Table 475. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected

Table 475. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

### Usage

Use this element to understand which CONCURRENTDBCOORDACTIVITIES service superclass threshold, if any, was applied to the activity.

### **concurrentdbcoordactivities\_superclass\_threshold\_queued - Concurrent database coordinator activities service superclass threshold queued monitor element**

This monitor element returns '1' (Yes) to indicate that the activity was queued by the CONCURRENTDBCOORDACTIVITIES service superclass threshold. A value of '0' (No) indicates that the activity was not queued.

Table 476. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

### Usage

Use this element to understand if the activity was queued by the CONCURRENTDBCOORDACTIVITIES service superclass threshold applied to the activity.

### **concurrentdbcoordactivities\_superclass\_threshold\_value - Concurrent database coordinator activities service superclass threshold value monitor element**

The upper bound of the CONCURRENTDBCOORDACTIVITIES service superclass threshold that was applied to the activity.

Table 477. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

## Usage

Use this element to understand the value of the CONCURRENTDBCOORDACTIVITIES service superclass threshold applied to the activity, if any.

### **concurrentdbcoordactivities\_superclass\_threshold\_violated - Concurrent database coordinator activities service superclass threshold violated monitor element**

This monitor element returns '1' (Yes) to indicate that the activity violated the CONCURRENTDBCOORDACTIVITIES service superclass threshold. A value of '0' (No) indicates that the activity has not yet violated the threshold.

*Table 478. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

## Usage

Use this element to determine if the activity violated the CONCURRENTDBCOORDACTIVITIES service superclass threshold that was applied to the activity.

### **concurrentdbcoordactivities\_wl\_was\_threshold\_id - Concurrent database coordinator activities workload work action set threshold ID monitor element**

The identifier of the CONCURRENTDBCOORDACTIVITIES workload work action set threshold that was applied to the activity.

*Table 479. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

## Usage

Use this element to understand which CONCURRENTDBCOORDACTIVITIES workload work action set threshold, if any, was applied to the activity.

## **concurrentdbcoordactivities\_wl\_was\_threshold\_queued - Concurrent database coordinator activities workload work action set threshold queued monitor element**

This monitor element returns '1' (Yes) to indicate that the activity was queued by the CONCURRENTDBCOORDACTIVITIES workload work action set threshold. A value of '0' (No) indicates that the activity was not queued.

*Table 480. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

### **Usage**

Use this element to understand if the activity was queued by the CONCURRENTDBCOORDACTIVITIES workload work action set threshold applied to the activity.

## **concurrentdbcoordactivities\_wl\_was\_threshold\_value - Concurrent database coordinator activities workload work action set threshold value monitor element**

The upper bound of the CONCURRENTDBCOORDACTIVITIES workload work action set threshold that was applied to the activity.

*Table 481. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

### **Usage**

Use this element to understand the value of the CONCURRENTDBCOORDACTIVITIES workload work action set threshold applied to the activity.

## **concurrentdbcoordactivities\_wl\_was\_threshold\_violated - Concurrent database coordinator activities workload work action set threshold violated monitor element**

This monitor element returns '1' (Yes) to indicate that the activity violated the CONCURRENTDBCOORDACTIVITIES workload work action set threshold. A value of '0' (No) indicates that the activity has not yet violated the threshold.

*Table 482. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

### **Usage**

Use this element to determine if the activity violated the CONCURRENTDBCOORDACTIVITIES workload work action set threshold that was applied to the activity.

## **concurrentdbcoordactivities\_work\_action\_set\_threshold\_id - Concurrent database coordinator activities work action set threshold ID monitor element**

The identifier of the CONCURRENTDBCOORDACTIVITIES database work action set threshold that was applied to the activity.

*Table 483. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

### **Usage**

Use this element to understand which CONCURRENTDBCOORDACTIVITIES work action set threshold, if any, was applied to the activity.

## **concurrentdbcoordactivities\_work\_action\_set\_threshold\_queued - Concurrent database coordinator activities work action set threshold queued monitor element**

This monitor element returns '1' (Yes) to indicate that the activity was queued by the CONCURRENTDBCOORDACTIVITIES database work action set threshold. A value of '0' (No) indicates that the activity was not queued.

Table 484. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

### Usage

Use this element to understand if the activity was queued by the CONCURRENTDBCOORDACTIVITIES database work action set threshold applied to the activity.

### **concurrentdbcoordactivities\_work\_action\_set\_threshold\_value - Concurrent database coordinator activities work action set threshold value monitor element**

The upper bound of the CONCURRENTDBCOORDACTIVITIES database work action set threshold that was applied to the activity.

Table 485. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

### Usage

Use this element to understand the value of the CONCURRENTDBCOORDACTIVITIES database work action set threshold applied to the activity, if any.

### **concurrentdbcoordactivities\_work\_action\_set\_threshold\_violated - Concurrent database coordinator activities work action set threshold violated monitor element**

This monitor element returns '1' (Yes) to indicate that the activity violated the CONCURRENTDBCOORDACTIVITIES database work action set threshold. A value of '0' (No) indicates that the activity has not yet violated the threshold.

Table 486. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected

Table 486. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

### Usage

Use this element to determine if the activity violated the CONCURRENTDBCOORDACTIVITIES database work action set threshold that was applied to the activity.

### **concurrentworkloadactivities\_threshold\_id - Concurrent workload activities threshold ID monitor element**

The ID of the CONCURRENTWORKLOADACTIVITIES workload threshold that was applied to the activity.

Table 487. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

### **concurrentworkloadactivities\_threshold\_value - Concurrent workload activities threshold value monitor element**

This monitor element returns the upper bound of the CONCURRENTWORKLOADACTIVITIES workload threshold that was applied to the activity.

Table 488. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

## concurrentworkloadactivities\_threshold\_violated - Concurrent workload activities threshold violated monitor element

This monitor element returns '1' (Yes) to indicate that the activity violated the CONCURRENTWORKLOADACTIVITIES workload threshold. A value of '0' (No) indicates that the activity has not yet violated the threshold.

Table 489. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

## configured\_cf\_gbp\_size - Configured cluster caching facility group buffer pool size monitor element

The allocated and reserved group buffer pool memory specified using the **cf\_gbp\_sz** configuration parameter, in pages with a page size of 4 KB.

Table 490. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CF table function - Get CF metrics	Always collected

## configured\_cf\_lock\_size - Configured cluster caching facility lock size monitor element

Global lock memory configured, in pages with a page size of 4 KB. This value is specified using the **cf\_lock\_sz** configuration parameter.

Table 491. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CF table function - Get CF metrics	Always collected

## configured\_cf\_sca\_size - Configured cluster caching facility shared communications area size monitor element

Shared communications area memory currently allocated and reserved, in pages with a page size of 4 KB. This value is specified using the **cf\_sca\_sz** configuration parameter.

Table 492. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CF table function - Get CF metrics	Always collected

## configured\_cf\_mem\_size - Configured cluster caching facility memory size monitor element

Configured total memory size for the cluster caching facility, in pages with a page size of 4 KB. This value is specified using the **cf\_mem\_sz** configuration parameter.

Table 493. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CF table function - Get CF metrics	Always collected

## conn\_complete\_time - Connection Request Completion Timestamp

The date and time that a connection request was granted.

### Element identifier

conn\_complete\_time

### Element type

timestamp

Table 494. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl	Timestamp

### Usage

Use this element to determine when a connection request to the database was granted.

## conn\_time - Time of database connection monitor element

The date and time of the connection to the database (at the database level, this is the first connection to the database), or when the activate database was issued.

Table 495. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Unit of work	-	Always collected
Database	event_dbheader	Always collected
Connections	event_connheader	Always collected

### Usage

Use this element with the **disconn\_time** monitor element to calculate the elapsed time since:

- The database was active (for information at the database level).
- The connection was active (for information at the connection level).

## connect\_cipher\_spec - Cipher specification used on the connection

This monitor element contains the cipher specification that is used on the connection. Specifically, it identifies a combination of encryption algorithm and Message Authentication Code algorithm that is agreed on by both ends of the connection. NONE is returned if SSL is not in use.

**Note:** This element is reported for the coordinating member only. On remote members, the value reported is NONE.

Table Function	Monitor Element Collection Level
	Always collected
	Always collected

## Usage

If TLS v1.3 is detected to be in use, additional information including key exchange group, signature scheme, and peer signature group are appended to the element output. A sample output is listed below:

```
TLS_AES_128_GCM_SHA256, Key Exchange Group: GSK_TLS_SUPPORTED_GROUP_ECDHE_SECP256R1, Signature Scheme: GSK_TLS_SIG_SCHEME_RSA_PSS_RSAE_SHA256, Peer Signature Scheme: NONE
```

## connect\_sec\_type - SSL/TLS level

This monitor element contains the SSL/TLS level in use of the connection. NONE is returned if SSL is not in use.

**Note:** This element is reported for the coordinating member only. On remote members, the value reported is NONE.

Table Function	Monitor Element Collection Level
	Always collected
	Always collected

## Usage

Use this element to identify the version of SSL/TLS in use for the current connection.

Value	SSL Version
SSLV2	SSL v2.0
SSLV3	SSL v3.0
TLSV0	TLS v1.0
TLSV11	TLS v1.1
TLSV12	TLS v1.2
TLSV13	TLS v1.3

## connection\_reusability\_status - Connection reusability status monitor element

Identifies if the connection is reusable.

- 0 - The connection cannot be reused
- 1 - The connection is reusable

Reusability is determined at time of commit or rollback. If the value displayed is "-", then commit or rollback has not occurred yet.

*Table 496. Table function monitoring information*

Table function	Monitor element collection level
MON_GET_CONNECTION table function - Get connection metrics	Always collected

Table 496. Table function monitoring information (continued)

Table function	Monitor element collection level
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics	Always collected

### connection\_start\_time - Connection start time monitor element

The time at which the connection was established with the database server. The connection\_time monitor element is an alias of the connection\_start\_time monitor element.

Table 497. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	Always collected
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	Always collected

Table 498. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Threshold violations	event_thresholdviolations	Always collected

### connection\_status - Connection Status

For snapshot monitor, this monitor element reports the status of the communication connection between the node issuing the GET SNAPSHOT command and other nodes listed in the db2nodes.cfg file. For table function monitor, this monitor element reports the text identifier indicating the FCM connection status.

Table 499. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_FCM_CONNECTION_LIST - Get details for all FCM connections	Always collected

Table 500. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	fcm_node	Basic

### Usage

For the snapshot monitor, the connection values are :

#### SQLM\_FCM\_CONNECT\_INACTIVE

No current connection

#### SQLM\_FCM\_CONNECT\_ACTIVE

Connection is active

For table function monitoring, the available values are:

#### Active

No current connection

## Inactive

Connection is active

Two members can be active, but the communication connection between them remains inactive until there is some communication between the members.

## connections\_top - Maximum Number of Concurrent Connections

The highest number of simultaneous connections to the database since the database was activated.

Table 501. Table function monitoring information

Table function	Monitor element collection level
MON_GET_DATABASE table function - Get database level information	Always collected
MON_GET_DATABASE_DETAILS table function - Get database information metrics	Always collected

Table 502. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic

Table 503. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected

## Usage

You may use this element to evaluate the setting of the *maxappls* configuration parameter.

If the value of this element is the same as the *maxappls* parameter, it is likely that some database connection requests were rejected, since *maxappls* limits the number of database connections allowed.

The current number of connections at the time the snapshot was taken can be calculated using the following formula:

```
rem_cons_in + local_cons
```

## consistency\_token - Package consistency token monitor element

For a particular package name and creator, there might be more than one version. The package consistency token helps to identify the version of the package that contains the SQL currently executing.

Table 504. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	stmt	Statement

Table 505. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	Always collected
Statements	event_stmt	Always collected

## Usage

You can use this element to help identify the package and the SQL statement that is executing.

### **container\_accessible - Accessibility of container monitor element**

This element indicates whether a container is accessible. A value of 1 means "Yes"; a value of 0 means "No".

*Table 506. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_CONTAINER table function - Get table space container metrics	Always collected

*Table 507. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_container	Basic

## Usage

This element can be used in conjunction with the elements **container\_id**, **container\_name**, **container\_type**, **container\_total\_pages**, **container\_usable\_pages**, and **container\_stripe\_set** to describe the container.

### **container\_id - Container identification monitor element**

An integer that uniquely defines a container within a table space.

*Table 508. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_FORMAT_LOCK_NAME table function - Format the internal lock name and return details	Always collected
MON_GET_CONTAINER table function - Get container metrics	Always collected

*Table 509. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_container	Basic

## Usage

This element can be used in conjunction with the elements **container\_name**, **container\_type**, **container\_total\_pages**, **container\_usable\_pages**, **container\_stripe\_set**, and **container\_accessible** to describe the container.

### **container\_name - Container name monitor element**

The name of a container.

*Table 510. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_CONTAINER table function - Get container metrics	Always collected

Table 511. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_container	Basic

#### Usage

This element can be used in conjunction with the elements `container_id`, `container_type`, `container_total_pages`, `container_usable_pages`, `container_stripe_set`, and `container_accessible` to describe the container.

### container\_stripe\_set - Container stripe set monitor element

The stripe set that a container belongs to.

Table 512. Table Function Monitoring Information

Table Function	Monitor Element Collection Command and Level
MON_GET_CONTAINER table function - Get table space container metrics	Always collected

Table 513. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_container	Basic

#### Usage

Use this monitor element in conjunction with the elements `container_id`, `container_name`, `container_type`, `container_total_pages`, `container_usable_pages`, and `container_accessible` to describe the container. This is only applicable to a DMS table space.

### container\_total\_pages - Total pages in container monitor element

The total number of pages occupied by the container.

Table 514. Table Function Monitoring Information

Table Function	Monitor Element Collection Command and Level
MON_GET_CONTAINER table function - Get table space container metrics	Always collected

Table 515. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_container	Basic (DMS table spaces) Buffer Pool (SMS table spaces)

#### Usage

This element can be used in conjunction with the elements `container_id`, `container_name`, `container_type`, `container_usable_pages`, `container_stripe_set`, and `container_accessible` to describe the container.

## container\_type - Container type monitor element

The type of the container.

Table 516. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONTAINER table function - Get container metrics	Always collected

Table 517. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_container	Basic

### Usage

This element returns the type of the container, which can be a directory path (for SMS only), file (for DMS) or a raw device (for DMS). This element can be used in conjunction with the elements **container\_id**, **container\_name**, **container\_total\_pages**, **container\_usable\_pages**, **container\_stripe\_set**, and **container\_accessible** to describe the container.

The valid values for this monitor element are defined in the `sqlutil.h` file.

## container\_usable\_pages - Usable pages in container monitor element

The total number of usable pages in a container.

Table 518. Table Function Monitoring Information

Table Function	Monitor Element Collection Command and Level
MON_GET_CONTAINER table function - Get table space container metrics	Always collected

Table 519. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_container	Basic (DMS table spaces) Buffer Pool (SMS table spaces)

### Usage

This element can be used in conjunction with the elements `container_id`, `container_name`, `container_type`, `container_total_pages`, `container_stripe_set`, and `container_accessible` to describe the container. For SMS table spaces, this value is the same as `container_total_pages`.

## coord\_act\_aborted\_total - Coordinator activities aborted total monitor element

The total number of coordinator activities at any nesting level that completed with errors since the last reset. For service classes, the value is updated when the activity completes. For workloads, the value is updated by each workload occurrence at the end of its unit of work.

For service classes, if you remap an activity to a different subclass with a `REMAP ACTIVITY` action before it aborts, then this activity counts only toward the total of the subclass it aborts in.

Table 520. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	Always collected
MON_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected
MON_GET_WORKLOAD_STATS table function - Return workload statistics	Always collected
WLM_GET_SERVICE_CLASS_WORKLOAD_OCCURRENCES table function - list workload occurrences	Always collected
WLM_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	Always collected
WLM_GET_WORKLOAD_STATS table function - Return workload statistics	Always collected

Table 521. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats	Always collected
Statistics	event_superclasstats	Always collected
Statistics	event_wlstats	Always collected

## Usage

Use this element to understand if activities on the system are completing successfully. Activities may be aborted due to cancellation, errors or reactive thresholds.

### **coord\_act\_completed\_total - Coordinator activities completed total monitor element**

The total number of coordinator activities at any nesting level that completed successfully since the last reset. For service classes, the value is updated when the activity completes. For workloads, the value is updated by each workload occurrence at the end of its unit of work.

For service classes, if you remap an activity to a different subclass with a REMAP ACTIVITY action before it completes, then this activity counts only toward the total of the subclass it completes in.

Table 522. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	Always collected
MON_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected
MON_GET_WORKLOAD_STATS table function - Return workload statistics	Always collected
WLM_GET_SERVICE_CLASS_WORKLOAD_OCCURRENCES table function - list workload occurrences	Always collected

Table 522. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
WLM_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	Always collected
WLM_GET_WORKLOAD_STATS table function - Return workload statistics	Always collected

Table 523. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_wlstats	Always collected
Statistics	event_scstats	Always collected
Statistics	event_superclasstats	Always collected

## Usage

This element can be used to determine the throughput of activities in the system or to aid in calculating average activity lifetime across multiple members.

### **coord\_act\_est\_cost\_avg - Coordinator activity estimated cost average monitor element**

Arithmetic mean of the estimated costs for coordinator DML activities at nesting level 0 associated with this service subclass or work class since the last reset. If the internally tracked average has overflowed, the value -2 is returned. For service subclasses, this monitor element returns -1 when COLLECT AGGREGATE ACTIVITY DATA for the service subclass is set to NONE or BASE. For work classes, this monitor elements returns -1 if no COLLECT AGGREGATE ACTIVITY DATA EXTENDED work action is specified for the work class. For workloads, this monitor element returns -1 when COLLECT AGGREGATE ACTIVITY DATA for the workload is set to NONE or BASE. It is measured in units of timerons.

Table 524. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected
MON_GET_WORKLOAD_STATS table function - Return workload statistics	Always collected

For service classes, the estimated cost of an activity is counted only toward the service subclass in which the activity enters the system. When you remap activities between service subclasses with a REMAP ACTIVITY action, the coord\_act\_est\_cost\_avg mean of the service subclass you remap an activity to is unaffected.

Table 525. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats	Always collected
Statistics	event_superclasstats	Always collected
Statistics	event_wcstats	Always collected
Statistics	event_wlstats	Always collected

## Usage

Use this statistic to determine the arithmetic mean of the estimated costs of coordinator DML activities at nesting level 0 that are associated this service subclass, workload, or work class that completed or aborted since the last statistics reset.

This average can also be used to determine whether or not the histogram template used for the activity estimated cost histogram is appropriate. Compute the average activity estimated cost from the activity estimated cost histogram. Compare the computed average with this monitor element. If the computed average deviates from the true average reported by this monitor element, consider altering the histogram template for the activity estimated cost histogram, using a set of bin values that are more appropriate for your data.

## **COORD\_ACT\_EST\_COST\_STDDEV - The coordinator activity estimated cost standard deviation monitor element**

The standard deviation of the estimated costs for coordinator DML activities, at the nesting level 0 that is associated with this service subclass or superclass.

*Table 526. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	Always collected
MON_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected
MON_GET_WORKLOAD_STATS table function - Return workload statistics	Always collected

*Table 527. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats	Always collected
Statistics	event_superclasstats	Always collected
Statistics	event_superclasstats	Always collected

## **coord\_act\_exec\_time\_avg - Coordinator activities execution time average monitor element**

Arithmetic mean of execution times for coordinator activities at nesting level 0 associated with this service subclass or work class since the last reset. If the internally tracked average has overflowed, the value -2 is returned. For service subclasses, this monitor element returns -1 when COLLECT AGGREGATE ACTIVITY DATA for the service subclass is set to NONE. For work classes, this monitor elements returns -1 if no COLLECT AGGREGATE ACTIVITY DATA work action is specified for the work class. For workloads, this monitor element returns -1 when COLLECT AGGREGATE ACTIVITY DATA for the workload is set to NONE. Units are milliseconds.

For service classes, when you remap activities between service subclasses with a REMAP ACTIVITY action, the coord\_act\_exec\_time\_avg mean of service subclasses an activity is mapped to but does not complete in is unaffected.

Table 528. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	ACTIVITY METRICS BASE
MON_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected
MON_GET_WORKLOAD_STATS table function - Return workload statistics	ACTIVITY METRICS BASE
WLM_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	COLLECT AGGREGATE ACTIVITY DATA
WLM_GET_WORKLOAD_STATS table function - Return workload statistics	COLLECT AGGREGATE ACTIVITY DATA

Table 529. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats	-
Statistics	event_superclasstats	-
Statistics	event_wcstats	-
Statistics	event_wlstats	-

## Usage

Use this statistic to determine the arithmetic mean of execution time for coordinator activities associated with a service subclass, workload, or work class that completed or aborted.

This average can also be used to determine whether or not the histogram template used for the activity execution time histogram is appropriate. Compute the average activity execution time from the activity execution time histogram. Compare the computed average with this monitor element. If the computed average deviates from the true average reported by this monitor element, consider altering the histogram template for the activity execution time histogram, using a set of bin values that are more appropriate for your data.

## coord\_act\_interarrival\_time\_avg - Coordinator activity arrival time average monitor element

Arithmetic mean of the time between arrivals of coordinator activities at nesting level 0 associated with this service subclass or work class since the last reset. If the internally tracked average has overflowed, the value -2 is returned. For service subclasses, this monitor element returns -1 when COLLECT AGGREGATE ACTIVITY DATA for the service subclass is set to NONE or BASE. For work classes, this monitor elements returns -1 if no COLLECT AGGREGATE ACTIVITY DATA EXTENDED work action is specified for the work class. For workloads, this monitor element returns -1 when COLLECT AGGREGATE ACTIVITY DATA for the workload is set to NONE or BASE. It is measured in milliseconds.

Table 530. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected
MON_GET_WORKLOAD_STATS table function - Return workload statistics	Always collected

For service classes, the inter-arrival time mean is calculated for service subclasses through which activities enter the system. When you remap activities between service subclasses with a REMAP ACTIVITY action, the coord\_act\_interarrival\_time\_avg of the service subclass you remap an activity to is unaffected.

Table 531. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats	-
Statistics	event_superclasstats	-
Statistics	event_wcstats	-
Statistics	event_wlstats	-

## Usage

Use this statistic to determine the arithmetic mean between arrivals of coordinator activities at nesting level 0 associated with this service subclass, workload, or work class.

The inter-arrival time can be used to determine arrival rate, which is the inverse of inter-arrival time. This average can also be used to determine whether or not the histogram template used for the activity inter-arrival time histogram is appropriate. Compute the average activity inter-arrival time from the activity inter-arrival time histogram. Compare the computed average with this monitor element. If the computed average deviates from the true average reported by this monitor element, consider altering the histogram template for the activity inter-arrival time histogram, using a set of bin values that are more appropriate for your data.

## COORD\_ACT\_INTERARRIVAL\_TIME\_STDDEV - The coordinator activity inter-arrival time standard deviation monitor element

The standard deviation of the time between arrivals of coordinator activities, at the nesting level 0 that is associated with this service subclass or superclass.

Table 532. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	Always collected
MON_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected
MON_GET_WORKLOAD_STATS table function - Return workload statistics	Always collected

Table 533. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats	Always collected
Statistics	event_supercl	
Statistics	event_superclasstats	Always collected

## coord\_act\_lifetime\_avg - Coordinator activity lifetime average monitor element

Arithmetic mean of lifetime for coordinator activities at nesting level 0 associated with this service subclass, workload, or work class since the last reset. If the internally tracked average has overflowed, the value -2 is returned. For service subclasses, this monitor element returns -1 when COLLECT AGGREGATE ACTIVITY DATA for the service subclass is set to NONE. For work classes, this monitor element returns -1 if no COLLECT AGGREGATE ACTIVITY DATA work action is specified for the work class. For workloads, this monitor element returns -1 when COLLECT AGGREGATE ACTIVITY DATA for the workload is set to NONE. It is measured in milliseconds.

For service classes, when you remap activities between service subclasses with a REMAP ACTIVITY action, only the coord\_act\_lifetime\_avg mean of the final service class where the activity completes is affected.

Table 534. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	ACTIVITY METRICS BASE
MON_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected
MON_GET_WORKLOAD_STATS table function - Return workload statistics	ACTIVITY METRICS BASE
WLM_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	COLLECT AGGREGATE ACTIVITY DATA
WLM_GET_WORKLOAD_STATS table function - Return workload statistics	COLLECT AGGREGATE ACTIVITY DATA

Table 535. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats	-
Statistics	event_superclasstats	-
Statistics	event_wcstats	-
Statistics	event_wlstats	-

### Usage

Use this statistic to determine the arithmetic mean of the lifetime for coordinator activities associated with a service subclass, workload, or work class that completed or aborted.

This statistic can also be used to determine whether or not the histogram template used for the activity lifetime histogram is appropriate. Compute the average activity lifetime from the activity lifetime histogram. Compare the computed average with this monitor element. If the computed average deviates from the true average reported by this monitor element, consider altering the histogram template for the activity lifetime histogram, using a set of bin values that are more appropriate for your data.

## coord\_act\_lifetime\_top - Coordinator activity lifetime top monitor element

The coord\_act\_lifetime\_top element is a high watermark for coordinator activity lifetime, counted at all nesting levels. The stored information is represented in milliseconds. For service classes, this monitor element returns -1 when COLLECT AGGREGATE ACTIVITY DATA for the service class is set to NONE. For work classes, this monitor element returns -1 if no COLLECT AGGREGATE ACTIVITY DATA work action is

specified for the work class. For workloads, this monitor element returns -1 when COLLECT AGGREGATE ACTIVITY DATA for the workload is set to NONE.

To effectively use this statistic with service classes when you also remap activities between service subclasses with a REMAP ACTIVITY action, you must aggregate the coord\_act\_lifetime\_top high watermark of any given service subclass with that of other subclasses affected by the same remapping threshold or thresholds. This is because an activity will complete after it has been remapped to a different service subclass by a remapping threshold, and the time the activity spends in other service subclasses before being remapped is counted only toward the service class in which it completes.

*Table 536. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	ACTIVITY METRICS BASE
MON_GET_WORKLOAD_STATS table function - Return workload statistics	ACTIVITY METRICS BASE
WLM_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	COLLECT AGGREGATE ACTIVITY DATA
WLM_GET_WORKLOAD_STATS table function - Return workload statistics	COLLECT AGGREGATE ACTIVITY DATA

*Table 537. Event Monitoring Information*

<b>Event Type</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Statistics	event_wcstats	-
Statistics	event_scstats	-
Statistics	event_superclasstats	-
Statistics	event_wlstats	-

## Usage

This element can be used to help determine whether or not thresholds on activity lifetime are being effective and can also help to determine how to configure such thresholds.

### **coord\_act\_queue\_time\_avg - Coordinator activity queue time average monitor element**

Arithmetic mean of queue time for coordinator activities at nesting level 0 associated with this service subclass or work class since the last reset. If the internally tracked average has overflowed, the value -2 is returned. For service subclasses, this monitor element returns -1 when COLLECT AGGREGATE ACTIVITY DATA for the service subclass is set to NONE. For work classes, this monitor elements returns -1 if no COLLECT AGGREGATE ACTIVITY DATA work action is specified for the work class. For workloads, this monitor element returns -1 when COLLECT AGGREGATE ACTIVITY DATA for the workload is set to NONE. It is measured in milliseconds.

For service classes, the queue time counts only toward the service subclass in which the activity completes or is aborted. When you remap activities between service subclasses with a REMAP ACTIVITY action, the coord\_act\_queue\_time\_avg mean of service subclasses an activity is mapped to but does not complete in is unaffected.

Table 538. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	ACTIVITY METRICS BASE
MON_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected
MON_GET_WORKLOAD_STATS table function - Return workload statistics	ACTIVITY METRICS BASE
WLM_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	COLLECT AGGREGATE ACTIVITY DATA
WLM_GET_WORKLOAD_STATS table function - Return workload statistics	COLLECT AGGREGATE ACTIVITY DATA

Table 539. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats	Always collected
Statistics	event_superclasstats	Always collected
Statistics	event_wcstats	Always collected
Statistics	event_wlstats	Always collected

## Usage

Use this statistic to determine the arithmetic mean of the queue time for coordinator activities associated with a service subclass, workload, or work class that completed or aborted.

This statistic can also be used to determine whether or not the histogram template used for the activity queue time histogram is appropriate. Compute the average activity queue time from the activity queue time histogram. Compare the computed average with this monitor element. If the computed average deviates from the true average reported by this monitor element, consider altering the histogram template for the activity queue time histogram, using a set of bin values that are more appropriate for your data.

## coord\_act\_rejected\_total - Coordinator activities rejected total monitor element

The coord\_act\_rejected\_total stores the total number of coordinator activities at any nesting level that were rejected instead of being allowed to execute since the last reset. This counter is updated when an activity is prevented from executing by either a predictive threshold or a prevent execution work action. For service classes, the value is updated when the activity completes. For workloads, the value is updated by each workload occurrence at the end of its unit of work.

Table 540. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	Always collected
MON_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected

Table 540. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_WORKLOAD_STATS table function - Return workload statistics	Always collected
WLM_GET_SERVICE_CLASS_WORKLOAD_OCCURRENCES table function - list workload occurrences	Always collected
WLM_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	Always collected
WLM_GET_WORKLOAD_STATS table function - Return workload statistics	Always collected

Table 541. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats	Always collected
Statistics	event_superclassstats	Always collected
Statistics	event_wlstats	Always collected

## Usage

This element can be used to help determine whether or not predictive thresholds and work actions that prevent execution are being effective and whether or not they are too restrictive.

## coord\_agent\_pid - Coordinator agent identifier monitor element

The engine dispatchable unit (EDU) identifier of the coordinator agent for the application. Except on the Linux operating system, the EDU ID is mapped to the thread ID. On the Linux operating system, the EDU ID is a unique identifier the is generated by the database system.

Table 542. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl_info	Basic

Table 543. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	-

## Usage

You can use this element to link database system monitor information to other sources of diagnostic information, such as system traces.

## coord\_agent\_tid - Coordinator agent engine dispatchable unit ID monitor element

The engine dispatchable unit (EDU) identifier of the coordinator agent for the application.

Table 544. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	lock_participants	

## coord\_agents\_top - Maximum Number of Coordinating Agents

The maximum number of coordinating agents working at one time.

Table 545. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_DATABASE table function - Get database level information	Always collected
MON_GET_DATABASE_DETAILS table function - Get database information metrics	Always collected
MON_GET_INSTANCE table function - Get instance level information	Always collected

Table 546. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	db2	Basic
Database	dbase	Basic

## Usage

If the peak number of coordinating agents represents too high a workload for this node, you can reduce this upper boundary by changing the **max\_coordagents** configuration parameter.

## coord\_member - Coordinator member monitor element

Coordinating member for an application.

Table 547. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
MON_GET_CONNECTION table function - Get connection metrics	Always collected
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	Always collected

Table 547. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics	Always collected
MON_GET_UTILITY table function - Get utilities running on the database	Always collected
WLM_GET_SERVICE_CLASS_WORKLOAD_OCCURRENCES table function - list workload occurrences	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

Table 548. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Unit of work	-	Always collected
Change history	changesummary	Always collected

## coord\_node - Coordinating Node

In a multi-node system, the node number of the node where the application connected or attached to the instance.

Table 549. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl	Basic

Table 550. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Connection	event_conn	Always collected

### Usage

Each connected application is served by one coordinator node.

## coord\_partition\_num - Coordinator partition number monitor element

The coordinator partition of the unit of work or activity. In a multi-partition system, the coordinator partition is the partition where the application connected to the database.

Table 551. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
WLM_GET_SERVICE_CLASS_WORKLOAD_OCCURRENCES table function - list workload occurrences	Always collected

Table 551. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

Table 552. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Unit of work	-	Always collected
Activities	event_activity	Always collected
Threshold violations	event_thresholdviolations	Always collected

## Usage

This element allows the coordinator partition to be identified for activities or units of work that have records on partitions other than the coordinator.

### **coord\_stmt\_exec\_time - Execution time for statement by coordinator agent monitor element**

The total time spent executing this statement by coordinator agents on this member. The value is given in milliseconds.

Table 553. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE_EXEC_LIST table function - get list of statements executed by routine	ACTIVITY METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 554. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## coord\_time\_created - Time of execution on member monitor element

The time at which the activity described by this activity record began executing on the coordinator member. This element is a local timestamp.

Table 555. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	<ul style="list-style-type: none"><li>event_activity</li><li>event_activitystmt</li><li>event_activityvals</li><li>event_activitymetrics</li></ul>	Always collected

### Usage

Use this element in conjunction with other activity history elements for analysis of the behavior of an activity.

Use this element in conjunction with the [application\\_handle](#) monitor element in queries to join the activity, activitystmt, activityvals and activitymetrics tables., If the activity is rejected, then the value of the [act\\_exec\\_time](#) monitor element is 0.

In this case, the value of the [time\\_started](#) monitor element equals the value of the [time\\_completed](#) monitor element.

## corr\_token - DRDA Correlation Token

The DRDA AS correlation token.

Table 556. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl_info	Basic
Application	appl	Basic

Table 557. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Connections	event_connheader	Always collected

### Usage

The DRDA correlation token is used for correlating the processing between the application server and the application requester. It is an identifier dumped into logs when errors arise, that you can use to identify the conversation that is in error. In some cases, it will be the LUWID of the conversation.

If communications are not using DRDA, this element returns the *appl\_id* (see *appl\_id*).

If you are using the database system monitor APIs, note that the API constant `SQLM_APPLID_SZ` is used to define the length of this element.

## cost\_estimate\_top - Cost estimate top monitor element

The `cost_estimate_top` monitor element is a high watermark for the estimated cost of DML activities at all nesting levels in a service subclass or work class. For service subclasses, this monitor element returns -1 when `COLLECT AGGREGATE ACTIVITY DATA` for the service subclass is set to `NONE`. For work classes, this monitor elements returns -1 if no `COLLECT AGGREGATE ACTIVITY DATA` work action is specified for the work class.

For service classes, the estimated cost of DML activities is counted only toward the service subclass in which the activity enters the system. When you remap activities between service subclasses with a REMAP ACTIVITY action, the cost\_estimate\_top of the service subclass you remap an activity to is unaffected.

Table 558. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected

Table 559. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats	-
Statistics	event_superclasstats	-
Statistics	event_wcstats	-
Statistics	event_wlstats	-

## Usage

Use this element to determine the highest DML activity estimated cost reached on a member for a service class, workload, or work class in the time interval collected.

## count - Number of Event Monitor Overflows

The number of consecutive overflows that have occurred.

### Element identifier

count

### Element type

counter

Table 560. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Overflow Record	event_overflow	Always collected

## Usage

You may use this element to get an indication of how much monitor data has been lost.

The event monitor sends one overflow record for a set of consecutive overflows.

## cpu\_configured - Number of configured CPUs monitor element

The number of processors on this host that the operating system is aware of.

Table 561. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ENV_GET_SYSTEM_RESOURCES table function - Return system information	Always collected

Table 562. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_osmetrics	Always collected

### Usage

This metric reports point in time information at statistics event monitor record generation.

### cpu\_cores\_per\_socket - Number of CPU cores per socket monitor element

The number of CPU cores per socket. On single core systems, this value is 1.

Table 563. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ENV_GET_SYSTEM_RESOURCES table function - Return system information	Always collected

Table 564. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_osmetrics	Always collected

### Usage

This metric reports point in time information at statistics event monitor record generation.

### CPU\_ENTITLEMENT - The CPU entitlement monitor element

The percentage of total cpu on a host or lpar that this service subclass or superclass is configured to use.

Table 565. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	Always collected
MON_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected

Table 566. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats	Always collected
Statistics	event_superclasstats	Always collected
Statistics	event_superclasstats	Always collected

## cpu\_hmt\_degree - Number of logical CPUs monitor element

On systems that support hardware multithreading, the number of logical processors that appear to be present as a result of multithreading. On systems that do not support multithreading, this value is 1.

Table 567. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ENV_GET_SYSTEM_RESOURCES table function - Return system information	Always collected

Table 568. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_osmetrics	Always collected

### Usage

This metric reports point in time information at statistics event monitor record generation.

## cpu\_idle - Processor idle time monitor element

Processor idle time, expressed in processor ticks. Reported for Windows, AIX and Linux systems only. This measurement represents the aggregate for all processors on the system.

Table 569. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ENV_GET_SYSTEM_RESOURCES table function - Return system information	Always collected

Table 570. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_osmetrics	Always collected

### Usage

This measurement represents the aggregate for all processors on the system. For the statistics event monitor, this value is a delta from the previously collected value.

On AIX, this metric is reported for the workload partition (WPAR) and the logical partition (LPAR) on which the database server is running.

You can use this monitor element along with the related processor timer elements to calculate processor utilization for a specific time interval on the host system. To calculate processor utilization as a percentage, perform the following steps:

1. Use the ENV\_GET\_SYSTEM\_RESOURCES function at the beginning to the time interval to retrieve the values for the following metrics:
  - $cpu\_user_{t1} = \mathbf{cpu\_user}$
  - $cpu\_system_{t1} = \mathbf{cpu\_system}$
  - $cpu\_idle_{t1} = \mathbf{cpu\_idle}$
  - $cpu\_wait_{t1} = \mathbf{cpu\_wait}$
2. Repeat the preceding step to determine the timestamps for the same metrics at the end of the time interval for which you want to calculate processor utilization:

- $\text{cpu\_user}_{t_2} = \text{cpu\_user}$
- $\text{cpu\_system}_{t_2} = \text{cpu\_system}$
- $\text{cpu\_idle}_{t_2} = \text{cpu\_idle}$
- $\text{cpu\_iowait}_{t_2} = \text{cpu\_iowait}$

3. Calculate processor utilization using the following formula:

$$100 \times \frac{(\text{cpu\_system}_{t_2} - \text{cpu\_system}_{t_1}) + (\text{cpu\_user}_{t_2} - \text{cpu\_user}_{t_1})}{(\text{cpu\_system}_{t_2} - \text{cpu\_system}_{t_1}) + (\text{cpu\_user}_{t_2} - \text{cpu\_user}_{t_1}) + (\text{cpu\_idle}_{t_2} - \text{cpu\_idle}_{t_1}) + (\text{cpu\_iowait}_{t_2} - \text{cpu\_iowait}_{t_1})}$$

## cpu\_iowait - IO Wait time monitor element

Time spent waiting for IO (Linux, UNIX); time spent receiving and servicing hardware interrupts (Windows), expressed in processor ticks. Reported for Windows, AIX and Linux systems only. This measurement represents the aggregate for all processors on the system.

Table 571. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ENV_GET_SYSTEM_RESOURCES table function - Return system information	Always collected

Table 572. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_osmetrics	Always collected

## Usage

This measurement represents the aggregate for all processors on the system. For the statistics event monitor, this value is a delta from the previously collected value.

On AIX, this metric is reported for the workload partition (WPAR) and the logical partition (LPAR) on which the database server is running.

You can use this monitor element along with the related processor timer elements to calculate processor utilization for a specific time interval on the host system. To calculate processor utilization as a percentage, perform the following steps:

1. Use the ENV\_GET\_SYSTEM\_RESOURCES function at the beginning to the time interval to retrieve the values for the following metrics:
  - $\text{cpu\_user}_{t_1} = \text{cpu\_user}$
  - $\text{cpu\_system}_{t_1} = \text{cpu\_system}$
  - $\text{cpu\_idle}_{t_1} = \text{cpu\_idle}$
  - $\text{cpu\_wait}_{t_1} = \text{cpu\_wait}$
2. Repeat the preceding step to determine the timestamps for the same metrics at the end of the time interval for which you want to calculate processor utilization:
  - $\text{cpu\_user}_{t_2} = \text{cpu\_user}$
  - $\text{cpu\_system}_{t_2} = \text{cpu\_system}$
  - $\text{cpu\_idle}_{t_2} = \text{cpu\_idle}$
  - $\text{cpu\_iowait}_{t_2} = \text{cpu\_iowait}$
3. Calculate processor utilization using the following formula:

$$100 \times \frac{(\text{cpu\_system}_{t_2} - \text{cpu\_system}_{t_1}) + (\text{cpu\_user}_{t_2} - \text{cpu\_user}_{t_1})}{(\text{cpu\_system}_{t_2} - \text{cpu\_system}_{t_1}) + (\text{cpu\_user}_{t_2} - \text{cpu\_user}_{t_1}) + (\text{cpu\_idle}_{t_2} - \text{cpu\_idle}_{t_1}) + (\text{cpu\_iowait}_{t_2} - \text{cpu\_iowait}_{t_1})}$$

## cpu\_limit - WLM dispatcher CPU limit monitor element

The WLM dispatcher CPU limit configured for the service class.

Table 573. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_SAMPLE_SERVICE_CLASS_METRICS - Get sample service class metrics	Always collected

## cpu\_load\_long - Processor load (long timeframe) monitor element

Processor load over the longer term, as defined by the system. For example, the average processor load over the past 10 or 15 minutes. Reported for all platforms except Windows.

Table 574. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ENV_GET_SYSTEM_RESOURCES table function - Return system information	Always collected

Table 575. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_osmetrics	Always collected

### Usage

This metric reports point in time information at statistics event monitor record generation.

## cpu\_load\_medium - Processor load (medium timeframe) monitor element

Processor load over the medium term, as defined by the system. For example, the average processor load over the past 5 or 10 minutes. Reported for all platforms except Windows.

Table 576. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ENV_GET_SYSTEM_RESOURCES table function - Return system information	Always collected

Table 577. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_osmetrics	Always collected

### Usage

This metric reports point in time information at statistics event monitor record generation.

## cpu\_load\_short - Processor load (short timeframe) monitor element

Processor load over the short term, as defined by the system. For example, the average processor load over the past 1 or 5 minutes. Reported for all platforms except Windows.

Table 578. Table Function Monitoring Information

Table Function	Monitor Element Collection Level

Statistics	event_superclasstats	Always collected

## cpu\_shares - WLM dispatcher CPU shares monitor element

The number of WLM dispatcher CPU shares configured for the service class.

Table 584. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_SAMPLE_SERVICE_CLASS_METRICS - Get sample service class metrics	Always collected

## cpu\_speed - CPU clock speed monitor element

The clock speed of the processors on this host, in MHz. The speed reported reflects the current CPU clock speed and not the maximum speed.

Table 585. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ENV_GET_SYSTEM_RESOURCES table function - Return system information	Always collected

Table 586. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_osmetrics	Always collected

## Usage

This metric reports point in time information at statistics event monitor record generation.

## cpu\_system - Kernel time monitor element

Time spent running kernel code, expressed in processor ticks. Reported for Windows, AIX and Linux systems only. This measurement represents the aggregate for all processors on the system.

Table 587. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ENV_GET_SYSTEM_RESOURCES table function - Return system information	Always collected
ENV_GET_DB2_SYSTEM_RESOURCES table function - Return Db2(r) system information	Always collected

Table 588. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_osmetrics	Always collected

## Usage

This measurement represents the aggregate for all processors on the system. For the statistics event monitor, this value is a delta from the previously collected value.

On AIX, this metric is reported for the workload partition (WPAR) and the logical partition (LPAR) on which the database server is running.

You can use this monitor element along with the related processor timer elements to calculate processor utilization for a specific time interval on the host system. To calculate processor utilization as a percentage, perform the following steps:

1. Use the ENV\_GET\_SYSTEM\_RESOURCES function at the beginning to the time interval to retrieve the values for the following metrics:
  - $cpu\_user_{t1} = \mathbf{cpu\_user}$
  - $cpu\_system_{t1} = \mathbf{cpu\_system}$
  - $cpu\_idle_{t1} = \mathbf{cpu\_idle}$
  - $cpu\_wait_{t1} = \mathbf{cpu\_wait}$
2. Repeat the preceding step to determine the timestamps for the same metrics at the end of the time interval for which you want to calculate processor utilization:
  - $cpu\_user_{t2} = \mathbf{cpu\_user}$
  - $cpu\_system_{t2} = \mathbf{cpu\_system}$
  - $cpu\_idle_{t2} = \mathbf{cpu\_idle}$
  - $cpu\_iowait_{t2} = \mathbf{cpu\_iowait}$
3. Calculate processor utilization using the following formula:

$$100 \times \frac{(cpu\_system_{t2} - cpu\_system_{t1}) + (cpu\_user_{t2} - cpu\_user_{t1})}{(cpu\_system_{t2} - cpu\_system_{t1}) + (cpu\_user_{t2} - cpu\_user_{t1}) + (cpu\_idle_{t2} - cpu\_idle_{t1}) + (cpu\_iowait_{t2} - cpu\_iowait_{t1})}$$

## cpu\_timebase - Frequency of timebase register increment monitor element

The frequency, in Hz, at which the timebase register is incremented. For Linux and PowerPC systems only

Table 589. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ENV_GET_SYSTEM_RESOURCES table function - Return system information	Always collected

Table 590. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_osmetrics	Always collected

## Usage

This metric reports point in time information at statistics event monitor record generation.

## cpu\_total - Number of CPUs monitor element

The number of processors on this host.

Table 591. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ENV_GET_SYSTEM_RESOURCES table function - Return system information	Always collected

Table 592. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_osmetrics	Always collected

### Usage

This metric reports point in time information at statistics event monitor record generation.

The number reported for this monitor element means different things in different operating environments. For example, when returned from a Windows, system, **cpu\_total** refers to the total number of processors installed; on AIX, it represents the number of configured processors.

## cpu\_usage\_total - Processor usage monitor element

The overall processor usage on this host including kernel processing time, expressed as a percentage. Reported for AIX, Linux and Windows systems only.

Table 593. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ENV_GET_SYSTEM_RESOURCES table function - Return system information	Always collected

Table 594. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_osmetrics	Always collected

### Usage

This metric reports point in time information at statistics event monitor record generation.

## cpu\_user - Non-kernel processing time monitor element

Time spent running user (non-kernel) code, expressed in processor ticks. Reported for Windows, AIX, and Linux systems only. This measurement represents the aggregate for all processors on the system.

Table 595. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ENV_GET_SYSTEM_RESOURCES table function - Return system information	Always collected
ENV_GET_DB2_SYSTEM_RESOURCES table function - Return Db2(r) system information	Always collected

Table 596. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_osmetrics	Always collected

## Usage

This measurement represents the aggregate for all processors on the system. For the statistics event monitor, this value is a delta from the previously collected value.

On AIX, this metric is reported for the workload partition (WPAR) and the logical partition (LPAR) on which the database server is running.

You can use this monitor element along with the related processor timer elements to calculate processor utilization for a specific time interval on the host system. To calculate processor utilization as a percentage, perform the following steps:

1. Use the ENV\_GET\_SYSTEM\_RESOURCES function at the beginning to the time interval to retrieve the values for the following metrics:
  - $cpu\_user_{t1} = \mathbf{cpu\_user}$
  - $cpu\_system_{t1} = \mathbf{cpu\_system}$
  - $cpu\_idle_{t1} = \mathbf{cpu\_idle}$
  - $cpu\_wait_{t1} = \mathbf{cpu\_wait}$
2. Repeat the preceding step to determine the timestamps for the same metrics at the end of the time interval for which you want to calculate processor utilization:
  - $cpu\_user_{t2} = \mathbf{cpu\_user}$
  - $cpu\_system_{t2} = \mathbf{cpu\_system}$
  - $cpu\_idle_{t2} = \mathbf{cpu\_idle}$
  - $cpu\_iowait_{t2} = \mathbf{cpu\_iowait}$
3. Calculate processor utilization using the following formula:

$$100 \times \frac{(cpu\_system_{t2} - cpu\_system_{t1}) + (cpu\_user_{t2} - cpu\_user_{t1})}{(cpu\_system_{t2} - cpu\_system_{t1}) + (cpu\_user_{t2} - cpu\_user_{t1}) + (cpu\_idle_{t2} - cpu\_idle_{t1}) + (cpu\_iowait_{t2} - cpu\_iowait_{t1})}$$

## cpu\_utilization - CPU utilization monitor element

The total CPU time consumed by the service class or workload on a particular logical partition divided by the amount of CPU time available on the host or the LPAR in a given period of time. The CPU usage is expressed as a percentage in the range 0 - 100.

Table 597. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	ACTIVITY METRICS BASE
MON_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected
MON_GET_WORKLOAD_STATS table function - Return workload statistics	REQUEST METRICS BASE
MON_SAMPLE_SERVICE_CLASS_METRICS - Get sample service class metrics	REQUEST METRICS BASE

Table 597. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_SAMPLE_WORKLOAD_METRICS - Get sample workload metrics	REQUEST METRICS BASE
WLM_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	REQUEST METRICS BASE
WLM_GET_WORKLOAD_STATS table function - Return workload statistics	REQUEST METRICS BASE

Table 598. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document	REQUEST METRICS BASE

## Usage

When returned by the WLM\_GET\_WORKLOAD\_STATS or the WLM\_GET\_SERVICE\_SUBCLASS\_STATS function, this monitor element represents the CPU utilization since the last reset of the statistics.

When returned by the MON\_SAMPLE\_SERVICE\_CLASS\_METRICS or the MON\_SAMPLE\_WORKLOAD\_METRICS function, this monitor element represents the CPU utilization since the function was executed.

## cpu\_velocity - CPU velocity monitor element

A measure of the amount of contention for the CPU resources, measured on a scale from 0 to 1, with lower numbers meaning greater contention.

CPU velocity is computed by measuring the amount of time that work in a service class has access to the CPU divided by the total time spent accessing the CPU or waiting to access the CPU. It gives a measure of how efficiently the work is being executed relative to how efficiently it could be executed if such work never had to wait for the CPU. The formula is as follows:

$$\text{cpu\_velocity} = \text{total\_cpu\_time} / (\text{total\_cpu\_time} + \text{total\_disp\_run\_queue\_time})$$

The **wlm\_dispatcher** database manager configuration parameter must be set to ON for **cpu\_velocity** to be collected.

Table 599. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_SAMPLE_SERVICE_CLASS_METRICS - Sample service class metrics	REQUEST METRICS BASE
MON_SAMPLE_WORKLOAD_METRICS - Sample workload metrics	REQUEST METRICS BASE

## Usage

The dispatcher is effective at prioritizing a service class or workload when that service class or workload demands more CPU resources at a given instant than can be supplied. In such instances, the work executing in the service class or workload spends time queuing to access the CPU resources. It is when this occurs that the dispatcher can give more of the CPU resources to such a service class or workload by reducing how much of the CPU resources it gives to another. A high CPU velocity indicates that the dispatcher can have little effect on improving response times or throughput for this service class at its current level of CPU demand because this demand is already being met. A low CPU velocity indicates that the dispatcher can potentially have a significant effect on improving response times or throughput for this service class or workload at its current level of CPU demand.

Use this element to determine whether the work executing in a service class or workload is spending a relatively large proportion of its time queuing to use the CPU resources. If the CPU velocity for a service class is low and you want to increase it, you can adjust the WLM dispatcher control of the CPU resources by increasing the number of CPU shares or increasing the CPU limit assigned to the service class that is exhibiting a low CPU velocity.

## **cputime\_threshold\_id - CPU time threshold ID monitor element**

The ID of the CPUTIME threshold that was applied to the activity.

*Table 600. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

## Usage

Use this element to understand which CPUTIME threshold, if any, was applied to the activity.

## **cputime\_threshold\_value - CPU time threshold value monitor element**

The upper bound of the CPUTIME threshold that was applied to the activity.

*Table 601. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

## Usage

Use this element to understand the value of the CPUTIME threshold applied to the activity, if any.

## **cputime\_threshold\_violated - CPU time threshold violated monitor element**

This monitor element returns '1' (Yes) to indicate that the activity violated the CPUTIME threshold. '0' (No) indicates that the activity has not yet violated the threshold.

*Table 602. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

### **Usage**

Use this element to determine if the activity violated the CPUTIME threshold that was applied to the activity.

## **cputimeinsc\_threshold\_id - CPU time in service class threshold ID monitor element**

The ID of the CPUTIMEINSC threshold that was applied to the activity.

*Table 603. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

### **Usage**

Use this element to understand which CPUTIMEINSC threshold, if any, was applied to the activity.

## **cputimeinsc\_threshold\_value - CPU time in service class threshold value monitor element**

The upper bound of the CPUTIMEINSC threshold that was applied to the activity.

*Table 604. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_ACTIVITY table function - Return a list of activities	Always collected

Table 604. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

### Usage

Use this element to understand the value of the CPUTIMEINSC threshold applied to the activity, if any.

### **cputimeinsc\_threshold\_violated - CPU time in service class threshold violated monitor element**

This monitor element returns '1' (Yes) to indicate that the activity violated the CPUTIMEINSC threshold. '0' (No) indicates that the activity has not yet violated the threshold.

Table 605. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

### Usage

Use this element to determine if the activity violated the CPUTIMEINSC threshold that was applied to the activity.

### **create\_nickname - Create Nicknames**

This element contains a count of the total number of times the federated server has created a nickname over an object residing on this data source on behalf of any application since the start of the federated server instance or the last reset of the database monitor counters. The monitor stores the most recent of the values.

Table 606. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase_remote	Basic
Application	appl_remote	Basic

For snapshot monitoring, this counter can be reset.

### Usage

Use this element to determine the amount of CREATE NICKNAME activity against this data source by this federated server instance or an application. CREATE NICKNAME processing results in multiple queries

running against the data source catalogs; therefore, if the value of this element is high, you should determine the cause and perhaps restrict this activity.

## create\_nickname\_time - Create Nickname Response Time

This element contains the aggregate amount of time, in milliseconds, that it has taken this data source to process CREATE NICKNAME statements from all applications or a single application running on this federated server instance. The response time is measured since the start of the federated server instance, or the last reset of the database monitor counter, whichever is the latest. The response time is measured as the difference between the time the federated server started retrieving information from the data source to process the CREATE NICKNAME statement, and the time it took to retrieve all the required data from the data source.

Table 607. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase_remote	Timestamp
Application	appl_remote	Timestamp

For snapshot monitoring, this counter can be reset.

### Usage

Use this element to determine how much actual time was used to create nicknames for this data source.

## creator - Application Creator

The authorization ID of the user that pre-compiled the application.

Table 608. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	stmt	Statement
DCS Statement	dcs_stmt	Statement

Table 609. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Deadlocks	event_dlconn	-
Statements	event_stmt	-
Activities	event_activitystmt	-

### Usage

Use this element to help identify the SQL statement that is processing, in conjunction with the CREATOR column of the package section information in the catalogs.

If the CURRENT PACKAGE PATH special register is set, the *creator* value may reflect different values over the lifetime of the SQL statement. If a snapshot or event monitor record is taken before PACKAGE PATH resolution, the *creator* value will reflect the value flowed in from the client request. If a snapshot or event monitor record is taken after PACKAGE PATH resolution, the *creator* value will reflect the creator of the resolved package. The resolved package will be the package whose *creator* value appears earliest in the CURRENT PACKAGE PATH SPECIAL REGISTER and whose package name and unique ID matches that of the client request.

## critical\_priority\_act\_total - The total number of critical priority activities monitor element

The total count of the number of critical priority activities since the last reset.

Table 610. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	Always collected
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	Always collected
MON_GET_DATABASE table function - Get database level information	Always collected
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	Always collected
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	Always collected
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	Always collected
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get service subclass metrics as an XML document	Always collected
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	Always collected
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	Always collected
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	Always collected
MON_GET_WORKLOAD table function - Get workload metrics	Always collected
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	Always collected

Table 611. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activity	event_activitymetrics	ACTIVITY METRICS BASE
Package cache statement eviction	pkgcache_metrics	ACTIVITY METRICS BASE
Statistics	event_wlmetrics	REQUEST METRICS BASE
Statistics	event_scmetrics	REQUEST METRICS BASE

Table 611. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Unit of work	uow_metrics	REQUEST METRICS BASE

## Usage

Use this element to determine the number of critical priority activities since the last reset.

## current\_active\_log - Current Active Log File Number

The file number of the active log file the database system is currently writing.

Table 612. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TRANSACTION_LOG table function - Get log information	Always collected

Table 613. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	detail_log	Basic

Table 614. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected

## Usage

Use this element in conjunction with the *first\_active\_log* and *last\_active\_log* elements to determine the range of active log files. Knowing the range of active log files helps you determine the disk space required for log files.

You can also use this element to determine which log files have data to help you identify log files needed for split mirror support.

## current\_archive\_log - Current Archive Log File Number

The file number of the log file that the database system is currently archiving. If the database system is not archiving a log file, the value for this element is SQLM\_LOGFILE\_NUM\_UNKNOWN.

Table 615. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TRANSACTION_LOG table function - Get log information	Always collected

Table 616. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	detail_log	Basic

---

Table 617. Event Monitoring Information

---

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected

---

**Usage**

Use this element to determine if there is a problem archiving log files. Such problems include:

- Slow archive media
- Archive media that is not available

**current\_cf\_gbp\_size - Current cluster caching facility group buffer pool size monitor element**

Group buffer pool memory currently in use at the cluster caching facility, in pages with a page size of 4 KB.

---

Table 618. Table Function Monitoring Information

---

Table Function	Monitor Element Collection Level
MON_GET_CF table function - Get CF metrics	Always collected

---

**current\_cf\_lock\_size - Current cluster caching facility lock size monitor element**

Global lock memory currently in use, in pages with a page size of 4 KB.

---

Table 619. Table Function Monitoring Information

---

Table Function	Monitor Element Collection Level
MON_GET_CF table function - Get CF metrics	Always collected

---

**current\_cf\_mem\_size - Current cluster caching facility memory size monitor element**

Total memory currently in use, in pages with a page size of 4 KB.

---

Table 620. Table Function Monitoring Information

---

Table Function	Monitor Element Collection Level
MON_GET_CF table function - Get CF metrics	Always collected

---

**current\_cf\_sca\_size - Current cluster caching facility shared communications area size monitor element**

Shared communications area memory currently in use, in pages with a page size of 4 KB.

---

Table 621. Table Function Monitoring Information

---

Table Function	Monitor Element Collection Level
MON_GET_CF table function - Get CF metrics	Always collected

---

## current\_extent - Extent currently being moved monitor element

The numeric identifier of the extent currently being moved by the table space reclaim process. A value of -1 indicates that an extent is not currently being moved. This will appear if the table space reclaim process has just been started or if it is in between moving a batch of extents.

Table 622. Table Function Monitoring Information

Table Function	Monitor Element Collection Command and Level
MON_GET_EXTENT_MOVEMENT_STATUS - Get extent movement progress status metrics	Always collected

## current\_isolation - Current isolation level monitor element

Identifies the isolation level for any dynamic SQL statements issued within the current session.

Table 623. Table function monitoring information

Table function	Monitor element collection level
MON_GET_CONNECTION table function - Get connection metrics	Always collected
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	Always collected
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	Always collected

## current\_request - Current operation request monitor element

The operation currently being processed or most recently processed by the agent.

Table 624. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	lock_participants	

## cursor\_name - Cursor Name

The name of the cursor corresponding to this SQL statement.

### Element identifier

cursor\_name

### Element type

information

Table 625. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	stmt	Statement

Table 626. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Deadlocks with Details	event_detailed_dlconn	Always collected
Statements	event_stmt	Always collected

### Usage

You may use this element to identify the SQL statement that is processing. This name will be used on an OPEN, FETCH, CLOSE, and PREPARE of an SQL SELECT statement. If a cursor is not used, this field will be blank.

## D

### data\_object\_l\_pages - Table data logical pages monitor element

The number of logical pages used on disk by data contained in this table.

Table 627. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLE table function - Get table metrics	Always collected

### Usage

- This value might be more than the amount of space allocated for the object. This can happen when you use the RECLAIM EXTENTS ONLY option with the REORG TABLE command. In this case, reclaimed extents are included in the logical number of pages returned by MON\_GET\_TABLE.
- This value might be less than the amount of space physically allocated for the object. This can happen when you use the REUSE STORAGE option of the TRUNCATE statement. This option causes storage allocated for the table to continue to be allocated, although the storage will be considered empty. In addition, the value for this monitor element might be less than the amount of space logically allocated for the object, because the total space logically allocated includes a small amount of additional meta data.

To retrieve an accurate measure of the logical or physical size of an object, use the ADMIN\_GET\_TAB\_INFO\_V97 function. This function provides more accurate information about the size of objects than you can obtain by multiplying the number of pages reported for this monitor element by the page size.

### data\_object\_pages - Data Object Pages

The number of disk pages consumed by a table. This size represents the base table size only. Space consumed by index objects are reported by *index\_object\_pages*, LOB data is reported by *lob\_object\_pages*, and long data is reported by *long\_object\_pages*.

Table 628. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table	table	Basic

Table 629. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Tables	event_table	Always collected

## Usage

This element provides a mechanism for viewing the actual amount of space consumed by a particular table. This element can be used in conjunction with a table event monitor to track the rate of table growth over time.

## data\_partition\_id - Data partition identifier monitor element

The identifier of the data partition for which information is returned.

Table 630. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ADMINTABINFO administrative view and ADMIN_GET_TAB_INFO table function - retrieve table size and state information	Always collected
MON_FORMAT_LOCK_NAME table function - Format the internal lock name and return details	Always collected
MON_GET_INDEX table function - Get index metrics	Always collected
MON_GET_INDEX_USAGE_LIST table function - Returns information from an index usage list	Always collected
MON_GET_PAGE_ACCESS_INFO table function - Get buffer pool page waiting information	Always collected
MON_GET_TABLE table function - Get table metrics	Always collected
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	Always collected
MON_GET_USAGE_LIST_STATUS table function - Returns the status on a usage list	Always collected

Table 631. Snapshot monitoring information

Snapshot level	Logical data grouping	Monitor switch
Table	table	Basic
Lock	lock	Lock
Lock	lock_wait	Lock

Table 632. Event monitoring information

Event type	Logical data grouping	Monitor switch
Table	event_table	-
Deadlocks	event_dlconn	-
Deadlocks with Details	event_detailed_dlconn	-
Deadlocks	lock	-

## Usage

This element is only applicable to partitioned tables and partitioned indexes. Otherwise, the value of this monitor element is NULL.

When returning lock level information, a value of -1 represents a lock which controls access to the whole table.

## **data\_sharing\_remote\_lockwait\_count - Data sharing remote lock wait count monitor element**

The number of times that the table exits the NOT\_SHARED data sharing state.

*Table 633. Table function monitoring information*

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_DATABASE - Get database level information	Always collected
MON_GET_DATABASE_DETAILS table function - Get database information metrics	Always collected
MON_GET_TABLE - Get table metrics	Always collected

### **Usage**

In a Db2 pureScale environment, when an application connected to a remote member requests a lock on a table that is in a NOT\_SHARED state on the specified member, the application must wait for the table to convert to a SHARED state before it can acquire a lock on the table.

This monitor element counts the number of times that remote applications waited for the specified table to transition out of the NOT\_SHARED state. At the table level, this number indicates the number of times that the specified table moved out of the NOT\_SHARED state during the current activation of the database on the specified member. At the database level, this number indicates the aggregate number of times that tables moved out of the NOT\_SHARED state during the current activation of the database on the specified member.

If the **opt\_direct\_wrkld** database configuration parameter is set to OFF, then the NULL value is returned.

## **data\_sharing\_remote\_lockwait\_time - Data sharing remote lock wait time monitor element**

The number of milliseconds that remote applications waited while the table transitions out of the NOT\_SHARED data sharing state.

*Table 634. Table function monitoring information*

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_DATABASE - Get database level information	Always collected
MON_GET_DATABASE_DETAILS table function - Get database information metrics	Always collected
MON_GET_TABLE - Get table metrics	Always collected

### **Usage**

In a Db2 pureScale environment, when an application connected to a remote member requests a lock on a table that is in a NOT\_SHARED state on the specified member, the application must wait for the table to convert to a SHARED state before it can acquire a lock on the table.

At the table level, this element measures the amount of time that the specified table spent exiting out of the NOT\_SHARED state during the current activation of the database on the specified member. At the database level, this element measures the aggregate amount of time that tables spent moving out of the NOT\_SHARED state during the current activation of the database on the specified member.

If the **opt\_direct\_wrkld** database configuration parameter is set to OFF, then the 'NULL' is returned.

## data\_sharing\_state - Data sharing state monitor element

Indicates the current data sharing state of the table.

*Table 635. Table function monitoring information*

Table function	Monitor element collection level
MON_GET_TABLE - Get table metrics	Always collected

### Usage

Use this monitor element to determine the current data sharing state of the table. The following string values are returned by the query:

#### SHARED

The table is fully shared across all members.

#### BECOMING\_NOT\_SHARED

The table is moving from SHARED to NOT\_SHARED.

#### NOT\_SHARED

All access to the table in this EHL state is done on this member.

#### BECOMING\_SHARED

The table is moving from NOT\_SHARED to SHARED.

#### NULL

The **opt\_direct\_wrkld** database configuration parameter is set to OFF or the database is not running the configuration for aDb2 pureScale instance. 'NULL' is used to indicate that no value is being returned.

This monitor element indicates the data sharing state for the specified member. A SHARED state means that table is shared according to the information available to that member, however it is possible that the table has a NOT\_SHARED state on other members. To determine the actual data sharing state of a table, you must determine its data sharing state on all members and see whether any are in a non-SHARED state.

## data\_sharing\_state\_change\_time - Data sharing state change time monitor element

The timestamp for the last explicit hierarchical locking (EHL) state change for this table.

If the table never exits the SHARED state during the current database activation on the specified member, then this element returns NULL. If the **opt\_direct\_wrkld** database configuration parameter is set to OFF, then the NULL value is returned.

*Table 636. Table function monitoring information*

Table function	Monitor element collection level
MON_GET_TABLE - Get table metrics	Always collected

## datasource\_name - Data Source Name

This element contains the name of the data source whose remote access information is being displayed by the federated server. This element corresponds to the 'SERVER' column in SYSCAT.SERVERS.

### Element identifier

datasource\_name

### Element type

information

Table 637. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase_remote	Basic
Application	appl_remote	Basic

### Usage

Use this element to identify the data source whose access information has been collected and is being returned.

## datataginsc\_threshold\_id - Data tag in service class threshold (IN condition) ID

The ID of the DATATAGINSC IN threshold that was applied to the activity.

Table 638. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

### Usage notes

- Use this element to understand which DATATAGINSC IN threshold was applied to the activity, if any.

## datataginsc\_threshold\_value - Data tag in service class threshold (IN condition) value

Comma separated list of data tags in the DATATAGINSC IN threshold that was applied to the activity.

Table 639. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected

Table 639. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

### Usage notes

- Use this element to understand the value of the DATATAGINSC IN threshold applied to the activity, if any.

### **datataginsc\_threshold\_violated - Data tag in service class threshold (IN condition) violated**

Indicates if the activity has violated the DATATAGINSC IN threshold. Returns 1 if the activity violated the DATATAGINSC IN threshold. Returns 0 if the activity has not violated the threshold.

Table 640. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

### Usage notes

- Use this element to determine if the activity violated the DATATAGINSC IN threshold that was applied to the activity.

### **datatagnotinsc\_threshold\_id - Data tag in service class threshold (NOT IN condition) ID**

The ID of the DATATAGINSC NOT IN threshold that was applied to the activity.

Table 641. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

### Usage notes

- Use this element to understand which DATATAGINSC NOT IN threshold was applied to the activity, if any.

## **datatagnotinsc\_threshold\_value - Data tag in service class threshold (NOT IN condition) value**

Comma separated list of data tags in the DATATAGINSC NOT IN threshold that was applied to the activity.

*Table 642. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

### **Usage notes**

- Use this element to understand the value of the DATATAGINSC NOT IN threshold applied to the activity, if any.

## **datatagnotinsc\_threshold\_violated - Data tag in service class threshold (NOT IN condition) violated**

Indicates if the activity has violated the DATATAGINSC NOT IN threshold. Returns 1 if the activity violated the DATATAGINSC NOT IN threshold. Returns 0 if the activity did not violate the threshold.

*Table 643. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

### **Usage notes**

- Use this element to determine if the activity violated the DATATAGINSC NOT IN threshold that was applied to the activity.

## **db\_activation\_state - Database activation state monitor element**

Current activation state of the database.

*Table 644. Table function monitoring information*

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_DATABASE table function - Get database level information	Always collected
MON_GET_DATABASE_DETAILS table function - Get database information metrics	Always collected

## Usage

Possible database activation states include:

### NONE

Not activated and shuts down on the last connection.

### IMPLICIT

Implicitly activated during connection processing and does not shutdown on last connection.

### EXPLICIT

Explicitly activated by a command and does not shutdown on last connection.

## db\_conn\_time - Database activation timestamp monitor element

The date and time of the connection to the database (at the database level, this is the first connection to the database), or when the activate database was issued.

Table 645. Table function monitoring information

Table function	Monitor element collection level
MON_GET_DATABASE table function - Get database level information	Always collected
MON_GET_DATABASE_DETAILS table function - Get database information metrics	Always collected

Table 646. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Timestamp
Table Space	tablespace_list	Buffer Pool, Timestamp
Table	table_list	Timestamp

Table 647. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Unit of work	-	-
Change history	evmonstart	Always collected

## Usage

Use this element with the **disconn\_time** monitor element to calculate the total connection time.

For the change history event monitor, this element can be used to track when deferred database configuration parameter updates took effect.

## db\_heap\_top - Maximum Database Heap Allocated

This element is being maintained for product version compatibility. It measures memory usage, but not exclusively usage by the database heap.

**Note:** The **db\_heap\_top** monitor element is deprecated. Using this monitor element will not generate an error. However, it does not return a valid value and might be removed in a future release.

Table 648. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic

Table 649. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected

## db\_location - Database Location

The location of the database in relation to the application.

Table 650. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic

### Usage

Determine the relative location of the database server with respect to the application taking the snapshot. Values are:

- SQLM\_LOCAL
- SQLM\_REMOTE

## db\_name - Database name monitor element

The real name of the database for which information is collected or to which the application is connected. This is the name the database was given when created.

Table 651. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_AUTO_MAINT_QUEUE table function - Get information on automatic maintenance jobs	Always collected
MON_GET_CF table function - Get CF metrics	Always collected
MON_GET_MEMORY_POOL table function - Get memory pool information	Always collected
MON_GET_MEMORY_SET table function - Get memory set information	Always collected
MON_SAMPLE_SERVICE_CLASS_METRICS - Get sample service class metrics	Always collected
MON_SAMPLE_WORKLOAD_METRICS - Get sample workload metrics	Always collected

Table 652. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic
Database	dbase_remote	Basic

Table 652. Snapshot Monitoring Information (continued)

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl_id_info	Basic
Application	appl_remote	Basic
Table Space	tablespace_list	Buffer Pool
Buffer Pool	bufferpool	Buffer Pool
Table	table_list	Table
Lock	db_lock_list	Basic
Dynamic SQL	dynsql_list	Basic
DCS Database	dcs_dbase	Basic
DCS Application	dcs_appl_info	Basic

Table 653. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_dbheader	Always collected

## Usage

You may use this element to identify the specific database to which the data applies.

For applications that are not using Db2 Connect to connect to a host or System i® database server, you can use this element in conjunction with the **db\_path** monitor element to uniquely identify the database and help relate the different levels of information provided by the monitor.

## db\_path - Database Path

The full path of the location where the database is stored on the monitored system.

Table 654. Table function monitoring information

Table function	Monitor element collection level
MON_GET_DATABASE table function - Get database level information	Always collected
MON_GET_DATABASE_DETAILS table function - Get database information metrics	Always collected

Table 655. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic
Application	appl_id_info	Basic
Table Space	tablespace_list	Buffer Pool
Buffer Pool	bufferpool	Buffer Pool
Table	table_list	Table
Lock	db_lock_list	Basic

Table 655. Snapshot Monitoring Information (continued)

Snapshot Level	Logical Data Grouping	Monitor Switch
Dynamic SQL	dynsql_list	Basic

Table 656. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_dbheader	Always collected

### Usage

This element can be used with the *db\_name* monitor element to identify the specific database to which the data applies.

## db\_status - Status of database monitor element

The current status of the database.

Table 657. Table function monitoring information

Table function	Monitor element collection level
MON_GET_DATABASE table function - Get database level information	Always collected
MON_GET_DATABASE_DETAILS table function - Get database information metrics	Always collected

Table 658. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic

### Usage

You can use this element to determine the state of your database.

The snapshot values for this element are:

API Constant	Value	Description
SQLM_DB_ACTIVE	0	The database is active.
SQLM_DB QUIESCE_PEND	1	The database is in quiesce-pending state. New connections to the database are not permitted and new units of work cannot be started. Depending on the quiesce request, active units of work will be allowed to complete or will be rolled back immediately.
SQLM_DB QUIESCED	2	The database has been quiesced. New connections to the database are <b>not</b> permitted and new units of work cannot be started.
SQLM_DB_ROLLFWD	3	A rollforward is in progress on the database.
SQLM_DB_ACTIVE_STANDBY	4	The database is a read-enabled HADR standby database.
SQLM_DB_STANDBY	5	The database is an HADR standby database.

The table function can return the following string values:

- ACTIVE
- QUIESCE\_PEND
- QUIESCED
- ROLLFWD
- ACTIVE\_STANDBY
- STANDBY

## db\_storage\_path - Automatic storage path monitor element

This element shows the full path of a location that is used by the database for placing automatic storage table spaces. There can be 0 or more storage paths associated with a database.

*Table 659. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
ADMIN_GET_STORAGE_PATHS table function - Get storage path information for storage groups	Always collected

*Table 660. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	db_sto_path_info	Basic

## Usage

Use this element with the **num\_db\_storage\_paths** monitor element to identify the storage paths that are associated with this database.

## db\_storage\_path\_id - Storage path identifier

Unique identifier for each occurrence of a storage path in a storage group.

*Table 661. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
ADMIN_GET_STORAGE_PATHS table function - Get storage path information for storage groups	Always collected
MON_GET_CONTAINER table function - Get table space container metrics	Always collected

## db\_storage\_path\_state - Storage path state monitor element

The automatic storage path state indicates whether the storage path is in use by the database.

*Table 662. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
ADMIN_GET_STORAGE_PATHS table function - Get storage path information for storage groups	Always collected

Table 663. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	db_sto_path_info	Basic

### Usage

Use this monitor element to determine whether the storage path is in use by the database. The following values are possible:

#### NOT\_IN\_USE

There are no table spaces using this storage path on the specified database partition.

#### IN\_USE

There are table spaces using this storage path on the specified database partition.

#### DROP\_PENDING

This storage path has been dropped, but some table spaces are still using it. Before storage paths are physically dropped from the database, all table spaces must stop using them. To stop using a dropped storage path, either drop the table space or rebalance the table space using the REBALANCE clause of the ALTER TABLESPACE statement.

### db\_storage\_path\_with\_dpe - Storage path including database partition expression monitor element

Automatic storage path that includes the unevaluated database partition expression.

Table 664. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ADMIN_GET_STORAGE_PATHS table function - Get storage path information for storage groups	Always collected

Table 665. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	db_sto_path_info	Basic

### Usage

Use this monitor element to determine the storage path that was specified for the database as part of the CREATE DATABASE command or the ALTER DATABASE statement, if the storage path contains a database partition expression.

If the storage path does not contain a database partition expression, then this monitor element returns a null value.

### db\_work\_action\_set\_id - Database work action set ID monitor element

If this activity has been categorized into a work class of database scope, this monitor element shows the ID of the work action set associated with the work class set to which the work class belongs. Otherwise, this monitor element shows the value of 0.

Table 666. Table Function Monitoring Information

Table Function	Monitor Element Collection Command and Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected

Table 666. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Command and Level
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

Table 667. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity	Always collected

### Usage

This element can be used with the **db\_work\_class\_id** element to uniquely identify the database work class of the activity, if one exists.

### db\_work\_class\_id - Database work class ID monitor element

If this activity has been categorized into a work class of database scope, this monitor element displays the ID of the work class. Otherwise, this monitor element displays the value of 0.

Table 668. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

Table 669. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity	Always collected

### Usage

This element can be used with the **db\_work\_action\_set\_id** element to uniquely identify the database work class of the activity, if one exists.

### db2\_process\_id - process ID monitor element

Numeric identifier of the database process that is running on the reported member.

Table 670. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ENV_GET_DB2_EDU_SYSTEM_RESOURCES table function - Return DB2 engine dispatchable units system information	Always collected

Table 670. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
ENV_GET_DB2_SYSTEM_RESOURCES table function - Return DB2(r) system information	Always collected

## db2\_process\_name - process name monitor element

Name of the database process that is running on the reported member.

Table 671. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ENV_GET_DB2_SYSTEM_RESOURCES table function - Return DB2(r) system information	Always collected

## db2\_status - Status of the database instance monitor element

The current status of the instance of the database manager.

Table 672. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_INSTANCE table function - Get instance level information	Always collected

Table 673. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	db2	Basic

## Usage

You can use this element to determine the state of your database manager instance.

The snapshot values for this element are:

API Constant	Value	Description
SQLM_DB2_ACTIVE	0	The database manager instance is active.
SQLM_DB2_QUIESCE_PEND	1	The instance and the databases in the instance are in quiesce-pending state. New connections to any instance database are not permitted and new units of work cannot be started. Depending on the quiesce request, active units of work will be allowed to complete or will be rolled back immediately.
SQLM_DB2_QUIESCED	2	The instance and the databases in the instance has been quiesced. New connections to any instance database are not permitted and new units of work cannot be started.

The table function can return the following string values:

- ACTIVE
- QUIESCE\_PEND

- QUIESCED

## db2start\_time - Start Database Manager Timestamp

The date and time that the database manager was started using the db2start command.

Table 674. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_INSTANCE table function - Get instance level information	Always collected

Table 675. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	db2	Basic

Table 676. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Change history	evmonstart	Always collected

### Usage

This element can be used with the *time\_stamp* monitor element to calculate the elapsed time since the database manager was started up until the snapshot was taken.

For the change history event monitor, this element can be used to track when deferred database manager configuration parameter updates took effect.

## dbpartitionnum - Database partition number monitor element

In a partitioned database environment, this is the numeric identifier for the database member. For Db2 Enterprise Server Edition and in a Db2 pureScale environment, this value is 0.

Table 677. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ADMIN_GET_INDEX_COMPRESS_INFO table function - returns compressed index information	Always collected
ADMIN_GET_INDEX_INFO table function - returns index information	Always collected
ADMIN_GET_MSGS table function - Retrieve messages generated by a data movement utility that is executed through the ADMIN_CMD procedure	Always collected
ADMIN_GET_STORAGE_PATHS table function - Get storage path information for storage groups	Always collected
ADMIN_GET_TAB_COMPRESS_INFO table function - estimate compression savings	Always collected
ADMIN_GET_TAB_DICTIONARY_INFO table function - report properties of existing table dictionaries	Always collected

Table 677. Table Function Monitoring Information (continued)

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
ADMINTABINFO administrative view and ADMIN_GET_TAB_INFO table function - retrieve table size and state information	Always collected
AUDIT_ARCHIVE procedure and table function - Archive audit log file	Always collected
DBCFG administrative view and DB_GET_CFG table function - Retrieve database configuration parameter information	Always collected
DBPATHS administrative view and ADMIN_LIST_DB_PATHS table function - Retrieve database paths	Always collected
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_AGENT table function - List agents, fenced mode processes, and system entities for the database	Always collected
MON_GET_CONTAINER table function - Get table space container metrics	Always collected
MON_GET_QUEUE_STATS table function - Return threshold queue statistics	Always collected
MON_GET_REBALANCE_STATUS table function - Get rebalance progress for a table space	Always collected
MON_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	Always collected
MON_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected
MON_GET_TABLE table function - get table metrics	Always collected
MON_GET_TABLESPACE table function - Get table space metrics	Always collected
MON_GET_TABLESPACE QUIESCER table function - Get information about quiesced table spaces	Always collected
MON_GET_TABLESPACE_RANGE table function - Get information about table space ranges	Always collected
MON_GET_WORKLOAD_STATS table function - Return workload statistics	Always collected
MON_GET_WORK_ACTION_SET_STATS table function - Return work action set statistics	Always collected
PD_GET_DIAG_HIST table function - Return records from a given facility	Always collected
PDLOGMSGGS_LAST24HOURS administrative view and PD_GET_LOG_MSGGS table function - Retrieve problem determination messages	Always collected
WLM_GET_QUEUE_STATS table function - Return threshold queue statistics	Always collected

Table 677. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
WLM_GET_SERVICE_CLASS_AGENTS table function - list agents running in a service class	Always collected
WLM_GET_SERVICE_CLASS_WORKLOAD_OCCURRENCES table function - list workload occurrences	Always collected
WLM_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	Always collected
WLM_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected
WLM_GET_WORK_ACTION_SET_STATS table function - Return work action set statistics	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected
WLM_GET_WORKLOAD_STATS table function - Return workload statistics	Always collected

## Usage

In a Db2 pureScale environment, multiple members operate on a single partition. When running in such a configuration, physical attributes of storage, such as the number of free pages in a table space, are duplicated across all members in the system. Each member reports the total accurate size for the system. In a multiple partition configuration, the values from each partition must be correlated by the user in order to understand the overall value for the system.

The **dbpartitionnum** monitor element is different to the **data\_partition\_id** monitor element, which is used to identify a data partition that was created by subdividing data in a table based on a value.

## dc\_s\_appl\_status - DCS application status monitor element

The status of a DCS application at the Db2 Connect gateway.

Table 678. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
DCS Application	dc_s_appl_info	Basic

## Usage

Use this element for problem determination on DCS applications. Values are:

- SQLM\_DCS\_CONNECTPEND\_OUTBOUND

The application has initiated a database connection from the Db2 Connect gateway to the host database, but the request has not completed yet.

- SQLM\_DCS\_UOWWAIT\_OUTBOUND

The Db2 Connect gateway is waiting for the host database to reply to the application's request.

- SQLM\_DCS\_UOWWAIT\_INBOUND

The connection from the Db2 Connect gateway to the host database has been established and the gateway is waiting for SQL requests from the application. Or the Db2 Connect gateway is waiting on

behalf of the unit of work in the application. This usually means that the application's code is being executed.

## **dcx\_db\_name - DCS Database Name**

The name of the DCS database as cataloged in the DCS directory.

*Table 679. Snapshot Monitoring Information*

<b>Snapshot Level</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
DCS Database	dcx_dbase	Basic
DCS Application	dcx_appl_info	Basic

### **Usage**

Use this element for problem determination on DCS applications.

## **ddl\_classification - DDL classification**

Classification describing type of DDL executed.

*Table 680. Event Monitoring Information*

<b>Event Type</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Change History	DDLSTMTEXEC	Always collected

### **Usage**

DDL can be classified as one of:

#### **STORAGE**

The execution of alter database, buffer pool, partition group, storage group, and table space DDL.

#### **WLM**

The execution of histogram, service class, threshold, work action set, work class set, and workload DDL.

#### **MONITOR**

The execution of event monitor, and usage list DDL.

#### **SECURITY**

The execution of audit policy, grant, mask, permission role, revoke, security label, security label component, security policy, and trusted context DDL.

#### **SQL**

The execution of alias, function, method, module, package, procedure, schema, synonym, transform, trigger, type, variable, and view DDL.

#### **DATA**

The execution of index, sequence, table, and temporary table DDL.

#### **XML**

The execution of XSROBJECT DDL.

#### **FEDERATED**

The execution of nickname/server, type/user mapping, and wrapper DDL.

## **ddl\_sql\_stmts - Data Definition Language (DDL) SQL Statements**

This element indicates the number of SQL Data Definition Language (DDL) statements that were executed.

Table 681. Table function monitoring information

Table function	Monitor element collection level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics	REQUEST METRICS BASE

Table 682. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic
Application	appl	Basic

For snapshot monitoring, this counter can be reset.

Table 683. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Connection	event_conn	Always collected

Table 683. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected
Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmmetrics	REQUEST METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

### Usage

You can use this element to determine the level of database activity at the application or database level. DDL statements are expensive to run due to their impact on the system catalog tables. As a result, if the value of this element is high, you should determine the cause, and possibly restrict this activity from being performed.

You can also use this element to determine the percentage of DDL activity using the following formula:

```
ddl_sql_stmts / total number of statements
```

This information can be useful for analyzing application activity and throughput. DDL statements can also impact:

- the catalog cache, by invalidating table descriptor information and authorization information that are stored there and causing additional system usage to retrieve the information from the system catalogs
- the package cache, by invalidating sections that are stored there and causing additional processing time due to section recompilation.

Examples of DDL statements are CREATE TABLE, CREATE VIEW, ALTER TABLE, and DROP INDEX.

## deadlock\_id - Deadlock Event Identifier

The deadlock identifier for a deadlock.

### Element identifier

deadlock\_id

### Element type

information

Table 684. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Deadlocks	event_deadlock	Always collected
Deadlocks	event_dlconn	Always collected
Deadlocks with Details	event_detailed_dlconn	Always collected
Deadlocks with Details History	event_detailed_dlconn	Always collected
Deadlocks with Details History	event_stmt_history	Always collected
Deadlocks with Details History Values	event_data_value	Always collected
Deadlocks with Details History Values	event_detailed_dlconn	Always collected

Table 684. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Deadlocks with Details History Values	event_stmt_history	Always collected

#### Usage

Use this element in your monitoring application to correlate deadlock connection and statement history event records with deadlock event records.

### deadlock\_member - Deadlock member monitor element

The member were the participant is requesting the lock.

Table 685. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	lock_participants	

### deadlock\_node - Partition Number Where Deadlock Occurred

Partition number where the deadlock occurred.

#### Element identifier

deadlock\_node

#### Element type

information

Table 686. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Deadlocks	event_deadlock	Always collected
Deadlocks	event_dlconn	Always collected
Deadlocks with Details	event_detailed_dlconn	Always collected

#### Usage

This element is relevant only for partitioned databases. Use this in your monitoring application to correlate deadlock connection event records with deadlock event records.

### deadlock\_type - Deadlock type monitor element

The type of deadlock that has occurred. The value can be either LOCAL or GLOBAL. In a local deadlock, all participants run on the same member. In a global deadlock, at least one deadlock participant is running on a remote member.

Table 687. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	lock	

## deadlocks - Deadlocks detected monitor element

The total number of deadlocks that have occurred.

Table 688. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE

Table 688. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 689. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic
Application	appl	Lock

For snapshot monitoring, this counter can be reset.

Table 690. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Database	event_db	Always collected
Connection	event_conn	Always collected
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

This element can indicate that applications are experiencing contention problems. These problems could be caused by the following situations:

- Lock escalations are occurring for the database
- An application may be locking tables explicitly when system-generated row locks may be sufficient
- An application may be using an inappropriate isolation level when binding
- Catalog tables are locked for repeatable read
- Applications are getting the same locks in different orders, resulting in deadlock.

You may be able to resolve the problem by determining in which applications (or application processes) the deadlocks are occurring. You may then be able to modify the application to better enable it to run concurrently. Some applications, however, may not be capable of running concurrently.

You can use the connection timestamp monitor elements (**last\_reset**, **db\_conn\_time**, and **appl\_con\_time**) to determine the severity of the deadlocks. For example, 10 deadlocks in 5 minutes is much more severe than 10 deadlocks in 5 hours.

The descriptions for the previously listed related elements may also provide additional tuning suggestions.

## deferred - Deferred

Indicates if a change to a configuration parameter value is deferred.

Table 691. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Change History	DBDBMCFG	Always collected

### Usage

The change history event monitor collected this value as:

**Y**

Change deferred until next database activation

**N**

Change takes effect immediately

## degree\_parallelism - Degree of Parallelism

The degree of parallelism requested when the query was bound.

### Element identifier

degree\_parallelism

### Element type

information

Table 692. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	stmt	Statement

### Usage

Use with `agents_top`, to determine if the query achieved maximum level of parallelism.

## del\_keys\_cleaned - Pseudo deleted keys cleaned monitor element

Number of pseudo deleted keys that have been cleaned.

Table 693. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_INDEX table function - Get index metrics	Always collected

## delete\_sql\_stmts - Deletes

This element contains a count of the total number of times the federated server has issued a DELETE statement to this data source on behalf of any application since the start of the federated server instance or the last reset of the database monitor counters, whichever is latest.

Table 694. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase_remote	Basic
Application	appl_remote	Basic

For snapshot monitoring, this counter can be reset.

#### Usage

Use this element to determine the level of database activity directed against this data source by the federated server or an application.

You can also use this element to determine the percentage of write activity against this data source by the federated server or an application, with the following formula:

```
write_activity =
  (INSERT statements + UPDATE statements + DELETE statements ) /
  (SELECT statements + INSERT statements + UPDATE statements +
  DELETE statements)
```

### delete\_time - Delete Response Time

This element contains the aggregate amount of time, in milliseconds, that it has taken this data source to respond to DELETES from all applications or a single application running on this federated server instance since the start of the federated server instance or the last reset of the database monitor counters, whichever is latest.

The response time is measured as the difference in time between the time the federated server submits a DELETE statement to the data source, and the time the data source responds to the federated server, indicating the DELETE has been processed.

Table 695. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase_remote	Timestamp
Application	appl_remote	Timestamp

For snapshot monitoring, this counter can be reset.

#### Usage

Use this element to determine how much actual time transpires while waiting for DELETES to this data source to be processed. This information can be useful for capacity planning and tuning.

### destination\_service\_class\_id - Destination service class ID monitor element

The ID of the service subclass to which an activity was remapped when the threshold violation record to which this element belongs was generated. This element has a value of zero for any threshold action other than REMAP ACTIVITY.

Table 696. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Threshold violations	event_thresholdviolations	-

#### Usage

Use this element to trace the path of an activity through the service classes to which it was remapped. This element can also be used to compute aggregates of how many activities were mapped into a given service subclass.

## details\_xml - Details XML monitor element

An XML document containing some of the system monitor elements collected by the statistics event monitor.

Table 697. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Element Collection Level
Statistics	EVENTS_SCSTATS	Always collected
Statistics	EVENT_WLSTATS	Always collected

### Usage

The schema for the XML documents returned is available in the file `sql1lib/misc/DB2MonCommon.xsd`. The top level element is **system\_metrics**.

The XML documents associated with this monitor element and the **metrics** monitor element contain the same system metrics, but there is an important difference. The metrics in this monitor element generally start at 0 and continue to accumulate until the next database activation, while the metrics in **metrics** are calculated to show the change in value for the metric since the last time statistics were collected.

**Important:** Starting with Version 10.1 Fix Pack 1, this monitor element is deprecated for the statistics event monitor and might be removed in a future release. If you use the XML metrics data returned in this element, start using the **metrics** document instead.

## device\_type - Device type

This element is an identifier for the device type associated with a UTILSTART event.

Table 698. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Change History	UTILLOCATION	Always collected

### Usage

For the change history event monitor, this field determines the interpretation for the LOCATION field:

- A** TSM
- C** Client
- D** Disk
- F** Snapshot backup
- L** Local
- N** Internally generated by the database management system
- O** Other vendor device support
- P** Pipe

- Q** Cursor
- R** Remove fetch data
- S** Server
- T** Tape
- U** User exit
- X** X/Open XBSA interface

## **diaglog\_write\_wait\_time - Diagnostic log file write wait time monitor element**

The time spent waiting on a write to the db2diag log file. The value is given in milliseconds.

*Table 699. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE

Table 699. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 700. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

Use this element to understand the amount of time spent writing to the db2diag log file. In a partitioned database environment, a high value for this time may indicate contention for the db2diag log file if shared storage is being used for the diagnostic directory path (diagpath). A high value may also indicate excessive logging, for example if **diaglevel** has been set to log all informational messages.

## diaglog\_writes\_total - Total diagnostic log file writes monitor element

The number of times agents have written to the db2diag log file.

Table 701. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE

Table 701. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 702. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

Use this element with the **diaglog\_write\_wait\_time** monitor element to understand the average amount of time spent writing to the db2diag log file.

## direct\_read\_reqs - Direct read requests monitor element

The number of requests to perform a direct read of one or more sectors of data.

Table 703. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE

Table 703. Table Function Monitoring Information (continued)

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_TABLE table function - get table metrics	DATA OBJECT METRICS EXTENDED
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	DATA OBJECT METRICS EXTENDED
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 704. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Buffer Pool
Table Space	tablespace	Buffer Pool
Buffer Pool	bufferpool	Buffer Pool
Application	appl	Buffer Pool

For snapshot monitoring, this counter can be reset.

Table 705. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Database	event_db	Always collected
Connection	event_conn	Always collected
Tablespaces	event_tablespace	Always collected
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

Use the following formula to calculate the average number of sectors that are read by a direct read:

$$\text{direct\_reads} / \text{direct\_read\_reqs}$$

## direct\_read\_time - Direct read time monitor element

The elapsed time required to perform the direct reads. This value is given in milliseconds.

Table 706. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Database	event_db	Always collected
Connection	event_conn	Always collected
Tablespaces	event_tablespace	Always collected
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

Use the following formula to calculate the average direct read time per sector:

$$\text{direct\_read\_time} / \text{direct\_reads}$$

A high average time may indicate an I/O conflict.

## direct\_reads - Direct reads from database monitor element

The number of read operations that do not use the buffer pool.

Table 709. Table Function Monitoring Information

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE

Buffer Pool	bufferpool	Buffer Pool
Application	appl	Buffer Pool

For snapshot monitoring, this counter can be reset.

Table 711. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Database	event_db	Always collected
Connection	event_conn	Always collected
Tablespaces	event_tablespace	Always collected
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

Use the following formula to calculate the average number of sectors that are read by a direct read:

```
direct_reads / direct_read_reqs
```

When using system monitors to track I/O, this element helps you distinguish database I/O from non-database I/O on the device.

Direct reads are performed in units, the smallest being a 512-byte sector. They are used when:

- Reading LONG VARCHAR columns
- Reading LOB (large object) columns
- Performing a backup

## direct\_write\_reqs - Direct write requests monitor element

The number of requests to perform a direct write of one or more sectors of data.

Table 712. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Database	event_db	Always collected
Connection	event_conn	Always collected
Tablespaces	event_tablespace	Always collected
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

Use the following formula to calculate the average number of sectors that are written by a direct write:

```
direct_writes / direct_write_reqs
```

## direct\_write\_time - Direct write time monitor element

The elapsed time required to perform the direct writes. This value is reported in milliseconds.

Table 715. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE

MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 716. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Buffer Pool
Table Space	tablespace	Buffer Pool
Buffer Pool	bufferpool	Buffer Pool
Application	appl	Buffer Pool

For snapshot monitoring, this counter can be reset.

Table 717. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Database	event_db	Always collected
Connection	event_conn	Always collected
Tablespaces	event_tablespace	Always collected
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

Use the following formula to calculate the average direct write time per sector:

```
direct_write_time / direct_writes
```

A high average time may indicate an I/O conflict.

## direct\_writes - Direct writes to database monitor element

The number of write operations that do not use the buffer pool.

Table 718. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 718. Table Function Monitoring Information (continued)

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_CONTAINER table function - Get table space container metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_TABLE table function - get table metrics	DATA OBJECT METRICS EXTENDED
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	DATA OBJECT METRICS EXTENDED
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 719. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Buffer Pool
Table Space	tablespace	Buffer Pool
Buffer Pool	bufferpool	Buffer Pool
Application	appl	Buffer Pool

For snapshot monitoring, this counter can be reset.

Table 720. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Database	event_db	Always collected
Connection	event_conn	Always collected
Tablespaces	event_tablespace	Always collected
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

Use the following formula to calculate the average number of sectors that are written by a direct write.

```
direct_writes / direct_write_reqs
```

When using system monitors to track I/O, this element helps you distinguish database I/O from non-database I/O on the device.

Direct writes are performed in units, the smallest being a 512-byte sector. They are used when:

- Writing LONG VARCHAR columns
- Writing LOB (large object) columns
- Performing a restore
- Performing a load
- Allocating new extents for SMS table space if MPFA is enabled (which is the default)

## disabled\_peds - Disabled partial early distincts monitor element

The number of times that partial early distinct operations were disabled because insufficient sort heap was available.

Table 721. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE

Table 721. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 722. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Connection	event_conn	-
Statements	event_stmt	-
Transactions	event_xact	-
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

Use this element in conjunction with the **total\_peds** monitor element to determine if partial early distinct operations are getting sufficient sort heap memory most of the time. If the ratio of the **disabled\_peds** monitor element to the **total\_peds** monitor element is high, your database performance may be sub-optimal. You should consider increasing the sort heap size or the sort heap threshold, or both.

## disconn\_time - Database Deactivation Timestamp

The date and time that the application disconnected from the database (at the database level, this is the time the last application disconnected).

### Element identifier

disconn\_time

### Element type

timestamp

Table 723. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected
Connection	event_conn	Always collected

## Usage

Use this element to calculate the elapsed time since:

- The database was active (for information at the database level)
- The connection was active (for information at the connection level).

## disconnects - Disconnects

This element contains a count of the total number of times the federated server has disconnected from this data source on behalf of any application since the start of the federated server instance or the last reset of the database monitor counters, whichever is latest.

*Table 724. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase_remote	Basic

For snapshot monitoring, this counter can be reset.

## Usage

Use this element to determine the total number of times the federated server has disconnected from this data source on behalf of any application. Together with the CONNECT count, this element provides a mechanism by which you can determine the number of applications this instance of the federated server believes is currently connected to a data source.

## dl\_conns - Connections involved in deadlock monitor element

The number of connections that are involved in the deadlock.

*Table 725. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	Always collected
Deadlocks <sup>1</sup>	event_deadlock	Always collected

### 1

This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the `CREATE EVENT MONITOR` for `locking` statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

## Usage

Use this element in your monitoring application to identify how many deadlock connection event records will follow in the event monitor data stream.

## dyn\_compound\_exec\_id - Dynamic compound statement executable identifier monitor element

Executable ID identifying the dynamically prepared compound SQL statement or anonymous block in PL/SQL.

*Table 726. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	Always collected

Table 726. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	Always collected
MON_GET_ROUTINE_EXEC_LIST table function - get list of statements executed by routine	Always collected

## Usage

Use this value to retrieve the statement text of the routine using the MON\_GET\_PKG\_CACHE\_STMT table function.

## dynamic\_sql\_stmts - Dynamic SQL Statements Attempted

The number of dynamic SQL statements that were attempted.

Table 727. Table function monitoring information

Table function	Monitor element collection level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 727. Table function monitoring information (continued)

Table function	Monitor element collection level
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics	REQUEST METRICS BASE

Table 728. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic
Application	appl	Basic

For snapshot monitoring, this counter can be reset.

Table 729. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Connection	event_conn	Always collected
Database	event_db	Always collected
Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmmetrics	REQUEST METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

An occurrence of each of the following operations increments the value of the `dynamic_sql_stmts` monitor element by one.

- OPEN
- EXECUTE
- EXECUTE IMMEDIATE

### Usage

You can use this element to calculate the total number of successful SQL statements at the database or application level:

```
dynamic_sql_stmts
+ static_sql_stmts
- failed_sql_stmts
= throughput during monitoring period
```

## E

### **edu\_ID - Engine dispatchable unit ID monitor element**

ID of engine dispatchable unit with which this memory pool is associated.

*Table 730. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
ENV_GET_DB2_EDU_SYSTEM_RESOURCES table function - Return Db2 engine dispatchable units system information	Always collected
MON_GET_LATCH table function - List all latches in the current member	Always collected
MON_GET_MEMORY_POOL table function - Get memory pool information	Always collected
PD_GET_DIAG_HIST table function - Return records from a given facility	Always collected

#### **Usage**

When returned by the table function MON\_GET\_MEMORY\_POOL, this monitor element is NULL except when the memory pool being described is PRIVATE.

### **edu\_name - Engine dispatchable unit name monitor element**

The name of the database engine dispatchable unit.

*Table 731. Table function monitoring information*

<b>Table function</b>	<b>Monitor element collection level</b>
ENV_GET_DB2_EDU_SYSTEM_RESOURCES table function - Return database engine dispatchable units system information	Always collected
MON_GET_LATCH table function - List all latches in the current member	Always collected

### **EFF\_PARALLELISM - The effective parallelism monitor element**

The total effective\_query\_degree across all activities in this service subclass, superclass, or workload.

*Table 732. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_WORKLOAD table function - Get workload metrics	Always collected
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service superclass metrics	REQUEST METRICS BASE

Table 733. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats	Always collected
Statistics	event_superclasstats	Always collected
Statistics	event_superclasstats	Always collected
Statistics	event_wlstats	Always collected

### **EFF\_PARALLELISM\_AVG - The average effective parallelism monitor element**

The average effective\_query\_degree for all activities in this service subclass, superclass, or workload.

Table 734. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_WORKLOAD_STATS table function - Return workload statistics	Always collected
MON_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	Always collected
MON_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected

Table 735. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats	Always collected
Statistics	event_superclasstats	Always collected
Statistics	event_superclasstats	Always collected
Statistics	event_wlstats	Always collected

### **EFF\_PARALLELISM\_TOP - The top effective parallelism monitor element**

The peak effective\_query\_degree for an individual activity across all activities in this service subclass, superclass, or workload.

Table 736. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_WORKLOAD_STATS table function - Return workload statistics	Always collected
MON_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	Always collected
MON_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected

Table 737. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats	Always collected

Table 737. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_superclasstats	Always collected
Statistics	event_superclasstats	Always collected
Statistics	event_wlstats	Always collected

### eff\_stmt\_text - Effective statement text monitor element

The effective text of the SQL statement, if the statement was modified as a result of the statement concentrator.

Table 738. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

Table 739. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activity	event_activitystmt	Always collected

### Usage

If the statement concentrator is enabled and if the statement text has been modified as a result of the statement concentrator, then this monitor element contains the effective statement text. Otherwise, this monitor element contains a text string which is 0 bytes long.

### effective\_isolation - Effective isolation monitor element

The effective isolation level for this statement.

Table 740. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	Always collected
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	Always collected

Table 740. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

Table 741. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	Always collected
Package cache	-	Always collected

## Usage

Use this element to understand the isolation level that was used during the execution of the statement.

### **effective\_lock\_timeout - Effective lock timeout monitor element**

The effective lock timeout value for this activity. This value is reported in seconds.

Table 742. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

### **effective\_query\_degree - Effective query degree monitor element**

The effective query degree of parallelism for this activity.

Table 743. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
<a href="#">MON_GET_WLM_ADMISSION_QUEUE</a> table function - Return a list of queued activities	Always Collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

Table 744. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	Always collected

### ehl\_lockwait\_time - Total time for EHL object lock wait monitor element

During extent movement, this monitor element shows the overall time taken to acquire the Explicit Hierarchical Locking (EHL) table lock.

The EHL table lock is required to switch the object out of the NOT\_SHARED state, if applicable. The value is given in milliseconds.

Table 745. Table function monitoring information

Table function	Monitor element collection level
MON_GET_EXTENT_MOVEMENT_STATUS - get extent movement progress	Always collected

### elapsed\_exec\_time - Statement Execution Elapsed Time

At the DCS statement level, this is the elapsed time spent processing an SQL request on a host database server. This value is reported by this server. For event monitors that write to tables, the value of this element is given in microseconds by using the BIGINT data type. In contrast to the host\_response\_time element, this element does not include the network elapsed time between Db2 Connect and the host database server. At other levels, this value represents the sum of the host execution times for all the statements that were executed for a particular database or application, or for those statements that used a given number of data transmissions.

Table 746. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Statement, Timestamp
Application	appl	Statement, Timestamp
DCS Database	dcс_dbase stmt_transmissions	Statement, Timestamp
DCS Application	dcс_appl stmt_transmissions	Statement, Timestamp
DCS Statement	dcс_stmt	Statement, Timestamp

For snapshot monitoring at the statement level, this counter cannot be reset. This counter can be reset at other levels.

#### Usage

Use this element, along with other elapsed time monitor elements, to evaluate the database server's processing of SQL requests and to help isolate performance issues.

Subtract this element from the host\_response\_time element to calculate the network elapsed time between Db2 Connect and the host database server.

**Note:** For the dcs\_dbase, dcs\_appl, dcs\_stmt and stmt\_transmissions levels, the *elapsed\_exec\_time* element applies only to z/OS® databases. If the Db2 Connect gateway is connecting to a Windows, Linux, AIX, or other UNIX database, the *elapsed\_exec\_time* is reported as zero.

## empty\_pages\_deleted - Empty pages deleted monitor element

The number of pseudo empty pages that have been deleted. Pseudo empty pages are pages where all the keys have been pseudo deleted.

Table 747. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_INDEX table function - Get index metrics	Always collected

## empty\_pages\_reused - Empty pages reused monitor element

The number of pseudo empty pages that have been reused. Pseudo empty pages are pages where all the keys have been pseudo deleted.

Table 748. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_INDEX table function - Get index metrics	Always collected

## entry\_time - Entry time monitor element

The time at which this activity entered the system.

Table 749. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

## Usage

### estimated\_cpu\_entitlement - Estimated CPU entitlement monitor element

The percentage of total CPU on a host or an LPAR that a service subclass is configured to consume based on its CPU shares assuming that it consumes no more and no less than what it is configured to consume. The determination of which service classes participate in its calculation is based on the actual CPU utilization measured over the sampling period versus the WLM\_DISP\_MIN\_UTIL database manager configuration setting. The impact of a CPU limit on a service class itself, on the service classes with which it competes, or on a parent service class (if it has one) are not taken into account in the calculation.

Table 750. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_SAMPLE_SERVICE_CLASS_METRICS - Get sample service class metrics	Always collected

## estimated\_util\_heap\_top - estimated peak utility heap monitor element

Estimated peak utility heap memory usage for the query.

**Note:** This monitor element is available in Db2version 11.5.4 and later.

<i>Table 751. Table function monitoring information</i>	
<b>Table function</b>	<b>Monitor element collection level</b>
<u>MON_GET_WLM_ADMISSION_QUEUE table function - Return a list of queued activities</u>	Always Collected

*Table 752. Event monitoring information*

<b>Event type</b>	<b>Logical data grouping</b>	<b>Monitor switch</b>
Activity	event_activity	Always collected
Package cache	pkgcache	Always collected

## estimated\_runtime - Estimated execution time for a DML statement monitor element

The estimated execution time for a DML statement. This value is impacted by system and database usage. The estimate does not include any time spent outside query execution (for example, prepare time, queue time or client time). A NULL value will be reported for any non-DML statements (such as CALL or DDL), or if an estimate is not available. The value is given in microseconds.

*Table 753. Table function monitoring information*

<b>Table function</b>	<b>Monitor element collection level</b>
	Always Collected
	Always Collected
	Always Collected
	Always Collected
<u>MON_GET_WLM_ADMISSION_QUEUE table function - Return a list of queued activities</u>	Always Collected
	Always Collected

*Table 754. Event monitoring information*

<b>Event type</b>	<b>Logical data grouping</b>	<b>Monitor switch</b>
Activity	event_activity	Always collected
Package Cache	pkgcache	Always collected

## estimated\_sort\_consumers\_top - Estimated concurrently executing sort memory consumers monitor element

Estimate of the highest number of sort memory consumers that will be active concurrently during execution of an activity.

Table 755. Table function monitoring information

Table function	Monitor element collection level
	Always Collected
	Always Collected
	Always Collected
	Always Collected
	Always Collected

Table 756. Event monitoring information

Event type	Logical data grouping	Monitor switch
Activity	event_activity	Always collected
Package cache	pkgcache	Always collected

## estimated\_sort\_shrheap\_top - Estimated shared sort heap consumption monitor element

Estimate of the shared sort memory that will be used during execution of an activity, in 4 KB pages. If shared sort memory is not enabled, the estimated\_sort\_shrheap\_top monitor element will be reported as 0.

Table 757. Table function monitoring information

Table function	Monitor element collection level
	Always Collected
	Always Collected
	Always Collected
	Always Collected
<a href="#">MON_GET_WLM_ADMISSION_QUEUE</a> table function - Return a list of queued activities	Always Collected
	Always Collected

Table 758. Event monitoring information

Event type	Logical data grouping	Monitor switch
Activity	event_activity	Always collected
Package cache	pkgcache	Always collected

## estimatedsqlcost\_threshold\_id - Estimated SQL cost threshold ID monitor element

The ID of the ESTIMATEDSQLCOST threshold that was applied to the activity.

Table 759. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

### Usage

Use this element to understand which ESTIMATEDSQLCOST threshold, if any, was applied to the activity.

## estimatedsqlcost\_threshold\_value - Estimated SQL cost threshold value monitor element

The upper bound of the ESTIMATEDSQLCOST threshold that was applied to the activity.

Table 760. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

### Usage

Use this element to understand the value of the ESTIMATEDSQLCOST threshold applied to the activity, if any.

## estimatedsqlcost\_threshold\_violated - Estimated SQL cost threshold violated monitor element

This monitor element returns '1' (Yes) to indicate that the activity violated the ESTIMATEDSQLCOST threshold. '0' (No) indicates that the activity has not yet violated the threshold.

Table 761. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected

Table 761. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

## Usage

Use this element to determine if the activity violated the ESTIMATEDSQLCOST threshold that was applied to the activity.

## event\_id - Event ID monitor element

An identifier associated with an event that is used in conjunction with other monitor elements to uniquely identify the event. This monitor element forms a part of the **xmlid** monitor element in the interfaces that return that element.

Table 762. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Element Collection Level
Change History	changesummary dbdbmcfg ddlstmtexec evmonstart regvar txncompletion utillocation utilphase utilstart utilstop	Always collected
Locking	<ul style="list-style-type: none"> <li>• event_lock</li> <li>• event_lock_participants</li> <li>• event_lock_participants_activities</li> <li>• event_lock_activity_values</li> </ul>	Always collected
Package Cache	<ul style="list-style-type: none"> <li>• event_pkgcache</li> <li>• event_pkgcache_metrics</li> <li>• event_pkgcache_stmt_args</li> </ul>	Always collected
Unit of Work	event_uow	Always collected

## Usage

The value for this identifier is different depending on the type of event record in which it appears:

### Locking event monitor records

An numeric identifier for the event. The ID is recycled at database activation time. Uniqueness is guaranteed by the combination of **event\_timestamp**, **event\_id**, **member**, and **event-type**.

### Unit of work event monitor records

An alias of the UOW ID that is unique per connection. Uniqueness is guaranteed by the combination of **event\_timestamp**, **event\_id**, **event-type**, **member**, and **appl\_id**.

### Package cache event monitor record

An numeric identifier for the event. The ID is recycled at database activation time. Uniqueness is guaranteed by the combination of **event\_timestamp**, **event\_id**, **member**, and **event-type**.

### Change history event monitor record

An numeric identifier for the event. The ID is recycled at database activation time. The uniqueness of events is guaranteed by the combination of **event\_timestamp**, **event\_id**, **member**, and **event-type**.

## event\_monitor\_name - Event Monitor Name

The name of the event monitor that created the event data stream.

### Element identifier

event\_monitor\_name

### Element type

information

---

*Table 763. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Event Log Header	event_log_header	Always collected

### Usage

This element allows you to correlate the data that you are analyzing to a specific event monitor in the system catalog tables. This is the same name that can be found in the NAME column of the SYSCAT.EVENTMONITORS catalog table, which is the name specified on the CREATE EVENT MONITOR and SET EVENT MONITOR statements.

## event\_time - Event Time

The date and time an event occurred.

---

*Table 764. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Tablespaces	event_tablespace	-
Tables	event_table	-

### Usage

You can use this element to help relate events chronologically.

## event\_timestamp - Event timestamp monitor element

The time that this event record was generated by the database manager.

Table 765. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Element Collection Level
Activity	<ul style="list-style-type: none"><li>• event_activity</li><li>• event_activitystmt</li><li>• event_activityvals</li><li>• event_activitymetrics</li></ul>	Always collected
Change History	changesummary dbdbmcfg ddlstmtexec evmonstart regvar txncompletion utillocation utilphase utilstart utilstop	Always collected
Locking	<ul style="list-style-type: none"><li>• event_lock</li><li>• event_lock_participants</li><li>• event_lock_participants_activities</li><li>• event_lock_activity_values</li></ul>	Always collected
Package Cache	<ul style="list-style-type: none"><li>• event_pkgcache</li><li>• event_pkgcache_metrics</li><li>• event_pkgcache_stmt_args</li></ul>	Always collected
Unit of Work	<ul style="list-style-type: none"><li>• event_uow</li></ul>	Always collected

## event\_type - Event Type monitor element

The event type of the event that is being reported. Reported by the change history, locking, and package cache event monitors only.

Many event monitors capture only one type of event. For example, a unit of work event monitor records a unit of work completion event that captures data related to the unit of work when it is completed. Other event monitors, such as the database, table, buffer pool or table space event monitors each capture one type of event after database deactivation.

Some event monitors, however, generate different types of events. These event monitors report the type of event in the **event\_type** monitor element. [Table 766 on page 844](#) shows the event monitors that return this monitor element. [Table 767 on page 844](#) shows the possible values that this monitor element can have.

Table 766. Event Monitoring Information

Event Monitor	Logical Data Grouping	Monitor Element Collection Level
Change History	changesummary dbdbmcfg ddlstmexec evmonstart regvar txncompletion utillocation utilphase utilstart utilstop	Always collected
Locking	<ul style="list-style-type: none"> <li>• event_lock</li> <li>• event_lock_participants</li> <li>• event_lock_participants_activities</li> <li>• event_lock_activity_values</li> </ul>	Always collected
Unit of work	Not applicable. For more information, see the usage notes for this event monitor in <a href="#">Table 767 on page 844</a> .	Always collected
Package cache	<ul style="list-style-type: none"> <li>• pkgcache</li> </ul>	Always collected

Table 767. Possible values for **event\_type**

Event monitor	Possible values for event_type element	Usage notes
Change history	<ul style="list-style-type: none"> <li>• DBCFG</li> <li>• DBCFGVALUES</li> <li>• DBMCFG</li> <li>• DBMCFGVALUES</li> <li>• REGVAR</li> <li>• REGVARVALUES</li> <li>• DDLSTMEXEC</li> <li>• TXNCOMPLETION</li> <li>• EVMONSTART</li> <li>• UTILSTART</li> <li>• UTILSTOP</li> <li>• UTILSTARTPROC</li> <li>• UTILSTOPPROC</li> <li>• UTILPHASESTART</li> <li>• UTILPHASESTOP</li> </ul>	The <b>event_type</b> monitor element is included as a column in the output of this event monitor.

Table 767. Possible values for **event\_type** (continued)

Event monitor	Possible values for event_type element	Usage notes
Locking	<ul style="list-style-type: none"> <li>• LOCKTIMEOUT</li> <li>• LOCKWAIT</li> <li>• DEADLOCK</li> </ul>	The <b>event_type</b> monitor element is included as a column in the output of this event monitor when it writes to either regular or unformatted event (UE) tables. It is also included in the output created by the routines EVMON_FORMAT_UE_TO_TABLES or EVMON_FORMAT_UE_TO_XML.
Package cache	<ul style="list-style-type: none"> <li>• PKGCACHEBASE</li> <li>• PKGCACHEDETAILED</li> </ul>	The <b>event_type</b> monitor element is included as a column in the output of this event monitor when it writes to unformatted event (UE) tables, but not regular tables. It is also included in the output created by the routines EVMON_FORMAT_UE_TO_TABLES or EVMON_FORMAT_UE_TO_XML.
Unit of work	<ul style="list-style-type: none"> <li>• UOW</li> </ul>	The <b>event_type</b> monitor element is included as a column in the output of this event monitor only when it writes to an unformatted event (UE) table. Moreover, it is included only in the UE table created by this event monitor; it is not included in the output created by the routines EVMON_FORMAT_UE_TO_TABLES or EVMON_FORMAT_UE_TO_XML.

## evmon\_activates - Number of event monitor activations

The number of times an event monitor has been activated.

### Element identifier

evmon\_activates

### Element type

counter

This monitor element is not reported by all event monitors. See [Table 768 on page 845](#) for more details.

Table 768. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected
Tables	event_table	Always collected
Tablespaces	event_tablespace	Always collected
Bufferpools	event_bufferpool	Always collected
Deadlocks	event_deadlock	Always collected
Deadlocks	event_dlconn	Always collected
Deadlocks with Details	event_detailed_dlconn	Always collected
Statements	event_stmt_history	Always collected
Connections*	-	
Transactions*	-	
Statistics*	-	

Table 768. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Threshold violations*	-	

\* This event monitor updates the `evmon_activates` column only in the catalog table `SYSCAT.EVENTMONITORS`. The monitor element is not included in any of the logical data groups that are written to event monitor output tables.

### Usage

Use this element to correlate information returned by the event monitors listed in Table 768 on page 845. This element is applicable only to write-to-table event monitors; it is not maintained for event monitors that write to a file or pipe.

All of the event monitors in Table 768 on page 845 update the `evmon_activates` column of the `SYSCAT.EVENTMONITORS` catalog table when the event monitor is activated. This change is logged, so the DATABASE CONFIGURATION displays:

```
All committed transactions have been written to disk = NO
```

If an event monitor is created with the `AUTOSTART` option, and the first user `CONNECTS` to the database and immediately `DISCONNECTS` so that the database is deactivated, a log file is produced.

Unless otherwise noted, these event monitors also include the value for `evmon_activates` as a column in the tables to which event data is written.

Event monitors not included in this table do not report the `evmon_activates` monitor element.

## evmon\_flushes - Number of Event Monitor Flushes

The number of times the `FLUSH EVENT MONITOR SQL` statement has been issued.

### Element identifier

`evmon_flushes`

### Element type

information

Table 769. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	<code>event_db</code>	Always collected
Tables	<code>event_table</code>	Always collected
Tablespaces	<code>event_tablespace</code>	Always collected
Bufferpools	<code>event_bufferpool</code>	Always collected

### Usage

This identifier increments with each successive `FLUSH EVENT MONITOR SQL` request processed by the database manager after an application has connected to the database. This element helps to uniquely identify database, table, table space and buffer pool data.

