Agenda

§ **z/VSE V3.1 Performance considerations**

   – Release overhead

   – VSE CPU Monitor Tool

   – Native Tape Library Support

   – VTAM 31 Bit I/O buffer support

§ **SCSI Performance considerations**

   – Overhead

   – Basics

   – Migration aspects

§ **Hardware support**

§ **Turbo dispatcher**

Overhead Deltas for VSE Releases

VSE/ESA 2.3

Standard
Dispatcher
CICS/VSE

Remember that you get a lot of new functions that in most cases helps you to increase VSE system performance and throughput:

Partition Balancing, PRTY SHARE (Turbo Dispatcher), FlashCopy, Buffer Hashing, Shared data Tables (CICS TS)

+5-10%

New VSE CPU Monitor Tool – free download

§ **Intended to help customers to measure the CPU utilization of their VSE system over a period of time.**

§ **When you plan for a processor upgrade it is very important to know the CPU utilization of your VSE system over a day or a week.**

  – Helps you to estimate the size of the new processor.

§ **The VSE CPU Monitor Tool is not intended to replace any existing monitoring product provided by partners.**

§ **It provides only very basic monitoring capabilities on an overall VSE system level.**

§ **No details about CPU usage of certain applications are provided**

§ **Download for free**

  – http://www.ibm.com/servers/eserver/zseries/zvse/downloads/tools.html
New VSE CPU Monitor Tool – free download

§ **CPUMON periodically issues a TDSERV FUNC=TDINFO macro to get performance relevant data.**

§ **The data provided by the macro is the same as command QUERY TD shows.**

§ **The data from each measurement interval is printed to SYSLST in a comma separated format.**

§ **Later on this data can be imported into a spreadsheet (EXCEL)**

§ **CPUMON runs in a VSE partition (dynamic or static).**

§ **CPUMON is started using:**

```
// EXEC DTRIATTN,PARM='SYSDEF TD,RESETCNT'
/*
// EXEC CPUMON,PARM='nn'  nn = interval in seconds
/*
```

§ **The tool can be stopped by entering the following command:**

```
MSG xx,DATA=EXIT           xx = partition id
```

Native Tape Library Support (TLS)

§ **z /VSE supports**

- IBM TotalStorage 3494 Enterprise Tape Library

- IBM TotalStorage 3584 UltraScalable Tape Library
- IBM TotalStorage Virtual Tape Server

Native Tape Library Support (TLS)

§ **Before z/VSE 3.1**

– LCDD (library control device driver)

– Running in a VSE partition

– via VTAM LU6.2

– difficult VTAM – LAN setup

– XPCC connection

VSE/ESA

| LIBSERV |

| I/O | | LCDD |

Library Manager Database

ON DEMAND BUSINESS™

# Native Tape Library Support (TLS)

§ **New** **with z/VSE 3.1**

   – Via S/390 channel command interface

   – No XPCC

   – No VTAM LU6.2

§ **LBSERV macro**

§ **LIBSERV JCL / AR command interface**

§ **Example :**

```
// LIBSERV MOUNT,VOL=123456/w,UNIT=480

// LIBSERV RELEASE,UNIT=480
```

Diagram:

VSE/ESA → LIBSERV → I/O

I/O connects via Channel (both sides) to:
- Tape Drives
- Library Manager

IBM 3494

Library Manager ↔ Library Manager Database

Native Tape Library Support (TLS)

§ **New LIBSERV JCL commands**
  – LIBSERV AQUERY,VOL=123456

    • query all libraries for a specified volume
  – LIBSERV CMOUNT,UNIT=480,SRCCAT=SCRATCH01

    • mount from category
  – LIBSERV CQUERY,LIB=TAPELIB1,SRCCAT=SCRATCH01

    • query count of volumes
  – LIBSERV DQUERY,UNIT=480

    • query device
  – LIBSERV IQUERY,LIB=TAPELIB1,SRCCAT=SCRATCH01

    • query inventory of library
  – LIBSERV LQUERY,LIB=TAPELIB1

    • query library
  – LIBSERV MINVENT,MEMNAME=ALL,TGTCAT=SCRATCH01

    • manage inventory
  – LIBSERV SETVCAT,VOL=123456,TGTCAT=SCRATCH01

    • change category
  – LIBSERV SQUERY,VOL=123456,LIB=TAPELIB1

ON DEMAND BUSINESS™

Native Tape Library Support (TLS)

§ **z/VSE TLS support customization**

– SYS ATL=TLS | VSE | VM

§ **TLSDEF skeleton in ICCF LIB 59**

– define library name and corresponding tape drives

```
// LIBDEF *,CATALOG=IJSYSRS.SYSLIB
// EXEC LIBR,PARM='MSHP'
   ACCESS S=IJSYSRS.SYSLIB
   CATALOG TLSDEF.PROC REPLACE=YES
   LIBRARY_ID TAPELIB1 SCRDEF=SCRATCH00 INSERT=SCRATCH00
   LIBRARY_ID TAPELIB2                  * SECOND LIB DEF
   DEVICE_LIST TAPELIB1 460:463    *  DRIVES  460 TO 463
   DEVICE_LIST TAPELIB2 580:582    *  DRIVES  580 TO 582
   QUERY_INV_LISTS LIB=TLSINV      * MASTER INVENTORY FILES
   MANAGE_INV_LISTS LIB=TLSMAN     * MANAGE FROM MASTER
   /+
```

VTAM 31 Bit I/O Buffer Support

§ **VSE/VTAM is providing new 31 bit IO buffer support via PTF**

– Removes the 24 bit I/O buffer restriction.

