

Job Watcher Situation: Job Watcher cannot collect data fast enough

ID: 27

Problem:

The Job Watcher collection engine cannot capture data fast enough. This can make analysis difficult in some situations because fewer call stacks are captured, and data has inconsistent interval sizes.

Resolution:

Use the Data Viewer's Variable-width Bars toolbar button to identify long running intervals. Job Watcher being unable to capture data fast enough often indicates a performance problem.

Disable J9 data collection or other optional data collection settings like activation groups and communication metrics and try again.
