The following are trademarks or registered trademarks of other companies.

INFINIBAND, InfiniBand Trade Association and the INFINIBAND design marks are trademarks and/or service marks of the INFINIBAND Trade Association.

Intel is a trademark of Intel Corporation in the United States, other countries, or both.

Java and all Java-related trademarks and logos are trademarks of Sun Microsystems, Inc., in the United States and other countries.

Linux is a registered trademark of Linus Torvalds in the United States, other countries, or both.

UNIX is a registered trademark of The Open Group in the United States and other countries.

Microsoft, Windows and Windows NT are registered trademarks of Microsoft Corporation.

Red Hat, the Red Hat "Shadow Man" logo, and all Red Hat-based trademarks and logos are trademarks or registered trademarks of Red Hat, Inc., in the United States and other countries.

* All other products may be trademarks or registered trademarks of their respective companies.

Notes:

Performance is in Internal Throughput Rate (ITR) ratio based on measurements and projections using standard IBM benchmarks in a controlled environment. The actual throughput that any user will experience will vary depending upon considerations such as the amount of multiprogramming in the user's job stream, the I/O configuration, the storage configuration, and the workload processed. Therefore, no assurance can be given that an individual user will achieve throughput improvements equivalent to the performance ratios stated here.

IBM hardware products are manufactured from new parts, or new and serviceable used parts. Regardless, our warranty terms apply.

All customer examples cited or described in this presentation are presented as illustrations of the manner in which some customers have used IBM products and the results they may have achieved. Actual environmental costs and performance characteristics will vary depending on individual customer configurations and conditions.

This publication was produced in the United States. IBM may not offer the products, services or features discussed in this document in other countries, and the information may be subject to change without notice. Consult your local IBM business contact for information on the product or services available in your area.

All statements regarding IBM's future direction and intent are subject to change or withdrawal without notice, and represent goals and objectives only.

Information about non-IBM products is obtained from the manufacturers of those products or their published announcements. IBM has not tested those products and cannot confirm the performance, compatibility, or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

Prices subject to change without notice. Contact your IBM representative or Business Partner for the most current pricing in your geography.

Introduction to Storage Area Networks (SAN)

- § What are the building blocks of a SAN
- § Optimizing storage for business continuity
- § Storage virtualization
- § SAN Volume Controller
- § z/VSE SCSI support

Storage Architectures/Topologies

- § **DAS – Direct Attached Storage**
 - Server-centered storage architecture
 - Storage devices are linked directly to a server via a direct physical connection
- § **NAS – Network Attached Storage**
 - Server dedicated to file sharing (NAS Appliance)
 - Shared connection to data and its storage using a file system
 - Uses network file system protocols such as NFS or CIFS
- § **SAN – Storage Area Network**
 - Storage-network-centered
 - Storage devices and storage users are attached to a separate network
 - SCSI commands and data pass over fiber channel (FC)
- § **FICON**
 - Same as SAN but mainframe channel commands and data pass over FC

Components of a SAN Connection

§ Many different combinations of components

§ Connectors

- SC is the older style 1 Gbps connector
- LC is the newer style 2/4/8 Gbps connector

§ Fiber

- Single-mode provides long distance connection (~10 to 80 km +)
- Multi-mode provides local distance connection (~75 to 500 m)

6

IBM Storage Systems

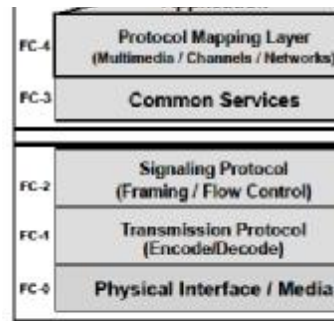

WAVV 2009

Fibre Channel Protocol

Fibre Channel (FC) provides high speed transport for upper level (i.e. FICON or SCSI) payloads

- § Some confusing terms
 - "Fiber" is the glass cable
 - "Fibre" is the protocol/architecture
- § FC is the "protocol" for a Storage Network
- § Attributes are:
 - Highly scalable – addressing for up to 16 million nodes
 - Various switched topologies
 - High speeds – up to 10 Gbps
 - Segments of up to 100 km between switches
 - Support for multiple protocols like FICON and OPEN (SAN)
 - Support for security via **Zoning** and Prohibit/Allow Matrix