– Moves the I/O buffer pool and all I/O CTC packing buffers above the 24 bit line

– Support I/O operations in 31 bit mode (using format 1 CCWs).

– Allow z/VSE customers to grow their communications workloads associated with their business critical applications

§ **PTFs**

– VTAM support - APAR DY46471 - PTF UD52964

– z/VSE support - APAR DY46396 - PTF UD52873 (AF Base) or UD52874 (Generation Feature)

VTAM 31 Bit I/O Buffer Support

§ **To enable the 31 Bit support:**

– Make sure both PTFs (VTAM and AF) are applied

– Set VTAM start option IOBUF31=YES (default is NO)

§ **Display settings**

```
d net,vtamopts,opt=iobuf31
AR 0015 1C39I COMMAND PASSED TO ACF/VTAM
F3 0003 IST097I DISPLAY ACCEPTED

Hardware and software requirements for SCSI

§ **IBM eServer zSeries 800, 900, 890 or 990**

§ **IBM zSeries FCP Adapter**
 – Microcode Level:
   • z800 und z900: J11233.015 or higher
   • z890 und z990: J13471.004 or higher

§ **FCP Switch (e.g. IBM 2109)**

§ **IBM TotalStorage Enterprise Storage Server (ESS)**
 – Microcode Level: 2.3.1 or higher

§ **IBM TotalStorage DS6000 or DS8000**

§ **z/VSE Version 3 Release 1**

§ **z/VM 4.4. or higher (only if VSE runs under VM)**

ON DEMAND BUSINESS™

Hardware and software requirements for SCSI (2)

§ **IPL von SCSI**

- CPU Feature Code 9904

- z800 and z900:
  - Microcode Level EC-Number J12811 or higher

- z890 and z990:
  - Microcode Level EC-Number J12221 or higher

§ **IPL von SCSI under z/VM 4.4**

- z/VM Service Level:
  - UM31181 (English)
  - UM31180 (German)
  - UM31179 (Kanji)

§ **Emulated FBA Disks:**

- z/VM 5.1

Ingo Franzki – ifranzki@de.ibm.com - © 2006 IBM Corporation   31. März 2006

ON DEMAND BUSINESS™

SCSI disk characteristics

§ **Size of a SCSI Disk**
  - Minimum 8 MB
  - Maximum about. 24 GB
  - 4 MB are used internally from z/VSE
  - Usable size = size – 4 MB
  - VSAM can only use the first 16 GB

§ **Model**
  - SCSI Disks are defined as FBA Devices
    • 9336 Model 20

§ **Block sizes**
 - z/VSE supports only SCSI Disks with a block size of 512 Bytes

§ **Standards**
 - SCSI Disks must support ANSI SCSI Version 3

§ **z/VM SCSI to FBA emulation**
  - Maximum size of 2 GB

ON DEMAND BUSINESS

SCSI components

SCSI Adressing

FBA Device	FCP Device	Worldwide Port Name	Logical Unit Number

SCSI messages

§ **AR 0033 0S45I SCSI DEVICE 618 CONSISTS OF 03906304 BLOCKS, 03897432 BLOCKS ARE AVAILABLE, 680 BLOCKS ARE UNUSED**

– Multiple of 777 Blocks

• Internal Model: 1 „Cylinder" = 777 Blocks

§ **AR 0033 0S40I SCSI PROCESSING EVENT: REASON=0060 FUNCTION=INIT-SCSI FBA=609 FCP=4A7 WWPN=5005076300CA9A76 LUN=5711000000000000**

– Message description shows the reason based on the Reason Codes

§ **0S46I I/O ERROR ON FBA=600 FCP=C00 RC=01, REASON==052500**

– SCSI I/O Error has been mapped to an FBA Error

– Message description shows the reason based on the Reason Codes

§ **SCSI I/O errors are mapped in S/390 I/O errors for user programs (e.g. Unit check)**

– In addition, message 0S40I message is issued, to inform about the exact reason

SCSI multipathing

§ **One or more alternative paths to the same SCSI Disk**
  - Increases the availability
  - NOT: Workload-Balancing

§ **Each path must be defined over a different FCP adapter**
  - One FCP card can contain multiple FCP adapters (CHIPID)
  - To increase availability, you should use different FCP adapters on different physical FCP cards

§ **As best, even over different switches and/or ports**

§ **Example:**

```
DEF SCSI,FBA=DA1,FCP=FA0,WWPN=5005076300CA9A76,LUN=5600
DEF SCSI,FBA=DA1,FCP=FB0,WWPN=5005076300C29A76,LUN=5600
```

§ **QUERY SCSI**

