Enabling the infrastructure for smarter computing

zDG04 - 64 bit virtual in z/VSE V5.1

Trademarks

The following are trademarks of the International Business Machines Corporation in the United States and/or other countries.

IBM* IBM Logo*

* Registered trademarks of IBM Corporation

The following are trademarks or registered trademarks of other companies.

Adobe, the Adobe logo, PostScript, and the PostScript logo are either registered trademarks or trademarks of Adobe Systems Incorporated in the United States, and/or other countries. Cell Broadband Engine is a trademark of Sony Computer Entertainment, Inc. in the United States, other countries, or both and is used under license therefrom.

Java and all Java-based trademarks are trademarks of Sun Microsystems, Inc. in the United States, other countries, or both.

Microsoft, Windows, Windows NT, and the Windows logo are trademarks of Microsoft Corporation in the United States, other countries, or both.

INFINIBAND, InfiniBand Trade Association and the INFINIBAND design marks are trademarks and/or service marks of the INFINIBAND Trade Association.

Intel, Intel logo, Intel Inside, Intel Inside logo, Intel Centrino, Intel Centrino logo, Celeron, Intel Xeon, Intel SpeedStep, Itanium, and Pentium are trademarks or registered trademarks of Intel Corporation or its subsidiaries in the United States and other countries.

UNIX is a registered trademark of The Open Group in the United States and other countries.

Linux is a registered trademark of Linus Torvalds in the United States, other countries, or both.

ITIL is a registered trademark, and a registered community trademark of the Office of Government Commerce, and is registered in the U.S. Patent and Trademark Office.

IT Infrastructure Library is a registered trademark of the Central Computer and Telecommunications Agency, which is now part of the Office of Government Commerce.

* All other products may be trademarks or registered trademarks of their respective companies.

Notes:

Performance is in Internal Throughput Rate (ITR) ratio based on measurements and projections using standard IBM benchmarks in a controlled environment. The actual throughput that any user will experience will vary depending upon considerations such as the amount of multiprogramming in the user's job stream, the I/O configuration, the storage configuration, and the workload processed. Therefore, no assurance can be given that an individual user will achieve throughput improvements equivalent to the performance ratios stated here.

IBM hardware products are manufactured from new parts, or new and serviceable used parts. Regardless, our warranty terms apply.

All customer examples cited or described in this presentation are presented as illustrations of the manner in which some customers have used IBM products and the results they may have achieved. Actual environmental costs and performance characteristics will vary depending on individual customer configurations and conditions.

This publication was produced in the United States. IBM may not offer the products, services or features discussed in this document in other countries, and the information may be subject to change without notice. Consult your local IBM business contact for information on the product or services available in your area.

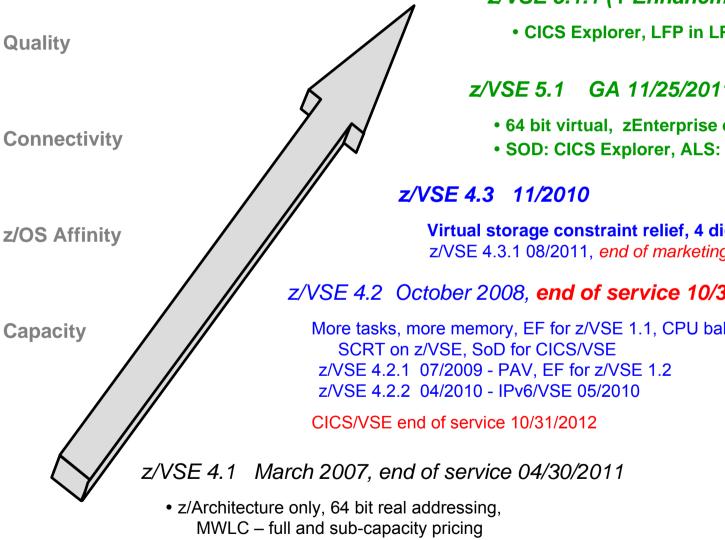

All statements regarding IBM's future direction and intent are subject to change or withdrawal without notice, and represent goals and objectives only.

