# DB2 VSAM Transparency

## User Experiences

Roland P. Chung  
Senior Consultant

**The Fillmore Group**<sup>®</sup>  
Relational Database Solutions ™

# VSAM Transparency Defined

- Class of “middleware” software that intercepts VSAM calls and maps them to a DB2 database server.
- Part of an overall strategy for extending VSAM data.
  - Phased approach – one file at a time
  - Rapid implementation – produces results quickly
  - Coexisting applications
    - Old
    - New

# Why VSAM Transparency?

- Opens up closed business information *NOW* to new applications through SQL and industry-standard interfaces.
- Adopt and leverage the benefits of DB2.
- Extends the value of existing data to new areas of the enterprise.
- Avoids changes to existing BATCH and CICS programs.
  - Preserve business logic.
  - Utilize existing staff expertise.
  - Introduce incremental change.
- Accelerates delivery of new functionality through distributed access to data.
- Produces results in DAYS!

## Why DB2?

- You probably already own it.
- Greater accessibility to data.
  - Concurrency (think about VSAM file sharing issues).
  - Distributed access through other platforms/systems.
  - 24x7
- New applications.
- Better business tools (analytics, intelligence enablement).
- Reduced maintenance costs.
- Stronger security.
- Improved data integrity.
  - Strong data types.
  - Locking.
- Better tools.

# DB2 Enhanced Connectivity

- Enable Business Intelligence / Analytics.
  - Reporting tools such as crystal reports.
  - BI/BA frameworks.
- Power distributed systems and applications via:
  - SQL / ODBC / JDBC / OLEDB.
  - The Web.
    - EJB / Servlets.
    - Server scripts / CGI.
    - Web services.
    - .Net

# VSAM Transparency Features

- Supports:
  - Key sequenced data sets (KSDS).
  - VSAM alternate indexes.
  - Entry sequenced data sets (ESDS).
  - Relative record data sets (RRDS) in some cases.
- No changes required to application programs.
- Maps VSAM to normalized data model.
  - Within VSAM file.
  - Across VSAM files.
- May require change to JCL