## evmon\_wait\_time - Event monitor wait time monitor element

The amount of time that an agent waited for an event monitor record to become available.

A wait occurs when the agent tries to write an event monitor record and the agent is blocked until a fast writer record becomes available. Fast writers are used for high volume, parallel writing of event monitor data to tables, files, or pipes.

The unit of measurement is milliseconds.

Table 770. Table Function Monitoring Information

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics	REQUEST METRICS BASE

Statistics	TABLE, FILE, PIPE	event_wlstats (reported in the DETAILS XML document)	REQUEST METRICS BASE

### evmon\_waits\_total - Event monitor total waits monitor element

The number of times that an agent waited for an event monitor record to become available.

A wait occurs when the agent tries to write an event monitor record and the agent is blocked until a fast writer record becomes available. Fast writers are used for high volume, parallel writing of event monitor data to tables, files, or pipes.

Table 772. Table Function Monitoring Information

Table Function	Monitor Element Collection Level

Statistics	TABLE	event_wlstats (reported in the DETAILS_XML document)	REQUEST METRICS BASE

### **exec\_list\_cleanup\_time - Execution list cleanup time monitor element**

Time when the execution list was last pruned.

This element returns NULL if execution list was never pruned.

Table 774. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	Always collected
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	Always collected

## Usage

A routine execution list is a list of all statements (sections) that are executed by an invoked procedure, external function, compiled function, compiled trigger, or anonymous block. Section information appears in the routine execution list if you set the value of the **mon\_rtn\_execlist** configuration parameter to ON.

Routine execution list data cannot use more than 20% of the available monitor heap. If the value of the **mon\_heap\_sz** configuration parameter is set to AUTOMATIC, the routine execution list data can take up to 20% of the value of the **instance\_memory** configuration parameter.

Regular pruning is expected for databases with workloads that invoke many complex procedures and for databases where multiple features that use the monitor heap are enabled. If the value of the **exec\_list\_cleanup\_time** configuration parameter is being updated too frequently, ensure that the values of the **mon\_heap\_sz** and the **instance\_memory** database configuration parameters are AUTOMATIC, or increase the value of the **mon\_heap\_sz** configuration parameter.

## exec\_list\_mem\_exceeded - Execution list memory exceeded monitor element

Identifies if there was insufficient memory in the monitor heap to capture all statement information for the routine.

Possible values for this element are as follows:

**Y**

Insufficient memory to capture all statement information

**N**

For all other cases

The value is set to 'N' when the execution list for the routine is pruned.

---

*Table 775. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	Always collected
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	Always collected

## Usage

This element is set to 'Y' when routine monitoring could not keep track of all the statements executed by the routine. This tracking inability can occur when the routine execution list data for the database reaches 20% of the available monitor heap or the monitor heap is full. In order for routine monitoring to maintain more entries in its execution list, you can increase the monitor heap size using the **mon\_heap\_sz** database configuration parameter, or set the **mon\_heap\_sz** and the **instance\_memory** database configuration parameters to AUTOMATIC. If **mon\_heap\_sz** is already set to AUTOMATIC, you can increase the **instance\_memory** configuration parameter.

## executable\_id - Executable ID monitor element

An opaque binary token generated on the data server that uniquely identifies the SQL statement section that was executed. For non-SQL activities, a 0-length string value is returned by event monitors and a NULL value is returned by table functions.

---

*Table 776. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected

Table 776. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_AGENT table function - List agents, fenced mode processes, and system entities for the database	Always collected
MON_GET_INDEX_USAGE_LIST table function - Returns information from an index usage list	Always collected
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	Always collected
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	ACTIVITY METRICS BASE
MON_GET_ROUTINE_EXEC_LIST table function - get list of statements executed by routine	ACTIVITY METRICS BASE
WLM_GET_SERVICE_CLASS_AGENTS table function - list agents running in a service class	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

Table 777. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activity	event_activitystmt	Always collected
Package cache	-	Always collected

## Usage

Use this monitor element as input to different monitoring interfaces to obtain data about the section. The MON\_GET\_PKG\_CACHE\_STMT table function, which is used to get SQL statement activity metrics in the package cache, takes the executable ID as input.

## executable\_list\_size - Size of executable list monitor element

The number of entries that are present within the executable ID listing for a particular unit of work.

Table 778. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Unit of Work	uow	

## executable\_list\_truncated - Executable list truncated monitor element

Indicates whether the executable list is truncated. Possible values are YES or NO. The list can be truncated if there is insufficient memory available to store the entire executable list during processing.

Table 779. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Unit of Work	uow	

## execution\_id - User Login ID

The ID that the user specified when logging in to the operating system. This ID is distinct from auth\_id, which the user specifies when connecting to the database.

Table 780. Table function monitoring information

Table function	Monitor element collection level
MON_GET_CONNECTION table function - Get connection metrics	Always collected
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics	REQUEST METRICS BASE

Table 781. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl_info	Basic
Application	appl	Basic
DCS Application	dc_s_appl_info	Basic

Table 782. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Connections	event_connheader	-

### Usage

You can use this element to determine the operating system userid of the individual running the application that you are monitoring.

**Note:** Authorization IDs are truncated to 30 bytes (if they exceed that length), so execution IDs that begin with the same 30-byte strings have the same execution\_id value.

## ext\_table\_read\_volume - Total data read by external table readers monitor element

The total volume of data read by the external table readers from physical devices such as hard disks and solid state drives (SSD).

Table 783. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - return a list of activities	ACTIVITY METRICS BASE

## ext\_table\_send\_volume - Total data sent to external table writers monitor element

The total volume of data sent by the agent to the external table writers.

*Table 791. Table function monitoring information*

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_ACTIVITY table function - return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - return information about an activity as an XML document	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get connection metrics as an XML document	REQUEST METRICS BASE
MON_GET_DATABASE table function - get database information metrics	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - get database information metrics as an XML document	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - get package cache statement metrics	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get package cache statement metrics as an XML document	ACTIVITY METRICS BASE
MON_GET_ROUTINE table function - get aggregated routine execution metrics	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated routine execution metrics as an XML document	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get service subclass metrics as an XML document	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_TABLE table function - get table metrics	DATA OBJECT METRICS EXTENDED
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	DATA OBJECT METRICS EXTENDED
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE

Table 791. Table function monitoring information (continued)

Table function	Monitor element collection level
MON_GET_UNIT_OF_WORK_DETAILS table function - Get unit of work metrics as an XML document	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get workload metrics as an XML document	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - return a list of activities	ACTIVITY METRICS BASE

Table 792. Event monitoring information

Event type	Logical data grouping	Monitor switch
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmetrics	REQUEST METRICS BASE
Package cache	pkgcache_metrics	ACTIVITY METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

## ext\_table\_send\_wait\_time - Total agent wait time for external table writers monitor element

The total amount of time that the agent spent waiting for the sent data to be processed and written by the external table writers.

Table 793. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - return information about an activity as an XML document	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get connection metrics as an XML document	REQUEST METRICS BASE
MON_GET_DATABASE table function - get database information metrics	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - get database information metrics as an XML document	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - get package cache statement metrics	ACTIVITY METRICS BASE

Table 793. Table function monitoring information (continued)

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_PKG_CACHE_STMT_DETAILS table function - get package cache statement metrics as an XML document	ACTIVITY METRICS BASE
MON_GET_ROUTINE table function - get aggregated routine execution metrics	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated routine execution metrics as an XML document	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get service subclass metrics as an XML document	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_TABLE table function - get table metrics	DATA OBJECT METRICS EXTENDED
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	DATA OBJECT METRICS EXTENDED
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get unit of work metrics as an XML document	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get workload metrics as an XML document	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - return a list of activities	ACTIVITY METRICS BASE

Table 794. Event monitoring information

<b>Event type</b>	<b>Logical data grouping</b>	<b>Monitor switch</b>
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmetrics	REQUEST METRICS BASE
Package cache	pkgcache_metrics	ACTIVITY METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

## ext\_table\_sends\_total - Total row batches sent to external table writers monitor element

The total number of row batches sent to the external table writers.

*Table 795. Table function monitoring information*

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_ACTIVITY table function - return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - return information about an activity as an XML document	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get connection metrics as an XML document	REQUEST METRICS BASE
MON_GET_DATABASE table function - get database information metrics	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - get database information metrics as an XML document	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - get package cache statement metrics	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get package cache statement metrics as an XML document	ACTIVITY METRICS BASE
MON_GET_ROUTINE table function - get aggregated routine execution metrics	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated routine execution metrics as an XML document	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get service subclass metrics as an XML document	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_TABLE table function - get table metrics	DATA OBJECT METRICS EXTENDED
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	DATA OBJECT METRICS EXTENDED
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE

Table 795. Table function monitoring information (continued)

Table function	Monitor element collection level
MON_GET_UNIT_OF_WORK_DETAILS table function - Get unit of work metrics as an XML document	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get workload metrics as an XML document	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - return a list of activities	ACTIVITY METRICS BASE

Table 796. Event monitoring information

Event type	Logical data grouping	Monitor switch
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmetrics	REQUEST METRICS BASE
Package cache	pkgcache_metrics	ACTIVITY METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

## ext\_table\_write\_volume - Total data written by external table writers monitor element

The total volume of data written by the external table writers to physical devices such as hard disks and solid state drives (SSD)..

Table 797. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - return information about an activity as an XML document	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get connection metrics as an XML document	REQUEST METRICS BASE
MON_GET_DATABASE table function - get database information metrics	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - get database information metrics as an XML document	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - get package cache statement metrics	ACTIVITY METRICS BASE

Table 797. Table function monitoring information (continued)

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_PKG_CACHE_STMT_DETAILS table function - get package cache statement metrics as an XML document	ACTIVITY METRICS BASE
MON_GET_ROUTINE table function - get aggregated routine execution metrics	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated routine execution metrics as an XML document	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get service subclass metrics as an XML document	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_TABLE table function - get table metrics	DATA OBJECT METRICS EXTENDED
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	DATA OBJECT METRICS EXTENDED
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get unit of work metrics as an XML document	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get workload metrics as an XML document	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - return a list of activities	ACTIVITY METRICS BASE

Table 798. Event monitoring information

<b>Event type</b>	<b>Logical data grouping</b>	<b>Monitor switch</b>
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmetrics	REQUEST METRICS BASE
Package cache	pkgcache_metrics	ACTIVITY METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

## F

### failed\_sql\_stmts - Failed Statement Operations

The number of SQL statements that were attempted, but failed.

*Table 799. Table function monitoring information*

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics	REQUEST METRICS BASE

*Table 800. Snapshot Monitoring Information*

<b>Snapshot Level</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Database	dbase	Basic
Database	dbase_remote	Basic
Application	appl	Basic

Table 800. Snapshot Monitoring Information (continued)

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl_remote	Basic
DCS Database	dcс_dbase	Basic
DCS Application	dcс_appl	Basic

For snapshot monitoring, this counter can be reset.

Table 801. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Connection	event_conn	Always collected
Database	event_db	Always collected
Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmmetrics	REQUEST METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

### Usage

You can use this element to calculate the total number of successful SQL statements at the database or application level:

```
dynamic_sql_stmts
+ static_sql_stmts
- failed_sql_stmts
= throughput during monitoring period
```

This count includes all SQL statements that received a negative SQLCODE.

This element may also help you in determining reasons for poor performance, since failed statements mean time wasted by the database manager and as a result, lower throughput for the database.

## fcm\_congested\_sends - FCM congested sends monitor element

The number of send operations to a remote member that were delayed due to congestion. A state of congestion occurs when data sent on a network connection are blocked because previously sent data not being received at the remote member. Congestion can be the result latency in processing by the receiver, or network issues that cause packet loss and retransmission of data.

Table 802. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_FCM_CONNECTION_LIST - Get details for all FCM connections	Always collected

Table 803. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_FCM_CONNECTION_LIST - Get details for all FCM connections	Always collected

## **fcm\_congestion\_time - FCM congestion time monitor element**

The duration of time that the FCM network connection to a remote member was in a state of congestion. Unit of measure is milliseconds. A state of congestion occurs when data sent on a network connection are blocked because previously sent data not being received at the remote member. Congestion can be the result latency in processing by the receiver, or network issues that cause packet loss and retransmission of data.

*Table 804. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_FCM_CONNECTION_LIST - Get details for all FCM connections	Always collected

## **fcm\_message\_rcv\_volume - FCM message received volume monitor element**

The amount of data received for internal requests (such as RPCs) distributed by the FCM communications layer. This value is reported in bytes.

*Table 805. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_FCM_CONNECTION_LIST - Get details for all FCM connections	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 805. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 806. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

Use this element to determine how much of the data volume being sent through the FCM subsystem is for request or reply message traffic as opposed to actual table data.

## fcm\_message\_rcv\_wait\_time - FCM message received wait time monitor element

The fcm\_message\_rcv\_wait\_time monitor element stores the time spent by an agent waiting for an FCM reply message containing the results of a previously sent FCM request message. This value reflects

both the time required to send the response between partitions using FCM and the time required for the subagent to process the request message. The value is given in milliseconds.

*Table 807. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE

Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

This element can be used to determine how much time was spent on a given partition waiting for requests to be processed on other partitions in a multi-partition instance.

## **fcm\_message\_rcv\_waits\_total - Number of times spent waiting for FCM reply message monitor element**

The total number of times that the Db2 system spent waiting for an FCM reply message containing the results of a previously sent FCM request message.

Table 809. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	ACTIVITY METRICS BASE

MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 812. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## Usage

This element can be used to determine both the average volume per FCM message received, as well as the average time spent waiting for a single FCM message to be received.

### **fcm\_message\_send\_volume - FCM message send volume monitor element**

Amount of data volume sent via internal FCM requests. This value is reported in bytes.

Table 813. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE

MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 814. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## Usage

Use this element to determine how much of the data volume being sent through the FCM subsystem is used for sending request and reply message traffic, as opposed to sending actual table data.

## fcm\_message\_send\_wait\_time - FCM message send wait time monitor element

The time spent blocking on an FCM message send. The value is given in milliseconds. This monitor element reflects the time spent blocking for FCM buffers to be flushed from an FCM channel when distributing internal requests on the database system.

Table 815. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE

Table 816. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## Usage

Use this element to determine how much time agents are spending waiting to send an FCM request message through the FCM subsystem. Depending on how busy the FCM daemons are, an agent may need to wait when attempting to send messages.

### **fcm\_message\_send\_waits\_total - Number of times spent blocking on an FCM message send monitor element**

The total number of times that the Db2 system spent blocking on an FCM message send.

Table 817. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get connection metrics as an XML document	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database metrics	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database metrics as an XML document	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get package cache statement metrics	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - Get package cache statement metrics as an XML document	ACTIVITY METRICS BASE
MON_GET_ROUTINE table function - get aggregated routine execution metrics	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated routine execution metrics as an XML document	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get service subclass metrics as an XML document	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

Use this element to determine both the average amount of data sent per FCM request message, as well as the average amount of time waited per FCM message.

## fcm\_num\_congestion\_timeouts - FCM congestion timeouts monitor element

The number of times that a state of congestion on an FCM network connection did not resolve itself within the allowable time period. A timeout occurs when the sender drops the connection because the remote member was temporarily unreachable. A state of congestion occurs when data sent on a network connection are blocked because previously sent data not being received at the remote member. Congestion can be the result latency in processing by the receiver, or network issues that cause packet loss and retransmission of data.

Table 821. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_FCM_CONNECTION_LIST - Get details for all FCM connections	Always collected

Table 822. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_FCM_CONNECTION_LIST - Get details for all FCM connections	Always collected

## fcm\_num\_conn\_lost - FCM lost connections monitor element

The number of times that an FCM network connection to a remote member was unexpectedly disconnected.

Table 823. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_FCM_CONNECTION_LIST - Get details for all FCM connections	Always collected

Table 824. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_FCM_CONNECTION_LIST - Get details for all FCM connections	Always collected

### fcm\_num\_conn\_timeouts - FCM connection timeouts monitor element

The number of times out out when attempting to establish an FCM network connection with a remote member.

Table 825. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_FCM_CONNECTION_LIST - Get details for all FCM connections	Always collected

Table 826. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_FCM_CONNECTION_LIST - Get details for all FCM connections	Always collected

### fcm\_rcv\_volume - FCM received volume monitor element

The total amount of data received via the FCM communications layer. This value is reported in bytes.

Table 827. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_FCM_CONNECTION_LIST - Get details for all FCM connections	Always collected
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS - Get detailed metrics for package cache entries	ACTIVITY METRICS BASE

Table 827. Table Function Monitoring Information (continued)

MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 828. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

Indicates the total volume of data received on this partition using FCM, including both message traffic and table queue data.

### **fcm\_recv\_wait\_time - FCM received wait time monitor element**

The total time spent waiting to receive data through FCM. The value is given in milliseconds.

*Table 829. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE

Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

Use this element to determine the total time spent waiting to receive data through FCM on this database partition. This includes both data from replies to request messages as well as table queue data.

### **fcm\_rcv\_waits\_total - Number of times spent waiting to receive data through FCM monitor element**

The total number of times that the Db2 system spent waiting to receive data through FCM.

Table 831. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE

Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

Use this element together with the **fcm\_recv\_wait\_time** monitor element to determine the average wait time per FCM receive operation as well as the average volume returned from an FCM receive operation.

## fcm\_send\_volume - FCM send volume monitor element

The total amount of data distributed by the FCM communications layer. This value is reported in bytes.

Table 835. Table Function Monitoring Information

Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

Use this monitor element to determine the total volume of data sent using FCM, including both message traffic and table queue data.

## fcm\_send\_wait\_time - FCM send wait time monitor element

The time spent blocking on an FCM send operation. This includes time spent waiting for buffers for internal requests to be flushed and time spent waiting for window count acknowledgements when sending data over table queues. The value is given in milliseconds.

Table 837. Table Function Monitoring Information

Table Function	Monitor Element Collection Level

WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 842. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE

Table 842. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

### Usage

Use this element to determine the average wait time per FCM receive operation as well as the average volume returned from an FCM receive operation.

### **fcm\_tq\_recv\_volume - FCM table queue received volume monitor element**

The amount of data received on table queues by the FCM communications layer. This value is reported in bytes.

Table 843. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_FCM_CONNECTION_LIST - Get details for all FCM connections	Always collected
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE

Table 843. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 844. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

Use this monitor element to determine the total volume of data received through table queues.

## fcm\_tq\_recv\_wait\_time - FCM table queue received wait time monitor element

The time spent waiting to receive the next buffer from a table queue. The value is given in milliseconds.

Table 845. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE

Table 845. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 846. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

Use this element to determine how much time agents are spending waiting to receive data on table queues.

### **fcm\_tq\_rcv\_waits\_total - Number of times spent waiting to receive the next buffer monitor element**

The total number of times that the Db2 system spent waiting to receive the next buffer from a table queue.

Table 847. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get connection metrics as an XML document	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database metrics	REQUEST METRICS BASE

Table 847. Table function monitoring information (continued)

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_DATABASE_DETAILS table function - Get database metrics as an XML document	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get package cache statement metrics	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - Get package cache statement metrics as an XML document	ACTIVITY METRICS BASE
MON_GET_ROUTINE table function - get aggregated routine execution metrics	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated routine execution metrics as an XML document	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get service subclass metrics as an XML document	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get unit of work metrics as an XML document	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get workload metrics as an XML document	REQUEST METRICS BASE

Table 848. Event monitoring information

<b>Event type</b>	<b>Logical data grouping</b>	<b>Monitor switch</b>
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE

Table 848. Event monitoring information (continued)

Event type	Logical data grouping	Monitor switch
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

### **fcm\_tq\_recvs\_total - FCM table queue receives total monitor element**

The total number of buffers received from table queues using the internal FCM communications mechanism.

Table 849. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 849. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 850. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

Use this element in conjunction with **fcm\_tq\_recv\_volume** and **fcm\_tq\_recv\_wait\_time** to determine the average wait time and volume per table queue buffer received.

## **fcm\_tq\_send\_volume - FCM table queue send volume monitor element**

The amount of data sent over table queues by the FCM communications layer. This value is reported in bytes.

Table 851. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE

Table 851. Table Function Monitoring Information (continued)

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_FCM_CONNECTION_LIST - Get details for all FCM connections	Always collected
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 851. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 852. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

Use this monitor element to determine the total volume of data sent over FCM through table queue buffer sends.

### fcm\_tq\_send\_wait\_time - FCM table queue send wait time monitor element

The time spent waiting to send the next buffer through a table queue. This reflects the time spent waiting for window count acknowledgements from the receiver end of the table queue. The value is given in milliseconds.

Table 853. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE

Table 853. Table Function Monitoring Information (continued)

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 854. Event Monitoring Information

<b>Event Type</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE

Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

Use this monitor element to determine how much time is being spent waiting to send a data buffer over FCM through a table queue.

### **fcm\_tq\_send\_waits\_total - Number of times spent waiting to send the next buffer monitor element**

The total number of times that the Db2 system spent waiting to send the next buffer through a table queue.

Table 855. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get connection metrics as an XML document	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database metrics	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database metrics as an XML document	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get package cache statement metrics	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - Get package cache statement metrics as an XML document	ACTIVITY METRICS BASE
MON_GET_ROUTINE table function - get aggregated routine execution metrics	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated routine execution metrics as an XML document	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE

Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

### **fcm\_tq\_sends\_total - FCM table queue send total monitor element**

The total number of buffers containing table queue data sent using the internal FCM communications mechanism.

Table 857. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE

Table 857. Table Function Monitoring Information (continued)

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 858. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

Use this element in conjunction with **fcm\_tq\_send\_volume** and **fcm\_tq\_send\_wait\_time** monitor elements to determine the average data volume and time waited for buffer sent using a table queue.

## fed\_rows\_deleted - Rows deleted by a federation system monitor element

Indicates the number of rows deleted in a remote database by a federation system statement.

Table 859. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS - Get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	REQUEST METRICS BASE

Table 859. Table function monitoring information (continued)

Table function	Monitor element collection level
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Event type	Logical data grouping	Monitor switch
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Package cache	pkgcache_metrics	ACTIVITY METRICS BASE
Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmetrics	REQUEST METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

### **fed\_rows\_updated - Rows updated by a federation system monitor element**

Indicates the number of rows updated in a remote database by a federation system statement.

Table 865. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS - Get detailed metrics for package cache entries	ACTIVITY METRICS BASE

Table 865. Table function monitoring information (continued)

Table function	Monitor element collection level
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 866. Event monitoring information

Event type	Logical data grouping	Monitor switch
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Package cache	pkgcache_metrics	ACTIVITY METRICS BASE
Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmetrics	REQUEST METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

## fed\_waits\_total - Total number of execution times for a federation server monitor element

Indicates the total number of times that a federation server ran statements and received results from a remote data source.

*Table 867. Table function monitoring information*

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS - Get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics	REQUEST METRICS BASE

Table 867. Table function monitoring information (continued)

Table function	Monitor element collection level
WLM_GET_WORKLOAD_OCCURRENCE _ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 868. Event monitoring information

Event type	Logical data grouping	Monitor switch
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Package cache	pkgcache_metrics	ACTIVITY METRICS BASE
Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmetrics	REQUEST METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

### fed\_wait\_time - Time spent by a federation server monitor element

Indicates the time that was spent by a federation server to run a statement and get results from a remote data source.

Table 869. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS - Get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	REQUEST METRICS BASE

Table 869. Table function monitoring information (continued)

Table function	Monitor element collection level
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 870. Event monitoring information

Event type	Logical data grouping	Monitor switch
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Package cache	pkgcache_metrics	ACTIVITY METRICS BASE
Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmetrics	REQUEST METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

### fetch\_count - Number of Successful Fetches

The number of successful physical fetches or the number of attempted physical fetches, depending on the snapshot monitoring level.

- For the stmt and dynsql snapshot monitoring levels and the statement event type: the number of successful fetches performed on a specific cursor.
- For the dcs\_stmt snapshot monitoring level: The number of attempted physical fetches during a statement's execution (regardless of how many rows were fetched by the application). In this situation, **fetch\_count** represents the number of times the server needed to send a reply data back to the gateway while processing a statement.

Table 871. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	stmt	Statement
DCS Statement	dcs_stmt	Statement
Dynamic SQL	dynsql	Statement

For Dynamic SQL snapshot monitoring, this counter can be reset.

Table 872. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statements	event_stmt	Always collected

## Usage

You can use this element to gain insight into the current level of activity within the database manager.

For performance reasons, a statement event monitor does not generate a statement event record for every FETCH statement. A record event is only generated when a FETCH returns a non-zero SQLCODE.

## files\_closed - Database files closed monitor element

The total number of database files closed.

Table 873. Table Function Monitoring Information

Table Function	Monitor Element Collection Command and Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

Table 874. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Buffer Pool
Table Space	tablespace	Buffer Pool
Buffer Pool	bufferpool	Buffer Pool

For snapshot monitoring, this counter can be reset.

Table 875. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected
Tablespaces	event_tablespace	Always collected

## Usage

The database manager opens files for reading and writing into and out of the buffer pool. The maximum number of database files open by an application at any time is controlled by the **maxfilop** configuration parameter. If the maximum is reached, one file will be closed before the new file is opened. Note that the actual number of files opened may not equal the number of files closed.

You can use this element to help you determine the best value for the **maxfilop** configuration parameter.

## first\_active\_log - First Active Log File Number

The file number of the first active log file.

### Element identifier

first\_active\_log

### Element type

information

Table 876. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TRANSACTION_LOG table function - Get log information	Always collected

Table 877. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	detail_log	Basic

Table 878. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected

## Usage

Use this element in conjunction with the *last\_active\_log* and *current\_active\_log* elements to determine the range of active log files. Knowing the range of active log files helps you determine the disk space required for log files.

You can also use this element to determine which log files have data to help you identify log files needed for split mirror support.

## first\_overflow\_time - Time of First Event Overflow

The date and time of the first overflow recorded by this overflow record.

Table 879. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Overflow Record	event_overflow	-

## Usage

Use this element with *last\_overflow\_time* to calculate the elapsed time for which the overflow record was generated.

## fs\_caching - File system caching monitor element

Indicates whether file system caching is intended for a table space.

Possible values:

- 0: FILE SYSTEM CACHING was specified. Direct I/O is not requested for tables space files, usually resulting in caching of I/O in the operating system file cache.
- 1: NO FILE SYSTEM CACHING was specified. Direct I/O is requested where possible for table space files, usually resulting in bypassing the file system cache. Exceptions are LOB and long field objects in SMS table spaces, where direct I/O is not requested as to allow operating system-level caching of these objects.
- 2 (Default value): Direct I/O usage is determined at runtime based on operating system preferences, file system preferences, table space type, and object type. See [File system caching configurations](#)

Table 880. Table Function Monitoring Information

Table Function	Monitor Element Collection Command and Level
MON_GET_TABLESPACE table function - Get table space metrics	Always collected

Table 881. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table space	tablespace	Basic

Table 882. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Tablespaces	event_tablespace	-

## fs\_id - Unique file system identification number monitor element

This element shows the unique identification number provided by the operating system for a file system pointed to by a storage path or container.

Table 883. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ADMIN_GET_STORAGE_PATHS table function - Get storage path information for storage groups	Always collected
MON_GET_CONTAINER table function - Get table space container metrics	Always collected

Table 884. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	db_sto_path_info	Buffer Pool

## Usage

Use this element together with the following elements to gather data on space utilization for the database:

- **db\_storage\_path**
- **sto\_path\_free\_size**

- **fs\_used\_size**
- **fs\_total\_size**

## **fs\_total\_size - Total size of a file system monitor element**

This element shows the capacity (in bytes) of a file system pointed to by a storage path or container.

*Table 885. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
ADMIN_GET_STORAGE_PATHS table function - Get storage path information for storage groups	Always collected
MON_GET_CONTAINER table function - Get table space container metrics	Always collected

*Table 886. Snapshot Monitoring Information*

<b>Snapshot Level</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Database	db_sto_path_info	Buffer Pool

### **Usage**

You can use this element together with the following elements to gather data on space utilization for the database:

- **db\_storage\_path**
- **sto\_path\_free\_size**
- **fs\_used\_size**
- **fs\_id**

## **fs\_used\_size - Amount of space used on a file system monitor element**

This element shows the amount of space (in bytes) already used on a file system pointed to by a storage path or container.

*Table 887. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
ADMIN_GET_STORAGE_PATHS table function - Get storage path information for storage groups	Always collected
MON_GET_CONTAINER table function - Get table space container metrics	Always collected

*Table 888. Snapshot Monitoring Information*

<b>Snapshot Level</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Database	db_sto_path_info	Buffer Pool

### **Usage**

You can use this element together with the following elements to gather data on space utilization for the database:

- **db\_storage\_path**
- **sto\_path\_free\_size**

- **fs\_total\_size**
- **fs\_id**

## G

### **gbp\_update\_time - Group puffer pool update time monitor element**

During extent movement, this monitor element shows the cumulative time taken to update cached page locations for moved extents in the group buffer pool.

The value is given in milliseconds.

*Table 889. Table function monitoring information*

Table function	Monitor element collection level
MON_GET_EXTENT_MOVEMENT_STATUS - get extent movement progress	Always collected

### **global\_transaction\_id - Global transaction identifier monitor element**

The XA transaction ID in use at the time the event occurred.

*Table 890. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Change history	ddlstmexec txncompletion	Always collected
Unit of Work	uow	Always collected

#### **Usage**

For the change history event monitor, this is the global transaction ID in use at the time the event occurred. This is the data field in the SQLP\_GXID structure that is part of the transaction logs.

### **gw\_comm\_error\_time - Communication Error Time**

The date and time when the most recent communication error (SQL30081) occurred while a DCS application was attempting to connect to a host database, or while it was processing an SQL statement.

*Table 891. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
DCS Database	dcs_dbase	Timestamp

#### **Usage**

Use this element for problem determination, in conjunction with [Communication Error](#) and the communication error logged in `administration notification log`.

### **gw\_comm\_errors - Communication Errors**

The number of times that a communication error (SQL30081) occurred while a DCS application was attempting to connect to a host database, or while it was processing an SQL statement.

Table 892. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
DCS Database	dcс_dbase	Basic

For snapshot monitoring, this counter can be reset.

#### Usage

By monitoring the number of communication errors over time, you can assess whether your Db2 Connect gateway has connectivity problems with a particular host database. You can establish what you consider to be a normal error threshold, so that any time the number of errors exceeds this threshold an investigation of the communication errors should be made.

Use this element for problem determination, in conjunction with the communication error logged in administration notification log.

### gw\_con\_time - Db2 Connect Gateway First Connect Initiated

The date and time when the first connection to the host database was initiated from the Db2 Connect gateway.

Table 893. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
DCS Database	dcс_dbase	Timestamp
DCS Application	dcс_appl	Timestamp

#### Usage

Use this element for problem determination on DCS applications.

### gw\_connections\_top - Maximum Number of Concurrent Connections to Host Database

The maximum number of concurrent connections to a host database that have been handled by the Db2 Connect gateway since the first database connection.

#### Element identifier

gw\_connections\_top

#### Element type

watermark

Table 894. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
DCS Database	dcс_dbase	Basic

#### Usage

This element will help you understand the level of activity at the Db2 Connect gateway and the associated use of system resources.

### gw\_cons\_wait\_client - Number of Connections Waiting for the Client to Send Request

The current number of connections to host databases being handled by the Db2 Connect gateway that are waiting for the client to send a request.

Table 895. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_INSTANCE table function - Get instance level information	Always collected

Table 896. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	db2	Basic
DCS Database	dcx_dbase	Basic

**Usage**

This value can change frequently. It should be sampled at regular intervals over an extended period in order to obtain a realistic view of gateway usage.

**gw\_cons\_wait\_host - Number of Connections Waiting for the Host to Reply**

The current number of connections to host databases being handled by the Db2 Connect gateway that are waiting for a reply from the host.

Table 897. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_INSTANCE table function - Get instance level information	Always collected

Table 898. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	db2	Basic
DCS Database	dcx_dbase	Basic

**Usage**

This value can change frequently. It should be sampled at regular intervals over an extended period in order to obtain a realistic view of gateway usage.

**gw\_cur\_cons - Current Number of Connections for Db2 Connect**

The current number of connections to host databases being handled by the Db2 Connect gateway.

Table 899. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_INSTANCE table function - Get instance level information	Always collected

Table 900. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	db2	Basic
DCS Database	dcx_dbase	Basic

### Usage

This element will help you understand the level of activity at the Db2 Connect gateway and the associated use of system resources.

## gw\_db\_alias - Database Alias at the Gateway

The alias used at the Db2 Connect gateway to connect to the host database.

### Element identifier

gw\_db\_alias

### Element type

information

Table 901. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
DCS Application	dcz_appl_info	Basic

### Usage

Use this element for problem determination on DCS applications.

## gw\_exec\_time - Elapsed Time Spent on Db2 Connect Gateway Processing

The time in seconds and microseconds at the Db2 Connect gateway to process an application request (since the connection was established), or to process a single statement.

Table 902. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
DCS Application	dcz_appl	Statement, Timestamp
DCS Statement	dcz_stmt	Statement, Timestamp

For snapshot monitoring, this counter can be reset.

### Usage

Use this element to determine what portion of the overall processing time is due to Db2 Connect gateway processing.

## gw\_total\_cons - Total Number of Attempted Connections for Db2 Connect

The total number of connections attempted from the Db2 Connect gateway since the last db2start command or the last reset.

Table 903. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_INSTANCE table function - Get instance level information	Always collected

Table 904. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	db2	Basic
DCS Database	dcz_dbase	Basic

For snapshot monitoring, this counter can be reset.

## Usage

This element will help you understand the level of activity at the Db2 Connect gateway and the associated use of system resources.

## H

### hadr\_connect\_status - HADR Connection Status monitor element

The current high availability disaster recovery (HADR) connection status of the database.

Table 905. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

Table 906. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	hadr	Basic

## Usage

Use this element to determine the HADR connection status of a database.

For the MON\_GET\_HADR interface, this element is a character string, and it can be one of the following values:

- CONNECTED
- CONGESTED
- DISCONNECTED

For snapshot monitor interface, the data type of this element is integer, and its value is one of the following constants:

#### **SQLM\_HADR\_CONN\_CONNECTED**

The database is connected to its partner node.

#### **SQLM\_HADR\_CONN\_DISCONNECTED**

The database is not connected to its partner node.

#### **SQLM\_HADR\_CONN\_CONGESTED**

The database is connected to its partner node, but the connection is congested. A connection is congested when the TCP/IP socket connection between the primary-standby pair is still alive, but one end cannot send to the other end. For example, the receiving end is not receiving from the socket connection, resulting in a full TCP/IP send space. The reasons for network connection being congested include the following:

- The network is being shared by too many resources or the network is not fast enough for the transaction volume of the primary HADR node.
- The server on which the standby HADR node resides is not powerful enough to retrieve information from the communication subsystem at the necessary rate.

This element should be ignored if the database's HADR role is standard. Use the **hadr\_role** monitor element to determine the HADR role of the database.

## hadr\_connect\_status\_time - HADR connect status time monitor element

**Note:** The **hadr\_connect\_time** and **hadr\_connect\_status\_time** monitor elements are aliases that represent the same information in different monitoring interfaces. **hadr\_connect\_time** is returned by the snapshot monitor interfaces, and **hadr\_connect\_status\_time** is returned by the MON\_GET\_HADR table function and db2pd interfaces.

This element returns the time the HADR database became in the state indicated by the **hadr\_connect\_status** element. Shows one of the following values: connection start time, congestion start time, or disconnection time, depending on **hadr\_connect\_status**.

Table 907. Table function monitoring information

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

## hadr\_connect\_time - HADR Connection Time monitor element

This monitor element can return one of the following values: high availability disaster recovery (HADR) connection time, HADR congestion time, or HADR disconnection time.

Table 908. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	hadr	Basic

### Usage

Use this element to determine when the current HADR connection status began.

If the database is in HADR primary or standby role, the meaning of this element depends on the value of the **hadr\_connect\_status** element:

- If the value of the **hadr\_connect\_status** element is SQLM\_HADR\_CONN\_CONNECTED, then this element shows connection time.
- If the value of the **hadr\_connect\_status** element is SQLM\_HADR\_CONN\_CONGESTED, then this element shows the time when congestion began.
- If the value of the **hadr\_connect\_status** element is SQLM\_HADR\_CONN\_DISCONNECTED, then this element shows disconnection time.

If there has been no connection since the HADR engine dispatchable unit (EDU) was started, connection status is reported as Disconnected and HADR EDU startup time is used for the disconnection time. Since HADR connect and disconnect events are relatively infrequent, the time is collected and reported even if the DFT\_MON\_TIMESTAMP switch is off.

**Important:** This monitor element is deprecated and might be removed in a future release. For more information, see "New fields improve HADR monitoring" in *What's New for Db2 Version 10.5*. and "Some monitoring interfaces for HADR have been deprecated" at [http://www.ibm.com/support/knowledgecenter/SSEPGG\\_10.1.0/com.ibm.db2.luw.wn.doc/doc/i0059582.html](http://www.ibm.com/support/knowledgecenter/SSEPGG_10.1.0/com.ibm.db2.luw.wn.doc/doc/i0059582.html).

This element should be ignored if the database's HADR role is standard. Use the **hadr\_role** monitor element to determine the HADR role of the database.

## hadr\_flags - HADR flags monitor element

Flags for HADR information.

Table 909. Table function monitoring information

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

### Usage

**hadr\_flags** is a space delimited string made from the following flags:

#### **ASSISTED\_REMOTE\_CATCHUP**

The stream is in assisted remote catchup state.

#### **ASSISTED\_MEMBER\_ACTIVE**

During assisted remote catchup, the member on primary that is being assisted is active. This is an abnormal condition because an active member is expected to connect to the standby database directly.

#### **STANDBY\_LOG\_RETRIEVAL**

The standby database is interacting with the log archive device to retrieve log files.

#### **STANDBY\_RECV\_BLOCKED**

The standby database temporarily cannot receive logs. The following conditions are possible causes of this flag:

- When log spooling is disabled, the buffer that receives logs is full (**standby\_recv\_buf\_percent** is 100%).
- When log spooling is enabled, spooling has reached the spool limit (**standby\_spool\_percent** is 100%).
- The Standby log device is full (**standby\_log\_device\_full** flag is set). This condition can happen when spooling is enabled or disabled.

In all cases, progress made during replay will release space and let log receiving resume.

#### **STANDBY\_LOG\_DEVICE\_FULL**

The standby log device is full. This condition blocks receiving of logs until space is released as replay proceeds.

#### **STANDBY\_REPLAY\_NOT\_ON\_PREFERRED**

The current replay member on the standby is not the preferred replay member.

#### **STANDBY\_KEY\_ROTATION\_ERROR**

The standby database encountered a master key rotation error. No logs are received until the error is corrected. The system shuts down if the error is not corrected within the timeout period (30 minutes).

#### **STANDBY\_TABLESPACE\_ERROR**

The standby database has a table space in an invalid error state and can no longer replay transactions that affect it. Replay of transactions on other valid table spaces continues. This can happen if there is a container or disk problem for a table space. This problem should be investigated and addressed immediately via reinitializing the standby database or [../com.ibm.db2.luw.admin.ha.doc/doc/c0070277.dita](#). If this state occurs during a database upgrade and if the problem is not resolved before the upgrade completes, the table spaces that are in error will not be recoverable.

#### **TCP\_PROTOCOL**

Communication between the primary and standby databases is configured with TCP/IP protocol.

#### **SSL\_PROTOCOL**

Communication between the primary and standby databases is configured with secure sockets layer (SSL) protocol. For more information, see [Configuring TLS for the communication between primary and standby HADR servers](#).

## hadr\_heartbeat - HADR Heartbeat monitor element

Number of consecutively missed heartbeats on the high availability disaster recovery (HADR) connection. This number is reset to zero when the database receives a heartbeat again. If the database is in the HADR primary or standby role, this element indicates the health of the HADR connection.

Table 910. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	hadr	Basic

For snapshot monitoring, this counter cannot be reset.

### Usage

Use this element to determine the health of the HADR connection.

A heartbeat is a message sent from the other HADR database at regular intervals. If the value for this element is zero, no heartbeats have been missed and the connection is healthy. The higher the value, the worse the condition of the connection.

In disconnected mode, heartbeat missed is always shown as 0, because it is not applicable.

The heartbeat interval is derived from configuration parameters such as **hadr\_timeout** and **hadr\_peer\_window**, with a maximal setting of 30 seconds.

The data type of this element is integer.

Ignore this element if the HADR role of the database is standard. Use the **hadr\_role** monitor element to determine the HADR role of the database.

## hadr\_last\_takeover\_time - HADR last takeover time monitor element

Time when HADR\_ROLE value for this database changed from STANDBY to PRIMARY.

**Attention:** This monitor element is only available in Db2 version 11.5.2 and later versions.

Table 911. Table function monitoring information

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

### Usage

#### hadr\_last\_takeover\_time

- Only the primary database will report the **hadr\_last\_takeover\_time**. Standby or non-HADR databases will always report **NULL**.
- On the primary database, **NULL** is reported if no **TAKEOVER** has occurred, yet. For example, on newly initialized databases or when existing HADR databases have moved to a new release.
- **db2pd -hadr** will also report the new info with the same backend data.

## hadr\_local\_host - HADR Local Host monitor element

The local high availability disaster recovery (HADR) host name. The value is displayed as a host name string or an IP address string such as "1.2.3.4".

Table 912. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	hadr	Basic

## Usage

Use this element to determine the effective HADR local host name. HADR database configuration parameters are static. Changes to a parameter are not effective until the database is stopped and restarted. This monitor element reports the value that the HADR system is actually using rather than the value in the database configuration file.

Changes to this element take effect on database activation or, if the database is already online, after HADR has been stopped and restarted on the primary.

**Note:** Any name used must resolve to one IP address. A name that resolves to more than one address will cause an error when trying to start HADR.

**Important:** This monitor element is deprecated and might be removed in a future release. For more information, see "New fields improve HADR monitoring" in *What's New for Db2 Version 10.5*, and "Some monitoring interfaces for HADR have been deprecated" at [http://www.ibm.com/support/knowledgecenter/SSEPGG\\_10.1.0/com.ibm.db2.luw.wn.doc/doc/i0059582.html](http://www.ibm.com/support/knowledgecenter/SSEPGG_10.1.0/com.ibm.db2.luw.wn.doc/doc/i0059582.html).

This element should be ignored if the database's HADR role is standard. Use the **hadr\_role** monitor element to determine the HADR role of the database.

## hadr\_local\_service - HADR Local Service monitor element

The local HADR TCP service. This value is displayed as a service name string or a port number string.

Table 913. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	hadr	Basic

## Usage

Use this element to determine the effective HADR local service name.

Changes to this element take effect on database activation or, if the database is already online, after HADR has been stopped and restarted on the primary.

This element should be ignored if the database's HADR role is standard. Use the **hadr\_role** monitor element to determine the HADR role of the database.

## hadr\_log\_gap - HADR Log Gap

This element shows the recent average of the gap between the PRIMARY\_LOG\_POS value and STANDBY\_LOG\_POS value. The gap is measured in number of bytes.

Table 914. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

Table 915. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	hadr	Basic

## Usage

Use this element to determine the gap between the primary and standby HADR database logs.

**Note:** If some of the log files have been truncated, it can appear that you have an inflated log gap due to this truncation.

This element should be ignored if the database's HADR role is standard. Use the **hadr\_role** monitor element to determine the HADR role of the database.

## hadr\_peer\_window - HADR peer window monitor element

The value of the HADR\_PEER\_WINDOW database configuration parameter.

Table 916. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	hadr	Basic

## Usage

Use this element to determine the value of the HADR\_PEER\_WINDOW database configuration parameter.

**Important:** This monitor element is deprecated and might be removed in a future release. For more information, see "New fields improve HADR monitoring" in *What's New for Db2 Version 10.5*, and "Some monitoring interfaces for HADR have been deprecated" at [http://www.ibm.com/support/knowledgecenter/SSEPGG\\_10.1.0/com.ibm.db2.luw.wn.doc/doc/i0059582.html](http://www.ibm.com/support/knowledgecenter/SSEPGG_10.1.0/com.ibm.db2.luw.wn.doc/doc/i0059582.html).

## hadr\_peer\_window\_end - HADR peer window end monitor element

The point in time until which a high availability disaster recovery (HADR) primary database promises to stay in peer or disconnected peer state, as long as the primary database is active.

Table 917. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	hadr	Basic

## Usage

Use this element to determine the point in time until which the primary promises to stay in peer or disconnected peer state.

The value reported by the primary database might be different from the value reported by the standby database. This occurs because the primary database updates the value when it sends a heartbeat message, but the new value is shown on the standby database only after the message is received and processed on the standby database.

If a database moves out of peer or disconnected peer state, the value of this monitor element is not reset. The last known value is kept and returned. If a database never reached peer state, a value of zero will be returned.

The peer window end time is set by the primary database and then sent to the standby database. For this reason, the value of the peer window end is based on the clock of the primary database. When you

compare the peer window end time with the primary database down time, you might need to add an offset to convert the timestamp to the primary database clock, if the two clocks are not well synchronized.

**Important:** This monitor element is deprecated and might be removed in a future release. For more information, see "New fields improve HADR monitoring" in *What's New for Db2 Version 10.5*. and "Some monitoring interfaces for HADR have been deprecated" at [http://www.ibm.com/support/knowledgecenter/SSEPGG\\_10.1.0/com.ibm.db2.luw.wn.doc/doc/i0059582.html](http://www.ibm.com/support/knowledgecenter/SSEPGG_10.1.0/com.ibm.db2.luw.wn.doc/doc/i0059582.html).

## hadr\_primary\_log\_file - HADR Primary Log File monitor element

The name of the current log file on the primary HADR database.

Table 918. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	hadr	Basic

### Usage

Use this element to determine the current log file on the primary HADR database.

**Important:** This monitor element is deprecated and might be removed in a future release. For more information, see "New fields improve HADR monitoring" in *What's New for Db2 Version 10.5*. and "Some monitoring interfaces for HADR have been deprecated" at [http://www.ibm.com/support/knowledgecenter/SSEPGG\\_10.1.0/com.ibm.db2.luw.wn.doc/doc/i0059582.html](http://www.ibm.com/support/knowledgecenter/SSEPGG_10.1.0/com.ibm.db2.luw.wn.doc/doc/i0059582.html).

This element should be ignored if the database's HADR role is standard. Use the **hadr\_role** monitor element to determine the HADR role of the database.

## hadr\_primary\_log\_lsn - HADR Primary Log LSN monitor element

The current log position of the primary HADR database. Log sequence number (LSN) is a byte offset in the database's log stream.

Table 919. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	hadr	Basic

### Usage

Use this element to determine the current log position on the primary HADR database.

**Important:** This monitor element is deprecated and might be removed in a future release. For more information, see "New fields improve HADR monitoring" in *What's New for Db2 Version 10.5*. and "Some monitoring interfaces for HADR have been deprecated" at [http://www.ibm.com/support/knowledgecenter/SSEPGG\\_10.1.0/com.ibm.db2.luw.wn.doc/doc/i0059582.html](http://www.ibm.com/support/knowledgecenter/SSEPGG_10.1.0/com.ibm.db2.luw.wn.doc/doc/i0059582.html).

This element should be ignored if the database's HADR role is standard. Use the **hadr\_role** monitor element to determine the HADR role of the database.

## hadr\_primary\_log\_page - HADR Primary Log Page monitor element

The page number in the current log file indicating the current log position on the primary HADR database. The page number is relative to the log file. For example, page zero is the beginning of the file.

Table 920. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	hadr	Basic

## Usage

Use this element to determine the current log page on the primary HADR database.

**Important:** This monitor element is deprecated and might be removed in a future release. For more information, see "New fields improve HADR monitoring" in *What's New for Db2 Version 10.5*, and "Some monitoring interfaces for HADR have been deprecated" at [http://www.ibm.com/support/knowledgecenter/SSEPGG\\_10.1.0/com.ibm.db2.luw.wn.doc/doc/i0059582.html](http://www.ibm.com/support/knowledgecenter/SSEPGG_10.1.0/com.ibm.db2.luw.wn.doc/doc/i0059582.html).

This element should be ignored if the database's HADR role is standard. Use the **hadr\_role** monitor element to determine the HADR role of the database.

## hadr\_remote\_host - HADR Remote Host monitor element

The remote high availability disaster recovery (HADR) host name. The value is displayed as a host name string or an IP address string such as "1.2.3.4".

Table 921. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	hadr	Basic

## Usage

Use this element to determine the effective HADR remote host name.

Changes to this element take effect on database activation or, if the database is already online, after HADR has been stopped and restarted on the primary.

**Note:** Any name used must resolve to one IP address. A name that resolves to more than one address will cause an error when trying to start HADR.

**Important:** This monitor element is deprecated and might be removed in a future release. For more information, see "New fields improve HADR monitoring" in *What's New for Db2 Version 10.5*, and "Some monitoring interfaces for HADR have been deprecated" at [http://www.ibm.com/support/knowledgecenter/SSEPGG\\_10.1.0/com.ibm.db2.luw.wn.doc/doc/i0059582.html](http://www.ibm.com/support/knowledgecenter/SSEPGG_10.1.0/com.ibm.db2.luw.wn.doc/doc/i0059582.html).

This element should be ignored if the database's HADR role is standard. Use the *hadr\_role* monitor element to determine the HADR role of the database.

## hadr\_remote\_instance - HADR Remote Instance monitor element

The remote HADR instance name.

Table 922. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	hadr	Basic

## Usage

Use this element to determine the effective HADR remote instance name.

Changes to this element take effect on database activation or, if the database is already online, after HADR has been stopped and restarted on the primary.

**Important:** This monitor element is deprecated and might be removed in a future release. For more information, see "New fields improve HADR monitoring" in *What's New for Db2 Version 10.5*. and "Some monitoring interfaces for HADR have been deprecated" at [http://www.ibm.com/support/knowledgecenter/SSEPGG\\_10.1.0/com.ibm.db2.luw.wn.doc/doc/i0059582.html](http://www.ibm.com/support/knowledgecenter/SSEPGG_10.1.0/com.ibm.db2.luw.wn.doc/doc/i0059582.html).

This element should be ignored if the database's HADR role is standard. Use the **hadr\_role** monitor element to determine the HADR role of the database.

## hadr\_remote\_service - HADR Remote Service monitor element

The remote HADR TCP service. This value is displayed as a service name string or a port number string.

Table 923. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	hadr	Basic

### Usage

Use this element to determine the effective HADR remote service name.

Changes to this element take effect on database activation or, if the database is already online, after HADR has been stopped and restarted on the primary.

This element should be ignored if the database's HADR role is standard. Use the **hadr\_role** monitor element to determine the HADR role of the database.

## hadr\_role - HADR Role

The current high availability disaster recovery (HADR) role of the database.

Table 924. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

Table 925. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	hadr	Basic

### Usage

Use this element to determine the HADR role of a database.

For the MON\_GET\_HADR interface, this element is a character string, and it can be one of the following values:

- PRIMARY
- STANDARD
- STANDBY

For snapshot monitor interface, the data type of this element is integer, and its value is one of the following constants:

### SQLM\_HADR\_ROLE\_STANDARD

The database is not an HADR database.

### SQLM\_HADR\_ROLE\_PRIMARY

The database is the primary HADR database.

### SQLM\_HADR\_ROLE\_STANDBY

The database is the standby HADR database.

## hadr\_standby\_log\_file - HADR Standby Log File monitor element

The name of the current log file on the standby HADR database.

Table 926. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	hadr	Basic

### Usage

Use this element to determine the current log file on the standby HADR database.

**Important:** This monitor element is deprecated and might be removed in a future release. For more information, see "New fields improve HADR monitoring" in *What's New for Db2 Version 10.5*, and "Some monitoring interfaces for HADR have been deprecated" at [http://www.ibm.com/support/knowledgecenter/SSEPGG\\_10.1.0/com.ibm.db2.luw.wn.doc/doc/i0059582.html](http://www.ibm.com/support/knowledgecenter/SSEPGG_10.1.0/com.ibm.db2.luw.wn.doc/doc/i0059582.html).

This element should be ignored if the database's HADR role is standard. Use the **hadr\_role** monitor element to determine the HADR role of the database.

## hadr\_standby\_log\_lsn - HADR Standby Log LSN monitor element

The current log position of the standby HADR database. Log sequence number (LSN) is a byte offset in the database's log stream.

Table 927. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	hadr	Basic

### Usage

Use this element to determine the current log position on the standby HADR database.

**Important:** This monitor element is deprecated and might be removed in a future release. For more information, see "New fields improve HADR monitoring" in *What's New for Db2 Version 10.5*, and "Some monitoring interfaces for HADR have been deprecated" at [http://www.ibm.com/support/knowledgecenter/SSEPGG\\_10.1.0/com.ibm.db2.luw.wn.doc/doc/i0059582.html](http://www.ibm.com/support/knowledgecenter/SSEPGG_10.1.0/com.ibm.db2.luw.wn.doc/doc/i0059582.html).

This element should be ignored if the database's HADR role is standard. Use the **hadr\_role** monitor element to determine the HADR role of the database.

## hadr\_standby\_log\_page - HADR Standby Log Page monitor element

The page number in the current log file indicating the current log position on the standby HADR database. The page number is relative to the log file. For example, page zero is the beginning of the file.

Table 928. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	hadr	Basic

## Usage

Use this element to determine the current log page on the standby HADR database.

**Important:** This monitor element is deprecated and might be removed in a future release. For more information, see "New fields improve HADR monitoring" in *What's New for Db2 Version 10.5*, and "Some monitoring interfaces for HADR have been deprecated" at [http://www.ibm.com/support/knowledgecenter/SSEPGG\\_10.1.0/com.ibm.db2.luw.wn.doc/doc/i0059582.html](http://www.ibm.com/support/knowledgecenter/SSEPGG_10.1.0/com.ibm.db2.luw.wn.doc/doc/i0059582.html).

This element should be ignored if the database's HADR role is standard. Use the **hadr\_role** monitor element to determine the HADR role of the database.

## hadr\_state - HADR State monitor element

The current high availability disaster recovery (HADR) state of the database.

Table 929. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

Table 930. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	hadr	Basic

## Usage

For the MON\_GET\_HADR interface, this element is a character string, and it can be one of the following values:

- DISCONNECTED
- LOCAL\_CATCHUP
- REMOTE\_CATCHUP\_PENDING
- REMOTE\_CATCHUP
- PEER
- DISCONNECTED\_PEER

For snapshot monitor interface, the data type of this element is integer, and its value is one of the following constants:

### SQLM\_HADR\_STATE\_DISCONNECTED

The database is not connected to its partner database.

### SQLM\_HADR\_STATE\_LOC\_CATCHUP

The database is doing local catchup.

### SQLM\_HADR\_STATE\_REM\_CATCH\_PEND

The database is waiting to connect to its partner to do remote catchup.

### SQLM\_HADR\_STATE\_REM\_CATCHUP

The database is doing remote catchup.

### **SQLM\_HADR\_STATE\_PEER**

The primary and standby databases are connected and are in peer state.

### **SQLM\_HADR\_STATE\_DISCONN\_PEER**

The primary and standby databases are in disconnected peer state.

This element should be ignored if the database's HADR role is standard. Use the **hadr\_role** monitor element to determine the HADR role of the database.

## **hadr\_syncmode - HADR Synchronization Mode monitor element**

The current high availability disaster recovery (HADR) synchronization mode of the database.

*Table 931. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

*Table 932. Snapshot Monitoring Information*

<b>Snapshot Level</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Database	hadr	Basic

### **Usage**

Use this element to determine the HADR synchronization mode of a database.

For the MON\_GET\_HADR interface, this element is a character string, and it can be one of the following values:

- ASYNC
- NEARSYNC
- SYNC
- SUPERASYNC

For snapshot monitor interface, the data type of this element is integer, and its value is one of the following constants:

### **SQLM\_HADR\_SYNCMODE\_SYNC**

SYNC mode.

### **SQLM\_HADR\_SYNCMODE\_NEARSYNC**

NEARSYNC mode.

### **SQLM\_HADR\_SYNCMODE\_ASYNC**

ASYNC mode.

### **SQLM\_HADR\_SYNCMODE\_SUPERASYNC**

SUPERASYNC mode.

This element should be ignored if the database's HADR role is standard. Use the **hadr\_role** monitor element to determine the HADR role of the database.

## **hadr\_timeout - HADR Timeout monitor element**

The number of seconds without any communication from its partner after which an HADR database server will consider that the connection between them has failed.

Table 933. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

Table 934. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	hadr	Basic

## Usage

Use this element to determine the effective HADR timeout value.

Changes to this element take effect on database activation or, if the database is already online, after HADR has been stopped and restarted on the primary.

This element should be ignored if the database's HADR role is standard. Use the **hadr\_role** monitor element to determine the HADR role of the database.

## hash\_grpby\_overflows - Hash GROUP BY overflows monitor element

The number of times that GROUP BY operations using hashing as their grouping method exceeded the available sort heap memory.

Table 935. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS - Get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	REQUEST METRICS BASE

Table 935. Table function monitoring information (continued)

Table function	Monitor element collection level
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 936. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Package Cache	pkgcache_metrics	ACTIVITY METRICS BASE
Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmetrics	REQUEST METRICS BASE
Unit of work	event_wlmetrics	REQUEST METRICS BASE

## Usage

Use this element along with the **total\_hash\_grpbys** element to determine if a large number of hashed GROUP BY operations are overflowing to disk. If the overflow value is high and the performance of applications using hashed GROUP BY operations needs improvement, then consider increasing the size of the sort heap.

## hash\_join\_overflows - Hash Join Overflows

The number of times that hash join data exceeded the available sort heap space.

Table 937. Table function monitoring information

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS - Get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 938. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic
Application	appl	Basic

For snapshot monitoring, this counter can be reset.

Table 939. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Connection	event_conn	Always collected
Database	event_db	Always collected
Package cache	pkgcache_metrics	ACTIVITY METRICS BASE
Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmmetrics	REQUEST METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

#### Usage

At the database level, if the value of hash\_join\_small\_overflows is greater than 10% of this hash\_join\_overflows, then you should consider increasing the sort heap size. Values at the application level can be used to evaluate hash join performance for individual applications.

### hash\_join\_small\_overflows - Hash Join Small Overflows

The number of times that hash join data exceeded the available sort heap space by less than 10%.

Table 940. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	ACTIVITY METRICS BASE

Table 941. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic
Application	appl	Basic

For snapshot monitoring, this counter can be reset.

Table 942. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Connection	event_conn	Always collected
Database	event_db	Always collected
Package cache	pkgcache_metrics	ACTIVITY METRICS BASE
Statistics	event_scmetrics	REQUEST METRICS BASE

Table 942. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmmetrics	REQUEST METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

### Usage

If this value and `hash_join_overflows` are high, then you should consider increasing the sort heap threshold. If this value is greater than 10% of `hash_join_overflows`, then you should consider increasing the sort heap size.

## heartbeat\_expected - Heartbeats expected monitor element

The number of heartbeat messages expected on this log stream.

Table 943. Table function monitoring information

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

### Usage

These messages accumulate when a database is started on the local member. With the `heartbeat_missed` value, you can determine the health of a network for a given time duration.

## heartbeat\_interval - Heartbeat interval monitor element

The heartbeat interval. The interval is computed from various factors like `hadr_timeout` and `peer_window`. This element indicates how often primary and standby exchange monitor information. Units are milliseconds.

Table 944. Table function monitoring information

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

## heartbeat\_missed - Heartbeats missed monitor element

The number of heartbeat messages not received on time on this log stream.

Table 945. Table function monitoring information

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

### Usage

These messages start accumulating when a database is started on the local member. This number should be viewed relative to the `heartbeat_expected` value. For example, 100 missed heartbeats

when **heartbeat\_expected** is 1000 is a 10% miss rate. This miss rate indicates a network problem with. However, 100 missed heartbeats when **heartbeat\_expected** is 10000 is a 1% miss rate is unlikely to be a network issue. Take the **heartbeat\_interval** value into account when assessing the **heartbeat\_expected** value. A short **heartbeat\_interval** value can cause the **heartbeat\_missed** value to appear high even though it is safe.

## high\_priority\_act\_total - The total number of high priority activities monitor element

The total count of the number of high priority activities since the last reset.

*Table 946. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	Always collected
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	Always collected
MON_GET_DATABASE table function - Get database level information	Always collected
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	Always collected
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	Always collected
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	Always collected
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get service subclass metrics as an XML document	Always collected
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	Always collected
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	Always collected
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	Always collected
MON_GET_WORKLOAD table function - Get workload metrics	Always collected
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	Always collected

*Table 947. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Activity	event_activitymetrics	ACTIVITY METRICS BASE

Table 947. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Package cache statement eviction	pkgcache_metrics	ACTIVITY METRICS BASE
Statistics	event_wlmetrics	REQUEST METRICS BASE
Statistics	event_scmetrics	REQUEST METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

## Usage

Use this element to determine the number of high priority activities since the last reset.

## histogram\_type - Histogram type monitor element

The type of the histogram, in string format.

There are seven histogram types.

### CoordActQueueTime

A histogram of the time (in milliseconds) non-nested activities spend queued (for example, in a threshold queue), measured on the coordinator member.

### CoordActExecTime

A histogram of the time (in milliseconds) non-nested activities spend executing at the coordinator member. Execution time does not include time spent initializing or queued. For cursors, execution time includes only the time spent on open, fetch and close requests. When an activity is remapped between service subclasses, the execution time histogram is updated only for the service subclass in which the activity completes execution.

### CoordActLifetime

A histogram of the elapsed time (in milliseconds) from when a non-nested activity is identified by the database manager until the activity completes execution, as measured on the coordinator member. When you remap activities between service subclasses, the lifetime histogram is updated only for the service subclass in which the activity completes execution.

### CoordActInterArrivalTime

A histogram of the time interval (in milliseconds) between the arrival of non-nested coordinator activities. The inter-arrival time mean is calculated for service subclasses through which activities enter the system. When you remap activities between service subclasses, the inter-arrival time histogram of the service subclass you remap an activity to is unaffected.

### CoordActEstCost

A histogram of the estimated cost (in timerons) of non-nested DML activities. The estimated cost of an activity is counted only toward the service subclass in which the activity enters the system.

### ReqExecTime

A histogram of request execution times (in milliseconds), which includes requests on the coordinator member, and any subrequests on both coordinator and non-coordinator members (like RPC requests or SMP subagent requests). Requests included may or may not be associated with an activity: Both PREPARE and OPEN requests are included in this histogram, for example, but while OPEN requests are always associated with a cursor activity, PREPARE requests are not part of any activity. The execution time histogram of a service subclass involved in remapping counts the portion of the execution time spent by the partial request in the service subclass.

### UowLifetime

A histogram of the elapsed time (in milliseconds) from the time that a unit of work is identified by the database manager until the time that the unit of work completes execution (committed or rolled back).

---

Table 948. Event Monitoring Information

---

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_histogrambin	Always collected

---

### Usage

Use this element to identify the type of histogram. Several histograms can belong to the same statistics record, but only one of each type.

### **hld\_application\_handle - Identifier for the application holding the lock monitor element**

System-wide unique ID for the application that is holding the lock. If the application holding this lock is unknown or cannot be found, then a value of NULL is returned.

---

Table 949. Table Function Monitoring Information

---

Table Function	Monitor Element Collection Level
MON_GET_APPL_LOCKWAIT table function - get information about locks for which an application is waiting	Always collected

---

### **hld\_member - Database member for application holding lock**

Database member where the lock is being held by the holding application.

---

Table 950. Table Function Monitoring Information

---

Table Function	Monitor Element Collection Level
MON_GET_APPL_LOCKWAIT table function - get information about locks for which an application is waiting	Always collected

---

### Usage

If the lock is being held on a remote member, the value of **hld\_member** is -2. To determine which member the lock is being held at, use the MON\_GET\_LOCKS table function and specify the **lock\_name** as a search argument.

### **host\_ccsid - Host Coded Character Set ID**

This is the coded character set identifier (CCSID) of the host database.

#### **Element identifier**

host\_ccsid

#### **Element type**

information

---

Table 951. Snapshot Monitoring Information

---

Snapshot Level	Logical Data Grouping	Monitor Switch
DCS Application	dcs_appl_info	Basic

---

### Usage

Use this element for problem determination on DCS applications.

## host\_db\_name - Host Database Name

The real name of the host database for which information is being collected or to which the application is connected. This is the name that was given to the database when it was created.

Table 952. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
DCS Database	dcс_dbase	Basic
DCS Application	dcс_appl_info	Basic

### Usage

Use this element for problem determination on DCS applications.

## host\_name - Host name monitor element

Name of the host on which the cluster caching facility process resides.

Table 953. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
DB_MEMBERS table function	Always collected
ENV_GET_NETWORK_RESOURCES table function - Return network adapter information	Always collected
ENV_GET_SYSTEM_RESOURCES table function - Return system information	Always collected
MON_GET_CF table function - Get CF metrics	Always collected
MON_GET_MEMORY_POOL table function - Get memory pool information	Always collected
MON_GET_MEMORY_SET table function - Get memory set information	Always collected

## host\_prdid - Host Product/Version ID

The product and version that is running on the server.

Table 954. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
DCS Application	dcс_appl_info	Basic

### Usage

Used to identify the product and code version of the DRDA host database product. It is in the form PPPVRRM, where:

- PPP identifies the host DRDA product:
  - ARI for Db2 Server for VSE & VM
  - DSN for Db2 for z/OS
  - QSQ for Db2 for IBM i
  - SQL for other relational database products
- VV identifies a 2-digit version number.
- RR identifies a 2-digit release number.

- M identifies a 1-character modification level (0-9 or A-Z).

## host\_response\_time - Host Response Time

At the DCS statement level, this is the elapsed time between the time that the statement was sent from the Db2 Connect gateway to the host for processing and the time when the result was received from the host. At DCS database and DCS application levels, it is the sum of the elapsed times for all the statements that were executed for a particular application or database. At the data transmission level, this is the sum of host response times for all the statements that used this many data transmissions.

Table 955. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
DCS Database	dcс_dbase stmt_transmissions	Statement
DCS Application	dcс_appl stmt_transmissions	Statement, Timestamp
DCS Statement	dcс_stmt	Statement, Timestamp

For snapshot monitoring at the statement level, this counter cannot be reset. This counter can be reset at other levels.

### Usage

Use this element with [Outbound Number of Bytes Sent](#) and [Outbound Number of Bytes Received](#) to calculate the outbound response time (transfer rate):

```
(outbound bytes sent + outbound bytes received) / host response time
```

This element is composed of two subelements that report time spent as seconds and microseconds (one millionth of a second). The names of the subelements can be derived by adding "\_s" and "\_ms" to the name of this monitor element. To retrieve the total time spent for this monitor element, the values of the two subelements must be added together. For example, if the "\_s" subelement value is 3 and the "\_ms" subelement value is 20, then the total time spent for the monitor element is 3.00002 seconds.

## hostname - Host name monitor element

The host name of the machine on which the database member resides.

Table 956. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
DB2_CLUSTER_HOST_STATE administrative view and DB2_GET_CLUSTER_HOST_STATE table function - get information about hosts	Always collected
MON_GET_CF_CMD table function - Get cluster caching facility command processing time	Always collected
MON_GET_CF_WAIT_TIME table function - Get cluster caching facility command wait time	Always collected
MON_GET_FCM - Get FCM metrics	Always collected
MON_GET_SERVERLIST table function - get member priority details	Always collected

Table 956. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_SAMPLE_SERVICE_CLASS_METRICS - Get sample service class metrics	Always collected
MON_SAMPLE_WORKLOAD_METRICS - Get sample workload metrics	Always collected

## I

### id - cluster caching facility identification monitor element

cluster caching facility identifier, as defined in the db2nodes . cfg file.

Table 957. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
DB2_MEMBER and DB2_CF administrative views and DB2_GET_INSTANCE_INFO table function	Always collected
MON_GET_CF table function - Get CF metrics	Always collected
MON_GET_CF_CMD table function - Get cluster caching facility command processing time	Always collected
MON_GET_CF_WAIT_TIME table function - Get cluster caching facility command wait time	Always collected

### ida\_recv\_volume - Total data volume received monitor element

The total volume of data (in bytes) that the database server received from an in-database analytics process.

Table 958. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
EVMON_FORMAT_UE_TO_XML table function - convert unformatted events to XML	REQUEST METRICS BASE
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics as an XML document	REQUEST METRICS BASE

Table 958. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS - get detailed metrics for package cache entries (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	Always collected
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	Always collected
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 959. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activity	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activity	event_activitymetrics	ACTIVITY METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE
Package cache	event_pkgcache_metrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE

Table 959. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Unit of work	event_uow_metrics	REQUEST METRICS BASE

### ida\_recv\_wait\_time - Time spent waiting to receive data monitor element

The total amount of time spent waiting to receive data from an in-database analytics process.

Table 960. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
EVMON_FORMAT_UE_TO_XML table function - convert unformatted events to XML	REQUEST METRICS BASE
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics as an XML document	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS - get detailed metrics for package cache entries (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	Always collected
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	Always collected
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 960. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 961. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activity	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activity	event_activitymetrics	ACTIVITY METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE
Package cache	event_pkgcache_metrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Unit of work	event_uow_metrics	REQUEST METRICS BASE

## ida\_recvs\_total - Number of times data received monitor element

The total number of times data was received from an in-database analytics process.

Table 962. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
EVMON_FORMAT_UE_TO_XML table function - convert unformatted events to XML	REQUEST METRICS BASE
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics as an XML document	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS - get detailed metrics for package cache entries (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	Always collected
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	Always collected
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 962. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 963. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activity	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activity	event_activitymetrics	ACTIVITY METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE
Package cache	event_pkgcache_metrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE

MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 965. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activity	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activity	event_activitymetrics	ACTIVITY METRICS BASE

Table 965. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE
Package cache	event_pkgcache_metrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Unit of work	event_uow_metrics	REQUEST METRICS BASE

### ida\_send\_wait\_time - Time spent waiting to send data monitor element

The total amount of time spent waiting to send data to an in-database analytics process.

Table 966. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
EVMON_FORMAT_UE_TO_XML table function - convert unformatted events to XML	REQUEST METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics as an XML document	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS - get detailed metrics for package cache entries (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	Always collected
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	Always collected

Table 966. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 967. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activity	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activity	event_activitymetrics	ACTIVITY METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE
Package cache	event_pkgcache_metrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Unit of work	event_uow_metrics	REQUEST METRICS BASE

## ida\_sends\_total - Number of times data sent monitor element

The total number of times data was sent to an in-database analytics process.

Table 968. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
EVMON_FORMAT_UE_TO_XML table function - convert unformatted events to XML	REQUEST METRICS BASE
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics as an XML document	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS - get detailed metrics for package cache entries (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	Always collected
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	Always collected
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 968. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 969. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activity	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activity	event_activitymetrics	ACTIVITY METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE
Package cache	event_pkgcache_metrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Unit of work	event_uow_metrics	REQUEST METRICS BASE

## idle\_agents - Number of Idle Agents

The number of agents in the agent pool that are currently unassigned to an application and are, therefore, "idle".

Table 970. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_INSTANCE table function - Get instance level information	Always collected

Table 971. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	db2	Basic

## Usage

You can use this element to help set the *num\_poolagents* configuration parameter. Having idle agents available to service requests for agents can improve performance.

## iid - Index identifier monitor element

Identifier for the index.

Table 972. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ADMIN_GET_INDEX_COMPRESS_INFO table function - returns compressed index information	Always collected
ADMIN_GET_INDEX_INFO table function - returns index information	Always collected
MON_GET_INDEX table function - Get index metrics	Always collected
MON_GET_PAGE_ACCESS_INFO table function - Get buffer pool page waiting information	Always collected

## implicit\_rebinds - number of implicit rebinds monitor element

The number of automatic rebinds (or recompiles) that have been attempted.

Table 973. Table function monitoring information

Table function	Monitor element collection level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 973. Table function monitoring information (continued)

Table function	Monitor element collection level
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics	REQUEST METRICS BASE

Table 974. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmmetrics	REQUEST METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

### inact\_stmthist\_sz - Statement history list size

When a detailed deadlock event monitor with history is running, this element reports the number of bytes being used from the database monitor heap (MON\_HEAP\_SZ) to keep track of the statement history list entries.

Table 975. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
application	appl	-
database	db	-

#### Usage

You can use this element when tuning the database monitor heap.

### inbound\_bytes\_received - Inbound Number of Bytes Received

The number of bytes received by the Db2 Connect gateway from the client, excluding communication protocol usage (for example, TCP/IP).

Table 976. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
DCS Application	dcs_appl	Basic
DCS Statement	dcs_stmt	Statement

For snapshot monitoring at the application level, this counter can be reset. This counter cannot be reset at other levels.

### Usage

Use this element to measure the throughput from the client to the Db2 Connect gateway.

## **inbound\_bytes\_sent - Inbound Number of Bytes Sent**

The number of bytes sent by the Db2 Connect gateway to the client, excluding communication protocol usage (for example, TCP/IP).

*Table 977. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
DCS Application	dcz_appl	Basic
DCS Statement	dcz_stmt	Statement

For snapshot monitoring at the application level, this counter can be reset. This counter cannot be reset at other levels.

### Usage

Use this element to measure the throughput from the Db2 Connect gateway to the client.

## **inbound\_comm\_address - Inbound Communication Address**

This is the communication address of the client. For example, it could be an IP address and port number for TCP/IP.

*Table 978. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl_info	Basic
DCS Application	dcz_appl_info	Basic

### Usage

Use this element for problem determination on DCS applications.

## **include\_col\_updates - Include column updates monitor element**

Number of include column updates.

*Table 979. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_INDEX table function - Get index metrics	Always collected

## **incremental\_bind - Incremental bind monitor element**

Indicates whether the package was incrementally bound at execution time. Possible values are YES or NO.

*Table 980. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Locking	lock_participant_activities	

## index\_jump\_scans - Index jump scans monitor element

Number of jump scans. A jump scan is an index scan where there is a gap in the index start and stop keys and sections of the index that will not yield results are skipped.

Table 981. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_INDEX table function - Get index metrics	Always collected

### Usage

You can use this monitor element to validate that jump scans are happening at an expected rate. If the value for this monitor element is not increasing as expected, check the following conditions:

- For queries being issued where you expect a jump scan, verify that the target table has an appropriate composite index and that the query predicates introduce an index gap. The database optimizer will not create plans with jump scans if there are no index gaps.
- Jump scans do not scan the following types of indexes:
  - range-clustered table indexes
  - extended indexes (for example, spatial indexes)
  - XML indexes
  - text indexes (for Text Search)

**Note:** When creating an access plan, the database optimizer performs costing analysis to determine if jump scans should be executed. There might be cases where the optimizer finds that not using a jump scan is more efficient.

## index\_name - Index name monitor element

The name of an index.

Table 982. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ADMIN_GET_INDEX_COMPRESS_INFO table function - returns compressed index information	Always collected
ADMIN_GET_INDEX_INFO table function - returns index information	Always collected
MON_GET_INDEX_USAGE_LIST table function - Returns information from an index usage list	Always collected

## index\_object\_l\_pages - Index data logical pages monitor element

The number of logical pages used on disk by all indexes associated with this table. For partitioned tables, the value returned is NULL.

Table 983. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLE table function - Get table metrics	Always collected

## Usage

- This value might be less than the amount of space physically allocated for the object. This can happen when you use the REUSE STORAGE option of the TRUNCATE statement. This option causes storage allocated for the table to continue to be allocated, although the storage will be considered empty. In addition, the value for this monitor element might be less than the amount of space logically allocated for the object, because the total space logically allocated includes a small amount of additional meta data.

To retrieve an accurate measure of the logical or physical size of an object, use the ADMIN\_GET\_TAB\_INFO\_V97 function. This function provides more accurate information about the size of objects than you can obtain by multiplying the number of pages reported for this monitor element by the page size.

## index\_object\_pages - Index Object Pages

The number of disk pages consumed by all indexes defined on a table.

*Table 984. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Table	table	Basic

*Table 985. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Tables	event_table	Always collected

## Usage

This element provides a mechanism for viewing the actual amount of space consumed by indexes defined on a particular table. This element can be used in conjunction with a table event monitor to track the rate of index growth over time. This element is not returned for partitioned tables.

## index\_only\_scans - Index-only scans monitor element

Number of index-only scans. Index-only scans occur when the results of scan was satisfied by access to the index only.

*Table 986. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_INDEX table function - Get index metrics	Always collected

## index\_scans - Index scans monitor element

Number of index scans.

*Table 987. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_INDEX table function - Get index metrics	Always collected

## index\_schema - Index schema monitor element

The name of an index schema.

Table 988. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ADMIN_GET_INDEX_COMPRESS_INFO table function - returns compressed index information	Always collected
ADMIN_GET_INDEX_INFO table function - returns index information	Always collected
MON_GET_INDEX_USAGE_LIST table function - Returns information from an index usage list	Always collected

## index\_tbsp\_id - Index table space ID monitor element

An identifier of the table space that holds indexes created on this table.

Table 989. Table Function Monitoring Information

Table Function	Monitor Element Collection Command and Level
MON_GET_TABLE table function - Get table metrics	Always collected

### Usage

The value of this element matches a value from column TBSPACEID of view SYSCAT.TABLESPACES.

## input\_db\_alias - Input Database Alias

The alias of the database provided when calling the snapshot function.

Table 990. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic
Application	appl_id_info	Basic
Table Space	tablespace_list	Buffer Pool
Buffer Pool	bufferpool	Buffer Pool
Table	table_list	Table
Lock	db_lock_list	Basic

### Usage

This element can be used to identify the specific database to which the monitor data applies. It contains blanks unless you requested monitor information related to a specific database.

The value of this field may be different than the value of the *client\_db\_alias* monitor element since a database can have many different aliases. Different applications and users can use different aliases to connect to the same database.

## insert\_sql\_stmts - Inserts

This element contains a count of the total number of times the federated server has issued an INSERT statement to this data source on behalf of any application since the start of the federated server instance or the last reset of the database monitor counters, whichever is latest.

Table 991. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase_remote	Basic
Application	appl_remote	Basic

For snapshot monitoring, this counter can be reset.

## Usage

Use this element to determine the level of database activity directed against this data source by the federated server or an application.

You can also use this element to determine the percentage of write activity against this data source by the federated server or an application, with the following formula:

```
write_activity =  
  (INSERT statements + UPDATE statements + DELETE statements ) /  
  (SELECT statements + INSERT statements + UPDATE statements +  
  DELETE statements)
```

## insert\_time - Insert Response Time

This element contains the aggregate amount of time, in milliseconds, that it has taken this data source to respond to INSERTs from all applications or a single application running on this federated server instance since the start of the federated server instance or the last reset of the database monitor counters. The monitor stores the most recent value.

The response time is measured as the difference in time between the time the federated server submits an INSERT statement to the data source, and the time the data source responds to the federated server, indicating that the INSERT has been processed.

Table 992. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase_remote	Timestamp
Application	appl_remote	Timestamp

For snapshot monitoring, this counter can be reset.

## Usage

Use this element to determine the actual amount of time that transpires waiting for INSERTs to this data source to be processed. This information can be useful for capacity planning and tuning.

## insert\_timestamp - Insert timestamp monitor element

The insert\_timestamp monitor element stores the time when the statement or section was inserted into the cache. For dynamic sql snapshots this represents the time when the statement entered the cache. For MON\_GET\_PKG\_CACHE\_STMT, MON\_GET\_PKG\_CACHE\_STMT\_DETAILS and the package cache event monitor, the value is more granular and represents the time when an individual section for this statement was inserted into the cache.

Table 993. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	Always collected
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	Always collected

Table 994. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Dynamic SQL	dynsql	Basic

Table 995. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Package cache	-	Always collected

## Usage

This element specifies the time when the statement was inserted into the cache. It can be used to estimate the lifetime of a statement in the cache.

## int\_auto\_rebinds - Internal Automatic Rebinds

The number of automatic rebinds (or recompiles) that have been attempted.

Table 996. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic
Application	appl	Basic

For snapshot monitoring, this counter can be reset.

Table 997. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected
Connection	event_conn	Always collected

## Usage

Automatic rebinds are the internal binds the system performs when an package has been invalidated. The rebind is performed the first time that the database manager needs to execute an SQL statement from the package. For example, packages are invalidated when you:

- Drop an object, such as a table, view, or index, on which the plan is dependent
- Add or drop a foreign key
- Revoke object privileges on which the plan is dependent.

You can use this element to determine the level of database activity at the application or database level. Since `int_auto_rebinds` can have a significant impact on performance, they should be minimized where possible.

You can also use this element to determine the percentage of rebind activity using the following formula:

```
int_auto_rebinds / total number of statements
```

This information can be useful for analyzing application activity and throughput.

## **int\_commits - Internal commits monitor element**

The total number of commits initiated internally by the database manager.

*Table 998. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE

Table 998. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 999. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic
Application	appl	Basic

For snapshot monitoring, this counter can be reset.

Table 1000. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected
Connection	event_conn	Always collected
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## Usage

An internal commit may occur during any of the following events:

- A reorganization
- An import
- A bind or pre-compile

This value, which does not include explicit SQL COMMIT statements, represents the number of these internal commits since the later of:

- The connection to the database (for database-level information, this is the time of the first connection)
- The last reset of the database monitor counters.

You can use this element to calculate the total number of units of work by calculating the sum using the following expression:

```
commit_sql_stmts
+ int_commits
+ rollback_sql_stmts
+ int_rollbacks
```

**Note:** The units of work calculated will only include those since the later of:

- The connection to the database (for database-level information, this is the time of the first connection)

- The last reset of the database monitor counters.

This calculation can be done at the application or the database level.

## int\_deadlock\_rollbacks - Internal Rollbacks Due To Deadlock

The total number of forced rollbacks initiated by the database manager due to a deadlock. A rollback is performed on the current unit of work in an application selected by the database manager to resolve the deadlock.

### Element identifier

int\_deadlock\_rollbacks

### Element type

counter

*Table 1001. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic
Application	appl	Basic

For snapshot monitoring, this counter can be reset.

*Table 1002. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Connection	event_conn	Always collected

### Usage

This element shows the number of deadlocks that have been broken and can be used as an indicator of concurrency problems. It is important, since int\_deadlock\_rollbacks lower the throughput of the database.

This value is included in the value given by int\_rollbacks.

## int\_node\_splits - Intermediate node splits monitor element

Number of times an intermediate index node was split during an insert operation.

*Table 1003. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_INDEX table function - Get index metrics	Always collected

## int\_rollbacks - Internal rollbacks monitor element

The total number of rollbacks initiated internally by the database manager.

*Table 1004. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	Always collected
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 1005. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic
Application	appl	Basic

For snapshot monitoring, this counter can be reset.

Table 1006. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected
Connection	event_conn	Always collected
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE

Table 1006. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_superclasstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## Usage

An internal rollback occurs when any of the following cannot complete successfully:

- A reorganization
- An import
- A bind or pre-compile
- An application ends as a result of a deadlock situation or lock timeout situation
- An application ends without executing an explicit commit or rollback statement

This value represents the number of these internal rollbacks since the later of:

- The connection to the database (for database-level information, this is the time of the first connection)
- The last reset of the database monitor counters.

While this value does not include explicit SQL ROLLBACK statements, the count from the **int\_deadlock\_rollbacks** monitor element is included.

You can use this element to calculate the total number of units of work by calculating the sum of the following:

```

commit_sql_stmts
+ int_commits
+ rollback_sql_stmts
+ int_rollbacks

```

**Note:** The units of work calculated will include those since the later of:

- The connection to the database (for database-level information, this is the time of the first connection)
- The last reset of the database monitor counters.

This calculation can be done at the application or the database level.

## int\_rows\_deleted - Internal Rows Deleted

This is the number of rows deleted from the database as a result of internal activity.

Table 1007. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE

Table 1008. Snapshot Monitoring Information

<b>Snapshot Level</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Database	dbase	Basic
Application	appl	Basic
Application	stmt	Basic
Dynamic SQL	dynsql	Statement

For snapshot monitoring, this counter can be reset.

*Table 1009. Event Monitoring Information*

<b>Event Type</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Connection	event_conn	Always collected
Database	event_db	Always collected
Package cache	pkgcache_metrics	ACTIVITY METRICS BASE
Statements	event_stmt	Always collected
Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmmetrics	REQUEST METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

### Usage

This element can help you gain insight into internal activity within the database manager of which you might not be aware. If this activity is high, you may want to evaluate your table design to determine if the referential constraints or triggers that you have defined on your database are necessary.

Internal delete activity can be a result of:

- A cascading delete enforcing an ON CASCADE DELETE referential constraint
- A trigger being fired.

## **int\_rows\_inserted - Internal Rows Inserted**

The number of rows inserted into the database as a result of internal activity caused by triggers.

*Table 1010. Table function monitoring information*

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE

Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmmetrics	REQUEST METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

### Usage

This element can help you gain insight into the internal activity within the database manager. If this activity is high, you may want to evaluate your design to determine if you can alter it to reduce this activity.

## int\_rows\_updated - Internal Rows Updated

This is the number of rows updated from the database as a result of internal activity.

Table 1013. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	ACTIVITY METRICS BASE

Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmmetrics	REQUEST METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

### Usage

This element can help you gain insight into internal activity within the database manager of which you might not be aware. If this activity is high, you may want to evaluate your table design to determine if the referential constraints that you have defined on your database are necessary.

Internal update activity can be a result of:

- A *set null* row update enforcing a referential constraint defined with the ON DELETE SET NULL rule
- A trigger being fired.

## intra\_parallel\_state - Current state of intrapartition parallelism monitor element

The current state of intrapartition parallelism reported at statement, activity, transaction, or workload level. Possible values are "YES" to indicate that intrapartition parallelism is enabled so a statement can run with subagents; and "NO" to indicate that intrapartition parallelism is disabled.

Table 1016. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected

Table 1017. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Unit of work	uow	Always collected

## invocation\_id - Invocation ID monitor element

An identifier that distinguishes one invocation of a routine from others at the same nesting level within a unit of work. It is unique within a unit of work for a specific nesting level. This monitor element is an alias for the `invocation_id` element.

The **invocation\_id** monitor element is an alias of the **stmt\_invocation\_id** monitor element.

Table 1018. Table Function Monitoring Information

Unit of work	Reported in the package list.	Always collected

**1**

This option has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the CREATE EVENT MONITOR FOR LOCKING statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

**Usage**

You can use this element to uniquely identify the invocation in which a particular SQL statement has been executed. You can also use this element in conjunction with other statement history entries to see the sequence of SQL statements that caused the deadlock.

**ipc\_rcv\_volume - Interprocess communication received volume monitor element**

The amount of data received by data server from clients over IPC. This value is reported in bytes.

Table 1020. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE

Table 1020. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 1021. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the details_xml document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the details_xml document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the details_xml document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## ipc\_recv\_wait\_time - Interprocess communication received wait time monitor element

The time spent by an agent receiving an incoming client request using the IPC communications protocol. The value is reported in milliseconds.

Table 1022. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE

Table 1022. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 1023. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the details_xml document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the details_xml document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the details_xml document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

### ipc\_recvs\_total - Interprocess communication receives total monitor element

The number of times data was received by the database server from the client application using IPC.

Table 1024. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE

Table 1024. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 1025. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the details_xml document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the details_xml document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the details_xml document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## ipc\_send\_volume - Interprocess communication send volume monitor element

The amount of data sent by data server to clients over the IPC protocol. This value is reported in bytes.

Table 1026. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE

Table 1026. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 1027. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the details_xml document)	REQUEST METRICS BASE
Statistics	event_superclass stats (reported in the details_xml document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the details_xml document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

### ipc\_send\_wait\_time - Interprocess communication send wait time monitor element

The time spent blocking on an IPC send to the client. The value is given in milliseconds.

Table 1028. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE

Table 1028. Table Function Monitoring Information (continued)

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 1029. Event Monitoring Information

<b>Event Type</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Statistics	event_scstats (reported in the details_xml document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the details_xml document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the details_xml document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## ipc\_sends\_total - Interprocess communication send total monitor element

The number of times data was sent by the database server to client applications using IPC.

Table 1030. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 1031. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the details_xml document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the details_xml document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the details_xml document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## is\_system\_appl - Is System Application monitor element

Indicates whether the application is a system application.

Table 1032. Table function monitoring information

Table function	Monitor element collection level
MON_GET_APPL_LOCKWAIT table function - Get information about locks for which an application is waiting	Always collected
MON_GET_CONNECTION table function - Get connection metrics	Always collected
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	Always collected
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	Always collected

Table 1033. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	Always collected
MON_GET_AGENT table function - List agents, fenced mode processes, and system entities for the database	Always collected
MON_GET_APPL_LOCKWAIT table function - Get information about locks for which an application is waiting	Always collected
MON_GET_CONNECTION table function - Get connection metrics	Always collected
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	Always collected
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	Always collected
WLM_GET_SERVICE_CLASS_AGENTS table function - list agents running in a service class	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

Table 1034. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl_info	Basic

## Usage

The **is\_system\_app1** monitor element indicates whether an application is an internal system application. The possible values are

**0**

user application

**1**

system application

## K

### key\_updates - Key updates monitor element

Number of key updates.

Table 1035. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_INDEX table function - Get index metrics	Always collected

### ktid - Kernel thread ID monitor element

A unique identifier for the operating system kernel thread in service.

Table 1036. Table function monitoring information

Table function	Monitor element collection level
ENV_GET_DB2_EDU_SYSTEM_RESOURCES table function - Return Db2 engine dispatchable units system information	Always collected

## L

### last\_active\_log - Last Active Log File Number

The file number of the last active log file.

#### Element identifier

last\_active\_log

#### Element type

information

Table 1037. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TRANSACTION_LOG table function - Get log information	Always collected

Table 1038. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	detail_log	Basic

Table 1039. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected

### Usage

Use this element in conjunction with the *first\_active\_log* and *current\_active\_log* elements to determine the range of active log files. Knowing the range of active log files helps you determine the disk space required for log files.

You can also use this element to determine which log files have data to help you identify log files needed for split mirror support.

## last\_backup - Last Backup Timestamp

The date and time that the latest database backup was completed.

Table 1040. Table function monitoring information

Table function	Monitor element collection level
MON_GET_DATABASE table function - Get database level information	Always collected
MON_GET_DATABASE_DETAILS table function - Get database information metrics	Always collected

Table 1041. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Timestamp

### Usage

You may use this element to help you identify a database that has not been backed up recently, or to identify which database backup file is the most recent. If the database has never been backed up, this timestamp is initialized to zero for snapshots and NULL for table functions.

## last\_executable\_id - Last executable identifier monitor element

The executable id for the statement most recently completed by the application.

Table 1042. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	Always collected
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	Always collected

Table 1042. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	Always collected

### LAST\_EXEC\_ERROR - The last error of the statement monitor element

The SQLCODE from the error SQLCA for the last error of this statement. If this statement has not had an error, then this value is NULL.

Table 1043. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_PKG_CACHE_STMT table function - Get package cache statement metrics	Always collected

Table 1044. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Package cache	event_pkgcache	Always collected

### LAST\_EXEC\_ERROR\_SQLERRMC - The tokens for last statement error monitor element

The SQLERRMC from the error SQLCA containing SQLCODE tokens for the last error of this statement. If this statement has not had an error, then this value is NULL.

Table 1045. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_PKG_CACHE_STMT table function - Get package cache statement metrics	Always collected

Table 1046. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Package cache	event_pkgcache	Always collected

### LAST\_EXEC\_ERROR\_TIMESTAMP - The time of last statement error monitor element

The time when the last error for this statement occurred. If this statement has not had an error, then this value is NULL.

Table 1047. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_PKG_CACHE_STMT table function - Get package cache statement metrics	Always collected

Table 1048. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Package cache	event_pkgcache	Always collected

### LAST\_EXEC\_WARNING - The last statement warning monitor element

The SQLCODE from the warning SQLCA for the last warning of this statement. If this statement has not had a warning this value is NULL.

Table 1049. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_PKG_CACHE_STMT table function - Get package cache statement metrics	Always collected

Table 1050. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Package cache	event_pkgcache	Always collected

**SQL0100W is not reported by this element.**

### Explanation

One of the following conditions is true:

- No row was found that meets the search conditions specified in an UPDATE or DELETE statement.
- The result of a SELECT statement was an empty table.
- A FETCH statement was executed when the cursor was positioned after the last row of the result table.
- The result of the SELECT used in an INSERT statement is empty.

No data was retrieved, updated, or deleted.

### User Response

No action is required. Processing can continue.

sqlcode: +100

sqlstate: 02000

### LAST\_EXEC\_WARNING\_SQLERRMC - The tokens for last statement warning monitor element

The SQLERRMC from the warning SQLCA containing SQLCODE tokens for the last warning of this statement. If this statement has not had a warning this value is NULL.

Table 1051. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_PKG_CACHE_STMT table function - Get package cache statement metrics	Always collected

Table 1052. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Package cache	event_pkgcache	Always collected

### **LAST\_EXEC\_WARNING\_TIMESTAMP - The time of last statement warning monitor element**

The time when the last warning for this statement occurred. If this statement has not had a warning, then this value is NULL.

Table 1053. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_PKG_CACHE_STMT table function - Get package cache statement metrics	Always collected

Table 1054. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Package cache	event_pkgcache	Always collected

### **last\_extent - Last extent moved monitor element**

The numeric identifier of the last extent moved by the table space rebalancer process.

Table 1055. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_EXTENT_MOVEMENT_STATUS - Get extent movement progress status metrics	Always collected

### **last\_metrics\_update - Metrics last update timestamp monitor element**

Timestamp reflecting the last time metrics were updated for this cache entry.

Table 1056. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE

Table 1057. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Package cache	-	COLLECT BASE DATA

### **last\_overflow\_time - Time of Last Event Overflow**

The date and time of the last overflow recorded this overflow record.

---

Table 1058. Event Monitoring Information

---

Event Type	Logical Data Grouping	Monitor Switch
Overflow Record	event_overflow	-

---

**Usage**

Use this element with *first\_overflow\_time* to calculate the elapsed time for which the overflow record was generated.

**last\_reference\_time - Last reference time monitor element**

The last time the activity was accessed by a request.

---

Table 1059. Table Function Monitoring Information

---

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

---

**last\_request\_type - Last request type monitor element**

The type of the last request completed by the application.

---

Table 1060. Table Function Monitoring Information

---

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	Always collected
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	Always collected
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	Always collected

---

**Usage**

This monitor element is only reported on the coordinator member for the application.

The following values are possible.

- CLOSE
- COMMIT
- COMPILE
- DESCRIBE
- EXCSQLSET

- EXECIMMD
- EXECUTE
- FETCH
- INTERNAL *number*, where *number* is the value of the internal constant
- OPEN
- PREPARE
- REBIND
- REDISTRIBUTE
- REORG
- ROLLBACK
- RUNSTATS

## last\_reset - Last Reset Timestamp

Indicates the date and time that the monitor counters were reset for the application issuing the GET SNAPSHOT.

*Table 1061. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_QUEUE_STATS table function - Return threshold queue statistics	Always collected
MON_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	Always collected
MON_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected
MON_GET_WORKLOAD_STATS table function - Return workload statistics	Always collected
MON_GET_WORK_ACTION_SET_STATS table function - Return work action set statistics	Always collected
WLM_GET_QUEUE_STATS table function - Return threshold queue statistics	Always collected
WLM_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	Always collected
WLM_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected
WLM_GET_WORK_ACTION_SET_STATS table function - Return work action set statistics	Always collected
WLM_GET_WORKLOAD_STATS table function - Return workload statistics	Always collected

*Table 1062. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	db2	Timestamp
Database	dbase	Timestamp
Application	appl	Timestamp

Table 1062. Snapshot Monitoring Information (continued)

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_list	Buffer Pool, Timestamp
Table	table_list	Timestamp
DCS Database	dcс_dbase	Timestamp
DCS Application	dcс_appl	Timestamp

### Usage

You can use this element to help you determine the scope of information returned by the database system monitor.

If the counters have never been reset, this element will be zero.

The database manager counters will only be reset if you reset all active databases.

### last\_updated - Last update time stamp monitor element

The time stamp indicating the last time this entry was updated.

Table 1063. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_INDEX_USAGE_LIST table function - Returns information from an index usage list	Always collected
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	Always collected

### last\_wlm\_reset - Time of last reset monitor element

This element, in the form of a local timestamp, shows the time at which the last statistics event record of this type was created.

Table 1064. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_osmetrics	-
Statistics	event_qstats	-
Statistics	event_scmetrics	Always collected
Statistics	event_scstats	-
Statistics	event_superclassmetrics	Always collected
Statistics	event_superclasstats	-
Statistics	event_wcstats	-
Statistics	event_wlmetrics	Always collected
Statistics	event_wlstats	-

### Usage

Use the **wlm\_last\_reset** and **statistics\_timestamp** monitor elements to determine a period of time over which the statistics in an event monitor statistics record were collected. The collection interval begins at the **wlm\_last\_reset** time and ends at **statistics\_timestamp**.

## **latch\_name - Latch name monitor element**

The unique name of a latch.

This value corresponds to latch names that are reported database diagnostic files, such as the db2diag log files, or the stack files.

---

*Table 1065. Table function monitoring information*

---

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_EXTENDED_LATCH_WAIT table function - Return information for latches	Always collected
MON_GET_LATCH table function - List all latches in the current member	Always collected

---

## **latch\_status - Latch status monitor element**

The status of a latch.

The values for latch\_status are:

**H**

An engine dispatchable unit is holding the latch

**W**

An engine dispatchable unit is waiting on the latch

---

*Table 1066. Table function monitoring information*

---

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_LATCH table function - List all latches in the current member	Always collected

---

## **latch\_wait\_time - Latch wait time monitor element**

The time that an engine dispatchable unit spends waiting for a latch, in milliseconds.

---

*Table 1067. Table function monitoring information*

---

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_LATCH table function - List all latches in the current member	Always collected

---

## **lbp\_update\_time - Local buffer pool update time monitor element**

During extent movement, this monitor element shows the cumulative time taken to update cached page locations for moved extents in each member's local buffer pool.

The value is given in milliseconds.

---

*Table 1068. Table function monitoring information*

---

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_EXTENT_MOVEMENT_STATUS - get extent movement progress	Always collected

---

## **lib\_id - Library identifier monitor element**

Internal unique identifier for triggers and trigger subroutines.

This element returns NULL when it is not applicable for the monitored object.

Table 1069. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	Always collected
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	Always collected
MON_GET_ROUTINE_EXEC_LIST table function - get list of statements executed by routine	Always collected
MON_GET_SECTION_ROUTINE table function - get list of routines for input section	Always collected

## Usage

Use this element to relate a trigger to its subroutine.

## lob\_object\_l\_pages - LOB data logical pages monitor element

The number of logical pages used on disk by LOBs associated with this table.

Table 1070. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLE table function - Get table metrics	Always collected

## Usage

- This value might be less than the amount of space physically allocated for the object. This can happen when you use the REUSE STORAGE option of the TRUNCATE statement. This option causes storage allocated for the table to continue to be allocated, although the storage will be considered empty. In addition, the value for this monitor element might be less than the amount of space logically allocated for the object, because the total space logically allocated includes a small amount of additional meta data.

To retrieve an accurate measure of the logical or physical size of an object, use the ADMIN\_GET\_TAB\_INFO\_V97 function. This function provides more accurate information about the size of objects than you can obtain by multiplying the number of pages reported for this monitor element by the page size.

## lob\_object\_pages - LOB Object Pages

The number of disk pages consumed by LOB data.

Table 1071. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table	table	Basic

Table 1072. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Tables	event_table	Always collected

## Usage

This element provides a mechanism for viewing the actual amount of space consumed by LOB data in a particular table. This element can be used in conjunction with a table event monitor to track the rate of LOB data growth over time.

## lob\_prefetch\_reqs - LOB prefetcher request count monitor element

The number of times an application waited for an I/O server (prefetcher) to finish a LOB read or write operation.

Table 1073. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	ACTIVITY METRICS BASE
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS - Get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE

## local\_cons - Local Connections

The number of local applications that are currently connected to a database within the database manager instance being monitored.

Table 1077. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	db2	Basic

### Usage

This number can help you determine the level of concurrent processing occurring in the database manager. This value will change frequently, so you may need to sample it at specific intervals over an extended period of time to get a realistic view of system usage.

This number only includes applications that were initiated from the same instance as the database manager. The applications are connected, but may or may not be executing a unit of work in the database.

When used in conjunction with the `rem_cons_in` monitor element, this element can help you adjust the setting of the `max_connections` configuration parameter.

### local\_cons\_in\_exec - Local Connections Executing in the Database Manager

The number of local applications that are currently connected to a database within the database manager instance being monitored and are currently processing a unit of work.

Table 1078. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	db2	Basic

### Usage

This number can help you determine the level of concurrent processing occurring in the database manager. This value will change frequently, so you may need to sample it at specific intervals over an extended period of time to get a realistic view of system usage. This number only includes applications that were initiated from the same instance as the database manager.

When used in conjunction with the `rem_cons_in_exec` monitor element, this element can help you adjust the setting of the `max_coordagents` configuration parameter.

The following recommendations apply to non-concentrator configurations only. When concentrator is enabled, the database system is multiplexing a larger number of client connections onto a smaller pool of coordinator agents. In this case, it is usually acceptable to have the sum of `rem_cons_in_exec` and `local_cons_in_exec` approach the `max_coordagents` value.

- If `max_coordagents` is set to AUTOMATIC, do not make any adjustments.
- If `max_coordagents` is not set to AUTOMATIC and if the sum of `rem_cons_in_exec` and `local_cons_in_exec` is close to `max_coordagents`, increase the value of `max_coordagents`.

### local\_start\_time - Local start time monitor element

The time that this activity began doing work on the member. It is in local time. This field can be an empty string when an activity has entered the system but is in a queue and has not started executing.

Table 1079. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected

Table 1079. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

## Usage

### local\_transaction\_id - Local transaction identifier monitor element

The local transaction ID in use at the time the event occurred.

Table 1080. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Change history	ddlstmtexec txncompletion	Always collected
Unit of Work	uow	

## Usage

For the change history event monitor, this is the local transaction ID in use at the time the event occurred. This is the SQLU\_TID structure that is part of the transaction logs.

### location - Location

Identifies the location associated with the event.

Table 1081. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Change History	UTILLOCATION	Always collected

## Usage

For the change history event monitor, locations depend on the UTILITY\_TYPE, for example, load input files or backup target path name.

### location\_type - Location type

A description of what the location is used for.

Table 1082. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Change History	UTILLOCATION	Always collected

## Usage

If the utility\_type element is LOAD, one of:

- C** Copy target

**D**  
Input data

**L**  
LOB path

**X**  
XML path

If the `utility_type` element is BACKUP, one of:

**B**  
Backup target location

If the `utility_type` element is RESTORE, one of:

**S**  
Restore source location

If the `utility_type` element is ROLLFORWARD, one of:

**O**  
Alternate overflow log path captured as part of the ROLLFORWARD DATABASE command. Note that if the default overflow log path is used, no location record will be captured.

otherwise a blank character.

## lock\_attributes - Lock attributes monitor element

The lock attributes of the application that is currently holding the lock.

*Table 1083. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_APPL_LOCKWAIT table function - get information about locks for which an application is waiting	Always collected
MON_GET_LOCKS table function - list all locks in the currently connected database	Always collected

*Table 1084. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Lock	lock	Basic
Lock	lock_wait	Basic

*Table 1085. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	Always collected
Deadlocks <sup>1</sup>	lock	Always collected
Deadlocks <sup>1</sup>	event_dlconn	Always collected

**1**  
This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the `CREATE EVENT MONITOR` for `locking` statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

## Usage

The following table lists all possible lock attribute settings. Each lock attribute setting is based upon a bit flag value defined in `sqlmon.h`.

Lock Attribute Value in Table Functions	API Constant	Description
0000000000000001	SQLM_LOCKATTR_WAIT_FOR_AVAIL	Wait for availability.
0000000000000002	SQLM_LOCKATTR_ESCALATED	Acquired by escalation.
0000000000000004	SQLM_LOCKATTR_RR_IN_BLOCK	RR lock in block.
0000000000000008	SQLM_LOCKATTR_INSERT	Insert lock.
0000000000000010	SQLM_LOCKATTR_RR	Lock by RR scan.
0000000000000020	SQLM_LOCKATTR_UPDATE_DELETE	Update/delete row lock.
0000000000010000	SQLM_LOCKATTR_INDOUBT	Lock held by Indoubt Transaction.
0000000010000000	SQLM_LOCKATTR_ALLOW_NEW	Allow new lock requests.
0000000020000000	SQLM_LOCKATTR_NEW_REQUEST	A new lock requester.

Bits returned that are not listed in the previously shown table are reserved for internal use.

## lock\_count - Lock count monitor element

The number of locks currently held.

*Table 1086. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_APPL_LOCKWAIT table function - Get information about locks for which an application is waiting	Always collected

*Table 1087. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Lock	lock	Basic

*Table 1088. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	Always collected
Deadlocks <sup>1</sup>	lock	Always collected
Deadlocks <sup>1</sup>	event_dlconn	Always collected

### 1

This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the `CREATE EVENT MONITOR` for locking statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

## Usage

This value ranges from 0 to 255. It is incremented as new locks are acquired, and decremented as locks are released.

When the **lock\_count** monitor element has a value of 255, this indicates that a transaction duration lock is being held. At this point, the **lock\_count** monitor element is no longer incremented or decremented when locks are acquired or released. The **lock\_count** monitor element is set to a value of 255 in one of two possible ways:

1. The **lock\_count** monitor element value is incremented 255 times due to new locks being acquired.
2. A transaction duration lock is explicitly acquired. For example, with a LOCK TABLE statement, or an INSERT.

## lock\_current\_mode - Original lock mode before conversion monitor element

During a lock conversion operation, the lock mode held by the application waiting to acquire the lock, before the conversion is completed.

Table 1089. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_APPL_LOCKWAIT table function - get information about locks for which an application is waiting	Always collected
MON_GET_LOCKS table function - list all locks in the currently connected database	Always collected

Table 1090. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Lock	lock	Basic
Lock	lock_wait	Basic

Table 1091. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	Always collected
Deadlocks <sup>1</sup>	lock	Always collected
Deadlocks <sup>1</sup>	event_dlconn	Always collected

### 1

This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the [CREATE EVENT MONITOR for locking](#) statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

## Usage

The following scenario describes an example of lock conversion. During an update or delete operation it is possible to wait for an X lock on the target row. If the transaction is holding an S or V lock on the row, this would require a conversion. At this point, the **lock\_current\_mode** element is assigned a value of S or V, while the lock waits to be converted to an X lock.

The possible lock modes are listed in the following table.

Mode	Type of Lock	API Constant	Numeric value
	No Lock	SQLM_LNON	0
IS	Intention Share Lock	SQLM_LOIS	1
IX	Intention Exclusive Lock	SQLM_LOIX	2
S	Share Lock	SQLM_LOOS	3
SIX	Share with Intention Exclusive Lock	SQLM_LSIX	4
X	Exclusive Lock	SQLM_LOOX	5
IN	Intent None	SQLM_LOIN	6
Z	Super Exclusive Lock	SQLM_LOOZ	7
U	Update Lock	SQLM_LOOU	8
NS	Scan Share Lock	SQLM_LONS	9
NX	Next-Key Exclusive Lock	SQLM_LONX	10
W	Weak Exclusive Lock	SQLM_LOOW	11
NW	Next Key Weak Exclusive Lock	SQLM_LONW	12

### lock\_escalation - Lock escalation monitor element

Indicates whether the application waiting to acquire this lock was a result of a lock escalation request. The possible values are Y (Yes) and N (No).

*Table 1092. Table Function Monitoring Information*

Table Function	Monitor Element Collection Command and Level
MON_GET_APPL_LOCKWAIT table function - get information about locks for which an application is waiting	Always collected

*Table 1093. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Lock	lock	Lock
Lock	lock_wait	Lock

*Table 1094. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	Always collected
Deadlocks <sup>1</sup>	lock	Always collected
Deadlocks <sup>1</sup>	event_dlconn	Always collected
Deadlocks with Details <sup>1</sup>	event_detailed_dlconn	Always collected

## 1

This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the `CREATE EVENT MONITOR` for `locking` statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

## Usage

Use this element to better understand the cause of deadlocks. If you experience a deadlock that involves applications doing lock escalation, you may want to increase the amount of lock memory or change the percentage of locks that any one application can request.

## lock\_escals - Number of lock escalations monitor element

The number of times that locks have been escalated from several row locks to a table lock.

When `DB2_AVOID_LOCK_ESCALATION` is ON, lock escalation is not performed by the database. Instead, lock escalation is avoided and the `lock_escals` monitor element is used to count the number of times the database avoids escalation.

Table 1095. Table Function Monitoring Information

Table Function	Monitor Element Collection Level

## Usage

A lock is escalated when the total number of locks held by an application reaches the maximum amount of lock list space available to the application, or the lock list space consumed by all applications is approaching the total lock list space. The amount of lock list space available is determined by the **maxlocks** and **locklist** configuration parameters.

When an application reaches the maximum number of locks allowed and there are no more locks to escalate, it will then use space in the lock list allocated for other applications. When the entire lock list is full, an error occurs.

This data item includes a count of all lock escalations, including exclusive lock escalations and escalations in the Db2 pureScale environment. To determine just the lock escalations in the Db2 pureScale environment, use the **lock\_escals\_global** monitor element.

There are several possible causes for excessive lock escalations:

- The lock list size (**locklist**) may be too small for the number of concurrent applications
- The percent of the lock list usable by each application (**maxlocks**) may be too small
- One or more applications may be using an excessive number of locks.
- In the Db2 pureScale environment, the global lock list size (**cf\_lock\_sz**) may be too small.

To resolve these problems, you may be able to:

- Increase the **locklist** configuration parameter value.
- Increase the **maxlocks** configuration parameter value.
- Identify the applications with large numbers of locks, or those that are holding too much of the lock list, using one of the following formulae, and comparing the value to **maxlocks**.
  - On 64-bit systems,  $((locks\ held * 64) / (locklist * 4096)) * 100$
  - On 32-bit systems,  $((locks\ held * 48) / (locklist * 4096)) * 100$

These applications can also cause lock escalations in other applications by using too large a portion of the lock list. These applications may need to resort to using table locks instead of row locks, although table locks may cause an increase in **lock\_waits** and **lock\_wait\_time** monitor element values.

## lock\_escals\_global - Number of global lock escalations monitor element

Number of lock escalations on a global lock due to global lock memory usage reaching the limit specified in the **cf\_lock\_sz** database configuration parameter.

Deadlocks <sup>1</sup>	event_dlconn	Always collected

**1**

This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the `CREATE EVENT MONITOR` for locking statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

## lock\_list\_in\_use - Total lock list memory in use monitor element

The total amount of lock list memory (in bytes) that is in use.

Table 1106. Table function monitoring information

Table function	Monitor element collection level
MON_GET_DATABASE table function - Get database level information	Always collected
MON_GET_DATABASE_DETAILS table function - Get database information metrics	Always collected

Table 1107. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic

## Usage

This element may be used in conjunction with the `locklist` configuration parameter to calculate the lock list utilization. If the lock list utilization is high, you may want to consider increasing the size of that parameter.

**Note:** When calculating utilization, it is important to note that the `locklist` configuration parameter is allocated in pages of 4 KB each, while this monitor element provides results in bytes.

## lock\_mode - Lock mode monitor element

The type of lock being held. If the mode is unknown, the value of this monitor element is NULL.

Table 1108. Table Function Monitoring Information

Table Function	Monitor Element Collection Command and Level
MON_GET_APPL_LOCKWAIT table function - get information about locks for which an application is waiting	Always collected
MON_GET_LOCKS table function - list all locks in the currently connected database	Always collected

Table 1109. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl	Lock
Lock	lock	Lock
Lock	lock_wait	Lock

Table 1110. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	-
Deadlocks <sup>1</sup>	lock	-
Deadlocks <sup>1</sup>	event_dlconn	-
Deadlocks with Details <sup>1</sup>	event_detailed_dlconn	-

### 1

This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the `CREATE EVENT MONITOR` for `locking` statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

## Usage

This mode can help you determine the source of contention for resources.

This element indicates one of the following, depending on the type of monitor information being examined:

- The type of lock another application holds on the object that this application is waiting to lock (for application-monitoring and deadlock-monitoring levels).
- The type of lock held on the object by this application (for object-lock levels).

The possible values for this field are:

Mode	Type of Lock	API Constant	Numeric value
	No Lock	SQLM_LNON	0
IS	Intention Share Lock	SQLM_LOIS	1
IX	Intention Exclusive Lock	SQLM_LOIX	2
S	Share Lock	SQLM_LOOS	3
SIX	Share with Intention Exclusive Lock	SQLM_LSIX	4
X	Exclusive Lock	SQLM_LOOX	5
IN	Intent None	SQLM_LOIN	6
Z	Super Exclusive Lock	SQLM_LOOZ	7
U	Update Lock	SQLM_LOOU	8
NS	Scan Share Lock	SQLM_LONS	9
NX	Next-Key Exclusive Lock	SQLM_LONX	10
W	Weak Exclusive Lock	SQLM_LOOW	11

Mode	Type of Lock	API Constant	Numeric value
NW	Next Key Weak Exclusive Lock	SQLM_LONW	12

## lock\_mode\_requested - Lock mode requested monitor element

The mode in which the lock was requested by the application waiting to acquire the lock.

Table 1111. Table Function Monitoring Information

Table Function	Monitor Element Collection Command and Level
MON_GET_APPL_LOCKWAIT table function - get information about locks for which an application is waiting	Always collected

Table 1112. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Lock	lock_wait	Lock

Table 1113. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	Always collected
Deadlocks <sup>1</sup>	event_dlconn	Always collected
Deadlocks with Details <sup>1</sup>	event_detailed_dlconn	Always collected

### 1

This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the [CREATE EVENT MONITOR](#) for locking statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

## Usage

The mode in which the lock was requested by the application. This value can help you determine the source of contention for resources.

The possible lock modes are listed in the following table.

Mode	Type of Lock	API Constant	Numeric value
	No Lock	SQLM_LNON	0
IS	Intention Share Lock	SQLM_LOIS	1
IX	Intention Exclusive Lock	SQLM_LOIX	2
S	Share Lock	SQLM_LOOS	3
SIX	Share with Intention Exclusive Lock	SQLM_LSIX	4
X	Exclusive Lock	SQLM_LOOX	5
IN	Intent None	SQLM_LOIN	6
Z	Super Exclusive Lock	SQLM_LOOZ	7

Mode	Type of Lock	API Constant	Numeric value
U	Update Lock	SQLM_LOOU	8
NS	Scan Share Lock	SQLM_LONS	9
NX	Next-Key Exclusive Lock	SQLM_LONX	10
W	Weak Exclusive Lock	SQLM_LOOW	11
NW	Next Key Weak Exclusive Lock	SQLM_LONW	12

## lock\_name - Lock name monitor element

Internal binary lock name. This element serves as a unique identifier for locks.

*Table 1114. Table Function Monitoring Information*

Table Function	Monitor Element Collection Command and Level
MON_GET_APPL_LOCKWAIT table function - get information about locks for which an application is waiting	Always collected
MON_GET_LOCKS table function - list all locks in the currently connected database	Always collected

*Table 1115. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Lock	lock	Basic
Lock	lock_wait	lock_wait

*Table 1116. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	-
Deadlocks <sup>1</sup>	lock	-
Deadlocks <sup>1</sup>	event_dlconn	-

### 1

This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the [CREATE EVENT MONITOR](#) for locking statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

## Usage

The internal name can be formatted using the routine `MON_FORMAT_LOCK_NAME` to obtain more details about the lock. For example, if this is a table lock, then you can obtain the table and tablespace that the lock references.

## lock\_node - Lock Node

The node involved in a lock.

Table 1117. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	subsection	Statement
Deadlocks	event_dlconn	Statement
Deadlocks with Details	event_detailed_dlconn	Statement

### Usage

This can be used for troubleshooting.

## lock\_object\_name - Lock Object Name

This element is provided for informational purposes only. It is the name of the object for which the application holds a lock (for object-lock-level information), or the name of the object for which the application is waiting to obtain a lock (for application-level and deadlock-level information).

**Note:** This monitor element has been deprecated. Using this monitor element will not generate an error. However, it does not return a valid value. This monitor element is no longer recommended and might be removed in a future release.

Table 1118. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl	Lock
Lock	appl_lock_list	Lock
Lock	lock	Basic

Table 1119. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Deadlocks	lock	Always collected
Deadlocks	event_dlconn	Always collected
Deadlocks with Details	event_detailed_dlconn	Always collected

### Usage

For table-level locks, it is the file ID (FID) for SMS and DMS table spaces. For row-level locks, the object name is the row ID (RID). For table space locks, the object name is blank. For buffer pool locks, the object name is the name of the buffer pool.

To determine the table holding the lock, use *table\_name* and *table\_schema* instead of the file ID, since the file ID may not be unique.

To determine the table space holding the lock, use *tablespace\_name*.

## lock\_object\_type - Lock object type waited on monitor element

The type of object against which the application holds a lock (for object-lock-level information), or the type of object for which the application is waiting to obtain a lock (for application-level and deadlock-level information).

Table 1120. Table Function Monitoring Information

Table Function	Monitor Element Collection Command and Level
MON_FORMAT_LOCK_NAME table function - format the internal lock name and return details	Always collected
MON_GET_APPL_LOCKWAIT table function - get information about locks for which an application is waiting	Always collected
MON_GET_LOCKS table function - list all locks in the currently connected database	Always collected

Table 1121. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl	Lock
Lock	appl_lock_list	Lock
Lock	lock	Basic
Lock	lock_wait	Lock

Table 1122. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	-
Deadlocks <sup>1</sup>	lock	-
Deadlocks <sup>1</sup>	event_dlconn	-
Deadlocks with Details <sup>1</sup>	event_detailed_dlconn	-

### 1

This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the `CREATE EVENT MONITOR` for locking statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

## Usage

This element can help you determine the source of contention for resources.

