Trademarks

The following are trademarks of the International Business Machines Corporation in the United States, other countries, or both.

Not all common law marks used by IBM are listed on this page. Failure of a mark to appear does not mean that IBM does not use the mark nor does it mean that the product is not actively marketed or is not significant within its relevant market.

Those trademarks followed by ® are registered trademarks of IBM in the United States; all others are trademarks or common law marks of IBM in the United States.

For a complete list of IBM Trademarks, see www.ibm.com/legal/copytrade.shtml:

*, AS/400®, e business(logo)®, DBE, ESCO, eServer, FICON, IBM®, IBM (logo)®, iSeries®, MVS, OS/390®, pSeries®, RS/6000®, S/30, VM/ESA®, VSE/ESA, WebSphere®, xSeries®, z/OS®, zSeries®, z/VM®, System i, System i5, System p, System p5, System x, System z, System z9®, BladeCenter®

The following are trademarks or registered trademarks of other companies.

Adobe, the Adobe logo, PostScript, and the PostScript logo are either registered trademarks or trademarks of Adobe Systems Incorporated in the United States, and/or other countries. Cell Broadband Engine is a trademark of Sony Computer Entertainment, Inc. in the United States, other countries, or both and is used under license therefrom.

Java and all Java-based trademarks are trademarks of Sun Microsystems, Inc. in the United States, other countries, or both.

Microsoft, Windows, Windows NT, and the Windows logo are trademarks of Microsoft Corporation in the United States, other countries, or both.

Intel, Intel logo, Intel Inside, Intel Inside logo, Intel Centrino, Intel Centrino logo, Celeron, Intel Xeon, Intel SpeedStep, Itanium, and Pentium are trademarks or registered trademarks of Intel Corporation or its subsidiaries in the United States and other countries.

UNIX is a registered trademark of The Open Group in the United States and other countries.

Linux is a registered trademark of Linus Torvalds in the United States, other countries, or both.

ITIL is a registered trademark, and a registered community trademark of the Office of Government Commerce, and is registered in the U.S. Patent and Trademark Office.

IT Infrastructure Library is a registered trademark of the Central Computer and Telecommunications Agency, which is now part of the Office of Government Commerce.

Notes

Performance is in Internal Throughput Rate (ITR) ratio based on measurements and projections using standard IBM benchmarks in a controlled environment. The actual throughput that any user will experience will vary depending upon considerations such as the amount of multiprogramming in the user's job stream, the I/O configuration, the storage configuration, and the workload processed. Therefore, no assurance can be given that an individual user will achieve throughput improvements equivalent to the performance ratios stated here.

IBM hardware products are manufactured from new parts, or new and serviceable used parts. Regardless, our warranty terms apply.

All customer examples cited or described in this presentation are presented as illustrations of the manner in which some customers have used IBM products and the results they may have achieved. Actual environmental costs and performance characteristics will vary depending on individual customer configurations and conditions.

This publication was produced in the United States. IBM may not offer the products, services or features discussed in this document in other countries, and the information may be subject to change without notice. Consult your local IBM business contact for information on the product or services available in your area.

All statements regarding IBM's future direction and intent are subject to change or withdrawal without notice, and represent goals and objectives only.

Information about non-IBM products is obtained from the manufacturers of those products or their published announcements. IBM has not tested those products and cannot confirm the performance, compatibility, or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

