# Roadmap for dynamic e-business - SOA

# What is Service-Oriented Architecture (SOA)?

## § SOA is an IT architectural style

- supports **integrating your business** as linked services that can be accessed when needed over a network, enabling your business to adapt to changing conditions and requirements
- These services are **self-contained** and have **well-defined interfaces** to let the users of those services -- called clients or consumers -- know how to interact with them

## § SOA results in "**loosely coupled**" application components

- The code is not necessarily tied to a particular database, or even a particular infrastructure.

## § It is this loose coupling that enables the combination of services into diverse applications.

- It also enables much greater **code reuse**, cutting your workload at the same time that it increases your capabilities.

## § Because a service and the client accessing that service are not tied to each other

- a service used to process an order could be completely replaced, and the client-services placing orders would never know.

## What is Service-Oriented Architecture (SOA)?

- § **From a business standpoint, a Service-Oriented Architecture is focused on**
  - developing technology that helps you **accomplish your business tasks**
  - rather than allowing technological constraints to dictate your activities.
- § **For example, the process of selling, manufacturing, shipping, and getting paid for an item may involve dozens of steps and several different databases and computer systems.**
- § **But at the heart of things, the process encompasses a handful of human activities, for example:**
  - Salesmen finds a likely customer
  - Customer orders product
  - Production department produces product
  - Production department ships product
  - Billing department bills for product
  - Customer pays for product

## What is Service-Oriented Architecture (SOA)?

### § Implementing SOA can bring you a great number of benefits, including the following:

- Greater alignment of business and IT
- **Component-based** systems
- **Loosely coupled** components and systems
- A network-based infrastructure, enabling geographically and technologically diverse resources to work together
- On-demand, built-on-the-fly-applications
- Greater **code reuse**
- Better **process standardization** throughout the enterprise
- Easier centralization of corporate control

## What is Service-Oriented Architecture (SOA)?

- § **Web services** are the most common technology standards used to implement SOA
  - However, they are not the only technology one can use to develop the parts of an SOA
- § **Many SOAs -- most, in fact -- involve the integration of legacy data**
  - contained in systems that use technology such as MQSeries and Common Object Request Broker Architecture (CORBA) or even CICS.
- § **Many of these technologies have been adapted for the SOA world, and they can be used with or without a Web services wrapper.**
- § **But, Web services is rapidly becoming the de facto standard used to support SOA.**

## Why would a VSE customer do SOA ?

### § SOA is modern (hype) and strategic

- The management says: We also have to do SOA

### § Easy integration of existing VSE programs into the modern world

- Reducing the interface complexity
- Reuse of existing applications as services
- Use of standard protocols (XML, SOAP, HTTP)

### § Encapsulation of VSE programs

- Disconnecting business and display logic

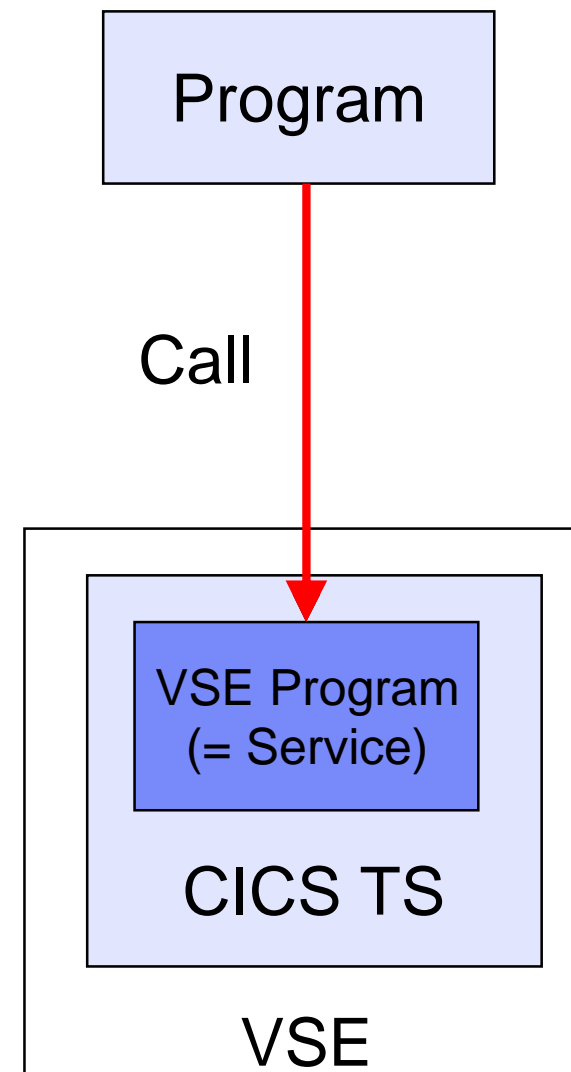

### § Integration of VSE into a Microsoft .Net environment

- You do not want to use Java
- You already have a Microsoft environment

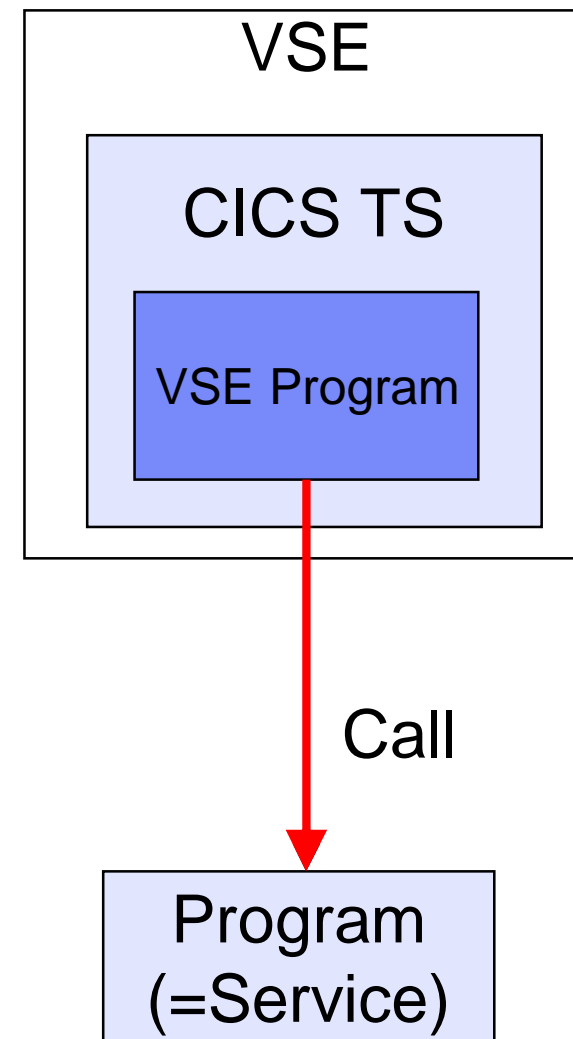

## What is a Web Service?

- § Assume **you have a VSE program** that implements some kind of important business logic
- § Someone else (outside VSE) wants to use this program
  - 1. Possibility: Rewrite the same logic
    - May need access to VSE data
    - Changes/Fixes in VSE code needs to be re-done in new code also
  - 2. Possibility: Call the VSE program from remote
    - VSE program can be treated as a **Web Service**
    - VSE is the Web Service provider

## What is a Web Service?

- § Assume **someone has a program** that implements some kind of important business logic
- § You want to use this program inside a VSE application
  - 1. Possibility: Rewrite the same logic
    - May need access to the remote data
    - Changes/Fixes in code needs to be re-done in VSE code also
  - 2. Possibility: Call the external program from VSE
    - External program can be treated as a **Web Service**
    - VSE is the Web Service Requestor