e-business

IBM

# Operating System Interfaces

- VSE
  - Typically uses VDA (IKQVEX01)
  - CICS EXEC interception

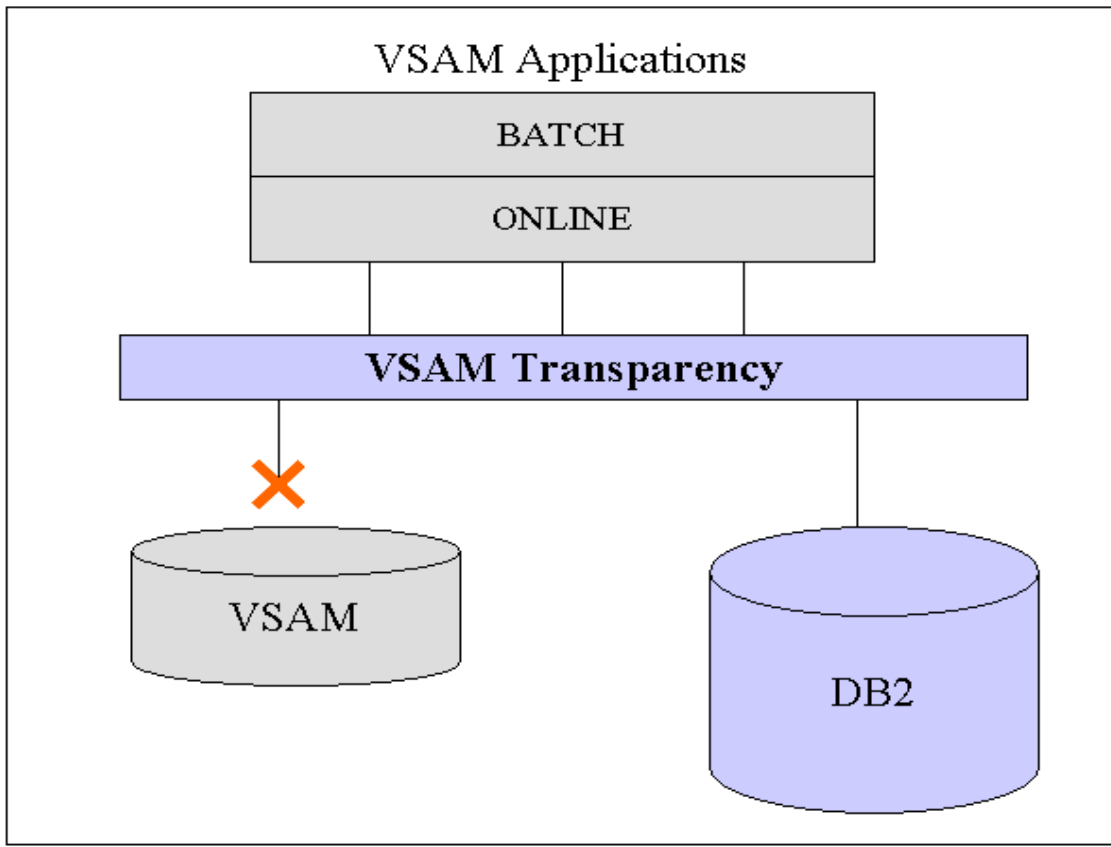

e-business

IBM

## Overview

## Components

- Assembler macros.
- Batch utilities.
- Configuration tools.
- Copybook conversion aids.
- CICS transactions.

e-business

IBM

# Capabilities

- One VSAM file can be mapped to multiple tables.
- Redefining (different record types) is supported.
- Alternate index files are usually replaced by DB2 indexes.
- VSAM fields can be converted to various data types.
- Repeating groups can be migrated into different DB2 tables and columns.
- Additional columns can be created in DB2 that did not exist in the VSAM file.
- Fields can be mapped into more than one column.
- Default values for DB2 and VSAM can be given.
- “File” and “Column” user exits are supported.

e-business

IBM

# Planning

- Identify initial group of VSAM files.
  - Most valuable to new applications and objectives.
- Identify associated BATCH and CICS programs for testing purposes.
- Create data mapping to DB2 data model.
  - Database design.
  - Data types.
  - Naming conventions.
  - Normalization.
- Determine VSAM data cleanliness.

e-business

IBM

# Implementation

- Install DB2 VSAM Transparency product.
- Define data mapping to VSAM Transparency.
- Load VSAM files into DB2 through VSAM Transparency.
- (Delete/redefine VSAM files with NOALLOC.)
- Turn VSAM Transparency ON.
- Run VSAM programs.

## Results

- Phased implementation produces most immediate results.
- Immediate results unlock business data quickly.
- Unlocked business data facilitates development of new applications.
- New applications address outstanding user requirements.
- Satisfied requirements translate into new functionality.
- New functionality helps to achieve overall business objectives.
- Achieved business objectives deliver greater value from IT investment.

