IMS Version 13

# Diagnosis (November 5, 2018 edition)

Note

Before you use this information and the product it supports, read the information in "Notices" on page 687.

November 5, 2018 edition.

This edition applies to IMS Version 13 (program number 5635-A04), IMS Database Value Unit Edition, V13.1 (program number 5655-DSM), IMS Transaction Manager Value Unit Edition, V13.1 (program number 5655-TM2), and to all subsequent releases and modifications until otherwise indicated in new editions.

# About this information

These topics provide guidance and reference information for setting up an IMS system for diagnosis, collecting information to help diagnose IMS problems, and searching problem-reporting databases. These topics also describe how to use keywords to develop a failure description that you can use to search problem-reporting databases and communicate with IBM<sup>®</sup> Software Support.

This information is available in IBM Knowledge Center.

## Prerequisite knowledge

You will be most successful in using this information if you have a basic understanding of:

- IMS concepts and externals
- How to access an IBM Software Support database
- Dump analyses
- z/OS<sup>®</sup> diagnostic practices
- Telecommunications
- System Network Architecture (SNA)

You can learn more about z/OS by visiting the "z/OS basic skills" topics in IBM Knowledge Center.

You can gain an understanding of basic IMS concepts by reading *An Introduction to IMS*, an IBM Press publication.

IBM offers a wide variety of classroom and self-study courses to help you learn IMS. For a complete list of courses available, go to the IBM Skills Gateway and search for IMS.

## IMS function names used in this information

In this information, the term HALDB Online Reorganization refers to the integrated HALDB Online Reorganization function that is part of IMS Version 13, unless otherwise indicated.

## How new and changed information is identified

New and changed information in most IMS library PDF publications is denoted by a character (revision marker) in the left margin. The first edition (-00) of *Release Planning*, as well as the *Program Directory* and *Licensed Program Specifications*, do not include revision markers.

Revision markers follow these general conventions:

- Only technical changes are marked; style and grammatical changes are not marked.
- If part of an element, such as a paragraph, syntax diagram, list item, task step, or figure is changed, the entire element is marked with revision markers, even though only part of the element might have changed.

• If a topic is changed by more than 50%, the entire topic is marked with revision markers (so it might seem to be a new topic, even though it is not).

Revision markers do not necessarily indicate all the changes made to the information because deleted text and graphics cannot be marked with revision markers.

## How to read syntax diagrams

The following rules apply to the syntax diagrams that are used in this information:

- Read the syntax diagrams from left to right, from top to bottom, following the path of the line. The following conventions are used:
  - The >>--- symbol indicates the beginning of a syntax diagram.
  - The ---> symbol indicates that the syntax diagram is continued on the next line.
  - The >--- symbol indicates that a syntax diagram is continued from the previous line.
  - The --->< symbol indicates the end of a syntax diagram.
- Required items appear on the horizontal line (the main path).

• Optional items appear below the main path.

▶ — required\_item

Loptional item

If an optional item appears above the main path, that item has no effect on the execution of the syntax element and is used only for readability.

• If you can choose from two or more items, they appear vertically, in a stack. If you *must* choose one of the items, one item of the stack appears on the main path.

```
▶—required_item—required_choice1—required_choice2—
```

If choosing one of the items is optional, the entire stack appears below the main path.

-

```
►→—required_item-
```

-optional\_choice1--optional\_choice2-

If one of the items is the default, it appears above the main path, and the remaining choices are shown below.

►►—required item—	default_choice	
' _	optional_choice optional_choice	

• An arrow returning to the left, above the main line, indicates an item that can be repeated.

If the repeat arrow contains a comma, you must separate repeated items with a comma.

A repeat arrow above a stack indicates that you can repeat the items in the stack.

• Sometimes a diagram must be split into fragments. The syntax fragment is shown separately from the main syntax diagram, but the contents of the fragment should be read as if they are on the main path of the diagram.

#### fragment-name:

- In IMS, a b symbol indicates one blank position.
- Keywords, and their minimum abbreviations if applicable, appear in uppercase. They must be spelled exactly as shown. Variables appear in all lowercase italic letters (for example, *column-name*). They represent user-supplied names or values.
- Separate keywords and parameters by at least one space if no intervening punctuation is shown in the diagram.
- Enter punctuation marks, parentheses, arithmetic operators, and other symbols, exactly as shown in the diagram.
- Footnotes are shown by a number in parentheses, for example (1).

## Accessibility features for IMS Version 13

Accessibility features help a user who has a physical disability, such as restricted mobility or limited vision, to use information technology products successfully.

## Accessibility features

The following list includes the major accessibility features in z/OS products, including IMS Version 13. These features support:

• Keyboard-only operation.

- Interfaces that are commonly used by screen readers and screen magnifiers.
- Customization of display attributes such as color, contrast, and font size.

## **Keyboard navigation**

You can access IMS Version 13 ISPF panel functions by using a keyboard or keyboard shortcut keys.

For information about navigating the IMS Version 13 ISPF panels using TSO/E or ISPF, refer to the *z*/OS *TSO/E Primer*, the *z*/OS *TSO/E User's Guide*, and the *z*/OS *ISPF User's Guide Volume* 1. These guides describe how to navigate each interface, including the use of keyboard shortcuts or function keys (PF keys). Each guide includes the default settings for the PF keys and explains how to modify their functions.

## **Related accessibility information**

Online documentation for IMS Version 13 is available in IBM Knowledge Center.

### IBM and accessibility

See the *IBM Human Ability and Accessibility Center* at www.ibm.com/able for more information about the commitment that IBM has to accessibility.

## How to send your comments

Your feedback is important in helping us provide the most accurate and highest quality information. If you have any comments about this or any other IMS information, you can take one of the following actions:

- Click the **Contact Us** tab at the bottom of any IBM Knowledge Center topic.
- Send an email to imspubs@us.ibm.com. Be sure to include the book title and the publication number.

To help us respond quickly and accurately, please include as much information as you can about the content you are commenting on, where we can find it, and what your suggestions for improvement might be.

# **Chapter 1. Collecting IMS diagnostic information**

Before you report a problem to IBM Software Support, collect information to help document the problem at your installation. Having this information available when you call IBM can save you time because you might not need to create the problem again.

As a result of its complexity, IMS can experience problems that must be diagnosed and corrected. Examples of problems that you might encounter while running IMS include an abnormal end (known as an *abend*) occurs in processing, a job hangs in the system and does not process, a process repetitively loops through a series of instructions, or processing slows down.

For these types of problems, IMS displays symptoms that can help you with your diagnosis, but, in order to obtain that information, you need to gather all of the correct data to diagnose a problem.

To collect data about a system problem:

- 1. Collect the symptom data and determine what type of problem it is.
- 2. Use the procedures recommended to diagnose the problem to determine whether the problem is an IMS problem or a user problem.
- **3**. If the problem is an IMS or system problem, build a search argument from the data that you collect as a result of following the procedure for that problem. For example, the data you gather from a control region wait can be helpful in building a search argument to search the symptom database with.
- 4. Search the symptom database. You might need to refine your search with more data from the problem.
- 5. If you cannot find a known problem with the same symptoms, report the problem to IBM Software Support.

#### **Related concepts:**

Setting up IMS for diagnostics (System Definition)

## Standard IMS diagnostic information

If you contact IBM Software Support for assistance with a problem, you might be asked to collect a standard set of logs, data sets, and dumps that can help them determine the source of your problem. Collecting this information before you contact IBM Software Support will shorten the amount of time required to resolve your problem.

The following table describes the types of information that are most commonly requested by IBM Software Support:

Table 1. Information IBM Software Support might need

Log, data set, or dump name	Purpose	Which version to save
SYSLOG	The SYSLOG is useful when the dumped MTRACE buffer is not large enough to contain all necessary error messages.	of IMS start up.

Log, data set, or dump name	Purpose	Which version to save
LOGREC data set	z/OS failures are logged internally.	Save the LOGREC data set from IMS start up time.
IMS master console log	The master console log provides a different message set than the SYSLOG.	Save the master console log from IMS start up time.
IMS log data sets (OLDS)	The IMS log data sets track IMS transaction and database activity.	Save the IMS online data sets that are active at the time of the error.
IMS system log data sets (SLDS)	The IMS system log data sets track IMS transaction and database activity.	Save the SLDS from IMS start up time.
JES job log of jobs related to failure	The JES job log provides JCL start up parameters and isolated system messages.	Save the JES job log from IMS start up time.
All dumps created near the time of IMS failure	Multiple SYS1.DUMPs might be created for related failures. SYSMDUMP for the IMS Control, DLI/SAS, and DBRC regions might be created if the primary SYS1.DUMP encounters problems. Also, look for related SYSUDUMPs for IMS dependent regions	Save copies of these dump datasets.
z/OS log data sets	The z/OS log data sets provide information for structure rebuild and checkpoint related problems.	Save the current z/OS log data sets for the failing CQS job stream.

Table 1. Information IBM Software Support might need (continued)

#### Related tasks:

"Collecting data about IMS Connect problems" on page 19

# Managing standard diagnostic information

You can preserve documentation that can be helpful near the time of error.

Consider implementing normal operating procedures for the following tasks:

# Preserving the z/OS console (syslog)

The z/OS Console should be saved to view relevant system messages.

- The ideal time frame:
  - Back to the last IMS restart
  - z/OS Console from the prior clean execution (for comparison)
- The moderate time frame:
  - 24 hours of z/OS Console messages
- The minimum time frame:
  - Two IMS system checkpoint intervals

# Preserving the JES JOBLOG

Preserve the JES JOBLOG to view relevant job-related messages.

- Save the JES JOBLOGs for:
  - The IMS control region
  - The IMS DLI/SAS region
  - The IMS DBRC region
  - Any suspicious IMS dependent regions
  - The CQS regions
  - The OM region
  - The RM region
  - The SCI regions
- The ideal time frame:
  - JES JOBLOG from the current error execution
  - JES JOBLOG from the prior clean execution (for comparison)
- The moderate time frame:
  - 24 hours of JES JOBLOG
- The minimum time frame:
  - Two IMS system checkpoint intervals, or two hours, whichever is greater

# Preserving the IMS master console log

The IMS Master Console Log should be saved to view relevant IMS messages:

- The ideal time frame:
  - IMS Master Console Log from the current error execution
  - IMS Master Console Log from the prior clean execution (for comparison)
- The moderate time frame:
  - 24 hours of IMS Master Console
- The minimum time frame:
  - Two IMS system checkpoint intervals or two hours, whichever is greater

# Preserving the SYS1.LOGREC

The SYS1.LOGREC should be saved to view system failures logged internally.

- The ideal time frame:
  - Back to the last IMS restart
- The moderate time frame:
  - 48 hours of SYS1.LOGREC data
- The minimum time frame:
  - Current SYS1.LOGREC data set

# **Preserving memory dumps**

Retain all IMS memory dumps generated at or near the time of a problem.

- SYS1.DUMP data sets should be examined:
  - Multiple dumps might be created.
  - Keep all dumps at time of failure, regardless of the subsystem.
- SYSMDUMP for the IMS Control, DLI/SAS, and DBRC regions need to be examined in case of primary SYS1.DUMP failures.

- Save these data sets, if a dump was produced.
- SYSUDUMP should be saved for IMS dependent regions.

# Preserving the IMS OLDS and SLDS

The IMS OLDS and SLDS should be saved in case IMS log analysis is required.

- The ideal time frame:
  - From the time of the last IMS restart
  - Prior execution
- The moderate time frame:
  - 24 hours of IMS log records
- The minimum time frame:
  - Active IMS OLDS

# Manual intervention for dump creation

IMS produces SDUMPs for some internal errors without manual intervention. However, IMS Wait/Loop or partial loss-of-function conditions require manual intervention to produce an SVC dump.

IMS hangs can be caused by interaction with many address spaces, including those shown in the list below:

- IMS control region
- IMS DLI/SAS region
- DBRC region
- IRLM region
- CQS
- Operations Manager
- Resource Manager
- Structured Call Interface
- Troublesome IMS dependent regions
- CCTL regions
- ODBA
- IXGLOGRC
- z/OS Resource Recovery Services
- APPC
- VTAM<sup>®</sup>
- WLM
- TCPIP
- WebSphere<sup>®</sup> Application Server
- ESAF Db2 for z/OS, IBM MQ, others
- Other regions
- · Other IMSplex members with all their related regions

# Deciding when to create a memory dump

Because of the complex interactions between these address spaces, it is difficult to determine exactly where the source of the problem lies without a dump of the associated address spaces.

Omission of any interrelated address space adds to the possibility that the dump might not be sufficient to solve the problem.

The time that is required to produce the dump must be weighed against the possibility that there might not be sufficient data to solve the problem, adding to the possibility that the problem could recur.

## Creating IMS memory dumps

IMS SVC dumps can be requested using three different commands.

- z/OS SYS1.PARMLIB IEADMCxx
  - DUMP command parmlib member
- z/OS SYS1.PARMLIB IEASLPxx
  - SLIP command parmlib member
- z/OS DUMP command
- Customized JCL can be built and submitted

## IEADMCxx, z/OS SYS1.PARMLIB

You can use the IEADMCxx, member of the z/OS SYS1.PARMLIB to create an SVC dump.

The following are characteristics of the IEADMCxx member of the z/OS SYS1.PARMLIB data set:

- DUMP command parmlib member
- Can be used to customize IMS memory dumps prior to error event.
- Simple operator interface.
- Create SYS1.PARMLIB members called IEADMCxx for each customized dump command.

#### Related reference:

■ z/OS: Syntax for the IEADMCxx member of the z/OS SYS1.PARMLIB data set

#### IEADMCxx example for IMS

This example shows creating a SYS1.PARMLIB member called IEADMCI1. DUMP parameters are given.

Create a SYS1.PARMLIB member called IEADMCI1 containing the following DUMP parameters:

JOBNAME=(j1,j2,j3,j4),SDATA=(CSA,PSA,RGN,SQA,SUM,TRT,GRSQ)

Where:

- *j1* IMS Control region job name.
- *j2* IMS DL/I region job name.
- *j3* DBRC region job name.
- *j4* IRLM region job name.

Create a second SYS1.PARMLIB member called IEADMCI2 containing the following DUMP parameters: JOBNAME=(*j5*, *j6*, *j7*), SDATA=(CSA, PSA, RGN, SQA, SUM, TRT)

Where:

- *j5* IMS CCTL region 1.
- *j6* IMS CCTL region 2.
- *j7* IMS CCTL region 3.

### **IEADMCxx DUMP activation**

When you request a dump from the IEADMCI1 and IEADMCI2 parmlib members, two dump data sets are created on the z/OS image from which the dump command was entered.

To request a dump from the IEADMCI1 and IEADMCI2 parmlib members, enter the following z/OS command:

DUMP TITLE=(DUMP OF IMS and CCTL Regions ), PARMLIB=(I1, I2)

## IMS sysplex dump considerations

IMS produces SDUMPs for some internal errors without manual intervention. However, IMS Wait/Loop or partial loss-of-function conditions require manual intervention to produce an SVC dump. IMS hangs can be caused by interaction with many address spaces.

The following are considerations for IMS sysplex dumps:

- IMS sysplex implementations need to consider the possibility that a hang or problem on one IMSplex member might be due to a problem originating from another member.
- Problems such as IMS Wait/Loops or partial loss-of-function conditions which require manual intervention to produce an SVC dump, should include SVC dumps from other members of the IMSplex.
- Ensure that a dump is taken for all necessary address spaces on each system.

#### Sysplex IEADMCxx example

This example shows how to create a SYS1.PARMLIB member containing various DUMP parameters.

Create a SYS1.PARMLIB member called IEADMCI1 containing the following DUMP parameters:

JOBNAME=(j1,j2,j3,j4),SDATA=(CSA,PSA,RGN,SQA,SUM,TRT,GRSQ), REMOTE=(SYSLIST=(\*('j1','j2','j3','j4'),SDATA))

Where:

- *j1* IMS Control region job name.
- *j*2 IMS DLI region job name.
- *j3* DBRC region job name.
- *j4* IRLM region job name.

Create a second SYS1.PARMLIB member called IEADMCI2 containing the following DUMP parameters:

JOBNAME=(*j5,j6,j7*),SDATA=(CSA,PSA,RGN,SQA,SUM,TRT,XESDATA), REMOTE=(SYSLIST=(\*('*j5*','*j6*','*j7*'),SDATA))

Where:

*j6* CCTL region 1.

- *j*7 CCTL region 3.
- *j8* CCTL region 2.

**Note:** The XESDATA and REMOTE parameters are for use in sysplex environments.

## Sysplex IEADMCxx DUMP activation

Activating a sysplex dump using the z/OS command DUMP is shown.

To request a dump from the IEADMCI1 and IEADMCI2 parmlib members, enter the following z/OS command:

DUMP TITLE=(IMS/CCTL SYSPLEX Dumps),PARMLIB=(I1,I2)

Two dump data sets are created on each z/OS image in the sysplex matching the REMOTE parameter specifications for the JOBNAMEs.

# Chapter 2. Collecting data about specific problems

Occasionally, there are problems in specific environments or certain problem types that require special handling.

## Collecting data about a control region wait or hang

When an IMS control region waits or hangs, IMS can appear frozen or lose partial function. The most critical piece of information in diagnosing such problems is the z/OS SVC dump.

**Recommendation:** Do not use the z/OS MODIFY dump (F jobname,DUMP) command as a source of IMS diagnostic information. This command adds unnecessary complexity to the dump while processing the modify abends.

Obtain a z/OS SVC dump by issuing this series of commands: DUMP COMM=(dump title) R id JOBNAME=(j1,j2,j3,j4,j5,j6), SDATA=(CSA,PSA,RGN,SQA,SUM,TRT),END

In the previous example,

- *j***1** is the IMS CTL or DBCTL region job name
- *j2* is the IMS DL/I region job name
- *j*3 is the suspicious IMS dependent region job name, if any
- *j4* is the suspicious CCTL (CICS<sup>®</sup>) region name, if any
- *j5* is the IRLM region job name (if IRLM DB locking is used)
- *j6* is the DBRC region job name

Also, consider dumping related regions:

- IMS Control region
- IMS DLI/SAS region
- DBRC region
- IRLM region
- CQS
- Operations Manager
- Resource Manager
- Structured Call Interface
- Troublesome IMS dependent regions
- CCTL regions
- ODBA
- IXGLOGRC
- z/OS Resource Recovery Services
- APPC
- VTAM
- WLM
- TCPIP

- WebSphere Application Server
- ESAF Db2 for z/OS, IBM MQ, others
- Other Regions
- · Other IMSplex members with all their related regions

Most likely, a dump of the IMS CTL, DL/I, and a suspicious dependent region or CCTL region is sufficient to solve wait or hang problems. Occasionally, the DBRC and IRLM (if used for DB locking) regions are a factor, so include DBRC and IRLM.

If IMS is not completely stopped (for example, IMS commands can still be entered, BMPs are still processing, and some transactions still process), taking a second z/OS SVC dump will help differentiate normal IMS processing from the problem.

## Collecting data about a control region or DL/I region loop

Occasionally, there are problems in specific environments or certain problem types, that require special handling. If IMS can accept commands, you can set a trace.

1. If IMS can accept commands, use the following IMS command to set up the internal trace environment:

/TRA SET ON TABLE nnnn

where *nnnn*= is the DISP, SCHD, DLI, LOCK or LATCH parameter. Each parameter must be entered in a separate /TRA command.

- Set the z/OS system trace table size to 999K and turn on branch tracing by issuing the following command: TRACE ST,999K,BR=0N
- 3. Obtain two z/OS SVC dumps of the CTL, DL/I, suspicious dependent region, or CCTL, DBRC, and IRLM regions. Taking a second z/OS SVC dump will help differentiate normal IMS processing from the problem. Obtain a z/OS SVC dump with this series of commands:

DUMP COMM=(dump title) R id JOBNAME=(j1,j2,j3,j4,j5,j6), SDATA=(CSA,PSA,RGN,SQA,SUM,TRT),END

In the previous example,

- *j1* is the IMS CTL or DBCTL region job name
- *j2* is the IMS DL/I region job name
- *j*3 is the suspicious IMS dependent region job name, if any
- *j4* is the suspicious CCTL (CICS) region name, if any
- *j*5 is the IRLM region job name (if IRLM DB locking is used)
- *j6* is the DBRC region job name
- 4. Reset the z/OS system trace table to its original settings.

**Note:** IMSplex partner dumps are probably not required for loop problems, unless they are also looping.

## Collecting data about an IMS dependent region wait or loop

Occasionally, there are problems in specific environments or certain problem types, that require special handling. If IMS can accept commands, you can set a trace.

If the dependent region appears to be looping, follow these steps:

1. If IMS can accept commands, use the following IMS command to set up the internal trace environment:

/TRA SET ON TABLE nnnn

where *nnnn* = can be DISP, SCHD, DLI, LOCK, or LATCH. Each must be entered separately.

2. Set the z/OS system trace table size to 999K and turn on branch tracing with this command:

TRACE ST,999K,BR=ON

3. If the problem is a wait, obtain two z/OS SVC dumps of the CTL, DL/I, suspicious dependent region, or CCTL, DBRC, and IRLM regions. If the problem is a loop, obtain two z/OS SVC dumps of the CTL, DL/I, suspicious dependent region, or CCTL, DBRC, and IRLM regions. Obtaining a second z/OS SVC dump will help differentiate normal IMS processing from the problem. Obtain a z/OS SVC dump with this series of commands:

DUMP COMM=(dump title) R id JOBNAME=(j1,j2,j3,j4,j5), SDATA=(CSA,PSA,RGN,SQA,SUM,TRT),END

- *j1* is the IMS CTL or DBCTL region job name
- *j***2** is the IMS DL/I region job name
- *j*3 is the suspicious IMS dependent region job name, if any
- *j4* is the IRLM region job name (if IRLM DB locking is used)
- *j5* is the DBRC region job name

In the previous example,

4. Reset the z/OS system trace table to its original settings.

**Note:** IMSplex partner dumps are probably not required for loop problems, unless they are also looping.

## Formatting a BPE trace entry

You can format a BPE trace entry by using either the Interactive Problem Control System (IPCS) or a batch job.

Before you begin to format BPE trace entries, ensure that the user ID that you use to format and print the external BPE trace records is authorized by RACF<sup>®</sup> to access the external trace data sets.

To format BPE trace entries by using the IPCS:

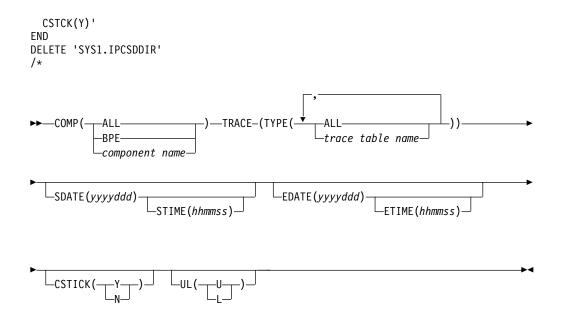

- 1. Select option 0 from the IPCS Primary Option menu to specify the generation data group (GDG) to analyze.
- 2. Specify the data set name for the GDG in the **Source** field of the IPCS Default Values menu. For example, specify: DSNAME('BPEEXTRC.GDG01.G0001V00').

- **3**. Select option 2.6 from the IPCS Primary Option menu to display a list of the dump component analysis tools.
- 4. Select option DFSAAMPR from the IPCS MVS<sup>™</sup> Dump Component Data Analysis menu to display options for the IMS Dump Formatter.
- 5. Select option 6 from the IMS Dump Formatting Primary menu to display formatting for other IMS components, such as BPE.
- 6. Select one of the options from the IMS Component Selection Dump Formatting menu to display formatting options for an IMS component (BPE, CQS, DBRC, ODBM, OM, REPO, RM, SCI, or IMS Connect). For example, select option **B** to display general BPE formatting options.
- 7. Select option 4 from the component subsystem dump formatting menu, for example the IMS BPE Subsystem Dump Formatting menu, to display the options for external trace formatting.
- 8. Specify the various formatting options for the external trace data from the subsystem's external trace formatting menu, for example the BPE External Trace Formatting menu.

You can also format BPE external trace records by using a batch job. The following figure shows sample JCL for formatting the BPE external trace records from a batch job.

Figure 1. Batch JCL for formatting BPE external trace records

```
//BPEEXTPR JOB ...

 UL(L) +
```

#### **BPETRFM0** Parameter Keywords

#### COMP()

Specify 'ALL' to format all trace records, 'BPE' to format BPE trace records, or a specific component name (BPE, CQS, DBRC, ODBM, OM, REPO, RM, SCI, or HWS) to format trace records for only that component.

#### TYPE()

Specify 'ALL' to format trace records for all trace tables or specify a specific trace table name to format records only for that trace table type.

#### SDATE()

Specify a starting date for the trace entries in Julian format (yyyyddd). Trace entries with a store clock (STCK) value prior to the specified date are filtered and not printed.

#### STIME()

Specify a starting time for the trace entries in 24 hour format (hhmmss). Trace entries with an STCK value prior to the specified time are filtered and not printed. SDATE() is required with STIME().

#### EDATE()

Specify an ending date for the trace entries in Julian format (yyyyddd). Trace entries with an STCK value after the specified date are filtered and not printed.

#### ETIME()

Specify an ending time for the trace entries in 24 hour format (hhmmss). Trace entries with an STCK value after the specified time are filtered and not printed. EDATE() is required with ETIME().

#### CSTCK()

Specify 'Y' to have the value for each trace entry printed in JDAYTIME format (DDD HHMMSS.thmiju).

#### UL()

Specify 'L' if the specified filtering time is based on the local time in the trace record or 'U' if the specified filtering time is based on UTC.

## Collecting data about DBRC-related problems

DBRC related problems can cause a variety of symptoms, including waits and loops. If you need to create the problem again, copies of the RECON listing, before and after the problem occurred, are most useful.

To diagnose a DBRC related problem, you need the following information:

- A listing of the DBRC RECON data sets for the time that is as close as possible to the time of the failure.
  - Use the DBRC LIST.RECON command to obtain the listing.
- A subsystem listing if you cannot obtain a RECON listing because of its size.

--- BPE ERRV Trace Table ---

- Use the DBRC LIST.SUBSYS ALL command to obtain a subsystem listing.
- If recreates are possible, obtain the before and after copies of the RECON data sets.
- Use the D GRS, CONTENTION command on each system that shares the RECON data set to determine if the data set is held at the exclusion of other waiters. If so, dump the owning address space by issuing the following command: DUMP COMM=(dump title)

R nn, JOBNAME=(j1), SDATA=(CSA, PSA, RGN, SQA, SUM, TRT, GRSQ), END

#### Related reference:

z/OS: VSAM Record-Level Sharing (RLS) diagnostic aids

## **DBRC** security override

To set a RCNQUAL value in the RECON that can be used to override DBRC security for copies of RECON data sets, use the DBRC command CHANGE.RECON with the CMDAUTH keyword.

You can then use the RECON data set for further testing purposes or to send on to an IBM Software Support representative without requiring a zap of the RECON, an exit routine, or requiring that you find an authorized individual to change the authorization level.

# Collecting data about DBCTL-related problems

DBCTL-related problems can originate from either the CCTL region or one of the IMS regions (CTL, DL/I, DBRC, or IRLM), so it is important to obtain dumps that relate to all these regions.

1. Issue the following IMS commands (because they include region ID numbers and recovery tokens in their various display output):

/DISPLAY ACTIVE /DISPLAY CCTL

The information that is returned by these commands greatly increases the accuracy and speed that is required to diagnose the problem. The DISPLAY ACTIVE command provides the reasons for waits and region numbers. The DISPLAY CCTL command provides recovery tokens and region numbers. Save the IMS console output.

- 2. Set the AP portion of the CICS trace to level 1-2. Save this output.
- 3. Set the FILE CONTROL portion of the CICS trace to level 1-2. Save this output.
- 4. Obtain the necessary z/OS SVC DUMP of the IMS regions by issuing this series of commands:

```
DUMP COMM=(dump title)
R id JOBNAME=(j1,j2,j3,j4,j5,j6),
SDATA=(CSA,PSA,RGN,SQA,SUM,TRT),END
```

In the previous example,

- *j***1** is the IMS CTL or DBCTL region job name
- *j2* is the IMS DL/I region job name
- *j*3 is the suspicious IMS dependent region job name, if any
- *j4* is the suspicious CCTL (CICS) region name, if any
- *j5* is the IRLM region job name (if IRLM DB locking is used)

- *j6* is the DBRC region job name
- 5. Save the IMS online log data set that was active during the failure.

# Collecting data about VTAM-related DC problems

IMS DC-related problems are associated mainly with VTAM or OTMA. Use these guidelines to collect diagnostic information about VTAM when you experience a problem.

VTAM dumps are often required to help diagnose problems, but are infrequently obtained by operations personnel. IMS NODE traces, VTAM BUFFER traces, and VTAM INTERNAL traces are often required, in conjunction with the IMS region dumps and VTAM dumps, to solve DC problems.

The IMS log tapes contain much of the transaction data that flows through IMS. This transaction data includes the following IMS records:

• TYPE01

1

Т

- TYPE03 (MSG queue entries)
- TYPE11 through TYPE16 (SPAs, DIALs, SIGN)

To start the recreate attempt after issuing an IMS /SWITCH OLDS command to have the related data placed on a new OLDS:

- 1. Issue the following IMS command and save the IMS console output: /DIS NODE nodename
- 2. Turn on the IMS NODE trace by issuing the following command.

/TRA SET ON NODE nodename

Data is captured in the IMS TYPE6701 log record. Save the IMS online log data set input to the IMS utility programs DFSERA10 and DFSERA30.

**3.** (Optional) Turn on the VTAM Buffer Trace and VTAM Internal Trace to complement the IMS NODE trace by issuing this series of commands:

F NET,TRACE,TYPE=BUF,ID=nodename
F NET,TRACE,TYPE=VTAM,MODE=EXT,
OPT=(API,PIU,MSG)

To capture these trace entries, GTF must be active with the USR option specified.

 Obtain a z/OS dump of the IMS regions by issuing this series of commands: DUMP COMM=(dump title)

R id JOBNAME=(*j1,j2,j3,j4,j5,j6*), SDATA=(CSA,PSA,RGN,SQA,SUM,TRT),END

- *j1* IMS CTL or DBCTL region job name
- *j2* IMS DL/I region job name
- *j*3 Suspicious IMS dependent region job name, if any
- *j4* Suspicious CCTL (CICS) region name, if any
- *j5* IRLM region job name (if IRLM DB locking is used)
- *j6* DBRC region job name

In the previous example,

5. Obtain a dump of the VTAM address space by issuing this series of commands:

DUMP COMM=(*dump title*) R id JOBNAME=(*vtam jobname*), SDATA=(CSA,PSA,RGN,SQA,SUM,TRT),END

6. Save the IMS log tapes created during the error period.

Collecting data a	bout OTMA-related DC problems
l the	IS DC-related problems are frequently related to either OTMA or VTAM. Use ese guidelines to collect diagnostic information about OTMA when you perience a problem.
	ere are four main tools that you can use to diagnose problems with OTMA essage traffic:
•	OTMT table trace
•	/DISPLAY commands
•	OTMA tmember and tpipe traces
•	IMS log records
	Enable the OTMT trace table. Issue the following command:
Ι	/TRA SET ON TABLE OTMT OPTION LOG VOLUME HIGH
     	This trace data is used by IBM Software Support to diagnose OTMA problems. You can also specify OTMADB=Y in the DFSPBxxx member of the IMS.PROCLIB data set to get more trace data. However, using OTMADB=Y causes a large amount of WTO output to be written to the MVS console, and the setting can be removed only by recycling IMS.
	<b>Recommendation:</b> Do not set OTMADB=Y unless instructed to do so by IBM Software Support.
2. 	Get the current status of OTMA clients and servers. Issue the following command:
Ι	/DISPLAY OTMA
1	Save the console output.
I 3.	Enable the OTMA tmember trace. Issue the following command:
I	/TRA SET ON TMEMBER XXXXXXXX
   	Where <i>XXXXXXXX</i> is the tmember name. If you cannot identify a specific OTMA tmember, specifyALL for the tmember name to enable the trace for all members.
4. 	If you know that the problem is associated with a specific OTMA tmember, you can get the current status for that tmember. Issue the following command:
Ι	/DISPLAY TMEMBER XXXXXXXX TPIPE ALL
1	Where XXXXXXXX is the tmember name. Save the console output.
5.   	If you know that the problem is associated with a specific OTMA tpipe, you can enable tracing at the tpipe level. Issue the following command: /TRA SET ON TMEMBER XXXXXXXX TPIPE YYYYYYYY
I	Where XXXXXXXXX is the tmember name and YYYYYYYY is the tpipe name.
6.   	For CM1 and CM0 problems that are associated with a specific PSB, enable DL/I tracing. Issue the following command: /TRA SET ON PGM <i>ppppppp</i>

Where *ppppppp* is the PSB name.

