

The CICS Transaction Gateway: Web and Java access to CICS

Chris Smith
smithch@uk.ibm.com

Colorado Springs, 6 - 10 October 2000

Trademarks

CICS Transaction Gateway

- The following terms are trademarks of International Business Machines Corporation in the United States and/or other countries:

AIX	DB2	OS/390	VisualAge
CICS	MVS/ESA	VSE/ESA	
CICS/VSE	OS/2	VTAM	

- Java and Solaris are trademarks of Sun Microsystems, Inc
- Windows, Windows 95, Windows 98, and Windows NT are trademarks of Microsoft Corporation, Inc
- Other company, product, and service names may be trademarks or service marks of others

Agenda

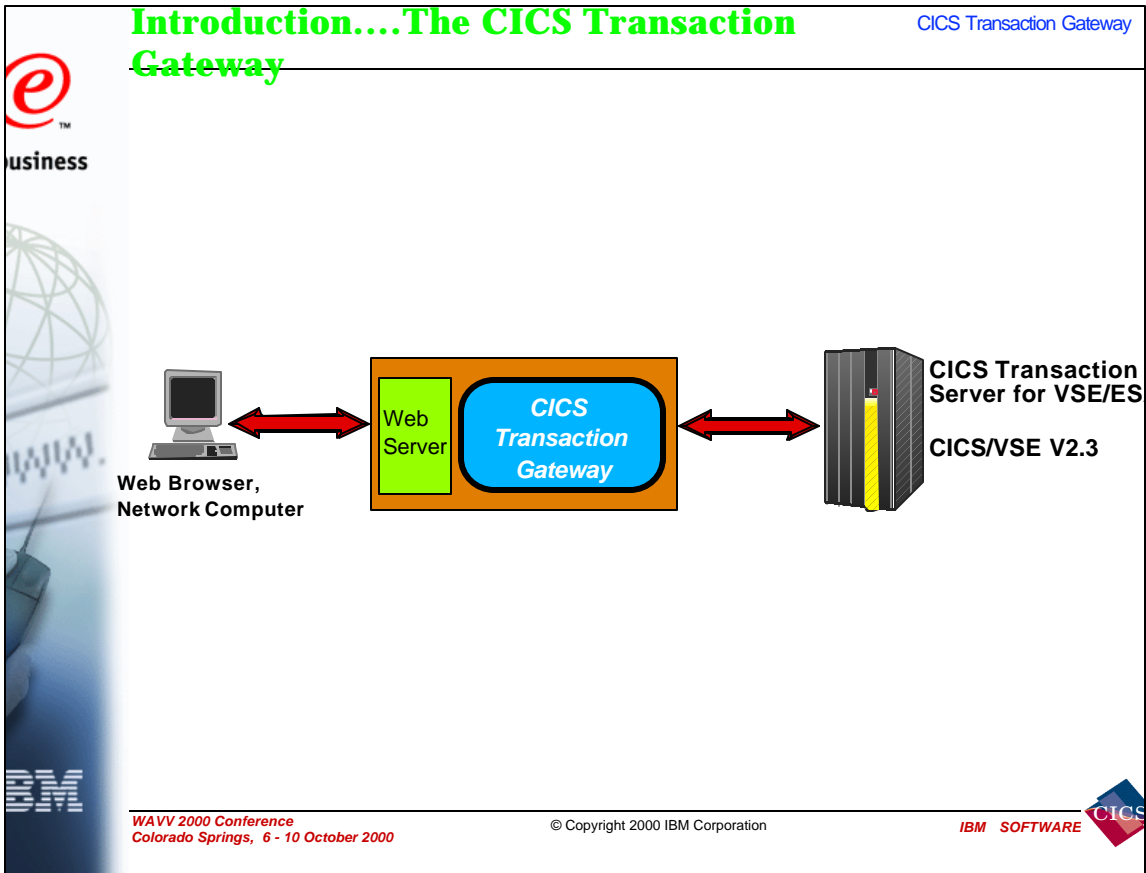

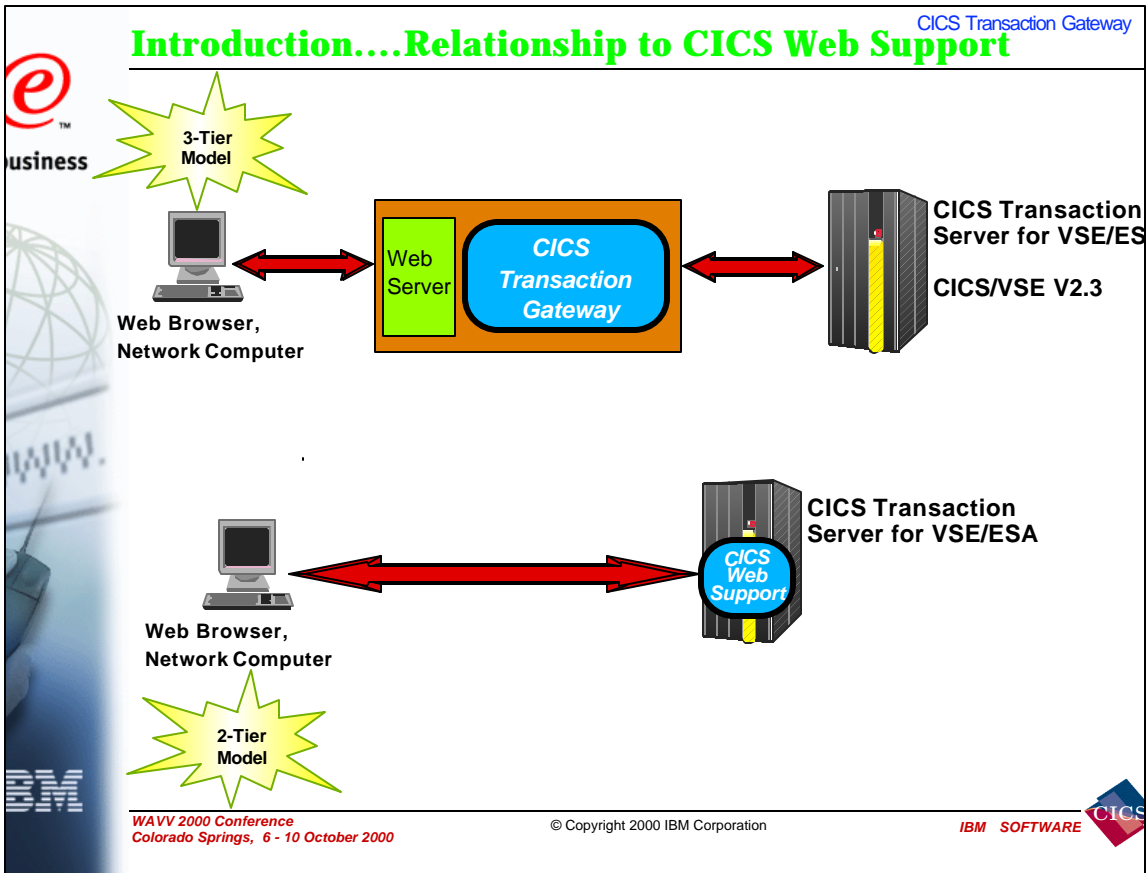

- The CICS Transaction Gateway
 - ▶ Introduction
 - ▶ Structure
 - ▶ Terminal Servlet
 - ▶ Network protocols
 - ▶ Connectivity to CICS
 - ▶ Security
 - ▶ Application Programming Interfaces
 - ▶ Common Connector Framework
- Summary