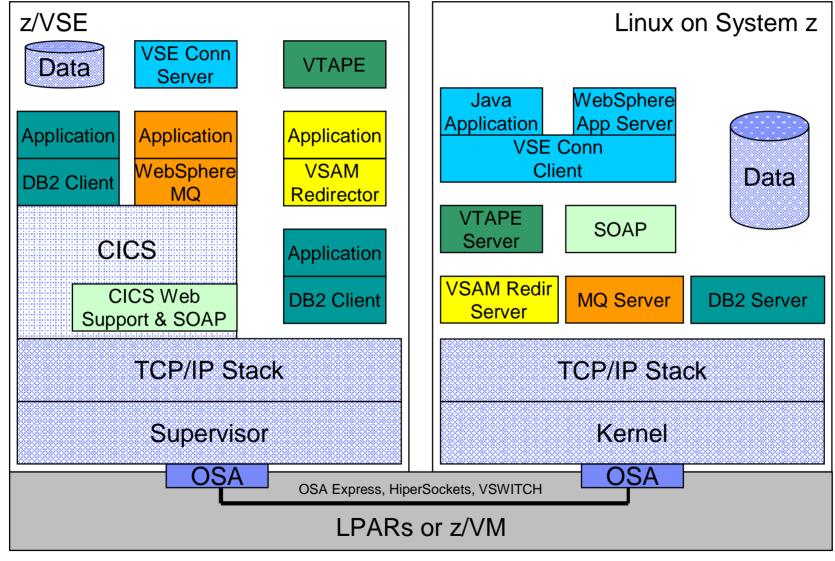

Prices subject to change without notice. Contact your IBM representative or Business Partner for the most current pricing in your geography.

^{*} All other products may be trademarks or registered trademarks of their respective companies.

z/VSE Applications communicating with Applications on Linux

z/VSE Applications communicating with Applications on Linux

§ Communication is mostly based on TCP/IP

Although z/VSE and Linux run on the same box

§ TCP/IP

- Allow reliable communication over a non-reliable network
- Uses sequence numbers, acknowledges, checksums
 - To protect against packet loss, duplicate packets, packet sequence errors, damaged or incomplete packets, etc.

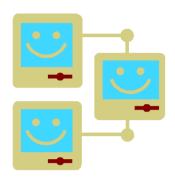

à Time consuming processing

§ When z/VSE and Linux run side by side on the same box

- Why do we need all this expensive processing in this case?
- There should be a more direct communication method!

à z/VSE Fast Path to Linux on System z

(for short: Linux Fast Path or just LFP)

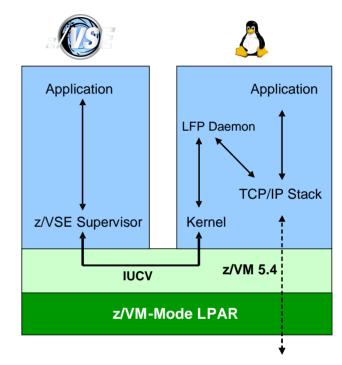

Fast Path to Linux on System z (LFP)

- à Allows selected TCP/IP applications to communicate with the TCP/IP stack on Linux without using a TCP/IP stack on z/VSE
- § The Linux Fast Path uses an IUCV connection between z/VSE and Linux on System z
- § Both systems run in the same z/VM-mode LPAR on IBM z10, z196 or z114 servers
- § All socket requests are transparently forwarded to a Linux on System z system running in the same z/VM
- § On Linux on System z, the LFP daemon must run
 - This daemon fulfills all socket requests by forwarding them to the Linux TCP/IP stack

- § The Fast Path to Linux on System z provides standard TCP/IP socket APIs for programs running on z/VSE
- **§ Possible performance increase due to:**
 - Less overhead for TCP/IP processing on z/VSE (TCP, sequence numbers and acknowledging, checksums, resends, etc)
 - More reliable communication method (IUCV) compared to HiperSockets, which is a network device, with all its packet drops, resends, etc.

Communication using TCP/IP

Z/VSE (VM Guest) DB2 Client DB2 Server for Linux G TCP/IP Stack Z/VSE Supervisor Linux Kernel OSAX Device Driver 4

