VSE/ESA 2.6/2.7 VSAM Redirector

The VSAM Redirector is a new VSE/ESA connector, introduced with VSE/ESA 2.6. The VSAM Redirector allows you to redirect all requests to a certain VSAM file into any other file system or database on any other (Java-enabled) platform. VSE/ESA is the client, while the server part runs on any other Java-enabled platform like Windows or Linux on zSeries.

For example you could use the VSAM Redirector to synchronize a VSAM file with a DB2 database running on a Windows or Linux on S/390 or zSeries. By using the VSAM Redirector your existing VSAM programs doesn't require any revisions.

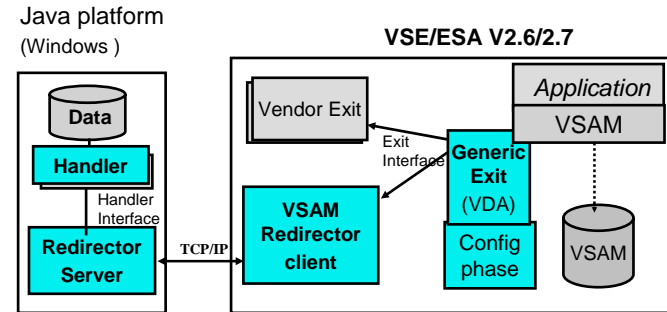

The VSAM Redirector makes use of a so called VSAM Data Access Exit (VDA). This exit intercepts all VSAM requests. The exit gets control at OPEN, CLOSE, and for all data requests (GET, PUT, INSERT,...).

A configuration table is used to define which VSAM files are being "redirected". The VSAM Redirector Client on VSE forwards all requests against a redirected file to the VSAM Redirector Server which then handles the request.

The VSAM Redirector Server is a Java application. It can run on any Java enabled platform.

3

Setup in a VSAM Redirector environment

The setup for a VSAM Redirector environment:

On Windows

- Setup Redirector server
- Adjust the handler(s) for data manipulation

On VSE:

- choose the VSAM files to be redirected
- define the options in the Configuration phase
 - define the type of redirection
 - local (Vendor Exit)
 - remote (Redirector client)
 - for remote redirection choose
 - Synchronization
 - pure remote work

4

Workshop Objective

Redirect VSAM requests to a HTML page on Windows - Overview

Initial state:

→ You have a VSAM file that contains data

FLIGHT.ORDERING.ORDERS

→ You have applications that work with that VSAM file (i.e. batch applications, CICS Application, tools like Ditto)

Goal:

→ Redirect all VSAM INSERT requests to a HTML page on Windows

→ This operation can be done with existing applications (without changing/touching them)

NOTE: The VSAM Redirector Server does NOT require the VSE Connector Client on Windows

Chapter 1. Software prerequisites for Windows

STEP1.1: Verification if Java environment installed

To install the VSE Connector Client, a Java Virtual Machine (JVM) must be installed in Windows.

The JVM can be installed in different flavors.

*To just run Java programs, the JRE 1.3.x or later is needed (Java Runtime Environment),

*to develop/compile Java programs, JDK 1.3.x or higher is needed (Java Developer Kit, which includes the JRE).

To verify if a Java Virtual Machine is installed, open a Command prompt and enter command:

```
java -version
```

You should see something like:

```
Java version "1.3.1"
```

```
Java(TM) 2 Runtime Environment, Standard Edition
```

If the messages above are shown go to [Chapter 2](#).

STEP1.2 Install a Java Environment

If following message (or similar) is shown:

```
java' is not recognized as an internal or external command,  
operable program or batch file.
```

then your system has no Java virtual machine (Runtime Environment) installed or it can not be found in the path.

To install a Java Virtual machine download the code from IBM:

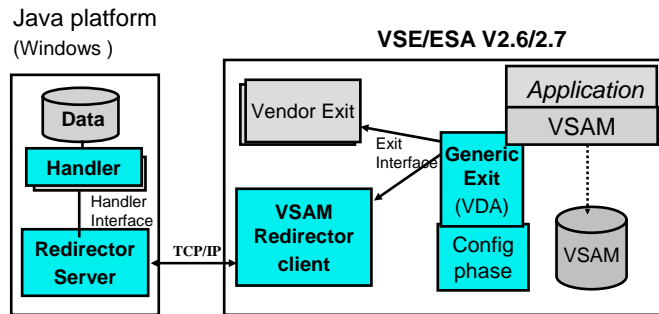

<http://www.ibm.com/developerworks/java/>

or download a SUN Version from <http://www.sun.com>

Install the downloaded JDK 1.3.x. or later.

