Disclaimer

This publication is intended to help VSE system programmers setting up infrastructure for their operating environment. The information contained in this document has not been submitted to any formal IBM test and is distributed AS IS. The information about non-IBM ("vendor") products in this manual has been supplied by the vendor and IBM assumes no responsibility for its accuracy or completeness. The use of this information or the implementation of any of these techniques is a customer responsibility and depends on the customer's ability to evaluate and integrate them into the customer's operational environment. While each item may have been reviewed by IBM for accuracy in a specific situation, there is no guarantee that the same or similar results will be obtained elsewhere. Customers attempting to adapt these techniques to their own environments do so at their own risk. Any pointers in this publication to external Web sites are provided for convenience only and do not in any manner serve as an endorsement of these Web sites.

Any performance data contained in this document was determined in a controlled environment, and therefore, the results that may be obtained in other operating environments may vary significantly. Users of this document should verify the applicable data for their specific environment. Reference to PTF numbers that have not been released through the normal distribution process does not imply general availability. The purpose of including these reference numbers is to alert IBM customers to specific information relative to the implementation of the PTF when it becomes available to each customer according to the normal IBM PTF distribution process.

Changes

Sept 2011 – initial version.

1 Introduction

This paper describes the stack and TN3270 server setup with the IPv6/VSE product from Barnard Software, Inc. Also TN3270E printing is covered.

Note: TN3270 with SSL (secure Telnet) is currently not possible with the IPv6/VSE product.

The following software has been used in the test setup.

- z/VSE 4.3
- IPv6/VSE
- Microsoft Windows XP Professional, SP3
- IBM Personal Communications 5.9 for Windows
- Open Text Exceed Host Explorer for Win32 V10.0.0.0

You can find some additional information from BSI in their IPv6/VSE User's Guide, which is available online at

<http://www.ibm.com/systems/z/os/zvse/documentation/#tcpip>

Note:

Early versions of IPv6/VSE shipped a phase EZASOH00, which is the name of the EZA interface phase. This can cause problems with the CSI stack when initializing the EZA interface.

IPv6/VSE is installed by default into PRD2.PROD, which is before IJSYSRS.SYSLIB in the standard LIBDEFs. So the wrong phase gets accessed. So remove the EZASOH00 phase if it is located in the IPv6 installation library.

The error symptom is:

```
1RT2I TCP/IP: EZASMI MACRO-REQUEST INITAPI FAILED, RC=-0000001, ERRNO=+0040009,  
TS=08, SOK=0000
```

2 Setting up VTAM for TN3270

This chapter describes the VTAM setup for a TN3270 server. Basically, the following steps must be performed:

- Adding VTAM applications to ATCCON00.B
- Cataloging the new VNETAPPL B-book
- Activating the modified setup

2.1 *Changing the ATCCON00.B book*

You must add following VTAM application to the ATCCON00.B member.

VNETAPPL

2.2 Cataloging the VNETAPPL.B book

You may use a JCL similar to the following to catalog the VNETAPPL B-book.

```
* $$ JOB JNM=VNETAPPL,CLASS=0,DISP=D
* $$ LST CLASS=0,DISP=D
// JOB VNETAPPL
// EXEC LIBR,SIZE=256K,PARM='MSHP'
ACCESS S=PRD2.CONFIG
CATALOG VNETAPPL.B REPLACE=YES
VNETAPPL VBUILD TYPE=APPL
BSTRUUN APPL
BSTRUUS ST APPL AUTH=(PASS,ACQ)
VNETTRM GROUP MODETAB=IESINCLM,DLOGMOD=SP3272QN
T001 APPL AUTH=(ACQ),EAS=1
T002 APPL AUTH=(ACQ),EAS=1
T003 APPL AUTH=(ACQ),EAS=1
T004 APPL AUTH=(ACQ),EAS=1
T005 APPL AUTH=(ACQ),EAS=1
T006 APPL AUTH=(ACQ),EAS=1
T007 APPL AUTH=(ACQ),EAS=1
T008 APPL AUTH=(ACQ),EAS=1
T009 APPL AUTH=(ACQ),EAS=1
T010 APPL AUTH=(ACQ),EAS=1
/
/*
/&
* $$ EOJ
```

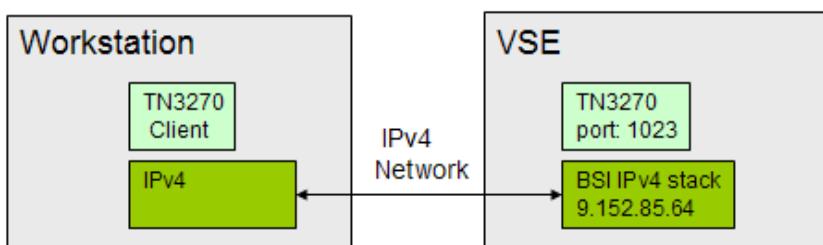

2.3 Activating the changed VTAM book

To activate the changed VTAM book, enter

V NET,ACT, ID=VNETAPPL

3 IPv4 network setup

Having both sides in an IPv4 network, the setup is rather simple.