7

IBM Storage Systems

Zoning

- § **A logical grouping of fabric connected devices within a SAN (or virtual fabric)**
- § Zoning establishes access control
 - Devices within a zone can access each other
- § Zoning increases security
 - Limited access prevents unauthorized access
- § Zone membership might be defined by:
 - Port World Wide Name (pWWN) – device
 - Fabric World Wide Name (fWWN) – fabric
 - Fibre Channel Identifier (FCID)
 - Fibre Channel Alias (FC_Alias)
 - IP address
 - Domain ID/Port number
 - Interface

8

Storage Network Components

- § Multiple infrastructure vendors (e.g., Brocade, McData, Cisco)
- § Several components required to build a SAN
 - Servers with Host Bus Adapters (HBA)
 - Mainframes with FICON/FICON Express Channels
 - Storage systems
 - Ø RAID
 - Ø JBOD (Just a Bunch Of Disks)
 - Ø Tape
 - Ø VTS/VSM (virtual tape)
 - Fibre Channel / FICON switches or directors
 - Ethernet Switches (iSCSI)
 - SAN management software

Tiers of Business Continuity

Technology changes as tiers increase

Storage Virtualization is . . .

Technology that makes one set of resources look and feel like another set of resources, preferably with more desirable characteristics...

A logical representation of resources not constrained by physical limitations

- Hides some of the complexity
- Adds or integrates new function with existing services
- Can be nested or applied to multiple layers of a system

What is Virtualization?

Logical representation of resources not constrained by physical limitations

- Enables user flexibility
- Centrally manage many resources as one
- Dynamically change and adjust across the infrastructure
- Create many virtual resources within single physical device
- Eliminates trapped capacities

A comprehensive platform to help virtualize the infrastructure

IBM Information Infrastructure for Storage Virtualization

IBM System Storage SAN Volume Controller for Linux on z

- § Improves storage utilization and reduces storage growth
- § Reduces power and cooling requirements helping make data centers more "green"
- § Boosts performance and simplifies storage management for IBM and non-IBM disk
 - Improve storage administration productivity by up to 2x
- § Redundant architecture supports enterprise-class availability
 - Non-disruptive upgrades of both hardware and software
- § Supports non-disruptive data movement
- § Advanced functionality:
 - Space-Efficient Virtual Disks
 - Space-Efficient FlashCopy - reduces storage needed for backup copies by as much as 75% or more
 - Virtual Disk Mirroring