```
AR 0015 FBA-CUU FCP-CUU WORLDWIDE PORTNAME LOGICAL UNIT NUMBER
AR 0015 DA1      FA0     5005076300CA9A76   5600000000000000
AR 0015 DA1      FB0     5005076300C29A76   5600000000000000
```

  - The first path is currently used to access the SCSI disk

ON DEMAND BUSINESS™

Sharing SCSI disks

§ **ADD cuu,FBA,SHR (FBA Device)**

§ **Lockfile is used (see DLF)**
- Using Reserve/Release SCSI Command (internal)
  - Reserve is based on FCP Adapter
  - Release must be done from same FCP Adapter
- Possible problem:
  - Hardwait during disk is reserved
    - Disk stays reserved
  - The system tries to release the disk during hardwait processing, but this may fail

§ **Restrictions**
- Lockfile can not reside on DOSRES/SYSWK1 (only for SCSI)
- No Multipathing possible for Lockfile-Disks
- Each VSE System must access the Lockfile using its own FCK CHPID

§ **Suggestion**
- Use separate Disk for Lockfile

Base installation on SCSI disks

§ **Only base installation possible**

– FSU from ECKD- to SCSI-Disks not possible

§ **Automatic installation**

– IPL from Tape

```
BG 0000 SI70D IF YOU WANT TO USE SCSI DEVICES SPECIFY YES, ELSE NO
0 YES

Migration from ECKD to SCSI

§ **FSU from ECKD to SCSI not possible**

  – Only base installation

§ **File allocations must be adapted**

  – Tracks/Cylinder into Blocks (for 3390):

  • 1 Track   = about 112 Blocks
  • 1 Cylinder   = about 1680 Blocks

  – VSAM Space

  • Hint: Specify cluster sizes in RECORDS, not Tracks

  – Sequential files

  – VSE Libraries

  • Hint: 1 LIBR Block = 1024 Bytes = 2 SCSI Blocks

§ **Programs must be able to work with FBA disks**

  – As best, implement it device independent

ON DEMAND BUSINESS™

Overhead Deltas for SCSI

```
┌──────────────┐         ┌──────────────┐         ┌──────────────┐

```

SCSI Overhead
SCSI I/O count considerations

§ **For PACEX16 workload**

– ECKD:

- 18000 ECKD I/Os per disk

– SCSI:

- 20000 FBA I/Os per disk

– ECKD → FBA:

- 11% increased I/O counts

§ **In general 1 FBA I/O is translated into 1 SCSI I/O**

§ **Except for**

– Long CCW chains

– Overlapping addresses (e.g. PHASE loading)

Comparison ESCON – FICON/FCP

	ESCON	FICON/FCP
Max # of channels	256	4 x 256
Max # device addresses per link	4096	65536
Max # logical CU-paths per port	64	256
Device addresses per channel	1024	16384
Link rate	20 MB/sec	200 MB/sec
Max achievable transfer rate	17 MB/sec	170 MB/sec
Full duplex	No	Yes
Concurrent I/O operations	1	Up to 32
CCW execution	Synchrony	Asynchrony (FICON)

When should I (not) use SCSI?

§ **When should I use SCSI?**

– When enough CPU power is available to handle the additional SCSI overhead.

  • SCSI overhead is mostly non-parallel code.

§ **When should I not use SCSI?**

– When you are already CPU constraint.

  • If you are today running at 80% CPU utilization, SCSI would fill up your CPU up to 100 %

ON DEMAND BUSINESS™

Agenda

- **z/VSE V3.1**
  - Release overhead
  - VSE CPU Monitor Tool
  - Native Tape Library Support
  - VTAM 31 Bit I/O buffer support
- **SCSI Performance considerations**
  - Overhead
  - Basics
  - Migration aspects
- **Hardware support**
- **Turbo dispatcher**

z/VSE 3.1 Hardware support

§ **z/VSE 3.1 and VSE/ESA 2.7 runs on the following machines**

- IBM System z9 109

- zSeries: z800, z900, z990, z890

- 9672 Parallel Enterprise Server (G5/G6)

- Multiprice 3000 (7060)

- equivalent emulators (Flex-ES)

§ **z/VSE 3.1 and VSE/ESA 2.7 is based on the hardware instruction set described in the manual 'ESA/390 Principles of Operation' (SA22-7201).**

- It is assumed that all the ESA/390 instructions and facilities described in that manual can be used.

ON DEMAND BUSINESS™

z/VSE 3.1 Hardware support - continuation

§ **z/VSE 3.1 is designed to support:**

- IBM System z9 109

- IBM eServer zSeries 800, 900, 890 and 990

- SCSI disks attached to zSeries FCP channels

- OSA-Express2 and FICON Express2 adapters

- Crypto Express2 and CP Assist for Cryptographic Function (CPACF)

- IBM TotalStorage 3494 Virtual Tape Server

- improved support for IBM 3494 Tape Library

- IBM TotalStorage DS8000 and DS6000 series Storage Servers

- IBM TotalStorage Enterprise Storage Server (ESS)

Supported VSE Releases

VSE Release	Available	End of Marketing	End of Service
z/VSE 3.1	03/04/2005		
VSE/ESA 2.7	03/14/2003	09/30/2005	02/28/2007
VSE/ESA 2.6	12/14/2001	03/14/2003 (no longer orderable)	03/31/2006 (out of service)
VSE/ESA 2.5	09/29/2000	12/14/2001	12/31/2003 (out of service)
VSE/ESA 2.4	06/25/1999	09/29/2000	06/30/2002 (out of service)
VSE/ESA 2.3	07/12/1997	06/30/2000	12/31/2001 (out of service)