In the following, the BSI IPv4 stack has SYSID=44.

3.1 *IPv4 stack startup job*

The following JCL was used in our test environment to start the IPv4 stack.

```
* $$ JOB JNM=BSI44,CLASS=S,DISP=L
* $$ LST CLASS=S,DISP=D
// JOB BSI44
// OPTION LOG,PARTDUMP,NOSYSDUMP,SADUMP=1
// LIBDEF *,SEARCH=(PRD2.CONFIG)
// ASSGN SYS000,SYSLST
// SETPFIX LIMIT=(2M,1M)
// EXEC BSTTINET,SIZE=BSTTINET,OS390,TASKS=ANY
ID 44
INTERVAL 120
*
DEVICE OSAXD10 OSAX D10 IPV4TST D12
*
LINK OSAXD10 0 9.152.85.64 255.255.252.0 1492
*

3.3 ***Connecting with IBM Personal Communications***

In our plain IPv4 setup, we used IBM Personal Communications as the TN3270 client. For “Host Name or IP Address” enter the IP address of the VSE system: 9.152.85.64 with port number 1023.

After connecting to VSE, the following VTAM selection screen is displayed.

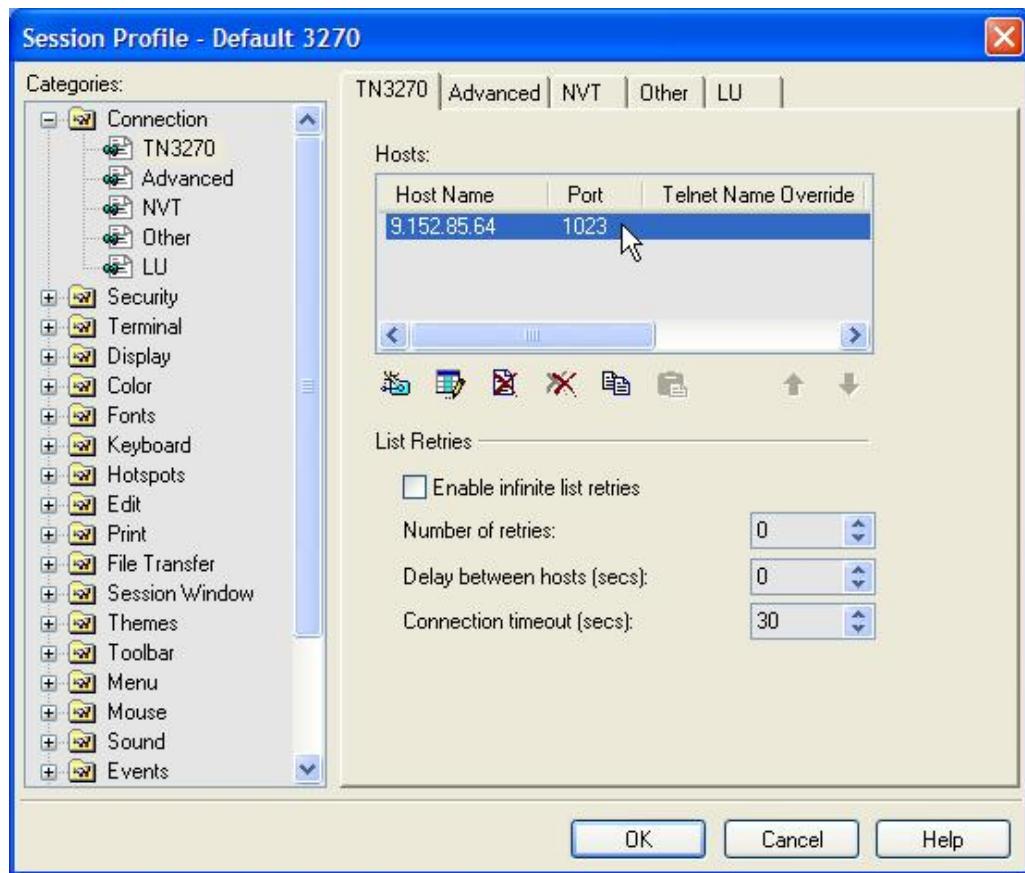

Move the cursor to DBDCCICS and press **Enter** to display the VSE signon screen.

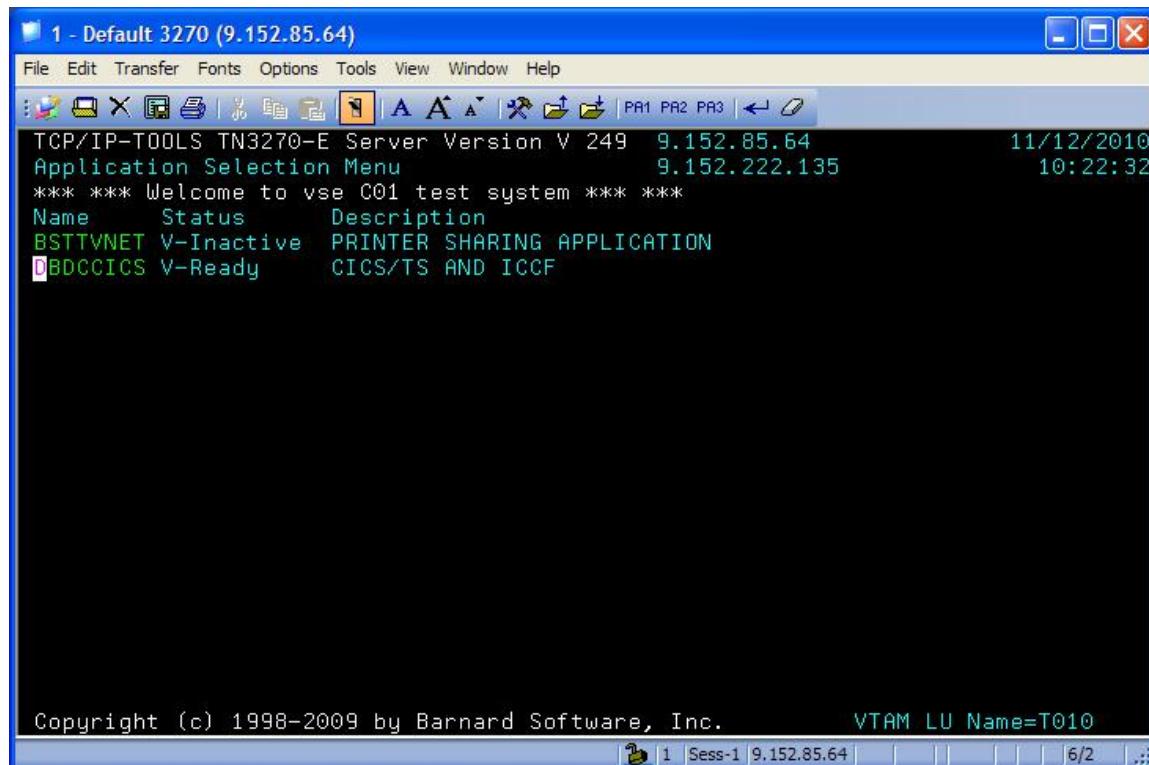

3.4 ***Connecting with Open Text Exceed***

The Open Text Exceed product was formerly known as Hummingbird Exceed and provides a variety of connectivity tools. In the “Hummingbird Neighborhood” folder double-click a “Default 3270” icon and configure the session to VSE.

In the 3270 session window select **Options – Session Properties** and specify the VSE IP address and TN3270 port.

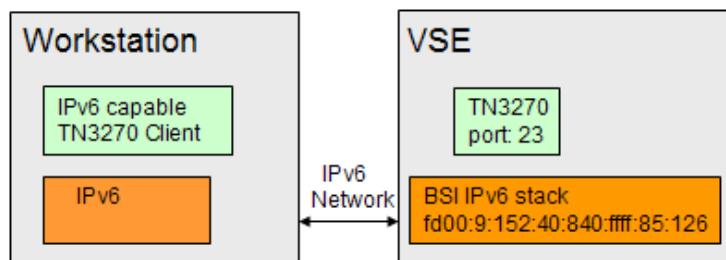

Then select **File – Connect** to display the VTAM selection screen.