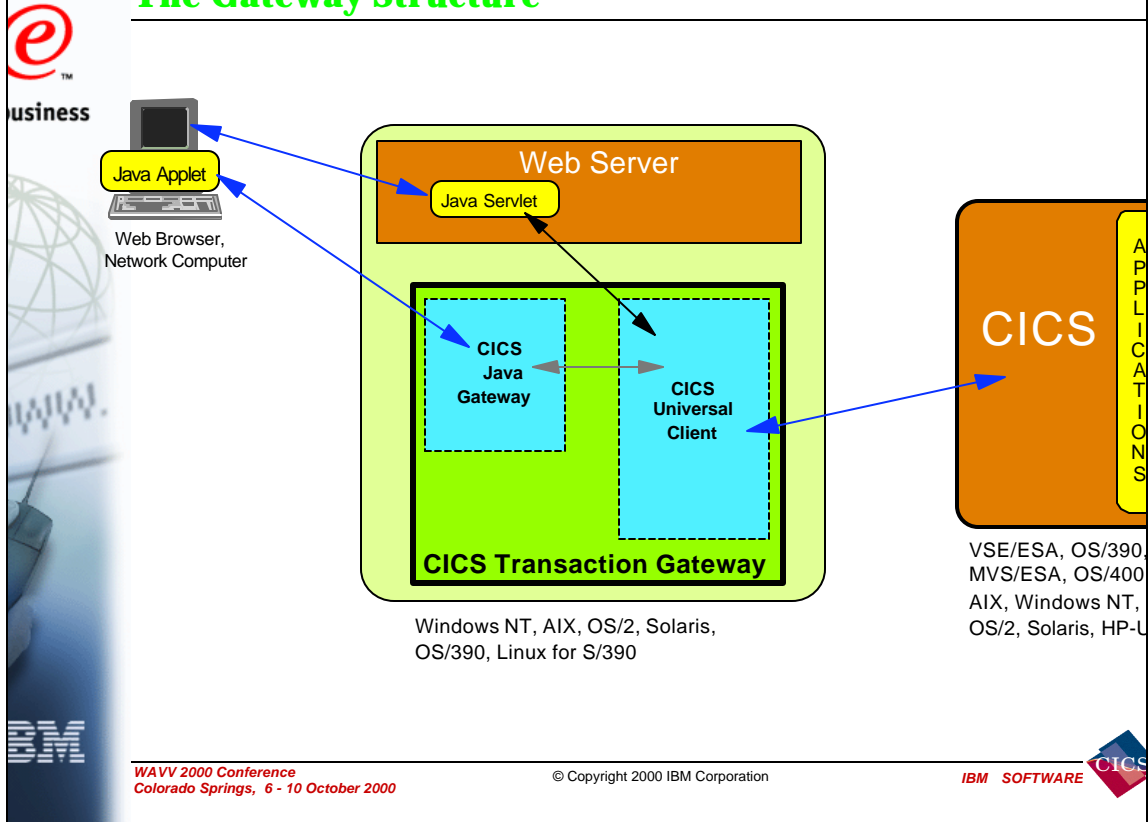

Introduction....The CICS Transaction Gateway

- Provides an interface to CICS from Java and the Web...
 - ▶ from a Web Browser or Network Computer
 - ▶ from any Java execution environment
- Is an IBM e-business Connector
- Replaces CICS Gateway for Java, CICS Internet Gateway
- Runs on Windows NT, AIX, Solaris, OS/2, OS/390
 - ▶ Linux for S/390 (GA 12/00), HP-UX (Future)
- Supports multiple concurrent users and CICS connections
- Is delivered and licensed with CICS Transaction Servers
 - ▶ Also delivered with WebSphere Enterprise Edition and with VisualAge for Java Enterprise Edition
 - ▶ Also downloadable from the CICS Web site

