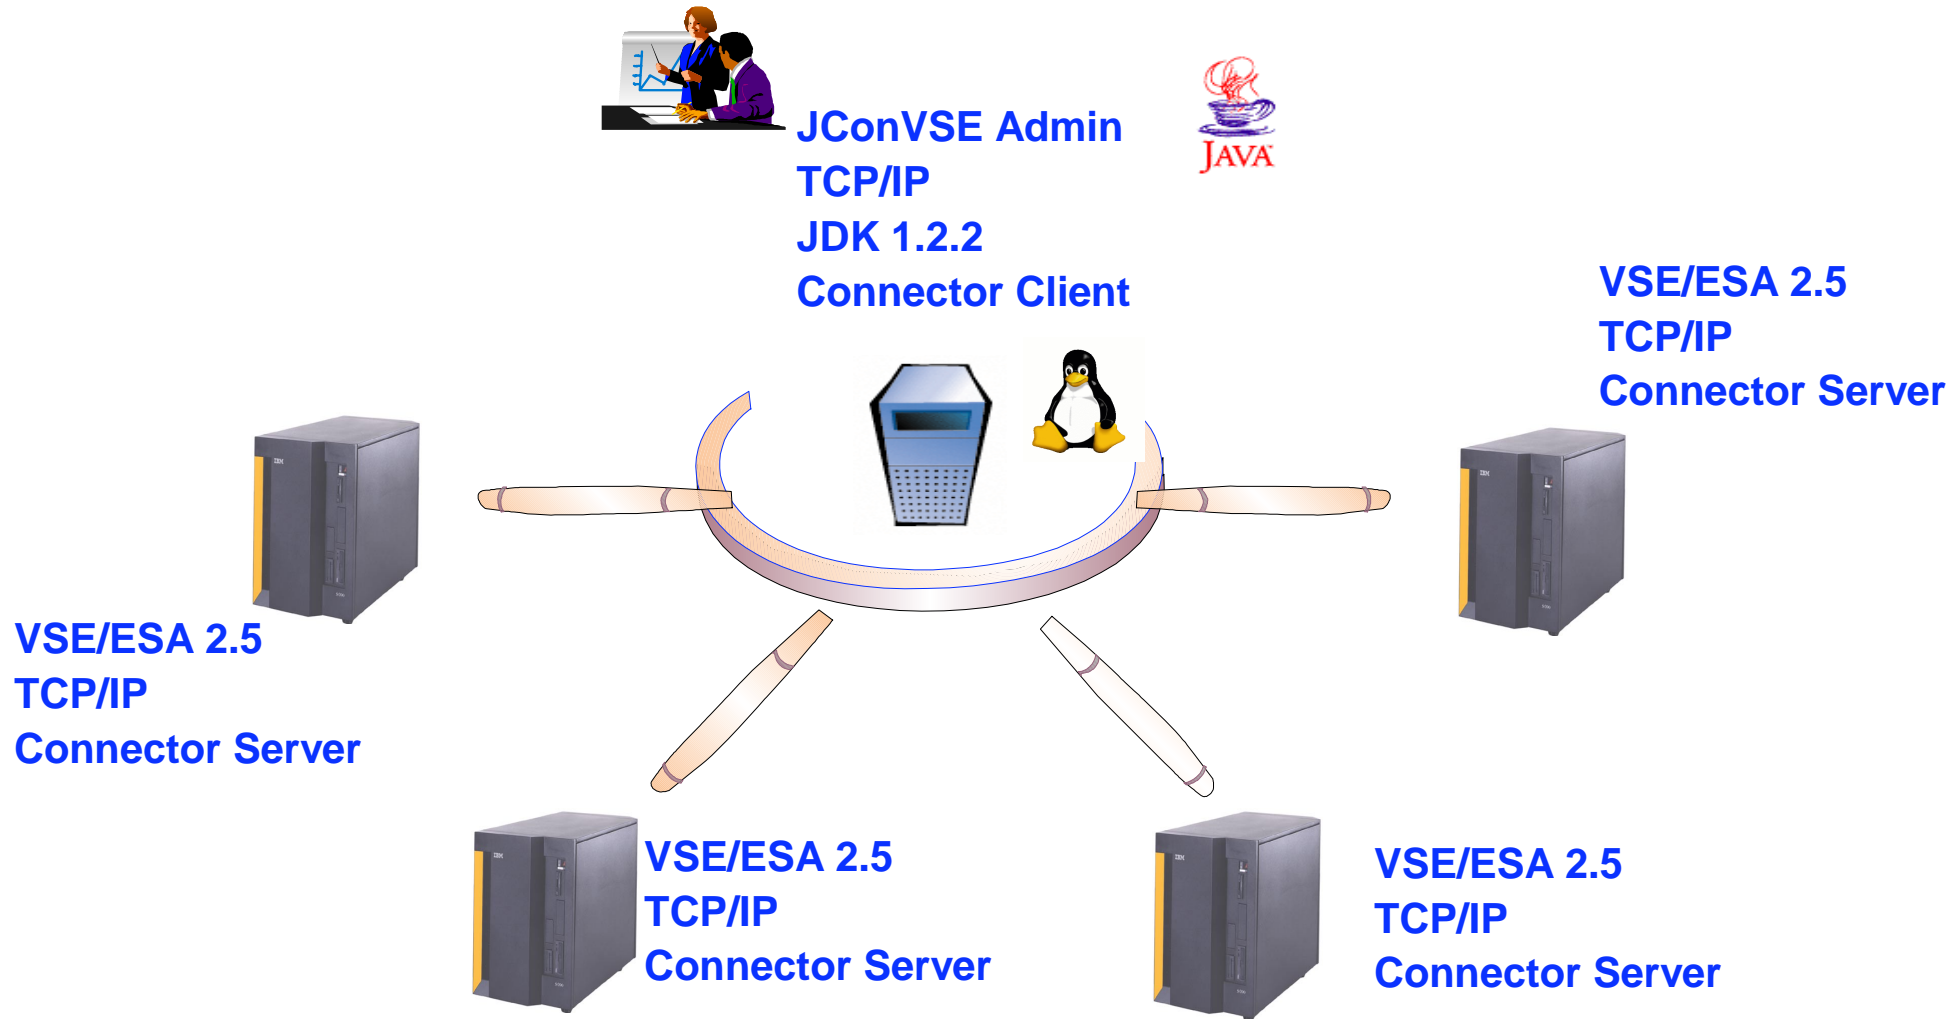

The screenshot displays the JConVSE Panel interface. At the top, there are function keys F1 through F12. The main area shows a table of system resources and their usage. A dialog box in the foreground says "Working, please wait..." with a cartoon computer monitor character. On the right side, there are buttons for "State", "SaveLog", "ReDisp", "ReDisp End", "SubJob", "PutRdr", "ToDo", "Help", and "Exit". At the bottom, there are PF1 through PF12 keys and a status bar showing "ready..." and the time "08:28:44".