After you enable the required traces, preserve the X'67D0' and X'6701' log records and the console output from the /DISPLAY commands.

# Collecting data about APPC-related DC problems

APPC problems that originate from IMS dependent regions and that make calls explicitly rely heavily on the dependent region dumps.

To diagnose an APPC-related IMS problem:

 Turn on the IMS LUMI trace for the external trace data set by issuing the following IMS /TRACE commands: /TRACE SET ON TABLE LUMI OPTION LOG

The LOG option can be set up to cause the output to be sent to the external trace data set with this /TRACE command:

/TRACE SET ON LUNAME XXXXXXX INPUT TRACE SET ON LUNAME XXXXXXX OUTPUT

where XXXXXXX is the partner LU

- 2. Turn on the VTAM buffer trace and VTAM internal trace to complement the IMS LUMI trace by issuing the following commands:
  - F NET, TRACE, TYPE=BUF, ID=luname
  - F NET,TRACE,TYPE=VTAM,MODE=EXT, OPT=(API,PIU,MSG)F

To capture these trace entries, GTF must be active with the USR option specified

**3.** Turn on the program trace to trace TPPCB DL/I calls, so that the APPC component trace can send its trace buffers to a SYS1.DUMP data set when it stops. Turn on the program trace by issuing the following command: /TRACE SET ON PROGRAM *ppppppp* 

where *ppppppp* is the program name of the application.

- 4. Turn on the z/OS APPC component trace by issuing the following command: TRACE CT, ON, 200M, COMP=SYSAPPC
- 5. Start the recreate attempt after issuing an IMS /SWITCH OLDS command to have related data placed in a new OLDS. Save the IMS log tapes that are created during the error period. IMS log records are not as useful for explicit APPC applications as they are for implicit APPC applications because little information is logged about explicit APPC applications.
- 6. Reply to the z/OS outstanding reply with the following response: nn,OPTIONS=(GLOBAL),END
- 7. When the problem has been recreated, stop the component trace with this command:

TRACE CT, OFF, COMP SYSAPPC

You can use the following IPCS commands to format the trace:

- For one-line entries: CTRACE COMP SYSAPPC SHORT
- Summary of each entry:

Т

T

1

CTRACE COMP SYSAPPC FULL

8. Obtain a z/OS SVC dump of the IMS regions with this series of commands:

DUMP COMM=(dump title) R id JOBNAME=(j1,j2,j3,j4,j5,j6), SDATA=(CSA,PSA,RGN,SQA,SUM,TRT),END

In the previous example,

- *j1* is the IMS CTL or DBCTL region job name
- *j2* is the IMS DL/I region job name
- *j*3 is the suspicious IMS dependent region job name, if any
- *j4* is the suspicious CCTL (CICS) region name, if any
- *j5* is the IRLM region job name (if IRLM DB locking is used)
- *j6* is the DBRC region job name
- **9**. Obtain a dump of the APPC, APPC Scheduler, and VTAM address spaces with this series of commands:

DUMP COMM=(dump title)
R id JOBNAME=(j1,j2,j3),SDATA=(CSA,PSA,RGN,SQA,SUM,TRT),END

In the previous example,

- *j1* is the APPC job name
- *j2* is the APPC scheduler job name
- *j*3 is the VTAM job name

## Collecting data about IMS Connect problems

If a problem occurs during IMS Connect execution, you need to collect logs, data sets, and dumps to determine the source of the problem.

For almost all problems that might occur during IMS Connect execution, you can take the following action to collect the data that is needed to diagnose the problem:

- Create a dump of the IMS Connect address space.
- Save the IMS Connect joblog, which contains only IMS Connect messages. IMS Connect messages are also written to the MVS system log (SYSLOG), but the IMS Connect messages can be difficult to find in the SYSLOG, because of the other z/OS subsystem messages that the SYSLOG contains.
- Save the MVS SYSLOG. The SYSLOG is useful for seeing what messages other subsystems issued before and after the IMS Connect messages were issued, because the MVS SYSLOG contains messages from all z/OS subsystems, including TCP/IP, IMS, and IMS Connect.
- Turn on the IMS Connect Recorder Trace facility and attempt to re-create the problem.

In addition to collecting data about IMS Connect, you might need to collect data about other components or products if they appear to be related to the problem in some way. For example:

• If the problem appears to be network related, you might also need to initiate a TCP/IP packet trace to trace the IP packets flowing to and from a TCP/IP stack on the z/OS Communications Server. For more information about initiating packet traces, see z/OS Communications Server IP Diagnosis Guide.

- If the problem is related to IMS Connect support for an IMS TM system, where the connections to IMS are through OTMA, you might also need to collect data about the IMS system.
- If the problem is related to IMS Connect support for an IMS DB system, where the connections to IMS are through an instance of the Open Database Manager (ODBM), which runs in its own address space as a component of the IMS Common Service Layer (CSL), you might also need to collect data about both the IMS system and any ODBM instance that might be associated with the problem.
- If the problem is related to two-phase-commit processing, you might also need to collect data related to z/OS Resource Recovery Services.

# Collecting data about ISC TCP/IP link problems

•	
   	If a problem occurs on an ISC link that uses TCP/IP, you might need to collect diagnostic information from IMS, the Structure Call Interface (SCI) component of the IMS Common Service Layer (CSL), IMS Connect, TCP/IP, and IBM CICS Transaction Server for z/OS.
	<b>Prerequisite:</b> Review error messages that were issued by IMS, the SCI, IMS Connect, and CICS around the time of the error to determine at which point in the ISC link the error might have occurred. If you can determine that any components are unrelated to the error, you might not need to collect information about that component.
 	To collect the data that is needed to diagnose a problem on an ISC link that uses TCP/IP:
Ι	<ul> <li>For IMS, the information that you can collect includes:</li> </ul>
Ι	<ul> <li>The IMS system console sheet</li> </ul>
Ι	<ul> <li>The IMS job log</li> </ul>
L	<ul> <li>The z/OS system log (SYSLOG)</li> </ul>
Ι	<ul> <li>A dump of the IMS control region</li> </ul>
Ι	– A DC trace
Ι	<ul> <li>For SCI, the information that you can collect includes:</li> </ul>
Ι	<ul> <li>An SCI region dump</li> </ul>
Ι	<ul> <li>The z/OS SYSLOG from the logical partition in which SCI is running.</li> </ul>
Ι	<ul> <li>A z/OS SVC dump of the CSL address spaces</li> </ul>
Ι	<ul> <li>For IMS Connect, the information that you can collect includes:</li> </ul>
Ι	<ul> <li>A dump of the IMS Connect address space</li> </ul>
Ι	<ul> <li>The IMS Connect job log</li> </ul>
Ι	<ul> <li>The z/OS SYSLOG</li> </ul>
Ι	<ul> <li>Output from the IMS Connect Recorder Trace facility</li> </ul>
 	• If the problem appears to be network related, you might also need to initiate a TCP/IP packet trace to trace the IP packets flowing to and from a TCP/IP stack

   	<ul> <li>on the z/OS Communications Server. For more information about initiating packet traces, see <i>z/OS Communications Server IP Diagnosis Guide</i>.</li> <li>For CICS, refer to the CICS documentation for current information about collecting diagnostic information. Information that might be helpful to collect</li> </ul>
	includes:
	<ul> <li>The CICS system console sheet</li> </ul>
I	<ul> <li>The CICS job log</li> </ul>
1	<ul> <li>The CICS message log including any DFHISnnnn messages</li> </ul>
1	<ul> <li>A z/OS system dump taken at the point of failure</li> </ul>
1	<ul> <li>A CICS internal trace</li> </ul>

# Collecting data about CQS-related problems

CQS problems can appear in various ways and, like the IMS control region, they can manifest themselves in the form of WAITs, HANGs, LOOPs, or some other type of internal error that results in an SDUMP being taken.

These dumps are in the SYS1.DUMP data sets. CQS can also produce LOGREC data set entries for these types of errors.

If an isolated event type within CQS encounters an error, then IBM Software Support might request additional CQS-trace level settings for the various trace types.

For a CQS WAIT problem, one or more inflight dumps might be required. Multiple dumps might need to be taken if the problem is a LOOP. If a structure rebuild or structure checkpoint related problem occurs, you will also need to dump the CQS address spaces for any CQS associated with the given structure, and save the associated SRDS (structure recovery data set) for the CQS structure checkpoints and CQS system checkpoints.

# Collecting data about CSL-related problems

The Common Service Layer address spaces, Open Database Manager (ODBM), Operations Manager, Structured Call Interface, and Resource Manager, produce SDUMPs for internal errors. The CSL dumps are in the SYS1.DUMP data sets.

You might need to collect one or more of the following types of information to diagnose CSL related problems:

#### SYSLOG

To determine the sequence of events, collect the SYSLOG from every logical partition (LPAR) where a CSL member resides. CSL address spaces issue messages that begin with "CSL"

- ODBM messages CSLDxxxx
- OM messages CSLOxxxx
- RM messages CSLRxxxx
- SCI messages CSLSxxxx
- CSL common messages CSLZxxxx

#### QUERY IMSPLEX SHOW(ALL) command output

Issue the QUERY IMSPLEX command to display the members of the IMSplex and their status.

If there are problems accessing OM or RM services, verify that at least one OM or RM is active in the IMSplex and that an active SCI resides on every LPAR where a CSL address space resides.

#### Obtain z/OS SVC dumps

Obtain a z/OS SVC dump of the CSL address spaces that appear to have a problem, are waiting, or are looping. CSL dumps contain the CSL traces, which can be very useful for diagnosing CSL related problems. Dump all of the CSL address spaces that appear to have a problem with the following series of commands:

DUMP COMM=(dump title) R id JOBNAME=(odbm1,om1,rm1,sci1) SDATA=(CSA,PSA,RGN,SQA,SUM,TRT),END

In the previous example:

- odbm1 An ODBM address space.
- om1 An OM address space.
- *rm1* An RM address space.
- sci1 An SCI address space.

For some CSL problems, IBM Software Support might request additional trace level settings for the various trace types.

## **Repository Server audit log records**

If AUDIT=YES is specified in the FRPCFG member of the IMS PROCLIB data set, the Repository Server (RS) writes to the z/OS logger audit log stream name specified in the AUDIT\_LOG= parameter.

Maintaining the RS audit log is optional.

The RS audit log contains information about selected events that occur during server execution.

The audit access rule identifies the information that can be written to the audit log. The default access rule can be specified in the FRPCFG member of the IMS PROCLIB data set using the AUDIT\_DEFAULT parameter. This specification is applicable to all IMS repositories managed by the RS. The value for the AUDIT\_DEFAULT parameter can be overridden by setting the AUDITACCESS parameter in the CSLRIxxx member of the IMS PROCLIB data set.

If an audit access rule is already set for a given repository type, setting it again replaces the rule. Setting AUDITACCESS=DEFAULT removes the audit rule for the given repository type. The audit rule is then set to the default access rule specified in the FRPCFG member.

Audit log entries can be triggered in the audit log by the following events:

- RS and repository events
- ADMIN and CONTROL requests
- Registration, connection, and UOW events
- Events relating to repository members during a client member session:
  - Access failure due to a security restriction
  - Update
  - Read
  - System-level read

Refer to the FRPLGREC macro that maps the RS audit log records to view the event types and subtypes that are written and the data in each log record type. **Related concepts**:

Overview of the IMSRSC repository (System Definition)

#### **Related reference:**

"Log records" on page 499

- FRPCFG member of the IMS PROCLIB data set (System Definition)
- CSLRIxxx member of the IMS PROCLIB data set (System Definition)

## Managing Repository Server audit log records

Issuance of Repository Server (RS) audit log records can be controlled by specifying parameters in the FRPCFG and CSLRIxxx members of the IMS PROCLIB data set and through the F reposervername,AUDIT RS command.

Auditing can be enabled for the RS to connect to the z/OS log stream by specifying AUDIT=Y in the FRPCFG member of the IMS PROCLIB data set, but no audit records are written if AUDIT\_LEVEL=NONE is specified.

Auditing can be restarted after an error during RS initialization if AUDIT\_FAIL=CONTINUE is specified.

You can also dynamically change the value specified for the AUDIT\_LEVEL parameter in the FRPCFG member by issuing the RS command F reposervername,AUDIT.

You can control which types of events and member access are audited during client member sessions by specifying the AUDIT\_DEFAULT= parameter in the FRPCFG member or the AUDITACCESS= parameter in the CSLRIxxx member. Audit access can also be modified through the UPDATE RM command. An audit access rule applies to all members of a specified repository type.

A read request from an authorized client that is done as a part of the update request is identified as a *system read* request. With an audit access rule of READ, system read requests do not cause a read audit record to be generated. With an audit access rule of SYSTEMREAD, all read requests, including system read requests, are audited.

#### **Related concepts:**

Overview of the IMSRSC repository (System Definition)

#### Related reference:

- FRPCFG member of the IMS PROCLIB data set (System Definition)

## How the Repository Server handles z/OS logger errors

The Repository Server (RS) uses the ENF48 exit to detect when system logger resources become unavailable or available.

This process enables the RS to resume logging when transient logger errors are resolved.

If AUDIT\_FAIL=CONTINUE is specified in the FRPCFG member of the IMS PROCLIB data set, during RS startup, the RS starts after an error and no audit log is enabled.

If AUDIT\_FAIL=ABORT is specified, during RS startup, the RS terminates on an error.

During a client request, if AUDIT\_FAIL=CONTINUE is specified, the RS continues processing as if the audit log is not enabled.

If AUDIT\_FAIL=ABORT is specified, the client request is rejected.

#### **Related concepts:**

Overview of the IMSRSC repository (System Definition)

**Related reference:** 

FRPCFG member of the IMS PROCLIB data set (System Definition)

## Printing Repository Server audit log records

To print the audit log records from the Repository Server (RS) audit log stream on the z/OS system logger, use the IMS File Select and Formatting Print utility (DFSERA10) with exit routine CSLRERA3.

#### **DD** statements

The DD statements for printing RS audit log records are:

#### STEPLIB DSN=

Points to IMS.SDFSRESL, which contains the IMS File Select and Formatting Print utility, DFSERA10.

#### SYSPRINT

Describes the output data set to which the formatted print records and

control messages are to be directed. SYSPRINT is usually defined as SYSOUT=A. DCB should not be specified on the SYSPRINT DD.

#### SYSUT1 DSN=

Points to the RS audit log stream name that is specified on the AUDIT\_LOG= parameter in the FRPCFG member of the IMS PROCLIB data set.

# **Control statements**

The control statements for printing the RS audit log records are:

**H=** Specifies the number of log records to print. H=EOF specifies to print all of the log records.

#### EXITR=

Identifies the Resource Manager (RM) audit log record exit routine that is called to format each log record. EXITR=CSLRERA3 specifies to print the records in a memory dump format, including the record type and time-stamp information for each record.

# Limiting log data to a specific time range

To limit the log data to a specific time range, use the FROM and TO parameters on the SUBSYS statement, as shown in the following example. This DD card prints log records from 11:00 to 12:00 on day 42 of the year 2010:

//SYSUT1	DD	DSN=SYSLOG.REPO.AUDIT.LOG
11		SUBSYS=(LOGR,IXGSEXIT,
//		'FROM=(2010/042,11:00:00),TO=(2010/042,12:00:00)'),
//		DCB=(BLKSIZE=32760)

Dates and times are specified in Greenwich mean time (GMT). The seconds field in the time value is optional. To use local dates and times, add the LOCAL keyword, as shown in the following example:

//SYSUT1 //	DD	DSN=SYSLOG.REPO.AUDIT.LOG, SUBSYS=(LOGR,IXGSEXIT,
    		'FROM=(2007/042,11:00:00),TO=(2007/042,12:00:00),LOCAL'), DCB=(BLKSIZE=32760)

# Sample

The following JCL shows what is required to print RS log records from the RS audit log stream:

//CSLERA1	JOB	MSGLEVEL=1,MSGCLASS=A,CLASS=K
//STEP1	EXEC	PGM=DFSERA10
//STEPLIB	DD	DISP=SHR,DSN=IMS.SDFSRESL
//SYSPRINT	DD	SYSOUT=A
//SYSUT1	DD	DSN=SYSLOG.REPO.AUDIT.LOG,
//		SUBSYS=(LOGR,IXGSEXIT),
//		DCB=(BLKSIZE=32760)
//SYSIN	DD	
CONTROL	CNTL	H=EOF
OPTION	PRINT	EXITR=CSLRERA3
END		
//

# Collecting data about ESAF and DB2 ESS interface problems

ESAF (External Subsystem Attach Facility) interface problems can be diagnosed by using the external trace data set. You can use the IMS /TRACE command to direct and control the tracing of internal IMS events.					
The IMS external subsystem (ESS) trace impacts performance. Activate the trace only when you notice a problem or if you need to re-create a problem. IBM software support may ask you to provide dumps of IMS CTL, z/OS SVC and the IMS online log data set.					
To document problems that involve the Db2 for $z/OS$ ESS interface:					
1. Use the following TRACE command to turn on the IMS ESS trace and to direct its output to the external trace data set:					
/TRACE SET ON TABLE SUBS OPTION LOG					
2. Obtain dumps of the IMS CTL and involved dependent regions, before and after the failure, by issuing this series of commands:					
DUMP COMM= <i>(dump title)</i> R id JOBNAME= <i>(j1,j2,j3,j4,j5)</i> , SDATA= <i>(CSA,PSA,RGN,SQA,SUM,TRT)</i> ,END					
3. Obtain a z/OS SVC dump of the DB2 <sup>®</sup> MSTR and DBM1 regions by issuing this series of commands:					
DUMP COMM= <i>(dump title)</i> R id JOBNAME= <i>(dbtmstr,dbwdbm1)</i> , SDATA= <i>(CSA,PSA,RGN,SQA,SUM,TRT)</i> ,END					
4. Save the IMS online log data set that was active during the failure because IMS TYPE5501, 08, 07, 56 and other log records can be critical to diagnosis. The IMS TYPE5501 records are updated by DB2. The internal buffer for these records is stored at the location described by the CDE entry named WAL in the IMS regions.					
<ol> <li>If the IMS monitor is started, issue the following command to monitor the IMS data set: /TRACE SET ON MONITOR ALL</li> </ol>					

# Collecting data about database problems

The first step to diagnosing an IMS problem is to collect data about the problem. If you call an IBM service representative, you will be asked for documentation about the problem.

For database problems, obtain the following information:

- The damaged database data set.
- The database image copy of the damaged database in a state prior to damage.
- The image copy of logically related databases.
- The IMS OLDS from all data-sharing IMS subsystems.
  - Save from the last good database image copy of damaged database.
- If possible, and not already set, use the following IMS commands and save the output:

/TRA SET ON TABLE DLI OPTION LOG

and

1

/TRA SET ON TABLE LOCK OPTION LOG

- The SYSOUT from the Pointer Checker jobs for the damaged database.
- The SYSOUT from batch jobs that accessed the damaged database.
- The LIST.RECON and LIST.HISTORY DBD from the damaged database.
- The SMF 60, 62, and 64 records from all data-sharing systems back to the last good image copy of damaged database.
- For VSAM data sets:
  - Issue IDCAMS LISTC for the damaged VSAM data set.
  - Issue IDCAMS DIAGNOSE and IDCAMS EXAMINE for the damaged VSAM KSDS data sets.

# Collecting data about z/OS Resource Recovery Services problems

RRS provides a system resource recovery platform such that applications that run on z/OS can have access to local and distributed resources and have system-coordinated recovery management of these resources.

If you use RRS with your IMS system:

- Take an SVC dump of the standard IMS regions using one of the methods discussed earlier: CTL, DL/I, DBRC, suspicious dependent regions, IRLM, and so on.
  - In addition, include the z/OS RRS address space and the z/OS logger address space (IXGLOGR).
    - Consider setting the following SLIP trap to supplement standard IMS/RRS ABENDU0711 diagnostics:

SLIP SET,C=U0711,JOBLIST=(ctljname,rrsjname,IXGLOGR), SDATA=(CSA,PSA,RGN,SQA,SUM,TRT,GRSQ,LPA,ALLNUC), ID=nnnn,DSPNAME=('RRS'.\*),END

In the previous example:

#### ctljname

IMS control region job name

```
rrsjname
```

RRS region job name

nnnn Name used to recognize this SLIP

- Turn on the RRS component trace.
  - Place the following statements in the CTIRRSxx PARMLIB member:

```
TRACEOPTS
ON
BUFSIZE(500M)
```

OPTIONS('EVENTS(URSERVS,LOGGING,CONTEXT,EXITS,STATECHG,RRSAPI,RESTART)')

Place the following statement in the z/OS COMMNDxx SYS1.PARMLIB member:

TRACE CT,ON,COMP=SYSRRS,500M,PARM=CTIRRSxx

Note: This statement allows the trace to be active at IPL.

- Use the D TRACE, COMP=SYSRRS command to view the current trace setting.
- RRS component trace is present in the RRS address space.
- Format the trace by using IPCS CTRACE COMP(SYSRRS) FULL command.
- Save the IMS OLDS

- IMS 67D0 log records are produced for some ABENDU0711 abends.
  - Print these records by using the IMS utility programs DFSERA10 and DFSERA30.
- Other RRS related records that are produced:
  - TYPE4098 Checkpoint for RRS log name.
  - TYPE5615 IMS restarted with RRS.
  - TYPE5616 Start of protected UOW.
- Issue two or three IMS DISPLAY UOR ALL commands to show status about the IMS UOR for protected resources on the RRS recovery platform.
  - The RRS-URID provided by RRS and the IMS recovery token are displayed.
- If the problem is recreatable, then:
  - Turn on the RRS component trace: TRACE CT,ON,500M,COMP=SYSRRS nn,OPTIONS=(EVENTS(ALL)),END
  - When the problem has been recreated, stop the component trace: TRACE CT,OFF,COMP=SYSRRS
    - RRS component trace is present in the RRS address space.
    - Format the trace by using the IPCS CTRACE COMP(SYSRRS) FULL command.
- Issue two or three IMS DISPLAY UOR ALL commands to show status about the IMS UOR for protected resources on the RRS recovery platform.
  - The RRS-URID provided by RRS and the IMS recovery token are displayed.

# Related tasks:

"Collecting data about IMS Connect problems" on page 19

# Collecting data about MSC-related problems

If you experience IMS Multiple Systems Coupling (MSC) related problems, you can collect diagnosis data with SVC dumps.

If you use IMS MSC and experience a related problem, complete the following tasks:

- Create an SVC dump of the coupled IMS regions (minimally, the CTL regions, but the problem might reside in any IMS-related region). In addition, ensure that the VTAM address space is also included. Create this dump as close to the time of the problem as possible, before you try to fix the problem.
- Save the IMS OLDS for both coupled systems from the time of the message creation.
- To show the status and queue counts for the logical link, issue the type-1 commands /DISPLAY LINK ALL and /DISPLAY LINK ALL MODE, or issue the type-2 command QUERY MSLINK NAME(*linkname*) SHOW(ALL).
- If the problem is recreatable:
  - Turn on the VTAM Internal Trace for both coupled systems:
     F NET,TRACE,TYPE=VTAM,OPT=(API,PIU,MSG),DSPSIZE=5,SIZE=999
  - Using the options shown above, the VIT (VTAM internal trace) is created in a VTAM data space. After the problem has been recreated, the dump parameters should also include the VTAM data space:
     DSPNAME=('NET'.ISTITDS1)
  - Turn on the MSC LINK trace for both coupled systems by issuing either the type-1 command /TRACE SET ON LINK *link#* LEVEL 3 MODULE ALL or the type-2 command UPDATE MSLINK NAME(*linkname*) START(TRACE).

- The type-2 command UPDATE MSLINK NAME(*linkname*) START(TRACE) uses the same level and module settings that were used the last time the command /TRACE SET ON LINK *link#* was issued. If a /TRACE SET ON LINK *link#* command has not been issued since the last cold start, this command defaults to MODULE ALL and LEVEL 4.

# Chapter 3. Collecting data about abends by using IMS abend search and notification

IMS abend search and notification enables IMS to send an email or text message to a designated email address when an abend occurs.

When an abnormal termination (or *abend*) occurs, IMS sends a message that contains an abend code to an operator's console or to the master terminal operator (MTO). This process delays a response because the person who can respond to the abend might not be near the console when the message is sent. Therefore, action in response to the abend is delayed until the message reaches the correct person.

IMS abend search and notification enables IMS to send an email or text message to a designated email address when an abend occurs, in order to:

- Notify the correct person of an abnormal termination (abend).
- Provide a web address (URL) to the location of additional informational resources, such as IMS product documentation, technical notes in an IBM technical support database, and information in the preventive service planning (PSP) database.

You can also use IMS abend search and notification to dynamically research abends and build links to web addresses that provide information that relates to the abend, such as online product documentation and technical support databases.

# Enabling IMS abend search and notification

Before you can use IMS abend search and notification to search online documents and technical support databases for information related to IMS abends, you must enable it.

Complete the setup procedures for the IMS abend search and notification, as described in "Setting up IMS for diagnostics" in *IMS Version 13 System Definition*.

# Researching information about abends dynamically

You can use IMS abend search and notification to dynamically generate emails for specific abends, specify research criteria, and replicate the search criteria that IMS used in a particular abend event and generate an email.

To research information about abends dynamically:

1. Start IMS abend search and notification by using one of the following methods:

Option	Description
Select IMS abend search and notification from the IMS Application Menu.	The IMS Abend Search and Notification panel is displayed.
From the ISPF option 6, enter the following command, where <i>hlq</i> is the high-level qualifier used to install IMS: exec ' <i>hlq</i> .SDFSEXEC(DFSRASN0)' 'HLQ( <i>hlq</i> )'	The IMS Abend Search and Notification panel is displayed.

2. Type 2 in the IMS ASN On-Demand Interface field and press Enter.

The IMS Abend Search and Notification panel - on demand interface panel is displayed, as shown in the following figure.

OMMAND ===>	
Product Name	UIRED (example: IMS)

3. Type your search criteria and press Enter.

# Chapter 4. How to search problem-reporting databases

After you obtain background information about the problem you are diagnosing, you can then use that information to create search arguments to search problem-reporting databases for known problems that describe an aspect of a program failure.

You use keyword strings to search an IBM Technical Support database for documents such as Authorized Program Analysis Reports (APARs), Preventative Service Planning buckets, or Technotes for information about the resolution of reported problems. If the search is successful, you will find a similar problem description, and usually a fix or recommendation. If the failure is one that is not known, you will use the keywords to describe the failure when you contact IBM Product Software Support for assistance.

Some optional search tools might require keywords in a structured database (SDB) format.

# **Developing search arguments**

A keyword describes one aspect of a program failure. A set of keywords, called a *keyword string*, describes a specific problem in detail. Because you use a keyword string to search a database, a keyword string is also called a *search argument*.

The keywords you use to search for problems in IMS are:

• The component identification

This is the first keyword in the string. A search of the database with this keyword alone detects all reported problems for that version of IMS.

The type of failure

The second keyword specifies the type of failure that occurred. Its values can be:

- ABENDxxx
- ABENDUxxxx
- DOC
- PERFM
- MSGx
- INCORROUT
- WAIT/LOOP
- Symptom keywords

These can follow the keywords above and supply additional details about the failure. You select these keywords as you proceed through the type-of-failure keyword procedure that applies to your problem.

Add symptom keywords to the search argument gradually so that you receive all data matches or *hits*, which are problem descriptions that might match your problem. If you receive too many problem descriptions to examine, you can add AND or OR operators to additional keywords in various combinations to the keyword string to reduce the number of hits.

Dependency keywords

These are program or device dependent keywords that define the specific environment that the problem occurred in. When added to your set of keywords, they can help reduce the number of problem descriptions you need to examine. See "Dependency keywords" on page 67 for a list.

# Creating a search argument

After you have performed some analysis on the problem you are diagnosing, you can then use that information to search problem reporting databases. To do that, you create a search argument comprised of keyword strings. If that search technique is unsuccessful, you can prepare an Authorized Program Analysis Report (APAR).

To build the keyword string and search the IBM software support database for a problem similar to the one you are experiencing, follow these steps:

- 1. Begin with "Component identification keyword procedure" to determine the failing IMS component.
- Follow the sequential steps in one of the "Type-of-Failure Keyword" procedures until you build a keyword string.
- **3.** Go to "Searching the database" on page 68, to learn how to search the IBM software support database with your completed string.
  - a. Optional: Use the "IMS keyword dictionary" on page 65, which provides guidance on translating free-form keywords into structured database (SDB) format.
  - b. If needed, you could use "Dependency keywords" on page 67, which are used to narrow search arguments.
- If your search is unsuccessful, go to "Procedures for preparing an APAR" on page 70.

# Selecting the keywords

You select the proper keywords to search the IBM Software Support database for a problem similar to the one you are experiencing. The keywords you select depend on the component that is experiencing the problem and the type of failure that occurred.

#### Related tasks:

"Analyzing DRA problems" on page 374

# Component identification keyword procedure

Use a component identification number with at least one other keyword to search the IBM software support database.

The component identification numbers for IMS appear in the following table.

Table 2. IMS component identification numbers

Identification number	Description			
5635A04	IMS Services			
	Database Manager			
	Transaction Manager			
	Extended Terminal Option (ETO)			
	Recovery-level Tracking			
	Database-level Tracking			
569516401	Internal Resource Lock Manager (IRLM) version 2			

1

Some of the procedures in these topics contain offsets within control blocks. Be aware that maintenance might change the offsets in these control blocks. For a current version of the layout of the control blocks for your system, assemble the DFSADSCT module that is in the IMS.ADFSSMPL library.

# **Related concepts:**

"PERFM procedure" on page 40

#### Related tasks:

"Type-of-failure keyword"

# Type-of-failure keyword

You choose the keyword that best describes the program failure you experienced, and then go to the procedure for that type of failure.

#### Related reference:

"Component identification keyword procedure" on page 34

# ABENDxxx procedure

Use this procedure when the system terminates abnormally with a system abend completion code.

# Keyword: ABENDxxx

Compare the completion code and PSW address in both the z/OS-formatted section of the dump and the IMS-formatted section of the dump. If the code and address do not match, use only the data from the IMS-formatted section, because the system dump data might be produced if an abend occurs during abend processing.

Replace the xxx part of the ABENDxxx keyword with the abend code from either the termination message or the abend dump.

# Keyword: RCxx

This keyword applies only if the abend has an associated return code as described in *z*/*OS MVS System Commands*.

Replace the xx part of the RCxx keyword with the return code.

#### Keyword: module name

You can determine the name of the module that received the abend in one of the following ways:

- Check both the dump title and message DFS629I, which might contain the name of the module that ended abnormally.
- Check the summary section, called "Diagnostic Area", in the offline formatted dump.
- Find the PSW address at the time of abend. Locate this address in the storage section of the dump, and scan backward through the eye catchers until you find a module identifier.

#### Module-specific keyword: Failing instruction, register

You can use these module-specific keywords to further narrow the field of hits.

# **Failing Instruction**

The PSW address at the time of abend usually points to the next instruction to be executed. If ABEND0C4 or ABEND0C5 occurs and the INTC (interrupt code) field on the PSW AT ENTRY TO ABEND line contains X'0011' (segment exception) or X'0010' (page translation exception), the PSW points directly to the instruction that failed.

#### **Register in Error**

Examine the code near the failure to determine the register that is invalid or in error, if possible.

For example, if the failing instruction is BALR (05EF), look at registers 14 (E) and 15 (F). If register 15 (F) contains zeros, the program cannot branch to that location. Therefore, register 15 is in error.