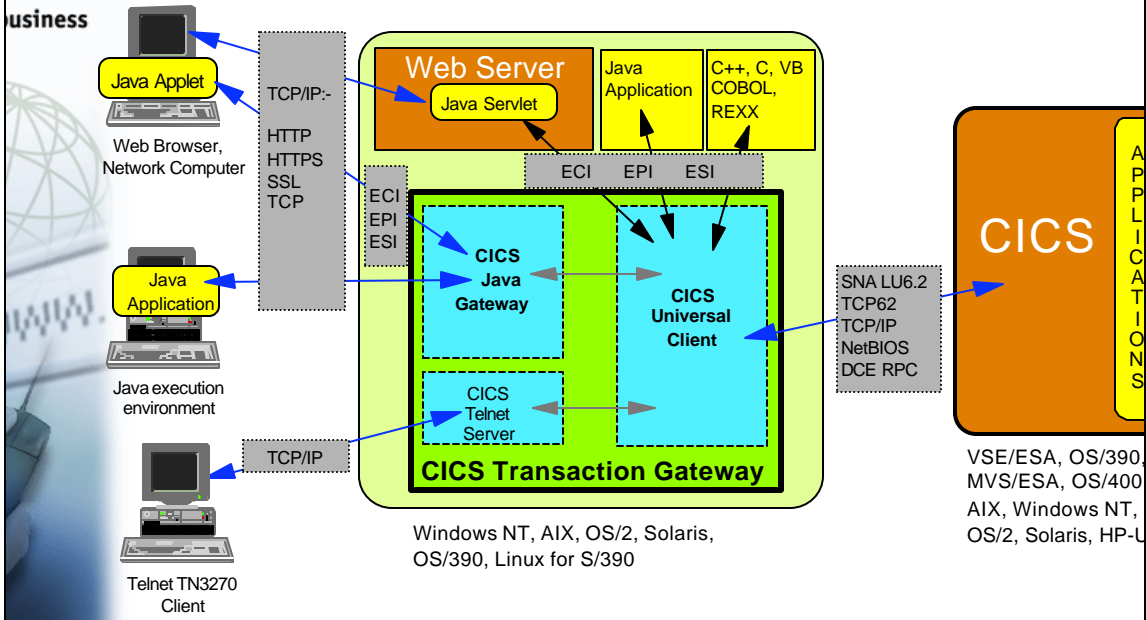

The Gateway Structure

The Gateway Structure....CICS Universal Clients

- The CICS Universal Clients
 - ▶ Integrated within the CICS Transaction Gateway
 - ▶ Also available separately
- Provides access to CICS systems
 - ▶ Client API's
 - ▶ Connectivity
- Includes Telnet TN3270 support
- Runs on Windows 95/98, Windows NT, AIX, Solaris, OS/2

The Gateway Structure....

- The CICS Java Gateway component is a Java application
- Applets are Java applications that execute on web browsers
- Servlets are Java applications that execute on web servers

The Gateway Structure....Applet Flows

1. Web browser requests HTML page from the Web-server
2. Web server returns HTML page which identifies applet
3. Web browser downloads applet
4. Applet creates a CICS request and passes it to the Gateway
5. Gateway calls CICS Universal Client to pass request to CICS
6. CICS processes the request and returns result to the Client
7. Gateway gets result from the Client and sends to applet

The Gateway Structure....Servlet flows

1. Web browser requests an HTML page from the Web-server
2. Web server loads servlet identified in HTML page
3. Servlet creates a CICS request and passes to CICS Client
4. CICS Universal Client passes the request to CICS
5. CICS processes request and returns result to the Client
6. Servlet receives result from the Client
7. Servlet formats HTML page and web server sends to browser

The Terminal Servlet

- Provides access to CICS *transactions* from Web Browsers
- Supplied as part of the CICS Transaction Gateway
- The Terminal Servlet can...
 - ▶ Behave like a simple terminal emulator
 - ▶ Substitute data from CICS into HTML template files
 - ▶ Display CICS screen data in server-side includes
 - ▶ Map specific CICS screens to HTML pages
- Can be invoked in three ways...
 - ▶ By URL
 - ▶ With an HTML FORM
 - ▶ With a server-side include

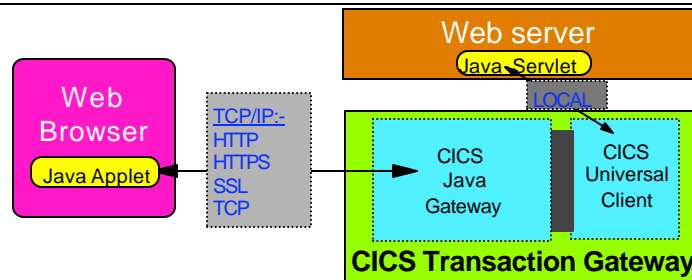

The Terminal Servlet....

- Invoking the Terminal Servlet with a URL:
 - ▶ `http://webserver/servlet/TerminalServlet?request=send&transaction=CECI`
- Invoking the Terminal Servlet with an HTML FORM:
 - ▶ `<FORM METHOD="GET" ACTION="/servlet/TerminalServlet">`
 - ▶ `<INPUT TYPE="HIDDEN" NAME="REQUEST" VALUE="SEND">`
 - ▶ `<INPUT TYPE="HIDDEN" NAME="TRANSACTION" VALUE="CECI">`
 - ▶Text entry tags, buttons, etc.....
 - ▶ `</FORM>`
- Invoking the Terminal Servlet with a server-side include:
 - ▶ `<SERVLET NAME="TerminalServlet">`
 - ▶ `<PARAM NAME="request" VALUE="send">`
 - ▶ `<PARAM NAME="transaction" VALUE="CECI">`

