Agenda

IBM Storage & SDI

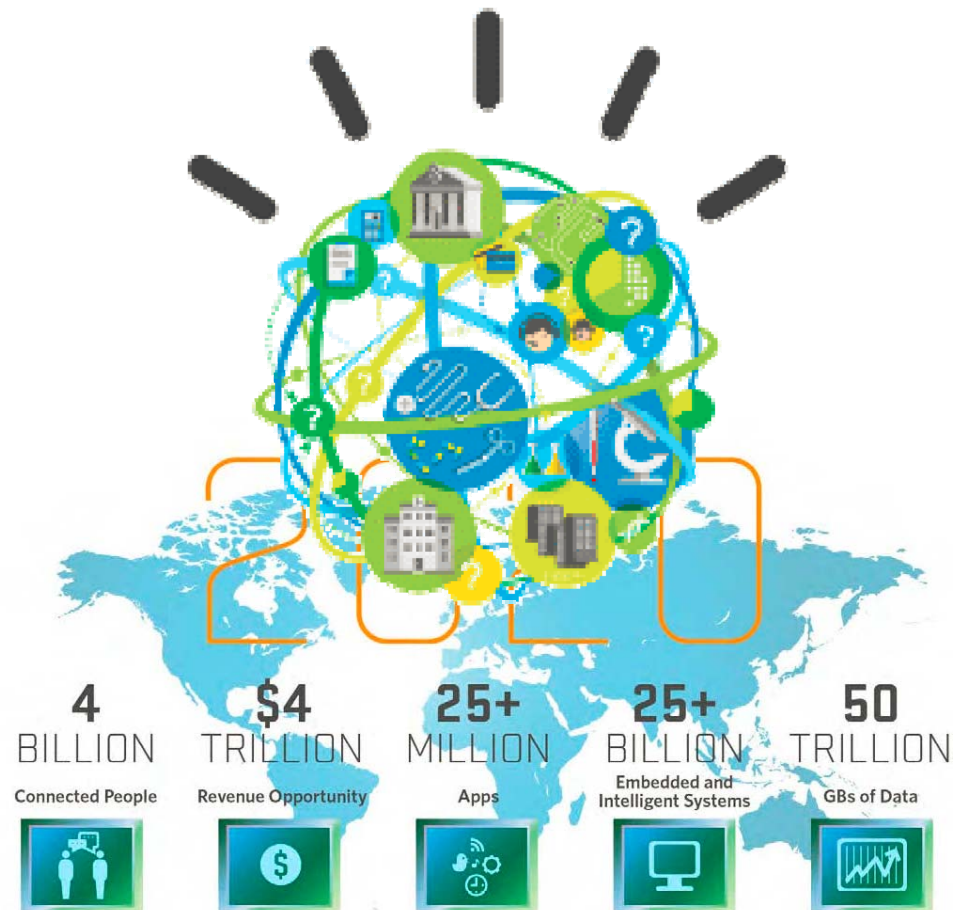

- The Storage Industry – Trends and Developments
- Overview IBM Storage Solutions
- DS8880 Family of Products
- The Future of Tape

Megatrends in the Storage Market

IBM Storage & SDI

- Software Defined Storage
- Cloud/Hybrid Cloud
- Transition to Flash
- (Hyper-) Converged Systems

Bimodality in Storage

IBM Storage & SDI

...transformation to adapt new business models while preserving core IT operation

Flash – IBM Flashsystem Family

Traditional Disk Systems and Tape Systems

Commodity Hardware, Hybrid Cloud

IBM Storage Portfolio Q4 2017:

IBM SDS und SDI

Traditional Workload

IBM Spectrum Accelerate

IBM Spectrum Virtualize

New-generation Workload

IBM Spectrum Scale

IBM Cloud Object Storage

Data Management Products

- Snapshots to the Cloud
 - Spectrum Virtualize
- Replication to the Cloud
 - Spectrum Virtualize
 - Spectrum Accelerate
 - Spectrum Scale

IBM Copy Data Management

Copy Data Management (CDM) is an IT modernization technology that focuses on making **use of existing data** in a manner that is efficient, automated, scalable and easy to use, delivering the data access that is urgently needed to transform IT.