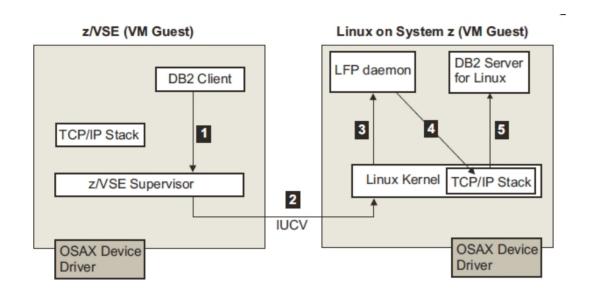

HiperSockets

- 1. Data is passed from the application to the TCP/IP stack partition (using cross-partition communication mechanisms, involves dispatching).
- 2. TCP/IP builds IP packets (including TCP, checksums, sequence numbers, etc) and sends it through the OSAX device driver.
- 3. The TCP/IP stack passes the packets to the network device driver for use with HiperSockets
- 4. The HiperSockets network forwards the packets to the Linux image.
- 5. The Linux HiperSockets device driver receives the packets and passes them to the TCP/IP stack. The TCP/IP stack on Linux checks and unpacks the IP and TCP header. This processing includes handling for retransmissions, sequence numbers and acknowledging, validating checksums and so on.
- 6. The TCP/IP stack passes the data to the application which processes it.

Communication using Linux Fast Path

- 1. The data to be sent is passed to the Linux Fast Path (LFP) stack running on z/VSE.
- The LFP stack builds IUCV packets including the data, and sends the packets via the IUCV channel to the Linux image.
- The Linux IUCV device driver receives the packets and passes them to the LFP Daemon running on the Linux image. The LFP Daemon then processes the data received from the IUCV channel, and translates it into a socket call.
- 4. The socket call is processed by the TCP/IP stack. Because the data is to be sent to an application that runs on the same Linux system, the TCP/IP stack simply forwards the data directly to the application (using a Unix pipe, thus no TCP/IP processing required).
- 5. The application receives the data and processes it.

Performance measurements using Linux Fast Path

Comparison TCP/IP for VSE versus Linux Fast Path:

Workload	TCP/IP for VSE	Linux Fast Path (LFP)	Difference
FTP (BSI FTP server) §VSE à Linux (1GB)	19 MB/sec	72 MB/sec	3.7 times faster
(NULL file, no I/O)	29% CPU (5% App + 24% TCPIP)	20% CPU (App)	9% less CPU
§Linux à VSE (1GB) (NULL file, no I/O)	21 MB/sec 55% CPU (11% App + 44% TCPIP)	70 MB/sec 20% CPU (App)	3.3 times faster 35% less CPU
Socket Application (running 3 times) §VSE à Linux (100MB) §Linux à VSE (100MB)	4.6 MB/sec (*3 = 13.8 MB/sec) 9.7 MB/sec (*3 = 29.1 MB/sec) 26% CPU (3*1% App + 23% TCP/IP)	14.6 MB/sec (*3 = 43.8 MB/sec) 16.2 MB/sec (*3 = 48.6 MB/sec) 9 % CPU (3*3% App)	3.2 times faster 1,7 times faster 17% less CPU

Environment: IBM System z10 EC (2097-722). TCP/IP connection via shared OSA adapter.

à Significant benefits in transfer rate as well as CPU usage

Prerequisites for using the Linux Fast Path

- § If you use a z/VM-mode LPAR, z/VM 5.4 or later. Otherwise, any z/VM release that is supported by z/VSE
- § If you use a z/VM-mode LPAR, IBM System z10, z196 or z114. Otherwise, any server supported by z/VSE
- § z/VSE 4.3 or later
- **§ One of these Linux on System z operating systems:**
 - SUSE Linux Enterprise Server 10 Service Pack 3 together with security update kernel 2.6.16.60-0.57.1

- SUSE Linux Enterprise Server 11 Service Pack 1
- Red Hat Enterprise Linux 5 Update 5
- Red Hat Enterprise Linux 6

- § z/VSE and Linux on System z are configured as z/VM guests within the same LPAR
- § The IUCV ("Inter-User Communication Vehicle") is configured and enabled in both z/VM guests (z/VSE and Linux on System z)

Preparing to use Linux Fast Path

§ Preparing the LPAR

- For use with LFP, the Linux on System z and z/VSE must run under the same z/VM system
- The use of a z/VM Mode-LPAR is recommended
 - Allows you to mix CPs and IFLs in one z/VM Installation
 - Linux runs on IFLs
 - z/VSE runs on CPs
- Change the LPAR Mode to z/VM-Mode and add the IFLs to it