For snapshot monitoring and the deadlock<sup>1</sup> event monitor, the object type identifiers are defined in `sqlmon.h`. The objects may be one of the following types:

- Table space (SQLM\_TABLESPACE\_LOCK in `sqlmon.h`)
- Table
- Buffer pool
- Block
- Record (or row)
- Data partition (SQLM\_TABLE\_PART\_LOCK in `sqlmon.h`)
- Internal (another type of lock held internally by the database manager)
- Automatic resize
- Automatic storage.

For the locking event monitor and the monitoring table functions in Table 1, the possible values for the **lock\_object\_type** monitor element are defined in Table 4.

<i>Table 1123. Possible values for lock_object_type monitor element</i>	
<b>Possible values</b>	<b>Description</b>
TABLE	Table lock
ROW	Row lock
TABLESPACE	Table space lock
EOT	End of table lock
KEYVALUE	Key value lock
SYSBOOT	Sysboot lock
PLAN	Plan lock
VARIATION	Variation lock
SEQUENCE	Sequence lock
BUFFERPOOL	Buffer pool lock
LOB	LOB/Long region lock
CATALOG	Catalog cache lock
ONLINE_BACKUP	Online backup lock
OBJECT_TABLE	Object table lock
ALTER_TABLE	Table alter lock
DMS_SEQUENCE	DMS sequence lock
REORG	Inplace reorganization lock
MDC_BLOCK	MDC block lock
TABLE_PARTITION	Table partition lock
AUTORESIZE	Autoresize lock
AUTOSTORAGE	Autostorage lock
XMLPATH	XML path lock
EXTENT_MOVEMENT	Extent movement lock
WORKLOAD	Workload authorization lock
FED_SERVER	Federation server lock
FED_USER	Federation user mapping lock
CHUNK	Chunk lock
LOAD_PRE_PART	Load table pre-partitioning lock
LOAD_PART	Load table partitioning lock
LOAD_TS	Loading table space lock
LONG_FIELD_ESC	Long field escalation lock
LONG_FIELD_SPACE	Long field buddy space lock
INSERT_RANGE	Insert range lock

<i>Table 1123. Possible values for lock_object_type monitor element (continued)</i>	
Possible values	Description
COL_TABLE_SERIALIZE	Column-organized table update/delete serialization lock.

## lock\_object\_type\_id - Internal lock object type waited on monitor element

This element is reserved for internal use only.

Refer to the **lock\_object\_type** monitor element for details on the type of object for which a lock is being waited or held.

## lock\_release\_flags - Lock release flags monitor element

Lock release flags.

*Table 1124. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_LOCKS table function - List all locks in the currently connected database	Always collected

*Table 1125. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Lock	lock	Basic
Lock	lock_wait	Basic

*Table 1126. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	Always collected
Deadlocks <sup>1</sup>	lock	Always collected
Deadlocks <sup>1</sup>	event_dlconn	Always collected

### 1

This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the `CREATE EVENT MONITOR` for locking statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

## Usage

The following table lists all possible release flag settings. Each release flag is based upon a bit flag value defined in `sqlmon.h`.

API Constant	Description
SQLM_LOCKRELFIELDS_SQLCOMPILER	Locks by SQL compiler.
SQLM_LOCKRELFIELDS_UNTRACKED	Non-unique, untracked locks.

**Note:** All non-assigned bits are used for application cursors.

## lock\_status - Lock status monitor element

Indicates the internal status of the lock.

Table 1127. Table Function Monitoring Information

Table Function	Monitor Element Collection Command and Level
MON_GET_APPL_LOCKWAIT table function - get information about locks for which an application is waiting	Always collected
MON_GET_LOCKS table function - list all locks in the currently connected database	Always collected

Table 1128. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Lock	lock	Basic

Table 1129. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	Always collected
Deadlocks <sup>1</sup>	lock	Always collected

### 1

This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the CREATE EVENT MONITOR for locking statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

## Usage

This element can help explain what is happening when an application is waiting to obtain a lock on an object. While it may appear that the application already has a lock on the object it needs, it may have to wait to obtain a different type of lock on the same object.

The lock can be in one of the following statuses:

### G

Granted state: The application has the lock in the state specified by the **lock\_mode** monitor element.

### C

Converting state: The application is trying to change the lock held to a different type; for example, changing from a share lock to an exclusive lock.

### W

Waiting state.

**Note:** The lock event monitor, deadlock event monitor, and snapshot APIs report numeric values rather than the character values described above. The following table shows the numeric values used for each of the above statuses:

Lock event monitor	Snapshot APIs and deadlock event monitor
1 - Granted	1 - Granted
4 - Converting	2 - Converting
2 - Waiting	not applicable

**Note:** API users should refer to the `sqlmon.h` header file containing definitions of database system monitor constants.

## lock\_timeout\_val - Lock timeout value monitor element

Indicates the timeout value (in seconds) when an application has issued a SET CURRENT LOCK TIMEOUT statement. In cases where the statement has not been executed, the database level lock timeout will be shown.

*Table 1131. Table function monitoring information*

Table function	Monitor element collection level
MON_GET_CONNECTION table function - Get connection metrics	Always collected
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	Always collected
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	Always collected

*Table 1132. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl	Basic
Application	agent	Basic

*Table 1133. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	-

## Usage

The SET CURRENT LOCK TIMEOUT statement can be used to specify the maximum duration for which application agents will wait for a table or index lock.

If an application is waiting too long on a lock, you can check the **lock\_timeout\_val** monitor element value to see whether it is set too high inside the application. You can modify the application to lower the lock timeout value to let the application time out, if that is appropriate for the application logic. You can accomplish this modification with the SET CURRENT LOCK TIMEOUT statement.

If the application is timing out frequently, you can check whether the lock timeout value is set too low and increase it as appropriate.

## lock\_timeouts - Number of lock timeouts monitor element

The number of times that a request to lock an object timed out instead of being granted.

Table 1134. Table Function Monitoring Information

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE

For snapshot monitoring, this counter can be reset.

Table 1136. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Database	event_db	Always collected
Connection	event_conn	Always collected
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

This element can help you adjust the setting for the **locktimeout** database configuration parameter. If the number of lock timeouts becomes excessive when compared to normal operating levels, you may have an application that is holding locks for long durations. In this case, this element may indicate that you should analyze some of the other lock and deadlock monitor elements to determine if you have an application problem.

You could also have too few lock timeouts if your **locktimeout** database configuration parameter is set too high. In this case, your applications may wait excessively to obtain a lock.

## lock\_timeouts\_global - Lock timeouts global monitor element

Number of lock timeouts where the application holding the lock was on a remote member.

Table 1137. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE

Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	-	REQUEST METRICS BASE
Package cache	-	ACTIVITY METRICS BASE

## Usage

Use this element in conjunction with the **lock\_timeouts** monitor element. The **lock\_timeouts\_global** monitor element represents the number of times a lock timeout has occurred while waiting to acquire a lock held on another member. To determine the number of times a lock timeout has occurred while waiting to acquire a lock held on the same member, use the following formula:

```
lock_timeouts - lock_timeouts_global
```

Outside of the Db2 pureScale environment, this value is always zero.

## lock\_wait\_end\_time - Lock wait end timestamp monitor element

The date and time the application stopped waiting to obtain a lock on the object that is currently lock.

Table 1139. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	lock_participants	

## lock\_wait\_start\_time - Lock wait start timestamp monitor element

The date and time that this application started waiting to obtain a lock on the object that is currently locked by another application.

Table 1140. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_APPL_LOCKWAIT table function - get information about locks for which an application is waiting	Always collected

Deadlocks with Details <sup>1</sup>	event_detailed_dlconn	Timestamp

### 1

This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the `CREATE EVENT MONITOR` for locking statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

## Usage

This element can help you determine the severity of resource contention.

## lock\_wait\_time - Time waited on locks monitor element

The total elapsed time spent waiting for locks. The value is given in milliseconds.

Table 1143. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE

Database	event_db	Always collected
Connection	event_conn	Always collected
Transactions	event_xact	Always collected
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

At the database level, this is the total amount of elapsed time that all applications were waiting for a lock within this database. This measure of elapsed time can include time spent on locks taken during activities, as well as locks taken during other processing, such compilation.

At the application-connection and transaction levels, this is the total amount of elapsed time that this connection or transaction has waited for a lock to be granted to it.

The value for this element does not include lock wait times for agents that are currently still in a lock wait state. It only includes lock wait times for agents that have already completed their lock waits.

This element may be used in conjunction with the **lock\_waits** monitor element to calculate the average wait time for a lock. This calculation can be performed at either the database or the application-connection level.

When using monitor elements providing elapsed times, you should consider:

- Elapsed times are affected by system load, so the more processes you have running, the higher this elapsed time value.
- To calculate this element at the database level, the database system monitor sums the application-level times. This can result in double counting elapsed times at a database level, since more than one application process can be running at the same time.

To provide meaningful data, you can calculate the average wait time for a lock, as previously shown.

## **lock\_wait\_time\_global - Lock wait time global monitor element**

Time spent on global lock waits. The unit of measurement for time is in milliseconds.

*Table 1146. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE

Table 1146. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 1147. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	-	REQUEST METRICS BASE
Package cache	-	ACTIVITY METRICS BASE

## Usage

Use this monitor element in conjunction with the **lock\_wait\_time** monitor element, which represents all the time spent waiting for locks. The **lock\_wait\_time\_global** monitor element represents the time spent waiting for locks held by conflicting applications on different members. To determine the total time spent waiting for locks held by conflicting applications on the same member, use the following formula:

```
lock_wait_time - lock_wait_time_global
```

Outside of the Db2 pureScale environment, this value is always zero.

## lock\_wait\_time\_global\_top - Top global lock wait time monitor element

The longest lock wait that has occurred for a lock that is held on another member. This value is reported in milliseconds.

Table 1148. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_wlstats	Always collected

## lock\_wait\_time\_top - Lock wait time top monitor element

The high watermark for lock wait times of any request in a workload. Units are milliseconds. The lock\_wait\_time\_top high watermark is always collected for workloads. A request contributes toward this high watermark only when request metrics are enabled.

Table 1149. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_wlstats	Always collected

### Usage

Use this element to determine the highest lock wait time of any request on a partition for a workload during the time interval collected.

## lock\_wait\_val - Lock wait value monitor element

The amount of time spent in lock wait (in milliseconds) before an event for mon\_lockwait is generated.

Table 1150. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	lock_participants	

## lock\_waits - Lock waits monitor element

The total number of times that applications or connections waited for locks.

Table 1151. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Database	event_db	Always collected
Connection	event_conn	Always collected
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

At the database level, this is the total number of times that applications have had to wait for locks within this database.

At the application-connection level, this is the total number of times that this connection requested a lock but had to wait because another connection was already holding a lock on the data.

This element may be used with **lock\_wait\_time** to calculate, at the database level, the average wait time for a lock. This calculation can be done at either the database or the application-connection level.

If the average lock wait time is high, you should look for applications that hold many locks, or have lock escalations, with a focus on tuning your applications to improve concurrency, if appropriate. If escalations are the reason for a high average lock wait time, then the values of one or both of the **locklist** and **maxlocks** configuration parameters may be too low.

## lock\_waits\_global - Lock waits global monitor element

Number of lock waits due to the application holding the lock being on a remote member.

Table 1154. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	-	REQUEST METRICS BASE
Package cache	-	ACTIVITY METRICS BASE

## Usage

Use this monitor element in conjunction with the **lock\_waits** monitor element, which reports the total number of lock waits due to locks held by conflicting applications on all members. The **lock\_waits\_global** monitor element indicates the number of times that a lock wait was held by conflicting applications on different members. To determine the number of lock waits held by a conflicting application on the same member as the waiting application, use the following formula:

```
lock_waits - lock_waits_global
```

Outside of the Db2 pureScale environment, this value is always zero.

## locks\_held - Locks held monitor element

The number of locks currently held.

Table 1156. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	Always collected
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	Always collected
MON_GET_DATABASE table function - Get database level information	Always collected
MON_GET_DATABASE_DETAILS table function - Get database information metrics	Always collected
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	Always collected

Table 1157. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic
Application	appl	Basic

Table 1157. Snapshot Monitoring Information (continued)

Snapshot Level	Logical Data Grouping	Monitor Switch
Lock	db_lock_list	Basic
Lock	appl_lock_list	Basic

Table 1158. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Deadlocks with Details	event_detailed_dlconn	Always collected

## Usage

If the monitor information is at the database level, this is the total number of locks currently held by all applications in the database.

If the monitor information is at the application level, this is the total number of locks currently held by all agents for the application.

## locks\_held\_top - Maximum number of locks held monitor element

The maximum number of locks held during this transaction.

Table 1159. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Transactions	event_xact	Always collected

## Usage

You can use this element to determine if your application is approaching the maximum number of locks available to it, as defined by the **maxlocks** configuration parameter. This parameter indicates the percentage of the lock list that each application can use before lock escalations occur. Lock escalations can result in a decrease in concurrency between applications connected to a database.

Since the **maxlocks** parameter is specified as a percentage and this element is a counter, you can compare the count provided by this element against the total number of locks that can be held by an application, as calculated using one of the following formulae:

- On 64-bit systems,  $(\text{locklist} * 4096 / 64) * (\text{maxlocks} / 100)$
- On 32-bit systems,  $(\text{locklist} * 4096 / 48) * (\text{maxlocks} / 100)$

If you have a large number of locks, you may need to perform more commits within your application so that some of the locks can be released.

## locks\_in\_list - Number of Locks Reported

The number of locks held by a particular application to be reported on by the event monitor.

Table 1160. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Deadlocks with Details	event_detailed_dlconn	Always collected

## locks\_waiting - Current agents waiting on locks monitor element

Indicates the number of agents waiting on a lock.

Table 1161. Table function monitoring information

Table function	Monitor element collection level
MON_GET_CONNECTION table function - Get connection metrics	Always collected
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	Always collected
MON_GET_DATABASE table function - Get database level information	Always collected
MON_GET_DATABASE_DETAILS table function - Get database information metrics	Always collected
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	Always collected

Table 1162. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic
Application	appl	Basic
Lock	db_lock_list	Basic

## Usage

When used in conjunction with **appls\_cur\_cons**, this element indicates the percentage of applications waiting on locks. If this number is high, the applications may have concurrency problems, and you should identify applications that are holding locks or exclusive locks for long periods of time.

## log\_buffer\_wait\_time - Log buffer wait time monitor element

The amount of time an agent spends waiting for space in the log buffer. The value is given in milliseconds.

Table 1163. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE

Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

### LOG\_EXTRACTION\_DISK\_SPACE\_USED - The number of bytes for extraction logs monitor element

The number of bytes used in the extraction log files for this transaction.  
 DB2\_ADVANCED\_LOG\_SPACE\_MGMT=ON, Otherwise 0.

Table 1169. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get unit of work metrics as an XML document	Always collected

### log\_extraction\_status - Current status of extraction

Use the **log\_extraction\_status** monitor element to determine the current status of extraction.

Table 1170. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TRANSACTION_LOG table function - Get log information	Always collected

#### Extraction Status

Values can be n/a (0), Error (1), Active (2) or Recovery (3).

n/a (0) – Log extraction is not enabled or not available.

Error (1) – Log extraction is in some error state, see Db2 diagnostics log for detail.

Active (2) – Log extraction is enabled and active.

Recovery (3) – Log extraction is in a recovery state and is being rebuilt.

## log\_extraction\_throttle\_reason - Reason for extraction throttling

Use the **log\_extraction\_throttle\_reason** monitor element to determine the reason for extraction throttling.

Table 1171. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TRANSACTION_LOG table function - Get log information	Always collected

Throttling can occur for any of the following reasons:

### Throttling not enabled

- Throttling not available, for example because ALSM has been disabled.
- Throttle reason: n/a

### Disk full

- During runtime and recovery undo, throttle extraction if the extraction log files were to interfere with the upper limit of the configured number of log files for the database. This rule ensures that the disk space that would be needed for extraction files is not taken away from the configured log space for the database. Running out of disk space in the active log path during regular logging activities could result in an unexpected database shutdown, therefore this condition overrules any other throttle reasons.

This rule accounts for the **logprimary** and **logsecond** database configuration parameters, and ensures that extraction log files never breach this space. There are special cases when Db2 may end up with more primary log files than specified by **logprimary** (for example, with extraction running), or with less primary log files (for example, when the database is in the process of being activated and log files are being allocated asynchronously). Additionally, the **logsecond** parameter can change dynamically. The rule accounts for all such cases.

When log spooling is enabled on an HADR standby database, extraction is throttled to protect disk space for log spooling. If the database **hadr\_spool\_limit** configuration parameter is set to a fixed value, this rule will ensure that extraction does not take away any disk space needed for log spooling. If **hadr\_spool\_limit** is set to AUTOMATIC and disk space is limited, this rule forces extraction to share disk space between itself and log spooling. If **hadr\_spool\_limit** is set to -1, then this rule will not throttle extraction.

- Throttle reason: DISK\_FULL

### Distance from active log file

- Throttle extraction if the log file being considered for extraction is the current active log file for writing. Extraction only works on closed log files.
- Throttle reason: CURRENT\_ACTIVE\_FILE

### Log archiving

- Throttle extraction if log archiving has not been enabled for the database, or if the log file being considered for extraction has not yet been archived. Active log files waiting to be archived will always stay in the active log path, and extraction would only duplicate disk space without any added benefit.
- Throttle reason: LOG\_ARCHIVING

### Log space usage

- Throttle extraction when consumed active log space is below a calculated threshold. This rule is designed to save system resources and ensures that extraction will only start when the database is close to running out of the configured log space.
- Throttle reason: DB\_LOG\_SPACE\_USED

### Extraction ratio

- Throttle extraction if the sum of the extracted data exceeds the calculated configured log space percentage limit. The purpose of this rule is to prevent extraction for very large transactions, thus potentially duplicating what is found in the active log files.
- Throttle reason: EXTRACTION\_RATIO

### New extraction zone

- Do not extract data if a new extraction zone has been detected and any extraction log files before this zone are no longer needed. An extraction zone is the range of log records from start to end that the extraction scan will need to process.
- Throttle reason: NEW\_EXTRACTION\_ZONE

### Buffer pool flush needed

- Throttle extraction if the currently processed log record has not yet been flushed to the disk. Log records that have not been flushed from the buffer pool will always be needed for recovery purposes, and thus would always need to be extracted. This can be controlled by the database configuration parameters **PAGE\_AGE\_TRGT\_MCR** and **PAGE\_AGE\_TRGT\_GCR**
- Throttle reason: SLOW\_BP\_FLUSH

### Previous extraction error

- Throttle extraction if the currently processed log file needs to be skipped. Upon encountering certain types of errors, the extraction scanner may decide to skip the currently processed log file and restart the scan in the next log file.
- Throttle reason: SCAN\_ERROR

## log\_hadr\_wait\_cur - Current logger wait time monitor element

The current logger waiting time on an HADR log shipping request, after the log data has been written to disk locally. This can be viewed as the additional overhead of having the HADR feature on the logging performance of your system. Returns 0 if logger is not waiting for HADR. When wait time reaches peer wait limit, HADR will break out of peer state to unblock the primary database. If logger is completely blocked, **log\_hadr\_wait\_cur** and **log\_hadr\_wait\_time** will grow in real time, while **log\_hadr\_waits\_total** stays the same. Units are milliseconds.

Table 1172. Table function monitoring information

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

## log\_hadr\_wait\_time - Total logger wait time monitor element

The total time the logger spent waiting for HADR to ship logs, after the log data has been written to disk locally. This can be viewed as the additional overhead of having the HADR feature on the logging performance of your system. With **log\_hadr\_wait\_time** and **log\_hadr\_waits\_total**, you can compute average HADR wait time per log flush in arbitrary interval. The two fields are also reported by table function **mon\_get\_transaction\_log**. Units are milliseconds.

Table 1173. Table function monitoring information

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

## log\_hadr\_waits\_total - Total logger wait events monitor element

The total number of HADR wait events in the logger. The count is incremented every time logger initiates a wait on HADR log shipping, even if the wait returns immediately. Thus this count is effectively the number of log flushes in peer state. With **log\_hadr\_wait\_time** and **log\_hadr\_waits\_total**, you can compute average HADR wait time per log flush in arbitrary interval. The two fields are also reported by table function **mon\_get\_transaction\_log**.

Table 1174. Table function monitoring information

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

## log\_held\_by\_dirty\_pages - Amount of Log Space Accounted for by Dirty Pages

The amount of log (in bytes) corresponding to the difference between the oldest dirty page in the database and the top of the active log.

### Element identifier

log\_held\_by\_dirty\_pages

### Element type

watermark

Table 1175. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TRANSACTION_LOG table function - Get log information	Always collected

Table 1176. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic

Table 1177. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected

### Usage

When the snapshot is taken, this value is calculated based on conditions at the time of that snapshot.

Use this element to evaluate the effectiveness of page cleaning for older pages in the buffer pool.

The cleaning of old pages in the buffer pool is governed by the **page\_age\_trgt\_mcr** database configuration parameter.

If it is required that less log are to be held by dirty pages, for example, to reduce crash recovery time, then decrease the **page\_age\_trgt\_mcr** configuration parameter. If this action does not reduce the amount of log held by the dirty pages, then increase the number of page cleaners (**num\_iocleaners**) configuration parameter.

## log\_read\_time - Log Read Time

The total elapsed time spent by the logger reading log data from the disk. For event monitors that write to tables, the value of this element is given in microseconds by using the BIGINT data type.

Table 1178. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TRANSACTION_LOG table function - Get log information	Always collected

Table 1179. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic

For snapshot monitoring, this counter can be reset.

Table 1180. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected

### Usage

Use this element in conjunction with the *log\_reads*, *num\_log\_read\_io*, and *num\_log\_data\_found\_in\_buffer* elements to determine if:

- The current disk is adequate for logging.
- The log buffer size is adequate.

## log\_reads - Number of Log Pages Read

The number of log pages read from disk by the logger.

### Element identifier

log\_reads

### Element type

counter

Table 1181. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TRANSACTION_LOG table function - Get log information	Always collected

Table 1182. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic

For snapshot monitoring, this counter can be reset.

Table 1183. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected

### Usage

You can use this element with an operating system monitor to quantify the amount of I/O on a device that is attributable to database activity.

## log\_to\_redo\_for\_recovery - Amount of Log to be Redone for Recovery

The amount of log (in bytes) that will have to be redone for crash recovery.

### Element identifier

log\_to\_redo\_for\_recovery

### Element type

watermark

Table 1184. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TRANSACTION_LOG table function - Get log information	Always collected

Table 1185. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic

Table 1186. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected

### Usage

When the snapshot is taken, this value is calculated based on conditions at the time of that snapshot. Larger values indicate longer recovery times after a system crash. If the value seems excessive, check the *log\_held\_by\_dirty\_pages* monitor element to see if page cleaning needs to be tuned. Also check if there are any long running transactions that need to be terminated.

## log\_write\_time - Log Write Time

The total elapsed time spent by the logger writing log data to the disk. The value is given in milliseconds for table function interfaces. For event monitors that write to tables, the value of this element is given in microseconds by using the BIGINT data type.

Table 1187. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TRANSACTION_LOG table function - Get log information	Always collected

Table 1188. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic

For snapshot monitoring, this counter can be reset.

Table 1189. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected

### Usage

Use this element in conjunction with the *log\_writes* and *num\_log\_write\_io* elements to determine if the current disk is adequate for logging.

## log\_writes - Number of Log Pages Written

The number of log pages written to disk by the logger.

### Element identifier

log\_writes

### Element type

counter

---

*Table 1190. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_TRANSACTION_LOG table function - Get log information	Always collected

---

*Table 1191. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic

For snapshot monitoring, this counter can be reset.

---

*Table 1192. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected

### Usage

You may use this element with an operating system monitor to quantify the amount of I/O on a device that is attributable to database activity.

**Note:** When log pages are written to disk, the last page might not be full. In such cases, the partial log page remains in the log buffer, and additional log records are written to the page. Therefore log pages might be written to disk by the logger more than once. You should not use this element to measure the number of pages produced by the database system.

## log\_stream\_id - Log stream ID monitor element

Identifies log stream being shipped. Stream ID on source database is returned.

---

*Table 1193. Table function monitoring information*

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

## long\_object\_l\_pages - Long object data logical pages monitor element

The number of logical pages used on disk by long data contained in this table.

Table 1194. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLE table function - Get table metrics	Always collected

### Usage

- This value might be less than the amount of space physically allocated for the object. This can happen when you use the REUSE STORAGE option of the TRUNCATE statement. This option causes storage allocated for the table to continue to be allocated, although the storage will be considered empty. In addition, the value for this monitor element might be less than the amount of space logically allocated for the object, because the total space logically allocated includes a small amount of additional meta data.

To retrieve an accurate measure of the logical or physical size of an object, use the ADMIN\_GET\_TAB\_INFO\_V97 function. This function provides more accurate information about the size of objects than you can obtain by multiplying the number of pages reported for this monitor element by the page size.

## long\_object\_pages - Long Object Pages

The number of disk pages consumed by long data in a table.

Table 1195. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table	table	Basic

Table 1196. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Tables	event_table	Always collected

### Usage

This element provides a mechanism for viewing the actual amount of space consumed by long data in a particular table. This element can be used in conjunction with a table event monitor to track the rate of long data growth over time.

## long\_tbsp\_id - Long table space ID monitor element

An identifier of the table space that holds long data (LONG or LOB type columns) for this table.

Table 1197. Table Function Monitoring Information

Table Function	Monitor Element Collection Command and Level
MON_GET_TABLE table function - Get table metrics	Always collected

### Usage

The value of this element matches a value from column TBSPACEID of view SYSCAT.TABLESPACES.

## low\_priority\_act\_total - The total number of low priority activities monitor element

Total count of the number of low priority activities since the last reset.

*Table 1198. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_CONNECTION table function - Get connection metrics	Always collected
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	Always collected
MON_GET_DATABASE table function - Get database level information	Always collected
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	Always collected
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	Always collected
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	Always collected
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get service subclass metrics as an XML document	Always collected
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	Always collected
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	Always collected
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	Always collected
MON_GET_WORKLOAD table function - Get workload metrics	Always collected
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	Always collected

*Table 1199. Event Monitoring Information*

<b>Event Type</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Activity	event_activitymetrics	ACTIVITY METRICS BASE
Package cache statement eviction	pkgcache_metrics	ACTIVITY METRICS BASE
Statistics	event_wlmetrics	REQUEST METRICS BASE
Statistics	event_scmetrics	REQUEST METRICS BASE

Table 1199. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Unit of work	uow_metrics	REQUEST METRICS BASE

## Usage

Use this element to determine the number of low priority activities since the last reset.

## M

### machine\_identification - Host hardware identification monitor element

A string that describes the processor architecture. For example, "x86 64 bit". The value returned for this identifier is determined by the operating system running on the host.

Table 1200. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ENV_GET_SYSTEM_RESOURCES table function - Return system information	Always collected

### max\_agent\_overflows - Maximum Agent Overflows

The number of times a request to create a new agent was received when the Maximum Number of Agents (**maxagents**) configuration parameter had already been reached.

**Note:** The **max\_agent\_overflows** monitor element is deprecated. Using this monitor element will not generate an error. However, it does not return a valid value and might be removed in a future release.

Table 1201. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	db2	Basic

## Usage

If agent creation requests are still being received when the **maxagents** configuration parameter has been reached, this might indicate too high a workload for this node.

### max\_coord\_stmt\_exec\_time - Maximum coordinator statement execution time monitor element

The maximum coordinator execution time of a single run of the statement, in milliseconds. This value will be zero at non-coordinator nodes or if the statement has not been executed.

Table 1202. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries (reported in DETAILS XML document)	ACTIVITY METRICS BASE

Table 1203. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Package cache	pkgcache	ACTIVITY METRICS BASE

### max\_coord\_stmt\_exec\_time\_args - Maximum coordinator statement execution time arguments monitor element

An XML document that represents the input arguments provided to the statement that was running when the maximum execution time of a single run of the statement (**max\_coord\_stmt\_exec\_time**) took place on the coordinator member. This column is NULL if the statement has not yet run or if the statement has no input arguments. This document contains a parent element named **max\_coord\_stmt\_exec\_time\_args**, which consists of one or more elements with the name **max\_coord\_stmt\_exec\_time\_arg**. See [Figure 15 on page 1054](#) for an example of the structure of the XML document.

Table 1204. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries (reported in DETAILS XML document)	ACTIVITY METRICS BASE

Table 1205. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Package cache	pkgcache_stmt_args	ACTIVITY METRICS BASE

### Usage

You can view the content of this document with the XMLPARSE scalar function. For example: You can view the content of this document with the XMLPARSE scalar function. For example:

```
SELECT XMLPARSE(DOCUMENT MAX_COORD_STMT_EXEC_TIME_ARGS)
FROM TABLE(MON_GET_PKG_CACHE_STMT(NULL, NULL, NULL, -2));
```

Figure 15 on page 1054 shows an example of the contents of XML document returned by the preceding statement.

```
<?xml version="1.0" encoding="ISO-8859-1" ?>
<max_coord_stmt_exec_time_args
  xmlns="http://www.ibm.com/xmlns/prod/db2/mon" release="10010000">
  <max_coord_stmt_exec_time_arg>
    <stmt_value_index>1</stmt_value_index>
    <stmt_value_isreopt id="0">no</stmt_value_isreopt>
    <stmt_value_isnull id="0">no</stmt_value_isnull>
    <stmt_value_type>INTEGER</stmt_value_type>
    <stmt_value_data>5</stmt_value_data>
  </max_coord_stmt_exec_time_arg>
  <max_coord_stmt_exec_time_arg>
    <stmt_value_index>2</stmt_value_index>
    <stmt_value_isreopt id="0">no</stmt_value_isreopt>

    <stmt_value_isnull id="0">no</stmt_value_isnull>
    <stmt_value_type>VARCHAR</stmt_value_type>
    <stmt_value_data>john</stmt_value_data>
  </max_coord_stmt_exec_time_arg>
  <max_coord_stmt_exec_time_arg>
    <stmt_value_index>4</stmt_value_index>
    <stmt_value_isreopt id="0">no</stmt_value_isreopt>
    <stmt_value_isnull id="0">no</stmt_value_isnull>
    <stmt_value_type>VARCHAR</stmt_value_type>
    <stmt_value_data>x</stmt_value_data>
  </max_coord_stmt_exec_time_arg>
  <max_coord_stmt_exec_time_arg>
    <stmt_value_index>5</stmt_value_index>
    <stmt_value_isreopt id="0">no</stmt_value_isreopt>
    <stmt_value_isnull id="0">no</stmt_value_isnull>
    <stmt_value_type>DATE</stmt_value_type>
    <stmt_value_data>2001-02-12</stmt_value_data>
    :
  <max_coord_stmt_exec_time_arg>
    <stmt_value_index>15</stmt_value_index>
    <stmt_value_isreopt id="0">no</stmt_value_isreopt>
    <stmt_value_isnull id="0">no</stmt_value_isnull>
    <stmt_value_type>DECIMAL</stmt_value_type>
    <stmt_value_data>+0002000.55</stmt_value_data>
  </max_coord_stmt_exec_time_arg>
</max_coord_stmt_exec_time_args>
```

Figure 15. Sample content of `max_coord_stmt_exec_time_args`

Entries for the following data types are recorded in this XML document, however, the actual values for arguments of these types are not captured in the `STMT_VALUE_DATA` element:

- BLOB
- CLOB
- REF
- BOOLEAN
- Structured data types
- DATALINK
- LONG VARGRAPHIC
- LONG VARCHAR
- XML tyoes
- DBCLOB

- ARRAY types
- ROW types
- ROWID
- CURSOR variables

Input arguments are recorded beginning with the one that appears first in the statement, and continuing with each one in succession. The number of input parameters that can be recorded is constrained only by the upper limit on the size of the BLOB containing the XML document. In practical terms, it is unlikely the number input arguments captured would ever cause this limit to be reached.

The schema for the XML document that contains this element can be found in the path `sql1lib/misc/DB2EvmonPkgCache.xsd`.

## **max\_coord\_stmt\_exec\_timestamp - Maximum coordinator statement execution timestamp monitor element**

The time the statement that produced the `max_coord_stmt_exec_time` value began execution.

*Table 1206. Table Function Monitoring Information*

### Usage

Use this element to get a better idea of the database activity and network traffic at the database or application levels.

## max\_data\_sent\_64000 - Number of Statements with Outbound Bytes Sent Between 32000 and 64000 Bytes

This element represents the number of statements or chains with outbound bytes sent between 32000 and 64000 inclusive.

### Element identifier

max\_data\_sent\_64000

**Element type**

counter

*Table 1227. Snapshot Monitoring Information*

<b>Snapshot Level</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
DCS Database	dcс_dbase	Statement
DCS Application	dcс_appl	Statement
Data Transmission	stmt_transmissions	Statement

For snapshot monitoring, this counter can be reset.

**Usage**

Use this element to get a better idea of the database activity and network traffic at the database or application levels.

### **max\_data\_sent\_8192 - Number of Statements with Outbound Bytes Sent Between 4097 and 8192 Bytes**

This element represents the number of statements or chains with outbound bytes sent between 4097 and 8192 inclusive.

**Element identifier**

max\_data\_sent\_8192

**Element type**

counter

*Table 1228. Snapshot Monitoring Information*

<b>Snapshot Level</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
DCS Database	dcс_dbase	Statement
DCS Application	dcс_appl	Statement
Data Transmission	stmt_transmissions	Statement

For snapshot monitoring, this counter can be reset.

**Usage**

Use this element to get a better idea of the database activity and network traffic at the database or application levels.

### **max\_data\_sent\_gt64000 - Number of Statements with Outbound Bytes Sent Greater than 64000 Bytes**

This element represents the number of statements or chains with outbound bytes sent greater than 64000.

**Element identifier**

max\_data\_sent\_gt64000

**Element type**

counter

*Table 1229. Snapshot Monitoring Information*

<b>Snapshot Level</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
DCS Database	dcс_dbase	Statement

Table 1229. Snapshot Monitoring Information (continued)

Snapshot Level	Logical Data Grouping	Monitor Switch
DCS Application	dc_s_appl	Statement
Data Transmission	stmt_transmissions	Statement

For snapshot monitoring, this counter can be reset.

**Usage**

Use this element to get a better idea of the database activity and network traffic at the database or application levels.

**max\_network\_time\_1\_ms - Number of Statements with Network Time of up to 1 ms**

This element represents the number of statements or chains whose network time was less or equal to 1 millisecond. (Network time is the difference between host response time and elapsed execution time for a statement or chain.)

Table 1230. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
DCS Database	dc_s_dbase	Statement
DCS Application	dc_s_appl	Statement
Data Transmission	stmt_transmissions	Statement

For snapshot monitoring, this counter can be reset.

**Usage**

Use this element to get a better idea of the database activity and network traffic at the database or application levels.

**max\_network\_time\_100\_ms - Number of Statements with Network Time between 16 and 100 ms**

This element represents the number of statements or chains whose network time was greater than 16 milliseconds but less or equal to 100 milliseconds. (Network time is the difference between host response time and elapsed execution time for a statement or chain.)

Table 1231. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
DCS Database	dc_s_dbase	Statement
DCS Application	dc_s_appl	Statement
Data Transmission	stmt_transmissions	Statement

For snapshot monitoring, this counter can be reset.

**Usage**

Use this element to get a better idea of the database activity and network traffic at the database or application levels.

## max\_network\_time\_16\_ms - Number of Statements with Network Time between 4 and 16 ms

This element represents the number of statements or chains whose network time was greater than 4 milliseconds but less or equal to 16 milliseconds. (Network time is the difference between host response time and elapsed execution time for a statement or chain.)

### Element identifier

max\_network\_time\_16\_ms

### Element type

counter

Table 1232. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
DCS Database	dcс_dbase	Statement
DCS Application	dcс_appl	Statement
Data Transmission	stmt_transmissions	Statement

For snapshot monitoring, this counter can be reset.

### Usage

Use this element to get a better idea of the database activity and network traffic at the database or application levels.

## max\_network\_time\_4\_ms - Number of Statements with Network Time between 1 and 4 ms

This element represents the number of statements or chains whose network time was greater than 1 millisecond but less or equal to 4 milliseconds. (Network time is the difference between host response time and elapsed execution time for a statement or chain.)

### Element identifier

max\_4\_network\_time\_4\_ms

### Element type

counter

Table 1233. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
DCS Database	dcс_dbase	Statement
DCS Application	dcс_appl	Statement
Data Transmission	stmt_transmissions	Statement

For snapshot monitoring, this counter can be reset.

### Usage

Use this element to get a better idea of the database activity and network traffic at the database or application levels.

## max\_network\_time\_500\_ms - Number of Statements with Network Time between 100 and 500 ms

This element represents the number of statements or chains whose network time was greater than 100 milliseconds but less or equal to 500 milliseconds. (Network time is the difference between host response time and elapsed execution time for a statement or chain.)

Table 1234. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
DCS Database	dcс_dbase	Statement
DCS Application	dcс_appl	Statement
Data Transmission	stmt_transmissions	Statement

For snapshot monitoring, this counter can be reset.

**Usage**

Use this element to get a better idea of the database activity and network traffic at the database or application levels.

**max\_network\_time\_gt500\_ms - Number of Statements with Network Time greater than 500 ms**

This element represents the number of statements or chains whose network time was greater than 500 milliseconds. (Network time is the difference between host response time and elapsed execution time for a statement or chain.)

Table 1235. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
DCS Database	dcс_dbase	Statement
DCS Application	dcс_appl	Statement
Data Transmission	stmt_transmissions	Statement

For snapshot monitoring, this counter can be reset.

**Usage**

Use this element to get a better idea of the database activity and network traffic at the database or application levels.

**medium\_priority\_act\_total - Total number of medium priority activities monitor element**

Total count of the number of medium priority activities since the last reset.

Table 1236. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	Always collected
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	Always collected
MON_GET_DATABASE table function - Get database level information	Always collected
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	Always collected
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	Always collected

Table 1236. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	Always collected
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get service subclass metrics as an XML document	Always collected
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	Always collected
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	Always collected
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	Always collected
MON_GET_WORKLOAD table function - Get workload metrics	Always collected
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	Always collected

Table 1237. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activity	event_activitymetrics	ACTIVITY METRICS BASE
Package cache statement eviction	pkgcache_metrics	ACTIVITY METRICS BASE
Statistics	event_wlmetrics	REQUEST METRICS BASE
Statistics	event_scmetrics	REQUEST METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

## Usage

Use this element to determine the number of medium priority activities since the last reset.

## member - Database member monitor element

The numeric identifier for the database member from which the data was retrieved for this result record.

Table 1238. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ADMIN_GET_MEM_USAGE table function - Get total memory consumption for instance	Always collected
AUDIT_ARCHIVE procedure and table function - Archive audit log file	Always collected

Table 1238. Table Function Monitoring Information (continued)

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
DBCFCG administrative view and DB_GET_CFG table function - Retrieve database configuration parameter information	Always collected
ENV_GET_REG_VARIABLES table function - Retrieve database registry settings in use	Always collected
ENV_GET_DB2_EDU_SYSTEM_RESOURCES table function - Return Db2 engine dispatchable units system information	Always collected
ENV_GET_DB2_SYSTEM_RESOURCES table function - Return Db2(r) system information	Always collected
ENV_GET_NETWORK_RESOURCES table function - Return network adapter information	Always collected
ENV_GET_SYSTEM_RESOURCES table function - Return system information	Always collected
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	Always collected
MON_GET_AGENT table function - List agents, fenced mode processes, and system entities for the database	Always collected
MON_GET_AUTO_MAINT_QUEUE table function - Get information on automatic maintenance jobs	Always collected
MON_GET_AUTO_RUNSTATS_QUEUE table function - Retrieve information about objects queued for evaluation	Always collected
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	Always collected
MON_GET_CF_WAIT_TIME table function - Get cluster caching facility command wait time	Always collected
MON_GET_CONNECTION table function - Get connection metrics	Always collected
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics	Always collected
MON_GET_CONTAINER table function - Get table space container metrics	Always collected
MON_GET_DATABASE table function - Get database level information	Always collected
MON_GET_DATABASE_DETAILS table function - Get database information metrics	Always collected
MON_GET_EXTENDED_LATCH_WAIT table function - Return information for latches	Always collected
MON_GET_EXTENT_MOVEMENT_STATUS - Get extent movement progress status metrics	Always collected

Table 1238. Table Function Monitoring Information (continued)

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_FCM - Get FCM metrics	Always collected
MON_GET_FCM_CONNECTION_LIST - Get details for all FCM connections	Always collected
MON_GET_GROUP_BUFFERPOOL table function - Get group buffer pool metrics	Always collected
MON_GET_INDEX table function - Get index metrics	Always collected
MON_GET_INDEX_USAGE_LIST table function - Returns information from an index usage list	Always collected
MON_GET_INSTANCE table function - Get instance level information	Always collected
MON_GET_LATCH table function - List all latches in the current member	Always collected
MON_GET_LOCKS table function - list all locks in the currently connected database	Always collected
MON_GET_MEMORY_POOL table function - Get memory pool information	Always collected
MON_GET_MEMORY_SET table function - Get memory set information	Always collected
MON_GET_PAGE_ACCESS_INFO table function - Get buffer pool page waiting information	Always collected
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	Always collected
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	Always collected
MON_GET_QUEUE_STATS table function - Return threshold queue statistics	Always collected
MON_GET_REBALANCE_STATUS table function - get rebalance progress for a table space	Always collected
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	Always collected
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	Always collected
MON_GET_ROUTINE_EXEC_LIST table function - get list of statements executed by routine	Always collected
MON_GET_RTS_RQST table function - Retrieve information about real-time statistics requests	Always collected
MON_GET_SECTION_OBJECT table function - List objects accessed by a section	Always collected
MON_GET_SERVERLIST table function - get member priority details	Always collected
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	Always collected

Table 1238. Table Function Monitoring Information (continued)

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics	Always collected
MON_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	Always collected
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected
MON_GET_TABLE table function - Get table metrics	Always collected
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	Always collected
MON_GET_TABLESPACE table function - Get table space metrics	Always collected
MON_GET_TABLESPACE QUIESCER table function - Get information about quiesced table spaces	Always collected
MON_GET_TRANSACTION_LOG table function - Get log information	Always collected
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics	Always collected
MON_GET_USAGE_LIST_STATUS table function - Returns the status on a usage list	Always collected
MON_GET_UTILITY table function - Get utilities running on the database	Always collected
<u>MON_GET_WLM_ADMISSION_QUEUE table function - Return a list of queued activities</u>	Always Collected
MON_GET_WORKLOAD table function - Get workload metrics	Always collected
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics	Always collected
MON_GET_WORKLOAD_STATS table function - Return workload statistics	Always collected
MON_SAMPLE_SERVICE_CLASS_METRICS - Get sample service class metrics	Always collected
MON_SAMPLE_WORKLOAD_METRICS - Get sample	Always collected
MON_GET_WORK_ACTION_SET_STATS table function - Return work action set statistics	Always collected

Table 1238. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
PD_GET_DIAG_HIST table function - Return records from a given facility	Always collected
PDLOGMSGs_LAST24HOURS administrative view and PD_GET_LOG_MSGS table function - Retrieve problem determination messages	Always collected
WLM_GET_QUEUE_STATS table function - Return threshold queue statistics	Always collected
WLM_GET_SERVICE_CLASS_AGENTS table function - list agents running in a service class	Always collected
WLM_GET_SERVICE_CLASS_WORKLOAD_OCCURRENCES table function - list workload occurrences	Always collected
WLM_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	Always collected
WLM_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected
WLM_GET_WORK_ACTION_SET_STATS table function - Return work action set statistics	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected
WLM_GET_WORKLOAD_STATS table function - Return workload statistics	Always collected

Table 1239. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity	Always collected
Statistics	event_scstats	Always collected
Statistics	event_superclasstats	Always collected
Statistics	event_osmetrics	Always collected
Statistics	event_wlstats	Always collected
Unit of work	system_metrics	Always collected
Package cache	-	Always collected
Locking	-	Always collected
Change history	changesummary dbdbmcfg regvar ddlstmtexec txncompletion evmonstart utilstart utillocation utilstop	Always collected

## Usage

A database member is a database manager instance that runs database server software on a single host. A database member accepts and processes database requests from applications that are connected to it.

### **member\_subset\_id - Member subset ID monitor element**

An integer which uniquely identifies a member subset.

*Table 1240. Table function monitoring information*

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_CONNECTION table function - Get connection metrics	Always collected
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics	Always collected
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics	Always collected
MON_GET_SERVERLIST table function - get member priority details	Always collected

*Table 1241. Event monitoring information*

<b>Event type</b>	<b>Logical data grouping</b>	<b>Monitor switch</b>
Unit of work	uow	Always collected

## Usage

Use this ID to uniquely identify the member subset to which this connection or unit of work belongs. Possible values for this element are:

- 0**  
A TCP/IP based connection assigned to the default user-created member subset
- 1**  
The application is not assigned to a member subset
- 2**  
IPC-based connections

### **memory\_address - Memory address monitor element**

Memory address.

*Table 1242. Table function monitoring information*

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_LATCH table function - List all latches in the current member	Always collected

## memory\_free - Amount of free physical memory monitor element

The total amount of physical memory on this host that is not allocated to a running process, in MB.

Table 1243. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ENV_GET_SYSTEM_RESOURCES table function - Return system information	Always collected

Table 1244. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_osmetrics	Always collected-

### Usage

This metric reports point in time information at statistics event monitor record generation.

## memory\_pool\_id - Memory pool identifier monitor element

Memory pool identifier

Table 1245. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_MEMORY_POOL table function - Get memory pool information	Always collected

## memory\_pool\_type - Memory pool name monitor element

The name of the memory pool.

Table 1246. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_MEMORY_POOL table function - Get memory pool information	Always collected

### Usage

Use the memory\_pool\_type element to identify the type of memory pool. The possible values returned by this monitor element are listed in [Table 1247 on page 1074](#).

Table 1247. Possible values returned for memory\_pool\_type

Memory pool name*	Description	Additional information
APM	Agent pool management (APM) heap	Internal memory pool
APPL_SHARED	Application shared heap	Internal memory pool
APPLICATION	Application heap	See applheapsz - Application heap size configuration parameter.
APS	APS heap	Internal memory pool
BSU_CF	Base service utility (BSU) CF heap	Internal memory pool
BSU	Base service utility (BSU) heap	Internal memory pool

Table 1247. Possible values returned for `memory_pool_type` (continued)

Memory pool name*	Description	Additional information
BP	Buffer pool heap	See CREATE BUFFERPOOL statement.
CAT_CACHE	Catalog cache heap	See catalogcache_sz - Catalog cache size configuration parameter.
CLIENT_CONTEXT	Client context heap	Internal memory pool
DATABASE_CF	Database CF heap	Internal memory pool
DATABASE	Database heap	See dbheap - Database heap configuration parameter.
DEBUG	Debug heap	Internal memory pool
DROP_INDEX	Drop index heap	Internal memory pool
EDU	Engine dispatchable unit (EDU) heap	Internal memory pool
FCMBP	Fast communications manager (FCM) buffer heap	See fcm_num_buffers - Number of FCM buffers configuration parameter.
FCM_CHANNEL	FCM channel heap	See fcm_num_channels - Number of FCM channels configuration parameter
FCM_CONTROL	FCM control heap	Internal memory pool
FCM_LOCAL	FCM local heap	Internal memory pool
FCM_SESSION	FCM session heap	Internal memory pool
FEDERATED	Federated heap	Internal memory pool
KERNEL_CONTROL	Kernel control block heap	Internal memory pool
KERNEL	Kernel heap	Internal memory pool
LOCK_MGR	Lock manager heap	See locklist - Maximum storage for lock list configuration parameter.
MISC	Miscellaneous heap	See DB2_FMP_COMM_HEAPSZ registry variable.
MONITOR	Monitor heap	See mon_heap_sz - Database system monitor heap size configuration parameter.
OPTPROF_PARSER	OptProf XML parser heap	Internal memory pool
OSS_TRACKER	OSS resource tracking heap	Internal memory pool
PERSISTENT_PRIVATE	Persistent private heap	Internal memory pool
PACKAGE_CACHE	Package cache heap	See pckcachesz - Package cache size configuration parameter.
PRIVATE	Private	Internal memory pool
RESYNC	Resync heap	Internal memory pool
SORT	Private sort heap	See sortheap - Sort heap size configuration parameter.

Table 1247. Possible values returned for `memory_pool_type` (continued)

Memory pool name*	Description	Additional information
SHARED_SORT	Shared sort heap	See <code>sheapthres_shr</code> - Sort heap threshold for shared sorts configuration parameter.
SQL_COMPILER	SQL compiler heap	Internal memory pool
STATEMENT	Statement heap	See <code>stmtheap</code> - Statement heap size configuration parameter.
STATISTICS	Statistics heap	See <code>stat_heap_sz</code> - Statistics heap size configuration parameter.
USER_DATA	User data heap	Internal memory pool
UTILITY	Utility heap	See <code>util_heap_sz</code> - Utility heap size configuration parameter.
XMLCACHE	XML cache heap	Internal memory pool
XMLPARSER	XML parser heap	Internal memory pool

### **memory\_pool\_used - Amount of memory pool in use monitor element**

Amount of committed memory in use by this memory pool, in KB.

Table 1248. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_MEMORY_POOL table function - Get memory pool information	Always collected

### **memory\_pool\_used\_hwm - Memory pool high water mark monitor element**

The highest amount of memory assigned to this pool since it was created, in KB.

Table 1249. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_MEMORY_POOL table function - Get memory set information	Always collected

### **memory\_set\_committed - Memory currently committed monitor element**

The amount of memory currently committed to this memory set, in KB.

Table 1250. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_MEMORY_SET table function - Get memory set information	Always collected

### **Usage**

Committed memory is memory that is backed by RAM, or paging space, or both on the system.

## memory\_set\_id - Memory set identifier monitor element

A numeric identifier that maps to a specific memory set type.

Table 1251. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_MEMORY_SET table function - Get memory set information	Always collected

## memory\_set\_size - Memory set size monitor element

Maximum memory commitment limit, in KB.

This value represents either a configured setting for a memory set or an internally calculated value for those memory sets that are managed automatically.

Table 1252. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_MEMORY_SET table function - Get memory set information	Always collected

## memory\_set\_type - Memory set type monitor element

The type of memory set.

Table 1253. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_MEMORY_POOL table function - Get memory pool information	Always collected
MON_GET_MEMORY_SET table function - Get memory set information	Always collected

## Usage

The possible values returned for this monitor element are described in [Table 1254 on page 1077](#):

Table 1254. Possible values for *memory\_set\_type*

Memory set type	Description	Scope
DBMS	Database manager memory set	Instance
FMP	Fenced mode process memory set	Instance
PRIVATE	Private memory set	Instance
DATABASE	Database memory set	Database
APPLICATION	Application memory set	Database
FCM	Fast communication manager (FCM) memory set	Instance, Host

## memory\_set\_used - Memory in use by this set monitor element

Amount of memory from this set that has been assigned to memory pools, in KB.

Table 1255. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_MEMORY_SET table function - Get memory set information	Always collected

### Usage

This element returns the memory assigned to pools. All memory assigned to pools is committed. Additional committed memory can be cached within a memory set to improve performance.

## memory\_set\_used\_hwm - Memory set high water mark monitor element

The highest amount of memory assigned to memory pools from this set since the memory set was created, in KB.

Table 1256. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_MEMORY_SET table function - Get memory set information	Always collected

## memory\_swap\_free - Total free swap space monitor element

The total amount of unused swap space on this host, in MB.

Table 1257. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ENV_GET_SYSTEM_RESOURCES table function - Return system information	Always collected

Table 1258. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_osmetrics	Always collected

### Usage

This metric reports point in time information at statistics event monitor record generation.

## memory\_swap\_total - Total swap space monitor element

The total amount of swap space on this host, in MB.

Table 1259. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ENV_GET_SYSTEM_RESOURCES table function - Return system information	Always collected

Table 1260. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_osmetrics	Always collected

### Usage

This metric reports point in time information at statistics event monitor record generation.

## memory\_total - Total physical memory monitor element

The total amount of physical memory on this host, in MB.

Table 1261. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ENV_GET_SYSTEM_RESOURCES table function - Return system information	Always collected

Table 1262. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_osmetrics	Always collected

### Usage

This metric reports point in time information at statistics event monitor record generation.

## merge\_sql\_stmts - Merge SQL statements executed monitor element

The number of MERGE statements that were executed.

Table 1263. Table function monitoring information

Table function	Monitor element collection level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics	REQUEST METRICS BASE

Table 1263. Table function monitoring information (continued)

Table function	Monitor element collection level
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics	REQUEST METRICS BASE

Table 1264. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmmetrics	REQUEST METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

### message - Control Table Message

The nature of the timestamp in the MESSAGE\_TIME column. This element is only used in the CONTROL table by write-to-table event monitors.

Table 1265. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
-	-	Always collected

### Usage

The following are possible values:

#### FIRST\_CONNECT

The time of the first connect to the database after activation.

#### EVMON\_START

The time the event monitor listed in the EVMONNAME column was started.

#### OVERFLOWS: *n*

Denotes that *n* records were discarded due to buffer overflow.

### message\_time - Timestamp Control Table Message

The timestamp corresponding to the event described in the MESSAGE column. This element is only used in the CONTROL table by write-to-table event monitors.

Table 1266. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
EVMON_UPGRADE_TABLES	Always collected

Table 1267. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
-	-	Always collected

## metrics - Metrics monitor element

An XML document containing some of the system monitor elements collected by the statistics event monitor.

Table 1268. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Element Collection Level
Statistics	EVENTS_SCSTATS	Always collected
Statistics	EVENT_WLSTATS	Always collected

## Usage

The schema for the XML documents returned is available in the file `sql1lib/misc/DB2MonCommon.xsd`. The top level element is **system\_metrics**.

The XML documents associated with this monitor element and the **details\_xml** monitor element contain the same system metrics, but there is an important difference. The metrics in this monitor element are calculated to show the change in value for the metric since the last time statistics were collected. While the metrics in **details\_xml** generally start at 0 and continue to accumulate until the next database activation.

Using the logical data groups `EVENT_SCMETRICS` and `EVENT_WLMETRICS`, you can directly view the monitor elements contained in **metrics** as individual elements. For example, if your statistics event monitor writes to tables, you can access the metrics by using an SQL query to retrieve data from the new logical data groups, rather than of having to post-process or parse the **metrics** monitor element XML document.

**Important:** Starting with Version 10.1 Fix Pack 1, the **details\_xml** monitor element is deprecated for the statistics event monitor and might be removed in a future release. If you use the XML metrics data returned in **details\_xml**, start using this monitor element instead.

## mon\_interval\_id - Monitor interval identifier monitor element

The value of the `MON_INTERVAL_ID` database global variable when a particular transaction is completed.

Table 1269. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_INDEX_USAGE_LIST table function - Returns information from an index usage list	Always collected
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	Always collected

Table 1270. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity	Always collected
Statistics	event_histogrambin	Always collected
Statistics	event_osmetrics	Always collected
Statistics	event_qstats	Always collected
Statistics	event_scmetrics	Always collected
Statistics	event_superclassmetrics	Always collected

Statistics	event_wlstats	Always collected
Unit of Work	uow	Always collected

## N

### nesting\_level - Nesting level monitor element

This element shows the level of nesting or recursion in effect when the statement was being run; each level of nesting corresponds to nested or recursive invocation of a stored procedure or user-defined function (UDF). This monitor element is an alias for the nesting\_level element.

The **nesting\_level** monitor element is an alias of the **stmt\_nest\_level** monitor element.

Table 1271. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected

Table 1272. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	Always collected
Deadlocks with Details History Values <sup>1</sup>	event_stmt_history	Always collected
Deadlocks with Details History <sup>1</sup>	event_stmt_history	Always collected
Activities	event_activitystmt	Always collected
Unit of work	Reported in the package list.	Always collected

## 1

This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the `CREATE EVENT MONITOR` for `locking` statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

### Usage

You can use this element, along with `stmt_invocation_id` monitor element, to uniquely identify the invocation in which a particular SQL statement has been executed. You can also use this element in conjunction with other statement history entries to see the sequence of SQL statements that caused the deadlock.

### **network\_interface\_bound - Network interface hostname or IP address for remote client and server communications monitor element**

The hostname or IP address corresponding to one or more network interfaces for communications between the member and remote clients and servers. The value is stored in the Db2 instance configuration file `nicbinding.cfg`. This value is NULL if no network interface is specified for the member in the configuration file.

Table 1273. Table function monitoring information

Table function	Monitor element collection level
MON_GET_INSTANCE table function - Get instance level information	Always collected

### **network\_time\_bottom - Minimum Network Time for Statement**

This element represents the shortest network time for a statement executed against this DCS database or in this DCS application, or having used this many data transmissions. (Network time is the difference between host response time and elapsed execution time for a statement.)

#### Element identifier

network\_time\_bottom

#### Element type

watermark

Table 1274. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
DCS Database	dcс_dbase	Statement, Timestamp
DCS Application	dcс_appl	Statement, Timestamp
Data Transmission	stmt_transmissions	Statement, Timestamp

For snapshot monitoring, this counter can be reset.

### Usage

Use this element to get a better idea of the database activity and network traffic at the database or application levels.

This element is composed of two subelements that report time spent as seconds and microseconds (one millionth of a second). The names of the subelements can be derived by adding "\_s" and "\_ms" to the name of this monitor element. To retrieve the total time spent for this monitor element, the values of the two subelements must be added together. For example, if the "\_s" subelement value is 3 and the "\_ms" subelement value is 20, then the total time spent for the monitor element is 3.00002 seconds.

## network\_time\_top - Maximum Network Time for Statement

This element represents the longest network time for a statement executed against this DCS database or in this DCS application, or having used this many data transmissions. (Network time is the difference between host response time and elapsed execution time for a statement.)

### Element identifier

network\_time\_top

### Element type

watermark

Table 1275. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
DCS Database	dcс_dbase	Statement, Timestamp
DCS Application	dcс_appl	Statement, Timestamp
Data Transmission	stmt_transmissions	Statement, Timestamp

For snapshot monitoring, this counter can be reset.

## Usage

Use this element to get a better idea of the database activity and network traffic at the database or application levels. Note that this element is not collected when the timestamp switch is off.

This element is composed of two subelements that report time spent as seconds and microseconds (one millionth of a second). The names of the subelements can be derived by adding "\_s" and "\_ms" to the name of this monitor element. To retrieve the total time spent for this monitor element, the values of the two subelements must be added together. For example, if the "\_s" subelement value is 3 and the "\_ms" subelement value is 20, then the total time spent for the monitor element is 3.00002 seconds.

## nleaf - Number of leaf pages monitor element

The approximate number of leaf pages.

Table 1276. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_INDEX table function - Get index metrics	Always collected

## nlevels - Number of index levels monitor element

Number of index levels. This is an approximation.

Table 1277. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_INDEX table function - Get index metrics	Always collected

## no\_change\_updates - Number of no change row updates monitor element

The number of row updates that resulted in no changes to any of the column values of a row. If a LOB, XML, or LONG column is included in the SET clause of an UPDATE statement, every row affected by that statement is assumed to change, and will not participate in this counter. For column-organized tables, this counter is always 0.

Table 1278. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLE table function - get table metrics	Always collected

## node\_number - Node Number

The number assigned to the node in the *db2nodes.cfg* file.

Table 1279. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	collected	Basic
Database Manager	memory_pool	Basic
Database Manager	fcm	Basic
Database Manager	fcm_node	Basic
Database Manager	utility_info	Basic
Database	detail_log	Basic
Buffer Pool	bufferpool_nodeinfo	Buffer Pool
Table Space	rollforward	Basic
Lock	lock	Basic
Lock	lock_wait	Basic
Database	db_sto_path_info	Buffer Pool

Table 1280. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Connections	event_connheader	Always collected
Deadlocks	lock	Always collected
Overflow Record	event_overflow	Always collected
Database	event_dbmemuse	Always collected
Connection	event_connmemuse	Always collected

## Usage

This value identifies the current node number, which can be used when monitoring multiple nodes.

## nonboundary\_leaf\_node\_splits - Non-boundary leaf node splits monitor element

A non-boundary leaf node split is when a leaf node split is triggered by the insertion of a key that is not a new highest or new lowest key in an index. The **nonboundary\_leaf\_node\_splits** monitor element returns the number of times a non-boundary leaf node was split during an insert operation.

Table 1281. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_INDEX table function - Get index metrics	Always collected

## num\_agents - Number of Agents Working on a Statement

Number of concurrent agents currently executing a statement or subsection.

Table 1282. Table Function Monitoring Information

Table Function	Monitor Element Collection Command and Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

Table 1283. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	stmt	Statement
Application	subsection	Statement

### Usage

An indicator how well the query is parallelized. This is useful for tracking the progress of query execution, by taking successive snapshots.

## num\_assoc\_agents - Number of Associated Agents

At the application level, this is the number of subagents associated with an application. At the database level, it is the number of subagents for all applications.

Table 1284. Table function monitoring information

Table function	Monitor element collection level
MON_GET_CONNECTION table function - Get connection metrics	Always collected
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics	Always collected
MON_GET_DATABASE table function - Get database level information	Always collected
MON_GET_DATABASE_DETAILS table function - Get database information metrics	Always collected

Table 1284. Table function monitoring information (continued)

Table function	Monitor element collection level
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics	Always collected

Table 1285. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic
Application	appl_info	Basic

### Usage

You can use this element to help evaluate your settings for your agent configuration parameters.

## num\_columns\_referenced - Number of columns referenced monitor element

This element counts the number of columns referenced during the execution of a section for an SQL statement.

Table 1286. Table function monitoring information

Table function	Monitor element collection level
MON_GET_TABLE table function - get table metrics	DATA OBJECT METRICS EXTENDED

### Usage

The following statement would increase this element by 2, regardless of the number of row read by the query:

```
SELECT C1, C2 FROM T1
```

This element applies to both column-organized and row-organized tables. Columns referenced in synopsis tables and temporary tables are not included in this counter.

## num\_compilations - Statement Compilations

The number of different compilations for a specific SQL statement.

Table 1287. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Dynamic SQL	dynsql	Basic

### Usage

Some SQL statements issued on different schemas, such as **SELECT t1 FROM test**, will appear to be the same statement in the database cache even though they refer to different access plans. Use this value in conjunction with num\_executions to determine whether a bad compilation environment is skewing the results of dynamic SQL snapshot statistics.

## num\_coord\_agents - Number of coordinator agents monitor element

Current number of active coordinating agents.

Table 1288. Table function monitoring information

Table function	Monitor element collection level
MON_GET_DATABASE table function - Get database level information	Always collected
MON_GET_DATABASE_DETAILS table function - Get database information metrics	Always collected
MON_GET_INSTANCE table function - Get instance level information	Always collected

## num\_coord\_exec - Number of executions by coordinator agent monitor element

The number of times this section was executed by a coordinator agent.

Table 1289. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	Always collected
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	Always collected
MON_GET_ROUTINE_EXEC_LIST table function - get list of statements executed by routine	Always collected

Table 1290. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Package cache	-	Always collected

## num\_coord\_exec\_with\_metrics - Number of executions by coordinator agent with metrics monitor element

The number of times this section was executed by a coordinator agent and monitoring metrics were being captured

Table 1291. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	Always collected
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	Always collected

Table 1291. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_ROUTINE_EXEC_LIST table function - get list of statements executed by routine	Always collected

Table 1292. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Package cache	-	Always collected

## num\_db\_storage\_paths - Number of automatic storage paths

The number of automatic storage paths associated with a database.

Table 1293. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic

### Usage note

You can use this element with the db\_storage\_path monitor element to identify the storage paths that are associated with this database.

If you use storage groups, this element shows the number of automatic storage paths in the default database storage group only.

## num\_exec\_with\_metrics - Number of executions with metrics collected monitor element

The number of times that this SQL statement section has been executed with the metrics collected. This element can be used to calculate the per execution value for monitor elements for statements in the package cache.

Table 1294. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	Always collected
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	Always collected
MON_GET_ROUTINE_EXEC_LIST table function - get list of statements executed by routine	Always collected

Table 1295. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Package cache	-	Always collected

## num\_executions - Statement executions monitor element

The number of times that an SQL statement has been executed.

Table 1296. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	Always collected
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	Always collected
MON_GET_ROUTINE_EXEC_LIST table function - get list of statements executed by routine	Always collected

Table 1297. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Dynamic SQL	dynsql	Basic

For snapshot monitoring, this counter can be reset.

Table 1298. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Package cache	-	Always collected

## Usage

You can use this element to identify the most frequently executed SQL statements in your system.

At the package cache level, use this element to compute averages for the activity metrics reported per statement. For example, the average CPU usage for an execution of a statement reported at the package cache level can be calculated by the following formula:

```
total_cpu_time / num_exec_with_metrics
```

Use the **num\_exec\_with\_metrics** monitor element instead of the **num\_executions** monitor element when computing averages, since the **num\_executions** monitor element counts all executions of a statement, regardless of whether or not the execution of the statement contributed to the activity metrics that are reported.

## NUM\_EXEC\_WITH\_ERROR - The number of executions with errors monitor element

The number of executions of this statement that resulted in an error.

Table 1299. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_PKG_CACHE_STMT table function - Get package cache statement metrics	Always collected

---

Table 1300. Event Monitoring Information

---

Event Type	Logical Data Grouping	Monitor Switch
Package cache	event_pkgcache	Always collected

---

### **NUM\_EXEC\_WITH\_WARNING - The number of executions with warnings monitor element**

The number of executions of this statement that resulted in a warning.

---

Table 1301. Table Function Monitoring Information

---

Table Function	Monitor Element Collection Level
MON_GET_PKG_CACHE_STMT table function - Get package cache statement metrics	Always collected

---

---

Table 1302. Event Monitoring Information

---

Event Type	Logical Data Grouping	Monitor Switch
Package cache	event_pkgcache	Always collected

---

### **num\_extents\_left - Number of extents left to process monitor element**

The number of extents left to move during this table rebalancing process.

---

Table 1303. Table Function Monitoring Information

---

Table Function	Monitor Element Collection Level
MON_GET_EXTENT_MOVEMENT_STATUS - Get extent movement progress status metrics	Always collected

---

### **num\_extents\_moved - Number of extents moved monitor element**

The number of extents moved so far during this extent movement operation.

---

Table 1304. Table Function Monitoring Information

---

Table Function	Monitor Element Collection Level
MON_GET_EXTENT_MOVEMENT_STATUS - Get extent movement progress status metrics	Always collected

---

### **num\_gw\_conn\_switches - Connection Switches**

The number of times that an agent from the agents pool was primed with a connection and was reassigned for use with a different DRDA database.

---

Table 1305. Table Function Monitoring Information

---

Table Function	Monitor Element Collection Level
MON_GET_INSTANCE table function - Get instance level information	Always collected

---

Table 1306. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	db2	Basic

## Usage

For most users, the default setting of the **num\_poolagents** configuration parameter ensures optimal performance. The default setting for this configuration parameter automatically manages agent pooling and avoids reassigning agents.

To reduce the value of this monitor element, adjust the value of the **num\_poolagents** configuration parameter.

The GET SNAPSHOT command displays the num\_gw\_conn\_switches monitor element as "Gateway connection pool agents stolen".

## num\_indoubt\_trans - Number of Indoubt Transactions

The number of outstanding indoubt transactions in the database.

Table 1307. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TRANSACTION_LOG table function - Get log information	ACTIVITY METRICS BASE

Table 1308. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic

## Usage

Indoubt transactions hold log space for uncommitted transactions, which can cause the logs to become full. When the logs are full, further transactions cannot be completed. The resolution of this problem involves a manual process of heuristically resolving the indoubt transactions. This monitor element provides a count of the number of currently outstanding indoubt transactions that must be heuristically resolved.

## num\_log\_buffer\_full - Number of times full log buffer caused agents to wait monitor element

The num\_log\_buffer\_full element stores the number of times agents have to wait for log data to write to disk while copying log records into the log buffer. This value is incremented per agent per incident. For example, if two agents attempt to copy log data while the buffer is full, then this value is incremented by two.

Table 1309. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE

Table 1309. Table Function Monitoring Information (continued)

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_TRANSACTION_LOG table function - Get log information	Always collected
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 1310. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic

For snapshot monitoring, this counter can be reset.

Table 1311. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

Use this element to determine if the **logbufsz** database configuration parameter needs to be increased.

### num\_log\_data\_found\_in\_buffer - Number of Log Data Found In Buffer

The number of times an agent reads log data from the buffer. Reading log data from the buffer is preferable to reading from the disk because the latter is slower.

Table 1312. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TRANSACTION_LOG table function - Get log information	Always collected

Table 1313. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic

For snapshot monitoring, this counter can be reset.

Table 1314. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected

## Usage

Use this element in conjunction with the *num\_log\_read\_io* element to determine if the LOGBUFSZ database configuration parameter needs to be increased.

## num\_log\_part\_page\_io - Number of Partial Log Page Writes

The number of I/O requests issued by the logger for writing partial log data to the disk.

Table 1315. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TRANSACTION_LOG table function - Get log information	Always collected

Table 1316. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic

For snapshot monitoring, this counter can be reset.

Table 1317. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected

## Usage

Use this element in conjunction with the *log\_writes*, *log\_write\_time*, and *num\_log\_write\_io* elements to determine if the current disk is adequate for logging.

## num\_log\_read\_io - Number of Log Reads

The number of I/O requests issued by the logger for reading log data from the disk.

Table 1318. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TRANSACTION_LOG table function - Get log information	Always collected

Table 1319. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic

For snapshot monitoring, this counter can be reset.

Table 1320. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected

## Usage

Use this element in conjunction with the *log\_reads* and *log\_read\_time* elements to determine if the current disk is adequate for logging.

## num\_log\_write\_io - Number of Log Writes

The number of I/O requests issued by the logger for writing log data to the disk.

Table 1321. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TRANSACTION_LOG table function - Get log information	Always collected

Table 1322. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic

For snapshot monitoring, this counter can be reset.

Table 1323. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected

### Usage

Use this element in conjunction with the *log\_writes* and *log\_write\_time* elements to determine if the current disk is adequate for logging.

## num\_lw\_thresh\_exceeded - Number of lock wait thresholds exceeded monitor element

This monitor element reports the number of times the lock wait threshold (set using **mon\_lw\_thresh** configuration parameter) was exceeded and a lock wait event was captured by the locking event monitor. If no lock wait event is generated, the monitor element is not incremented.

Table 1324. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE

Table 1324. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

Table 1325. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

### num\_nodes\_in\_db2\_instance - Number of Nodes in Partition

The number of nodes on the instance where the snapshot was taken.

Table 1326. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	db2	Basic

Table 1327. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Event Log Header	event_log_header	Always collected

#### Usage

Use this element to determine the number of nodes for an instance. For non-partitioned system databases, this value will be 1.

### num\_page\_dict\_built - Number of page-level compression dictionaries created or recreated

The number of page-level compression dictionaries created or recreated for a table since the database was last activated.

Table 1328. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLE table function - get table metrics	Always collected

### num\_pooled\_agents - Number of pooled agents monitor element

Identifies the number of pooled agents.

Table 1329. Table function monitoring information

Table function	Monitor element collection level
MON_GET_DATABASE table function - Get database level information	Always collected
MON_GET_DATABASE_DETAILS table function - Get database information metrics	Always collected

## num\_ref\_with\_metrics - Number of references with metrics monitor element

The total number of times that a section referenced the database object. The usage list for the data object must be created and active; in addition the collection of object metrics must be enabled for the section.

Table 1330. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_INDEX_USAGE_LIST table function - Returns information from an index usage list	Always collected
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	Always collected

## num\_references - Number of references monitor element

The number of times that this section has referenced this object since it was added to the list.

Table 1331. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_INDEX_USAGE_LIST table function - Returns information from an index usage list	Always collected
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	Always collected

## num\_remaps - Number of remaps monitor element

Count of the number of times this activity has been remapped. If num\_remaps is greater than zero, the service\_class\_id of this activity record is the ID of the last service class to which the activity was remapped.

Table 1332. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity	Always collected

## Usage

Use this information to verify whether the activity was remapped the expected number of times.

## num\_routines - Number of routines monitor element

Number of procedures, external functions, compiled functions, and compiled triggers that might be invoked during section execution.

Table 1333. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	Always collected
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	Always collected

Table 1333. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_PKG_CACHE_STMT_DETAILS - Get detailed metrics for package cache entries	Always collected
MON_GET_ROUTINE_EXEC_LIST table function - get list of statements executed by routine	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

Table 1334. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Element Collection Level
Activities	event_activitystmt	Always collected
Package Cache	event_pkgcache	Always collected

### Usage

Use MON\_GET\_SECTION\_ROUTINE table function to list the routines and triggers. This list can be compared to the output from the MON\_GET\_ROUTINE and MON\_GET\_ROUTINE\_EXEC\_LIST table functions.

### num\_tbsps - Number of table spaces monitor element

The number of table spaces associated with a logged event.

Table 1335. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_UTILITY table function - Get utilities running on the database	Always collected

Table 1336. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Change history	utilstart	Always collected

### Usage

For the change history event monitor, if the **object\_type** element is DATABASE or TABLESPACE, then this value is the number of table spaces.

### num\_threshold\_violations - Number of threshold violations monitor element

The number of threshold violations that have taken place in this database since it was last activated. This monitor element is an alias of the [“thresh\\_violations - Number of threshold violations monitor element”](#) on page 1538 monitor element, which is returned by some monitoring (MON\_\*) table functions.

Table 1337. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic

For snapshot monitoring, this counter can be reset.

Table 1338. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected

## Usage

This element can be used to help determine whether or not thresholds are effective for this particular application or whether the threshold violations are excessive.

## num\_transmissions - Number of Transmissions

Number of data transmissions between the Db2 Connect gateway and the host that was used to process this DCS statement. (One data transmission consists of either one send or one receive.)

### Note:

This is a legacy monitor element that is not relevant for Db2 UDB Version 8.1.2 or higher. If you are using Db2 UDB Version 8.1.2 or higher, refer to the **num\_transmissions\_group** monitor element.

### Element identifier

num\_transmissions

### Element type

counter

-->

Table 1339. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
DCS Statement	dcx_stmt	Statement

## Usage

Use this element to get a better understanding of the reasons why a particular statement took longer to execute. For example, a query returning a large result set may need many data transmissions to complete.

## num\_transmissions\_group - Number of Transmissions Group

The range of data transmissions between the Db2 Connect gateway and the host that was used to process this DCS statement. (One data transmission consists of either one send or one receive.)

Table 1340. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
DCS Statement	dcx_stmt	Statement

## Usage

Use this element to get a better understanding of the reasons why a particular statement took longer to execute. For example, a query returning a large result set may need many data transmissions to complete.

The constants representing the ranges of transmissions are described as follows and are defined in sqlmon.h.

API Constant	Description
SQLM_DCS_TRANS_GROUP_2	2 transmissions

API Constant	Description
SQLM_DCS_TRANS_GROUP_3TO7	3 to 7 transmissions
SQLM_DCS_TRANS_GROUP_8TO15	8 to 15 transmissions
SQLM_DCS_TRANS_GROUP_16TO64	16 to 64 transmissions
SQLM_DCS_TRANS_GROUP_GT64	Greater than 64 transmissions

### number\_in\_bin - Number in bin monitor element

This element holds the count of the number of activities or requests that fall within the histogram bin.

Table 1341. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_histogrambin	-

### Usage

Use this element to represent the height of a bin in the histogram.

## O

### object\_col\_gbp\_indep\_pages\_found\_in\_lbp - Group buffer pool column-organized independent data pages found in local buffer pool monitor element

The number of group buffer pool (GBP) independent column-organized pages found in a local buffer pool (LBP) by an agent.

Table 1342. Table function monitoring information

Table function	Monitor element collection level
MON_GET_TABLE table function - get table metrics	DATA OBJECT METRICS EXTENDED
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	DATA OBJECT METRICS EXTENDED

### object\_col\_gbp\_invalid\_pages - Group buffer pool column-organized invalid data pages monitor element

The number of times that a column-organized page is requested from the group buffer pool (GBP) for a table. The page is requested because the version of the page in the local buffer pool (LBP) is invalid. Outside of a Db2 pureScale environment, this value is null.

Table 1343. Table function monitoring information

Table function	Monitor element collection level
MON_GET_TABLE table function - get table metrics	DATA OBJECT METRICS EXTENDED
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	DATA OBJECT METRICS EXTENDED

## **object\_col\_gbp\_l\_reads - Group buffer pool column-organized logical reads monitor element**

The number of times that a group buffer pool (GBP) dependent column-organized page is requested from the GBP for a table. The page is requested because a valid version of the page does not exist in the local buffer pool (LBP).

*Table 1344. Table function monitoring information*

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_TABLE table function - get table metrics	DATA OBJECT METRICS EXTENDED
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	DATA OBJECT METRICS EXTENDED

## **object\_col\_gbp\_p\_reads - Group buffer pool column-organized physical reads monitor element**

The number of times that a group buffer pool (GBP) dependent column-organized page is read into the local buffer pool (LBP) from disk for a table. The page is read from disk into the LBP because the page is not in the GBP.

*Table 1345. Table function monitoring information*

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_TABLE table function - get table metrics	DATA OBJECT METRICS EXTENDED
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	DATA OBJECT METRICS EXTENDED

## **object\_col\_l\_reads - Column-organized logical reads monitor element**

The number of column-organized pages that are logically read from the buffer pool for a table.

*Table 1346. Table function monitoring information*

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_TABLE table function - get table metrics	DATA OBJECT METRICS EXTENDED
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	DATA OBJECT METRICS EXTENDED

## **object\_col\_lbp\_pages\_found - Local buffer pool column-organized pages found monitor element**

The number of times that a column-organized page for a table is present in the local buffer pool (LBP).

*Table 1347. Table function monitoring information*

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_TABLE table function - get table metrics	DATA OBJECT METRICS EXTENDED
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	DATA OBJECT METRICS EXTENDED

## object\_col\_p\_reads - Column-organized physical reads monitor element

The number of column-organized pages that are physically read for a table.

Table 1348. Table function monitoring information

Table function	Monitor element collection level
MON_GET_TABLE table function - get table metrics	DATA OBJECT METRICS EXTENDED
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	DATA OBJECT METRICS EXTENDED

## object\_data\_gbp\_indep\_pages\_found\_in\_lbp - Group buffer pool independent data pages found in local buffer pool monitor element

The number of group buffer pool (GBP) independent data pages found in a local buffer pool (LBP) by an agent. Outside of a Db2 pureScale environment, this value is null.

Table 1349. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLE table function - get table metrics	DATA OBJECT METRICS EXTENDED
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	DATA OBJECT METRICS EXTENDED

## object\_data\_gbp\_invalid\_pages - GBP invalid data pages for a table monitor element

The number of times that a data page is requested from the group buffer pool (GBP) for a table. The page is requested because the version of the page in the local buffer pool (LBP) is invalid. Outside of a Db2 pureScale environment, this value is null.

Table 1350. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLE table function - Get table metrics	DATA OBJECT METRICS EXTENDED
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	DATA OBJECT METRICS EXTENDED

## Usage

To determine how often a requested data page is found in the LBP, use the following formula, which uses the values of monitor elements:

```
(object_data_lbp_pages_found + object_xda_lbp_pages_found) / (object_data_l_reads + object_xda_l_reads)
```

To determine how often a requested data page is found in the GBP, use the following formula, which also uses the values of monitor elements:

```
(object_data_gbp_l_reads + object_xda_gbp_l_reads - object_data_gbp_p_reads - object_xda_gbp_p_reads) / (object_data_gbp_l_reads + object_xda_gbp_l_reads)
```

LBP and GBP hit rates are important factors in the overall performance of a cluster caching facility. Using these formulas can help you determine whether the LBP or GBP might be limiting the throughput of your database.

## object\_data\_gbp\_l\_reads - GBP data logical reads for a table monitor element

The number of times that a group buffer pool (GBP) dependent data page is requested from the GBP for a table. The page is requested because a valid version of the page does not exist in the local buffer pool (LBP). Outside of a Db2 pureScale environment, this value is null.

Table 1351. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLE table function - Get table metrics	DATA OBJECT METRICS EXTENDED
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	DATA OBJECT METRICS EXTENDED

### Usage

To determine how often a requested data page is found in the LBP, use the following formula, which uses the values of monitor elements:

$$\frac{(\text{object\_data\_lbp\_pages\_found} + \text{object\_xda\_lbp\_pages\_found})}{(\text{object\_data\_l\_reads} + \text{object\_xda\_l\_reads})}$$

To determine how often a requested data page is found in the GBP, use the following formula, which also uses the values of monitor elements:

$$\frac{(\text{object\_data\_gbp\_l\_reads} + \text{object\_xda\_gbp\_l\_reads} - \text{object\_data\_gbp\_p\_reads} - \text{object\_xda\_gbp\_p\_reads})}{(\text{object\_data\_gbp\_l\_reads} + \text{object\_xda\_gbp\_l\_reads})}$$

LBP and GBP hit rates are important factors in the overall performance of a cluster caching facility. Using these formulas can help you determine whether the LBP or GBP might be limiting the throughput of your database.

## object\_data\_gbp\_p\_reads - GBP data physical reads for a table monitor element

The number of times that a group buffer pool (GBP) dependent data page is read into the local buffer pool (LBP) from disk for a table. The page is read from disk into the LBP because the page is not in the GBP. Outside of a Db2 pureScale environment, this value is null.

Table 1352. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLE table function - Get table metrics	DATA OBJECT METRICS EXTENDED
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	DATA OBJECT METRICS EXTENDED

### Usage

To determine how often a requested data page is found in the LBP, use the following formula, which uses the values of monitor elements:

$$\frac{(\text{object\_data\_lbp\_pages\_found} + \text{object\_xda\_lbp\_pages\_found})}{(\text{object\_data\_l\_reads} + \text{object\_xda\_l\_reads})}$$

To determine how often a requested data page is found in the GBP, use the following formula, which also uses the values of monitor elements:

$$(\text{object\_data\_gbp\_l\_reads} + \text{object\_xda\_gbp\_l\_reads} - \text{object\_data\_gbp\_p\_reads})$$

$$\frac{\text{object\_xda\_gbp\_p\_reads}}{\text{object\_data\_gbp\_l\_reads} + \text{object\_xda\_gbp\_l\_reads}}$$

LBP and GBP hit rates are important factors in the overall performance of a cluster caching facility. Using these formulas can help you determine whether the LBP or GBP might be limiting the throughput of your database.

## object\_data\_lbp\_pages\_found - LBP data pages found for a table monitor element

The number of times that a data page for a table is present in the local buffer pool (LBP).

Table 1353. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLE table function - Get table metrics	DATA OBJECT METRICS EXTENDED
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	DATA OBJECT METRICS EXTENDED

### Usage

To determine how often a requested data page is found in the LBP, use the following formula, which uses the values of monitor elements:

$$\frac{\text{object\_data\_lbp\_pages\_found} + \text{object\_xda\_lbp\_pages\_found}}{\text{object\_data\_l\_reads} + \text{object\_xda\_l\_reads}}$$

To determine how often a requested data page is found in the GBP, use the following formula, which also uses the values of monitor elements:

$$\frac{\text{object\_data\_gbp\_l\_reads} + \text{object\_xda\_gbp\_l\_reads} - \text{object\_data\_gbp\_p\_reads} - \text{object\_xda\_gbp\_p\_reads}}{\text{object\_data\_gbp\_l\_reads} + \text{object\_xda\_gbp\_l\_reads}}$$

LBP and GBP hit rates are important factors in the overall performance of a cluster caching facility. Using these formulas can help you determine whether the LBP or GBP might be limiting the throughput of your database.

## object\_data\_l\_reads - Buffer pool data logical reads for a table monitor element

The number of data pages that are logically read from the buffer pool for a table.

Table 1354. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLE table function - Get table metrics	DATA OBJECT METRICS EXTENDED
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	DATA OBJECT METRICS EXTENDED

### Usage

This monitor element tracks the number of accesses to the following data:

- Data that is in the buffer pool when the database manager needs to process the page
- Data that is read into the buffer pool before the database manager can process the page

Calculate the data page hit ratio by using the following formula, which uses the values of monitor elements:

$$(1 - (\text{object\_data\_p\_reads} + \text{object\_xda\_p\_reads}) / (\text{object\_data\_l\_reads} + \text{object\_xda\_l\_reads}))$$

If the hit ratio is low, increasing the number of buffer pool pages might improve performance.

## object\_data\_p\_reads - Buffer pool physical data reads for a table monitor element

The number of data pages that are physically read for a table.

Table 1355. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLE table function - Get table metrics	DATA OBJECT METRICS EXTENDED
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	DATA OBJECT METRICS EXTENDED

### Usage

Calculate the data page hit ratio by using the following formula, which uses the values of monitor elements:

$$(1 - (\text{object\_data\_p\_reads} + \text{object\_xda\_p\_reads}) / (\text{object\_data\_l\_reads} + \text{object\_xda\_l\_reads}))$$

If the hit ratio is low, increasing the number of buffer pool pages might improve performance.

## object\_index\_gbp\_indep\_pages\_found\_in\_lbp - Group buffer pool independent index pages found in local buffer pool monitor element

The number of Group Buffer Pool (GBP) independent index pages found in Local Buffer Pool (LBP) by agent. Outside of a Db2 pureScale environment, this value is null.

Table 1356. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_INDEX table function - get index metrics	DATA OBJECT METRICS EXTENDED
MON_GET_INDEX_USAGE_LIST table function - Returns information from an index usage list	DATA OBJECT METRICS EXTENDED

## object\_index\_gbp\_invalid\_pages - GBP invalid index pages for an index monitor element

The number of times that an index page is requested from the group buffer pool (GBP) for an index. The page is requested because the version of the page in the local buffer pool (LBP) is invalid. Outside of a Db2 pureScale environment, this value is null.

Table 1357. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_INDEX table function - Get index metrics	DATA OBJECT METRICS EXTENDED
MON_GET_INDEX_USAGE_LIST table function - Returns information from an index usage list	DATA OBJECT METRICS EXTENDED

## Usage

To determine how often a requested index page is found in the LBP, use the following formula, which uses the values of monitor elements:

$$\text{object\_index\_lbp\_pages\_found} / \text{object\_index\_l\_reads}$$

To determine how often a requested index page is found in the GBP, use the following formula, which also uses the values of monitor elements:

$$(\text{object\_index\_gbp\_l\_reads} - \text{object\_index\_gbp\_p\_reads}) / \text{object\_index\_gbp\_l\_reads}$$

LBP and GBP hit rates are important factors in the overall performance of a cluster caching facility. Using these formulas can help you determine whether the LBP or GBP might be limiting the throughput of your database.

## object\_index\_gbp\_l\_reads - GBP index logical reads for an index monitor element

The number of times that a group buffer pool (GBP) dependent index page is requested from the GBP for an index. The page is requested because a valid version of the page does not exist in the local buffer pool (LBP). Outside of a Db2 pureScale environment, this value is null.

Table 1358. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_INDEX table function - Get index metrics	DATA OBJECT METRICS EXTENDED
MON_GET_INDEX_USAGE_LIST table function - Returns information from an index usage list	DATA OBJECT METRICS EXTENDED

## Usage

To determine how often a requested index page is found in the LBP, use the following formula, which uses the values of monitor elements:

$$\text{object\_index\_lbp\_pages\_found} / \text{object\_index\_l\_reads}$$

To determine how often a requested index page is found in the GBP, use the following formula, which also uses the values of monitor elements:

$$(\text{object\_index\_gbp\_l\_reads} - \text{object\_index\_gbp\_p\_reads}) / \text{object\_index\_gbp\_l\_reads}$$

LBP and GBP hit rates are important factors in the overall performance of a cluster caching facility. Using these formulas can help you determine whether the LBP or GBP might be limiting the throughput of your database.

## object\_index\_gbp\_p\_reads - GBP index physical reads for an index monitor element

The number of times that a group buffer pool (GBP) dependent index page is read into the local buffer pool (LBP) from disk for an index. The page is read from disk into the LBP because the page is not in the GBP. Outside of a Db2 pureScale environment, this value is null.

Table 1359. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_INDEX table function - Get index metrics	DATA OBJECT METRICS EXTENDED
MON_GET_INDEX_USAGE_LIST table function - Returns information from an index usage list	DATA OBJECT METRICS EXTENDED

### Usage

To determine how often a requested index page is found in the LBP, use the following formula, which uses the values of monitor elements:

$$\text{object\_index\_lbp\_pages\_found} / \text{object\_index\_l\_reads}$$

To determine how often a requested index page is found in the GBP, use the following formula, which also uses the values of monitor elements:

$$(\text{object\_index\_gbp\_l\_reads} - \text{object\_index\_gbp\_p\_reads}) / \text{object\_index\_gbp\_l\_reads}$$

LBP and GBP hit rates are important factors in the overall performance of a cluster caching facility. Using these formulas can help you determine whether the LBP or GBP might be limiting the throughput of your database.

## object\_index\_lbp\_pages\_found - LBP index pages found for an index monitor element

The number of times that an index page for an index is present in the local buffer pool (LBP).

Table 1360. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_INDEX table function - Get index metrics	DATA OBJECT METRICS EXTENDED
MON_GET_INDEX_USAGE_LIST table function - Returns information from an index usage list	DATA OBJECT METRICS EXTENDED

### Usage

To determine how often a requested index page is found in the LBP, use the following formula, which uses the values of monitor elements:

$$\text{object\_index\_lbp\_pages\_found} / \text{object\_index\_l\_reads}$$

To determine how often a requested index page is found in the GBP, use the following formula, which also uses the values of monitor elements:

$$(\text{object\_index\_gbp\_l\_reads} - \text{object\_index\_gbp\_p\_reads}) / \text{object\_index\_gbp\_l\_reads}$$

LBP and GBP hit rates are important factors in the overall performance of a cluster caching facility. Using these formulas can help you determine whether the LBP or GBP might be limiting the throughput of your database.

## object\_index\_l\_reads - Buffer pool index logical reads for an index monitor element

The number of index pages that are logically read from the buffer pool for an index.

*Table 1361. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_INDEX table function - Get index metrics	DATA OBJECT METRICS EXTENDED
MON_GET_INDEX_USAGE_LIST table function - Returns information from an index usage list	DATA OBJECT METRICS EXTENDED

### Usage

This monitor element tracks the number of accesses to the following pages:

- Index pages that are in the buffer pool when the database manager needs to process the pages
- Index pages that are read into the buffer pool before the database manager can process the pages

Calculate the index page hit ratio by using the following formula, which uses the values of monitor elements:

$$(1 - (\text{object\_index\_p\_reads} / \text{object\_index\_l\_reads}))$$

If the hit ratio is low, increasing the number of buffer pool pages might improve performance.

## object\_index\_p\_reads - Buffer pool index physical reads for an index

The number of index pages that are physically read for an index.

*Table 1362. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_INDEX table function - Get index metrics	DATA OBJECT METRICS EXTENDED
MON_GET_INDEX_USAGE_LIST table function - Returns information from an index usage list	DATA OBJECT METRICS EXTENDED

### Usage

Calculate the index page hit ratio by using the following formula, which uses the values of monitor elements:

$$(1 - (\text{object\_index\_p\_reads} / \text{object\_index\_l\_reads}))$$

If the hit ratio is low, increasing the number of buffer pool pages might improve performance.

## object\_module - Object module monitor element

The name of a database module.

Table 1363. Table function monitoring information

Table function	Monitor element collection level
MON_GET_SECTION_OBJECT table function - List objects accessed by a section	Always collected

## object\_name - Object name monitor element

The name of a database object. Refer to the monitor interface for the type of database object.

Table 1364. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_AUTO_MAINT_QUEUE table function - Get information about automatic maintenance jobs	Always collected
MON_GET_AUTO_RUNSTATS_QUEUE table function - Retrieve information about objects queued for evaluation	Always collected
MON_GET_RTS_RQST table function - Retrieve information about real-time statistics requests	Always collected
MON_GET_SECTION_OBJECT table function - List objects accessed by a section	Always collected
MON_GET_USAGE_LIST_STATUS table function - Returns the status of a usage list	Always collected
MON_GET_UTILITY table function - Get utilities running on the database	Always collected

Table 1365. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Change history	utilphase utilstart	Always collected

## Usage

For the change history event monitor, if the object\_type element is INDEX, PARTIONGROUP, or TABLE, then this is the name of the index, partition group, or table.

When this element is returned by the MON\_GET\_UTILITY function, this object refers to the table for the automatic dictionary creation (ADC) operation.

## object\_requested - Requested object monitor element

The type of lock the requester is trying to acquire from the owner. Values can be LOCK for database locks, or TICKET for WLM tickets..

Table 1366. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	lock_participants	

## object\_schema - Object schema monitor element

The schema of a database object. Refer to the monitor interface for the type of database object.

Table 1367. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_AUTO_MAINT_QUEUE table function - Get information about automatic maintenance jobs	Always collected
MON_GET_AUTO_RUNSTATS_QUEUE table function - Retrieve information about objects queued for evaluation	Always collected
MON_GET_RTS_RQST table function - Retrieve information about real-time statistics requests	Always collected
MON_GET_SECTION_OBJECT table function - List objects accessed by a section	Always collected
MON_GET_USAGE_LIST_STATUS table function - Returns the status of a usage list	Always collected
MON_GET_UTILITY table function - Get utilities running on the database	Always collected

Table 1368. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Change history	utilphase utilstart	Always collected

### Usage

For the change history event monitor, if the `object_type` element is INDEX or TABLE, then this is the schema of the index or table, otherwise it is an empty string.

When this element is returned by the MON\_GET\_UTILITY function, this object refers to the table schema for the automatic dictionary creation (ADC) operation.

## object\_xda\_gbp\_indep\_pages\_found\_in\_lbp - Group buffer pool XDA independent pages found in local buffer pool monitor element

The number of group buffer pool (GBP) independent XML storage object (XDA) data pages found in a local buffer pool (LBP) by an agent. Outside of a Db2 pureScale environment, this value is null.

Table 1369. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLE table function - get table metrics	DATA OBJECT METRICS EXTENDED
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	DATA OBJECT METRICS EXTENDED

## object\_xda\_gbp\_invalid\_pages - GBP invalid XDA data pages for a table monitor element

The number of times that a data page for an XML storage object (XDA) is requested from the group buffer pool (GBP) for a table. The page is requested because the version of the page in the local buffer pool (LBP) is invalid. Outside of a Db2 pureScale environment, this value is null.

Table 1370. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLE table function - Get table metrics	DATA OBJECT METRICS EXTENDED
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	DATA OBJECT METRICS EXTENDED

### Usage

To determine how often a requested XDA page is found in the LBP, use the following formula, which uses the values of monitor elements:

$$\text{object\_xda\_lbp\_pages\_found} / \text{object\_xda\_l\_reads}$$

To determine how often a requested XDA page is found in the GBP, use the following formula, which also uses the values of monitor elements:

$$(\text{object\_xda\_gbp\_l\_reads} - \text{object\_xda\_gbp\_p\_reads}) / \text{object\_xda\_gbp\_l\_reads}$$

LBP and GBP hit rates are important factors in the overall performance of a cluster caching facility. Using these formulas can help you determine whether the LBP or GBP might be limiting the throughput of your database.

## object\_xda\_gbp\_l\_reads - GBP XDA data logical read requests for a table monitor element

The number of times that a group buffer pool (GBP) dependent data page for an XML storage object (XDA) is requested from the GBP for a table. The page is requested because a valid version of the page does not exist in the local buffer pool (LBP). Outside of a Db2 pureScale environment, this value is null.

Table 1371. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLE table function - Get table metrics	DATA OBJECT METRICS EXTENDED
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	DATA OBJECT METRICS EXTENDED

### Usage

To determine how often a requested XDA page is found in the LBP, use the following formula, which uses the values of monitor elements:

$$\text{object\_xda\_lbp\_pages\_found} / \text{object\_xda\_l\_reads}$$

To determine how often a requested XDA page is found in the GBP, use the following formula, which also uses the values of monitor elements:

$$(\text{object\_xda\_gbp\_l\_reads} - \text{object\_xda\_gbp\_p\_reads}) / \text{object\_xda\_gbp\_l\_reads}$$

LBP and GBP hit rates are important factors in the overall performance of a cluster caching facility. Using these formulas can help you determine whether the LBP or GBP might be limiting the throughput of your database.

## object\_xda\_gbp\_p\_reads - GBP XDA data physical read requests for a table monitor element

The number of times that a group buffer pool (GBP) dependent data page for an XML storage object (XDA) is read into the local buffer pool (LBP) from disk for a table. The page is read from disk into the LBP because the page is not in the GBP. Outside of a Db2 pureScale environment, this value is null.

Table 1372. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLE table function - Get table metrics	DATA OBJECT METRICS EXTENDED
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	DATA OBJECT METRICS EXTENDED

### Usage

To determine how often a requested XDA page is found in the LBP, use the following formula, which uses the values of monitor elements:

$$\text{object\_xda\_lbp\_pages\_found} / \text{object\_xda\_l\_reads}$$

To determine how often a requested XDA page is found in the GBP, use the following formula, which also uses the values of monitor elements:

$$(\text{object\_xda\_gbp\_l\_reads} - \text{object\_xda\_gbp\_p\_reads}) / \text{object\_xda\_gbp\_l\_reads}$$

LBP and GBP hit rates are important factors in the overall performance of a cluster caching facility. Using these formulas can help you determine whether the LBP or GBP might be limiting the throughput of your database.

## object\_xda\_lbp\_pages\_found - LBP XDA data pages found for a table monitor element

The number of times that an XML storage object (XDA) data page for a table is present in the local buffer pool (LBP).

Table 1373. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLE table function - Get table metrics	DATA OBJECT METRICS EXTENDED
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	DATA OBJECT METRICS EXTENDED

### Usage

To determine how often a requested data page is found in the LBP, use the following formula, which uses the values of monitor elements:

$$(\text{object\_data\_lbp\_pages\_found} + \text{object\_xda\_lbp\_pages\_found}) / (\text{object\_data\_l\_reads} + \text{object\_xda\_l\_reads})$$

To determine how often a requested data page is found in the GBP, use the following formula, which also uses the values of monitor elements:

$$\frac{(\text{object\_data\_gbp\_l\_reads} + \text{object\_xda\_gbp\_l\_reads} - \text{object\_data\_gbp\_p\_reads} - \text{object\_xda\_gbp\_p\_reads})}{(\text{object\_data\_gbp\_l\_reads} + \text{object\_xda\_gbp\_l\_reads})}$$

LBP and GBP hit rates are important factors in the overall performance of a cluster caching facility. Using these formulas can help you determine whether the LBP or GBP might be limiting the throughput of your database.

## object\_xda\_l\_reads - Buffer pool XDA data logical reads for a table monitor element

The number of data pages for XML storage objects (XDAs) that are logically read from the buffer pool for a table.

Table 1374. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLE table function - Get table metrics	DATA OBJECT METRICS EXTENDED
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	DATA OBJECT METRICS EXTENDED

### Usage

This monitor element tracks the number of accesses to the following data:

- Data that is in the buffer pool when the database manager needs to process the page.
- Data that is read into the buffer pool before the database manager can process the page

Calculate the data page hit ratio by using the following formula, which uses the values of monitor elements:

$$\frac{(1 - (\text{object\_data\_p\_reads} + \text{object\_xda\_p\_reads}))}{(\text{object\_data\_l\_reads} + \text{object\_xda\_l\_reads})}$$

If the hit ratio is low, increasing the number of buffer pool pages might improve performance.

## object\_xda\_p\_reads - Buffer pool XDA data physical reads for a table monitor element

The number of data pages for XML storage objects (XDAs) that are physically read for a table.

Table 1375. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLE table function - Get table metrics	DATA OBJECT METRICS EXTENDED
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	DATA OBJECT METRICS EXTENDED

### Usage

Calculate the data page hit ratio by using the following formula, which uses the values of monitor elements:

$$\frac{(1 - (\text{object\_data\_p\_reads} + \text{object\_xda\_p\_reads}))}{(\text{object\_data\_l\_reads} + \text{object\_xda\_l\_reads})}$$

If the hit ratio is low, increasing the number of buffer pool pages might improve performance.

## objtype - Object type monitor element

The type of object for which monitoring data is being reported.

This element is a synonym for the **object\_type** monitor element.

Table 1376. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Change history	utilphase utilstart	Always collected

## Usage Notes

When this element is returned by the change history event monitor, the returned value for the **objtype** monitor element can be 'DATABASE', 'INDEX', 'PARTITIONGROUP', 'TABLE', 'TABLESPACE', or 'VIEW'.

## olap\_func\_overflows - OLAP Function Overflows monitor element

The number of times that OLAP function data exceeded the available sort heap space.

Table 1377. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS - Get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE

Table 1377. Table function monitoring information (continued)

Table function	Monitor element collection level
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 1378. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic
Application	appl	Basic

For snapshot monitoring, this counter can be reset.

Table 1379. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Connection	event_conn	Always collected
Database	event_db	Always collected
Package cache	pkgcache_metrics	ACTIVITY METRICS BASE
Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmmetrics	REQUEST METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

## Usage

At the database level, use this element in conjunction with total\_olap\_funcs to calculate the percentage of OLAP functions that overflowed to disk. If this percentage is high and the performance of applications using OLAP functions needs to be improved, then you should consider increasing the sort heap size.

At the application level, use this element to evaluate OLAP function performance for individual applications.

## open\_cursors - Number of Open Cursors

The number of cursors currently open for an application.

Table 1380. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
DCS Application	dcs_appl	Statement

### Usage

Use this element to assess how much memory is being allocated. The amount of memory allocated by the database client, Db2 Connect, or the database agent on the target database is related to the number of cursors that are currently open. Knowing this information can help with capacity planning. For example, each open cursor that is doing blocking has a buffer size of RQRIOBLK. If *deferred\_prepare* is enabled, then two buffers will be allocated.

This element does not include cursors that were closed by an early close. An early close occurs when the host database returns the last record to the client. The cursor is closed at the host and gateway, but is still open at the client. Early close cursors can be set using the Call Level Interface.

## open\_loc\_curs - Open Local Cursors

The number of local cursors currently open for this application, including those cursors counted by *open\_loc\_curs\_blk*.

### Element identifier

open\_loc\_curs

### Element type

gauge

Table 1381. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl	Basic

### Usage

You may use this element in conjunction with *open\_loc\_curs\_blk* to calculate the percentage of local cursors that are blocking cursors. If the percentage is low, you may be able to improve performance by improving the row blocking in the application.

For cursors used by remote applications, see *open\_rem\_curs*.

## open\_loc\_curs\_blk - Open Local Cursors with Blocking

The number of local blocking cursors currently open for this application.

### Element identifier

open\_loc\_curs\_blk

### Element type

gauge

Table 1382. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl	Basic

## Usage

You may use this element in conjunction with *open\_loc\_curs* to calculate the percentage of local cursors that are blocking cursors. If the percentage is low, you may be able to improve performance by improving the row blocking in the application:

- Check the pre-compile options for record blocking for treatment of ambiguous cursors
- Redefine cursors to allow for blocking (for example, if possible, specify FOR FETCH ONLY on your cursors).

*rej\_curs\_blk* and *acc\_curs\_blk* provide additional information that may help you tune your configuration parameters to improve row blocking in your application.

For blocking cursors used by remote applications, see *open\_rem\_curs\_blk*.

## open\_rem\_curs - Open Remote Cursors

The number of remote cursors currently open for this application, including those cursors counted by *open\_rem\_curs\_blk*.

### Element identifier

open\_rem\_curs

### Element type

gauge

---

Table 1383. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl	Basic

## Usage

You may use this element in conjunction with *open\_rem\_curs\_blk* to calculate the percentage of remote cursors that are blocking cursors. If the percentage is low, you may be able to improve performance by improving the row blocking in the application. See *open\_rem\_curs\_blk* for more information.

For the number of open cursors used by applications connected to a local database, see *open\_loc\_curs*.

## open\_rem\_curs\_blk - Open Remote Cursors with Blocking

The number of remote blocking cursors currently open for this application.

### Element identifier

open\_rem\_curs\_blk

### Element type

gauge

---

Table 1384. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl	Basic

## Usage

You can use this element in conjunction with *open\_rem\_curs* to calculate the percentage of remote cursors that are blocking cursors. If the percentage is low, you may be able to improve performance by improving the row blocking in the application:

- Check the pre-compile options for record blocking for treatment of ambiguous cursors
- Redefine cursors to allow for blocking (for example, if possible, specify FOR FETCH ONLY on your cursors).

*rej\_curs\_blk* and *acc\_curs\_blk* provide additional information that may help you tune your configuration parameters to improve row blocking in your application.

For the number of open blocking cursors used by applications connected to a local database see *open\_loc\_curs\_blk*.

## os\_arch\_type - Operating system architecture type monitor element

This element returns the instruction set architecture of the processor.

*Table 1385. Table function monitoring information*

Table function	Monitor element collection level
ENV_GET_SYSTEM_RESOURCES table function - Return system information	Always collected
ENV_SYS_INFO administrative view - Retrieve information about the system	Always collected

## os\_full\_version - Operating system full version monitor element

This element returns the full version number of the operating system.

*Table 1386. Table function monitoring information*

Table function	Monitor element collection level
ENV_GET_SYSTEM_RESOURCES table function - Return system information	Always collected
ENV_SYS_INFO administrative view - Retrieve information about the system	Always collected

## Usage

Use this element to identify the operating system and any major service updates.

## os\_kernel\_version - Operating system kernel identifier monitor element

This element identifies the kernel (if applicable).

*Table 1387. Table function monitoring information*

Table function	Monitor element collection level
ENV_GET_SYSTEM_RESOURCES table function - Return system information	Always collected
ENV_SYS_INFO administrative view - Retrieve information about the system	Always collected

## os\_level - Operating system level monitor element

The modification level of the operating system running on this host. Reported for Linux systems only.

*Table 1388. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
ENV_GET_SYSTEM_RESOURCES table function - Return system information	Always collected

## os\_name - Operating system name monitor element

The name of the operating system running on this host.

Table 1389. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ENV_GET_SYSTEM_RESOURCES table function - Return system information	Always collected

## os\_release - Operating system release monitor element

The release of the operating system running on this host.

Table 1390. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ENV_GET_SYSTEM_RESOURCES table function - Return system information	Always collected

## os\_version - Operating system version monitor element

The version of the operating system running on this host.

Table 1391. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ENV_GET_SYSTEM_RESOURCES table function - Return system information	Always collected

## outbound\_appl\_id - Outbound Application ID

This identifier is generated when the application connects to the DRDA host database. It is used to connect the Db2 Connect gateway to the host, while the **appl\_id** monitor element is used to connect a client to the Db2 Connect gateway.

### Element identifier

outbound\_appl\_id

### Element type

information

Table 1392. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
DCS Application	dcs_appl_info	Basic

## Usage

You may use this element in conjunction with **appl\_id** to correlate the client and server parts of the application information.

This identifier is unique across the network.

This element will be blank when the gateway concentrator is on, or if the DCS application is not in a logical unit of work.

### Format

Network.LU Name.Application instance

## Example

CAIBMTOR.OSFDBM0.930131194520

## outbound\_bytes\_received - Outbound Number of Bytes Received

The number of bytes received by the Db2 Connect gateway from the host, excluding communication protocol usage (for example, TCP/IP). For the data transmission level: Number of bytes received by the Db2 Connect gateway from the host during the processing of all the statements that used this number of data transmissions.

Table 1393. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
DCS Database	dcs_dbase	Basic
DCS Application	dcs_appl	Basic
DCS Statement	dcs_stmt	Statement
Data Transmission	stmt_transmissions	Statement

For snapshot monitoring at the statement level, this counter cannot be reset. This counter can be reset at other levels.

## Usage

Use this element to measure the throughput from the host databases to the Db2 Connect gateway.

## outbound\_bytes\_received\_bottom - Minimum Outbound Number of Bytes Received

The lowest number of bytes received per statement or chain by the Db2 Connect gateway from the host during the processing of all the statements or chains against this DCS database, or in this DCS application, that used this number of data transmissions.

Table 1394. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Data Transmission	stmt_transmissions	Statement

## Usage

Use this element in conjunction with "outbound number of bytes received" as yet another parameter that illustrates the throughput from the host database to the Db2 Connect gateway.

## outbound\_bytes\_received\_top - Maximum Outbound Number of Bytes Received

Maximum number of bytes received per statement or chain by the Db2 Connect gateway from the host during the processing of all the statements or chains against this DCS database, or in this DCS application, that used this number of data transmissions.

Table 1395. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Data Transmission	stmt_transmissions	Statement

### Usage

Use this element in conjunction with "outbound number of bytes received" as yet another parameter that illustrates the throughput from the host database to the Db2 Connect gateway.

## outbound\_bytes\_sent - Outbound Number of Bytes Sent

The number of bytes sent by the Db2 Connect gateway to the host, excluding communication protocol usage (for example, TCP/IP). For the data transmission level: Number of bytes sent by the Db2 Connect gateway to the host during the processing of all the statements that used this number of data transmissions.

Table 1396. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
DCS Database	dcс_dbase	Basic
DCS Application	dcс_appl	Basic
DCS Statement	dcс_stmt	Statement
Data Transmission	stmt_transmissions	Statement

For snapshot monitoring at the statement level, this counter cannot be reset. This counter can be reset at other levels.

### Usage

Use this element to measure the throughput from the Db2 Connect gateway to the host database.

## outbound\_bytes\_sent\_bottom - Minimum Outbound Number of Bytes Sent

The lowest number of bytes sent per statement or chain by the Db2 Connect gateway to the host during the processing of all the statements or chains against this DCS database, or in this DCS application, that used this number of data transmissions.

Table 1397. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Data Transmission	stmt_transmissions	Statement

### Usage

Use this element in conjunction with "outbound number of bytes sent" as yet another parameter that illustrates the throughput from the Db2 Connect Gateway to the host database.

## outbound\_bytes\_sent\_top - Maximum Outbound Number of Bytes Sent

Maximum number of bytes sent per statement or chain by the Db2 Connect gateway to the host during the processing of all the statements or chains against this DCS database, or in this DCS application, that used this number of data transmissions.

Table 1398. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Data Transmission	stmt_transmissions	Statement

### Usage

Use this element in conjunction with "outbound number of bytes sent" as yet another parameter that illustrates the throughput from the Db2 Connect Gateway to the host database.

## outbound\_comm\_address - Outbound Communication Address

This is the communication address of the target database. For example, it could be an IP address and port number for TCP/IP.

### Element identifier

outbound\_comm\_address

### Element type

information

Table 1399. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl_info	Basic
DCS Application	dc_s_appl_info	Basic

### Usage

Use this element for problem determination on DCS applications.

## outbound\_comm\_protocol - Outbound Communication Protocol

The communication protocol used between the Db2 Connect gateway and the host.

Table 1400. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
DCS Application	dc_s_appl_info	Basic

### Usage

Use this element for problem determination on DCS applications. The valid value is:

- SQLM\_PROT\_TCPIP

## outbound\_sequence\_no - Outbound Sequence Number

This element will be blank when the gateway concentrator is on, or if the DCS application is not in a logical unit of work.

Table 1401. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
DCS Application	dc_s_appl_info	Basic

## overflow\_accesses - Accesses to overflowed records monitor element

The number of accesses (reads and writes) to overflowed rows of this table.

Table 1402. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLE table function - Get table metrics	Always collected
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	DATA OBJECT METRICS BASE

Table 1403. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table	table	Basic

For snapshot monitoring, this counter can be reset.

Table 1404. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Tables	event_table	Always collected

## Usage

Overflowed rows indicate that data fragmentation has occurred. If this number is high, you may be able to improve table performance by reorganizing the table using the **REORG** utility, which cleans up this fragmentation.

A row overflows if it is updated and no longer fits in the data page where it was originally written. This usually happens as a result of an update of a VARCHAR or an ALTER TABLE statement.

## overflow\_creates - Overflow creates monitor element

The number of overflowed rows created on this table.

Table 1405. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLE table function - Get table metrics	Always collected
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	DATA OBJECT METRICS BASE

## Usage

## P

## package\_id - Package identifier monitor element

A unique identifier for the package.

Table 1406. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Unit of work	Reported in the package list.	Always collected

## Usage

The value of this element matches a value from column PKGID of view SYSCAT.PACKAGES.

## package\_elapsed\_time - Package elapsed time monitor element

The elapsed time spent executing sections within the package. Value is in milliseconds.

Table 1407. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Unit of work	Reported in the package list.	Always collected

## package\_list\_count - Package list count monitor element

The number of entries that are present within the package listing for a particular unit of work

Table 1408. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Unit of work	-	Always collected

## package\_list\_exceeded - Package list exceeded monitor element

Indicates whether the number of packages used within the unit of work has exceeded the capacity of the package list. Possible values are YES and NO.

Table 1409. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Unit of work	-	Always collected

## package\_list\_size - Size of package list monitor element

The count of the number of package identifiers included in the package list.

Table 1410. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Unit of Work	uow	

## package\_name - Package name monitor element

The name of the package that contains the SQL statement.

Table 1411. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	Always collected
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	Always collected

Table 1411. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_ROUTINE_EXEC_LIST table function - get list of statements executed by routine	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - return a list of activities	Always collected

Table 1412. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	stmt	Statement
DCS Statement	dcs_stmt	Statement

Table 1413. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	Always collected
Deadlocks with Details <sup>1</sup>	event_detailed_dlconn	-
Statements	event_stmt	-
Activities	event_activitystmt	Always collected
Package cache	-	Always collected

**1**

This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the `CREATE EVENT MONITOR` for locking statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

**Usage**

You may use this element to help identify the application program and the SQL statement that is executing.

**package\_schema - Package schema monitor element**

The schema name of the package associated with an SQL statement.

Table 1414. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	Always collected
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	Always collected

Table 1414. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_ROUTINE_EXEC_LIST table function - get list of statements executed by routine	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - return a list of activities	Always collected

Table 1415. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	Always collected
Package cache	-	Always collected

### package\_version\_id - Package version monitor element

For a particular package name and creator, there might be more than one version. The package version identifies the version identifier of the package that contains the SQL statement currently executing. The version of a package is determined at precompile (PREP) time of the embedded SQL program using the VERSION keyword. If not specified at precompile time the package version has a value of "" (empty string).

Table 1416. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	Always collected
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	Always collected
MON_GET_ROUTINE_EXEC_LIST table function - get list of statements executed by routine	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - return a list of activities	Always collected

Table 1417. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	stmt	Statement

Table 1418. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	Always collected
Statements	event_stmt	Always collected

Table 1418. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activitystmt	Always collected
Package cache	-	Always collected

## Usage

Use this element to help identify the package and the SQL statement that is currently executing.

## packet\_receive\_errors - Packet receive errors monitor element

Number of errors receiving packets since the network adapter started.

Table 1419. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ENV_GET_NETWORK_RESOURCES table function - Return network adapter information	Always collected

## packets\_received - Packets received monitor element

Number of packets received since the network adapter started.

Table 1420. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ENV_GET_NETWORK_RESOURCES table function - Return network adapter information	Always collected

## packet\_send\_errors - Packet send errors monitor element

Number of errors sending packets since the network adapter started.

Table 1421. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ENV_GET_NETWORK_RESOURCES table function - Return network adapter information	Always collected

## packets\_sent - Packets sent monitor element

Number of packets sent since the network adapter started.

Table 1422. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ENV_GET_NETWORK_RESOURCES table function - Return network adapter information	Always collected

## page\_allocations - Page allocations monitor element

Number of pages that have been allocated to the index.

Table 1423. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_INDEX table function - Get index metrics	Always collected

## page\_reorgs - Page reorganizations monitor element

The number of page reorganizations executed for a table.

Table 1424. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLE table function - Get table metrics	Always collected

Table 1425. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table	table	Basic

For snapshot monitoring, this counter can be reset.

Table 1426. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Tables	event_table	Always collected

## Usage

Although a page might have enough space, the page could become fragmented in the following situations:

- When a new row is inserted
- When an existing row is updated, and the update results in an increased record size

A page might require reorganization when it becomes fragmented. Reorganization moves all fragmented space to a contiguous area, where the new record can be written. Such a page reorganization (page reorg) might require thousands of instructions. It also generates a log record of the operation.

Too many page reorganizations can result in less than optimal insert performance. You can use the REORG TABLE utility to reorganize a table and eliminate fragmentation. You can also use the APPEND parameter for the ALTER TABLE statement to indicate that all inserts are appended at the end of a table to avoid page reorganizations.

In situations where updates to rows causes the row length to increase, the page may have enough space to accommodate the new row, but a page reorg may be required to defragment that space. If the page does not have enough space for the new larger row, an overflow record is created causing *overflow\_accesses* during reads. You can avoid both situations by using fixed length columns instead of varying length columns.

## page\_reclaims\_x - Page reclaims exclusive access monitor element

The number of times a page related to the object was reclaimed by another member in the Db2 pureScale instance before its planned release, where the member that reclaimed the page required exclusive access.

Table 1427. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_PAGE_ACCESS_INFO table function - Get buffer pool page waiting information	Always collected

### Usage

Page reclaims related to internally maintained object space maps are counted separately.

## page\_reclaims\_s - Page reclaims shared access monitor element

The number of times a page related to the object was reclaimed by another member in the Db2 pureScale instance before its planned release, where the member that reclaimed the page required shared access.

Table 1428. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_PAGE_ACCESS_INFO table function - Get buffer pool page waiting information	Always collected

### Usage

Page reclaims related to internally maintained object space maps are counted separately.

## page\_reclaims\_initiated\_x - Page reclaims initiated exclusive access monitor element

The number of times a page accessed in exclusive mode caused the page to be reclaimed from another member. Page reclaims related to internally maintained object space maps are counted separately.