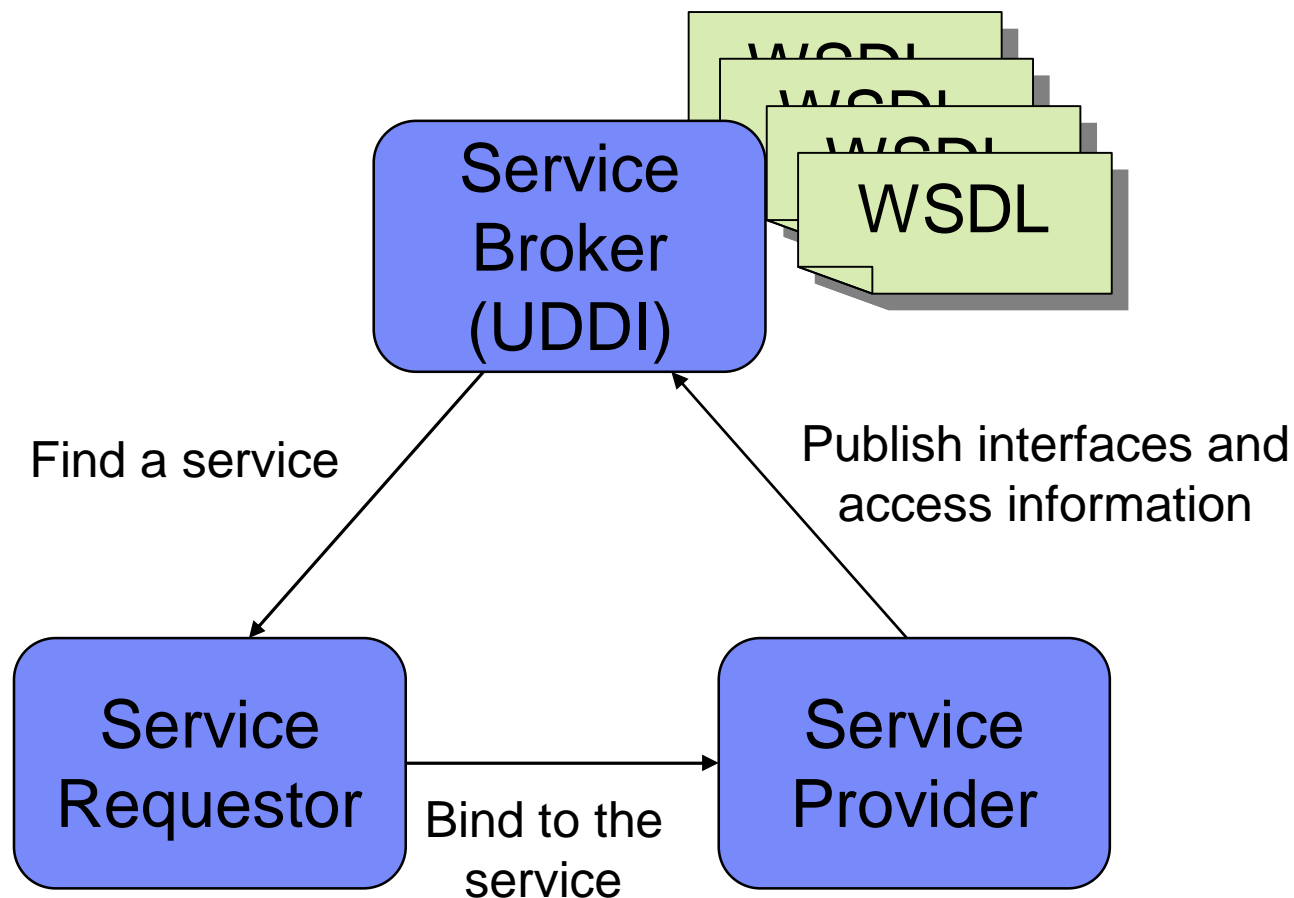

# Web Services - Summary

**HTTP - Transport Service**

**TCP/IP - Street**

## News with z/VSE V4.2

### § Web Service Security

- Message Encryption
  - Transport-layer authentication using:
    - HTTPS/SSL
- Authentication:
  - Transport-layer authentication using:
    - HTTP authentication (Basic and Digest Access Authorization).
    - SSL Client Authentication with HTTPS.
  - Message-layer authentication using:
    - a UsernameToken (plaintext password or password digest).
    - an X.509 Certificate ( BinarySecurityToken).

### § Long-name to short-name mapping

- To support parameter names longer than 16 characters
- A mapping table can be used to translate long (external) names to short (internal) names

### § New Redbook-style document: “How to use Web Services with z/VSE“

- <http://www.ibm.com/servers/eserver/zseries/zvse/documentation/ebusiness.html#soap>

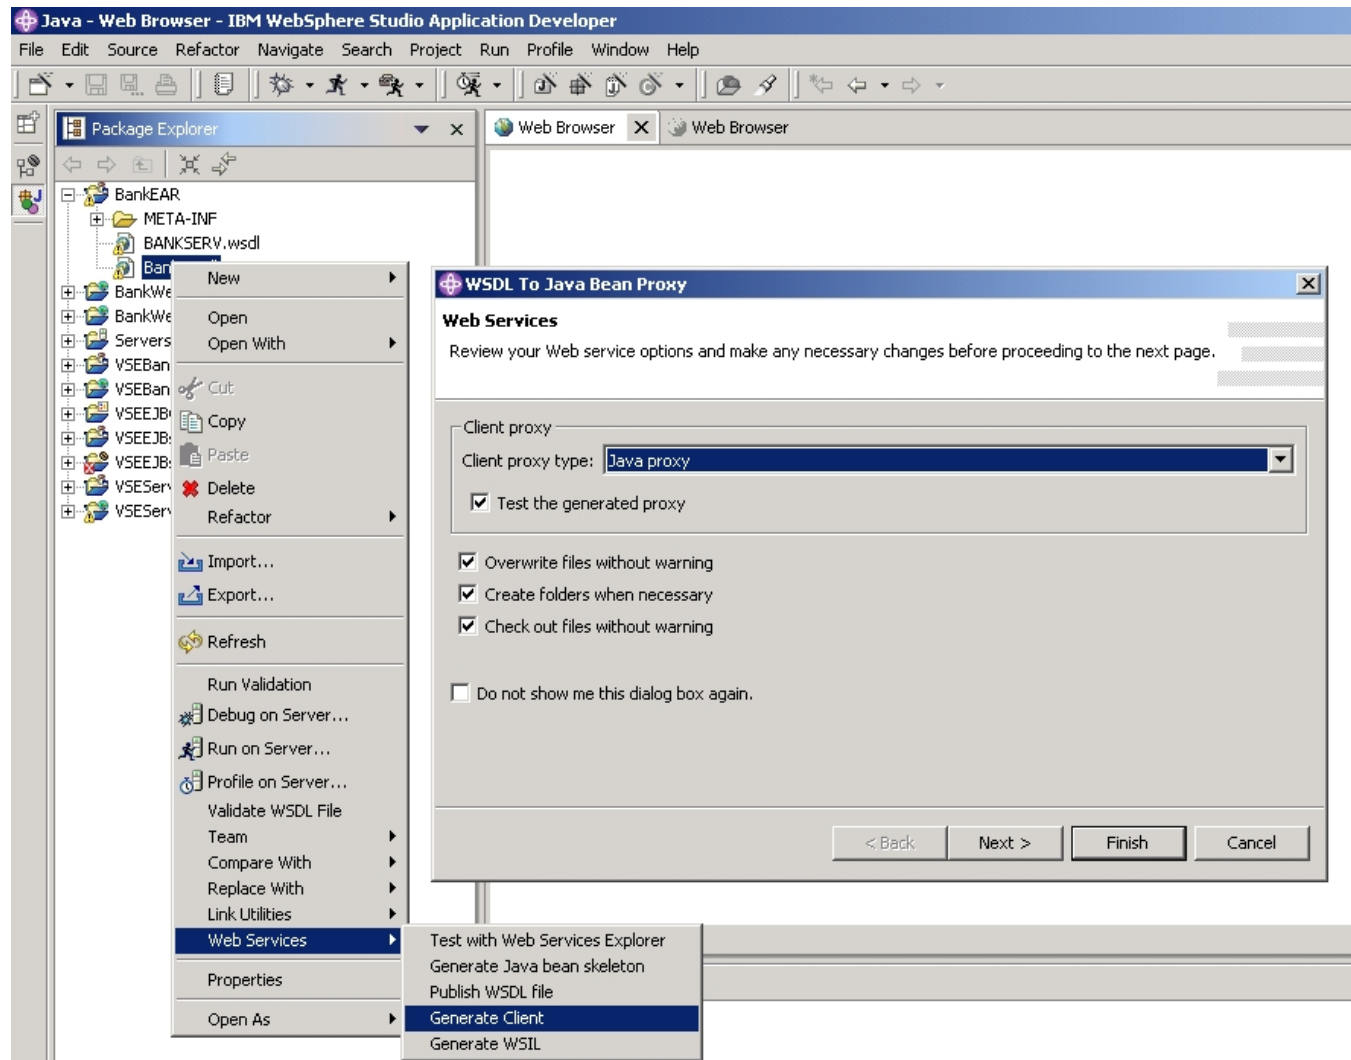

## Using Web Services with Java or MS .Net

### § Use/Call an existing Web Service

- You know that a specific Web Service exists
- Locate the Web Service Description (WSDL)
- Use a tool like Rational Application Developer (RAD/WSAD) or Microsoft Visual Studio and import the WSDL
  - Generate “proxy code” that implements all things needed to invoke the Web Service
  - Applications will call a function or method of the proxy code as it would implement the service locally