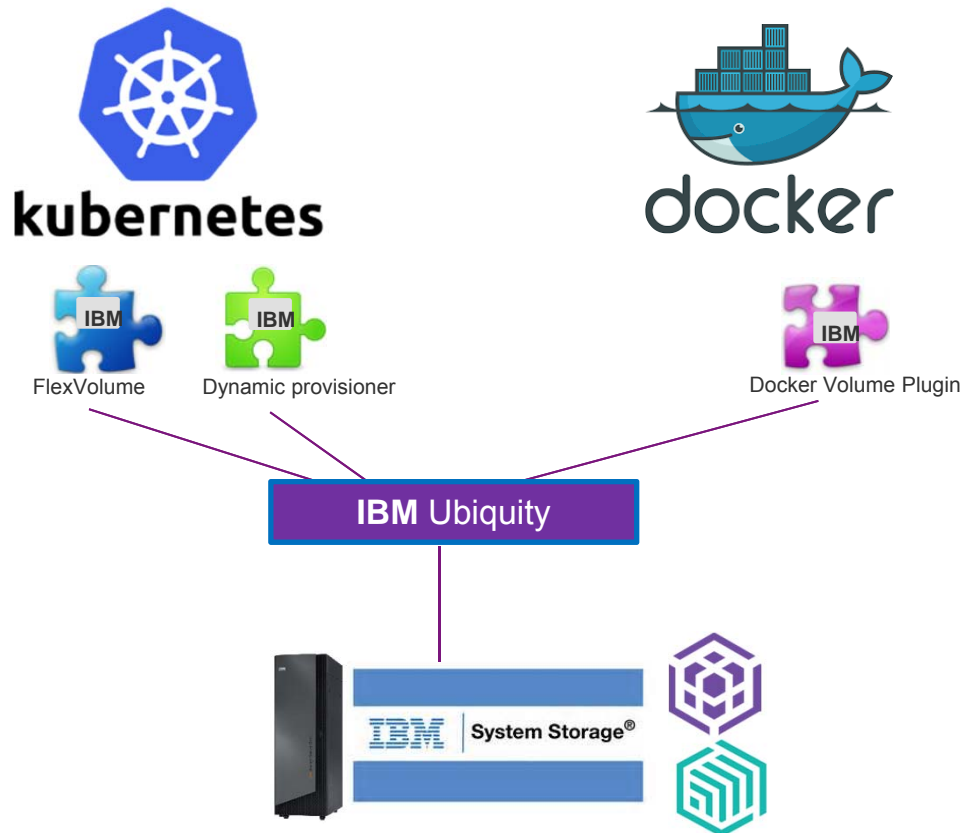

“There’s a couple different approaches to CDM that are out there. If you can, you don’t want to create a whole other separate storage silo. Because that’s not really saving you in terms of capital savings.”

The more you can do to manage data “in-place” is really going to give you an edge up in terms of economics.”

*Laura DuBois
IDC – VP of Storage

Transition to Flash

Why Flash?

- **Fast storage**
- **Predictable performance**
- **Fast applications**
- **Stable applications**
- **Far fewer storage devices**
- **Much lower environmental impact**
- **Fewer servers**
- **Lower Software Licensing**
- **Lowered Administration Cost**
- **Much better device level reliability**

All-Flash for all workloads

“secondary economic benefits of flash deployment at Scale”