**Outstanding performance,
flexibility, and high availability
while controlling storage TCO**

Information Availability

SVC 2145-CF8 Storage Engine

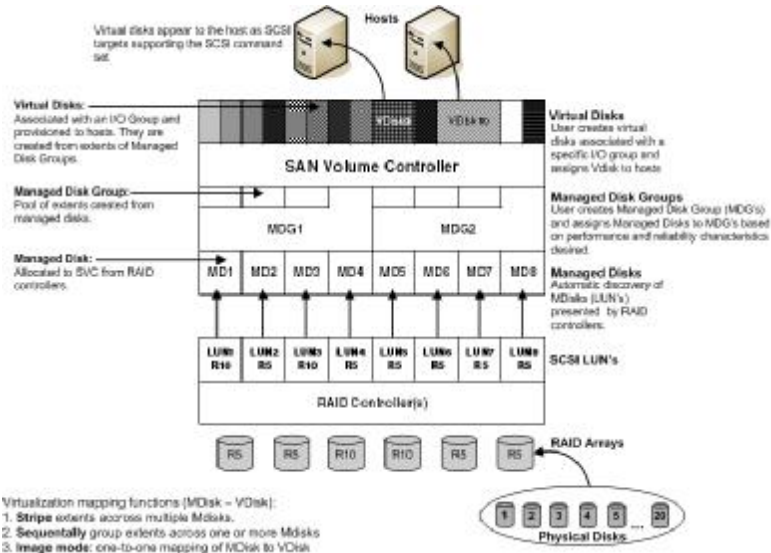

- § New SVC engine based on IBM System x3550M2 server
 - Intel® Core™ i7 2.4 GHz quad-core processor
 - 24GB of cache (with future growth possibilities)
 - Four 8Gbps FC ports
 - IBM® Systems Director Active Energy Manager enabled
- § Bandwidth twice that of the Model 8G4
 - Expect 2x MB/s and 1.5x IOPS of Model 8G4
- § Support for Solid State Drives (up to four per SVC node) enabling scale-out high performance SSD support with SVC
- § New engines may be intermixed in pairs with other engines in SVC clusters
 - **Mixing engine types in a cluster results in VDisk throughput characteristics of the engine type in that I/O group**
- § Cluster non-disruptive upgrade capability may be used to replace older engines with new CF8 engines
- § Replaces the SVC 2145-8G4 engine as premier offering; 2145-8A4 Entry Storage Engine also available

Flexible Storage Infrastructure with SAN Volume Controller

SVC – Relationship between physical and logical disks

Infrastructure Simplification with SAN Volume Controller

Traditional SAN

- § Capacity is isolated in SAN islands
- § Multiple management points
- § Poor capacity utilization
- § Capacity is purchased for, and owned by individual processors

SAN Volume Controller

- § Combines capacity into a single pool
- § Uses storage assets more efficiently
- § Single management point
- § Capacity purchases can be deferred until the physical capacity of the SAN reaches a trigger point.

Non-disruptive Data Migration with SAN Volume Controller

Traditional SAN

1. Stop applications
2. Move data
3. Re-establish host connections
4. Restart applications

SAN Volume Controller

1. Move data
Host systems and applications are not affected.

Space-Efficient Virtual Disks (SEV)

§ Space-Efficient Virtual Disks function is the SVC implementation of “thin provisioning”

§ Traditional (“fully allocated”) virtual disks use physical disk capacity for the entire capacity of a virtual disk even if it is not used

- Just like traditional disk systems

§ With SEV, SVC allocates and uses physical disk capacity *when data is written*

- Can significantly reduce amount of physical disk capacity needed

§ Available at *no additional charge* with SVC base virtualization license

IBM

SVC: The Benefits are Real

Key Areas of Cost Saving Observed by Forrester in SVC Customers

- § **Reduction in storage management and administration cost**
 - Allowing a core group of administrators to control multiple assets across a distributed storage environment (*50% efficiency improvement*)
- § **Improved storage utilization**
 - Improve capacity utilization of existing storage assets
 - Control the growth of future spending (*improved utilization by 30%*)
- § **Reduced cost of storage**
 - Capitalize on being able to purchase the lowest cost storage resources (*controlled growth on average by 20%*)
- § **Improved customer and end user availability to data-driven applications**
 - Minimize downtime associated with migrating data between storage assets (*\$240,000 in annual savings*)

z/VSE – SCSI Support

- § SCSI disks are widely used in 'open' systems
- § SCSI disks supporting the FCP (Fibre Channel Protocol) can be attached to IBM System z servers
- § z/VSE 3.1 and later supports FCP-attached SCSI disks
- § SAN Volume Controller is qualified to be used with z/VSE 4.2
 - Through the SVC, disk controllers supported by the SVC can be used

SAN Summary

A Storage Area Network -

§ is a specialized, high-speed network attaching servers and storage devices

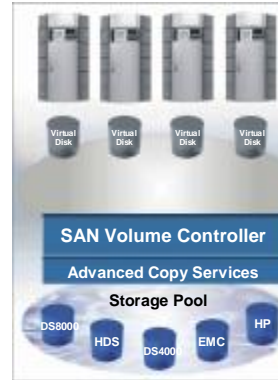

§ Enables one server or many heterogeneous servers to share a common storage utility

§ Can be used to bypass traditional network bottlenecks

IBM SAN Volume Controller –

§ Designed to combine storage capacity

Consolidation and virtualization can help to achieve a simpler, more scalable, more cost-effective IT infrastructure that aligns more flexibly with business goals