Information about non-IBM products is obtained from the manufacturers of those products or their published announcements. IBM has not tested those products and cannot confirm the performance, compatibility, or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products. Prices subject to change without notice. Contact your IBM representative or Business Partner for the most current pricing in your geography.

Agenda

- VSE Roadmap and z/VSE 5.1
- z/Architecture
- z/VSE 4.3 64 bit real addressing
- z/VSE 5.1 64 bit virtual addressing
 - Memory objects
 - IARV64 services
 - Addressing modes
 - Considerations
- z/VSE 5.1 enhancements

VSE Roadmap

z/VSE 5.1.1 (+ Enhancments) GA 06/15/2012

• CICS Explorer, LFP in LPAR, database connector

GA 11/25/2011

64 bit virtual, zEnterprise exploitation

SOD: CICS Explorer, ALS: z9 or higher

Virtual storage constraint relief, 4 digit cuus z/VSE 4.3.1 08/2011, end of marketing 06/25/2012

z/VSE 4.2 October 2008, end of service 10/31/2012

More tasks, more memory, EF for z/VSE 1.1, CPU balancing,

©2012 IBM Corporation

z/VSE V5.1

- z/VSE 5.1: Preview 04/12/2011, Announcement 10/12/2011, GA 11/25/2011
- z/VSE 5.1.1: GA 06/15/2012

64 bit virtual

- Introduces Architectural Level Set (ALS) that requires System z9 or later
- zEnterprise exploitation (z114 and z196)
- Exploitation of IBM System Storage options
- Networking enhancements
 - IPv6 support to be added to Fast Path to Linux on System z function
- IPv6/VSE
 - Large TCP window support, can increase throughput
 - 64 bit virtual exploitation, large TCP window storage allocated above the bar
- Fast Service Upgrade (FSU) from z/VSE 4.2 and z/VSE 4.3
- CICS SOD:
 - IBM intends to provide CICS Explorer capabilities for CICS TS for VSE/ESA, to deliver additional value.

All statements regarding IBM's plans, directions, and intent are subject to change or withdrawal without notice.

z/VSE 5.1 Announcement (04/03/2012)

- IBM z/VSE V5.1 Additional enhancements available
- Announcement content for
 - GA on June 15, 2012 contained in z/VSE 5.1.1:
 - CICS Explorer
 - Linux Fast Path in LPAR
 - Linux Fast Path via z/VSE z/VM IP Assist (z/VSE VIA)
 - z/VSE database connector
 - VSE/POWER enhancement to ease job output handling
 - IBM System Storage Tape Controller 3592 Model C07
 - Later PTFs (after June 15. 2012)
 - 64-bit input/output (I/O) processing for applications
 - IPv6/VSE V1.1 enhancements

z/Architecture

Required for 64 bit addressing, introduced with z/VSE 4.1

ESA/390	z/Architecture
Addressing up to 2 GB	Addressing up to and above 2GB
Addressing modes: 24, 31	Addressing modes: 24, 31, 64
8-byte PSW (4 byte instruction address)	16-byte PSW (8 byte instruction address)
general purpose registers: 4 bytes	general purpose registers: 8 bytes
control registers: 4 bytes	control registers: 8 bytes
access registers: 4 bytes	access registers: 4 bytes
Prefix area (low core): 4K	Prefix area (low core): 8K

Remark: VSE/ESA and z/VSE 3.1 based on ESA/390 Architecture

64 bit Addressing in z/VSE 4.3

- 64 bit real addressing only, introduced with z/VSE 4.1
- Processor storage support up to 32 GB
- Virtual address/data space size remains at max. 2 GB
- 64 bit virtual addressing not supported
- 64 bit addressing mode not supported for applications or ISVs
- Implementation transparent to user applications
- Performance: 64 bit real can reduce / avoid paging
- Many z/VSE environments can run without a page dataset (NOPDS option)
- 64 bit register support for programs
- 64 bit registers are not support by
 - CICS services
 - High level languages

64 bit real - Implementation

- IPL starts in ESA/390 mode and switches to z/Architecture mode during the IPL process
- Simulation of ESA/390 low core fields
- Only the z/VSE page manager has access to the area above 2GB
- Virtual pages can be backed by 64 bit real page frames
- Large pages (1 MB page frames) for dataspaces allocated in 64 bit real space
- PFIX or TFIX requests will use real page frames below 2 GB
- Page manager control blocks above 2 GB
- 64-bit page frames used directly for page-in and page-out I/O

64 bit real – Implementation ...