In performing system-abend analysis, another module might have passed the register in error. You might be able to determine this by looking at the registers on entry to the failing module. If the incorrect value is in one of the registers, that value might have been passed.

#### Module-specific keyword: Search argument example

If, for example, ABEND0C4 occurred in IMS module DFSFXC30 on a BALR (05EF) instruction because register 15 (F) contained zeros, use the following search argument:

5655J3800 ABEND0C4 DFSFXC30

For a structured database search, use the following search argument: PIDS/5655J3800 AB/S00C4 RIDS/DFSFXC30

With this search argument, you might receive numerous hits, which would most likely include the APAR that describes your problem. You can add module-specific keywords to narrow the field of hits received. Use the OR operator with these additional keywords at first.

The additional keywords for this example are:

BALR | R15 ZEROS

For a structured database search, use the following search argument: OPCS/BALR | REGS/GR15 VALU/H00000000

## **Related concepts:**

"ABENDUxxxx procedure"

# ABENDUxxxx procedure

Use this procedure when an IMS user abnormal termination occurs. For user abends, you must gather more information before calling IBM Software Support.

A message usually precedes a user abend. First, find the message and then the abend code in *IMS Version 13 Messages and Codes, Volume 1: DFS Messages* or *IMS Version 13 Messages and Codes, Volume 2: Non-DFS Messages*. Then, if you need further diagnostic information (such as return codes) that you can use to build the search argument, or information about why the abend was issued, refer to the *IMS Version 13 Messages and Codes, Volume 3: IMS Abend Codes*.

If you cannot solve the problem by using the information in the *IMS Version* 13 *Messages and Codes, Volume 3: IMS Abend Codes,* develop a search argument.

#### **ABENDUxxxx** keywords

Replace the xxxx part of the ABENDUxxxx keyword with the user abend code from either the termination message or the abend dump. User abends are always represented in decimal.

## Keyword: module name

You can determine the name of the module that received the abend in either of the following ways:

- Check both the dump title and message DFS629I, which might contain the name of the module that ended abnormally.
- Use the PSW address at the time of abend. You can find this address in the IMS-formatted section of the dump under the diagnostic area or in the z/OS-formatted section. From the PSW address, scan backward through the eye catchers until you find a module identifier.

Use the module name in the search argument for standard user abends only. For pseudoabends, do not include the module name as part of the argument. *IMS Version 13 Messages and Codes, Volume 3: IMS Abend Codes* indicates whether the abend is a pseudoabend or a standard abend.

# Abend-specific keywords

By examining the information in *IMS Version 13 Messages and Codes, Volume 3: IMS Abend Codes,* you might gather additional keywords that can be pertinent to the problem, such as:

- User call function
- Internal call function
- Database organization
- Messages

Replace the *xxxxxx* part of keyword MSG*xxxxxx* with the actual message identifier (for example, the keyword for message DFS053I is MSGDFS053I).

Return codes

Replace the *xx* part of keyword RC*xx* with the associated hexadecimal return code (for example, the keyword for return code C is RC0C).

Function codes

Replace the xxxx part of keyword FCxxxx with the associated hexadecimal function code (for example, the keyword for function code 13 is FC0013).

## Search argument example

If, for example, ABENDU3046 occurred in IMS module DFSPCC20 with message DFS3624I indicating function code 291 and return code 4, the search argument to use is:

5655J3800 ABENDU3046

For a structured database search, use this search argument: PIDS/5655J3800 AB/U3046

With this search argument, you might receive numerous hits, which would most likely include the APAR describing your problem. You can add keywords from the section "Type-of-failure keyword" on page 35 to narrow the field of hits received.

It is a good idea to use the **OR** operator on these additional keywords at first. Module name DFSPCC20 is not included as part of the search argument because ABENDU3046 is a pseudoabend.

The additional keywords for the above scenario are: MSGDFS3624I | RC04 | FC0291

For a structured database search, use this search argument: MS/DFS3624I PRCS/00000004 0PCS/0291

# Additional documentation

IBM Software Support might ask you to obtain certain information to determine and resolve the problem. At times you might need to create the problem again in order to gather this documentation.

For database problems, ensure that you have access to the following documentation before calling IBM Software Support:

- A dump of the problem
- DBDGENs
- PSBGENs
- A copy of the databases involved in the error
- Logs and archive tapes that might have activity against the databases
- Output from both the DL/I and LOCK traces
- When tracing to the log, a printout of the traces
- A current CDS list or a current SMP/E target zone
- A current assembly listing of DFSADSCT from IMS.ADFSSMPL (control block DSECTs)

Problems can be resolved more quickly if the documentation listed above is available.

# **IRLM procedure**

Use this procedure when the IRLM terminates abnormally.

- 1. Locate the PSW and register contents at entry to the abend either from the software LOGREC entry or from the RTM2WA summary in the formatted section of the SDUMP.
  - **a.** If the PSW is not within an IRLM module (prefixed with DXR), determine the system component in which the abend occurred and use the diagnostic procedure for that component to resolve the problem.
  - b. If the RTM2WA summary entry shows that the IRLM was terminated by an abend completion code of U2017, U2018, U2019, U2020, U2022, U2023, U2024, U2025, U2027, U2031 (X'7E1', X'7E2', X'7E3', X'7E4', X'7E6', X'7E7', X'7E8', X'7E9', X'7EB', or X'7EF'), the IRLM task was terminated because of an error either in a subtask or in an SRB related to the IRLM. To diagnose the problem, use the software LOGREC entry or the RTM2WA summary entry for the original error in the subtask or related SRB.
- 2. Register 12 normally contains the base register contents for the module that was in control at the time of the error.
- **3.** Register 9 normally contains the address of the RLMCB if the error occurred during IRLM processing.

4. Using the module name, find the function keyword and locate the function and subfunction keywords.

## Examples

An example of a search argument for an IRLM problem is: 569516401 ABEND0C4 DXRRL200

For a structured database search, an example is: PIDS/569516401 AB/S00C4 RIDS/DXRRL200

#### Related tasks:

"ABENDxxx procedure" on page 35

#### **DOC** procedure

Use this procedure if you find a deficiency in documentation through omission or inaccuracy.

# Keyword: order-number

Your feedback is important in helping us provide the most accurate and highest quality information. If you have any comments about this or any other IMS information, you can take one of the following actions:

- From any topic in IBM Knowledge Center at www.ibm.com/support/ knowledgecenter, click the **Feedback** link at the bottom of the page and complete the form.
- Send your comments by email to imspubs@us.ibm.com. Be sure to include the title, the part number of the title, the version of IMS, and, if applicable, the specific location of the text on which you are commenting (for example, a page number in the PDF or a heading in IBM Knowledge Center).

Corrections resulting from readers' comments are included in future editions of the manual, but are not included in the software support database.

If a problem can have severe results or cause lost time for many other users, contact IBM Software Support to initiate a documentation change.

APARs are not generally accepted for documentation errors. However, APARs that correct a programming error can result in documentation changes.

Use this keyword to search for all changes to a specific manual. The format for the order-number is *ppnnnnnee*, where *pp* is the alphabetic prefix, *nnnnn* is the 6-digit base publication number, and *ee* is the edition number. For example, the order number for *IMS Version 13 Messages and Codes, Volume 1: DFS Messages* is GC18-9712-00. Replace *ppnnnnnee* with GC18971200. The edition number is optional. To broaden the search to include all editions of a publication, either omit the edition number or replace it with two asterisks (\*\*).

#### Search argument example

Use this search argument to search for all changes to any edition of *IMS Version 13 Messages and Codes, Volume 1: DFS Messages*: 5655J3800 GC189712\*\*

For a structured database search, use this search argument:

PIDS/5655J3800 PUBS/GC269712\*\*

You can add more keywords to narrow the search. For example, if you cannot find message DFS3007 in *IMS Version 13 Messages and Codes, Volume 1: DFS Messages,* add this keyword to the above search argument: MSGDFS3007

For a structured database search, use this search argument: MS/DFS3007

If you do not find an APAR that adds message DFS3007, you can report the omission to IBM by clicking the **Feedback** link at the bottom of any topic in IBM Knowledge Center.

# **PERFM** procedure

Most performance problems are related to system tuning and should be handled by system programmers.

# Keyword: PERFM or PERFORMANCE

Always use the keywords PERFM and PERFORMANCE for performance problems. You should use the **OR** operator to link them together in the search argument.

You can use the following search argument to check for all performance APARs in IMS Fast Path:

5655J3800 PERFM | PERFORMANCE FAST | PATH | FASTPATH

For a structured database search, you can use this search argument: PIDS/5655J3800 PERFM | PERFORMANCE RIDS/FASTPATH

You can add the **OR** operator to the general component identifier together with the Fast Path component identifier. With this search argument, the resulting number of hits could be very large, but would include APARs describing performance problems in Fast Path.

You can add more keywords to narrow the number of hits. For example, if the performance problem occurs because of an excessive number of file opens and closes, you can add the **OR** operator with the following keywords to the above search argument:

OPEN | CLOSE

For a structured database search, use this search argument: PCSS/OPEN | PCSS/CLOSE

If you cannot find an appropriate APAR with these search arguments, contact IBM Software Support.

Appropriate documentation for performance problems might include:

- Traces, such as DL/I, lock, dispatcher, scheduler, external subsystem, and others, depending on the area of the performance problem
- · Dumps of the problem during the period of performance degradation
- Dumps of the problem during normal periods, for comparison
- DB or IMS Monitor reports during the performance problem period

- DB or IMS Monitor reports during normal operations, for comparison
- Copy of the IMS log during the performance problem period
- · Copy of the IMS log during the normal period, for comparison

If a coordinator controller (CCTL) application program experiences a performance problem in a Database Control (DBCTL) environment, you might need the following documentation in addition to that listed above:

- Any CCTL traces or monitor reports
- · A dump of the CCTL subsystem during the period of performance degradation

#### Related reference:

"Component identification keyword procedure" on page 34

#### MSG procedure

If, after analyzing the message, you believe that the message should not have been issued or describes an error condition, use the MSGxxxxxxx keyword.

## Keyword: MSGxxxxxxxx

Replace the *xxxxxxx* part of keyword MSG*xxxxxxx* with the actual message identifier (for example, the keyword for message DFS0861 is MSGDFS0861).

#### Search argument examples

If, for example, you receive message DFS34011 RACF NOT AVAILABLE, and you determine that RACF is indeed available in your system, the search argument to use is:

5655J3800 MSGDFS3401I

For a structured database search, use this search argument: PIDS/5655J3800 MS/DFS34011

#### Incorrout procedure

INCORROUT is when either output is missing, or output is incorrect.

#### Keyword: INCORROUT

Use this procedure to determine the appropriate search argument.

Always use the keyword INCORROUT for problems related to incorrect or missing output.

## Keyword: utility module name

If the incorrect or missing output is associated with a utility, use the utility module name as a keyword. For example, if output from the File Select and Formatting Print utility (DFSERA10) is incorrect, use DFSERA10 as a keyword.

#### Keyword: command

If the output from a command is missing or incorrect, use the first three letters of the command as a keyword. Also, you should use the **OR** operator in the search argument with CMDxxx, where xxx is replaced by the first three letters of the command.

If, for example, the DISPLAY command provides incorrect output, use the following search argument: 5655J3800 INCORROUT DIS | CMDDIS

For a structured database search, use this search argument: PIDS/5655J3800 INCORROUT PCSS/DIS

If applicable, you can add the output column or heading as a keyword in the search argument.

## Keywords: columns, headings, fields

Whenever possible, you can add additional keywords to narrow the field of search results. If a particular heading, field name, or column is incorrect, use it as a keyword. For example, if the deadlock event summary section of the IMS Monitor report (DFSUTR20) is incorrect for the DMB NAME column, use the following search argument:

5655J3800 INCORROUT DFSUTR20 DEADLOCK | DMB

For a structured database search, use this search argument: PIDS/5655J3800 INCORROUT RIDS/DFSUTR20 PCSS/DEADLOCK PCSS/DMB

If you receive too many search results, remove the **OR** operator (1) to focus the selection.

#### Keyword: database type or call

If the incorrect output is a database record, use the database type (such as VSAM, HDAM, or HIDAM) and possibly the call (such as GU, ISRT, or DELETE).

# Additional diagnostics

This section does not apply to a Database Control (DBCTL) environment.

If the output is a transaction message produced as output from an application program, perform the steps below. (The message can be directed either to a terminal or to another application program. This is called a program switch.)

- 1. If the output is missing, continue with this step; otherwise, go to step 2.
  - a. When the output is missing, determine if the transaction is being scheduled.
    - Issue the /DIS ACTIVE command to make sure the transaction is not stopped.
    - Then issue the /DIS TRAN command to find out if the transaction is scheduled.

QCT should decrease by at least one each time the transaction is scheduled and terminates normally.

If the transaction is not being scheduled, go to step 1f.

- b. Determine if the message is being enqueued to the proper output destination by issuing one of the following commands:
  - Issue the /DIS TRAN command (for program switch). ENQCT should increase.
  - Issue the /DIS LTERM command (for output to terminal). ENQCT should increase.

If the message is not being enqueued to the proper output destination, go to step 1e.

c. If the output destination is another application program, it should be scheduled as a result of the message enqueue.

If the transaction is scheduled but there is no input, the problem is probably within the SYS function.

If the application program is not scheduled, go to step 1f.

- d. If the output destination is a terminal, verify that I/O errors did not prevent the message from being sent. Take both of the following actions.
  - Review the console log for I/O error messages.
  - Issue the /DIS LTERM command for operational status.

If you detected valid I/O errors, stop here and correct the hardware problem. Otherwise, the problem is probably within the TM function. Stop here and build your search argument.

**e**. Determine if the application program is using the proper PCB for the ISRT call.

• Force a dump in the application program at the time of the ISRT call.

If the proper PCB is being used, the problem is probably within the SYS function. Stop here and build your search argument. Otherwise, stop here and correct the application program.

- f. Determine if the resources necessary to schedule the application program are available.
  - Issue the /DIS ACTIVE command for the active region.
  - Issue the /DIS SUBSYS ALL command for all external subsystems connected to or in the process of being connected to IMS.
  - Issue the /DIS TRAN command to make sure the transaction is not stopped.
  - Issue the /DIS DATABASE command to determine if the necessary databases are available.

If a resource is not available, stop here and make it available. Otherwise, force a console dump. Use the PST ANALYSIS step in procedure "WAIT/LOOP procedure" on page 44 to determine the reason the transaction is not being scheduled. Stop here and build your search argument using that information.

- **2**. If the incorrect data is input to an application, perform this step, otherwise go to step 3.
  - a. Verify the text data in the X'01' log record to determine if the data reached IMS properly.

If the data did not reach IMS properly, go to step 2c.

b. Force a dump in the application program immediately after the application program GU call, in order to determine if the data reached the I/O area correctly.

If the data did not reach the I/O area correctly, the problem is probably within the SYS function. Stop here and report the problem. Otherwise, the application program received the data correctly. Stop here.

**c.** Start the line or node trace and verify the data in the X'6701' log record to determine if the data reached the input TP buffer correctly.

If the data reached the input TP buffer correctly, the problem is probably within the DC function. Stop here and report the problem. Otherwise, if the data did not reach the input TP buffer correctly, the problem is probably a

hardware or an operating system failure. Stop here and correct the hardware or operating system problem.

- **3**. Determine if the message data is actually incorrect rather than merely formatted incorrectly.
  - · Compare received data with expected data.
  - · Check MFS blocks for correct format definition.
  - a. Force a dump in the application program just before the ISRT call to determine whether the data is correct in the I/O area at the time of the ISRT.

If the data in the I/O area is incorrect, the problem is probably in the application program. Stop here and correct the application program. Otherwise, continue. Verify the text in the X'03' log record to determine whether the data reached the message queue correctly.

If the message did not reach the message queue correctly, the problem is probably within the SYS function. Stop here and build your search argument. Otherwise, continue.

b. Start the line or node trace and verify the data in the X'6701' log records, in order to determine if the data reached the output TP buffer correctly.

If the data did not reach the output TP buffer correctly, the problem is probably within the DC function. Stop here and build your search argument. Otherwise, if the data is correct in the output TP buffer, but not at the terminal, the problem is probably a hardware or operating system failure. Stop here and correct the hardware or operating system problem.

### **IRLM** problems

Incorrect output from the IRLM can be divided into the following three areas:

- · Incorrect information on a display status command
- Locks granted when locks should not be granted
- · Locks not granted when locks should be granted

For help in diagnosing these problems, call the IBM Support Center. A support representative will tell you what type of documentation to gather.

#### WAIT/LOOP procedure

The procedures for the WAIT and LOOP keywords are combined because the WAIT and LOOP symptoms might not be distinguishable at first.

## Determine the type of WAIT or LOOP that is in progress

Use the following procedure to determine the type of WAIT or LOOP occurring, and to find the appropriate keywords for the problem.

Maintenance might change the offsets in these control blocks. For a current version of the control blocks assemble DFSADSCT.

- 1. Is IMS being shut down?
  - If the operator issued a CHECKPOINT DUMPQ, PURGE, or FREEZE command before the manifestation of the wait/loop, go to "Shutdown processing" on page 60.
  - If IMS is not being shut down, continue with the next step.
- 2. Determine whether IMS was in selective dispatching mode.

Find the dispatch work areas in the formatted dump. The dispatch work areas are created using the DISPATCH or All IMS dump formatting options. The dispatch work area eye catcher is \*\*DSP.

The selective dispatch bits are in the SFLAGS field in the DYNAMIC SAP EXT. section, where the X'xxxxx8x' bit represents selective dispatching. To determine whether selective dispatching was entered for save area prefixes (SAPs), search the DISPATCH AREA section for the following message:

\*\*\* NOTE: THIS TCB IS IN SELECTIVE DISPATCHING FOR SAPS

If you find this message, IMS wrote an X'450F' log record to the OLDS. This log record contains information about dynamic SAPs, such as the highest number of dynamic SAPs used and the number of times IMS was in selective dispatch for dynamic SAPs.

Examine this X'450F' log record to help determine what might have led to the shortage of dynamic SAPs. Then go to the "Determine the type of WAIT or LOOP that is in progress" on page 44. While performing SAP analysis, keep in mind that the dynamic SAPs are labeled DYNAMIC SAP, and that the CURRENT TCB= indicates the associated task control block (TCB).

If IMS is not in selective dispatching mode, continue with the next step.

- **3**. Can the operator communicate with IMS through the z/OS system console by using the IMS outstanding reply to enter an IMS command, such as /DISPLAY?
  - If no, or if you are not sure, go to step 5 now.
  - If yes, the problem might be caused by:
    - A data communication failure.
    - The inability of a task to acquire a resource.
    - Non-completion of an event, such as I/O.

Continue with the next step.

- 4. Can the IMS master terminal operator (MTO) communicate with IMS by issuing various IMS commands, such as /DISPLAY?
  - If yes, go to "Determine the type of WAIT or LOOP that is in progress" on page 44.
  - If no, the problem might be data communication related. If IMS is still running, issue the following commands:
    - Issue the IMS /DIS NODE *nodename* command. Save the IMS console output.
    - Turn on the IMS node trace with the /TRA SET ON NODE *nodename* command.

Data is captured in the IMS X'6701' log record. Save the IMS OLDS for execution with IMS utility programs DFSERA10 and DFSERA30.

- Consider turning the VTAM buffer trace and VTAM internal trace on to complement the IMS node trace, as follows:
  - F NET, TRACE, TYPE=BUF, ID=nodename
  - F NET,TRACE,TYPE=VTAM,MODE=EXT,OPT=(API,PIU,MSG)

GTF must be active for this option.

Obtain a memory dump of the IMS and VTAM regions using this series of commands:

DUMP COMM=(dump title)

R id JOBNAME=(j1,j2,j3,j4,j5,j6,j7),SDATA=(CSA,PSA,RGN,SQA,SUM,TRT),END The variables have the following meanings:

- j1 IMS CTL region job name.
- j2 VTAM region job name.

- j3 IMS DL/I region job name.
- j4 Suspicious IMS dependent region job name, if any.
- j5 Suspicious CCTL (CICS) region name, if any.
- j6 DBRC region job name.
- j7 IRLM region job name (if IRLM database locking was used).

The jobs are listed in order of importance.

**Recommendations:** A memory dump of the IMS CTL, VTAM, DL/I, and suspicious dependent region or CCTL is usually sufficient to solve wait/hang problems. Occasionally, the DBRC and IRLM (if they are used for database locking) can be a factor. Obtain a memory dump of DBRC and IRLM as well to ensure that the problem can be resolved quickly.

SYS1.DUMP data sets are often not large enough to hold all regions requested in the DUMP command. Make them large enough to hold the regions. If the z/OS SVC DUMP command fails due to lack of space, take separate memory dumps in smaller combinations to accommodate the smaller SYS1.DUMP data set size.

- Go to the "Determine the type of WAIT or LOOP that is in progress" on page 44.
- 5. Query the IMS Dispatch Work Areas.
  - a. Find the Dispatch Work Areas in the formatted dump. The Dispatch Work Areas are created using the DISPATCH or ALL IMS dump formatting options. The Dispatch Work Area eye catcher is \*\*DSP.
  - b. Scan each Dispatch Work Area (STM, CTL, restart data set, and so on) except for the DRC and dependent region entries (labeled DEP, MPP, BMP, DBT, DRA, or IFP). Examine the QPOST field at offset X'1C'. If the high-order bit of the QPOST field is off, note the address and type of Dispatch Work Area.
  - **c.** If, after scanning all Dispatch Work Areas, except for the DBRC (DRC) task and dependent regions, you find that the QPOST high-order bit is always set, one of the following situations has occurred:
    - IMS is in an IMS WAIT (IWAIT) state. Go to "Determine the type of WAIT or LOOP that is in progress" on page 44 now.
    - If at least one Dispatch Work Area has an incorrect high-order bit, a LOOP or operating system WAIT has occurred. Continue with the next step.
- 6. Query the TCB/RB chain.
  - a. Find the current ECB, address space ID (ASID), and TCB address for each Dispatch Work Area noted previously in step 5b.
    - In IDSPWRK SECTION 1, find field CECB at offset X'28'. The field CECB at offset X'28' contains the ECB of the current dispatched ECB.
    - In IDSPWRK SECTION 1, find the field ASIDS at offset X'30'. The first halfword of the field ASIDS at offset X'30' contains the ASID number for the task; the second halfword contains the CTL region ASID.
    - In IDSPWRK SECTION 1, find the field TCB at offset X'40'. The field TCB at offset X'40' contains the TCB address for the task.
  - b. Find the formatted TCB/RB chain in the z/OS formatted dump. Use the IPCS SUMMARY FORMAT ASID(X'\_\_') command for the ASID/TCB found in step 6a. Use the following FIND command to locate the TCB:

F 'TCB: xxxxxxxx' 1 16

where *xxxxxxxx* is the 8-character TCB address, including leading zeros.

c. Examine the request block (RB) structure (PRBs, SVRBs, or IRBs), focusing on the last RB in the chain for that TCB. The TCBRBP field at offset X'00' contains the address of the last RB. Use the following FIND command to locate the RB:

F 'RB: xxxxxxx' 1 16

where xxxxxx is the 8-character RB address, including leading zeros.

Exception: Using the last RB in the TCBs RB chain is usually accurate. However, there are occasions when additional RBs might be appended to the end of the chain to facilitate dump processing, but they have nothing to do with the problem. X'00020033' in the WLIC field in any RB in the RB chain normally indicates dump processing. In such a case, examine the RBs prior to the RB with WLIC=X'00020033'. If the RB before the RB containing WLIC=X'00020033' contains WLIC=X'0002000C, it might be necessary to examine the RB before the RB containing WLIC=X'0002000C'.

Example:

 PRB
 WLIC = X'00020006'

 PRB
 WLIC = X'00020078'

 SVRB
 WLIC = X'0002000C'
 Examine prior RB.

 SVRB
 WLIC = X'00020033'
 <== Indicates dump processing</th>

 SVRB
 WLIC = X'00020078'

- d. Examine the LINK field in the RB found in step 6c. The high-order byte of the LINK field is the wait count field.
  - If the wait count is X'00', the task is probably looping. Perform the following steps:
    - Perform system loop diagnostics. Obtain the OPSW and registers from the looping RB, (located in the following RB or in the TCB, if this is the last RB (TCBRBP)) for a snapshot of the loop.
    - Obtain the PSW address from the z/OS system trace table. Use the IPCS VERBX TRACE ASID(xx) command to obtain the entries for the ASID in question. Focus on the entries for the TCB found in step 6a. You can ignore entries between any SVC and associated SVCR because they reflect necessary z/OS operating system activity indirectly involved in the loop. (The IMS TYPE2 SVC is an exception to this since it results in execution of IMS code.) Sorting the pertinent addresses by OPSW address greatly aids in laying out the loop.
    - Resolve the PSW address found by using either IPCS BROWSE mode, the IPCS WHERE command, or by using an LPA or NUCLEUS MAP to obtain the name of the modules involved in the loop. The IPCS commands used to obtain the maps are LPAMAP, and VERBX NUCMAP. Calculate the offset at which the instruction appears in the modules to outline the path of the loop.
    - Another source of information for the looping task can sometimes be found at the top of the IMS SAPS AND SAVEAREA section (\*\*SSA) of the IMS formatted dump. Look for the \*\*\*\* A C T I V E \*\*\*\* save area set nearest the top of the \*\*SSA with the SAPECB filed matching the CECB field obtained in step 6a. The save area flow can indicate IMS modules involved in the loop or those passing control to the looping function.
  - If the wait count is not X'00' (that is, = X'01', or X'02', and so on), a system WAIT has probably occurred. Perform the following steps:

- Obtain the address portion of the OPSW. It points to the waiting module.
- Resolve the PSW address found by using either IPCS BROWSE mode, the IPCS WHERE command, or by using an LPA or NUCLEUS MAP to obtain the name of the waiting module. The IPCS commands used to obtain the maps are LPAMAP, and VERBX NUCMAP, respectively. Calculate the offset at which the wait occurred in the module. This information can be used for APAR searches and to assist IBM Software Support representatives.
- Use the CECB field obtained in step 6a to find the related SAP save area by scanning for the SAPECB match in the IMS formatted memory dump \*\*SSA section.

# SAP analysis procedure

 Find the formatted SAP AND SAVE AREA section in the IMS formatted dump. Choose either the SAVEAREA, SYSTEM, ALL or SAVEAREA, SUM options of the IMS Offline Dump Formatter. The eye catcher of the SAP AND SAVE AREA section is \*\*SSA.

The following table defines the key fields in SAP analysis.

Offset	Field name	Length	Field description
SAP+X'00'	SAPFLAG1	1	X'80' = Active SAP X'40' = Waiting SAP
SAP+X'01'	SAPDSPCD	1	IMS TCB number. This number matches the associated TCB number at offset X'3B' in the dispatch work area.
SAP+X'14'	SAPIWAIT	4	In waiting SAPs, this is the address of the last active save area. Those below this address are residual. In SAPs that are active but not waiting, this field is residual and should not be used.
			Exception: SAPIWAIT might not be valid for Fast Path save area sets (DBF-prefixed modules). The active save area set usually ends with DBFXSL30, the Fast Path wait module, unless DFSIWAIT or DFSISERW appears previously in a save area set.
SAP+X'18'	SAPECB	4	Address of the ECB associated with this ITASK. If the PST is used, this field points to the beginning of the PST.
SAP+X'24'	SAPCDSP	4	Address of the current dispatch work area.
SAP+X'30'	SAPSDPNO	4	Dispatch number for the ITASK.

Table 3. Key fields in SAP analysis

2. Begin SAP analysis at the end of the sorted SAPs.

Find the end of the sorted SAPS. Eye catcher **\*\*\***END OF SORTED SAP FORMATTING marks the end of the list. SAPs are sorted by the SAPSDPNO (system dispatch number). The most recently dispatched ITASKs are at the end of the sorted

SAPs. These are the ITASKS that have been waiting the longest and possibly causing the other ITASKS to wait behind them by holding a resource, such as a lock or a latch.

**3**. Scan backwards from the end, examining only active or waiting SAPs. Focus only on the active save area sets (that is, SAPFLAG1 has the X'00' bit turned on (X'08', X'Cx', X'Dx', X'Fx')). Active save area sets are marked with the eye catcher \*\*\*\* W A I T I N G \*\*\*\* or \*\*\*\* A C T I V E \*\*\*\*. To find waiting or active SAPs, use the following find command:

F ' \*\*\*\* ' PREV

The SAVEAREA, SUM option of the Offline Dump Formatter produces only active save area sets. Active running SAPs are marked with the eye catcher RUN. The end of this formatting is marked by the eye catcher \*\*\*\*\* END SAP SUMMARY.

4. Skip all normal save area sets.

This step describes all normal save area sets. After you have identified all types of normal save area sets, you can disregard them because they are unrelated to the problem.

a. WAITING save area sets in which module name DFSIWAIT appears after label EP at the second-level save area are considered normal save area sets.

The following example shows a normal save area set at the second level:

```
***SAVE AREA SET***
  EP DFSQMRT0-11/13/94
  SA 00133BC4
                      WD1 8091E430
                                     HSA 8000000
                                                     LSA 00133C0C ...
  EP DFSIWAIT
  SA 00133C0C
                      WD1 00000000 HSA 00133BC4
                                                    LSA 00133C54 ...
  EP DFSFLLG0-220-PL46803
                      WD1 00000000
                                     HSA 00133C0C
  SA 00133C54
                                                     LSA 00133C9C ...
   . . . . . .
```

b. The only normal save area sets in which the save area set contains DFSIWAIT at the third level are shown in the following example. Ensure that register 08 contains a value of X'00000003' for any of the first four save area sets, as shown in the example. Otherwise, it is abnormal and indicates an intent conflict, as described in "Intent conflict" on page 57. Use the SAPSECB field to obtain the PST address for use in the intent conflict procedure.

```
EP DFSSMIC0 --> EP SMSC2 --> EP DFSIWAIT with REG08 = x'00000003'
EP DFSSMIC0 --> EP DFSSMSC2 --> EP DFSIWAIT with
REG08 = x'00000003'
EP DFSSMIC0 --> EP DFSSMSC1 --> EP DFSIWAIT with
REG08 = x'00000003'
EP DFSSMIC0 --> EP MPPENQ00 --> EP DFSIWAIT with REG08 = x'00000003'
EP DFSFXC30 --> EP DFSFXC30-WFITEST --> EP DFSIWAIT
EP DFSFXC30 --> EP DFSFXC30-WFITEST --> EP DFSIWAIT
EP DFSVTP00 --> EP VTPOWORK --> EP DFSIWAIT
EP DFSVTP00 --> EP DFFHQU10 --> DBFXSL30
```

**c**. The only normal save area sets in which the save area contains DFSIWAIT at the fourth level are those shown in the following example. Ensure that register 08 in the DFSIWAIT save area set contains X'00000003'. Otherwise, it is abnormal and indicates an intent conflict, as described in "Intent conflict" on page 57. Use the SAPSECB field to obtain the PST address for use in the intent conflict procedure.

The following examples show normal save area sets at the fourth level:

DFSSMIC0 --> DFSSMSC0 --> SMSC1000 --> DFSIWAIT REG08 = x'00000003' DFSFXC30 --> DFSDLA30 --> DLA32000 --> DFSIWAIT

- d. The following active save area sets are probably normal, so you can ignore them.
  - Save area sets marked ACTIVE or RUN with SAPDSPCD=X'07'. This is a DRC task SAP. This condition is usually normal for the DBRC task.
  - Save area sets marked ACTIVE or RUN with SAPDSPCD=X'0F'. This is the ESI task SAP if SAPCDSP=X'00000000'.
  - Dependent region save area sets marked ACTIVE with SAPDSPCD=X'03'(MPP), X'04'(BMP), X'0D'(DRA), X'12' (IFP), X'13'(DBT), X'0C' (ESS), or X'00' (RESIDUAL), in which the top save area indicates it was returned. (The last bit of the address in the field labeled RET, which is register 14, is odd or has X'FF' in the high-order byte.)
  - If the SAPDSPCD=X'13'(DBT), and the first save area EPA is marked UNKNOWN with the second-level save area RET field marked returned (the last bit of the address in RET is odd), this is a normal save area set if the first save area EPA is within module DFSDASC0 or DFSDAST0.
- 5. Obtain abnormal save area set information.