Application Application LFP Daemon TCP/IP Stack Kernel IUCV z/VM 5.4

§ Preparing z/VM

- LFP uses IUCV as the underlying communication vehicle. Therefore the z/VSE and the Linux on System z guests on the z/VM system need to be configured for IUCV.
- The following z/VM parameters for the guest systems are relevant:
 - IUCV ALLOW
 - IUCV ANY
 - IUCV MSGLIMIT
 - OPTION MAXCONN maxno
- For details about the parameters check the z/VM documentation.

Preparing to use Linux Fast Path

§ Preparing Linux on System z

- Download and install the LFP Daemon
 - Part of the "z/VSE Connector Workstation Code" component 5686-CF8-38 / 02P
 - Member IJBLFPLX.W from PRD2.PROD or download from Internet at http://ibm.com/zvse/downloads/
 - This ZIP file contains an RPM (RPM Package Manager) that can be used to install the LFPD
- Configure one or multiple LFPD Instances
 - Textual configuration files in /etc/opt/ibm/vselfpd/confs-available and /etc/opt/ibm/vselfpd/confs-enabled
- It is recommended to use separate (virtual) network adapters or at least separate IP addresses for each LFPD Instance (give each VSE its own IP address)
- Start LFP daemon using lfpd-ctl or automatically at boot via init.d start script

§ Preparing z/VSE

- The LFP code is part of the z/VSE system, no installation step needed
- Start and configure an LFP Instance
 - Textual configuration statements in LIBR member or SYSIPT of start job
 - LFP Instance operation via IJBLFPOP tool
- LFP does not require a partition to run
- Every LFP Instance is identified by a 2 digit number (System ID)
 - Same concept as used by TCP/IP stacks

Sample configuration on z/VSE

```
* $$ JOB JNM=LFPSTART, CLASS=0, DISP=L
// JOB LFPSTART
// EXEC IJBLFPOP, PARM='START DD:SYSIPT LOGALL'
ID = 01
MTU = 8192
                                             IJBLFPOP will read
                                             input from SYSIPT
IucvMsgLimit = 1024
InitialBufferSpace = 512K
                                            IUCV Name of LFP
MaxBufferSpace = 4M
                                               on z/VSE
IucvSrcAppName = TESTV
IucvDestAppName = LINR02
                                          IUCV Name of LFPD
IucvDestVMId = LINLFP
                                              on Linux
WindowSize = 65535
                                      Guest name where
WindowThreshold = 25
                                        Linux runs
/*
/&
* $$ EOJ
```

z/VSE Skeletons for use with LFP

§ The following skeletons are available in ICCF library 59 for use with LFP:

Skeleton	Description	
SKLFPSTA	Start an LFP Instance	
SKLFPSTO	Stop an LFP Instance	
SKLFPLST	List all active LFP Instances	
SKLFPINF	Query information about an active LFP Instance	
SKLFPACT	Contains control statements to activate LFP you many need to include into the JCL of your applications	

Operating an Linux Fast Path on z/VSE

§ List active LFP Instances

- // EXEC IJBLFPOP, PARM='LIST'
LFPB025I ACTIVE LFP INSTANCES: 1
INSTANCE 01 HAS 3 ACTIVE TASKS
LFPB026I END OF ACTIVE LFP INSTANCES LIST

§ Display information about an active instance

```
- // EXEC IJBLFPOP, PARM='INFO <INSTID> [SHOWTASKS] [LOGALL]'
 LFPB023I INFO ABOUT LFP INSTANCE '01':
   *** INSTANCE ***
    STATUS ..... : UP
    WINDOW SIZE ..... : 65,535
   *** DEVICE ***
    DEVICE STATUS ..... : ACTIVE
    PACKETS WAITING FOR MSG COMPLETE: 0
    MAXIMUM PACKETS USED ...... : 37
   *** TASKS ***
    ACTIVE TASK COUNT ...... : 3
   -- TASK #1 -
    TASK ID (PARTITION ID)..... : 2E (Z1)
    SOCKET COUNT ..... : 1
    L2 SOCKET LIST COUNT ..... : 1
 LFPB024I END OF INFO ABOUT LFP INSTANCE '01'.
```