- Hardware uses z/Architecture new and old PSWs and interrupt locations for interrupts
 - Interrupts: external, SVC, I/O, machine check, program check
 - Interrupt processing: hardware stores old PSW and interrupt information and passes control to interrupt new PSW
- Task save areas are extended.
 - Low order half (4 byte) of registers are located in problem program save area
 - High order half (4 byte) of registers are located in Shared Area (31 bit)

64 bit real – ESA/390 Emulation

- In z/VSE z/Architechture new PSWs point to emulation code
- When an interrupt occurs, emulation code
 - Translates z/Architecture old PSW into ESA/390 old PSW
 - Prepares ESA/390 interrupt information
 - Passes control to z/VSE interrupt handlers
- In most cases system programs use ESA/390 locations
 - Such as ESA/390 old PSWs
 - Interrupt handlers/dispatcher work with ESA/390 information/locations
 - Emulation guarantees that system code runs unchanged
- ESA/390 interrupt information is not used by hardware

64 bit real – ESA/390 Emulation - Example

Generated within Supervisor:

ESA/390 PC New PSW at 00000068: 000C0000 8000F142 (points to interrupt handler) z/Arch PC New PSW at 000001D0: 00040000 80000000 00000000 0000F0B2 (points to emulation code)

Program check (page fault) occurs:

0000000000133B8 MVC D21F10009398 00506000 000000000133B8 PROG 0011 -> 0000F0B2

Hardware sets:

z/Arch PC Old PSW at 00000150: 04040000 0000000 0000000 000133B8 z/Arch Transl. Excep. at 000000A8: 0000000 00506000 (page fault address)

Emulation code at F0B2 provides (31 bit addresses only): ESA/390 PC Old PSW at 0000028: 040C0000 000133B8 ESA/390 Transl. Excep. at 0000090: 00506000 Supervisor can continue at F142 (program check handler) as in ESA/390 mode

z/VSE 5.1: 64 bit virtual

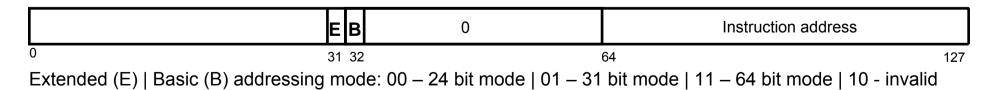

- GA 11/25/2011
- Support of 64 bit virtual addressing
- 64 bit area can be used for **data only**
 - No instruction execution above the bar
- **z/OS affinity:** APIs (IARV64 services) to manage memory objects compatible with z/OS
 - Private memory objects for use in one address space
 - Shared memory objects to be shared among multiple address spaces
- Maximum VSIZE still limited to 90 GB
- Access to memory objects via IARV64 services and switch into AMODE 64 (SAM64)
- Advantages:
 - Eases the access of large amounts of data, e.g. instead of using and managing data spaces
 - Reduces complexity of programs: Data contained in primary address space
 - Chosen design has no dependencies to existing APIs
 - Minor impact on existing system code

64 bit virtual - Naming Convention

- Area above 2 GB private area = extended private area (EPA)
- Area above 2 GB shared area = extended shared area (ESA)
- Area above 2 GB private or shared = extended area
- The (2 GB) bar: a line that separates the address space into storage below 2 GB (below the bar) and above 2GB (above the bar)
- The (16 MB) line: a virtual "line" marks the 16-megabyte address.
- 64 bit general purpose registers = 8 byte registers
 - High order half = 0-31 bits of register
 - Low order half = 32-63 bits of register