4 IPv6 network setup

The network setup of a plain IPv6 network looks similar to plain IPv4.

However, many Telnet clients, for example IBM Personal Communications V5.9, are not IPv6 capable. Therefore we used Open Text Exceed as the TN3270 client with IPv6.

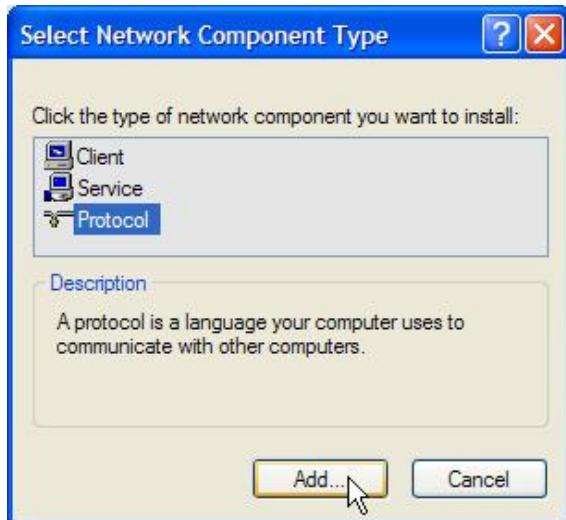

4.1 Configuring IPv6 in Windows

This section gives some brief overview of configuring IPv6 for Windows. IPv6 is not pre-installed on Windows XP, so you have to install and configure the IPv6 protocol manually. IPv6 cannot be fully installed and configured using a GUI. Instead, the netsh command must be used here. On Windows Vista and Windows 7, all steps are supported via the GUI.

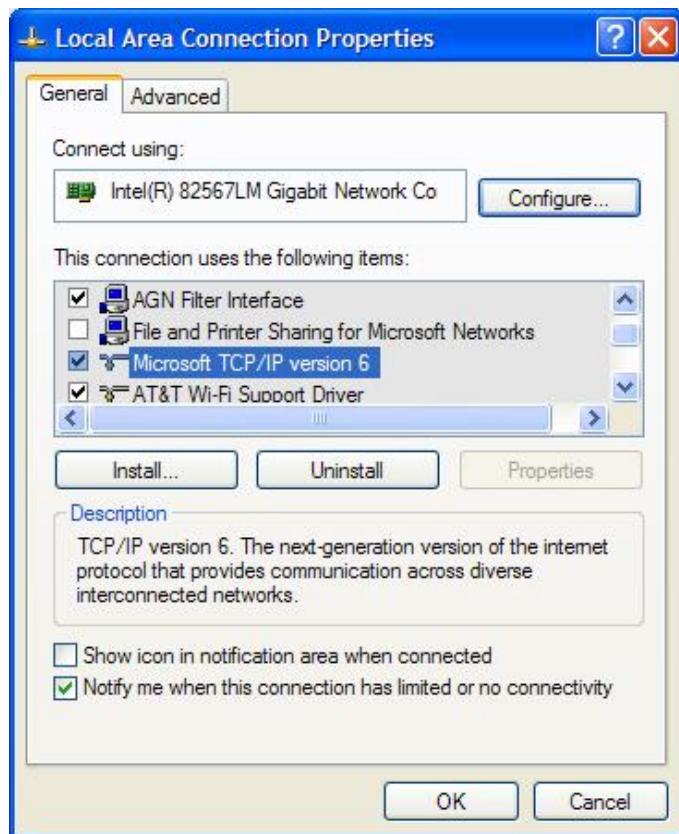

4.1.1 Installing IPv6

The following are the steps to install the Windows IPv6 protocol.

- Open the Windows Control Panel
- Open the Windows Network Connections
- Open the properties box of your LAN connection and click on the **Install** button
- On the Network Component Type box select Protocol and click on **Add**

- On the Select Network Protocol box select the IPv6 protocol and press **OK**.

Now the **Microsoft TCP/IP version 6** item should be visible in the LAN Connection Properties box.

This picture has been taken from a Windows XP SP3, so the Properties button is not available. Instead, the netsh command must be used for configuring IPv6.

4.1.2 Configuring IPv6

First you have to determine the index of your IPv6 interface.