Operating an Linux Fast Path on z/VSE

§ Enable or disable socket diagnosis

```
-// EXEC IJBLFPOP, PARM='DIAG <INSTID> <ON OFF>'
```

- If socket diagnosis is ON for an LFP instance, socket statistics are printed to the job listing each time a socket is closed by the application that is using the LE/C socket API:

```
-LFP Statistics for Socket '0':

Number of Bytes Sent: 1020364776

Number of Bytes Received: 943718400

Number of Packets Sent: 233923

Number of Packets Received: 183220

Times in Wait for Send Window: 18158

Times in Wait for Receive Window: 28002

Times in Wait for Message Limit: 0

Times in Wait for Packets: 0
```

Sample configuration on Linux on System z

lfpd-LINR02.conf: **IUCV Name of LFPD** on Linux # lfpd configuration file IUCV SRC APPNAME = LINR02 # ensure that only TESTV from VSER05 can connect PEER IUCV VMID = VSER05 Guest name where PEER IUCV APPNAME = TESTV z/VSE runs IUCV MSGLIMIT = 1024 MTU SIZE = 8192MAX SOCKETS = 1024**IUCV Name of LFP** INITIAL IO BUFS = 128 on z/VSE WINDOW SIZE = 65535WINDOW THRESHOLD = 25 VSE CODEPAGE = EBCDIC-US This is the IP address VSE HOSTID = 10.0.0.1VSE will appear under RESTRICT TO HOSTID = yes LOG INFO MSG = no

Note: The configuration file must be named "Ifpd-XXX", where XXX is the IUCV_SRC_APPNAME specified in the configuration file!

The XXX characters in the filename must be specified in uppercase!

Operating an Linux Fast Path on Linux on System z

§ Display LFP daemon status

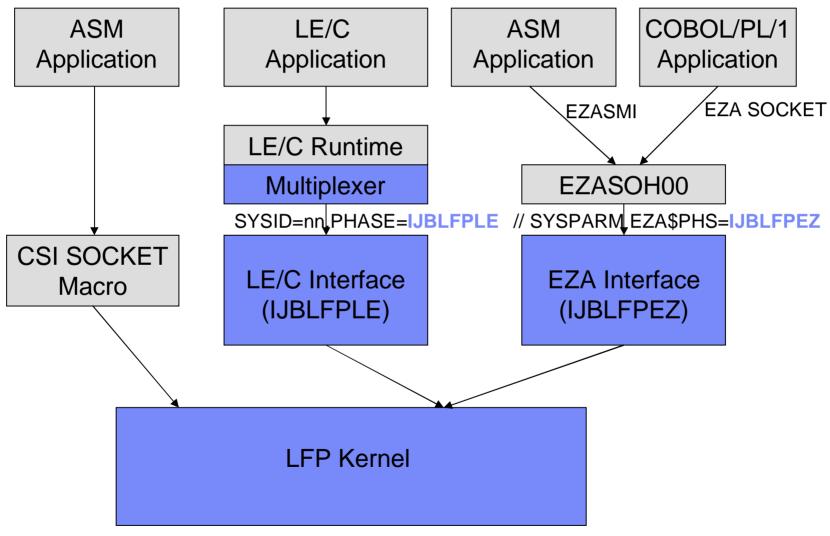

- lfpd-admin <--iucv_appname | -i appname > <--status | -s >

```
Status:
  z/VSE instance is connected.
  Peer VM ID .....: VSER05
 Peer IUCV Appl. name : TESTV
 Applied host id .... : 10.0.0.1
 Applied host name .. : linlfp
 Allocated I/O buffers .....: 128
  Number of active z/VSE tasks: 1
  Number of active sockets: 1
Trace Status:
 Running in daemon mode
  No trace is running
Configuration:
  LOCAL IUCV APPNAME = LINR02
  PEER IUCV VMID = VSER05
  PEER IUCV APPNAME = TESTV
  MAX VSE TASKS = 512
  MTU SIZE = 8192
  MAX SOCKETS = 1024
  INITIAL_IO_BUFS = 128
  WINDOW SIZE = 65536
  WINDOW THRESHOLD = 25% (16384 bytes)
```