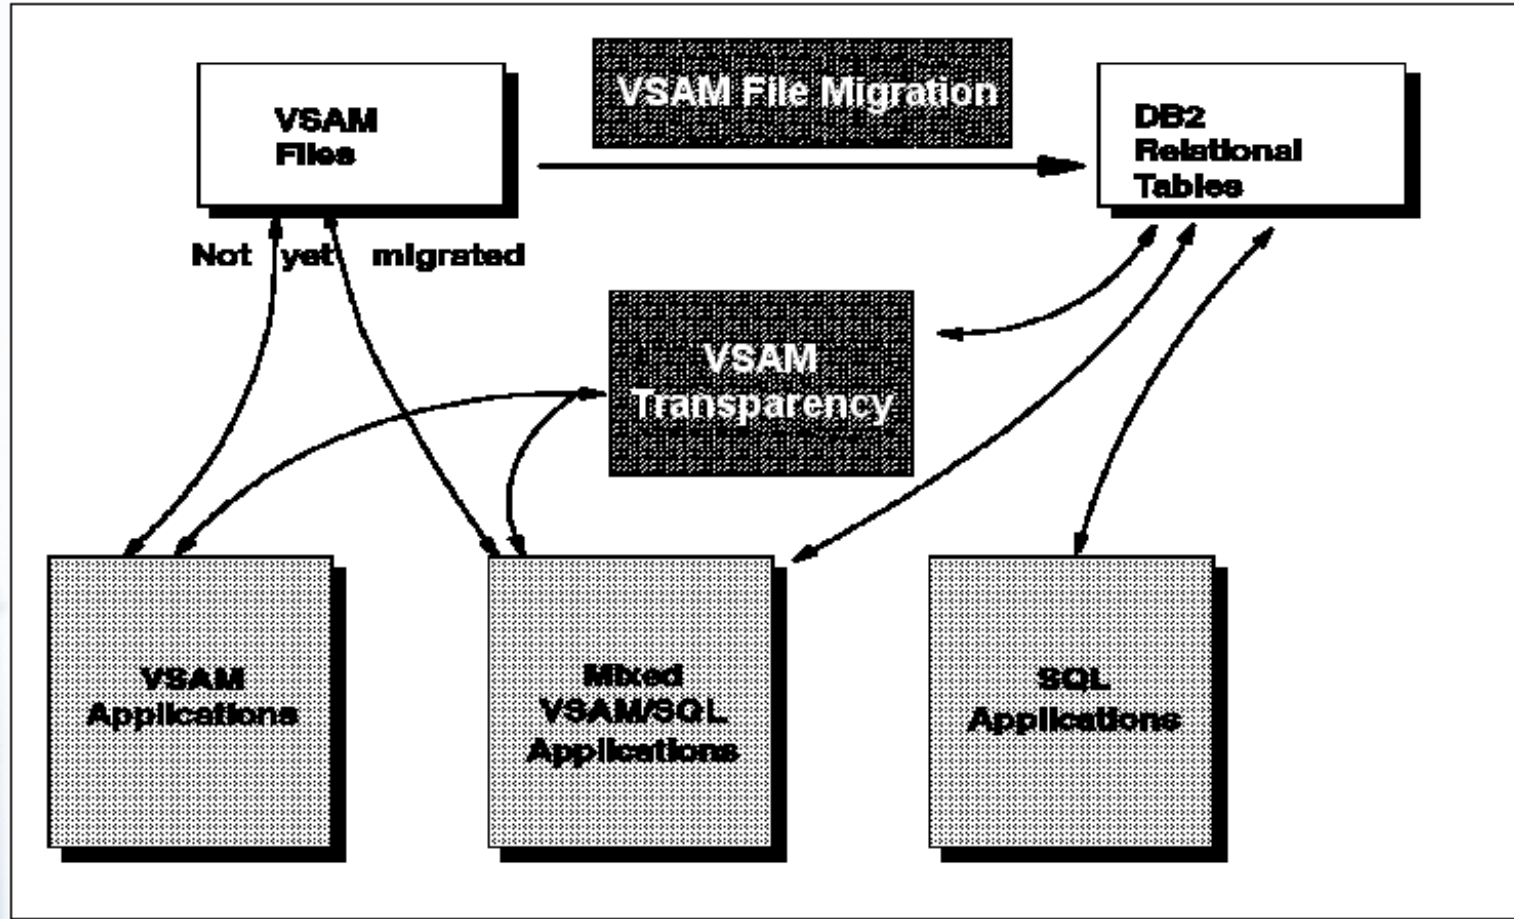

e-business

IBM

## Mix and Match

## Handy Tools

- VSAM IDCAMS
  - Note that IBM DB2 VSAM Transparency for VSE does not allow IDCAMS to run against a file that has been placed under its control.
- DITTO
  - Great tool for testing VTr, checking VSAM files, etc...
  - VV, VP (FORMAT=HEX)
  - Batch and CICS
- ISQL
  - Confirm Loaded data
  - Alter tables as needed
- CECI
  - online test that I run

e-business

IBM

# Data Design Hints

- Addition of new Columns
  - Only in DB2, not detected by VSAM program
  - Can be derived and maintained by VT through FILE user exits.
  - Future expansion and growth.