```
D:\>netsh interface ipv6 show interface
Querying active state...

Idx  Met      MTU      State           Name
---  ---      ----      -----          -----
 6    2       1280     Disconnected   Teredo Tunneling Pseudo-Interface
 5    0       1500     Connected      Local Area Connection
 4    0       1500     Disconnected   Wireless Network Connection
 3    1       1280     Connected      6to4 Tunneling Pseudo-Interface
 2    1       1280     Connected      Automatic Tunneling Pseudo-Interface
 1    0       1500     Connected      Loopback Pseudo-Interface
```

In this example, it is index 5 (Local Area Connection).

Then use the following netsh commands to configure a static IPv6 address. Make sure to use the right interface number from above output.

```
netsh interface IPv6 add address interface=5 address=fd00:9:152:40:840::1001
netsh interface IPv6 add prefixpolicy prefix=fd00:9:152:40:840::/80 5 6
```

```
netsh interface IPv6 add route fd00:9:152::/48 interface=5 nexthop=fd00:9:15
2:40:840::1
```

You can now go ahead and test the connection to VSE.

4.1.3 Testing the connection

On Windows you can either use “ping -6” or “ping6” to test if a computer is reachable in an IPv6 network. Here is the output from our test setup.

```
D:\>ping6 fd00:9:152:40:840:ffff:85:126
Pinging fd00:9:152:40:840:ffff:85:126
from fd00:9:152:40:840::1001 with 32 bytes of data:

Reply from fd00:9:152:40:840:ffff:85:126: bytes=32 time=4ms
Reply from fd00:9:152:40:840:ffff:85:126: bytes=32 time<1ms
Reply from fd00:9:152:40:840:ffff:85:126: bytes=32 time<1ms
Reply from fd00:9:152:40:840:ffff:85:126: bytes=32 time<1ms

Ping statistics for fd00:9:152:40:840:ffff:85:126:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 4ms, Average = 1ms
```

You may use the netsh command to display further information, for example showing neighbors (VSE shown in blue).