VSE Server Support

Ingo Franzki – ifranzki@de.ibm.com - © 2006 IBM Corporation   31. März 2006

IBM Processor Capacity Reference for zSeries (zPCR)

§ **The zPCR tool was released for customer use on October 25, 2005**

- **http://www.ibm.com/support/techdocs/atsmastr.nsf/WebIndex/PRS1381**
- **'As is', no official support, e-mail to zpcr@us.ibm.com**

§ **PC-based productivity tool under Windows**

§ **It is designed to provide capacity planning insight for IBM System z9 and eServer zSeries processors running various workload environments**

§ **Capacity results are based on IBM's LSPR data supporting all IBM System z9 and eServer zSeries processors**

- Large System Performance Reference:
  http://www.ibm.com/servers/eserver/zseries/lspr/

§ **For VSE use z/OS CBW2 workload (Commercial Batch Workload 2)**

- CBW2 fits best to most VSE workloads

ON DEMAND BUSINESS™

zSeries Remarks – Split cache

§ **Prior to zSeries there is one cache for data and instructions**

§ **zSeries has split data and instruction cache**

§ **Performance implications:**

– If program variables and code that updates these program variables are in the same cache line (256 byte)

- Update of program variable invalidates instruction cache
- Performance decrease if update is done in a loop

– See APAR PQ66981 for FORTRAN compiler

zSeries Remarks – Split cache - example

Killer example:

```
*    prepare length
BCTR   R2,0   ADJUST FOR SS-INSTR.
STC    R2,*+5
MVC    RECEIVER(*-*),SENDER
```

STC instruction modifies the
next instruction to set the length.

Better code:

```
*    prepare length
BCTR   R2,0   ADJUST FOR SS-INSTR.
EX     R2,MVC01

...

MVC01  MVC    RECEIVER(*-*),SENDER
```

Use EXECUTE instruction instead.

zSeries Performance: Processor Design Considerations:
http://www.ibm.com/support/techdocs/atsmastr.nsf/WebIndex/FLASH10208

zSeries Remarks – Split cache - example

Not causing a problem:

```
          LA    R1,PHASNAME    POINT AT PHASE NAME
          CDDELETE (1)
+*        SUPERVISOR - CDDELETE - 5686-032-06
+         CNOP  0,4
+         BAL   15,*+8
+         DC    A(B'00010010')
+         L     15,0(,15)
+         SVC   65             ISSUE SVC FOR CDDELETE
          DS    0H
```

Can cause a problem:

```
          WTO TEXT=DATA
+         CNOP  0,
+         BAL   1,IHB0003A   BRANCH AROUND MESSAGE
+         DC    AL2(8)                  TEXT LENGTH
+         DC    B'0000000000010000'  MCSFLAGS
+         DC    AL4(0)               MESSAGE TEXT ADDR
          ...
+IHB0003A DS    0H
+         LR    14,1         FIRST BYTE OF PARM LIST
+         SR    15,15        CLEAR REGISTER 15
+         AH    15,0(1,0)    ADD LENGTH OF TEXT + 4
+         AR    14,15        FIRST BYTE AFTER TEXT
+         LA    15,DATA      LOAD TEXT VALUE
+         ST    15,4(0,1)    STORE ADDR INTO PLIST
+*        SUPERVISOR - SIMSVC - 5686-032
          ...
+         SVC   35           ISSUE SVC 35
 @GE00016 DS    0H
```

CDDELETE uses an inline flag byte, but does not modify it

WTO uses an inline parameter list, but modifies the parameter list

Note: WTO can be coded with an external parameter list: WTO …,MF=(E,addr)

z890, z990 and z9-109 Considerations

§ **The z890, z990 and z9-109 are LPAR-only machines**

– No basic mode any more

– Even if you run just one VSE system, it now runs in an LPAR

– Running VSE systems under z/VM means

  • running VSE in z/VM in an LPAR

– No I/O Assist in LPARs

  • Only available if z/VM runs in basic mode, but no basic mode available on z890, z990, z9-109

z/VM 5.1 considerations

§ **z/VM 5.1 no longer supports V=R and V=F guests**

§ **z/VM 5.1 no longer support I/O Assist**

– If you currently run with preferred guests, you will need to estimate and plan for a likely increase in processor requirements as those preferred guests become V=V guests as part of the migration.

– Refer to Preferred Guest Migration Considerations at http://www.vm.ibm.com/perf/tips/z890.html for assistance and background information

§ **How to size the impact (on your current system)**

– **Loss of I/O Assist:** Run your workload with CP SET IOASSIST OFF and measure the increase

– **Loss of V=R/F:** Run your workload with V=V and use the CP Monitor to watch for increased CPU consumption

§ **How to tune**

– **Dedicated processors:** CP SET SHARE ABSOLUTE

– **Dedicated memory:** CP SET RESERVED

– **I/O Assist:** Use minidisks, turn minidisk caching on (MDC)

Possible performance problem with PPRC

§ **Problem can occur if**

- PPRC is used

- VSE runs in native or in LPAR

- Not all devices that are defined in IOCP are also defined in VSE ADD statements

§ **In case there is an PPRC state change, interrupts are sent to all LPARs where the related device are defined in IOCP.**

- If the device is defined in VSE ADD, no problem occurs: VSE will process the interrupt correctly.