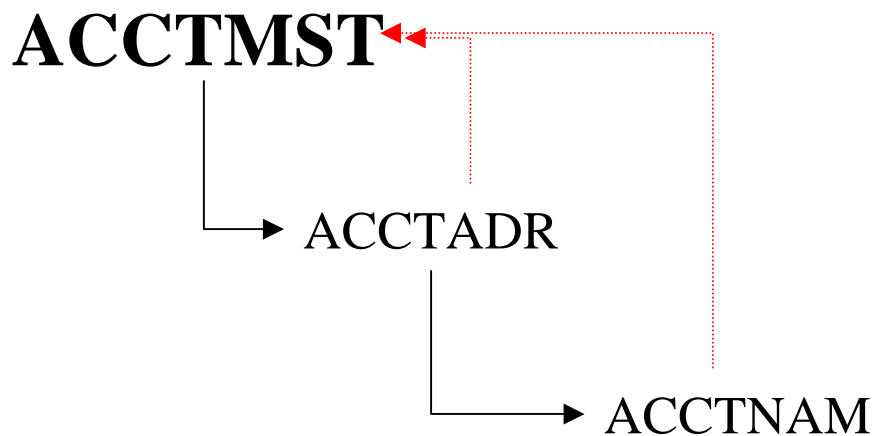

## Data Design Hints

e-business

- Consider using BASE Tables

# Creating User Exits

- COBOL
  - LE Startup/Teardown
  - Use existing copy books for record layout
- ASSEMBLER
  - Faster execution
  - Smaller executables

## User Exit Hints

- DO
  - PREP with BLOCK
  - PREP with ISOL(CS)
  - Use cursor for SELECT and INSERT
- DON'T
  - COMMIT WORK
  - Use WHENEVER
- REMEMBER
  - The exit has been called within an EXISTING LUW!
  - The exit does NOT persist from record to record!

# Is Your Data Ready?

e-business

- SPACES where packed data is expected
- Years of COBOL data checks built into your applications
- Zoned where packed data is expected
- Consider using Column or File exits to build permanent “data cleansing filters” into your VSAM Transparency layer.
  - Addresses data issues at LOAD
  - Addresses data issues at RUNTIME!

# Subtle Differences

e-business

- Sign Digit issues
  - VSAM “F”, returned as “C”
  - Example: Was: x'00000F' Now: x'00000C'

Code (Binary)	Recognized as	
	digit	sign
1010	A	plus
1011	B	minus
1100	C	plus (preferred)
1101	D	minus (preferred)
1110	E	plus
1111	F	plus (zone)

# TEST TEST TEST

- Use DITTO VP to read a record with `FORMAT=HEX`
  - Compare before and after for that record
- Close VSAM file in CICS
  - `CEMT SET FILE(ACCTMST) CLOSED`
- Use CECI. Excellent tool!
- Execute application transaction to read (`SELECT`) or write (`INSERT NEW`)

e-business

IBM

# CICS Considerations

e-business

- Pseudo-conversational
  - “Preferred” by VSAM Transparency due to inherently small LUWs
- Conversational
  - SYNCPOINT should trigger an end to the LUW.
  - If using the START BROWSE function:
    - ENDBR prior to the SYNCPOINT.
    - STARTBR and reposition after the SYNCPOINT.

# DB2 VSE Considerations

e-business

- Number of packages per LUW (NPACKAGE)
  - SQLCODE –807: The maximum number of packages per agent has been exceeded.
    - Every VSAM file uses at least 2 packages per DB2 table
      - 1 for BATCH and 1 for online.
    - Every user EXIT, if contains DB2 calls, would use a package
    - Bringing more VSAM files over will increase the number of packages used within a single LUW.
- SYSACCESS may need to be expanded by adding another SYS00nn DBSPACE.
- Partition sizes – DB2 application requestor now inside each partition where a VSAM job is using transparency.

# Presenting Numeric Data

- Field is PICTURE 99 (ex: x'F0F1') in VSAM
- Converted to SMALLINT and stored as '1' in DB2
- SELECT colname FROM ... returns '1'
- But you are used to viewing the field as '01'
- SELECT SUBSTR(DIGITS(colname),2) ...
- Use same approach within a VIEW

## Performance Observations

- Elapsed Time

~1X

Minimal Data model

Up to 30X

Complex Data model

# Miscellaneous

e-business

- VSAM buffer may not be cleared by the user EXIT from call to call. Always assume residual garbage during INSERT processing.
- VSAM Transparency maintains cursors. You don't! User EXITs will not persist across calls within an LUW.
- With BLOCKING and an INSERT cursor, errors will be deferred!

## Products

- VSE
  - VSAM Transparency feature of DB2 from IBM
  - VSAM Redirector for VSE from IBM
- OS/390
  - 2BDB2/VSAM from ISI
  - CICS VSAM Transparency

# Conclusion

- VSAM Transparency supports a normalized relational data model.
- VSAM Transparency yields tangible results in DAYS.
- VSAM Transparency provides the ultimate defense against lurking data integrity issues while you convert your applications.
