

# CICS Interdependency Analyzer

CICS® IA is a dynamic discovery tool that helps you understand the relationships, dependencies and flows of CICS applications.

## KEY FEATURES

### Optimise applications

CICS IA enables improvements in operational efficiency through threadsafety and region consolidation projects, reducing CPU costs and system complexity.

New in 5.2: Enhancements for Threadsafe Analysis and region consolidation.

### Understand application structure & dependencies

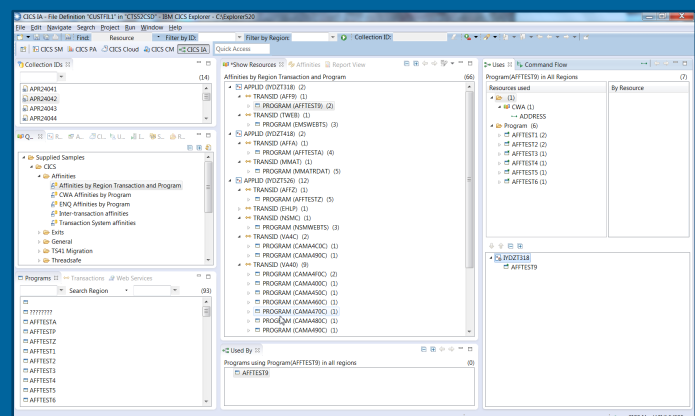

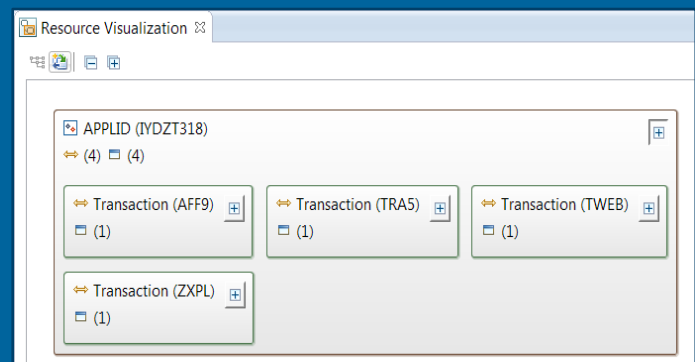

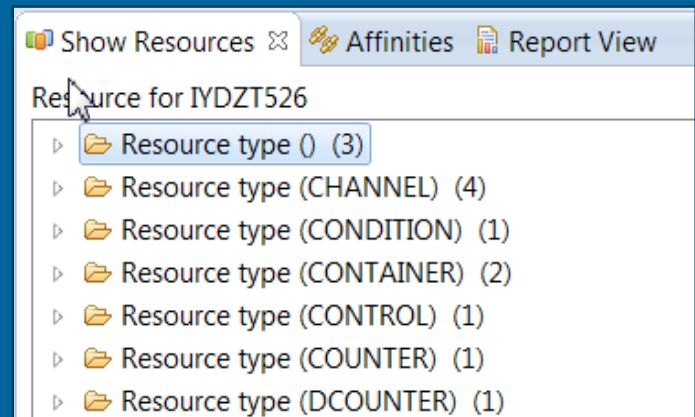

CICS IA can discover and build a collection of dependency, affinity and command flow data for your CICS applications. This information is made easily digestible through graphical visualisations in the CICS Explorer® client plug-in.

New in 5.2: New visualisations to help understand the application architecture.

### Affinity analysis

CICS IA's Affinity analysis functions help you address affinities in transactions. Where they cannot be resolved, CICS IA enables the creation of CICSplex SM® TRANGRPs to be built and deployed to CICSplex SM so workload management can handle transactions appropriately.

New in 5.2: New supporting documentation

IBM® CICS Interdependency Analyzer for z/OS®