INDUSTRY DEVELOPMENTS AND MODELS
Justifying Investment in All-Flash Arrays

Eric Burgener

IDC OPINION

During the course of research efforts in the all-flash array (AFA) space, IDC is still encountering IT executives, particularly CIOs and CFOs, who have an outdated perspective on relevant cost metrics for comparing all-flash solutions with legacy hard disk drive (HDD)-based systems. In IDC's view, flash is an absolute requirement for performance reasons in any 3rd Platform computing environment. While most understand the need for flash performance, there is still a subset that does not view the broader use of flash in the enterprise as cost effective. AFA vendors have struggled to adequately explain what IDC refers to as the "secondary economic benefits of flash deployment at scale" to prospective customers that are often still using the storage metrics of a bygone era to evaluate flash cost-effectiveness. More than 10,000 AFAs are deployed in production. The AFA market is one of the fastest-growing subsegments of the overall enterprise storage space with a compound annual growth rate (CAGR) of 21.4% through 2020, and AFAs are already being used by a number of organizations – both enterprises and service providers – as general-purpose primary storage platforms hosting multiple mission-critical applications. In an effort to more clearly explain the economic benefits of an "all flash for primary storage" strategy, this IDC study provides a business-level discussion of the financial advantages AFAs can bring to the table when used as a general-purpose storage platform. These benefits span six areas, each of which contribute to a compelling total cost of ownership (TCO) story for AFAs. It is crucial to understand the impact of storage efficiency technologies to be able to fully evaluate the TCO of an AFA in any environment. With a good understanding of each of these contributions, it is much easier for executive management to see how the financial advantages of all-flash array deployment are compellingly better today than those offered by HDD-based alternatives. The six areas that lower the AFA TCO are:

- Far fewer devices to meet performance requirements
- Much lower energy and floor space consumption
- Fewer application servers
- Lower software licensing
- Lowered administration costs
- Much better device-level reliability

FlashSystem 900

Optimize CapEx and OpEx with low latency, ultra-dense flash

- **3X capacity to 180TB effective capacity** with new 3D TLC in 2U
- **Inline data compression (2:1) with no performance impact**
 - Next generation FlashCore technology
- **High performance you can count on**
 - Consistent response time; latency as low as 90 microseconds
- **Enhanced user experience**
 - Consistency (cross-generation familiarity)
 - Visualization of effective capacity
- **Centralized encryption key management**
 - SKLM (AES 256); backwards compatible
- **7-year flash wear guarantee**
- **Foundation of the entire FlashSystem family and FlashSystem based Versastack**

Storage Media...the future in Sight

Cross Point Structure
 Perpendicular wires connect submicroscopic columns. An individual memory cell can be addressed by selecting its top and bottom wire.

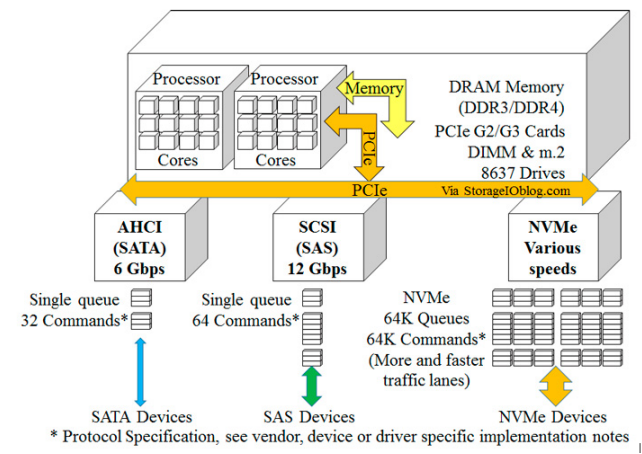

Non-Volatile
 3D XPoint™ Technology is non-volatile—which means your data doesn't go away when your power goes away—making it a great choice for storage.

High Endurance
 Unlike other storage memory technologies, 3D XPoint™ Technology is not significantly impacted by the number of write cycles it can endure, making it more durable.

Stackable
 These thin layers of memory can be stacked to further boost density.

Selector
 Whereas DRAM requires a transistor at each memory cell—making it big and expensive—the amount of voltage sent to each 3D XPoint™ Technology selector enables its memory cell to be written to or read without requiring a transistor.

Memory Cell
 Each memory cell can store a single bit of data.