The remaining save area sets (those that are ACTIVE or WAITING, but abnormal, as described in step 4 are involved in the wait in some way.

**Recommendation:** Concentrate on one save area set at a time, beginning with the first abnormal save area set. Remember to start from the end of the sorted SAPs.

If you find an abnormal save area set marked \*\*\*\* A C T I V E \*\*\*\* (SAPFLAG1=X'80'), the problem is associated with the TCB/RB save area set. Use the address of the current dispatch area in SAPCDSP to find the dispatch work area associated with this save area set. Go to step 6a in the WAIT/LOOP procedure. Continue from there, using the ASID/TCB obtained from the dispatch work area. If the high-order bit in QPOST is on (QPOST=X'8x'), this SAP is suspended. Record this save area set and continue to the next abnormal save area set. Discontinue step 6a because this save area set should probably be ignored. Otherwise, continue.

Record the following key fields from the abnormal save area sets flagged as:\*\*\*\* W A I T I N G \*\*\*\*

- a. The address of the SAP.
- b. For each save area in the save area set, from the first save area down to the save area pointed to by the SAPIWAIT field, obtain the following information. (See exception for SAPIWAIT in Table 3 on page 48 before proceeding.)
  - 1) EP module name
  - **2)** APAR level (the APAR number and last few letters of the changeID string)
  - **3)** RET address (this is register 14)
  - 4) EPA address

If the module name is UNKNOWN and the module save area set begins with DFSDLA00, the EPA address can probably be resolved in the DL/I region dump by using IPCS BROWSE mode for the DL/I ASID.

**c.** The offset from which DFSIWAIT, DFSISERW, or DBFXSL was invoked from the calling module.

You can calculate the offset by subtracting the EPA address in the save area **before** the save area pointed to by SAPIWAIT from the RET address of the save area pointed to by SAPIWAIT.

The following table shows key data from an abnormal save area set.

	EP module name	APAR number	Last few ChangeIDs	RET	EPA	Wait call offset	
DFSBML00 none 50A07AC2 00B5DAE0 X'10	DFSCST00	PL45938	abcde	80A7BA14	00A8E110		
	DFSDBDR0	PL49770	mnopr	60A8E6D6	00A07A58		
DESIMAIT popo 40B5DBEE 70A7C7E6	DFSBML00	none		50A07AC2	00B5DAE0	X'10E'	
DISIWAII IIONE 400500EE 70A7C/10	DFSIWAIT	none		40B5DBEE	70A7C7F6		

Table 4. Key data from an abnormal save area set

6. Identify the reason for the WAIT.

To identify the reason for the WAIT, do the following:

a. Assemble the module that issued the wait. Use the offset obtained in step 5 as an approximate displacement into the module where an IWAIT or ISERWAIT was issued. Examine the code and comments at that point. Most modules give the reason for the IWAIT in the comments above the IWAIT issue point.

The EP name might not be the actual module name, but rather a CSECT within a module. To find the actual module name, using IPCS BROWSE mode, scan backwards from the EPA address for the actual module name.

7. Repeat steps 5 and 6 for the first three abnormal save area sets you found. You should be able to gather enough information from the first three abnormal save area sets to perform a search or determine the cause of the problem.

#### **Keyword: WAIT**

At this point, you can be sure that you are in an IMS WAIT. Therefore, WAIT is an appropriate keyword for the search argument.

## Keyword: module name issuing IWAIT or ISERWAIT

The Module Name column in your worksheet indicates the modules that issued the IWAITs. These modules can provide useful search arguments. Use the 8-character module name for this keyword.

## Keyword: WAIT reason

The IWAIT REASON column in your worksheet indicates the reason or resource, or both, that is causing the IMS WAIT.

For example, if the reason was a WAIT for the DPST latch, the IWAIT REASON keyword is DPST LATCH.

#### Keyword: additional related keywords

External events might trigger WAITs. These events might be indicated by console messages, or they might be related to a procedure that was being performed at the time the WAIT began.

You can use each of these additional keywords in the search argument when applicable.

# Search argument example

Consider this scenario:

- IMS went into a IWAIT after a WADS write error occurred.
- Multiple unusual save area sets were found from module DFSFLLG0.
- The reason for the IWAIT was found to be the LOG LATCH.

The broad search argument to use is: 5655J3800 WAIT LOG | LATCH | W ADS | DFSFLLG0

For a structured database search, use this search argument: PIDS/5655J3800 WAIT PCSS/LOG | PCSS/LATCH | PCSS/WADS | RIDS/DFSFLLGO

With this search argument, you might receive numerous search results, which will probably contain the APAR describing your problem. You can then take various combinations of the additional keywords that were compared with the **OR** operator in the above example and use the **AND** operator on the keywords instead. You can use this technique to narrow your field of search until you find the appropriate APAR.

# **PST** analysis

This section deals with analyzing regions for possible problems in scheduling, intent conflicts, and so forth.

1. Determine the number of active regions.

SCDREGCT at SCD+X'C8A' is a 2-byte field that contains the number of active regions, if any.

If SCDREGCT = X'0000', no regions are active. Go back to "Determine the type of WAIT or LOOP that is in progress" on page 44.

If SCDREGCT is not equal to X'0000', go to step 2.

2. Determine if the scheduler sequence queues (SSQs) have any entries.

Obtain the address of the transaction anchor block (TAB) from the SCDTAB field in the DSECT (label TABEP in the formatted dump). The TAB, which is mapped by DSECT DFSTAB, consists of:

- TAB header
- Headers for each of the six subqueues (SSQ1 SSQ6)
- Class vector table (CVT)
- Transaction class tables (TCTs)

If the count of partition specification tables (PSTs) waiting on any subqueue (field TABSCHQC) equals 0, no region should be waiting on any subqueue. However, you should also check each subqueue header. Calculate the address of the subqueue header for a specific subqueue (SSQ#) as follows:

- a.  $SSQ\# \times X'18' X'8' = offset of header for SSQ\#$
- b. Offset of header for SSQ# + SCDTAB address = address of header for SSQ#

Perform this calculation for each subqueue number. If field TABSSQ*n*F, where *n* is the subqueue number, is not zero, this field contains the address of an entry on the SSQ for the specified subqueue.

a. The SSQ consists of the following six subqueues. All subqueues are formatted in a dump.

# Subqueue 1

Reserved for future use.

#### Subqueue 2

JMP region waiting for work.

Subqueue 3

MPP region waiting for work.

Subqueue 4

MPP/JMP region waiting for intent.

Subqueue 5

BMP/JBP region waiting for intent.

Subqueue 6

MPP/BMP/JMP region waiting for input.

- b. Each subqueue represents a resource. A PST enqueued on a subqueue is waiting for that resource.
- c. The TAB and SSQs are formatted after the SCD LATCH EXTENSION in an IMS formatted dump, as follows:

**TAB - T	RANSACTIO	N ANCHOR	BLOCK	**			
0D1873B0			0058	00FF	00000000		**
0D1873C0	0000000E	00000000	0000	0000	00000000		**
0D1873D0	00000000	00000000	0000	0000	00000000		**
LINES		E0-0D1873			AS THE AE		
0D1873F0		00000000					*
0D187400	00000000				00000000		*••••
0D187410	0CF18C40				00000000		*.11*
0D187420	00003AEB	00000000					**
0D187430	00000000				00000000		**
0D187440	00000000	00000000			00000000		**
0D187450	000010B4				0D1878B0		**
0D187460	0D187908				0D187A10		*••••*
0D187470	0D18/A68	0D18/AC0	0018	/818	0D187B70		**
• • • • • • • •							
• • • • • • • •							
•••••							
••••							
***SCHEDULER SEQUENCE QUEUES***							
DFSPS	TQE 0000	9000	SUBQ	1		NOT	ACTIVE
			SUBQ	2		NOT	ACTIVE
			SUBQ	3		NOT	ACTIVE
			SUBQ	4		NOT	ACTIVE
			SUBQ	5		NOT	ACTIVE

d. If the words NOT ACTIVE follow the subqueue entry, no PSTs are enqueued on that entry.

SUBQ 6

- e. If entries are listed for subqueue 3, go to "No work to do" on page 55.
- f. If no entries are listed for subqueue 3, go to step 3.
- 3. Are there subqueue 4 or 5 entries?

Subqueue 4 does not apply to a DBCTL environment.

Entries on subqueue 4 or 5 are waiting for intent conflicts to be resolved.

a. If entries are listed for subqueue 4 or 5, go to "Intent conflict" on page 57.

b. If not, go to step 4.

4. Are there subqueue 6 entries?

This step does not apply to a DBCTL environment. Continue with the next step.

Entries on subqueue 6 are waiting for input.

NOT ACTIVE

- a. If there are entries listed for subqueue 6, go to "WAIT for input" on page 57.
- b. If there are no entries, go to step 5.
- 5. Are all regions accounted for?

Compare the number of regions in the SCDREGCT (SCD+X'C92') with the number of regions enqueued on the subqueues. (The SCDREGCT is 2 bytes.)

- a. If the numbers of regions are equal, go to step 6.
- b. If the numbers of regions are not equal, all regions are unaccounted for. Go to the analysis for "PST analysis" on page 52.
- 6. Report the problem.

This problem occurs when there are entries queued on the subqueues and no reason can be found to prevent their scheduling, but nothing schedules. Report the problem to the IBM Support Center.

#### **PST** active

You reach this point in the analysis either when:

- The SCDREGCT field is not equal to zero, and there are no entries on the Scheduler Sequence Queues, or
- No problem was found in analyzing the PSTs on the subqueues, and the number of PSTs on the subqueues is less than that in the SCDREGCT field.
- 1. Locate the PSTs.

Find the stack of dependent region PSTs in the dump. (Two stacks of PSTs exist in the dump. System PSTs are printed separately from the dependent region PSTs.)

- 2. Is the PST scheduled?
  - a. Find all the PSTs with PSTTERM (X'1BC') = X'02' (ACTIVE) and PSTCODE1 (X'B7A') = X'10' (SCHEDULED).
  - b. Ignore the PSTs without the SCHEDULED bit on.
- 3. For the scheduled PSTs, do SAP analysis.
  - a. PST at offset minus X'04' (field name PTR) is usually the SAP address. (The PTR field is the last entry on the line above the X'0000' line in the dump.) If not, PST + X'5B8' (PSTSAV1) is the address of the first Save Area in a set, and WD1 in that Save Area is the address of the SAP.
  - b. Go to "Determine the type of WAIT or LOOP that is in progress" on page 44. Return here after doing SAP analysis for the scheduled PSTs only.
- 4. Are there any ACTIVE non WAITING SAPs?
  - a. If any of the SAPs are marked ACTIVE go to step 5.
  - b. If SAPs are found WAITING, use normal SAP analysis to report the problem. Use the search argument format "Search argument example" on page 52.
- 5. Is the dependent region active within an IMS save area set?
  - a. If SAP +X'08' (SAPCNTRL) = X'10', this region is in a DL/I call within IMS. Go to step 6.
  - b. Otherwise go to step 7.
- 6. Analyze the region dump.

You must analyze the region dump using the PSW address to identify the problem. Refer to "WAIT/LOOP procedure" on page 44, steps 6c and 6d.

7. Determine what the application program is doing.

I

T

T

T

T

1

You must analyze the region dump using the PSW address to identify what the application program is doing.

In a DBCTL environment, you must analyze the CCTL region dump using the PSW address to find out what the DRA, CCTL, or application program is doing. Refer to "WAIT/LOOP procedure" on page 44, steps 6c and 6d.

8. Determine the reason the latch is not freed.

If a latch is being waited for, and the owner is not waiting for I/O, use SAP analysis to identify the reason for the WAIT.

#### No work to do

This section does not apply to a DBCTL environment.

You came to this point because subqueue 3 contains PSTs.

1. Locate the PSTs on subqueue 3.

The addresses under the field name SQPSTADD are the PST addresses. In the formatted dump, the PSTs start with the eye catcher \*\*\* DB PST AREA \*\*\*. Locate the PSTs that are on subqueue 3.

2. Find the classes the PSTs can execute.

PST + X'C68' (PSTCLASS) is a 4-byte field. Each byte indicates a class transaction that the PST is allowed to process. If, for example, PSTCLASS = 01030506, the PST can process classes 01, 03, 05, and 06.

- **3**. For each PST on subqueue 3, locate the transaction class table (TCT) for each class that the PST can process. There is one TCT for each class.
  - a. Obtain the TAB address from the SCDTAB.
  - b. Take the first PSTCLASS value and subtract 1.
  - c. Multiply this result by 4.
  - d. Add this value to the TABCLASS offset value + X'70'.
  - e. TCT =  $4 \times (\text{first PSTCLASS value 1}) + X'70'$ .
    - When the high-order byte contains a X'80' this indicates the TCT class is not active.
- 4. Can any SMBs be scheduled?

TCT +X'04' = zero or the address of an SMB that can be scheduled.

- a. If zero, no SMBs can be scheduled. Go to step 7.
- b. If SMBs can be scheduled, locate the SMBs and then go to step 5.
- 5. Is SMB locked or stopped?
  - a. If SMB +X'24' (SMBSTATS) = X'10' (STOPPED) or X'08' (LOCKED), go to step 6.
  - b. Otherwise, go to step 9.
- 6. Are there any more SMBs on this class?
  - a. If SMB+X'04' (SMBQEFP) is not equal to zero, it is the address of the next SMB. Move on to the next SMB and repeat step 5.
  - b. If SMB+X'04' (SMBQEFP) = zero, there are no more SMBs. Go to step 7.
- 7. Are all classes accounted for?
  - a. If all classes found in PST + X'C68' (PSTCLASS) are not accounted for, repeat step 4 for each remaining class.
  - b. Otherwise, go to step 8.
- 8. Are all regions accounted for?

To determine whether all regions are accounted for, use SCDREGCT (SCD + X'C8A'). The SCDREGCT is 2 bytes. There is one PST for each region.

- a. If the number of PSTs on subqueue 3 is equal to the SCDREGCT and they have been examined and accounted for, there are no transactions scheduled for the regions. This is a normal WAIT, and there is no work for IMS to perform. This is not a problem.
- b. Otherwise, go back to 3 to continue the scheduler queue analysis.
- 9. Locate the PSB directory (PDIR).

If the SMB is not locked or stopped, locate the PDIR: SMB+X'3C' (SMBPDIR) = address of the PDIR.

10. Can PDIR schedule?

Locate the PDIR entry. When any of the following bits are ON, the PDIR is unable to schedule.

# PDIR +X'20' (PDIRCODE) =

X'40'X'10'X'08'X'02'

- a. If the PDIR cannot schedule, go back to step 6.
- b. Otherwise, go to step 11.
- 11. Is PDIR marked parallel?
  - a. If the PDIR is marked scheduled but not parallel:
    - PDIR+X'20' (PDIRCODE) = X'04' (Scheduled)

and:

PDIR+X'21' (PDIROPTC) is not equal to X'04' (Not parallel)

If there are entries listed for subqueue 6, go to "WAIT for input" on page 57 to determine if any of the waiters on subqueue 6 are pseudo WFIs scheduled against the same PDIR. If there is a pseudo WFI scheduled against the same PDIR, report the problem to the IBM Support Center.

If there are no entries listed for subqueue 6 or none of the waiters on subqueue 6 point to the same PDIR, go back to step 6.

- b. If marked parallel (PDIR +X'21' = X'04'), go to step 12.
- 12. Are enough messages enqueued for another PST?

If the PDIR is marked parallel, check if enough messages are enqueued on the SMB to schedule another PST.

- a. You do this by finding:
  - 1) SMB+X'46' (SMBPARLM) = number of messages per region (2 bytes).
  - SMB+X'44' (SMBRGNS) = number of message regions scheduled for the SMB (2 bytes).
  - 3) SMB+X'1A'(SMBENQCT) minus SMB +X'18' (SMBDEQCT) = number of messages currently enqueued. (To find the number currently enqueued, subtract the messages dequeued from those enqueued.)
- b. If the number of messages currently enqueued (step 12a3) is greater than the number of messages per region (step 12a1) multiplied by the number of message regions scheduled (step 12a2), there are enough messages enqueued on the SMB to schedule another PST. Go back to step 6.
- c. Otherwise, go to step 13.
- 13. Report the problem.

At this point, regions are waiting, enqueued on subqueue 3 with transactions that can be scheduled. Report the problem to the IBM Support Center.

# Intent conflict

You reach this point by having entries on subqueue 4 or 5.

An intent problem is indicated when the PST is on the intent queue.

1. Locate the PSTs that are on subqueue 4 or subqueue 5, or both.

The addresses under the field name SQPSTADD are the PST addresses. To analyze the INTENT CONFLICT fields in a PST, you must locate the PST in the unformatted section of the dump.

- 2. Is the PSB work pool too small?
  - a. If PST + X'B7A' (PSTCODE1) = X'06', the PST is on the PSB WAIT queue for pool space. The PSB work pool is too small. You must increase the size of the PSBW parameter in the DFSPBxxx member.
  - b. Otherwise, go to step 3.
- 3. Is the Data Management Block (DMB) pool too small?
  - a. If PST + X'B7A' (PSTCODE1) = X'20', the DMB pool is too small. You must increase the size of the DMB parameter in the DFSPBxxx member.
  - b. Otherwise, go to step 4.
- 4. Can intent be satisfied?
  - a. If PST + X'B7A' (PSTCODE1) = X'40', the intent cannot be satisfied. Go to step 6.
  - b. Otherwise, go to step 5.
- 5. Is the region scheduled?
  - **a**. If any PST has the following:
    - PST +X'B7A' (PSTCODE1) = X'10'(SCHEDULED)
    - and:
    - PST +X'1BC' (PSTTERM) = X'02'(ACTIVE)

the region is scheduled, and this a normal WAIT for subqueue 4 and subqueue 5. Usually this is not a problem. Go back to the subqueue 6 entry of "PST analysis" on page 52, step 4 and continue.

- b. Otherwise, go to step 7.
- 6. There is an intent conflict.

If you reach this point, there is an intent conflict. Usually, the intent conflict is caused by a PSB having the exclusive option. This option is defined during the PSBGEN. See the PSBGEN section of *IMS Version 13 System Utilities*. If the exclusive option did not cause the intent conflict, report the problem to the IBM Support Center.

7. Report the problem.

If you reach this point, the problem is that the last region to terminate should have posted the PST on subqueue 4 and subqueue 5 and did not. In a DBCTL environment, the last thread to unschedule a PSB did not post subqueue 4 or 5. Thus, there is a WAIT with a PST on subqueue 4 or subqueue 5 with no scheduled regions. Use subqueue 4 or subqueue 5 in your search argument, or report the problem to the IBM Support Center.

# WAIT for input

You can reach this point only by having entries on subqueue 6.

1. Find the PSTs on subqueue 6.

The addresses under the field name SQPSTADD are the PST addresses. The PSTs are found in the stack of PSTs.

- Find Scheduler Message Blocks (SMBs) for the PSTs.
   For each PST enqueued on subqueue 6, find the related SMB: PST +X'C4' (PSTSMB) = address of the SMB.
- 3. Are any of the regions on subqueue 6 pseudo WFIs?
  - If SMB+X'27' (SMBFLAG3) = X'08' (WFI transaction), the region is not a pseudo WFI.
  - If the region is a pseudo WFI, check if the region is holding any resources needed by transactions waiting to be processed.
- 4. Are any messages enqueued on SMB?

There should be no messages enqueued on the SMB.

- SMB+X'1A' (SMBENQCT) minus SMB+X'18' (SMBDEQCT) = number of messages enqueued
  - If there are messages enqueued on the SMB, go to step 6.
  - If no messages are enqueued, go to step 5.
- 5. Are all regions accounted for?

Compare the count of regions enqueued on the subqueues with the count in SCDREGCT (SCD + X'C8A') (2 bytes).

- If the counts are equal, all regions are accounted for, and the IMS regions are in a normal scheduling environment. The problem is not with scheduling.
- If not equal, other regions are active in IMS. Go to "PST active" on page 54.
- 6. Report the problem.

The problem is that IMS messages are enqueued on the SMB and wait-for-input (subqueue 6) is not posted. Report the problem to the IBM Support Center.

# Loop

Use standard z/OS system diagnostic procedures for loops.

Using the RB found in step 6c of "WAIT/LOOP procedure" on page 44, determine the PSW address. The PSW address is labeled OPSW. The PSW address is always the second word following the label. This PSW address belongs to one of the modules involved in the loop.

You can use the z/OS system trace to examine entries for the ASID and TCB indicated in the Dispatch Work Area at step 5 of the "WAIT/LOOP procedure" on page 44. The PSW address in the system trace entries indicates the modules involved in the loop.

Locate the PSW addresses in the storage section of the dump and scan backward through the eye catchers on the right side of the dump until you find a module identifier.

The looping module might not be an IMS module. Sometimes, the addresses are in the Link Pack Area (LPA) or the nucleus and might require an LPA or nucleus map.

# Create the search argument

You can use the following additional keywords in the search argument to narrow the search, but they might not be necessary.

# **Keyword: LOOP**

At this point, you can be sure that you are in a loop situation. Therefore, LOOP is an appropriate keyword for the search argument.

# Keyword: module names involved in the loop

The module names derived in the loop procedure above are also valid keywords.

# Keyword: label in module

If it is a tight loop, labels from the assembly listing of the modules involved might be useful keywords.

# Keyword: additional related keywords

External events can trigger loops. These events might be indicated by console messages or be related to a procedure that was being performed at the time the LOOP began.

# Search argument example

Consider the following scenario:

- IMS went into a loop.
- The active modules indicated in the RB chain and the z/OS system trace table were DFSCFEI0 and DFSCFE00.
- The loop began after the operator issued a /DISPLAY NODE command.

The broad search argument to use is: 5655J3800 LOOP DFSCFE00 | DFSCFEI0 | DISPLAY | NODE

For a structured database search, use this search argument: PIDS/5655J3800 LOOP RIDS/DFSCFE00 | RIDS/DFSCFE10 | PCSS/NODE

With this search argument you might receive numerous hits, which will probably contain the APAR describing your problem. You can then take various combinations of the additional keywords that were compared with the **OR** operator in the above example and use the **AND** operator on them instead. You can use this technique to narrow the field of search until you find the appropriate APAR.

If the loop was not in an IMS module, do not use the IMS component ID, 5655J3800.

# System wait

Use standard z/OS systems diagnostic procedures.

If the PSW address is for a system module, include that information when reporting the problem. You can use the module name in your search along with the WAIT keyword.

# Shutdown processing

Use this analysis if the operator issued a /CHECKPOINT FREEZE, DUMPQ, or PURGE to IMS and IMS failed to come down normally. Before taking IMS out of the system, be sure to use a /DISPLAY SHUTDOWN STATUS command. Obtain the listing of the /DISPLAY command and any subsequent activity to find any unusual conditions that might have prevented an orderly termination of IMS.

You should also use this analysis if IMS shut itself down and failed to terminate normally. For example, when IMS runs low on message queue space, it shuts itself down.

Before starting this procedure, you need to obtain an IMS dump in order to examine bit settings. Be aware that if you received only the first part of the DFS994I message during shutdown processing, VTAM might be involved in the failure. (For a DBCTL environment, ignore any further instructions that refer to VTAM in this topic and in the next topic, "Shutdown analysis (CHE FREEZE, DUMPQ, or PURGE)" on page 61.) If you received the DFS994I xxx (FREEZE, DUMPQ, PURGE), but not DFS994I IMS SHUTDOWN COMPLETED, be sure to obtain a dump of VTAM and IMS. Here are two ways to get a dump:

- Enter the z/OS DUMP command to dump the VTAM address space and then modify IMS down with a dump.
- Enter the z/OS DUMP command to dump the VTAM, IMS control, DL/I, and CCTL address spaces, and then modify IMS down without a dump.
   Be sure to include the RGN option along with the other standard SDATA defaults in the DUMP command.

In the section "Shutdown Analysis" that follows, note the following:

- Displacements and test conditions can change when maintenance is applied to a system.
- The bit settings shown are cumulative. This means that they usually combine with any bits already set in the byte. Check the bit settings as described. If a bit was not set or reset as shown, include both the module name and the cumulative bit settings in each byte in your search argument.
- SET turns the bit ON. RESET turns the bit OFF. Other bits in the byte might already be ON.
- It is essential in using the following analysis to find out if the indicated bits were SET or RESET and to use only the DUMPQ/FREEZE or PURGE sections where applicable.
- The Save Areas (SAs) might not always identify the last module to have control. In some cases, control is passed back to the initiating module (such as DFSCST00), and you can find no trace of any lower modules in the SAs.
- The main control block in shutdown problem analysis is the system contents directory (SCD). This flow of control lists most of the modules involved. When you find a field that does not have the bits SET or RESET as indicated, stop the analysis and report the problem.
- Be aware that defective code can produce results that appear to contradict this information.
- The following analysis does not list every action that is taking place in IMS shutdown processing, but only activity that causes bit setting to be changed in key SCD fields.

• Comments scattered throughout the analysis are for information only. For example, the statement, "If input or output is pending, return to DFSICIO0 with RC=C to complete", is for information. Do not look at return codes, but examine only the bit settings.

## Shutdown analysis (CHE FREEZE, DUMPQ, or PURGE)

Remember that in this analysis you will be looking at bit settings, not hexadecimal values.

These sections do not apply to DBCTL shutdown:

- PURGE
- DFSICL20
- DFSICLX0
- DFSICIO0
- DFSIPCP0
- DFSCPCP0
  - DFSICL20
    - If PURGE, then set SCDCKCTL(X'C08') = X'34' and then set SCDSTOP1(X'C02') = X'80'
    - If not PURGE, then:
      - If DUMPQ, set SCDCKCTL(X'C08') = X'1C'
      - If FREEZE, set SCDCKCTL(X'C08') = X'14'
        - Reset POLL the lines and then (not applicable to DBCTL)
        - Set SCDSTOP1(X'C02') = X'C0' (for DBCTL, set AWE to TRM1)
  - DFSICLX0
  - DFSICIO0
  - DFSIPCP0
    - If SCDCFLG1(X'AC7') = X'08', then
      - Set SCDCQFLG(X'AC8') = X'04' and
      - Set SCDCNXW4(X'ACF') = X'40'
    - If input or output is pending, return to DFSICIO0 with RC=C to complete.
    - When there is no input or output pending, or when the input or output is finished, then:
      - Set SCDCPCTL(X'AC4') = X'80'
      - Set AWE to TRM1
  - DFSCST00
  - DFSTRM00

#### For PURGE

- AWE = TRM1, First phase of termination
- If SCDIDCNT +1 (X'BC8') is not equal to X'000000' and SCDCKCTL(X'C08') = X'20' (PURGE):
  - Set SCDSTOP1(X'C02') = X'10'
  - Set SCDSTOP1(X'C02') = X'02'
- If SCDFTFLG(X'290') = X'20' (Fast Path active), DBFTERM0 posts the Fast Path regions for SHUTDOWN
- DFSTRM00

#### For DUMPQ or FREEZE

- If SCDIDCNT+1(X'BC8') is not equal to X'000000' and SCDCKCTL(X'C08') is not equal to X'20' (Not PURGE)
  - Set SCDSTOP1(X'C02') = X'04'
  - Set SCDSTOP1(X'C02') = X'02'
- If SCDFTFLG(X'290') = X'20' (Fast Path Active), DBFTERM0 posts the Fast Path regions for SHUTDOWN

#### For DUMPQ, PURGE, or FREEZE

- If Fast Path was active on return from DBFTERM0, *or* if Fast Path was not active, and SCDREGCT(X'C8A') is not equal to X'0000' (ACTIVE REGIONS), then post the PSTs waiting in the scheduler.
- If SCDSHFL1(X'3A4') = X'80' (IRLM in system) or SCDIDCNT+1(X'BC8'), or both, is not equal to X'000000' then return to DFSCST00 to wait for regions to end, If DBCTL, notify DRA before returning to DFSCST00.
- When or if SCDIDCNT+1(X'BC8') = X'000000' (REGIONS ENDED), set SCDSTOP1(X'C02') = X'01'.

#### For PURGE only

- If SCDCKCTL(X'C08') = X'20' (PURGE)
- Set SCDSTOP1(X'C02') = X'20'
- IWAIT for all output to go.

## For DUMPQ, PURGE, or FREEZE

When all output is done for PURGE or FREEZE or DUMPQ, then:

- If SCDFTFLG(X'290') = X'20' (Fast Path active), DBFTERM1 closes the areas.
- If SCDFTFLG(X'290') is not equal to X'20' or when Fast Path areas are closed then:
  - If SCDSMMS1(X'033') = X'02' (DLI SAS), then:
    - Tell the DL/I region to close the databases (DFSSDL40).
    - IWAIT for the databases to close.
  - If not DLI/SAS, then let DFSDLOC0 close the databases.

Then when all databases and areas are closed: Set SCDSTOP1+1(X'C02') = X'04'.

– DFSCPCP0

Set return code (RC) = 8 to ask DFSIPCP0 if communication is still going on.

- DFSIPCP0 (DFSIPCP2)
  - If no output or no messages on Q3, set return code (RC) = 0 to inform DFSCPCP0.
  - If output or messages on Q3, set return code (RC) = 4 to inform DFSCPCP0, which causes DFSCPCP0 to IWAIT.
- DFSCPCP0
  - If output is pending (RC = 4)
    - Set SCDCPCTL(X'AC4') = X'08'
    - Set SCDSTOP1(X'C02') = X'40'
    - IWAIT for DC to finish.
  - If no output or when output finishes

- Set off SCDCPCTL(X'AC4') = X'08' (reset the bit)
- Set SCDSTOP1+1(X'C02') = X'08'
- Reset Poll all lines that are candidates for the SHUTDOWN message
- Set CTBFLAG3(0D) = X'10' (for all terminals that are to receive the shutdown message)
- DFSICLX0
- DFSICIO0
- DFSIPCP0
  - If any CTBFLAG3(0D) = X'10':
    - Set CTBACTL(10) = X'20'
    - Set CTBACTL(10) = X'10'
    - RC = 8 to DFSICIO0 (send SHUTDOWN message)
  - If NO CTBFLAG3(0D) = X'10':
    - Set SCDDFLGS(X'718') = X'80'
    - Set SCDCPCTL(X'AC4') = X'20'
    - RC = 4 to DFSICIO0 (quiesce lines)
- DFSICIO0
  - If RC = 4, idle the lines
  - If RC = 8, send DFS991 IMS SHUTDOWN message
  - The WRITE interrupt from the SHUTDOWN message results in the following:
    - Set off CTBFLAG5(0F) = X'80' (reset)
    - Set off CTBFLAG3(0D) = X'10' (the)
    - Set off CTBACTL (10) = X'30' (bits)
- DFSIPCP0
  - When all line activity is stopped
- DFSCPCP0
- DFSTRM00
  - If DBCTL set SCDSTOP =SCDSTSNT, then set SCDSTOP1+1(X'C02') = X'01'
- DFSRCRT0
- DFSRCP00
  - Send "DFS994I \*CHKPT yyddd/hhmmss\*ctype" (first part of DFS994I message)
  - Set AWE = "TRM2"
  - Set off SCDCKCTL(X'C08') = X'04' (reset the bit)
- DFSTRM00

Set SCDTRMFL(X'430') = X'40'

- DFSCST00
- DFSTRM00
  - If DLI/SAS SCDSMMS1(X'033') = X'02', pass AWE to DFSSDL40 to begin Normal Termination
  - If not DLI/SAS or when DFSSDL40 returns
  - If SCDRFPIN(X'C32') = X'80' (Fast Path errors):
    - · Print error message

- Set off SCDRFPIN(X'C32') = X'80' (reset the bit)
- Close queue data sets (not applicable to DBCTL)
- IWAIT for closing
- Set off SCDSTOP1(X'C02') = X'08' (reset the bit)
- DFSTERM0
  - Terminate DASD log
  - Set off SCDRECTL(X'146') = X'80' (reset the bit)
  - Terminate RDS
  - Terminate IMS system type tasks
  - Signoff DBRC
  - Quit IRLM
  - Close VTAM ACB (not applicable to DBCTL)
  - If DLI/SAS, SCDSMMS1(X'033') = X'02' and the ECB at SCDRSETF(X'D1C') is not equal to X'40' (posted) :
    - IWAIT for the DL/I region to end
    - Set AWE = "TRM3"
    - Set SCDTRMFL(X'430') = X'20'
    - Send "DFS994I IMS SHUTDOWN COMPLETED" (second part of DFS994I message)
- DFSTRM00
- DFSCST00

#### **IRLM** procedure

WAIT states can be encountered during IRLM processing in four areas:

- "Deadlock involving non-IRLM resources"
- "Deadlock involving only IRLM resources" on page 65
- "Lock request not granted because holder did not release lock" on page 65
- "IRLM latch unavailable" on page 65

#### Deadlock involving non-IRLM resources

#### Failure Description

Application programs waiting for non-IRLM resources and holding IRLM resources are waiting for other applications also holding IRLM resources. The IRLM cannot detect deadlocks involving non-IRLM resources.