6

Components in a VSAM Redirector environment

The setup for a VSAM Redirector environment:

On Windows

- Setup Redirector server
- Adjust the handler(s) for data manipulation

On VSE:

- choose the VSAM files to be redirected
- define the options in the Configuration phase
 - Synchronization
 - pure remote access

7

Chapter 2. Setup Redirector Sever on Windows

Download of Redirector server code

The download of VSAM Redirector server for this workshop was already done from the VSE homepage.

The Steps are described in [Appendix A](#)

STEP2.1: Install VSE Redirector Server

In a command prompt enter:

```
C:
cd C:\vsamredir
install.bat
```

This will guide you trough the installation process of the VSAM Redirector Server.

The VSAM Redirector Server consists of:

- * the VSAM Redirector Server code
- * a detailed HTML documentation about the functions and possibilities
- * two sample handlers, one for relational database DB2 and one for HTML
 - * The HTML handler allows, to collect data inserted into a VSAM cluster, on a HTML page on Windows
 - * The DB2 handler allows the synchronization of a VSAM cluster with a remote DB2 database or to redirect all VSAM requests to DB2
- * documentation how to develop own handlers.

NOTE: The VSE Redirector Server does NOT require the VSE Connector Client

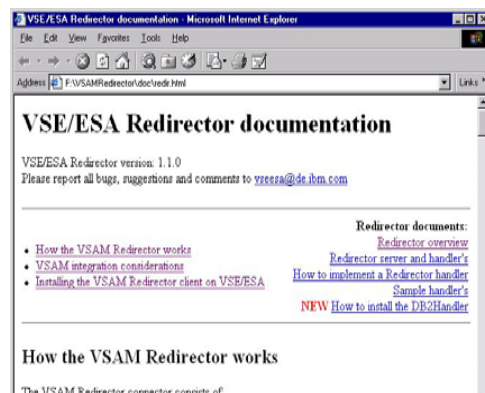

8

STEP2.2: Verify Redirector Server Documentation

To verify that the VSAM Redirector Server is installed properly, open the HTML Documentation:

START -> Programs -> VSAM Redirector -> Online Help

The Main HTML page will be opened.

STEP2.3: Operations with VSAM Redirector server

To start the VSAM Redirector Server, in a command prompt enter:

C:

```
cd C:\vsamredir
run.bat
```

• Commands for Redirector server:

status - shows the status of the server

stop x | all - stop client with number 'x' (show in status) or stop all clients 9

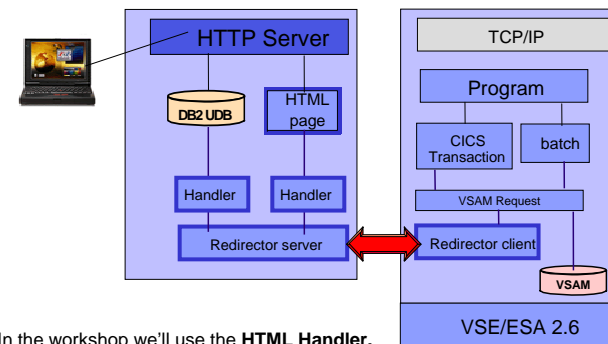

quit - stop all clients and exit server

STEP2.4: Handler specifications

To be able to work via the VSAM access method on VSE (EBCDIC) with data from another platform (ASCII), the most important component is the **Handler**.

Multiple handler can be invoked via the **Redirector server**.

The Redirector server and handler are Java components

In the workshop we'll use the **HTML Handler**.

The description how to use Redirector with a DB2 database is described in [Appendix D](#).

The handler used is stored in directory:
C:\vsamredir\com\ibm\vse\htmlhandler
and is coded in **HtmlHandler.java**

The handler needs to know the structure (mapping) of the VSAM record which will be transferred with each request to it.

In the Lab, the VSAM Cluster **FLIGHT.ORDERING.ORDER** and its map **ORDERS_MAP** will be used.

In the HTML handler:

C:\vsamredir\com\ibm\vse\htmlhandler\HtmlHandler.java

the mapping for the VSAM record is hard coded.