```
D:\>netsh interface ipv6 show neighbors

Interface 5: Local Area Connection

Internet Address                               Physical Address      Type
-----  

fd00:9:152:40:840::1                         00-0a-8b-bf-71-80  Stale  

(router)  

fd00:9:152:40:840::1001                      00-24-7e-e0-72-4a  Permanent  

fe80::224:7eff:fee0:724a                     00-24-7e-e0-72-4a  Permanent  

fe80::20a:8bff:feb7:7180                      00-0a-8b-bf-71-80  Stale  

fd00:9:152:40:840:ffff:85:126              00-11-25-bd-98-c2  Stale  

...  

```

Refer to section 8.1 on page 21 if you cannot reach VSE.

4.2 IPv6 stack startup job

The following JCL is used in our test environment to start the IPv6 stack. The BSI IPv6 stack has SYSID=66.

```
* $$ JOB JNM=BSI66,CLASS=S,DISP=L
* $$ LST CLASS=S,DISP=D
// JOB BSI66
// OPTION LOG,PARTDUMP,NOSYSDUMP,SADUMP=1
/. LIBDEF *,SEARCH=(PRD2.CONFIG,PRD2.BSI)
// LIBDEF *,SEARCH=(PRD2.CONFIG)
// ASSGN SYS000,SYSLST
/. SETPFX LIMIT=(3M,32M)
// SETPFX LIMIT=(2M,1M)
```

```
// EXEC BSTT6NET,SIZE=BSTT6NET,OS390,TASKS=ANY
ID 66
INTERVAL 120
*
DEVICE OSAXD00 OSAX D20 IPV6TST D22
*
LINK      OSAXD00 0 FD00:9:152:40:840:FFFF:85:64 /80 1492
*
ROUTE     OSAXD00 FD00:9:152:40:840::1 /80 ::0 0
ROUTE     OSAXD00 ::0 ::0 FD00:9:152:40:840::1 1
DNS       FD00:9:152:41:2422:FFFF:4:230 PRI
*
HOST      LOCALHOST ::1
HOST      IP6GW    fd00:9:152:40:840::1

* $$ EOJ
```

4.3 Starting a TN3270 server

You can use the same JCL for starting the TN3270 server with IPv6 as used with IPv4 with just one change: specify the SYSID of the IPv6 stack.

```
// EXEC BSTTVNET,SIZE=BSTTVNET,DSPACE=3M,TASKS=ANY,OS390
ID 66
OPEN VSEC01 1023
*
```

The daemon startup is shown on the VSE console.

```

4.4 Connecting with Open Text Exceed

Just enter the IPv6 address and TN3270 port of the VSE system in the Edit Host Info box for directly connecting to VSE via IPv6.

5 Mixed IPv4 and IPv6 network setup

Having the TN3270 client and server in different network types, requires a gateway that is able to handle both IPv4 and IPv6 traffic.

In our test setup a C-program was used as the gateway. Here, the middle-tier platform is a Linux, but can be any platform with a dual stack, e.g. also Windows.

There is an example of a TCP forwarding program given at:

http://www.kernel.org/doc/man-pages/online/pages/man2/select_tut.2.html

Note: also z/VSE 4.3 can be used as the gateway when using the EZA socket interface. With EZA you can access ipv4 and IPv6 sockets in the same program. However, a C interface is not yet available.