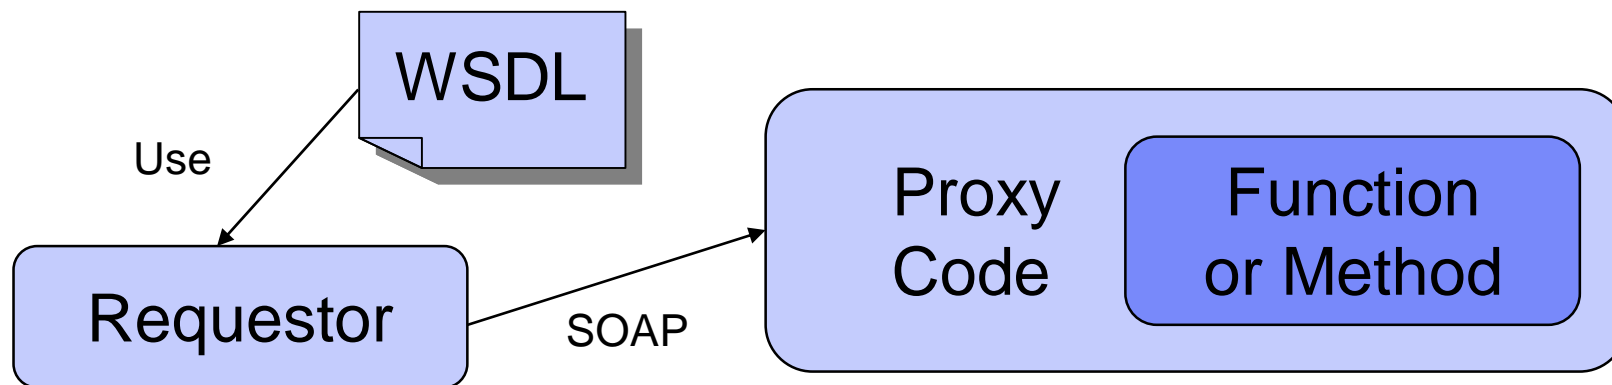

# Using Web Services with Java or MS .Net

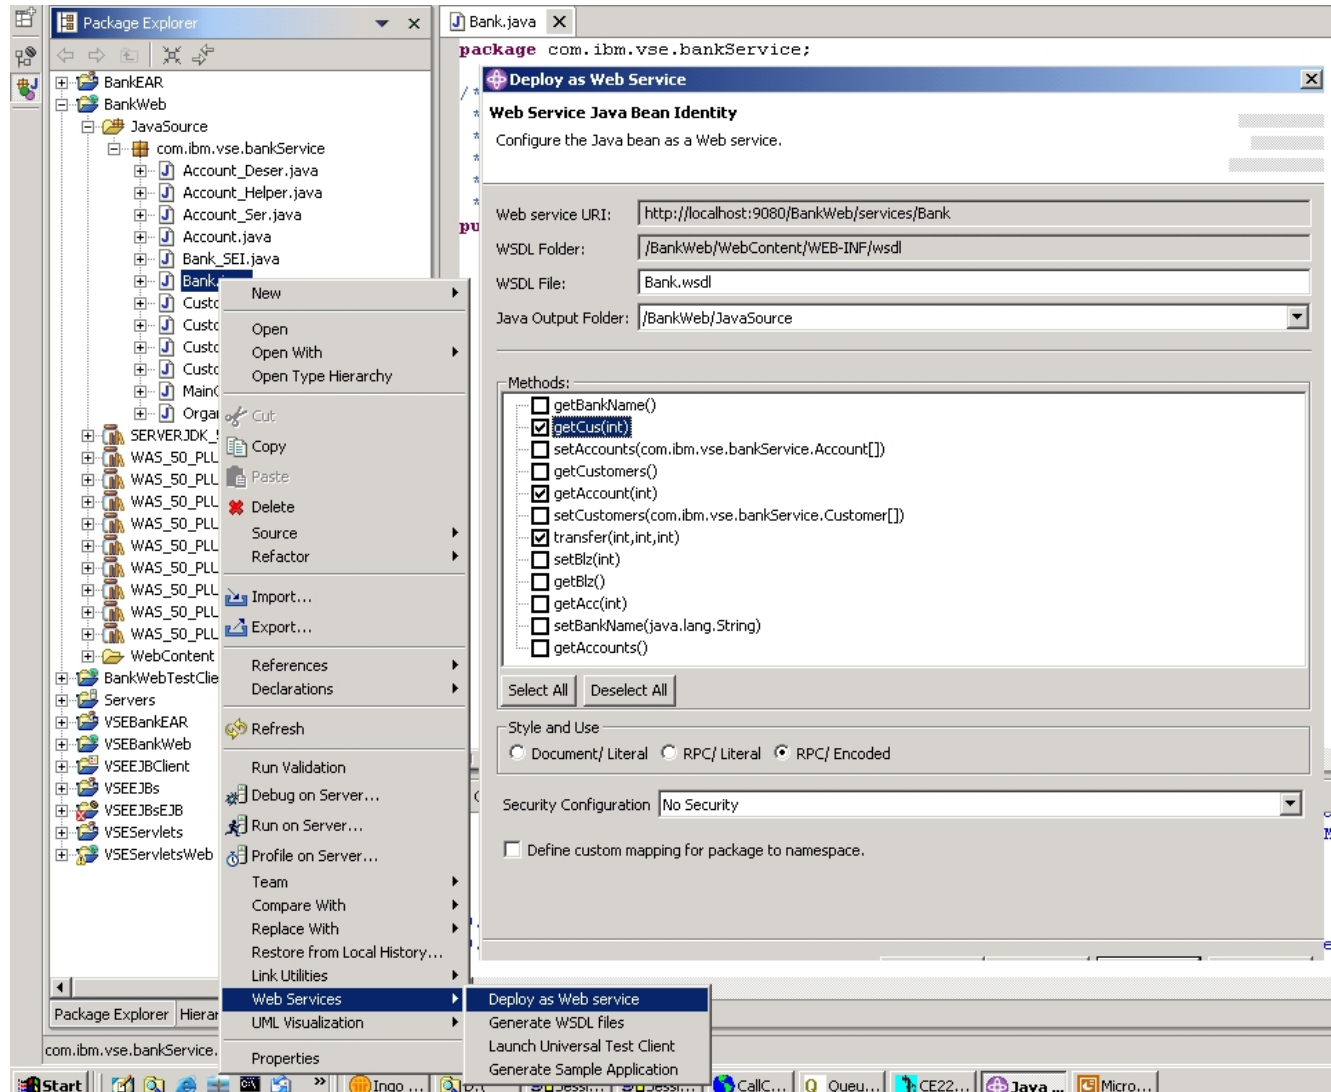

## Using Web Services with Java or MS .Net

### § Create/provide a new Web Service

- You have a function or method that implements some kind of service that you want to provide
- Use a tool like Rational Application Developer (RAD/WSAD) or Microsoft Visual Studio to model a Web Service
  - Generate a Web Service Description (WSDL) and publish it
  - Generate “proxy code” that makes the function or method callable from outside as a Web Service via SOAP
  - Deploy it in an application server