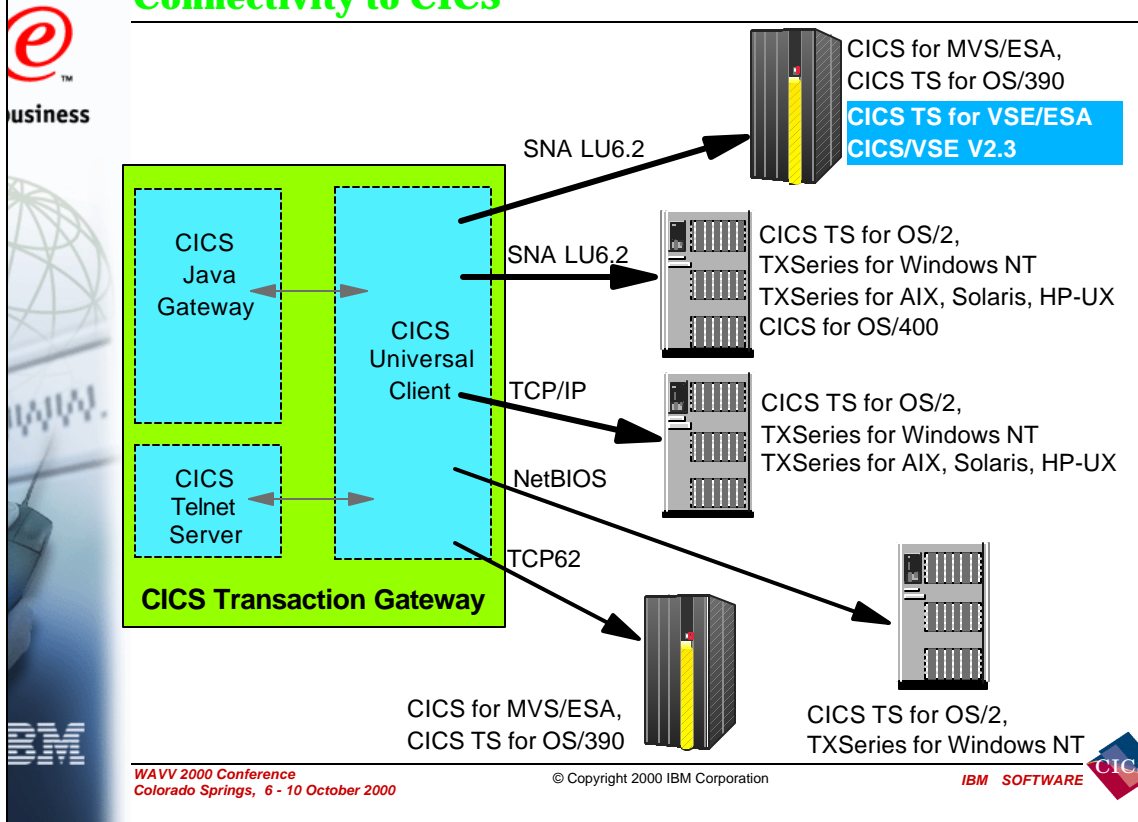

Network Protocols

- tcp
 - ▶ Private persistent connection protocol
- http
 - ▶ Standard protocol used for the Web
- ssl
 - ▶ Private persistent secure connection protocol
- https
 - ▶ Secure protocol used for the web
- local
 - ▶ Private protocol used on Gateway machine

Connectivity to CICS

Security

- Between end-user or client application and the Gateway....
 - ▶ Via Secure Sockets Layer
 - ➔ User Exits provided
- Between the Gateway and CICS on S/390....
 - ▶ LU6.2 security
 - ➔ Link
 - ➔ Session (Bind-time)
 - ➔ User (Conversation)

Application Programming Interfaces

- Three API 's
 - ▶ External Call Interface
 - ▶ External Presentation Interface
 - ▶ External Security Interface
- Java is the primary language
 - ▶ Applets
 - ▶ Servlets
 - ▶ Applications

NB: The CICS Universal Clients interfaces are also available on the system on which the Gateway is running

→ C++, C, Visual Basic, COBOL, REXX

The External Call Interface

- Usually referred to as the **ECI**
- Allows invocation of COMMAREA-based **applications**
- CICS application invoked via
 - ▶ Program name
 - ▶ Userid and password
 - ▶ COMMAREA
- Like a CICS Distributed Program Link
- Calls may be extended to create one logical transaction
- Calls may be synchronous or asynchronous