The Record Layout of the **FLIGHT.ORDERING.ORDERS** cluster is defined as follows:

Offset	Length	Type	Key	Field Name	Description
0	20	STRING	no	FIRST_NAME	First Name
20	20	STRING	no	LAST_NAME	Last Name
40	4	UNSIGNED	no	FLIGHT_NUMBER	Flight Number
44	4	UNSIGNED	no	SEATS	Seats
48	1	BINARY	no	NON_SMOKE	Smoker 0=no

The Record length is 49 Bytes

The handler will be used as it is shipped in the VSAM redirector package available for free download on the VSE home page.

The handler is a program that can be modified and adapted to your private needs. [Appendix C](#) shows how to change the HtmlHandler.

Chapter 3. VSE Setup to redirect VSAM requests

STEP3.1: Configuration for Redirector Client on VSE/ESA

The configuration on VSE is done for the VDA (VSAM Data Access) Exit in a Configuration member.

Based on these settings the Redirector client will be invoked or not.

Logon to your VSE system using the icon on your desktop:

On Command line Enter:

d vse27

A

On the CICS logon screen enter:

User: **LLxx** (xx- is your team number 00 – 10)

Password: **linlabxx**

You are now in the **Interactive User Interface (UI) of VSE.**

ENTER the numbers of the Libraries you want to access
PRIMARY..... 21 You may read and write in this library
SECONDARY.... ____ You may only read from this library

SPECIFY optionally
PREFIX..... ____ To list only members whose names begin
with the specified prefix.

SELECT which library you want to display
OPTION..... 1 1 = Primary Library
2 = Secondary Library

PF1=HELP 2=REDISPLAY 3=END 4=RETURN
-----
Connected to remote server/host 9.82.1.89 using port: JIBM 4019 LaserPrinter on LPT1: 06/023
```

Hit the **<enter>** key to see the member in your primary library.

13

We have to setup the Configuration phase (**IESRDCFG.PHASE**).

In this phase we have to define which VSAM cluster should be redirected to which remote location, and optionally decide which requests.

For that a skeleton in ICCF Library 59 is shipped, called **SKRDCFG** **It was copied to your primary library.**

The definitions for the redirected file were extracted into member **RDCFGxx** where xx is your team ID

This was done to be able to build one phase with the settings from all attendees of this workshop.

We want to redirect the requests for the:

- VSAM cluster: **FLIGHT.ORDERING.ORDERS.TEAMxx**
- in VSAM catalog: **VSESP.USER.CATALOG**

Edit skeleton **RDCFGxx** and change the text in the configuration member.

Enter:

1 <enter> (in the left margin of RDCFGxx)

```
Session E - [24 x 80]
File Edit View Communication Actions Window Help

- SKRDCFG _____ 03/10/2004 MILD -

PF1=HELP 2=REFRESH 3=END 4=RETURN 6=ADD MEMBER
9=SORT.DATE 10=SORT.NAME 11=SORT.SIZE 12=LIST QUEUE

LOCATE MEMBER/LIST QUEUE PREFIX ==> _____ MEMBER PREFIX (PF2) ==>
-----
Connected to remote server/host 9.82.1.89 using port: JIBM 4019 LaserPrinter on LPT1: 10/022
```

14

Enter **CASE M** in the command line to switch to mixed case mode before editing.
Change the text as shown below. Please keep track of the mixed case format.

```

IESRDENT CATALOG='VSESP.USER.CATALOG',           X
        CLUSTER='FLIGHT.ORDERING.ORDERS.TEAMxxx', X
        EXIT='IESREDIR',                          X
        OWNER=REDIRECTOR,                         X
        IP='x.x.x.x',                              X
        HANDLER='com.ibm.vse.htmlhandler.HtmlHandler', X
        OPTIONS=' '

```

Replace x.x.x.x with the IP address of your PC. Enter **ipconfig** in a command prompt to find out which IP address has been assigned to your PC.

The most important parameter is **OWNER**:

OWNER=VSAM means the READ requests will be done from the VSAM cluster and the INSERTS will be done to VSAM and to the remote site specified in IP. That means a synchronization takes place.

OWNER=REDIRECTOR means all requests are redirected to the remote site. The **HANDLER** parameter specifies the Java class that should be invoked for this VSAM cluster by the Redirector server on Windows.