- If the device is NOT defined in VSE ADD, the interrupt is ignored by VSE and the interrupt is resent very quickly to that LPAR

  • Results in very high channel activity (up to 100%)

§ **Solution:**

- Define ALL devices in VSE ADD that are defined in IOCP

ON DEMAND BUSINESS

VSE/POWER POFFLOAD Performance Problems

§ **Caused by 'incompatibility' between VSE/POWER tape format and new tape drives**

§ **3490F empties cache for FSF used by POFFLOAD LOAD**

 – Install DY46164/DY46245 for VSE/ESA 2.7/2.6

§ **3590 synchronizes cache with tape for each WTM**

 – Install microcode FC0520 on A60 controller + VSE/AF APAR DY45817 + AR command TAPE WTM=NOSYNC

 – Unfortunately controller A50 is to small to install FC0520

Agenda

- **z/VSE V3.1**
  - Release overhead
  - VSE CPU Monitor Tool
  - Native Tape Library Support
  - VTAM 31 Bit I/O buffer support
- **SCSI Performance considerations**
  - Overhead
  - Basics
  - Migration aspects
- **Hardware support**
- **Turbo dispatcher**

Turbo Dispatcher - Overview

§ **Turbo Dispatcher**

– available since 1995

– VSE/ESA 2.1-2.3 Standard and Turbo Dispatcher

– since VSE/ESA 2.4 only Turbo Dispatcher

– last changes:

● VSE/ESA 2.6.2 (APAR DY45869)
● VSE/ESA 2.7.0 (APAR DY45926)

– Supports basic (native), LPAR and VM mode

– Runs on Uni- and n-Way-procerssors

● CPUs have "equal" rights
● more than 3 CPUs are not recommended

Turbo Dispatcher - Overview (2)

§ **IPL is done on 1 CPU only**

- after IPL other CPUs can be started

- CPUs can be started or stopped without re-IPL

- at least 1 CPU (IPL CPU) must always be active

SYSDEF TD,START=n|ALL

SYSDEF TD,STOP=n|ALL

SYSDEF TD,STOPQ=n|ALL

QUERY TD

Turbo Dispatcher - Quiesced CPUs

§ **SYSDEF TD,STOPQ=n to set a CPU in quiesced mode**

  – Implemented for z/VM guest systems

   • Not started guest CPUs stop IOASSIST
   • STOPQ remains IOASSIST active, and avoids TD Overhead, (CPU will no longer participate in work unit selection)
   • quiesced CPUs will not process any work units
   • quiesced CPUs will not handle any interrupt
   • quiesced CPUs can be started with SYSDEF TD,START

ON DEMAND BUSINESS

Turbo Dispatcher - Design

§ **TD dynamically assigns partitions to CPUs**

- Work unit = from assignment to one CPU until next interrupt/SVC

- If one task (subtask) of a partition is active, no other task of the same partition will be selected

- TD dispatches on partition-basis, not on task-basis

- A job running in a partition is processed in several work units.

Turbo Dispatcher - Design (2)

§ **parallel work units**

– application code (CICS, Batch)

– may run on any CPU concurrently with other parallel or non-parallel work units.

§ **non-parallel work units**

– system code (Services, VTAM, Vendor code)

– As long as one non-parallel work unit is active on one CPU, no other non-parallel work unit can execute on any other CPU.

Turbo Dispatcher - Design - Example 1

	CPU 1	CPU 2
Step 1	A1 (N)	B1 (P)
Step 2	C1 (P)	A2 (N)
Step 3	B2 (N)	A3 (P)
Step 4	C2 (P)	B3 (P)
Step 5		C3 (P)

