z/VSE Version 3 Release 1

The 1950's

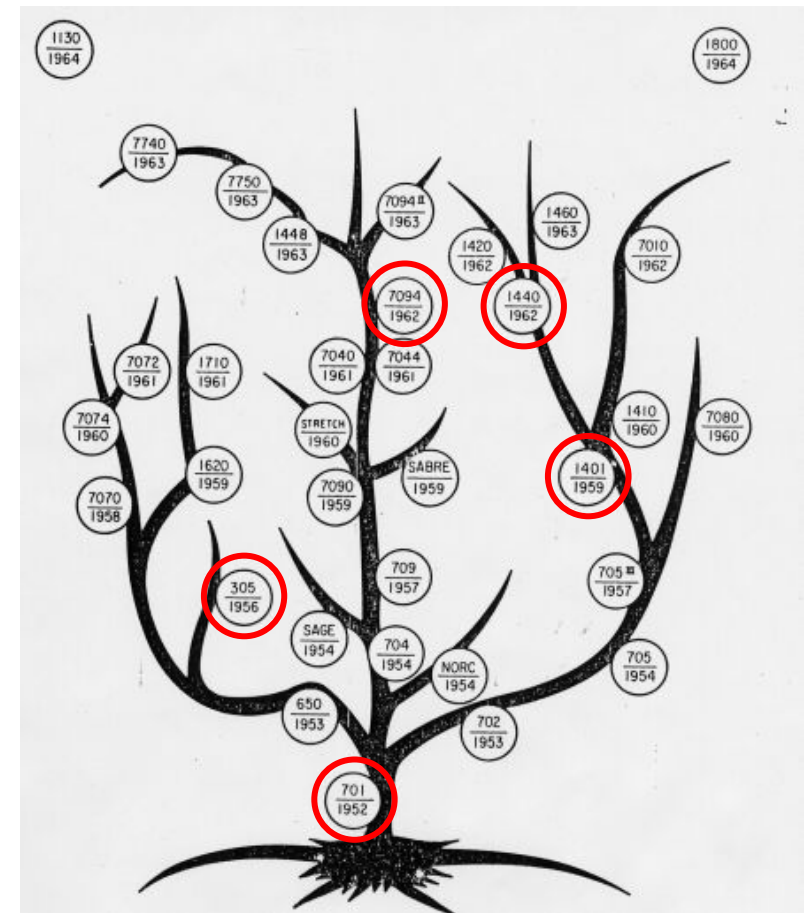

..... OK - no VSE yet, but we have to start somewhere

The IBM family tree – 1952 to 1964

- Several mainframe families, each uniquely designed for different applications
- Each family had a different, incompatible architecture
- Even within families, moving from one generation to the next involved a migration
 - ▶ the advent of 'common' compilers (i.e. COBOL and FORTRAN) made migration a bit easier

IBM 1401 – 1959

2nd generation

- The all-transistorized IBM 1401 Data Processing System offered **features found in electronic data processing systems to smaller businesses, previously limited to the use of conventional punched card equipment.**
- Features included: high speed card punching and reading, magnetic tape input and output, high speed printing, stored program, and arithmetic and logical ability

z/VSE Version 3 Release 1

The 1960's

.....a mainframe revolution begins with IBM System/360 *and*
IBM System/360 Disk Operating System (DOS/360)

IBM System/360 – 1964

3rd generation

- **Customers were frustrated with the migration costs that came with each processor upgrade**
- **IBM developed a family of processors using the same durable architecture**
 - ▶ published in the S/360 Principles of Operations
 - ▶ 24-bit addressing (31-bit architecture)
- **Solid logic circuit cards**
- **Common peripheral devices**
- **One operating system - *initially***
 - ▶ Operating System/360 (OS/360)