5.1 IPv6 stack startup job

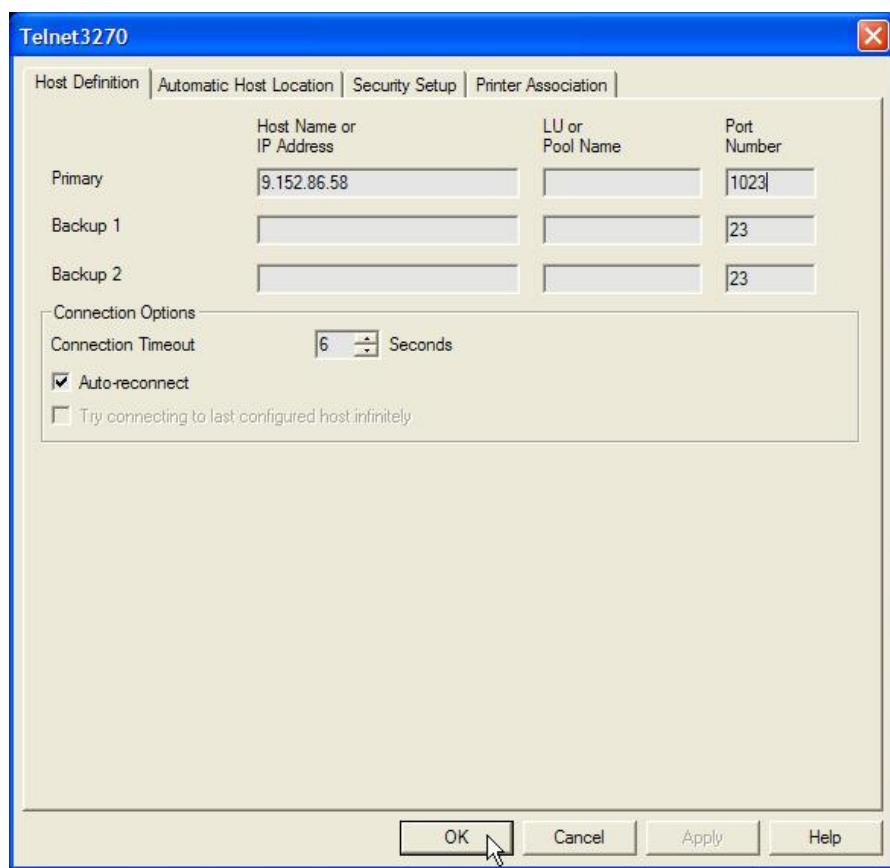

The same JCL as displayed in section 4.2 on page 12 is used to start the IPv6 stack.

5.2 Starting a TN3270 server

The same JCL as displayed in section 4.3 on page 13 is used to start the TN3270 server.

5.3 Connecting with a TN3270 client

Like with the plain IPv4 setup, we can use IBM Personal Communications as the TN3270 client. For “Host Name or IP Address” enter the IP address of the middle-tier platform: 9.152.86.58 with port number 1023. The gateway program forwards traffic to the VSE system in the IPv6 network where the TN3270 daemon listens on port 23.

After connecting to VSE, the following VTAM selection screen is displayed.

```

Session E - [24 x 80]
File Edit View Communication Actions Window Help
TCP/IP-TOOLS TN3270-E Server Version V 249 fd00:9:152:40:840:ffff:8511/09/2010

```

Again, select DBDCCICS and press **Enter** to display the VSE sign-on screen. You can use the same setup with any other TN3270 client, like Open Text Host Explorer.

6 Setting up a dual-stacked system

This chapter describes the setup of a dual-stacked system with an IPv4 stack coupled to an IPv6 stack. This setup has the advantage that your applications work transparently on IPv4 and IPv6 networks.

All types of requests are first routed to the IPv6 stack, which recognizes IPv4 packets and sends them to the IPv4 stack for processing.

Refer to

- “IPv6/VSE User’s Guide” for more details on the COUPLED command.
- “IPv6/VSE Installation Guide” for more details on configuring a dual-stack system.

7 Setting up printer sessions

This chapter discusses how to setup TN3270E printing.

7.1 LPR versus TN3270E

LPR/LPD is a platform-independent printing protocol for remote printing that allows multiple platforms to print to the same printer without any extra configurations. This requires an LPD (Line Printer Damon) on the platform where the printer is connected.

TN3270E provides printing to workstation printers without the need for an LPD. However, it requires an emulator program with TN3270E support. With TN3270E the 3270 print data stream is passed unchanged to the TN3270E printer client software running on a remote PC. It is the TN3270E printer client's function to translate the data and adjust the print output including font, pitch, and so on.

A TN3270E server has more than just 3270 terminal display capabilities. It can also support the SNA print data stream. It accepts the print data stream from the application and forwards it to the TN3270E client running on the workstation. The workstation can then print the data using normal workstation printer facilities.

7.2 TN3270E setup

Here is a simple BSTTVNET startup for printers. BSTTVNET will accept connections using port 5023 for the 3 TN3270E printer sessions defined. The DIRECT/LPR/FTP/FTPP sessions are non-SNA. See chapter “Printing without using a TN3270E Client” in the IPv6/VSE User’s Guide. The DIRECT and LPR type printer session are widely used.

```
// OPTION SYSPARM='10'
// EXEC BSTTWAIT,SIZE=BSTTWAIT
/*
// EXEC BSTTVNET,SIZE=BSTTVNET,DSPACE=3M
ID 10
OPEN 127.0.0.1 5023
*
APPLID BSTTVNET PRINTER SHARING APPLICATION
*
PRINTER P001 BSTTVNET
PRINTER P002 BSTTVNET
PRINTER P003 BSTTVNET SCS
*
DIRECT  DIR  BSTTVNET 192.168.1.101  9100  *
LPR     LPR  BSTTVNET 192.168.1.60    *      *      hp2505
FTP     FTP  BSTTVNET 192.168.1.60    *      *      tstuser   tstpswd

*
ATTACH TN3270E
/*
```

BSI recommends running a separate BSTTVNET partition for TERMINAL and PRINTER/DIRECT/LPR sessions.

The following table shows the CICS TYPETERMs and VTAM LOGMODEs to be used for particular printers.

| Printer | CICS Typeterm | VTAM Logmode |
|---------------------|---------------|--------------|
| CICS printer | VSEDSCP | SPDSCPRT |
| SNA LUI SCS printer | VSESCSPA | SPSCSPRT |

For more details refer to chapter “Using the TN3270E Server” in the IPv6/VSE User’s Guide.