```

```

16

Submit **SKRDCFG** and check for RC=0000 (this is only to test for errors)
 Enter: **7 <CR>** (in the left margin)
 Enter: **RDC** to the *List queue prefix* field and hit **PF12** (look for your Team name in List queue)

Enter **1** to display the member and **PF12** to go to bottom.
 If the **RC=0** tell the instructor and he'll activate your definitions.

17

Chapter 4. Use a standard program to redirect VSAM requests

STEP4.1: Copy the VSAM file to a remote file (HTML)

Make sure the Redirector server is started on your Windows PC ([STEP2.6](#))

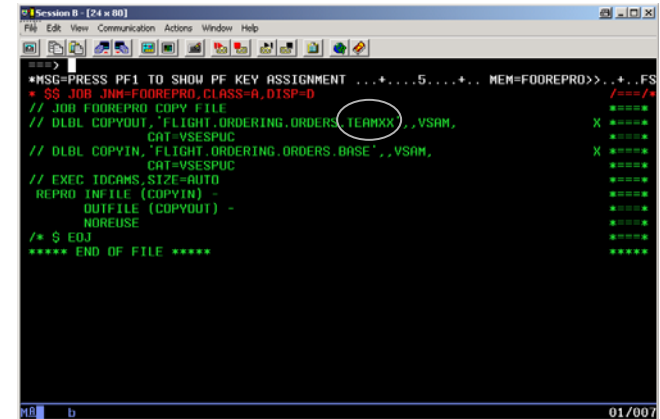

Use **IDCAMS REPRO** to copy the VSAM file to another VSAM file which is redirected to a remote location. The copy job will transfer all VSAM records to Windows and generate an HTML page via the HTMLHandler.

On the *main IUI Panel* enter:

(To get there hit **PF3** until you see the screen title '*VSE/ESA function selection*')
51<Enter>

1 (Edit) for file **FOOREPRO**

Update the file name with your team number:

Enter:

PF3 (Exit and save)

7 (Submit the job)

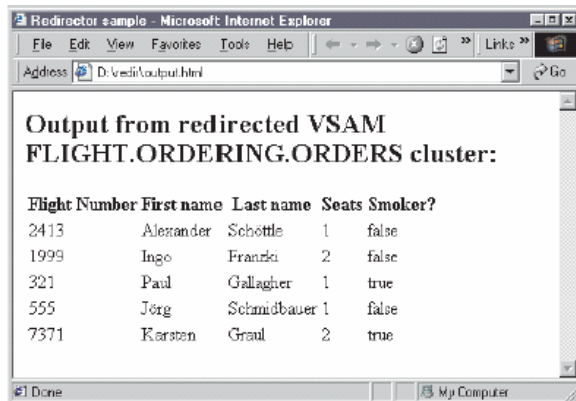

18

The Redirector Server Console on Windows should show some messages with the number of records processed and that the **output.html** page was created.

Open the HTML page in Windows to verify that the Copy function did transfer your Data from VSAM to Windows, translated them from EBCDIC to ASCII, and generated a HTML file.

In the Internet Explorer, open the file (File -> Open... -> Browse)
C:\vsamredir\output.html

You should see the records from your VSAM file:
FLIGHT.ORDERING.ORDERS . TEAM

Similar to a batch program, the Redirector can work with a CICS transaction. The description for DITTO is in [Appendix B](#).

Summary

Major Steps to install VSAM Redirector Server on any Java Platform

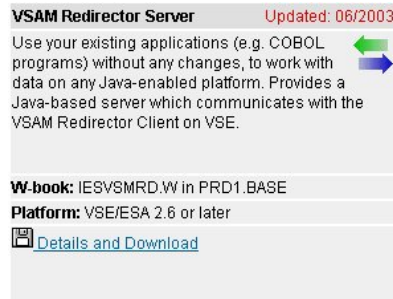

- ✓ install Java Runtime Environment (JRE) or
- ✓ Java Developer Kit (JDK)
 - ✓ free download from SUN or IBM
 - ✓ version 1.3.x or later
 - <http://www.ibm.com/developerworks/java/>
- ✓ download VSAM Redirector Server
- <http://www-1.ibm.com/servers/eserver/zseries/os/vse/support/vseconn/redir.html>
- ✓ install VSAM Redirector Server
 - ✓ in a command prompt run: [install.bat](#)