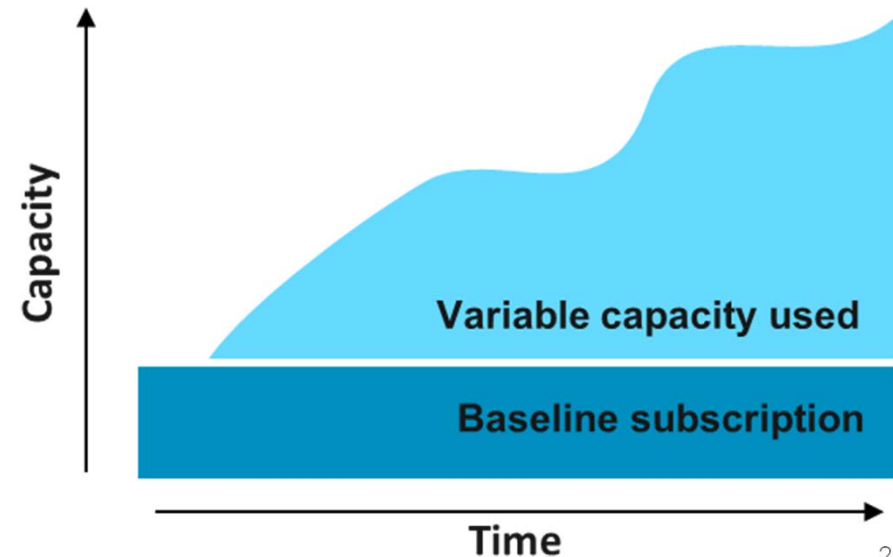

Storage Utility Model

Benefits

The Storage Utility Offering program provides End Users with the ability to pay for storage capacity based on their actual monthly usage, which may increase or decrease monthly.

It is designed for **End Users with high rates of storage growth** needing storage capacity immediately available who can't afford the time required to go through the procurement process each time they need to increase capacity.

- Capacity is ready to use whenever needed
- Pay for what you use, when you use it
- Flex-up and flex-down the variable charge
- Asset title remains with IBM
 - Implemented as OPEX via an IGF Lease
- Model promotes increased utilization with decreased costs

*DS8880
Family of Products*

The DS8880 Family

IBM Storage & SDI

DS8884 and DS8884F

Hybrid and All-Flash Block Storage
Lowest entry cost for midrange enterprises
256 GB Cache (DRAM)
64 16Gb FICON or FCP Ports
192 High Performance or High Capacity Flash
or 768 HDD plus 96 HP/HC Flash
19" Rack
Single phase Power

DS8886 and DS8886F

Hybrid and All-Flash Block Storage
High performance for large enterprises
2 TB Cache (DRAM)
128 16Gb FICON or FCP Ports
384 High Performance or High Capacity Flash
or 1536 HDD plus 192 HP/HC Flash
19" Rack
Single / three phase Power

DS8888F

Fastest All-Flash Block Storage
Industry's fastest T1 Subsystem
2 TB Cache (DRAM)
128 16Gb FICON or FCP Ports
768 High Performance or High Capacity Flash
19" Rack
Three phase Power

DS8880 Success

During 1Q17, DS8000 increased leadership by 2% in the external storage market for mainframe environments

IBM DS8880 Highlights

Bulletproof hybrid- and all-flash data systems, made for the cognitive business in the digital era

PERFORMANCE

- All-flash configuration
- Low latency storage to open up new business opportunities
- Up to 2.5 million IOPS
- Built on Power8 platform

SYNERGY

- Deep synergy with IBM z Systems and integration with IBM Power servers
- The most robust FICON connectivity
- Integration with spectrum control, spectrum virtualize, GDPS and OpenStack
- **Thin provisioning for maximum utilization and reclamation of capacity from deleted data ***
- **Super PAV**

SECURITY

- Self-encrypted flash drives
- **Key Interoperability Management Protocol (KMIP)**
- **Syslog protocol**