Addressing Modes

- z/VSE 5.1 provides three addressing modes
 - AMODE 24 for instructions / data below 16 MB
 - AMODE 31 for instructions / data below the bar
 - AMODE 64 for instructions / data below 2 GB and data above 2 GB
- Change addressing mode
 - AMODESW macro to switch into AMODE 24 or AMODE 31
 - Set Addressing Mode (SAM) instructions to switch addressing modes
 - SAM24 to switch into AMODE 24
 - SAM31 to switch into AMODE 31
 - SAM64 to switch into AMODE 64
 - Branch and Save and Set Mode (BASSM) or Branch and Set Mode (BSM)
- Program Status Word (PSW)

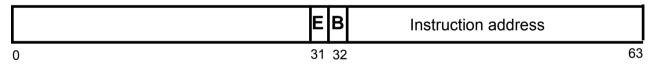

Using 64 bit Addressing Mode

- 64 bit addressing mode required to access data above the bar
- The processor checks the addressing mode and truncates the answer
 - AMODE 24 the processor truncates bits 0 through 39
 - AMODE 31 the processor truncates bits 0 through 32
 - AMODE 64 no truncation
- Before changing the addressing mode to AMODE 64 (via SAM64)
 - It may be necessary to clear the high-order half of registers to be used.
 - Use the LLGT (Load Logical Thirty One Bits) or LLGTR instruction to clear the high-order 33 bits
- Test Addressing Mode (TAM) instruction to test current addressing mode
- SAM64, BASSM and BSM are the only ways to set the AMODE to 64

Register saving – Extended save area

- If a task is interrupted, z/VSE will store the 64 bit registers.
 - Low-order of the registers to be stored in the problem program save area
 - High-order half of the registers to be stored in an extended task save area
- Pointer to the extended save area can be obtained via a GETFLD service
- Short form of PSW (8 byte) will be stored into the save area

Extended (E) | Basic (B) addressing mode: 00 – 24 bit mode | 01 – 31 bit mode | 11 – 64 bit mode | 10 - invalid

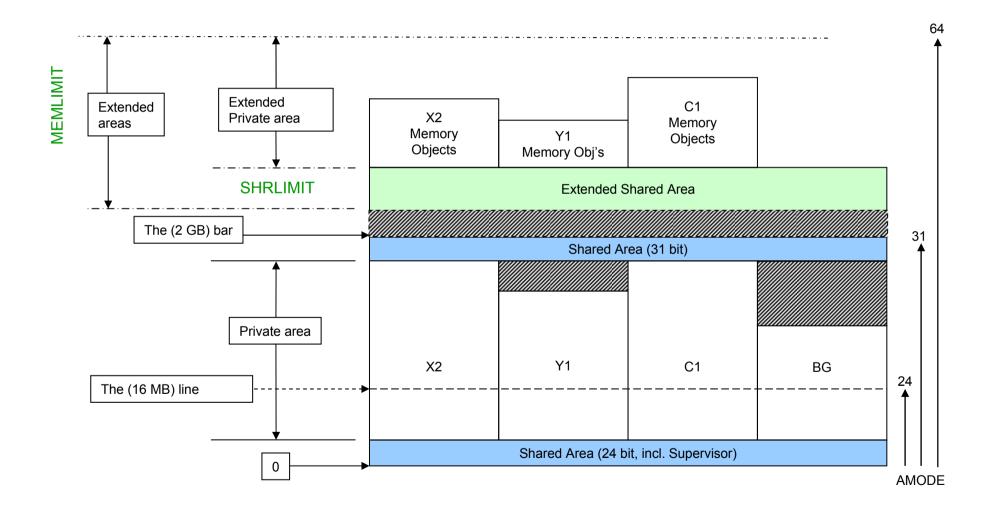

- z/VSE exit routines provide 64 bit register support
- CICS services do not support 64 bit registers

Memory Objects

- "chunks" of virtual storage obtained by a program
- Allocated above the bar
- Contiguous range of virtual addresses
- Begins on a 1 MB boundary and is multiple of 1 MB in size
- Two types of memory objects:
 - **Private memory objects** are created within an address space
 - In extended private area (EPA)
 - **Shared memory objects** are created within extended shared area (ESA)
 - Can be accessed from any address space, that requests access

64 bit virtual - Address Space Layout

Virtual Storage Size (VSIZE)

