

Job Watcher Situation: Concurrent write support not enabled

ID: 10

Problem:

Concurrent write support may not be enabled.

Resolution:

Concurrent write support may not be enabled. To allow multiple jobs to write rows to a file concurrently, specify REUSEDLT(*YES) on the file.

Workload that is doing blocked writes into a table that has a significant number of indexes (and keyed LFs), may have better performance if you enable parallel processing of the indexes. Parallel index maintenance requires DB2 SMP, blocked inserts of 8 or more rows, and Reuse = *NO.

OVRDBF REUSEDLT(*NO) enables reuse to be turned off for those jobs that would benefit from parallel index maintenance whereas the interactive jobs could still benefit from concurrent write.