AVAILABILITY

- More than six 9's availability
- Flexible replication (IBM FlashCopy, Metro Mirror, Global Mirror, Metro/Global Mirror, Global Copy & Multiple Target Peer-to-Peer Remote Copy (MT-PPRC))
- 3-site replication

EFFICIENCY

- Intuitive graphical user interface (GUI)
- Innovative DS8880 advanced function license packages
- RESTful and OpenStack APIs to move critical workloads between private & public cloud environments
- **Three-phase power support for DS8888 and now optional on the DS8886**

Highlighted in **BOLD** new features of the DS8880 Release 8.1
Thin Provisioning ESE on CKD as Flash Copy Target for DS8884 and DS8886
Small Extents as Flash Copy Target on CKD and FB for DS8884 and DS8886

DS8880 Flash Configurations

Manage business data growth with up to 3.75x more flash capacity in the same physical space for storage

- DS8884F
 - 192 Flash Drives
 - 64 FICON/FCP ports
 - 256GB cache memory

730 TB

- DS8886F
 - 384 Flash Drives
 - 128 FICON/FCP ports
 - 2TB cache memory

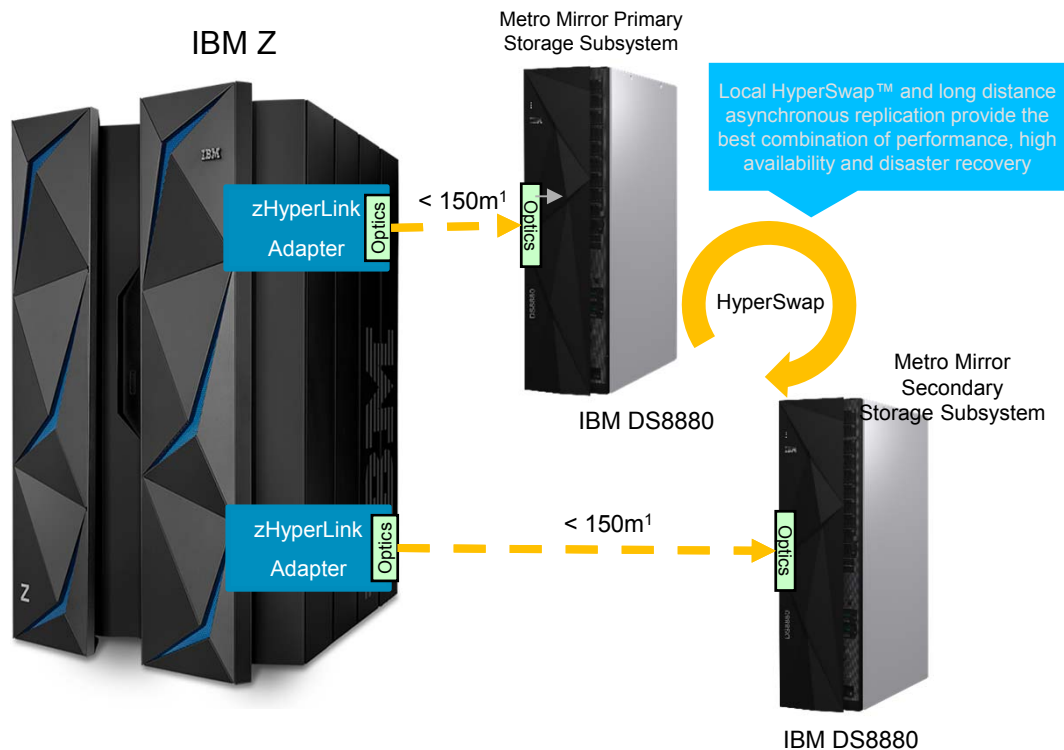

1460 TB

- DS8888F
 - 768 Flash Drives
 - 128 FICON/FCP ports
 - 2TB cache memory

2918 TB

zHyperLink™ delivers extreme data access acceleration

IBM Storage & SDI

zHyperLink² provides real value:

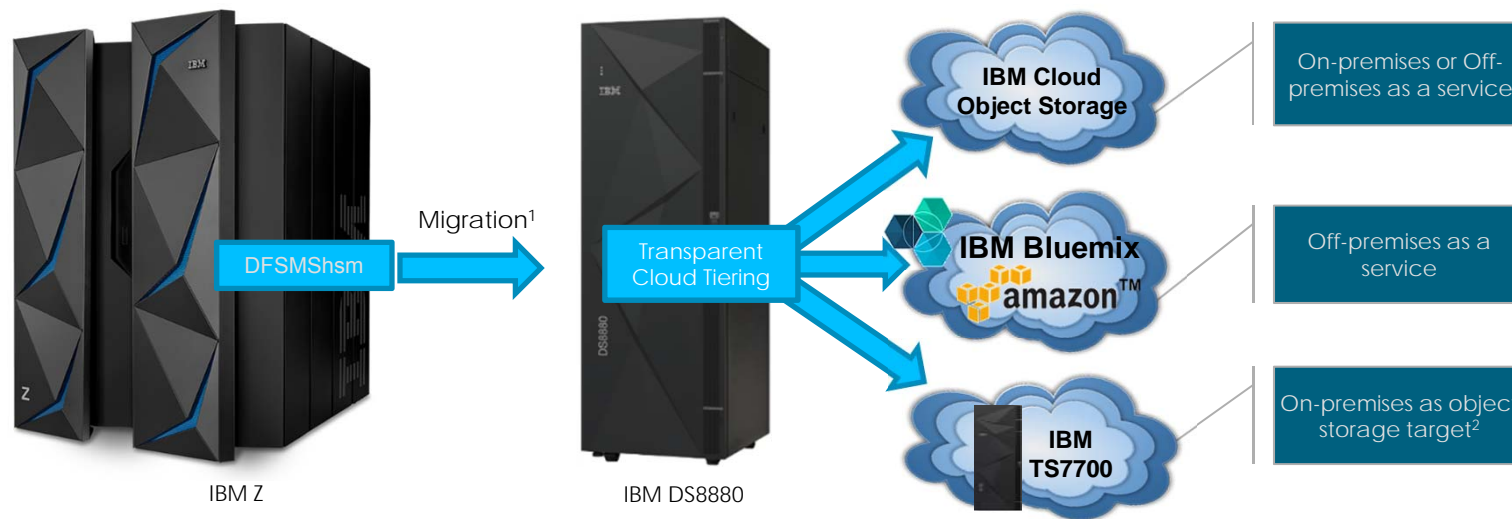

- ✓ Dramatically accelerates the read access to data with less than 20µs response time; this represents a 10x improvement compared to High-performance FICON (zHPF)
- ✓ Cuts the elapsed time of DB2 transaction in half without requiring application changes

¹zHyperLink™ point to point connections should be lower than 150m

² The initial release of zHyperLink will only support read IO

Transparent Cloud Tiering for DS8880

Transparent Cloud Tiering improves business efficiency and flexibility while reducing capital and operating expenses with direct data transfer from DS8880 to hybrid cloud environments for simplified data archiving operations on IBM Z

¹ Migration based on age of data

² For development and testing environments on this first release.

Just how much CPU?

CPU consumed to migrate a 5 GB data set

** Disclaimer: Based on projections and/or measurements completed in a controlled EC12 environment. Results will vary by customer based on individual workload, configuration and software levels.*

The future of Tape

Some facts...real facts...

1. still the cheapest way to store data
2. The only technology to keep pace with projected data growth

Relative Costs of Different Platforms

IBM Lab Rüschlikon: Tape-Technology Demonstration August 2017

**Areal recording density :
201 Gb/in²**

20x TS1155 areal density

→ 330 TB cartridge capacity

Cost advantage of tape will continue to grow!

Why Tape...

- Cost
- Performance (single Stream, Scalability)
- **Security**
- Capacity / Floorspace
- Roadmap

Use Case....