Socket API Support of Linux Fast Path

Socket API Support of Linux Fast Path

§ Linux Fast Path supports the following Socket APIs

- LE/C Socket API
- EZA SOCKET and EZASMI
- CSI's SOCKET Macro (limited support)

§ LE/C Socket API considerations

- The LE/C interface phase for LFP is shipped as IJBLFPLE.PHASE in IJSYSRS.SYSLIB
- You must configure the LE/C TCP/IP Socket API Multiplexer to use the LFP LE/C TCP/IP interface phase IJBLFPLE for the IDs of all LFP instances that are running
- To configure the multiplexer, use skeleton EDCTCPMC in ICCF library 62
- You can add entries for all your LFP instances with the following statement:
 - EDCTCPME SYSID='01',PHASE='IJBLFPLE'

§ EZA SOCKET and EZASMI considerations

- With the EZA socket and EZASMI interfaces you can specify which interface module is to be used
- For LFP, you must use the EZA interface module IJBLFPEZ
- You must set the JCL parameter "EZA\$PHA" in all your jobs that you want to use LFP
- To do so use the following statement in your jobs:
 - // SETPARM [SYSTEM] EZA\$PHA=IJBLFPEZ
- If you are using the EZA SOCKET or EZASMI interface under CICS, you need to activate the EZA 'TASK-RELATED-USER-EXIT' (TRUE)

LE/C Socket API Multiplexer

- § Different Stacks use different Interface routines
 - TCP/IP for VSE (CSI/IBM): \$EDCTCPV
 - Linux Fast Path: IJBLFPLE
 - IPv6/VSE (BSI/IBM):
 BSTTTCPV
- § Avoid complicated setup using specific LIBDEFs for different stacks
- § Interface phase is selected by System ID
- § Use skeleton EDCTCPMC in ICCF library 62 (G Attention: Typo in documentation)

```
// EXEC ASMA90,SIZE=(ASMA90,64K),PARM='EXIT(LIBEXIT(EDECKXIT)),SIZE(MAXC -200K,ABOVE)'

EDCTCPMC CSECT

EDCTCPMC AMODE ANY

EDCTCPMC RMODE ANY

*

EDCTCPME SYSID='00',PHASE='$EDCTCPV'

EDCTCPME SYSID='01',PHASE='IJBLFPLE'

EDCTCPME SYSID='02',PHASE='BSTTTCPV'

*

END

/*
```

Specifying the System ID (Instance ID)

- § Using the System ID, you specify which Stack or LFP Instance an application will use
- § The following table shows how to specify instance IDs and where they can be applied
 - The settings are checked from top to bottom as listed in the table

	LE/C Socket API	EZA SOCKET and EZASMI APIS	CSI SOCKET Macro
'LFP\$ID' (environment variable)	X		
// SETPARM [SYSTEM] LFP\$ID=NN	X	Х	
'SYSID' (environment variable)	Х		
IDENT.TCPNAME passed to INITAPI call		X	
ID parameter on SOCKET macro			Х
// OPTION SYSPARM='NN'	Х	Х	Х
Default '00'	Х	X	Х

CICS task isolation options

§ LFP isolates CICS tasks from each other

- This means that sockets that are allocated by one CICS task, can <u>not</u> be used by another CICS task
 - except the socket is passed to the other CICS task via GIVESOCKET/TAKESOCKET calls
- When a CICS task ends, all sockets allocated by this task will be closed (terminated) automatically
 - Except it has been given to another task prior to task termination