7.3 Sample setup

This section shows the definitions from one sample setup with some typical printer applications.

7.3.1 List of printers

The following printers are used in the sample setup.

| Printer Name | Typeterm | Logmode | Description |
|--------------|----------|----------|---|
| ADV3 | BSIRAPS | SPDSCPRT | Tractor feed Matrix and Laser order form, Vertical A4 |
| ADV4 | BSIORDRE | SPSCSPRT | Matrix, Horizontal on preprinted paper |
| ADV5 | BSIORDST | SPSCSPRT | Laser, Vertical order A4 |
| ADV6 | BSIORDRE | SPSCSPRT | Laser, Used from different applications with different layouts PCOMM client PDT |
| ADV7 | BSIRAPS | SPDSCPRT | Matrix, commonly for printing lists from Power LST Q. Used with CA/Raps. |
| ADV8 | BSIFRAKT | SPDSCPRT | Laser, Transport letter Vertical A4 |
| ADV9 | BSIRAPS | SPDSCPRT | Small Receipt from Cash Register machine in shops. |

7.3.2 CICS Typeterm definitions

This table shows the Typeterm definitions for the above listed printers.

| TYpeterm | BSIFRAKT | BSIORDRE | BSIORDST | BSIRAPS |
|-------------|-----------|----------|----------|---------|
| Group | ADTYPE | | | |
| DEvice | 3270P | SCSPRINT | SCSPRINT | 3270P |
| TERmmodeL | 2 | | | 2 |
| PRINTErtype | 3284 | 3284 | 3284 | 3284 |
| PAGEsizE | 024 , 080 | 016,120 | 022,080 | 024,080 |
| ALTPage | 000 , 000 | | | 016,120 |
| AUTOPage | Yes | | | |
| DEFscreen | 024 , 080 | | | 024,080 |
| ALTSCreen | 000 , 000 | | | 016,120 |
| FOrmfeed | No | | | Yes |
| SENdsizE | 256 | | | 00000 |
| RECEivesizE | 256 | | | |
| BRacket | Yes | | | |

| | | | | |
|-------------|-------------|--|--|--|
| AUTOConnect | No | | | |
| ATi | Yes | | | |
| TTi | Yes | | | |
| Createsess | Yes | | | |
| RELreq | Yes | | | |
| DIscreq | Yes | | | |
| Nepclass | 0 | | | |
| SIgnoff | Yes | | | |
| Xrfsignoff | Noforce | | | |
| ROutedmsgs | All | | | |
| LOGOnmsg | No | | | |
| BUILDchain | No | | | |
| USerarealen | 255 | | | |
| Ioarealen | 00001,00000 | | | |
| UCtran | No | | | |

7.3.3 BSTTVNET JCL

The following JCL starts a BSI printer server to use the sample printers. This Server setup is only for printers and should be connected through the IP4 stack.

```
* $$ JOB JNM=BSITELNP,CLASS=H,DISP=D
* $$ LST DISP=H,CLASS=Q
// JOB BSITELNP Printer Server for TELNET ACCESS FROM PCOMM V6
// LIBDEF *,SEARCH=(PRD2.CONFIG,BARNARD.IPV6)
// OPTION SYSPARM='44'
/*
// EXEC BSTTVNET,SIZE=BSTTVNET,DSPACE=3M,OS390,TASKS=ANY
ID 44
OPEN 192.168.1.61 2023
SBCS DN_03
*
APPLID BSTTVNET PRINTER SHARING APPLICATION
*
PRINTER TADV3 BSTTVNET
PRINTER TADV4 BSTTVNET SCS
PRINTER TADV5 BSTTVNET SCS
PRINTER TADV6 BSTTVNET SCS
PRINTER TADV7 BSTTVNET
PRINTER TADV8 BSTTVNET
PRINTER TADV9 BSTTVNET
ATTACH TN3270E
/*
/&
* $$ EOJ
```