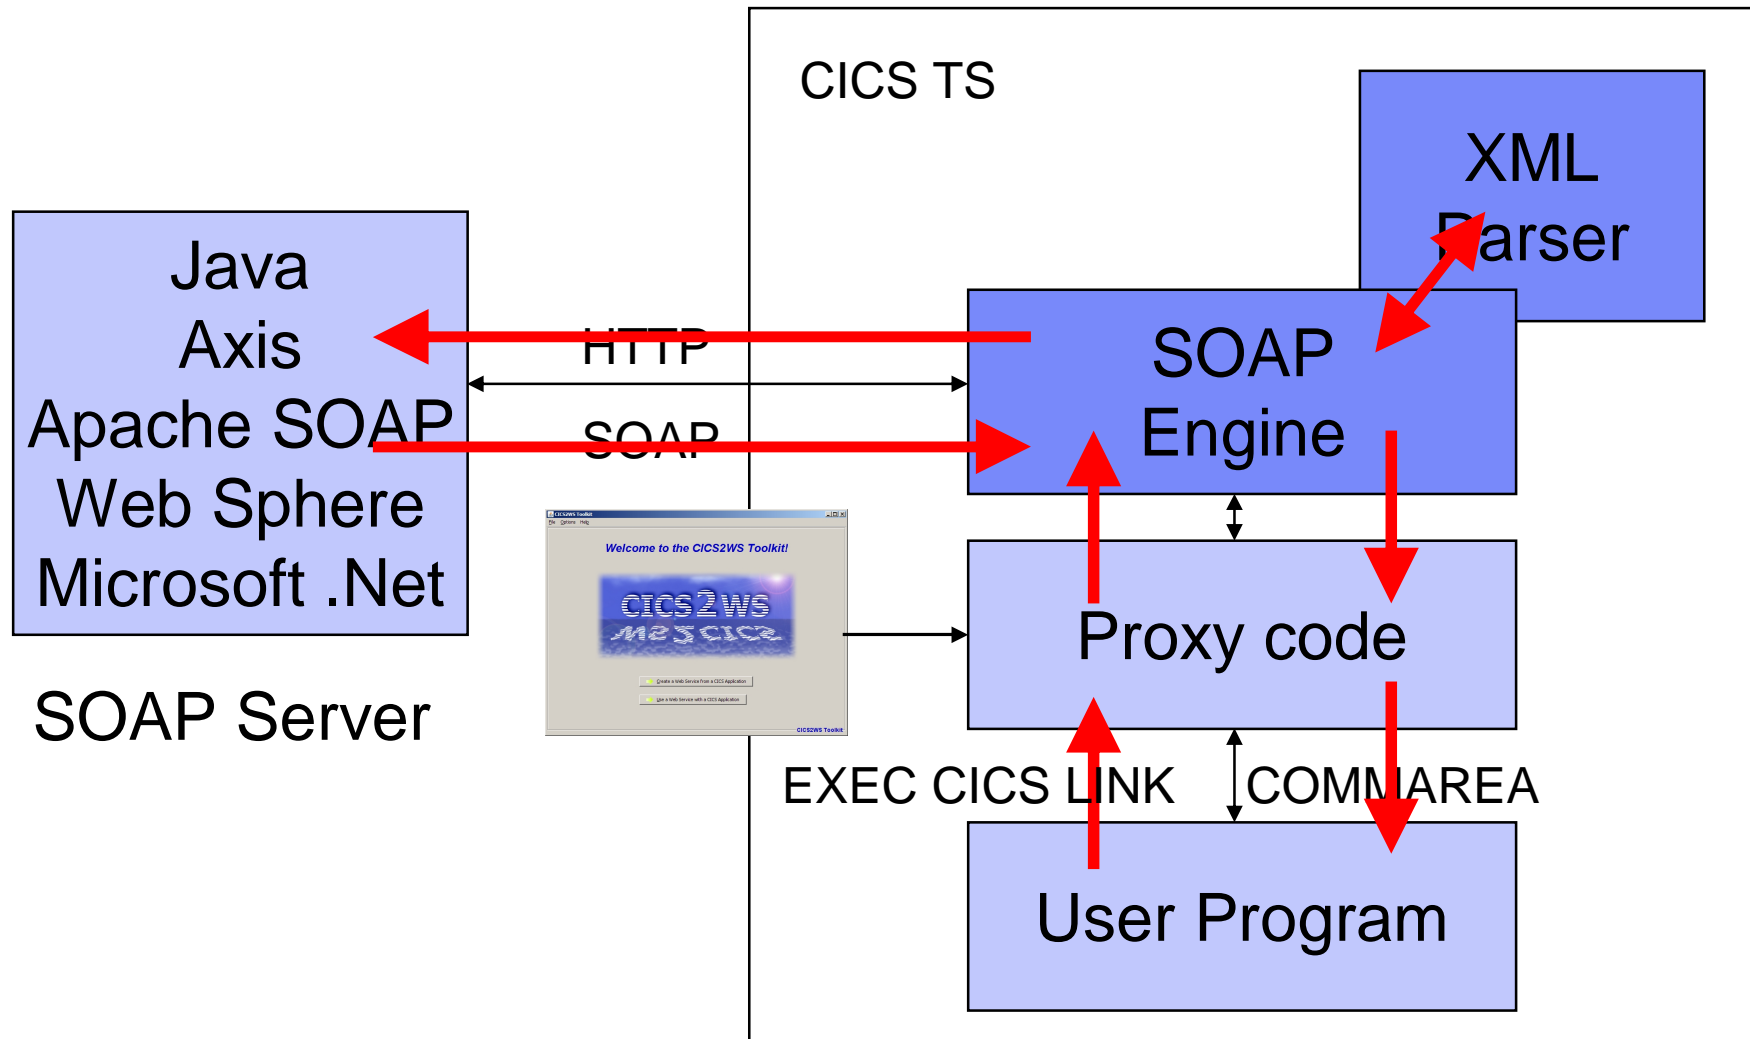

# Using Web Services with Java or MS .Net

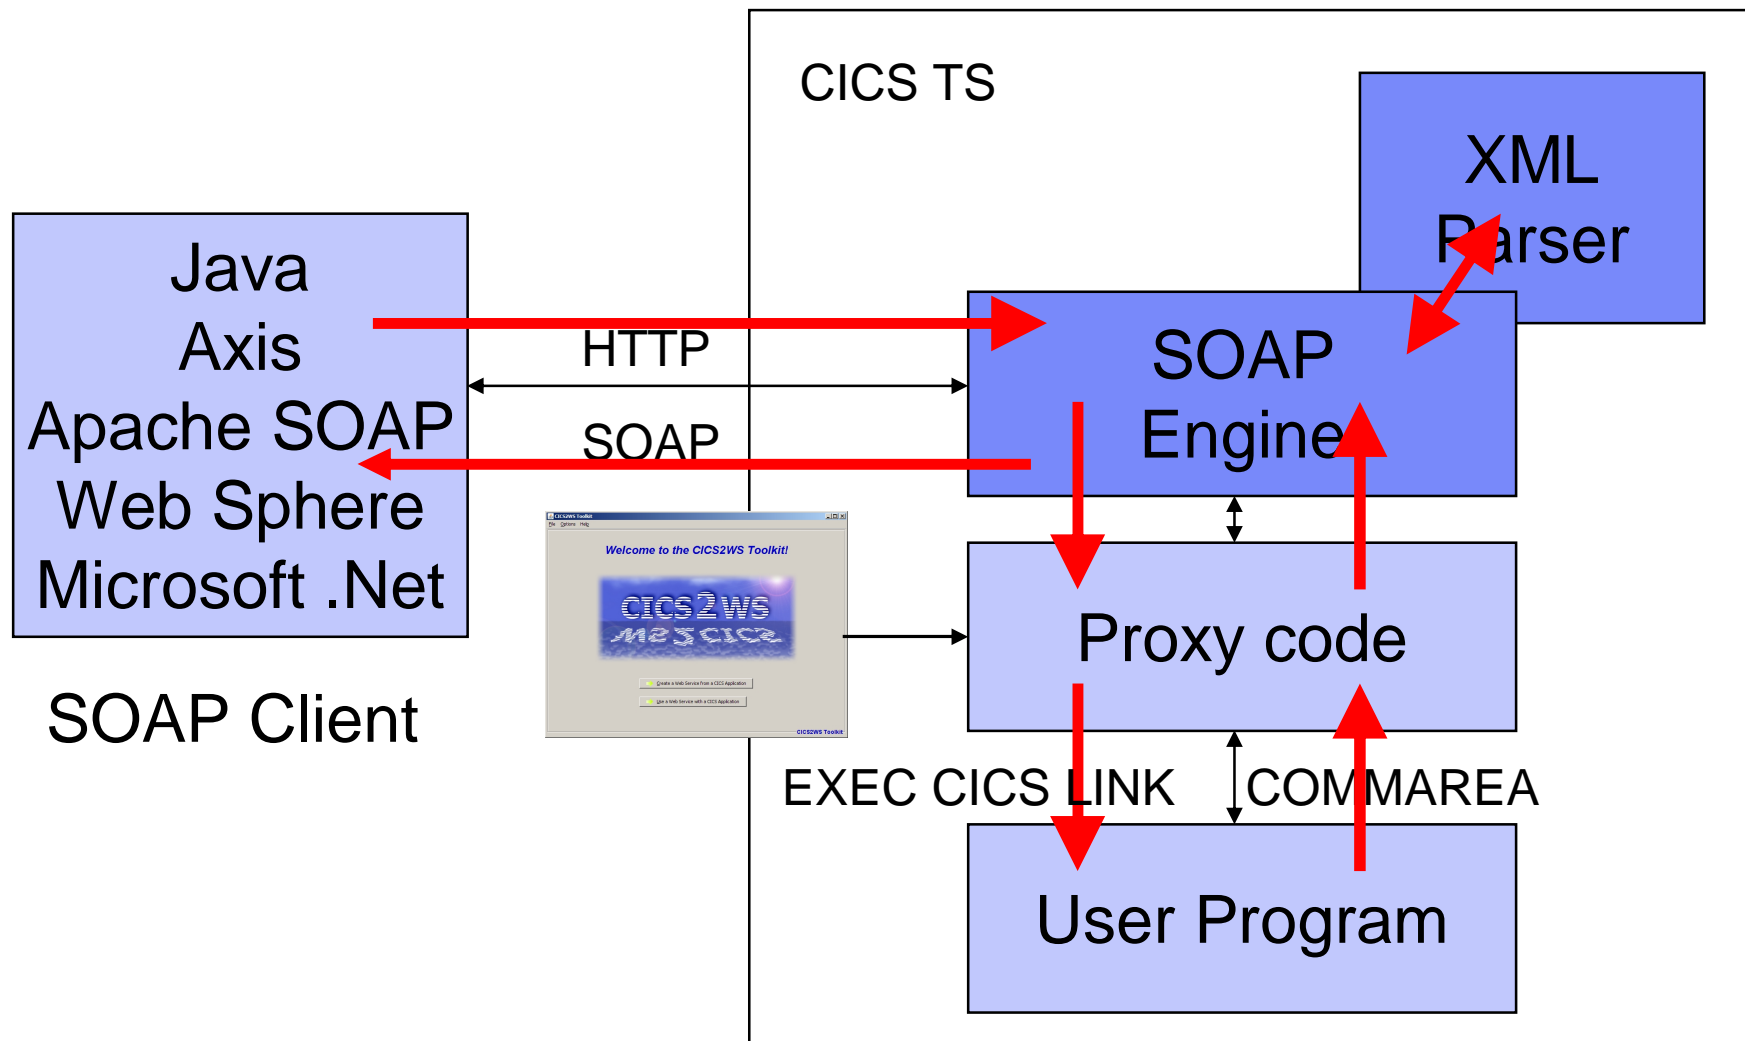

# Using Web Services with VSE – SOAP client

# Providing Web Services with VSE – SOAP server

# VSE SOAP Engine

## § Input/Output parameters

- Each parameter is represented by a TS-Queue entry
  - Parameter name (e.g. “StockPrice”)
  - Parameter type (e.g. “String”)
  - Parameter value (e.g. “34.5”)
  - Length of the parameter data
- Input parameters are put onto the Input-Queue
- Output parameters are read from the Output Queue

```
01 SOAP-PARAM-HDR .
   05  NAME                PIC X(16) .
   05  TYPENAME            PIC X(16) .
   05  LENGTH              PIC 9(8)  COMP .
   05  TYPECODE            PIC 9(8)  COMP .
   05  VALUE               PIC X(20) .

EXEC CICS WRITEQ TS QUEUE(OUTQUEUE)
        FROM(SOAP-PARAM-HDR)
        LENGTH(TS-QUEUE-LENGTH-OUT)
        RESP(COMMAND-RESPONSE)
        END-EXEC.
```

## Why use a proxy program?

- § **Although the SOAP Engine interface uses standard CICS methods, special coding is needed to interface with the VSE SOPA Engine.**
- § **Proxy code 'maps' between standard COMMAREA interface and SOAP Engine**
  - All SOAP specific handling is done in proxy code
  - User applications calls the proxy code or gets called by the proxy code like a local program call (EXEC CICS LINK) using a COMMAREA
  - User COMMAREA format can be freely defined by user
  - Proxy code copies fields from COMMAREA into TS queue entries and vice versa

## Why use a proxy program?

- § **All SOAP implementations use some kind of “proxy code”**
  - Java (RAD/WSAD)
  - Microsoft .Net
  - ...
- § **The proxy code maps the implementation specifics of the SOAP engine to a common interface**
- § **The proxy code is generated using the information from the WSDL**
- § **The proxy code is usually not modified directly by user**
- § **VSE uses the same technique as other SOAP implementations**