- VSIZE to be specified in Supervisor statement at IPL = Size of private areas of all active partitions
 - + size of SVA(24 bit)
 - + size of SVA(31 bit)
 - + size of page manager address spaces
 - + size of defined data spaces
 - + size of created memory objects

64 bit virtual – Define System Limits

SYSDEF statement to define the limits for memory objects

- Before IARV64 services can be used.
- SYSDEF MEMOBJ, MEMLIMIT=, SHRLIMIT=, LFAREA=, LF64ONLY
 - MEMLIMIT maximum virtual storage available for memory objects
 - Theoretical maximum value is VSIZE.
 - SHRLIMIT maximum virtual storage available for shared memory objects = size of extended area, included in MEMLIMIT
 - LFAREA maximum real storage to fix private memory objects
 - LF64ONLY YES|NO memory objects are fixed in 64 bit frames only

- Example:

sysdef memobj,memlimit=1g,shrlimit=100m,lfarea=50m AR 0015 1I40I READY

64 bit virtual – Display Memory Object Information

QUERY command to retrieve memory object information

- QUERY MEMOBJ displays
 - Effective settings of MEMLIMIT, SHRLIMIT, LFAREA, LF64ONLY
 - Summary information: virtual storage consumption of private / shared memory objects
- QUERY MEMOBJ,ALL displays
 - Additional statistic information
 - Virtual storage consumption of shared memory objects
 - Virtual storage consumption of private memory objects per partition

IARV64 Macro

- IARV64 macro ported from z/OS provides services to
 - Creates and frees storage areas above the bar
 - Manage the physical frames behind the storage
 - Requires SYSSTATE AMODE64=YES
- Programs use the IARV64 macro to obtain memory objects
- Services (IARV64 REQUEST=):
 - GETSTORE create a private memory object
 - DETACH free one or more memory objects
 - GETSHARED create a memory object that can be shared across multiple address spaces
 - SHAREMEMOBJ request that the specified address space be given access to a shared memory object
 - PAGEFIX fix pages within one or more private memory objects
 - PAGEUNFIX unfix pages within one or more private memory objects

Private Memory Object (PMO)

- Created by IARV64 GETSTOR
 - Successful creation depends on available virtual storage (VSIZE)
 - Allocated in extended private area (EPA) of an address space
 - EPA only exists, if there is at least one PMO allocated.
 - All tasks within the address space (partition) may have access to PMOs
 - User token can be used to identify PMOs
 - The task creating the PMO is the PMO owner
- Free PMOs by IARV64 DETACH
 - One or more PMOs can only be freed, if task owns PMOs
- System frees PMOs, if owning task terminates
- Authorized programs may IARV64 PAGEFIX or PAGEUNFIX PMOs

Private Memory Object - Example

Shared Memory Objects (SMO)

- Created by IARV64 GETSHARED
 - Successful creation depends on available virtual storage (VSIZE)
 - Authorized programs only
 - Allocated in extended shared area (ESA)
 - Size of ESA depends on SHRLIMIT
 - ESA only exists, if there is at least one memory object allocated (PMO or SMO)
 - Similar to SVA storage
 - · No automatic addressability / access to SMO storage
 - Any z/VSE user task may have access to SMO storage
- Allow access to SMO storage by IARV64 SHAREMEMOBJ
 - Tasks get access to specified memory objects = shared interest
 - Shared interest is owned by maintask
 - All tasks within partition have access
 - Shared interest can be removed via IARV64 DETACH AFFINITY=LOCAL
 - When maintask terminates, system removes all shared interests owned by it

Shared Memory Objects (SMO) - Ownership

- The task creating the SMO is not the owner
 - SMO is always owned by the system = system affinity
- To free a SMO any authorized program may use
 - IARV64 DETACH AFFINITY=SYSTEM
 - The system will free the SMO only, if all shared interests are removed

IARV64 GETSHARED example creates a 1 MB shared memory object

Memory Objects ...