§ Some programs rely on passing sockets from one CICS task to another without the use of GIVESOCKET/TAKESOCKET

- For example, DB2 (client or server) application requestor, requires socket sharing, if running under CICS
- § To allow such programs to work with LFP, you need to specify the following JCL statement for the program:
 - // SETPARM [SYSTEM] LFP\$CIC=SHARE
 - This setting applies to the LE/C socket interface as well as the EZA interfaces
- § If socket sharing is active, the applications are responsible to close sockets that are no longer needed
 - No automatic cleanup will be performed at end of CICS task
 - If the applications miss to do proper cleanup, dead sockets may be left over

CSI SOCKET macro considerations

§ For the CSI SOCKET macro, the Linux Fast Path only supports the following connection types:

- TCP
- UDP
- CONTROL
- Other connection types (such as CLIENT, TELNET, FTP, RAW, and so on) are not supported and will be rejected if used with the Linux Fast Path.

§ For CONTROL type connections, the only commands supported are:

- GETHOSTBYNAME
- GETHOSTBYADDR
- GETHOSTNAME
- GETHOSTID
- For details, refer to the individual macro descriptions in the "TCP/IP for VSE V1R5F Programmers Guide" manual.

§ For CONTROL type connections, these commands (from Barnard Software, Incorporated) are also supported:

- NTOP
- PTON
- GETVENDORINFO
- For details, refer to the "IPv6/VSE Programming Guide" manual

Using existing Applications with Linux Fast Path

§ Most existing applications run unchanged with Linux Fast Path

- Provided they use one of the supported Socket API (LE/C, EZA or ASM SOCKET)
 - ... and they do not use any CSI or BSI specific interface, features or functions

§ IBM Applications supporting Linux Fast Path

- VSE Connector Server
- CICS Web Support
- VSE Web Services (SOAP) support (client and server)
- CICS Listener
- DB2/VSE Server and Client
- WebSphere MQ Server and Client
- VSAM Redirector
- VSE VTAPE
- VSE LDAP Support
- VSE Script Client
- POWER PNET
- TCP/IP-TOOLS included in IPv6/VSE product (e.g. FTP Server/Client)

§ Customer applications should run unchanged:

- Provided they use one of the supported Socket API (LE/C, EZA or ASM SOCKET)

Latest news

§ Enhancements planned for z/VSE 5.1

- IPv6 support
 - LFP acts a 'dual stack'
 - Supports both, IPv4 and IPv6 at the same time
 - Available for EZASOCKET, EZASMI, LE/C Socket and SOCKET Macro (using BSI IPv6 enhancements)

§ Latest APARs and PTFs:

- DY47243 UD53682
- DY47226 UD53662
- DY47159 UD53608/UD53609

New Tool: Virtual z/VSE FTP Daemon

§ The Virtual z/VSE FTP Daemon can be installed on any Java-enabled platform and emulates an FTP server

- The actual access to z/VSE resources is done using the VSE Connector Server.
- § Download: http://ibm.com/zvse/download

à Fits perfectly to Linux Fast Path

§ The Virtual z/VSE FTP Daemon:

- Handles all incoming FTP clients.
- Connects to one or multiple VSE Connector Servers.
- Is responsible for connection-handling.
- Is responsible for data translation (ASCII-EBCDIC).
- Is IPv6 ready
 - You can connect FTP clients using IPv6, the Virtual z/VSE FTP Daemon connects to the VSE Connector Server using IPv4.

Client

- Supports SSL
 - both for the FTP connection (between FTP client and Virtual z/VSE FTP Daemon, using implicit SSL (FTPS)),
 - and for the connection to the VSE Connector Server (between Virtual z/VSE FTP Daemon and z/VSE host).

Questions?

October 3-7, 2011, Miami, FL will host the 2011 **IBM System z Technical University**.

A wide range of z/VSE sessions will be presented covering the latest features in z/VSE, including a preview of z/VSE V5.1, zEnterprise exploitation, and interoperability options with Linux on System z and z/VM technology.

à Enroll today!