#### Detection

Use the IMS WAIT diagnostic procedures to discover the non-IRLM resources being waited for. Follow the RLB chains representing resources held or requested for each requesting work unit (WHB) to discover the IRLM resources being waited for. If the wait state occurred as a result of an IRLM error, the function/subfunction is IRLM/DEADLK.

An example of a search argument is:

569516401 AR101 WAIT IRLM IRLM/DEADLK

For a structured database search, use this search argument: PIDS/569516401 LVLS/101 WAIT RIDS/IRLM RIDS/DEADLK

#### Deadlock involving only IRLM resources

#### Failure Description

Application programs are deadlocked for IRLM resources. If all the application programs are waiting for IRLM resources (there are no application programs running which could release the locks that the other application programs are waiting for), this is a deadlock. The IRLM should detect this condition and post one of the waiters as unable to obtain the lock because of a deadlock.

#### Detection

Follow the RLB chains representing resources held or requested for each requesting work unit (WHB) to discover the IRLM resources being waited for. If the wait state occurred as a result of an IRLM error, the function/subfunction is IRLM/DEADLK.

An example of a search argument is:

569516401 AR101 WAIT IRLM IRLM/DEADLK

For structured database search, use this search argument: PIDS/569516401 LVLS/101 WAIT RIDS/IRLM RIDS/DEADLK

#### Lock request not granted because holder did not release lock

#### Failure Description

An application program requested a lock, but the request was not granted because the holder of the resource did not release it. This does not result in a deadlock. However, If the requester is not timed out, its task and any others waiting after it might enter a wait state.

An example of a search argument is:

569516401 AR101 WAIT IRLM

For structured database search, use this search argument: PIDS/569516401 LVLS/101 WAIT RIDS/IRLM

#### **IRLM** latch unavailable

#### Failure Description

An error in IRLM processing can result in an IRLM latch being permanently unavailable. If this condition exists, no new IRLM requests can be processed.

If this error occurs, call the IBM Support Center for help in diagnosing the problem. The support representative will tell you what type of documentation to gather.

	applied prior to system definition	D/3600	3600 Device Types
		D/3790	3790 Device Types

## Searching the database

To find out if a problem like the one you experienced has already been reported, you use the keyword string you completed to search an IBM Software Support database (such as Software Support Facility), or you can use it when talking to your Level 1 support representative.

- 1. Determine the maintenance level of the IMS system by identifying the APARs and PTFs that have been applied.
  - Run the SMP PTF list program or have access to online SMP/E dialogs.

**Tip:** You can extract the current maintenance level of your IMS system (or of a specific IMS load module) by using the /DIAGNOSE SNAP MODULE(*modname*) command.

- 2. Search SSF, using the keyword string developed by following procedures from "Selecting the keywords" on page 34. Your search is most successful if you follow these guidelines:
  - Start with a broad search argument so you receive all problem descriptions that might match your problem.
  - If you find too many Authorized Program Analysis Reports (APARs) to examine, add the logical operators **AND** or **OR** to the keyword string in various combinations gradually to reduce the number of database matches (hits). If the keywords are connected by the logical operator **AND** (a blank), a record is selected if it contains both words separated by the blank. If the keywords are connected by the logical operator **OR** (|), a record is selected if it contains either of the words separated by the character, |.
  - You can use dependency keywords with the keyword string to select only those APARs that apply to a certain environment. These can be particularly useful when a search yields a large number of database matches and you are almost certain that the program failure occurred in a specific environment. For the list of dependency keywords, see "Dependency keywords" on page 67.

**Recommendation:** Use dependency keywords only if you are sure the problem is limited to that dependency. If you do not get any database matches, eliminate the dependency keyword.

• If you want to narrow the search to a specific release level, you can add the logical operators **AND** or **OR** for the release level keywords to the search argument. The following list describes the release level keywords for IMS Version 13:

AR100 IMS Services

AR101 Database Manager

- AR102 Transaction Manager
- AR103 Extended Terminal Option
- AR104 Recovery-level Tracking

AR105 Database-level Tracking

**AR106** IMS Java<sup>™</sup> On Demand features

R220 Internal Resource Lock Manager (IRLM) 2.2

R230 Internal Resource Lock Manager (IRLM) 2.3

For a structured database search, the release level keywords are:

#### LVLS/100

IMS Services

#### LVLS/101

Database Manager

#### LVLS/102

Transaction Manager

#### LVLS/103

Extended Terminal Option

#### LVLS/104

Recovery-level Tracking

#### LVLS/105

Database-level Tracking

#### LVLS/106

IMS Java On Demand features

#### LVLS/R220

Internal Resource Lock Manager (IRLM) 2.2

#### LVLS/R230

Internal Resource Lock Manager (IRLM) 2.3

Examples:

- For the Database Manager, type 5635A0400 AR101
- For a structured database search, type: PIDS/5635A0400 LVLS/101

**Tip:** If you do not get any database matches, remove the release level from your search argument.

- **3.** Eliminate the APARs that also appear in the SMP PTF list from the list of database matches. These will have already been applied.
- 4. Compare each remaining APAR with the current failure symptoms. Analyze trace output for your problem situation, looking for similarities in the situations described by APARs that you are reviewing. Frequently, APAR descriptions include information about the traces that were run for those problems.
- 5. If you find an appropriate APAR, determine if it has been closed. If it has been closed, you can correct the problem by applying the fix that is associated with the APAR. If it has not been closed, contact IBM Software Support for information about what you can do until it is closed.
- **6.** If you do not find an appropriate APAR, verify that the problem is not caused by a user specification error.

7. If you find no user specification error, contact IBM Software Support for assistance.

# Procedures for preparing an APAR

An Authorized Program Analysis Report (APAR) might be necessary if the keyword search proves unsuccessful. Call IBM Software Support for help in determining if an APAR is necessary. Only authorized IBM personnel can generate APARs.

The information in the following table describes the procedures for preparing an APAR.

Procedure	Action		
Reporting a problem	To report a problem, contact IBM Software Support. Be prepared to supply such information as:		
	Customer number.		
	• Release level.		
	<ul> <li>Current maintenance level (from PTF list).</li> <li>Tip: You can extract the current maintenance level of your IMS syste (or of a specific IMS load module) from your IMS system by using the /DIAGNOSE SNAP MODULE(<i>modname</i>) command.</li> </ul>		
	• The keyword string or strings used to search the IBM Software Supp- database.		
Gathering APAR documentation	You might be asked to supply various types of information that describ the IMS nucleus, database, environment, or activities. Include applicable items from the following list with the APAR.		
	• JCL listings		
	• Address space storage dumps at time of failure—the entire machine-readable dump data set (normally copied to tape) and the J0 used to copy the dump to tape		
	• Bind map		
	• z/OS console printout. A partial console is generally in the offline formatted dump.		
	Master terminal printout		
	Local/remote terminal printout		
	• IMS log data sets		
	IMSGEN listing		
	DBD listing		
	• PSB listing		
	ACB generation output		
	Log trace		
	Consolidated trace output		
	• Transmittal notes explaining any unusual events leading up to the problem symptoms		
	• SNAPs produced before and after the failing call by DFSDDLT0		
	Type X'67FF' SNAP log records		
	• Type X'6705' SNAP log records		
	DBRC RECON data set		
	• LPA map		
	<ul> <li>LOGREC (especially software diagnostic records)</li> </ul>		

Table 6. Procedures for preparing an APAR

Table 6. Procedures for preparing an APAR (continued)

Procedure	Action
Submitting APAR	When submitting material for an APAR to IBM, carefully pack and clearly label all materials sent to IBM with the following information:
documentation	1. The APAR number assigned by IBM
	2. A list of data sets on the tape, including JCL, if any
	3. A description of how the tape was made, including:
	<ul> <li>The exact JCL listing or the list of commands used</li> </ul>
	The recording mode and density
	Tape labeling
	<ul> <li>The record format and block size used for each data set</li> </ul>

# Chapter 5. Data areas and record formats

This section describes the major IMS control blocks and their interrelationships. It also describes the formats of records that you need to analyze when diagnosing problems.

# Finding more information on modules, control blocks, and record formats

You can find the module directory, IMS control block DSECTs, and the log record formats on Service Link. Contact your systems engineer for further information on accessing Service Link.

## **Control block linkage**

The IMS.ACBLIB is a partitioned data set whose members are pre-system-generated, expanded PSB and DMB control blocks. You can view the formats of these control blocks by assembling the database DSECT and CSECT control blocks macro IDLI. You can also find the layout of IMS.ACBLIB members in the ACBGEN module, DFSUACB0, and the Write-PSBs-and-DMBs-to-ACBLIB module, DFSUAMB0.

The following figure provides an overview of the linkage between the major control blocks used for diagnosis.

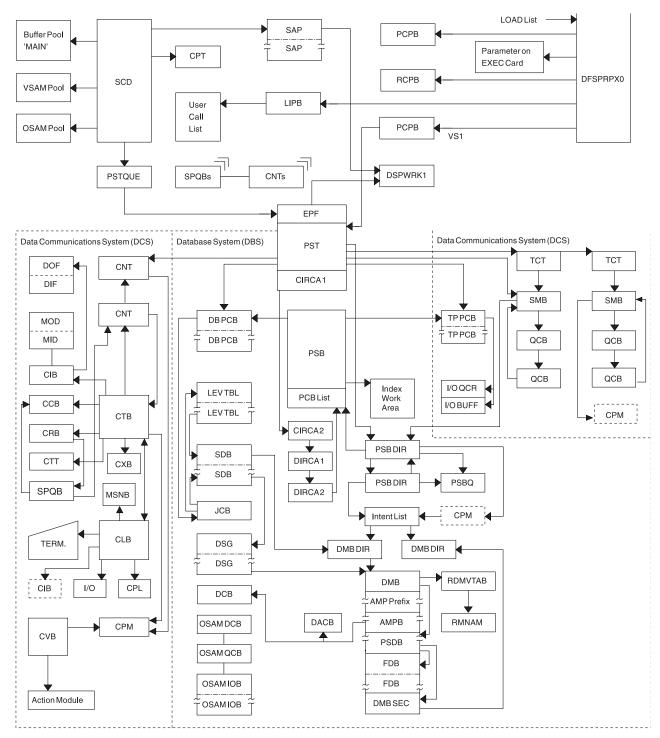

Figure 3. IMS control block linkage for a static DB/DC environment

# Table of control block definitions

All of the control blocks are listed, and for each control block the acronyms, macros and descriptions are given.

Control block acronym	Mapping macro	Description
ADSC	DBFADSC	Area data set control block.
ALDS	DBFAREA	Area list data set.
AMPB	IDLI DMBBASE=0	Access method prefix block. Contains information relative to a data set belonging to a database.
BALG	DBFBALG	Balancing group control block.
BFSP	IDLIVSAM BFSP	DL/I VSAM buffer handler pool prefix.
BFUS	IDLIVSAM BFUS	Subpool statistics block.
BHDR	BHDR	MSDB header.
BLOCKHDR	DFSSPBLK	Block header used by DFSPOOL Storage Manager.
BSPH	IDLIVSAM BSPH	Buffer subpool header block. Contains the number of buffers in this subpool.
BUFC	IDLIVSAM BUFC	Buffer control block. Contains pointers to buffers.
BUFENTRY	DFSSPBLK	Used by DFSPOOL Storage Manager to map the buffer size entries within the pool header.
CADSECT	ICADSECT	Communication area block. Contains the main dump formatter control block.
CBT	DFSCBTS	Control block. Represents storage pools (IPAGES) defined in DFSCBT00.
ССВ	ICLI CCBBASE=0	Conversational control block. Controls resources for conversational tasks.
CIB	ICLI CIBBASE=0	Communication interface block. Contains information the device-dependent module needs to determine Message Format Service (MFS) operation.
CIRCA	IPST	IMS control region interregion communication area.
CLB	ICLI CLBBASE=0	Communication line block. One exists for each communication line and for each node.
CLLE	DFSCLLE	Common Latch List Element. There is one block for each IMS ITASK, which is maintained in Key 7 storage.
CNT	ICLI CNTBASE=0	Communication name table. One exists for each named logical terminal and component.
СРМ	(generated)	Communication password matrix. Length varies based upon the number of passwords in the CPT.
СРТ	(generated)	Communication password table. Defined by user.
CRB	ICLI CRBBASE=0	Communication restart block.
CSAB	OCO	Callable Service Anchor Block. Used by IMS callable services modules.
CSVT	DFSCSVT	Callable Services Vector Table. Used by IMS callable services modules.
СТВ	ICLI CTBBASE=0	Communication terminal block. One exists for each terminal and for each subpool in the system.

Table 7. Control block definitions

Table 7. Control block definitions	(continued)
------------------------------------	-------------

Control block acronym	Mapping macro	Description
СТМ	(generated)	Communication terminal matrix. Length varies based upon the number of logical terminals (CNTs).
CTT	ICLI CTTBASE=0	Communication terminal table. There is one for each different type of terminal, as well as different features.
CULE	DFSCULE	Common Use List Element. Used in latching by the IMS Use Manager.
CVB	ICLI CVBBASE=0	Communication verb block. Reflects the relationship between the command message verbs and the passwords. It also reflects logical terminals associated with those commands.
СХВ	(generated)	Communication extension block. Contains information that is required for control of a particular terminal. It is a logical extension of the CTB.
DBPCB	IDLI DPCBASE=0	DL/I DB PCB.
DCB	IDCBOSD	Data communication block. Contains data pertinent to the current use of a data set.
DCB-EXT	DFSDCBEX	OSAM extension to the DCB.
DDIR	IDLI DDRBASE=0	DMB directory entry. Contains an entry for each DMB known to IMS.
DFSAVEC	DFSAVECT	Dump formatter vector table.
DFSDOPTE	DFSDOPTB	Dump option entry block. It is the dump formatter CBTE request definition block.
DFSDPBFH	DFSDBPFH	Dump buffer pool blocks. Used for buffering offline dump storage.
DFSSBWO	DFSSBWA	Work area used by sequential buffering.
DMAC	DBFDMAC	DEDB area control block.
DMB	IDLI DMBBASE=0	Data management block. There is one for each database descriptor entry described in the DDIR.
DMBSEC	IDLI DMBBASE=0	Secondary list. There is one or more entry for each logically related segment and each index relationship.
DMCB	DBFDMCB	DEDB master control block.
DMHR	DBFDMHR	The buffer header for Fast Path. Describes the status of a particular buffer. The buffer headers (and buffers) are allocated in DBFCONT0. ESCDDMHR points to the first buffer and ESCDMBFN contains the number of headers. The relationship between buffer headers and buffers is fixed during IMS control region initialization.
DSEB	DFSDSPDS	Dynamic SAP Extension Block. Used to manage dynamic SAPs.
DSG	IDLI DSGBASE=0	Data set group control block. There is typically one for each data set group referenced by the DBPCB.
DSPWRK1	IDSPWRK	Dispatcher work area. There is one for each VS task (TCB) in an IMS environment.
ECB	z/OS macro	Event control block. Describes the status of an event in an IMS environment.
ECNT	DBFECNT	Extended communications name table. (Fast Path)
EDSG	DFSSBDSG	Sequential buffering extension to the DSG.
ЕМНВ	DBFEMHB	Expedited message handler block. (Fast Path)
EIB	DFSPCA	Partition Exit Interface Block Prefix.

Control block acronym	Mapping macro	Description
EPCB	DBFEPCB	Extended PCB. (Fast Path)
EPF	IEPF	ECB prefix. Used to indicate the current status of the ECB and to connect the ECB to the appropriate SAP.
EPST	DBFEPST	Extended partition specification table. (Fast Path)
EQEL	DFSEQEL	Recoverable in-doubt structure queue elements. Identifies inaccessible data due to in-doubt status.
ESCD	DBFESCD	Extended system contents directory. (Fast Path)
ESRB	DBFESRB	Extended service request block. (Fast Path)
ESRT	DBFESRT	Expedited message handling region insert buffer. This buffer is a temporary save area for a message input. ESRTs are allocated in module DBFCONT0 by IMS control region initialization with a length equal to the largest terminal buffer defined. ESCDESRT points to the first ESRT. EPSTESRT points to a related ESRT. (Fast Path)
FAQE	DFSSPBLK	Free allocated queue element. Used by the DFSISMN0 Storage Manager to manage storage within a pool.
FDB	IDLI FDBBASE=0	Field descriptor block.
FDT	DBFMFDB	Field description table.
FEDB	ICLI FEDBBASE=0	Front end directory block. Stores global information about the front end switching facility.
FEIB	ICLI FEIBBASE=0	Front end interface block. Contains data to allow the front end switching user exit to communicate with the transaction manager.
FRB	DFSFRB	Fast restart block.
GB	IGLI	GSAM data set control block. Contains information concerning the data set operation and pointers to other control blocks used for accessing records.
GBCB	IGLI	GSAM buffer control block. Contains the address of a unique buffer.
GLT	IGLI	GSAM load table. Provides all addresses of the GSAM load modules necessary for initialization.
GPT	IGLI	GSAM pointer table. Provides information required by resident and nonresident GSAM routines.
GQCB	IGLI	GSAM queues control block. Contains first and last pointers for the four queues of GSAM GBCBs used by GSAM BUFFIO.
HSSR	DBFHSSR	Holds area range information from SETR statements. HSSR is formatted in the offline dump.
HSSO	DBFHSSO	Holds image copy (IC) information from SETO statements.
HSSD	DBFHSSD	Holds information for the /DISPLAY HSSP command. HSSD is formatted in the offline dump.
HSSP	DBFHSSPS	Skeleton block. Temporarily holds HSSO/HSSR/HSSD information before scheduling.
IBFPRF	IBFPRF	Buffer prefix. There is one for each buffer described in each subpool used by the OSAM buffer manager.
IBPOOL	IBPOOL	OSAM buffer handler main buffer pool. Contains statistics and vectors to OSAM buffer subpools.

Table 7. Control block definitions	s (continued)
------------------------------------	---------------

Table 7. Control block definitions	(continued)
------------------------------------	-------------

Control block acronym	Mapping macro	Description
IDSC	DBFIDSC	IDSC is the image copy data set control block. It represents the Image Copy data set (IDS) the same way the area data set control block (ADSC) represents the area data set (ADS). IDSC also uses the same control block structure as the ADSC. An IDSC contains a description of the Image Copy data set. There are up to two IDSCs for each DEDB area with the Image Copy option. An IDSC is built dynamically at the first call to the area that is running as HSSP with the Image Copy option requested. The ISDC is released during Image Copy termination.
		The IDSC control block is formatted in the offline dump.
IEEQE	DFSIEQE	In-doubt error queue element. Contains buffers of changed data (data in the in-doubt state).
ISPL	ISUBPL	OSAM buffer subpool. Provides a base for fixed length buffers and statistics about the buffers.
ISL	DXRRLISL	IRLM identified subsystem list. Contains the name of each subsystem and its status.
JCB	IDLI JCBBASE=0	Job control block. There is one for each PCB. It contains level tables and segment blocks and a trace table of the previous calls.
LCB	LCB	Link control block. Represents the link for channel to channel, memory to memory, VTAM, and binary synchronous connections in MSC.
LCD	LCDSECT	Log contents directory. Controls the interface between the logical and physical loggers in a DB/DC environment.
LCRE	DFSLCRE	Local current recovery element. Contains the sync point, checkpoint recovery information relative to each PST.
LEV	IDLI LEVBASE=0	Level table. Consists of two parts: previous call and current call that is filled in by the call analyzer.
LIPARMS	PARMBLK	Language interface parameter block.
LLB	ICLI CLBBASE=0	Link line block.
LTB	ICLI CTBBASE=0	Link terminal block.
LXB	LXB	Link extension block.
MRMB	DBFMRMB	DEDB randomizing module block.
MSNB	MSNB	Message Control/Error exit interface block. Contains the block content before and after calling Message Control/Error exit DFSCMUX0 or during the interface processing.
PAC	DFSPAC	Database Resource Adapter (DRA) control block.
PAPL	DFSPAPL	DRA architected parameter list.
PARMLIST	ICADSECT	Dump formatter bulk print interface block.
PAT	DFSPAT	DRA thread control block.
PATE	DFSPAT	DRA thread entry control block.
PCA	DFSPCA	Partition Communication Area.
PCIB	ICLI PCIBASE=0	Partition communication interface block.
PCPARMS	PARMBLK	Program control parameter block.
РСТ	DFSPCT	Partition chaining table.
PDAE	DFSPSEIB	Partition Definition Area Prefix. Partition Definition Area Entry.

Control block acronym	Mapping macro	Description
PDEX	DFSDDIR	Partition Directory Extension
PDIR IDLI PDRBASE=0		Program specification block directory. Contains entries for every program known to IMS.
PDL	DFSPDL	DRA dump parameter list.
PECA	DFSPSEIB	Partition Exit Communication Area.
PNT	DFSPNT	Partition Name Table.
POOLHDR	DFSSPBLK	Storage pool header used by the DFSPOOL storage manager to keep track of pool information.
PPRE	DFSPPRE	Standard IPAGE prefix mapping macro. Used for all IPAGEs created in IMS.
PQE	DFSPQE	DRA queuing element.
PSB	IDLI PSBBASE=0	Program specification block. Relates to the application program and contains the PCBs associated with this PSB.
PSDB	IDLI DMBBASE=0	Physical segment descriptor block. Describes each segment in the database.
PST	IPST	Partition specification table. There is one for each message or batch region; it contains a DECB for this partition, I/O terminal PCB, and parameters required for this region.
PTBWA	DXRPTBWA	IRLM pass-the-buck work area.
PTE	DFSPNT	Partition Table Entry.
РТК	DFSPTK	Partition Key Index Table.
PTX	DFSPTX	Partition Entry Index Table.
PXPARMS	PARMBLK	Parameter Anchor Block.
QCB	IAPS SMBBASE=0	Queue control block.
QEL	IAPS SMBBASE=0	Queue Element.
QMBA	DFSQMGR	Queue Manager Buffer Area.
RCPARMS	IDLI PSTBASE=0	Region control parameter block.
RCTE	DBFRCTE	Routing code table entry.
RDLWA	DXRRDLWA	IRLM deadlock process work area. Contains information that must be communicated between the deadlock process modules.
RHB	DXRRHB	IRLM resource header block. Represents a resource.
RHT	DXRRHT	IRLM resource hash table. Provides a series of anchors for resource chains.
RLB	DXRRLB	IRLM resource lock block. Represents a request for a lock or a lock held on a resource.
RLCBT	DXRRLCBT	IRLM private area control block and table. Contains addresses of IRLM entry points.
RLMCB	DXRRLMCB	IRLM master control block. Contains branch entry addresses for all RLMREQ as well as queue anchors.
RLPL	DXRRLPL	IRLM request parameter list. This is the parameter list for all functional requests for the resource lock manager.
RLQD	DXRRLQD	IRLM query mapping macro. Maps IRLM control blocks/structures returned to the IMS invoker of QUERY.

Table 7. Control block definitions	(continued)
------------------------------------	-------------

Control block acronym	Mapping macro	Description
RPL	IDLIVSAM	Request parameter list. Contains parameters passed to VSAM from IMS and the status returned to IMS from VSAM.
RPST	DFSRPST	Restart PST. Contains identifying information and characteristics of units of recovery.
RRE	DFSRRE	Residual recovery element. Contains sync point actions, such as Commit and Abort, relative to eachDb2 for z/OS connection out of a dependent region and is used for BMP restart processing, in-doubt processing, and restartable backout processing.
SAP	ISAP	Save area prefix. Relates to a save area set.
SBHE	DFSSBHE	Sequential buffering hash entry. Used to hash or anchor SDCB control blocks and to serialize the sequential buffer SDCB and SDSG control block subsystem chains. The SBHEs are part of the SBSCD.
SBPARMS	DFSSBPAR	Sequential buffering extension to PXPARMS.
SBPSS	DFSSBPSS	Small section of the SBPST that needs to be in CSA.
SBPST	DFSSBPST	Sequential buffering extension to the PST.
SBSCD	DFSSBSCD	Sequential buffering extension to the SCD. This extension contains the SBHE hash entries.
SBUE	DFSSBBUF	Sequential buffering buffer extension. There is one SBUE for each SBUF.
SBUF	IBFPRF SBEXT=YES	Sequential buffering buffer. One SBUF control block is used by sequential buffering to control each SB buffer. The SBUF control blocks of one SB buffer pool are contiguous in storage and are formatted as one entity.
SCAR	DFSSBCAR	Control block containing the interpreted data of one SBPARM control statement in the //DFSCTL file.
SCA1	DFSSBCAR	Control block containing the uninterpreted data of one SBPARM control statement in the //DFSCTL file.
SCD	ISCD	System contents directory. Produced at system definition time, it contains major entry points for all facilities and system control information.
SDB	IDLI SDBBASE=0	Segment descriptor block. Contains a logical description of the segment.
SDCB	DFSSBDCB	Sequential buffering extension to the DCB. Is for those DB data sets that are buffered by sequential buffering.
SDSG	DFSSBDSG	Sequential buffering extension to the DSG. Describes one I/O process. There is typically one SDSG control block for each data set group control block (DSG) that might potentially be buffered by sequential buffering.
SDWA	IHASDWA	System diagnostic work area.
SGT	DFSPRSGT	Segment table. Describes the segments used by the partial reorganization process. It is built during the DBD analysis phase. Its address is held in the common area field (COMASGT). The segment extension table (SGX) holds additional information about the segments.
SIDB	DXRSIDB	IRLM subsystem identification block. Used to identify each subsystem that relates to IRLM.
SIDX	DFSSSIE	Subsystem index entry.

Control block acronym	Mapping macro	Description
SMB	IAPS	Scheduler message block. Related to a transaction.
SPQB	ICLI SPQBASE=0	Subpool queue block. The SPQB represents the dynamic user for an ETO terminal and represents a set of static queues (CNTs) for a static ISC parallel session terminal.
SQPST	ISQPST	PST queue. Associated with the scheduler sequence queue.
SRAN DFSSBRAN		Sequential range. Used in sequential buffering to describe a recently referenced set of consecutive DB blocks. Sequential buffering allocates one Sequential SRAN control block for each buffer set of each buffer pool. SB also allocates Random SRAN control blocks to each buffer pool. The Sequential SRANs and Random SRANs of one SB buffer pool are contiguous in storage and are formatted as one entity.
SSIB	IEFJSSIB	Subsystem identification block. Identifies the subsystem that requested services.
SSOB	IEFJSSOB	Subsystem options block. Used to request a particular function from the $z/OS$ subsystem.
SSVP	DFSSSVPL	System Services Parameter List. Used by IMS System Macros for parameter lists for mailing out of line calls. There is one SSVP per ITASK, anchored off of the SAP.
ТАВ	DFSTAB	Transaction anchor block.
ТСТ	DFSTAB	Transaction class table. Used for queuing of messages in a priority sequence within a specified class.
ТРРСВ	IDLI TPCBASE=0	Program communication block. There is one for each logical database being referenced by the application program.
UEHB UEHB		User exit header block. Used for automated operator exit interface processing.
UXDT DFSUSRX		User Exit Definition Table. Contains control information and user exit addresses for user exits managed by IMS standard user exit service.
UXRB	DBRUXRB	A unit of work (UOW) is represented by a UOW exclusive resource control block (UXRB), similar to the XCRB representing the CI. The UXRB contains information about the UOW (for example, Area, RBA) and is used for resolving potential UOW resource contention among dependent regions. Other UXRB fields include the lock token, number of associated XCRBs, the owning EPST, the update intent flag, and the PCB.
VSI	IDLIVSAM VSI	The UXRB control block is formatted in the offline dump.           VSAM sharing information control block. Controls VSAM sharing
		between subsystems.
WHB	DXRWHB	IRLM work unit block. Contains the anchor for all requests associated with that owner.
XCRB	DBFXCRB	Exclusive control resource block.
XMCA	DFSXMC	Cross-Memory Control-Address Spaces. There is one block for each IMS subsystem, which is maintained in Key 0 storage.
XMCI	DFSXMC	Cross Memory Control-ITASKs. There is one block for each IMS ITASK, which is maintained in Key 7 storage.
ZIB	IZIB	Zone initialization block. Used by the DFSISMN0 Storage Manager to keep track of a buffer obtained using ICREATE.