- Protecting storage above the bar
 - IARV64 KEY parameter to assign storage key to the memory object
 - Default storage key = PSW key of caller
 - Unauthorized caller can set key 9 (all tasks can run in key 9)
 - · Authorized callers can set any key
 - IARV64 FPROT parameter to fetch-protect the memory object
- Fix / unfix pages of a memory object
 - IARV64 PAGEFIX fix pages within one or more private memory objects
 - IARV64 PAGEUNFIX unfix pages within one or more private memory objects
- Dumping memory objects
 - SDUMPX macro with LIST64 parameter can be used to dump memory objects
 - Standalone dump
 - STDOPT | OPTION SADUMP parameter controls the priority of the private memory object
 - Shared memory objects are always included in one single dump file with lowest priority
 no matter what values are specified for SADUMP

64 bit virtual – Exit routines

- STXIT routines AB | IT | OC | PC
 - New parameter: AMODE=ANY64
 - E.g. STXIT AB, rtnaddr, savearea,...,AMODE={24|ANY|ANY64}
 - AMODE specifies
 - · Addressing mode in which the exit receives control
 - Layout of save area (as of macro MAPSAVAR)
 - Length of save area
 - AMODE=24 -> 72 bytes
 - AMODE=ANY -> 216 bytes
 - AMODE=ANY64 -> 420 bytes

64 bit virtual - Considerations

- Memory objects can be allocated for data only.
 - Instruction execution above the bar (RMODE 64) not supported
- High Level Assembler support only.
 - High level languages (COBOL, PL/I, C, RPG, ...) do not support 64 bit registers or 64 bit mode.
 - AMODE 64 attribute should not be used.
- AMODE 64 is not supported by
 - LOAD / CDLOAD and the linkage editor
 - z/VSE system services (Supervisor, VSAM, BAM, DL/I, …)
 - Space switching Program Calls (ss-PCs)
 - Data areas for system services including **I/O buffers** to be allocated below the bar.
- Services in online environment do not support 64 bit registers or AMODE 64
 - ICCF pseudo partitions
- CICS considerations
 - CICS services do not save / restore the high order half of 64 bit registers
 - The program must save them before invoking a CICS service and restore them afterwards
 - The program has to switch into AMODE 31 or 24 before invoking a CICS service

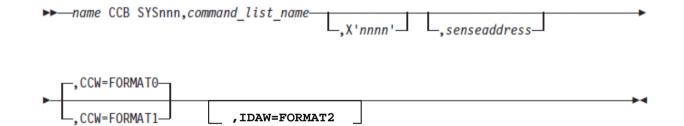

64 bit virtual I/O

- Extend z/VSE's 64 bit virtual support to 64 bit virtual I/O
- Ensures z/OS compatibility for EXCP interfaces
- DASD (ECKD) support only
- I/O can only be done for private memory objects
- Format 0 and Format 1 CCW with Format 2 IDAWs
 - New CCB parameter
- Not supported by VSAM, BAM (LIOCS)
- Available via z/VSE 5.1 PTF some time after June 15, 2012

64 bit I/O Request: User CCB for EXCP

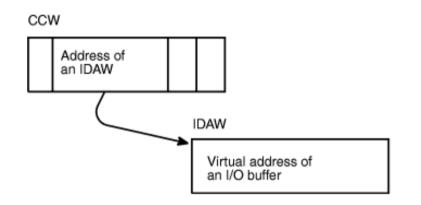

- CCB macro will be extended by a new parameter
 - IDAW=FORMAT2: FORMAT-2-IDAW control set

- Format-1 IDAW not supported
- 2K-IDAW control not supported (\rightarrow block size=4K)

64 bit I/O Request: User CCW

- Indirect-Data-Adressing bit set
- User passes virtual IDAW \rightarrow IDAL with only one list entry

CCW can either be Format-0 or Format-1

Steps to perform a 64-bit I/O request:

- 1) Create a private memory object (IARV64 REQUEST=GETSTOR)
- 2) Prepare CCWs (IDA-bit set) pointing to a Format 2 IDAW with a virtual 64 bit address
- 3) Prepare a CCB (using the CCB macro) with IDAW=FORMAT2
- 4) Issue an I/O request using the EXCP macro
- 5) After I/O operations completed: Detach the memory object (IARV64 REQUEST= DETACH)