The External Presentation Interface

- Usually referred to as the **EPI**
- Provides access to CICS 3270 **transactions**
- Acts as a logical terminal
- Used to control existing CICS 3270 applications
- No change to CICS application

The External Security Interface

- Usually referred to as the **ESI**
- Enables use of APPC **Password Expiry Management (PEM)**
- Passwords can be verified or changed
- Provides audit trail information
- Requires an External Security Manager on S/390

The Java API....basic concepts

- A **Class** is a collection of methods, data and interfaces common to all objects of a certain type
- A **Method** is the object-oriented term for a function
- An **Object** is created by instantiating the relevant class
 - ▶ Behaviour implemented with methods
 - ▶ State maintained in variables
- **JavaBeans** are self-contained re-usable Java components
 - ▶ Require no programming
 - ▶ Use any JavaBean enabled visual application builder
 - ➔ e.g. IBM VisualAge for Java, Sun JDK BeanBox

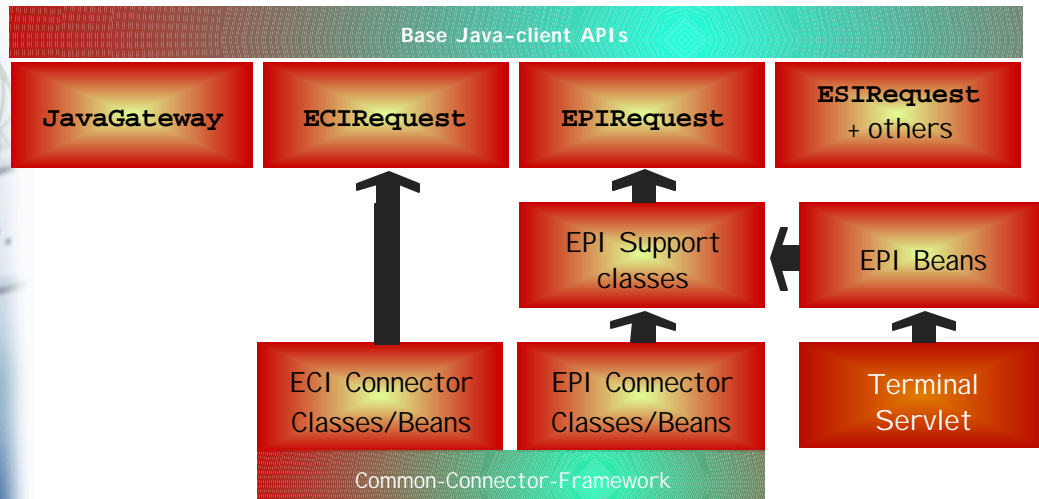

The Java API....the class library

- Class library
 - ▶ Contains all the Java source code which implements the CICS Transaction Gateway API
- Class library contains
 - ▶ All classes
 - ▶ JavaBeans
- JavaBeans supplied:
 - ▶ EPI Beans
 - ▶ Common Connector Framework (CCF) Beans

The Java API....

- Several layers of Java API supported

IBM SOFTWARE

Base Java API's

- **JavaGateway** object
 - ▶ Represents connection to the CICS Transaction Gateway
 - ▶ Has various properties...
 - ➔ URL
 - ➔ Network address
 - ➔ Security classes to be used
 - ▶ Core method is **flow**
 - ➔ Sends requests to the Gateway
 - ➔ Synchronous or asynchronous

WAVV 2000 Conference
Colorado Springs, 6 - 10 October 2000

© Copyright 2000 IBM Corporation

IBM SOFTWARE

Base Java API's....