Job A | A1 (N) | A2 (N) | A3 (P) |

Job B | B1 (P) | B2 (N) | B3 (P) |

Job C | C1 (P) | C2 (P) | C3 (P) |

Ax, Bx, Cx = workunits of job A, B, C

(N) = non-parallel work unit

(P) = parallel work unit

ON DEMAND BUSINESS
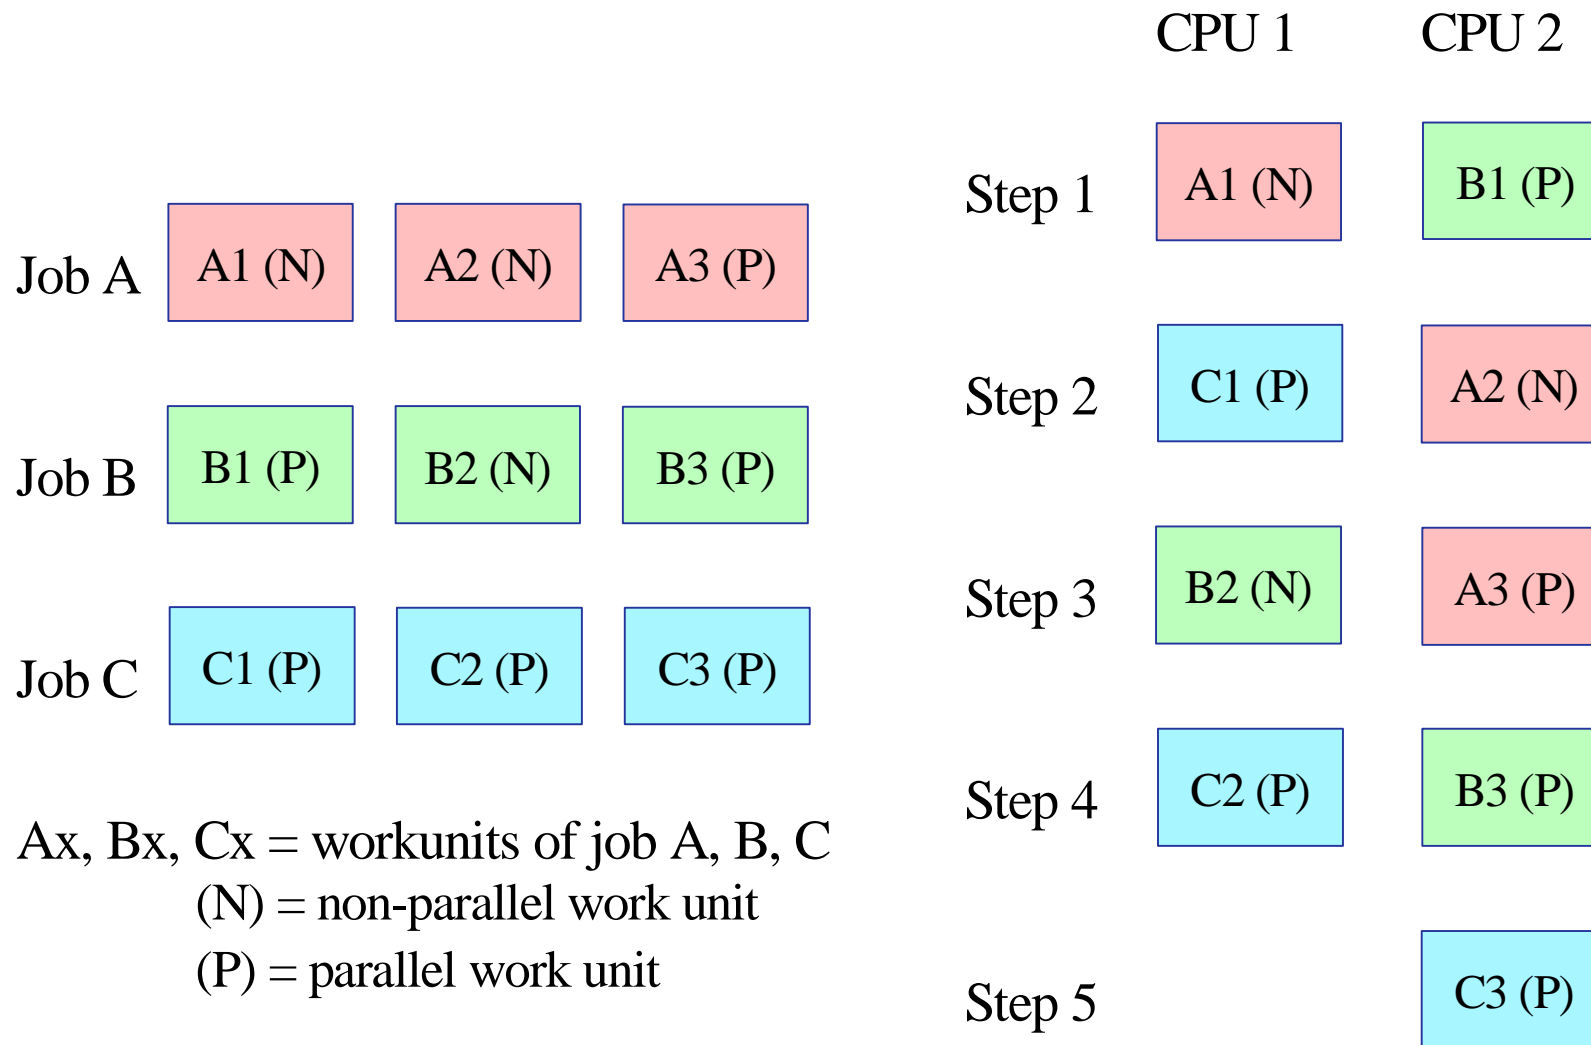

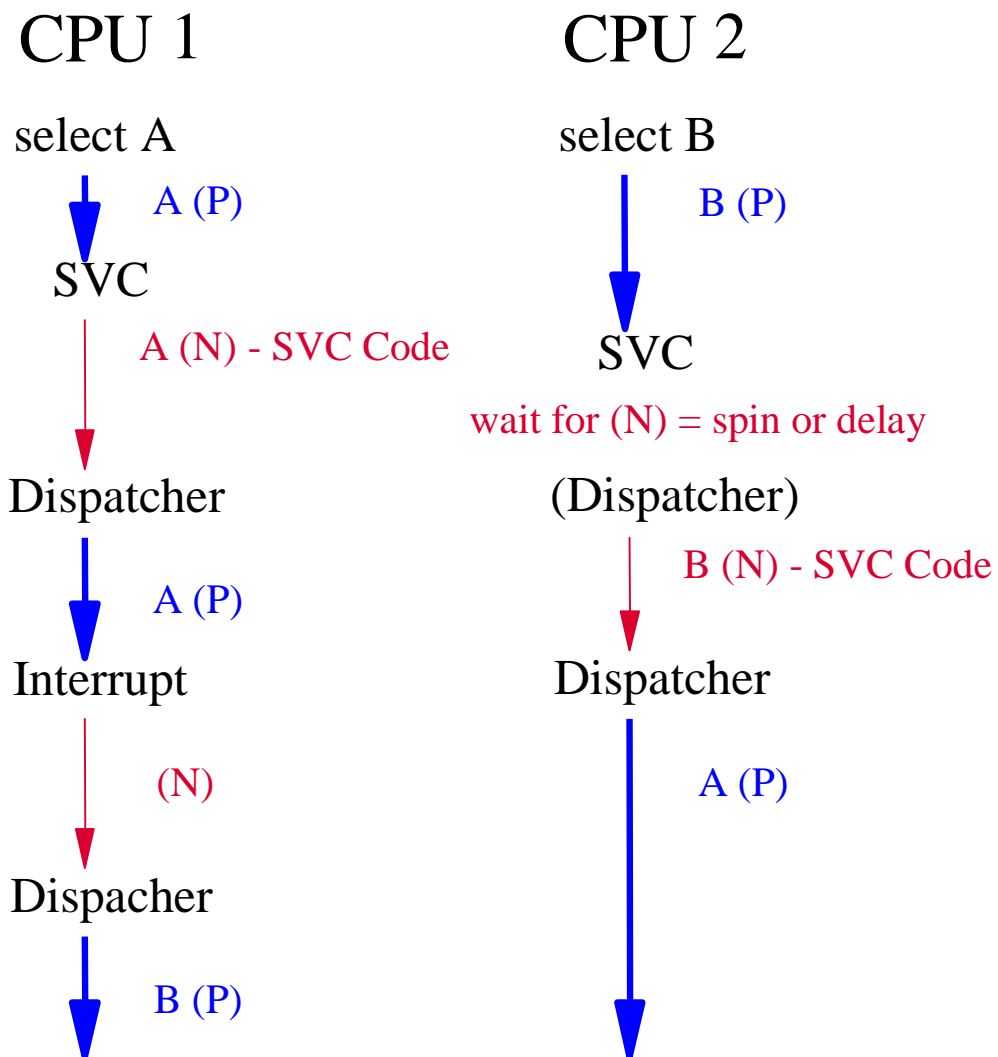

Turbo Dispatcher - Exploitation

§ **Uni-Processor**

– new Partition Balancing Concept

- Helps to set priorities of partitions

– Determination of non-parallel share, to find out if a 2. or 3. CPU would be of use

§ **n-Way Processors (2-3 CPUs)**

– System tuning required for exploitation

– Increased Capacity (dependent on workload)

- Exploitation increases by reduction of non-parallel work units

Turbo Dispatcher - CPU time measurement

§ **CPU time measurement (overall system)**

 – SYSDEF TD,RESETCNT

 – Workload (e.g. run a job)

 – QUERY TD (QUERY TD,INTERNAL)

```
CPU     STATUS     SPIN_TIME      NP_TIME  TOTAL_TIME  NP/TOT
 00     ACTIVE            0       237100      416698   0.568
 01     ACTIVE            0       157556      415229   0.379
 02     QUIESCED          0            0           0   *.***
 03     INACTIVE

                       ----------------------------------------
TOTAL                     0       394656      831927   0.474