- ✓ Configure the VSAM clusters to be redirected on the VSE side using skeleton SKRDCFG from ICCF lib 59.

Appendix A: Download from the Internet

Open the VSE Homepage with a web browser:
<http://www-1.ibm.com/servers/eserver/zseries/os/vse/>
Click on "Service and Support" on the left side
and then on "e-business connectors and utilities".

The page opened contains the VSE Connector Client and other tools and Add-Ons that can be downloaded for free, like VSAM Redirector server.

Navigate to the **VSAM Redirector Server** which represents the remote component of the VSAM Redirector function.

Click on:

Details and Download

The page explains the most important functions of the VSAM Redirector Server and the communication with VSE. It also mentions that a **Java** environment is needed.

To Download latest Code. Click on:

redir270-pq74694.zip (VSE 2.6 and 2.7).

The file name may vary since it contains an APAR number. Please make sure you have applied the corresponding APAR on your VSE system.

21

Appendix B. Use standard program to redirect VSAM requests

Access the VSAM file with Ditto

Similar to a batch program (Chapter 4), the Redirector can work with a CICS transaction. Here the description how to use DITTO to write to a HTML page on Windows.

Make sure the Redirector server is started on your Windows PC (*STEP2.7*)

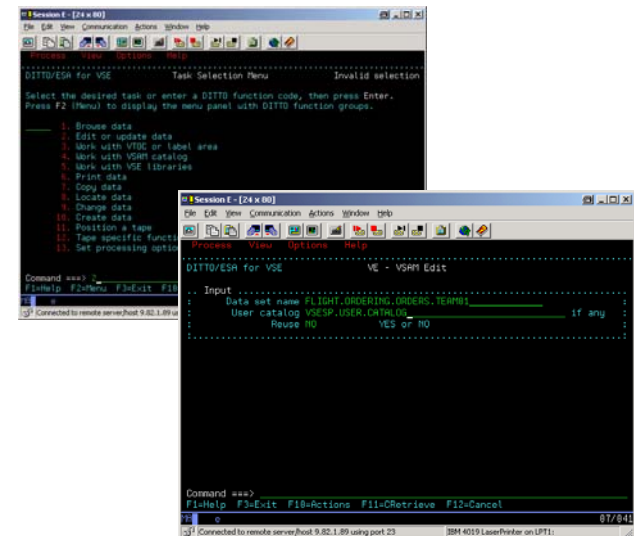

Use **Ditto** to edit a VSAM file. All inserts, and only the inserts, that will be done in VSAM, will be also redirected into a HTML page in Windows.

On the main UI Panel enter:

(To get there hit PF3 until you see the screen title 'VSE/ESA function selection')

PF6

ditto

Enter:

2 (Edit or update data)

1 (Edit VSAM data)

Enter the VSAM cluster name: **FLIGHT.ORDERING.ORDERS.TEAMxx**

Enter the catalog name: **VSESP.USER.CATALOG**

22

Appendix C. Change the handler on Windows

STEP C.1: Change Handler to read the entire VSAM record as string.

Exit Ditto on VSE (PF3).

Stop the Redirector server on Windows using command **Quit** in the Redirector console window.

To avoid the complexity with Ditto to enter hex values, we'll change the HtmlHandler on **Windows**.

That would allow to use string fields in Ditto for the entire VSAM record.

Use a Windows command prompt and **Notepad** to edit the handler:

C:

```
cd C:\vsamredir\com\ibm\lvse\htmlhandler
```

Notepad HtmlHandler.java

Make following changes:

1. Change the HTML header tag to create an HTML page that will refresh itself all 5 seconds.

```
<html><head><title>VSE/ESA Redirector sample</title>
<meta http-equiv=refresh content=5></head>
```

2. Change the lines in the source as below to read a string of 49 char.

- Define all fields as String:

String firstname, lastname, flightnumber, seats, smoker;

- Make the changes below in the source code (it's in the last 3-rd)

```
    firstname = requestInfo.getString(0, 20);
    lastname = requestInfo.getString(20, 20);
    flightnumber = requestInfo.getString(40, 4);
    seats = requestInfo.getString(44, 4);
    smoker = requestInfo.getString(48, 1);
    smoktmp = requestInfo.getString(48, 1);
    //
    // if(smoktmp.length > 0)
    //     if( smoktmp[0] == 0 )
    //         smoker = false;
    //     else
    //         smoker = true;
    //
    htmloutput.newLine();
    htmloutput.flush();
```

25

STEP C.2: Save and recompile the changed handler

To be able to compile it we have to update the CLASSPATH temporary.

In a *Windows command prompt* enter:

```
set CLASSPATH=VsamRedir.jar;.;%CLASSPATH%
```

C:

```
cd C:\vsamredir
```

```
javac com\ibm\lvse\htmlhandler\HtmlHandler.java
```

STEP C.3: Activate the changed handler

Restart the Redirector server on Windows.

In *the command prompt* enter:

```
run.bat
```

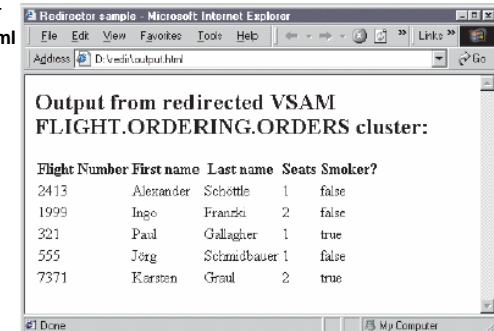

In VSE repeat STEP 4.1

Use Ditto again, in **CHAR** mode (right upper corner) add some records with 49 characters each. **SAVE** the changes you made in VSE.

Open the HTML page

with the Internet Explorer

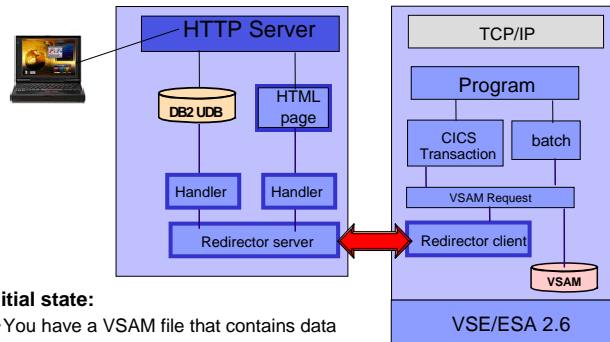

C:\vsamredir\output.html

Now the **output.html** should refresh itself each 5 seconds and show the inserted records.

26

Appendix D: Redirect VSAM requests to a DB2 UDB on Windows

Initial state:

- You have a VSAM file that contains data (i.e. FFSTORES.DEMO.CLUSTER)
- You have applications that work with that VSAM file (i.e. FFST a CICS Transaction accessing FFSTORES)

Goal:

- Redirect all VSAM requests to DB2 UDB on Windows
- Access the data with existing applications (without changing them)

NOTE: The VSAM Redirector Server does NOT require the VSE Connector Client on Windows

STEP D.1: Define a map

Relational databases have columns with specific characteristics.

To move VSAM data into a database, we must know the internal structure and format of the records. Therefore we need a mapping containing all fields of a VSAM record including their offset in the record, length and type. Easiest a map can be created with the Maptool or VSE Navigator.

- Start the VSE Navigator, connect to the VSAM host, and navigate to the VSAM cluster **FFSTORES.DEMO.CLUSTER**.
- Right click on the Cluster, choose "Create map definition". Enter a name for the map, e.g. "FFMAP"
- Right click on the map, choose "Change map definition":

27

Insert the definitions based on the mapping information below.

Mapping of FFSTORES.DEMO.CLUSTER:

Field name	Type	Offset	Length
STOREID	STRING	0	6
STORENAME	STRING	6	25
LOCSTREET	STRING	31	25
LOCCITY	STRING	56	25
LOCZIP	STRING	81	10
LOCCOUNTRY	STRING	91	25
LOCREP	STRING	116	20
STOREN1	UNSIGNED	136	4
STOREN2	UNSIGNED	140	4
LDATE	STRING	144	10
WEBPIC1	STRING	154	20
WEBPIC2	STRING	174	20
ACODE	STRING	194	10

To verify the mapping, use the VSE Navigator to display the VSAM data. Right click on the map, choose "Display VSAM Data". On the "Display Filter" dialog box, press "OK" to display all records (no filter).

STO...	STORENAME	LOCSTREET	
000001	Frechdax	Elbeplatz 2	Boeblingen
000002	Cafe Keese	Reeperbahn 15	Hamburg
000003	Hotel Sacher	Hauptstr. 15	Wien
000004	Cafe Frech	Postplatz 3	Boeblingen
000005	Cafe Frech Filiale 1	Seestrasse 2	Boeblingen
000006	Cafe Frech Filiale 2	Schoenaicherstrasse	Boeblingen
000007	Cafe Frech Filiale 3	Blumenstrasse	Boeblingen

Note: If the structure definition of the VSAM record exists in a Cobol Copy book or PL/I structure, use **MAPTOOL** to import the definitions and generate the map

STEP D.2: Export the mapping to a XML File

The VSAM Redirector "Create DB2 Tables" tool reads the mapping from a XML file. Therefore we export the definitions from Navigator into XML form. Right click on the map and choose "Export map to XML". Enter a filename 28 (e.g. **ffstores.xml**). This file is needed in the next step.

STEP D.3: Create the tables in the DB2 database

To continue with the next steps

-you must have installed a database management system (i.e. DB2).

-you must have a JDBC Driver for it (i.e. db2java.zip in <db2>\java).

-you must be able to connect to the database (userid/password)

Make sure the JDBC driver is in the utility CLASSPATH. You may have to edit the **create.bat/create.cmd/create.sh** batch files as well as the **run.bat/run.cmd/run.sh** batch files and add the JDBC Driver Archive to the classpath:

```
set CLASSPATH=.;xerces.jar;<db2>\java\db2java.zip;
%CLASSPATH%
```

Also the path must setup to contain the DB2 libraries.

Start the "Create DB2 Tables" utility (**create.bat/create.sh** or **START - Programs - VSAM Redirector - Create DB2 Tables**).

Enter following parameters when prompted by the tool:

-**XML Filename**: name of the XML File you exported before (i.e. **ffstores.xml**)

-**DB url**: the JDBC URL for your database, i.e. **jdbc:db2:sample**

-**DB user**: a user id you use for accessing the database

-**DB password**: db users password

-**DB table name**: name of the data table, i.e. **FFSTORES**. This table will contain the VSAM data later on.

-**Map table name**: Enter the name of the table that contains the mapping information, (structure of VSAM record) i.e. **FFSTORES_MAP**. You can use the same map table for several clusters.

-**Map name**: Enter the name of the map, that will be the selection key in the 'Map table' i.e. **FFSTORES**. This name is independent from the map defined with the VSE Navigator.

-**DB system**: Enter **1** for DB/2, **2** for Oracle.

-The tool now imports the XML file and connects to the database.

-Next, the map info table is created (FFSTORES_MAP).

Enter **Yes** to continue.

-The data table is created (FFSTORES).

Enter **Yes** to continue.

-**Cluster Type**: Enter **1** (**KSDS without AIX**).

-**Primary key field**: Enter the name of the key field: **STOREID**.

Press enter to create the table and indexes.

29

Before we can work with data in that database, we have to load/migrate once the whole data from VSAM into the database. To do this we define a 'twin' cluster, with the same characteristics as the one with the data, redirect this cluster and copy (repro) the original cluster into the redirected one.

STEP D.4: Define 'twin' cluster FFSTORES.REPRO.CLUSTER

Define it with the same attributes as FFSTORES.DEMO.CLUSTER:

-KSDS

-Max/Avg. record length: 210

-Key Position: 0, Keylength: 6

STEP D.5: Configure the Redirector for FFSTORES.REPRO.CLUSTER:

Copy skeleton SKRD CFG from ICCF Library 59 to your primary library.

Edit/add an entry to the configuration table. Enter **CASE M** in the command line to switch to mixed case mode before editing.

```
IESRDENT CATALOG='VSESP.USER.CATALOG', X
          CLUSTER='FFSTORES.REPRO.CLUSTER', X
          EXIT='IESREDIR', X
          OWNER=REDIRECTOR, X
          IP='<ip-addr>', X
          HANDLER='com.ibm.vse.db2handler.DB2Handler', X
          OPTIONS='dburl=jdbc:db2:<db>;dbuser=<userid>; X
                  mactable=FFSTORES_MAP;map=FFSTORES; X
                  dbpassword=<password>;dbtable=FFSTORES'
```

-let the job load IESRD CFG into the SVA (Step 2)

-let the job copy IESVEX01 to IKQVEX01 in PRD2.CONFIG (Step 3)

-let the job load IKQVEX01 into the SVA (Step 4)

-let the job load IESRDANC into the SVA, if not already done (Step 5)

-let the job execute IESRD LDA to register the new configuration (Step 6)

-submit and check for RC=0000

30

STEP D.6: Copy FFSTORES.DEMO.CLUSTER into FFSTORES.REPRO.CLUSTER:

Use the IDCAMS REPRO function to copy the contents of FFSTORES.DEMO.CLUSTER into the redirected FFSTORES.REPRO.CLUSTER:

```
* $$ JOB JNM=REPRO,CLASS=A,DISP=L
// JOB REPRO COPY FILE
// DLBL COPYIN, 'FFSTORES.DEMO.CLUSTER',,VSAM,CAT=VSESPUC
// DLBL COPYOUT, 'FFSTORES.REPRO.CLUSTER',,VSAM,CAT=VSESPUC
// EXEC IDCAMS,SIZE=AUTO
REPRO INFILE (COPYIN) -
      OUTFILE (COPYOUT) -
      NOREUSE
/*
/&
* $$ EOJ
```

During the copy process, the VSAM Redirector Client will get control (at open time of FFSTORES.REPRO.CLUSTER) and will connect to the VSAM Redirector Server and to the database. In case this fails, a VSAM open error message will be displayed.

To verify the data in the DB/2 table, issue the following SQL statement in a DB2 command window, or use the DB/2 Control Center:

SELECT * FROM FFSTORES

UNIQRBAC	STOREID	STORENA	LOCSTREET	LOCCTY	LOCZIP	LOCCOUN	LOCREP	STOREI
0	000001	Frechdax ...	Elbplatz 2...	Boeblinge...	71032	Germany ...	Hiller	3i
1	000002	Cafe Kees...	Reeperbah...	Hamburg ...	20000	Germany ...	Domina ...	3i
2	000003	Hotel Sach...	Hauptstr. 1...	Wien ...	11111	Austria ...	Arnold S ...	3i
3	000004	Cafe Frech...	Postplatz 3...	Boeblinge...	71032	Germany ...	Hiller	3i
4	000005	Cafe Frech...	Seestrass...	Boeblinge...	71032	Germany ...	Hiller	3i
5	000006	Cafe Frech...	Schoenaic...	Boeblinge...	71032	Germany ...	Hiller	3i
6	000007	Cafe Frech...	Blumenstr...	Boeblinge...	71034	Germany ...	Hiller	3i
7	000008	Cafe Frech...	Dahlienstr...	Boeblinge...	71034	Germany ...	Hiller	3i
8	000009	Cafe Frech...	Rosenstra...	Boeblinge...	71034	Germany ...	Hiller	3i
9	000010	Cafe Muell...	Marienplatz...	Munich ...	0000080000	Germany ...	Hiller	3i
10	000011	McDonalds...	Main Street...	Melbourne	20000	Australia ...	Hiller	3i
11	000012	Cafe Howa...	Harbor Ro...	Sydney ...	10000	Australia ...	Hiller	3i
12	000013	McDonalds...	Main Street...	Perth ...	30000	Australia ...	Hiller	3i

31

STEP D.7: Configure the Redirector for FFSTORES.DEMO.CLUSTER:

Edit skeleton SKRD CFG:

Change the previously created entry in the configuration table.

Enter **case m** in the command line to switch to mixed case mode before editing.

Change FFSTORES.**REPRO**.CLUSTER to FFSTORES.**DEMO**.CLUSTER

```
IESRDENT CATALOG='VSESP.USER.CATALOG', X
        CLUSTER='FFSTORES.DEMO.CLUSTER', X
        EXIT='IESREDIR', X
        OWNER=REDIRECTOR, X
        IP='<ip-addr>', X
        HANDLER='com.ibm.vse.db2handler.DB2Handler', X
        OPTIONS='dburl=jdbc:db2:<db>;dbuser=<userid>; X
                mactable=FFSTORES_MAP;map=FFSTORES; X
                dbpassword=<password>;dbtable=FFSTORES'
```

-let the job load IESRD CFG into the SVA (Step 2)

-let the job copy IESVEX01 to IKQVEX01 in PRD2.CONFIG (Step 3)

-let the job load IKQVEX01 into the SVA (Step 4)

-do NOT let the job load IESRDANC into the SVA, because it has already be done (Step 5)

-let the job execute IESRD LDA to register the new configuration (Step 6)

-submit and check for RC=0000

STEP D.8: Reopen the file in CICS and start applications.

You have to reopen the VSAM file in CICS, since the VSAM Redirector configuration becomes active at open time.

You can now work with your VSAM applications which will transparently access DB2 data and think they are working with VSAM data .