# What does the proxy code do?

## § To call an external Web Service

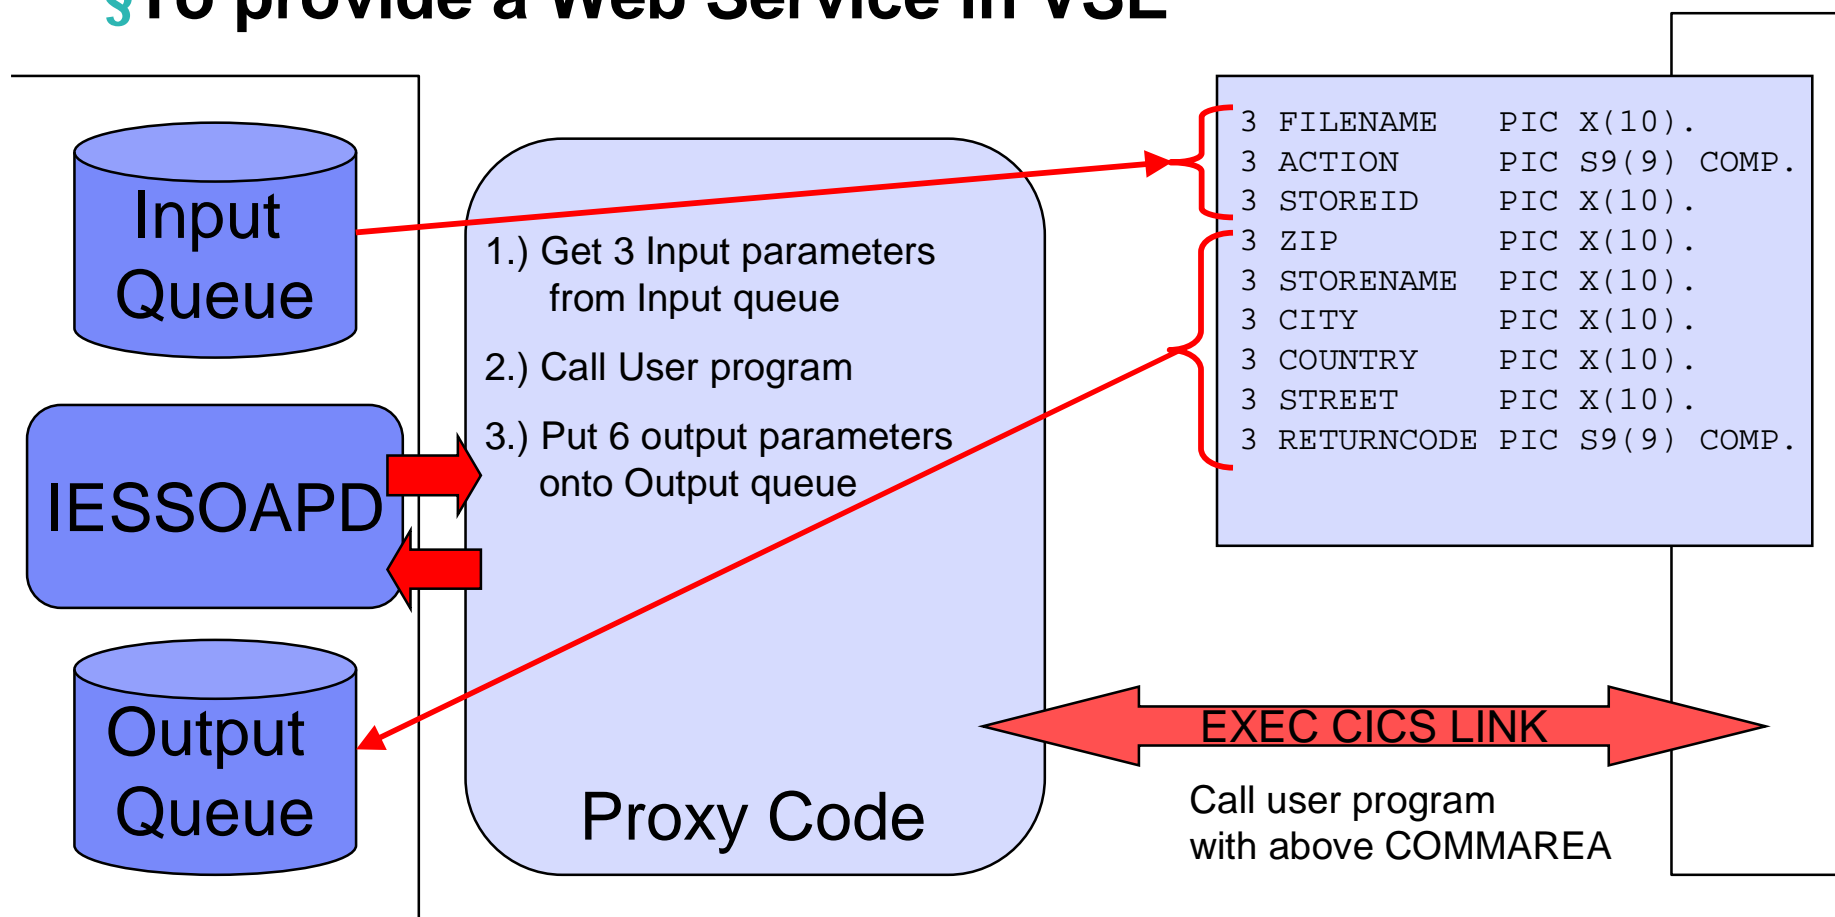

## What does the proxy code do?

### § To call an external Web Service

- Proxy code gets invoked via EXEC CICS LINK by user program
- Put input parameters onto input queue
- Setup parameter area for Web Service call
  - Endpoint URL
  - Name of method to call
  - Names of Input and Output queues
- Call SOAP Engine
  - EXEC CICS LINK to IESSOAPE
- On return
  - Check for errors
  - Get output parameters from output queue
  - Return to user program

# What does the proxy code do?

## §To provide a Web Service in VSE

## What does the proxy code do?

### § To provide a Web Service in VSE

- Proxy code gets called by SOAP Engine
- Get input parameters from input queue
- Prepare user COMMAREA
- Call user program
  - EXEC CICS LINK service provider program (user program)
- On return
  - Check for errors
  - Put output parameters onto output queue
  - Return to SOAP engine

## Which programs can be used with Web Services?

### § Which VSE programs can be used as an Web Service?

- All CICS TS programs that implement the “service” you want to provide
  - In any programming language (COBOL, PL/1, C, Assembler)
- You should separate business logic from user interface
  - 3270 screens or BMS maps can not be used
- The proxy code calls your program with **EXEC CICS LINK** and an **user defined COMMAREA**

### § Which VSE programs can call an external Web Service?

- All CICS TS programs that can call another program with a COMMAREA
  - In any programming language (COBOL, PL/1, C, Assembler)
- Your program calls the proxy code with **EXEC CICS LINK** and an **user defined COMMAREA**

### § VSE SOAP Engine requires CICS TS

- But you can use MRO or remote program definitions to use programs running in CICS/VSE 2.3

## Requirements for web services to be used with z/VSE

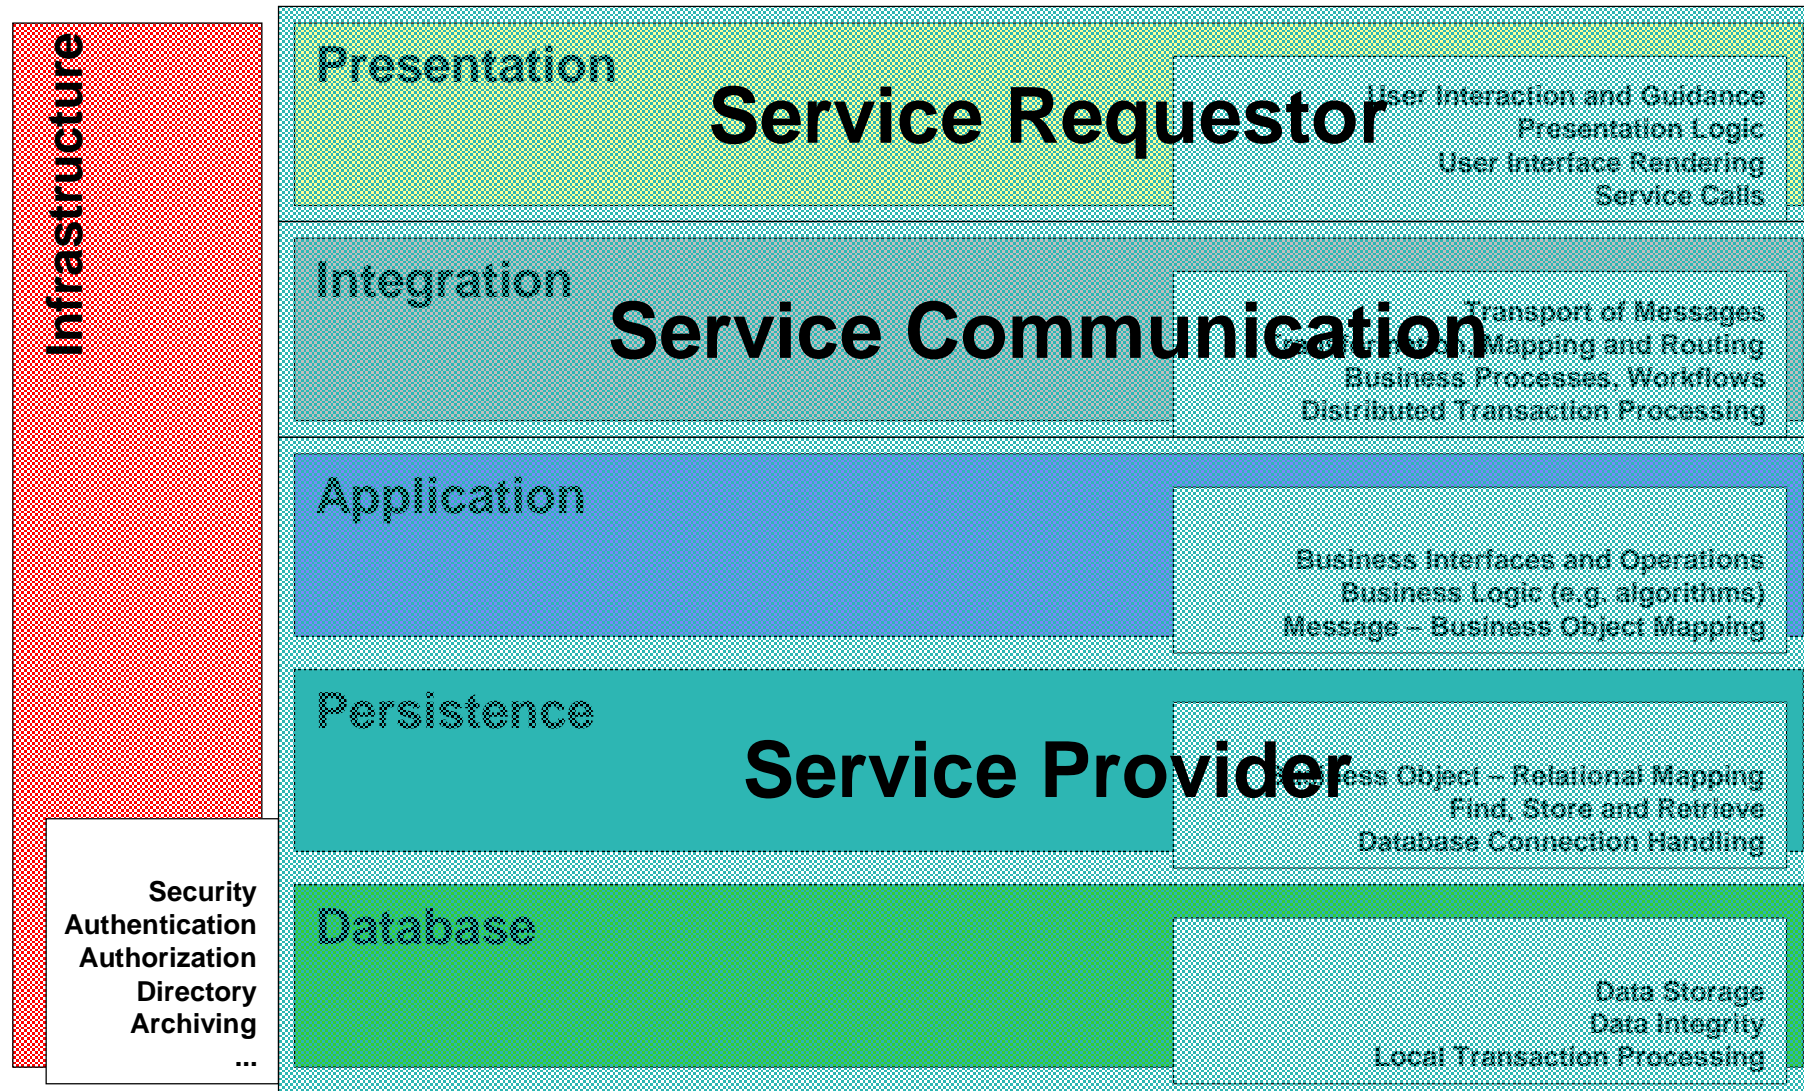

### § You need to have an WSDL that describes:

- where the web service is located (URL)
- what methods/operations it provides
- what input and output parameters it expects