Table 1429. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_PAGE_ACCESS_INFO table function - Get buffer pool page waiting information	Always collected

## page\_reclaims\_initiated\_s - Page reclaims initiated shared access monitor element

The number of times a page accessed in shared mode caused the page to be reclaimed from another member. Page reclaims related to internally maintained object space maps are counted separately.

Table 1430. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_PAGE_ACCESS_INFO table function - Get buffer pool page waiting information	Always collected

## pages\_from\_block\_ios - Total number of pages read by block I/O monitor element

The total number of pages read by block I/O into the block area of the buffer pool.

Table 1431. Table Function Monitoring Information

Table Function	Monitor Element Collection Command and Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_CONTAINER table function - Get table space container metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

Table 1432. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Buffer Pool	bufferpool	Buffer Pool

### Usage

If block-based buffer pool is enabled, this element reports the total number of pages read by block I/O. Otherwise, this element returns 0.

To calculate the average number of pages sequentially prefetched per block-based I/O, divide the value of the **pages\_from\_block\_ios** monitor element by the value of the **block\_ios** monitor element. If this value is much less than the BLOCKSIZE option you have defined for the block-based buffer pool in the CREATE BUFFERPOOL or ALTER BUFFERPOOL statement, then block-based I/O is not being used to its full advantage. One possible cause for this is a mismatch between the extent size for the table space being sequentially prefetched and the block size of the block-based buffer pool.

## pages\_from\_vectorized\_ios - Total number of pages read by vectored I/O monitor element

The total number of pages read by vectored I/O into the page area of the buffer pool.

Table 1433. Table Function Monitoring Information

Table Function	Monitor Element Collection Command and Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_CONTAINER table function - Get table space container metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE

---

Table 1433. Table Function Monitoring Information (continued)

---

Table Function	Monitor Element Collection Command and Level
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

---

Table 1434. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Buffer Pool	bufferpool	Buffer Pool

---

### pages\_merged - Pages merged monitor element

Number of index pages that have been merged.

---

Table 1435. Table Function Monitoring Information

---

Table Function	Monitor Element Collection Level
MON_GET_INDEX table function - Get index metrics	Always collected

---

### pages\_read - Number of pages read monitor element

The number of pages (data, index, and XML) read in from the physical table space containers for regular and large table spaces.

---

Table 1436. Table Function Monitoring Information

---

Table Function	Monitor Element Collection Level
MON_GET_CONTAINER table function - Get table space container metrics	DATA OBJECT METRICS BASE

---

### Usage

### pages\_written - Number of pages written monitor element

The number of pages (data, index, and XML) physically written to the table space container.

---

Table 1437. Table Function Monitoring Information

---

Table Function	Monitor Element Collection Level
MON_GET_CONTAINER table function - Get table space container metrics	DATA OBJECT METRICS BASE

---

### Usage

## parent\_activity\_id - Parent activity ID monitor element

The unique ID of the activity's parent activity within the parent activity's unit of work. If there is no parent activity, the value of this monitor element is NULL.

Table 1438. Table Function Monitoring Information

Table Function	Monitor Element Collection Command and Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
MON_GET_AGENT table function - List agents, fenced mode processes, and system entities for the database	Always collected
WLM_GET_SERVICE_CLASS_AGENTS table function - list agents running in a service class	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

Table 1439. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity	Always collected

### Usage

Use this element along with the **parent\_uow\_id** element and **appl\_id** element to uniquely identify the parent activity of the activity described in this activity record.

## parent\_uow\_id - Parent unit of work ID monitor element

The unique unit of work identifier within an application handle. The ID of the unit of work in which the activity's parent activity originates. If there is no parent activity, the value is NULL.

Table 1440. Table Function Monitoring Information

Table Function	Monitor Element Collection Command and Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
MON_GET_AGENT table function -List agents, fenced mode processes, and system entities for the database	Always collected
WLM_GET_SERVICE_CLASS_AGENTS table function - list agents running in a service class	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

Table 1441. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity	Always collected

## Usage

Use this element along with the **parent\_activity\_id** element and **appl\_id** element to uniquely identify the parent activity of the activity described in this activity record.

## partial\_record - Partial Record monitor element

Indicates that an event monitor record is only a partial record.

Table 1442. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	-
Tables	event_table	-
Tablespaces	event_tablespace	-
Bufferpools	event_bufferpool	-
Connection	event_conn	-
Statements	event_stmt	-
Statements	event_subsection	-
Transactions	event_xact	-
Activities	event_activity	-

## Usage

Most event monitors do not output their results until database deactivation. You can use the `FLUSH EVENT MONITOR <monitorName>` statement to force monitor values to the event monitor output writer. This allows you to force event monitor records to the writer without needing to stop and restart the event monitor. This element indicates whether an event monitor record was the result of flush operation and so is a partial record.

Flushing an event monitor does not cause its values to be reset. This means that a complete event monitor record is still generated when the event monitor is triggered.

At the event\_activity logical data grouping, the possible values of **partial\_record** monitor element are:

- 0** The activity record was generated normally at the end of activity.
- 1** The activity record was generated as a result of calling the `WLM_CAPTURE_ACTIVITY_IN_PROGRESS` stored procedure.
- 2** Information is missing for this activity because not enough storage was available to create the records. Information may be missing from the event\_activity, event\_activitystmt, or event\_activityvals records.

## participant\_no - Participant within Deadlock

A sequence number uniquely identifying this participant within this deadlock.

### Element identifier

participant\_no

### Element type

information

Table 1443. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Deadlocks	event_dlconn	Always collected
Deadlocks with Details	event_detailed_dlconn	Always collected

### Usage

Use this in your monitoring application to correlate deadlock connection event records with deadlock event records.

## participant\_no\_holding\_lk - Participant Holding a Lock on the Object Required by Application

The participant number of the application that is holding a lock on the object that this application is waiting to obtain.

### Element identifier

participant\_no\_holding\_lk

### Element type

information

Table 1444. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Deadlocks	event_dlconn	Always collected
Deadlocks with Details	event_detailed_dlconn	Always collected

### Usage

This element can help you determine which applications are in contention for resources.

## participant\_type - Participant type monitor element

The type of lock participant which can be either Requestor or Owner.

Table 1445. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	lock_participants	

## partition\_key - Partitioning key monitor element

The partitioning key for the event monitor tables. This value is chosen so that each event monitor process inserts data into the database partition on which the process is running; that is, insert operations are performed locally on the database partition where the event monitor process is running.

Table 1446. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Element Collection Level

Table 1446. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Element Collection Level
Change History	changesummary dbdbmcfg ddlstmtexec evmonstart regvar txncompletion utillocation utilphase utilstart utilstop	Always collected

### partition\_number - Partition Number

This element is only used in the target SQL tables by write-to-table event monitors in a partitioned database environment or Db2 pureScale environment. This value indicates the number of the member where event monitor data is inserted.

Table 1447. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
DB_MEMBERS table function	Always collected

Table 1448. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activitymetrics	Always collected

### passthru\_time - Pass-Through Time

This element contains the aggregate amount of time, in milliseconds, that it has taken this data source to respond to PASSTHRU statements from all applications or a single application running on this federated server instance since the start of the federated server instance or the last reset of the database monitor counters. The monitor stores the most recent of the values. The response time is measured as the difference between the time the federated server submits a PASSTHRU statement to the data source, and the time it takes the data source to respond, indicating that the statement has been processed.

Table 1449. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase_remote	Timestamp
Application	appl_remote	Timestamp

For snapshot monitoring, this counter can be reset.

### Usage

Use this element to determine how much actual time is spent at this data source processing statements in pass-through mode.

## passthru - Pass-Through

This element contains a count of the total number of SQL statements that the federated server has passed through directly to this data source on behalf of any application since the start of the federated server instance or the last reset of the database monitor counters, whichever is latest.

Table 1450. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase_remote	Basic
Application	appl_remote	Basic

For snapshot monitoring, this counter can be reset.

### Usage

Use this element to determine what percentage of your SQL statements can be handled natively by the federated server, and what percentage requires pass-through mode. If this value is high, you should determine the cause and investigate ways to better use the native support.

## past\_activities\_wrapped - Past activities list wrapped monitor element

Indicates whether the activities list has wrapped. The default limit on the number of past activities to be kept by any one application is 250. This default can be overridden using the `DB2_MAX_INACT_STMTS` registry variable. Users may want to choose a different value for the limit to increase or reduce the amount of system monitor heap used for inactive statement information.

Table 1451. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	lock_participants	

## peer\_wait\_limit - Peer wait limit monitor element

Reflects peer wait limit configuration (set via the registry variable `DB2_HADR_PEER_WAIT_LIMIT`). Units are milliseconds.

Table 1452. Table function monitoring information

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

## peer\_window - Peer window monitor element

**Note:** The `hadr_peer_window` and `peer_window` monitor elements are aliases that represent the same information in different monitoring interfaces. `hadr_peer_window` is returned by the snapshot monitor interfaces, and `peer_window` is returned by the `MON_GET_HADR` table function and `db2pd` interfaces.

The value of the `HADR_PEER_WINDOW` database configuration parameter. Units are milliseconds.

Table 1453. Table function monitoring information

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

## peer\_window\_end - Peer window end monitor element

**Note:** The **hadr\_peer\_window\_end** and **peer\_window\_end** monitor elements are aliases that represent the same information in different monitoring interfaces. **hadr\_peer\_window\_end** is returned by the snapshot monitor interfaces, and **peer\_window\_end** is returned by the MON\_GET\_HADR table function and db2pd interfaces.

End time of current peer window. The value is NULL if peer window is not enabled.

Table 1454. Table function monitoring information

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

## phase\_start\_event\_id - Phase start event ID

The EVENT\_ID of corresponding UTILPHASESTART.

Table 1455. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Change History	UTILPHASE	Always collected

### Usage

For the change history event monitor:

- If the event is the stopping of a utility phase or processing stage (UTILPHASESTOP), this is the EVENT\_ID of the corresponding start of the utility phase (UTILPHASESTART), otherwise -1.

Use with the PHASE\_START\_EVENT\_TIMESTAMP and member elements to associate the phase stop record with the corresponding start record.

## phase\_start\_event\_timestamp - Phase start event timestamp

Time of the corresponding UTILPHASESTART

Table 1456. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Change History	UTILPHASE	Always collected

### Usage

For the change history event monitor:

- If the event is the stopping of a utility phase or processing stage (UTILPHASESTOP), this is the time of the corresponding start of the utility phase (UTILPHASESTART), otherwise empty.

Use with the PHASE\_START\_EVENT\_ID and member elements to associate the phase stop record with the corresponding start record.

## physical\_move\_time - Physical extent move time monitor element

During extent movement, this monitor element shows the cumulative time taken to do disk I/O on an extent to move it from one position to another. The value is given in milliseconds.

Table 1457. Table function monitoring information

Table function	Monitor element collection level
MON_GET_EXTENT_MOVEMENT_STATUS - get extent movement progress	Always collected

## pipedsorts\_accepted - Piped Sorts Accepted

The number of piped sorts that have been accepted.

Table 1458. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	db2	Basic

For snapshot monitoring, this counter can be reset.

### Usage

Each active sort on the system allocates memory, which may result in sorting taking up too much of the available system memory.

When the number of accepted piped sorts is low compared to the number requested, you can improve sort performance by adjusting one or both of the following configuration parameters:

- `sortheap`
- `sheapthres`

If piped sorts are being rejected, you might consider decreasing your sort heap or increasing your sort heap threshold. You should be aware of the possible implications of either of these options. If you increase the sort heap threshold, then there is the possibility that more memory will remain allocated for sorting. This could cause the paging of memory to disk. If you decrease the sort heap, you might require an extra merge phase that could slow down the sort.

## pipedsorts\_requested - Piped Sorts Requested

The number of piped sorts that have been requested.

Table 1459. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	db2	Basic

For snapshot monitoring, this counter can be reset.

### Usage

Each active sort on the system allocates memory, which may result in sorting taking up too much of the available system memory.

The sort list heap (`sortheap`) and sort heap threshold (`sheapthres`) configuration parameters help to control the amount of memory used for sort operations. These parameters are also used to determine whether a sort will be piped.

Since piped sorts may reduce disk I/O, allowing more piped sorts can improve the performance of sort operations and possibly the performance of the overall system. A piped sort is not be

accepted if the sort heap threshold will be exceeded when the sort heap is allocated for the sort. See *pipedReader\_accepted* for more information if you are experiencing pipedReader sort rejections.

The SQL EXPLAIN output will show whether the optimizer requests a pipedReader sort.

## pkg\_cache\_inserts - Package cache inserts monitor element

The total number of times that a requested section was not available for use and had to be loaded into the package cache. This count includes any implicit prepares performed by the system.

Table 1460. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE

Connection	event_conn	Always collected
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## Usage

In conjunction with the **pkg\_cache\_lookups** monitor element, use this monitor element to calculate the package cache hit ratio using the following formula:

$$1 - (\text{Package Cache Inserts} / \text{Package Cache Lookups})$$

## pkg\_cache\_lookups - Package cache lookups monitor element

The package cache lookups monitor element counts the number of times that an application looked for a section or package in the package cache. At a database level, it indicates the overall number of references since the database was started, or monitor data was reset. This counter includes the cases where the section is already loaded in the cache and when the section has to be loaded into the cache. In a concentrator environment where agents are being associated with different applications, additional package cache lookups may be required as a result of a new agent not having the required section or package available in local storage.

Table 1463. Table Function Monitoring Information

Table Function	Monitor Element Collection Level

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## Usage

To calculate the package cache hit ratio use the following formula:

$$1 - (\text{Package Cache Inserts} / \text{Package Cache Lookups})$$

The package cache hit ratio tells you whether or not the package cache is being used effectively. If the hit ratio is high (more than 0.8), the cache is performing well. A smaller hit ratio may indicate that the package cache should be increased.

You will need to experiment with the size of the package cache to find the optimal number for the **pckcachesz** configuration parameter. For example, you might be able to use a smaller package cache size if there is no increase in the **pkg\_cache\_inserts** element when you decrease the size of the cache. Decreasing the package cache size frees up system resources for other work. It is also possible that you could improve overall system performance by increasing the size of the package cache if by doing so, you decrease the number of **pkg\_cache\_inserts**. This experimentation is best done under full workload conditions.

You can use this element with **ddl\_sql\_stmts** to determine whether or not the execution of DDL statements is impacting the performance of the package cache. Sections for dynamic SQL statements can become invalid when DDL statements are executed. Invalid sections are implicitly prepared by the system when next used. The execution of a DDL statement could invalidate a number of sections and the resulting additional processing time required when preparing those sections could significantly impact performance. In this case, the package cache hit ratio reflects the implicit recompilation of invalid sections. It does not reflect the insertion of new sections into the cache, so increasing the size of the package cache will not improve overall performance. You might find it less confusing to tune the cache for an application on its own before working in the full environment.

It is necessary to determine the role that DDL statements are playing in the value of the package cache hit ratio before deciding on what action to take. If DDL statements rarely occur, then cache performance may be improved by increasing its size. If DDL statements are frequent, then improvements may require that you limit the use of DDL statements (possibly to specific time periods).

The **static\_sql\_stmts** and **dynamic\_sql\_stmts** counts can be used to help provide information about the quantity and type of sections being cached.

**Note:** You may want to use this information at the database level to calculate the average package cache hit ratio all each applications. You should look at this information at an application level to find out the exact package cache hit ratio for a given application. It may not be worthwhile to increase the size of the package cache in order to satisfy the cache requirements of an application that only executes infrequently.

## pkg\_cache\_num\_overflows - Package Cache Overflows

The number of times that the package cache overflowed the bounds of its allocated memory.

Table 1466. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_DATABASE table function - Get database level information	Always collected
MON_GET_DATABASE_DETAILS table function - Get database information metrics	Always collected

Table 1467. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic

For snapshot monitoring, this counter can be reset.

Table 1468. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected

## Usage

Use this element with the **pkg\_cache\_size\_top** monitor element to determine whether the size of the package cache needs to be increased to avoid overflowing.

## pkg\_cache\_size\_top - Package cache high watermark

The largest size reached by the package cache.

**Note:** The **pkg\_cache\_size\_top** monitor element is deprecated. Using this monitor element will not generate an error. However, it does not return a valid value and might be removed in a future release.

Table 1469. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic

Table 1470. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected

## Usage

If the package cache overflowed, then this element contains the largest size reached by the package cache during the overflow.

Check the **pkg\_cache\_num\_overflows** monitor element to determine if such a condition occurred.

You can determine the minimum size of the package cache required by your workload by:

```
maximum package cache size / 4096
```

Rounding the result up to a whole number, indicates the minimum number of 4K pages required by the package cache to avoid overflow.

## planid - Query plan ID monitor element

The hash key value which identifies a query plan for a section.

The **planid** monitor element tracks important performance sensitive aspects of the access plan. Such aspects include the list and layout of access plan operators, identifiers of the objects that are being accessed, the number of each type of predicate for each operator, and performance sensitive operator arguments.

Table 1471. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Return information about an activity as an XML document	Always collected
MON_GET_PKG_CACHE_STMT table function - Get package cache statement metrics	Always collected
MON_GET_PKG_CACHE_STMT_DETAILS table function - Get package cache statement metrics as an XML document	Always collected
WLM_GET_WORKLOAD_OCCURENCE_ACTIVITIES table function - Return a list of activities	Always collected

Table 1472. Event monitoring information

Event type	Logical data grouping	Monitor switch
Activities	event_activitystmt	Always collected
Package cache	pkgcache	Always collected

## Usage

Use this monitor element with the **stmtid** and **semantic\_env\_id** monitor elements to detect changes in access plan that might affect performance.

## pool\_async\_col\_gbp\_indep\_pages\_found\_in\_lbp - Asynchronous group buffer pool column-organized independent data pages found in local buffer pool monitor element

The number of group buffer pool (GBP) independent column-organized pages found in a local buffer pool by a prefetcher.

Table 1473. Table function monitoring information

Table function	Monitor element collection level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE

---

Table 1473. Table function monitoring information (continued)

---

Table function	Monitor element collection level
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

---

### **pool\_async\_col\_gbp\_invalid\_pages - Asynchronous group buffer pool invalid data pages monitor element**

The number of times a column-organized page was attempted to be read from the group buffer pool by a prefetcher because the page was invalid in the local buffer pool.

---

Table 1474. Table function monitoring information

---

Table function	Monitor element collection level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

---

### **pool\_async\_col\_gbp\_l\_reads - Asynchronous group buffer pool column-organized logical reads monitor element**

The number of times a Group Buffer Pool (GBP) dependent column-organized page was attempted to be read from the group buffer pool by a prefetcher because the page was either invalid or not present in the local buffer pool.

---

Table 1475. Table function monitoring information

---

Table function	Monitor element collection level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

---

## pool\_async\_col\_gbp\_p\_reads - Asynchronous group buffer pool column-organized physical reads monitor element

The number of times a Group Buffer Pool (GBP) dependent column-organized page was read into the local buffer pool by a prefetcher from disk because it was not found in the GBP.

Table 1476. Table function monitoring information

Table function	Monitor element collection level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

## pool\_async\_col\_lbp\_pages\_found - Asynchronous local buffer pool column-organized pages found monitor element

The number of times a data page was present in the local buffer pool when a prefetcher attempted to access it.

Table 1477. Table function monitoring information

Table function	Monitor element collection level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

## pool\_async\_col\_read\_reqs - Buffer pool asynchronous column-organized read requests monitor element

The number of asynchronous column-organized read requests by the prefetcher to the operating system.

Table 1478. Table function monitoring information

Table function	Monitor element collection level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE

Table 1478. Table function monitoring information (continued)

Table function	Monitor element collection level
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

## Usage

To calculate the average number of column-organized pages in each read request, use the following formula:

```
pool_async_col_reads / pool_async_col_read_reqs
```

This average can help you determine the average read I/O size used by the prefetcher.

The maximum size of a prefetcher read I/O is the value specified on the EXTENTSIZE option of the CREATE TABLESPACE statement for the table space involved, but it can be smaller under some circumstances:

- when some pages of the extent are already in the buffer pool
- when exceeding operating system capabilities
- when the EXTENTSIZE option value is very large, such that doing a large I/O would be detrimental to overall performance

## pool\_async\_col\_reads - Buffer pool asynchronous column-organized reads monitor element

Indicates the number of column-organized pages which have been asynchronously read by prefetchers from the table space containers (physical) for all types of table spaces.

Table 1479. Table function monitoring information

Table function	Monitor element collection level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

## pool\_async\_col\_writes - Buffer pool asynchronous column-organized writes monitor element

The number of times a buffer pool data page was physically written to disk by either an asynchronous page cleaner, or a prefetcher. A prefetcher might have written dirty pages to disk to make space for the pages being prefetched.

Table 1480. Table function monitoring information

Table function	Monitor element collection level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE

Table 1480. Table function monitoring information (continued)

Table function	Monitor element collection level
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

## Usage

You can use this element with the **pool\_col\_writes** monitor element to calculate the number of columnar page writes that were performed synchronously (that is, physical data page writes that were performed by database manager agents). Use the following formula:

```
pool_col_writes - pool_async_col_writes
```

By comparing the ratio of asynchronous to synchronous writes, you can gain insight into how well the buffer pool page cleaners are performing. This ratio can be helpful when you are tuning the **num\_iocleaners** configuration parameter.

## pool\_async\_data\_gbp\_indep\_pages\_found\_in\_lbp - Group buffer pool independent data pages found by asynchronous EDUs in a local buffer pool monitor element

The number of group buffer pool (GBP) independent data pages found in a local buffer pool by asynchronous EDUs.

Table 1481. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

## pool\_async\_data\_gbp\_invalid\_pages - Asynchronous group buffer pool invalid data pages monitor element

The number of times a data page was attempted to be read from the group buffer pool by a prefetcher because the page was invalid in the local buffer pool. Outside of a Db2 pureScale environment, this value is null.

Table 1482. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE

Table 1482. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

## Usage

The prefetcher (or asynchronous) data page hit ratios can be computed as follows:

$$\text{GBP} = \left( \frac{\text{pool\_async\_data\_gbp\_l\_reads} - \text{pool\_async\_data\_gbp\_p\_reads}}{\text{pool\_async\_data\_gbp\_l\_reads}} \right)$$

Buffer pool hit rates are important factors in the overall performance of the IBM Db2 pureScale Feature. Using this formula can help you determine whether the group buffer pool may be a limiting factor on your database's throughput.

## pool\_async\_data\_gbp\_l\_reads - Asynchronous group buffer pool data logical reads monitor element

The number of times a Group Buffer Pool (GBP) dependent data page was attempted to be read from the group buffer pool by a prefetcher because the page was either invalid or not present in the local buffer pool. Outside of a Db2 pureScale environment, this value is null.

Table 1483. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	Always collected
MON_GET_DATABASE_DETAILS table function - Get database information metrics	Always collected
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

## Usage

The prefetcher (or asynchronous) data page hit ratios can be computed as follows:

$$\text{GBP} = \left( \frac{\text{pool\_async\_data\_gbp\_l\_reads} - \text{pool\_async\_data\_gbp\_p\_reads}}{\text{pool\_async\_data\_gbp\_l\_reads}} \right)$$

Buffer pool hit rates are important factors in the overall performance of the IBM Db2 pureScale Feature. Using this formula can help you determine whether the group buffer pool may be a limiting factor on your database's throughput.

## pool\_async\_data\_gbp\_p\_reads - Asynchronous group buffer pool data physical reads monitor element

The number of times a Group Buffer Pool (GBP) dependent data page was read into the local buffer pool by a prefetcher from disk because it was not found in the GBP. Outside of a Db2 pureScale environment, this value is null.

Table 1484. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

### Usage

The prefetcher (or asynchronous) data page hit ratios can be computed as follows:

$$\text{GBP} = \left( \frac{\text{pool\_async\_data\_gbp\_l\_reads} - \text{pool\_async\_data\_gbp\_p\_reads}}{\text{pool\_async\_data\_gbp\_l\_reads}} \right)$$

Buffer pool hit rates are important factors in the overall performance of the IBM Db2 pureScale Feature. Using this formula can help you determine whether the group buffer pool may be a limiting factor on your database's throughput.

## pool\_async\_data\_lbp\_pages\_found - Asynchronous local buffer pool data pages found monitor element

The number of times a data page was present in the local buffer pool when a prefetcher attempted to access it.

Table 1485. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

### Usage

The prefetcher (or asynchronous) data page hit ratios can be computed as follows:

$$\text{GBP} = \left( \frac{\text{pool\_async\_data\_gbp\_l\_reads} - \text{pool\_async\_data\_gbp\_p\_reads}}{\text{pool\_async\_data\_gbp\_l\_reads}} \right)$$

/ pool\_async\_data\_gbp\_1\_reads

Buffer pool hit rates are important factors in the overall performance of the IBM Db2 pureScale Feature. Using this formula can help you determine whether the group buffer pool may be a limiting factor on your database's throughput.

## pool\_async\_data\_read\_reqs - Buffer pool asynchronous read requests monitor element

The number of asynchronous read requests by the prefetcher to the operating system. These requests are typically large block I/Os of multiple pages.

Table 1486. Table Function Monitoring Information

Table Function	Monitor Element Collection Command and Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

Table 1487. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Buffer Pool
Table Space	tablespace	Buffer Pool
Buffer Pool	bufferpool	Buffer Pool

For snapshot monitoring, this counter can be reset.

Table 1488. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected
Tablespaces	event_tablespace	Always collected

## Usage

To calculate the average number of data pages in each read request, use the following formula:

$$\text{pool\_async\_data\_reads} / \text{pool\_async\_data\_read\_reqs}$$

This average can help you determine the average read I/O size used by the prefetcher. This data can also be helpful in understanding the large block I/O requirements of the measured workload.

The maximum size of a prefetcher read I/O is the value specified on the EXTENTSIZE option of the CREATE TABLESPACE statement for the table space involved, but it can be smaller under some circumstances:

- when some pages of the extent are already in the buffer pool

- when exceeding operating system capabilities
- when the EXTENTSIZE option value is very large, such that doing a large I/O would be detrimental to overall performance

## pool\_async\_data\_reads - Buffer pool asynchronous data reads monitor element

Indicates the number of data pages which have been asynchronously read by prefetchers from the table space containers (physical) for all types of table spaces.

*Table 1489. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

*Table 1490. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Buffer Pool
Table Space	tablespace	Buffer Pool
Buffer Pool	bufferpool	Buffer Pool

For snapshot monitoring, this counter can be reset.

*Table 1491. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected
Tablespaces	event_tablespace	Always collected

## Usage

You can use this element with **pool\_data\_p\_reads** to calculate the number of physical reads that were performed synchronously (that is, physical data page reads that were performed by database manager agents). Use the following formula to calculate the number of synchronous data reads:

```
# of sync data reads = pool_data_p_reads + pool_temp_data_p_reads - pool_async_data_reads
```

By comparing the ratio of asynchronous reads to total physical reads, you can gain insight into how well the prefetchers are working. This element can be helpful when you are tuning the **num\_ioservers** configuration parameter. You can calculate the ratio of asynchronous reads to physical reads by using the following formula:

```
(pool_async_data_reads + pool_async_index_reads) / (pool_data_p_reads + pool_temp_data_p_reads + pool_index_p_reads + pool_temp_index_p_reads)
```

## pool\_async\_data\_writes - Buffer pool asynchronous data writes monitor element

The number of times a buffer pool data page was physically written to disk by either an asynchronous page cleaner, or a prefetcher. A prefetcher may have written dirty pages to disk to make space for the pages being prefetched.

Table 1492. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

Table 1493. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Buffer Pool
Table Space	tablespace	Buffer Pool
Buffer Pool	bufferpool	Buffer Pool

For snapshot monitoring, this counter can be reset.

Table 1494. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected
Tablespaces	event_tablespace	Always collected

### Usage

You can use this element with the **pool\_data\_writes** monitor element to calculate the number of physical write requests that were performed synchronously (that is, physical data page writes that were performed by database manager agents). Use the following formula:

```
pool_data_writes - pool_async_data_writes
```

By comparing the ratio of asynchronous to synchronous writes, you can gain insight into how well the buffer pool page cleaners are performing. This ratio can be helpful when you are tuning the **num\_iocleaners** configuration parameter.

## pool\_async\_index\_gbp\_indep\_pages\_found\_in\_lbp - Group buffer pool independent index pages found by asynchronous EDUs in a local buffer pool monitor element monitor element

The number of group buffer pool (GBP) independent index pages found in a local buffer pool by asynchronous EDUs.

Table 1495. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

## pool\_async\_index\_gbp\_invalid\_pages - Asynchronous group buffer pool invalid index pages monitor element

The number of times an index page was attempted to be read from the group buffer pool by a prefetcher because the page was invalid in the local buffer pool. Outside of a Db2 pureScale environment, this value is null.

Table 1496. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

## Usage

The prefetcher (or asynchronous) index page hit ratios can be computed as follows:

```
GBP = ( pool_async_index_gbp_l_reads - pool_async_index_gbp_p_reads )  
      / pool_async_index_gbp_l_reads
```

Buffer pool hit rates are important factors in the overall performance of the Db2 pureScale instance. Using the previously mentioned formula can help you determine whether the group buffer pool may be a limiting factor on your database's throughput.

## pool\_async\_index\_gbp\_l\_reads - Asynchronous group buffer pool index logical reads monitor element

The number of times a Group Buffer Pool (GBP) dependent index page was attempted to be read from the group buffer pool by a prefetcher because the page was either invalid or not present in the local buffer pool. Outside of a Db2 pureScale environment, this value is null.

Table 1497. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

### Usage

The prefetcher (or asynchronous) index page hit ratios can be computed as follows:

$$\text{GBP} = \left( \frac{\text{pool\_async\_index\_gbp\_l\_reads} - \text{pool\_async\_index\_gbp\_p\_reads}}{\text{pool\_async\_index\_gbp\_l\_reads}} \right)$$

Buffer pool hit rates are important factors in the overall performance of the Db2 pureScale instance. Using the previously mentioned formula can help you determine whether the group buffer pool may be a limiting factor on your database's throughput.

## pool\_async\_index\_gbp\_p\_reads - Asynchronous group buffer pool index physical reads monitor element

The number of times a Group Buffer Pool (GBP) dependent index page was read into the local buffer pool by a prefetcher from disk because it was not found in the GBP. Outside of a Db2 pureScale environment, this value is null.

Table 1498. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

### Usage

The prefetcher (or asynchronous) index page hit ratios can be computed as follows:

$$\text{GBP} = \left( \frac{\text{pool\_async\_index\_gbp\_l\_reads} - \text{pool\_async\_index\_gbp\_p\_reads}}{\text{pool\_async\_index\_gbp\_l\_reads}} \right)$$

```
/ pool_async_index_gbp_l_reads
```

Buffer pool hit rates are important factors in the overall performance of the Db2 pureScale instance. Using the previously mentioned formula can help you determine whether the group buffer pool may be a limiting factor on your database's throughput.

## **pool\_async\_index\_lbp\_pages\_found - Asynchronous local buffer pool index pages found monitor element**

The number of times an index page was present in the local buffer pool when a prefetcher attempted to access it.

*Table 1499. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

### **Usage**

The prefetcher (or asynchronous) index page hit ratios can be computed as follows:

```
GBP = ( pool_async_index_gbp_l_reads - pool_async_index_gbp_p_reads )  
      / pool_async_index_gbp_l_reads
```

Buffer pool hit rates are important factors in the overall performance of the Db2 pureScale instance. Using the previously mentioned formula can help you determine whether the group buffer pool may be a limiting factor on your database's throughput.

## **pool\_async\_index\_read\_reqs - Buffer pool asynchronous index read requests monitor element**

The number of asynchronous read requests for index pages.

*Table 1500. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Command and Level</b>
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

Table 1501. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Buffer Pool
Table Space	tablespace	Buffer Pool
Buffer Pool	bufferpool	Buffer Pool

For snapshot monitoring, this counter can be reset.

Table 1502. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected
Tablespaces	event_tablespace	Always collected

### Usage

To calculate the number of index pages read per asynchronous request, use the following formula:

$$\text{pool\_async\_index\_reads} / \text{pool\_async\_index\_read\_reqs}$$

This average can help you determine the amount of asynchronous I/O done for index pages in each interaction with the prefetcher.

## pool\_async\_index\_reads - Buffer pool asynchronous index reads monitor element

Indicates the number of index pages which have been asynchronously read by prefetchers from the table space containers (physical) for all types of table spaces.

Table 1503. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

Table 1504. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Buffer Pool
Table Space	tablespace	Buffer Pool
Buffer Pool	bufferpool	Buffer Pool

For snapshot monitoring, this counter can be reset.

Table 1505. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected
Tablespaces	event_tablespace	Always collected

## Usage

You can use this element with the **pool\_index\_p\_reads** monitor element to calculate the number of physical reads that were performed synchronously (that is, physical index page reads that were performed by database manager agents). Use the following formula to calculate the number of synchronous index reads:

```
# of sync index reads = pool_index_p_reads + pool_temp_index_p_reads - pool_async_index_reads
```

By comparing the ratio of asynchronous reads to total physical reads, you can gain insight into how well the prefetchers are working. This element can be helpful when you are tuning the **num\_ioservers** configuration parameter. You can calculate the ratio of asynchronous index reads to total physical index reads by using the following formula:

```
(pool_async_index_reads) / (pool_index_p_reads + pool_temp_index_p_reads)
```

## pool\_async\_index\_writes - Buffer pool asynchronous index writes monitor element

The number of times a buffer pool index page was physically written to disk by either an asynchronous page cleaner, or a prefetcher. A prefetcher may have written dirty pages to disk to make space for the pages being prefetched.

Table 1506. Table Function Monitoring Information

Table Function	Monitor Element Collection Command and Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

Table 1507. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Buffer Pool
Table Space	tablespace	Buffer Pool
Buffer Pool	bufferpool	Buffer Pool

For snapshot monitoring, this counter can be reset.

Table 1508. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected
Tablespaces	event_tablespace	Always collected

## Usage

You can use this element with the **pool\_index\_writes** monitor element to calculate the number of physical index write requests that were performed synchronously (that is, physical index page writes that were performed by database manager agents). Use the following formula:

```
pool_index_writes - pool_async_index_writes
```

By comparing the ratio of asynchronous to synchronous writes, you can gain insight into how well the buffer pool page cleaners are performing. This ratio can be helpful when you are tuning the **num\_iocleaners** configuration parameter.

## pool\_async\_read\_time - Buffer Pool Asynchronous Read Time

Indicates the total amount of time spent reading in data and index pages from the table space containers (physical) by asynchronous engine dispatchable units (EDUs) for all types of table spaces. This value is given in milliseconds.

Table 1509. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

Table 1510. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Buffer Pool
Table Space	tablespace	Buffer Pool
Buffer Pool	bufferpool	Buffer Pool

For snapshot monitoring, this counter can be reset.

Table 1511. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected
Tablespaces	event_tablespace	Always collected

## Usage

You can use this element to calculate the elapsed time for synchronous reading, using the following formula:

```
pool_read_time - pool_async_read_time
```

You can also use this element to calculate the average asynchronous read time using the following formula:

```
pool_async_read_time / pool_async_data_reads
```

These calculations can be used to understand the I/O work being performed.

## pool\_async\_write\_time - Buffer pool asynchronous write time monitor element

Cumulative elapsed time for each asynchronous write to complete. This value is reported in milliseconds.

*Table 1512. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

*Table 1513. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Buffer Pool
Table Space	tablespace	Buffer Pool
Buffer Pool	bufferpool	Buffer Pool

For snapshot monitoring, this counter can be reset.

*Table 1514. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected
Tablespaces	event_tablespace	Always collected

## Usage

To calculate the elapsed time spent writing pages synchronously, use the following formula:

```
pool_write_time - pool_async_write_time
```

You can also use this element to calculate the average asynchronous write time using the following formula:

```
pool_async_write_time
/ (pool_async_data_writes
+ pool_async_index_writes)
```

These calculations can be used to understand the I/O work being performed.

### **pool\_async\_xda\_gbp\_indep\_pages\_found\_in\_lbp - Group buffer pool independent XML storage object(XDA) pages found by asynchronous EDUs in a local buffer pool monitor element monitor element**

The number of group buffer pool (GBP) independent XML storage object (XDA) pages found in a local buffer pool by asynchronous EDUs.

*Table 1515. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

### **pool\_async\_xda\_gbp\_invalid\_pages - Asynchronous group buffer pool invalid XDA data pages monitor element**

The number of times a request for a data page for an XML storage object (XDA) was made from the group buffer pool by a prefetcher due to the page being marked invalid in the local buffer pool. Outside of a Db2 pureScale environment, this value is null.

*Table 1516. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

### **Usage**

The prefetcher (or asynchronous) XDA page hit ratios can be computed as follows:

```
GBP = ( pool_async_xda_gbp_l_reads - pool_async_xda_gbp_p_reads )
/ pool_async_xda_gbp_l_reads
```

Buffer pool hit rates are important factors in the overall performance of the Db2 pureScale instance. Using the previously mentioned formula can help you determine whether the group buffer pool may be a limiting factor on your database's throughput.

## pool\_async\_xda\_gbp\_l\_reads - Group buffer pool XDA data asynchronous logical read requests monitor element

The number of times a GBP dependent data page for an XML storage object (XDA) was attempted to be read from the group buffer pool by a prefetcher because the page was either invalid or not present in the local buffer pool. Outside of a Db2 pureScale environment, this value is null.

Table 1517. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

### Usage

The prefetcher (or asynchronous) XDA page hit ratios can be computed as follows:

```
GBP = ( pool_async_xda_gbp_l_reads - pool_async_xda_gbp_p_reads )  
      / pool_async_xda_gbp_l_reads
```

Buffer pool hit rates are important factors in the overall performance of the Db2 pureScale instance. Using the previously mentioned formula can help you determine whether the group buffer pool may be a limiting factor on your database's throughput.

## pool\_async\_xda\_gbp\_p\_reads - Group buffer pool XDA data asynchronous physical read requests monitor element

The number of times a GBP dependent data page for an XML storage object (XDA) was read into the local buffer pool by a prefetcher from disk because it was not found in the GBP. Outside of a Db2 pureScale environment, this value is null.

Table 1518. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

### Usage

The prefetcher (or asynchronous) XDA page hit ratios can be computed as follows:

```
GBP = ( pool_async_xda_gbp_l_reads - pool_async_xda_gbp_p_reads )  
      / pool_async_xda_gbp_l_reads
```

Buffer pool hit rates are important factors in the overall performance of the Db2 pureScale instance. Using the previously mentioned formula can help you determine whether the group buffer pool may be a limiting factor on your database's throughput.

## pool\_async\_xda\_lbp\_pages\_found - Asynchronous local buffer pool XDA data pages found monitor element

The number of times a data page for an XML storage object (XDA) was requested by a prefetcher from and found in the local buffer pool.

Table 1519. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

### Usage

The prefetcher (or asynchronous) XDA page hit ratios can be computed as follows:

$$\text{GBP} = \left( \frac{\text{pool\_async\_xda\_gbp\_l\_reads} - \text{pool\_async\_xda\_gbp\_p\_reads}}{\text{pool\_async\_xda\_gbp\_l\_reads}} \right)$$

Buffer pool hit rates are important factors in the overall performance of the Db2 pureScale instance. Using the previously mentioned formula can help you determine whether the group buffer pool may be a limiting factor on your database's throughput.

## pool\_async\_xda\_read\_reqs - Buffer pool asynchronous XDA read requests monitor element

The number of asynchronous read requests for XML storage object (XDA) data.

Table 1520. Table Function Monitoring Information

Table Function	Monitor Element Collection Command and Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

Table 1521. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Buffer Pool
Table Space	tablespace	Buffer Pool
Buffer Pool	bufferpool	Buffer Pool

For snapshot monitoring, this counter can be reset.

Table 1522. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected
Tablespaces	event_tablespace	Always collected

### Usage

To calculate the average number of XML storage object data pages read per asynchronous request, use the following formula:

$$\text{pool\_async\_xda\_reads} / \text{pool\_async\_xda\_read\_reqs}$$

This average can help you determine the amount of asynchronous I/O done in each interaction with the prefetcher.

## pool\_async\_xda\_reads - Buffer pool asynchronous XDA data reads monitor element

Indicates the number of XML storage object (XDA) data pages which have been asynchronously read by prefetchers from the table space containers (physical) for all types of table spaces.

Table 1523. Table Function Monitoring Information

Table Function	Monitor Element Collection Command and Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

Table 1524. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Buffer Pool
Table Space	tablespace	Buffer Pool
Buffer Pool	bufferpool	Buffer Pool

For snapshot monitoring, this counter can be reset.

Table 1525. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected
Tablespaces	event_tablespace	Always collected

## Usage

Use the **pool\_async\_xda\_reads** and **pool\_xda\_p\_reads** monitor elements to calculate the number of physical reads that were performed synchronously on XML storage object data pages (that is, physical data page reads that were performed by database manager agents on XML data). Use the following formula:

```
pool_xda_p_reads + pool_temp_xda_p_reads - pool_async_xda_reads
```

By comparing the ratio of asynchronous to synchronous reads, you can gain insight into how well the prefetchers are working. This element can be helpful when you are tuning the **num\_ioservers** configuration parameter.

## pool\_async\_xda\_writes - Buffer pool asynchronous XDA data writes monitor element

The number of times a buffer pool data page for an XML storage object (XDA) was physically written to disk by either an asynchronous page cleaner, or a prefetcher. A prefetcher may have written dirty pages to disk to make space for the pages being prefetched.

Table 1526. Table Function Monitoring Information

Table Function	Monitor Element Collection Command and Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

Table 1527. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Buffer Pool
Table Space	tablespace	Buffer Pool
Buffer Pool	bufferpool	Buffer Pool

For snapshot monitoring, this counter can be reset.

Table 1528. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected

Table 1528. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Tablespaces	event_tablespace	Always collected

### Usage

You can use this element with the **pool\_xda\_writes** monitor element to calculate the number of physical write requests that were performed synchronously on XML storage object data pages (that is, physical data page writes that were performed by database manager agents on XML data). Use the following formula:

```
pool_xda_writes - pool_async_xda_writes
```

By comparing the ratio of asynchronous to synchronous writes, you can gain insight into how well the buffer pool page cleaners are performing. This ratio can be helpful when you are tuning the **num\_iocleaners** configuration parameter.

### pool\_col\_gbp\_indep\_pages\_found\_in\_lbp - Buffer pool column-organized GBP independent pages found in local buffer pool monitor element

The number of group buffer pool (GBP) independent column-organized pages found in a local buffer pool (LBP) by an agent.

Table 1529. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	ACTIVITY METRICS BASE
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE

## Usage

To determine how often a requested column-organized page was found in the local buffer pool, use the following formula:

$$(pool\_col\_lbp\_pages\_found - pool\_async\_col\_lbp\_pages\_found) / pool\_col\_l\_reads$$

To determine how many times a requested page was found in the group bufferpool, use the following formula

$$(pool\_col\_gbp\_l\_reads - pool\_col\_gbp\_p\_reads) / pool\_col\_gbp\_l\_reads$$

Local buffer pool and group buffer pool hit rates are both important factors in the overall performance of the cluster caching facility. Using these formulas can help you determine whether the local or group buffer pool may be a limiting factor on your database's throughput.

## pool\_col\_gbp\_p\_reads - Buffer pool column-organized GBP physical reads monitor element

Indicates the number of column-organized pages read in from the table space containers (physical) for regular and large table spaces.

Table 1535. Table function monitoring information

Table function	Monitor element collection level

## Usage

This count includes accesses to data that is:

- Already in the buffer pool when the database manager needs to process the page.
- Read into the buffer pool before the database manager can process the page.

Column-organized monitor elements can help you understand what portion of the I/O is being driven by access to column-organized tables when a workload includes a mixture of both row-organized and column-organized tables.

To determine how often a requested page was found in the local buffer pool, use the following formula:

$$(pool\_col\_lbp\_pages\_found - pool\_async\_col\_lbp\_pages\_found) / pool\_col\_l\_reads$$

Increasing buffer pool size will generally improve the hit ratio, but you will reach a point of diminishing return. Ideally, if you could allocate a buffer pool large enough to store your entire database, then once the system is up and running you would get a hit ratio of 100%. However, this is unrealistic in most cases. The significance of the hit ratio really depends on the size of your data, and the way it is accessed. A very large database where data is accessed evenly would have a poor hit ratio. There is little you can do with very large tables.

To improve hit ratios for smaller, frequently accessed tables and indexes, assign them to individual buffer pools.

### **pool\_col\_lbp\_pages\_found - Buffer pool column-organized LBP pages found monitor element**

Indicates the number of column-organized pages which have been synchronously read by agents and asynchronously read by prefetchers from the local buffer pool (logical) for regular and large table spaces.

*Table 1539. Table function monitoring information*

WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 1544. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

If a buffer pool data page is written to disk for a high percentage of the value of the **pool\_col\_p\_reads** monitor element, you may be able to improve performance by increasing the number of buffer pool pages available for the database.

A buffer pool data page is written to disk for the following reasons:

- To free a page in the buffer pool so another page can be read
- To flush the buffer pool

The system does not always write a page to make room for a new one. If the page has not been updated, it can simply be replaced. This replacement is not counted for this element.

The data page can be written by an asynchronous page-cleaner agent before the buffer pool space is required, as reported by the **pool\_async\_col\_writes** monitor element. These asynchronous page writes are included in the value of this element in addition to synchronous page writes.

When calculating this percentage, disregard the number of physical reads required to initially fill the buffer pool. To determine the number of pages written:

1. Run your application (to load the buffer).
2. Note the value of this element.
3. Run your application again.
4. Subtract the value recorded in step 2 from the new value of this element.

In order to prevent the buffer pool from being deallocated between the runnings of your application, you should do one of the following:

- Activate the database with the **ACTIVATE DATABASE** command.

- Have an idle application connected to the database.

If all applications are updating the database, increasing the size of the buffer pool may not have much impact on performance since most of the buffer pool pages contain updated data, which must be written to disk. However, if the updated pages can be used by other units of work before being written out, the buffer pool can save a write and a read, which will improve your performance.

## pool\_config\_size - Configured Size of Memory Pool

The internally configured size of a memory pool in the database system. The value is in bytes.

Table 1545. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	memory_pool	Basic
Database	memory_pool	Basic
Application	memory_pool	Basic

Table 1546. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_dbmemuse	Always collected
Connection	event_connmemuse	Always collected

### Usage

To track system memory usage, use this value in conjunction with **pool\_cur\_size**, **pool\_id**, and **pool\_watermark**.

To see if a memory pool is nearly full, compare **pool\_config\_size** to **pool\_cur\_size**. For example, assume that the utility heap is too small. You can diagnose this specific problem by taking snapshots at regular intervals, and looking in the utility heap section of the snapshot output. If required, the **pool\_cur\_size** might be allowed to exceed the **pool\_config\_size** to prevent an out of memory failure. If this occurs very infrequently, no further action is likely required. However if **pool\_cur\_size** is consistently close to or larger than **pool\_config\_size**, you might consider increasing the size of the utility heap.

## pool\_cur\_size - Current Size of Memory Pool

The current size of a memory pool. The value is given in bytes.

Table 1547. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	memory_pool	Basic
Database	memory_pool	Basic
Application	memory_pool	Basic

Table 1548. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_dbmemuse	Always collected
Connection	event_connmemuse	Always collected

## Usage

To track system memory usage, use this value in conjunction with *pool\_config\_size*, *pool\_id*, and *pool\_watermark*.

To see if a memory pool is nearly full, compare *pool\_config\_size* to *pool\_cur\_size*. For example, assume that the utility heap is too small. You can diagnose this specific problem by taking snapshots at regular intervals, and looking in the utility heap section of the snapshot output. If the value of *pool\_cur\_size* is consistently close to *pool\_config\_size*, you may want to consider increasing the size of the utility heap.

## **pool\_data\_gbp\_indep\_pages\_found\_in\_lbp - Group buffer pool independent data pages found in local buffer pool monitor element**

The number of group buffer pool (GBP) independent data pages found in a local buffer pool (LBP) by an agent. Outside of a Db2 pureScale environment, this value is null.

Table 1549. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE

Package cache	pkgcache_metrics	ACTIVITY METRICS BASE

## Usage

To determine how often a requested page was found in the local buffer pool, use the following formula:

$$(pool\_data\_lbp\_pages\_found - pool\_async\_data\_lbp\_pages\_found) / pool\_data\_l\_reads$$

To determine how many times a requested page was found in the group bufferpool, use the following formula

$$(pool\_data\_gbp\_l\_reads - pool\_data\_gbp\_p\_reads) / pool\_data\_gbp\_l\_reads$$

Local buffer pool and group buffer pool hit rates are both important factors in the overall performance of the cluster caching facility. Using these formulas can help you determine whether the local or group buffer pool may be a limiting factor on your database's throughput.

## pool\_data\_gbp\_l\_reads - Group buffer pool data logical reads monitor element

The number of times a Group Buffer Pool (GBP) dependent data page was attempted to be read from the group buffer pool because the page was either invalid or not present in the Local Buffer Pool (LBP). Outside of a Db2 pureScale environment, this value is null.

Table 1553. Table Function Monitoring Information

## Usage

This count includes accesses to data that is:

- Already in the buffer pool when the database manager needs to process the page.
- Read into the buffer pool before the database manager can process the page.

You can use the **pool\_data\_l\_reads** and **pool\_data\_p\_reads** monitor elements to calculate the data page hit ratios.

For example, the following formula returns the data page hit ratios in a Db2 environment without the IBM Db2 pureScale Feature:

```
((pool_data_lbp_pages_found
- pool_async_data_lbp_pages_found) / (pool_data_l_reads + pool_temp_data_l_reads))
x 100
```

For more information, see [“Formulas for calculating buffer pool hit ratios”](#) on page 1739.

Increasing buffer pool size will generally improve the hit ratio, but you will reach a point of diminishing return. Ideally, if you could allocate a buffer pool large enough to store your entire database, then once the system is up and running you would get a hit ratio of 100%. However, this is unrealistic in most cases. The significance of the hit ratio really depends on the size of your data, and the way it is accessed. A very large database where data is accessed evenly would have a poor hit ratio. There is little you can do with very large tables.

To improve hit ratios for smaller, frequently accessed tables and indexes, assign them to individual buffer pools.

## pool\_data\_p\_reads - Buffer pool data physical reads monitor element

Indicates the number of data pages which have been synchronously read by agents and asynchronously read by prefetchers from the table space containers (physical) for regular and large table spaces.

Table 1562. Table Function Monitoring Information

## Usage

By comparing the ratio of asynchronous reads to total physical reads, you can gain insight into how well the prefetchers are working. This element can be helpful when you are tuning the **num\_ioservers** configuration parameter. You can calculate the ratio of asynchronous reads to physical reads by using the following formula:

$$\frac{(\text{pool\_async\_data\_reads} + \text{pool\_async\_index\_reads})}{(\text{pool\_data\_p\_reads} + \text{pool\_temp\_data\_p\_reads} + \text{pool\_index\_p\_reads} + \text{pool\_temp\_index\_p\_reads})}$$

## pool\_data\_writes - Buffer pool data writes monitor element

The number of times a buffer pool data page was physically written to disk.

## Usage

If a buffer pool data page is written to disk for a high percentage of the value of the **pool\_data\_p\_reads** monitor element, you may be able to improve performance by increasing the number of buffer pool pages available for the database.

A buffer pool data page is written to disk for the following reasons:

- To free a page in the buffer pool so another page can be read
- To flush the buffer pool

The system does not always write a page to make room for a new one. If the page has not been updated, it can simply be replaced. This replacement is not counted for this element.

The data page can be written by an asynchronous page-cleaner agent before the buffer pool space is required, as reported by the **pool\_async\_data\_writes** monitor element. These asynchronous page writes are included in the value of this element in addition to synchronous page writes.

When calculating this percentage, disregard the number of physical reads required to initially fill the buffer pool. To determine the number of pages written:

1. Run your application (to load the buffer).
2. Note the value of this element.
3. Run your application again.
4. Subtract the value recorded in step 2 from the new value of this element.

In order to prevent the buffer pool from being deallocated between the runnings of your application, you should do one of the following:

- Activate the database with the **ACTIVATE DATABASE** command.
- Have an idle application connected to the database.

If all applications are updating the database, increasing the size of the buffer pool may not have much impact on performance since most of the buffer pool pages contain updated data, which must be written to disk. However, if the updated pages can be used by other units of work before being written out, the buffer pool can save a write and a read, which will improve your performance.

## **pool\_drty\_pg\_steal\_clns - Buffer pool victim page cleaners triggered monitor element**

The number of times a page cleaner was invoked because a synchronous write was needed during the victim buffer replacement for the database.

Table 1568. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE

Table 1569. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Buffer Pool

For snapshot monitoring, this counter can be reset.

Table 1570. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected

## Usage

Using the following formula, you may calculate what percentage of all cleaner invocations are represented by this element:

```

pool_drty_pg_steal_clns
/ (pool_drty_pg_steal_clns
+ pool_drty_pg_thrsh_clns
+ pool_lsn_gap_clns)

```

If this ratio is low, it may indicate that you have defined too many page cleaners. If your **chnpggs\_thrsh** configuration parameter is set too low, you may be writing out pages that you will dirty later. Aggressive cleaning defeats one purpose of the buffer pool, that is to defer writing to the last possible moment.

If this ratio is high, it may indicate that you have not defined enough page cleaners. Not having enough page cleaners increases recovery time after failures.

When the DB2\_USE\_ALTERNATE\_PAGE\_CLEANING registry variable is OFF:

- The **pool\_drty\_pg\_steal\_clns** monitor element is inserted into the monitor stream.
- The **pool\_drty\_pg\_steal\_clns** monitor element counts the number of times a page cleaner was invoked because a synchronous write was needed during the victim buffer replacement for the database.

When the DB2\_USE\_ALTERNATE\_PAGE\_CLEANING registry variable is ON:

- The **pool\_drty\_pg\_steal\_clns** monitor element inserts 0 into the monitor stream.
- There is no explicit triggering of the page cleaners when a synchronous write is needed during victim buffer replacement. To determine whether or not the right number of page cleaners is configured for the database or for specific buffer pools, refer to the **pool\_no\_victim\_buffer** monitor element.

**Note:** Although dirty pages are written out to disk, the pages are not removed from the buffer pool right away, unless the space is needed to read in new pages.

## pool\_drty\_pg\_thrsh\_clns - Buffer pool threshold cleaners triggered monitor element

The number of times a page cleaner was invoked because a buffer pool had reached the dirty page threshold criterion for the database.

Table 1571. Table Function Monitoring Information

Table Function	Monitor Element Collection Command and Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE

Table 1572. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Buffer Pool

For snapshot monitoring, this counter can be reset.

Table 1573. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected

### Usage

The threshold is set by the **chnpggs\_thresh** configuration parameter. It is a percentage applied to the buffer pool size. When the number of dirty pages in the pool exceeds this value, the cleaners are triggered.

If the **chnpggs\_thresh** configuration parameter value is set too low, pages might be written out too early, requiring them to be read back in. If it is set too high, then too many pages may accumulate, requiring users to write out pages synchronously.

When the DB2\_USE\_ALTERNATE\_PAGE\_CLEANING registry variable is OFF:

- The **pool\_drty\_pg\_thrsh\_clns** monitor element is inserted into the monitor stream.
- The **pool\_drty\_pg\_thrsh\_clns** monitor element counts the number of times a page cleaner was invoked because a buffer pool had reached the dirty page threshold criterion for the database.

When the DB2\_USE\_ALTERNATE\_PAGE\_CLEANING registry variable is ON:

- The **pool\_drty\_pg\_thrsh\_clns** monitor element inserts 0 into the monitor stream.
- Page cleaners are always active, attempting to ensure there are sufficient free buffers for victims available instead of waiting to be triggered by the criterion value.

## pool\_failed\_async\_col\_reqs - Failed column-organized prefetch requests monitor element

The number of times an attempt to queue a column-organized prefetch request was made but failed. One possible reason is the prefetch queue is full.

## Usage

This element, along with the other **pool\_failed\_async\_...\_reqs** elements tells you how many prefetch requests could not be added to a prefetch queue. Requests can fail to be added to the prefetch queue if the prefetch queue is too small, or if the prefetcher is running too slowly. When requests cannot be added to a prefetch queue, a database agent typically performs disk IO synchronously, which is less efficient than prefetching. You can use these elements in conjunction with other prefetcher monitor elements to determine how effectively prefetching is done on your system. For example, you can see what the percentage of requests were successfully added to the prefetch queue using a formula like the one that follows:

```

1 -
  (
    POOL_FAILED_ASYNC_DATA_REQS +
    POOL_FAILED_ASYNC_INDEX_REQS +
    POOL_FAILED_ASYNC_XDA_REQS +
    POOL_FAILED_ASYNC_COL_REQS +
    POOL_FAILED_ASYNC_TEMP_DATA_REQS +
    POOL_FAILED_ASYNC_TEMP_INDEX_REQS +
    POOL_FAILED_ASYNC_TEMP_XDA_REQS +
    POOL_FAILED_ASYNC_TEMP_COL_REQS
  )
÷
  (
    (
      POOL_FAILED_ASYNC_DATA_REQS +
      POOL_FAILED_ASYNC_INDEX_REQS +
      POOL_FAILED_ASYNC_XDA_REQS +
      POOL_FAILED_ASYNC_COL_REQS +
      POOL_FAILED_ASYNC_TEMP_DATA_REQS +
      POOL_FAILED_ASYNC_TEMP_INDEX_REQS +
      POOL_FAILED_ASYNC_TEMP_XDA_REQS +
      POOL_FAILED_ASYNC_TEMP_COL_REQS
    )
  +
    (
      POOL_QUEUED_ASYNC_DATA_REQS +
      POOL_QUEUED_ASYNC_INDEX_REQS +
      POOL_QUEUED_ASYNC_XDA_REQS +
      POOL_QUEUED_ASYNC_COL_REQS +
      POOL_QUEUED_ASYNC_TEMP_DATA_REQS +
      POOL_QUEUED_ASYNC_TEMP_INDEX_REQS +
      POOL_QUEUED_ASYNC_TEMP_XDA_REQS +
      POOL_QUEUED_ASYNC_TEMP_COL_REQS
    )
  ) × 100

```

This formula calculates the ratio of successful prefetch requests to the total number of requests made. A failed prefetch request is one that could not be added to the prefetch queue. Requests can fail to be

added to the prefetch queue if there are a large number of requests being created, or if the prefetcher is running too slowly due to poor configuration or poor tuning. If the percentage of successful requests is low, this can indicate a bottleneck in the prefetching mechanism. You might need to configure more prefetchers by modifying the value for the configuration parameter **num\_ioservers**. The condition of prefetch queues being full can also be caused by agents submitting too many small requests; you can use the related monitor elements **pool\_queued\_async\_...\_pages** and **pool\_queued\_async\_...\_reqs** to determine the average prefetch request size.

## **pool\_failed\_async\_index\_reqs - Failed index prefetch requests monitor element**

The number of times an attempt to queue an index prefetch request was made but failed. One possible reason is the prefetch queue is full and a request could not be obtained from the free list.

POOL_QUEUED_ASYNC_TEMP_INDEX_REQS +
POOL_QUEUED_ASYNC_TEMP_XDA_REQS +
POOL_QUEUED_ASYNC_TEMP_COL_REQS
)
) × 100

```

This formula calculates the ratio of successful prefetch requests to the total number of requests made. A failed prefetch request is one that could not be added to the prefetch queue. Requests can fail to be added to the prefetch queue if there are a large number of requests being created, or if the prefetcher is running too slowly due to poor configuration or poor tuning. If the percentage of successful requests is low, this can indicate a bottleneck in the prefetching mechanism. You might need to configure more prefetchers by modifying the value for the configuration parameter **num\_ioservers**. The condition of prefetch queues being full can also be caused by agents submitting too many small requests; you can use the related monitor elements **pool\_queued\_async\_...\_pages** and **pool\_queued\_async\_...\_reqs** to determine the average prefetch request size.

## pool\_failed\_async\_temp\_col\_reqs - Failed column-organized temporary prefetch requests monitor element

The number of times an attempt to queue a column-organized prefetch request for temporary table spaces was made but failed. One possible reason is the prefetch queue is full and a request could not be obtained from the free list.

**Note:** In Db2 version 10.5, this element returns 0 as column-organized temporary tables are not currently supported.

    pool_queued_async_temp_index_reqs +
    pool_queued_async_temp_xda_reqs
  )
) × 100

```

This formula calculates the ratio of successful prefetch requests to the total number of requests made. A failed prefetch request is one that could not be added to the prefetch queue. Requests can fail to be added to the prefetch queue if there are many requests being created, or if the prefetcher is running too slowly due to poor configuration or poor tuning. If the percentage of successful requests is low, this can indicate a bottleneck in the prefetching mechanism. You might need to configure more prefetchers by modifying the value for the **num\_ioservers** configuration parameter. The condition of prefetch queues being full can also be caused by agents submitting too many small requests; you can use the related monitor elements **pool\_queued\_async\_\*\_pages** and **pool\_queued\_async\_\*\_reqs** to determine the average prefetch request size.

## **pool\_failed\_async\_other\_reqs - Failed non-prefetch requests monitor element**

The number of times an attempt to queue a non-prefetch request was made but failed. This element is for non-prefetch work done by prefetchers. One possible reason for the failed request is that the prefetch queue is full.

*Table 1582. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE

Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE

## Usage

This monitor element reports the number of requests for work that is not related to the prefetching dictated by an access plan that could not be added to the prefetch queue. Utilities like the backup utility use the prefetcher mechanism to perform their tasks, but in a way that is different from the way an access plan for an SQL statement does. A request might fail to be added to a prefetch queue because the queue is full.

## pool\_failed\_async\_temp\_data\_reqs - Failed data prefetch requests for temporary table spaces monitor element

The number of times an attempt to queue a data prefetch request for temporary table spaces was made but failed. One possible reason is the prefetch queue is full and a request could not be obtained from the free list.

Table 1584. Table Function Monitoring Information

Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE

## Usage

This element, along with the other **pool\_failed\_async\_...\_reqs** elements tells you how many prefetch requests could not be added to a prefetch queue. Requests can fail to be added to the prefetch queue if the prefetch queue is too small, or if the prefetcher is running too slowly. When requests cannot be added to a prefetch queue, a database agent typically performs disk IO synchronously, which is less efficient than prefetching. You can use these elements in conjunction with other prefetcher monitor elements to determine how effectively prefetching is done on your system. For example, you can see what the percentage of requests were successfully added to the prefetch queue using a formula like the one that follows:

```

1 -
(
  POOL_FAILED_ASYNC_DATA_REQS +
  POOL_FAILED_ASYNC_INDEX_REQS +
  POOL_FAILED_ASYNC_XDA_REQS +
  POOL_FAILED_ASYNC_COL_REQS +
  POOL_FAILED_ASYNC_TEMP_DATA_REQS +
  POOL_FAILED_ASYNC_TEMP_INDEX_REQS +

```

```

POOL_FAILED_ASYNC_TEMP_XDA_REQS +
POOL_FAILED_ASYNC_TEMP_COL_REQS
)
÷
(
(
POOL_FAILED_ASYNC_DATA_REQS +
POOL_FAILED_ASYNC_INDEX_REQS +
POOL_FAILED_ASYNC_XDA_REQS +
POOL_FAILED_ASYNC_COL_REQS +
POOL_FAILED_ASYNC_TEMP_DATA_REQS +
POOL_FAILED_ASYNC_TEMP_INDEX_REQS +
POOL_FAILED_ASYNC_TEMP_XDA_REQS +
POOL_FAILED_ASYNC_TEMP_COL_REQS
)
+
(
POOL_QUEUED_ASYNC_DATA_REQS +
POOL_QUEUED_ASYNC_INDEX_REQS +
POOL_QUEUED_ASYNC_XDA_REQS +
POOL_QUEUED_ASYNC_COL_REQS +
POOL_QUEUED_ASYNC_TEMP_DATA_REQS +
POOL_QUEUED_ASYNC_TEMP_INDEX_REQS +
POOL_QUEUED_ASYNC_TEMP_XDA_REQS +
POOL_QUEUED_ASYNC_TEMP_COL_REQS
)
) × 100

```

This formula calculates the ratio of successful prefetch requests to the total number of requests made. A failed prefetch request is one that could not be added to the prefetch queue. Requests can fail to be added to the prefetch queue if there are a large number of requests being created, or if the prefetcher is running too slowly due to poor configuration or poor tuning. If the percentage of successful requests is low, this can indicate a bottleneck in the prefetching mechanism. You might need to configure more prefetchers by modifying the value for the configuration parameter **num\_ioservers**. The condition of prefetch queues being full can also be caused by agents submitting too many small requests; you can use the related monitor elements **pool\_queued\_async\_...\_pages** and **pool\_queued\_async\_...\_reqs** to determine the average prefetch request size.

### **pool\_failed\_async\_temp\_index\_reqs - Failed index prefetch requests for temporary table spaces monitor element**

The number of times an attempt to queue an index prefetch request for temporary table spaces was made but failed. One possible reason is the prefetch queue is full and a request could not be obtained from the free list.

*Table 1586. Table Function Monitoring Information*

## Usage

This element, along with the other **pool\_failed\_async\_...\_reqs** elements tells you how many prefetch requests could not be added to a prefetch queue. Requests can fail to be added to the prefetch queue if the prefetch queue is too small, or if the prefetcher is running too slowly. When requests cannot be added to a prefetch queue, a database agent typically performs disk IO synchronously, which is less efficient than prefetching. You can use these elements in conjunction with other prefetcher monitor elements to determine how effectively prefetching is done on your system. For example, you can see what the percentage of requests were successfully added to the prefetch queue using a formula like the one that follows:

```

1 -
  (
    POOL_FAILED_ASYNC_DATA_REQS +
    POOL_FAILED_ASYNC_INDEX_REQS +
    POOL_FAILED_ASYNC_XDA_REQS +
    POOL_FAILED_ASYNC_COL_REQS +
    POOL_FAILED_ASYNC_TEMP_DATA_REQS +
    POOL_FAILED_ASYNC_TEMP_INDEX_REQS +
    POOL_FAILED_ASYNC_TEMP_XDA_REQS +
    POOL_FAILED_ASYNC_TEMP_COL_REQS
  )
÷
  (
    (
      POOL_FAILED_ASYNC_DATA_REQS +
      POOL_FAILED_ASYNC_INDEX_REQS +
      POOL_FAILED_ASYNC_XDA_REQS +
      POOL_FAILED_ASYNC_COL_REQS +
      POOL_FAILED_ASYNC_TEMP_DATA_REQS +
      POOL_FAILED_ASYNC_TEMP_INDEX_REQS +
      POOL_FAILED_ASYNC_TEMP_XDA_REQS +
      POOL_FAILED_ASYNC_TEMP_COL_REQS
    )
  +
    (
      POOL_QUEUED_ASYNC_DATA_REQS +
      POOL_QUEUED_ASYNC_INDEX_REQS +
      POOL_QUEUED_ASYNC_XDA_REQS +
      POOL_QUEUED_ASYNC_COL_REQS +
      POOL_QUEUED_ASYNC_TEMP_DATA_REQS +
      POOL_QUEUED_ASYNC_TEMP_INDEX_REQS +
      POOL_QUEUED_ASYNC_TEMP_XDA_REQS +
      POOL_QUEUED_ASYNC_TEMP_COL_REQS
    )
  ) × 100

```

This formula calculates the ratio of successful prefetch requests to the total number of requests made. A failed prefetch request is one that could not be added to the prefetch queue. Requests can fail to be

added to the prefetch queue if there are a large number of requests being created, or if the prefetcher is running too slowly due to poor configuration or poor tuning. If the percentage of successful requests is low, this can indicate a bottleneck in the prefetching mechanism. You might need to configure more prefetchers by modifying the value for the configuration parameter **num\_ioservers**. The condition of prefetch queues being full can also be caused by agents submitting too many small requests; you can use the related monitor elements **pool\_queued\_async\_...\_pages** and **pool\_queued\_async\_...\_reqs** to determine the average prefetch request size.

### **pool\_failed\_async\_temp\_xda\_reqs - Failed XDA prefetch requests for temporary table spaces monitor element**

The number of times an attempt to queue a XML storage object (XDA) data prefetch request for temporary table spaces was made but failed. One possible reason is the prefetch queue is full and a request could not be obtained from the free list.

*Table 1588. Table Function Monitoring Information*

## Usage

This element, along with the other **pool\_failed\_async\_...\_reqs** elements tells you how many prefetch requests could not be added to a prefetch queue. Requests can fail to be added to the prefetch queue if the prefetch queue is too small, or if the prefetcher is running too slowly. When requests cannot be added to a prefetch queue, a database agent typically performs disk IO synchronously, which is less efficient than prefetching. You can use these elements in conjunction with other prefetcher monitor elements to determine how effectively prefetching is done on your system. For example, you can see what the percentage of requests were successfully added to the prefetch queue using a formula like the one that follows:

```

1 -
(
  POOL_FAILED_ASYNC_DATA_REQS +
  POOL_FAILED_ASYNC_INDEX_REQS +
  POOL_FAILED_ASYNC_XDA_REQS +
  POOL_FAILED_ASYNC_COL_REQS +
  POOL_FAILED_ASYNC_TEMP_DATA_REQS +
  POOL_FAILED_ASYNC_TEMP_INDEX_REQS +
  POOL_FAILED_ASYNC_TEMP_XDA_REQS +
  POOL_FAILED_ASYNC_TEMP_COL_REQS
)
÷
(
  (
    POOL_FAILED_ASYNC_DATA_REQS +
    POOL_FAILED_ASYNC_INDEX_REQS +
    POOL_FAILED_ASYNC_XDA_REQS +
    POOL_FAILED_ASYNC_COL_REQS +
    POOL_FAILED_ASYNC_TEMP_DATA_REQS +
    POOL_FAILED_ASYNC_TEMP_INDEX_REQS +
    POOL_FAILED_ASYNC_TEMP_XDA_REQS +
    POOL_FAILED_ASYNC_TEMP_COL_REQS
  )
  +
  (
    POOL_QUEUED_ASYNC_DATA_REQS +
    POOL_QUEUED_ASYNC_INDEX_REQS +
    POOL_QUEUED_ASYNC_XDA_REQS +
    POOL_QUEUED_ASYNC_COL_REQS +
    POOL_QUEUED_ASYNC_TEMP_DATA_REQS +
    POOL_QUEUED_ASYNC_TEMP_INDEX_REQS +
    POOL_QUEUED_ASYNC_TEMP_XDA_REQS +
    POOL_QUEUED_ASYNC_TEMP_COL_REQS
  )
)

```

$$\frac{\text{successful\_prefetch\_requests}}{\text{total\_requests}} \times 100$$

This formula calculates the ratio of successful prefetch requests to the total number of requests made. A failed prefetch request is one that could not be added to the prefetch queue. Requests can fail to be added to the prefetch queue if there are a large number of requests being created, or if the prefetcher is running too slowly due to poor configuration or poor tuning. If the percentage of successful requests is low, this can indicate a bottleneck in the prefetching mechanism. You might need to configure more prefetchers by modifying the value for the configuration parameter **num\_ioservers**. The condition of prefetch queues being full can also be caused by agents submitting too many small requests; you can use the related monitor elements **pool\_queued\_async\_...\_pages** and **pool\_queued\_async\_...\_reqs** to determine the average prefetch request size.

## pool\_id - Memory Pool Identifier

The type of memory pool.

Table 1592. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	memory_pool	Basic
Database	memory_pool	Basic
Application	memory_pool	Basic

Table 1593. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_dbmemuse	-
Connection	event_connmemuse	-

## Usage

To track system memory usage, use this value in conjunction with **pool\_config\_size**, **pool\_cur\_size**, and **pool\_watermark**.

Use **pool\_id** to identify the memory pools discussed in the system monitor output. The various memory pool identifiers can be found in `sqlmon.h`. Under normal operating conditions, one or more of each of the following pools can be expected.

API Constant	Description
SQLM_HEAP_APPLICATION	Application Heap
SQLM_HEAP_DATABASE	Database Heap
SQLM_HEAP_LOCK_MGR	Lock Manager Heap
SQLM_HEAP_UTILITY	Backup/Restore/Utility Heap
SQLM_HEAP_STATISTICS	Statistics Heap
SQLM_HEAP_PACKAGE_CACHE	Package Cache Heap
SQLM_HEAP_CAT_CACHE	Catalog Cache Heap
SQLM_HEAP_MONITOR	Database Monitor Heap
SQLM_HEAP_STATEMENT	Statement Heap
SQLM_HEAP_FCMBP	FCMBP Heap

API Constant	Description
SQLM_HEAP_IMPORT_POOL	Import Pool
SQLM_HEAP_OTHER	Other Memory
SQLM_HEAP_BP	Buffer Pool Heap
SQLM_HEAP_APPL_SHARED	Applications Shared Heap
SQLM_HEAP_SHARED_SORT	Sort Shared Heap

### **pool\_index\_gbp\_indep\_pages \_found\_in\_lbp - Group buffer pool independent index pages found in local buffer pool monitor element**

The number of group buffer pool (GBP) independent index pages found in a local buffer pool (LBP) by an agent. Outside of a Db2 pureScale environment, this value is null.

*Table 1594. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level

Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	uow_metrics-	REQUEST METRICS BASE
Package cache	pkgcache_metrics	ACTIVITY METRICS BASE

## Usage

To determine how often a requested index page was found in the local buffer pool, use the following formula:

$$(POOL\_INDEX\_LBP\_PAGES\_FOUND - POOL\_ASYNC\_INDEX\_LBP\_PAGES\_FOUND) / POOL\_INDEX\_L\_READS$$

To determine how many times a requested index page was found in the group bufferpool, use the following formula

$$(POOL\_INDEX\_GBP\_L\_READS - POOL\_INDEX\_GBP\_P\_READS) / POOL\_INDEX\_GBP\_L\_READS$$

Local buffer pool and group buffer pool hit rates are both important factors in the overall performance of the cluster caching facility. Using these formulas can help you determine whether the local or group buffer pool may be a limiting factor on your database's throughput.

## pool\_index\_gbp\_l\_reads - Group buffer pool index logical reads monitor element

The number of times a Group Buffer Pool (GBP) dependent index page was attempted to be read from the group buffer pool because the page was either invalid or not present in the local buffer pool. Outside of a Db2 pureScale environment, this value is null.

Table 1598. Table Function Monitoring Information

Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

This count includes accesses to index pages that are:

- Already in the buffer pool when the database manager needs to process the page
- Read into the buffer pool before the database manager can process the page.

In conjunction with **pool\_index\_p\_reads** and **pool\_async\_index\_reads**, you can use **pool\_index\_l\_reads** to calculate the index page hit ratio for the buffer pool.

For example, the following formula returns the index page hit ratios in a Db2 environment without the IBM Db2 pureScale Feature

```
((pool_index_lbp_pages_found
- pool_async_index_lbp_pages_found )
/ (pool_index_l_reads
+ pool_temp_index_l_reads)) × 100
```

For more information, see “[Formulas for calculating buffer pool hit ratios](#)” on page 1739.

If the hit ratio is low, increasing the number of buffer pool pages may improve performance.

## **pool\_index\_p\_reads - Buffer pool index physical reads monitor element**

Indicates the number of index pages which have been synchronously read by agents and asynchronously read by prefetchers from the table space containers (physical) for regular and large table spaces.

## Usage

In conjunction with the **pool\_index\_l\_reads** and **pool\_async\_index\_reads**, you can use **pool\_index\_p\_reads** to calculate the index page hit ratio for the buffer pool.

For example, the following formula returns the index page hit ratios in a Db2 environment without the IBM Db2 pureScale Feature

```
((pool_index_lbp_pages_found
- pool_async_index_lbp_pages_found )
/ (pool_index_l_reads
+ pool_temp_index_l_reads)) × 100
```

For more information, see [“Formulas for calculating buffer pool hit ratios”](#) on page 1739.

## pool\_index\_writes - Buffer pool index writes monitor element

Indicates the number of times a buffer pool index page was physically written to disk.

## Usage

Like a data page, a buffer pool index page is written to disk for the following reasons:

- To free a page in the buffer pool so another page can be read
- To flush the buffer pool

The system does not always write a page to make room for a new one. If the page has not been updated, it can simply be replaced. This replacement is not counted for this element.

The index page can be written by an asynchronous page-cleaner agent before the buffer pool space is required. These asynchronous index page writes are included in the value of this element in addition to synchronous index page writes (see the **pool\_async\_index\_writes** monitor element).

If a buffer pool index page is written to disk for a high percentage of the value of the **pool\_index\_p\_reads** monitor element, you may be able to improve performance by increasing the number of buffer pool pages available for the database.

When calculating this percentage, disregard the number of physical reads required to initially fill the buffer pool. To determine the number of pages written:

1. Run your application (to load the buffer).
2. Note the value of this element.
3. Run your application again.
4. Subtract the value recorded in step 2 from the new value of this element.

In order to prevent the buffer pool from being deallocated between the runnings of your application, you should do one of the following:

- Activate the database with the **ACTIVATE DATABASE** command.
- Have an idle application connected to the database.

If all applications are updating the database, increasing the size of the buffer pool may not have much impact on performance, since most of the pages contain updated data which must be written to disk.

## pool\_lsn\_gap\_clns - Buffer pool log space cleaners triggered monitor element

The number of times a page cleaner was invoked because the logging space used had reached a predefined criterion for the database.

Table 1613. Table Function Monitoring Information

Table Function	Monitor Element Collection Command and Level

Database	event_db	Always collected

### Usage

This element can be used to help evaluate whether you have enough space for logging, and whether you need more log files or larger log files.

The page cleaning criterion is determined by the setting for the **page\_age\_trgt\_mcr** configuration parameter. Page cleaners are triggered when the oldest page in the buffer pool exceeds the configured time for the **page\_age\_trgt\_mcr** configuration parameter.

When the DB2\_USE\_ALTERNATE\_PAGE\_CLEANING registry variable is OFF:

- The **pool\_lsn\_gap\_clns** monitor element is inserted into the monitor stream.
- Page cleaners are triggered if the oldest page in the buffer pool contains an update described by a log record that is older than the current log position by the criterion value.

When the DB2\_USE\_ALTERNATE\_PAGE\_CLEANING registry variable is ON:

- The **pool\_lsn\_gap\_clns** monitor element inserts 0 into the monitor stream.
- Page cleaners write pages proactively instead of waiting to be triggered by the criterion value.

## pool\_no\_victim\_buffer - Buffer pool no victim buffers monitor element

Number of times an agent did not have a preselected victim buffer available.

Table 1616. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE

Table 1616. Table Function Monitoring Information (continued)

Tablespace	tablespace	Buffer Pool
Buffer Pool	bufferpool	Buffer Pool

For snapshot monitoring, this counter can be reset.

Table 1618. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected
Tablespace	event_tablespace	Always collected

### Usage

This element can be used to help evaluate whether you have enough page cleaners for a given buffer pool when using proactive page cleaning.

When the DB2\_USE\_ALTERNATE\_PAGE\_CLEANING registry variable is ON, the pool\_no\_victim\_buffer element counts the number of times that an agent did not find a preselected victim buffer available for immediate use, and was forced to search the buffer pool for a suitable victim buffer.

If the value of pool\_no\_victim\_buffer element is high relative to the number of logical reads in the buffer pool, the database system is having difficulty ensuring that sufficient numbers of good victims are available for use. Increasing the number of page cleaners will increase the ability of the database system to provide preselected victim buffers.

When the DB2\_USE\_ALTERNATE\_PAGE\_CLEANING registry variable is OFF, the pool\_no\_victim\_buffer element has no predictive value, and can be safely ignored. In this configuration, the database system does not attempt to ensure that agents have preselected victim buffers available to them, so most accesses to the buffer pool will require that the agent search the buffer pool to find a victim buffer.

## pool\_queued\_async\_col\_pages - Column-organized page prefetch requests monitor element

The number of column-organized pages successfully requested for prefetching.

Table 1619. Table function monitoring information

Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE

## Usage

This monitor element, along with the other **pool\_queued\_async\_...\_pages** elements tells you how many pages of data were retrieved by prefetch requests. You can use this information to determine whether prefetch requests are being performed efficiently on your system. For example, you can calculate the average number of pages per prefetch request using a formula like the one that follows:

$$\frac{(\text{POOL\_QUEUED\_ASYNC\_DATA\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_INDEX\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_XDA\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_COL\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_DATA\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_INDEX\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_XDA\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_COL\_PAGES})}{(\text{POOL\_QUEUED\_ASYNC\_DATA\_REQS} + \text{POOL\_QUEUED\_ASYNC\_INDEX\_REQS} + \text{POOL\_QUEUED\_ASYNC\_XDA\_REQS} + \text{POOL\_QUEUED\_ASYNC\_COL\_REQS} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_DATA\_REQS} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_INDEX\_REQS} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_XDA\_REQS} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_COL\_REQS})}$$

If the average number of pages per request is low, and there is a significant amount of prefetching on the system, then your system might be performing more IO operations than necessary. In general, request size is based on prefetch size, which should be at least as large as extent size. So a small average request size might indicate that prefetch size is set too low, and that increasing prefetch size to a multiple of extent size may improve performance. Also note that a small average request size may

mean that the prefetch queues fill up too quickly, so it is worthwhile to also monitor the associated **pool\_failed\_async\_...\_reqs** monitor element

## **pool\_queued\_async\_data\_reqs - Data prefetch requests monitor element**

The number of data prefetch requests successfully added to the prefetch queue.

*Table 1625. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>

Table 1626. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in details_xml document) event_activitymetrics	ACTIVITY METRICS BASE
Package Cache	pkgcache (reported in the metrics.xml document) pkgcache_metrics	ACTIVITY METRICS BASE
Unit of Work	uow (reported in the metrics.xml document) uow_metrics	REQUEST METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE

## Usage

This element, along with the other **pool\_queued\_async\_\*\_reqs** elements tells you how many prefetch requests have been added to the prefetch queue. You can use this information to see how often the database manager does prefetching. You can use these elements in conjunction with other prefetcher monitor elements to determine how effectively prefetching is done on your system. For example, you can see what the percentage of requests were successfully added to the prefetch queue using a formula like the one that follows:

```

1 -
  (
    POOL_FAILED_ASYNC_DATA_REQS +
    POOL_FAILED_ASYNC_INDEX_REQS +
    POOL_FAILED_ASYNC_XDA_REQS +
    POOL_FAILED_ASYNC_COL_REQS +
    POOL_FAILED_ASYNC_TEMP_DATA_REQS +
    POOL_FAILED_ASYNC_TEMP_INDEX_REQS +
    POOL_FAILED_ASYNC_TEMP_XDA_REQS +
    POOL_FAILED_ASYNC_TEMP_COL_REQS
  )
÷

```

```

(
  (
    POOL_FAILED_ASYNC_DATA_REQS +
    POOL_FAILED_ASYNC_INDEX_REQS +
    POOL_FAILED_ASYNC_XDA_REQS +
    POOL_FAILED_ASYNC_COL_REQS +
    POOL_FAILED_ASYNC_TEMP_DATA_REQS +
    POOL_FAILED_ASYNC_TEMP_INDEX_REQS +
    POOL_FAILED_ASYNC_TEMP_XDA_REQS +
    POOL_FAILED_ASYNC_TEMP_COL_REQS
  )
+
  (
    POOL_QUEUED_ASYNC_DATA_REQS +
    POOL_QUEUED_ASYNC_INDEX_REQS +
    POOL_QUEUED_ASYNC_XDA_REQS +
    POOL_QUEUED_ASYNC_COL_REQS +
    POOL_QUEUED_ASYNC_TEMP_DATA_REQS +
    POOL_QUEUED_ASYNC_TEMP_INDEX_REQS +
    POOL_QUEUED_ASYNC_TEMP_XDA_REQS +
    POOL_QUEUED_ASYNC_TEMP_COL_REQS
  )
) * 100

```

This formula calculates the ratio of failed prefetch requests to the total number of requests made. A failed prefetch request is one that could not be added to the prefetch queue. If the percentage is low, you might need to configure more prefetchers by modifying the **num\_ioservers** configuration parameter.

## pool\_queued\_async\_index\_pages - Index pages prefetch requests monitor element

The number of index pages successfully requested for prefetching.

Table 1627. Table Function Monitoring Information

### Usage

This monitor element, along with the other **pool\_queued\_async\_...\_pages** elements tells you how many pages of data were retrieved by prefetch requests. You can use this information to determine whether prefetch requests are being performed efficiently on your system. For example, you can calculate the average number of pages per prefetch request using a formula like the one that follows:

$$\frac{(\text{POOL\_QUEUED\_ASYNC\_DATA\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_INDEX\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_XDA\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_COL\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_DATA\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_INDEX\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_XDA\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_COL\_PAGES})}{(\text{POOL\_QUEUED\_ASYNC\_DATA\_REQS} + \text{POOL\_QUEUED\_ASYNC\_INDEX\_REQS} + \text{POOL\_QUEUED\_ASYNC\_XDA\_REQS} + \text{POOL\_QUEUED\_ASYNC\_COL\_REQS} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_DATA\_REQS} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_INDEX\_REQS} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_XDA\_REQS} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_COL\_REQS})}$$

If the average number of pages per request is low, and there is a significant amount of prefetching on the system, then your system might be performing more IO operations than necessary. In general, request size is based on prefetch size, which should be at least as large as extent size. So a small average request size might indicate that prefetch size is set too low, and that increasing prefetch size to a multiple of extent size may improve performance. Also note that a small average request size may mean that the prefetch queues fill up too quickly, so it is worthwhile to also monitor the associated **pool\_failed\_async\_...\_reqs** monitor element

### pool\_queued\_async\_index\_reqs - Index prefetch requests monitor element

The number of index prefetch requests successfully added to the prefetch queue.

Table 1629. Table Function Monitoring Information

## Usage

This element, along with the other **pool\_queued\_async\_\*\_reqs** elements tells you how many prefetch requests have been added to the prefetch queue. You can use this information to see how often the database manager does prefetching. You can use these elements in conjunction with other prefetcher monitor elements to determine how effectively prefetching is done on your system. For example, you can see what the percentage of requests were successfully added to the prefetch queue using a formula like the one that follows:

```

1 -
  (
    POOL_FAILED_ASYNC_DATA_REQS +
    POOL_FAILED_ASYNC_INDEX_REQS +
    POOL_FAILED_ASYNC_XDA_REQS +
    POOL_FAILED_ASYNC_COL_REQS +
    POOL_FAILED_ASYNC_TEMP_DATA_REQS +
    POOL_FAILED_ASYNC_TEMP_INDEX_REQS +
    POOL_FAILED_ASYNC_TEMP_XDA_REQS +
    POOL_FAILED_ASYNC_TEMP_COL_REQS )
  ÷
  (
    (
      POOL_FAILED_ASYNC_DATA_REQS +
      POOL_FAILED_ASYNC_INDEX_REQS +
      POOL_FAILED_ASYNC_XDA_REQS +
      POOL_FAILED_ASYNC_COL_REQS +
      POOL_FAILED_ASYNC_TEMP_DATA_REQS +
      POOL_FAILED_ASYNC_TEMP_INDEX_REQS +
      POOL_FAILED_ASYNC_TEMP_XDA_REQS +
      POOL_FAILED_ASYNC_TEMP_COL_REQS )
    +
    (
      POOL_QUEUED_ASYNC_DATA_REQS +
      POOL_QUEUED_ASYNC_INDEX_REQS +
      POOL_QUEUED_ASYNC_XDA_REQS +
      POOL_QUEUED_ASYNC_COL_REQS +
      POOL_QUEUED_ASYNC_TEMP_DATA_REQS +
      POOL_QUEUED_ASYNC_TEMP_INDEX_REQS +
      POOL_QUEUED_ASYNC_TEMP_XDA_REQS +
      POOL_QUEUED_ASYNC_TEMP_COL_REQS )
  ) * 100

```

This formula calculates the ratio of failed prefetch requests to the total number of requests made. A failed prefetch request is one that could not be added to the prefetch queue. If the percentage is low, you might need to configure more prefetchers by modifying the **num\_ioservers** configuration parameter.

## pool\_queued\_async\_other\_reqs - Other requests handled by prefetchers monitor element

The number of requests for non-prefetch work successfully added to the prefetch queue. This is for other work done by prefetchers.

Table 1631. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE

Table 1632. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in details_xml document) event_activitymetrics	ACTIVITY METRICS BASE
Package Cache	pkgcache (reported in the metrics.xml document) pkgcache_metrics	ACTIVITY METRICS BASE
Unit of Work	uow (reported in the metrics.xml document) uow_metrics	REQUEST METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE

### Usage

This monitor element reports the number of requests added to the prefetch queue for IO work that is not related to the prefetching dictated by an access plan. Utilities like the backup utility use the prefetcher mechanism to perform their tasks, but in a way that is different from the way an access plan for an SQL statement does.

### pool\_queued\_async\_temp\_col\_pages - Column-organized page temporary prefetch requests monitor element

The number of column-organized pages for temporary table spaces successfully requested for prefetching.

**Note:** In Db2 version 10.5, this element returns 0 as column-organized temporary tables are not currently supported.

Table 1633. Table function monitoring information

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	ACTIVITY METRICS BASE

Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE

## Usage

This monitor element, along with the other **pool\_queued\_async\_\*\_pages** elements tells you how many pages of data were retrieved by prefetch requests. You can use this information to determine whether prefetch requests are being performed efficiently on your system. For example, you can calculate the average number of pages per prefetch request using a formula like the one that follows:

```
(pool_queued_async_col_pages +
pool_queued_async_data_pages +
pool_queued_async_index_pages +
pool_queued_async_xda_pages +
pool_queued_async_temp_col_pages +
pool_queued_async_temp_data_pages +
pool_queued_async_temp_index_pages +
pool_queued_async_temp_xda_pages)
/
(pool_queued_async_col_reqs +
pool_queued_async_data_reqs +
pool_queued_async_index_reqs +
pool_queued_async_xda_reqs +
pool_queued_async_temp_col_reqs +
pool_queued_async_temp_data_reqs +
pool_queued_async_temp_index_reqs +
pool_queued_async_temp_xda_reqs)
```

If the average number of pages per request is low, and there is a significant amount of prefetching on the system, then your system might be performing more IO operations than necessary. In general, request size is based on prefetch size, which should be at least as large as extent size. So a small average request size might indicate that prefetch size is set too low, and that increasing prefetch size to a multiple of extent size may improve performance. Also note that a small average request size may mean that the prefetch queues fill up too quickly, so it is worthwhile to also monitor the associated **pool\_failed\_async\_\*\_reqs** monitor element.

## pool\_queued\_async\_temp\_col\_reqs - Column-organized temporary prefetch requests monitor element

The number of column-organized prefetch requests for temporary table spaces successfully added to the prefetch queue.

**Note:** In Db2 version 10.5, this element returns 0 as column-organized temporary tables are not currently supported.

Table 1635. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE

Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE

## Usage

This monitor element, along with the other **pool\_queued\_async\_...\_pages** elements tells you how many pages of data were retrieved by prefetch requests. You can use this information to determine whether prefetch requests are being performed efficiently on your system. For example, you can calculate the average number of pages per prefetch request using a formula like the one that follows:

$$\frac{(\text{POOL\_QUEUED\_ASYNC\_DATA\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_INDEX\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_XDA\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_COL\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_DATA\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_INDEX\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_XDA\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_COL\_PAGES})}{(\text{POOL\_QUEUED\_ASYNC\_DATA\_REQS} + \text{POOL\_QUEUED\_ASYNC\_INDEX\_REQS} + \text{POOL\_QUEUED\_ASYNC\_XDA\_REQS} + \text{POOL\_QUEUED\_ASYNC\_COL\_REQS} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_DATA\_REQS} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_INDEX\_REQS} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_XDA\_REQS} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_COL\_REQS})}$$

If the average number of pages per request is low, and there is a significant amount of prefetching on the system, then your system might be performing more IO operations than necessary. In general, request size is based on prefetch size, which should be at least as large as extent size. So a small average request size might indicate that prefetch size is set too low, and that increasing prefetch size to a multiple of extent size may improve performance. Also note that a small average request size may mean that the prefetch queues fill up too quickly, so it is worthwhile to also monitor the associated **pool\_failed\_async\_...\_reqs** monitor element

## pool\_queued\_async\_temp\_data\_reqs - Data prefetch requests for temporary table spaces monitor element

The number of data prefetch requests for temporary table spaces successfully added to the prefetch queue.

Table 1639. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE

MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 1640. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in details_xml document) event_activitymetrics	ACTIVITY METRICS BASE
Package Cache	pkgcache (reported in the metrics.xml document) pkgcache_metrics	ACTIVITY METRICS BASE
Unit of Work	uow (reported in the metrics.xml document) uow_metrics	REQUEST METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE

## Usage

This element, along with the other **pool\_queued\_async\_\*\_reqs** elements tells you how many prefetch requests have been added to the prefetch queue. You can use this information to see how often the database manager does prefetching. You can use these elements in conjunction with other prefetcher monitor elements to determine how effectively prefetching is done on your system. For example, you can see what the percentage of requests were successfully added to the prefetch queue using a formula like the one that follows:

```

1 -
  (
    POOL_FAILED_ASYNC_DATA_REQS +
    POOL_FAILED_ASYNC_INDEX_REQS +
    POOL_FAILED_ASYNC_XDA_REQS +
    POOL_FAILED_ASYNC_COL_REQS +
    POOL_FAILED_ASYNC_TEMP_DATA_REQS +
    POOL_FAILED_ASYNC_TEMP_INDEX_REQS +
    POOL_FAILED_ASYNC_TEMP_XDA_REQS +
    POOL_FAILED_ASYNC_TEMP_COL_REQS
  )
  ÷
  (
    (
      POOL_FAILED_ASYNC_DATA_REQS +
      POOL_FAILED_ASYNC_INDEX_REQS +

```

```

POOL_FAILED_ASYNC_XDA_REQS +
POOL_FAILED_ASYNC_COL_REQS +
POOL_FAILED_ASYNC_TEMP_DATA_REQS +
POOL_FAILED_ASYNC_TEMP_INDEX_REQS +
POOL_FAILED_ASYNC_TEMP_XDA_REQS +
POOL_FAILED_ASYNC_TEMP_COL_REQS )
+
(
POOL_QUEUED_ASYNC_DATA_REQS +
POOL_QUEUED_ASYNC_INDEX_REQS +
POOL_QUEUED_ASYNC_XDA_REQS +
POOL_QUEUED_ASYNC_COL_REQS +
POOL_QUEUED_ASYNC_TEMP_DATA_REQS +
POOL_QUEUED_ASYNC_TEMP_INDEX_REQS +
POOL_QUEUED_ASYNC_TEMP_XDA_REQS +
POOL_QUEUED_ASYNC_TEMP_COL_REQS )
) * 100

```

This formula calculates the ratio of failed prefetch requests to the total number of requests made. A failed prefetch request is one that could not be added to the prefetch queue. If the percentage is low, you might need to configure more prefetchers by modifying the **num\_ioservers** configuration parameter.

## pool\_queued\_async\_temp\_index\_pages - Index pages prefetch requests for temporary table spaces monitor element

The number of index pages for temporary table spaces successfully requested for prefetching.

Table 1641. Table Function Monitoring Information

Table Function	Monitor Element Collection Level

Table 1642. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in details_xml document) event_activitymetrics	ACTIVITY METRICS BASE
Package Cache	pkgcache (reported in the metrics.xml document) pkgcache_metrics	ACTIVITY METRICS BASE
Unit of Work	uow (reported in the metrics.xml document) uow_metrics	REQUEST METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE

## Usage

This monitor element, along with the other **pool\_queued\_async\_...\_pages** elements tells you how many pages of data were retrieved by prefetch requests. You can use this information to determine whether prefetch requests are being performed efficiently on your system. For example, you can calculate the average number of pages per prefetch request using a formula like the one that follows:

$$\frac{(\text{POOL\_QUEUED\_ASYNC\_DATA\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_INDEX\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_XDA\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_COL\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_DATA\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_INDEX\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_XDA\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_COL\_PAGES})}{(\text{POOL\_QUEUED\_ASYNC\_DATA\_REQS} + \text{POOL\_QUEUED\_ASYNC\_INDEX\_REQS} + \text{POOL\_QUEUED\_ASYNC\_XDA\_REQS} + \text{POOL\_QUEUED\_ASYNC\_COL\_REQS} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_DATA\_REQS} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_INDEX\_REQS} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_XDA\_REQS} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_COL\_REQS})}$$

If the average number of pages per request is low, and there is a significant amount of prefetching on the system, then your system might be performing more IO operations than necessary. In general, request size is based on prefetch size, which should be at least as large as extent size. So a small average request size might indicate that prefetch size is set too low, and that increasing prefetch size to a multiple of extent size may improve performance. Also note that a small average request size may mean that the prefetch queues fill up too quickly, so it is worthwhile to also monitor the associated **pool\_failed\_async\_...\_reqs** monitor element

## pool\_queued\_async\_temp\_index\_reqs - Index prefetch requests for temporary table spaces monitor element

The number of index prefetch requests for temporary table spaces successfully added to the prefetch queue.

Table 1643. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE

## Usage

This element, along with the other **pool\_queued\_async\_\*\_reqs** elements tells you how many prefetch requests have been added to the prefetch queue. You can use this information to see how often the database manager does prefetching. You can use these elements in conjunction with other prefetcher monitor elements to determine how effectively prefetching is done on your system. For example, you can see what the percentage of requests were successfully added to the prefetch queue using a formula like the one that follows:

```

1 -
  (
    POOL_FAILED_ASYNC_DATA_REQS +
    POOL_FAILED_ASYNC_INDEX_REQS +
    POOL_FAILED_ASYNC_XDA_REQS +
    POOL_FAILED_ASYNC_COL_REQS +
    POOL_FAILED_ASYNC_TEMP_DATA_REQS +
    POOL_FAILED_ASYNC_TEMP_INDEX_REQS +
    POOL_FAILED_ASYNC_TEMP_XDA_REQS +
    POOL_FAILED_ASYNC_TEMP_COL_REQS      )
  ÷
  (
    (
      POOL_FAILED_ASYNC_DATA_REQS +
      POOL_FAILED_ASYNC_INDEX_REQS +
      POOL_FAILED_ASYNC_XDA_REQS +
      POOL_FAILED_ASYNC_COL_REQS +
      POOL_FAILED_ASYNC_TEMP_DATA_REQS +
      POOL_FAILED_ASYNC_TEMP_INDEX_REQS +
      POOL_FAILED_ASYNC_TEMP_XDA_REQS +
      POOL_FAILED_ASYNC_TEMP_COL_REQS      )
    +
    (
      POOL_QUEUED_ASYNC_DATA_REQS +
      POOL_QUEUED_ASYNC_INDEX_REQS +
      POOL_QUEUED_ASYNC_XDA_REQS +
      POOL_QUEUED_ASYNC_COL_REQS +
      POOL_QUEUED_ASYNC_TEMP_DATA_REQS +
      POOL_QUEUED_ASYNC_TEMP_INDEX_REQS +
      POOL_QUEUED_ASYNC_TEMP_XDA_REQS +
      POOL_QUEUED_ASYNC_TEMP_COL_REQS      )
  ) * 100

```

This formula calculates the ratio of failed prefetch requests to the total number of requests made. A failed prefetch request is one that could not be added to the prefetch queue. If the percentage is low, you might need to configure more prefetchers by modifying the **num\_ioservers** configuration parameter.

## pool\_queued\_async\_temp\_xda\_pages - XDA data pages prefetch requests for temporary table spaces monitor element

The number of XML storage object (XDA) data pages for temporary table spaces successfully requested for prefetching.

Table 1645. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE

MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE

Table 1645. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 1646. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in details_xml document) event_activitymetrics	ACTIVITY METRICS BASE
Package Cache	pkgcache (reported in the metrics.xml document) pkgcache_metrics	ACTIVITY METRICS BASE
Unit of Work	uow (reported in the metrics.xml document) uow_metrics	REQUEST METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE

## Usage

This monitor element, along with the other **pool\_queued\_async\_...\_pages** elements tells you how many pages of data were retrieved by prefetch requests. You can use this information to determine whether prefetch requests are being performed efficiently on your system. For example, you can calculate the average number of pages per prefetch request using a formula like the one that follows:

$$\frac{(\text{POOL\_QUEUED\_ASYNC\_DATA\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_INDEX\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_XDA\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_COL\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_DATA\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_INDEX\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_XDA\_PAGES} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_COL\_PAGES})}{(\text{POOL\_QUEUED\_ASYNC\_DATA\_REQS} + \text{POOL\_QUEUED\_ASYNC\_INDEX\_REQS} + \text{POOL\_QUEUED\_ASYNC\_XDA\_REQS} + \text{POOL\_QUEUED\_ASYNC\_COL\_REQS} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_DATA\_REQS} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_INDEX\_REQS} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_XDA\_REQS} + \text{POOL\_QUEUED\_ASYNC\_TEMP\_COL\_REQS})}$$

If the average number of pages per request is low, and there is a significant amount of prefetching on the system, then your system might be performing more IO operations than necessary. In general, request size is based on prefetch size, which should be at least as large as extent size. So a small average request size might indicate that prefetch size is set too low, and that increasing prefetch size to a multiple of extent size may improve performance. Also note that a small average request size may mean that the prefetch queues fill up too quickly, so it is worthwhile to also monitor the associated **pool\_failed\_async\_...\_reqs** monitor element

### **pool\_queued\_async\_temp\_xda\_reqs - XDA data prefetch requests for temporary table spaces monitor element**

The number of XML storage object (XDA) data prefetch requests for temporary table spaces successfully added to the prefetch queue.

*Table 1647. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE

WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 1648. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in details_xml document) event_activitymetrics	ACTIVITY METRICS BASE
Package Cache	pkgcache (reported in the metrics.xml document) pkgcache_metrics	ACTIVITY METRICS BASE
Unit of Work	uow (reported in the metrics.xml document) uow_metrics	REQUEST METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE

## Usage

This element, along with the other **pool\_queued\_async\_\*\_reqs** elements tells you how many prefetch requests have been added to the prefetch queue. You can use this information to see how often the database manager does prefetching. You can use these elements in conjunction with other prefetcher monitor elements to determine how effectively prefetching is done on your system. For example, you can see what the percentage of requests were successfully added to the prefetch queue using a formula like the one that follows:

1 -  
(

```

POOL_FAILED_ASYNC_DATA_REQS +
POOL_FAILED_ASYNC_INDEX_REQS +
POOL_FAILED_ASYNC_XDA_REQS +
POOL_FAILED_ASYNC_COL_REQS +
POOL_FAILED_ASYNC_TEMP_DATA_REQS +
POOL_FAILED_ASYNC_TEMP_INDEX_REQS +
POOL_FAILED_ASYNC_TEMP_XDA_REQS +
POOL_FAILED_ASYNC_TEMP_COL_REQS )
÷
(
(
POOL_FAILED_ASYNC_DATA_REQS +
POOL_FAILED_ASYNC_INDEX_REQS +
POOL_FAILED_ASYNC_XDA_REQS +
POOL_FAILED_ASYNC_COL_REQS +
POOL_FAILED_ASYNC_TEMP_DATA_REQS +
POOL_FAILED_ASYNC_TEMP_INDEX_REQS +
POOL_FAILED_ASYNC_TEMP_XDA_REQS +
POOL_FAILED_ASYNC_TEMP_COL_REQS )
+
(
POOL_QUEUED_ASYNC_DATA_REQS +
POOL_QUEUED_ASYNC_INDEX_REQS +
POOL_QUEUED_ASYNC_XDA_REQS +
POOL_QUEUED_ASYNC_COL_REQS +
POOL_QUEUED_ASYNC_TEMP_DATA_REQS +
POOL_QUEUED_ASYNC_TEMP_INDEX_REQS +
POOL_QUEUED_ASYNC_TEMP_XDA_REQS +
POOL_QUEUED_ASYNC_TEMP_COL_REQS )
) * 100

```

This formula calculates the ratio of failed prefetch requests to the total number of requests made. A failed prefetch request is one that could not be added to the prefetch queue. If the percentage is low, you might need to configure more prefetchers by modifying the **num\_ioservers** configuration parameter.

## pool\_queued\_async\_xda\_pages - XDA pages prefetch requests monitor element

The number of XML storage object (XDA) data pages successfully requested for prefetching.

Table 1649. Table Function Monitoring Information

Table Function	Monitor Element Collection Level

Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE

## Usage

This element, along with the other **pool\_queued\_async\_\*\_reqs** elements tells you how many prefetch requests have been added to the prefetch queue. You can use this information to see how often the database manager does prefetching. You can use these elements in conjunction with other prefetcher monitor elements to determine how effectively prefetching is done on your system. For example, you can see what the percentage of requests were successfully added to the prefetch queue using a formula like the one that follows:

```

1 -
(
  POOL_FAILED_ASYNC_DATA_REQS +
  POOL_FAILED_ASYNC_INDEX_REQS +
  POOL_FAILED_ASYNC_XDA_REQS +
  POOL_FAILED_ASYNC_COL_REQS +
  POOL_FAILED_ASYNC_TEMP_DATA_REQS +
  POOL_FAILED_ASYNC_TEMP_INDEX_REQS +
  POOL_FAILED_ASYNC_TEMP_XDA_REQS +
  POOL_FAILED_ASYNC_TEMP_COL_REQS )
÷
(
  (
    POOL_FAILED_ASYNC_DATA_REQS +
    POOL_FAILED_ASYNC_INDEX_REQS +
    POOL_FAILED_ASYNC_XDA_REQS +
    POOL_FAILED_ASYNC_COL_REQS +
    POOL_FAILED_ASYNC_TEMP_DATA_REQS +
    POOL_FAILED_ASYNC_TEMP_INDEX_REQS +
    POOL_FAILED_ASYNC_TEMP_XDA_REQS +
    POOL_FAILED_ASYNC_TEMP_COL_REQS )
  +
  (
    POOL_QUEUED_ASYNC_DATA_REQS +
    POOL_QUEUED_ASYNC_INDEX_REQS +
    POOL_QUEUED_ASYNC_XDA_REQS +
    POOL_QUEUED_ASYNC_COL_REQS +
    POOL_QUEUED_ASYNC_TEMP_DATA_REQS +
    POOL_QUEUED_ASYNC_TEMP_INDEX_REQS +
    POOL_QUEUED_ASYNC_TEMP_XDA_REQS +
    POOL_QUEUED_ASYNC_TEMP_COL_REQS )
) * 100

```

This formula calculates the ratio of failed prefetch requests to the total number of requests made. A failed prefetch request is one that could not be added to the prefetch queue. If the percentage is low, you might need to configure more prefetchers by modifying the **num\_ioservers** configuration parameter.

## pool\_read\_time - Total buffer pool physical read time monitor element

Indicates the total amount of time spent reading in data and index pages from the table space containers (physical) for all types of table spaces. This value is given in milliseconds.

Table 1653. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE

Table 1655. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Database	event_db	Always collected
Tablespaces	event_tablespace	Always collected
Connection	event_conn	Always collected
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

You can use this element with **pool\_data\_p\_reads**, **pool\_col\_p\_reads**, **pool\_xda\_p\_reads** and **pool\_index\_p\_reads** monitor elements to calculate the average page-read time. This average is important since it may indicate the presence of an I/O wait, which in turn may indicate that you should be moving data to a different device.

At the database and table space levels, this element includes the value of the **pool\_async\_read\_time** monitor element.

When reported by the following interfaces, the **POOL\_READ\_TIME** monitor element includes asynchronous read time (**POOL\_ASYNC\_READ\_TIME**):

- MON\_GET\_DATABASE
- MON\_GET\_DATABASE\_DETAILS
- MON\_GET\_BUFFERPOOL
- MON\_GET\_TABLESPACE
- MON\_GET\_CONTAINER

## pool\_secondary\_id - Memory Pool Secondary Identifier

An additional identifier to help determine the memory pool for which monitor data is returned.

### Element identifier

pool\_secondary\_id

### Element type

Information

*Table 1656. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	memory_pool	Basic
Database	memory_pool	Basic
Application	memory_pool	Basic

*Table 1657. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Database	event_dbmemuse	Always collected
Connection	event_connmemuse	Always collected

## Usage

Use together with **pool\_id** to determine the memory pool for which monitor data is returned. Data for **pool\_secondary\_id** only appears when necessary. For example, it appears when the **pool\_id** indicated is Buffer Pool Heap to determine which buffer pool the monitor data relates to.

When a database is created, it has a default buffer pool, called IBMDEFAULTBP, with a size determined by the platform. This buffer pool has a secondary id of "1". In addition to this buffer pool and any buffer pools that you create, a set of system buffer pools are created by default, each corresponding to a different page size. IDs for these buffer pools can appear in snapshots for **pool\_secondary\_id**:

- System 32k buffer pool
- System 16k buffer pool
- System 8k buffer pool
- System 4k buffer pool

## **pool\_sync\_data\_gbp\_reads - Synchronous group buffer pool data reads monitor element**

On a Db2 pureScale environment, the number of times a data page was expected to be in the bufferpool, but was instead retrieved from the group bufferpool. This value will be 0 for environments outside of a Db2 pureScale environment.

## **pool\_sync\_data\_reads - Synchronous buffer pool data reads monitor element**

The number of times a data page was expected to be in the bufferpool, but was instead read from disk.

## **pool\_sync\_index\_gbp\_reads - Synchronous group buffer pool index reads monitor element**

On a Db2 pureScale environment, the number of times an index page was expected to be in the bufferpool, but was instead retrieved from the group bufferpool. This value will be 0 for environments outside of a Db2 pureScale environment.

## **pool\_sync\_index\_reads - Synchronous buffer pool index reads monitor element**

The number of times an index page was expected to be in the bufferpool, but was instead read from disk.

## **pool\_sync\_xda\_gbp\_reads - Synchronous group buffer pool XDA data reads monitor element**

On a Db2 pureScale environment, the number of times an XML page was expected to be in the bufferpool, but was instead retrieved from the group bufferpool. This value will be 0 for environments outside of a Db2 pureScale environment.

## **pool\_sync\_xda\_reads - Synchronous buffer pool XDA data reads monitor element**

The number of times an XML page was expected to be in the bufferpool, but was instead read from disk.

## **pool\_temp\_col\_l\_reads - Buffer pool column-organized temporary logical reads monitor element**

Indicates the number of column-organized pages which have been requested from the buffer pool (logical) for temporary table spaces.

**Note:** In Db2 version 10.5, this element returns 0 as column-organized temporary tables are not currently supported.

## Usage

In conjunction with the **pool\_temp\_col\_p\_reads** element, you can calculate the data page hit ratio for buffer pools located in temporary table spaces.

For more information, see [“Formulas for calculating buffer pool hit ratios”](#) on page 1739.

Column-organized monitor elements can help you understand what portion of the I/O is being driven by access to column-organized tables when a workload includes a mixture of both row-organized and column-organized tables.

## pool\_temp\_col\_p\_reads - Buffer pool column-organized temporary physical reads monitor element

Indicates the number of column-organized pages read in from the table space containers (physical) for temporary table spaces.

**Note:** In Db2 version 10.5, this element returns 0 as column-organized temporary tables are not currently supported.

Table 1661. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

### Usage

In conjunction with the **pool\_temp\_col\_l\_reads** element, you can calculate the data page hit ratio for buffer pools located in temporary table spaces.

For more information, see [“Formulas for calculating buffer pool hit ratios” on page 1739](#)

### pool\_temp\_data\_l\_reads - Buffer pool temporary data logical reads monitor element

Indicates the number of data pages which have been requested from the buffer pool (logical) for temporary table spaces.

Table 1662. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	Always collected

Database	event_db	Always collected
Tablespaces	event_tablespace	Always collected
Connection	event_conn	Always collected
Statement	event_stmt	Always collected
Activities	event_activity	Buffer Pool, Statement
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

In conjunction with the **pool\_temp\_data\_p\_reads** element, you can calculate the data page hit ratio for buffer pools located in temporary table spaces.

For more information, see [“Formulas for calculating buffer pool hit ratios”](#) on page 1739.

## pool\_temp\_data\_p\_reads - Buffer pool temporary data physical reads monitor element

Indicates the number of data pages read in from the table space containers (physical) for temporary table spaces.

Table 1665. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE

Table 1665. Table Function Monitoring Information (continued)

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Tablespaces	event_tablespace	Always collected
Connection	event_conn	Always collected
Statement	event_stmt	Always collected
Activities	event_activity	Buffer Pool, Statement
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## Usage

The functionality to record buffer pool information at the statement level is supported for API and CLP snapshot requests.

In conjunction with the **pool\_temp\_data\_l\_reads** element, you can calculate the data page hit ratio for buffer pools located in temporary table spaces.

For more information, see [“Formulas for calculating buffer pool hit ratios” on page 1739](#)

## pool\_temp\_index\_l\_reads - Buffer pool temporary index logical reads monitor element

Indicates the number of index pages which have been requested from the buffer pool (logical) for temporary table spaces.

Table 1668. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE

Tablespaces	event_tablespace	Always collected
Connection	event_conn	Always collected
Statement	event_stmt	Always collected
Activities	event_activity	Buffer Pool, Statement
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

You can use the **pool\_temp\_xda\_l\_reads** monitor element in conjunction with **pool\_temp\_xda\_p\_reads**, **pool\_temp\_data\_l\_reads**, and **pool\_temp\_data\_p\_reads** monitor elements to calculate the data page hit ratio for buffer pools located in temporary table spaces by using the following formula:

$$1 - \left( \frac{\text{pool\_temp\_data\_p\_reads} + \text{pool\_temp\_xda\_p\_reads}}{\text{pool\_temp\_data\_l\_reads} + \text{pool\_temp\_xda\_l\_reads}} \right)$$

## pool\_temp\_xda\_p\_reads - Buffer pool temporary XDA data physical reads monitor element

Indicates the number of pages for XML storage object (XDA) data read in from the table space containers (physical) for temporary table spaces.

Table 1677. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE

Table 1677. Table Function Monitoring Information (continued)

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE

Statement	event_stmt	Always collected
Activities	event_activity	Buffer Pool, Statement
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## Usage

You can use the **pool\_temp\_xda\_p\_reads** monitor element in conjunction with **pool\_temp\_xda\_l\_reads**, **pool\_temp\_data\_l\_reads**, and **pool\_temp\_data\_p\_reads** monitor elements to calculate the data page hit ratio for buffer pools located in temporary table spaces by using the following formula:

$$1 - ((\text{pool\_temp\_data\_p\_reads} + \text{pool\_temp\_xda\_p\_reads}) / (\text{pool\_temp\_data\_l\_reads} + \text{pool\_temp\_xda\_l\_reads}))$$

## pool\_watermark - Memory Pool Watermark

The largest size of a memory pool since its creation. The value is given in bytes.

### Element identifier

pool\_watermark

### Element type

Information

Table 1680. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	memory_pool	Basic
Database	memory_pool	Basic
Application	memory_pool	Basic

Table 1681. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_dbmemuse	Always collected
Connection	event_connmemuse	Always collected

### Usage

On continuously running systems, you can use the *pool\_watermark* and *pool\_config\_size* elements together to predict potential memory problems.

For example, take a snapshot at regular intervals (for example, daily), and examine the *pool\_watermark* and *pool\_config\_size* values. If you observe that the value of *pool\_watermark* is becoming increasingly close to *pool\_config\_size* (a premature indication of potential future memory-related problems), this may indicate that you should increase the size of the memory pool.

## pool\_write\_time - Total buffer pool physical write time monitor element

Cumulative elapsed time for each asynchronous write to complete. This value is reported in milliseconds.

Table 1682. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Connection	event_conn	Always collected
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

Use this element with **pool\_data\_writes** and **pool\_index\_writes** monitor elements to calculate the average page-write time. This average is important since it may indicate the presence of an I/O wait, which in turn may indicate that you should be moving data to a different device.

At the database and table space levels, this element includes the value of the **pool\_async\_write\_time** monitor element.

When reported by the following interfaces, the **POOL\_WRITE\_TIME** monitor element includes asynchronous write time (**POOL\_ASYNC\_WRITE\_TIME**):

- MON\_GET\_DATABASE
- MON\_GET\_DATABASE\_DETAILS
- MON\_GET\_BUFFERPOOL

- MON\_GET\_CONTAINER

## **pool\_xda\_gbp\_indep\_pages\_found\_in\_lbp - Group buffer pool XDA independent pages found in local buffer pool monitor element**

The number of group buffer pool (GBP) independent XML storage object (XDA) data pages found in a local buffer pool (LBP) by an agent.

Table 1685. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE

Table 1685. Table Function Monitoring Information (continued)

<b>Table Function</b>	<b>Monitor Element Collection Level</b>

Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

To determine how often a requested XDA page was found in the local buffer pool, use the following formula:

$$(pool\_xda\_lbp\_pages\_found - pool\_async\_xda\_lbp\_pages\_found) / pool\_xda\_l\_reads$$

To determine how many times a requested XDA page was found in the group buffer pool, use the following formula

$$(pool\_xda\_gbp\_l\_reads - pool\_xda\_gbp\_p\_reads) / pool\_xda\_gbp\_l\_reads$$

Local buffer pool and group buffer pool hit rates are both important factors in the overall performance of the cluster caching facility. Using these formulas can help you determine whether the local or group buffer pool may be a limiting factor on your database's throughput.

## pool\_xda\_gbp\_l\_reads - Group buffer pool XDA data logical read requests monitor element

The number of times a GBP dependent data page for an XML storage object (XDA) was attempted to be read from the group buffer pool because the page was either invalid or not present in the local buffer pool. Outside of a Db2 pureScale environment, this value is null.

Table 1689. Table Function Monitoring Information

Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

To determine how often a requested XDA page was found in the local buffer pool, use the following formula:

$$(pool_xda_lbp\_pages\_found - pool\_async\_xda\_lbp\_pages\_found) / pool\_xda\_l\_reads$$

To determine how many times a requested XDA page was found in the group buffer pool, use the following formula

$$(pool\_xda\_gbp\_l\_reads - pool\_xda\_gbp\_p\_reads) / pool\_xda\_gbp\_l\_reads$$

Local buffer pool and group buffer pool hit rates are both important factors in the overall performance of the cluster caching facility. Using these formulas can help you determine whether the local or group buffer pool may be a limiting factor on your database's throughput.

