

Job Watcher Situation: Seize contention due to data forced to disk

ID: 5

Problem:

Job(s) are using force-end-of-data to force data to disk. This can cause seize contention on the file in a multi-threaded application.

Resolution:

Use the N option. This option writes the changes to the database but does not force them out disk. In this way the records are available to other jobs without the penalty of synchronous write operations to disk.