IMS Control Block Table (CBT) Pools			
	The IMS CBT storage manager (also known as the DFSBCB storage manager) manages pools of fixed-length control blocks.		
	All CBT pools can be displayed by issuing the /DISPLAY POOL CBT. Issuing the /DISPLAY POOL command with other keywords, such as DBB, DCC, DEP, DISP, FP, GEN, OSAM, SUM, and others, limits the display of the CBT pools to those related to the functional area of IMS that the keyword represents.		
I	All of the CBT pools are briefly described in the following alphabetical list.		
l	AAB RSR Archive anchor block		
l	ADSC	Fast Path area data set control block	
l	AESL	Fast Path DEDB ADS list	
	AHDR	ETO autologon LU header/ autologon hash table synonym	
l	APST	Partition specification table - above the line	
l	ATPW	Attach catalog PSB work area block	
l	AWE	Asynchronous work element	
l	BCPT	Checkpoint id table	
l	BQEL	ISAM/OSAM/VSAM buffer queue element	
l	BXQE	BCB queue elements for use by DFSBCBxx modules only	
l	CBLK	BLK Used in place of message queue to keep track of CPI-C scheduling reques	
l	CCB	CCB Conversational control block	
l	CFEZ	Block used to store local parms for DC trace re-entrancy	
l	CLLE Common latch list element		
l	CM24 Common work unit, 24-bit		
	CMWU		
	CDCD	Common work unit OM command response block	
		Callable services anchor block (CSAB) - global storage	
	<ul><li>CSAL Callable services anchor block (CSAB) - local stoarge</li><li>CSWA Common system work area - global storage</li></ul>		
	CTBW	Common system work area global storage	
	CIDI	Communication terminal block work area	
I	CULE	Common use list element	
I	D1WA	Dispatcher work area 1	
l	DACT	DL/I call accounting block	
l	DBBD	Database (DDIR) descriptor	

DBPB	Data base purge block
DBRC	DBRC work area
DCM	RSR Deferred ILT control message
DDIR	DMB directory entry
DDRE	DMB directory extension
DESC	LU 6.2 descriptor block
DG2W	
	Global dispatcher area
	Local dispatcher area
I DLWA	DL/I private work area
DMHR	Fast Path VSO dynamic DHMRs for write staging area
DPST	Dependent region PST
DPXB	Dispatcher extension block
DSME	
	Fast Path data space mapping entry
DSML	Fast Path data space mapping list
EMAC	The Third and Share multiply int
	RSR Extended DMAC
EPST	Fast Path extended PST
EQEL	Resolve indoubt structure queue element
EZS	External connection status element
FEIB	Front end message switch interface block
FMMC	
	Fast Path control block to contain VSAM extents
	Fast Path notify control block
FPB6	Fast Path DBFBPND6 block for FP 64-bit buffer pools
	Fast Path command parameter list
	Fast Path SRB
	RSR Gap descriptor
	Global external subsystem entry
	Global IOSB
GOWA	Global OSWA
GPNT	Fast Path global name table
GQMW	-
	Global queue manager work area
GSAV	Global save area
HSHE	Hash table element header

		The build of the deal	
1		Hash table slot header	
1		BPE LFS hash table services: hash table element block, CTL private	
1	IAFP	IAFP dataset control block	
1	IDT	Identify table entry	
	IEQE	Inflight/indoubt data buffers	
Ι	IOSB	I/O supervisor block	
I	IPST	System PST in DLI/SAS private, 31-bit storage	
Ι	IRLM	IRLM parameter area	
I	KLSD	LSO dependent control block	
Ι	L56X	Fast Path DBCTL log record	
1	LCLL	Local common latch list element (local storage)	
I	LCRE	Local current recovery entry	
I	LG24	An LSAV below the 16m line	
I	LGND		
		Logon descriptor control block sets	
	LGWA	Log work area	
I	LGWX	-	
I		Log work area extension (private)	
1	LPNT	Fast Path local name table	
I	LPST	Local PST block	
1	LQB	Local queue block	
I	LQMW		
I		Local queue manager work area	
I	LRA	RSR Log read area	
I	LS24	24-bit quick block, local save area / AWE	
I	LSAV	Local save area	
I	LSWA	Local system work area	
I	LUB	LUB pool below 16 MB line for LU 6.2	
Ι	MPB	RSR Milestone position block	
l	MPCB	PCB block for MSC bandwidth. The MPCB control block is mapped by the DFSMSPCB macro.	
I	MSCL	MSC logical link control blocks.	
Ι	MSCP	MSC physical link control blocks.	
	MSEB	Work area for the TM and MSC Message Routing and Control User exit routine (DFSMSCE0). The MSEB work area is mapped by the DFSMSCEB macro.	
l l	MSGP	Message pool	

 	MUTE	OTMA MCB user table entry
I	OCMD	-
I	OCIVID	OM command instance block
I	OFB	RSR Online forward recovery block
I	OLRK	OLR KSDS update entry
I	OSWA	
		OSAM work area (IOMA)
I	PCIB	Partition CIB
I	PDEX	Partition directory extension
I	PDIR	PSB directory entry
I	PF62	Message prefix block for LU 6.2
I		CQSPUT failure queue element
	PGMD	
1	DCT	Program (PDIR) descriptor
1	PST	Partition specification table
1	QAB	QAB pool for LU 6.2
		Work area to hold queue manager parameter list
1		DEDB and area quiesce latch blocks for DEDB Alter
	QMBA	Queue manager buffer area (large message)
· I	QMBS	
l	~	Queue manager buffer area (small message)
	QQSN	
I		Queue space notification area
l		Temporary save area set with parm areas - 24-bit storage
I		Temporary save area set with parm areas - 31-bit storage
	RACW	RACF work area used for racinit, fracheck, etc.
1	RBAT	Fast Path VSO RBA update table entries
' 		Remote communication name table. The RCNT control block is mapped by
		the RCNT copy.
I		Fast Path routing code (RCTE) descriptor
l		Fast Path routing code table entry
I	RECA	VTAM receive any buffer
I	RPST	Restart partition specification table
I	RRE	Residual recovery entry
Ι	RSCX	Resource extension block
I	SAA	RSR Stream archive anchor
Ι	SAP	Save area prefix

I	SIDX	Subsystem index entry
I	SLOG	DC monitor work area
I	SMB	Scheduler message block
I	SOPB	Sign-on parameter block
T	SPQX	SPQB extension block
T	SQOF	Shared queues overflow hash table element
T	SRA	RSR Stream receive anchor
I	SRBC	Common SRB pool
I	STAT	DBCTL and DRA statistics area
I	STB	RSR Stream block
I	STTR	DL/I trace stacks
I	SVPG	System service parameter lists - global
I	SVPL	System service parameter lists - local
I	TCBT	TCB table
I	TDBC	RSR Tracking data base control
I	TDCB	RSR Tracking log data set DCB
I	TIB	TIB pool for LU 6.2
I	TLS	Transaction level statistics area
I	TPIP	TPIPE pool for OTMA
I	TRND	
I		Transaction (SMB) descriptor
I	<b>TT24</b>	Trace table (24-bit storage)
I	TT3P	Trace table (31-bit, private storage)
I	TTAB	Trace table (31-bit storage)
	UOWE	Unit of work table entry
I		2
		User descriptor control blocks
	USTB	RSR Update sequence number tracking block
	UXIC UXIP	
		User exit instance (private)
		User exit static area (common)
	UXSP	ίι ,
		VSAM RPL/save area stack
1		VTAM session control block
	VWA	Volatile work area
	X124	DL/I pool below 16m line
		Cross memory itask block
I	XMCL	Local XMCI block (ctl private)

I	XPST	Extended PST area (dependent region)
I	XT62	LU 6.2 and OTMA PST extension
I	YQAB	OTMA queue anchor block

# Control block interrelationship diagrams

These diagrams show the interrelationships between major control blocks in an IMS environment.

**Note:** This information is intended for users with experience in obtaining and reading IMS system dumps. The training course IMS Diagnostic Approaches provides an introduction to this information. Further information about this training course is available on the Information Management Training and Certification web site.

# **DFSPRPX0**-parameter blocks

The following figure shows the parameter blocks for DFSPRPX0.

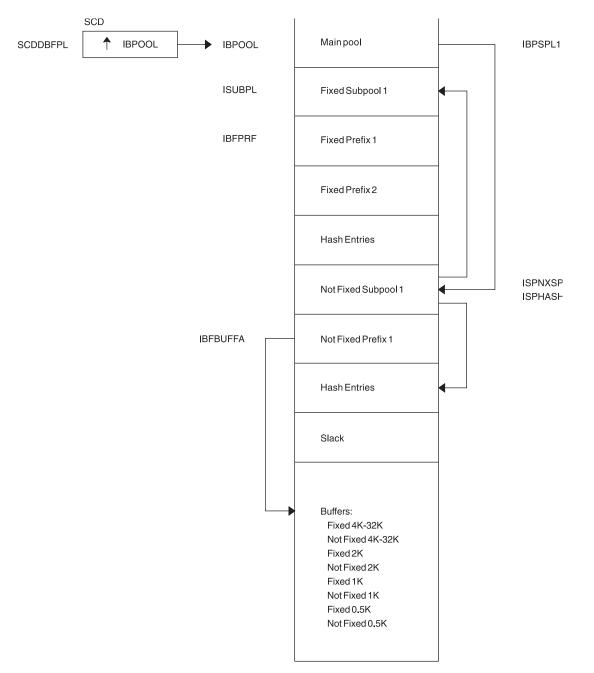

- Note 1: See Figure 4 on page 89
- Note 2: See Figure 21 on page 109
- Note 3: See Figure 26 on page 114

Figure 10. DFSPRPX0-parameter blocks

# **DL/I OSAM buffer pool**

The following figure shows the control blocks for DL/I OSAM buffer pool.

# Sequential buffering control blocks

The following figure shows the sequential buffering control blocks.

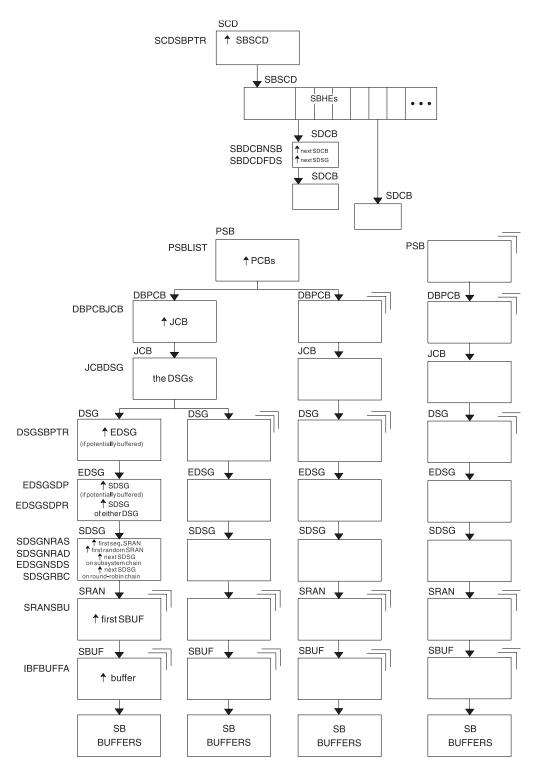

Figure 12. Sequential buffering control blocks

### Notes to Figure 12:

- 1. SCD is the IMS systems content directory.
- 2. SBSCD is a sequential buffering extension to the SCD.
- **3**. SBHEs are sequential buffering hash entries located within the SBSCD (sequential buffering extension to the systems content directory). IMS uses SBHEs to:

- Anchor the sequential buffering extension to the DCB (SDCB)
- Serialize the SDCB and SDSG subsystem chains (defined in notes 4 and 8).
- 4. SDCB is a sequential buffering extension to the data communication block. There is one SDCB for each data set that is actively being sequentially buffered. There must be a separate SDCB for each SBPST that references a HALDB partition, because information in the SDSG will change as the DL/I calls go from partition to partition. As a result, multiple SBPSTs cannot share an SDCB, as is possible for non-HALDB databases. For HALDB, there is one SDCB for each partition used by a PST. IMS uses each SDCB to anchor any sequential buffering SDSGs that have buffer pools allocated to them.
- 5. The chains of SDCBs and SDSGs anchored in the SBHEs are called the SDCB and SDSG subsystem chains.
- **6**. The program specification blocks, DBPCBs, job control blocks, and the data set group control blocks in the figure are DL/I control blocks.
- 7. EDSG is a sequential buffering extension to the DSG. The field EDSGSDP points to the SDSG if the data set group control block is potentially buffered by SB. If the DSG is not potentially buffered (but another DSG for the same data set and same application is), then the field EDSGSDPR points to one of the SDSGs of these "other" DSGs.
- 8. SDSG is a sequential buffering extension to the data set group control block. The SDSG is present if the user wants to have the DSG sequentially buffered. The SDSG is the control block that controls one sequential buffering buffer pool.
- **9**. SRAN is a sequential buffering control block that describes references in one set of recently referenced consecutive data set blocks.
- **10**. SBUF is a sequential buffering control block that describes one individual buffer.

## Buffer handler pool (VSAM)

The following figure shows the buffer handler pool (VSAM).

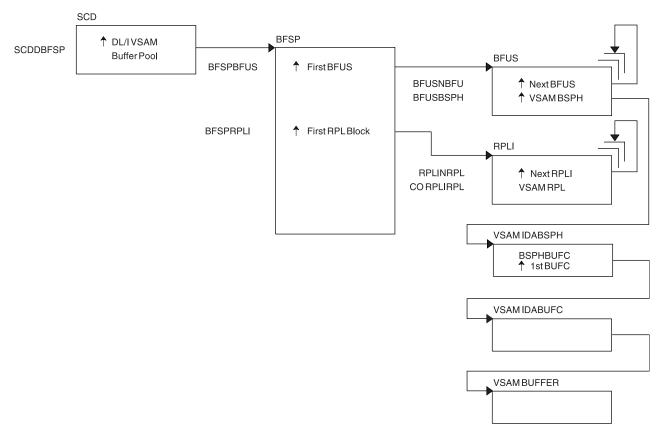

Figure 13. Buffer handler pool (VSAM)

# OSAM DECB with IOB in use

The following figure shows the OSAM DECB with IOB in use.

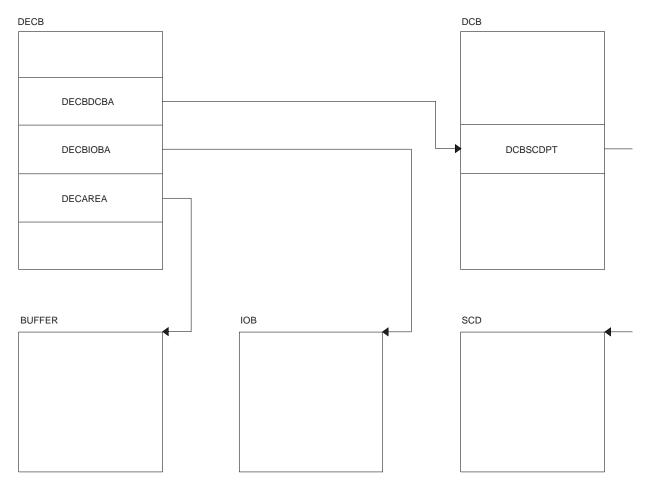

Figure 14. OSAM DECB with IOB in use

# OSAM IOB pool showing available IOBs

The following figure shows OSAM IOB pool showing available IOBs.

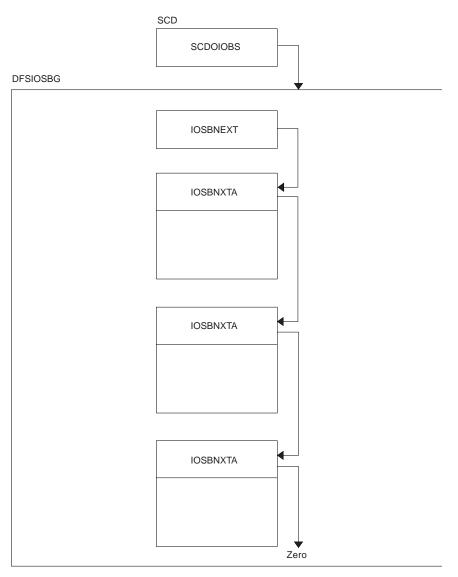

Figure 15. OSAM IOB pool showing available IOBs

Storage allocated using the ICREATE/IDESTROY macros is obtained from the MAIN (WKAP) pool. The control block relationship for the MAIN pool is shown in Figure 16 on page 102.

# Storage management control block relationships created for the MAIN pool

The following figure shows storage management control block relationships created for the MAIN pool.

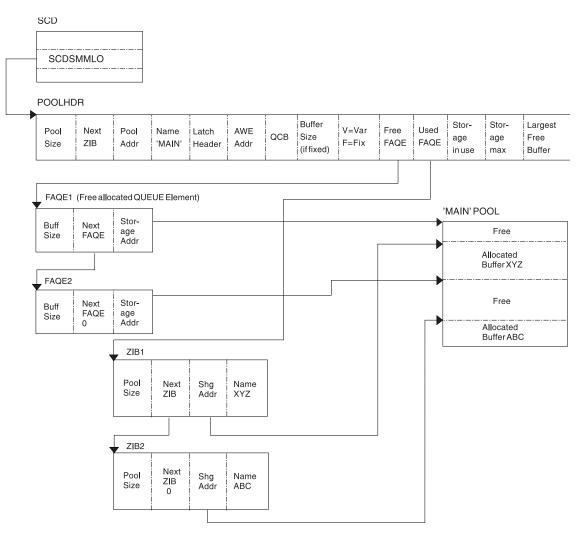

Figure 16. Storage management control block relationships created for the MAIN pool

# Storage management control block relationships for preallocated storage blocks

The following diagram shows the control block relationships for those pools managed by the DFSISMN0 Storage Manager.

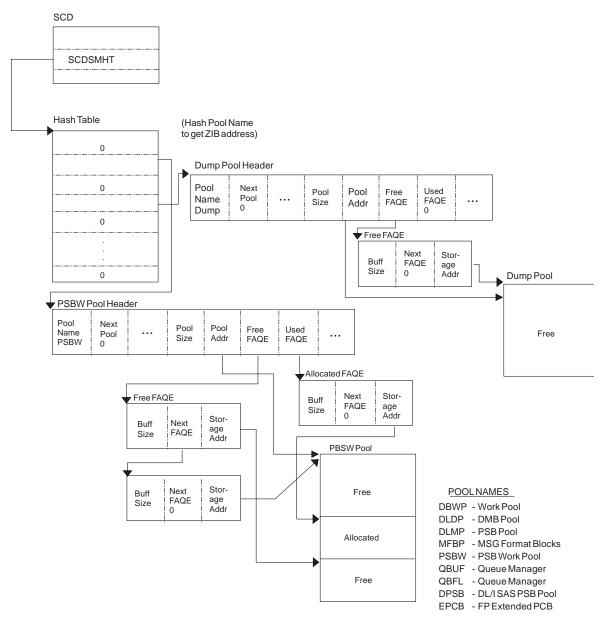

Figure 17. Storage management control block relationships for preallocated storage blocks

Figure 18 on page 105 shows the control block relationship for pools managed by the DFSPOOL Storage Manager. Each pool consists of zero or more noncontiguous storage blocks anchored off a pool header. By obtaining new blocks and releasing unused blocks, you can expand and contract a pool as needed during the execution of IMS.

Each block is divided into a number of fixed-length buffers that are used to satisfy storage requirements. The size and number of buffers can vary from block to block within a pool. Each block also has a block header which contains various information on the block

Each pool can be allocated with a maximum of thirty-two different buffer sizes. The pool header contains a noncompressible block pointer and a compressible block chain anchor for each buffer size available.

The pool header also contains an oversized block chain anchor. If the request size is larger than the largest buffer size available, a block is obtained containing a single buffer of the requested size. Blocks obtained in this manner are placed on the oversized chain. The intention of the oversized chain is to allow for exceptional requests, since normal processing should not need any oversized buffers.

The first block allocated for each buffer size is referred to as the primary block. The number of buffers contained within the primary block can vary from any secondary blocks of the same buffer size. If the primary block is obtained when the pool is allocated, it is held until IMS termination. Because it cannot be compressed, serialization logic is not required when allocating or releasing a buffer from one of these blocks.

If the primary block is not obtained until the first GET request, it along with any secondary blocks are placed on the compressible block chain anchored off the pool header. Serialization logic must be used when scanning the blocks on the compressible chains.

An 8-byte prefix and an 8-byte suffix is added to each buffer. The prefix and suffix are used by the Storage Manager exclusively. The size of the prefix and suffix is included in the current pool size.

The buffer size used to satisfy an incoming request is determined on a best fit basis. Unless the size of the buffer requested is the same size as the actual buffer, there is some unused storage between what the caller views as the end of the buffer and the actual end of the buffer. The buffer the user receives appears to be of the size requested. Any unused space is transparent.

The following pools are defined with user overlay detection: AOIP, CIOP, CMDP, DYNP, EMHB, HIOP, LUMC, LUMP, and SPAP. If a pool is defined with user overlay detection, an 8-byte constant is added to the user portion of the buffer. As far as the caller is concerned, the length of the buffer received is the length requested, followed by an 8-byte constant. For example, if a caller requests a 100-byte buffer from a pool with a user overlay detection, and the smallest buffer size available to satisfy the request is 128 bytes, the user overlay detection constant is placed at an offset of 100 bytes into the buffer. Bytes 107 through 127 are unused.

The user overlay detection constant is used by IMS modules. The Storage Manager does not look at the user overlay detection constant.

# Storage management control block relationships (DFSPOOL pools)

The following figure shows storage management control block relationships (DFSPOOL pools).

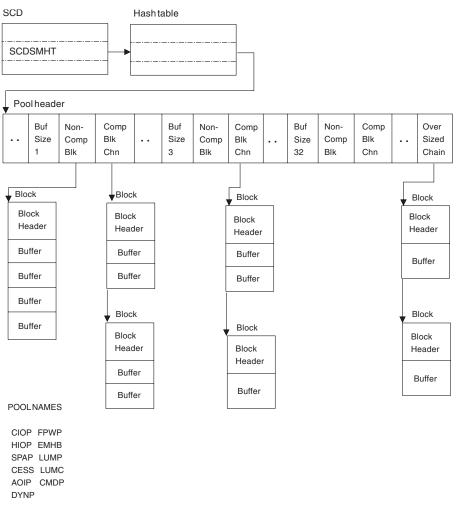

Figure 18. Storage management control block relationships (DFSPOOL pools)

# Storage management control block relationships (DFSCBT00 pools)

The following figure shows the Storage Management (DFSCBT00 Pools) control blocks relationships.

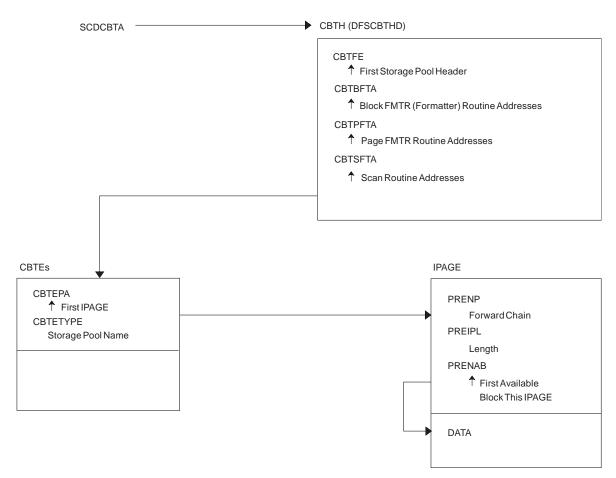

Figure 19. Storage management control block relationships (DFSCBT00 pools)

# Database Manager control blocks for a representative database

The following figure shows the Database Manager control blocks for a representative database.

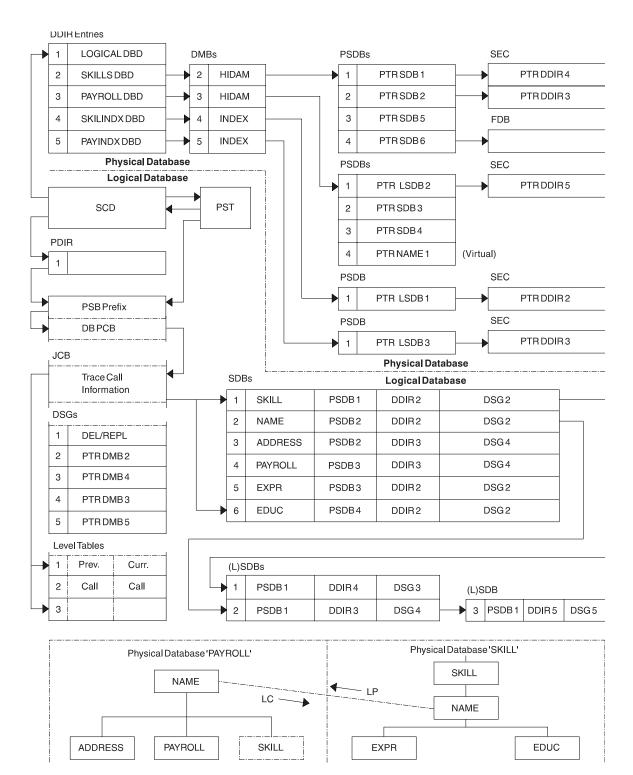

Figure 20. Database Manager control blocks for a representative database

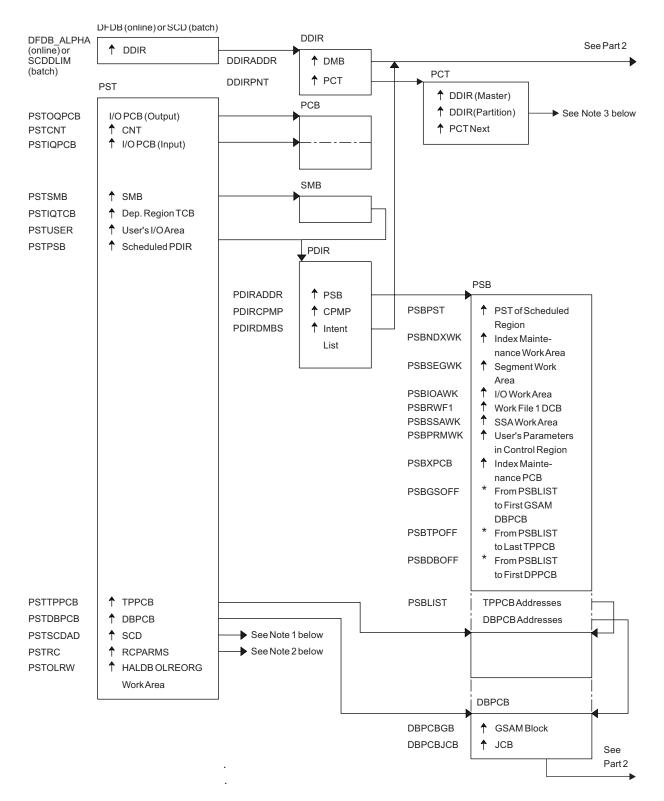

### Note the following HALDB differences for Figure 20:

- The SDBs pointer to the DDIR always points to the HALDB Master's DDIR.
- The PSDBs are under the HALDB master DMB in the DMB pool. The partition DMBs do not contain PSDBs.

- There is no separately defined DDIR or DMB for the primary INDEX database of a PHIDAM. Instead there is an additional AMP in the partition DMB for the primary index.
- There is an ILE DSG for the ILDS which follows the Delete/Replace DSG.

## **Database control blocks**

The following figure shows the relationships between database control blocks.

See the notes that follow Figure 21.

Figure 21. Database control blocks: Part 1 of 2

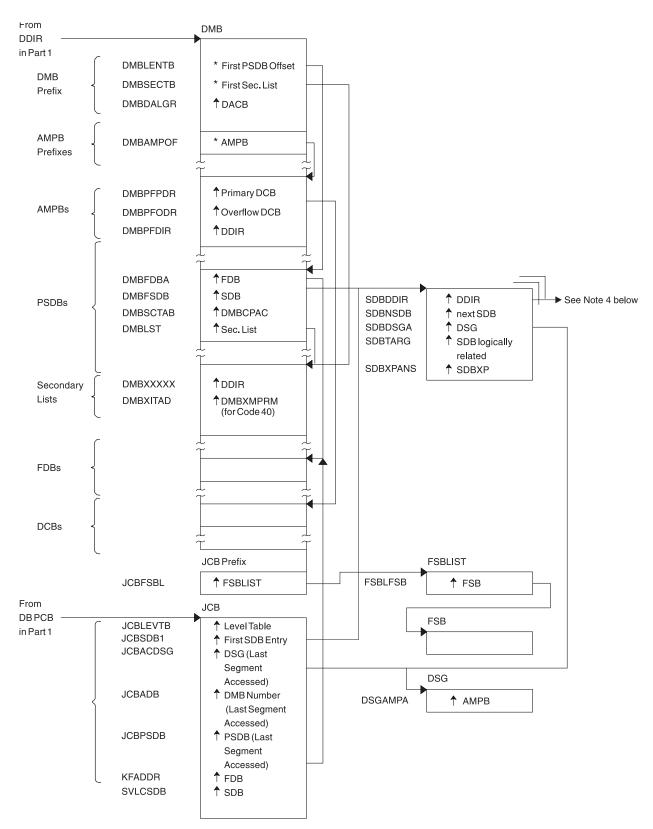

Figure 22. Database control blocks: Part 2 of 2

Notes to Figure 21 on page 109:

1. See Figure 4 on page 89.

- 2. See Figure 10 on page 95.
- **3**. This is a unique HALDB control block. This control block points the partition DDIR to each other and points the partition DDIR to the master DDIR.
- 4. For HALDB, the SDB points to the Master DDIR.

## Diagram of a Data Management Block (DMB)

The following figure shows a diagram of a Data Management Block (DMB).

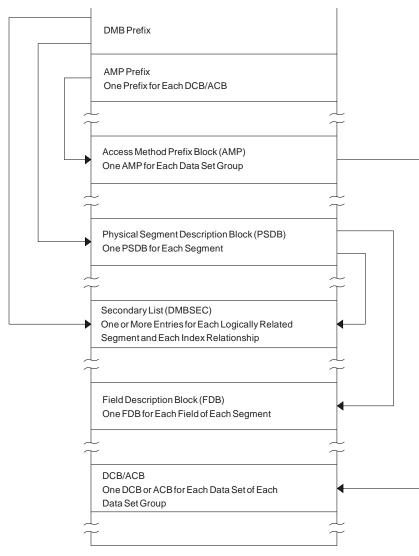

Figure 23. Diagram of a Data Management Block (DMB)

**Note to Figure 23:** For a HALDB, dual DMBs exist in storage. When HALDB Online Reorganization is not in progress, one DMB is active and the other inactive. When HALDB Online Reorganization is in progress, both DMBs are active, with one DMB representing the input data sets, and one DMB representing the output data sets.

## **Overview of Fast Path control blocks**

The following figure shows an overview of Fast Path Control Blocks.

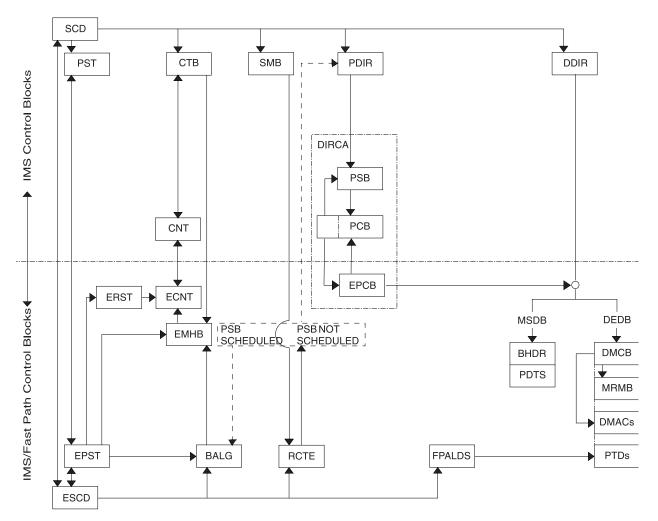

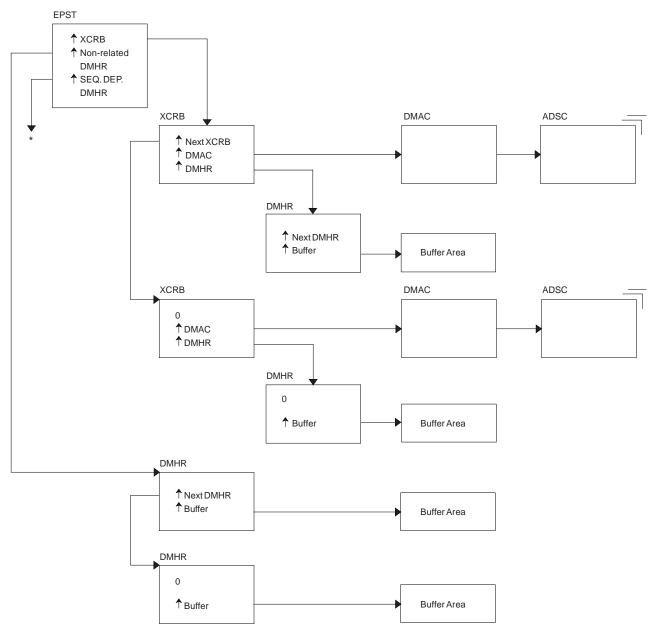

Figure 24. Overview of Fast Path control blocks

# Relationships between buffer control blocks for Fast Path databases

The following figure shows the relationships between buffer control blocks for Fast Path databases.

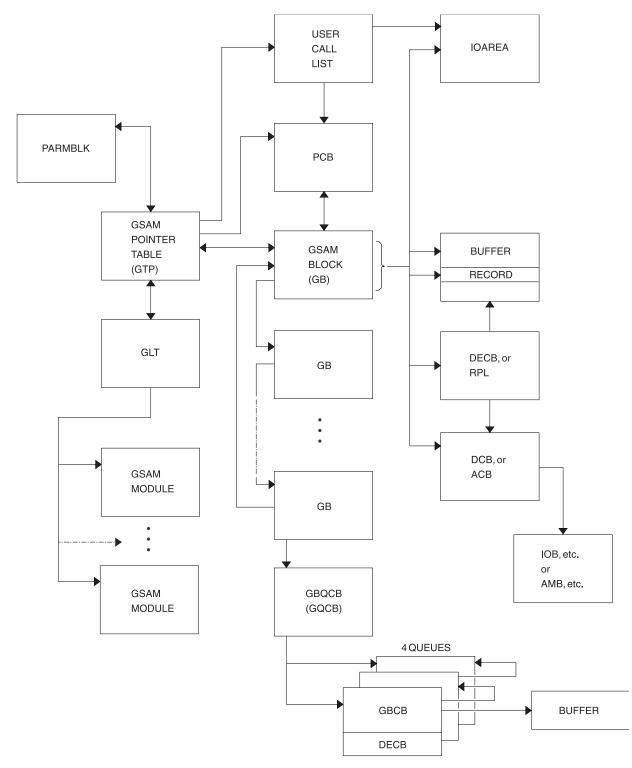

\* EPSTSDBH (This chain is identical to non-related DMHR chain.)