## **pool\_xda\_gbp\_p\_reads - Group buffer pool XDA data physical read requests monitor element**

The number of times a GBP dependent data page for an XML storage object (XDA) was read into the local buffer pool from disk because it was not found in the group buffer pool. Outside of a Db2 pureScale environment, this value is null.

## Usage

To determine how often a requested XDA page was found in the local buffer pool, use the following formula:

$$(pool\_xda\_lbp\_pages\_found - pool\_async\_xda\_lbp\_pages\_found) / pool\_xda\_l\_reads$$

To determine how many times a requested XDA page was found in the group buffer pool, use the following formula

$$(pool\_xda\_gbp\_l\_reads - pool\_xda\_gbp\_p\_reads) / pool\_xda\_gbp\_l\_reads$$

Local buffer pool and group buffer pool hit rates are both important factors in the overall performance of the cluster caching facility. Using these formulas can help you determine whether the local or group buffer pool may be a limiting factor on your database's throughput.

### **pool\_xda\_l\_reads - Buffer pool XDA data logical reads monitor element**

Indicates the number of data pages for XML storage objects (XDAs) which have been synchronously read by agents from the buffer pool (logical) for regular and large table spaces.

*Table 1693. Table Function Monitoring Information*

Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

This count includes accesses to data that is:

- Already in the buffer pool when the database manager needs to process the page
- Read into the buffer pool before the database manager can process the page.

Use the **pool\_xda\_l\_reads**, **pool\_xda\_p\_reads**, **pool\_data\_l\_reads**, and **pool\_data\_p\_reads** monitor elements to calculate the data page hit ratio for the buffer pool. For more information, see [“Formulas for calculating buffer pool hit ratios” on page 1739](#)

For example, the overall buffer pool hit ratio can be calculated as follows:

```

((pool_data_lbp_pages_found
+ pool_index_lbp_pages_found
+ pool_xda_lbp_pages_found
+ pool_col_lbp_pages_found
- pool_async_data_lbp_pages_found
- pool_async_index_lbp_pages_found - pool_async_xda_lbp_pages_found
- pool_async_col_lbp_pages_found)
/ (pool_data_l_reads
+ pool_index_l_reads + pool_xda_l_reads + pool_col_l_reads + pool_temp_data_l_reads
+ pool_temp_xda_l_reads + pool_temp_index_l_reads + pool_temp_col_l_reads))
× 100

```

This calculation takes into account all of the pages (index and data) that are cached by the buffer pool.

Increasing buffer pool size will generally improve the hit ratio, but you will reach a point of diminishing return. Ideally, if you could allocate a buffer pool large enough to store your entire database, then once the system is up and running you would get a hit ratio of 100%. However, this is unrealistic in most cases. The significance of the hit ratio depends on the size of your data, and the way it is accessed. A very large database where data is accessed evenly would have a poor hit ratio. There is little you can do with very large tables. In such case, you would focus your attention on smaller, frequently accessed tables, and on the indexes.

## pool\_xda\_lbp\_pages\_found - Local buffer pool XDA data pages found monitor element

Indicates the number of data pages for an XML storage object (XDA) which have been synchronously read by agents and asynchronously read by prefetchers from the local buffer pool (logical) for regular and large table spaces.

Table 1696. Table Function Monitoring Information

## Usage

To determine how often a requested XDA page was found in the local buffer pool, use the following formula:

$$(pool\_xda\_lbp\_pages\_found - pool\_async\_xda\_lbp\_pages\_found) / pool\_xda\_l\_reads$$

To determine how many times a requested XDA page was found in the group buffer pool, use the following formula

$$(pool\_xda\_gbp\_l\_reads - pool\_xda\_gbp\_p\_reads) / pool\_xda\_gbp\_l\_reads$$

Local buffer pool and group buffer pool hit rates are both important factors in the overall performance of the cluster caching facility. Using these formulas can help you determine whether the local or group buffer pool may be a limiting factor on your database's throughput.

## pool\_xda\_p\_reads - Buffer pool XDA data physical reads monitor element

Indicates the number of data pages for XML storage objects (XDAs) which have been synchronously read by agents and asynchronously read by prefetchers from the table space containers (physical) for regular and large table spaces.

Table 1698. Table Function Monitoring Information

Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

Use the **pool\_async\_xda\_reads** and **pool\_xda\_p\_reads** monitor elements to calculate the number of physical reads that were performed synchronously on XML storage object data pages (that is, physical data page reads that were performed by database manager agents on XML data). Use the following formula:

$$\text{pool\_xda\_p\_reads} + \text{pool\_temp\_xda\_p\_reads} - \text{pool\_async\_xda\_reads}$$

By comparing the ratio of asynchronous to synchronous reads, you can gain insight into how well the prefetchers are working. This element can be helpful when you are tuning the **num\_ioservers** configuration parameter.

Use the **pool\_xda\_l\_reads**, **pool\_xda\_p\_reads**, **pool\_data\_l\_reads**, and **pool\_data\_p\_reads** monitor elements to calculate the data page hit ratio for the buffer pool. For more information, see [“Formulas for calculating buffer pool hit ratios”](#) on page 1739

## pool\_xda\_writes - Buffer pool XDA data writes monitor element

Indicates the number of times a buffer pool data page for an XML storage object (XDA) was physically written to disk.

Table 1701. Table Function Monitoring Information

Table 1703. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Database	event_db	Always collected
Tablespaces	event_tablespace	Always collected
Connection	event_conn	Always collected
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

This monitor element helps you to assess whether performance may be improved by increasing the number of buffer pool pages available for the database. For databases containing XML data, you should consider the ratio of buffer pool page writes to buffer pool page reads both for XML data (using the **pool\_xda\_writes** and the **pool\_xda\_p\_reads** monitor elements) and for relational data types (using the **pool\_data\_writes** and the **pool\_data\_p\_reads** monitor elements).

Use the **pool\_xda\_l\_reads**, **pool\_xda\_p\_reads**, **pool\_data\_l\_reads**, and **pool\_data\_p\_reads** monitor elements to calculate the data page hit ratio for the buffer pool. For more information, see [“Formulas for calculating buffer pool hit ratios” on page 1739](#)

## port\_number - Port number monitor element

The TCP/IP port that a member is listening on for client connections.

*Table 1704. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
DB_MEMBERS table function	Always collected
MON_GET_SERVERLIST table function - get member priority details	Always collected

## post\_shrthreshold\_hash\_joins - Post threshold hash joins

The total number of hash joins that were throttled back by the sort memory throttling algorithm. A throttled hash join is a hash join that was granted less memory than requested by the sort memory manager.

*Table 1705. Table function monitoring information*

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS - Get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	REQUEST METRICS BASE

Table 1706. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	-

For snapshot monitoring, this counter can be reset.

Table 1707. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Database	event_db	Always collected
Package cache	pkgcache_metrics	ACTIVITY METRICS BASE
Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmmetrics	REQUEST METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

A hash join is throttled back when the memory allocation from the shared sort heap is close to the limit set by database configuration parameter *sheapthres\_shr*. This throttling will significantly reduce the number of overflows over *sheapthres\_shr* limit in a system that is not properly configured. The data reported in this element only reflects hash joins using memory allocated from the shared sort heap.

## post\_shrthreshold\_sorts - Post shared threshold sorts monitor element

The total number of sorts that were throttled back by the sort memory throttling algorithm. A throttled sort is a sort that was granted less memory than requested by the sort memory manager.

Table 1708. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE

## Usage

A sort is throttled back when the memory allocation for sorts is close to the limit set by database configuration parameter **sheapthres\_shr**. This throttling will significantly reduce the number of overflows over **sheapthres\_shr** limit in a system that is not properly configured. The data reported in this element only reflects sorts using memory allocated from the shared sort heap.

## post\_threshold\_col\_vector\_consumers - Post-threshold columnar vector memory consumers monitor element

The number of columnar vector memory consumers that requested memory after the sort heap threshold was exceeded.

Table 1711. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY_DETAILS table function - return information about an activity as an XML document	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE

Unit of Work Metrics	uow_metrics	REQUEST METRICS BASE

## Usage

Use the **post\_threshold\_col\_vector\_consumers** monitor element to help configure the amount of sort heap memory that is available to applications.

When most sort memory consumers need more sort memory but have reached the maximum that was allocated for them, the database manager can take one of the following actions:

- It throttles the use of sort memory for the sort memory consumer.
- If the sort memory consumer cannot continue with less memory, the database manager suspends the sort memory consumer operation and writes it to disk to free sort memory.

Columnar vector memory consumers are not written to disk when they request additional memory after reaching the maximum that is available. The database manager can only throttle the amount of memory that is allocated to them. This situation is called a post-threshold operation, and it can negatively affect the performance of the affected application. If the value that the **post\_threshold\_col\_vector\_consumers** element returns is high or increases over time, consider increasing the amount of sort heap memory that is available to applications to help improve performance. You control the amount of sort heap memory by using the **sortheap** configuration parameter.

## post\_threshold\_hash\_grpbys - Hash GROUP BY threshold monitor element

The total number of hashed GROUP BY sort memory requests that were limited because of a concurrent use of the shared or private sort heap space.

Table 1713. Table function monitoring information

#### Usage

If this value is large (greater than 5% of hash\_join\_overflows), the sort heap threshold should be increased.

### post\_threshold\_olap\_funcs - OLAP Function Threshold monitor element

The number of OLAP functions that have requested a sort heap after the sort heap threshold has been exceeded.

Table 1718. Table function monitoring information

## Usage

Sorts, hash joins, and OLAP functions are examples of operations which use a sort heap. Under normal conditions, the database manager will allocate sort heap using the value specified by the `sortheap` configuration parameter. If the amount of memory allocated to sort heaps exceeds the sort heap threshold (`sheapthres` configuration parameter), the database manager will allocate subsequent sort heaps using a value less than that specified by the `sortheap` configuration parameter.

OLAP functions which start after the sort heap threshold has been reached may not receive an optimum amount of memory to execute.

To improve sort, hash join, OLAP function performance, and overall system performance, modify the sort heap threshold and sort heap size configuration parameters.

If this element's value is high, increase the sort heap threshold (`sheapthres`).

## post\_threshold\_peas - Partial early aggregation threshold monitor element

The number of times that partial early aggregation operations received less memory than requested due to sort heap threshold being exceeded.

Table 1721. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE

Transactions	event_xact	-
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

Use this element in conjunction with the **total\_peas** monitor element to determine if partial early aggregation operations are getting sufficient sort heap memory most of the time. If the ratio of the **post\_threshold\_peas** monitor element to the **total\_peas** monitor element is high, your database performance may be sub-optimal. You should consider increasing the sort heap size or the sort heap threshold, or both.

## post\_threshold\_peds - Partial early distincts threshold monitor element

The number of times that partial early distinct operations received less memory than requested due to sort heap threshold being exceeded.

Table 1723. Table Function Monitoring Information

Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

Under normal conditions, the database manager will allocate sort heap using the value specified by the **sortheap** configuration parameter. If the amount of memory allocated to sort heaps exceeds the sort heap threshold (**sheapthres** configuration parameter), the database manager will allocate sort heap using a value less than that specified by the **sortheap** configuration parameter.

Each active sort on the system allocates memory, which may result in sorting taking up too much of the system memory available. Sorts that start after the sort heap threshold has been reached may not receive an optimum amount of memory to execute, but, as a result, the entire system may benefit. By modifying the sort heap threshold and sort heap size configuration parameters, sort operation performance and overall system performance can be improved. If this element's value is high, you can:

- Increase the sort heap threshold (**sheapthres**) or,
- Adjust applications to use fewer or smaller sorts via SQL query changes.

## prefetch\_wait\_time - Time waited for prefetch monitor element

The time an application spent waiting for an I/O server (prefetcher) to finish loading pages into the buffer pool. The value is given in milliseconds.

Table 1728. Table Function Monitoring Information

Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Database	event_db	Bufferpool
Connection	event_db	Bufferpool

#### Usage

This element can be used to experiment with changing the number of I/O servers, and I/O server sizes.

## prefetch\_waits - Prefetcher wait count monitor element

The number of times waited for an I/O server (prefetcher) to finish loading pages into the buffer pool.

Table 1731. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries (reported in DETAILS XML document)	ACTIVITY METRICS BASE

Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE

### prep\_time - Preparation time monitor element

Time in milliseconds required to convert an SQL statement from text form to an executable form (if the activity is an SQL statement; otherwise, the value is 0).

Table 1733. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	Always collected
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	Always collected

Table 1734. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity	Always collected
Package cache	-	Always collected

## Usage

The `prep_time` monitor element indicates how much time was spent converting an SQL statement or XQuery expression from text form to an executable form if this activity was an SQL statement, when the statement was first introduced to the Db2 package cache. This preparation time includes:

- Time the compiler uses to generate the executable form.
- Time to insert this into the Db2 package cache.

This preparation time is not part of the activity lifetime nor does it represent time spent during a specific invocation of the statement if the statement has already been cached in the package cache before that invocation.

Note:

- The `prep_time` relates specifically to compiling and inserting into the Db2 package cache, including dynamic SQL statements in that cache that are not necessarily issued via a PREPARE statement request. If a PREPARE statement is issued by an application, the `prep_time` may be somewhat less than the total time required to process the PREPARE statement on the server (which could include the compilation and insertion as well as other processing overhead or waiting on resources).
- Issuing a PREPARE of a statement that is already in the package cache will typically take less than the `prep_time` to successfully complete the PREPARE request, since the PREPARE will actually skip the compilation and insertion into the cache in such a case.

## **prep\_time\_best - Statement best preparation time monitor element**

The shortest amount of time in milliseconds that was required to prepare a specific SQL statement.

Table 1735. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Dynamic SQL	dynsql	Basic

## Usage

Use this value in conjunction with `prep_time_worst` to identify SQL statements that are expensive to compile.

## **prep\_time\_worst - Statement worst preparation time monitor element**

The longest amount of time in milliseconds that was required to prepare a specific SQL statement.

Table 1736. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Dynamic SQL	dynsql	Basic

## Usage

Use this value in conjunction with `prep_time_best` to identify SQL statements that are expensive to compile.

## prep\_warning - Prepare warning SQLCODE monitor element

An SQLCODE warning value that indicates if the statement was compiled suboptimally

Possible values are as follows:

- 437 - Statement was compiled suboptimally
- 20516 - Access plan for the statement could not be preserved

If any other SQLCODE was returned during compilation, 0 is reported.

Table 1737. Table function monitoring information

Table function	Monitor element collection level
MON_GET_PKG_CACHE_STMT table function - Get package cache statement metrics	Always collected
MON_GET_PKG_CACHE_STMT_DETAILS table function - Get package cache statement metrics as an XML document	Always collected

Table 1738. Event monitoring information

Event type	Logical data grouping	Monitor switch
Package cache	pkgcache	Always collected

## prep\_warning\_reason - Prepare warning SQLCODE reason identifier monitor element

The reason code that explains why a statement was compiled suboptimally.

Table 1739. Table function monitoring information

Table function	Monitor element collection level
MON_GET_PKG_CACHE_STMT table function - Get package cache statement metrics	Always collected
MON_GET_PKG_CACHE_STMT_DETAILS table function - Get package cache statement metrics as an XML document	Always collected

Table 1740. Event monitoring information

Event type	Logical data grouping	Monitor switch
Package cache	pkgcache	Always collected

## prev\_uow\_stop\_time - Previous Unit of Work Completion Timestamp

This is the time the unit of work completed.

Table 1741. Table function monitoring information

Table function	Monitor element collection level
MON_GET_CONNECTION table function - Get connection metrics	Always collected
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics	Always collected

Table 1741. Table function monitoring information (continued)

Table function	Monitor element collection level
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics	Always collected

Table 1742. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl	Unit of Work, Timestamp
DCS Application	dcs_appl	Unit of Work, Timestamp

Table 1743. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Transaction	event_xact	Always collected

### Usage

You may use this element with *uow\_stop\_time* to calculate the total elapsed time between COMMIT/ROLLBACK points, and with *uow\_start\_time* to calculate the time spent in the application between units of work. The time of one of the following actions:

- For applications currently within a unit of work, this is the time that the latest unit of work completed.
- For applications not currently within a unit of work (the application has completed a unit of work, but not yet started a new one), this is the stop time of the last unit of work that completed before the one that just completed. The stop time of the one just completed is indicated *uow\_stop\_time*.
- For applications within their first unit of work, this is the database connection request completion time.

### primary\_instance - Primary instance monitor element

Instance name of the member on the primary that is processing the log stream.

Table 1744. Table function monitoring information

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

### primary\_log\_file - Primary log file monitor element

**Note:** The **hadr\_primary\_log\_file** and **primary\_log\_file** monitor elements are aliases that represent the same information in different monitoring interfaces. **hadr\_primary\_log\_file** is returned by the snapshot monitor interfaces, and **primary\_log\_file** is returned by the MON\_GET\_HADR table function and db2pd interfaces.

The name of the current log file on this log stream on the primary HADR database.

*Table 1745. Table function monitoring information*

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

**Note:** When the log spool is full on the standby database (as indicated by the `standby_spool_percent` monitor element reporting value 100), the `hadr_primary_log_file / primary_log_file` monitor element reported by the standby database is the value at the time of log spool becomes full. It is not being updated while the primary database produces new logs. For a more accurate value, obtain this element from the primary database.

### **primary\_log\_page - Primary log page monitor element**

The page number in the current log file corresponding to the current log position on the primary HADR database. The page number is relative to the log file. For example, page zero is the beginning of the file.

**Note:** The `hadr_primary_log_page` and `primary_log_page` monitor elements are aliases that represent the same information in different monitoring interfaces. `hadr_primary_log_page` is returned by the snapshot monitor interfaces, and `primary_log_page` is returned by the `MON_GET_HADR` table function and `db2pd` interfaces.

*Table 1746. Table function monitoring information*

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

### **primary\_log\_pos - Primary log position monitor element**

**Note:** The `hadr_primary_log_lsn` and `primary_log_pos` monitor elements are aliases that represent the same information in different monitoring interfaces. `hadr_primary_log_lsn` is returned by the snapshot monitor interfaces, and `primary_log_pos` is returned by the `MON_GET_HADR` table function and `db2pd` interfaces.

The current log position on this log stream on the primary HADR database. This is a byte offset.

*Table 1747. Table function monitoring information*

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

### **primary\_log\_time - Primary log time monitor element**

The latest transaction timestamp on this log stream on the primary HADR database.

*Table 1748. Table function monitoring information*

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

## primary\_member - Primary member monitor element

Member ID on the primary that is processing the log stream.

Table 1749. Table function monitoring information

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

## primary\_member\_host - Primary member host monitor element

The value of the **hadr\_local\_host** configuration parameter for the member on the primary that is processing the log stream.

Table 1750. Table function monitoring information

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

## priority - Priority value monitor element

Describes the relative capacity of a member to handle work. The higher the value, the more work a client should drive to that member.

Table 1751. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_SERVERLIST table function - get member priority details	Always collected

## Usage Notes

- This monitor element represents the relative load of a member, also known as the weight. For example, if member A has a priority value of 80 and member B has a priority value of 40, this means that member A should receive double the amount of work that is given to member B.
- This value does not represent a percentage.
- The maximum value of this monitor element is 100.

## priv\_workspace\_num\_overflows - Private Workspace Overflows

The number of times that the private workspaces overflowed the bounds of its allocated memory.

**Note:** This monitor element has been discontinued. Using this monitor element will not generate an error. However, it does not return a valid value.

Table 1752. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic
Application	appl	Basic

For snapshot monitoring, this counter can be reset.

Table 1753. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected
Connection	event_conn	Always collected

#### Usage

Use this element with `priv_workspace_size_top` to determine whether the size of the private workspace needs to be increased to avoid overflowing. Overflows of the private workspace may cause performance degradation as well as out of memory errors from the other heaps allocated out of agent private memory.

At the database level, the element reported will be from the same private workspace as that which was reported as having the same Maximum Private Workspace size. At the application level, it is the number of overflows for the workspace of every agent that have serviced the current application.

### priv\_workspace\_section\_inserts - Private Workspace Section Inserts

Inserts of SQL sections by an application into the private workspace.

**Note:** This monitor element has been discontinued. Using this monitor element will not generate an error. However, it does not return a valid value.

Table 1754. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic
Application	appl	Basic

For snapshot monitoring, this counter can be reset.

Table 1755. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected
Connection	event_conn	Always collected

#### Usage

The working copy of executable sections are stored in the private workspace.

This counter indicates when a copy was not available and had to be inserted. At the database level, it is the cumulative total of all inserts for every application across all private workspaces in the database. At the application level, it is the cumulative total of all inserts for all sections in the private workspace for this application.

In a concentrator environment where agents are being associated with different applications, additional private workspace inserts may be required as a result of a new agent not having the required section available in its private workspace.

### priv\_workspace\_section\_lookups - Private Workspace Section Lookups

Lookups of SQL sections by an application in its agents' private workspace.

**Note:** This monitor element has been discontinued. Using this monitor element will not generate an error. However, it does not return a valid value.

Table 1756. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic
Application	appl	Basic

For snapshot monitoring, this counter can be reset.

Table 1757. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected
Connection	event_conn	Always collected

### Usage

Each application has access to the private workspace of the agent working for it.

This counter indicates how many times the private workspace was accessed in order to locate a specific section for an application. At the database level, it is the cumulative total of all lookups for every application across all private workspaces in the database. At the application level, it is the cumulative total of all lookups for all sections in the private workspace for this application.

You can use this element in conjunction with Private Workspace Section Inserts to tune the size of the private workspace. The size of the private workspace is controlled by the `applheapsz` configuration parameter.

## priv\_workspace\_size\_top - Maximum Private Workspace Size

The largest size reached by the Private Workspace.

**Note:** This monitor element has been discontinued. Using this monitor element will not generate an error. However, it does not return a valid value.

Table 1758. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic
Application	appl	Basic

Table 1759. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected
Connection	event_conn	Always collected

### Usage

Each agent has a private workspace that the application it is servicing has access to. This element indicates the maximum number of bytes required from a private workspace by any agent servicing it. At the database level, it is the maximum number of bytes required of all the private workspaces for all agents attached to the current database. At the application level, it is the maximum size from among all of the agents' private workspaces that have serviced the current application.

When the private workspace overflows, memory is temporarily borrowed from other entities in agent private memory. This can result in memory shortage errors from these entities or possibly performance degradation. You can reduce the chance of overflow by increasing `APPLHEAPSZ`.

## product\_name - Product Name

Details of the version of the database instance that is running.

Table 1760. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_INSTANCE table function - Get instance level information	Always collected

Table 1761. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	db2	Basic

## progress\_completed\_units - Completed Progress Work Units

The number of work units for the current phase which have been completed.

Table 1762. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	progress	Basic

The value of this element will typically increase as the utility operates. This element will always be less than or equal to *progress\_total\_units* (if both elements are defined).

### Note:

1. This element might not be included for all utilities.
2. This element is expressed in units displayed by the *progress\_work\_metric* monitor element.

### Usage

Use this element to determine the amount of completed work within a phase. By itself, this element can be used to monitor the activity of a running utility. This element should constantly increase as the utility executes. If the *progress\_completed\_units* fails to increase over a long period of time then the utility might be stalled.

If *progress\_total\_units* is defined, then this element can be used to calculate the percentage of completed work:

```
percentage complete = progress_completed_units / progress_total_units* 100
```

## progress\_description - Progress Description

Describes the phase of work.

Table 1763. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	progress	Basic

Example values for the load utility include:

- DELETE
- LOAD
- REDO

## Usage

Use this element to obtain a general description of a phase.

## progress\_list\_attr - Current Progress List Attributes

This element describes how to interpret a list of progress elements.

Table 1764. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	progress list	Basic

## Usage

The value for this element is one of the following constants:

- `SQLM_ELM_PROGRESS_LIST_ATTR_SERIAL` - The elements in the list are to be interpreted as a set of serial phases meaning that completed work must equal the total work for element  $n$  before the completed work of element  $n+1$  is first updated. This attribute is used to describe progress of a task which consists of a set of serial phases where a phase must fully complete before the next phase begins.
- `SQLM_ELM_PROGRESS_LIST_ATTR_CONCURRENT` - Any element in the progress list can be updated at any time.

Use this element to determine how the elements of a progress list will be updated.

## progress\_list\_cur\_seq\_num - Current Progress List Sequence Number

If the utility contains multiple sequential phases, then this element displays the number of the current phase.

Table 1765. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	progress_list	Basic

## Usage

Use this element to determine the current phase of a multiphase utility. See [“progress\\_seq\\_num - Progress Sequence Number”](#) on page 1349.

## progress\_seq\_num - Progress Sequence Number

Phase number.

**Note:** The phase number displays only for utilities that consist of multiple phases of execution.

Table 1766. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	progress	Basic

## Usage

Use this element to determine the order of phases within a multiphase utility. The utility will execute phases serially in order of increasing progress sequence numbers. The current phase of a multiphase utility can be found by matching the `progress_seq_num` with the value of `progress_list_current_seq_num`.

## progress\_start\_time - Progress Start Time

A timestamp representing the start of the phase.

Table 1767. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	progress	Basic

### Usage

Use this element to determine when a phase started. This element is omitted if the phase has not yet begun.

## progress\_total\_units - Total Progress Work Units

Total amount of work to perform in order for the phase to be complete.

Table 1768. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	progress	Basic

Some utilities might not be able to quantify the total work so they will continuously update this element. Other utilities might not be able to provide an estimate for the total work so this element might be omitted entirely.

This element is expressed in units displayed by the *progress\_work\_metric* monitor element.

### Usage

Use this element to determine the total amount of work in the phase. Use this element with *progress\_completed\_units* to calculate the percentage of work completed within a phase:

```
percentage complete = progress_completed_units / progress_total_units* 100
```

## progress\_work\_metric - Progress Work Metric

The metric for interpreting the *progress\_total\_units* and *progress\_completed\_units* elements.

Table 1769. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	progress	Basic

Example values include:

- SQLM\_WORK\_METRIC\_BYTES
- SQLM\_WORK\_METRIC\_EXTENTS

### Note:

1. This element might not be included for all utilities.
2. Values for this element can be found in `sqlmon.h`

### Usage

Use this element to determine what *progress\_total\_units* and *progress\_completed\_units* use as their reporting metric.

## **pseudo\_deletes - Pseudo deletes monitor element**

The number of keys that have been marked pseudo deleted.

*Table 1770. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_INDEX table function - Get index metrics	Always collected

## **pseudo\_empty\_pages - Pseudo empty pages monitor element**

The number of pages that have been identified as pseudo empty. Pseudo empty pages are pages where all the keys have been pseudo deleted.

*Table 1771. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_INDEX table function - Get index metrics	Always collected

### **Usage**

**Note:** This monitor element does not report the current number of pseudo empty pages.

## **Q**

## **query\_actual\_degree - Actual runtime degree of intrapartition parallelism monitor element**

The actual runtime degree of intrapartition parallelism reported at the statement, activity, transaction, or workload level.

*Table 1772. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

*Table 1773. Event Monitoring Information*

<b>Event Type</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Activities	event_activity	Always collected
Locking	lock_participant_activities	Always collected

## **query\_card\_estimate - Query Number of Rows Estimate**

An estimate of the number of rows that will be returned by a query.

Table 1774. Table Function Monitoring Information

Table Function	Monitor Element Collection Command and Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

Table 1775. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Activities	event_activity	Always collected
Application	stmt	Statement
DCS Statement	dcs_stmt	Statement

### Usage

This estimate by the SQL compiler can be compared with the run-time actual values.

This element also returns information for the following SQL statements when you are monitoring Db2 Connect:

- INSERT, UPDATE, and DELETE

Indicates the number of rows affected.

- PREPARE

Estimate of the number of rows that will be returned. Collected only if the DRDA server is Db2, Db2 for VM and VSE, or Db2 for OS/400®.

- FETCH

Set to the number of rows fetched. Collected only if the DRDA server is Db2 for OS/400.

If information is not collected for a DRDA server, then the element is set to zero.

### query\_cost\_estimate - Query cost estimate monitor element

Estimated cost for a query, as determined by the SQL compiler. This value is reported in timerons.

Table 1776. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	Always collected
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

Table 1777. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	stmt	Statement
DCS Statement	dcs_stmt	Statement

Table 1778. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity	Always collected
Package cache	pkgcache	Always collected

## Usage

This monitor element allows correlation of actual run time with the compile-time estimates.

When you are monitoring Db2 Connect, this element also returns information for the following SQL statements:

- PREPARE

Represents the relative cost of the prepared SQL statement.

- FETCH

Contains the length of the row retrieved. This is collected only if the DRDA server is Db2 for OS/400.

If information is not collected for a DRDA server, then the element is set to zero.

**Note:** If the DRDA server is Db2 for z/OS and OS/390®, this estimate could be higher than  $2^{32} - 1$  (the maximum integer number that can be expressed through an unsigned long variable). In that case, the value returned by the monitor for this element will be  $2^{32} - 1$ .

## query\_data\_tag\_list - Estimated query data tag list monitor element

The query\_data\_tag\_list monitor element is a comma separated list of data tag values that the compiler estimates will be referenced in a statement. A data tag value is in the list if the compiler predicts the statement will access a table whose data table space has a non-zero data tag attribute defined. The list does not contain duplicate values.

Table 1779. Table Function Monitoring Information

Table Function	Monitor Element Collection Command and Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	Always collected
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	Always collected
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

Table 1780. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity	Always collected
Package cache	pkgcache	Always collected

### Usage note

If none of the data table spaces accessed by the query have a data tag defined, the list is empty.

### queue\_assignments\_total - Queue assignments total monitor element

The number of times any connection or activity was assigned to this threshold queue since the last reset.

Table 1781. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_QUEUE_STATS table function - Return threshold queue statistics	Always collected
WLM_GET_QUEUE_STATS table function - Return threshold queue statistics	Always collected

Table 1782. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_qstats	Always collected

### Usage

This element can be used to determine the number of times any connection or activity was queued in this particular queue in a given period of time determined by the statistics collection interval. This can help to determine the effectiveness of queuing thresholds.

### queue\_start\_time - Queue start timestamp monitor element

The date and time the application started waiting in the queue to obtain a threshold ticket.

Table 1783. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	lock_participants	

### queue\_size\_top - Queue size top monitor element

Highest queue size that has been reached since the last reset.

Table 1784. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_QUEUE_STATS table function - Return threshold queue statistics	Always collected
WLM_GET_QUEUE_STATS table function - Return threshold queue statistics	Always collected

Table 1785. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_qstats	Always collected

## Usage

Use this element to gauge the effectiveness of queuing thresholds and to detect when queuing is excessive.

## queue\_time\_total - Queue time total monitor element

Sum of the times spent in the queue for all connections or activities placed in this queue since the last reset. Units are milliseconds.

Table 1786. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_QUEUE_STATS table function - Return threshold queue statistics	Always collected
WLM_GET_QUEUE_STATS table function - Return threshold queue statistics	Always collected

Table 1787. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_qstats	Always collected

This element is used to gauge the effectiveness of queuing thresholds and to detect when queuing is excessive.

## Usage notes

**queue\_time\_total** is not reset at the end of a statistic collection interval. If **queue\_time\_total** is used over multiple intervals, it can be greater than the product of **wlm\_collect\_int** and **queue\_size\_top**.

## queued\_agents - Queued threshold agents monitor element

The total number of agents currently queued in the threshold.

Table 1788. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	lock_participants	

## quiescer\_agent\_id - Quiescer Agent Identification

Agent ID of the agent holding a quiesce state.

This element is an alias for the **quiescer\_application\_handle** monitor element.

### Element identifier

quiescer\_agent\_id

### Element type

information

---

Table 1789. Snapshot Monitoring Information

---

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_quiescer	Basic

---

#### Usage

Use this element in conjunction with **quiescer\_auth\_id** to determine who is responsible for quiescing a table space.

### quiescer\_application\_handle - Quiescer application handle monitor element

Application handle of the application that is holding a quiesce state.

This element is an alias for the **quiescer\_agent\_id** monitor element.

---

Table 1790. Table function monitoring information

---

Table function	Monitor element collection level
MON_GET_TABLESPACE_QUIESCER table function - Get information about quiesced table spaces	Always collected

---

#### Usage

Use this element with the **quiescer\_auth\_id** monitor element to determine what quiesced a table space.

### quiescer\_auth\_id - Quiescer User Authorization Identification

Authorization ID of the user holding a quiesce state.

#### Element identifier

quiescer\_auth\_id

#### Element type

information

---

Table 1791. Table function monitoring information

---

Table function	Monitor element collection level
MON_GET_TABLESPACE_QUIESCER table function - Get information about quiesced table spaces	Always collected

---

Table 1792. Snapshot Monitoring Information

---

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_quiescer	Basic

---

#### Usage

Use this element to determine who is responsible for quiescing a table space.

### quiescer\_obj\_id - Quiescer Object Identification

The object ID of the object that causes a table space to be quiesced.

#### Element identifier

quiescer\_obj\_id

#### Element type

information

Table 1793. Table function monitoring information

Table function	Monitor element collection level
MON_GET_TABLESPACE QUIESCER table function - Get information about quiesced table spaces	Always collected

Table 1794. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_quiescer	Basic

#### Usage

Use this element in conjunction with quiescer\_ts\_id and quiescer\_auth\_id to determine who is responsible for quiescing a table space. The value of this element matches a value from column TABLEID of view SYSCAT.TABLES.

### quiescer\_state - Quiescer State

The type of quiesce being done (for example, "SHARE", "INTENT TO UPDATE", or "EXCLUSIVE").

#### Element identifier

quiescer\_state

#### Element type

information

Table 1795. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_quiescer	Basic

#### Usage

The value of this element matches the value of constants SQLB QUIESCED\_SHARE, SQLB QUIESCED\_UPDATE, or SQLB QUIESCED\_EXCLUSIVE from sqlutil.h.

### quiescer\_ts\_id - Quiescer Table Space Identification

The table space ID of the object that causes a table space to be quiesced.

#### Element identifier

quiescer\_ts\_id

#### Element type

information

Table 1796. Table function monitoring information

Table function	Monitor element collection level
MON_GET_TABLESPACE QUIESCER table function - Get information about quiesced table spaces	Always collected

Table 1797. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_quiescer	Basic

### Usage

Use this element in conjunction with `quiescer_obj_id` and `quiescer_auth_id` to determine who is responsible for quiescing a table space. The value of this element matches a value from column `TBSPACEID` of view `SYSCAT.TABLES`.

## R

### range\_adjustment - Range Adjustment

This value represents the offset into the container array in which a range actually starts.

*Table 1798. Table function monitoring information*

Table function	Monitor element collection level
MON_GET_TABLESPACE_RANGE table function - Get information about table space ranges	Always collected

*Table 1799. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_range	Basic

### Usage

This element is applicable only to a DMS table space.

### range\_container\_id - Range Container

An integer that uniquely defines a container within a range.

*Table 1800. Table function monitoring information*

Table function	Monitor element collection level
MON_GET_TABLESPACE_RANGE table function - Get information about table space ranges	Always collected

*Table 1801. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_range	Basic

### Usage

This element is applicable only to a DMS table space.

### range\_end\_stripe - End Stripe

This value represents the number of the last stripe in a range.

*Table 1802. Table function monitoring information*

Table function	Monitor element collection level
MON_GET_TABLESPACE_RANGE table function - Get information about table space ranges	Always collected

Table 1803. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_range	Basic

**Usage**

This element is applicable only to a DMS table space.

**range\_max\_extent - Maximum Extent in Range**

This value represents the maximum extent number that is mapped by a range.

Table 1804. Table function monitoring information

Table function	Monitor element collection level
MON_GET_TABLESPACE_RANGE table function - Get information about table space ranges	Always collected

Table 1805. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_range	Basic

**Usage**

This element is applicable only to a DMS table space.

**range\_max\_page\_number - Maximum Page in Range**

This value represents the maximum page number that is mapped by a range.

Table 1806. Table function monitoring information

Table function	Monitor element collection level
MON_GET_TABLESPACE_RANGE table function - Get information about table space ranges	Always collected

Table 1807. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_range	Basic

**Usage**

This element is applicable only to a DMS table space.

**range\_num\_container - Number of Containers in Range**

This value represents the number of containers in the current range.

Table 1808. Table function monitoring information

Table function	Monitor element collection level
MON_GET_TABLESPACE_RANGE table function - Get information about table space ranges	Always collected

Table 1809. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_range	Basic

#### Usage

This element is applicable only to a DMS table space.

### range\_number - Range Number

This value represents the number of a range within the table space map.

Table 1810. Table function monitoring information

Table function	Monitor element collection level
MON_GET_TABLESPACE_RANGE table function - Get information about table space ranges	Always collected

Table 1811. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_range	Basic

#### Usage

This element is applicable only to a DMS table space.

### range\_offset - Range Offset

The offset from stripe 0 of the beginning of the stripe set to which a range belongs.

Table 1812. Table function monitoring information

Table function	Monitor element collection level
MON_GET_TABLESPACE_RANGE table function - Get information about table space ranges	Always collected

Table 1813. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_range	Basic

#### Usage

This element is applicable only to a DMS table space.

### range\_start\_stripe - Start Stripe

This value represents the number of the first stripe in a range.

Table 1814. Table function monitoring information

Table function	Monitor element collection level
MON_GET_TABLESPACE_RANGE table function - Get information about table space ranges	Always collected

Table 1815. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_range	Basic

#### Usage

This element is applicable only to a DMS table space.

### range\_stripe\_set\_number - Stripe Set Number

This value represents the stripe set in which a range resides.

Table 1816. Table function monitoring information

Table function	Monitor element collection level
MON_GET_TABLESPACE_RANGE table function - Get information about table space ranges	Always collected

Table 1817. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_range	Basic

#### Usage

This element is applicable only to a DMS table space.

### reads\_on\_standby\_enabled - reads on standby enabled monitor element

Indicates whether the reads on standby feature is enabled.

Table 1818. Table function monitoring information

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

#### Usage

Controlled by registry variable DB2\_HADR\_ROS. One of:

- Y (Yes)
- N (No)

### reusability\_status\_reason - Reusability status reason monitor element

Identifies the reasons why the connection might not be reusable. Each reason is separated by a semi-colon.

Reasons for non-reusability are:

- WITHHOLD\_CURSOR - Connection has with hold cursor
- DGTT - DGTTs are in use
- CGTT - CGTTs with PRESERVE ROWS are in use
- ENCRYPT\_PASSWD - Connections are using encrypted passwords
- TRANSFORM\_GROUP - Transform Group Register is set

- SESSION\_AUTHID - SESSION AUTHID register was changed
- SEQUENCES - Sequences are used without setting DB2\_ALLOW\_WLB\_WITH\_SEQUENCES registry variable
- GLOBAL\_VARS - Global variables in use
- COLLECT\_ACTIVITY - Activity collection is enabled for the connection by using the WLM\_SET\_CONN\_ENV stored procedure
- SECTION\_ACTUALS - Section actuals were changed from the default for the connection by using the WLM\_SET\_CONN\_ENV stored procedure
- DYNAMIC\_SQL - Connection reuse is blocked because Dynamic SQL is used

*Table 1819. Table function monitoring information*

Table function	Monitor element collection level
MON_GET_CONNECTION table function - Get connection metrics	Always collected
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics	Always collected

### **rebalancer\_extents\_processed - Number of extents the rebalancer has processed**

**Note:** This monitor element is an alias for the tablespace\_rebalancer\_extents\_processed element.

The number of extents that the rebalancer has already moved since the rebalancer has been started or restarted (whichever is most recent).

*Table 1820. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_REBALANCE_STATUS table function - get rebalance progress for a table space	Always collected

*Table 1821. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_nodeinfo	Basic

#### **Usage**

This can be used as an indicator of the completion level of the rebalancer. You can monitor the progress of rebalancing by keeping track of the change in this element over time. You can use tablespace\_state and rebalance\_mode to check if the rebalancing is completed. This is only applicable to a DMS table space.

### **rebalancer\_extents\_remaining - Total number of extents to be processed by the rebalancer**

**Note:** This monitor element is an alias for the tablespace\_rebalancer\_extents\_remaining element.

The number of extents to be moved. This value is calculated at either the rebalancer start time or restart time (whichever is most recent).

*Table 1822. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_REBALANCE_STATUS table function - get rebalance progress for a table space	Always collected

*Table 1823. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_nodeinfo	Basic

#### Usage

This element can be used as an indicator of the completion level of the rebalancer. You can monitor the progress of rebalancing by keeping track of the change in this element over time. You can use `tablespace_state` to check if rebalancing has completed. This is only applicable to a DMS table space.

### rebalancer\_last\_extent\_moved - Last extent moved by the rebalancer

**Note:** This monitor element is an alias for the `tablespace_rebalancer_last_extent_moved` element.

The last extent moved by the rebalancer.

*Table 1824. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_REBALANCE_STATUS table function - get rebalance progress for a table space	Always collected

*Table 1825. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_nodeinfo	Basic

#### Usage

This can be used as an indicator of the completion level of the rebalancer. You can monitor the progress of rebalancing by keeping track of the change in this element over time. You can use `tablespace_state` and `rebalance_mode` to check if the rebalancing is completed. This is only applicable to a DMS table space.

### rebalancer\_mode - Rebalancer mode monitor element

**Note:** This monitor element is an alias for the `tablespace_rebalancer_mode` element.

Indicates whether the current rebalance process is removing space from a table space or adding space to a table space.

*Table 1826. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_REBALANCE_STATUS table function - get rebalance progress for a table space	Always collected
MON_GET_TABLESPACE table function - Get table space metrics	Always collected

Table 1827. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_nodeinfo	Basic

## Usage

A *forward rebalance* occurs when new containers are added or existing containers have their size increased. In a forward rebalancing operation, data movement starts with the first extent in the table space and ends with the high watermark extent.

A *reverse rebalance* occurs when containers are removed or reduced in size and data needs to move out of the space being freed. In a reverse rebalancing operation, data movement starts at the high watermark extent and moves in reverse order through the table space, ending with the first extent in the table space.

A *two-pass rebalance* is a forward rebalance followed by a reverse rebalance. A two-pass rebalance might occur when containers are being both added and dropped as part of the rebalance operation.

For DMS non-automatic storage table spaces, this monitor element indicates the type of rebalance that is occurring for the table space. Only a single forward rebalance or a single reverse rebalance can occur for DMS non-automatic table space.

For automatic storage table spaces, this monitor element indicates what the current rebalance process is doing to the table space. In general, only a single forward rebalance or a single reverse rebalance is necessary when a rebalance is initiated. However, there are cases when a two-pass rebalance is necessary for automatic storage table spaces.

The possible **tablespace\_rebalancer\_mode** values are defined in the `sqlmon.h` file. The following values are returned in snapshot monitoring:

### **SQLM\_TABLESPACE\_NO\_REBAL**

No rebalancing is taking place.

### **SQLM\_TABLESPACE\_FWD\_REBAL**

Forward rebalance is taking place.

### **SQLM\_TABLESPACE\_REV\_REBAL**

Reverse rebalance is taking place.

### **SQLM\_TABLESPACE\_FWD\_REBAL\_OF\_2PASS**

The forward rebalance phase of two pass rebalance is taking place.

### **SQLM\_TABLESPACE\_REV\_REBAL\_OF\_2PASS**

The reverse rebalance phase of two pass rebalance is taking place.

If using either the `MON_GET_TABLESPACE` or the `MON_GET_REBALANCE_STATUS` table function, the following `rebalancer_mode` values are returned:

- NO\_REBAL
- FWD\_REBAL
- REV\_REBAL
- FWD\_REBAL\_OF\_2PASS
- REV\_REBAL\_OF\_2PASS

## **rebalancer\_priority - Current rebalancer priority**

**Note:** This monitor element is an alias for the `tablespace_rebalancer_priority` element.

The priority at which the rebalancer is running in the database.

Table 1828. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_REBALANCE_STATUS table function - get rebalance progress for a table space	Always collected

Table 1829. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_nodeinfo	Basic

#### Usage

This is only applicable to a DMS table space.

### rebalancer\_restart\_time - Rebalancer restart time

**Note:** This monitor element is an alias for the tablespace\_rebalancer\_restart\_time element.

A timestamp representing when a rebalancer was restarted after being paused or suspended.

Table 1830. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_REBALANCE_STATUS table function - get rebalance progress for a table space	Always collected

Table 1831. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_nodeinfo	Basic

#### Usage

This can be used as an indicator of the completion level of the rebalancer. It will note when the rebalancer was restarted, and will allow for the derivation of the speed of the rebalancer and the estimated time until completion. This is only applicable to a DMS table space.

### rebalancer\_source\_storage\_group\_id - Rebalancer source storage group identifier

**Note:** This monitor element is an alias for the tablespace\_rebalancer\_source\_storage\_group\_id element.

The source storage group identifier if the rebalancer is moving a table space from one storage group to another. Otherwise, it is -1.

Table 1832. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_REBALANCE_STATUS table function - Get rebalance progress for a table space	Always collected

### rebalancer\_source\_storage\_group\_name - Rebalancer source storage group name

**Note:** This monitor element is an alias for the tablespace\_rebalancer\_source\_storage\_group\_name element.

The source storage group name if the rebalancer is moving a table space from one storage group to another. Otherwise, it is NULL.

*Table 1833. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_REBALANCE_STATUS table function - Get rebalance progress for a table space	Always collected

## rebalancer\_start\_time - Rebalancer start time

**Note:** This monitor element is an alias for the tablespace\_rebalancer\_start\_time element.

A timestamp representing when a rebalancer was initially started.

*Table 1834. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_REBALANCE_STATUS table function - get rebalance progress for a table space	Always collected

*Table 1835. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_nodeinfo	Basic

### Usage

This will be used to note the time at which a rebalancer was initially started. This can be used to derive metrics as to the speed at which the rebalancer is operating, and the estimated time of completion of the rebalance. This is only applicable to a DMS table space.

## rebalancer\_status - Rebalancer status monitor element

**Note:** This monitor element is an alias for the tablespace\_rebalancer\_status element.

Indicates the current status of the rebalance operation.

*Table 1836. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_REBALANCE_STATUS table function - get rebalance progress for a table space	Always collected

### Usage note

Current status of the rebalance operation is one of:

- ACTIVE - Rebalance operation is active.
- SUSPENDED - Rebalance operation has been explicitly suspended by a user using the ALTER TABLESPACE statement.
- PAUSED - Rebalance operation has been implicitly paused due to an online backup. The rebalance will proceed when the backup is complete.

If the rebalance operation has been explicitly suspended and implicitly paused, the status is reported as SUSPENDED.

## rebalancer\_target\_storage\_group\_id - Rebalancer target storage group identifier

**Note:** This monitor element is an alias for the tablespace\_rebalancer\_target\_storage\_group\_id element.

The target storage group identifier if the rebalancer is moving a table space from one storage group to another. Otherwise, it is -1.

Table 1837. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_REBALANCE_STATUS table function - Get rebalance progress for a table space	Always collected

This monitor element is connected to the target\_storage\_group\_name monitor element, as well as source\_storage\_group\_id monitor element and source\_storage\_group\_name monitor element. You use these elements together to understand if a rebalance operation is moving a tablespace from one storage group to another, and to understand which storage group the tablespace is moving from (the source) and where it is moving to (the target).

## rebalancer\_target\_storage\_group\_name - Rebalancer target storage group name

**Note:** This monitor element is an alias for the tablespace\_rebalancer\_target\_storage\_group\_name element.

The target storage group name if the rebalancer is moving a table space from one storage group to another. Otherwise, it is NULL.

Table 1838. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_REBALANCE_STATUS table function - Get rebalance progress for a table space	Always collected

## reclaim\_wait\_time - Reclaim wait time monitor element

In a Db2 pureScale environment, this element represents the amount of time spent waiting on page locks, where the lock request caused a page to be reclaimed. The unit of measurement for time is in milliseconds.

Table 1839. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE

Table 1839. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PAGE_ACCESS_INFO table function - Get buffer pool page waiting information	Always collected
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - Get package cache statement metrics as an XML document	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 1840. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Package cache	pkgcache_metrics	ACTIVITY METRICS BASE

Table 1840. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

## Usage

The time spent waiting for reclaims on space map pages is counted separately and reported in the **spacemappage\_reclaim\_wait\_time** monitor element.

## reclaimable\_space\_enabled - Reclaimable space enabled indicator monitor element

If the table space is enabled for reclaimable storage, then this monitor element returns a value of 1. Otherwise, it returns a value of 0.

Table 1841. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLESPACE table function - Get table space metrics	Always collected

## regvar\_collection\_type - Registry variable collection type

Indicates when the registry variable value was collected.

Table 1842. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Change History	REGVAR	Always collected

## Usage

The change history event monitor collected this value as:

**I**

The initial value that was captured when the event monitor was activated.

**U**

Updated value

## regvar\_level - Registry variable level

Indicates the level of the registry variable.

Table 1843. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Change History	REGVAR	Always collected

## Usage

For the change history event monitor, the level of the registry variable is one of:

### E

Environment

### G

Global

### I

Instance-level

### P

Database partition

## regvar\_name - Registry variable name

The name of the registry variable.

*Table 1844. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Change History	REGVAR	Always collected

## Usage

For the change history event monitor, this element identifies the registry variable that was updated as part of a REGVAR event, or captured at event monitor startup as part of a REGVARVALUES event. These events represent the following:

### REGVAR

Changing a registry variable value

### REGVARVALUES

Capturing registry variable values at event monitor startup

## regvar\_old\_value - Registry variable old value

The old value for the registry variable.

*Table 1845. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Change History	REGVAR	Always collected

## Usage

For the change history event monitor, if the registry variable value was not set, this value is an empty string.

## regvar\_value - Registry variable value

This is the value for the registry variable.

*Table 1846. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Change History	REGVAR	Always collected

## Usage

For the change history event monitor, if the value was not set, this value is an empty string.

Only immediate registry variable updates generate REGVAR events.

## rej\_curs\_blk - Rejected Block Cursor Requests

The number of times that a request for an I/O block at server was rejected and the request was converted to non-blocked I/O.

### Element identifier

rej\_curs\_blk

### Element type

counter

---

Table 1847. Snapshot Monitoring Information

---

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl	Basic

---

Table 1848. Event Monitoring Information

---

Event Type	Logical Data Grouping	Monitor Switch
Connection	event_conn	Always collected

---

### Usage

If there are many cursors blocking data, the communication heap may become full. When this heap is full, an error is not returned. Instead, no more I/O blocks are allocated for blocking cursors. If cursors are unable to block data, performance can be affected.

If a large number of cursors were unable to perform data blocking, you may be able to improve performance by:

- Increasing the size of the *query\_heap* database manager configuration parameter.

## rem\_cons\_in - Remote Connections To Database Manager

The current number of connections initiated from remote clients to the instance of the database manager that is being monitored.

---

Table 1849. Snapshot Monitoring Information

---

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	db2	Basic

---

### Usage

Shows the number of connections from remote clients to databases in this instance. This value will change frequently, so you may need to sample it at specific intervals over an extended period of time to get a realistic view of system usage. This number does not include applications that were initiated from the same instance as the database manager.

When used in conjunction with the local\_cons monitor element, these elements can help you adjust the setting of the **max\_coordagents** and **max\_connections** configuration parameters.

## rem\_cons\_in\_exec - Remote Connections Executing in the Database Manager

The number of remote applications that are currently connected to a database and are currently processing a unit of work within the database manager instance being monitored.

Table 1850. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	db2	Basic

## Usage

This number can help you determine the level of concurrent processing occurring on the database manager. This value will change frequently, so you may need to sample it at specific intervals over an extended period of time to get a realistic view of system usage. This number does not include applications that were initiated from the same instance as the database manager.

When used in conjunction with the `local_cons_in_exec` monitor element, this element can help you adjust the setting of the `max_coordagents` configuration parameter.

If `max_coordagents` is set to `AUTOMATIC`, then you do not need to make any adjustments. If it is not set to `AUTOMATIC` and if the sum of `rem_cons_in_exec` and `local_cons_in_exec` is close to `max_coordagents`, you should increase the value of `max_coordagents`.

## remote\_lock\_time - Remote Lock Time

This element contains the aggregate amount of time, in milliseconds, that this data source spends in a remote lock from all applications or a single application running on this federated server instance since the start of the federated server instance or the last reset of the database monitor counters. The monitor stores the most recent of these values. The response time is measured as the difference between the time the federated server submits a remote lock to the data source, and the time the federated server releases a remote lock at the data source.

Table 1851. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase_remote	Timestamp
Application	appl_remote	Timestamp

For snapshot monitoring, this counter can be reset.

## Usage

Use this element to determine how much actual time is spent at this data source in a remote lock.

## remote\_locks - Remote Locks

This element contains a count of the total number of remote locks that the federated server has called at this data source on behalf of any application since the start of the federated server instance or the last reset of the database monitor counters, whichever is latest.

Table 1852. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase_remote	Basic
Application	appl_remote	Basic

For snapshot monitoring, this counter can be reset.

## Usage

Use this element to determine how many remote locks were made remotely at the data source.

## remote\_member - Remote member monitor element

The numeric identifier for the database member to which data was sent or from which data was received, using the fast communication manager (FCM).

Table 1853. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_FCM_CONNECTION_LIST - Get details for all FCM connections	Always collected

### Usage

All the metrics returned by the MON\_GET\_FCM\_CONNECTION\_LIST table function apply to the FCM connection between the members described in the **member** and **remote\_member** monitor elements.

## remote\_update\_time - Remote member update time monitor element

During extent movement, this monitor element shows the cumulative time spent waiting for remote members to update cached page locations for moved extents on remote members.

The value is given in milliseconds.

Table 1854. Table function monitoring information

Table function	Monitor element collection level
MON_GET_EXTENT_MOVEMENT_STATUS - get extent movement progress	Always collected

## reopt - Reopt bind option monitor element

The REOPT bind option used to precompile this package. Possible values are: NONE, ONCE, and ALWAYS.

Table 1855. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	lock_participant_activities	

## reorg\_completion - Reorganization Completion Flag

Table reorganization success indicator, which includes the reclamation of extents from a multidimensional clustering (MDC) or insert time clustering (ITC) table. For partitioned tables, this value indicates the completion status for the data partition.

Table 1856. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table	table_reorg	Basic

### Usage

This element will have a value of 0 if a table or data partition reorganize operation is successful. If a table or data partition reorganize operation is unsuccessful, this element will have a value of -1. Success and failure values are defined in sqlmon.h as follows:

- Success: SQLM\_REORG\_SUCCESS
- Failure: SQLM\_REORG\_FAIL

In the case of an unsuccessful table reorganization, see the history file for any diagnostic information, including warnings and errors. This data can be accessed by using the LIST HISTORY command. For

partitioned tables, the completion status is indicated per data partition. If index re-create fails on a partitioned table, the failed status is updated on all data partitions. See the administration notification log for further diagnostic information.

## reorg\_current\_counter - Reorganize Progress

A unit of progress that indicates the amount of reorganization that has been completed. The amount of progress this value represents is relative to the value of reorg\_max\_counter, which represents the total amount of table reorganization that is to be done.

Table 1857. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table	table_reorg	Basic

## Usage

You can determine the percentage of table reorganization that has been completed using the following formula:

```
table_reorg_progress = reorg_current_counter / reorg_max_counter * 100
```

## reorg\_end - Table Reorganize End Time

The end time of a table reorganization including a reorganization to reclaim extents from a multidimensional clustering (MDC) or insert time clustering (ITC) table. For partitioned tables, this time indicates the end time for each data partition reorganization.

Table 1858. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table	table_reorg	Basic

## reorg\_index\_id - Index Used to Reorganize the Table

The index being used to reorganize the table.

Table 1859. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table	table_reorg	Basic

## reorg\_long\_tbspc\_id - Table Space Where Long Objects are Reorganized monitor element

The table space in which any long objects (LONG VARCHAR or LOB data) will be reorganized. For partitioned tables, this is the table space in which each partition's LONG VARCHAR and LOB will be reorganized.

Table 1860. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table	table_reorg	Basic

## reorg\_max\_counter - Total Amount of Reorganization

A value that indicates the total amount of work to be done in a reorganization. This value includes a reorganization to reclaim extents from multidimensional clustering (MDC) or insert time clustering (ITC) tables. This value can be used with reorg\_current\_counter, which represents the amount of work completed, to determine the progress of a reorganization.

Table 1861. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table	table_reorg	Basic

## reorg\_max\_phase - Maximum Reorganize Phase

The maximum number of reorganization phases that occurs during reorganization processing. This number applies to classic (offline) reorganizations and to reorganizations with the RECLAIM EXTENTS option. The range of values is 2 - 4 ([SORT], BUILD, REPLACE,[INDEX\_RECREATE]). The value could also indicate the total amount of work to be done in a reorganization to reclaim extents from a multidimensional clustering (MDC) or insert time clustering (ITC) table. When such a reorganization occurs, this value is 3 (SCAN, DRAIN, RELEASE).

Table 1862. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table	table_reorg	Basic

## reorg\_phase - Table reorganization phase monitor element

Indicates the reorganization phase of the table. For partitioned tables, this will also indicate the reorganization phase for each data partition. This applies to offline table reorganizations only.

Table 1863. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table	table_reorg	Basic

## Usage

For partitioned tables, the reorganization occurs on a data partition by data partition basis. For classic table reorganization, the following phases are possible (phases are listed with their corresponding defines from the sqlmon.h file):

- Sort: SQLM\_REORG\_SORT
- Build: SQLM\_REORG\_BUILD
- Replace: SQLM\_REORG\_REPLACE
- Index Recreate: SQLM\_REORG\_INDEX\_RECREATE
- Dictionary Build: SQLM\_REORG\_DICT\_SAMPLE

For partitioned tables, the Index Recreate phase for partitioned indexes (if any) might be directly entered after the replace phase for that data partition. The **reorg\_phase** element will indicate the Index Recreate phase only after the successful completion of all prior phases on every data partition.

During XDA object compression, the XML data reorganization phase involves reorganizing the XML storage object of the table. The XML dictionary build phase involves attempting to create a compression dictionary for the XML storage object. For XDA object compression, the following two phases are possible:

- XML Reorg: SQLM\_REORG\_XML\_DATA

- XML Dictionary Build: SQLM\_REORG\_XML\_DICT\_SAMPLE

For partitioned tables, where reclamation of extents is being performed, the following phases are possible:

- Scan: SQLM\_REORG\_SCAN
- Drain: SQLM\_REORG\_DRAIN
- Release: SQLM\_REORG\_RELEASE

### **reorg\_phase\_start - Reorganize Phase Start Time**

The start time of a phase of table reorganization or reclaim reorganization. For partitioned tables, this will also indicate the start time of a reorganization phase for each data partition. During the index re-create phase, data groups for all data partitions are updated at the same time for nonpartitioned indexes.

*Table 1864. Snapshot Monitoring Information*

<b>Snapshot Level</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Table	table_reorg	Basic

### **reorg\_rows\_compressed - Rows Compressed**

Number of rows compressed in the table during reorganization.

*Table 1865. Snapshot Monitoring Information*

<b>Snapshot Level</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Table	table_reorg	Basic

#### **Usage**

A running count of the number of rows compressed in the table during reorganization. Some records may never be compressed (if the record size is less than the minimum record length).

It is important to note that this row count does not measure the effectiveness of data compression. It only displays the number of records meeting compression criteria.

### **reorg\_rows\_rejected\_for\_compression - Rows Rejected for Compression**

Number of rows that were not compressed during reorganization due to the record length being less than or equal to the minimum record length.

*Table 1866. Snapshot Monitoring Information*

<b>Snapshot Level</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Table	table_reorg	Basic

#### **Usage**

A record will not be compressed if it is less than or equal to the minimum record length. The number of rows rejected reflects a running count for these records that fail to meet this compression requirement.

### **reorg\_start - Table Reorganize Start Time**

The start time of a table reorganization including a reorganization to reclaim extents from a multidimensional clustering (MDC) or insert time clustering (ITC) table. For partitioned tables, this indicates the start time for each data partition reorganization.

---

Table 1867. Snapshot Monitoring Information

---

Snapshot Level	Logical Data Grouping	Monitor Switch
Table	table_reorg	Basic

---

### reorg\_status - Table Reorganize Status

The status of an in-place (online) table or a data partition level reorganization. This is not applicable to classic (offline) table reorganizations.

---

Table 1868. Snapshot Monitoring Information

---

Snapshot Level	Logical Data Grouping	Monitor Switch
Table	table_reorg	Basic

---

#### Usage

An in-place table or data partition reorganization can be in one of the following states (states are listed with their corresponding defines from sqlmon.h):

- Started/Resumed: SQLM\_REORG\_STARTED
- Paused: SQLM\_REORG\_PAUSED
- Stopped: SQLM\_REORG\_STOPPED
- Completed: SQLM\_REORG\_COMPLETED
- Truncate: SQLM\_REORG\_TRUNCATE

An inplace table or data partition reorganization to reclaim extents can be in one of the following states:

- Started: SQLM\_REORG\_STARTED
- Stopped: SQLM\_REORG\_STOPPED
- Completed: SQLM\_REORG\_COMPLETED

### reorg\_tbspc\_id - Table Space Where Table or Data partition is Reorganized

The table space in which the table will be reorganized. For partitioned tables, this indicates the table space where each data partition is reorganized.

---

Table 1869. Snapshot Monitoring Information

---

Snapshot Level	Logical Data Grouping	Monitor Switch
Table	table_reorg	Basic

---

### reorg\_type - Table Reorganize Attributes

Table reorganize attribute settings.

---

Table 1870. Snapshot Monitoring Information

---

Snapshot Level	Logical Data Grouping	Monitor Switch
Table	table_reorg	Basic

---

#### Usage

The following are possible attribute settings. Each attribute setting is based upon a bit flag value defined in db2Ap1Df.h.

- Allow Write Access: DB2REORG\_ALLOW\_WRITE

- Allow Read Access: DB2REORG\_ALLOW\_READ
- Allow No Access: DB2REORG\_ALLOW\_NONE
- Recluster Via Index Scan: DB2REORG\_INDEXSCAN
- Reorg Long Field LOB Data: DB2REORG\_LONGLOB
- No Table Truncation: DB2REORG\_NOTRUNCATE\_ONLINE
- Replace Compression Dictionary: DB2REORG\_RESET\_DICTIONARY
- Keep Compression Dictionary: DB2REORG\_KEEP\_DICTIONARY
- Reclaim Extents: DB2REORG\_RECLAIM\_EXTS

In addition to the preceding attribute settings, the following attributes are listed in the CLP output of the GET SNAPSHOT FOR TABLES command. These attribute settings are based on the values of other attribute settings or table reorganize monitor elements.

- Reclustering: If the value of the reorg\_index\_id monitor element is non-zero, then the table reorganize operation has this attribute.
- Reclaiming: If the value of the reorg\_index\_id monitor element is zero, then the table reorganize operation has this attribute.
- Inplace Table Reorg: If the reorg\_status monitor element has a value that is not null, then the in-place (online) reorganization method is in use.
- Table Reorg: If the reorg\_phase monitor element has a value that is not null, then the classic (offline) reorganization method is in use.
- Recluster Via Table Scan: If the DB2REORG\_INDEXSCAN flag is not set, then the table reorganize operation has this attribute.
- Reorg Data Only: If the DB2REORG\_LONGLOB flag is not set, then the table reorganize operation has this attribute.

### **reorg\_xml\_regions\_compressed - XML regions compressed monitor element**

Number of XML regions that were compressed during the table reorganization process.

*Table 1871. Snapshot Monitoring Information*

<b>Snapshot Level</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Table	table_reorg	Basic

### **reorg\_xml\_regions\_rejected\_for\_compression - XML regions rejected for compression monitor element**

Number of XML regions that were not compressed during the table reorganization process.

*Table 1872. Snapshot Monitoring Information*

<b>Snapshot Level</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Table	table_reorg	Basic

### **replay\_type - HADR replication type monitor element**

*Table 1873. Table function monitoring information*

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

## Usage

The type of HADR replication.

- PHYSICAL

## req\_agent\_tid - Thread identifier for agent waiting to acquire lock monitor element

Thread identifier of the agent or system entity that is waiting to acquire the lock.

Table 1874. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_APPL_LOCKWAIT table function - get information about locks for which an application is waiting	Always collected

## req\_application\_handle - Identifier for application waiting to acquire lock monitor element

System-wide unique ID for the application that is waiting to acquire the lock.

Table 1875. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_APPL_LOCKWAIT table function - get information about locks for which an application is waiting	Always collected

## req\_executable\_id - Identifier for statement section waiting to acquire lock monitor element

The binary token generated on the data server that uniquely identifies the SQL statement section which is waiting to acquire a lock. For non-SQL activities, a 0-length string value is returned.

Table 1876. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_APPL_LOCKWAIT table function - get information about locks for which an application is waiting	Always collected

## req\_member - Member of application waiting to acquire lock monitor element

Database member where the application waiting to acquire this lock is located.

Table 1877. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_APPL_LOCKWAIT table function - get information about locks for which an application is waiting	Always collected

## request\_exec\_time\_avg - Request execution time average monitor element

Arithmetic mean of the execution times for requests associated with this service subclass since the last reset. If the internally tracked average has overflowed, the value -2 is returned. This monitor element

returns -1 when COLLECT AGGREGATE REQUEST DATA for the service subclass is set to NONE. Units are milliseconds.

When you remap activities between service subclasses with a REMAP ACTIVITY action, the request\_exec\_time\_avg mean counts the partial request in each subclass involved in remapping.

*Table 1878. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	ACTIVITY METRICS BASE
WLM_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	COLLECT AGGREGATE REQUEST DATA

*Table 1879. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats	-

## Usage

Use this statistic to quickly understand the average amount of time that is spent processing each request on a member in this service subclass.

This average can also be used to determine whether or not the histogram template used for the request execution time histogram is appropriate. Compute the average request execution time from the request execution time histogram. Compare the computed average with this monitor element. If the computed average deviates from the true average reported by this monitor element, consider altering the histogram template for the request execution time histogram, using a set of bin values that are more appropriate for your data.

## req\_tenant\_id - Requestor tenant identifier monitor element

The identifier of the tenant for the requestor of the lock.

*Table 1880. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_APPL_LOCKWAIT table function - returns index information	Always collected

## Usage

Use this element to identify the requestor tenant in which this RUNSTATS job is queued.

## req\_tenant\_name - Requestor tenant name monitor element

The name of the tenant for the requestor of the lock

*Table 1881. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_APPL_LOCKWAIT table function - returns index information	Always collected

## Usage

Use this element to find the name of the requestor tenant in which this RUNSTATS job is queued.

## RESOURCE\_ENTITLEMENT monitor element

The resource entitlement for this service subclass, superclass, or workload.

Table 1882. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_WORKLOAD_STATS table function - Return workload statistics	Always collected
MON_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	Always collected
MON_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected

Table 1883. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats	Always collected
Statistics	event_superclasstats	Always collected
Statistics	event_superclasstats	Always collected

## RESOURCE\_SHARES monitor element

The resource shares for this service subclass or superclass.

Table 1884. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	Always collected
MON_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected

Table 1885. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats	Always collected
Statistics	event_superclasstats	Always collected

## RESOURCE\_SHARE\_TYPE monitor element

The resource shares type for this service subclass or superclass.

Table 1886. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	Always collected

Table 1886. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected

Table 1887. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats	Always collected
Statistics	event_superclasstats	Always collected
Statistics	event_superclasstats	Always collected

## rf\_log\_num - Log being rolled forward monitor element

The log being processed in the rollforward operation.

Table 1888. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	rollforward	Basic

### Usage

If a rollforward is in progress, this element identifies the log involved. In a Db2 pureScale environment, the **rf\_log\_num** monitor element identifies the log file from each log stream that is currently involved in the rollforward operation.

## rf\_status - Log Phase

The status of the recovery.

### Element identifier

rf\_status

### Element type

information

Table 1889. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	rollforward	Basic

### Usage

This element indicates the progression of a recovery. It indicates if the recovery is in an undo (rollback) or redo (rollforward) phase.

## rf\_timestamp - Rollforward Timestamp

The timestamp of the last committed transaction..

### Element identifier

rf\_timestamp

### Element type

timestamp

Table 1890. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	rollforward	Timestamp

**Usage**

If a rollforward is in progress, this is the timestamp of the last committed transaction processed by rollforward recovery. This is an indicator of how far the rollforward operation has progressed.

**rf\_type - Rollforward Type**

The type of rollforward in progress.

**Element identifier**

rf\_type

**Element type**

information

Table 1891. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	rollforward	Basic

**Usage**

An indicator of whether recovery is happening at a database or table space level.

**rollback\_sql\_stmts - Rollback Statements Attempted**

The total number of SQL ROLLBACK statements that have been attempted.

**Element identifier**

rollback\_sql\_stmts

**Element type**

counter

Table 1892. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic
Database	dbase_remote	Basic
Application	appl	Basic
Application	appl_remote	Basic
DCS Database	dcs_dbase	Basic
DCS Application	dcs_appl	Basic

For snapshot monitoring, this counter can be reset.

Table 1893. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected
Connection	event_conn	Always collected

## Usage

A rollback can result from an application request, a deadlock, or an error situation. This element **only** counts the number of rollback statements issued from applications.

At the application level, this element can help you determine the level of database activity for the application and the amount of conflict with other applications. At the database level, it can help you determine the amount of activity in the database and the amount of conflict between applications on the database.

**Note:** You should try to minimize the number of rollbacks, since higher rollback activity results in lower throughput for the database.

It may also be used to calculate the total number of units of work, by calculating the sum of the following expression:

```
commit_sql_stmts
+ int_commits
+ rollback_sql_stmts
+ int_rollbacks
```

## rolled\_back\_agent\_id - Rolled Back Agent

Agent that was rolled back when a deadlock occurred.

### Element identifier

rolled\_back\_agent\_id

### Element type

information

Table 1894. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Deadlocks	event_deadlock	Always collected

## Usage

A system administrator can use this information to determine which application did not complete its updates, and determine which applications should be restarted.

## rolled\_back\_appl\_id - Rolled Back Application

Application id that was rolled back when a deadlock occurred.

### Element identifier

rolled\_back\_appl\_id

### Element type

information

Table 1895. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Deadlocks	event_deadlock	Always collected

## Usage

A system administrator can use this information to determine which application did not complete its updates, and determine which applications should be restarted.

## rolled\_back\_participant\_no - Rolled back application participant monitor element

The participant number identifying the rolled back application.

Table 1896. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	Always collected
Deadlocks <sup>1</sup>	event_deadlock	Always collected

### 1

This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the `CREATE EVENT MONITOR` for `locking` statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

### Usage

A system administrator can use this information to determine which application did not complete its updates, and determine which application should be started.

## rolled\_back\_sequence\_no - Rolled Back Sequence Number

The sequence number of the application that was rolled back when a deadlock occurred.

### Element identifier

rolled\_back\_sequence\_no

### Element type

information

Table 1897. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Deadlocks	event_deadlock	Always collected

### Usage

A system administrator can use this information to determine which application did not complete its updates, and determine which applications should be restarted.

## root\_node\_splits - Root node splits monitor element

Number of times the root node of the index was split during an insert operation.

Table 1898. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_INDEX table function - Get index metrics	Always collected

## routine\_id - Routine ID monitor element

A unique routine identifier. This monitor element returns 0 if the activity is not part of a routine.

Table 1899. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in the DETAILS XML document)	Always collected
MON_GET_AGENT table function - List agents, fenced mode processes, and system entities for the database	Always collected
MON_GET_PKG_CACHE_STMT table function	Always collected
MON_GET_PKG_CACHE_STMT_DETAILS - Get detailed metrics for package cache entries	Always collected
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	Always collected
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	Always collected
MON_GET_ROUTINE_EXEC_LIST table function - get list of statements executed by routine	Always collected
MON_GET_SECTION_ROUTINE table function - get list of routines for input section	Always collected
WLM_GET_SERVICE_CLASS_AGENTS table function - list agents running in a service class	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

Table 1900. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activitystmt	Always collected
Unit of work	uow_package_list	Always collected
Package cache	pkgcache_metrics	Always collected

### Usage

The value of this element matches a value from column ROUTINEID of view SYSCAT.ROUTINES. When the activity is part of an SQL PL routine that you declare in another SQL PL routine, the value of this element is the ROUTINEID of the outer routine.

## routine\_module\_name - Routine module name monitor element

Unqualified name of the module to which the routine belongs.

This element is NULL when the routine does not belong to a module.

---

Table 1901. Table Function Monitoring Information

---

Table Function	Monitor Element Collection Level
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	Always collected
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	Always collected
MON_GET_ROUTINE_EXEC_LIST table function - get list of statements executed by routine	Always collected
MON_GET_SECTION_ROUTINE table function - get list of routines for input section	Always collected

---

### **routine\_name - Routine name monitor element**

Unqualified name of the routine.

This element might be system generated for subroutines and dynamically prepared compound SQL statements or anonymous blocks in PL/SQL.

---

Table 1902. Table Function Monitoring Information

---

Table Function	Monitor Element Collection Level
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	Always collected
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	Always collected
MON_GET_ROUTINE_EXEC_LIST table function - get list of statements executed by routine	Always collected
MON_GET_SECTION_ROUTINE table function - get list of routines for input section	Always collected

---

### **routine\_schema - Routine schema monitor element**

Schema name of the routine when the routine does not belong to a module, otherwise this is the schema name of the module to which the routine belongs.

This element might be system generated for subroutines and dynamically prepared compound SQL statements or anonymous blocks in PL/SQL.

---

Table 1903. Table Function Monitoring Information

---

Table Function	Monitor Element Collection Level
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	Always collected
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	Always collected
MON_GET_ROUTINE_EXEC_LIST table function - get list of statements executed by routine	Always collected
MON_GET_SECTION_ROUTINE table function - get list of routines for input section	Always collected

---

## routine\_type - Routine type monitor element

Identifies the type of routine.

The routine type can be one of the following:

- C** Dynamically prepared compound SQL statement or PL/SQL anonymous block
- F** Function
- P** Procedure
- T** Trigger

Table 1904. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	Always collected
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	Always collected
MON_GET_ROUTINE_EXEC_LIST table function - get list of statements executed by routine	Always collected
MON_GET_SECTION_ROUTINE table function - get list of routines for input section	Always collected

## rows\_deleted - Rows deleted monitor element

This is the number of row deletions attempted.

Table 1905. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE

Table 1905. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_PKG_CACHE_STMT_DETAILS - Get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_TABLE table function - Get table metrics	Always collected
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	DATA OBJECT METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 1906. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic
Database	dbase_remote	Basic
Application	appl	Basic
Application	appl_remote	Basic

For snapshot monitoring, this counter can be reset.

Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmmetrics	REQUEST METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

### Usage

You can use this element to gain insight into the current level of activity within the database.

This count does not include the attempts counted in the **int\_rows\_deleted** monitor element.

## rows\_fetched - Rows fetched monitor element

The number of rows read from the table.

This monitor element is an alias of the **rows\_read** monitor element.

**Note:** This monitor element reports only the values for the member for which this information is recorded. In multimember database environments, these values might not reflect the correct totals for the whole activity.

Table 1908. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity	Statement

### Usage

See the **rows\_read** monitor element for details.

## rows\_inserted - Rows inserted monitor element

The number of row insertions attempted.

Table 1909. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 1909. Table Function Monitoring Information (continued)

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS - Get detailed metrics for package cache entries	ACTIVITY METRICS BASE

Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmmetrics	REQUEST METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

### Usage

You can use this element to gain insight into the current level of activity within the database.

In a federated system, multiple rows can be inserted, per INSERT statement, because the federated server can push INSERT FROM SUBSELECT to the data source, when appropriate.

This count does not include the attempts counted in the **int\_rows\_inserted** monitor element.

## rows\_modified - Rows modified monitor element

The number of rows inserted, updated, or deleted.

This monitor element is an alias of the **rows\_written** monitor element.

This monitor element includes activity for rows in permanent tables and temporary tables. It is possible in certain circumstances for its value to be greater than the sum of the monitor elements **rows\_inserted**, **rows\_updated**, and **rows\_deleted**.

Table 1912. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE

Connection	event_conn	Always collected
Tables	event_table	Always collected
Statements	event_stmt	Always collected
Transactions	event_xact	Always collected
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

This element helps you identify tables with heavy usage for which you may want to create additional indexes. To avoid the maintenance of unnecessary indexes, use the SQL EXPLAIN statement to determine if the package uses an index.

This count is *not* the number of rows that were returned to the calling application. Rather, it is the number of rows that had to be read in order to return the result set. For example, the following statement returns one row to the application, but many rows are read to determine the average salary:

```
SELECT AVG(SALARY) FROM USERID.EMPLOYEE
```

This count includes the value in the **overflow\_accesses** monitor element. Additionally, this count does not include any index accesses. That is, if an access plan uses index access only and the table is not touched to look at the actual row, then the value of the **rows\_read** monitor element is not incremented.

## rows\_returned - Rows returned monitor element

The rows\_returned monitor element is the number of rows that have been selected and returned to the application. This element has a value of 0 for partial activity records (for example, if an activity is collected while it is still executing or when a full activity record could not be written to the event monitor due to memory limitations).

This monitor element is an alias of the **fetch\_count** monitor element.

Table 1917. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE

Table 1917. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	REQUEST METRICS BASE

Table 1918. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## Usage

This element can be used to help determine thresholds for rows returned to the application or can be used to verify that such a threshold is configured correctly and doing its job.

### rows\_returned\_top - Actual rows returned top monitor element

The rows\_returned\_top monitor element is the high watermark for the actual rows returned of DML activities at all nesting levels in a service class or work class. For service classes, this monitor element returns -1 when COLLECT AGGREGATE ACTIVITY DATA for the service class is set to NONE. For work classes, this monitor element returns -1 if no COLLECT AGGREGATE ACTIVITY DATA work action is specified for the work class. For workloads, this monitor element returns -1 when COLLECT AGGREGATE ACTIVITY DATA for the workload is set to NONE.

For service classes, when you remap activities between service subclasses with a REMAP ACTIVITY action, only the rows\_returned\_top high watermark of the service subclass where an activity completes

is updated. High watermarks of service subclasses an activity is mapped to but does not complete in are unaffected.

*Table 1919. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected

*Table 1920. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats	-
Statistics	event_superclasstats	-
Statistics	event_wcstats	-
Statistics	event_wlstats	-

## Usage

Use this element to know the highest DML activity actual rows returned reached on a member for a service class, workload, or work class in the time interval collected.

## rows\_selected - Rows Selected

This is the number of rows that have been selected and returned to the application.

*Table 1921. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic
Database	dbase_remote	Basic
Application	appl	Basic
Application	appl_remote	Basic

For snapshot monitoring, this counter can be reset.

*Table 1922. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected
Connection	event_conn	Always collected

## Usage

You can use this element to gain insight into the current level of activity within the database.

This element does not include a count of rows read for actions such as COUNT(\*) or joins.

For a federated system;, you can compute the average time to return a row to the federated server from the data source:

```
average time = rows returned / aggregate query response time
```

You can use these results to modify CPU speed or communication speed parameters in SYSCAT.SERVERS. Modifying these parameters can impact whether the optimizer does or does not send requests to the data source.

**Note:** This element is collected at the dcs\_dbase and dcs\_appl snapshot monitor logical data groups if the gateway being monitored is at Db2 database version 7.2 or lower.

## rows\_updated - Rows updated monitor element

This is the number of row updates attempted.

Table 1923. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS - Get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_TABLE table function - Get table metrics	Always collected
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	DATA OBJECT METRICS BASE

Table 1923. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 1924. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic
Database	dbase_remote	Basic
Application	appl	Basic
Application	appl_remote	Basic

For snapshot monitoring, this counter can be reset.

Table 1925. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Connection	event_conn	Always collected
Database	event_db	Always collected
Package cache	pkgcache_metrics	ACTIVITY METRICS BASE
Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmmetrics	REQUEST METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

### Usage

You can use this element to gain insight into the current level of activity within the database.

This value does not include updates counted in the **int\_rows\_updated** monitor element. However, rows that are updated by more than one update statement are counted for each update.

### rows\_written - Rows Written

This is the number of rows changed (inserted, deleted or updated) in the table.

Table 1926. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table	table	Basic
Application	appl	Basic
Application	stmt	Basic
Application	subsection	Statement
Dynamic SQL	dynsql	Statement

For snapshot monitoring, this counter can be reset.

Table 1927. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Connection	event_conn	Always collected
Tables	event_table	Always collected
Statements	event_stmt	Always collected
Transactions	event_xact	Always collected

### Usage

A high value for table-level information indicates there is heavy usage of the table and you may want to use the Run Statistics (RUNSTATS) utility to maintain efficiency of the packages used for this table.

For application-connections, statements, and dynsql logical data groupings, this element includes the number of rows inserted, updated, and deleted in temporary tables. It is possible in certain circumstances for its value to be greater than the sum of the monitor elements **rows\_inserted**, **rows\_updated**, and **rows\_deleted**.

At the application, transaction, and statement levels, this element can be useful for analyzing the relative activity levels, and for identifying candidates for tuning.

### rqsts\_completed\_total - Total requests completed monitor element

The total number of requests executed, including both application and internal requests. For service subclasses, this monitor element is only updated where the request completes. If the request moved between different service subclasses, it is not counted twice.

Table 1928. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE

Table 1928. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 1929. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

### **rts\_rows\_modified - Rows modified since last real time statistics monitor element**

Returns the number of rows modified since last real-time statistics collection.

Table 1930. Table function monitoring information

Table function	Monitor element collection level
ADMIN_GET_TAB_INFO table function - retrieve table size and state information	Always collected
MON_GET_TABLE table function - get table metrics	Always collected

## Usage

Use this element and the *stats\_rows\_modified* monitor element to help determine if a running of the RUNSTATS command is required.

After a TRUNCATE TABLE statement is run, this element displays the value -1 until a RUNSTATS command is run against the table.

## S

### savepoint\_id - Savepoint ID

The ID of the savepoint set within a unit of work.

Table 1931. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Change History	DDLSTMTEEXEC TXNCOMPLETION	Always collected

### sc\_work\_action\_set\_id - Service class work action set ID monitor element

If this activity has been categorized into a work class of service class scope, this monitor element displays the ID of the work action set associated with the work class set to which the work class belongs. Otherwise, this monitor element displays the value of 0. This monitor element is an alias for the *service\_class\_work\_action\_set\_id* element.

## Usage

This element can be used with the *sc\_work\_class\_id* element to uniquely identify the service class work class of the activity, if one exists.

### sc\_work\_class\_id - Service class work class ID monitor element

If this activity has been categorized into a work class of service class scope, this monitor element displays the ID of the work class assigned to this activity. Otherwise, this monitor element displays the value of 0. This monitor element is an alias for the *service\_class\_work\_class\_id* element.

## Usage

This element can be used with the *sc\_work\_action\_set\_id* element to uniquely identify the service class work class of the activity, if one exists.

### sec\_log\_used\_top - Maximum Secondary Log Space Used

The maximum amount of secondary log space used (in bytes).

Table 1932. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TRANSACTION_LOG table function - Get log information	Always collected

Table 1933. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic

---

Table 1934. Event Monitoring Information

---

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected

---

#### Usage

You may use this element in conjunction with *sec\_logs\_allocated* and *tot\_log\_used\_top* to show your current dependency on secondary logs. If this value is high, you may need larger log files, or more primary log files, or more frequent COMMIT statements within your application.

As a result, you may need to adjust the following configuration parameters:

- logfilsiz
- logprimary
- logsecond
- logarchmeth1

The value will be zero if the database does not have any secondary log files. This would be the case if there were none defined.

**Note:** While the database system monitor information is given in bytes, the configuration parameters are set in pages, which are each 4K bytes.

### sec\_logs\_allocated - Secondary Logs Allocated Currently

The total number of secondary log files that are currently being used for the database.

---

Table 1935. Table Function Monitoring Information

---

Table Function	Monitor Element Collection Level
MON_GET_TRANSACTION_LOG table function - Get log information	Always collected

---

---

Table 1936. Snapshot Monitoring Information

---

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic

---

#### Usage

You may use this element in conjunction with *sec\_log\_used\_top* and *tot\_log\_used\_top* to show your current dependency on secondary logs. If this value is consistently high, you may need larger log files, or more primary log files, or more frequent COMMIT statements within your application.

As a result, you may need to adjust the following configuration parameters:

- logfilsiz
- logprimary
- logsecond
- logarchmeth1

## section\_actuals - Section actuals monitor element

A binary string generated at the data server containing runtime statistics for a section that was executed. If section capture or actuals collection are not enabled, the value is a 0 length string. For non-SQL activities (for example, LOAD) the value is a 0 length string.

Table 1937. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity	Always collected

### Usage

The data collected in the **section\_actuals** monitor element or per connection using WLM\_SET\_CONN\_ENV is used when a section explain is performed using the EXPLAIN\_FROM\_ACTIVITY stored procedure. This data is used during EXPLAIN processing to populate the EXPLAIN\_ACTUALS explain table and represents the runtime statistics for the operators in the access plan.

#### Note:

- Section actuals are only available if they have been enabled (set to BASE) using the **section\_actuals** database configuration parameter or if they have been enabled for a particular application using the WLM\_SET\_CONN\_ENV stored procedure. For more information describing the stored procedure, see [WLM\\_SET\\_CONN\\_ENV](#).
- The collection of **section actuals** can be controlled by specifying the INCLUDE ACTUALS BASE clause of workload management DDL statements.
- The **section\_actuals** setting specified by the WLM\_SET\_CONN\_ENV procedure for an application takes effect immediately.

## section\_env - Section environment monitor element

A blob that contains the section for an SQL statement. It is the actual section contents, that is the executable form of the query plan.

Table 1938. Table function monitoring information

Table function	Monitor element collection level
MON_GET_SECTION table function - Get a copy of a section from the package cache	Always collected

Table 1939. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activitystmt	Always collected
Package cache	pkgcache	COLLECT DETAILED DATA

### Usage

Use this element with the section explain procedures to explain the statement and view the access plan for the statement.

## section\_exec\_with\_col\_references - Section execution with column-organized references monitor element

This element counts the number of section executions that referenced columns in a table using a scan.

Table 1940. Table function monitoring information

Table function	Monitor element collection level
MON_GET_TABLE table function - get table metrics	DATA OBJECT METRICS EXTENDED

### Usage

This element and the **num\_columns\_referenced** element can be used to determine the average number of columns being accessed from a table during execution of the runtime section for an SQL statement. This average column access count can help identify row-organized tables that might be candidates for conversion to column-organized tables (for example, wide tables where only a few columns are typically accessed).

The element can also be used to help understand the efficiency of access to column-organized tables (for example, the number of columns typically read when scanning the table).

## section\_number - Section number monitor element

The internal section number in the package for an SQL statement.

Table 1941. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	Always collected
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	Always collected
MON_GET_ROUTINE_EXEC_LIST table function - get list of statements executed by routine	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - return a list of activities	Always collected

Table 1942. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	stmt	Statement
DCS Statement	dcs_stmt	Statement

Table 1943. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activitystmt	Always collected
Deadlocks with Details <sup>1</sup>	event_detailed_dlconn	-

Table 1943. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Locking	lock_participant_activities	Always collected
Package cache	pkgcache	Always collected
Statements	event_stmt	-

**1**

This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the `CREATE EVENT MONITOR` for locking statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

**Usage**

For static SQL statements, you can use this element along with **creator**, **package\_version\_id**, and **package\_name** monitor elements to query the SYSCAT.STATEMENTS system catalog table and obtain the static SQL statement text, using the sample query as follows:

```
SELECT SEQNO, SUBSTR(TEXT,1,120)
FROM SYSCAT.STATEMENTS
WHERE PKGNAME = 'package_name' AND
      PKGSHEMA = 'creator' AND
      VERSION = 'package_version_id' AND
      SECTNO = section_number
ORDER BY SEQNO
```

**Note:** Exercise caution in obtaining static statement text, because this query against the system catalog table could cause lock contention. Whenever possible, only use this query when there is little other activity against the database.

**section\_type - Section type indicator monitor element**

Indicates whether the SQL statement section is dynamic or static.

Table 1944. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	Always collected
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	Always collected
MON_GET_ROUTINE_EXEC_LIST table function - get list of statements executed by routine	Always collected
MON_GET_SECTION table function - Get a copy of a section from the package cache	Always collected

Table 1945. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Package cache	-	Always collected

## Usage

The possible values for this monitor element are:

- D: dynamic
- S: static

## select\_sql\_stmts - Select SQL Statements Executed

The number of SQL SELECT statements that were executed.

*Table 1946. Table function monitoring information*

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics	REQUEST METRICS BASE

Table 1947. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic
Database	dbase_remote	Basic
Table Space	tablespace	Basic
Application	appl	Basic
Application	appl_remote	Basic

For snapshot monitoring, this counter can be reset.

Table 1948. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Connection	event_conn	Always collected
Database	event_db	Always collected
Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmmetrics	REQUEST METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

### Usage

You can use this element to determine the level of database activity at the application or database level.

You can also use the following formula to determine the ratio of SELECT statements to the total statements:

```
select_sql_stmts
/ ( static_sql_stmts
+ dynamic_sql_stmts )
```

This information can be useful for analyzing application activity and throughput.

### select\_time - Query Response Time

This element contains the aggregate amount of time, in milliseconds, that it has taken this data source to respond to queries from all applications or a single application running on this federated server instance since the start of the federated server instance or the last reset of the database monitor counters. The monitor stores the most recent of the values.

**Note:** Due to query blocking, not all attempts by the federated server to retrieve a row result in communication processing; the request to get the next row can potentially be satisfied from a block of returned rows. As a result, the aggregate query response time does not always indicate processing at the data source, but it usually indicates processing at either the data source or client.

Table 1949. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase_remote	Timestamp
Application	appl_remote	Timestamp

For snapshot monitoring, this counter can be reset.

## Usage

Use this element to determine how much actual time is spent waiting for data from this data source. This can be useful in capacity planning and tuning the CPU speed and communication rates in SYSCAT.SERVERS. Modifying these parameters can impact whether the optimizer does or does not send requests to the data source.

The response time is measured as the difference in time between the time the federated server requests a row from the data source, and the time the row is available for the federated server to use.

## semantic\_env\_id - Query semantic compilation environment ID monitor element

A hash key value for identifying the elements of the query compilation environment that have an effect on the semantics of an SQL statement.

This hash value is computed over the default schema and function path elements in the compilation environment.

A value of 1 means the default schema and function path were not used during the compilation of the statement. The function path is treated as not being used if only functions in the SYSIBM schema are accessed and SYSIBM is the first entry in the function path.

A value of 0 means the query semantic environment ID is not available. An example where the query semantic environment ID is not available is if the statement was compiled on a release of Db2 before Version 10.5 Fix Pack 3.

*Table 1950. Table function monitoring information*

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Return information about an activity as an XML document	Always collected
MON_GET_PKG_CACHE_STMT table function - Get package cache statement metrics	Always collected
MON_GET_PKG_CACHE_STMT_DETAILS table function - Get package cache statement metrics as an XML document	Always collected
WLM_GET_WORKLOAD_OCCURENCE_ACTIVITIES table function - Return a list of activities	Always collected

*Table 1951. Event monitoring information*

Event type	Logical data grouping	Monitor switch
Activities	event_activitystmt	Always collected
Package cache	pkgcache	Always collected

## Usage

Use this element with the query statement ID monitor element (**stmtid**) to identify an SQL statement. The semantic compilation environment ID is used to distinguish queries that have the same statement text, but are semantically different because they reference different objects. For example, the table that is referenced in the statement `SELECT * FROM T1` depends on the value of the default schema in the

compilation environment. If two users with different default schemas issued this statement, there would be two entries for the statement in the package cache. The two entries would have the same **stmtid** value, but would have different values for **semantic\_env\_id**.

### sequence\_no - Sequence number monitor element

This identifier is incremented whenever a unit of work ends (that is, when a COMMIT or ROLLBACK terminates a unit of work). Together, the **appl\_id** and **sequence\_no** uniquely identify a transaction.

*Table 1952. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl_id_info	Basic
DCS Application	dc_s_appl_info	Basic

*Table 1953. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Connection	event_conn	-
Connections	event_connheader	-
Statements	event_stmt	-
Transactions	event_xact	-
Deadlocks	event_dlconn	-
Deadlocks with Details	event_detailed_dlconn	-
Deadlocks with Details History	event_detailed_dlconn	-
Deadlocks with Details History	event_stmt_history	-
Deadlocks with Details History Values	event_detailed_dlconn	-
Deadlocks with Details History Values	event_stmt_history	-

### sequence\_no\_holding\_lk - Sequence Number Holding Lock

The sequence number of the application that is holding a lock on the object that this application is waiting to obtain.

#### Element identifier

sequence\_no\_holding\_lk

#### Element type

information

*Table 1954. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl	Basic
Lock	appl_lock_list	Basic

Table 1955. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Deadlocks	event_dlconn	Always collected
Deadlocks with Details	event_detailed_dlconn	Always collected

#### Usage

This identifier is used in tandem with `appl_id` to uniquely identify a transaction that is holding a lock on the object that this application is waiting to obtain.

## server\_db2\_type - Database Manager Type at Monitored (Server) Node

Identifies the type of database manager being monitored.

Table 1956. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	collected	Basic

#### Usage

It contains one of the following types of configurations for the database manager:

#### API Symbolic Constant

##### Command Line Processor Output

#### `sqlf_nt_server`

Database server with local and remote clients

#### `sqlf_nt_stand_req`

Database server with local clients

The API symbolic constants are defined in the include file `sqlutil.h`.

## server\_instance\_name - Server Instance Name

The name of the database manager instance for which the snapshot was taken.

#### Element identifier

`server_instance_name`

#### Element type

information

Table 1957. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	collected	Basic

Table 1958. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Event Log Header	event_log_header	Always collected

#### Usage

If more than one instance of the database manager is present on the same system, this data item is used to uniquely identify the instance for which the snapshot call was issued. This information can be useful if you are saving your monitor output in a file or database for later analysis, and you need to differentiate the data from different instances of the database manager.

## server\_list\_entry\_member - Member ID for the member in the server list monitor element

The member ID of the member specified in the server list entry.

Table 1959. Table function monitoring information

Table function	Monitor element collection level
MON_GET_SERVERLIST table function - get member priority details	Always collected

## server\_platform - Server Operating System

The operating system running the database server.

Table 1960. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_INSTANCE table function - Get instance level information	Always collected

Table 1961. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic

Table 1962. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected

### Usage

This element can be used for problem determination for remote applications. Values for this field can be found in the header file *sqlmon.h*.

## server\_prdid - Server Product/Version ID

The product and version that is running on the server.

Table 1963. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	collected	Basic

Table 1964. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Event Log Header	event_log_header	-

### Usage

It is in the form PPPVRRM, where:

**PPP**  
is SQL

**VV**

identifies a 2-digit version number (with high-order 0 in the case of a 1-digit version)

**RR**

identifies a 2-digit release number (with high-order 0 in the case of a 1-digit release)

**M**

identifies a 1-character modification level (0-9 or A-Z)

**server\_version - Server Version**

The version of the server returning the information.

*Table 1965. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	collected	Basic

**Usage**

This field identifies the level of the database server collecting database system monitor information. This allows applications to interpret the data based on the level of the server returning the data. Valid values are:

**SQLM\_DBMON\_VERSION1**

Data was returned by Db2 Version 1

**SQLM\_DBMON\_VERSION2**

Data was returned by Db2 Version 2

**SQLM\_DBMON\_VERSION5**

Data was returned by Db2 Universal Database Version 5

**SQLM\_DBMON\_VERSION5\_2**

Data was returned by Db2 Universal Database Version 5.2

**SQLM\_DBMON\_VERSION6**

Data was returned by Db2 Universal Database Version 6

**SQLM\_DBMON\_VERSION7**

Data was returned by Db2 Universal Database Version 7

**SQLM\_DBMON\_VERSION8**

Data was returned by Db2 Universal Database Version 8

**SQLM\_DBMON\_VERSION9**

Data was returned by Db2 Version 9

**SQLM\_DBMON\_VERSION9\_5**

Data was returned by Db2 Version 9.5

**service\_class\_id - Service class ID monitor element**

Unique ID of service subclass. For a unit of work, this ID represents the service subclass ID of the workload with which the connection issuing the unit of work is associated.

*Table 1966. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected

Table 1966. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	Always collected
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics	Always collected
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics	Always collected
MON_SAMPLE_SERVICE_CLASS_METRICS - Get sample service class metrics	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

Table 1967. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	Always collected
Locking	-	Always collected
Unit of work	-	Always collected
Statistics	event_histogrambin	Always collected
Statistics	event_scstats (reported in the metrics document)	Always collected
Statistics	event_scstats	Always collected
Statistics	event_superclasstats	Always collected

## Usage

The value of this element matches a value from column SERVICECLASSID of view SYSCAT.SERVICECLASSES. Use this element to look up the service subclass name, or link information about a service subclass from different sources. For example, join service class statistics with histogram bin records.

The value of this element is 0 when the following conditions are met:

- The element is reported in an event\_histogrambin logical data group.
- The histogram data is collected for an object that is not a service class.

## service\_class\_work\_action\_set\_id - Service class work action set ID monitor element monitor element

If this activity has been categorized into a work class of service class scope, this monitor element displays the ID of the work action set associated with the work class set to which the work class belongs. Otherwise, this monitor element displays the value of 0.

Table 1968. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

Table 1969. Event monitoring information

Event type	Logical data grouping	Monitor switch
Activities	event_activity	Always collected

### Usage

This monitor element is an alias for the `sc_work_action_set_id` monitor element.

## service\_class\_work\_class\_id - Service class work class ID monitor element monitor element

If this activity has been categorized into a work class of service class scope, this monitor element displays the ID of the work class assigned to this activity. Otherwise, this monitor element displays the value of 0.

Table 1970. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

Table 1971. Event monitoring information

Event type	Logical data grouping	Monitor switch
Activities	event_activity	Always collected

### Usage

This monitor element is an alias for the `sc_work_class_id` monitor element.

## service\_level - Service Level

This is the current corrective service level of the database instance.

Table 1972. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_INSTANCE table function - Get instance level information	Always collected

Table 1973. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	db2	Basic

## service\_subclass\_name - Service subclass name monitor element

The name of a service subclass.

Table 1974. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_AGENT table function - List agents, fenced mode processes, and system entities for the database	Always collected
MON_GET_QUEUE_STATS table function - Return threshold queue statistics	Always collected
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	Always collected
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	Always collected
MON_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	Always collected
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	Always collected
MON_GET_WLM_ADMISSION_QUEUE table function - Return a list of queued activities	Always Collected
MON_SAMPLE_SERVICE_CLASS_METRICS - Get sample service class metrics	Always collected

Table 1974. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
WLM_GET_QUEUE_STATS table function - Return threshold queue statistics	Always collected
WLM_GET_SERVICE_CLASS_AGENTS table function - list agents running in a service class	Always collected
WLM_GET_SERVICE_CLASS_WORKLOAD_OCCURRENCES table function - list workload occurrences	Always collected
WLM_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	Always collected

Table 1975. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the details_xml document)	Always collected
Locking	-	Always collected
Unit of work	-	Always collected
Activities	event_activity	Always collected
Statistics	event_scstats	Always collected
Statistics	event_superclasstats	Always collected
Statistics	event_qstats	Always collected

## Usage

Use this element in conjunction with other activity elements for analysis of the behavior of an activity or with other statistics elements for analysis of a service class or threshold queue.

## service\_superclass\_name - Service superclass name monitor element

The name of a service superclass.

Table 1976. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_AGENT table function - List agents, fenced mode processes, and system entities for the database	Always collected
MON_GET_QUEUE_STATS table function - Return threshold queue statistics	Always collected
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	Always collected
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	Always collected

Table 1976. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	Always collected
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	Always collected
MON_GET_WLM_ADMISSION_QUEUE table function - Return a list of queued activities	Always Collected
MON_SAMPLE_SERVICE_CLASS_METRICS - Get sample service class metrics	Always collected
WLM_GET_QUEUE_STATS table function - Return threshold queue statistics	Always collected
WLM_GET_SERVICE_CLASS_AGENTS table function - list agents running in a service class	Always collected
WLM_GET_SERVICE_CLASS_WORKLOAD_OCCURRENCES table function - list workload occurrences	Always collected
WLM_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	Always collected
WLM_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected

Table 1977. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the details_xml document)	Always collected
Unit of work	-	Always collected
Activities	event_activity	Always collected
Statistics	event_scstats	Always collected
Statistics	event_superclassstats	Always collected
Statistics	event_qstats	Always collected

## Usage

Use this element in conjunction with other activity elements for analysis of the behavior of an activity or with other statistics elements for analysis of a service class or threshold queue.

### **session\_auth\_id - Session authorization ID monitor element**

The current authorization ID for the session being used by this application.

For monitoring workload management activities, this monitor element describes the session authorization ID under which the activity was injected into the system.

This monitor element is a synonym for the **session\_authid monitor element**.

*Table 1978. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_AGENT table function - List agents, fenced mode processes, and system entities for the database	Always collected
MON_GET_CONNECTION table function - Get connection metrics	Always collected
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	Always collected
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	Always collected
MON_GET_UTILITY table function - Get utilities running on the database	Always collected
WLM_GET_SERVICE_CLASS_AGENTS table function - list agents running in a service class	Always collected
WLM_GET_SERVICE_CLASS_WORKLOAD_OCCURRENCES table function - list workload occurrences	Always collected

*Table 1979. Snapshot Monitoring Information*

<b>Snapshot Level</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Application	appl_info	Basic
Lock	appl_lock_list	Basic

*Table 1980. Event Monitoring Information*

<b>Event Type</b>	<b>Logical Data Grouping</b>	<b>Monitor Element Collection Level</b>
Activities	event_activity	Always collected
Change history	changesummary	Always collected
Threshold violations	event_activity	Always collected

Table 1980. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Element Collection Level
Unit of work	uow	Always collected

## Usage

You can use this element to determine what authorization ID is being used to prepare SQL statements, execute SQL statements, or both. This monitor element does not report any session authorization ID values set within executing stored procedures.

## session\_priority - Session priority monitor element

The priority of the activity which is compared against other work in the same superclass to help determine admission ordering.

**Note:** This monitor element is available in Db2version 11.5.4 and later.

Table 1981. Table function monitoring information	
Table function	Monitor element collection level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
MON_GET_CONNECTION table function - Get connection metrics	Always collected
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	Always collected
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	Always collected
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get service subclass metrics as an XML document	Always collected
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	Always collected
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	Always collected
<u>MON_GET_WLM_ADMISSION_QUEUE</u> table function - Return a list of queued activities	Always collected
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	Always collected

Table 1982. Event monitoring information

Event type	Logical data grouping	Monitor switch
Activity	event_activity	Always collected
Package cache	pkgcache	Always collected
Statistics	event_wlmetrics	Always collected
Statistics	event_scmetrics	Always collected
Unit of work	uow_metrics	Always collected

### shr\_workspace\_active - Shared workspace active memory monitor element

The working copy of any executable section is stored in a shared SQL workspace. This element identifies the workspace's amount of memory that is currently in use by active database connections. This memory is not eligible for freeing because the active database connections are running SQL in their current transactions.

Table 1983. Table function monitoring information

Table function	Monitor element collection level
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE

### shr\_workspace\_inactive - Shared workspace inactive memory monitor element

The working copy of any executable section is stored in a shared SQL workspace. This element identifies the workspace's amount of memory that is not in use by active database connections.

These working copies of the executable section can be reused by a database connection. However, if the working copy is not reused, it might be deleted if more memory is needed for additional working copies.

Table 1984. Table function monitoring information

Table function	Monitor element collection level
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE

### shr\_workspace\_num\_overflows - Shared Workspace Overflows

The number of times that shared workspaces overflowed the bounds of their allocated memory.

**Note:** This monitor element has been discontinued. Using this monitor element will not generate an error. However, it does not return a valid value.

Table 1985. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic
Application	appl	Basic

For snapshot monitoring, this counter can be reset.

*Table 1986. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected
Connection	event_conn	Always collected

#### Usage

Use this element with shr\_workspace\_size\_top to determine whether the size of the Shared Workspaces need to be increased to avoid overflowing. Overflows of Shared Workspaces may cause performance degradation as well as out of memory errors from the other heaps allocated out of application shared memory.

At the database level, the element reported will be from the same shared workspace as that which was reported as having the Maximum Shared Workspace Size. At the application level, it is the number of overflows for the workspace used by the current application.

### shr\_workspace\_section\_inserts - Shared Workspace Section Inserts

Number of inserts of SQL sections by applications into shared workspaces.

**Note:** This monitor element has been discontinued. Using this monitor element will not generate an error. However, it does not return a valid value.

*Table 1987. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic
Application	appl	Basic

For snapshot monitoring, this counter can be reset.

*Table 1988. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected
Connection	event_conn	Always collected

#### Usage

The working copy of executable sections are stored in shared workspaces. This counter indicates when a copy was not available and had to be inserted.

At the database level, it is the cumulative total of all inserts for every application across all shared workspaces in the database. At the application level, it is the cumulative total of all inserts for all sections in the shared workspace for this application.

### shr\_workspace\_section\_lookups - Shared Workspace Section Lookups

Lookups of SQL sections by applications in shared workspaces.

**Note:** This monitor element has been discontinued. Using this monitor element will not generate an error. However, it does not return a valid value.

*Table 1989. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic

Table 1989. Snapshot Monitoring Information (continued)

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl	Basic

For snapshot monitoring, this counter can be reset.

Table 1990. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected
Connection	event_conn	Always collected

### Usage

Each application has access to a shared workspace where the working copy of executable sections are kept.

This counter indicates how many times shared workspaces were accessed in order to locate a specific section for an application. At the database level, it is the cumulative total of all lookups for every application across all Shared Workspaces in the database. At the application level, it is the cumulative total of all lookups for all sections in the shared workspace for this application.

You can use this element in conjunction with Shared Workspace Section Inserts to tune the size of shared workspaces. The size of the shared workspace is controlled by the `app_ctl_heap_sz` configuration parameter.

## shr\_workspace\_size\_top - Maximum Shared Workspace Size

The largest size reached by shared workspaces.

**Note:** This monitor element has been discontinued. Using this monitor element will not generate an error. However, it does not return a valid value.

Table 1991. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic
Application	appl	Basic

Table 1992. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected
Connection	event_conn	Always collected

### Usage

This element indicates the maximum number of bytes the shared workspaces required for the workload run against the database since it was activated. At the database level, it is the maximum size reached by all of the shared workspaces. At the application level, it is the maximum size of the shared workspace used by the current application.

If a shared workspace overflowed, then this element contains the largest size reached by that shared workspace during the overflow. Check Shared Workspace Overflows to determine if such a condition occurred.

When the shared workspace overflows, memory is temporarily borrowed from other entities in application shared memory. This can result in memory shortage errors from these entities or possibly performance degradation. You can reduce the chance of overflow by increasing APP\_CTL\_HEAP\_SZ.

## skipped\_prefetch\_col\_p\_reads - Skipped prefetch column-organized physical reads monitor element

The number of column-organized pages that an I/O server (prefetcher) skipped because the pages were already loaded into the buffer pool.

Table 1993. Table function monitoring information

Table function	Monitor element collection level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

### Usage

This monitor element, along with the other **skipped\_prefetch\_\*\_p\_reads** elements tells you the number of times a page that was scheduled for retrieval by a prefetcher was not prefetched because it was already in a buffer pool. Pages that are already in a buffer pool might be there for a number of reasons:

- The page is a new page and is not yet created on disk.
- Another agent might need the same page, and thus it was loaded it into the buffer pool by a different prefetch request. In this case, along with the preceding one, an increase in skipped prefetch requests might not be a problem, because the additional prefetch request that was generated was redundant.
- An agent retrieved them from disk directly before the prefetcher was able to complete the prefetch operation. Agents might be forced to read a page directly from disk if a system has an insufficient number of prefetchers configured, or if there is another type of prefetching bottleneck. . For example, in an OLTP system, where most of the workload is generally transactional in nature, it might be the case that the minimum number of prefetchers is configured by setting the **num\_ioservers** configuration parameter to 1. However, if an operation that uses prefetching, such as a table scan is performed, the single prefetcher might not be able to keep up, and so the agent requests the pages directly. This behavior can cause a degradation in performance, because the application waits on IO that otherwise would have been performed by prefetchers. In this case, consider increasing the number of prefetchers by adjusting the **num\_ioservers** configuration parameter. Other potential causes include having an excessively large prefetch size, which can cause prefetch times that are longer than normal, or the **db2\_parallel\_io** registry variable not being set, which can restrict parallel prefetching within a table space container.

The **skipped\_prefetch\_\*\_p\_reads** elements tell you about all skipped read requests, regardless of the reason the read was skipped. To see how many requests were skipped because an agent from the same unit of work performed a read before the prefetcher was able to retrieve the page, examine the **skipped\_prefetch\_uow\_\*\_p\_reads** monitor elements.

## skipped\_prefetch\_data\_p\_reads - Skipped prefetch data physical reads monitor element

The number of data pages that an I/O server (prefetcher) skipped because the pages were already loaded into the buffer pool.

Table 1994. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

### Usage

This monitor element, along with the other **skipped\_prefetch\_\*\_p\_reads** elements tells you the number of times a page that was scheduled for retrieval by a prefetcher was not prefetched because it was already in a buffer pool. Pages that are already in a buffer pool might be there for a number of reasons:

- The page is a new page, and is not yet created on disk.
- Another agent might need the same page, and thus it was loaded it into the buffer pool by a different prefetch request. In this case, along with the preceding one, an increase in skipped prefetch requests might not be a problem, because the additional prefetch request that was generated was redundant.
- An agent retrieved them from disk directly before the prefetcher was able to complete the prefetch operation. Agents might be forced to read a page directly from disk if a system has an insufficient number of prefetchers configured, or if there is another type of prefetching bottleneck. . For example, in an OLTP system, where most of the workload is generally transactional in nature, it might be the case that the minimum number of prefetchers is configured by setting the configuration parameter **num\_ioservers** to 1. However, if an operation that uses prefetching, such as a table scan is performed, the single prefetcher might not be able to keep up, and so the agent requests the pages directly. This behavior can cause a degradation in performance, because the application waits on IO that otherwise would have been performed by prefetchers. In this case, consider increasing the number of prefetchers by adjusting the configuration parameter **num\_ioservers**. Other potential causes include having an excessively large prefetch size, which can cause prefetch times that are longer than normal, or the **db2\_parallel\_io** registry variable not being set, which can restrict parallel prefetching within a table space container.

The **skipped\_prefetch\_\*\_p\_reads** elements tell you about all skipped read requests, regardless of the reason the read was skipped. To see how many requests were skipped because an agent from the same unit of work performed a read before the prefetcher was able to retrieve the page, examine the **skipped\_prefetch\_uow\_\*\_p\_reads** monitor elements.

## skipped\_prefetch\_index\_p\_reads - Skipped prefetch index physical reads monitor element

The number of index pages that an I/O server (prefetcher) skipped because the pages were already loaded into the buffer pool.

Table 1995. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

### Usage

This monitor element, along with the other **skipped\_prefetch\_\*\_p\_reads** elements tells you the number of times a page that was scheduled for retrieval by a prefetcher was not prefetched because it was already in a buffer pool. Pages that are already in a buffer pool might be there for a number of reasons:

- The page is a new page, and is not yet created on disk.
- Another agent might need the same page, and thus it was loaded it into the buffer pool by a different prefetch request. In this case, along with the preceding one, an increase in skipped prefetch requests might not be a problem, because the additional prefetch request that was generated was redundant.
- An agent retrieved them from disk directly before the prefetcher was able to complete the prefetch operation. Agents might be forced to read a page directly from disk if a system has an insufficient number of prefetchers configured, or if there is another type of prefetching bottleneck. . For example, in an OLTP system, where most of the workload is generally transactional in nature, it might be the case that the minimum number of prefetchers is configured by setting the configuration parameter **num\_ioservers** to 1. However, if an operation that uses prefetching, such as a table scan is performed, the single prefetcher might not be able to keep up, and so the agent requests the pages directly. This behavior can cause a degradation in performance, because the application waits on IO that otherwise would have been performed by prefetchers. In this case, consider increasing the number of prefetchers by adjusting the configuration parameter **num\_ioservers**. Other potential causes include having an excessively large prefetch size, which can cause prefetch times that are longer than normal, or the **db2\_parallel\_io** registry variable not being set, which can restrict parallel prefetching within a table space container.

## Usage

This monitor element, along with the other **skipped\_prefetch\_\*\_p\_reads** elements tells you the number of times a page that was scheduled for retrieval by a prefetcher was not prefetched because it was already in a buffer pool. Pages that are already in a buffer pool might be there for a number of reasons:

- The page is a new page, and is not yet created on disk.
- Another agent might need the same page, and thus it was loaded it into the buffer pool by a different prefetch request. In this case, along with the preceding one, an increase in skipped prefetch requests might not be a problem, because the additional prefetch request that was generated was redundant.
- An agent retrieved them from disk directly before the prefetcher was able to complete the prefetch operation. Agents might be forced to read a page directly from disk if a system has an insufficient number of prefetchers configured, or if there is another type of prefetching bottleneck. . For example, in an OLTP system, where most of the workload is generally transactional in nature, it might be the case that the minimum number of prefetchers is configured by setting the configuration parameter **num\_ioservers** to 1. However, if an operation that uses prefetching, such as a table scan is performed, the single prefetcher might not be able to keep up, and so the agent requests the pages directly. This behavior can cause a degradation in performance, because the application waits on IO that otherwise would have been performed by prefetchers. In this case, consider increasing the number of prefetchers by adjusting the configuration parameter **num\_ioservers**. Other potential causes include having an excessively large prefetch size, which can cause prefetch times that are longer than normal, or the **db2\_parallel\_io** registry variable not being set, which can restrict parallel prefetching within a table space container.

The **skipped\_prefetch\_\*\_p\_reads** elements tell you about all skipped read requests, regardless of the reason the read was skipped. To see how many requests were skipped because an agent from the same unit of work performed a read before the prefetcher was able to retrieve the page, examine the **skipped\_prefetch\_uow\_\*\_p\_reads** monitor elements.

## skipped\_prefetch\_temp\_xda\_p\_reads - Skipped prefetch temporary XDA data physical reads monitor element

The number of XML storage object (XDA) data pages for temporary table spaces that an I/O server (prefetcher) skipped because the pages were already loaded into the buffer pool.

Table 1999. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

## Usage

This monitor element, along with the other **skipped\_prefetch\_\*\_p\_reads** elements tells you the number of times a page that was scheduled for retrieval by a prefetcher was not prefetched because it was already in a buffer pool. Pages that are already in a buffer pool might be there for a number of reasons:

- The page is a new page, and is not yet created on disk.
- Another agent might need the same page, and thus it was loaded it into the buffer pool by a different prefetch request. In this case, along with the preceding one, an increase in skipped prefetch requests might not be a problem, because the additional prefetch request that was generated was redundant.
- An agent retrieved them from disk directly before the prefetcher was able to complete the prefetch operation. Agents might be forced to read a page directly from disk if a system has an insufficient number of prefetchers configured, or if there is another type of prefetching bottleneck. . For example, in an OLTP system, where most of the workload is generally transactional in nature, it might be the case that the minimum number of prefetchers is configured by setting the configuration parameter **num\_ioservers** to 1. However, if an operation that uses prefetching, such as a table scan is performed, the single prefetcher might not be able to keep up, and so the agent requests the pages directly. This behavior can cause a degradation in performance, because the application waits on IO that otherwise would have been performed by prefetchers. In this case, consider increasing the number of prefetchers by adjusting the configuration parameter **num\_ioservers**. Other potential causes include having an excessively large prefetch size, which can cause prefetch times that are longer than normal, or the **db2\_parallel\_io** registry variable not being set, which can restrict parallel prefetching within a table space container.

The **skipped\_prefetch\_\*\_p\_reads** elements tell you about all skipped read requests, regardless of the reason the read was skipped. To see how many requests were skipped because an agent from the same unit of work performed a read before the prefetcher was able to retrieve the page, examine the **skipped\_prefetch\_uow\_\*\_p\_reads** monitor elements.

## skipped\_prefetch\_uow\_col\_p\_reads - Skipped prefetch unit of work column-organized physical reads monitor element

The number of column-organized pages that an I/O server (prefetcher) skipped because the pages were already loaded into the buffer pool by an agent in the same unit of work.

*Table 2000. Table function monitoring information*

Table function	Monitor element collection level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

## Usage

This monitor element, along with the other **skipped\_prefetch\_uow\_\*\_p\_reads** elements tells you the number of pages that were in a prefetch request that were read directly by an agent in the same unit of work that caused the prefetch request to be created. Agents might be forced to read a page directly from disk if a system has an insufficient number of prefetchers configured, or if there is another type of prefetching bottleneck. . For example, in an OLTP system, where most of the workload is generally transactional in nature, it might be the case that the minimum number of prefetchers is configured by

setting the **num\_ioservers** configuration parameter to 1. However, if an operation that uses prefetching, such as a table scan is performed, the single prefetcher might not be able to keep up, and so the agent requests the pages directly. This behavior can cause a degradation in performance, because the application waits on IO that otherwise would have been performed by prefetchers. In this case, consider increasing the number of prefetchers by adjusting the **num\_ioservers** configuration parameter. Other potential causes include having an excessively large prefetch size, which can cause prefetch times that are longer than normal, or the **db2\_parallel\_io** registry variable not being set, which can restrict parallel prefetching within a table space container.

## skipped\_prefetch\_uow\_data\_p\_reads - Skipped prefetch unit of work data physical reads monitor element

The number of data pages that an I/O server (prefetcher) skipped because the pages were already loaded into the buffer pool by an agent in the same unit of work..

MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

## skipped\_prefetch\_uow\_xda\_p\_reads - Skipped prefetch unit of work XDA data physical reads monitor element

The number of XML storage object (XDA) data pages that an I/O server (prefetcher) skipped because the pages were already loaded into the buffer pool by an agent in the same unit of work.

Table 2007. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE

Table 2007. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

### Usage

This monitor element, along with the other **skipped\_prefetch\_uow\_\*\_p\_reads** elements tells you the number of pages that were in a prefetch request that were read directly by an agent in the same unit of work that caused the prefetch request to be created. Agents might be forced to read a page directly from disk if a system has an insufficient number of prefetchers configured, or if there is another type of prefetching bottleneck. . For example, in an OLTP system, where most of the workload is generally transactional in nature, it might be the case that the minimum number of prefetchers is configured by setting the configuration parameter **num\_ioservers** to 1. However, if an operation that uses prefetching, such as a table scan is performed, the single prefetcher might not be able to keep up, and so the agent requests the pages directly. This behavior can cause a degradation in performance, because the application waits on IO that otherwise would have been performed by prefetchers. In this case, consider increasing the number of prefetchers by adjusting the configuration parameter **num\_ioservers**. Other potential causes include having an excessively large prefetch size, which can cause prefetch times that are longer than normal, or the **db2\_parallel\_io** registry variable not being set, which can restrict parallel prefetching within a table space container.

### skipped\_prefetch\_xda\_p\_reads - Skipped prefetch XDA physical reads monitor element

The number of XML storage object (XDA) data pages that an I/O server (prefetcher) skipped because the pages were already loaded into the buffer pool.

Table 2008. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

### Usage

This monitor element, along with the other **skipped\_prefetch\_\*\_p\_reads** elements tells you the number of times a page that was scheduled for retrieval by a prefetcher was not prefetched because it was already in a buffer pool. Pages that are already in a buffer pool might be there for a number of reasons:

- The page is a new page, and is not yet created on disk.
- Another agent might need the same page, and thus it was loaded it into the buffer pool by a different prefetch request. In this case, along with the preceding one, an increase in skipped prefetch requests might not be a problem, because the additional prefetch request that was generated was redundant.
- An agent retrieved them from disk directly before the prefetcher was able to complete the prefetch operation. Agents might be forced to read a page directly from disk if a system has an insufficient number of prefetchers configured, or if there is another type of prefetching bottleneck. . For example, in an OLTP system, where most of the workload is generally transactional in nature, it might be the

case that the minimum number of prefetchers is configured by setting the configuration parameter **num\_ioservers** to 1. However, if an operation that uses prefetching, such as a table scan is performed, the single prefetcher might not be able to keep up, and so the agent requests the pages directly. This behavior can cause a degradation in performance, because the application waits on IO that otherwise would have been performed by prefetchers. In this case, consider increasing the number of prefetchers by adjusting the configuration parameter **num\_ioservers**. Other potential causes include having an excessively large prefetch size, which can cause prefetch times that are longer than normal, or the **db2\_parallel\_io** registry variable not being set, which can restrict parallel prefetching within a table space container.

The **skipped\_prefetch\_\*\_p\_reads** elements tell you about all skipped read requests, regardless of the reason the read was skipped. To see how many requests were skipped because an agent from the same unit of work performed a read before the prefetcher was able to retrieve the page, examine the **skipped\_prefetch\_uow\_\*\_p\_reads** monitor elements.

### **smallest\_log\_avail\_node - Node with Least Available Log Space**

This element is only returned for global snapshots and indicates the node with the least amount (in bytes) of available log space.

**Element identifier**

smallest\_log\_avail\_node

**Element type**

information

---

*Table 2009. Snapshot Monitoring Information*

<b>Snapshot Level</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Database	dbase	Basic

**Usage**

Use this element, in conjunction with **appl\_id\_oldest\_xact**, to ensure that adequate log space is available for the database. In a global snapshot, **appl\_id\_oldest\_xact**, **total\_log\_used**, and **total\_log\_available** correspond to the values on this node.

### **snapshot\_timestamp - Snapshot timestamp monitor element**

The date and time that the snapshot was taken.

### **sock\_rcv\_buf\_actual - Actual socket receive buffer size monitor element**

The number of bytes for actual socket receive buffer size. This may differ from the requested size.

---

*Table 2010. Table function monitoring information*

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

## sock\_recv\_buf\_requested - Requested socket receive buffer size monitor element

The number of bytes for requested socket receive buffer size (registry variable DB2\_HADR\_SORCVBUF). Value is 0 for no request (use system default).

Table 2011. Table function monitoring information

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

## sock\_send\_buf\_actual - Actual socket send buffer size monitor element

The number of bytes for actual socket send buffer size. This may differ from the requested size.

Table 2012. Table function monitoring information

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

## sock\_send\_buf\_requested - Requested socket send buffer size monitor element

The size requested for the socket send buffer, set by the registry variable DB2\_HADR\_SOSNDBUF. Value is 0 for no request (use system default). Units are bytes.

Table 2013. Table function monitoring information

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

## sort\_consumer\_heap\_top - Individual private sort heap consumer high watermark monitor element

The high watermark for any individual private sort heap consumer, that is, the largest amount of memory that was used by any individual sort operator.

Table 2014. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - return information about an activity as an XML document	Always collected
MON_GET_DATABASE table function - get database information metrics	Always collected
MON_GET_DATABASE_DETAILS table function - get database information metrics as an XML document	Always collected

Table 2014. Table function monitoring information (continued)

Table function	Monitor element collection level
MON_GET_PKG_CACHE_STMT table function - get package cache statement metrics	Always collected
MON_GET_PKG_CACHE_STMT_DETAILS table function - Get package cache statement metrics as an XML document	Always collected
MON_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	Always collected
MON_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected
MON_GET_WORKLOAD_STATS table function - Return workload statistics	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

Table 2015. Event monitoring information

Event type	Logical data grouping	Monitor switch
Activities	event_activity	Always collected
Package Cache	pkgcache	Always collected
Statistics	event_scstats	Always collected
Statistics	event_superclasstats	Always collected
Statistics	event_wlstats	Always collected
Unit of Work	uow	Always collected

## Usage

Use this element with other sort memory high watermark monitor elements to determine what activities are the heaviest users of sort heap memory. For example, issue the MON\_GET\_ACTIVITY table function to get a list of current activities. You can determine which activities use the most sort memory by noting the values of the **sort\_consumer\_heap\_top**, **sort\_consumer\_shrheap\_top**, **sort\_heap\_top**, and **sort\_shrheap\_top** monitor elements. If the heaviest memory users are negatively affecting other activities, reduce the memory requirements of the heaviest users to help improve concurrency.

### **sort\_consumer\_shrheap\_top - Individual shared sort heap consumer high watermark monitor element**

The high watermark for any individual shared sort heap consumer, that is, the largest amount of memory in 4 KB pages that is used by any individual sort operator.

Table 2016. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - return information about an activity as an XML document	Always collected

Table 2016. Table function monitoring information (continued)

Table function	Monitor element collection level
MON_GET_DATABASE table function - get database information metrics	Always collected
MON_GET_DATABASE_DETAILS table function - get database information metrics as an XML document	Always collected

MON_GET_PKG_CACHE_STMT_DETAILS table function - Get package cache statement metrics as an XML document	Always collected
MON_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	Always collected
MON_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected
MON_GET_WORKLOAD_STATS table function - Return workload statistics	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

Table 2017. Event monitoring information

Event type	Logical data grouping	Monitor switch
Activities	event_activity	Always collected
Package Cache	pkgcache	Always collected
Statistics	event_scstats	Always collected
Statistics	event_superclasstats	Always collected
Statistics	event_wlstats	Always collected
Unit of Work	uow	Always collected

## Usage

Use this element with other sort memory high watermark monitor elements to determine what activities are the heaviest users of sort heap memory. For example, issue the MON\_GET\_ACTIVITY table function to get a list of current activities. You can determine which activities use the most sort memory by noting the values of the **sort\_consumer\_heap\_top**, **sort\_consumer\_shrheap\_top**, **sort\_heap\_top**, and **sort\_shrheap\_top** monitor elements. If the heaviest memory users are negatively affecting other activities, reduce the memory requirements of the heaviest users to help improve concurrency.

## sort\_heap\_allocated - Total Sort Heap Allocated

The total number of allocated pages of sort heap space for all sorts at the level chosen and at the time the snapshot was taken.

Table 2018. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - return information about an activity as an XML document	Always collected
MON_GET_CONNECTION table function - Get connection metrics	Always collected
MON_GET_CONNECTION_DETAILS table function - Get connection metrics as an XML document	Always collected
MON_GET_DATABASE table function - Get database level information	Always collected
MON_GET_DATABASE_DETAILS table function - Get database information metrics	Always collected
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	Always collected
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get service subclass metrics as an XML document	Always collected
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get unit of work metrics as an XML document	Always collected
MON_GET_WORKLOAD table function - Get workload metrics	Always collected
MON_GET_WORKLOAD_DETAILS table function - Get workload metrics as an XML document	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

Table 2019. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	db2	Basic
Database	dbase	Basic

### Usage

The amount of memory allocated for each sort may be some or all of the available sort heap size. Sort heap size is the amount of memory available for each sort as defined in the *sortheap* database configuration parameter.

It is possible for a single application to have concurrent sorts active. For example, in some cases a SELECT statement with a subquery can cause concurrent sorts.

Information may be collected at two levels:

- At the database manager level, it represents the sum of sort heap space allocated for all sorts in all active databases in the database manager
- At the database level, it represents the sum of the sort heap space allocated for all sorts in a database.

Normal memory estimates do not include sort heap space. If excessive sorting is occurring, the extra memory used for the sort heap should be added to the base memory requirements for running the database manager. Generally, the larger the sort heap, the more efficient the sort. Appropriate use of indexes can reduce the amount of sorting required.

You may use the information returned at the database manager level to help you tune the *sheapthres* configuration parameter. If the element value is greater than or equal to *sheapthres*, it means that the sorts are not getting the full sort heap as defined by the *sortheap* parameter.

## sort\_heap\_top - Sort private heap high watermark

The private sort memory high watermark, in 4 KB pages, across the database manager.

Table 2020. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - return information about an activity as an XML document	Always collected
MON_GET_DATABASE table function - get database information metrics	Always collected
MON_GET_DATABASE_DETAILS table function - get database information metrics as an XML document	Always collected
MON_GET_PKG_CACHE_STMT table function - get package cache statement metrics	Always collected

Activities	event_activity	Always collected
Package Cache	pkgcache	Always collected
Statistics	event_scstats	Always collected
Statistics	event_superclasstats	Always collected
Statistics	event_wlstats	Always collected
Unit of Work	uow	Always collected

### Usage

This element can be used to determine if the SHEAPTHRES configuration parameter is set to an optimal value. For example, if this watermark approaches or exceeds SHEAPTHRES, it is likely that SHEAPTHRES should be increased. This is because private sorts are given less memory whenever SHEAPTHRES is exceeded, and this can adversely affect system performance.

## sort\_overflows - Sort overflows monitor element

The total number of sorts that ran out of sort heap and may have required disk space for temporary storage.

Table 2023. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE

Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

At a database or application level, use this element in conjunction with **total\_sorts** to calculate the percentage of sorts that had to overflow to disk. If this percentage is high, you may want adjust the database configuration by increasing the value of **sortheap**.

At a statement level, use this element to identify statements that require large sorts. These statements may benefit from additional tuning to reduce the amount of sorting required.

When a sort overflows, additional processing time is required because the sort will require a merge phase and can potentially require more I/O, if data needs to be written to disk.

This element provides information for one statement, one application, or all applications accessing one database.

A value of -1 indicates that the data collection switch **DFT\_MON\_SORT** is turned off.

## sort\_shrheap\_allocated - Sort Share Heap Currently Allocated

Total amount of shared sort memory allocated in 4KB pages.

Table 2026. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - return a list of activities	Always collected

WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

Table 2027. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic

### Usage

The interface reporting the monitor element provides the context for the element. For example, in the MON\_GET\_ACTIVITY interface this element reports the total shared sort memory allocated for each currently executing activity, while in the MON\_GET\_DATABASE interface this element reports the total shared sort memory allocated in the database.

Use the monitor element reported by the different interfaces to understand what percentage of the total shared sort memory different monitored objects such as applications, statements and transactions are currently using.

Use the monitor element in the database interfaces (for example, MON\_GET\_DATABASE) to assess the threshold for shared sort memory. If this value is frequently much higher or lower than the current shared sort memory threshold, it is likely that the threshold should be adjusted.

**Note:** The "shared sort memory threshold" is determined by the value of the SHEAPTHRES database manager configuration parameter if the SHEAPTHRES\_SHR database configuration parameter is 0. Otherwise, it is determined by the value of SHEAPTHRES\_SHR.

## **SORT\_SHRHEAP\_AVG - The average amount of used sort shared heap monitor element**

The average amount of sort shared heap used by this service subclass, superclass, or workload, in 4k pages.

*Table 2028. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_WORKLOAD_STATS table function - Return workload statistics	Always collected

Unit of Work	uow	Always collected

### Usage

The interface reporting the monitor element provides the context for the element. For example, in the MON\_GET\_ACTIVITY interface this element reports the shared sort memory high watermark for each currently executing activity, while in the MON\_GET\_DATABASE interface this element reports the database-wide shared sort memory high watermark.

Use the monitor element reported by the different interfaces to understand the peak shared sort memory requirements for different monitored objects such as applications, statements and transactions.

Use the monitor element in the database interfaces (for example, MON\_GET\_DATABASE) to assess whether or not SHEAPTHRES (or SHEAPTHRES\_SHR) is set to an optimal value. For example, if this high watermark is persistently much lower than the shared sort memory threshold, it is likely that this threshold needs to be decreased, thus freeing memory for other database functions. Conversely, if this high watermark begins to approach the shared sort memory threshold, then this might indicate that this threshold needs to be increased. This is important because the shared sort memory threshold is a hard limit. When the total amount of sort memory reaches this threshold, no more shared sorts can be initiated.

This element, along with the high watermark for private sort memory, can also help users determine if the threshold for shared and private sorts need to be set independently of each other. Normally, if the SHEAPTHRES\_SHR database configuration option has a value of 0, then the shared sort memory threshold is determined by the value of the SHEAPTHRES database manager configuration option. However, if there is a large discrepancy between the private and shared sort memory high watermarks, this might be an indication that the user needs to override SHEAPTHRES and set SHEAPTHRES\_SHR to a more appropriate value that is based on the shared sort memory high watermark.

**Note:** This element reports the high watermark of sort reservation requests granted by the sort memory controller. Requests that are granted do not always result in a similar level of memory allocation, since they only permit consumers of sort heap to allocate memory as necessary, up to the granted amount, during the processing of an SQL request. It is normal for there to be a discrepancy between the value for this element and the high water mark of the shared sort memory pool (pool\_watermark).

## **SORT\_SHRHEAP\_UTILIZATION - The sort shared heap utilization monitor element**

The percentage utilization, based the SORT\_SHRHEAP\_TOP value of this service subclass, superclass, or workload, and the database's SORT\_SHRHEAP\_TOP value.

*Table 2039. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>

Statistics	event_wlstats	Always collected

## **SORT\_SHRHEAP\_UTILIZATION\_TOP - The peak sort shared heap utilization monitor element**

The peak shared sort memory utilization for this service subclass, superclass, or workload.

*Table 2043. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_WORKLOAD_STATS table function - Return workload statistics	Always collected
MON_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	Always collected
MON_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected

*Table 2044. Event Monitoring Information*

<b>Event Type</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Statistics	event_scstats	Always collected
Statistics	event_superclasstats	Always collected
Statistics	event_superclasstats	Always collected
Statistics	event_wlstats	Always collected

## sortshrheaputil\_threshold\_id - shared sortheap utilization threshold ID monitor element

The ID of the SORTSHRHEAPUTIL threshold that was applied to the activity.

Table 2045. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - return information about an activity as an XML document	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

## sortshrheaputil\_threshold\_value - Shared sortheap utilization threshold value monitor element

The upper bound of the SORTSHRHEAPUTIL threshold applied to the activity.

Table 2046. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - return information about an activity as an XML document	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

## sortshrheaputil\_threshold\_violated - Shared sortheap utilization threshold violated monitor element

This monitor element returns a value of **1** (Yes) to indicate that the activity violated the SORTSHRHEAPUTIL threshold. A value of **0** (No) indicates that the activity has not yet violated the threshold.

Table 2047. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - return information about an activity as an XML document	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

## source\_service\_class\_id - Source service class ID monitor element

The ID of the service subclass from which an activity was remapped when the threshold violation record to which this element belongs was generated. This element has a value of zero when the threshold action is anything other than a REMAP ACTIVITY action.

Table 2048. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Threshold violations	event_thresholdviolations	-

### Usage

Use this element to trace the path of an activity through the service classes to which it was remapped. It can also be used to compute aggregates of how many activities were mapped out of a given service subclass.

## sp\_rows\_selected - Rows Returned by Stored Procedures

This element contains the number of rows sent from the data source to the federated server at the start of the federated server instance, or the last reset of the database monitor counters as a result of stored procedure operations for this application.

Table 2049. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase_remote	Basic
Application	appl_remote	Basic

For snapshot monitoring, this counter can be reset.

### Usage

This element has several uses. You can use it to compute the average number of rows sent to the federated server from the data source, per stored procedure, with the following formula:

```
rows per stored procedure
= rows returned
/ # of stored procedures invoked
```

You can also compute the average time to return a row to the federated server from the data source for this application:

```
average time = aggregate stored proc. response time / rows returned
```

## spacemappage\_page\_reclaims\_x - Space map page reclaims exclusive access monitor element

The number of times a page related to a space map page was reclaimed by another member in the Db2 pureScale instance before its planned release. The member that reclaimed the page required exclusive access to the space map page.

Table 2050. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_PAGE_ACCESS_INFO table function - Get buffer pool page waiting information	Always collected

## Usage

This value is only reported for object-relative table spaces, that is table spaces that have been enabled for reclaimable storage. Use the **reclaimable\_space\_enabled** monitor element to determine if the table space has been enabled for reclaimable storage.

Since Extent Map Pages (EMPs) are metadata, EMPs are included in the value of this monitor element.

Data space map pages contain user data, therefore they are included in the value of the **page\_reclaims\_x** monitor element, in addition to being included the value of the **spacemappage\_page\_reclaims\_x** monitor element. Index space map pages do not contain user data, therefore they are included only in the value of the **spacemappage\_page\_reclaims\_x** monitor element.

## spacemappage\_page\_reclaims\_s - Space map page reclaims shared access monitor element

The number of times a page related to a space map page was reclaimed by another member in the Db2 pureScale instance before its planned release. The member that reclaimed the page required shared access to the space map page.

---

*Table 2051. Table Function Monitoring Information*

---

Table Function	Monitor Element Collection Level
MON_GET_PAGE_ACCESS_INFO table function - Get buffer pool page waiting information	Always collected

---

## Usage

This value is only reported for object-relative table spaces, that is table spaces that have been enabled for reclaimable storage. Use the **reclaimable\_space\_enabled** monitor element to determine if the table space has been enabled for reclaimable storage.

Since Extent Map Pages (EMPs) are metadata, EMPs are included in the value of this monitor element.

Data space map pages contain user data, therefore they are included in the value of the **page\_reclaims\_s** monitor element, in addition to being included the value of the **spacemappage\_page\_reclaims\_s** monitor element. Index space map pages do not contain user data, therefore they are included only in the value of the **spacemappage\_page\_reclaims\_s** monitor element.

## spacemappage\_page\_reclaims\_initiated\_x - Space map page reclaims initiated exclusive access monitor element

The number of times a page accessed in exclusive mode for a space map page caused the page to be reclaimed from another member.

---

*Table 2052. Table Function Monitoring Information*

---

Table Function	Monitor Element Collection Level
MON_GET_PAGE_ACCESS_INFO table function - Get buffer pool page waiting information	Always collected

---

## Usage

This value is only reported for object-relative table spaces, that is table spaces that have been enabled for reclaimable storage. Use the **reclaimable\_space\_enabled** monitor element to determine if the table space has been enabled for reclaimable storage.

Since Extent Map Pages (EMPs) are metadata, EMPs are included in the value of this monitor element.

Data space map pages contain user data, therefore they are included in the value of the **page\_reclaims\_initiated\_x** monitor element, in addition to being included the value of the **spacemappage\_page\_reclaims\_initiated\_x** monitor element. Index space map pages do not contain user data, therefore they are included only in the value of the **spacemappage\_page\_reclaims\_initiated\_x** monitor element.

## spacemappage\_page\_reclaims\_initiated\_s - Space map page reclaims initiated shared access monitor element

The number of times a page accessed in shared mode of a space map page caused the page to be reclaimed from another member.

*Table 2053. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_PAGE_ACCESS_INFO table function - Get buffer pool page waiting information	Always collected

### Usage

This value is only reported for object-relative table spaces, that is table spaces that have been enabled for reclaimable storage. Use the **reclaimable\_space\_enabled** monitor element to determine if the table space has been enabled for reclaimable storage.

Since Extent Map Pages (EMPs) are metadata, EMPs are included in the value of this monitor element.

Data space map pages contain user data, therefore they are included in the value of the **page\_reclaims\_initiated\_s** monitor element, in addition to being included the value of the **spacemappage\_page\_reclaims\_initiated\_s** monitor element. Index space map pages do not contain user data, therefore they are included only in the value of the **spacemappage\_page\_reclaims\_initiated\_s** monitor element.

## spacemappage\_reclaim\_wait\_time - Space map page reclaim wait time monitor element

In a Db2 pureScale environment, this element represents the amount of time spent waiting on page locks for pages related to internally maintained object space management where the lock request caused a reclaim from another member. The unit of measurement for time is in milliseconds.

*Table 2054. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE

Table 2054. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PAGE_ACCESS_INFO table function - Get buffer pool page waiting information	Always collected
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - Get package cache statement metrics as an XML document	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2055. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Package cache	pkgcache_metrics	ACTIVITY METRICS BASE

Table 2055. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

### specific\_name - Specific name monitor element

Name of the routine instance.

This element might be system generated.

Table 2056. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	Always collected
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	Always collected
MON_GET_ROUTINE_EXEC_LIST table function - get list of statements executed by routine	Always collected
MON_GET_SECTION_ROUTINE table function - get list of routines for input section	Always collected

### sql\_chains - Number of SQL Chains Attempted

Represents the number of SQL statements taking *n* data transmissions between the Db2 Connect gateway and the host during statement processing. The range *n* is specified by the *num\_transmissions\_group* element.

Table 2057. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Data Transmission	stmt_transmissions	Basic

For snapshot monitoring, this counter can be reset.

For example, if chaining is on, and if PREP and OPEN statements are chained together and the chain takes a total of two transmissions, *sql\_chains* is reported as "1" and *sql\_stmts* is reported as "2".

If chaining is off, then the *sql\_chains* count equals the *sql\_stmts* count.

#### Usage

Use this element to get statistics on how many statements used 2, 3, 4 (and so on) data transmissions during their processing. (At least two data transmissions are necessary to process a statement: a send and a receive.) These statistics can give you a better idea of the database or application activity and network traffic at the database or application levels.

**Note:** The `sql_stmts` monitor element represents the number of attempts made to send an SQL statement to the server. At the transmission level, all statements within the same cursor count as a single SQL statement.

## sql\_req\_id - Request Identifier for SQL Statement

The request identifier for an operation in an SQL statement.

Table 2058. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statements	event_stmt	-

### Usage

This identifier increments with each successive SQL operation processed by the database manager since the first application has connected to the database. Its value is unique across the database and uniquely identifies a statement operation.

## sql\_reqs\_since\_commit - SQL Requests Since Last Commit

Number of SQL requests that have been submitted since the last commit.

Table 2059. Table function monitoring information

Table function	Monitor element collection level
MON_GET_CONNECTION table function - Get connection metrics	Always collected
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics	Always collected
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics	Always collected

Table 2060. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl	Basic

### Usage

You can use this element to monitor the progress of a transaction.

## sql\_stmts - Number of SQL Statements Attempted

For data transmission snapshots, this element represents the number of SQL statements taking  $n$  data transmissions between the Db2 Connect gateway and the host during statement processing. The range  $n$  is specified by the `num_transmissions_group` element.

Table 2061. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
DCS Database	dcs_dbase	Basic
DCS Application	dcs_appl	Basic

Table 2061. Snapshot Monitoring Information (continued)

Snapshot Level	Logical Data Grouping	Monitor Switch
Data Transmission	stmt_transmissions	Basic

For snapshot monitoring, this counter can be reset.

For DCS DATABASE snapshots, this statement count is the number of statements since the database was activated.

For DCS APPLICATION snapshots, this statement count is the number of statements since the connection to the database was established by this application.

### Usage

Use this element to measure database activity at the database or application level. To calculate the SQL statement throughput for a given period, you can divide this element by the elapsed time between two snapshots.

For the data transmission level: Use this element to get statistics on how many statements used 2, 3, 4 (and so on) data transmissions during their processing. (At least 2 data transmissions are necessary to process a statement: a send and a receive.) These statistics can give you a better idea of the database or application activity and network traffic at the database or application levels.

### Note:

1. The *sql\_stmts* monitor element represents the number of attempts made to send an SQL statement to the server:
  - At the application level and database level, each SQL statement within a cursor is counted separately.
  - At the transmission level, all statements within the same cursor count as a single SQL statement.

## sqlca - SQL Communications Area (SQLCA)

The SQLCA data structure that was returned to the application at statement completion.

Table 2062. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statements	event_stmt	-
Activities	event_activity	-

### Usage

The SQLCA data structure can be used to determine if the statement completed successfully. For information about the content of the SQLCA, see "SQLCA (SQL communications area)" in *SQL Reference Volume 1* or "SQLCA data structure" in *Administrative API Reference*.

## sqlrowsread\_threshold\_id - SQL rows read threshold ID monitor element

The ID of the SQLROWSREAD threshold that was applied to the activity.

Table 2063. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected

Table 2063. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

### Usage

Use this element to understand which SQLROWSREAD threshold, if any, was applied to the activity.

### **sqlrowsread\_threshold\_value - SQL rows read threshold value monitor element**

The upper bound of the SQLROWSREAD threshold that was applied to the activity.

Table 2064. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

### Usage

Use this element to understand the value of the SQLROWSREAD threshold applied to the activity, if any.

### **sqlrowsread\_threshold\_violated - SQL rows read threshold violated monitor element**

This monitor element returns '1' (Yes) to indicate that the activity violated the SQLROWSREAD threshold. '0' (No) indicates that the activity has not yet violated the threshold.

Table 2065. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

## Usage

Use this element to determine if the activity violated the SQLROWSREAD threshold that was applied to the activity.

### **sqlrowsreadinsc\_threshold\_id - SQL rows read in service class threshold ID monitor element**

The ID of the SQLROWSREADINSC threshold that was applied to the activity.

*Table 2066. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

## Usage

Use this element to understand which SQLROWSREADINSC threshold, if any, was applied to the activity.

### **sqlrowsreadinsc\_threshold\_value - SQL rows read in service class threshold value monitor element**

The upper bound of the SQLROWSREADINSC threshold that was applied to the activity.

*Table 2067. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

## Usage

Use this element to understand the value of the SQLROWSREADINSC threshold applied to the activity, if any.

### **sqlrowsreadinsc\_threshold\_violated - SQL rows read in service class threshold violated monitor element**

This monitor element returns '1' (Yes) to indicate that the activity violated the SQLROWSREADINSC threshold. '0' (No) indicates that the activity has not yet violated the threshold.

Table 2068. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

### Usage

Use this element to determine if the activity violated the SQLROWSREADINSC threshold that was applied to the activity.

### **sqlrowsreturned\_threshold\_id - SQL rows read returned threshold ID monitor element**

The ID of the SQLROWSRETURNED threshold that was applied to the activity.

Table 2069. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

### Usage

Use this element to understand which SQLROWSRETURNED threshold, if any, was applied to the activity.

### **sqlrowsreturned\_threshold\_value - SQL rows read returned threshold value monitor element**

The upper bound of the SQLROWSRETURNED threshold that was applied to the activity.

Table 2070. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

## Usage

Use this element to understand the value of the SQLROWSRETURNED threshold applied to the activity, if any.

### **sqlrowsreturned\_threshold\_violated - SQL rows read returned threshold violated monitor element**

This monitor element returns '1' (Yes) to indicate that the activity violated the SQLROWSRETURNED threshold. '0' (No) indicates that the activity has not yet violated the threshold.

*Table 2071. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

## Usage

Use this element to determine if the activity violated the SQLROWSRETURNED threshold that was applied to the activity.

### **sqltempespace\_threshold\_id - SQL temporary space threshold ID monitor element**

The ID of the SQLTEMPSPACE threshold that was applied to the activity.

*Table 2072. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Command and Level</b>
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

## Usage

Use this element to understand which SQLTEMPSPACE threshold, if any, was applied to the activity.

### **sqltempespace\_threshold\_value - SQL temporary space threshold value monitor element**

The upper bound of the SQLTEMPSPACE threshold that was applied to the activity.

Table 2073. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

### Usage

Use this element to understand the value of the SQLTEMPSPACE threshold applied to the activity, if any.

### sqltempespace\_threshold\_violated - SQL temporary space threshold violated monitor element

This monitor element returns '1' (Yes) to indicate that the activity violated the SQLTEMPSPACE threshold. '0' (No) indicates that the activity has not yet violated the threshold.

Table 2074. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

### Usage

Use this element to determine if the activity violated the SQLTEMPSPACE threshold that was applied to the activity.

### ss\_exec\_time - Subsection Execution Elapsed Time

The time in seconds that it took a subsection to execute.

Table 2075. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	subsection	Statement

Table 2076. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statements	event_subsection	-

### Usage

Allows you to track the progress of a subsection.

## ss\_node\_number - Subsection Node Number

Node where the subsection was executed.

Table 2077. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	subsection	Statement

Table 2078. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statements	event_subsection	-

### Usage

Use to correlate each subsection with the database partition where it was executed.

## ss\_number - Subsection number monitor element

Identifies the subsection associated with the returned information.

Table 2079. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_AGENT table function - List agents running in a service class	Always collected
MON_GET_APPL_LOCKWAIT table function - get information about locks for which an application is waiting	Always collected

Table 2080. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	subsection	Statement

Table 2081. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statements	event_subsection	Always collected

### Usage

This number relates to the subsection number in the access plan that can be obtained with **db2exp1n** command.

## ss\_status - Subsection status monitor element

The current status of an executing subsection.

Table 2082. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	subsection	Statement

## Usage

The current status values can be:

- executing (SQLM\_SSEXEC in sqlmon.h)
- waiting for a lock
- waiting to receive data on a table queue
- waiting to send data on a table queue

## ss\_sys\_cpu\_time - System CPU Time used by Subsection

The total system CPU time (in seconds and microseconds) used by the currently executing statement subsection. For event monitors that write to tables, the value of this element is given in microseconds by using the BIGINT data type.

### Element identifier

ss\_sys\_cpu\_time

### Element type

time

*Table 2083. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	subsection	Timestamp

*Table 2084. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Statements	event_subsection	Timestamp

## Usage

This element along with the other related CPU-time elements can help you understand the level of activity within an application, and can help you identify applications that could benefit from additional tuning.

System CPU represents the time spent in system calls. User CPU represents time spent executing database manager code.

## ss\_usr\_cpu\_time - User CPU Time used by Subsection

The total user CPU time (in seconds and microseconds) used by the currently executing statement subsection. For event monitors that write to tables, the value of this element is given in microseconds by using the BIGINT data type.

### Element identifier

ss\_usr\_cpu\_time

### Element type

time

*Table 2085. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	subsection	Timestamp

Table 2086. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statements	event_subsection	Timestamp

### Usage

This element along with the other related CPU-time elements can help you understand the level of activity within an application, and can help you identify applications that could benefit from additional tuning.

System CPU represents the time spent in system calls. User CPU represents time spent executing database manager code.

## ssl\_port\_number - SSL port number monitor element

The SSL TCP/IP port that a member is listening on for client connections.

Table 2087. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_SERVERLIST table function - get member priority details	Always collected

## ssl\_srv\_cert\_fingerprint - Server certificate label of the connection

This monitor element contains the label for the server's fingerprint in SHA256 of the certificate in use when the connection was established. The certificate is identified by dbm cfg parameter SSL\_SVR\_LABEL, located in the keystore identified by SSL\_SVR\_KEYDB. A certificate's fingerprint is the unique identifier of the certificate. It can be used to differentiate certificates even if the labels are identical. NONE is returned if SSL is not in use.

**Note:** This element is reported for the coordinating member only. On remote members, the value reported is NONE.

Table Function	Monitor Element Collection Level
	Always collected
	Always collected

### Usage

Below is an example of fingerprint retrieved from a server certificate.

A certificate's fingerprint can be extracted with the following gsk8capicmd\_64 command:  
**gsk8capicmd\_64 -cert -details -db <keystore.kdb> -stashed -label <certLabel>**  
 Replace the keystore and label with correct names you wish to verify.

```
Sample Output
-----
Label : certLabel
Key Size : 2048
Version : X509 V3
Serial : 5a14f2af3061cc65
Issuer : OU=DB2,O=IBM,L=Markham,ST=ON,C=CA
Subject : OU=DB2,O=IBM,L=Markham,ST=ON,C=CA
Not Before : February 8, 2022 6:51:34 PM PST

Not After : February 9, 2023 6:51:34 PM PST
...

Fingerprint : SHA1 :
    F5 10 4E 6A F0 AE 67 B1 23 4F E2 0C DF 7C 9C BB
    A7 8B BF 61

82 E4 CA 45 8D 59 DA 70 86 58 0F 64 10 65 ED 7A

```

**Note:** The monitor element only contains the fingerprint in SHA256 format.

## ssl\_srv\_cert\_label - Server certificate label of the connection

This monitor element contains the label for the server's certificate in use when the connection was established. The certificate is identified by dbm cfg parameter SSL\_SVR\_LABEL, located in the keystore identified by SSL\_SVR\_KEYDB. NONE is returned if SSL is not in use.

**Note:** This element is reported for the coordinating member only. On remote members, the value reported is NONE.

Table Function	Monitor Element Collection Level
	Always collected
	Always collected

### Usage

When SSL\_SVR\_LABEL is dynamically updated, the value of this monitoring element is not refreshed until a new connection is established.

## standby\_error\_time - Standby error time monitor element

The most recent time when the standby database encountered a major error.

*Table 2088. Table function monitoring information*

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

### Usage

Check the administration notification log and db2diag.log for error messages that have occurred since the last time you checked for errors. Check the logs fully, not just until the value reported by the **standby\_error\_time** value. There might be multiple errors. Log entries might include, but are not limited to the following errors:

- Replay errors taking a table space to an abnormal state
- Load replay errors taking a table to an invalid state

The **standby\_error\_time** value is reset to NULL when a database changes its role from standby to primary or standard. It is not reset when a standby database is deactivated and reactivated.

## standby\_id - Standby id monitor element

Standby ID used to differentiate between the standbys.

*Table 2089. Table function monitoring information*

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

## Usage

This ID is used to differentiate the standbys. This ID is system generated. The mapping from ID to standby might change from query to query. However, the ID "1" is always assigned to the principal standby (or the only standby in single standby systems). Other standbys are not visible when the query is issued on a standby database; in such cases, 0 is always returned.

## standby\_instance - Standby instance monitor element

Instance name of the standby member processing the log stream.

Table 2090. Table function monitoring information

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

## standby\_log\_file - Standby log file monitor element

**Note:** The **hadr\_standby\_log\_file** and **standby\_log\_file** monitor elements are aliases that represent the same information in different monitoring interfaces. **hadr\_standby\_log\_file** is returned by the snapshot monitor interfaces, and **standby\_log\_file** is returned by the MON\_GET\_HADR table function and db2pd interfaces.

The name of the log file corresponding to the standby received log position on this log stream.

Table 2091. Table function monitoring information

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

## standby\_log\_page - Standby log page monitor element

**Note:** The **hadr\_standby\_log\_page** and **standby\_log\_page** monitor elements are aliases that represent the same information in different monitoring interfaces. **hadr\_standby\_log\_page** is returned by the snapshot monitor interfaces, and **standby\_log\_page** is returned by the MON\_GET\_HADR table function and db2pd interfaces.

The page number in **standby\_log\_file** corresponding to standby receive log position. The page number is relative to the log file. For example, page zero is the beginning of the file.

Table 2092. Table function monitoring information

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

## standby\_log\_pos - Standby log position monitor element

**Note:** The **hadr\_standby\_log\_lsn** and **standby\_log\_pos** monitor elements are aliases that represent the same information in different monitoring interfaces. **hadr\_standby\_log\_lsn** is returned by the snapshot monitor interfaces, and **standby\_log\_pos** is returned by the MON\_GET\_HADR table function and db2pd interfaces.

Standby receive log position on this log stream. This is a byte offset.

*Table 2093. Table function monitoring information*

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

## Usage

The receive and replay positions are reported separately for more detailed standby status. Spooling allows receive and replay positions to differ greatly. **standby\_log\_pos** shows receive position. When compared with **primary\_log\_pos**, the **standby\_log\_pos** indicates risk of data loss in case of failover. **standby\_replay\_log\_pos** affects how long a takeover (forced and not forced) would take, since the takeover has to complete the replay of all received logs. The **standby\_replay\_log\_pos** also indicates how up-to-date data read on standby will be. In Version 9.7 and earlier, the reported standby log position is the replay position.

## standby\_log\_time - Standby log time monitor element

The latest transaction timestamp of received logs on this log stream on the standby HADR database.

*Table 2094. Table function monitoring information*

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

## standby\_member - Standby member monitor element

ID of the standby member processing the log stream.

*Table 2095. Table function monitoring information*

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

## standby\_member\_host - Standby member hostname monitor element

The value of the **hadr\_local\_host** configuration parameter of the standby member processing the log stream.

*Table 2096. Table function monitoring information*

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

## standby\_replay\_log\_file - Standby replay log file monitor element

The name of the log file corresponding to the standby replay log position on this log stream.

Table 2097. Table function monitoring information

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

## standby\_replay\_log\_page - Standby replay log page monitor element

The page number in **standby\_replay\_log\_file** corresponding to standby replay log position. The page number is relative to the log file. For example, page zero is the beginning of the file.

Table 2098. Table function monitoring information

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

## standby\_replay\_log\_pos - Standby replay log position monitor element

The standby replay log position on this log stream. This is a byte offset.

Table 2099. Table function monitoring information

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

## standby\_replay\_log\_time - Standby replay log time monitor element

The transaction timestamp of logs being replayed on the standby HADR database.

Table 2100. Table function monitoring information

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

## standby\_recv\_replay\_gap - Standby receive replay gap monitor element

The recent average of the gap between the standby log receive position and the standby log replay position.

Table 2101. Table function monitoring information

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

## Usage

The gap is measured in number of bytes. It generally will not exceed sum of **standby\_recv\_buf\_size** and **standby\_spool\_limit**. A small amount over the sum is possible due to flexibility in buffer and spool management. When the gap reaches the combined buffer and spool limit, standby will stop receiving logs which will block primary in peer state. Standby may also run out of buffer and spool space when reported receive-replay gap is smaller than sum of buffer and spool, because a partial page can be sent multiple times and occupy multiple pages of space in buffer (always one page in spool though). However, the log gap calculation does not take multiple sends into account.

### **standby\_replay\_delay - Standby replay delay monitor element**

The value of the **hadr\_replay\_delay** configuration parameter on the standby database. Units are milliseconds.

---

*Table 2102. Table function monitoring information*

---

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

---

### **standby\_replay\_only\_window\_active - Standby replay only window active monitor element**

Replay only window status.

---

*Table 2103. Table function monitoring information*

---

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

---

## Usage

The values are:

- Y: ACTIVE
- N: INACTIVE

### **standby\_replay\_only\_window\_start - Replay only window start time monitor element**

The replay only window start time.

---

*Table 2104. Table function monitoring information*

---

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

---

## **standby\_replay\_only\_window\_tran\_count - Replay only window transactions monitor element**

The total number of uncommitted DDL or maintenance transactions executed so far in the current replay only window.

*Table 2105. Table function monitoring information*

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

## **standby\_recv\_buf\_size - Standby receive buffer size monitor element**

The standby receive buffer size, in number of pages.

*Table 2106. Table function monitoring information*

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

## **standby\_recv\_buf\_percent - Standby receive buffer percentage monitor element**

The percentage of standby receive buffer in use. When spooling is enabled, standby can continue to receive logs even when receive buffer is full (100% used).

*Table 2107. Table function monitoring information*

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

## **standby\_spool\_limit - Standby spool limit monitor element**

The maximum number of pages to spool. 0 for spooling disabled and -1 for no limit. This element reflects the **hadr\_spool\_limit** configuration on the standby database.

*Table 2108. Table function monitoring information*

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

## standby\_spool\_percent - Standby spool percentage monitor element

The percentage of spool space used, relative to the configured spool limit.

Table 2109. Table function monitoring information

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

### Usage

If the spool limit is 0 (spooling disabled), NULL is returned. If the spool limit is -1 (unlimited spooling), a percentage of spool's page number in active log path size is returned. When the spool percentage reaches 100%, the standby database will stop receiving logs until space is released as replay proceeds. Spooling can stop before the limit is reached if the spool device (standby log path) is full.

## start\_event\_id - Start event ID

Unique identifier of the corresponding UTILSTART or UTILSTARTPROC event.

Table 2110. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Change History	UTILSTOP	Always collected

### Usage

For the change history event monitor, unique identifier of the corresponding starting of a utility event (UTILSTART or UTILSTARTPROC). Use this element with the START\_EVENT\_TIMESTAMP and member elements to associate the stop record with the corresponding start record.

## start\_event\_timestamp - Start event timestamp

Time of the corresponding UTILSTART or UTILSTARTPROC event.

Table 2111. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Change History	UTILSTOP	Always collected

### Usage

For the change history event monitor, use with the START\_EVENT\_ID and member elements to associate the stop record with the corresponding start record.

## start\_time - Event start time

The date and time of unit of work start, statement start, or deadlock detection. This element, in the event\_start API structure indicates the start of the event monitor.

Table 2112. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_start	Timestamp
Statements	event_stmt	Timestamp

Table 2112. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Deadlocks	event_deadlock	Timestamp
Deadlocks	event_dlconn	Timestamp
Deadlocks with Details	event_detailed_dlconn	Timestamp
Unit of Work	uow	Always Collected

### Usage

Use this element to correlate the deadlock connection records to the deadlock event record. You can also use it with the *stop\_time* element to calculate the elapsed statement or transaction execution time.

**Note:** When the **Timestamp** switch is **OFF**, the **start\_time** element that is reported by the statement event monitor returns **0** (zero).

## static\_sql\_stmts - Static SQL Statements Attempted

The number of static SQL statements that were attempted.

Table 2113. Table function monitoring information

Table function	Monitor element collection level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE

Table 2113. Table function monitoring information (continued)

Table function	Monitor element collection level
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics	REQUEST METRICS BASE

Table 2114. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic
Application	appl	Basic

For snapshot monitoring, this counter can be reset.

Table 2115. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Connection	event_conn	Always collected
Database	event_db	Always collected
Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmetrics	REQUEST METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

### Usage

You can use this element to calculate the total number of successful SQL statements at the database or application level:

```
dynamic_sql_stmts
+ static_sql_stmts
- failed_sql_stmts
= throughput during monitoring period
```

### statistics\_timestamp - Statistics timestamp monitor element

The time at which this statistics record was generated.

Table 2116. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats	-
Statistics	event_superclassstats	-
Statistics	event_wlstats	-
Statistics	event_wcstats	-

Table 2116. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_qstats	-
Statistics	event_histogrambin	-
Statistics	event_osmetrics	-

## Usage

Use this element to determine when this statistics record was generated.

Use this element along with the **last\_wlm\_reset** element to identify the time interval over which the statistics in this statistics record were generated.

This monitor element can also be used to group together all statistics records that were generated for the same collection interval.

## stats\_cache\_size - Size of statistics cache monitor element

The current size of the statistics cache, in bytes, which is used in a catalog partition to cache statistics information generated by real-time statistics gathering.

**Important:** The SQL administrative views and table functions that return this monitor element are deprecated.

**Note:** Since the statistics cache resides in the catalog partition, only the snapshot taken at the catalog partition will report the statistics cache size. Snapshots taken at other partitions will report the value of zero instead. When taking a global snapshot, the values reported by all the database partitions are aggregated together.

Table 2117. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_DATABASE table function - Get database level information	Always collected
MON_GET_DATABASE_DETAILS table function - Get database information metrics	Always collected

Table 2118. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	-

Table 2119. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected

## Usage

Use this element to determine the size of the current statistics cache. This value changes frequently. In order to evaluate system usage, take the snapshot at specific intervals over an extended period of time. Use this element to adjust the value of the **catalogcache\_sz** configuration parameter.

## stats\_dbpartition - Automatics statistics collection indicator monitor element

Indicates if automatic statistics collection is occurring on this database partition.

Table 2120. Table function monitoring information

Table function	Monitor element collection level
ADMIN_GET_TAB_INFO table function - retrieve table size and state information	Always collected

## stats\_fabricate\_time - Total time spent on statistics fabrication activities monitor element

The stats\_fabricate\_time monitor element stores the total time spent on statistics fabrications by real-time statistics gathering, in milliseconds. Statistics fabrication is the statistics collection activity needed to generate statistics during query compilation. If this monitor element is collected at the database level, it represents the total time spent on real-time statistics gathering activities for all the applications running on the database. If it is collected at the statement level, it represents the time spent on the latest real-time statistics gathering activities for the statement. The times reported by all the database partitions are aggregated together.

**Important:** The SQL administrative views and table functions that return this monitor element are deprecated. For SQL access to this information, see “total\_stats\_fabrication\_time - Total statistics fabrication time monitor element” on page 1651.

Table 2121. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Statement
Dynamic SQL	dynsql	Statement

For snapshot monitoring, this element can be reset.

Table 2122. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected
Statement	event_stmt	Always collected

## Usage

Use this element along with **stats\_fabrications** to evaluate the performance impact of real-time statistics gathering at the database level. For snapshot monitor for dynamic SQL, you can use this element along with **total\_exec\_time** and **num\_executions** to evaluate the impact of statistics fabrications. For the statement event monitor, you can combine this element with **stmt\_start** and **stmt\_stop** for further evaluation of real-time statistics gathering impact.

## stats\_fabrications - Total number of statistics fabrications monitor elements

The stats\_fabrications monitor elements are the total number of statistics fabrications performed by real-time statistics during query compilation for all the database applications. Rather than obtaining statistics by scanning data stored in a table or an index, statistics are fabricated based on metadata maintained by the index and data manager. Values reported by all the database partitions are aggregated together.

**Important:** The SQL administrative views and table functions that return this monitor element are deprecated. For SQL access to this information, see for “[total\\_stats\\_fabrications - Total statistics fabrications monitor elements](#)” on page 1653.

Table 2123. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Statement

For snapshot monitoring, this counter can be reset.

Table 2124. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected

## Usage

Use this element to determine the frequency of statistics fabrications in the database. This value changes frequently. In order to get a better overview of the system usage, take the snapshot at specific intervals over an extended period of time. When used in conjunction with **stats\_fabricate\_time**, this element can help you evaluate the impact of statistics fabrications.

## stats\_rows\_modified - Rows modified since last RUNSTATS monitor element

Returns the number of rows modified since the last RUNSTATS.

Table 2125. Table function monitoring information

Table function	Monitor element collection level
ADMIN_GET_TAB_INFO table function - retrieve table size and state information	Always collected
MON_GET_TABLE table function - get table metrics	Always collected

## Usage

Use this element and the *rts\_rows\_modified* monitor element to help determine if a running of the RUNSTATS command is required.

After a TRUNCATE TABLE statement is run, this element displays the value -1 until a RUNSTATS command is run against the table.

## status\_change\_time - Application Status Change Time

The date and time the application entered its current status.

### Element identifier

status\_change\_time

### Element type

timestamp

Table 2126. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl_id_info	Unit of Work, Timestamp
Lock	appl_lock_list	Unit of Work, Timestamp

Table 2126. Snapshot Monitoring Information (continued)

Snapshot Level	Logical Data Grouping	Monitor Switch
DCS Application	dcs_appl_info	Unit of Work, Timestamp

### Usage

This element allows you to determine how long an application has been in its current status. If it has been in the same status for a long period of time, this may indicate that it has a problem.

### stmt\_comments - Comments in SQL statement text monitor element

In Db2 version 11.5.4 and later, when the database configuration parameter **stmt\_conc** is set to COMMENTS or COMM\_LIT, this field contains an XML representation of the removed simple comment.

For example if the following statement is issued: `select empno from employee -- OPTLEVEL( 5 ) --QUERY_DEGREE( 1 ) --APPSERVER(A) --TIME 08:35`

The individual comments (each beginning with --) are parsed out, so that the **stmt\_comments** field would be:

```
<DATA>
  <item>
    <COMMENT>OPTLEVEL( 5 )</COMMENT>
  </item>
  <item>
    <COMMENT>QUERY_DEGREE( 1 )</COMMENT>
  </item>
  <item>
    <COMMENT>APPSERVER(A)</COMMENT>
  </item>
  <item>
    <COMMENT>TIME 08:35</COMMENT>
  </item>
</DATA>
```

The comments are those associated with the first time the statement had comments removed and stripped. All subsequent statements that issue the statement with different comments will end up sharing the same entry in the package cache, but the **stmt\_comments** reflect the comments removed when the statement is cached.

Table 2127. Table function monitoring information

Table function	Monitor element collection level
MON_GET_PKG_CACHE_STMT table function - Get package cache statement metrics	Always collected
MON_GET_PKG_CACHE_STMT_DETAILS table function - Get package cache statement metrics as an XML document	Always collected

Table 2128. Event monitoring information

Event type	Logical data grouping	Monitor switch
Package Cache	pkgcache	Always collected

### stmt\_elapsed\_time - Most Recent Statement Elapsed Time

The elapsed execution time of the most recently completed statement.

Table 2129. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	stmt	Statement, Timestamp
DCS Statement	dcs_stmt	Statement, Timestamp

## Usage

Use this element as an indicator of the time it takes for a statement to complete.

This element is composed of two subelements that report time spent as seconds and microseconds (one millionth of a second). The names of the subelements can be derived by adding "\_s" and "\_ms" to the name of this monitor element. To retrieve the total time spent for this monitor element, the values of the two subelements must be added together. For example, if the "\_s" subelement value is 3 and the "\_ms" subelement value is 20, then the total time spent for the monitor element is 3.00002 seconds.

## stmt\_exec\_time - Statement execution time monitor element

The total time spent executing this statement by all agents on this member. The value is given in milliseconds.

Table 2130. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2131. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## stmt\_first\_use\_time - Statement first use timestamp monitor element

This element shows the first time the statement entry was processed. For cursor operations, **stmt\_first\_use\_time** shows when the cursor was opened. At application coordination nodes, this value reflects the application requests; at non-coordinator nodes, this value reflects when requests were received from the originating node.

Table 2132. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	-
Deadlocks with Details History Values <sup>1</sup>	event_stmt_history	timestamp
Deadlocks with Details History <sup>1</sup>	event_stmt_history	timestamp
Activities	event_activitystmt	timestamp

**1**

This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the [CREATE EVENT MONITOR](#) for locking statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

**Usage**

Use this element in conjunction with other statement history entries to see the sequence of SQL statements that caused the deadlock.

**stmt\_history\_id - Statement history identifier**

This numeric element shows the position in which the statement was run within the unit of work indicated by the sequence\_no element, relative to other statement history elements. The earliest statement run in the unit of work will have the lowest value. If the same statement is run twice in the same unit of work, two different occurrences of the statement will be shown with two different stmt\_history\_id values.

Table 2133. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Deadlocks with Details History Values	event_stmt_history	-
Deadlocks with Details History Values	event_data_value	-
Deadlocks with Details History	event_stmt_history	-

**Usage**

You can use this information to see the sequence of SQL statements that caused the deadlock.

**stmt\_invocation\_id - Statement invocation identifier monitor element**

An identifier that distinguishes one invocation of a routine from others at the same nesting level within a unit of work. It is unique within a unit of work for a specific nesting level. This monitor element is an alias for the invocation\_id element.

**Usage**

You can use this element to uniquely identify the invocation in which a particular SQL statement has been executed. You can also use this element in conjunction with other statement history entries to see the sequence of SQL statements that caused the deadlock.

**stmt\_isolation - Statement isolation**

This element shows the isolation value in effect for the statement while it was being run.

Table 2134. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Deadlocks with Details History Values	event_stmt_history	-
Deadlocks with Details History	event_stmt_history	-
Activities	event_activitystmt	-

The possible isolation level values are:

- SQLM\_ISOLATION\_LEVEL\_NONE 0 (no isolation level specified)
- SQLM\_ISOLATION\_LEVEL\_UR 1 (uncommitted read)
- SQLM\_ISOLATION\_LEVEL\_CS 2 (cursor stability)
- SQLM\_ISOLATION\_LEVEL\_RS 3 (read stability)
- SQLM\_ISOLATION\_LEVEL\_RR 4 (repeatable read)

### Usage

You can use this element in conjunction with other statement history entries to understand the cause of the deadlock and the execution behavior of a particular SQL statement.

## stmt\_last\_use\_time - Statement last use timestamp monitor element

This element shows the last time the statement entry was processed. For cursor operations, **stmt\_last\_use\_time** shows the time of the last action on the cursor where that action could be an open, fetch, or close. At application coordination nodes, this value reflects the application requests; at non-coordinator nodes, this value reflects when requests were received from the originating node.

Table 2135. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	-
Deadlocks with Details History Values <sup>1</sup>	event_stmt_history	timestamp
Deadlocks with Details History <sup>1</sup>	event_stmt_history	timestamp
Activities	event_activitystmt	timestamp

### 1

This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the `CREATE EVENT MONITOR for locking` statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

### Usage

Use this element in conjunction with other statement history entries to see the sequence of SQL statements that caused the deadlock.

## stmt\_lock\_timeout - Statement lock timeout monitor element

This element shows the lock timeout value in effect for the statement while it was being run.

Table 2136. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	-
Deadlocks with Details History Values <sup>1</sup>	event_stmt_history	-
Deadlocks with Details History <sup>1</sup>	event_stmt_history	-
Activities	event_activitystmt	-

**1**

This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the [CREATE EVENT MONITOR](#) for locking statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

**Usage**

You can use this element in conjunction with other statement history entries to understand the cause of the deadlock and the execution behavior of a particular SQL statement.

**stmt\_nest\_level - Statement nesting level monitor element**

This element shows the level of nesting or recursion in effect when the statement was being run; each level of nesting corresponds to nested or recursive invocation of a stored procedure or user-defined function (UDF). This monitor element is an alias for the nesting\_level element.

**Usage**

You can use this element, along with **stmt\_invocation\_id** monitor element, to uniquely identify the invocation in which a particular SQL statement has been executed. You can also use this element in conjunction with other statement history entries to see the sequence of SQL statements that caused the deadlock.

**stmt\_node\_number - Statement Node**

Node where the statement was executed.

Table 2137. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	stmt	Statement

**Usage**

Used to correlate each statement with the node where it was executed.

**stmt\_operation/operation - Statement operation monitor element**

The statement operation currently being processed or most recently processed (if none currently running).

**Important:** The SQL administrative views and table functions that return this monitor element are deprecated. For SQL access to this information, see [“last\\_request\\_type - Last request type monitor element”](#) on page 991.

Table 2138. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	stmt	Statement
DCS Statement	dcs_stmt	Statement

Table 2139. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	Always collected
Deadlocks with Details <sup>1</sup>	event_detailed_dlconn	Always collected
Statements	event_stmt	Always collected

**1**

This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the `CREATE EVENT MONITOR` for locking statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

**Usage**

You can use this element to determine the operation that is executing or recently finished.

It can be one of the following.

For SQL operations:

Value	Constant	Description
1	SQLM_PREPARE	SQL Prepare
2	SQLM_EXECUTE	SQL Execute
3	SQLM_EXECUTE_IMMEDIATE	SQL Execute Immediate
4	SQLM_OPEN	SQL Open
5	SQLM_FETCH	SQL Fetch
6	SQLM_CLOSE	SQL Close
7	SQLM_DESCRIBE	SQL Describe
8	SQLM_STATIC_COMMIT	SQL Static Commit
9	SQLM_STATIC_ROLLBACK	SQL Static Rollback
10	FREE LOCATOR	SQL Free Locator
11	SQLM_PREP_COMMIT	Prepare to commit (2-phase commit)
12	SQLM_CALL	Call a stored procedure
15	SQLM_SELECT	SELECT statement
16	SQLM_PREP_OPEN	Prep. and open (Db2 Connect only)
17	SQLM_PREP_EXEC	Prep. and execute (Db2 Connect)
18	SQLM_COMPILE	Compile (Db2 Connect only)

Value	Constant	Description
19	SQLM_SET	SET statement

For non-SQL operations:

Value	Constant	Description
20	SQLM_RUNSTATS	Runstats
21	SQLM_REORG	Reorg.
22	SQLM_REBIND	Rebind package
23	SQLM_REDIST	Redistribute
24	SQLM_GETTA	Get Table Authorization
25	SQLM_GETAA	Get Administrative Authorization
27	SQLM_DRPPKG	Drop Package

**Note:** API users should refer to the `sqlmon.h` header file containing definitions of database system monitor constants.

### **stmt\_pkg\_cache\_id - Statement package cache identifier monitor element**

This element shows the internal package cache identifier (ID) for a dynamic SQL statement. The element name `stmt_pkg_cache_id` is used as a synonym for this element in some monitoring interfaces.

*Table 2140. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	Always collected
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

*Table 2141. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Dynamic SQL	dynsql	Basic

*Table 2142. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Locking	lock_participant_activities	Always collected

Table 2142. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Deadlocks with Details History Values <sup>1</sup>	event_stmt_history	Always collected
Deadlocks with Details History <sup>1</sup>	event_stmt_history	Always collected
Activities	event_activitystmt	Always collected
Package cache	pkgcache-	Always collected

**1**

This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the [CREATE EVENT MONITOR](#) for locking statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

**Usage**

In a multi-partitioned environment, each partition has a unique statement ID for a cached statement. A given statement may not have the same ID across partitions.

In a global dynamic SQL snapshot, only the first statement ID is returned.

**stmt\_query\_id - Statement query identifier monitor element**

This element shows the internal query identifier (ID) given to any SQL statement used as a cursor.

Table 2143. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	-
Deadlocks with Details History Values <sup>1</sup>	event_stmt_history	-
Deadlocks with Details History <sup>1</sup>	event_stmt_history	-
Activities	event_activitystmt	-

**Usage**

You can use this element, along with the **stmt\_nest\_level** monitor element, to uniquely identify an invocation of a particular SQL statement. You can also use this element in conjunction with other statement history entries to understand the cause of the deadlock.

**stmt\_sorts - Statement Sorts**

The total number of times that a set of data was sorted in order to process the stmt\_operation.

Table 2144. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl	Statement
Application	stmt	Statement
Dynamic SQL	dynsql	Statement

## Usage

You can use this element to help identify the need for an index, since indexes can reduce the need for sorting of data. Using the related elements in the previously shown table you can identify the SQL statement for which this element is providing sort information, and then analyze this statement to determine index candidates by looking at columns that are being sorted (for example, columns used in ORDER BY and GROUP BY clauses and join columns). See **explain** in the *Administration Guide* for information on checking whether your indexes are used to optimize sort performance.

This count includes sorts of temporary tables that were generated internally by the database manager to execute the statement. The number of sorts is associated with the first FETCH operation of the SQL statement. This information is returned to you when the operation for the statement is the first FETCH. You should note that for blocked cursors several fetches may be performed when the cursor is opened. In these cases it can be difficult to use the snapshot monitor to obtain the number of sorts, since a snapshot would need to be taken while the database system was internally issuing the first FETCH.

A more reliable way to determine the number of sorts performed when using a blocked cursor would be with an event monitor declared for statements. The total\_sorts counter, in the statement event for the CLOSE cursor, contains the total number of sorts that were performed while executing the statement for which the cursor was defined.

## stmt\_source\_id - Statement source identifier

This element shows the internal identifier (ID) given to the source of the SQL statement that was run.

Table 2145. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	-
Deadlocks with Details History Values <sup>1</sup>	event_stmt_history	-
Deadlocks with Details History <sup>1</sup>	event_stmt_history	-
Activities	event_activitystmt	-

### 1

This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the CREATE EVENT MONITOR for [locking](#) statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

## Usage

You can use this element, along with **app1\_id** monitor element, to uniquely identify the origin of a request to run a particular SQL statement. You can also use this element in conjunction with other statement history entries to understand the cause of the deadlock.

## stmt\_start - Statement Operation Start Timestamp

The date and time when the stmt\_operation started executing.

### Element identifier

stmt\_start

### Element type

timestamp

Table 2146. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	stmt	Statement, Timestamp
DCS Statement	dc_stmt	Statement, Timestamp

#### Usage

You can use this element with `stmt_stop` to calculate the elapsed statement operation execution time.

### stmt\_stop - Statement Operation Stop Timestamp

The date and time when the `stmt_operation` stopped executing.

#### Element identifier

`stmt_stop`

#### Element type

Timestamp

Table 2147. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	stmt	Statement, Timestamp
DCS Statement	dc_stmt	Statement, Timestamp

#### Usage

You can use this element with `stmt_start` to calculate the elapsed statement operation execution time.

### stmt\_sys\_cpu\_time - System CPU Time used by Statement

The total *system* CPU time (in seconds and microseconds) used by the currently executing statement.

#### Element identifier

`stmt_sys_cpu_time`

#### Element type

time

Table 2148. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl	Statement, Timestamp
Application	stmt	Statement, Timestamp

#### Usage

This element along with the other related CPU-time elements can help you understand the level of activity within an application, and can help you identify applications that could benefit from additional tuning.

This counter includes time spent on both SQL and non-SQL statements, as well as any unfenced user defined functions (UDF) or stored procedures executed by the application.

System CPU represents the time spent in system calls. User CPU represents time spent executing database manager code.

**Note:** If this information is not available for your operating system, this element will be set to 0.

## stmt\_text - SQL statement text monitor element

The text of the SQL statement.

Table 2149. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	Always collected
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

Table 2150. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	stmt	Statement
Dynamic SQL	dynsql	Basic
DCS Statement	dcs_stmt	Statement

Table 2151. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activitystmt	Always collected
Change history	ddlstmtexec	Always collected
Deadlocks with Details <sup>1</sup>	event_detailed_dlconn	Always collected
Deadlocks with Details History <sup>1</sup>	event_stmt_history	Always collected
Locking	lock_participant_activities	Always collected
Package cache	pkgcache	Always collected
Statements	event_stmt	Always collected

### 1

This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the `CREATE EVENT MONITOR` for locking statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

## Usage

For application snapshots, this statement text helps you identify what the application was executing when the snapshot was taken, or most recently processed if no statement was being processed right at the time the snapshot was taken.

The information returned by this element is taken from the SQL statement cache and it might not be available if the cache has overflowed. The only guaranteed way to capture the SQL text of a statement is to use an event monitor for statements.

For dynamic SQL statements, this element identifies the SQL text associated with a package.

For statement event monitors, this element is returned only for dynamic statements. If a statement event monitor record cannot fit into the size of the buffer specified by the BUFFERSIZE option of a statement event monitor, the value of the **stmt\_text** monitor may be truncated so that the record can fit.

For the EVENT\_STMT\_HISTORY event monitor, this element is returned only for dynamic statements. For remaining event monitors, **stmt\_text** is returned for dynamic and static statements only if it is available in the SQL statement cache.

For information about how to query the system catalog tables to obtain static SQL statement text that is not provided due to performance considerations, see the **section\_number** monitor element.

## stmt\_type - Statement type monitor element

The type of statement processed.

Table 2152. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	stmt	Statement

Table 2153. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	Always collected
Deadlocks with Details <sup>1</sup>	event_detailed_dlconn	Always collected
Statements	event_stmt	Always collected
Activities	event_activitystmt	Always collected

### 1

This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the CREATE EVENT MONITOR for [locking](#) statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

## Usage

You can use this element to determine the type of statement that is executing. It can be one of the following values:

Type of statement	API constant	Numeric value
static SQL statement	SQLM_STATIC	1
dynamic SQL statement	SQLM_DYNAMIC	2
operation other than an SQL statement; for example, a bind or pre-compile operation	SQLM_NON_STMT	3

For the snapshot monitor, this element describes the statement that is currently being processed or was most recently processed.

**Note:** API users should refer to the `sqlmon.h` header file containing definitions of database system monitor constants.

## stmt\_type\_id - Statement type identifier monitor element

Statement type identifier.

Table 2154. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	Always collected
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	Always collected

Table 2155. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Package cache	-	Always collected

### Usage

The **stmt\_type\_id** monitor element has the following possible values:

- Statement not prepared
- DDL, (not Set Constraints)
- DDL, Set Constraints
- DML, Select
- DML, Insert/Update/Delete
- Authorization
- DML, Select (blockable)
- DML, Lock Table
- DML, Commit/Rollback
- Set environment
- DDL, Savepoint
- DDL, (declared user temp)
- Passthru support
- CALL
- Free locator
- DML, Select with IUD
- DML, Select with IUD (blockable)
- Top-level SET, no SQL
- Top-level SET, reads SQL
- DDL, (issues internal commit)
- Top-level SET, modifies SQL
- Unknown

## stmt\_unicode - Statement unicode flag monitor element

The SQL statement unicode flag. Possible values: Yes or No.

Table 2156. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	lock_participant_activities	

## stmt\_usr\_cpu\_time - User CPU Time used by Statement

The total *user* CPU time (in seconds and microseconds) used by the currently executing statement.

### Element identifier

stmt\_usr\_cpu\_time

### Element type

time

Table 2157. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl	Statement, Timestamp
Application	stmt	Statement, Timestamp

### Usage

This element along with the other related CPU-time elements can help you understand the level of activity within an application, and can help you identify applications that could benefit from additional tuning.

This counter includes time spent on both SQL and non-SQL statements, as well as any unfenced user-defined functions (UDFs) or stored procedures executed by the application.

System CPU represents the time spent in system calls. User CPU represents time spent executing database manager code.

**Note:** If this information is not available for your operating system, this element will be set to 0.

## stmt\_value\_data - Value data

This element contains a string representation of a data value to an SQL statement. LOB, LONG, and structured type parameters appear as empty strings. Date, time, and timestamp fields are recorded in ISO format.

Table 2158. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_PKG_CACHE_STMT_DETAILS - Get detailed metrics for package cache entries	Always collected

Table 2159. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	Always collected
Deadlocks with Details History Values <sup>1</sup>	stmt_value_data	Always collected
Activities	event_activityvals	Always collected

**1**

This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the `CREATE EVENT MONITOR for locking` statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

**Usage**

You can use this element in conjunction with other statement history entries to understand the cause of the deadlock.

**stmt\_value\_index - Value index**

This element represents the position of the input parameter marker or host variable used in the SQL statement.

*Table 2160. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_PKG_CACHE_STMT_DETAILS - Get detailed metrics for package cache entries	Always collected

*Table 2161. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	Always collected
Deadlocks with Details History Values <sup>1</sup>	stmt_value_data	Always collected
Activities	event_activityvals	Always collected

**1**

This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the `CREATE EVENT MONITOR for locking` statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

**Usage**

You can use this element in conjunction with other statement history entries to understand the cause of the deadlock.

**stmt\_value\_isnull - Value has null value monitor element**

This element shows whether a data value that is associated with an SQL statement is the NULL value; whether an extended indicator has been used to specify the default value; or that this statement value is unassigned.

Possible values are:

- 0 or "no" if the value is not NULL
- 1 or "yes" if the value is NULL
- 2 or "default" if the extended indicator value of default (-5) was specified for this statement value
- 3 or "unassigned" if the extended indicator value of unassigned (-7) was specified for this statement value

Table 2162. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_PKG_CACHE_STMT_DETAILS - Get detailed metrics for package cache entries	Always collected

Table 2163. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	Always collected
Deadlocks with Details History Values <sup>1</sup>	stmt_value_isnull	Always collected
Activities	event_activityvals	Always collected

**1**

This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the [CREATE EVENT MONITOR](#) for locking statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

**Usage**

You can use this element in conjunction with other statement history entries to understand the cause of the deadlock.

**stmt\_value\_isreopt - Variable used for statement reoptimization monitor element**

This element shows whether the provided value was a value used during statement reoptimization. It returns a value of "True" if the statement was reoptimized (for example, due to the setting of the REOPT bind option) and if the value was used as input to the SQL compiler during this reoptimization.

Table 2164. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_PKG_CACHE_STMT_DETAILS - Get detailed metrics for package cache entries	ACTIVITY METRICS BASE

Table 2165. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	-
Deadlocks with Details History Values <sup>1</sup>	event_data_value	-
Activities	event_activityvals	-

**1**

This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the [CREATE EVENT MONITOR](#) for locking statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

## Usage

You can use this element in conjunction with the provided compilation environment to allow for full analysis of the SQL compiler's treatment of the SQL statement.

## stmt\_value\_type - Value type monitor element

This element contains a string representation of the type of a data value associated with an SQL statement.

Table 2166. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_PKG_CACHE_STMT_DETAILS - Get detailed metrics for package cache entries	Always collected

Table 2167. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	Always collected
Deadlocks with Details History Values <sup>1</sup>	stmt_value_type	Always collected
Activities	event_activityvals	Always collected

### 1

This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the `CREATE EVENT MONITOR` for `locking` statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

## Usage

You can use this element in conjunction with other statement history entries to understand the cause of the deadlock.

## stmtid - Query statement ID monitor element

The hash key value that identifies normalized statement text that is associated with a section. Semantic content such as the function path and current schema are not part of the statement identifier.

Table 2168. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Return information about an activity as an XML document	Always collected
MON_GET_PKG_CACHE_STMT table function - Get package cache statement metrics	Always collected
MON_GET_PKG_CACHE_STMT_DETAILS table function - Get package cache statement metrics as an XML document	Always collected
WLM_GET_WORKLOAD_OCCURENCE_ACTIVITIES table function - Return a list of activities	Always collected

Table 2169. Event monitoring information

Event type	Logical data grouping	Monitor switch
Activities	event_activitystmt	Always collected
Package cache	pkgcache	Always collected

## Usage

Use this monitor element with the **semantic\_env\_id** monitor element to aggregate and group monitor data for similar statements.

## stmtno - Statement number monitor element

Statement number within a package for a static SQL statement.

This element is set to '1' for dynamic SQL statements. The element is set to '-1' if the statement number is unavailable, for example the statement number for DDL statements is not available.

Table 2170. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	Always collected
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	Always collected
MON_GET_PKG_CACHE_STMT_DETAILS - Get detailed metrics for package cache entries	Always collected
MON_GET_ROUTINE_EXEC_LIST table function - get list of statements executed by routine	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - return a list of activities	Always collected

Table 2171. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Element Collection Level
Activities	event_activitystmt	Always collected
Package CacheActivities	event_pkgcache	Always collected

## Usage

For static SQL statements, this value is the same as the value used for the SYSCAT.STATEMENTS catalog view.

## sto\_path\_free\_size - Automatic storage path free space monitor element

This element shows the amount of free space (in bytes) available on a file system pointed to by a storage path. If multiple storage paths point to the same file system, the free size is not divided between the

separate storage groups. The free size is divided between the multiple paths that point to the same file system within one storage group.

Table 2172. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ADMIN_GET_STORAGE_PATHS table function - Get storage path information for storage groups	Always collected

Table 2173. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	db_sto_path_info	Buffer Pool

## Usage

You can use this element together with the following elements to gather per-node data on space utilization for the database:

- **db\_storage\_path**
- **fs\_used\_size**
- **fs\_total\_size**
- **fs\_id**

## stop\_time - Event stop time

The date and time when the statement stopped executing or the unit of work completed.

Table 2174. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statements	event_stmt	Timestamp
Unit of Work	uow	Always Collected

## Usage

Use this element with the **start\_time** element to calculate the elapsed statement execution time or the elapsed unit of work time.

For a FETCH statement event, the value of **stop\_time** is the time of the last successful fetch.

**Note:** When the **Timestamp** switch is **OFF**, the **stop\_time** element that is reported by the statement event monitor returns **0** (zero).

## storage\_group\_id - Storage group identifier

An integer that uniquely represents a storage group used by the current database.

Table 2175. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ADMIN_GET_STORAGE_PATHS table function - get storage path information for storage groups	Always collected
MON_GET_TABLESPACE table function - get table space metrics	Always collected

## Usage notes

- If using the ADMIN\_GET\_STORAGE\_PATHS table function, the storage group identifier indicates the storage group to which a storage path is defined.
- If using the MON\_GET\_TABLESPACES table function, the storage group identifier indicates which storage group the table space is defined in.

## storage\_group\_name - Storage group name

Name of a storage group.

Table 2176. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ADMIN_GET_STORAGE_PATHS table function - get storage path information for storage groups	Always collected
MON_GET_TABLESPACE table function - get table space metrics	Always collected

## Usage notes

- If using the ADMIN\_GET\_STORAGE\_PATHS table function, this monitor element indicates the storage group to which a storage path is defined.
- If using the MON\_GET\_TABLESPACES table function, this monitor element indicates which storage group the table space is defined in.

## stored\_proc\_time - Stored Procedure Time

This element contains the aggregate amount of time, in milliseconds, that it has taken this data source to respond to stored procedure statements from all applications or a single application running on this federated server instance from the start of the federated server instance or the last reset of the database monitor counters.

Table 2177. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase_remote	Timestamp
Application	appl_remote	Timestamp

For snapshot monitoring, this counter can be reset.

The response time is measured as the difference between the time the federated server submits a stored procedure to the data source, and the time it takes the data source to respond, indicating that the stored procedure has been processed.

### Usage

Use this element to determine how much actual time is spent at this data source processing stored procedures.

## stored\_procs - Stored Procedures

This element contains a count of the total number of stored procedures from the start of the federated server instance, or the last reset of the database monitor counters, that the federated server has called at this data source on behalf of any application.

Table 2178. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase_remote	Basic
Application	appl_remote	Basic

For snapshot monitoring, this counter can be reset.

### Usage

Use this element to determine how many stored procedure calls were made locally at the federated database or by an application against the federated database.

## subroutine\_id - Subroutine identifier monitor element

A unique subroutine identifier.

This element returns NULL when the object is not a subroutine.

Table 2179. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	Always collected
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	Always collected
MON_GET_ROUTINE_EXEC_LIST table function - get list of statements executed by routine	Always collected
MON_GET_SECTION_ROUTINE table function - get list of routines for input section	Always collected

### Usage

Declared procedures have the same external ROUTINE\_ID value as their parent, use this element to differentiate between them.

## swap\_pages\_in - Pages swapped in from disk monitor element

The number of pages swapped in from disk since system startup. Reported for AIX and Linux systems only.

Table 2180. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ENV_GET_SYSTEM_RESOURCES table function - Return system information	Always collected

Table 2181. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_osmetrics	Always collected

### Usage

This metric reports point in time information at statistics event monitor record generation.

## swap\_pages\_out - Pages swapped out to disk monitor element

The number of pages swapped out to disk since system startup. Reported for AIX and Linux systems only.

Table 2182. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ENV_GET_SYSTEM_RESOURCES table function - Return system information	Always collected

Table 2183. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_osmetrics	Always collected

### Usage

This metric reports point in time information at statistics event monitor record generation.

## swap\_page\_size - Swap page size monitor element

The page size used for swap space, in bytes. Reported for AIX and Linux systems only.

Table 2184. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ENV_GET_SYSTEM_RESOURCES table function - Return system information	Always collected

Table 2185. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_osmetrics	Always collected

### Usage

This metric reports point in time information at statistics event monitor record generation.

## sync\_runstats - Total number of synchronous RUNSTATS activities monitor element

The total number of synchronous RUNSTATS activities triggered by real-time statistics gathering for all the applications in the database. This value includes both successful and unsuccessful synchronous RUNSTATS commands. Values reported by all the database partitions are aggregated together.

**Important:** The SQL administrative views and table functions that return this monitor element are deprecated. For SQL access to this information, see [“total\\_runstats - Total runtime statistics monitor element”](#) on page 1634.

Table 2186. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Statement

For snapshot monitoring, this counter can be reset.

Table 2187. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected

## Usage

Use this monitor element to determine how many synchronous RUNSTATS activities have been triggered by real-time statistics gathering in the database. This value changes frequently. In order to get a better view of the system usage, take a snapshot at specific intervals over an extended period of time. When used in conjunction with **sync\_runstats\_time**, this element can help you evaluate the performance impact of synchronous RUNSTATS activities triggered by real-time statistics gathering.

### **sync\_runstats\_time - Total time spent on synchronous RUNSTATS activities monitor element**

The `sync_runstats_time` monitor element stores the total time spent on synchronous RUNSTATS activities triggered by real-time statistics gathering, in milliseconds. The synchronous RUNSTATS activities occur during query compilation. At the database level, this monitor element represents the total time spent on synchronous RUNSTATS activities for all the applications running on the database, triggered by real-time statistics gathering. At the statement level, it represents the time spent on the latest synchronous RUNSTATS activities for a particular statement, triggered by real-time statistics gathering. Values reported by all the database partitions are aggregated together.

**Important:** The SQL administrative views and table functions that return this monitor element are deprecated. For SQL access to this information, see [“total\\_sync\\_runstats\\_time - Total synchronous RUNSTATS time monitor elements”](#) on page 1654.

Table 2188. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Statement
Dynamic SQL	dynsql	Statement

For snapshot monitoring, this element can be reset.

Table 2189. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected
Statement	event_stmt	Always collected

## Usage

Use this element along with **sync\_runstats** to evaluate the performance impact of synchronous RUNSTATS activities triggered by real-time statistics gathering, at the database level,

For dynamic SQL snapshot monitor, use this element along with **total\_exec\_time** and **num\_executions** to evaluate the impact of synchronous RUNSTATS on query performance.

For the statement event monitor, use this element along with **stmt\_start** and **stmt\_stop** for further evaluation of the impact of real-time statistics gathering.

## system\_auth\_id - System authorization identifier monitor element

The system authorization id for the connection.

This monitor element is a synonym for the **system\_authid** monitor element.

Table 2190. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	Always collected
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	Always collected
WLM_GET_SERVICE_CLASS_WORKLOAD_OCCURRENCES table function - list workload occurrences	Always collected

Table 2191. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Element Collection Level
Threshold violations	event_thresholdviolations	Always collected
Change history	changesummary	Always collected

## system\_cpu\_time - System CPU time monitor element

The total *system* CPU time (in seconds and microseconds) used by the database manager agent process, the unit of work, or the statement. For event monitors that write to tables, the value of this element is given in microseconds by using the BIGINT data type.

When either the statement monitor switch or the timestamp switch is not turned on, this element is not collected. In that case, the monitor element displays -1 instead.

Table 2192. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Connection	event_conn	Always collected
Transactions	event_xact	Always collected
Statements	event_stmt	Always collected
Activities	event_activity	Always collected

### Usage

This element, along with the other related CPU-time elements, can help you understand the level of activity within an application, and can help you identify applications that could benefit from additional tuning.

**Note:** If this information is not available for your operating system, this element will be set to 0.

**Note:** Due to the differences in granularity with which the database system collects statistics, the value of the **total\_exec\_time** monitor element might not equal the sum of values of **system\_cpu\_time** and **user\_cpu\_time** monitor elements. In this case, the sum of **system\_cpu\_time** and **user\_cpu\_time** monitor elements more accurately reflects the actual total execution time.

# T

## tab\_organization - Data organization in table monitor element

This element reports the organization of data in the table.

*Table 2193. Table function monitoring information*

Table function	Monitor element collection level
ADMIN_GET_TEMP_TABLES table function - Retrieve information for temporary tables	Table collection level
MON_GET_TABLE table function - get table metrics	Always collected

### Usage

Possible returned values are:

#### C

Indicates that data is column-organized.

#### R

Indicates that data is row-organized.

This element can be used to help interpret other monitoring data.

## table\_file\_id - Table file ID monitor element

The file ID (FID) for the table.

*Table 2194. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
ADMINTEMPtables administrative view and ADMIN_GET_TEMP_TABLES table function - Retrieve information for temporary tables	Always collected
MON_GET_APPL_LOCKWAIT table function - get information about locks for which an application is waiting	Always collected
MON_GET_LOCKS table function - list all locks in the currently connected database	Always collected
MON_GET_TABLE table function - Get table metrics	Always collected

*Table 2195. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl	Lock
Table	table	Basic
Lock	appl_lock_list	Lock
Lock	lock	Lock

Table 2196. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Deadlocks	lock	Always collected

## Usage

For snapshot monitoring, this element is provided for information purposes only. It is returned for compatibility with previous versions of the database system monitor, and it may not uniquely identify the table. Use **table\_name** and **table\_schema** monitor elements to identify the table.

In MON\_GET\_LOCKS and MON\_GET\_APPL\_LOCKWAIT table functions, this element represents the file ID (FID) for the table that the lock references.

## table\_name - Table name monitor element

The name of the table.

Table 2197. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ADMIN_GET_INDEX_COMPRESS_INFO table function - returns compressed index information	Always collected
ADMIN_GET_INDEX_INFO table function - returns index information	Always collected
ADMIN_GET_TAB_COMPRESS_INFO table function - estimate compression savings	Always collected
ADMIN_GET_TAB_DICTIONARY_INFO table function - report properties of existing table dictionaries	Always collected
ADMINTABINFO administrative view and ADMIN_GET_TAB_INFO table function - retrieve table size and state information	Always collected
ADMINTEMPCOLUMNS administrative view and ADMIN_GET_TEMP_COLUMNS table function - Retrieve column information for temporary tables	Always collected
ADMINTEMPTABLES administrative view and ADMIN_GET_TEMP_TABLES table function - Retrieve information for temporary tables	Always collected
MON_FORMAT_LOCK_NAME table function - Format the internal lock name and return details	Always collected
MON_GET_INDEX table function - Get index metrics	Always collected
MON_GET_PAGE_ACCESS_INFO table function - Get buffer pool page waiting information	Always collected
MON_GET_TABLE table function - Get table metrics	Always collected
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	Always collected

Table 2198. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table	table	Basic
Application	appl	Lock
Lock	appl_lock_list	Lock
Lock	lock	Lock
Lock	lock_wait	Lock

Table 2199. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	Always collected
Tables	event_table	Always collected
Deadlocks <sup>1</sup>	lock	Always collected
Deadlocks <sup>1</sup>	event_dlconn	Always collected
Deadlocks with Details <sup>1</sup>	event_detailed_dlconn	Always collected

**1**

This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the [CREATE EVENT MONITOR](#) for locking statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

**Usage**

Along with **table\_schema**, this element can help you determine the source of contention for resources.

At the application-level, application-lock level, and deadlock-monitoring-level, this is the table that the application is waiting to lock, because it is currently locked by another application. For snapshot monitoring, this item is only valid when the "lock" monitor group information is set to ON, and when **lock\_object\_type** indicates that the application is waiting to obtain a table lock.

For snapshot monitoring at the object-lock level, this item is returned for table-level and row-level locks. The table reported at this level is the table against which this application holds these locks.

For snapshot and event monitoring at the table level, this is the table for which information has been collected. For temporary tables, the format for **table\_name** is "TEMP (*n*, *m*)", where:

- *n* is the table space ID
- *m* is the **table\_file\_id** element

**table\_scans - Table scans monitor element**

The number of scans on this table.

Table 2200. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLE table function - Get table metrics	Always collected

## table\_schema - Table schema name monitor element

The schema of the table.

*Table 2201. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
ADMIN_GET_INDEX_COMPRESS_INFO table function - returns compressed index information	Always collected
ADMIN_GET_INDEX_INFO table function - returns index information	Always collected
ADMIN_GET_TAB_COMPRESS_INFO table function - estimate compression savings	Always collected
ADMIN_GET_TAB_DICTIONARY_INFO table function - report properties of existing table dictionaries	Always collected
ADMINTABINFO administrative view and ADMIN_GET_TAB_INFO table function - retrieve table size and state information	Always collected
ADMINTEMPCOLUMNS administrative view and ADMIN_GET_TEMP_COLUMNS table function - Retrieve column information for temporary tables	Always collected
ADMINTEMPFILES administrative view and ADMIN_GET_TEMP_FILES table function - Retrieve information for temporary tables	Always collected
MON_FORMAT_LOCK_NAME table function - Format the internal lock name and return details	Always collected
MON_GET_INDEX table function - Get index metrics	Always collected
MON_GET_PAGE_ACCESS_INFO table function - Get buffer pool page waiting information	Always collected
MON_GET_TABLE table function - Get table metrics	Always collected
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	Always collected

*Table 2202. Snapshot Monitoring Information*

<b>Snapshot Level</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Table	table	Basic
Application	appl	Lock
Lock	appl_lock_list	Lock
Lock	lock	Lock
Lock	lock_wait	Lock

*Table 2203. Event Monitoring Information*

<b>Event Type</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Locking	-	Always collected

Table 2203. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Tables	event_table	Always collected
Deadlocks <sup>1</sup>	lock	Always collected
Deadlocks <sup>1</sup>	event_dlconn	Always collected
Deadlocks with Details <sup>1</sup>	event_detailed_dlconn	Always collected

**1**

This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the `CREATE EVENT MONITOR` for locking statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

**Usage**

Along with **table\_name**, this element can help you determine the source of contention for resources.

For application-level, application-lock-level, deadlock-monitoring-level, this is the schema of the table that the application is waiting to lock, because it is currently locked by another application. This element is only set if **lock\_object\_type** indicates that the application is waiting to obtain a table lock. For snapshot monitoring at the application-level and application-lock levels, this item is only valid when the "lock" monitor group information is set to ON.

For snapshot monitoring at the object-lock level, this item is returned for table and row level locks. The table reported at this level is the table against which this application holds these locks.

For snapshot and event monitoring at the table level, this element identifies the schema of the table for which information has been collected. For temporary tables, the format for **table\_schema** is "`<agent_id><auth_id>`", where:

- *agent\_id* is the Application Handle of the application creating the temporary table
- *auth\_id* is the authorization ID used by the application to connect to the database

**table\_type - Table type monitor element**

The type of table for which information is returned.

Table 2204. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLE table function - Get table metrics	Always collected

Table 2205. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table	table	Basic

Table 2206. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Tables	event_table	Always collected

## Usage

Use this element to help identify the table for which information is returned. If the table is a user table or a system catalog table, you can use **table\_name** and **table\_schema** to identify the table.

The type of table may be one of the following values. The possible values are text strings based on defines in the `sqlmon.h` file.

### **CATALOG\_TABLE**

System catalog table.

### **SYNOPSIS\_TABLE**

Synopsis table.

### **TEMP\_TABLE**

Temporary table. Information about temporary tables is returned although temporary tables are not kept in the database after being used. Information about this type of tables might be useful even if they are no longer in the database.

### **USER\_TABLE**

User table.

## **tablespace\_auto\_resize\_enabled - Table space automatic resizing enabled monitor element**

This element describes whether automatic resizing is enabled for the table space. A value of 1 means "Yes"; a value of 0 means "No".

---

*Table 2207. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_TABLESPACE table function - Get table space metrics	Always collected

---

*Table 2208. Snapshot Monitoring Information*

<b>Snapshot Level</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Table Space	tablespace	Basic

## Usage

This element is only applicable to DMS table spaces and non-temporary automatic storage table spaces. If this element is set to 1, then automatic resizing is enabled. See the following monitor elements for information about the rate of increase and the maximum size for the table space.

- **tablespace\_max\_size**
- **tablespace\_increase\_size**
- **tablespace\_increase\_size\_percent**

## **tablespace\_content\_type - Table space content type monitor element**

The type of content in a table space.

---

*Table 2209. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_TABLESPACE table function - Get table space metrics	Always collected

Table 2210. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace	Basic

### Usage

The type of content in the table space (defined in sqlmon.h) can be one of the following values:

- All types of permanent data.
  - Regular table space: SQLM\_TABLESPACE\_CONTENT\_ANY
  - Large table space: SQLM\_TABLESPACE\_CONTENT\_LARGE
- System temporary data: SQLM\_TABLESPACE\_CONTENT\_SYSTEMP
- User temporary data: SQLM\_TABLESPACE\_CONTENT\_USRTEMP

### tablespace\_cur\_pool\_id - Buffer pool currently being used monitor element

The buffer pool identifier for a buffer pool that a table space is currently using.

Table 2211. Table Function Monitoring Information

Table Function	Monitor Element Collection Command and Level
MON_GET_TABLESPACE table function - Get table space metrics	Always collected

Table 2212. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace	Basic

### Usage

Each buffer pool is identified by a unique integer. The value of this element matches a value from column BUFFERPOOLID of view SYSCAT.BUFFERPOOLS.

### tablespace\_current\_size - Current table space size

This element shows the current size of the table space in bytes.

Table 2213. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_nodeinfo	Basic

### Usage

For DMS and automatic storage table spaces, this element represents the total size of all table space containers in bytes. This value is equal to the total pages for the table space (tablespace\_total\_pages) multiplied by the table space's page size (tablespace\_page\_size). This element is not applicable for SMS table spaces, or for temporary automatic storage table spaces.

On table space creation for an automatic storage table space, the current size might not match the initial size. The value of current size will be within page size multiplied by extent size multiplied by the number of storage paths of the initial size on creation (usually greater, but sometimes smaller). It will always be less than or equal to tablespace\_max\_size (if set). This is because containers can only grow by full extents, and must be grown as a set.

## tablespace\_extent\_size - Table space extent size monitor element

The extent size used by a table space.

Table 2214. Table Function Monitoring Information

Table Function	Monitor Element Collection Command and Level
MON_GET_TABLESPACE table function - Get table space metrics	Always collected

Table 2215. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace	Basic

## tablespace\_free\_pages - Free pages in table space monitor element

The total number of pages that are currently free in a table space.

Table 2216. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLESPACE table function - Get table space metrics	Always collected

Table 2217. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_nodeinfo	Basic

## Usage

This is applicable only to a DMS table space.

## tablespace\_id - Table space identification monitor element

An integer that uniquely represents a table space used by the current database.

Table 2218. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ADMINTEMPtables administrative view and ADMIN_GET_TEMP_TABLES table function - Retrieve information for temporary tables	Always collected
MON_GET_APPL_LOCKWAIT table function - get information about locks for which an application is waiting	Always collected
MON_GET_CONTAINER table function - Get table space container metrics	Always collected
MON_GET_EXTENT_MOVEMENT_STATUS - Get extent movement progress status metrics	Always collected
MON_GET_LOCKS table function - list all locks in the currently connected database	Always collected

Table 2218. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_REBALANCE_STATUS table function - get rebalance progress for a table space	Always collected
MON_GET_TABLE table function - Get table metrics	Always collected
MON_GET_TABLESPACE table function - Get table space metrics	Always collected
MON_GET_TABLESPACE QUIESCER table function - Get information about quiesced table spaces	Always collected
MON_GET_TABLESPACE_RANGE table function - Get information about table space ranges	Always collected

Table 2219. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace	Basic
Table	table	Basic

Table 2220. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Tables	event_table	Always collected

## Usage

The value of this element matches a value from column TBSPACEID of view SYSCAT.TABLESPACES.

### tablespace\_increase\_size - Increase size in bytes

This element shows the size that an auto-resize table space will increase by in bytes when the table space becomes full and more space is required.

Table 2221. Table function monitoring information

Table function	Monitor element collection level
MON_GET_TABLESPACE table function - Get table space metrics	Always collected

Table 2222. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_nodeinfo	Basic

## Usage

This represents the amount of space that will be added to a table space that can be automatically resized when it becomes full, more space is being requested, and the maximum table space size has not been reached. If the value of this element is -1 (or "AUTOMATIC" in the snapshot output), then the database automatically determines the value when space needs to be added. This element is only applicable to table spaces that are enabled to be automatically resized.

## tablespace\_increase\_size\_percent - Increase size by percent monitor element

This element shows the amount by which an auto-resize table space will increase when the table space becomes full and more space is required. The actual number of bytes is determined at the time the table space is resized based on the size of the table space at that time.

Table 2223. Table function monitoring information

Table function	Monitor element collection level
MON_GET_TABLESPACE table function - Get table space metrics	Always collected

Table 2224. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_nodeinfo	Basic

### Usage

This represents the amount of space that will be added to a table space that can be automatically resized when it becomes full, more space is being requested, and the maximum table space size has not been reached. The growth rate is based on a percentage of the current table space size (tablespace\_current\_size) at the time the table space is resized. This element is only applicable to table spaces that are enabled to be automatically resized.

## tablespace\_initial\_size - Initial table space size

The initial size of the automatic storage table space in bytes.

Table 2225. Table function monitoring information

Table function	Monitor element collection level
MON_GET_TABLESPACE table function - Get table space metrics	Always collected

Table 2226. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_nodeinfo	Basic

### Usage

For non-temporary automatic storage table spaces, this monitor element represents the initial size in bytes for the table space when it was created.

## tablespace\_last\_resize\_failed - Last resize attempt failed

This element describes whether or not the last attempt to automatically increase the size of the table space failed. A value of 1 means yes, 0 means no.

Table 2227. Table function monitoring information

Table function	Monitor element collection level
MON_GET_TABLESPACE table function - Get table space metrics	Always collected

Table 2228. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_nodeinfo	Basic

#### Usage

For an automatic storage table space, this element may show that there is no space left on any of the database's storage paths. For a non-automatic storage table space, a failure means that one of the containers could not be extended because its filesystem was full. Another reason for failure is that the maximum size of the table space has been reached. This element is only applicable to table spaces that are enabled to be automatically resized.

### tablespace\_last\_resize\_time - Time of last successful resize

This element shows a timestamp representing the last time that the size of the table space was successfully increased.

Table 2229. Table function monitoring information

Table function	Monitor element collection level
MON_GET_TABLESPACE table function - Get table space metrics	Always collected

Table 2230. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_nodeinfo	Basic

#### Usage

For table spaces that can be automatically resized, this element represents the last time that space was automatically added to the table space when it became full, more space was being requested, and the maximum table space size had not been reached. This element is only applicable to table spaces that are enabled to be automatically resized.

### tablespace\_max\_size - Maximum table space size

This element shows the maximum size in bytes to which the table space can automatically resize or increase.

Table 2231. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLESPACE table function - Get table space metrics	Always collected

Table 2232. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_nodeinfo	Basic

#### Usage

This represents the maximum size in bytes to which a table space that can be automatically resized can automatically increase. If this value is equal to the tablespace\_current\_size element, then there is no room for the table space to grow. If the value of this element is -1, then the maximum size is considered to be "unlimited" and the table space can automatically resize until the file systems

are full or the architectural size limit of the table space is reached. (This limit is described in the SQL Limits appendix of the *SQL Reference*). This element is only applicable to table spaces that are enabled for automatic resizing.

## tablespace\_min\_recovery\_time - Minimum recovery time for rollforward monitor element

A timestamp showing the earliest point in time to which a table space can be rolled forward. The timestamp reflects local time.

Table 2233. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLESPACE table function - Get table space metrics	Always collected

Table 2234. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_nodeinfo	Basic

### Usage

Displayed only if non zero.

## tablespace\_name - Table space name monitor element

The name of a table space.

Table 2235. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_FORMAT_LOCK_NAME table function - Format the internal lock name and return details	Always collected
MON_GET_CONTAINER table function - Get table space container metrics	Always collected
MON_GET_EXTENT_MOVEMENT_STATUS - Get extent movement progress status metrics	Always collected
MON_GET_REBALANCE_STATUS - Get rebalance progress for a table space	Always collected
MON_GET_TABLESPACE table function - Get table space metrics	Always collected
MON_GET_TABLESPACE_QUIESCER table function - Get information about quiesced table spaces	Always collected
MON_GET_TABLESPACE_RANGE table function - Get information about table space ranges	Always collected

Table 2236. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace	Basic
Lock	appl_lock_list	Basic

Table 2236. Snapshot Monitoring Information (continued)

Snapshot Level	Logical Data Grouping	Monitor Switch
Lock	lock	Lock
Lock	lock_wait	Lock

Table 2237. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	-
Deadlocks <sup>1</sup>	lock	-
Deadlocks <sup>1</sup>	event_dlconn	-
Deadlocks with Details <sup>1</sup>	event_detailed_dlconn	-
Table Space	tablespace_list	-

### 1

This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the `CREATE EVENT MONITOR` for `locking` statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

## Usage

This element can help you determine the source of contention for resources.

It is equivalent to the `TBSPACE` column in the database catalog table `SYSCAT.TABLESPACES`. At the application level, application-lock level, and deadlock monitoring level, this is the name of the table space that the application is waiting to lock. Another application currently holds a lock on this table space.

At the lock level, this is the name of the table space against which the application currently holds a lock.

At the table space level (when the buffer pool monitor group is ON), this is the name of the table space for which information is returned.

This element will not be returned for a table lock held on a partitioned table.

## tablespace\_next\_pool\_id - Buffer pool that will be used at next startup monitor element

The buffer pool identifier for a buffer pool that a table space will use at the next database startup.

Table 2238. Table Function Monitoring Information

Table Function	Monitor Element Collection Command and Level
MON_GET_TABLESPACE table function - Get table space metrics	Always collected

Table 2239. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace	Basic

## Usage

Each buffer pool is identified by a unique integer. The value of this element matches a value from column `BUFFERPOOLID` of view `SYSCAT.BUFFERPOOLS`

## tablespace\_num\_containers - Number of Containers in Table Space

Total number of containers in the table space.

Table 2240. Table function monitoring information

Table function	Monitor element collection level
MON_GET_TABLESPACE table function - Get table space metrics	Always collected

Table 2241. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_nodeinfo	Basic

## tablespace\_num\_quiescers - Number of Quiescers

The number of users quiescing the table space (can be in the range of 0 to 5).

Table 2242. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLESPACE table function - Get table space metrics	Always collected

Table 2243. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_nodeinfo	Basic

### Usage

This value represents the number of agents that have quiesced the table space (either in "SHARE", "UPDATE", or "EXCLUSIVE" mode). For each quiescer, the following information is returned in a tablespace\_quiescer logical data group:

- User authorization ID of the quiescer
- Agent ID of the quiescer
- Table space ID of the object that was quiesced that resulted in this table space being quiesced
- Object ID of the object that was quiesced that resulted in this table space being quiesced
- Quiesce state

## tablespace\_num\_ranges - Number of Ranges in the Table Space Map

The number of ranges (entries) in the table space map. This can be in the range of 1 to 100's (but is usually less than a dozen). The table space map only exists for DMS table spaces.

Table 2244. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLESPACE table function - Get table space metrics	Always collected

---

Table 2245. Snapshot Monitoring Information

---

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_nodeinfo	Basic

---

### **tablespace\_page\_size - Table space page size monitor element**

Page size used by a table space in bytes.

---

Table 2246. Table Function Monitoring Information

---

Table Function	Monitor Element Collection Command and Level
MON_GET_TABLESPACE table function - Get table space metrics	Always collected

---

---

Table 2247. Snapshot Monitoring Information

---

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace	Basic

---

### **tablespace\_page\_top - Table space high watermark monitor element**

The page in a table space that is holding the high watermark.

---

Table 2248. Table Function Monitoring Information

---

Table Function	Monitor Element Collection Level
MON_GET_TABLESPACE table function - Get table space metrics	Always collected

---

---

Table 2249. Snapshot Monitoring Information

---

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_nodeinfo	Basic

---

### **Usage**

For DMS, this element represents the page number of the first free extent following the last allocated extent of a table space. Note that this is not really a "high watermark", but rather a "current watermark", since the value can decrease. For SMS, this is not applicable.

### **tablespace\_paths\_dropped - Table space using dropped path monitor element**

Indicates that the table space is using a storage path that has been dropped.

---

Table 2250. Table Function Monitoring Information

---

Table Function	Monitor Element Collection Level
MON_GET_TABLESPACE table function - Get table space metrics	Always collected

---

Table 2251. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_nodeinfo	Basic

## Usage

For table spaces using automatic storage, use this monitor element to determine whether any of the table space containers reside on a storage path that has been dropped. Before storage paths are physically dropped from the database, all table spaces must stop using them. To stop using a dropped storage path, either drop the table space or rebalance the table space using the REBALANCE clause of the ALTER TABLESPACE statement.

## tablespace\_pending\_free\_pages - Pending free pages in table space monitor element

The number of pages in a table space which would become free if all pending transactions are committed or rolled back and new space is requested for an object.

Table 2252. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLESPACE table function - Get table space metrics	Always collected

Table 2253. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_nodeinfo	Basic

## Usage

This is applicable only to a DMS table space.

## tablespace\_prefetch\_size - Table space prefetch size monitor element

The maximum number of pages the prefetcher gets from the disk at a time.

Table 2254. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLESPACE table function - Get table space metrics	Always collected

Table 2255. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace	Basic
Table Space	tablespace_nodeinfo	Basic

## Usage

- For table function monitoring, this element always reports the actual value for the table space prefetch size.

- For snapshot monitoring, if automatic prefetch size is enabled, this element reports the value "-1" in the *tablespace* Logical Data Grouping, and the actual value is reported in the *tablespace\_nodeinfo* Logical Data Grouping.
- For snapshot monitoring, if automatic prefetch size is not enabled, this element reports the actual value in the *tablespace* Logical Data Grouping, and the element does not appear in the *tablespace\_nodeinfo* Logical Data Grouping.

## tablespace\_state - Table space state monitor element

This element describes the current state of a table space.

Table 2256. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLESPACE table function - Get table space metrics	Always collected

Table 2257. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_nodeinfo	Basic

## Usage

In administrative views and table functions, this monitor element returns a text identifier based on defines in `sqlutil.h`, and is combination of the following values separated by a '+' sign:

- BACKUP\_IN\_PROGRESS
- BACKUP\_PENDING
- DELETE\_PENDING
- DISABLE\_PENDING
- DROP\_PENDING
- LOAD\_IN\_PROGRESS
- LOAD\_PENDING
- MOVE\_IN\_PROGRESS
- EM\_STARTED
- EM\_TERMINATING
- NORMAL
- OFFLINE
- PSTAT\_CREATION
- PSTAT\_DELETION
- QUIESCED\_EXCLUSIVE
- QUIESCED\_SHARE
- QUIESCED\_UPDATE
- REBAL\_IN\_PROGRESS
- REDIST\_IN\_PROGRESS
- REORG\_IN\_PROGRESS
- RESTORE\_IN\_PROGRESS
- RESTORE\_PENDING
- ROLLFORWARD\_IN\_PROGRESS

- ROLLFORWARD\_PENDING
- STORDEF\_ALLOWED
- STORDEF\_CHANGED
- STORDEF\_FINAL\_VERSION
- STORDEF\_PENDING
- SUSPEND\_WRITE

This element contains a hexadecimal value indicating the current table space state. The externally visible state of a table space is composed of the hexadecimal sum of certain state values. For example, if the state is "quiesced: EXCLUSIVE" and "Load pending", the value is 0x0004 + 0x0008, which is 0x000c. Use the **db2tbst** command to obtain the table space state associated with a given hexadecimal value.

<i>Table 2258. Bit definitions listed in sqlutil.h</i>		
<b>Hexadecimal Value</b>	<b>Decimal Value</b>	<b>State</b>
0x0	0	Normal (see the definition SQLB_NORMAL in sqlutil.h)
0x1	1	Quiesced: SHARE
0x2	2	Quiesced: UPDATE
0x4	4	Quiesced: EXCLUSIVE
0x8	8	Load pending
0x10	16	Delete pending
0x20	32	Backup pending
0x40	64	Roll forward in progress
0x80	128	Roll forward pending
0x100	256	Restore pending
0x100	256	Recovery pending (not used)
0x200	512	Disable pending
0x400	1024	Reorg in progress
0x800	2048	Backup in progress
0x1000	4096	Storage must be defined
0x2000	8192	Restore in progress
0x4000	16384	Offline and not accessible
0x8000	32768	Drop pending
0x10000	65536	No write is allowed
0x20000	131072	Load in progress
0x40000	262144	Redistribute in progress
0x80000	524288	Move in progress
0x100000	1048576	Move has started
0x200000	2097152	Move is terminating
0x2000000	33554432	Storage may be defined
0x4000000	67108864	Storage Definition is in 'final' state

Table 2258. Bit definitions listed in sqlutil.h (continued)

Hexadecimal Value	Decimal Value	State
0x8000000	134217728	Storage Definition was changed before rollforward
0x10000000	268435456	DMS rebalancer is active
0x20000000	536870912	TBS deletion in progress
0x40000000	1073741824	TBS creation in progress

**Note:** LOAD does not set the table space state to Load pending or Delete pending.

### tablespace\_state\_change\_object\_id - State Change Object Identification

The object that caused the table space state to be set to "Load pending" or "Delete pending".

**Element identifier**

tablespace\_state\_change\_object\_id

**Element type**

information

Table 2259. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_nodeinfo	Basic

**Usage**

This element is meaningful only if the table space state is "Load pending" or "Delete pending". If nonzero, the value of this element matches a value from column TABLEID of view SYSCAT.TABLES.

**Note:** LOAD does not set the table space state to Load pending or Delete pending.

### tablespace\_state\_change\_ts\_id - State Change Table Space Identification

If the table space state is "Load pending" or "Delete pending", this shows the table space ID of the object that caused the table space state to be set.

**Element identifier**

tablespace\_state\_change\_ts\_id

**Element type**

information

Table 2260. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_nodeinfo	Basic

**Usage**

This element is meaningful only if the table space state is "Load pending" or "Delete pending". If nonzero, the value of this element matches a value from column TABLESPACEID of view SYSCAT.TABLES.

**Note:** LOAD does not set the table space state to Load pending or Delete pending.

## tablespace\_total\_pages - Total pages in table space monitor element

Total number of pages in a table space.

Table 2261. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLESPACE table function - Get table space metrics	Always collected

Table 2262. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_nodeinfo	Basic (DMS table spaces) Buffer Pool (SMS table spaces)

### Usage

Total operating system space occupied by a table space. For DMS, this is the sum of the container sizes. For SMS, this is the sum of all file space used for the tables stored in this table space (and is only collected if the buffer pool switch is on).

## tablespace\_type - Table space type monitor element

The type of a table space.

Table 2263. Table Function Monitoring Information

Table Function	Monitor Element Collection Command and Level
MON_GET_TABLESPACE table function - Get table space metrics	Always collected

Table 2264. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace	Basic

### Usage

This element shows whether this table space is a database managed table space (DMS), or system managed table space (SMS).

The values for tablespace\_type (defined in sqlmon.h) are as follows:

- For DMS: SQLM\_TABLESPACE\_TYP\_DMS
- For SMS: SQLM\_TABLESPACE\_TYP\_SMS

## tablespace\_usable\_pages - Usable pages in table space monitor element

The total number of pages in a table space minus overhead pages.

Table 2265. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLESPACE table function - Get table space metrics	Always collected

Table 2266. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_nodeinfo	Basic (DMS table spaces) Buffer Pool (SMS table spaces)

## Usage

This element is applicable to DMS table spaces only. For SMS table spaces, this element will have the same value as the **tablespace\_total\_pages** monitor element.

During a table space rebalance, the number of usable pages will include pages for the newly added container, but these new pages may not be reflected in the number of free pages until the rebalance is complete. When a table space rebalance is not taking place, the number of used pages plus the number of free pages, plus the number of pending free pages will equal the number of usable pages.

## tablespace\_used\_pages - Used pages in table space monitor element

The total number of pages that are currently used (not free) in a table space.

Table 2267. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLESPACE table function - Get table space metrics	Always collected

Table 2268. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace_nodeinfo	Basic (DMS table spaces) Buffer Pool (SMS table spaces)

## Usage

This is the total number of pages in use for a DMS table space. For an SMS table space it is equal to the value of **tablespace\_total\_pages** monitor element.

## tablespace\_using\_auto\_storage - Table space enabled for automatic storage monitor element

This element describes whether the table space was created as an automatic storage table space. A value of 1 means "Yes"; a value of 0 means "No".

Table 2269. Table Function Monitoring Information

Table Function	Monitor Element Collection Command and Level
MON_GET_TABLESPACE table function - Get table space metrics	Always collected

Table 2270. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	tablespace	Basic

## Usage

You can use this element to determine whether the given table space was created using automatic storage (that is, created with the `MANAGED BY AUTOMATIC STORAGE` clause), rather than with containers that are explicitly provided. The table space can have containers that exist on some or all of the storage paths associated with the database.

### **takeover\_app\_remaining\_primary - Applications remaining on primary monitor element**

During non forced takeover, the number of applications still to be forced off on primary. Return NULL if not in takeover.

---

*Table 2271. Table function monitoring information*

---

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

---

### **takeover\_app\_remaining\_standby - Applications remaining on standby monitor element**

The number of reads on standby applications still to be forced off on the standby during takeover (forced and non forced). Return NULL if not in takeover.

---

*Table 2272. Table function monitoring information*

---

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

---

### **target\_cf\_gbp\_size - Target cluster caching facility group buffer pool size monitor element**

During a dynamic resize, this monitor element shows the group buffer pool memory target value, in pages with a page size of 4 KB. A resize is complete when the target value matches the configured value.

---

*Table 2273. Table Function Monitoring Information*

---

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_CF table function - Get CF metrics	Always collected

---

### **target\_cf\_lock\_size - Target cluster caching facility lock size monitor element**

During a dynamic resize, this monitor element shows the global lock memory target value, in pages with a page size of 4 KB. A resize is complete when the target value matches the configured value.

---

*Table 2274. Table Function Monitoring Information*

---

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_CF table function - Get CF metrics	Always collected

---

## target\_cf\_sca\_size - Target cluster caching facility shared communications area size monitor element

During a dynamic resize, this monitor element shows the shared communications area memory target value, in pages with a page size of 4 KB. A resize is complete when the target value matches the configured value.

Table 2275. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CF table function - Get CF metrics	Always collected

## tbsp\_datatag - Table space data tag

This element identifies the effective data tag value for a table space. The effective data tag is the data tag value that was specified explicitly for the table space or inherited from the table space storage group. Valid user-specified range is 1 through 9; 0 indicates no data tag specified.

Table 2276. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLESPACE table function - get table space metrics	Always collected

### Usage note

A data tag is used to identify and group data that can be referenced within WLM configurations. The WLM configurations determine the effect of the tagging which may affect the processing priority of user work.

## tbsp\_last\_consec\_page - Last consecutive object table page monitor element

Object relative page number of the last contiguous meta-data page for the table space. This value is only valid for DMS table spaces. It is 0 otherwise.

Table 2277. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLESPACE table function - Get table space metrics	Always collected

## tbsp\_max\_page\_top - Maximum table space page high watermark monitor element

The highest allocated page number for a DMS table space since the database was activated.

Table 2278. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TABLESPACE table function - Get table space metrics	Always collected

### Usage

This value changes whenever the value of the **tablespace\_page\_top** monitor element increases.

## tbody\_names - Table space names

This element lists the table space names that the utility acts on.

*Table 2279. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_UTILITY table function - Get utilities running on the database	Always collected

*Table 2280. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Change History	UTILSTART	Always collected

### Usage

For the change history event monitor, if the object\_type element is DATABASE or TABLESPACE, this is a comma delimited list of table space names that the utility acts on.

## tbody\_trackmod\_state - Table space trackmod state monitor element

The modification state that a table space is in with respect to the last or next backup.

*Table 2281. Table function monitoring information*

Table Function	Monitor Element Collection Level
MON_GET_TABLESPACE table function - Get table space metrics	Always

### Usage

You can use this monitor element to determine the modification status of a table space. The status of a table space can be in one of the following states:

#### **CLEAN**

No modifications occurred in the table space since the previous backup. If an incremental or delta backup is executed at this time, no data pages from this table space would be backed up.

#### **DIRTY**

Table space contains data that needs to be picked up by the next backup.

#### **ININCREMENTAL**

Table space contains modifications that were copied into an incremental backup. This state is in a DIRTY state relative to a full backup such that a future incremental backup needs to include some pages from this pool. This state is also in a CLEAN state such that a future delta backup does not need to include any pages from this pool.

#### **READFULL**

The latest table space modification state change was caused by a dirty table space that is being read by a full backup that might not have completed successfully, or is currently in progress.

#### **READINCREMENTAL**

The latest table space modification state change was caused by a dirty table space that is being read by an incremental backup that might not have completed successfully, or is currently in progress.

#### **UNAVAILABLE**

The **trackmod** configuration parameter is set to No. Therefore, no table space modification status information is available.

## tcpip\_recv\_volume - TCP/IP received volume monitor element

The amount of data received by the data server from clients over TCP/IP. This value is reported in bytes.

Table 2282. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 2283. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the details_xml document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the details_xml document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the details_xml document)	REQUEST METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

## tcpip\_recv\_wait\_time - TCP/IP received wait time monitor element

The time spent waiting for an incoming client request over TCP/IP excluding idle time. The value is given in milliseconds.

Table 2284. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 2293. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

## temp\_tablespace\_top - Temporary table space top monitor element

The temp\_tablespace\_top monitor element is a high watermark, in KB, for the temporary table space usage of DML activities at all nesting levels in a service class or work class. For service classes, this monitor element returns -1 when COLLECT AGGREGATE ACTIVITY DATA for the service class is set to NONE. For work classes, this monitor elements returns -1 if no COLLECT AGGREGATE ACTIVITY DATA work action is specified for the work class. For workloads, this monitor element returns -1 when COLLECT AGGREGATE ACTIVITY DATA for the workload is set to NONE.

For service classes, when you remap activities between service subclasses with a REMAP ACTIVITY action, only the temp\_tablespace\_top high watermark of the service subclass where an activity completes is changed. High watermarks of service subclasses an activity is mapped to but does not complete in are unaffected.

Table 2294. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected

Table 2295. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats	-
Statistics	event_superclasstats	-
Statistics	event_wcstats	-
Statistics	event_wlstats	-

### Usage

Use this element to determine the highest DML activity system temporary table space usage reached on a member for a service class, workload, or work class in the time interval collected.

This element is only updated by activities that have a temporary table space threshold applied to them. If no temporary table space threshold is applied to an activity, a value of 0 is returned.

## tenant\_id - Tenant identifier monitor element

Identifies the tenant in which this RUNSTATS job is queued

To map tenant ID values to a tenant name, the contents of the SYSCAT.TENANT catalog view can be searched for a matching value. If the tenant has been dropped, the number will not be present in this view.

The default SYSTEM tenant has the permanent identifier of 0 (zero) and does not appear in the SYSCAT.TENANT catalog view.

Table 2296. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ADMIN_GET_INDEX_COMPRESS_INFO table function - returns compressed index information	Always collected
ADMIN_GET_INDEX_INFO table function - returns index information	Always collected
ADMIN_GET_TAB_COMPRESS_INFO table function - estimate compression savings	Always collected

Table 2296. Table Function Monitoring Information (continued)

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
ADMIN_GET_TAB_DICTIONARY_INFO table function - report properties of existing table dictionaries	Always collected
ADMIN_GET_TAB_INFO table function - retrieve table size and state information	Always collected
MON_FORMAT_LOCK_NAME table function - Format the internal lock name and return details	Always collected
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Return information about an activity as an XML document	Always collected
MON_GET_AUTO_MAINT_QUEUE table function - Get information about the automatic maintenance jobs	Always collected
MON_GET_AUTO_RUNSTATS_QUEUE table function - Retrieve information about objects queued for evaluation	Always collected
MON_GET_CONNECTION table function - Get connection metrics	Always collected
MON_GET_CONNECTION_DETAILS table function - Get connection metrics as an XML document	Always collected
MON_GET_INDEX table function - get index metrics	Always collected
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	Always collected
MON_GET_PKG_CACHE_STMT_DETAILS table function - Get package cache statement metrics as an XML document	Always collected
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	Always collected
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	Always collected
MON_GET_ROUTINE_EXEC_LIST table function - get list of statements executed by routine	Always collected
MON_GET_RTS_RQST table function - Retrieve information about real-time statistics requests	Always collected
MON_GET_SECTION_OBJECT table function - List objects accessed by a section	Always collected
MON_GET_TABLE table function - Get table metrics	Always collected
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get unit of work metrics as an XML document	Always collected
MON_GET_UTILITY table function - Get utilities running on the database	Always collected

Table 2297. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity	Always collected
Change history	changesummary	Always collected
Deadlocks with Details <sup>2</sup>	event_detailed_dlconn	Always collected
Locking	lock_participants	Always collected
Statements	event_stmt	Always collected
Table	table	Always collected
Threshold violations	event_thresholdviolations	Always collected
Transactions <sup>1</sup>	event_xact	Always collected
Package cache	pkgcache	Always collected
Unit of work	uow	Always collected

**Note:**

1. This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the CREATE EVENT MONITOR FOR UNIT OF WORK statement to monitor transaction events.
2. This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the CREATE EVENT MONITOR FOR LOCKING statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

**Usage**

Use this element to identify the tenant in which this RUNSTATS job is queued.

**tenant\_name - Tenant name monitor element**

The name of the tenant in which this RUNSTATS job is queued.