            NP/TOT: 0.474       SPIN/(SPIN+TOT): 0.000
OVERALL UTILIZATION: 179%         NP UTILIZATION:  85%

ELAPSED TIME SINCE LAST RESET:         463433
```

NP/TOT   = non-paralell share (NPS)

SPIN_TIME = CPU time waiting for NP

Display System Activity Dialog

Migration aspects

§ **Consider hard-/software requirements:**

– Does my largest partition still fit into a single CPU of the target processor?

  • Note: a partition can only run on 1 CPU at a time!

– Is the processor capacity and speed still sufficient to run the workload?

– Does multiprocessing help to run the workload?

  • What about non-parallel share (on 1-Way)?

  • Are there many parallel batch jobs?

    – A large CICS partition does not benefit of a 2. CPU

Migration overhead

§ **Uni-Processor**

– increased overhead because of

  • Release migration (VSE/ESA 2.6/2.7 vs. z/VSE 3.1)
  • TD overhead (Standard Dispatcher vs. TD)
  • CICS/VSE vs. CICS TS

§ **N-Way Processor**

– CPU time increases when migrating from uni to n-Way Processor (for the same workload)

  • For PACEX Workload: Factor 1.4 (2 CPUs)
  • TD overhead for multiprocessor exploitation
  • z/VM Overhead

ON DEMAND BUSINESS™

Change only
one thing at a time!