### § The web service must follow these requirements:

- It must use the **SOAP 1.1** protocol
- It must use **SOAP encoding** (use="encoded"), literal style is not supported by CICS2WS
- It must use **RPC style**. Document style is not supported
- Parameter names must not be larger than 16 characters
  - unless you use long-name to short-name mapping

# Layered Software Architecture

## How to write the proxy code

### § You can write the proxy code “by hand”

- Not very difficult, use samples as skeleton
- COBOL Example (from Rich Smrcina):
  - [ftp://ftp.software.ibm.com/eserver/zseries/zos/vse/download/xmps/soap\\_cobol\\_rsmrcina.zip](ftp://ftp.software.ibm.com/eserver/zseries/zos/vse/download/xmps/soap_cobol_rsmrcina.zip)

### § Use the new CICS2WS tool

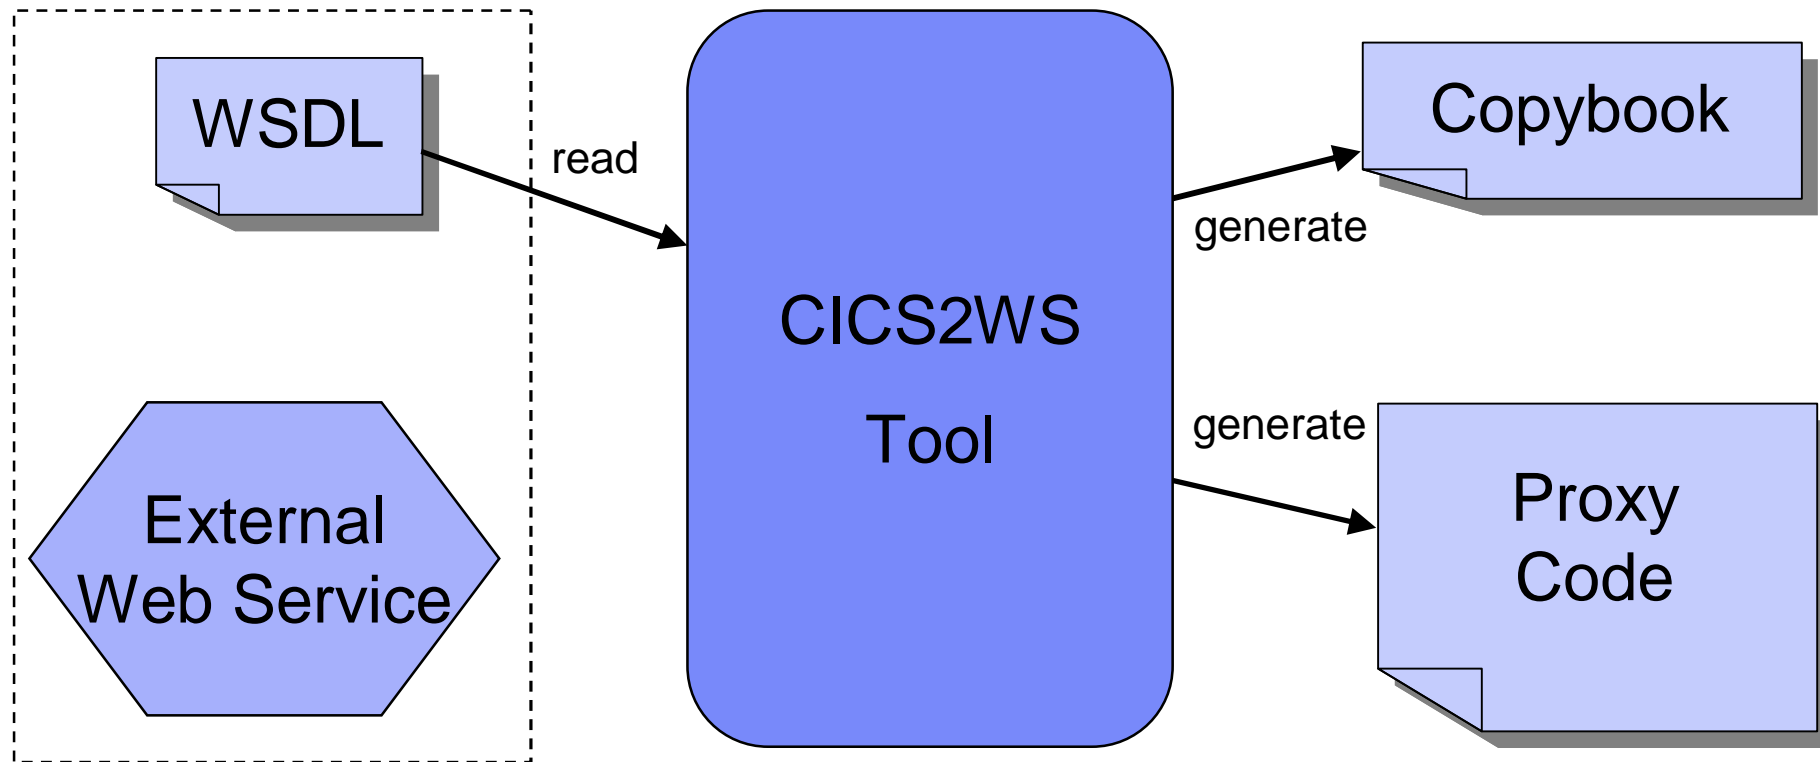

- Generates proxy code and WSDL files
- Proxy code is in assembler language
  - No extra charged compiler needed (e.g. COBOL or PL/I)
  - Code is very simple, straight forward
  - Usually no manual changes needed in proxy code