Table 2298. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ADMIN_GET_INDEX_COMPRESS_INFO table function - returns compressed index information	Always collected
ADMIN_GET_INDEX_INFO table function - returns index information	Always collected
ADMIN_GET_TAB_COMPRESS_INFO table function - estimate compression savings	Always collected
ADMIN_GET_TAB_DICTIONARY_INFO table function - report properties of existing table dictionaries	Always collected
ADMIN_GET_TAB_INFO table function - retrieve table size and state information	Always collected
MON_FORMAT_LOCK_NAME table function - Format the internal lock name and return details	Always collected
MON_GET_ACTIVITY table function - Return a list of activities	Always collected

Table 2298. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY_DETAILS table function - Return information about an activity as an XML document	Always collected
MON_GET_AUTO_MAINT_QUEUE table function - Get information about the automatic maintenance jobs	Always collected
MON_GET_AUTO_RUNSTATS_QUEUE table function - Retrieve information about objects queued for evaluation	Always collected
MON_GET_CONNECTION table function - Get connection metrics	Always collected
MON_GET_CONNECTION_DETAILS table function - Get connection metrics as an XML document	Always collected
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get unit of work metrics as an XML document	Always collected
MON_GET_UTILITY table function - Get utilities running on the database	Always collected
WLM_GET_SERVICE_CLASS_WORKLOAD_OCCURRENCES table function - list workload occurrences	Always collected

Table 2299. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Change history	changesummary	Always collected
Activities	event_activity	Always collected
Deadlocks with Details <sup>2</sup>	event_detailed_dlconn	Always collected
Statements	event_stmt	Always collected
Threshold violations	event_thresholdviolations	Always collected
Locking	lock_participants	Always collected
Transactions <sup>1</sup>	event_xact	Always collected
Unit of work	uow	Always collected

**Note:**

1. This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the CREATE EVENT MONITOR FOR UNIT OF WORK statement to monitor transaction events.
2. This event monitor has been deprecated. Its use is no longer recommended and might be removed in a future release. Use the CREATE EVENT MONITOR FOR LOCKING statement to monitor lock-related events, such as lock timeouts, lock waits, and deadlocks.

**Usage**

Use this element to find the name of the tenant in which this RUNSTATS job is queued.

## territory\_code - Database Territory Code

The territory code of the database for which the monitor data is collected. This monitor element was formerly known as country\_code.

Table 2300. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl_info	Basic
Application	appl	Basic

Table 2301. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Event Log Header	event_log_header	Always collected
Connections	event_connheader	Always collected

### Usage

Territory code information is recorded in the database configuration file.

For DRDA AS connections, this element will be set to 0.

## thresh\_violations - Number of threshold violations monitor element

Number of times a threshold was violated. This monitor element is an alias of the “num\_threshold\_violations - Number of threshold violations monitor element” on page 1100 monitor element, which is returned by snapshot monitoring routines and the Database event monitor.

Table 2302. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE

Table 2302. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2303. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the details_xml) document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## Usage

Use this element to quickly determine if there have been any WLM thresholds that have been violated. If thresholds have been violated you can then use the threshold violations event monitor (if created and active) to obtain details about the threshold violations.

For example, to obtain details which threshold was violated.

### **threshold\_action - Threshold action monitor element**

The action of the threshold to which this threshold violation record applies. Possible values include Stop, Continue and Remap.

*Table 2304. Event Monitoring Information*

<b>Event Type</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Threshold violations	event_thresholdviolations	-

### **Usage**

Use this element to determine whether the activity that violated the threshold was stopped when the violation occurred, was allowed to continue executing, or was remapped to another service subclass. If the activity was stopped, the application that submitted the activity will have received an SQL4712N error. If the activity was remapped to another service subclass, agents working for the activity on the member will be moving to the target service subclass of the threshold.

### **threshold\_domain - Threshold domain monitor element**

The domain of the threshold responsible for this queue.

Possible values are

- Database
- Work Action Set
- Service Superclass
- Service Subclass
- Workload

*Table 2305. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_QUEUE_STATS table function - Return threshold queue statistics	Always collected
WLM_GET_QUEUE_STATS table function - Return threshold queue statistics	Always collected

*Table 2306. Event Monitoring Information*

<b>Event Type</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Statistics	event_qstats	Always collected

### **Usage**

This element can be used for distinguishing the queue statistics of thresholds that have the same predicate but different domains.

### **threshold\_maxvalue - Threshold maximum value monitor element**

For non-queuing thresholds, this monitor element represents the value that was exceeded to cause this threshold violation. For queuing thresholds, this monitor element represents the level of concurrency that caused the queuing. The level of concurrency that caused the violation of the queuing threshold is the sum of **threshold\_maxvalue** and **threshold\_queuesize** monitor elements.

---

*Table 2307. Event Monitoring Information*

---

<b>Event Type</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Threshold violations	event_thresholdviolations	Always collected

---

### Usage

For activity thresholds, this element provides a historical record of what the threshold's maximum value was at the time the threshold was violated. This is useful when the threshold's maximum value has changed since the time of the violation and the old value is no longer available from the SYSCAT.THRESHOLDS view. For the DATATAGINSC IN and DATATAGINSC NOT IN thresholds, this element contains the value of the data tag that violated the threshold.

### **threshold\_name - Threshold name monitor element**

The unique name of the threshold responsible for this queue.

---

*Table 2308. Table Function Monitoring Information*

---

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_QUEUE_STATS table function - Return threshold queue statistics	Always collected
WLM_GET_QUEUE_STATS table function - Return threshold queue statistics	Always collected

---

---

*Table 2309. Event Monitoring Information*

---

<b>Event Type</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Statistics	event_qstats	Always collected

---

### Usage

Use this element to uniquely identify the queuing threshold whose statistics this record represents.

### **threshold\_predicate - Threshold predicate monitor element**

Identifies the type of threshold that was violated or for which statistics were collected.

---

*Table 2310. Table Function Monitoring Information*

---

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_QUEUE_STATS table function - Return threshold queue statistics	Always collected
WLM_GET_QUEUE_STATS table function - Return threshold queue statistics	Always collected

---

---

*Table 2311. Event Monitoring Information*

---

<b>Event Type</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Threshold violations	event_thresholdviolations	Always collected
Statistics	event_qstats	Always collected

---

## Usage

Use this element in conjunction with other statistics or threshold violation monitor elements for analysis of a threshold violation.

The valid values for this element when reported in the event\_thresholdviolations logical group are:

- ActivityRunTime
- ActivityRunTimeInAllSC
- ActivityTotalTime
- AggSQLTempSpace
- ConcurrentDBCoordActivities
- ConcurrentWorkloadActivities
- ConcurrentWorkloadOccurrences
- ConnectionIdleTime
- CPUTime
- CPUTimeInSC
- DataTagInSC
- DataTagNotInSC
- EstimatedSQLCost
- SortShrHeapUtil

**Attention:** This feature is available in Db2 Version 11.5 Mod Pack 2 and later versions.

- SQLRowsRead
- SQLRowsReadInSC
- SQLRowsReturned
- SQLTempSpace
- TotalMemberConnections
- TotalSCMemberConnections
- UowTotalTime

The valid values for this element when reported in the event\_qstats logical group are:

- ConcurrentDBCoordActivities
- TotalMemberConnections
- TotalSCMemberConnections

## threshold\_queuesize - Threshold queue size monitor element

The size of the queue for a queuing threshold. An attempt to exceed this size causes a threshold violation. For a non-queuing threshold, this value is 0.

---

*Table 2312. Event Monitoring Information*

---

Event Type	Logical Data Grouping	Monitor Switch
Threshold violations	event_thresholdviolations	-

---

## Usage

Use this element to determine the number of activities or connections in the queue for this threshold at the time the threshold was violated.

## thresholdid - Threshold ID monitor element

Identifies the threshold to which a threshold violation record applies or for which queue statistics were collected.

*Table 2313. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_QUEUE_STATS table function - Return threshold queue statistics	Always collected
WLM_GET_QUEUE_STATS table function - Return threshold queue statistics	Always collected

*Table 2314. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Threshold violations	event_thresholdviolations	Always collected
Statistics	event_qstats	Always collected

### Usage

Use this element in conjunction with other activity history monitor elements to analyze a threshold queue or the activity that violated a threshold.

## time\_completed - Time completed monitor element

The time at which the activity described by this activity record finished executing. This element is a local timestamp.

*Table 2315. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity	Always collected

### Usage

Use this element in conjunction with other activity history elements for analysis of the behavior of an activity.

This field has a value of "0000-00-00-00.00.00.000000" when a full activity record could not be written to a table event monitor due to memory limitations. If the activity was captured while it was in progress, then this field represents the time that activity was collected.

## time\_created - Time created monitor element

The time at which a user submitted the activity described by this activity record. This element is a local timestamp.

*Table 2316. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity	-

## Usage

Use this element in conjunction with other activity history elements for analysis of the behavior of an activity.

### **time\_of\_violation - Time of violation monitor element**

The time at which the threshold violation described in this threshold violation record occurred. This element is a local timestamp.

*Table 2317. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Threshold violations	event_thresholdviolations	-

## Usage

Use this element in conjunction with other threshold violations monitor elements for analysis of a threshold violation.

### **time\_since\_last\_rcv - Time since last message received monitor element**

The time since the last message was received. Normally, this number is no more than **heartbeat\_interval** because an HADR database sends out a heartbeat message on heartbeat interval when the channel is idle. A larger number indicates a delay in message delivery. When this number reaches **hadr\_timeout**, the connection is closed. Units are milliseconds.

*Table 2318. Table function monitoring information*

Table function	Monitor element collection level
MON_GET_HADR table function - Returns high availability disaster recovery (HADR) monitoring information	Always collected

### **time\_stamp - Snapshot Time**

The date and time when the database system monitor information was collected.

*Table 2319. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	collected	Basic

## Usage

You can use this element to help relate data chronologically if you are saving the results in a file or database for ongoing analysis.

### **time\_started - Time started monitor element**

The time at which the activity described by this activity record began executing. This element is a local timestamp.

*Table 2320. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity	Always collected

## Usage

Use this element in conjunction with other activity history elements for analysis of the behavior of an activity.

If the activity got rejected, then the value of **act\_exec\_time** monitor element is 0. In this case, the value of **time\_started** monitor element equals the value of **time\_completed** monitor element.

## time\_zone\_disp - Time Zone Displacement

Number of seconds that the local time zone is displaced from Greenwich Mean Time (GMT).

Table 2321. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	collected	Basic

## Usage

All time reported by reported by the database system monitor is GMT, this displacement calculates the local time.

## timezoneid - Time zone identifier monitor element

Identifies the time zone (for example, US/Eastern).

Table 2322. Table function monitoring information

Table function	Monitor element collection level
MON_GET_INSTANCE table function - Get instance level information	Always collected

## timezoneoffset - Time difference from UCT monitor element

Time difference (in milliseconds) from Universal Coordinated Time (UCT).

Table 2323. Table function monitoring information

Table function	Monitor element collection level
MON_GET_INSTANCE table function - Get instance level information	Always collected

## top - Histogram bin top monitor element

The inclusive top end of the range of a histogram bin. The value of this monitor element is also the bottom exclusive end of the range of the next histogram bin.

Table 2324. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_histogrambin	-

## Usage

Use this element with the corresponding **bottom** element to determine the range of a bin within a histogram.

## tot\_log\_used\_top - Maximum Total Log Space Used

The maximum amount of total log space used (in bytes).

Table 2325. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TRANSACTION_LOG table function - Get log information	Always collected

Table 2326. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic

Table 2327. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected

### Usage

You can use this element to help evaluate the amount of primary log space that you have allocated. Comparing the value of this element with the amount of primary log space you have allocated can help you to evaluate your configuration parameter settings. Your primary log space allocation can be calculated using the following formula:

```
logprimary x logfilsiz x 4096 (see note below)
```

You can use this element in conjunction with *sec\_log\_used\_top* and *sec\_logs\_allocated* to show your current dependency on secondary logs.

This value includes space used in both primary and secondary log files.

You may need to adjust the following configuration parameters:

- logfilsiz
- logprimary
- logsecond

**Note:** While the database system monitor information is given in bytes, the configuration parameters are set in pages, which are each 4K bytes.

## total\_act\_time - Total activity time monitor element

The total amount of time spent executing activities. This value is given in milliseconds.

Table 2328. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE

Table 2328. Table Function Monitoring Information (continued)

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_EXEC_LIST table function - get list of statements executed by routine	ACTIVITY METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2329. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE
Statistics	event_scmetrics event_wlmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## Usage

During its life cycle, an activity can spend time in various states, which are reported by the **activity\_state** event monitor element. Some of the states for an activity include:

- EXECUTING - This state indicates that the coordinator agent is working on the activity. An activity that encounters a lock wait situation is reported as executing.
- IDLE - This state indicates that the coordinator agent is waiting for the next request from a client.
- QUEUED - Some thresholds include a built-in queue. This state indicates that the activity is waiting in the queue for its turn to begin executing.

This monitor element returns only SQL execution time and does not include time when the statement was idle.

Use this monitor element along with the **total\_act\_wait\_time** monitor element to determine the percentage of time the data server spent working on the activity.

```
(total_act_time - total_act_wait_time)/(total_act_time) =  
% of time data server is actively working on activity
```

## total\_act\_wait\_time - Total activity wait time monitor element

Total time spent waiting within the database server, while processing an activity. The value is given in milliseconds.

Table 2330. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 2330. Table Function Monitoring Information (continued)

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_EXEC_LIST table function - get list of statements executed by routine	ACTIVITY METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Statistics	event_scmetrics event_wlmetrics	REQUEST METRICS BASE
Statistics	event_superclasstats event_wlmetrics	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## Usage

Use this monitor element along with the **total\_act\_time** monitor element to determine the percentage of time the data server spent working on the activity.

```
(total_act_time - total_act_wait_time)/(total_act_time) =  
% of time data server is actively working on activity
```

## total\_app\_commits - Total application commits monitor elements

Total number of commit statements issued by the client application.

Table 2332. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE

Table 2334. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 2335. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## Usage

If you issue a **CONNECT RESET** or **TERMINATE** command, you also initiate a rollback operation. This operation increments the **total\_app\_rollbacks** counter by 1.

## total\_app\_rqst\_time - Total application request time monitor element

The total elapsed time spent on application requests; this is the total time spent by coordinator agents on the server executing application requests. This value is reported in milliseconds.

Table 2336. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE

Table 2336. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

## Usage

Use this monitor element to determine the time that the application request spent in the data server. This value can be used to help determine if the data server is the source of an observed performance problem.

For example, if a user reports that there is a problem with an application and it has taken 20 minutes to return, and if you determine that total application request time is 1 minute and there are currently no application requests in progress for the connection, then the performance problem might lie outside of the data server.

## **total\_app\_section\_executions - Total application section executions monitor element**

Number of section executions performed by an application.

Table 2337. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE

Table 2337. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2338. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE

Table 2338. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

### total\_async\_runstats - Total number of asynchronous RUNSTATS requests monitor element

The total number of successful asynchronous RUNSTATS activities performed by real-time statistics gathering for all the applications in the database. Values reported by all the database partitions are aggregated together.

Table 2339. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_DATABASE table function - Get database level information	Always collected
MON_GET_DATABASE_DETAILS table function - Get database information metrics	Always collected

Table 2340. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Statement

For snapshot monitoring, this counter can be reset.

Table 2341. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected

### Usage

Use this element to determine how many successful asynchronous RUNSTATS activities have been performed by real-time statistics gathering. This value changes frequently. In order to get a better view of the system usage, take a snapshot at specific intervals over an extended period of time. When used in conjunction with **sync\_runstats** and **stats\_fabrications** monitor elements, this element can help you to track the different types of statistics collection activities related to real-time statistics gathering and analyze their performance impact.

## total\_backup\_proc\_time - Total non-wait time for online backups monitor element

The total amount of processing (non-wait) time that was spent doing online backups. The value is in milliseconds.

Table 2342. Table function monitoring information

Table function	Monitor element collection level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get connection metrics as an XML document	REQUEST METRICS BASE
MON_GET_DATABASE table function - get database information metrics	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - get database information metrics as an XML document	REQUEST METRICS BASE
MON_GET_ROUTINE table function - get aggregated routine execution metrics	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated routine execution metrics as an XML document	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get service subclass metrics as an XML document	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get unit of work metrics as an XML document	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get workload metrics as an XML document	REQUEST METRICS BASE

Table 2343. Event monitoring information

Event type	Logical data grouping	Monitor switch
Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmetrics	REQUEST METRICS BASE

Table 2343. Event monitoring information (continued)

Event type	Logical data grouping	Monitor switch
Unit of Work	uow_metrics	REQUEST METRICS BASE

## Usage

Use the **total\_backup\_proc\_time** monitor element to determine the portion of the elapsed time that was spent in online backups that is spent only processing requests. The **total\_backup\_time** monitor element indicates the total amount of elapsed time that is spent in online backups.

## **total\_backup\_time - Total elapsed time for doing online backups monitor element**

The total elapsed time that was spent doing online backups. The value is in milliseconds.

Table 2344. Table function monitoring information

Table function	Monitor element collection level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get connection metrics as an XML document	REQUEST METRICS BASE
MON_GET_DATABASE table function - get database information metrics	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - get database information metrics as an XML document	REQUEST METRICS BASE
MON_GET_ROUTINE table function - get aggregated routine execution metrics	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated routine execution metrics as an XML document	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get service subclass metrics as an XML document	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get unit of work metrics as an XML document	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE

Table 2344. Table function monitoring information (continued)

Table function	Monitor element collection level
MON_GET_WORKLOAD_DETAILS table function - Get workload metrics as an XML document	REQUEST METRICS BASE

Table 2345. Event monitoring information

Event type	Logical data grouping	Monitor switch
Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmetrics	REQUEST METRICS BASE
Unit of Work	uow_metrics	REQUEST METRICS BASE

## Usage

Use the **total\_backup\_time** monitor element to determine the portion of the total amount of time that was spent on database requests that was used for backup operations. The **total\_rqst\_time** monitor element determines the total amount of time that is spent on database requests.

## total\_backups - Total online backups monitor element

The total number of online backups.

Table 2346. Table function monitoring information

Table function	Monitor element collection level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get connection metrics as an XML document	REQUEST METRICS BASE
MON_GET_DATABASE table function - get database information metrics	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - get database information metrics as an XML document	REQUEST METRICS BASE
MON_GET_ROUTINE table function - get aggregated routine execution metrics	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated routine execution metrics as an XML document	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get service subclass metrics as an XML document	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE

Table 2346. Table function monitoring information (continued)

Table function	Monitor element collection level
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get unit of work metrics as an XML document	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get workload metrics as an XML document	REQUEST METRICS BASE

Table 2347. Event monitoring information

Event type	Logical data grouping	Monitor switch
Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmetrics	REQUEST METRICS BASE
Unit of Work	uow_metrics	REQUEST METRICS BASE

### total\_buffers\_rcvd - Total FCM Buffers Received

For snapshot monitor, this monitor element reports the total number of FCM buffers received by the node issuing the GET SNAPSHOT command from the node identified by the **node\_number** monitor element. For table function monitor, this monitor element reports the total number of FCM buffers received from a remote database member.

Table 2348. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_FCM_CONNECTION_LIST - Get details for all FCM connections	Always collected

Table 2349. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	fcm_node	Basic

### Usage

Use this element to measure the level of traffic between the current member and the remote member. If the total number of FCM buffers received from this member is high, consider redistributing the database or moving tables to reduce the traffic between members.

### total\_buffers\_sent - Total FCM Buffers Sent

For snapshot monitor, this monitor element reports the total number of FCM buffers that have been sent from the node issuing the GET SNAPSHOT command to the node identified by the **node\_number** monitor

element. For table function monitor, this monitor element reports the total number of FCM buffers sent from the current database member to a remote database member.

*Table 2350. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_FCM_CONNECTION_LIST - Get details for all FCM connections	Always collected

*Table 2351. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	fcm_node	Basic

## Usage

Use this element to measure the level of traffic between the current member and the remote member. If the total number of FCM buffers sent to this member is high, consider redistributing the database or moving tables to reduce the traffic between members.

## total\_bytes\_received - Bytes received monitor element

Total number of bytes received since the network adapter started.

*Table 2352. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
ENV_GET_NETWORK_RESOURCES table function - Return network adapter information	Always collected

## total\_bytes\_sent - Bytes sent monitor element

Total number of bytes sent since the network adapter started.

*Table 2353. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
ENV_GET_NETWORK_RESOURCES table function - Return network adapter information	Always collected

## total\_col\_executions - Total column-organized executions monitor element

Total number of times that data in column-organized tables was accessed.

*Table 2354. Table function monitoring information*

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics	REQUEST METRICS BASE

Table 2354. Table function monitoring information (continued)

<b>Table function</b>	<b>Monitor element collection level</b>
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS - Get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2355. Event Monitoring Information

<b>Event Type</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE

Table 2355. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## Usage

This element is incremented when the following operators are processed in a query plan:

- Top level CTQ operator
- INSERT, UPDATE, and DELETE operators on a column-organized table.
- 

## total\_col\_proc\_time - Total column-organized processing time monitor element

The total non-wait processing time spent accessing columnar data in a query on column-organized tables. The value is given in milliseconds. This element is a subset of the elapsed time returned by the monitor element **total\_col\_time**, and represents the time in which the column-organized processing subagents were not idle on a measured wait time (for example, lock wait or IO).

Table 2356. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS - Get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	REQUEST METRICS BASE

Table 2356. Table function monitoring information (continued)

Table function	Monitor element collection level
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2357. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Unit of work	uow_metrics	REQUEST METRICS BASE

### **total\_col\_synopsis\_proc\_time - Total column-organized synopsis table processing time monitor element**

The total non-wait processing time spent accessing column-organized synopsis tables.

The value is given in milliseconds.

This element is a subset of the elapsed time returned by the monitor element **total\_col\_synopsis\_time**. This element represents the time in which the column-organized processing subagents were not idle on a measured wait time (for example, lock wait or I/O).

Table 2360. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS - Get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmetrics	REQUEST METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

## total\_col\_time - Total column-organized time monitor element

The total elapsed time spent accessing columnar data in a query on column-organized tables. The value is given in milliseconds.

Table 2364. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS - Get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2365. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

### **total\_col\_vector\_consumers - Total columnar vector memory consumers monitor element**

The total number of consumers of columnar vector memory that ran.

Table 2366. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - return information about an activity as an XML document	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get connection metrics as an XML document	REQUEST METRICS BASE
MON_GET_DATABASE table function - get database information metrics	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - get database information metrics as an XML document	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - get package cache statement metrics	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - Get package cache statement metrics as an XML document	ACTIVITY METRICS BASE
MON_GET_ROUTINE table function - get aggregated routine execution metrics	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated routine execution metrics as an XML document	REQUEST METRICS BASE

Table 2366. Table function monitoring information (continued)

Table function	Monitor element collection level
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get service subclass metrics as an XML document	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get unit of work metrics as an XML document	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get workload metrics as an XML document	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2367. Event monitoring information

Event type	Logical data grouping	Monitor switch
Activity Metrics	event_activitymetrics	ACTIVITY METRICS BASE
Package Cache Metrics	pkgcache_metrics	ACTIVITY METRICS BASE
Statistics Metrics	event_scmetrics	REQUEST METRICS BASE
Statistics Metrics	event_superclassmetrics	REQUEST METRICS BASE
Statistics Metrics	event_wlmetrics	REQUEST METRICS BASE
Unit of Work Metrics	uow_metrics	REQUEST METRICS BASE

### total\_commit\_proc\_time - Total commits processing time monitor element

The total amount of processing (non-wait) time spent performing commit processing on the database server. The value is given in milliseconds.

Table 2368. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 2368. Table Function Monitoring Information (continued)

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 2369. Event Monitoring Information

<b>Event Type</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## total\_commit\_time - Total commit time monitor element

The total amount of time spent performing commit processing on the database server. The value is given in milliseconds.

*Table 2370. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

*Table 2371. Event Monitoring Information*

<b>Event Type</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the metrics document)	REQUEST METRICS BASE

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

### total\_compilations - Total compilations monitor element

The total number of explicit compiles on the database server. Explicit compiles are compilations directly initiated by a user request such as a bind, rebind, prepare or execute immediate.

Table 2372. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE

Table 2372. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 2373. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

### total\_compile\_proc\_time - Total compile processing time monitor element

The total amount of processing (non-wait) time spent performing explicit compiles on the database server. Explicit compiles are compilations directly initiated by a user request such as a bind, rebind, prepare or execute immediate. The value is given in milliseconds.

Table 2374. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 2385. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the details_xml document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the details_xml document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the details_xml document)	REQUEST METRICS BASE
Unit of Work	uow (reported in the metrics.xml document) uow_metrics	REQUEST METRICS BASE

### total\_connect\_requests - Connection or switch user requests monitor element

The total number of connection or switch user requests.

Table 2386. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE

Table 2386. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 2387. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the details_xml) document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the details_xml) document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the details_xml document)	REQUEST METRICS BASE
Unit of Work	uow (reported in the metrics.xml document) uow_metrics	REQUEST METRICS BASE

### **total\_connect\_request\_time - Total connection or switch user request time monitor element**

The amount of time spent performing a connection or switch user request, in milliseconds.

Table 2388. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE

Table 2388. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 2389. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the details_xml) document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the details_xml) document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the details_xml document)	REQUEST METRICS BASE
Unit of Work	uow (reported in the metrics.xml document) uow_metrics	REQUEST METRICS BASE

## total\_connections - Total connections monitor element

Current number of connections.

Table 2390. Table function monitoring information

Table function	Monitor element collection level
MON_GET_INSTANCE table function - Get instance level information	Always collected

## Usage

This element can be used to help determine the appropriate setting for the **max\_connections** configuration parameter.

This element combines local and remote connections.

## total\_cons - Connects Since Database Activation

Indicates the number of connections to the database since the first connect, activate, or last reset (coordinator agents).

Table 2391. Table function monitoring information

Table function	Monitor element collection level
MON_GET_DATABASE table function - Get database level information	Always collected
MON_GET_DATABASE_DETAILS table function - Get database information metrics	Always collected

Table 2392. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic
Database	dbase_remote	Basic

For snapshot monitoring, this counter can be reset.

Table 2393. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected

### Usage

You can use this element in conjunction with the db\_conn\_time and the db2start\_time monitor elements to calculate the frequency at which applications have connected to the database.

If the frequency of connects is low, you may want to explicitly activate the database using the `ACTIVATE DATABASE` command before connecting any other application, because of the extra processing time that is associated with the first connect to a database (for example, initial buffer pool allocation). This will result in subsequent connects being processed at a higher rate.

**Note:** When you reset this element, its value is set to the number of applications that are currently connected, not to zero.

### total\_cpu\_time - Total CPU time monitor element

The total amount of CPU time used while within the database system. Represents total of both user and system CPU time. This value is in microseconds.

When returned by the `WLM_GET_SERVICE_SUBCLASS_STATS` or the `WLM_GET_WORKLOAD_STATS` table function, it represents the total CPU time since the last reset of statistics. When returned by the `MON_SAMPLE_SERVICE_CLASS_METRICS` or the `MON_SAMPLE_WORKLOAD_METRICS` table function, it represents the total CPU time since the function was executed.

When returned by the `MON_GET_ROUTINE` or `MON_GET_ROUTINE_DETAILS` table function, this element represents the total CPU time spent in agents and subagents of the current member for this routine. CPU time spent in fenced processes is not included.

Table 2394. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE

Table 2394. Table Function Monitoring Information (continued)

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_EXEC_LIST table function - get list of statements executed by routine	ACTIVITY METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 2394. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_WORKLOAD_STATS table function - Return workload statistics	REQUEST METRICS BASE
MON_SAMPLE_SERVICE_CLASS_METRICS - Get sample service class metrics	REQUEST METRICS BASE
MON_SAMPLE_WORKLOAD_METRICS - Get sample workload metrics	REQUEST METRICS BASE
WLM_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	REQUEST METRICS BASE
WLM_GET_WORKLOAD_STATS table function - Return workload statistics	REQUEST METRICS BASE

Table 2395. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

Together with the **total\_disp\_run\_queue\_time** monitor element, **total\_cpu\_time** can be used to compute a measure of the amount of contention for the CPU resource, measured on a scale from 0 to 1, with lower numbers meaning greater contention for the CPU resource. This measure, called CPU velocity, is computed by measuring the amount of time that work in the service class has access to the CPU divided by the total time spent accessing the CPU or waiting to access the CPU. CPU velocity gives a measure of how efficiently the work executing in the service class is being executed relative to how efficiently it could be executed if such work never had to wait for the CPU. The formula is as follows:

$$\text{CPU velocity} = \text{total\_cpu\_time} / (\text{total\_cpu\_time} + \text{total\_disp\_run\_queue\_time})$$

## total\_disp\_run\_queue\_time - Total dispatcher run queue time monitor element

The total time that requests, that were run in this service class, spent waiting to access the CPU. This value is given in microseconds.

Table 2396. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS - Get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE

Table 2396. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD_STATS table function - Return workload statistics	REQUEST METRICS BASE
MON_SAMPLE_SERVICE_CLASS_METRICS - Get sample service class metrics	REQUEST METRICS BASE
MON_SAMPLE_WORKLOAD_METRICS - Get sample workload metrics	REQUEST METRICS BASE
WLM_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	REQUEST METRICS BASE
WLM_GET_WORKLOAD_STATS table function - Return workload statistics	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2397. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Package cache	Reported in the activity_metrics document	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE

## Usage

Together with the **total\_cpu\_time**, the **total\_disp\_run\_queue\_time** monitor element can be used to compute a measure of the amount of contention for the CPU resource, measured on a scale from 0 to 1, with lower numbers meaning greater contention for the CPU resource. This measure, called CPU velocity, is computed by measuring the amount of time that work in a service class has access to the CPU divided by the total time spent accessing the CPU or waiting to access the CPU. It gives a measure of how

efficiently the work is being executed relative to how efficiently it could be executed if such work never had to wait for the CPU. The formula is as follows:

$$\text{CPU velocity} = \text{total\_cpu\_time} / (\text{total\_cpu\_time} + \text{total\_disp\_run\_queue\_time})$$

When returned by the WLM\_GET\_SERVICE\_SUBCLASS\_STATS or the WLM\_GET\_WORKLOAD\_STATS function, this monitor element represents the total dispatcher run queue wait time since the last reset of statistics.

When returned by the MON\_SAMPLE\_SERVICE\_CLASS\_METRICS or the MON\_SAMPLE\_WORKLOAD\_METRICS function, this monitor element represents the total dispatcher run queue wait time since the function was executed.

## total\_exec\_time - Elapsed statement execution time monitor element

The total time in seconds and microseconds that was spent executing a particular statement in the SQL cache.

Table 2398. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Dynamic SQL	dynsql	Statement

For snapshot monitoring, this counter can be reset.

### Usage

Use this element with **num\_executions** monitor element determine the average elapsed time for the statement and identify the SQL statements that would most benefit from a tuning of their SQL. The **num\_compilation** monitor element must be considered when evaluating the contents of this element.

**Note:** Due to the differences in granularity with which the database system collects statistics, the value of the **total\_exec\_time** monitor element might not equal the sum of values of **system\_cpu\_time** and **user\_cpu\_time** monitor elements. In this case, the sum of **system\_cpu\_time** and **user\_cpu\_time** monitor elements more accurately reflects the actual total execution time.

## total\_extended\_latch\_wait\_time - Total extended latch wait time monitor element

The amount of time, in milliseconds, spent in extended latch waits.

Table 2399. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE

Table 2399. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_EXTENDED_LATCH_WAITS table function - Return information for latches	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2400. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE

Table 2400. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_superclasstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	uow (reported in the metrics.xml document) uow_metrics	REQUEST METRICS BASE
Package cache	pkgcache (reported in the metrics.xml document) pkgcache_metrics	ACTIVITY METRICS BASE

## Usage

- Use the following formula to determine extended latch wait time as a percentage of total wait time. This formula can be used to determine if the time spent waiting on extended latches is high relative to the total wait time.

$$(TOTAL\_EXTENDED\_LATCH\_WAIT\_TIME / TOTAL\_WAIT\_TIME) * 100$$

- Use the following formula to determine the average length of time in milliseconds of an extended latch wait.

$$TOTAL\_EXTENDED\_LATCH\_WAIT\_TIME / TOTAL\_EXTENDED\_LATCH\_WAITS$$

## total\_extended\_latch\_waits - Total extended latch waits monitor element

The number of extended latch waits.

Table 2401. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE

Event Type	Logical Data Grouping	Monitor Switch
Unit of work	uow (reported in the metrics.xml document) uow_metrics	REQUEST METRICS BASE
Package cache	pkgcache (reported in the metrics.xml document) pkgcache_metrics	ACTIVITY METRICS BASE

## Usage

Use the following formula to determine the average length of time in milliseconds of an extended latch wait.

$$\text{TOTAL\_EXTENDED\_LATCH\_WAIT\_TIME} / \text{TOTAL\_EXTENDED\_LATCH\_WAITS}$$

## total\_hash\_grpby - Total hash GROUP BY operations monitor element

The total number of hashed GROUP BY operations.

Table 2403. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	ACTIVITY METRICS BASE

MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2404. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Package Cache	pkgcache_metrics	ACTIVITY METRICS BASE
Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmetrics	REQUEST METRICS BASE
Unit of work	event_wlmetrics	REQUEST METRICS BASE

## Usage

Use this element along with the **hash\_grpby\_overflows** element to determine if a large number of hashed GROUP BY operations are overflowing to disk. If the overflow value is high and the performance of applications using hashed GROUP BY operations needs improvement, then consider increasing the size of the sort heap.

## total\_hash\_joins - Total Hash Joins

The total number of hash joins executed.

Table 2405. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE

Statistics	event_wlmmetrics	REQUEST METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

### Usage

At the database or application level, use this value in conjunction with hash\_join\_overflows and hash\_join\_small\_overflows to determine if a significant percentage of hash joins would benefit from modest increases in the sort heap size.

### total\_hash\_loops - Total Hash Loops

The total number of times that a single partition of a hash join was larger than the available sort heap space.

Package cache	pkgcache_metrics	ACTIVITY METRICS BASE
Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmmetrics	REQUEST METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

### Usage

Values for this element indicate inefficient execution of hash joins. This might indicate that the sort heap size is too small or the sort heap threshold is too small. Use this value in conjunction with the

other hash join variables to tune the sort heap size (*sortheap*) and sort heap threshold (*sheapthres*) configuration parameters.

## total\_implicit\_compilations - Total implicit compilations monitor element

The total\_implicit\_compilations monitor element stores the total number of implicit compiles on the database server. Implicit compiles are compilations that are not directly requested by the user. That is, they are not a result of a bind, rebind, prepare or execute immediate request. For example, an implicit compilation may occur when executing a statement that was bound using the VALIDATE RUN option if the statement needs to be compiled at execution time.

Table 2411. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

### **total\_implicit\_compile\_proc\_time - Total implicit compile processing time monitor element**

The total\_implicit\_compile\_proc\_time monitor element stores the total amount of processing (non-wait) time spent performing implicit compiles on the database server. Implicit compiles are compilations that are not directly requested by the user. That is, they are not a result of a bind, rebind, prepare or execute immediate request. For example, an implicit compilation may occur when executing a statement that was bound using the VALIDATE RUN option if the statement needs to be compiled at execution time. The value is given in milliseconds.

Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmetrics	REQUEST METRICS BASE
Unit of Work	uow_metrics	REQUEST METRICS BASE

## Usage

This element reports the numbers of both explicit and implicit index builds. A CREATE INDEX statement is an example of a way to explicitly build an index. Implicit index builds can include the following builds:

- Creation of an index to enforce primary key or unique key constraints
- Creation of an index for a system temporary table that is created internally to help optimize query performance
- Re-creation of an index, which is considered implicit because it occurs only as necessary and can be caused by any access to a table, depending on the value of the **INDEXREC** configuration parameter

The value of this element does not include time that is spent building or rebuilding indexes during the execution of utilities, including the **LOAD**, **REORG**, and **REDISTRIBUTE** utilities. That time is counted as part of the time for the corresponding utility's time monitor element when one exists. For example, time for an index rebuild that occurs during a **LOAD** operation is counted as part of the time for the **total\_load\_time** monitor element. The value of the **total\_index\_build\_proc\_time** monitor element also does not include time for indexes that are built during log replay (for **HADR** or **ROLLFORWARD** operations, for example) that can occur when index builds are fully logged. For more information, see the **logindexbuild** configuration parameter.

## **total\_index\_build\_time - Total time spent building indexes due to index creation or re-creation monitor element**

The total time that is spent building indexes due to index creation or re-creation, including the time that is spent by subagents when the index creation or re-creation operation is parallelized. The value is in milliseconds.

## Usage

This value of this element includes both explicit and implicit index builds. A CREATE INDEX statement is an example of a way to explicitly build an index. Implicit index builds can include the following builds:

- Creation of an index to enforce primary key or unique key constraints
- Creation of an index for a system temporary table that is created internally to help optimize query performance
- Re-creation of an index, which is considered implicit because it occurs only as necessary and can be caused by any access to a table, depending on the value of the **INDEXREC** configuration parameter

The value of this element does not include time that is spent building or rebuilding indexes during the execution of utilities, including the **LOAD**, **REORG**, and **REDISTRIBUTE** utilities. That time is counted as part of the time for the corresponding utility's time monitor element when one exists. For example, time for an index rebuild that occurs during a **LOAD** operation is counted as part of the time for the **total\_load\_time** monitor element. The value of the **total\_index\_build\_time** element also does not include time for indexes that are built during log replay (for **HADR** or **ROLLFORWARD** operations, for example) that can occur when index builds are fully logged. For more information, see the **logindexbuild** configuration parameter.

## **total\_indexes\_built** - Total number of indexes built monitor element

The total number of indexes that were built.

Table 2421. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - return information about an activity as an XML document	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get connection metrics as an XML document	REQUEST METRICS BASE
MON_GET_DATABASE table function - get database information metrics	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - get database information metrics as an XML document	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - get package cache statement metrics	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - Get package cache statement metrics as an XML document	ACTIVITY METRICS BASE
MON_GET_ROUTINE table function - get aggregated routine execution metrics	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated routine execution metrics as an XML document	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE

Table 2421. Table function monitoring information (continued)

Table function	Monitor element collection level
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get service subclass metrics as an XML document	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get unit of work metrics as an XML document	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get workload metrics as an XML document	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2422. Event monitoring information

Event type	Logical data grouping	Monitor switch
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Package Cache	pkgcache_metrics	ACTIVITY METRICS BASE
Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmetrics	REQUEST METRICS BASE
Unit of Work	uow_metrics	REQUEST METRICS BASE

## Usage

This element reports the numbers of both explicit and implicit index builds. A CREATE INDEX statement is an example of a way to explicitly build an index. Implicit index builds can include the following builds:

- Creation of an index to enforce primary key or unique key constraints
- Creation of an index for a system temporary table that is created internally to help optimize query performance
- Re-creation of an index, which is considered implicit because it occurs only as necessary and can be caused by any access to a table, depending on the value of the **INDEXREC** configuration parameter

The value of this element does not include time for indexes that are built during the execution of utilities, including the **LOAD**, **REORG**, and **REDISTRIBUTE** utilities. The value of this element also does not include time for indexes that are built during log replay (for **HADR** or **ROLLFORWARD** operations, for example) that can occur when index builds are fully logged. For more information, see the **logindexbuild** configuration parameter.

## total\_load\_proc\_time - Total load processing time monitor element

Total amount of processing (non-wait) time spent performing load processing on the database server. The value is given in milliseconds.

*Table 2423. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

*Table 2424. Event Monitoring Information*

<b>Event Type</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the metrics document)	REQUEST METRICS BASE

Table 2424. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

### total\_load\_time - Total load time monitor element

The total amount of time spent performing loads on the database server. The value is given in milliseconds.

Table 2425. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE

Table 2425. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 2426. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## total\_loads - Total loads monitor element

The total number of loads performed on the database server.

Table 2427. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 2427. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 2428. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the details_xml document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the details_xml document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the details_xml document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## total\_log\_available - Total Log Available

The amount of active log space in the database that is not being used by uncommitted transactions (in bytes).

Table 2429. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TRANSACTION_LOG table function - Get log information	Always collected

Table 2430. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic

## Usage

Use this element in conjunction with total\_log\_used to determine whether you may need to adjust the following configuration parameters to avoid running out of log space:

- logfilsiz
- logprimary
- logsecond

If total\_log\_available goes down to 0, SQL0964C will be returned. You may need to increase the above configuration parameters, or end the oldest transaction by COMMIT, ROLLBACK or FORCE APPLICATION.

If logsecond is set to -1 this element will contain SQLM\_LOGSPACE\_INFINITE.

**Note:** While the database system monitor information is given in bytes, the configuration parameters are set in pages, which are each 4K bytes.

## total\_log\_used - Total Log Space Used

The total amount of active log space currently used (in bytes) in the database.

Table 2431. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_TRANSACTION_LOG table function - Get log information	Always collected

Table 2432. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic

### Usage

Use this element in conjunction with total\_log\_available to determine whether you may need to adjust the following configuration parameters to avoid running out of log space:

- logfilsiz
- logprimary
- logsecond

**Note:** While the database system monitor information is given in bytes, the configuration parameters are set in pages, which are each 4K bytes.

## total\_metadata\_update\_time - Total time for metadata update for extent movement monitor element

During extent movement, this monitor element shows the overall time taken to update cached page locations for moved extents, including overhead.

The value is given in milliseconds.

Table 2433. Table function monitoring information

Table function	Monitor element collection level
MON_GET_EXTENT_MOVEMENT_STATUS - get extent movement progress	Always collected

## total\_move\_time - Total extent move time monitor element

In milliseconds, the total move time for all extents moved during the table space rebalance process.

Table 2434. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_EXTENT_MOVEMENT_STATUS - Get extent movement progress status metrics	Always collected

## total\_nested\_invocations - Total nested invocations monitor element

Number of times a routine is invoked at a nesting level > 1.

An example is when a routine or trigger is invoked under the context of another routine or trigger.

Table 2435. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	Always collected
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	Always collected

## total\_olap\_funcs - Total OLAP Functions monitor element

The total number of OLAP functions executed.

Table 2436. Table function monitoring information

Table function	Monitor element collection level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS - Get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE

Table 2436. Table function monitoring information (continued)

Table function	Monitor element collection level
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2437. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic
Application	appl	Basic

For snapshot monitoring, this counter can be reset.

Table 2438. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Connection	event_conn	Always collected
Database	event_db	Always collected
Package cache	pkgcache_metrics	ACTIVITY METRICS BASE
Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmmetrics	REQUEST METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

## Usage

At the database or application level, use this value in conjunction with `olap_func_overflows` to determine if a significant percentage of OLAP functions would benefit from modest increases in the sort heap size.

## total\_peas - Total partial early aggregations monitor element

The total number of times that partial early aggregation operations have been executed.

Table 2439. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE

Table 2439. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2440. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Connection	event_conn	-
Statements	event_stmt	-
Transactions	event_xact	-
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

At the database or application level, use this value in conjunction with **post\_threshold\_peas** to determine if a significant number of partial early aggregation operations would benefit from an increase in either sort heap size or sort heap threshold. If the ratio of **post\_threshold\_peas** to **total\_peas** is high, increasing the sort heap size or the sort heap threshold, or both, may improve database or application performance.

## total\_peds - Total partial early distincts monitor element

The total number of times that partial early distinct operations have been executed.

Table 2441. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE

Table 2441. Table Function Monitoring Information (continued)

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2442. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Connection	event_conn	-
Statements	event_stmt	-
Transactions	event_xact	-
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

At the database or application level, use this value in conjunction with the **disabled\_peds** monitor element and the **post\_threshold\_peds** monitor element to determine if a significant number of partial early distinct operations would benefit from an increase in either sort heap size or sort heap threshold. If the ratio of the **disabled\_peds** monitor element and the **post\_threshold\_peds** monitor element to the **total\_peds** monitor element is high, increasing the sort heap size or the sort heap threshold, or both, may improve database or application performance.

## total\_reorg\_proc\_time - Total reorganization processing time monitor element

The total amount of processing (non-wait) time spent performing reorg operations on the database server. The value is given in milliseconds.

Table 2443. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE

Table 2443. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 2444. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

### total\_reorg\_time - Total reorganization time monitor element

The total amount of time spent performing reorg operations on the database server. The value is given in milliseconds.

Table 2445. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE

Table 2445. Table Function Monitoring Information (continued)

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 2446. Event Monitoring Information

<b>Event Type</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## total\_reorgs - Total reorganizations monitor element

The number of reorg operations issued against the database server.

*Table 2447. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

*Table 2448. Event Monitoring Information*

<b>Event Type</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the metrics document)	REQUEST METRICS BASE

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

### **total\_rollback\_proc\_time - Total rollback processing time monitor element**

The total amount of processing (non-wait) time spent performing rollback operations on the database server. The value is given in milliseconds.

Table 2449. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE

Table 2449. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 2450. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

### total\_rollback\_time - Total rollback time monitor element

The total amount of time spent performing rollback operations on the database server. The value is given in milliseconds.

Table 2451. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE

Table 2451. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 2452. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

### **total\_routine\_coord\_time - Total routine coordinator time monitor element**

Total amount of time the coordinator agent spent executing the routine.

For procedures, compiled SQL functions, compiled triggers, and dynamically prepared compound SQL statements, this element represents the total elapsed time spent in the routine. If request metrics are disabled, this value is zero.

Table 2453. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	REQUEST METRICS BASE

## total\_routine\_invocations - Total routine invocations monitor elements

The total number of times a routine was invoked.

Table 2454. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE

Table 2454. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2455. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

### **total\_routine\_non\_sect\_proc\_time - Non-section processing time monitor element**

The total amount of processing time this statement spent performing non-section execution within routines. This value includes both the time spent executing user-code within routines and time spent performing non-section operations like commit or rollback. Processing time does not include wait time. The value is given in milliseconds.

Table 2456. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2457. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

### total\_routine\_non\_sect\_time - Non-section routine execution time monitor elements

The total amount of time this statement spent performing non-section execution within routines. This value includes both the time spent executing user-code within routines and the time spent performing non-section operations like commit or rollback. The value is given in milliseconds.

Table 2458. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2459. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

### total\_routine\_time - Total routine time monitor element

The total time spent executing routines. The value is given in milliseconds.

Table 2460. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2460. Table Function Monitoring Information (continued)

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2461. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## Usage

If the collection level is set to BASE, then the value of **total\_routine\_time** monitor element does not include any time spent executing functions that were defined using the NO SQL clause.

If the collection level is set to EXTENDED, then the value of **total\_routine\_time** monitor element includes the time spent in all routines.

## **total\_routine\_user\_code\_proc\_time - Total routine user code processing time monitor element**

The total amount of time spent processing user code in routines. The value is in milliseconds.

Table 2462. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE

Table 2462. Table Function Monitoring Information (continued)

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2463. Event Monitoring Information

<b>Event Type</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

Table 2463. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

### Usage

If the collection level is set to BASE, then this monitor element does not include any processing time spent executing functions that were defined using the NO SQL clause. Instead, this time is included in the value of the **total\_section\_proc\_time** monitor element.

If the collection level is set to EXTENDED, then the value of this monitor element includes the processing time spent executing all routines.

### **total\_routine\_user\_code\_time - Total routine user code time monitor element**

The total amount of time spent executing user code in routines. The value is in milliseconds.

Table 2464. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 2464. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2465. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## Usage

If the collection level is set to BASE, then the value of this monitor element does not include the time spent executing functions that were defined using the NO SQL clause. Instead, this time is included in the value of the **total\_section\_time** monitor element.

If the collection level is set to EXTENDED, then the value of this monitor element includes the time spent executing all routines.

## total\_rqst\_mapped\_in - Total request mapped-in monitor element

The total number of requests that were mapped into this service subclass via a remap threshold or a work action set.

Table 2466. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_DATABASE table function - Get database level information	Always collected
MON_GET_DATABASE_DETAILS table function - Get database information metrics	Always collected
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 2467. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the details_xml document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the details_xml document)	REQUEST METRICS BASE

## total\_rqst\_mapped\_out - Total request mapped-out monitor element

The total number of requests that were mapped out of this service subclass via a remap threshold or a work action set.

Table 2468. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_DATABASE table function - Get database level information	Always collected
MON_GET_DATABASE_DETAILS table function - Get database information metrics	Always collected
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE

Table 2468. Table Function Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE

### total\_rqst\_time - Total request time monitor element

The total amount of time spent working on requests. This value is reported in milliseconds.

Table 2470. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE

Table 2470. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 2471. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## total\_runstats - Total runtime statistics monitor element

The total number of runstats operations performed on the database server.

Table 2472. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 2472. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 2473. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

### **total\_runstats\_proc\_time - Total runtime statistics processing time monitor element**

The total amount of processing (non-wait) time spent performing runstats operations on the database server. The value is given in milliseconds. Any time the runstats utility spends throttled does not count towards the runstats processing time.

Table 2474. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE

Table 2474. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 2475. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## total\_runstats\_time - Total runtime statistics time monitor element

The total amount of time spent performing runstats operations on the database server. The value is given in milliseconds.

Table 2476. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 2477. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the metrics document)	REQUEST METRICS BASE

Table 2477. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## total\_sec\_cons - Secondary Connections

The number of connections made by a subagent to the database at the current node.

Table 2478. Table function monitoring information

Table function	Monitor element collection level
MON_GET_DATABASE table function - Get database level information	Always collected
MON_GET_DATABASE_DETAILS table function - Get database information metrics	Always collected

Table 2479. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic

### Usage

You can use this element in conjunction with the total\_cons, db\_conn\_time, and the db2start\_time monitor elements to calculate the frequency at which applications have connected to the database.

## total\_section\_proc\_time - Total section processing time monitor element

The total amount of processing time agents spent performing section execution. Processing time does not include wait time. The value is given in milliseconds.

Table 2480. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE

Table 2480. Table Function Monitoring Information (continued)

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2481. Event Monitoring Information

<b>Event Type</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE

Table 2481. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## Usage

If the collection level is set to BASE, then the value of the **total\_section\_proc\_time** monitor element includes processing time spent executing functions that were defined using the NO SQL clause.

If the collection level is set to EXTENDED, then the processing time spent executing these functions is not included in the value of the **total\_section\_proc\_time** monitor element. It is included in the value of the **total\_routine\_user\_code\_proc\_time** monitor element.

## total\_section\_sort\_proc\_time - Total section sort processing time monitor element

Total amount of processing (non-wait) time spent performing sorts while executing a section, which is the execution of the compiled query plan generated by the SQL statement that was issued by the client application. The value is given in milliseconds.

Table 2482. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE

Table 2482. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2483. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the details_xml document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the details_xml document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## Usage

At the system level, use this element with the **total\_section\_sorts** monitor element to calculate the average sort processing time (does not include waits) during section execution, which can indicate whether or not sorting is an issue as far as performance is concerned.

At the activity level, use this element to identify statements that spend a large amount of time sorting. These statements may benefit from additional tuning to reduce the sort time.

### **total\_section\_sort\_time - Total section sort time monitor element**

Total amount of time spent performing sorts while executing a section, which is the execution of the compiled query plan generated by the SQL statement that was issued by the client application. The value is given in milliseconds.

*Table 2484. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE

MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 2484. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2485. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the details_xml document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the details_xml document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## Usage

At the system level, use this element with the **total\_section\_sorts** monitor element to calculate the average sort time during section execution, which can indicate whether or not sorting is an issue as far as statement performance is concerned.

The **total\_section\_sort\_time** element includes both wait and processing time. If the value of (total\_section\_sort\_time - total\_section\_sort\_proc\_time) is high, sorts are spending a lot of time waiting. For example, if sorts are frequently spilling to disk, the value of the **total\_section\_sort\_time** monitor element will increase due to I/O waits. This time will not be included in the **total\_section\_sort\_proc\_time** monitor element value, which only counts the time actively processing a sort. In this case, you may consider tuning sort memory to improve performance.

At the activity level, use this element to identify statements that spend a large amount of time sorting. These statements may benefit from additional tuning to reduce the sort time.

## total\_section\_sorts - Total section sorts monitor element

Total number of sorts performed during section execution, which is the execution of the compiled query plan generated by the SQL statement that was issued by the client application.

Table 2486. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE

Table 2486. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2487. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## Usage

Use this element with the **total\_section\_sort\_time** monitor element to calculate the average amount of time spent performing sorts during section execution.

At the activity and package cache levels, use this element to identify statements which are performing large numbers of sorts. These statements may benefit from additional tuning to reduce the number of sorts. You can also use the EXPLAIN statement to identify the number of sorts a statement performs.

## total\_section\_time - Total section time monitor element

The total time agents spent performing section execution. The value is given in milliseconds.

Table 2488. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE

Table 2488. Table Function Monitoring Information (continued)

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2489. Event Monitoring Information

<b>Event Type</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE

Table 2489. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## Usage

If the collection level is set to BASE, then the value of **total\_section\_time** monitor element includes time spent executing functions that were defined using the NO SQL clause.

If the collection level is set to EXTENDED, then the time spent executing these functions is not included in the value of the **total\_section\_time** monitor element. It is included in the value of the **total\_routine\_user\_code\_time** monitor element instead.

## total\_sort\_time - Total sort time monitor element

The total elapsed time for all sorts that have been executed. This value is reported in milliseconds.

Table 2490. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Sort
Application	appl	Sort
Application	stmt	Sort
Dynamic SQL	dynsql	Sort

For snapshot monitoring, this counter can be reset.

Table 2491. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected
Connection	event_conn	Always collected
Statements	event_stmt	Always collected
Activities	event_activity	Statement, Sort

## Usage

At a database or application level, use this element with **total\_sorts** to calculate the average sort time, which can indicate whether or not sorting is an issue as far as performance is concerned.

At a statement level, use this element to identify statements that spend a lot of time sorting. These statements may benefit from additional tuning to reduce the sort time.

This count also includes sort time of temporary tables created during related operations. It provides information for one statement, one application, or all applications accessing one database.

When using monitor elements providing elapsed times, you should consider:

1. Elapsed times are affected by system load, so the more processes you have running, the higher this elapsed time value.
2. To calculate this monitor element at a database level, the database system monitor sums the application-level times. This can result in double counting elapsed times at a database level, since more than one application process can be running at the same time.

To provide meaningful data from the database level, you should normalize the data to a lower level. For example:

```
total_sort_time / total_sorts
```

provides information about the average elapsed time for each sort.

## total\_sorts - Total sorts monitor element

The total number of sorts that have been executed.

Table 2492. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_EXEC_LIST table function - get list of statements executed by routine	ACTIVITY METRICS BASE

Table 2492. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2493. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic
Application	appl	Basic

For snapshot monitoring, this counter can be reset.

Table 2494. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclasstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

Table 2494. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected
Connection	event_conn	Always collected
Statements	event_stmt	Always collected
Activities	event_activity	Statement, Sort
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

At a database or application level, use this value with **sort\_overflows** to calculate the percentage of sorts that need more heap space. You can also use it with **total\_sort\_time** to calculate the average sort time.

If the number of sort overflows is small with respect to the total sorts, then increasing the sort heap size may have little impact on performance, unless this buffer size is increased substantially.

At a statement level, use this element to identify statements which are performing large numbers of sorts. These statements may benefit from additional tuning to reduce the number of sorts. You can also use the SQL EXPLAIN statement to identify the number of sorts a statement performs.

## **total\_stats\_fabrication\_proc\_time - Total statistics fabrication processing time monitor element**

The total non-wait time spent on statistics fabrications by real-time statistics gathering, in milliseconds. Statistics fabrication is the statistics collection activity needed to generate statistics during query compilation.

Table 2495. Table Function Monitoring Information

Table Function	Monitor Element Collection Level

MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE

Table 2505. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 2506. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

### total\_sys\_cpu\_time - Total system CPU time for a statement monitor element

The total system CPU time for an SQL statement.

Table 2507. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Dynamic SQL	dynsql	Statement

For snapshot monitoring, this counter can be reset.

### Usage

Use this element with [Elapsed Statement Execution Time](#) and [Total User CPU for a Statement](#) to evaluate which statements are the most expensive.

This element is composed of two subelements that report time spent as seconds and microseconds (one millionth of a second). The names of the subelements can be derived by adding "\_s" and "\_ms" to the name of this monitor element. To retrieve the total time spent for this monitor element, the values of the two subelements must be added together. For example, if the "\_s" subelement value is 3 and the "\_ms" subelement value is 20, then the total time spent for the monitor element is 3.00002 seconds.

### total\_times\_routine\_invoked - Total routine invoked occurrences monitor element

Number of times the routine executed on a member.

Table 2508. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	Always collected
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	Always collected

## total\_usr\_cpu\_time - Total user CPU time for a statement monitor element

The total user CPU time for an SQL statement.

Table 2509. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Dynamic SQL	dynsql	Statement

For snapshot monitoring, this counter can be reset.

### Usage

Use this element with [Elapsed Statement Execution Time](#) and to evaluate the longest running statements.

This element is composed of two subelements that report time spent as seconds and microseconds (one millionth of a second). The names of the subelements can be derived by adding "\_s" and "\_ms" to the name of this monitor element. To retrieve the total time spent for this monitor element, the values of the two subelements must be added together. For example, if the "\_s" subelement value is 3 and the "\_ms" subelement value is 20, then the total time spent for the monitor element is 3.00002 seconds.

## total\_wait\_time - Total wait time monitor element

The total time spent waiting within the database server. The value is in milliseconds.

Table 2510. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 2510. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

Table 2511. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## Usage

To understand the percentage of time the database server spends actively working on requests, use the following ratio:

$$(total\_rqst\_time - total\_wait\_time) / total\_rqst\_time$$

The value of the **client\_idle\_wait\_time** monitor element is not included in the value of the **total\_wait\_time** monitor element. The **total\_wait\_time** element represents only time spent waiting while the database server is processing requests.

## tpmon\_acc\_str - TP monitor client accounting string monitor element

The data passed to the target database for logging and diagnostic purposes, if the `sqlseti` API was issued in this connection. The current value of the CLIENT\_ACCTNG special register for this connection, unit of work, or activity.

This monitor element is synonymous to the **client\_acctng** monitor element. The **client\_acctng** monitor element is used for monitoring table functions and event monitors that write to unformatted tables. The **tpmon\_acc\_str** monitor element is used for snapshot monitors and event monitors that write to tables, files, and pipes.

Table 2512. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl_info	Basic
DCS Application	dcs_appl	Basic

Table 2513. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity	-
Deadlock	event_dlconn	-
Transaction	event_xact	-

## Usage

Use this element for problem determination and accounting purposes.

## tpmon\_client\_app - TP monitor client application name monitor element

Identifies the server transaction program performing the transaction, if the `sqlseti` API was issued in this connection. The current value of the `CLIENT_APPLNAME` special register for this connection, unit of work, or activity.

This monitor element is synonymous to the `client_applname` monitor element. The `client_applname` monitor element is used for monitoring table functions and event monitors that write to unformatted tables. The `tpmon_client_app` monitor element is used for snapshot monitors and event monitors that write to tables, files, and pipes.

Table 2514. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl_info	Basic
DCS Application	dcs_appl	Basic

Table 2515. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity	-
Deadlock	event_dlconn	-
Transaction	event_xact	-

## Usage

Use this element for problem determination and accounting purposes.

## tpmon\_client\_userid - TP monitor client user ID monitor element

The client user ID generated by a transaction manager and provided to the server, if the `sqlseti` API is used. The current value of the `CLIENT_USERID` special register for this connection, unit of work, or activity.

This monitor element is synonymous to the `client_userid` monitor element. The `client_userid` monitor element is used for monitoring table functions and event monitors that write to unformatted tables. The `tpmon_client_userid` monitor element is used for snapshot monitors and event monitors that write to tables, files, and pipes.

Table 2516. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl_info	Basic

Table 2516. Snapshot Monitoring Information (continued)

Snapshot Level	Logical Data Grouping	Monitor Switch
DCS Application	dcs_appl	Basic

Table 2517. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity	-
Deadlock	event_dlconn	-
Transaction	event_xact	-

## Usage

Use this element in application server or Transaction Processing monitor environments to identify the end-user for whom the transaction is being executed.

### tpmon\_client\_wkstn - TP monitor client workstation name monitor element

Identifies the client's system or workstation (for example CICS EITERMID), if the `sqlseti` API was issued in this connection. The current value of the CLIENT\_WRKSTNNAME special register for this connection, unit of work, or activity.

This monitor element is synonymous to the `client_wrkstnname` monitor element. The `client_wrkstnname` monitor element is used for monitoring table functions and event monitors that write to unformatted tables. The `tpmon_client_wkstn` monitor element is used for snapshot monitors and event monitors that write to tables, files, and pipes.

Table 2518. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl_info	Basic
DCS Application	dcs_appl	Basic

Table 2519. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity	-
Deadlock	event_dlconn	-
Transaction	event_xact	-

## Usage

Use this element to identify the user's machine by node ID, terminal ID, or similar identifiers.

### tq\_cur\_send\_spills - Current number of table queue buffers overflowed monitor element

The current number of table queue buffers residing in a temporary table.

Table 2520. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	subsection	Statement

#### Usage

An agent writing to a table queue may be sending rows to several readers. The writing agent will overflow buffers to a temporary table when the agent that it is currently sending rows to is not accepting rows and another agent requires rows in order to proceed. Overflowing to temporary table allows both the writer and the other readers to continue processing.

Rows that have been overflowed will be sent to the reading agent when it is ready to accept more rows.

If this number is high, and queries fail with sqlcode -968, and there are messages in `db2diad.log` indicating that you ran out of temporary space in the TEMP table space, then table queue overflows may be the cause. This could indicate a problem on another node (such as locking). You would investigate by taking snapshots on all the partitions for this query.

There are also cases, perhaps because of the way data is partitioned, where many buffers need to be overflowed for the query. In these cases you will need to add more disk to the temporary table space.

### **tq\_id\_waiting\_on - Waited on node on a table queue monitor element**

The identifier of the table queue that is waiting to send or receive data.

Table 2521. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	subsection	Statement

#### Usage

This can be used for troubleshooting.

### **tq\_max\_send\_spills - Maximum number of table queue buffers overflows**

Maximum number of table queue buffers overflowed to a temporary table.

#### Element identifier

tq\_max\_send\_spills

#### Element type

watermark

Table 2522. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	subsection	Statement

Table 2523. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statements	event_subsection	Always collected

#### Usage

Indicates the maximum number of table queue buffers that have been written to a temporary table.

## tq\_node\_waited\_for - Waited for node on a table queue

If the subsection status *ss\_status* is *waiting to receive* or *waiting to send* and *tq\_wait\_for\_any* is FALSE, then this is the number of the node that this agent is waiting for.

### Element identifier

tq\_node\_waited\_for

### Element type

information

Table 2524. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	subsection	Statement

### Usage

This can be used for troubleshooting. You may want to take an application snapshot on the node that the subsection is waiting for. For example, the application could be in a lock wait on that node.

## tq\_rows\_read - Number of Rows Read from table queues

Total number of rows read from table queues.

### Element identifier

tq\_rows\_read

### Element type

counter

Table 2525. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	subsection	Statement

Table 2526. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statements	event_subsection	Always collected

### Usage

If monitoring does not indicate that this number is increasing, then processing progress is not taking place.

If there is significant differences in this number between nodes, then some nodes may be over utilized while others are being under utilized.

If this number is large, then there is a lot of data being shipped between nodes, suggest that optimization might improve the access plan.

## tq\_rows\_written - Number of rows written to table queues

Total number of rows written to table queues.

### Element identifier

tq\_rows\_written

### Element type

counter

Table 2527. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	subsection	Statement

Table 2528. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statements	event_subsection	Always collected

### Usage

If monitoring does not indicate that this number is increasing, then processing progress is not taking place.

If there is significant differences in this number between nodes, then some nodes may be over utilized while others are being under utilized.

If this number is large, then there is a lot of data being shipped between nodes, suggest that optimization might improve the access plan.

## tq\_sort\_heap\_rejections - Table queue sort heap rejections monitor element

The number of times that table queues requested for more sort heap memory and were rejected due to sort heap threshold being exceeded.

Table 2529. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE

Table 2529. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2530. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Connection	event_conn	-
Statements	event_stmt	-
Transactions	event_xact	-
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

Use this element in conjunction with the **tq\_sort\_heap\_requests** monitor element to determine if table queues are getting sufficient sort heap memory most of the time. If the ratio of the **tq\_sort\_heap\_rejections** monitor element to the **tq\_sort\_heap\_requests** monitor element is high, database performance may be sub-optimal. Consider increasing the sort heap size.

## tq\_sort\_heap\_requests - Table queue sort heap requests monitor element

The number of times that table queues requested for more sort heap memory to store data.

Table 2531. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE

Table 2531. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2532. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Connection	event_conn	-
Statements	event_stmt	-
Transactions	event_xact	-
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

Use this element in conjunction with the **tq\_sort\_heap\_rejections** monitor element to determine if table queues are getting sufficient sort heap memory most of the time. If the ratio of the **tq\_sort\_heap\_rejections** monitor element to the **tq\_sort\_heap\_requests** monitor element is high, database performance may be sub-optimal. Consider increasing the sort heap size.

## **tq\_tot\_send\_spills - Total number of table queue buffers overflowed monitor element**

Total number of table queue buffers overflowed to a temporary table.

Table 2533. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2533. Table Function Monitoring Information (continued)

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2534. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	subsection	Statement

Table 2535. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE
Statements	event_subsection	Always collected
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE

## Usage

Indicates the total number of table queue buffers that have been written to a temporary table. See the **tq\_cur\_send\_spills** monitor element for more information.

## tq\_wait\_for\_any - Waiting for any node to send on a table queue

This flag is used to indicate that the subsection is blocked because it is waiting to receive rows from any node.

### Element identifier

tq\_wait\_for\_any

### Element type

information

Table 2536. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	subsection	Statement

## Usage

If *ss\_status* indicates *waiting to receive data on a table queue* and this flag is TRUE, then the subsection is waiting to receive rows from any node. This generally indicates that the SQL statement has not processed to the point it can pass data to the waiting agent. For example, the writing agent may be performing a sort and will not write rows until the sort has completed. From the db2expln output, determine the subsection number associated with the tablequeue that the agent is waiting to receive rows from. You can then examine the status of that subsection by taking a snapshot on each node where it is executing.

## ts\_name - Table space being rolled forward monitor element

The name of the table space currently rolled forward.

### Element identifier

ts\_name

### Element type

information

Table 2537. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Table Space	rollforward	Basic

### Usage

If a rollforward is in progress, this element identifies the table spaces involved.

## txn\_completion\_status - Transaction completion status

This element indicates the status of the transaction.

Table 2538. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Change History	TXNCOMPLETION	Always collected

### Usage

For the change history event monitor, the status of the transaction is one of:

#### C

Commit

#### R

Rollback

#### S

Rollback to savepoint

## U

## uid\_sql\_stmts - Update/Insert/Merge/Delete SQL Statements Executed

The number of UPDATE, INSERT, MERGE and DELETE statements that were executed.

Table 2539. Table function monitoring information

Table function	Monitor element collection level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE

Table 2539. Table function monitoring information (continued)

Table function	Monitor element collection level
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics	REQUEST METRICS BASE

Table 2540. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic
Application	appl	Basic

For snapshot monitoring, this counter can be reset.

Table 2541. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Connection	event_conn	Always collected
Database	event_db	Always collected
Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmmetrics	REQUEST METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

#### Usage

You can use this element to determine the level of database activity at the application or database level.

You can also use the following formula to determine the ratio of UPDATE, INSERT, MERGE, and DELETE statements to the total number of statements:

```
uid_sql_stmts
/ (static_sql_stmts + dynamic_sql_stmts )
```

This information can be useful for analyzing application activity and throughput.

## unread\_prefetch\_pages - Unread prefetch pages monitor element

Indicates the number of pages that the prefetcher read into the bufferpool that were never used.

*Table 2542. Table Function Monitoring Information*

Table Function	Monitor Element Collection Command and Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

*Table 2543. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Buffer Pool
Table Space	tablespace	Buffer Pool
Buffer Pool	bufferpool	Buffer Pool
Application	appl	Buffer Pool

For snapshot monitoring, this counter can be reset.

*Table 2544. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Database	event_db	Always collected
Tablespaces	event_tablespace	Always collected
Connection	event_conn	Always collected

## Usage

If this number is high, prefetchers are causing unnecessary I/O by reading pages into the buffer pool that will not be used.

## uow\_client\_idle\_wait\_time - Client idle time within a unit of work monitor element

Indicates the time spent idle within a unit of work (UOW). The value is given in milliseconds.

Table 2545. Table function monitoring information

Table function	Monitor element collection level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE

## uow\_comp\_status - Unit of Work Completion Status

The status of the unit of work and how it stopped.

Table 2546. Table function monitoring information

Table function	Monitor element collection level
MON_GET_CONNECTION table function - Get connection metrics	Always collected
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics	Always collected
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics	Always collected

Table 2547. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl	Unit of Work
DCS Application	dcs_appl	Basic

Table 2548. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Transactions	event_xact	Always collected

### Usage

You may use this element to determine if the unit of work ended due to a deadlock or abnormal termination. It may have been:

- Committed due to a commit statement
- Rolled back due to a rollback statement
- Rolled back due to a deadlock
- Rolled back due to an abnormal termination
- Committed at normal application termination.
- Unknown as a result of a FLUSH EVENT MONITOR command for which units of work were in progress.

**Note:** API users should refer to the header file (*sqlmon.h*) containing definitions of database system monitor constants.

## **uow\_completed\_total - Total completed units of work monitor element**

The total number of units of work that completed, either by being committed or rolled back.

*Table 2549. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	ACTIVITY METRICS BASE
MON_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected
MON_GET_WORKLOAD_STATS table function - Return workload statistics	ACTIVITY METRICS BASE
MON_SAMPLE_SERVICE_CLASS_METRICS - Get sample service class metrics	REQUEST METRICS BASE
MON_SAMPLE_WORKLOAD_METRICS - Get sample workload metrics	REQUEST METRICS BASE
WLM_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	REQUEST METRICS BASE
WLM_GET_WORKLOAD_STATS table function - Return workload statistics	REQUEST METRICS BASE

*Table 2550. Event Monitoring Information*

<b>Event Type</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Statistics	event_scstats (reported in the metrics document)	Always collected
Statistics	event_superclassstats (reported in the metrics document)	Always collected
Statistics	event_wlstats (reported in the metrics document)	Always collected

### **Usage**

When returned by the WLM\_GET\_SERVICE\_SUBCLASS\_STATS or the WLM\_GET\_WORKLOAD\_STATS function, this monitor element represents the total completed units of work since the last reset of the statistics.

When returned by the MON\_SAMPLE\_SERVICE\_CLASS\_METRICS or the MON\_SAMPLE\_WORKLOAD\_METRICS function, this monitor element represents the total completed units of work since the function was executed.

## **uow\_elapsed\_time - Most Recent Unit of Work Elapsed Time**

The elapsed execution time of the most recently completed unit of work.

### **Element identifier**

uow\_elapsed\_time

### **Element type**

time

Table 2551. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl	Unit of Work, Timestamp
DCS Application	dcs_appl	Unit of Work, Timestamp

## Usage

Use this element as an indicator of the time it takes for units of work to complete.

This element is composed of two subelements that report time spent as seconds and microseconds (one millionth of a second). The names of the subelements can be derived by adding "\_s" and "\_ms" to the name of this monitor element. To retrieve the total time spent for this monitor element, the values of the two subelements must be added together. For example, if the "\_s" subelement value is 3 and the "\_ms" subelement value is 20, then the total time spent for the monitor element is 3.00002 seconds.

## uow\_id - Unit of work ID monitor element

The unit of work identifier. The unit of work ID is unique within an application handle.

Table 2552. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	Always collected
MON_GET_AGENT table function - List agents, fenced mode processes, and system entities for the database	Always collected
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics	Always collected
MON_GET_WLM_ADMISSION_QUEUE table function - Return a list of queued activities	Always Collected
WLM_GET_SERVICE_CLASS_AGENTS table function - list agents running in a service class	Always collected
WLM_GET_SERVICE_CLASS_WORKLOAD_OCCURRENCES table function - list workload occurrences	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

Table 2553. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity	Always collected
Activities	event_activitystmt	Always collected
Activities	event_activityvals	Always collected

Table 2553. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activitymetrics	Always collected
Change history	ddlstmtexec txncompletion	Always collected
Locking	lock_participant_activities lock_activity_values	Always collected
Threshold violations	event_thresholdviolations	Always collected
Unit of work	uow uow_metrics uow_package_list uow_executable_list	Always collected

### Usage

Use this element in conjunction with other activity history elements for analysis of the behavior of an activity.

You can also use this element with the **activity\_id** and **appl\_id** monitor elements to uniquely identify an activity.

### uow\_lifetime\_avg - Unit of work lifetime average monitor element

The average lifetime of a unit of work. Measured in milliseconds.

Table 2554. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	ACTIVITY METRICS BASE
MON_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected
MON_GET_WORKLOAD_STATS table function - Return workload statistics	ACTIVITY METRICS BASE
MON_SAMPLE_SERVICE_CLASS_METRICS - Get sample service class metrics	REQUEST METRICS BASE
MON_SAMPLE_WORKLOAD_METRICS - Get sample workload metrics	REQUEST METRICS BASE
WLM_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	REQUEST METRICS BASE
WLM_GET_WORKLOAD_STATS table function - Return workload statistics	REQUEST METRICS BASE

Table 2555. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the metrics document)	Always collected

Table 2555. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_superclasstats (reported in the metrics document)	Always collected
Statistics	event_wlstats (reported in the metrics document)	Always collected

## Usage

When returned by the WLM\_GET\_SERVICE\_SUBCLASS\_STATS or the WLM\_GET\_WORKLOAD\_STATS function, this monitor element represents the average unit of work lifetime since the last reset of the statistics.

When returned by the MON\_SAMPLE\_SERVICE\_CLASS\_METRICS or the MON\_SAMPLE\_WORKLOAD\_METRICS function, this monitor element represents the average unit of work lifetime since the function was executed.

## uow\_lock\_wait\_time - Total time unit of work waited on locks monitor element

The total amount of elapsed time this unit of work has spent waiting for locks. The value is given in milliseconds.

### Element identifier

uow\_lock\_wait\_time

### Element type

counter

Table 2556. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl	Unit of Work

## Usage

This element can help you determine the severity of the resource contention problem.

## uow\_log\_space\_used - Unit of work log space used monitor element

The amount of log space (in bytes) used in the current unit of work of the monitored application.

Table 2557. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	Always collected

Table 2558. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl	Unit of Work

Table 2559. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Transactions	event_xact	Always collected
Unit of work	-	Always collected

## Usage

You may use this element to understand the logging requirements at the unit of work level.

## uow\_start\_time - Unit of work start timestamp monitor element

The date and time that the unit of work first required database resources.

Table 2560. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	Always collected
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics	Always collected
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	Always collected

Table 2561. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl	Unit of Work, Timestamp
DCS Application	dcs_appl	Unit of Work, Timestamp

Table 2562. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Unit of work	uow	Always collected
Transaction	event_xact	-

## Usage

This resource requirement occurs at the first SQL statement execution of that unit of work:

- For the first unit of work, it is the time of the first database request (SQL statement execution) after **conn\_complete\_time**.
- For subsequent units of work, it is the time of the first database request (SQL statement execution) after the previous COMMIT or ROLLBACK.

**Note:** The *SQL Reference* defines the boundaries of a unit of work as the COMMIT or ROLLBACK points.

The database system monitor excludes the time spent between the COMMIT/ROLLBACK and the next SQL statement from its definition of a unit of work. This measurement method reflects the time spent by the database manager in processing database requests, separate from time spent in application logic before

the first SQL statement of that unit of work. The unit of work elapsed time does include the time spent running application logic between SQL statements within the unit of work.

You may use this element with the **uow\_stop\_time** monitor element to calculate the total elapsed time of the unit of work and with the **prev\_uow\_stop\_time** monitor element to calculate the time spent in the application between units of work.

You can use the **uow\_stop\_time** and the **prev\_uow\_stop\_time** monitor elements to calculate the elapsed time for the *SQL Reference* definition of a unit of work.

## uow\_status - Unit of Work Status

The status of the unit of work.

### Element identifier

uow\_status

### Element type

information

*Table 2563. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Transactions	event_xact	Always collected

### Usage

You may use this element to determine the status of a unit of work. API users should refer to the `sqlmon.h` header file containing definitions of database system monitor constants.

## uow\_stop\_time - Unit of work stop timestamp monitor element

The date and time that the most recent unit of work completed, which occurs when database changes are committed or rolled back.

*Table 2564. Table function monitoring information*

Table function	Monitor element collection level
MON_GET_CONNECTION table function - Get connection metrics	Always collected
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics	Always collected
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics	Always collected

*Table 2565. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl	Unit of Work, Timestamp
DCS Application	dcs_appl	Unit of Work, Timestamp

*Table 2566. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Unit of work	uow	Always collected

## Usage

Use this element with the **prev\_uow\_stop\_time** monitor element to calculate the total elapsed time between COMMIT/ROLLBACK points, and with the **uow\_start\_time** monitor element to calculate the elapsed time of the latest unit of work.

The timestamp contents will be set as follows:

- When the application has completed a unit of work and has not yet started a new one (as defined in the **uow\_start\_time** monitor element), this element reports a valid, non-zero timestamp.
- When the application is currently executing a unit of work, this element reports zeros.
- When the application first connects to the database, this element is set to the value of the **conn\_complete\_time** monitor element

As a new unit of work is started, the contents of this element are moved to the **prev\_uow\_stop\_time** monitor element.

## uow\_throughput - Unit of work throughput monitor element

The completion rate of units of work measured in units of work per second.

Table 2567. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_SAMPLE_SERVICE_CLASS_METRICS - Get sample service class metrics	REQUEST METRICS BASE
MON_SAMPLE_WORKLOAD_METRICS - Get sample workload metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	ACTIVITY METRICS BASE
MON_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected
MON_GET_WORKLOAD_STATS table function - Return workload statistics	ACTIVITY METRICS BASE
WLM_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	REQUEST METRICS BASE
WLM_GET_WORKLOAD_STATS table function - Return workload statistics	REQUEST METRICS BASE

Table 2568. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_scstats (reported in the metrics document)	Always collected
Statistics	event_superclasstats (reported in the metrics document)	Always collected
Statistics	event_wlstats (reported in the metrics document)	Always collected

## Usage

When returned by the WLM\_GET\_SERVICE\_SUBCLASS\_STATS or the WLM\_GET\_WORKLOAD\_STATS function, this monitor element represents the unit of work throughput since the last reset of the statistics.

When returned by the MON\_SAMPLE\_SERVICE\_CLASS\_METRICS or the MON\_SAMPLE\_WORKLOAD\_METRICS function, this monitor element represents the unit of work throughput since the function was executed.

## uow\_total\_time\_top - UOW total time top monitor element

High watermark for unit of work lifetime, in milliseconds.

Table 2569. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	Always collected
MON_GET_SERVICE_SUPERCLASS_STATS table function - Return statistics of service superclasses	Always collected
MON_GET_WORKLOAD_STATS table function - Return workload statistics	Always collected
WLM_GET_SERVICE_SUBCLASS_STATS table function - Return statistics of service subclasses	Always collected
WLM_GET_WORKLOAD_STATS table function - Return workload statistics	Always collected

Table 2570. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_wlstats	Always collected
Statistics	event_scstats	Always collected
Statistics	event_superclasstats	Always collected

## Usage

This element can be used to help determine whether or not the UOWTOTALTIME threshold is effective and can also help to determine how to configure such a threshold.

For service classes, this monitor element returns -1 when COLLECT AGGREGATE ACTIVITY DATA for the service class is set to NONE.

For workloads, this monitor element returns -1 if COLLECT AGGREGATE ACTIVITY DATA for the workload is set to NONE.

For a service class, measurements taken for this high watermark are computed for the service class assigned by the workload. Any mapping by a work action set to change the service class of an activity does not affect this high watermark.

## update\_sql\_stmts - Updates

This element contains a count of the total number of times the federated server has issued an UPDATE statement to this data source on behalf of any application from the start of the federated server instance, or the last reset of the database monitor counters.

Table 2571. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase_remote	Basic

Table 2571. Snapshot Monitoring Information (continued)

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl_remote	Basic

For snapshot monitoring, this counter can be reset.

#### Usage

Use this element to determine the level of database activity directed against this data source by the federated server or an application.

You can also use this element to determine the percentage of write activity against this data source by the federated server or an application, with the following formula:

```
write_activity =
  (INSERT statements + UPDATE statements + DELETE statements ) /
  (SELECT statements + INSERT statements + UPDATE statements +
  DELETE statements)
```

### update\_time - Update Response Time

This element contains the aggregate amount of time, in milliseconds, that it has taken this data source to respond to UPDATES from all applications or a single application running on this federated server instance from the start of the federated server instance, or the last reset of the database monitor counters.

Table 2572. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase_remote	Timestamp
Application	appl_remote	Timestamp

For snapshot monitoring, this counter can be reset.

The response time is measured as the difference in time between the time the federated server submits an UPDATE statement to the data source, and the time the data source responds to the federated server, indicating the UPDATE has been processed.

#### Usage

Use this element to determine how much actual time transpires while waiting for UPDATES to this data source to be processed. This information can be useful for capacity planning and tuning.

### usage\_list\_last\_state\_change - Last state change monitor element

A timestamp that indicates when the value of the **usage\_list\_state** monitor element last changed.

Table 2573. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_USAGE_LIST_STATUS table function - Returns the status of a usage list	Always collected

## usage\_list\_mem\_size - Usage list memory size monitor element

The total amount of memory that is allocated for a particular usage list, in kilobytes.

Table 2574. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_USAGE_LIST_STATUS table function - Returns the status of a usage list	Always collected

## usage\_list\_name - Usage list name monitor element

A usage list name.

Table 2575. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_INDEX_USAGE_LIST table function - Returns information from an index usage list	Always collected
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	Always collected
MON_GET_USAGE_LIST_STATUS table function - Returns the status of a usage list	Always collected

## usage\_list\_schema - Usage list schema monitor element

The name of the schema of a usage list.

Table 2576. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_INDEX_USAGE_LIST table function - Returns information from an index usage list	Always collected
MON_GET_TABLE_USAGE_LIST table function - Returns information from a table usage list	Always collected
MON_GET_USAGE_LIST_STATUS table function - Returns the status of a usage list	Always collected

## usage\_list\_size - Usage list size monitor element

The maximum number of entries that a particular usage list can hold.

Table 2577. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_USAGE_LIST_STATUS table function - Returns the status of a usage list	Always collected

## usage\_list\_state - Usage list state monitor element

The state of a particular usage list.

Table 2578. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_USAGE_LIST_STATUS table function - Returns the status of a usage list	Always collected

### Usage

Possible values are as follows:

#### A

Active.

#### F

Failed to activate.

#### I

Inactive.

#### P

Activation pending.

## usage\_list\_used\_entries - Usage list used entries monitor element

The number of entries currently in a usage list. If the usage list is in an Inactive state, this monitor element represents the number of entries that were in this usage list when it was last active for monitoring.

Table 2579. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_USAGE_LIST_STATUS table function - Returns the status of a usage list	Always collected

## usage\_list\_wrapped - Usage list wrap indicator monitor element

An indicator of whether a particular usage list has wrapped. When a usage list becomes full, the default behavior is for entries to wrap, which means the oldest entries get replaced by the newest entries.

Possible values are Y and N.

Table 2580. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_USAGE_LIST_STATUS table function - Returns the status of a usage list	Always collected

## user\_cpu\_time - User CPU time monitor element

The total *user* CPU time (in seconds and microseconds) used by the database manager agent process, the unit of work, or the statement. For event monitors that write to tables, the value of this element is given in microseconds by using the BIGINT data type.

When either the statement monitor switch or the timestamp switch is not turned on, this element is not collected and -1 is written instead.

Table 2581. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Connection	event_conn	Always collected
Transactions	event_xact	Always collected
Statements	event_stmt	Always collected
Activities	event_activity	Always collected

## Usage

This element along with the other related CPU-time elements can help you understand the level of activity within an application, and can help you identify applications that could benefit from additional tuning.

**Note:** If this information is not available for your operating system, this element will be set to 0.

**Note:** Due to the differences in granularity with which the database system collects statistics, the value of the **total\_exec\_time** monitor element might not equal the sum of values of **system\_cpu\_time** and **user\_cpu\_time** monitor elements. In this case, the sum of **system\_cpu\_time** and **user\_cpu\_time** monitor elements more accurately reflects the actual total execution time.

## UTIL\_HEAP\_ALLOCATED - total utility heap allocated monitor element

The total number of allocated 4K pages of utility heap for a given activity that was executed with the WLM admission control enabled. This element will be NULL if WLM admission control was disabled when this activity was submitted.

Table 2582. Table function monitoring information

Table function	Monitor element collection level
	Always Collected
	Always Collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES	Always Collected
table function - Return a list of activities	

Table 2583. Event monitoring information

Event type	Logical data grouping	Monitor switch
Activity	event_activitymetrics	ACTIVITY METRICS BASE

## utility\_dbname - Database Operated on by Utility

The database operated on by the utility.

Table 2584. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	utility_info	Basic

## utility\_description - Utility Description

A brief description of the work a utility is performing. For example, a rebalance invocation may contain "Tablespace ID: 2" representing that this rebalancer is working on table space with ID 2. The format of this field is dependent on the class of utility and is subject to change between releases.

Table 2585. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	utility_info	Basic

## utility\_detail - Utility detail

This element contains a brief description of the work a utility is performing.

Table 2586. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_UTILITY table function - Get utilities running on the database	Always collected

Table 2587. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Change History	UTILSTART	Always collected

## Usage

A brief description of the work a utility is performing, including some options specified for the utility. For example, a record for the invocation of REORG includes a partially reconstructed command string including some of the different options used by the utility such as access mode. The format of this field is dependent on the type of utility and might change between releases.

For the automatic dictionary creation (ADC), this element includes the descriptive name of the operation.

## utility\_id - Utility ID

The unique identifier corresponding to the utility invocation.

Table 2588. Table Function Monitoring Information

Table Function	Monitor Element Collection Command and Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
MON_GET_UTILITY table function - Get utilities running on the database	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

Table 2589. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	utility_info	Basic

## Usage

This element represents the job ID that identifies the unique job that links the tasks in an automatic dictionary creation (ADC) operation. Such ADC tasks include build, copy, and enable. These tasks share the same **utility\_id** across all members and stages. This identifier might not be unique across all database utilities.

### **utility\_invocation\_id - Utility invocation ID**

A unique identifier corresponding to the utility invocation.

*Table 2590. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details	Always collected
MON_GET_AGENT table function - List agents, fenced mode processes, and system entities for the database	Always collected
MON_GET_UTILITY table function - Get utilities running on the database	Always collected
WLM_GET_SERVICE_CLASS_AGENTS table function - list agents running in a service class	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

*Table 2591. Event Monitoring Information*

<b>Event Type</b>	<b>Logical Data Grouping</b>	<b>Monitor Element Collection Level</b>
Activities	event_activity	Always collected
Change History	changesummary utillocation utilphase utilstart utilstop	Always collected

## Usage

The **utility\_invocation\_id** is a binary token that uniquely identifies a given invocation of a utility. The **utility\_invocation\_id** is the same on each member where the utility is executing. The **utility\_invocation\_id** will retain its uniqueness across database deactivation, reactivation, and member shutdown, allowing quick identification of all event monitor records corresponding to a given invocation of a utility.

The value of this element uniquely identifies an automatic dictionary creation (ADC) operation composed of several tasks, such as build, copy, and enable. All tasks that are created for a single ADC job share the same **utility\_invocation\_id** across all members and stages. This element also distinguishes between concurrent ADC jobs running on different members.

### **utility\_invoker\_type - Utility Invoker Type**

This element describes how a utility was invoked.

Table 2592. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_UTILITY table function - Get utilities running on the database	Always collected

Table 2593. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	utility_info	Basic

Table 2594. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Change history	utilstart	Always collected

## Usage

Use this element to determine how a utility was invoked. For example, you can use it to determine whether a utility was invoked automatically by the database or by a user. The values for this element, listed as follows, are defined in sqlmon.h.

API Constant	Utility
SQLM_UTILITY_INVOKER_USER	Utility was invoked by a user.
SQLM_UTILITY_INVOKER_AUTO	Utility was invoked automatically by the database.

For the MON\_GET\_UTILITY table function and the change event history monitor, this element indicates how a utility was invoked:

### USER

Utility was invoked by a user.

### AUTO

Utility was invoked automatically by the database.

For the automatic dictionary creation (ADC) task, the value of this element is 'AUTO'. For ADC invocation initiated by a LOAD or REDISTRIBUTE operation, the value of this element is 'USER' for the first record written.

## utility\_operation\_type - Utility operation type

Indicates the type of utility operation.

Table 2595. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_UTILITY table function - Get utilities running on the database	Always collected

Table 2596. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Change History	UTILSTART	Always collected

## Usage

For the change history event monitor, this element contains details about utility events (UTILITY\_TYPE) that were started.

If UTILITY\_TYPE is ADC, this element will be one of:

- R** Ready operation
- B** Build operation
- C** Copy and drain operation
- E** Enable operation
- X** Cancel operation
- L** Load Initiated Automatic Dictionary Creation

If UTILITY\_TYPE is BACKUP, one of:

- D** Delta
- I** Incremental
- F** Full

If UTILITY\_TYPE is LOAD, one of:

- I** Insert
- R** Replace
- S** Restart
- T** Terminate

If UTILITY\_TYPE is MOVETABLE, one of:

- A** Cancel
- C** Copy
- I** Init
- L** Cleanup
- M** Move
- R** Replay
- S** Swap

**V**

Verify

If UTILITY\_TYPE is REDISTRIBUTE, one of:

**A**

Abort

**C**

Continue

**D**

Default

**T**

Target Map

If UTILITY\_TYPE is REORG, one of:

**A**

Reorganize all table indexes

**C**

Recompress table

**I**

Index reorganization

**N**

Inplace table reorganization

**R**

Reorganize table reclaim extents

**T**

Classic table reorganization

If UTILITY\_TYPE is RESTORE, one of:

**A**

Incremental automatic

**B**

Incremental abort

**F**

Full

**M**

Incremental manual

If UTILITY\_TYPE is ROLLFORWARD, one of:

**E**

End of logs

**P**

Point in time

If UTILITY\_TYPE is RUNSTATS, one of:

**A**

All indexes on a table

**I**

Index

**T**

Table

## utility\_phase\_detail - Utility phase detail

This element reserved for future use.

Table 2597. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Change History	UTILPHASE	Always collected

## utility\_phase\_type - Utility phase type

Identifies the utility phase type.

Table 2598. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Change History	UTILPHASE	Always collected

## Usage

For the change history event monitor, if the utility\_type element is BACKUP, the phase type is:

### BACKUPTS

Backup table space

## utility\_priority - Utility Priority

Utility priority specifies the amount of relative importance of a throttled utility with respect to its throttled peers. A priority of 0 implies that a utility is executing unthrottled. Non-zero priorities must fall in the range of 1-100, with 100 representing the highest priority and 1 representing the lowest.

Table 2599. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_UTILITY table function - Get utilities running on the database	Always collected

Table 2600. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	utility_info	Basic

Table 2601. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Change history	utilstart	Always collected

## utility\_start\_time - Utility Start Time

The date and time when the current utility was originally invoked.

Table 2602. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_UTILITY table function - Get utilities running on the database	Always collected

Table 2603. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	utility_info	Basic

## utility\_start\_type - Utility start type

This element indicates how a utility was started.

Table 2604. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Change History	UTILSTART	Always collected

## Usage

For the change history event monitor, utility start information is one of:

- RESUME
- START

For automatic dictionary creation (ADC), the start record for the readying job should have the value 'START'. This value indicates the overall start of utility since this is the first task to run. For all other ADC tasks the value is 'RESUME', because work is resuming on dictionary creation.

## utility\_state - Utility State

This element describes the state of a utility.

### Element identifier

utility\_state

### Element type

information

Table 2605. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	utility_info	Basic

## Usage

Use this element to determine the state of an active utility. The values for this field, listed as follows, are defined in sqlmon.h.

API Constant	Description
SQLM_UTILITY_STATE_EXECUTE	Utility is executing
SQLM_UTILITY_STATE_WAIT	Utility is waiting for an event to occur before resuming progress
SQLM_UTILITY_STATE_ERROR	Utility has encountered an error
SQLM_UTILITY_STATE_SUSPENDED	Utility has been suspended

## utility\_stop\_type - Utility stop type

This element indicates how a utility was stopped.

This element is a synonym for **util\_stop\_type**.

Table 2606. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Change History	UTILSTOP	Always collected

### Usage

For the change history event monitor, a utility was stopped in one of the following ways:

- PAUSE
- STOP

For the automatic dictionary creation (ADC) task, the stop or cancel record for the enable operation has the value of STOP, since these records indicate the completion of the utility. All other stop records have a value of PAUSE, since the utility will resume when the next task begins.

### utility\_type - Utility Type

The class of utility.

Table 2607. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_UTILITY table function - Get utilities running on the database	Always collected

Table 2608. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database Manager	utility_info	Basic

Table 2609. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor element collection level
Change history	changesummary utillocation utilphase utilstart utilstop	Always collected

### Usage

The values for this element can be any of the constants defined in `sqlmon.h` with names beginning "SQLM\_UTILITY\_".

For the MON\_GET\_UTILITY table function and the change history event monitor, the utility type is one of:

- ADC
- BACKUP
- LOAD
- MOVETABLE
- ONLINERECOVERY
- REBALANCE
- REDISTRIBUTE
- REORG

- RESTORE
- RUNSTATS

For the snapshot monitor interface, the utility type is one of:

- ADC
- ASYNC\_INDEX\_CLEANUP
- ASYNC\_PART\_DETACH
- BACKUP
- CRASH\_RECOVERY
- GROUP\_CRASH\_RECOVERY
- LOAD
- MDC\_ROLLOUT\_CLEANUP
- MEMBER\_CRASH\_RECOVERY
- REBALANCE
- REDISTRIBUTE
- RESTART\_RECREATE\_INDEX
- RESTORE
- ROLLFORWARD\_RECOVERY
- RUNSTATS

## V

### **valid - Section validity indicator monitor element**

Indicates whether the dynamic SQL statement section is valid. For static SQL statements, the value of this monitor element is always Y.

*Table 2610. Table Function Monitoring Information*

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	Always collected
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	Always collected

### **Usage**

Valid values for this monitor element are Y and N. An invalid section is implicitly prepared by the system when next used.

A dynamic statement section can become invalid when:

- SQL objects that the statement depends on directly or indirectly are altered or dropped
- Privileges that are required by the authorization ID used to prepare the statement are revoked

### **vectored\_ios - Number of vectored I/O requests monitor element**

The number of vectored I/O requests. More specifically, the number of times the database prefetches pages into the page area of the buffer pool.

Table 2611. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_BUFFERPOOL table function - Get buffer pool metrics	DATA OBJECT METRICS BASE
MON_GET_CONTAINER table function - Get table space container metrics	DATA OBJECT METRICS BASE
MON_GET_DATABASE table function - Get database level information	DATA OBJECT METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	DATA OBJECT METRICS BASE
MON_GET_TABLESPACE table function - Get table space metrics	DATA OBJECT METRICS BASE

Table 2612. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Buffer Pool	bufferpool	Buffer Pool

## Usage

Use this element to determine how often vectored I/O is being done. The number of vectored I/O requests is monitored only during prefetching.

## version - Version of Monitor Data

The version of the database manager that produced the event monitor data stream.

Table 2613. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Event Log Header	event_log_header	-

## Usage

The data structures used by the event monitor may change between releases of the database manager. As a result, your monitor applications should check the version of the data stream to determine if they can process the data they will be receiving.

For this release, this element is set to the API constant SQLM\_DBMON\_VERSION9\_5.

## virtual\_mem\_free - Free virtual memory monitor element

The amount of virtual memory available on this host that is not allocated to any process, in MB.

Table 2614. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ENV_GET_SYSTEM_RESOURCES table function - Return system information	Always collected

Table 2615. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_osmetrics	Always collected

### Usage

This metric reports point in time information at statistics event monitor record generation.

## virtual\_mem\_reserved - Reserved virtual memory monitor element

The amount of virtual memory reserved by running processes, in MB.

Table 2616. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ENV_GET_SYSTEM_RESOURCES table function - Return system information	Always collected

Table 2617. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_osmetrics	Always collected

### Usage

This metric reports point in time information at statistics event monitor record generation.

## virtual\_mem\_total - Total virtual memory monitor element

The total amount of virtual memory available on this host, in MB.

Table 2618. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
ENV_GET_SYSTEM_RESOURCES table function - Return system information	Always collected

Table 2619. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_osmetrics	Always collected

### Usage

This metric reports point in time information at statistics event monitor record generation.

## W

### wl\_work\_action\_set\_id - Workload work action set identifier monitor element

If this activity has been categorized into a work class of workload scope, this monitor element shows the ID of the work action set associated with the work class set to which the work class belongs. Otherwise, this monitor element shows the value of 0.

Table 2620. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

Table 2621. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity	Always collected

#### Usage

Use this monitor element, together with the **wl\_work\_class\_id** monitor element, to uniquely identify the workload work class of the activity, if one exists.

### wl\_work\_class\_id - Workload work class identifier monitor element

If this activity has been categorized into a work class of workload scope, then this monitor element displays the identifier of the work class. Otherwise, this monitor element displays the value of 0.

Table 2622. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	Always collected
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	Always collected

Table 2623. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity	Always collected

#### Usage

Use this monitor element, together with the **wl\_work\_action\_set\_id** monitor element, to uniquely identify the workload work class of the activity, if one exists.

## wlm\_queue\_assignments\_total - Workload manager total queue assignments monitor element

The number of times that activities or connections have been queued by a WLM threshold.

Table 2624. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE

Table 2624. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2625. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

### wlm\_queue\_time\_total - Workload manager total queue time monitor element

The time spent waiting on a WLM queuing threshold. This value is given in milliseconds.

Table 2626. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	ACTIVITY METRICS BASE
MON_GET_ACTIVITY_DETAILS table function - Get complete activity details (reported in DETAILS XML document)	ACTIVITY METRICS BASE
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE

Table 2626. Table Function Monitoring Information (continued)

<b>Table Function</b>	<b>Monitor Element Collection Level</b>
MON_GET_PKG_CACHE_STMT table function - Get SQL statement activity metrics in the package cache	ACTIVITY METRICS BASE
MON_GET_PKG_CACHE_STMT_DETAILS table function - get detailed metrics for package cache entries	ACTIVITY METRICS BASE
MON_GET_ROUTINE - get aggregated execution metrics for routines table function	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS - get aggregated execution metric details for routines table function	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
WLM_GET_WORKLOAD_OCCURRENCE_ACTIVITIES table function - Return a list of activities	ACTIVITY METRICS BASE

Table 2627. Event Monitoring Information

<b>Event Type</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Activities	event_activity (reported in the details_xml document)	ACTIVITY METRICS BASE
Activities	event_activitymetrics	ACTIVITY METRICS BASE
Statistics	event_scstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_superclassstats (reported in the metrics document)	REQUEST METRICS BASE
Statistics	event_wlstats (reported in the metrics document)	REQUEST METRICS BASE

Table 2627. Event Monitoring Information (continued)

Event Type	Logical Data Grouping	Monitor Switch
Package cache	Reported in the activity_metrics document.	ACTIVITY METRICS BASE
Unit of work	Reported in the system_metrics document.	REQUEST METRICS BASE

## wlo\_completed\_total - Workload occurrences completed total monitor element

The number of workload occurrences to complete since last reset.

Table 2628. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_WORKLOAD_STATS table function - Return workload statistics	Always collected
WLM_GET_WORKLOAD_STATS table function - Return workload statistics	Always collected

Table 2629. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_wlstats	Always collected

## Usage

Use this element to determine how many occurrences of a given workload are driving work into the system.

## work\_action\_set\_id - Work action set ID monitor element

The ID of the work action set to which this statistics record applies.

Table 2630. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_histogrambin	Always collected
Statistics	event_wcstats	Always collected

## Usage

Use this element in conjunction with other activity history elements for analysis of the behavior of an activity or with other statistics elements for analysis of a work class.

The value of this element is 0 when the following conditions are met:

- The element is reported in an event\_histogrambin logical data group.
- The histogram data is collected for an object that is not a work class.

## work\_action\_set\_name - Work action set name monitor element

The name of the work action set to which the statistics shown as part of this event are associated.

Table 2631. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_QUEUE_STATS table function - Return threshold queue statistics	Always collected
MON_GET_WORK_ACTION_SET_STATS table function - Return work action set statistics	Always collected
WLM_GET_QUEUE_STATS table function - Return threshold queue statistics	Always collected
WLM_GET_WORK_ACTION_SET_STATS table function - Return work action set statistics	Always collected

Table 2632. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_qstats	Always collected
Statistics	event_wcstats	Always collected

### Usage

Use this element along with the **work\_class\_name** element to uniquely identify the work class whose statistics are being shown in this record or to uniquely identify the work class which is the domain of the threshold queue whose statistics are shown in this record.

## work\_class\_id - Work class ID monitor element

The identifier of the work class to which this statistics record applies.

Table 2633. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_wcstats	Always collected
Statistics	event_histogrambin	Always collected

### Usage

Use this element in conjunction with other statistics elements for analysis of a work class.

The value of this element is 0 when the following conditions are met:

- The element is reported in an event\_histogrambin logical data group.
- The histogram data is collected for an object that is not a work class.

## work\_class\_name - Work class name monitor element

The name of the work class to which the statistics shown as part of this event are associated.

Table 2634. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_QUEUE_STATS table function - Return threshold queue statistics	Always collected
MON_GET_WORK_ACTION_SET_STATS table function - Return work action set statistics	Always collected
WLM_GET_QUEUE_STATS table function - Return threshold queue statistics	Always collected
WLM_GET_WORK_ACTION_SET_STATS table function - Return work action set statistics	Always collected

Table 2635. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Statistics	event_qstats	Always collected
Statistics	event_wcstats	Always collected

## Usage

Use this element along with the **work\_action\_set\_name** element to uniquely identify the work class whose statistics are being shown in this record or to uniquely identify the work class which is the domain of the threshold queue whose statistics are shown in this record.

## workload\_id - Workload ID monitor element

An integer that uniquely identifies a workload.

Table 2636. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_ACTIVITY table function - Return a list of activities	Always collected
MON_GET_ACTIVITY_DETAILS table function - Return information about an activity as an XML document	Always collected
MON_GET_WORKLOAD table function - Get workload metrics	Always collected
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics	Always collected
MON_SAMPLE_WORKLOAD_METRICS - Get sample	Always collected

Table 2637. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Application	appl_info	Basic

Table 2638. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	Always collected
Unit of work	-	Always collected
Activities	event_activity (reported in the details_xml document)	Always collected
Statistics	event_scstats (reported in the metrics document)	Always collected
Statistics	event_superclassstats	Always collected
Statistics	event_wlstats (reported in the metrics document)	Always collected
Unit of work	Reported in the system_metrics document.	Always collected
Statistics	event_wlstats	Always collected
Statistics	event_histogrambin	Always collected
Activities	event_activity	Always collected
Threshold violations	event_thresholdviolations	Always collected

## Usage

Use this ID to uniquely identify the workload to which this activity, application, histogram bin, or workload statistics record belongs.

The value of this element is 0 when the following conditions are met:

- The element is reported in an event\_histogrambin logical data group.
- The histogram data is collected for an object that is not a workload.

## workload\_name - Workload name monitor element

Name of the workload.

Table 2639. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_FORMAT_LOCK_NAME table function - Format the internal lock name and return details	Always collected
MON_GET_AGENT table function - List agents, fenced mode processes, and system entities for the database	Always collected
MON_GET_QUEUE_STATS table function - Return threshold queue statistics	Always collected
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics	Always collected
MON_GET_WORKLOAD table function - Get workload metrics	Always collected

Table 2639. Table Function Monitoring Information (continued)

Table Function	Monitor Element Collection Level
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics	Always collected
MON_GET_WORKLOAD_STATS table function - Return workload statistics	Always collected
MON_SAMPLE_WORKLOAD_METRICS - Get sample	Always collected
WLM_GET_QUEUE_STATS table function - Return threshold queue statistics	Always collected
WLM_GET_SERVICE_CLASS_AGENTS table function - list agents running in a service class	Always collected
WLM_GET_SERVICE_CLASS_WORKLOAD_OCCURRENCES table function - list workload occurrences	Always collected
WLM_GET_WORKLOAD_STATS table function - Return workload statistics	Always collected

Table 2640. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking	-	Always collected
Unit of work	-	Always collected
Activities	event_activity (reported in the details_xml document)	Always collected
Statistics	event_scstats (reported in the metrics document)	Always collected
Statistics	event_superclassstats	Always collected
Statistics	event_wlstats (reported in the metrics document)	Always collected
Unit of work	Reported in the system_metrics document.	Always collected
Statistics	event_wlstats	Always collected

## Usage

In the statistics event monitor and workload table functions, the workload name identifies the workload for which statistics or metrics are being collected and reported. In the unit of work event monitor and unit of work table functions, the workload name identifies the workload that the unit of work was associated with.

Use the workload name to identify units of work or sets of information that apply to a particular workload of interest.

## workload\_occurrence\_id - Workload occurrence identifier monitor element

The ID of the workload occurrence to which this activity belongs.

Table 2641. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_AGENT table function - List agents, fenced mode processes, and system entities for the database	Always collected
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics	Always collected
WLM_GET_SERVICE_CLASS_AGENTS table function - list agents running in a service class	Always collected
WLM_GET_SERVICE_CLASS_WORKLOAD_OCCURRENCES table function - list workload occurrences	Always collected

Table 2642. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Unit of work	-	Always collected
Activities	event_activity	Always collected

### Usage

Use this to identify the workload occurrence that submitted the activity.

## workload\_occurrence\_state - Workload occurrence state monitor element

The state of the workload occurrence.

Table 2643. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
MON_GET_CONNECTION table function - Get connection metrics	Always collected
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics	Always collected
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	Always collected
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	Always collected
WLM_GET_SERVICE_CLASS_WORKLOAD_OCCURRENCES table function - list workload occurrences	Always collected

## Usage

Possible values include:

### **DECOUPLED**

Workload occurrence does not have a coordinator agent assigned (concentrator case).

### **DISCONNECTPEND**

Workload occurrence is disconnecting from the database.

### **FORCED**

Workload occurrence has been forced.

### **INTERRUPTED**

Workload occurrence has been interrupted.

### **QUEUED**

Workload occurrence coordinator agent is queued by a workload management queuing threshold. In a partitioned database environment, this state may indicate that the coordinator agent has made an RPC another member to obtain threshold tickets and has not yet received a response.

### **TRANSIENT**

Workload occurrence has not yet been mapped to a service superclass.

### **UOWEXEC**

Workload occurrence is processing a request.

### **UOWWAIT**

Workload occurrence is waiting for a request from the client.

## X

### **x\_lock\_escals - Exclusive lock escalations monitor element**

The number of times that locks have been escalated from several row locks to one exclusive table lock, or the number of times an exclusive lock on a row caused the table lock to become an exclusive lock.

*Table 2644. Snapshot Monitoring Information*

<b>Snapshot Level</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Database	dbase	Basic
Application	appl	Basic

For snapshot monitoring, this counter can be reset.

*Table 2645. Event Monitoring Information*

<b>Event Type</b>	<b>Logical Data Grouping</b>	<b>Monitor Switch</b>
Database	event_db	Always collected
Connection	event_conn	Always collected
Transactions	event_xact	Always collected

## Usage

Other applications cannot access data held by an exclusive lock; therefore it is important to track exclusive locks since they can impact the concurrency of your data.

A lock is escalated when the total number of locks held by an application reaches the maximum amount of lock list space available to the application. The amount of lock list space available is determined by the **locklist** and **maxlocks** configuration parameters.

When an application reaches the maximum number of locks allowed and there are no more locks to escalate, it will then use space in the lock list allocated for other applications. When the entire lock list is full, an error occurs.

See the **lock\_escals** monitor element for possible causes and resolutions to excessive exclusive lock escalations.

An application may be using exclusive locks when share locks are sufficient. Although share locks may not reduce the total number of lock escalations share lock escalations may be preferable to exclusive lock escalations.

## xda\_object\_pages - XDA Object Pages

The number of disk pages consumed by XML storage object (XDA) data.

### Element identifier

xda\_object\_pages

### Element type

information

*Table 2646. Snapshot Monitoring Information*

Snapshot Level	Logical Data Grouping	Monitor Switch
Table	table	Basic

*Table 2647. Event Monitoring Information*

Event Type	Logical Data Grouping	Monitor Switch
Tables	event_table	Always collected

### Usage

This element provides a mechanism for viewing the actual amount of space consumed by XML storage object (XDA) data in a particular table. This element can be used in conjunction with a table event monitor to track the rate of XML storage object data growth over time.

## xda\_object\_l\_pages - XML storage object (XDA) data logical pages monitor element

The number of logical pages used on disk by XML storage object (XDA) data.

*Table 2648. Table Function Monitoring Information*

Table Function	Monitor Element Collection Level
MON_GET_TABLE table function - Get table metrics	Always collected

### Usage

- This value might be less than the amount of space physically allocated for the object. This can happen when you use the REUSE STORAGE option of the TRUNCATE statement. This option causes storage allocated for the table to continue to be allocated, although the storage will be considered empty. In addition, the value for this monitor element might be less than the amount of space logically allocated for the object, because the total space logically allocated includes a small amount of additional meta data.

To retrieve an accurate measure of the logical or physical size of an object, use the ADMIN\_GET\_TAB\_INFO\_V97 function. This function provides more accurate information about the size of objects than you can obtain by multiplying the number of pages reported for this monitor element by the page size.

## xid - Transaction ID

A unique transaction identifier (across all databases) generated by a transaction manager in a two-phase commit transaction.

Table 2649. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
DCS Application	dcx_appl	Unit of Work

### Usage

This identifier can be used to correlate the transaction generated by the transaction manager with the transactions executed against multiple databases. It can be used to help diagnose transaction manager problems by tying database transactions involving a two-phase commit protocol with the transactions originated by the transaction manager.

## xmlid - XML ID monitor element

A unique document ID. The ID is derived as follows:

<event\_header>\_<event\_id>\_<event\_type>\_<event\_timestamp>\_<partition>.

Table 2650. Table Function Monitoring Information

Table Function	Monitor Element Collection Level
EVMON_FORMAT_UE_TO_TABLES procedure - move an XML document to relational tables	Not applicable; reports whichever elements are in the XML document that is provided as input to the formatting function.
EVMON_FORMAT_UE_TO_XML table function - convert unformatted events to XML	Not applicable; reports whichever elements are in the XML document that is provided as input to the formatting function.

Table 2651. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Locking		
Package Cache		

## xquery\_stmts - XQuery Statements Attempted

The number of XQuery statements executed for an application or database.

Table 2652. Table function monitoring information

Table function	Monitor element collection level
MON_GET_CONNECTION table function - Get connection metrics	REQUEST METRICS BASE
MON_GET_CONNECTION_DETAILS table function - Get detailed connection metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_DATABASE table function - Get database level information	REQUEST METRICS BASE
MON_GET_DATABASE_DETAILS table function - Get database information metrics	REQUEST METRICS BASE

Table 2652. Table function monitoring information (continued)

Table function	Monitor element collection level
MON_GET_ROUTINE table function - get aggregated execution metrics for routines	REQUEST METRICS BASE
MON_GET_ROUTINE_DETAILS table function - get aggregated execution metric details for routines	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUBCLASS_DETAILS table function - Get detailed service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS table function - Get service subclass metrics	REQUEST METRICS BASE
MON_GET_SERVICE_SUPERCLASS_DETAILS table function - Get detailed service subclass metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK table function - Get unit of work metrics	REQUEST METRICS BASE
MON_GET_UNIT_OF_WORK_DETAILS table function - Get detailed unit of work metrics (reported in DETAILS XML document)	REQUEST METRICS BASE
MON_GET_WORKLOAD table function - Get workload metrics	REQUEST METRICS BASE
MON_GET_WORKLOAD_DETAILS table function - Get detailed workload metrics	REQUEST METRICS BASE

Table 2653. Snapshot Monitoring Information

Snapshot Level	Logical Data Grouping	Monitor Switch
Database	dbase	Basic
Application	appl	Basic

For snapshot monitoring, this counter can be reset.

Table 2654. Event Monitoring Information

Event Type	Logical Data Grouping	Monitor Switch
Connection	event_conn	Always collected
Database	event_db	Always collected
Statistics	event_scmetrics	REQUEST METRICS BASE
Statistics	event_superclassmetrics	REQUEST METRICS BASE
Statistics	event_wlmmetrics	REQUEST METRICS BASE
Unit of work	uow_metrics	REQUEST METRICS BASE

### Usage

You can use this element to gauge the activity of native XQuery language requests. This does not include embedded XQuery language requests such as `xmlquery`, `xmltable`, or `xmlexist`.

---

## Chapter 3. Monitoring in a Db2 pureScale environment

The IBM Db2 pureScale Feature provides a robust, highly available database processing environment. Problems that might arise with the operation of one or more host systems in the Db2 pureScale instance can typically be addressed without interrupting access to data. Ironically, this characteristic of high-availability in a Db2 pureScale environment can mask issues that might lead to less than optimal performance. Monitoring certain aspects of your Db2 pureScale environment can help you recognize and address such issues.

For example, you might have a hardware problem that causes a member or cluster caching facility (also known as a CF) to fail over repeatedly to another host. However, because recovery is in most cases automatic, you might never be aware of the problem. If the problem goes undetected and uncorrected, you will not be realizing the full performance potential of your Db2 pureScale environment .

For this reason, doing some level of ongoing, operational monitoring of your Db2 pureScale instance is recommended. It can help you answer such questions as:

- Are all components of my Db2 pureScale instance running?
- If a member or CF has failed, was it able to restart successfully?
- Is my CF running on its preferred primary host? Or has it failed over to another host?
- Is another CF in a state where it is ready to take over if the primary CF fails?

A good place to start when you want to see the overall status of your Db2 pureScale environment is to examine the operational status of the hosts, members and CFs in your instance. By examining state and alert information reported for each of these entities, you can form an overall picture of how well your Db2 pureScale instance is functioning.

Beyond looking at the overall state of your Db2 pureScale instance, you can also use the database monitoring infrastructure to examine monitor elements that provide information about specific aspects of the Db2 pureScale instance. This information can help you to better understand where configuration and application design issues might detract from overall system performance.

---

## Status monitoring of a Db2 pureScale instance

Viewing the overall status of the components in a Db2 pureScale instance can give you a picture of how effectively it is functioning. You can view this information using table functions and administrative views. There are also command-line processor (CLP) commands and system commands that you can use to display operational status for your instance.

The information returned from these table functions, views, and commands provide you with a high-level view of the state of your Db2 pureScale instance. For example, you can use these interfaces to find answer to questions like the ones that follow: :

- Are the hosts that comprise a Db2 pureScale instance active or not?
- Which hosts are functioning as cluster caching facilities or member servers?
- Are there hosts that are functioning as both a member and a cluster caching facility?
- Are there hosts that are running more than one member?
- Is a member running on its preferred home host?
- For configurations with two cluster caching facilities, which one is functioning as the primary server? What is the current state of the secondary cluster caching facility: PEER or CATCHUP?

- What is the current *state* of the members that comprise an instance? For example, has any member been stopped using the **db2stop** command? Or is any member currently waiting to fail back to its home host?
- Do any cluster caching facility or member servers indicate an active *alert* that requires investigation?

Included in the information returned by many of these interfaces is *state* and *alert* information. The state of a host, a member or a cluster caching facility reflects the current operational capacity of the object in question. For example, a member can be STARTED, STOPPED, RESTARTING, WAITING\_FOR\_FAILBACK, ERROR or UNKNOWN.

Alerts are used to indicate that there is something that requires further investigation. If an alert is raised for one or more cluster caching facilities or members in an instance, problems might exist that require investigation.

## Interfaces for retrieving status information for Db2 pureScale instances

To see the overall status of various components in your Db2 pureScale instance, you can choose from a number of administrative views, table functions, and CLP commands. In addition, there are commands that you can use from the system command prompt or shell, which are useful when any of the server components are not running.

You can view state and alert information about your Db2 pureScale instance in the following ways:

- [“Table functions and administrative views” on page 1714](#)
- [“CLP commands” on page 1715](#)
- [“System prompt \(shell\) commands” on page 1715.](#)

### Table functions and administrative views

Table functions provide a flexible interface for retrieving information about your system. Most table functions accept parameters to narrow the scope of the information returned. For example, you might be interested in viewing information about a specific host.

Administrative views provide quick and easy access to system information. Unlike table functions, you cannot pass parameters to an administrative view to narrow the scope of a query. Generally, information for all objects relevant to the view (for example, hosts, cluster caching facilities (also known as CFs) or members) in the system are returned. You can always filter the output of administrative views using SQL, however.

The following table functions and their corresponding administrative views return information about the overall status of a Db2 pureScale instance:

<i>Table 2655. Table functions and administrative views that display status information for components in a Db2 pureScale instance</i>	
<b>Interface</b>	<b>Description</b>
DB2_GET_CLUSTER_HOST_STATE table function DB2_CLUSTER_HOST_STATE administrative view	These interfaces provide basic information about the hosts that comprise a Db2 pureScale instance. They return a list of hosts and associated state information.
DB2_GET_INSTANCE_INFO table function DB2_MEMBER administrative view DB2_CF administrative view	These interfaces provide more detailed information about a Db2 pureScale instance. They return information about the role in the instance each host plays (cluster caching facility or member), whether each cluster caching facility or member is running on its home host, and connection information for each host.
DB2_INSTANCE_ALERTS administrative view	This interface provides information about alerts in a Db2 pureScale instance.

**Note:** Each of the preceding interfaces can be used in both Db2 pureScale instances and other Db2 instances. The results they return for each might be different. For example, the DB2\_MEMBER administrative view can be used for both types of instances; however, in an instance outside of a Db2 pureScale environment, no state or alert information is included in the information returned. You must remember to interpret the results returned from the functions and views in the context of the type of instance that is being queried. Consult the reference topics for each of the specific table functions or administrative views for details.

## CLP commands

The following commands can be used from the command-line processor (CLP):

<i>Table 2656. CLP commands that display status information for components in a Db2 pureScale instance</i>	
CLP command	Description
<b>LIST INSTANCE</b>	This command returns information about the state of members, hosts, and cluster caching facilities.
<b>LIST INSTANCE SHOW DETAIL</b>	This command is an extension of the LIST INSTANCE command that returns added information, including partition number and connection information for members, hosts, and cluster caching facilities.