Figure 25. Relationships between buffer control blocks for Fast Path databases

## **GSAM control block overview**

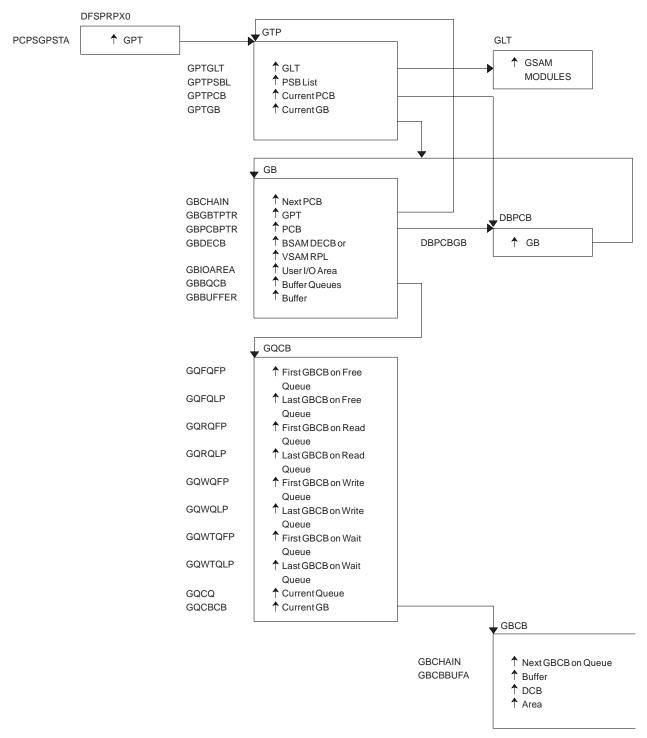

The following figure shows a GSAM control block overview.

# **GSAM control blocks**

The following figure shows the GSAM control blocks.

## **DL/I control block relationships**

The following figure shows the DL/I control block relationships.

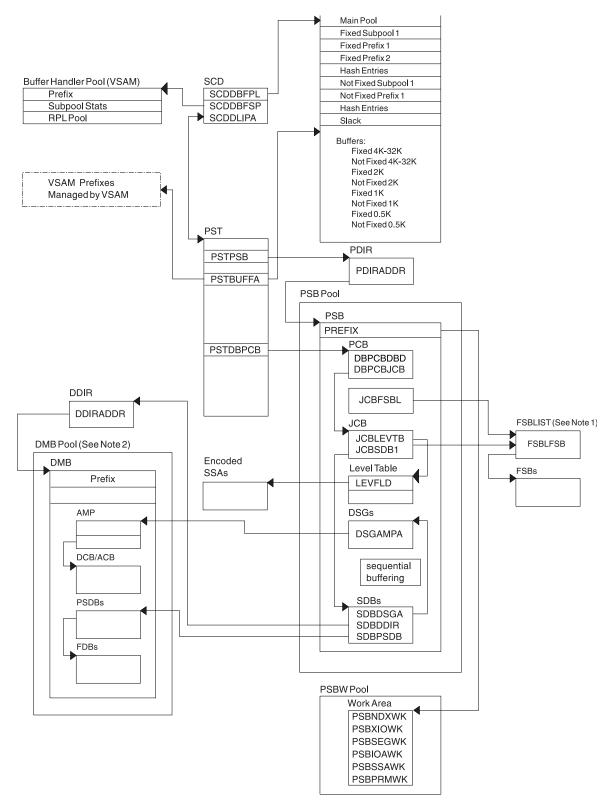

Figure 28. DL/I control block relationships

#### Notes to Figure 28:

1. The FSBLIST contains pointers to the Field Sensitivity Block (FSB). The FSB describes this user's logical use of the sensitive field.

**2**. A partition HALDB DMB is not in the DMB pool. For HALDB, only the Master DMB is in the DMB pool.

### IMS Transaction Manager control blocks

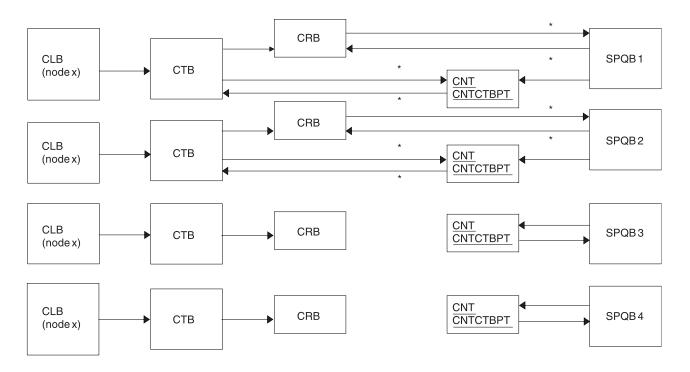

The following figure shows the IMS Transaction Manager control blocks.

	— Standard Prefix → Variable Section →								
WORD 0	WORD 1	WORD 2	WORD 3	WORD 4	WORD 5	WORD 6	WORD 7		
I R NUM	MOD SUB ID FUNC								
Va	Variable Section								
WORD 8	WORD 9	WORD 10	WORD 11	WORD 12	WORD 13	WORD 14	WORD 15		

Figure 29. IMS Transaction Manager control blocks

### Intersystem communication control block structure

The following figure shows the intersystem communication control block structure.

#### Note

Subpool Queue Blocks (SPQB1 and SPQB2) are allocated for sessions. SPQB3 and SPQB4 are not. One SPQB is required for each parallel session.

\* Asterisks indicate that these pointers are set when blocks are allocated.

Figure 30. Intersystem communication control block structure

## **VTCB** load module

The following figure shows the VTCB Load Module.

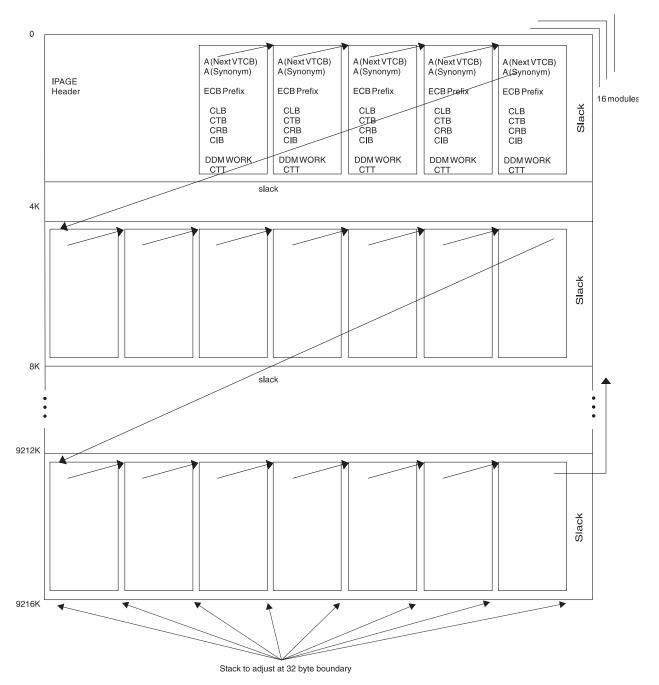

Figure 31. VTCB load module

As illustrated in the following figure, IMS maintains a VTAM terminal control block (VTCB) for each VTAM terminal except MSC VTAM terminals. A VTCB can contain a:

- Communication line block (CLB)
- Communication terminal block (CTB)
- Communication restart block (CRB)

- Communication interface block (CIB)
- Device-dependent module (DDM) work area
- Communication terminal table (CTT) (used only for ETO terminals)

The system of pointers between blocks within a VTCB is the same as the system of pointers used for VTAM terminals.

Some terminals do not require all six blocks. For example, static VTAM blocks use a statically created CTT.

You can find the VTCB for a terminal through the terminal's node name. To do so, you use the DFSCBTS macro interface.

### Multiple Systems Coupling (MSC) control block overview

The following figure shows the Multiple Systems Coupling (MSC) control block overview.

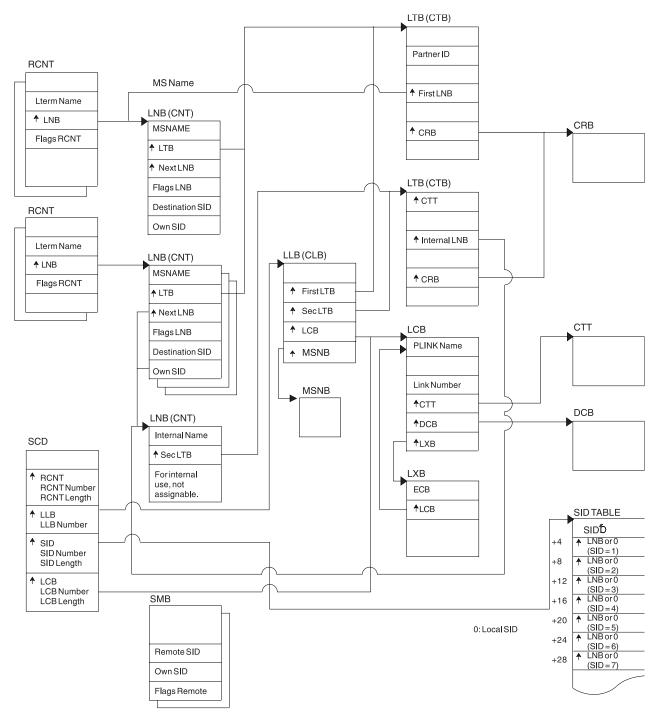

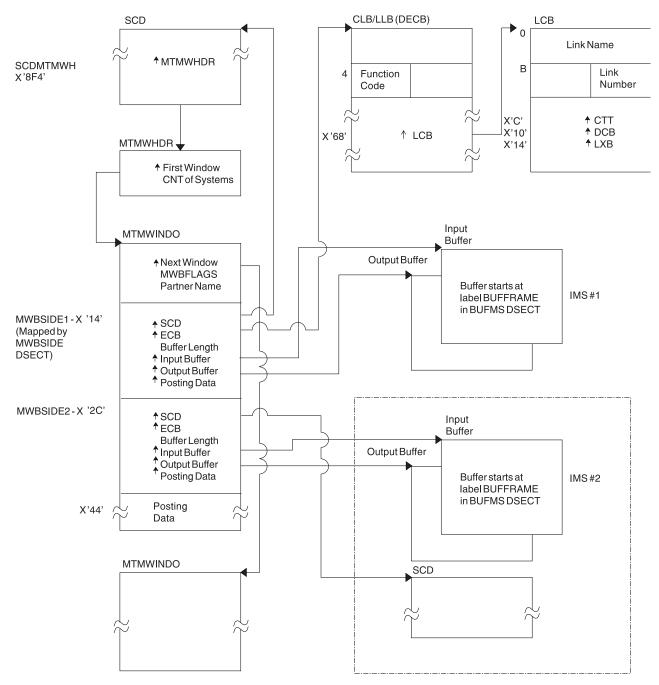

Figure 32. Multiple Systems Coupling (MSC) control block overview

# Multiple Systems Coupling (MSC) main storage-to-main storage control block overview

The following figure shows the Multiple Systems Coupling (MSC) Main Storage-to-Main Storage control block overview.

## z/OS storage map showing IMS-to-IRLM interrelationships

The following figure shows a z/OS storage map displaying IMS-to-IRLM interrelationships.

#### **MVS Common Services Area**

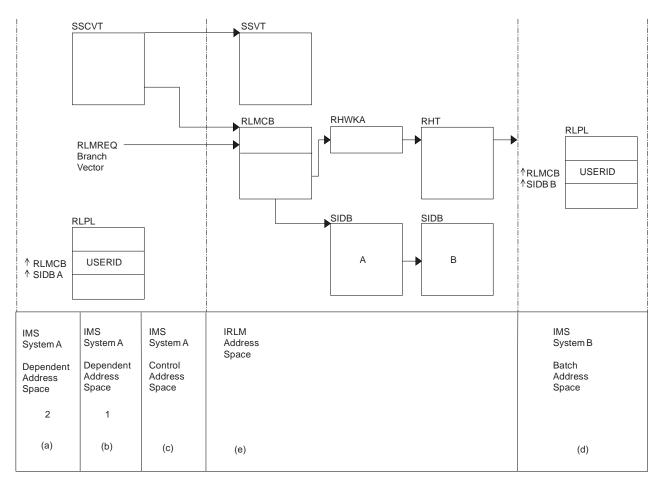

Figure 34. z/OS storage map showing IMS-to-IRLM interrelationships

#### Notes to Figure 34:

- 1. (a), (b), and (c) are z/OS address spaces that make up one online IMS subsystem.
- 2. (d) is a z/OS address space containing an IMS batch subsystem.
- 3. (e) is an IRLM address space to which the two IMS subsystems are connected.
- 4. The RLPLs used by both IMS subsystems reside in the z/OS common services area (CSA).
- 5. To obtain and release global locks, the IMS subsystems branch to the IRLM code (The subsystems enter the IRLM code through the RLMREQ branch vector within the RLMCB that resides in the CSA.)
- 6. The IRLM control block structure that controls the global locks resides in the CSA.
- 7. When PC=YES is in effect, the RHT is in a private address space.

### **IRLM overall control block structure**

The following figure shows the overall control block structure of IRLM.

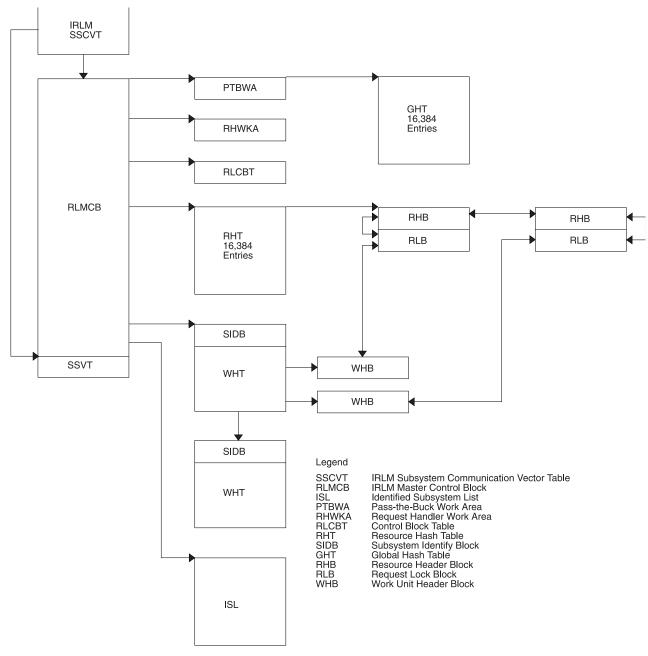

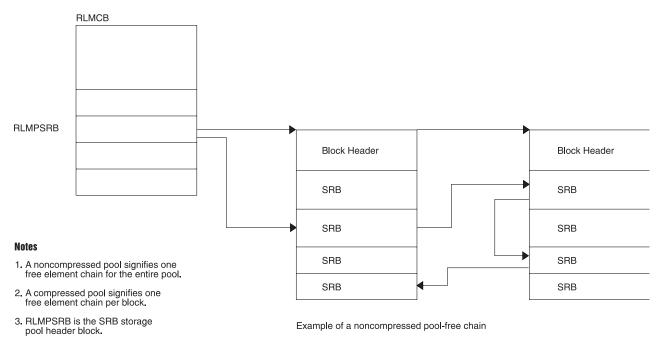

Figure 35. IRLM overall control block structure

## **IRLM storage manager pools**

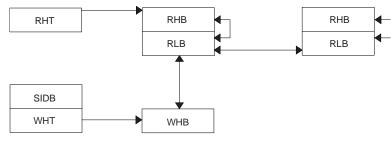

The following figure shows the IRLM Storage Manager pools.

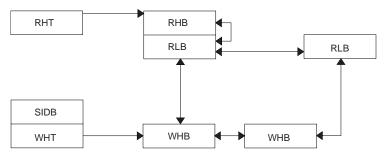

# **IRLM lock request examples**

The following figure shows examples of IRLM lock requests.

(One work unit holds a lock on two resources.)

(Two work units hold a lock on the same resource.)

Figure 37. IRLM lock request examples

# Control block overview of Database Recovery Control (DBRC)

The following figure shows an overview of the Database Recovery Control (DBRC) control blocks.

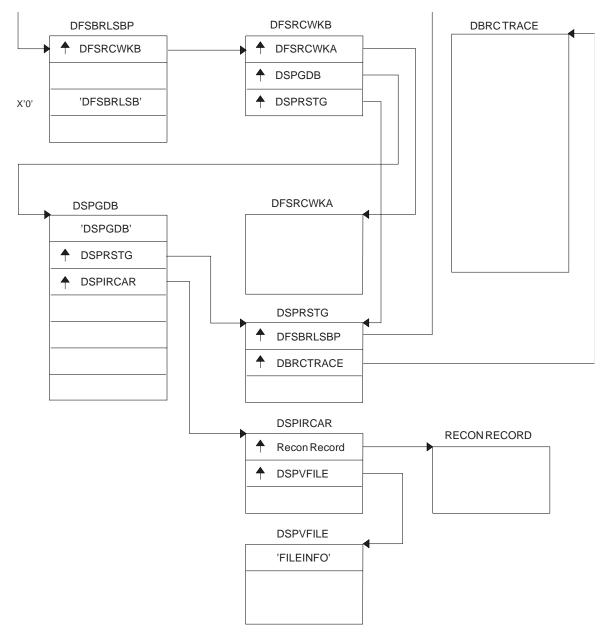

Figure 38. Control block overview of Database Recovery Control (DBRC)

# Organization and basic linkages: DOF (Device Output Format) and MOD (Message Output Descriptor)

The following figure shows the organization and basic linkages of Description Output Format (DOF) and Message Output Descriptor (MOD).

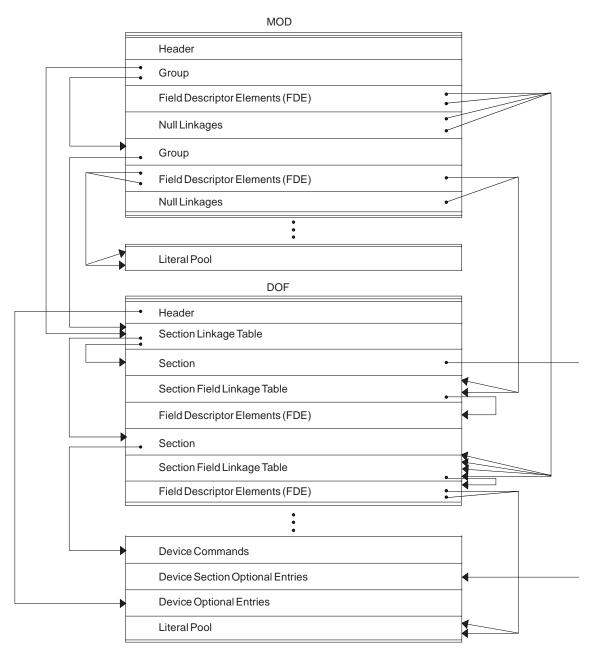

Figure 39. Organization and basic linkages: DOF (Device Output Format) and MOD (Message Output Descriptor)

# Organization and basic linkages: DIF (Device Input Format) and MID (Message Input Descriptor)

The following figure shows the organization and basic linkages between Device Input Format (DIT) and Message Input Descriptor (MID).

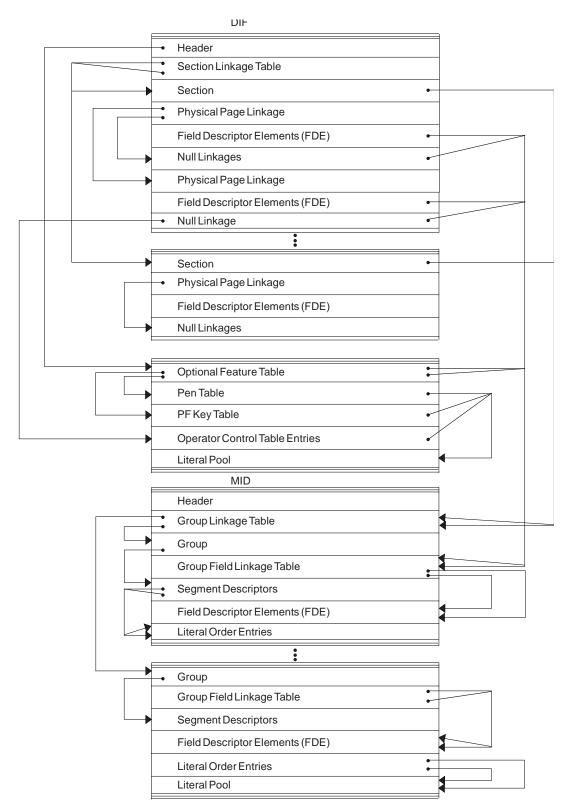

Figure 40. Organization and basic linkages: DIF (Device Input Format) and MID (Message Input Descriptor)

# **DL/I record formats**

The DL/I address space has seven distinct record formats.

# **HSAM and SHSAM database**

HSAM and SHSAM databases share the following record formats.

## Segment Formats

The following figure shows the  $\mathrm{DL}/\mathrm{I}$  data record formats for HSAM and SHSAM databases.

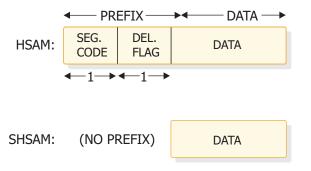

Figure 41. HSAM and SHSAM segment format

#### Delete Byte (Flag) Format

The following figure shows the delete byte (flag) format.

| BIT |
|-----|-----|-----|-----|-----|-----|-----|-----|
| 0   | 1   | 2   | 3   | 4   | 5   | 6   | 7   |
| <   |     |     |     |     |     |     |     |

Figure 42. Delete byte (flag) format

#### Bit Description

- **0** Segment deleted (HISAM or index).
- 1 DB record deleted (HISAM or index).
- 2 Segment processed by DELETE.
- 3 Reserved.
- 4 Data and prefix are separated in storage.
- 5 Segment has been deleted on its physical path.
- 6 Segment has been deleted on its logical path.
- 7 Segment space available to be freed; bits 5 and 6 must also be set on.

#### Block Format for HSAM and SHSAM

There are no dependent segments in a SHSAM block. Block size must be a multiple of segment size. The following figure shows the block format for HSAM and SHSAM.

ROOT SEG.	DEPND. SEG.	DEPND. SEG.	DEPND. SEG.	000 (2)	BLOCK 1
DEPND. SEG.	ROOT (3).	DEPND. SEG.	DEPND. SEG.	DEPND. SEG.	BLOCK 2
DEPND. SEG.			00000 (4)		BLOCK 3

Figure 43. Block format for HSAM and SHSAM

Notes:

- **1.** Pad with zeros if no room for next segment.
- 2. Next database record starts immediately.
- 3. Pad with zeros in last block, after last segment.

# **HISAM and SHISAM database**

HISAM and SHISAM databases share the following record formats.

### Segment Format

Figure 44 and Figure 45 on page 130 show the segment format of HISAM and SHISAM.

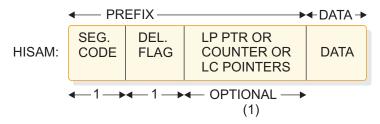

Figure 44. HISAM segment format

## Note:

- **1.** This field can be omitted, or it can be used to hold:
  - A 4-byte LP pointer (if this segment is an LC).
  - A 4-byte counter (if this segment is an LP).
  - One or more 4-byte LC pointers (if this segment is an LP).

DATA

#### Figure 45. SHISAM segment format

Note: This diagram is for a root-only database.

#### LRECL Format

The following figure shows the LRECL format.

		/ / /				
POINTER	SEGMENT	SEGMENT	SEGMENT	ZERO	POINTER	RESIDUAL
(1)	(2)			(3)	ZERO (4)	(5)
		/ / /	·			

(6) ----

#### Figure 46. LRECL format

#### Notes:

**1.** 4-byte RBA of ESDS record containing additional dependent segments for this root occurrence.

SHISAM: This field is omitted.

2. HISAM: Segment includes prefix and data.

SHISAM: Segment includes only data (no prefix). (See Figure 45)

- **3.** 1-byte of zeros indicates the end of segments in this LRECL.
- 4. This field is omitted.
- 5. Space not used.
- **6.** VSAM LRECLs must have an even length.

#### **VSAM Block Formats**

The following figure shows the VSAM block formats.

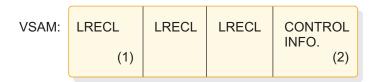

Figure 47. VSAM block formats

Notes:

- 1. LRECL length might change between KSDS and ESDS, depending on user definition.
- 2. 10 bytes in a blocked data set; 7 bytes in an unblocked data set.

## HDAM, HIDAM, PHDAM, or PHIDAM database

HDAM, HIDAM, PHDAM, and PHIDAM databases share the following record format.

## Segment Format

The following figure shows the segment format of HDAM, HIDAM, PHDAM, and PHIDAM databases.

Figure 48. HDAM, HIDAM, PHDAM, or PHIDAM segment format

In order for all segments to be half-word-aligned, a slack byte is added to the end of any segment whose length is an odd number.

#### Prefix of a Segment

The following figure maps the prefix of a segment.

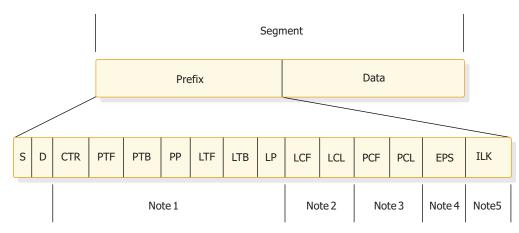

Figure 49. Mapping the prefix of a segment

Notes to Figure 49:

1.

#### Prefix Flag

#### Prefix Flag Description

Segment code (S)

Delete flag (D)

The pointers that exist in this section of the prefix are identified in the PSDB field DMBPTR, as shown in the following list:

- X'80' Counter (CTR) for logical relationships
- X'40' Physical twin forward (PTF)
- X'20' Physical twin backward (PTB)
- **X'10'** Physical parent (PP)
- X'08' Logical twin forward (LTF)
- X'04' Logical twin backward (LTB)

- X'02' Logical parent (LP)
- **X'01'** Hierarchical direct pointing (For twin-type pointing, this bit is off)
- 2. How to locate all logical children: logical child first (LCF); logical child last (LCL)
  - **a.** At DMBFLAG, if flag DMBLCEX (X'20') is on, then DMBLST points to a secondary list for this segment. Secondary lists are used for information concerning indexes, logical children, or the logical parents.
  - **b.** Secondary list entries whose field DMBSCDE (SEC+0) has flag DMBSLC (X'02') on are descriptions of logical children for a logical parent. Within these secondary lists, the field DMBSLCFL (X'02') has the number of the first and last logical child pointers in the prefix of the logical parent.
  - **c.** A logical parent can have multiple types of logical children; thus, there can be more than one logical child secondary list entry for a logical parent. The last secondary list for each segment has the DMBSND flag (X'80') set on in the field DMBSCDE (SEC+0).
- **3.** How to locate all physical children: physical child first (PCF); physical child last (PCL)
  - **a.** Physical child pointers are only present if this segment uses twin-type pointing rather than hierarchic-type pointing. The PSDB entries for the children of the segment being mapped indicate the number of the pointer in the prefix of the parent segment which points to the first and last occurrence of the child segments.
  - **b.** The PSDB fields DMBPPFD and DMBPPBK are used for these numbers. The PSDB entries for the children of the segment being mapped can be found by scanning the PSDBs for those segments with a parent segment code (PSDB+1) that matches the segment code (PSDB+0) of the segment being mapped.
- 4 An EPS (extended pointer set) that is 28 bytes in length is present in the prefix of an LC segment prefix of a HALDB.
- 5 An ILK (indirect list entry key) that is 8 bytes in length is present in each segment of a PHIDAM or PHDAM.

#### Related concepts:

"Dump analysis introduction" on page 161

## OSAM and VSAM ESDS block format

OSAM and VSAM ESDS blocks share the following format.

### **Block format**

The following figure shows the OSAM and VSAM ESDS block format.

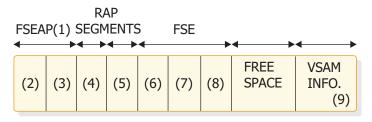

Figure 50. OSAM and VSAM ESDS block format

### Notes:

- **1.** Free space element anchor point.
- **2.** 2-byte offset to first free space element; contains zeros in a bit map block.
- **3.** 2-byte length (see 7); value is zero.
- 4. 4-byte root anchor point (RAP). The number per block is specified in DBDGEN, except if HIDAM with TF (and not TB) is pointing at root level, one anchor point per block is provided and it heads a LIFO chain of roots inserted in that block. If HIDAM or PHIDAM with TB or NT is pointing at the root level, there are no anchor points provided.
- **5.** User database segments (prefix and data). In a bit map block, the bit map starts here and extends to the end of the block or to the VSAM control information.
- 6. 2-byte offset to next free space element (FSE) from start of block.
- 7. 2-byte length of free space, including 8-byte FSE.
- **8.** 4-byte identification of the task that freed this space.
- 9. 7 bytes of VSAM control data; omitted for OSAM.

This format applies at the conclusion of initial load. The subsequent deletion of segments can result in free space elements that alternate with user database segments.

# VSAM LRECL for a primary index

The format of a VSAM LCRECL for a primary index depends on whether it is currently on a storage device, in the buffer pool, or being returned by the buffer handler.

# Format on a storage device or in the buffer pool

The following figure shows the format on a storage device or in the buffer pool.

DEL.	PTR	
FLAG	(1)	ROOT KEY VALUE

Figure 51. LRECL format on storage device and in buffer pool

### Note:

**1.** Four-byte RBA pointer to VSAM database root segment whose key value is the same as the value in the next field of this segment.

# Format as returned by the buffer handler

The following figure shows the VSAM LRECL format as returned by buffer handler (1).

### Notes:

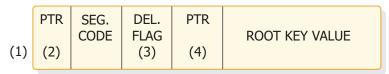

Figure 52. VSAM LRECL format as returned by buffer handler

- 1. Same as buffer pool format, except for pointer and segment code in front.
- 2. Four-byte pointer with value of zero.
- **3.** The segment code value is 01.
- 4. Four-byte RBA pointer to VSAM database root segment whose key value is the same as the value in the next field of this segment.

## VSAM block format on a storage device or in the buffer pool

The following figure shows the VSAM block format on device and in buffer pool.

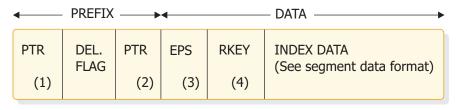

Figure 53. VSAM block format on device and in buffer pool

# Secondary index or PSINDEX database (VSAM only)

The LRECL Format on Device and in Buffer Pool are described.

## LRECL Format on Device and in Buffer Pool

One segment per LRECL. The following figure shows the LRECL Format on Device and in Buffer Pool.

**←** 4 **→ ←** 1 **→ ←** 4 **→ ←** 28 **→ ←** 1-256 **→** 

Figure 54. LRECL format on device and in buffer pool

### Notes:

- **1.** Nonunique keys: This points to ESDS LRECL with the same key value. Unique keys or PSINDEX: This field is omitted.
- 2. Direct pointer to index target segment. Omit this field if symbolic pointing is used or if this is a HALDB PSINDEX.

- **3** The EPS is present only if this is a HALDB PSINDEX. The 4-byte pointer to the target segment is included in the EPS.
- 4 RKEY means root key. The RKEY field is present only if this is a HALDB PSINDEX. This is the key value for the root of the target segment and its length can be from 1 to 256 bytes.

### LRECL as Returned by Buffer Handler

The following figure shows LRECL as returned by buffer handler.