- **ECIRequest** object
 - ▶ Encapsulates all types of ECI request
- **EPIRequest** object
 - ▶ Encapsulates all types of EPI request
- **ESIRequest** object
 - ▶ Encapsulates all types of ESI request
- **CicsCpRequest** object
 - ▶ Queries code page in use
- **Callbackable** interface
 - ▶ Used with asynchronous calls

Java EPI Support Classes

- Hides programmer from 3270 datastreams
- Based on C++ EPI classes in CICS Universal Client
- Terminal class handles all interactions with CICS
- Terminal has associated **Screen** instance....
 - ▶ Contains a number of **Fields**
 - ➔ accessed by index or screen position
- for BMS screens a **Map** class can be generated from BMS source and then fields accessed by name
- BMS Map classes created using supplied utility

Simple Java EPI application

```

import com.ibm.ctg.client.*;           // Need the client-side classes
import com.ibm.ctg.epi.*;             // And the enhanced EPI classes
public class EPIAndy
{
    public static void main (String [ ] astrArgs) // Invoke program using :
    {
        // java EPIAndy <Gateway_URL> <CICS_Server>
        try {
            JavaGateway jgate = new JavaGateway(); //Create a default JavaGateway
            jgate.setURL(astrArgs[0]); // Set URL of remote Gateway
            jgate.open(); // Open the connection

            Terminal terminal = new Terminal(jgate, astrArgs[1], null, null); // Add a terminal
            terminal.send(null, "CESN", null); // Start CESN on the terminal

            Screen screen = terminal.getScreen(); // Get the current screen
            for (int i = 1; i <= screen.fieldCount(); i++) // Loop round all fields
            {
                if (screen.field(i).textLength() > 0) { // Print non-empty fields
                    System.out.println("Field " + i + ": " + screen.field(i).getText());
                }
            }

            screen.setAID(AID.PF3); // Set the AID key to send
            terminal.send(); // Return the screen to CICS
            terminal.disconnect(); // Disconnect the terminal
        }
        catch (Exception e) { // Handle any problems
            System.out.println(e.getMessage());
        }
    }
}

```

IBM SOFTWARE

EPI JavaBeans

- Use to quickly create front-ends that connect to CICS
- The EPI Beans are ...
 - ▶ Built on top of the EPI Support classes
 - ▶ Fully compliant with Sun's JavaBeans API
- Four EPI Beans supplied
 - ▶ The **EPI Terminal** bean
 - ▶ The **EPI BasicScreenHandler** bean
 - ➔ Specific **ScreenHandler** beans can also be created
 - ▶ The **EPI ScreenButtons** bean
 - ▶ The **EPI Monitor** bean

IBM SOFTWARE

The Common Connector Framework

- The IBM **Common-Connector-Framework (CCF)** provides a consistent means of interacting with Enterprise resources from any Java execution environment
 - ▶ Consistent for User client applications
 - ▶ Consistent for the IBM Connectors
- Enterprise Access Builder (EAB), part of VisualAge for Java Enterprise Edition V3, provides CCF connectors....
 - ▶ CICS, MQSeries, IMS
 - ▶ Encina, Host-on-Demand, SAP R/3
- New CCF based connectors available with VSE/ESA V2.5
 - ▶ Access VSE resources such as VSAM, Librarian, POWER

The Common Connector Framework....

- The CCF Client API
 1. **ConnectionSpec**
 - ➔ Contains properties to access an Enterprise resource
 2. **InteractionSpec**
 - ➔ Contains properties for a single interaction
 3. **Communication**
 - ➔ The conduit used to execute interactions
- The CICS Connectors....
 - ▶ CICSConnectionSpec
 - ▶ ECI InteractionSpec
 - ▶ EPI InteractionSpec

Further Information

- CICS Website for general information and publications:
 - ▶ <http://www.ibm.com/software/ts/cics/>
- Red Books, downloadable from <http://www.redbooks.ibm.com>
 - ▶ Revealed! CICS Transaction Gateway with More CICS Clients Unmasked, SG24-5277
 - ▶ Revealed! Architecting Web Access to CICS, SG24-5466
- Samples provided with the Gateway...
 - ▶ Use of ECI, EPI, ESI
 - ▶ Use of EPI Beans with VisualAge for Java
 - ▶ Use of the Terminal Servlet

CICS Transaction Gateway Summary

- Enables access to CICS applications and transactions from:
 - ▶ Web Browsers or Network Computers
 - ▶ Java Applets, Servlets, Applications
- Is an IBM e-business Connector
- Provides the ECI, EPI and ESI programming interfaces
- Allows visual programming using supplied JavaBeans
- Terminal Servlet provides 3270 transaction access
- Supports the cross-product Common Connector Framework
- Provides network security via industry standard SSL
- Supports CICS/VSE V2.3 as well as CICS TS for VSE/ESA
- Provided as part of the CICS TS for VSE/ESA package