7.4 Node error program

The following is a sample node error program. Note that the ZNEP example from BSI caused a loop in IESX, see lines in red color below.

```
// JOB IESZNEP ASSEMBLE
// LIBDEF *,CATALOG=PRD2.CONFIG
// LIBDEF SOURCE,SEARCH=(PRD1.BASE,PRD1.MACLIB)
// OPTION ERRS,SXREF,SYM,CATAL,NODECK
```

```

PHASE DFHZNEP,*
INCLUDE DFHEAI
// EXEC ASMA90,SIZE=(ASMA90,64K),PARM='EXIT(LIBEXIT(EDECKXIT)),SIZE(MAXC
-200K,ABOVE)'
* $$ END
// ON $CANCEL OR $ABEND GOTO ENDJ2
// OPTION NOLIST,NODUMP,DECK
// EXEC DFHEAP1A,SIZE=512K
*
      PUNCH ' CATALOG IESZNEP.OBJ REP=YES'
      DFHSNEP TYPE=INITIAL,NAME=DFHZNEP
*
NEPBASE EQU 10           ERROR PROCESSOR BASE REGISTER
*
      DFHSNEP TYPE=ERRPROC,                                     X
      CODE=(10,11,D1,A7,61,57,49),GROUP=01
      USING NEPROC01,NEPBASE   DEFINE BASE
      LR    NEPBASE,EPBAR    LOAD BASE REGISTER
      ST    14,NEPEPRS     SAVE RETURN REGISTER
*
* CATCH POWER OFF AT SNA TERMINALS
      CLI TWAEC,X'61'      IS ERRORCODE=61 ?
      BNE NOT61            ..NO
      CLC TWASENSR(2),=X'0831' IS SENSECODE=0831 ?
      BNE RETURN           ..NO
      OI   TWAOPT3,TWAONCN SET CLSDST BIT
      B    ACTION
*
NOT61 DS 0H
ACTION DS 0H
*
      EXEC CICS LINK PROGRAM('IESCLEAN') COMMAREA(NEPCABEG) ,
*
* The below two lines from the Barnard example caused a loop in IESX.
* Removing these lines solved the problem.
*      CLI TWAEC,X'10'      EC=10?
*      BE YESD1             NO.
      CLI TWAEC,X'11'      EC=11?
      BE YESD1             NO.
      CLI TWAEC,X'D1'      EC=D1?
      BNE NOTD1            NO.
*
YESD1 DS 0H
      OI   TWAOPT3,TWAOINT   SET CREATE
      NI   TWAOPT3,X'FF'-TWAONINT RESET NOCREATE
NOTD1 DS 0H
*
* Link to a vendor Znep
      EXEC CICS LINK PROGRAM('MENUNEP')                               *
      COMMAREA(DFHNEPCA) LENGTH(=AL2(NEPCALEN))
*
RETURN DS 0H
      L    14,NEPEPRS       RESTORE REGISTER
      BR   CSVTBAR        RETURN TO NEP
      LTORG
      DFHSNEP TYPE=FINAL
      END   DFHNEPNA      NEP ENTRY POINT
*/
/. ENDJ2
// EXEC IESINSRT
/*
// IF $MRC GT 4 THEN

```

```
// GOTO NOLNK
// EXEC LNKEDT,SIZE=256K,PARM='MSHP'
/. NOLNK
/&
* $$ EOJ
* $$ END
/&
```

8 Known problems

This section shows some problems we had in our test setup.

8.1 VSE cannot be reached

Symptom:

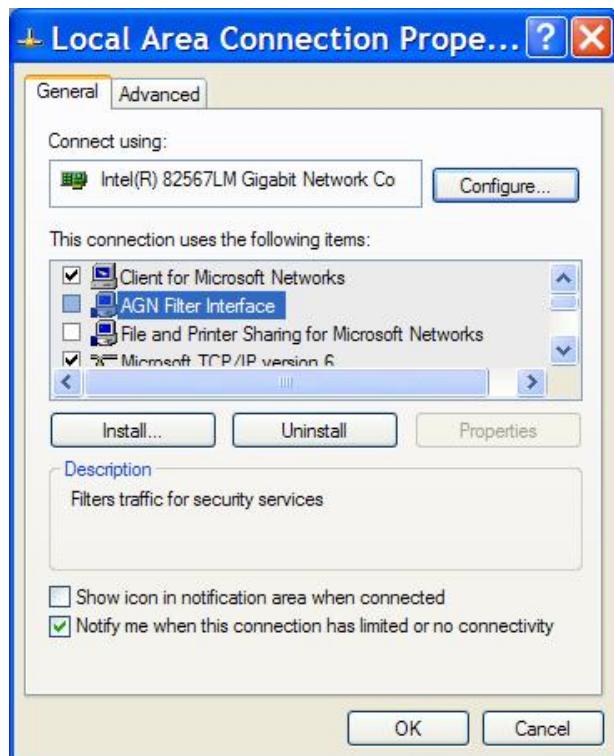

The VSE system is unreachable in the IPv6 network.

Possible reason:

In our test setup the reason for this problem was the AT&T network dialer version 7.6.3, which breaks IPv6 on Windows XP. See

<http://attnetclient.com/forum/viewtopic.php?f=4&t=1129>

The solution was to uncheck the "AGN Filter Interface" Box in the Local Area Connection's settings during the IPv6 tests.

If you are not using the AT&T dialer, you might check other installed programs for possibly influencing IPv6.

8.2 *BSTT075E LUNAME NOT AVAIL*

Symptom:

Message BSTT075E is issued repeatedly on console.

Possible reasons:

- Printer sessions are just closed without disconnecting first.
- The same printer-session is started twice.

The problem is solved by using the REACTIVATE command, e.g.

```
reactivate tpbpa
```