Allows you to see which step
has introduced a problem.

z/VSE 3.1
(Turbo Dispatcher)
CICS TS 1.1

Performance Tips

§ **A partition can only exploit 1 CPU at a time**

– 2 CPUs do not have any benefit for a CICS partition

– Use as many partitions as required for selected n-way

§ **Use/define only as many CPUs as really needed**

– additional CPUs create more overhead, but no benefit

§ **Partitions setup**

– Set up more batch and/or (independent) CICS partitions

– Split CICS production partitions into multiple partitions

Performance Tips (2)

§ **1 CPU** must be able to handle **all non-parallel workload**

§ **Non-parallel code limits the n-Way exploitation**

– QUERY TD: NP/TOT = NPS

– Measure NPS before migration

– max CPUs = 0.9 / NPS

NPS	#CPUs	NPS	#CPUs
0.20	4.5 (4)	0.40	2.2 (2)
0.25	3.6 (3)	0.45	2.0 (2)
0.30	3.0 (3)	0.50	1.8 (1)
0.35	2.6 (2)	0.55	1.6 (1)

Performance Tips (3)

§ **Non-parallel code limits the maximum MP exploitation**

§ **System code (Key 0) increases non-parallel share**

   – Vendor code can have significant impact

§ **Overhead increases when NP code limits throughput**

§ **Data In Memory (DIM) reduces non-parallel code**

   – less system calls (I/Os)

   – may increase throughput

§ **Change VSE/POWER startup to WORKUNIT=PA**

§ **In general ONE faster CPU is better than multiple slower ones**

   – Even if sum of slower CPUs is higher than one faster CPU

ON DEMAND BUSINESS™

CICS Implications

§ **Single CICS**

   – Can consume processing power of one CPU only

   – parallel batch jobs may exploit 2. CPU

§ **Multiple CICS partitions**

   – Number of CPUs depends on non-parallel share (NPS)

   – Function shipping and Transaction routing

      • AOR, TOR, FOR

Partition Balancing

§ **Balanced Group is defined with PRTY:**

- PRTY BG,C=F5=F8,F2,F3,F1

- Each partition/class of the group has a default-SHARE (100)

- Dynamic partitions gets the SHARE of its class

§ **To set a SHARE (1-1999)**

- PRTY SHARE,F5=50

- SHARE = 0 means the lowest priority within the group

```
PRTY
AR 0015 PRTY BG,C=F5=F8,F2,F3,F1
AR 0015
AR 0015 SHARE F5=  50, F8= 100,  C= 100
MSECS
AR 0015 MSECS    976        <---- influences task selection
```

Do's and Don't Do's
no virtual CPUs!
(creates overhead)
only if NPS < 4.5
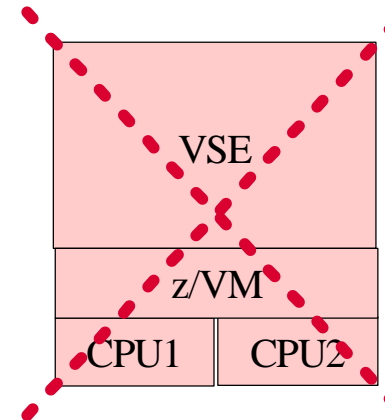

only if NPS < 4.5

Do's and Don't Do's (2)

The fastest uni-processor is (almost always) the best processor !

VSE Health Check

- § **Goals**
  - – Recognize actual/upcoming problems
  - – Optimize the system for new/current workload
- § **A-B-C analysis**
  - – A - concentrate on the essentials
    - • 20 % work for 80 % results
  - – B - more detailed analysis
    - • 30 % work for 15 % results
  - – C - analyze all details
    - • 50 % work for 5 % results
- § **A-B analysis takes about 2 days**
- § **C analysis takes about 1 week**
- § **Should be done about once a year**

ON DEMAND BUSINESS™

VSE Health Check - continued

§ **What should be checked?**

– Processor (utilization, dispatching, z/VM, ...)

– DASD, Tapes (I/O rate, cache, ...)

– Network (network load, misrouted packets, ...)

– System software

  • Turbo Dispatcher (PRTY, PRTY SHARE, ...)
  • VSAM (CA/CI sizes, share options, buffers, ...)
  • CICS (MXT, DSA/EDSA sizes, SOS, ...)
  • Storage Layout (GETVIS 24, SVA, partitions, DSPACE, ...)
  • VTAM (buffer pool)
  • POWER (DBLK, DBLKGP, ...)
  • LE runtime options (Heap size, ...)

– Application software

– New Tool: VSE Health Checker
http://www.ibm.com/servers/eserver/zseries/zvse/downloads/#healthchecker

ON DEMAND BUSINESS™

Hints and Tips for Performance

§ **Try to exploit Turbo Dispatcher functions**

– Priority settings

– Partition balancing

– Partition balancing groups

§ **Use as much data in memory (DIM) as possible**

– CICS Shared Data Tables

– Large/many VSAM Buffers (with buffer hashing)

– Virtual Disks

§ **Switch tracing/DEBUG off for production**

Hints and Tips for Connector and TCP/IP-Performance

§ **Reduce amount of data transferred**

– Transfer only data that is needed

– Issue only requests that are needed

§ **Use connection pooling**

– Reduce overhead of connection establishment

§ **Performance of connectors depends on**

– Network performance

– Performance of "server"

– Performance of "client" or middle tier

§ **Reduce misrouted packets**

§ **Use a packet filter**

– Unwanted packets increases TCP/IP and CPU load