- Data Protection / Backup
- Last Line of Defense (Sicherheit)
- Backup/Restore of big capacities (Performance)
- Archive of „Content-Rich“ Data
- Big Data / Much Data
- Scientific / Engineering Data, Video, CCTV, TV, Automotive
- Cold Data
- Unstructured Data / NAS (Never Access Storage)

IBM Tape Drive History and Roadmap

LTO Generations	LTO-5	LTO-6	LTO-7	LTO-8	LTO-9
New Format Capacity (Native)	1.5 TB (L5)	2.5 TB (L6)	6 TB (L7)	12.0 TB	Up to 25 TB (L9)

IBM Spectrum Archive

Linear Tape File System (LTFS)

Tape usable like a „USB-Stick“

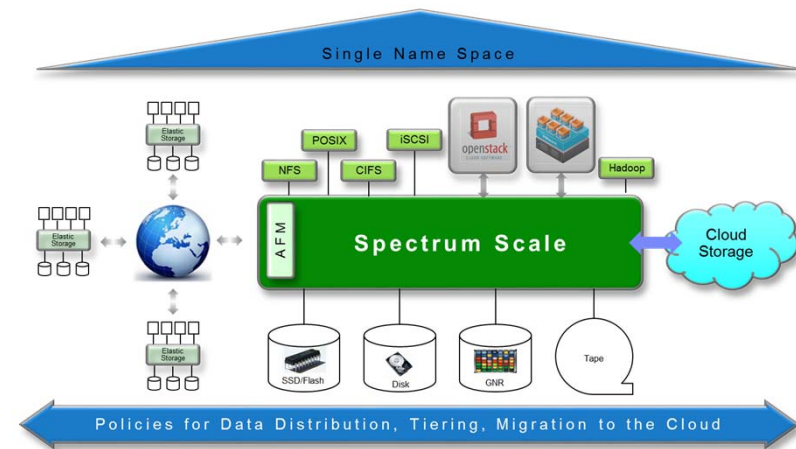

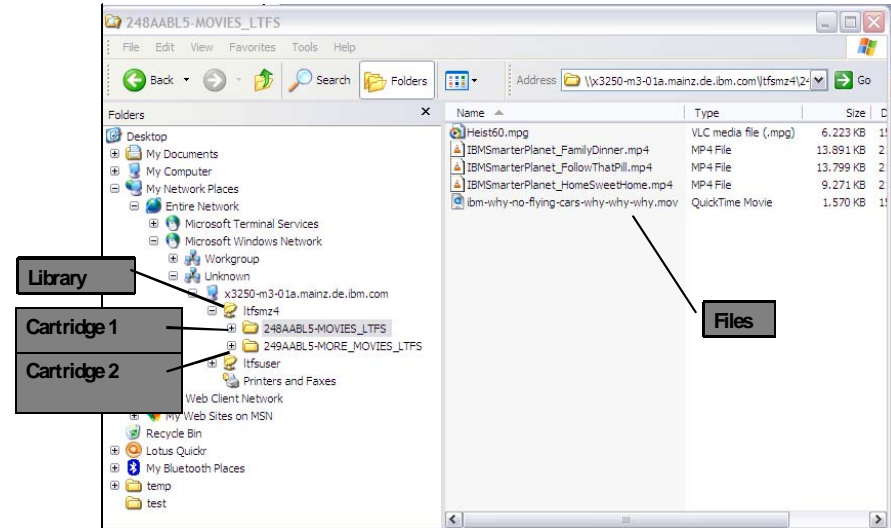

- Tape as a file system
- For Single-Drive and Library

New Use Cases for Tape with LTFS

- Simple Archiving to Tape
- Data Transfer/Exchange

Products:

- Single Drive: LTFS SE (free)
- **Library Version: LTFS LE (free)**
- Integrated into Spectrum Scale: LTFS EE
 - Spectrum Scale & Spectrum Archive

Thank You.