## CICS2WS Tool

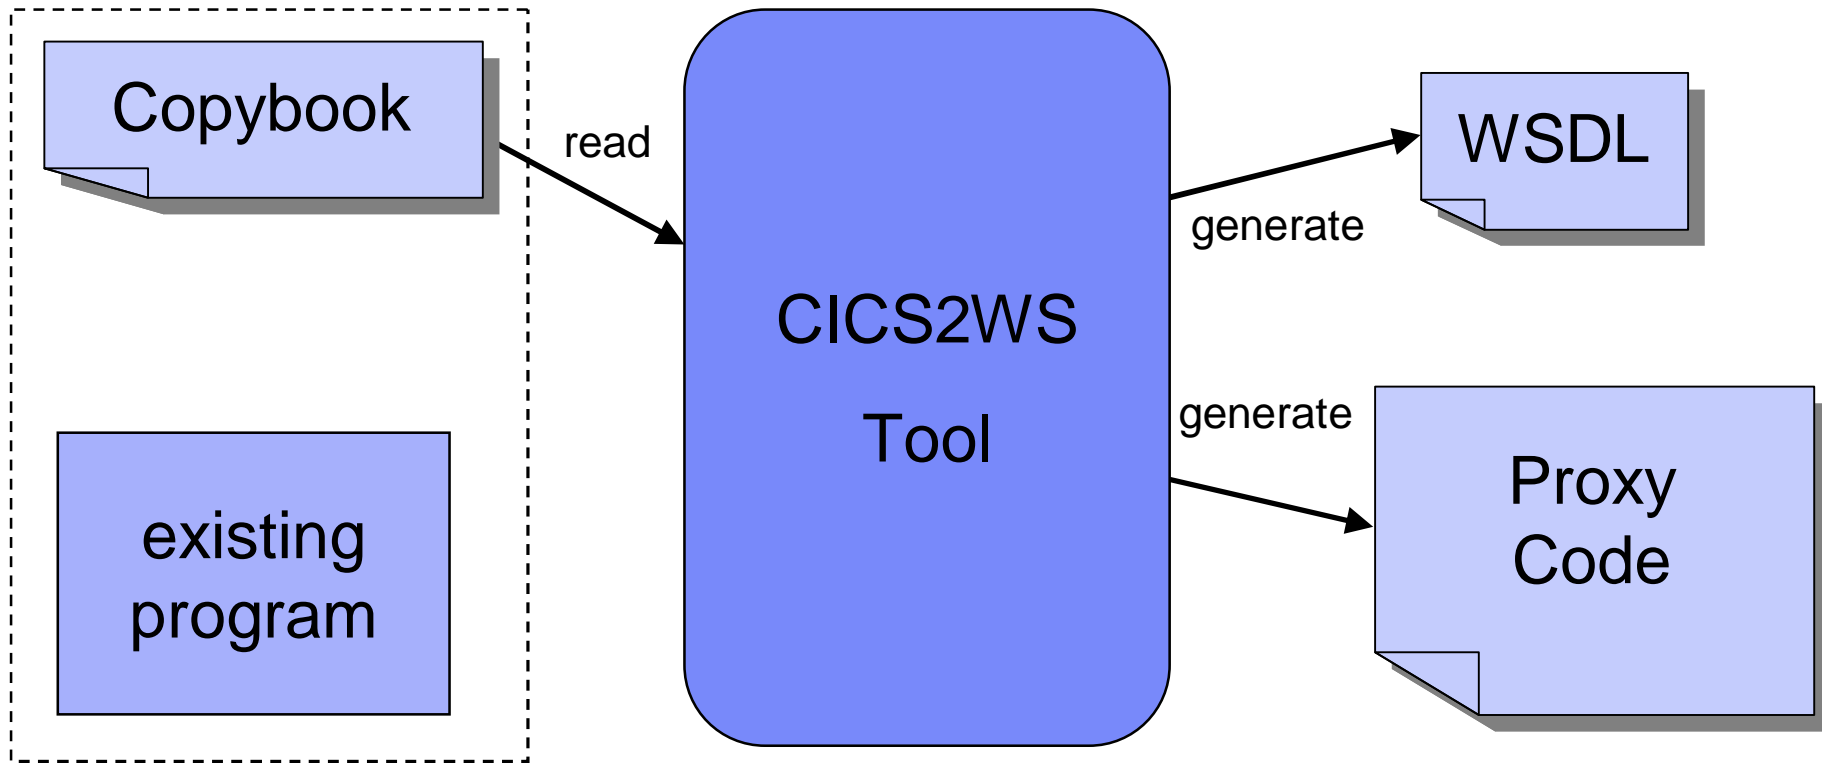

- § **The tool runs on your PC or workstation**
- § **Implemented in Java**
- § **VSE as a SOAP client (service requestor)**
  - Reads the WSDL file
  - Generates the proxy code (Assembler)
  - Generates a COMMAREA mapping (copybook)
    - in COBOL, PL/I or Assembler
- § **VSE as a SOAP server (service provider)**
  - Reads a given COMMAREA mapping (copybook)
    - in COBOL, PL/I or Assembler
  - Generates the proxy code (Assembler)
  - Generates the WSDL file

## VSE as a SOAP client (service requestor)

# VSE as a SOAP server (service provider)

## Disadvantages of Web services

### § When should you not use Web Services?

- When you have very high performance requirements
  - Communication using SOAP/XML is very time consuming
- When you transport large amounts of data
  - XML data can get really huge
- If you require transaction security
  - No 2 phase commit
- When you want to access the data directly
  - SOAP is program to program communication

### § Similar functions provide

- CICS Transaction Gateway
- MQ Series

## Other possibilities to participate into SOA solutions

### § 2 Tier Solutions

- The Web Service requestor or provider runs on VSE itself

### § 3 Tier Solutions

- The Web Service is implemented on a middle tier system, but accesses VSE data or programs

## 3 tier SOA solutions

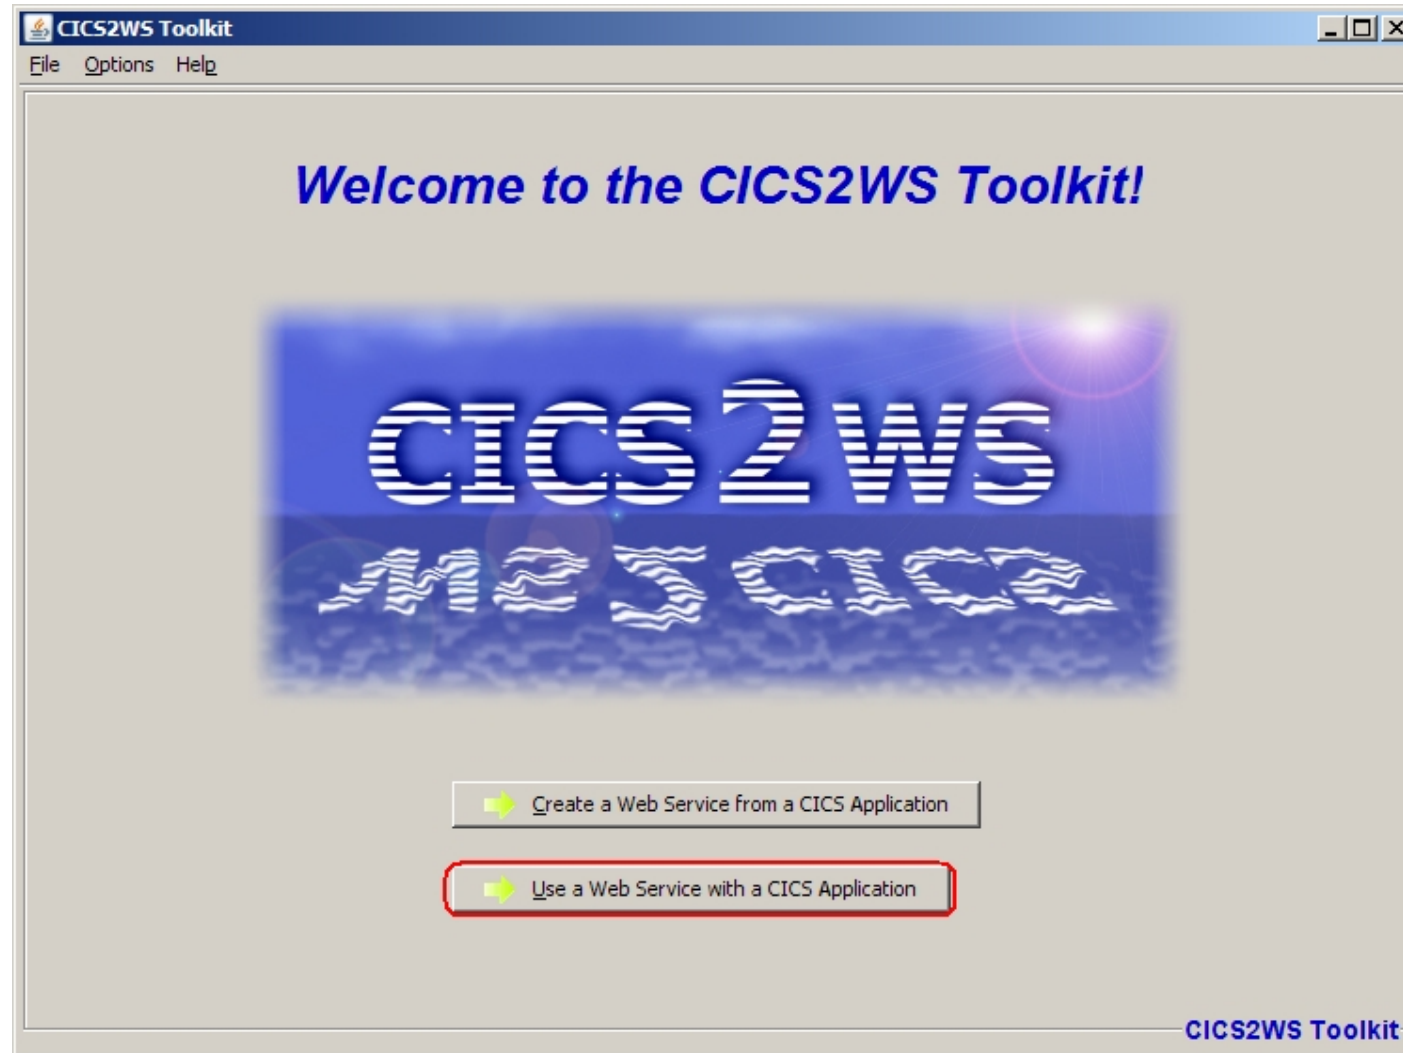

### § Access to VSE using connectors

- CICS Transaction Gateway (CICS programs)
- DB2 Connect (DB2 data)
- VSE Java-based Connectors (VSAM, DL/I, Jobs, ...)
- MQ Series

### § Middle tier

- Using modern technology and products
- E.g.. WebSphere SOA Products (Enterprise Service Bus, WebSphere Process Server)
- Can also run on Linux on System z