## System prompt (shell) commands

The following commands can be used from the system or shell prompt:

<i>Table 2657. System prompt (shell) commands that display information for components in a Db2 pureScale instance</i>	
Command	Description
<b>db2instance -list</b>	This command returns status information about members, hosts, and cluster caching facilities in a Db2 pureScale instance. It can be used even if there is no current database connection, or if the instance is stopped. In the latter case, the <b>db2instance -list</b> command works with the cluster manager to report the information about the hosts in the Db2 pureScale instance. There are several options available that restrict the output to members only, or cluster caching facilities only.
<b>db2cluster options</b>	This command can be used to view information about Db2 pureScale instances. There are several additional options to choose from for this command; when you specify the <b>-list</b> option, you must also specify additional options to specify what to include in the command output.

## Values for member and cluster caching facility states and alerts

Many of the table functions, administrative views, and commands that you can use to query the status of components in a Db2 pureScale environment return *state* and *alert* information. The *state* of a host, member or cluster caching facility (also known as a CF) reflects its operational status. An *alert* for a host, member or CF is an indication that a problem exists that might require investigation or intervention.

### States for hosts, members and cluster caching facilities

State information is returned by many of the table functions, administrative views, and commands that you can use to query the status of the components of a Db2 pureScale environment. The possible values for the state of each component are shown in [Table 2658 on page 1716](#):

Table 2658. Possible states for hosts, members and cluster caching facilities

Component	Possible states	Description
Host	ACTIVE	Host is available for use. This means that the host system is running and can respond to operating system or networking commands, such as the TCP/IP <b>ping</b> command.
	INACTIVE	Host is not available for use. This means that the host system is not running, not available or not responding to system commands. The reasons for being in this state can range from a power loss at the host to connection or networking issues.
cluster caching facility (CF)	STOPPED	CF has been manually stopped using the <b>db2stop</b> command as part of a normal shutdown by the administrator.
	RESTARTING	CF is in the process of starting, either from the <b>db2start</b> command, or after a CF failure.
	BECOMING_PRIMARY	Once a CF has started, it attempts to take on the role of the primary CF in the instance if no other CF already has this role.
	PRIMARY	The CF is operating normally as the primary CF.
	CATCHUP (n%)	When a secondary CF is initially started, it does not contain any information from the primary CF. During CATCHUP state, the secondary CF is in the process of obtaining a copy of all relevant information from the primary CF. This information that enables it to assume the role of primary CF if the primary CF fails. CATCHUP n% indicates how far along the secondary CF is in the process of copying information from the primary CF. When this copying process is complete, the secondary CF moves into PEER state.  <b>Note:</b> When you view the status of the secondary CF using the command <b>db2instance -list</b> , it will be in CATCHUP state until a connection is made to the database. Once the first connection is made, the process of copying data from the primary CF begins.
	PEER	The secondary CF is ready to take over the responsibilities of the primary CF in the event of a primary CF failure. Duplexing continues while the secondary CF is in PEER state.
ERROR	Db2 cluster services could not automatically restart the CF. When the CF reflects an ERROR state, the ALERT field is always set to YES, indicating intervention and investigation is required by the administrator. Db2 cluster services no longer attempts to restart the CF once it is in the ERROR state unless the alert has been cleared.  The ERROR state can also occur if a connection to a CF cannot be established to query its state. In this case, the ALERT field is not set to YES because the problem might be temporary. Rerun the <b>db2instance -list</b> command for a couple of iterations with some delay in between to check if the CF state changes to a healthy state, or if the ALERT field changes to YES.	

Table 2658. Possible states for hosts, members and cluster caching facilities (continued)

Component	Possible states	Description
Member	STARTED	Member is started in the instance and operating normally. All databases are consistent and member is ready to accept or is already accepting connections to databases. If a member failed and started again, it is possible that the process model has started, but that crash recovery of the database is not yet complete. Use the <b>LIST UTILITIES</b> command with the SHOW DETAIL option from any member to monitor the recovery progress.
	STOPPED	Member has been manually stopped using the <b>db2stop</b> command as part of a normal shutdown by the administrator.
	RESTARTING	Member is in the process of starting or restarting. If the current host is the same as the home host, then a local member restart is taking place. If current host is different from the home host, then a member has failed over to the current host, and is restarting in light mode.
	WAITING_FOR_FAILBACK	The process model for this member has successfully restarted on the current host in light mode. The member is waiting for its home host to become available, and which point, it will fail back on the home host. Use the <b>LIST UTILITIES</b> command with the SHOW DETAIL option from any active member to monitor recovery progress, and to see if crash recovery is complete for all databases. The member does not accept any new connections, nor does it process any transactions. Indoubt transactions might still exist.
	ERROR	Db2 cluster services could not automatically restart the member, either on its home host or on any other host in the Db2 pureScale instance. When the member reflects an ERROR state, the ALERT field is always set to YES, indicating intervention and investigation is required from the administrator. Db2 cluster services no longer attempts to restart the member once it is in the ERROR state unless the alert has been cleared.

## Alerts for hosts, members and cluster caching facilities

In addition to returning state information, the commands that query the status of the components in a Db2 pureScale environment also return alert information. The possible values for alerts for all components is either YES or NO. Generally speaking, an alert value of NO is an indication that things are running normally. An alert value of YES indicates that there is a problem that might require manual intervention. In some cases, the alert conditions are temporary, and the alert field might clear itself, such as when a host is rebooted. In other cases, the alert field remains set. Proceed to use **db2cluster -list -alert** command to display the alerts in detail, attempt to resolve them first. There are some alerts that require administrators to manually reset the alert field using the **db2cluster** command with the **-clear -alert** options. If the alerts persist or if you are unable to resolve them, engage Db2 support.

## Interpretation of status information

When you query hosts, members or cluster caching facilities for status information, the system presents state and alert information that tells you about the status of the various components in your Db2 pureScale environment. When problems arise, you generally need to examine both states and alerts to understand what is happening in the system.

The *state* of a host, member or cluster caching facility (also known as a CF) reflects its operational status. When everything is operating normally, the values reported for the state of hosts, members and cluster caching facilities (also known as CFs) can give you a general idea of the status of your system. For example, a status of RESTARTING, or WAITING\_FOR\_FAILBACK on a member does not itself indicate that there is a problem. There might be several valid reasons why a member is failing over to a new host, or restarting on its home host, such as when hosts are taken offline for maintenance. If a member is failing over on a frequent, repeated basis, there might be a problem that warrants further investigation.

An *alert* for a host, member or CF is an indication that a problem exists that might require investigation or intervention. Looking at alerts in the context of the state of a given system component can reveal additional information about the source of the problem. The sections that follow outline the various combinations of state and alert information that you might encounter for hosts, members or cluster caching facilities, and how to interpret different combinations of states and alerts.

**Remember:** The completeness of state and alert information returned by the interfaces that report on this information depends on the following factors:

- The type of instance in which the table function, administrative view, or command is being run (for example, Db2 pureScale instances or other database instances)
- Whether a supported cluster manager is employed in that instance. All Db2 pureScale Feature deployments use a cluster manager.

See [“Differences in reporting for data-sharing and environments other than Db2 pureScale environments” on page 1721](#) for details.

## Host status

You can view information about the hosts in a Db2 pureScale environment using a number of different interfaces. One such interface is the DB2\_CLUSTER\_HOST\_STATE administrative view. For example, consider this SQL query:

```
SELECT varchar(HOSTNAME,10) AS HOST,  
       varchar(STATE,8) AS STATE,  
       varchar(INSTANCE_STOPPED,7) AS STOPPED,  
       ALERT  
FROM SYSIBMADM.DB2_CLUSTER_HOST_STATE
```

The output of running the preceding SQL statement would look like this:

```
HOST      STATE      STOPPED  ALERT  
-----  
HOSTD     ACTIVE     NO       NO  
HOSTB     ACTIVE     NO       NO  
HOSTA     ACTIVE     YES      NO  
HOSTC     ACTIVE     NO       NO  
  
4 record(s) selected.
```

(In the preceding example, the STOPPED column corresponds to the INSTANCE\_STOPPED column returned by the administrative view.)

The values for the state, instance\_stopped and alert columns can take on different values, depending on the conditions at any given time. The possible values are summarized in [Table 2659 on page 1719](#).

Table 2659. Combinations of state, instance\_stopped, and alerts possible on a host system in a Db2 pureScale instance

STATE	INSTANCE_STOPPED	ALERT	Description
ACTIVE	NO	NO	The host is active and operating normally.
		YES	The host is active (that is, it responds to system commands), however there might be a problem preventing it from participating in the Db2 pureScale instance. For example, there might be a file system problem or a network communication issue, or the idle processes that the Db2 pureScale Feature requires for performing failovers might not be running.
	YES	NO	The host is active. The instance has been stopped explicitly on this host by the administrator using the <b>db2stop instance on hostname</b> command
		YES	The host is active, however, an alert exists for the host that has not been cleared. The administrator has explicitly stopped the instance.
INACTIVE	NO	NO	Not applicable. A host cannot be INACTIVE when both INSTANCE_STOPPED and ALERT are set to NO.
		YES	The host is not responding to system commands. The instance was not stopped explicitly by the administrator, however there is an alert. This combination of status information indicates the abnormal shutdown of a host. Such a shutdown might arise, for example, from a power failure on a host.
	YES	NO	Normal state when the instance has been stopped by the administrator. Such a combination of status information might arise when the host is being taken offline for the installation of software updates.
		YES	The host is not responding to system commands. An alert exists for the host that has not been cleared, but the instance was stopped explicitly by the administrator (that is, the system did not shut down abnormally).

**Tip:** You can see details about alerts using the DB2\_INSTANCE\_ALERTS administrative view.

### Member status

You can view member states and alerts using several different interfaces. One such interface is the DB2\_MEMBER administrative view. The DB2\_MEMBER administrative view shows status information for members in a Db2 pureScale instance. What follows is an example of how to use this administrative view to retrieve member status:

```
SELECT ID,
       varchar(STATE,21) AS STATE,
       varchar(HOME_HOST,10) AS HOME_HOST,
       varchar(CURRENT_HOST,10) AS CUR_HOST,
       ALERT
FROM SYSIBMADM.DB2_MEMBER
```

The values for the state, and alert columns can take on different values, depending on the conditions at any given time. The possible values are summarized in [Table 2660 on page 1720](#).

Table 2660. Combinations of state, and alerts possible for members in a Db2 pureScale instance

STATE	ALERT	Description
STARTED	NO	The member is started in the instance and is operating normally.
	YES	The member is started in the instance. However, at some point, there was an unsuccessful attempt to fail over to another host. Since that unsuccessful attempt to fail over, the member was able to fail over successfully to another host, or it has failed back to its home host. If the member is running on its home host, it is running normally; if it is running on a guest host, it is running in light mode. Either way, investigate the alert to determine what happened.
STOPPED	NO	The member has been stopped by the administrator using the <b>db2stop</b> command.
	YES	The member has been stopped by the administrator using the <b>db2stop</b> command, however, the alert field has not yet been cleared.
RESTARTING	NO	The member is starting.
	YES	The member is starting. However, at some point, there was an unsuccessful attempt to start the member on the home host or to fail over to another host. The alert field has not yet been cleared.
WAITING_FOR_FAILBACK	NO	The member is running in light mode on a guest host, and is waiting to fail back to the home host. You might want to examine the status of the home host to see if anything is preventing the member from failing back to the home host (for example, a failed network adapter).
	YES	An attempt to restart the member on the home host might have failed, automatic failback is disabled, or crash recovery might have failed. You need to resolve the problem and clear the alert manually before the member can automatically fail back to its home host. If automatic failback is disabled, manually clear the alert and enable automatic failback using the <b>db2cluster</b> command.
ERROR	YES	Db2 cluster services was not able to start the member on any host. You need to resolve the problem and clear the alert manually before attempting to restart the instance.

**Tip:** You can see details about alerts using the DB2\_INSTANCE\_ALERTS administrative view.

### cluster caching facility status

The DB2\_GET\_INSTANCE\_INFO table function lets you retrieve status information for members in a Db2 pureScale instance. One of the benefits of the table function is that you can pass parameters to it to narrow the scope of the results returned. For example, to retrieve information about CFs in a Db2 pureScale instance, you can construct a query such as:

```
SELECT ID,
       varchar(STATE,17) AS STATE,
       varchar(HOME_HOST,10) AS HOME_HOST,
       varchar(CURRENT_HOST,10) AS CUR_HOST,
       ALERT
FROM TABLE(DB2_GET_INSTANCE_INFO(NULL, '', '', 'CF', NULL))
```

The values for the state, and alert columns can take on different values, depending on the conditions at any given time. The possible values are summarized in [Table 2661 on page 1721](#).

*Table 2661. Combinations of state, and alerts possible for cluster caching facilities in a Db2 pureScale instance*

STATE	ALERT	Description
STOPPED	NO	The cluster caching facility (also known as a CF) has been manually stopped using the <b>db2stop</b> command.
	YES	There has been an unsuccessful attempt by the CF to become the primary CF. The cluster caching facility has been manually stopped in the instance by the administrator using the <b>db2stop</b> command.
RESTARTING	NO	The CF is restarting, either as a result of the <b>db2start</b> command, or after a primary CF failure.
	YES	The CF is restarting, however, there is a pending alert from a previous failed attempt by the CF to take on the primary role that must be cleared manually.
BECOMING_PRIMARY	NO	The CF will take on the role of primary CF if there is no other primary CF already running in the instance.
	YES	Not applicable. The CF cannot attempt to take on the primary role with an alert condition set.
PRIMARY	NO	The CF has taken on the role of primary CF and is operating normally.
	YES	Not applicable. The CF cannot be acting as the primary CF with an alert condition set.
CATCHUP ( <i>n%</i> )	NO	This secondary CF is in the process of copying information from the primary CF required for it to operate in PEER mode.  <b>Note:</b> When you view the status of the secondary CF using the command <b>db2instance -list</b> , it will be in <b>CATCHUP</b> state until a connection is made to the database. Once the first connection is made, the process of copying data from the primary CF begins.
	YES	This secondary CF is in the process of copying information from the primary CF required for it to operate in PEER mode. There is a pending alert from a previous failed attempt by this CF to take on the primary role that must be cleared manually.
PEER	NO	This secondary CF is ready to assume the role of primary CF if the current primary CF fails.
	YES	This secondary CF is ready to assume the role of primary CF if the current primary CF fails. There is a pending alert from a previous failed attempt by this CF to take on the primary role that must be cleared manually.
ERROR	YES	The CF could not be started on any host in the instance. You need to resolve the problem and clear the alert manually before attempting to restart the instance.

**Tip:** You can see details about alerts using the DB2\_INSTANCE\_ALERTS administrative view.

### Differences in reporting for data-sharing and environments other than Db2 pureScale environments

All the various table functions, administrative views and commands that report status data for hosts, members and cluster caching facilities can be used outside of a Db2 pureScale instance. However, the results returned by these interfaces might be different from what you see in a Db2 pureScale instance.

In a configuration that uses a clustered file system with a supported cluster manager (CM) (a configuration sometimes known as "integrated High Availability" or "integrated HA") the results returned for most of these status-reporting interfaces will resemble what you see in a Db2 pureScale instance. One exception is when retrieving information about hosts in your instance using the DB2\_GET\_CLUSTER\_HOST\_STATE table function or the DB2\_CLUSTER\_HOST\_STATE administrative view. Outside of a Db2 pureScale instance with integrated HA, neither of these interfaces will return the INSTANCE\_STOPPED column. The results of a query that uses the DB2\_CLUSTER\_HOST\_STATE administrative view, for example, resemble those shown in [Figure 16 on page 1722](#)

HOSTNAME	STATE	INSTANCE_STOPPED	ALERT
HOSTA	ACTIVE	-	NO
HOSTB	ACTIVE	-	NO
HOSTC	ACTIVE	-	NO
HOSTD	ACTIVE	-	NO

*Figure 16. Results returned by the DB2\_CLUSTER\_HOST\_STATE administrative view outside of a Db2 pureScale instance with a cluster manager.*

Another exception is any interface that specifically reports on status for cluster caching facilities. Outside of a Db2 pureScale environment, there are no cluster caching facilities, so there is no status to report. For example, the DB2\_CF administrative view returns results similar to the following in an environment other than a Db2 pureScale environment:

ID	CURRENT_HOST	STATE	ALERT
0 record(s) selected.			

*Figure 17. Results returned by the DB2\_CF administrative view outside of a Db2 pureScale instance.*

When the status-reporting interfaces are used in an instance without a CM, no status or alert information is returned at all. For example, the results of a query that uses the DB2\_CLUSTER\_\_HOST\_STATE administrative view resemble those in [Figure 18 on page 1722](#)

HOSTNAME	STATE	INSTANCE_STOPPED	ALERT
HOSTA	-	-	-
HOSTB	-	-	-
HOSTC	-	-	-
HOSTD	-	-	-
4 record(s) selected.			

*Figure 18. Results returned by the DB2\_CLUSTER\_HOST\_STATE administrative view outside of a Db2 pureScale instance without a cluster manager.*

## Examples: Viewing the status of hosts, members and cluster caching facilities

The topics that follow include examples of using the various interfaces to view the status of the components of your Db2 pureScale instance.

### Viewing status information for hosts in a Db2 pureScale instance

You can retrieve basic information that shows the overall status of hosts in a Db2 pureScale instance. This information tells you whether the host is active or not, if the instance is running on the host, and whether there are any alerts that require investigation.

#### About this task

Viewing the status of the hosts in a Db2 pureScale instance is one of the first places to start to get an overall view of the status of the instance.

One way to retrieve this status is using the DB2\_CLUSTER\_HOST\_STATE administrative view. This view returns status information for all hosts in the instance. You can also use the following interfaces to retrieve information about host status:

- DB2\_GET\_CLUSTER\_HOST\_STATE table function. This approach is useful if you want to query the status of a particular host, as the table function accepts a host ID as a parameter.
- **LIST INSTANCE** command.
- **db2instance** command, with the **-list** parameter

## Procedure

To view the status of the hosts in a Db2 pureScale instance:

1. Formulate an SQL statement using either the DB2\_CLUSTER\_HOST\_STATE administrative view, or the DB2\_GET\_CLUSTER\_HOST\_STATE table function.

This example uses the administrative view:

```
SELECT varchar(HOSTNAME,10) AS HOST,
       varchar(STATE,8) AS STATE,
       varchar(INSTANCE_STOPPED,7) AS STOPPED,
       ALERT
FROM SYSIBMADM.DB2_CLUSTER_HOST_STATE
```

2. Run the query.

## Results

The output of running the preceding SQL statement would look like this:

HOST	STATE	STOPPED	ALERT
HOSTD	ACTIVE	NO	NO
HOSTB	ACTIVE	NO	NO
HOSTA	ACTIVE	YES	NO
HOSTC	ACTIVE	NO	NO

4 record(s) selected.

In this example, there are 4 hosts in this instance. Three are active, which just means that the systems are powered on, and are able to respond to operating system commands. One host is stopped, which means that the instance has been stopped on that host explicitly by the administrator. There are no alerts that require investigation.

## Example

### *Retrieving host status using the DB2\_GET\_CLUSTER\_HOST\_STATE table function*

The DB2\_GET\_CLUSTER\_HOST\_STATE table function also lets you retrieve status information about hosts in a Db2 pureScale instance. One of the benefits of the table function is that you can pass parameters to it to narrow the scope of the results returned. For example, to retrieve information about the host HOSTD in the Db2 pureScale instance, construct a query like the following:

```
SELECT varchar(HOSTNAME,10) as HOST,
       varchar(STATE,10) AS STATE,
       ALERT
FROM TABLE(DB2_GET_CLUSTER_HOST_STATE('HOSTD'))
```

Results:

HOST	STATE	ALERT
HOSTD	ACTIVE	NO

1 record(s) selected.

## Viewing status information for members and cluster caching facilities in a Db2 pureScale instance

You can view details about the operational status of members and cluster caching facilities (also known as CFs) in a Db2 pureScale instance, such as the role played by CFs (for example, primary or peer), and whether or members have failed over to a different host.

### About this task

The example presented in this task shows how to retrieve information about the status of members and cluster caching facilities in a Db2 pureScale instance using the **db2instance** system command. The benefit of using a system command is that a database connection is not required. However, the command must be run from a host that is a member (not a CF) in the instance.

### Procedure

To retrieve status information about the members and CFs in a Db2 pureScale instance using the **db2instance** command, enter the command at the system prompt of one of the members in the instance, with the `-list` option:

```
db2instance -list
```

The `db2instance` command returns information like the following query (output has been slightly compressed for presentation purposes):

ID	TYPE	STATE	HOME_HOST	CURRENT_HOST	ALERT	PARTITION_NUMBER
LOGICAL_PORT	NETNAME					
----	----	----	-----	-----	----	-----
0	MEMBER	STARTED	HOSTA	HOSTA	NO	
0		OSTA-ib0				
1	MEMBER	STARTED	HOSTB	HOSTB	NO	
0		HOSTB-ib0				
2	MEMBER	STARTED	HOSTC	HOSTC	NO	
0		HOSTC-ib0				
128	CF	PRIMARY	HOSTD	HOSTD	NO	
-		HOSTD-ib0				
129	CF	PEER	HOSTE	HOSTE	NO	
-		HOSTE-ib0				

HOSTNAME	STATE	INSTANCE_STOPPED	ALERT
-----	----	-----	----
HOSTA	ACTIVE	NO	NO
HOSTC	ACTIVE	NO	NO
HOSTD	ACTIVE	NO	NO
HOSTE	ACTIVE	NO	NO
HOSTB	ACTIVE	NO	NO

### Results

The results returned depend on the structure of your Db2 pureScale instance. In this example, the report shows that:

- Hosts HOSTA through HOSTC are configured as members
- Each member is started, and is running on its own home host
- There are 2 cluster caching facilities CFs running on hosts HOSTD and HOSTE
- The primary CF is running on HOSTD; another CF is running on HOSTE in peer mode, indicating that it is ready to take over the responsibilities of the primary CF in the event of a primary CF failure.

## Example

You can also retrieve status information for members and cluster caching facilities using the following interfaces:

- DB2\_MEMBER or DB2\_CF administrative view
- DB2\_GET\_INSTANCE\_INFO table function
- **LIST INSTANCE** command-line processor (CLP) command
- **db2cluster** system command.

The examples that follow illustrate the use of some of these interfaces.

### **Example 1: Retrieving status information using the DB2\_MEMBER administrative view**

The DB2\_MEMBER administrative view shows status information for members in a Db2 pureScale instance. What follows is an example of how to use this administrative view to retrieve member status:

```
SELECT ID,
       varchar(STATE,21) AS STATE,
       varchar(HOME_HOST,10) AS HOME_HOST,
       varchar(CURRENT_HOST,10) AS CUR_HOST,
       ALERT
FROM SYSIBMADM.DB2_MEMBER
```

Results:

ID	STATE	HOME_HOST	CUR_HOST	ALERT
0	<b>WAITING_FOR_FAILBACK</b>	HOSTA	<b>HOSTB</b>	NO
1	STARTED	HOSTB	HOSTB	NO
2	STARTED	HOSTC	HOSTC	NO

3 record(s) selected.

In this example, member 0 has failed on its home host and has failed over to HOSTB. Member 0 is waiting to fail back to its home host, HOSTA.

### **Example 2: Retrieving status information for CFs using the DB2\_GET\_INSTANCE\_INFO table function**

The DB2\_GET\_INSTANCE\_INFO table function lets you retrieve status information for members in a Db2 pureScale instance. One of the benefits of the table function is that you can pass parameters to it to narrow the scope of the results returned. For example, to retrieve information about CFs in a Db2 pureScale instance, you can construct a query such as:

```
SELECT ID,
       varchar(STATE,17) AS STATE,
       varchar(HOME_HOST,10) AS HOME_HOST,
       varchar(CURRENT_HOST,10) AS CUR_HOST,
       ALERT
FROM TABLE(DB2_GET_INSTANCE_INFO(NULL, '', '', 'CF', NULL))
```

Results:

ID	STATE	HOME_HOST	CUR_HOST	ALERT
128	<b>RESTARTING</b>	HOSTD	HOSTD	NO
129	<b>BECOMING_PRIMARY</b>	HOSTE	HOSTE	NO

1 record(s) selected.

In this example, the CF with the host ID of 128 has failed. The CF with the host ID of 129 is in the process of taking over as the primary CF.

### **Example 3: Investigating alerts reported with the db2instance -list command.**

In this example, the results of running the **db2instance -list** command are as follows:

```

$ db2instance -list
ID      TYPE      STATE      HOME_HOST      CURRENT_HOST      ALERT  PARTITION_NUMBER  LOGICAL_PORT  NETNAME
-----
0       MEMBER    STARTED    HostA           HostA             NO     0                 0             -
1       MEMBER    STARTED    HostB           HostB             NO     0                 1             -
2       MEMBER    STARTED    HostC           HostC             NO     0                 2             -
128    CF        ERROR      HostD           HostD             YES    -                 0             -
129    CF        ERROR      HostE           HostE             YES    -                 0             -

HOSTNAME  STATE      INSTANCE_STOPPED  ALERT
-----
HostA     ACTIVE    NO                NO
HostB     ACTIVE    NO                NO
HostC     ACTIVE    NO                NO
HostD     ACTIVE    NO                YES
HostE     ACTIVE    NO                YES

There is currently an alert for a member, CF, or host in the data-sharing instance. For more information on the alert, its impact,
and how to clear it, run the following command: 'db2cluster -cm -list -alert'

```

In this example, there are alerts for both cluster caching facilities in the instance. Also, the state of the CFs appear as ERROR. As the message at the end of the report suggests, you can use the **db2cluster** command with the **-cm -list -alert** options to view more information about the alerts:

```

$db2cluster -cm -list -alert

Alert: CF '128' failed to start the PRIMARY role on host 'HostD'. Check the cadiag*.log for failures related to CF
'128' for more information.

Action: This alert must be cleared manually with the command: 'db2cluster -cm -clear -alert'.

Impact: CF '128' on host 'HostD' will be unavailable to service requests from Db2 members until the alert is
cleared.

```

#### Example 4: Member alert, a member failed to start in the Db2 pureScale instance

In this example, the results of running the **db2instance -list** command are as follows:

```

$ db2instance -list
ID      TYPE      STATE      HOME_HOST      CURRENT_HOST      ALERT  PARTITION_NUMBER  LOGICAL_PORT  NETNAME
-----
0       MEMBER    ERROR      HostA           HostA             YES    0                 0             -
1       MEMBER    STARTED    HostB           HostB             NO     0                 1             -
2       MEMBER    STARTED    HostC           HostC             NO     0                 2             -
128    CF        PRIMARY   HostD           HostD             NO     -                 0             -
129    CF        PEER      HostE           HostE             NO     -                 0             -

HOSTNAME  STATE      INSTANCE_STOPPED  ALERT
-----
HostA     ACTIVE    NO                NO
HostB     ACTIVE    NO                NO
HostC     ACTIVE    NO                NO
HostD     ACTIVE    NO                NO
HostE     ACTIVE    NO                NO

There is currently an alert for a member, CF, or host in the data-sharing instance. For more information on the alert, its impact,
and how to clear it, run the following command: 'db2cluster -cm -list -alert'

```

In this example, a member failed to start in the Db2 pureScale instance. Running the **db2cluster** command with the **-cm -list -alert** options recommends an action to take and outlines the impact of this failure in the Db2 pureScale instance.

```

$db2cluster -cm -list -alert

Alert: Db2 member '0' failed to start on its home host 'HostA'. The cluster manager will attempt to restart the Db2 member in restart
light mode on another host. Check the db2diag.log for messages concerning failures on host 'HostA' for member '0'."

Action: This alert must be cleared manually with the command: 'db2cluster -cm -clear -alert'.

Impact: Db2 member '%0' will not be able to service requests until this alert has been cleared and the Db2 member returns to its home host.

```

#### Example 5: CF error, the secondary CF failed CATCHUP phase

In this example, the results of running the **db2instance -list** command are as follows:

```

$ db2instance -list
ID      TYPE      STATE      HOME_HOST      CURRENT_HOST      ALERT  PARTITION_NUMBER  LOGICAL_PORT  NETNAME
-----
0       MEMBER    STARTED    HostA           HostA             NO     0                 0             -
1       MEMBER    STARTED    HostB           HostB             NO     0                 1             -
2       MEMBER    STARTED    HostC           HostC             NO     0                 2             -
128    CF        PRIMARY   HostD           HostD             NO     -                 0             -
129    CF        ERROR      HostE           HostE             YES    -                 0             -

HOSTNAME  STATE      INSTANCE_STOPPED  ALERT
-----
HostA     ACTIVE    NO                NO
HostB     ACTIVE    NO                NO
HostC     ACTIVE    NO                NO
HostD     ACTIVE    NO                NO
HostE     ACTIVE    NO                NO

There is currently an alert for a member, CF, or host in the data-sharing instance. For more information on the alert, its impact,
and how to clear it, run the following command: 'db2cluster -cm -list -alert'

```

In this example, the secondary CF failed CATCHUP phase. Running the **db2cluster** command with the **-cm -list -alert** options recommends an action to take and outlines the impact of this failure in the Db2 pureScale instance.

```
$db2cluster -cm -list -alert
```

```
Alert: CF '129' failed to complete CATCHUP on host 'HostE'. Check the db2diag.log for failure messages pertaining to CATCHUP on CF '129'.
```

```
Action: Contact IBM support to determine the reason for the failure. To re-attempt CATCHUP, restart the failed CF with the commands: 'db2stop 129; db2start 129'. This alert will clear itself when the CF is restarted.
```

```
Impact: CF '129' on host 'HostE' will not be available until it can undergo CATCHUP successfully.
```

### Example 6: Host alert, the host "HostA" lost a network connection.

In this example, the results of running the **db2instance -list** command are as follows:

```
$ db2instance -list
ID      TYPE      STATE      HOME_HOST      CURRENT_HOST      ALERT  PARTITION_NUMBER  LOGICAL_PORT  NETNAME
-----
0      MEMBER  WAITING_FOR_FAILBACK  HostA          HostA             NO      0                  0              -
1      MEMBER  STARTED    HostB          HostB             NO      0                  1              -
2      MEMBER  STARTED    HostC          HostC             NO      0                  2              -
128    CF      PRIMARY    HostD          HostD             NO      -                  0              -
129    CF      PEER      HostE          HostE             NO      -                  0              -

HOSTNAME      STATE      INSTANCE_STOPPED  ALERT
-----
HostA        INACTIVE      NO                YES
HostB        ACTIVE        NO                NO
HostC        ACTIVE        NO                NO
HostD        ACTIVE        NO                NO
HostE        ACTIVE        NO                NO

There is currently an alert for a member, CF, or host in the data-sharing instance. For more information on the alert, its impact, and how to clear it, run the following command: 'db2cluster -cm -list -alert'.
```

In this example, the host "HostA" lost a network connection. Running the **db2cluster** command with the **-cm -list -alert** options recommends an action to take and outlines the impact of this failure in the Db2 pureScale instance.

```
$db2cluster -cm -list -alert
```

```
Alert: Host 'HostA' is INACTIVE. Ensure the host is powered on and connected to the network.
```

```
Action: This alert will clear itself when the host is ACTIVE.
```

```
Impact: While the host is INACTIVE, the Db2 members on this host will be in restart light mode on other hosts and will be in the WAITING_FOR_FAILBACK state. Any CF defined on the host will not be able to start, and the host will not be available as a target for restart light.
```

## Checking restart status for members

If you know a member has failed, perhaps because of a power loss or other hardware problem that you have since corrected, you might want to know whether it has restarted successfully.

### About this task

You can use the DB2\_MEMBER administrative view to examine the operational status of all members in a Db2 pureScale instance. You can also use the DB2\_GET\_INSTANCE\_INFO table function, which provides options for querying specific hosts.

The process for checking member restart status is exactly as is shown in [Example 1 of “Viewing status information for members and cluster caching facilities in a Db2 pureScale instance” on page 1724](#). Specifically, formulate an SQL query that uses the DB2\_MEMBER administrative view (or the DB2\_GET\_INSTANCE\_INFO table function) to retrieve values for the following columns:

- ID
- HOME\_HOST
- CURRENT\_HOST
- STATE
- ALERT

## Procedure

1. Formulate the SQL query using whichever interface you prefer. This example uses the DB2\_MEMBER administrative view:

```
SELECT ID,
       varchar(STATE,21) AS STATE,
       varchar(HOME_HOST,10) AS HOME_HOST,
       varchar(CURRENT_HOST,10) AS CUR_HOST,
       ALERT
FROM SYSIBMADM.DB2_MEMBER
```

2. Run the query.

The results returned will look like the following:

ID	STATE	HOME_HOST	CUR_HOST	ALERT
0	STARTED	HOSTA	HOSTA	NO
1	STARTED	HOSTB	HOSTB	NO
2	STARTED	HOSTC	HOSTC	NO

3 record(s) selected.

In the previous example, all members are running on their own hosts with no alerts.

## Results

When looking at the restart status for the members, check that:

- The value for the STATE column is either RESTARTING or STARTED. The former is an indication that the member is in the process of being restarted; the latter indicates that it has successfully restarted. If the state is RESTARTING, check the status again in a few minutes to see if the state has changed to STARTED.
- The value for CUR\_HOST is the same as the value for HOME\_HOST. This indicates that the member is running on its home host.
- There is no YES value in the alert column for the member you are interested in.

If CUR\_HOST is different than HOME\_HOST, or if the state has not moved beyond RESTARTING, or remains as WAITING\_FOR\_FAILBACK, or if there is a YES value in the alert column, then there might be a problem that requires further investigation.

## Example

### **Example 1: Failed member in the process of restarting**

In this example, member 0 is in the process of restarting on its home host, HOSTA.

ID	STATE	HOME_HOST	CUR_HOST	ALERT
0	<b>RESTARTING</b>	HOSTA	HOSTA	NO
1	STARTED	HOSTB	HOSTB	NO
2	STARTED	HOSTC	HOSTC	NO

3 record(s) selected.

To see if the restart is ultimately successful, run the query again in a few seconds.

### **Example 2: Failed member that is not able to restart**

In this example, member 0 is waiting to fail back to its home host. Currently, it is running in light mode on HOSTB.

ID	STATE	HOME_HOST	CUR_HOST	ALERT
0	<b>WAITING_FOR_FAILBACK</b>	HOSTA	HOSTB	NO
1	STARTED	HOSTB	HOSTB	NO
2	STARTED	HOSTC	HOSTC	NO

3 record(s) selected.

In this case, you might want to check the host status for HOSTA to see if there is an issue. Using the DB2\_CLUSTER\_HOST\_STATE administrative view might return the following results:

HOST	STATE	STOPPED	ALERT
HOSTD	ACTIVE	NO	NO
HOSTB	ACTIVE	NO	NO
HOSTA	INACTIVE	NO	<b>YES</b>
HOSTC	ACTIVE	NO	NO

4 record(s) selected.

This report shows that there is an alert on HOSTA, and that the host is inactive. However, the instance was not stopped using the **db2stop** command. Further investigation might reveal an incident such as a loss of power to this host. Once the problem with the host is resolved, check the restart status again to see if the member is able to restart.

## Viewing details for an alert

If one of the members or cluster caching facilities reports an alert, you can view more information about the alert using the DB2\_INSTANCE\_ALERTS administrative view. Alternatively, as an instance owner, you can use the **db2cluster** command with the **[-cm] -list -alert** parameters. Similarly, as a root, use the **db2cluster** command with the **[-cm] -list -alert <instance>** with *<instance>* as the instance of interest.

## About this task

This task assumes that you already determined an alert was raised on one of the hosts in your Db2 pureScale instance. For example, the **LIST INSTANCE** command might have shown an alert for one of your members:

ID	TYPE	STATE	HOME_HOST	CURRENT_HOST	ALERT
0	MEMBER	STARTED	hostA	hostA	<b>YES</b>
1	MEMBER	STARTED	hostB	hostB	NO
2	MEMBER	STARTED	hostC	hostC	NO
3	MEMBER	STARTED	hostD	hostD	NO
128	CF	PRIMARY	hostE	-	NO
129	CF	PEER	hostF	-	NO

HOSTNAME	STATE	INSTANCE_STOPPED	ALERT
hostA	ACTIVE	NO	NO
hostB	ACTIVE	NO	NO
hostC	ACTIVE	NO	NO
hostD	ACTIVE	NO	NO
hostE	ACTIVE	NO	NO
hostF	ACTIVE	NO	NO

In this case, member 0 is showing an alert.

## Procedure

To find more information about the alerts in your instance:

1. Formulate an SQL statement that uses the DB2\_INSTANCE\_ALERTS administrative view:

```
SELECT * FROM SYSIBMADM.DB2_INSTANCE_ALERTS
```

2. Run the SQL statement.

## Results

Depending on the nature of the problem on member 0, the information that the DB2\_INSTANCE\_ALERTS administrative view returns varies. You might, for example, receive a message like the one that follows:

#### MESSAGE

-----  
Could not restart light Db2 member '0' on hosts 'hostA'. Check the db2diag.log for messages concerning a restart light or database crash recovery failure on the indicated hosts for Db2 member '0'.  
-----

#### ALERT\_ACTION

-----  
This alert must be cleared manually with the command: 'db2cluster -clear -alert -member 0'  
-----

#### IMPACT

-----  
Db2 member '0' will not be able to restart light on host 'hostC' until this alert has been cleared.  
-----

## Example

### Example 1: Using the `db2cluster` command to view alert information

In this example, the `db2instance -list` command returns the following information:

```
$ db2instance -list
ID      TYPE      STATE      HOME_HOST      CURRENT_HOST      ALERT  PARTITION_NUMBER  LOGICAL_PORT  NETNAME
-----
0       MEMBER    ERROR      HostA           HostA             YES    0                  0              -
1       MEMBER    STARTED    HostB           HostB             NO     0                  1              -
2       MEMBER    STARTED    HostC           HostC             NO     0                  2              -
128    CF        PRIMARY    HostD           HostD             NO     -                  0              -
129    CF        PEER      HostE           HostE             NO     -                  0              -

HOSTNAME      STATE      INSTANCE_STOPPED  ALERT
-----
HostA         ACTIVE    NO                YES
HostB         ACTIVE    NO                NO
HostC         ACTIVE    NO                NO
HostD         ACTIVE    NO                NO
HostE         ACTIVE    NO                NO

There is currently an alert for a member, CF, or host in the data-sharing instance. For more information on the alert, its impact,
and how to clear it, run the following command: 'db2cluster [-cm] -list -alert'
```

From the information contained in [Table 2660 on page 1720](#), you can see that the output of `db2instance -list` is showing that member 0 was not able to start on any host. (If it had started on guest host, then the status would be `STARTED`, and the current host would show the name of the host it was running on.)

Using the `db2cluster -cm -list -alert` command shows the following message:

```
$ db2cluster -cm -list -alert

Alert: Db2 member '0' failed to start on its home host 'Host A'. The cluster manager will
attempt to restart the Db2 member
in restart light mode on another host. Check the db2diag.log for messages concerning
failures
on hosts 'HostA' for member '0'.

Action: This alert must be cleared manually with the command: 'db2cluster [-cm] -clear
-alert'.

Impact: Db2 member '0' will not be able to service requests until this alert has been
cleared
and the Db2 member returns to its home host.
```

## What to do next

Perform the investigation or action specified in the information returned by the `DB2_INSTANCE_ALERTS` administrative view or the `db2cluster` command.

## Event and real-time database and system monitoring in a Db2 pureScale environment

In addition to viewing the overall status of the components of a Db2 pureScale instance, you can examine specific aspects of the operation of cluster caching facilities and members using the database monitoring infrastructure. You can use monitoring table functions and administrative views to display this information. You can also use selected event monitors to capture events as they occur.

Db2 9.7 introduced a number of enhancements to the monitoring infrastructure for the Db2 product. One of these enhancements was a set of table functions that provide access to hundreds of *in-memory* monitor elements that you can use query the state of your database environment at a specific point in

time. Other enhancements included improved event monitors for capturing information about such things as locking, units of work, and activities as they occur.

The Db2 pureScale Feature extends the monitoring capabilities built into the Db2 database with monitor elements that you can use to view data that describes specific aspects of the operation of cluster caching facilities (also known as CFs) and members in a Db2 pureScale instance. However, there are some differences between monitoring in Db2 pureScale instances and other Db2 instances to be aware of, including:

- [“The ability to monitor CFs in addition to Db2 members” on page 1731](#)
- [“How monitor elements in a Db2 pureScale instance are reported” on page 1731](#)
- [The effects of component failure on monitor element reporting.](#)

## The ability to monitor CFs in addition to Db2 members

CFs, with the different role they play as compared to members in a Db2 pureScale environment introduce additional monitoring needs. For example, in Db2 instances other than Db2 pureScale instances, you might be interested in monitoring for buffer pool hit ratios, which represents the number of pages that are found in memory, as compared to the number of pages that must be read from disk. Higher buffer pool hit ratios are, generally speaking, a reflection of better performance. The higher performance is because there is less I/O involved in bringing needed pages into memory. In a Db2 pureScale environment, all physical page reads from disk are performed by the members, but only after they first check with the CF to see if the group buffer pool has a record of any other member with a valid page that they can use. Thus, whereas you might be accustomed to tuning only local buffer pools in a Db2 environment other than a Db2 pureScale environment, monitoring buffer pool hit ratios in the group buffer pool of the CF is also important in a Db2 pureScale environment. The more times pages can be found in either a local or group buffer pool (GBP), the fewer times they must be read in from disk.

In addition to the GBP, the global lock manager (GLM) is another component of the CF that you can monitor. The GLM manages locking of objects across all the members in a Db2 pureScale instance. The Db2 pureScale Feature adds monitor elements that you can use to monitor locking between members.

## How monitor elements in a Db2 pureScale instance are reported

In general, the mechanics of monitoring in a Db2 pureScale instance are similar to the mechanics of monitoring in other database instances. For example, the `MON_GET_TABLESPACE` table function, which returns information about table spaces in a database, works similarly in both Db2 pureScale instance and other database instances. In a Db2 pureScale instance, the scope of some monitor elements is limited to a specific member, while the scope of others is global, across all members. For example, the data from monitor elements such as **direct\_reads**, or **pool\_data\_l\_reads** are specific to read activity performed by a member. By comparison, monitor elements such as **tbsp\_total\_pages**, which represent physical attributes of a table space is the same across all members, because all members share the same table space. For example, consider the following query:

```
SELECT VARCHAR(TBSP_NAME, 30) AS TBSP_NAME,
       MEMBER, POOL_DATA_L_READS,
       TBSP_TOTAL_PAGES
FROM TABLE(MON_GET_TABLESPACE('USERSPACE1', -2))
```

The results of this query look like the following example:

TBSP_NAME	MEMBER	POOL_DATA_L_READS	TBSP_TOTAL_PAGES
USERSPACE1	1	0	4096
USERSPACE1	2	0	4096
USERSPACE1	3	0	4096
USERSPACE1	0	36	4096

4 record(s) selected.

In this example, the number of logical reads from the local buffer pool for each member is different because each member performs its reads independently of other members; however the total pages

for the table space is the same across all members, because all members are working from the same instance of USERSPACE1.

## Effects of component failure on monitor element reporting

If a host, member or CF in a Db2 pureScale environment fails, unless the entire Db2 pureScale instance is taken down, you can still retrieve monitor elements from the instance. However, the components that fail do not generate statistics. This fact is apparent if you are running a query such as the first example shown in [“How monitor elements in a Db2 pureScale instance are reported” on page 1731](#), where data from each member is shown individually. If you use a query that aggregates information across members, though, you might not notice that data from a member is missing.

If a member fails while monitor element data collection is taking place, the data collection process pauses until the communications problem with the failed member has been detected, or the TCP/IP timeout period has passed. In this situation, the data is still reported, however, there is no information from the failed member.

Finally, keep in mind that if a member fails, all the statistics accumulated in the monitor elements are reset to 0.

## Cluster caching facility memory and CPU usage monitoring overview

A basic indicator of the operational effectiveness of a cluster caching facility is the extent to which memory and the CPU are consistently used to their maximum configured capacity.

### Memory usage

Cluster caching facilities (also known as CFs) use different memory heaps for the following purposes:

#### Group buffer pool memory

Group buffer pool memory is used for the group buffer pool for the Db2 pureScale instance. If this type of memory is consistently used to the maximum configured capacity, it might have a negative effect on performance. However, the fact that memory might be used to capacity is not itself an indicator that performance might be affected. Check the hit rates for the group buffer pool to confirm that performance has degraded. Low hit rates coupled with high group buffer pool memory usage might be an indication that this type of memory needs to be increased. This type of memory is configured by the **cf\_gbp\_sz** configuration parameter.

#### Lock memory

Lock memory is used for managing page locks across the Db2 pureScale instance. If there is insufficient memory available for locks on the CF, one or both of the following conditions might arise:

- Lock escalation might take place, which reduces concurrency for the objects involved
- Requests for locks might be denied, resulting in the SQL0912 message being returned.

This type of memory is configured by the **cf\_lock\_sz** configuration parameter.

#### Shared Communication Area (SCA) memory

SCA memory contains database-wide information for tables, indexes, table spaces, and catalogs. Each database has its own SCA memory in the CF. It is allocated during the first database activation on any database member, and is not freed until the database is dropped, or the CF is stopped. If table partitioning is used then the information required to synchronize the table partitioning data between the CF and the members is also stored in SCA memory.

If this type of memory is used to capacity, tables may fail to load, and an error is returned. This type of memory is configured by the **cf\_sca\_sz** configuration parameter.

#### Overall CF memory

Overall CF memory is the total amount of physical memory available to the CF. It is set by the **cf\_mem\_size** configuration parameter. The memory for the group buffer pool, locks and shared communication area are all allocated out of this pool of memory. For this reason, the total amount

of the memory allocated for these specific types of memory must not exceed the amount of memory configured using the **cf\_mem\_size** configuration parameter.

By default, configuration of each of these types of memory is performed automatically. The Db2 pureScale Feature provides monitor elements that you can use to examine the amount of each of these types of memory that is currently in use by the system. There are also related elements that you can use to determine what the maximum size is for each type of memory, and whether a memory resize operation is in progress.

In addition to monitor elements that report on the usage of specific types of CF memory, you can use the ENV\_CF\_SYS\_RESOURCES administrative view to examine the total amount of physical and virtual storage available to the CF.

## CPU load

CPU load on the CF is an indication of how heavily taxed its processors are. If you find that the processors on the host where the CF is running are working at maximum capacity most of the time, it might be an indication that the host the CF is running on is not powerful enough. You might want to add processors, or upgrade to a more powerful system.

You can view the overall CPU load for the host serving as the CF in a Db2 pureScale instance using the ENV\_CF\_SYS\_RESOURCES administrative view.

**Note:** The value reported for CPU load reflects the total usage of the CPU for actual processing performed by the CF, and for host processes other than processes from the CF.

## Retrieving information from cluster caching facility memory usage monitor elements

You can use the MON\_GET\_CF table function to retrieve the various monitor elements that report on memory usage on the cluster caching facility in a Db2 pureScale instance.

### About this task

Understanding the extent to which memory in a cluster caching facility (also known as a CF) is used can help you to determine whether to adjust memory allocations. For example, if your cluster caching facility is using close to the maximum amount of allocated buffer pool memory, the hit rates for the group buffer pool might be lower than they could be. Or, if your lock memory is used to capacity, you might notice a higher-than-expected number of lock escalations. For more information on the MON\_GET\_CF table function, refer to [.././com.ibm.db2.luw.sql.rtn.doc/doc/r0056575.dita](http://www.ibm.com.ibm.db2.luw.sql.rtn.doc/doc/r0056575.dita).

### Procedure

To retrieve information about memory usage in a cluster caching facility:

1. Determine which monitor elements you want to retrieve.  
For example, if you want to view lock memory usage, you can choose from one or more of the following monitor elements:
  - [current\\_cf\\_lock\\_size](#)
  - [configured\\_cf\\_lock\\_size](#)
  - [target\\_cf\\_lock\\_size](#)
2. Formulate a query using the MON\_GET\_CF table function.  
Using the example from step “1” on page 1733, the statement would look like the following example:

```
SELECT SUBSTR(HOST_NAME,1,8) AS HOST,  
       ID as HOSTID,  
       CURRENT_CF_LOCK_SIZE,  
       CONFIGURED_CF_LOCK_SIZE,  
       TARGET_CF_LOCK_SIZE  
FROM TABLE( MON_GET_CF( NULL ) )
```

3. Run the query.

Continuing with this example, the output from the preceding query would resemble the following example:

```

HOST          HOSTID  CURRENT_CF_LOCK_SIZE  CONFIGURED_CF_LOCK_SIZE
-----
HOSTA         128          133852                564224
HOSTB         129          133852                564224

TARGET_CF_LOCK_SIZE
-----
                564224
                564224

2 record(s) selected.

```

**Note:** The lock memory on both cluster caching facilities is typically the same, as one of the cluster caching facilities is duplexing its information and configuration to the other. You can check to see which of the two cluster caching facilities is the primary one by using one of the interfaces described in [“Viewing status information for members and cluster caching facilities in a Db2 pureScale instance”](#) on page 1724. Examples of two such interfaces are the **LIST INSTANCE** and **db2cluster** commands.

## Results

The preceding example shows that the current amount of lock memory used is 170,258 4k blocks, or 697,376,768 bytes. The maximum amount of lock memory available is 564,224 4k blocks, or 2,311,061,504 bytes.

## Example

### **Example 1: Retrieving group buffer pool memory usage data.**

The following query displays information about the group buffer pool memory size for all cluster caching facilities on the system:

```

SELECT SUBSTR(HOST_NAME,1,20) AS HOST,
       ID as HOSTID,
       CURRENT_CF_GBP_SIZE,
       CONFIGURED_CF_GBP_SIZE,
       TARGET_CF_GBP_SIZE
FROM TABLE( MON_GET_CF(NULL) )

```

The following output is an example of what the preceding query returns:

```

HOST          HOSTID  CURRENT_CF_GBP_SIZE  CONFIGURED_CF_GBP_SIZE
TARGET_CF_GBP_SIZE
-----
HOSTA         128          367611
500224        500224
HOSTB         129          367611
500224        500224

2 record(s) selected.

```

In this example, the current GBP size is 367,611 4k pages, or 1,505,734,656 bytes. The memory allocated to the GBP is 500,224 4k pages, or 2,048,917,504 bytes.

### **Example 2: Retrieving shared communications area (SCA) memory usage data for a specific host.**

The following query displays information about the SCA memory size for the cluster caching facility with the ID of 128:

```

SELECT SUBSTR(HOST_NAME,1,8)AS HOST,
       ID as HOSTID,
       CURRENT_CF_SCA_SIZE,
       CONFIGURED_CF_SCA_SIZE,

```

```
TARGET_CF_SCA_SIZE
FROM TABLE(MON_GET_CF(128))
```

The following output is an example of what the preceding query returns:

HOST	HOSTID	CURRENT_CF_SCA_SIZE	CONFIGURED_CF_SCA_SIZE
HOSTA	128	43	16128
TARGET_CF_SCA_SIZE			
23280			

1 record(s) selected.

In this example, the SCA memory currently being used is 43 4k pages. At the point these monitor elements were retrieved, the maximum size of the SCA memory was 16,128 4k pages. However, the configured and the target sizes are the different, which means that the SCA memory is undergoing a size increase from the previous maximum configured size to 23,280 pages.

## What to do next

In all the preceding examples, keep in mind that the values returned for memory usage provide only an overall view of memory usage. By themselves, they do not necessarily convey sufficient information to inform a decision about changing memory configuration. For example, the size of the group buffer pool (GBP), by itself, does not tell you whether it is large enough for the Db2 pureScale instance. In this case, consider using the monitor elements that report on buffer pool activity to calculate buffer pool hit rates. The hit rates can tell you whether you must adjust the size of your buffer pool. When it comes to lock memory, examining the number of lock escalations that take place gives you insight into whether enough lock memory has been allocated. A high rate of lock escalations can be an indicator that lock memory might need to be increased.

## Viewing cluster caching facility processor load

You can view the overall CPU load on the primary cluster caching facilities in a Db2 pureScale instance using the ENV\_CF\_SYS\_RESOURCES administrative view.

### Before you begin

You must be connected to a database running in a Db2 pureScale instance.

### About this task

The ENV\_CF\_SYS\_RESOURCES administrative view returns information for all cluster caching facilities (also known as CFs) in a Db2 pureScale instance. In instances where you have more than one CF configured, one to act as the primary and the others to serve as backup CFs running in PEER mode, the ENV\_CF\_SYS\_RESOURCES administrative view returns information for all CFs.

**Note:** The value reported for CPU load reflects the total usage of the CPU for actual processing performed by the CF, and for host processes other than processes from the CF.

### Procedure

To determine the CPU load on the CFs in a Db2 pureScale instance:

1. Formulate an SQL statement that uses the ENV\_CF\_SYS\_RESOURCES administrative view.  
For example:

```
SELECT  VARCHAR(NAME,20) AS HOST_ATTRIBUTE,
        VARCHAR(VALUE,25) AS VALUE,
        VARCHAR(UNIT,8) AS UNIT
FROM    SYSIBMADM.ENV_CF_SYS_RESOURCES
```

2. Run the statement.

The preceding query would return the following output:

HOST_ATTRIBUTE	VALUE	UNIT
HOST_NAME	HOSTA	-
MEMORY_TOTAL	24108	MB
MEMORY_FREE	3504	MB
MEMORY_SWAP_TOTAL	4102	MB
MEMORY_SWAP_FREE	4063	MB
VIRTUAL_MEM_TOTAL	28211	MB
VIRTUAL_MEM_FREE	7568	MB
CPU_USAGE_TOTAL	96	PERCENT
HOST_NAME	HOSTB	-
MEMORY_TOTAL	24108	MB
MEMORY_FREE	3342	MB
MEMORY_SWAP_TOTAL	4102	MB
MEMORY_SWAP_FREE	4063	MB
VIRTUAL_MEM_TOTAL	28211	MB
VIRTUAL_MEM_FREE	7406	MB
CPU_USAGE_TOTAL	97	PERCENT

16 record(s) selected.

In this output, there are results for both HOSTA and HOSTB, which indicates there are two hosts that are configured to serve as CFs.

- To determine which of the hosts is acting as the primary CF, you can use the DB2\_CF administrative view:

```
SELECT VARCHAR(CURRENT_HOST,12) AS HOST,
       ID,
       STATE
FROM SYSIBMADM.DB2_CF
```

The preceding query returns the following output:

HOST	ID	STATE
HOSTA	128	PRIMARY
HOSTB	129	PEER

2 record(s) selected.

In this case, the primary host is HOSTA, and based on the output from the command used in step [“2”](#) on [page 1735](#), you can surmise that the CPU load on the primary CF is 96%.

## What to do next

If you find your CPU usage is running at maximum capacity, adding processors to, or upgrading your cluster caching facilities might improve system throughput.

**Note:** For hosts with more than one logical processor, usage numbers can exceed 100%. For example, an eight processor host might have processor usage approach 800%.

## Monitor elements for viewing cluster caching facility memory usage

The IBM Db2 pureScale Feature provides a number of monitor elements that report on cluster caching facility memory usage.

### Monitor elements

The following monitor elements provide information about how various CF memory heaps are allocated and used:

- [“configured\\_cf\\_gbp\\_size - Configured cluster caching facility group buffer pool size monitor element” on page 743](#)
- [“current\\_cf\\_gbp\\_size - Current cluster caching facility group buffer pool size monitor element” on page 781](#)
- [“target\\_cf\\_gbp\\_size - Target cluster caching facility group buffer pool size monitor element” on page 1525](#)

- [“configured\\_cf\\_lock\\_size - Configured cluster caching facility lock size monitor element” on page 743](#)
- [“current\\_cf\\_lock\\_size - Current cluster caching facility lock size monitor element” on page 781](#)
- [“target\\_cf\\_lock\\_size - Target cluster caching facility lock size monitor element” on page 1525](#)
- [“configured\\_cf\\_mem\\_size - Configured cluster caching facility memory size monitor element” on page 744](#)
- [“current\\_cf\\_mem\\_size - Current cluster caching facility memory size monitor element” on page 781](#)
- [“configured\\_cf\\_sca\\_size - Configured cluster caching facility shared communications area size monitor element” on page 743](#)
- [“current\\_cf\\_sca\\_size - Current cluster caching facility shared communications area size monitor element” on page 781](#)
- [“target\\_cf\\_sca\\_size - Target cluster caching facility shared communications area size monitor element” on page 1526](#)

**Tip:** In all cases, the values reported for each of these monitor elements is expressed in terms of 4k pages. So, for example, if you queried the **current\_gbp\_size** monitor element, and it returned a value of 350, then the actual amount of memory currently used for the GBP would be  $350 \times 4096$  bytes = 1,433,600 bytes.

For most of these types of memory, there are three monitor elements that you can query that represent different aspects of how the memory is configured.

#### **Current**

The current memory size (for example, `current_cf_gbp_size`, or `current_cf_mem_size`) represents the amount of that type of memory currently in use by the system.

#### **Configured**

The configured memory size (for example, `configured_cf_sca_size`, `configured_cf_mem_size`) represents the total amount of that type of memory that is currently configured by the database as the maximum. The value for current memory can never exceed that of configured memory.

#### **Target**

The target memory size (for example, `target_cf_sca_size`) represents a new configured maximum value for that type of memory. Usually, the target size is the same as the configured size. However, if the target and configured sizes differ, that means that that particular type of memory is undergoing an online change in its configured size. The process of allocating memory takes place over time. At any point during this resizing process, the configured memory represents the maximum amount of that type of memory that can be used at that specific point in time. Eventually, the configured memory becomes the same as target memory.

Refer to the reference topics for each monitor element to see what monitoring interfaces you can use to examine the data associated with that monitor element.

## **Buffer pool monitoring in a Db2 pureScale environment**

Examining the number of times that pages of data requested by a member can be found in group or local buffer pools, as opposed to the number of times they need to be read in from disk can tell you where you might have performance problems related to I/O. Generally speaking, larger buffer pools increase the likelihood that a required page of data can be found in memory.

Viewing and comparing monitor elements related to buffer pool activity can help you understand the extent to which the group buffer pool (GBP) in the cluster caching facility, and the local buffer pools (LBPs) for each member are reducing the amount of disk I/O in your system.

## **Buffer pool hit rates and hit ratios in a Db2 pureScale environment**

One way of measuring the extent to which pages required by members are found in memory as opposed to on disk is by calculating the buffer pool *hit ratio*. The buffer pool hit ratio indicates the number of times that the database manager found a requested page in a buffer pool (also known as the *hit rate*) as compared to the number of times it had to read it from disk. In a Db2 pureScale environment, both the

local buffer pool and group buffer pool hit rates and hit ratios are important factors in assessing overall performance.

Local buffer pool (LBP) hit ratios reflect the extent to which pages that a member needs can be found in a valid state in the local buffer pool. A page in the LBP of a member is deemed to be in a valid state if that page has not been changed by another member since it was loaded into the LBP. If another member has changed the page, which might happen before the page has been cast out to disk, then the page is said to be *invalid*. If the member with the invalid page requires that page to perform a transaction, the member has to go to the CF to request a new, valid version of the page.

A low LBP hit ratio is an indication that the pages were not found locally, and had to be requested from the CF.

However, in a Db2 pureScale environment, looking at the LBP hit ratios provides only one side of the buffer pool story. You also need to consider the role that the group buffer pool (GBP) plays in retrieving pages, and the hit ratio for the GBP itself. If a member is unable to locate a valid copy of a page in its LBP, it makes a request to the CF to search the GBP for a valid copy of the page. The GBP does one of the following actions:

- If it has a valid copy of the page, the GBP provides it to the member making the request.
- Otherwise, the GBP tells the requesting member that it must read the page from disk.

An additional consideration for LBP usage is the concept of GBP-independent page. A GBP-independent page is a page that is only ever accessed through a LBP of a member, and never exists in the GBP. Pages might be GBP-independent because the operations using the page, or the objects where the pages come from, are only accessed by the local member.

Group buffer pool hit ratios reflect the extent to which pages required by members, for which they do not have a valid local copy, are found in the group buffer pool, as compared to having to be read in from disk. A low hit ratio for the GBP is an indication that relatively few of the pages required by members across the instance are available in the GBP. Increasing the size of the GBP can improve hit rates, and overall performance. Therefore, when calculating the hit ratios for data pages in the local buffer pool (LBP) for a member, you need to consider the number of times the member attempted to read pages from the LBP in comparison to the number of times attempted reads did not find a valid page in the LBP. See [“Formulas for calculating buffer pool hit ratios” on page 1739](#) for details on how LBP and GBP monitor elements are used to calculate the GBP hit rate.

**Tip:** Hit ratios can vary based on many factors, such as the nature of the data in your database, the queries that are run against it, as well as hardware and software configurations. Generally speaking, higher buffer pool hit ratios are reflective of better query performance. If you find hit ratios that seem low, or are declining over time, increasing the size of the buffer pools can help. To increase the size of the group buffer pool, adjust the **cf\_gbp\_sz** configuration parameter on the CF. To adjust local buffer pools, run the **ALTER BUFFERPOOL** statement on the member with the buffer pools that need correction.

## Buffer pool monitor element reporting

In Db2 pureScale environments, each member reports on its own local buffer pools. No aggregation of data across members takes place. You must take into account which member or members you are interested in, and interpret the data accordingly. In some cases, you might want to calculate the hit ratios for a specific member. In others cases, you might want to look at the data for all members together, to form an overall view of the hit rates and hit ratios for the Db2 pureScale environment as a whole.

For example, if you submit a query to return data for the number of times a data page was read into a local buffer pool from disk, and you do not specify which member to return, then because it was not found in the GBP (using the **pool\_data\_gbp\_p\_reads** monitor element) with the **MON\_GET\_BUFFERPOOL** table function, you will see results like the ones that follow:

```

MEMBER BP_NAME          POOL_DATA_GBP_P_READS
-----
0 IBMDEFAULTBP          408
0 IBMSYSTEMBP4K         0
0 IBMSYSTEMBP8K         0
0 IBMSYSTEMBP16K        0
0 IBMSYSTEMBP32K        0
1 IBMDEFAULTBP          108
1 IBMSYSTEMBP4K         0
1 IBMSYSTEMBP8K         0
1 IBMSYSTEMBP16K        0
1 IBMSYSTEMBP32K        0
2 IBMDEFAULTBP          112
2 IBMSYSTEMBP4K         0
2 IBMSYSTEMBP8K         0
2 IBMSYSTEMBP16K        0
2 IBMSYSTEMBP32K        0

```

15 record(s) selected.

**Important:** In the preceding example, you can see that the data reported for temporary buffer pools shows all zeros. This is not a coincidence; in Db2 pureScale instances, temporary objects and table spaces are local to the member they are associated with. They do not use the GBP on the CF.

If you are interested in the results across all members, you can use the SUM aggregate function to add the numbers for all members together:

```

SELECT  VARCHAR(BP_NAME,15) AS BP_NAME,
        SUM(POOL_DATA_GBP_P_READS) AS TOTAL_P_READS
FROM TABLE(MON_GET_BUFFERPOOL(' ', -2))
GROUP BY BP_NAME

```

The preceding query returns results like the following output:

```

BP_NAME          TOTAL_P_READS
-----
IBMDEFAULTBP          310
IBMSYSTEMBP16K        0
IBMSYSTEMBP32K        0
IBMSYSTEMBP4K         0
IBMSYSTEMBP8K         0

```

5 record(s) selected.

### Formulas for calculating buffer pool hit ratios

Buffer pool hit ratios reflect the extent to which data needed for queries is found in memory, as opposed to having to be read in from external storage. You can calculate hit rates and ratios with formulas that are based on buffer pool monitor elements.

### Local buffer pools

Table 2662. Formulas for local buffer pool hit ratios. The formulas shown express the hit ratios as a percentage.	
Type of page	Formula for calculating buffer pool hit ratio
Data pages	$((\text{pool\_data\_lbp\_pages\_found} - \text{pool\_async\_data\_lbp\_pages\_found}) / (\text{pool\_data\_l\_reads} + \text{pool\_temp\_data\_l\_reads})) \times 100$
Index pages	$((\text{pool\_index\_lbp\_pages\_found} - \text{pool\_async\_index\_lbp\_pages\_found}) / (\text{pool\_index\_l\_reads} + \text{pool\_temp\_index\_l\_reads})) \times 100$
Column-organized pages	$((\text{pool\_col\_lbp\_pages\_found} - \text{pool\_async\_col\_lbp\_pages\_found}) / (\text{pool\_col\_l\_reads} + \text{pool\_temp\_col\_l\_reads})) \times 100$
XML storage object (XDA) pages	$((\text{pool\_xda\_lbp\_pages\_found} - \text{pool\_async\_xda\_lbp\_pages\_found}) / (\text{pool\_xda\_l\_reads} + \text{pool\_temp\_xda\_l\_reads})) \times 100$
Overall hit ratio	$((\text{pool\_data\_lbp\_pages\_found} + \text{pool\_index\_lbp\_pages\_found} + \text{pool\_xda\_lbp\_pages\_found} + \text{pool\_col\_lbp\_pages\_found} - \text{pool\_async\_data\_lbp\_pages\_found} - \text{pool\_async\_index\_lbp\_pages\_found} - \text{pool\_async\_xda\_lbp\_pages\_found} - \text{pool\_async\_col\_lbp\_pages\_found}) / (\text{pool\_data\_l\_reads} + \text{pool\_index\_l\_reads} + \text{pool\_xda\_l\_reads} + \text{pool\_col\_l\_reads} + \text{pool\_temp\_data\_l\_reads} + \text{pool\_temp\_xda\_l\_reads} + \text{pool\_temp\_index\_l\_reads} + \text{pool\_temp\_col\_l\_reads})) \times 100$

## Group buffer pools (Db2 pureScale environments)

The formulas used to calculate group buffer pool hit ratios in a Db2 pureScale environment are different from formulas for hit ratios used in other database environments. This difference is because of how the group buffer pool in the cluster caching facility works with the local buffer pools in each member to retrieve pages of data. The following formulas, which are based on buffer pool monitor elements, can be used to calculate hit ratios for data, index, and XML storage object pages, for both the local and group buffer pools.

Type of page	Formula for calculating buffer pool hit ratio
Data pages	$((\text{pool\_data\_gbp\_l\_reads} - \text{pool\_data\_gbp\_p\_reads}) / \text{pool\_data\_gbp\_l\_reads}) \times 100$
Index pages	$((\text{pool\_index\_gbp\_l\_reads} - \text{pool\_index\_gbp\_p\_reads}) / \text{pool\_index\_gbp\_l\_reads}) \times 100$
XML storage object (XDA) pages	$((\text{pool\_xda\_gbp\_l\_reads} - \text{pool\_xda\_gbp\_p\_reads}) / \text{pool\_xda\_gbp\_l\_reads}) \times 100$
Column-organized pages	$((\text{pool\_col\_gbp\_l\_reads} - \text{pool\_col\_gbp\_p\_reads}) / \text{pool\_col\_gbp\_l\_reads}) \times 100$
Overall hit ratio	$((\text{pool\_data\_gbp\_l\_reads} + \text{pool\_index\_gbp\_l\_reads} + \text{pool\_col\_gbp\_l\_reads} + \text{pool\_xda\_gbp\_l\_reads} - \text{pool\_data\_gbp\_p\_reads} - \text{pool\_index\_gbp\_p\_reads} - \text{pool\_col\_gbp\_p\_reads} - \text{pool\_xda\_gbp\_p\_reads}) / (\text{pool\_data\_gbp\_l\_reads} + \text{pool\_index\_gbp\_l\_reads} + \text{pool\_col\_gbp\_l\_reads} + \text{pool\_xda\_gbp\_l\_reads})) \times 100$

In addition to the preceding formulas for calculating buffer pool hit ratios, you can also use the following formulas to show what percentage of the time pages that are prefetched are found in the GBP:

### Prefetches for data pages

$$((\text{pool\_async\_data\_gbp\_l\_reads} - \text{pool\_async\_data\_gbp\_p\_reads}) / \text{pool\_async\_data\_gbp\_l\_reads}) \times 100$$

### Prefetches for index pages

$$((\text{pool\_async\_index\_gbp\_l\_reads} - \text{pool\_async\_index\_gbp\_p\_reads}) / \text{pool\_async\_index\_gbp\_l\_reads}) \times 100$$

### Prefetches for column-organized pages

$$((\text{pool\_async\_col\_gbp\_l\_reads} - \text{pool\_async\_col\_gbp\_p\_reads}) / \text{pool\_async\_col\_gbp\_l\_reads}) \times 100$$

### Prefetches for XML storage object (XDA) pages

$$((\text{pool\_async\_xda\_gbp\_l\_reads} - \text{pool\_async\_xda\_gbp\_p\_reads}) / \text{pool\_async\_xda\_gbp\_l\_reads}) \times 100$$

## Calculating buffer pool hit ratios in a Db2 pureScale environment

Calculating buffer pool hit ratios for a Db2 pureScale instance can help you understand where there are opportunities to tune buffer pools to improve I/O efficiency.

## Before you begin

Determine which ratio or ratios you are interested in. If you want to see a ratio across all members in an instance, consider formulating your SQL to aggregate data across members using the SUM aggregate function. If you are interested in seeing the data for a specific member only, you can use specify the member for which you want to see data in the MON\_GET\_BUFFERPOOL table function.

## Procedure

To calculate buffer pool hit ratios, follow these steps:

1. Retrieve the information for the required monitor elements.

This example uses the MON\_GET\_BUFFERPOOL table function to retrieve the monitor elements that contain the values needed to calculate the hit ratio for data pages for the GBP, **pool\_data\_gbp\_l\_reads** and **pool\_data\_gbp\_p\_reads**.

```
SELECT varchar(bp_name,20) AS bp_name,  
       pool_data_gbp_l_reads,
```

```

pool_data_gbp_p_reads,
member
FROM TABLE(MON_GET_BUFFERPOOL(' ', -2))

```

The preceding query returns data like the following example:

BP_NAME	POOL_DATA_GBP_L_READS	POOL_DATA_GBP_P_READS	MEMBER
IBMDEFAULTBP	1814911	456990	1
IBMSYSTEMBP4K	0	0	1
IBMSYSTEMBP8K	0	0	1
IBMSYSTEMBP16K	0	0	1
IBMSYSTEMBP32K	0	0	1
IBMDEFAULTBP	1807959	455287	3
IBMSYSTEMBP4K	0	0	3
IBMSYSTEMBP8K	0	0	3
IBMSYSTEMBP16K	0	0	3
IBMSYSTEMBP32K	0	0	3
IBMDEFAULTBP	1813932	455225	2
IBMSYSTEMBP4K	0	0	2
IBMSYSTEMBP8K	0	0	2
IBMSYSTEMBP16K	0	0	2
IBMSYSTEMBP32K	0	0	2
IBMDEFAULTBP	1113396	278845	0
IBMSYSTEMBP4K	0	0	0
IBMSYSTEMBP8K	0	0	0
IBMSYSTEMBP16K	0	0	0
IBMSYSTEMBP32K	0	0	0

20 record(s) selected.

**Important:** In the preceding example, you can see that the data reported for temporary buffer pools shows all zeros. This is not a coincidence; in Db2 pureScale instances, temporary objects and table spaces are local to the member they are associated with. They do not use the GBP on the CF.

- Use the values returned for the monitor elements to calculate the hit ratio. The formula for calculating the hit ratio for the GBP (expressed as a percentage) is

$$((pool\_data\_gbp\_l\_reads - pool\_data\_gbp\_p\_reads) \div pool\_data\_gbp\_l\_reads) \times 100$$

So, using the data returned for the monitor elements in step “1” on page 1740:

$$\begin{aligned}
&(((1,814,911 + 1,807,959 + 1,813,932 + 1,113,396) - (456,990 + 455,287 + 455,225 + 278,845)) \\
&\div (1,814,911 + 1,807,959 + 1,813,932 + 1,113,396)) \times 100 \\
&= ((6,550,198 - 1,646,347) \div 6,550,198) \times 100 \\
&= 74.9\%
\end{aligned}$$

In this example, the hit ratio for the GBP is 74.9%

**Note:** The values shown in the output for queries are for illustrative purposes only.

## Example

### Example 1: Find the overall hit rates across all members

This example is similar to the one shown in the preceding procedure, except that it uses an aggregate function to provide overall hit rates across all members.

```

SELECT VARCHAR(BP_NAME, 20) AS BP,
       SUM(POOL_DATA_GBP_L_READS) AS POOL_DATA_GBP_L_READS,
       SUM(POOL_DATA_GBP_P_READS) AS POOL_DATA_GBP_P_READS
FROM TABLE(MON_GET_BUFFERPOOL(' ', -2))
GROUP BY BP_NAME

```

Results:

BP	POOL_DATA_GBP_L_READS	POOL_DATA_GBP_P_READS
IBMDEFAULTBP	6550198	1646347
IBMSYSTEMBP16K	0	0
IBMSYSTEMBP32K	0	0
IBMSYSTEMBP4K	0	0

IBMSYSTEMBP8K

0

0

5 record(s) selected.

### Example 2: Determining the GBP hit ratio for all data, index, and XML storage object (XDA) pages

To calculate the GBP hit ratio for all data, index, and XDA pages, use the following formula:

$$\frac{((pool\_data\_gbp\_l\_reads + pool\_index\_gbp\_l\_reads + pool\_xda\_gbp\_l\_reads) - (pool\_data\_gbp\_p\_reads + pool\_index\_gbp\_p\_reads + pool\_xda\_gbp\_p\_reads))}{(pool\_data\_gbp\_l\_reads + pool\_index\_gbp\_l\_reads + pool\_xda\_gbp\_l\_reads)} \times 100$$

The following example uses the **MON\_GET\_BUFFERPOOL** table function to retrieve the data contained in the required monitor elements and calculates the hit ratio for each member:

```
WITH BPMETRICS AS (
  SELECT BP_NAME,
         POOL_DATA_GBP_L_READS +
         POOL_INDEX_GBP_L_READS +
         POOL_XDA_GBP_L_READS
         AS LOGICAL_READS,
         POOL_DATA_GBP_P_READS +
         POOL_INDEX_GBP_P_READS +
         POOL_XDA_GBP_P_READS
         AS PHYSICAL_READS,
         MEMBER
  FROM TABLE(MON_GET_BUFFERPOOL('',-2)) AS METRICS)
SELECT VARCHAR(BP_NAME,20) AS BP_NAME,
       LOGICAL_READS,
       PHYSICAL_READS,
       CASE WHEN LOGICAL_READS > 0
            THEN DEC(((
              FLOAT(LOGICAL_READS) - FLOAT(PHYSICAL_READS)) /
              FLOAT(LOGICAL_READS))
              * 100,5,2)
            ELSE NULL END AS HIT_RATIO,
       MEMBER
FROM BPMETRICS
```

Results:

BP_NAME	LOGICAL_READS	PHYSICAL_READS	HIT_RATIO	MEMBER
IBMDEFAULTBP	5730213	617628	89.22	1
IBMSYSTEMBP4K	0	0	-	1
IBMSYSTEMBP8K	0	0	-	1
IBMSYSTEMBP16K	0	0	-	1
IBMSYSTEMBP32K	0	0	-	1
IBMDEFAULTBP	5724845	615395	89.25	3
IBMSYSTEMBP4K	0	0	-	3
IBMSYSTEMBP8K	0	0	-	3
IBMSYSTEMBP16K	0	0	-	3
IBMSYSTEMBP32K	0	0	-	3
IBMDEFAULTBP	5731714	615814	89.25	2
IBMSYSTEMBP4K	0	0	-	2
IBMSYSTEMBP8K	0	0	-	2
IBMSYSTEMBP16K	0	0	-	2
IBMSYSTEMBP32K	0	0	-	2
IBMDEFAULTBP	5024809	409159	91.85	0
IBMSYSTEMBP4K	0	0	-	0
IBMSYSTEMBP8K	0	0	-	0
IBMSYSTEMBP16K	0	0	-	0
IBMSYSTEMBP32K	0	0	-	0

20 record(s) selected.

### Example 3: Using the SUM aggregate function to compute an overall hit ratio

You can also use the SUM aggregate function to compute an overall hit ratio across all members as follows:

```
WITH BPMETRICS AS (
  SELECT SUM(POOL_DATA_GBP_L_READS) +
         SUM(POOL_INDEX_GBP_L_READS) +
         SUM(POOL_XDA_GBP_L_READS)
```

```

AS LOGICAL_READS,
SUM(PPOOL_DATA_GBP_P_READS) +
SUM(PPOOL_INDEX_GBP_P_READS) +
SUM(PPOOL_XDA_GBP_P_READS)
AS PHYSICAL_READS
FROM TABLE(MON_GET_BUFFERPOOL(' ', -2)) AS METRICS)
SELECT LOGICAL_READS,
        PHYSICAL_READS,
CASE WHEN LOGICAL_READS > 0
THEN DEC(((FLOAT(LOGICAL_READS) - FLOAT(PHYSICAL_READS)) /
        FLOAT(LOGICAL_READS))
        * 100,5,2)
ELSE NULL END AS HIT_RATIO
FROM BPMETRICS

```

Results:

LOGICAL_READS	PHYSICAL_READS	HIT_RATIO
22211581	2255996	89.84

1 record(s) selected.

## What to do next

If hit ratios seem low, or if they decline over time, you might want to increase the size of the buffer pools on either members, CFs, or both. If you are seeing lower than expected hit rates for the LBPs overall across the Db2 pureScale instance, look at the hit rates for each member individually, since the buffer pools on each member can have different sizes. A smaller sized LBP on one member might be unduly influencing the average hit rate for the instance.

**Tip:** Hit ratios can vary based on many factors, such as the nature of the data in your database, the queries that are run against it, as well as hardware and software configurations. Generally speaking, higher buffer pool hit ratios are reflective of better query performance. If you find hit ratios that seem low, or are declining over time, increasing the size of the buffer pools can help. To increase the size of the group buffer pool, adjust the **cf\_gbp\_sz** configuration parameter on the CF. To adjust local buffer pools, run the **ALTER BUFFERPOOL** statement on the member with the buffer pools that need correction.

## Monitor elements for viewing Db2 pureScale buffer pool activity

The IBM Db2 pureScale Feature uses a number of monitor elements to report on buffer pool activity across a Db2 pureScale instance.

### Monitor elements for the group buffer pool

The following monitor elements provide information about the group buffer (GBP) pool in the primary CF:

- [“pool\\_data\\_gbp\\_l\\_reads - Group buffer pool data logical reads monitor element” on page 1188](#)
- [“pool\\_data\\_gbp\\_p\\_reads - Group buffer pool data physical reads monitor element” on page 1190](#)
- [“pool\\_data\\_gbp\\_invalid\\_pages - Group buffer pool invalid data pages monitor element” on page 1186](#)
- [“pool\\_index\\_gbp\\_l\\_reads - Group buffer pool index logical reads monitor element” on page 1229](#)
- [“pool\\_index\\_gbp\\_p\\_reads - Group buffer pool index physical reads monitor elements” on page 1231](#)
- [“pool\\_index\\_gbp\\_invalid\\_pages - Group buffer pool invalid index pages monitor element” on page 1227](#)
- [“pool\\_xda\\_gbp\\_l\\_reads - Group buffer pool XDA data logical read requests monitor element” on page 1308](#)
- [“pool\\_xda\\_gbp\\_p\\_reads - Group buffer pool XDA data physical read requests monitor element” on page 1310](#)
- [“pool\\_xda\\_gbp\\_invalid\\_pages - Group buffer pool invalid XDA data pages monitor element” on page 1306](#)

- [“pool\\_async\\_data\\_gbp\\_indep\\_pages\\_found\\_in\\_lbp - Group buffer pool independent data pages found by asynchronous EDUs in a local buffer pool monitor element monitor element” on page 1151](#)
- [“pool\\_async\\_data\\_gbp\\_l\\_reads - Asynchronous group buffer pool data logical reads monitor element” on page 1152](#)
- [“pool\\_async\\_data\\_gbp\\_p\\_reads - Asynchronous group buffer pool data physical reads monitor element” on page 1153](#)
- [“pool\\_async\\_data\\_gbp\\_invalid\\_pages - Asynchronous group buffer pool invalid data pages monitor element” on page 1151](#)
- [“pool\\_async\\_index\\_gbp\\_indep\\_pages\\_found\\_in\\_lbp - Group buffer pool independent index pages found by asynchronous EDUs in a local buffer pool monitor element monitor element” on page 1157](#)
- [“pool\\_async\\_index\\_gbp\\_l\\_reads - Asynchronous group buffer pool index logical reads monitor element” on page 1158](#)
- [“pool\\_async\\_index\\_gbp\\_p\\_reads - Asynchronous group buffer pool index physical reads monitor element” on page 1158](#)
- [“pool\\_async\\_index\\_gbp\\_invalid\\_pages - Asynchronous group buffer pool invalid index pages monitor element” on page 1157](#)
- [“pool\\_async\\_xda\\_gbp\\_indep\\_pages\\_found\\_in\\_lbp - Group buffer pool independent XML storage object\(XDA\) pages found by asynchronous EDUs in a local buffer pool monitor element monitor element” on page 1164](#)
- [“pool\\_async\\_xda\\_gbp\\_l\\_reads - Group buffer pool XDA data asynchronous logical read requests monitor element” on page 1165](#)
- [“pool\\_async\\_xda\\_gbp\\_p\\_reads - Group buffer pool XDA data asynchronous physical read requests monitor element” on page 1165](#)
- [“pool\\_async\\_xda\\_gbp\\_invalid\\_pages - Asynchronous group buffer pool invalid XDA data pages monitor element” on page 1164](#)

**Note:** These monitor elements report data for the buffer pools for each member individually; no aggregation is performed. If you want to aggregate buffer pool usage information for local buffer pools, such as to calculate the average hit rates across all local buffer pools, use the SUM aggregate function.

Refer to the reference topics for each monitor element to see what monitoring interfaces you can use to examine the data associated with that monitor element.

## Monitor elements for local buffer pools

The following monitor elements provide information about the buffer pools local to each member in the Db2 pureScale instance:

- [“pool\\_data\\_gbp\\_indep\\_pages\\_found\\_in\\_lbp - Group buffer pool independent data pages found in local buffer pool monitor element” on page 1185](#)
- [“pool\\_data\\_lbp\\_pages\\_found - Local buffer pool found data pages monitor element” on page 1192](#)
- [“pool\\_index\\_gbp\\_indep\\_pages\\_found\\_in\\_lbp - Group buffer pool independent index pages found in local buffer pool monitor element” on page 1226](#)
- [“pool\\_index\\_lbp\\_pages\\_found - Local buffer pool index pages found monitor element” on page 1233](#)
- [“pool\\_xda\\_gbp\\_indep\\_pages\\_found\\_in\\_lbp - Group buffer pool XDA independent pages found in local buffer pool monitor element” on page 1304](#)
- [“pool\\_xda\\_lbp\\_pages\\_found - Local buffer pool XDA data pages found monitor element” on page 1314](#)
- [“pool\\_async\\_data\\_lbp\\_pages\\_found - Asynchronous local buffer pool data pages found monitor element” on page 1153](#)
- [“pool\\_async\\_index\\_lbp\\_pages\\_found - Asynchronous local buffer pool index pages found monitor element” on page 1159](#)
- [“pool\\_async\\_xda\\_lbp\\_pages\\_found - Asynchronous local buffer pool XDA data pages found monitor element” on page 1166](#)

The values reported for these next three monitor elements represent all reads from disk into the local buffer pool for a given member:

- [“pool\\_data\\_p\\_reads - Buffer pool data physical reads monitor element” on page 1197](#)
- [“pool\\_index\\_p\\_reads - Buffer pool index physical reads monitor element” on page 1238](#)
- [“pool\\_xda\\_p\\_reads - Buffer pool XDA data physical reads monitor element” on page 1316](#)

These last three monitor elements are the same as the ones used in environments *other than* Db2 pureScale environments. The elements are the same, because local buffer pools for a member in a Db2 pureScale environment equivalent to the buffer pools for a database in environments other than Db2 pureScale environments.

**Important:**

- The values reported by these last three monitor elements reflect reads the local buffer pools make from disk of GBP-dependent pages (that is, pages that a member requests from the GBP) that were not found in the GBP. They also include reads from disk of GBP-independent pages (that is, pages that are local to members, and for which members have no dependency on the GBP), such as temporary pages.
- Because of the relationship between LBPs and GBPs in a Db2 pureScale environment, the formulas for calculating buffer pool hit ratios are different than those used outside of a Db2 pureScale environment. See [“Formulas for calculating buffer pool hit ratios” on page 1739](#) for more information.

Refer to the reference topics for each monitor element to see what monitoring interfaces you can use to examine the data associated with that monitor element.

## Lock monitoring in a Db2 pureScale environment overview

Lock management is essential for maintaining both data integrity and high levels of concurrency. Locking across members in a Db2 pureScale environment is managed by the global lock manager (GLM) component of the cluster caching facility. Monitoring locking in a Db2 pureScale environment involves reviewing not only locks that might be held within a member, but also lock waits between members.

In a Db2 pureScale environment, the fact that different members work with the same data introduces the possibility of another type of contention for data: when two members want to update the same object. When a member needs a lock for an object, the local lock manager (LLM) component within the member works with the global lock manager (GLM): if the LLM does not already hold a lock for the object in question, the LLM requests a lock from the GLM. In this way, the GLM mediates requests for locks from different members.

When viewed at the global level for the Db2 pureScale instance, monitor elements such as **locks\_held**, or **lock\_wait\_time** report data on *all* locks in the instance, both within and between members. Monitor elements added specifically for the Db2 pureScale Feature can be used to examine just the lock waits between members.

### Lock requests between members

In a Db2 pureScale environment, an application on one member might request a lock for an object currently locked by another member. The Db2 pureScale Feature introduces monitor elements that specifically report information about locks across members.

Processing *within* members in a Db2 pureScale environment can result in locking of objects as one application attempts to perform an operation that is not compatible with an operation being performed by another application. This can occur, for example, if two applications attempt to update the same row of data at the same time. You can monitor the extent to which this type of locking within a member takes place using the locking event monitor to view lock-related information. In a Db2 pureScale environment, lock waits might also occur *between* members, as one member requests a lock for an object currently locked by an application on a different member. So, in a Db2 pureScale environment, in addition to examining locking on individual members, you might also want to look at cross-member lock information.

## Lock waits between members

The following monitor elements report *only* the portion of time that an application has been awaiting a lock held by another member:

- lock\_wait\_time\_global
- lock\_wait\_time\_global\_top
- lock\_waits\_global
- lock\_timeouts\_global

The time reported by these monitor elements is included as part of the overall **lock\_wait\_time** and **lock\_wait\_time\_top** monitor elements when these elements are viewed from the perspective of the Db2 pureScale instance as a whole. Similarly, the count of lock waits and time-outs is reported as part of both the **lock\_waits** and **lock\_timeouts** monitor elements when these monitor elements are viewed at the level of the instance as a whole.

The following scenario illustrates the relationship between these cross-member, or global lock-wait monitor elements and the monitor elements that report locks within a member:

1. Application 1 on member 1 holds a shared (S) lock on a row.
2. Application 2 on member 2 requests an exclusive (X) lock on the same row. Application 2 is forced to wait, as the row is currently locked by application 1.
3. 2 ms later, application 3 on member 2 requests an exclusive (X) lock on the same row. Application 3 is also forced to wait.
4. 8 ms later, application 1 releases its lock, and application 2 acquires its lock.
5. 5 ms later, application 2 releases its lock, and application 3 acquires its lock.

The total time spent waiting for locks, as reported by **lock\_wait\_time** is 23 ms; application 2 had to wait for 10 ms in total, while application 3 had to wait for 13 ms in total. However, the amount of time spent waiting for a lock *between* members, **lock\_wait\_time\_global** is only 10 ms, as this wait time is the only portion of the overall lock wait time that involved one member waiting on a lock held by another.

Similarly, the count of the number of locks held reported by **lock\_waits\_global** is 1. The wait by application 2 on application 1 counts as one member waiting on another. Even though application 3 was, for a portion of the time it was waiting, held up by an application on member 1, this lock wait is not counted as a lock wait between members because it obtained its lock from the local lock manager on member 2.

## Reporting of applications holding locks

The locking event monitor shows information about applications holding locks. Generally speaking, the locking event monitor reports application information regardless of which member the application is running on. However, in rare cases, it might not be possible to determine which application is holding a lock when that application is running on a remote member. Consider the following example:

```
ALTER WORKLOAD finance COLLECT LOCK WAIT DATA WITH HISTORY AND VALUES
FOR LOCKS WAITING MORE THAN 5 SECONDS
```

This statement causes locks held longer than 5 seconds for the "finance" workload to be recorded in a lock event monitor. Now consider the following scenario.

- A lock is held by application 1 on member 1.
- After 5 seconds, the system attempts to write information about the lock to the lock event monitor, including application and member information. However, if the lock is released by application 1 and then a lock is immediately granted for the same object to another application on another member, the application holding the lock might be recorded as "Lock holder was unavailable for collection".

Also note that if a member that held a lock fails, the locking event monitor is not able to report information about which applications running on that member might have held a lock on a required piece of data.

Finally, there are some limitations on reporting applications holding locks when you use deprecated monitoring features. See [“Monitoring locking with snapshot monitor”](#) on page 1754 for more information.

## Monitor elements for viewing locks between members

The IBM Db2 pureScale Feature adds a number of new monitor elements that you can use to monitor locking in a Db2 pureScale environment. These monitor elements report specifically on information about lock waits between members in a Db2 pureScale instance.

### Locking-related monitor elements

The following monitor elements can be used to get information about lock waits between members and lock escalations:

- [“lock\\_waits\\_global - Lock waits global monitor element”](#) on page 1034
- [“lock\\_wait\\_time\\_global - Lock wait time global monitor element”](#) on page 1030
- [“lock\\_wait\\_time\\_global\\_top - Top global lock wait time monitor element”](#) on page 1031
- [“lock\\_timeouts\\_global - Lock timeouts global monitor element”](#) on page 1025
- [“lock\\_escals\\_maxlocks - Number of maxlocks lock escalations monitor element”](#) on page 1011
- [“lock\\_escals\\_locklist - Number of locklist lock escalations monitor element”](#) on page 1009
- [“lock\\_escals\\_global - Number of global lock escalations monitor element”](#) on page 1007

While not directly related to locking, the following elements can be used to get information about the extent to which things like statements, units of work or workloads in a Db2 pureScale instance wait on a cluster caching facility:

- [“cf\\_waits - Number of cluster caching facility waits monitor element”](#) on page 703
- [“cf\\_wait\\_time - cluster caching facility wait time monitor element”](#) on page 701

The `cf_wait_time` element shows how long a statement, unit or work, or workload has had to wait for the cluster caching facility to service a request. Use this element in conjunction with `cf_waits` ( $cf\_wait\_time \div cf\_waits$ ) to find the average wait time for each request. Generally speaking, the average wait time for requests to be serviced by the cluster caching facility is on the order of a few milliseconds. If you find they are substantially longer (that is, an order of magnitude or more), you might have an InfiniBand setup issue. Alternatively, your cluster caching facility may be overwhelmed with requests that it is not able to keep up with.

Refer to the reference topics for each monitor element to see what monitoring interfaces you can use to examine the data associated with that monitor element.

You can also use the other monitor elements supported by the locking event monitor to view information about locking *within* members.

## Page reclaiming

Different members in a Db2 pureScale instance might require access to a page of data that another member is already using. The process whereby one member requests and is granted a page being used by another member is known as *page reclaiming*.

If different members require access to the same page of data, the cluster caching facility manages which member accesses the page and when. In some cases, the cluster caching facility (also known as the CF) might permit one member to *reclaim* the page from another member before the other member is finished with it. The following example illustrates how page reclaiming occurs:

Assume there are two members, M1 and M2 that intend to update two different rows on the same page of data.

1. M1 is doing an update on a row R1 within a page of data. It is granted exclusive access to the page containing that row of data.

2. M2 requires an exclusive to the same page to update row R2. It passes this request to the CF. M2 waits while the request is processed.
3. The CF sees that member M1 already has an exclusive access to the page. It issues a request to M1 to reclaim the page. In the meantime, M2 waits.
4. M1 processes the reclaim request by writing the page back to the GBP and then releasing the page. (M1 retains any row or table locks it might have.)
5. The CF grants M2 access to the page. M2 reads the page from the GBP to perform whatever operations for which the page is needed.

It is important to note that as pointed out in step 4, any locks that a member has on rows or tables for the purposes of updates are retained until the unit of work has completed, even if another member reclaims and begins using the page before the end of that unit of work. In this way, different members can work with the same page of data without compromising lock integrity. If it happens that two members require incompatible row locks to the same row of data, then as is the case with lock management on a single member, one member must complete its processing before the second is allowed to proceed.

## Monitoring page reclaiming between members

When examining where a particular application or statement is spending its time, in addition to the time spent waiting for locks, applications, or statements in a Db2 pureScale environment might need to wait for a page to become available when it is in use by another member. You can use page reclaiming monitor elements to view the extent to which this type of wait might be affecting throughput on your system.

### About this task

To view page reclaiming statistics, use the MON\_GET\_PAGE\_ACCESS\_INFO table function. This table function returns object-level information about the extent to which members both request pages currently in use by other members, and the extent to which members release those pages at the request of other members. You can also retrieve the wait times involved.

### Procedure

1. Determine what types of pages you are interested in viewing results for.  
The example that follows retrieves information about the number of times pages were reclaimed for all data and index pages, using the page\_reclaims\_x and page\_reclaims\_s monitor elements.
2. Formulate an SQL statement that uses the MON\_GET\_PAGE\_ACCESS\_INFO table function.  
For example, to retrieve information about data and index pages reclaimed for all members, you can construct a statement like the one that follows:

```
SELECT MEMBER,
       VARCHAR(TABNAME,30) AS TABLE,
       VARCHAR(OBJTYPE,8) AS OBJTYPE,
       PAGE_RECLAIMS_X,
       PAGE_RECLAIMS_S
FROM TABLE(MON_GET_PAGE_ACCESS_INFO('DTW', '', -2))
WHERE PAGE_RECLAIMS_X !=0 OR PAGE_RECLAIMS_S !=0
ORDER BY MEMBER ASC, PAGE_RECLAIMS_X ASC
```

3. Run the query.

In this case, the results returned would look like the following example:

MEMBER	TABLE	OBJTYPE	PAGE_RECLAIMS_X	PAGE_RECLAIMS_S
0	CUSTOMER	TABLE	196	0
0	STOCK_1_250	TABLE	213	0
0	STOCK_1251_1500	TABLE	237	0
0	STOCK_251_500	TABLE	239	0
0	STOCK_501_750	TABLE	245	0
0	STOCK_1751_2000	TABLE	253	0
0	STOCK_2001_2250	TABLE	254	0
0	STOCK_751_1000	TABLE	259	0

```

0 STOCK_1501_1750      TABLE      269      0
0 STOCK_2251_2500     TABLE      274      0
0 STOCK_251_500       INDEX      276     2934
0 STOCK_1001_1250     TABLE      280      0
0 STOCK_1501_1750     INDEX      284     3070

3 CUSTOMER            TABLE      159      0
3 STOCK_251_500       TABLE      226      0
3 ORDERS              INDEX     42192    1340
3 ORDER_LINE          INDEX     115459    3871

112 record(s) selected.

```

**Note:** Part of the lengthy output from the query has been excluded, as denoted by the vertical ellipsis.

**Results**

In the preceding example, you can see that information for data and index pages is returned separately. Also, the schema is specified to exclude data from objects associated with the SYSIBM schema from being reported.

**Example**

**Example 1: Retrieving page reclaim wait times**

The following SQL retrieves the total pages reclaimed and total wait time across all members.

```

SELECT
  SUM(PAGE_RECLAIMS_X+PAGE_RECLAIMS_S+SPACEMAPPAGE_PAGE_RECLAIMS_X
    +SPACEMAPPAGE_PAGE_RECLAIMS_S)AS PAGE_RECLAIMS,
  SUM(RECLAIM_WAIT_TIME) AS RECLAIM_WAIT_TIME
FROM TABLE(MON_GET_PAGE_ACCESS_INFO(' ','', -2))

```

The results of this query would look like the following example::

```

PAGE_RECLAIMS      RECLAIM_WAIT_TIME
-----
                156                91

1 record(s) selected.

```

(Wait time is reported in milliseconds)

**Example 2: Show the 10 tables that are associated with the highest number of pages reclaimed**

This example shows how you can see which table objects are involved with page reclaiming.

```

SELECT SUBSTR(TABSCHEMA,1,8) AS TABSCHEMA,
       SUBSTR(TABNAME,1,20) AS TABNAME,
       RECLAIM_WAIT_TIME,
       MEMBER,
       SUBSTR(OBJTYPE,1,10) AS OBJTYPE
FROM TABLE(MON_GET_PAGE_ACCESS_INFO(NULL,NULL,-2))
WHERE RECLAIM_WAIT_TIME > 0
ORDER BY RECLAIM_WAIT_TIME DESC
FETCH FIRST 10 ROWS ONLY

```

Results:

TABSCHEMA	TABNAME	RECLAIM_WAIT_TIME	MEMBER	OBJTYPE
DTW	ORDER_LINE	1307192	1	INDEX
DTW	ORDER_LINE	1250134	2	INDEX
DTW	ORDER_LINE	1249452	0	INDEX
DTW	ORDER_LINE	1159741	3	INDEX
DTW	DISTRICT	827598	0	TABLE
DTW	DISTRICT	785354	2	TABLE
DTW	DISTRICT	767148	1	TABLE
DTW	DISTRICT	687608	3	TABLE
DTW	ORDERS	556538	0	INDEX
DTW	ORDERS	539858	2	INDEX

10 record(s) selected.

(Wait time is reported in milliseconds)

**Example 3: Show the 10 statements that are causing the highest number of pages reclaimed**

This query is a variation on the preceding example; in this case, the query returns the 10 statements associated with the highest number of pages reclaimed:

```

SELECT SUBSTR(STMT_TEXT,1,50) AS STMT_TEXT,
       RECLAIM_WAIT_TIME
FROM TABLE(MON_GET_PKG_CACHE_STMT('D',NULL,NULL,-2))TABLE
WHERE RECLAIM_WAIT_TIME > 0
ORDER BY RECLAIM_WAIT_TIME DESC
FETCH FIRST 10 ROWS ONLY

```

Results:

STMT_TEXT	RECLAIM_WAIT_TIME
Select S_QUANTITY, S_DIST_01, S_DIST_02, S_DIST_03	796668
Select S_QUANTITY, S_DIST_01, S_DIST_02, S_DIST_03	785863
Select S_QUANTITY, S_DIST_01, S_DIST_02, S_DIST_03	746521
Select S_QUANTITY, S_DIST_01, S_DIST_02, S_DIST_03	623461
Insert into ORDER_LINE values (?, ?, ?, ?, ?, ?, ?	610602
Insert into ORDER_LINE values (?, ?, ?, ?, ?, ?, ?	522899
Insert into ORDER_LINE values (?, ?, ?, ?, ?, ?, ?	518076
Update DISTRICT set D_NEXT_O_ID = ? where D_W_ID =	419022
Update DISTRICT set D_NEXT_O_ID = ? where D_W_ID =	406028
Update DISTRICT set D_NEXT_O_ID = ? where D_W_ID =	406006

10 record(s) selected.

(Wait time is reported in milliseconds)

**Example 4: Show the 10 statements that are causing the highest number of pages reclaimed, with the average wait time for each execution of each statement**

In the preceding example, the wait time is expressed as an overall value per statement. The query does not take into account the fact that a given statement might have run numerous times. This example shows how you can examine the average wait time for each execution of each of the top 10 statements:

```

SELECT SUBSTR(STMT_TEXT,1,75) AS STMT_TEXT,
       NUM_EXECUTIONS,
       RECLAIM_WAIT_TIME,
       DEC(FLOAT(RECLAIM_WAIT_TIME)/FLOAT(NUM_EXECUTIONS),10,8)
       AS AVG_WAIT_PEREXEC
FROM TABLE(MON_GET_PKG_CACHE_STMT('D',NULL,NULL,-2))TABLE

```

```
WHERE RECLAIM_WAIT_TIME > 0
ORDER BY AVG_WAIT_PEREXEC DESC
FETCH FIRST 10 ROWS ONLY
```

Results:

STMT_TEXT AVG_WAIT_PEREXEC	NUM_EXECUTIONS	RECLAIM_WAIT_TIME
Update DISTRICT set D_NEXT_O_ID = ? where D_W_ID = ? and D_ID = ? 419497 2.66901439		157173
Update DISTRICT set D_NEXT_O_ID = ? where D_W_ID = ? and D_ID = ? 397870 2.55450973		155752
Update DISTRICT set D_NEXT_O_ID = ? where D_W_ID = ? and D_ID = ? 385613 2.48218883		155352
Update DISTRICT set D_NEXT_O_ID = ? where D_W_ID = ? and D_ID = ? 347847 2.24199006		155151
Insert into ORDERS values (?, ?, ?, ?, ?, ?, ?, ?) 259076 1.64834927		157173
Insert into ORDERS values (?, ?, ?, ?, ?, ?, ?, ?) 253548 1.62789562		155752
Insert into ORDERS values (?, ?, ?, ?, ?, ?, ?, ?) 232300 1.49531386		155352
Insert into ORDERS values (?, ?, ?, ?, ?, ?, ?, ?) 219607 1.41544044		155151
Delete from NEW_ORDER where NO_W_ID = ? and NO_D_ID = ? and NO_O_ID = ? 106525 0.69638747		152968
Delete from NEW_ORDER where NO_W_ID = ? and NO_D_ID = ? and NO_O_ID = ? 101367 0.66430523		152591

10 record(s) selected.

(Wait time is reported in milliseconds)

A slightly different version of this query shows how long each statement took to execute:

```
SELECT SUBSTR(STMT_TEXT,1,75) AS STMT_TEXT,
       NUM_EXECUTIONS,
       RECLAIM_WAIT_TIME,
       DEC(FLOAT(RECLAIM_WAIT_TIME)/FLOAT(NUM_EXECUTIONS),10,8)
       AS AVG_EXEC_TIME
FROM TABLE(MON_GET_PKG_CACHE_STMT('D',NULL,NULL,-2))TABLE
WHERE RECLAIM_WAIT_TIME > 0
ORDER BY RECLAIM_WAIT_TIME DESC
FETCH FIRST 10 ROWS ONLY
```

Results:

STMT_TEXT AVG_EXEC_TIME	NUM_EXECUTIONS	RECLAIM_WAIT_TIME
Select S_QUANTITY, S_DIST_01, S_DIST_02, S_DIST_03, S_DIST_04, S_DIST_05, S 755544 0.48573357		1555470
Select S_QUANTITY, S_DIST_01, S_DIST_02, S_DIST_03, S_DIST_04, S_DIST_05, S 754231 0.48522167		1554405
Select S_QUANTITY, S_DIST_01, S_DIST_02, S_DIST_03, S_DIST_04, S_DIST_05, S 741047 0.47192750		1570256
Select S_QUANTITY, S_DIST_01, S_DIST_02, S_DIST_03, S_DIST_04, S_DIST_05, S 707148 0.45597887		1550835
Insert into ORDER_LINE values (?, ?, ?, ?, ?, ?, ?, ?, ?, ?) 508568 0.32718130		1554392
Insert into ORDER_LINE values (?, ?, ?, ?, ?, ?, ?, ?, ?, ?) 497197 0.31964751		1555454
Insert into ORDER_LINE values (?, ?, ?, ?, ?, ?, ?, ?, ?, ?) 493692 0.31440444		1570245
Insert into ORDER_LINE values (?, ?, ?, ?, ?, ?, ?, ?, ?, ?) 465049 0.29987432		1550813
Update DISTRICT set D_NEXT_O_ID = ? where D_W_ID = ? and D_ID = ? 419283 2.66812816		157145
Update DISTRICT set D_NEXT_O_ID = ? where D_W_ID = ? and D_ID = ? 397364 2.55180164		155719

10 record(s) selected.

(Wait time is reported in milliseconds)

## Monitor elements for page reclaiming

The IBM Db2 pureScale Feature adds a number of new monitor elements that you can use to monitor the extent to which page reclaiming is taking place in a Db2 pureScale instance.

### Page reclaiming-related monitor elements

The following monitor elements can be used to get information about the extent to which page reclaiming is taking place in a Db2 pureScale instance:

- [“page\\_reclaims\\_x - Page reclaims exclusive access monitor element” on page 1131](#)
- [“page\\_reclaims\\_initiated\\_s - Page reclaims initiated shared access monitor element” on page 1131](#)
- [“spacemappage\\_page\\_reclaims\\_x - Space map page reclaims exclusive access monitor element” on page 1453](#)
- [“spacemappage\\_page\\_reclaims\\_s - Space map page reclaims shared access monitor element” on page 1454](#)
- [“page\\_reclaims\\_initiated\\_x - Page reclaims initiated exclusive access monitor element” on page 1131](#)
- [“page\\_reclaims\\_initiated\\_s - Page reclaims initiated shared access monitor element” on page 1131](#)
- [“spacemappage\\_page\\_reclaims\\_initiated\\_x - Space map page reclaims initiated exclusive access monitor element” on page 1454](#)
- [“spacemappage\\_page\\_reclaims\\_initiated\\_s - Space map page reclaims initiated shared access monitor element” on page 1455](#)
- [“reclaim\\_wait\\_time - Reclaim wait time monitor element” on page 1367](#)
- [“spacemappage\\_reclaim\\_wait\\_time - Space map page reclaim wait time monitor element” on page 1455](#)

Refer to the reference topics for each monitor element to see what monitoring interfaces you can use to examine the data associated with that monitor element.

## High Speed Interconnect Monitoring

Monitoring the performance on your Db2 high speed cluster interconnect layer can give valuable insight into the configuration between the members and CFs. The most appropriate way to measure this performance is through RDMA ping tests.

### Testing for all adapter combinations

To run the RDMA ping test for all combinations, run `db2cluster -verify -req -rdma_ping`. This produces two files in `sqlllib/db2dump/db2cluster`:

- A log file of the form `ibm.db2cluster_int-<timestamp>.log`
- A trace file of the form `ibm.db2cluster_int-<timestamp>.trace`

Each entry of the log file will show a summary per test pair. In this summary, the primary metric is the RDMA average round trip ping time.

Example entry:

```
12:07:34 -----
12:07:34 Testing rdma ping connection.
12:07:34 Client Hostname: coralpib259 Client Netname: coralpib259-ib0
12:07:34 Server Hostname: coralpib257 Server Netname: coralpib257-ib0
12:07:39
Starting connection test number 1
Connected to Server (10.1.2.5) in 3002499 microseconds after 1 attempt
100 bytes from 10.1.2.5: seq=0 time=6
100 bytes from 10.1.2.5: seq=1 time=11
100 bytes from 10.1.2.5: seq=2 time=9
100 bytes from 10.1.2.5: seq=3 time=147
100 bytes from 10.1.2.5: seq=4 time=23
100 bytes from 10.1.2.5: seq=5 time=8
```

```
100 bytes from 10.1.2.5: seq=6 time=12
100 bytes from 10.1.2.5: seq=7 time=7
100 bytes from 10.1.2.5: seq=8 time=9
100 bytes from 10.1.2.5: seq=9 time=34
round-trip average: 27 microseconds
Disconnected from Server in 283 microseconds
```

```
Performing udapl ping test from coralpib259-ib0 to coralpib257-ib0 status: PASS
12:07:39 -----
```

To quickly search for this metric for all entries, run `grep "round-trip average:" <logfile>`. Most results for a single site pureScale cluster should be in the threshold of single-digit or low-double digit microseconds. This is not to be confused with a singular ping test as seen above, which may be well above this threshold. If there is one or more round-trip time which is significantly higher than the threshold, then the specific adapter pairs producing these outliers should be identified and retested. These steps are detailed below.

## Testing for a specific pair of adapters

To identify which adapter pair contains an outlier, search the logfile for an entry which contains a high round-trip average found in the round-trip average search. Look at the entry block to determine the:

- Client hostname
- Client netname
- Server hostname
- Server netname

Once an outlier has been identified, the RDMA ping test should be run on the identified adapter pair. This is done by rerunning `db2cluster` with more options: `db2cluster -verify -req -rdma_ping -host <client_hostname> -netname <client_netname> -host <server_hostname> -netname <server_netname>`. This will produce another log file and trace file with a new timestamp for this specific test. Perform this test a few times for each outlier.

Example `db2cluster` using the above entry:

```
db2cluster -verify -req -rdma_ping -host coralpib259 -netname coralpib259-ib0 -host coralpib257
-netname coralpib257-ib0
```

Look at the newly generated log files and view its their entries. Consistently high round trip times for each pair after successive tests may be a sign of poor cluster performance. Contact your network administrator for further troubleshooting.

## Using deprecated monitoring features in a Db2 pureScale environment

The IBM Db2 pureScale Feature extends the database monitoring infrastructure with a rich set of monitor elements that you can use to retrieve information about a Db2 pureScale instance. However, there are some limitations to be aware of when retrieving and interpreting monitoring data using deprecated monitoring interfaces.

This topic describes the limitations to keep in mind when you are using any of the following deprecated features:

- [“Monitoring locking with snapshot monitor” on page 1754](#)
- [“Deadlock event monitor” on page 1754](#)
- [“LIST TABLESPACES and LIST TABLESPACE CONTAINERS commands” on page 1758](#)

## Monitoring locking with snapshot monitor

If you use snapshot monitoring commands, functions or views to examine information about locks between members, details about the applications holding locks are only displayed if the application is running on the same member as where the snapshot is being taken. Otherwise, the ID of the application holding the lock are reported as REMOTE APPLICATION, and other information, such as the application ID and the lock mode are omitted. For this reason, consider taking a global snapshot so that information from all members is returned.

For example, [Figure 19 on page 1754](#) shows the output of a **GET SNAPSHOT FOR APPLICATION** command, where the application holding the lock is on the same member as where the command is run:

```
ID of agent holding lock           = 73
Application ID holding lock        = *N0.user1.080616184956
Database partition lock wait occurred on = 0
Lock name                          = 0x0200040000000000000000000054
Lock attributes                    = 0x00000000
Release flags                      = 0x00000000
Lock object type                   = Table
Lock mode                          = Exclusive Lock (X)
Lock mode requested                = Share Lock (S)
Name of tablespace holding lock    = USERSPACE1
Schema of table holding lock       = USER1
Name of table holding lock         = T1
Data Partition Id of table holding lock = 0
Lock wait start timestamp          = 06/16/2009 14:50:26.744694
```

*Figure 19. Output for GET SNAPSHOT FOR APPLICATION command - command run on member holding lock*

However, if the lock is held by an application on a remote member, the same report would look like what is shown in [Figure 20 on page 1754](#):

```
Application ID holding lock        = REMOTE APPLICATION
Database partition lock wait occurred on = 0
Lock name                          = 0x0200040000000000000000000054
Lock attributes                    = 0x00000000
Release flags                      = 0x00000000
Lock object type                   = Table
Lock mode requested                = Share Lock (S)
Name of tablespace holding lock    = USERSPACE1
Schema of table holding lock       = USER1
Name of table holding lock         = T1
Data Partition Id of table holding lock = 0
Lock wait start timestamp          = 06/16/2009 14:50:26.744694
```

*Figure 20. Output for GET SNAPSHOT FOR APPLICATION command - command run on member other than one holding lock*

If you take a global snapshot, data for all members is returned. You can determine where the lock is being held by examining the lock name from the snapshot output. If you skim through the reports for each of the members, you can quickly find which application holds the lock in question.

## Deadlock event monitor

When a deadlock occurs, the deadlock detector generates information used by event monitors that track deadlocks. The **CREATE EVENT MONITOR ... FOR DEADLOCKS** command, which is deprecated, might not show certain details for deadlocks between members in a Db2 pureScale environment. For deadlock event reporting, the details regarding the application that was the victim of the deadlock might not be shown in the output of the **dbevmon** tool, as shown in [Figure 21 on page 1755](#) and in [Figure 22 on page 1755](#):

```

3) Deadlock Event ...
  Deadlock ID: 1
  Deadlock node: 0
  Number of applications deadlocked: 2
  Deadlock detection time: 06/17/2009 14:46:22.543136
  Rolled back Appl participant no: 2

```

Figure 21. Sample **db2evmon** output, Db2 pureScale instances

```

3) Deadlock Event ...
  Deadlock ID: 1
  Deadlock node: 0
  Number of applications deadlocked: 2
  Deadlock detection time: 06/17/2009 14:46:22.543136
  Rolled back Appl participant no: 2
  Rolled back Appl Id: *N0.finance.081217170042
  Rolled back Appl seq number: : 0001
  Rolled back Appl handle: 66

```

Figure 22. Sample **db2evmon** output, all other types of database instances

(Whether application details are shown or not is dependent on several factors, none of which are under user control.) However, you can determine which applications are involved in the deadlock by correlating the data reported for the deadlock ID and the rolled-back application participant number with information found in the Deadlocked Connection section of the **db2evmon** output.

Similarly, the Deadlocked Connection section of the output does not include the application ID, sequence number, or lock mode of the application holding the requested lock. However, the deadlock ID, member ID, lock name, lock time stamp, and participant number of the application holding the lock are displayed. (The member ID appears as "Deadlock node" in the output of the **db2evmon** tool.) You can use this information to correlate which applications are causing the contention. The following sample output from the **db2evmon** tool illustrates this behavior. The information to use for correlating the applications involved in the deadlock is underlined:

```

5) Deadlock Event ...
  Deadlock ID: 1
  Deadlock node: 0
  Number of applications deadlocked: 2
  Deadlock detection time: 12/17/2008 12:01:12.735436
  Rolled back Appl participant no: 2
  Rolled back Appl Id: *N0.finance.081217170042
  Rolled back Appl seq number: : 0001
  Rolled back Appl handle: 66

6) Connection Header Event ...
  Appl Handle: 66
  Appl Id: *N0.finance.081217170042
  Appl Seq number: 00001
  DRDA AS Correlation Token: *N0.finance.081217170042
  Program Name : db2bp

## LIST TABLESPACES and LIST TABLESPACE CONTAINERS commands

These commands are deprecated. They report only information that is known on the member they are run on. They do not retrieve information from other members in the instance. Consequently, some data, such as the number of used pages in a table space, might not be reported accurately. Use the `MON_GET_TABLESPACE` and `MON_GET_CONTAINER` table functions instead.

## Monitoring memory usage within the cluster caching facility server process

The `CF_MEM_SZ` cluster caching facility (also known as a CF) memory configuration parameter controls the maximum size that the CF process can grow to. When the CFs starts up, using memory tracking utilities such as `svmon`, will not show a large change in used memory because the full allocation is not yet committed or backed by real memory. Memory is only committed or backed when it is accessed for the first time. As more databases are activated and database activities take place, more memory is committed in order to keep track of the activities until the maximum CF memory size is reached.

The memory for certain structures persist until a database is dropped or the CF server is stopped therefore the memory might persist as shown in `svmon` output.

For example, the following Db2 pureScale instance has the CF configured to use around 132GB.

```
Memory size (4KB) (CF_MEM_SZ) = AUTOMATIC(33874432)
```

The `top` command shows the memory usage of the CF at only 5% after startup.

PID	USER	PR	NI	VIRT	RES	SHR	S	%CPU	%MEM	TIME+	COMMAND
6168	dtw	20	0	0.132t	9.498g	9.223g	S	2988.2	5.028	178819:52	ca-server
3070	root	20	0	841600	3128	2512	S	5.882	0.002	7:13.75	nscd
4135	root	20	0	433752	45292	19032	S	5.882	0.023	1544:02	BESClient
6652	dtw	20	0	15644	3020	2272	R	5.882	0.002	0:00.02	top

The `db2pd -cfinfo` command can show more detail about the CF memory usage. Here is a sample output:

```
CF Server (128) Information
  Hostname                = coralm215.torolab.ibm.com
  Management Port        = 27727
  Role                    = Primary
CF Host Information
  Virtual Memory Used     = 18793431040
  Virtual Memory Available = 188314128384
  Real Memory Used       = 18793431040
  Real Memory Available  = 184012312576
  Swap File Used         = 0
  Swap File Available    = 4301815808
  CPU Usage              = 0
  CPU Activity           = 97
  Total structure memory (4KB) = 34626048
  Free structure memory (4KB) = 2724096
  Memory frame Size (4KB) = 256
  Configured Size (4KB) = 34626048
  Current Worker Queue Size = 0
  Minimum Worker Queue Size = 0
  Maximum Worker Queue Size = 1
  Average Worker Queue Size = 0
```

The `db2pd -cfinfo -db < dbname >` command can be used to see the current memory allocation of each database structure in the CF. As shown in the following example, the current size of the GBP

structure is much smaller than the configured size. This size will grow as the structure is used by database activity.

```
Group Bufferpool Information
  Structure Name           = db2.dtw.DTW.gbp
  SID                     = 316
  Current Size (4KB)      = 1260227
  Target Size (4KB)       = 30700032
  Configured Size (4KB)   = 30700032
  CF Driven Castout       = 0

Shared Communication Area Information
  Structure Name           = db2.dtw.DTW.sca
  SID                     = 314
  Current Size (4KB)      = 5198
  Target Size (4KB)       = 58624
  Configured Size (4KB)   = 58624

List Structure / Smart Array Information
  Structure Name           = db2.dtw.DTW.list
  SID                     = 337
  Current Size (4KB)      = 14339
  Target Size (4KB)       = 141568
  Configured Size (4KB)   = 141568

Lock Structure Information
  Structure Name           = db2.dtw.DTW.lock
  SID                     = 318
  Current Size (4KB)      = 249742
  Target Size (4KB)       = 1000192
  Configured Size (4KB)   = 1000192
```