PTR	SEG	DEL.	PTR	EPS	RKEY	INDEX DATA
(1)	(2)	FLAG	(3)	(4)	(5)	(6)

**←**4**→←**4**→←**1**→←**4**→←**28**→←**1-256**→** 

Figure 55. LRECL as returned by buffer handler

### Notes:

- **1.** Four-byte pointer contains zeros.
- **2.** Code value is 01.
- **3.** Direct pointer to index target segment. Omit this field if symbolic pointing is used or if this is a HALDB PSINDEX.
- 4 The EPS is present only if this is a HALDB PSINDEX. The 4-byte pointer to the target segment is included in the EPS.
- 5 The RKEY field is present only if this is a HALDB PSINDEX. This is the key value for the root of the target segment and its length can be from 1 to 256 bytes.
- 6 Sequential segment data format.

### Block Format on Device and in Buffer Pool

The following figure shows the block format on device and in buffer pool.

LRECL	LRECL	LRECL	VSAM INFO.
			<b>←</b> 10 →

Figure 56. VSAM block format on device and in buffer pool

### Segment Data Format

The following figure shows the segment data format.

CONSTANT (Optional)	SEARCH FIELD	SUBSEQUENCE FIELD (Optional)	DUPLICATE DATA (Optional)	CONCAT KEY (Optional)	USER DATA (Optional)	
------------------------	-----------------	------------------------------------	---------------------------------	-----------------------------	----------------------------	--

Figure 57. Segment data format

# Variable-length segments

The HISAM, HDAM, HIDAM, PHDAM, and PHIDAM Segment Format are described.

## HISAM, HDAM, HIDAM, PHDAM, and PHIDAM Segment Format

The following figure shows the HISAM, HDAM, HIDAM, PHDAM, and PHIDAM Segment Format.

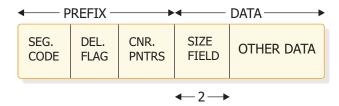

Figure 58. HISAM, HDAM, HIDAM, PHDAM, and PHIDAM segment format

**Note:** Variable-length segment must have a 2-byte length field at the front of the DATA portion.

### HDAM, HIDAM, PHDAM, and PHIDAM

When prefix and data are separated. The following figure shows HDAM, HIDAM, PHDAM, and PHIDAM.

SEG. CODE	DEL. FLAG (1)	CNR. PNTRS	DATA PNTR (2)	FREE SPACE	
← PREFIX → ← DATA →					
SEG. DEL. SIZE CODE FLAG FIELD (3)		OT	HER DATA		

Figure 59. HDAM, HIDAM, PHDAM, and PHIDAM

Notes:

- **1.** DEL FLAG containing X'08' indicates that the data has been separated from the prefix.
- **2.** DATA PNTR is a direct pointer to the segment containing the "other data".
- **3.** The flag value is X'FF'.

# Chapter 6. CQS - Common Queue Server service aids

Use trace records, log records, and utilities to analyze problems in Common Queue Server (CQS).

# Diagnosing a CQS related problem

CQS produces SDUMPs for internal errors. The CQS dumps are in the SYS1.DUMP data sets. CQS can also produce LOGREC data set entries for errors.

## CQS related problems

For a CQS environment, related problems might include:

- IMS WAIT problems
- CQS WAIT/HANG problems
- CQS checkpoint problems
- CQS restart problems
- CQS structure rebuild problems

Implement normal operating procedures to preserve the following documentation close to the time the error occurred:

- Additional manual dump intervention
- z/OS log stream (for problems related to IMS shared queues)
- Most recent SRDS (structure recovery data set) for each dumped structure

For a CQS WAIT/HANG problem, obtain dumps and syslogs of CQS address spaces in the sysplex such as:

- One dump and syslog from the master CQS
- One dump and syslog from the non-master CQS
- One dump and syslog from the error CQS
- One dump and syslog from the normal CQS

A sysplex contains only one master CQS and, most likely, one error CQS in a sysplex. Thus, the maximum number of CQS dumps and syslogs taken is three. If the sysplex contains fewer than three CQS address spaces, then dumps and syslogs of all CQS address spaces are needed.

Before obtaining the syslog, issue the following z/OS DISPLAY commands to write the sysplex information to the syslog:

- D CF,CFNAME=cfname
- D XCF,CF

D XCF, STRUCTURE, STRNAME=*strname* 

For a CQS loop problem, obtain two dumps. To obtain the two dumps:

1. Obtain a z/OS SVC dump of the CQS and its associated IMS control region address space by issuing the following command:

DUMP COMM=(*dump title*) R *id*,JOBNAME=(*j1,j2*), SDATA=(CSA,PSA,RGN,SQA,SUM,TRT),END In this command, *j*1 is the CQS job name, and *j*2 is the IMS control region job name.

- 2. Save the IMS log data sets that are created during the error period.
- **3**. Save the current z/OS log data sets that are created. You can copy the current z/OS log data sets for the CQS log stream by using the IEBGENER utility. No z/OS log data sets are logged (unlike the IMS logger, which does have log archive capability through SLDS).

If an isolated event type within CQS encounters an error, IBM Software Support might request additional trace level settings for the various trace types. If a structure rebuild or structure checkpoint related problem occurs, you will also need to dump the CQS address spaces for any CQS associated with the given structure, and save the associated SRDS (structure recovery data set) for the CQS structure checkpoints and CQS system checkpoints.

# CQS additional manual intervention for dump creation

Additional considerations for dump creation are presented.

## Additional dump considerations

CQS environment additional dump considerations include:

- Structure dumps
- · CQS regions and other CQS clients with their related CQS regions
- CQS regions and other CQS clients with their related CQS regions from other IMSplex members
- z/OS Logger

# CQS structure dump contents

CQS structure dumps should include the primary structures, the overflow structures, and the associated lock entries.

## CQS structure dump example

The following example shows the STRLIST for a dump: DUMP COMM=(MSGQ STRUCTURE DUMP) R nn, STRLIST=(STRNAME=imsmsgq01,LOCKE,(LISTNUM=ALL,ADJ=CAPTURE,EDATA=UNSER), STRNAME=imsmsgq01oflw,LOCKE,(LISTNUM=ALL,ADJ=CAPTURE,EDATA=UNSER)),END

Where *imsmsgq01* is the main structure name, and *imsmsgq01oflw* is the overflow structure name.

When an IMS structure dump is necessary, the z/OS Logger function might be involved with the problem. The following example dumps the z/OS Logger address spaces, the logger structure, and the IMS CF structure.

Where:

imsmsgq01

The main structure name.

```
imsmsgq01oflw
```

The overflow structure name.

mvslogmsg01

The associated logger structure.

## CQS - IEADMCxx example with structures

Create three SYS1.PARMLIB members named IEADMCIA, IEADMCIB, and IEADMCIC by issuing the following command:

```
JOBNAME=(j1,j2,j3,j4,j5),SDATA=(CSA,PSA,RGN,SQA,SUM,TRT,GRSQ),
REMOTE=(SYSLIST=(*('j1','j2','j3','j4','j5'),SDATA))
```

Where:

- *j1* IMS Control Region Jobname.
- j2 IMS DLI Region Jobname.
- *j*3 DBRC Region Jobname.
- *j4* IRLM Region Jobname.
- *j5* IMS CQS Region.

JOBNAME=(*j6,j7,j8,j9,j10*),SDATA=(CSA,PSA,RGN,SQA,SUM,TRT,XESDATA), REMOTE=(SYSLIST=(\*('*j6*','*j7*','*j8*','*j9*','*j10*'),SDATA))

### Where:

- *j6* APPC Region.
- *j*7 APPC Scheduler.
- j8 VTAM.
- *j9* Other CQS Client Region.
- *j10* Other CQS Region.

```
JOBNAME=(IXGLOGR),DSPNAME=('IXGLOGR'.SYSLOGR0),
SDATA=(COUPLE,ALLNUC,LPA,PSA,RGN,SQA,TRT,CSA,GRSQ,XESDATA),
STRLIST=(STRNAME=imsmsgq01,LOCKE,(LISTNUM=ALL,ADJ=CAPTURE,EDATA=UNSER),
STRNAME=imsmsgq01oflw,LOCKE,(LISTNUM=ALL,ADJ=CAPTURE,EDATA=UNSER),
STRNAME=mvslogqmsg01,LOCKE,ACC=NOLIM,(LISTNUM=ALL,EDATA=UNSER,ADJ=CAPTURE))
```

### Where:

### imsmsgq01

The main structure name.

## imsmsgq01oflw

The overflow structure name.

```
mvslogqmsg01
```

The associated logger structure.

## CQS - IEADMCxx dump activation

To create a dump from the IEADMCIA, IEADDMCIB and IEADMCIC parmlib members, issue the following z/OS command: DUMP TITLE=(DUMP OF IMSplex and Partners), PARMLIB=(IA, IB, IC).

Three dump data sets are created on the z/OS image from which the command is issued. Two dump data sets are created on each image in the sysplex that matches the REMOTE specifications for the JOBNAMEs.

**Recommendation:** Provide the z/OS logger address space from the system experiencing problems to z/OS logger support.

# CQS - z/OS log stream example

The merged z/OS log stream can be used to examine CQS log records. IEBGENER can be used along with the default log stream subsystem exit routine, IXGSEXIT, to copy the log records at time of failure for later analysis.

//CQSCPYLG JOB USERID,USERID,MSGLEVEL=1,CLASS=K

```
//* This job copies a CQS log stream to a dataset (max 32K / record) *
//*
//*
     - Replace the DSN on the SYSUT1 card with your CQS logstream
//*
       name.
//*
//*
     - Replace the DSN on the SYSUT2 card with your desired output *
       dataset name. You may also need to adjust the space
//*
//*
       allocations, depending on the size of your logstream.
                                                          *
//STEP1 EXEC PGM=IEBGENER,REGION=1024K
//SYSPRINT DD SYSOUT=*
//SYSUDUMP DD SYSOUT=*
//SYSIN DD DUMMY
//SYSUT1 DD DSN=SYSLOG.MSGQ01.LOG,
    SUBSYS=(LOGR,IXGSEXIT),
DCB=(BLKSIZE=32760)
11
11
//SYSUT2 DD DSN=CQS.LOG.COPY,
// DISP=(NEW, KEEP, DÉLETE),
11
            VOL=SER=USER05.
11
            SPACE=(CYL, (2, 10)),
            UNIT=SYSDA
11
```

# CQS structure recovery data set

Save the most recent CQS SRDS (structure recovery data set) for each structure that is dumped. Use the IDCAMS REPRO command if the LRECL is acceptable (less than 32 761).

# CQS checkpoint problems

There are two types of CQS checkpoints: system checkpoint and structure checkpoints.

## CQS checkpoint messages

Most problems are of structure checkpoint type because it is a sysplex-wide operation with shared resources (SRDS data set, structures on the CF), and it needs cooperation through z/OS IXLUSYNC between all CQSs within the sysplex. Sometimes, another CQS process (initialization, termination, rebuild, overflow threshold, or overflow scan) can interfere with the checkpoint process and cause it to fail.

### CQS System Checkpoint Messages

- 1. CQS0030I for a successful CQS system checkpoint.
- 2. CQS0035E for a failed CQS system checkpoint. If the CQS system checkpoint failed with CQS0035E, refer to "CQS messages" in *IMS*

*Version 13 Messages and Codes, Volume 2: Non-DFS Messages* for the details of the failure and the recommended system programmer action.

### **CQS Structure Checkpoint Messages**

The syslog of a successful CQS structure checkpoint will contain five CQS messages in the following order:

CQS0220I CQS cqsname START STRUCTURE CHECKPOINT FOR STRUCTURE strname CQS0200I STRUCTURE strname QUIESCED FOR STRUCTURE CHECKPOINT CQS0201I STRUCTURE strname RESUME AFTER STRUCTURE CHECKPOINT CQS0030I SYSTEM CHECKPOINT COMPLETE, STRUCTURE strname LOGTOKEN logtoken CQS0221I CQS COMPLETE STRUCTURE CHECKPOINT FOR STRUCTURE strname

If the CQS structure checkpoint failed with a CQS0222E message, refer to the "CQS messages" section in *IMS Version 13 Messages and Codes*, *Volume 2: Non-DFS Messages* for the details of the failure and the recommended system programmer action.

If message CQS0222E is not displayed and all five of the normal structure checkpoint messages did not appear on the console, CQS probably has encountered a serious WAIT/HANG problem.

The CQS log records, the structure dump of the related structure, and the SRDSs (structure recovery data sets) are helpful in diagnosing the problem. After collecting all the documents, you can stop the CQS in error and restart it to resolve the WAIT/HANG problem.

# CQS structure rebuild problems

The most common structure rebuild problem is a rebuild failure. Some environmental situations can occur that cause rebuild to fail.

# **Rebuild failures**

Other types of rebuild problems are much more rare, such as rebuild hanging, rebuild not being initiated when required, work hanging after a successful rebuild, rebuild losing data objects, and rebuild duplicating data objects. Follow these general steps to address any rebuild failure you encounter:

Collect SYSLOGs

Collect the syslog for each LPAR that is running a CQS that is sharing queues. Evaluate each syslog for the following information:

- How the rebuild was initiated (operator command, structure failure, CF failure, link failure).
- How the rebuild was stopped (operator command or CQS).
- Rebuild master (CQS0240I message).
- Rebuild type (COPY or RECOVERY in CQS0240I message).
- Structure quiesced or resumed messages:
  - CQS0200I STRUCTURE strname QUIESCED FOR reason
  - CQS02011 STRUCTURE strname RESUMED AFTER reason
- Structure status change messages (CQS0202I).
- Structure rebuild messages:
  - CQS0240I CQS cqsname STARTED STRUCTURE copy/recovery FOR STRUCTURE strname
  - CQS02411 CQS cqsname COMPLETED STRUCTURE copy/recovery FOR STRUCTURE strname

- CQS0242E CQS FAILED STRUCTURE copy/recovery/rebuild FOR STRUCTURE strname
- CQS0243E CQS cqsname UNABLE TO PARTICIPATE IN REBUILD FOR STRUCTURE strname
- CQS0244E STRUCTURE RECOVERY REQUIRED AFTER RECOVERY FAILURE FOR STRUCTURE *strname*
- CQS0245E STRUCTURE *strname* REBUILD ERROR
- Consult the CQS Restart and Rebuild Error Reason Codes table

## • Check rebuild status

Check the rebuild status by issuing the following command on every LPAR where a CQS participating in the rebuild resides:

## D XCF, STRUCTURE, STRNAME=*strname*

If the output indicates that rebuild is waiting for a particular event, a CQS might not be responding to a rebuild event because it is hung or in a loop, which hangs the rebuild. Consider dumping the CQS address space and canceling the CQS that is not responding to the rebuild event, to see if that enables the rebuild to continue.

## • Analyze if structure still viable

If a structure copy initiated by an operator failed, no action needs to be taken to restore access to the structure. The structure is still viable and you still have access. Analyze why the structure copy failed, to determine whether you need to take action to prevent a subsequent rebuild failure.

## • Restore link, if applicable

If a structure rebuild was initiated because of a link failure and the structure rebuild failed, try to restore the link to restore access to the structure. The structure is still viable. Analyze why the structure rebuild failed, to determine whether you need to take action to prevent a subsequent rebuild failure.

## Contact IBM

If you are unable to resolve the problem, take the following actions:

- Copy the SYSLOG, including the D XCF, STRUCTURE, STRNAME=*strname* output from every LPAR.
- Dump all the CQS address spaces, including the rebuild master CQS address space. Message CQS0240I indicates the rebuild master name.
- Retain the CQS log records. The CQS log might contain important log records pertaining to data objects put on the structure, moved on the structure, or deleted from the structure. The CQS log might also contain important log records pertaining to rebuild, such as:
  - Rebuild begin log record (4301).
  - Rebuild end log record (4302).
  - Rebuild failed log record (4303).
  - Rebuild lost UOW list log record (4304).
  - Request log records (03xx, 07xx, 08xx, 0Bxx, 0Dxx).
- Retain the IMS log records.
- Create a structure dump if you suspect a rebuild hang. The structure dump might contain important information about structure locks.
- Call the IBM Software Support for help.

# CQS trace records

Analyze CQS trace records in a formatted dump to determine which function encountered an error, and whether a problem is environmental or internal.

### Trace tables

Trace record eye catchers in a formatted dump provide clues about which functions resulted in errors. You might be able to correct environmental problems immediately. Refer internal IBM problems to IBM with appropriate documentation, such as system console logs and dumps.

CQS trace records are written to one or more of the trace tables shown in the following table.

Table name	Number of tables	Table description
ERR	1	Errors
CQS	1	CQS activity, including errors
INTF	1	CQS interface events
OFLW	1 per structure (EMHQ, MSGQ)	Structure overflow events
SEVT	1 per structure (EMHQ, MSGQ)	Structure event activity
STR	1 per structure (EMHQ, MSGQ)	Client activity for this structure, including errors

Table 8. Trace tables that contain CQS trace records

Each CQS trace record is 32 bytes long, except records in the SEVT and OFLW tables. Those tables use an expanded 64-byte format. In a standard 32-byte trace entry, the first byte is the trace code and the second byte is the trace subcode. Many trace records contain a structure ID that identifies which structure the trace record applies to: the MSGQ primary structure, the MSGQ overflow structure, the EMHQ primary structure, or the EMHQ overflow structure. Trace records that apply to a client request contain a client ID that identifies the client that issued the request. The last 8 bytes are the STCK time stamp of when the trace record was written. The mapping of the rest of the bytes in the trace record is unique to the trace code and subcode.

The expanded 64-byte format used by trace records in the SEVT and OFLW tables contains 16 words of trace data in the following format:

#### Word 0

Byte 0 contains the trace code of the event.

Byte 1 contains the trace subcode of the event.

Byte 2 contains data dependent on the type of event, typically the structure ID.

Byte 3 contains data dependent on the type of event, typically the client ID.

### Word 1 - word 12

These 48 bytes contain trace data generated by the event. The exact content is dependent on the type of event.

### Word 13

This word contains the ID of the event control block (ECB) of the task that wrote the trace record in the table.

## Word 14 - word 15

These 8 bytes contain the time stamp of the event in STCK format.

CQS trace records are mapped by macros that use the naming convention CQSTR*xxx*, where *xxx* represents the function that is being traced. For example, CQSTRPUT maps trace records associated with the CQSPUT request. Trace record mapping is based upon the trace code and the trace subcode.

Find the CQS trace code in the following table to locate the CQS macro that maps the trace record. The following table shows the CQS trace codes, the macro that maps the trace code, and a description of the trace macro.

Trace code	Macro	Description	
3	CQSTRCON	CQSCONN request	
4	CQSTRDSC	CQSDISC request	
5	CQSTRRSY	CQSRSYNC request	
6	CQSTRINF	CQSINFRM request	
7	CQSTRPUT	CQSPUT request	
8	CQSTRRD	CQSREAD request	
9	CQSTRBRW	CQSBRWSE request	
0A	CQSTRUNL	CQSUNLCK request	
0B	CQSTRMOV	CQSMOVE request	
0C	CQSTRRCV	CQSRECVR request	
0D	CQSTRDEL	CQSDEL request	
E	CQSTRQRY	CQSQUERY request	
0F	CQSTRCHK	CQSCHKPT request	
10	CQSTRSHT CQSSHUT re		
11	CQSTRUPD	CQSUPD request	
30	CQSTRICQ CQS initialization		
31	CQSTRTCQ	CQS termination	
32	CQSTRYCH	System checkpoint	
40	CQSTRIST	Structure initialization	
41	CQSTRSTS	Structure service	
42	CQSTRTCH	Structure checkpoint	
43	CQSTRRBL	Rebuild	
44	CQSTROFL	Overflow	
45	CQSTRSTE	Structure event	
50	CQSTRLOG	Log services	
51	CQSTRTBL	Table services	
52	CQSTRDYA	Dynamic allocation services	
53	CQSTRDSS	Data set services	

Table 9. CQS trace codes and mapping macros

Table 9. CQS trace codes ar	nd mapping macros (	(continued)
-----------------------------	---------------------	-------------

Trace code	Macro	Description	
54	CQSTRDSP	Data space services	
55	CQSTRLRR	Log record router	
56	CQSTRXCF	z/OS cross-system coupling facility interface	
57	CQSTRCMD	Command	
60	CQSTRSTT	Statistics	
70	CQSTRINT	CQS client interface	

Trace codes for CQS requests are defined in the CQSRQTYP macro. Trace codes for other CQS functions are defined in the CQSCODES macro. CQS trace records in a formatted dump might contain eye catchers that provide clues about which function encountered an error, such as "overflow," "rbld," "str chkpt," and "duplex."

CQS request trace records sometimes contain a return code, reason code, and completion code from the request. CQS request return codes, reason codes, and completion codes are mapped by macros that use the naming convention CQSRR*xxx*, where *xxx* represents the function that is being traced. For example, the macro CQSRRPUT maps return codes, reason codes, and completion codes that are associated with the CQSPUT request. The following table shows the macros that define the return codes, reason codes, and completion codes for CQS requests.

Table 10. CQS mapping macros and request trace records
--

Macro	CQS request macro for return codes, reason codes, and completion codes	
CQSRRCON	CQSCONN	
CQSRRDSC	CQSDISC	
CQSRRRSY	CQSRSYNC	
CQSRRINF	CQSINFRM	
CQSRRPUT	CQSPUT	
CQSRRD	CQSREAD	
CQSRRBRW	CQSBRWSE	
CQSRRUNL	CQSUNLCK	
CQSRRMOV CQSMOVE		
CQSRRRCV CQSRECVR		
CQSRRDEL	CQSDEL	
CQSRRQRY	CQSQUERY	
CQSRRCHK	CQSCHKPT	
CQSRRSHT	CQSSHUT	
CQSRRUPD CQSUPD		

CQS trace records in formatted dumps contain eye catchers that identify the trace code and the trace subcode.

The following example shows a CQS trace record with eye catchers:

INFRM: INF DONE FOR Q

06090101 05E3F3F2 F7F0D3C1 40404040 40404040 05541160 AF975E81 59426906

The trace code is in the first byte (X'06'), which the CQSRQTYP macro documents as the CQSINFRM request. The eye catcher is INFRM. The CQSTRINF macro maps the trace records for trace code X'06'.

The trace subcode is in the second byte (X'09'), which the CQSTRINF macro documents as "inform done for queue." The eye catcher is INF DONE FOR Q.

The CQSTRINF macro documents byte 3 for trace code X'06' as containing the structure ID (X'01'). Structure ID X'01' indicates the primary MSGQ structure.

The CQSTRINF macro documents byte 4 for trace subcode X'06' as containing the client ID (X'01'). Client ID X'01' represents the client that issued the CQSINFRM request. The CQSTRINF macro documents words 2, 3, 4, and 5 for trace subcode X'06' as containing the name of the queue for which the inform was done. This queue name is for queue type 05 (the IMS transaction queue). The queue name is T3270LA (X'E3F3F2F7F0D3C1').

The CQSTRINF macro documents word 6 for trace subcode X'06' as the ECB of the task that wrote this trace record (X'05541160').

The CQSTRINF macro documents words 7 and 8 as the STCK time of when the trace record was written.

# **CQS** log records

You can use Common Queue Server (CQS) log records to diagnose problems related to the CQS address space and generate various reports, such as statistics about the number of requests.

CQS writes records to the z/OS log stream that contains all CQS log records from all CQSs that are connected to a structure pair. You can use the log records to:

• Diagnose problems related to the CQS address space.

For CQS internal errors, the IBM support representative will direct you to print the appropriate log records.

You can sometimes use information in the log records to set up a keyword string to search APAR descriptions and compare them to your own problem.

 Generate various reports related to the CQS address space, such as statistics about the number of requests.

By knowing the content and format of the log records, you can set up a DFSERA10 job to format and print the specific log records you want.

Each CQS log record contains a log record prefix, followed by data that is unique to the record. Macro CQSLGRFX maps the log record prefix.

You can view the CQS log record formats by assembling mapping macro CQSLGREC with TYPE=ALL.

Individual log record DSECTs can be obtained by assembling the ILOGREG macro while including a format statement for the desired log record.

Table 11. CQS log records

Туре	Subtype	Mapping macro	Conditions for writing the log record
X'03'	X'01'	CQSLGCON	CQSCONN request: The client connect to a structure completed.
X'04'	X'01'	CQSLGDSC	CQSDISC request: The client disconnect from a structure completed.
X'07'	X'01'	CQSLGPUT	CQSPUT OBJECT request completed.
	X'02'		CQSPUT COMMIT request completed.
	X'03'		CQSPUT START request completed.
	X'04'		CQSPUT FORGET request completed.
	X'05'		CQSPUT ABORT request completed.
	X'06'		CQSPUT request failed.
	X'07'		CQSPUT system checkpoint record was written.
	X'08'		CQSPUT FORGET request completed. This is a batched log record.
X'08'	X'01'	CQSLGRD	CQSREAD request completed.
	X'02'		CQSREAD request failed.
	X'03'		CQSREAD system checkpoint record was written.
		CQSLGCHD	This system checkpoint header record is not a complete log record, but it is used in CQSLGPUT and CQSLGRD system checkpoint log records.
X'0B'	X'01'	CQSLGMOV	CQSMOVE or CQSUNLCK request completed.
	X'02'		CQSMOVE or CQSUNLCK request failed.
	X'03'		CQSMOVE or CQSUNLCK request moved an object between the primary and overflow structure.
X'0D'	X'01'	CQSLGDEL	CQSDEL request: Delete-type 1 (delete by token) completed.
	X'02'		CQSDEL request: Delete-type 2 (delete by queue name) completed.
	X'03'		CQSDEL request: Delete-type 3 (delete by queue name and UOW) completed.
	X'04'		CQSDEL request: Delete-type 1 (delete by token) completed. This is a batched log record.
		CQSLGBHD	This batched log record header record is not a complete log record, but is used in CQSLGPUT and CQSLGDEL batched log records.
X'10'	X'01'	CQSLGSHT	CQSSHUT request completed.
X'32'	X'01'	CQSLGYCH	System checkpoint started.
	X'02'		System checkpoint ended.
	X'03'		System checkpoint failed.
X'40'	X'01'	CQSLGIST	Beginning of log stream.
X'42'	X'01'	CQSLGTCH	Structure checkpoint started.
	X'02'		Structure checkpoint ended.
	X'03'		Structure checkpoint failed.
X'43'	X'01'	CQSLGRBL	Structure rebuild started. Statistics about the old structure, the rebuild structure, and rebuild failure are mapped by CQSSSTT6.
	X'02'		Structure rebuild ended. Statistics about the old structure, the rebuild structure, and rebuild failure are mapped by CQSSSTT6.

Table 11. CQS log records (continued)

Туре	Subtype	Mapping macro	Conditions for writing the log record
	X'03'		
			Structure rebuild failed. Statistics about
			the old structure, the rebuild structure,
			and rebuild failure are mapped by CQSSSTT6.
	X'04'		
			Structure rebuild resulted in a lost UOW list.
			This record lists the lost UOWs.
X'44'	X'01'	CQSLGOFL	Overflow threshold began.
	X'02'		Overflow threshold ended.
	X'03'		Overflow threshold failed.
	X'04'		Overflow mode ended.
	X'05'		Overflow status change.
	X'06'		Qnames were moved to overflow.
	X'07'		Qnames were removed from overflow.
	X'08'		CQSOVERFLOWQNMR, a control list entry containing the list of queue names deleted from overflow, was deleted.
	X'09'		Overflow Scan Begin.
	X'0A'		Overflow Scan End.
	X'0B'		Private Queue Scan Begin.
	X'0C'		Structure to be deleted.
X'60'	X'01'	CQSLGSTT	Structure statistics were written at the end of system checkpoint. Individual statistics areas are mapped by CQSSSTT1, CQSSSTT2, CQSSSTT3, CQSSSTT4, and CQSSSTT5.
	X'C0'		Internal BPE service statistics were written at the end of system checkpoint.

# **Printing CQS log records**

To print the CQS log records from the z/OS system log, use the IMS File Select and Formatting Print utility (DFSERA10) with exit routine CQSERA30.

### Example JCL to print CQS log records

The following example shows the required JCL to print the log records from a z/OS system log. This JCL causes the z/OS logger to invoke the default log stream subsystem exit routine, IXGSEXIT, to copy the log records. The exit routine returns a maximum of 32 760 bytes of data for each log record even though CQS supports larger log records. You can specify the name of a different exit routine, if necessary.

Use the following JCL to print the CQS log records:

//CQSERA10	JOB	MSGLEVEL=1,MSGCLASS=A,CLASS=K
//STEP1	EXEC	PGM=DFSERA10
//STEPLIB	DD	DISP=SHR,DSN=IMS.SDFSRESL
//SYSPRINT	DD	SYSOUT=A
//TRPUNCH	DD	SYSOUT=A,DCB=BLKSIZE=80
//SYSUT1	DD	DSN=SYSLOG.MSGQ01.LOG,
11		SUBSYS=(LOGR, IXGSEXIT),
11		DCB=(BLKSIZE=32760)
//SYSIN	DD 🛛	r

CONTROL CNTL H=EOF OPTION PRINT EXITR=CQSERA30 END //

**DD** statements

### **STEPLIB**

DSN= points to IMS.SDFSRESL, which contains the IMS File Select and Formatting Print utility (DFSERA10).

### SYSUT1

DSN= points to the CQS log stream name that was specified in the LOGNAME= parameter in the CQSSGxxx PROCLIB member.

### **Control Statements**

**H=** Specifies the number of log records to print. H=EOF prints all log records.

### EXITR=CQSERA30

The CQS log record routine that is called to format each log record. This routine prints the record type and time-stamp information for each record, and dumps the contents of the record (up to a maximum of 32 760 bytes (X'7FF8')).

### Limiting Log Data to a Specified Time Range

You can limit the log records you print to those in a particular interval of time by using the FROM and TO parameters on the SUBSYS statement. For example, the following DD card:

//SYSUT1	DD	DSN=SYSLOG.MSGQ01.LOG,
11		SUBSYS=(LOGR,IXGSEXIT,
//		'FROM=(2001/042,11:00:00),TO=(2001/042,12:00:00)'),
//		DCB=(BLKSIZE=32760)

would pass log records only from 11:00 to 12:00 on day 42 of the year 2001 to the DFSERA10 program. Dates and times specified in this manner are in GMT, and the seconds field of the time values is optional. If you want to use local dates and times, add the LOCAL keyword to the statement:

//SYSUT1	DD	DSN=SYSLOG.MSGQ01.LOG,
//		SUBSYS=(LOGR,IXGSEXIT,
//		'FROM=(2001/042,11:00:00),TO=(2001/042,12:00:00),LOCAL'),
//		DCB=(BLKSIZE=32760)

# Copying CQS log records for diagnostics

IBM Software Support sometimes requires a copy of a range of CQS log records for problem determination. You can use the IEBGENER utility program to copy some or all of the CQS log for a structure to a BSAM data set for sending to IBM Software Support.

## IEBGENER utility program example

The copy made by the IEBGENER utility is a binary image of the log records. The following JCL is a job that copies CQS log records between 15:10 and 15:30 local time on day 89 of 2001 to a data set named CQS.LOG.COPY:

//STEP1	EXE(	C PGM=IEBGENER
//SYSPRINT	DD	SYSOUT=*
//SYSUDUMP	DD	SYSOUT=*
//SYSIN	DD	DUMMY
//SYSUT1	DD	DSN=SYSLOG.MSGQ01.LOG,
11		SUBSYS=(LOGR,IXGSEXIT,
//		'FROM=(2001/089,15:10),TO=(2001/089,15:30),LOCAL'),
//		DCB=(BLKSIZE=32760)
//SYSUT2	DD	DSN=CQS.LOG.COPY,
//		DISP=(NEW,KEEP,DELETE),
11		VOL=SER=EDSDMP,
//		SPACE=(CYL,(10,10)),
//		UNIT=SYSDA

If you copy CQS log records using the IEBGENER utility, the following guidelines apply:

- The copied records cannot be used by CQS in any way (such as restart or recovery). They are for diagnostic purposes only.
- CQS log records that are greater than 32 KB in length are truncated. The SUBSYS exit supports a maximum of a 32 KB record size.

# Chapter 7. CSL - Common Service Layer service aids

Common Service Layer (CSL) and Resource Manager (RM) trace records can help you analyze problems in CSL.

### **Related tasks**:

"Collecting data about CSL-related problems" on page 21

# **CSL** trace records

You can analyze CSL address space trace records (for example OM, RM, or SCI) in a formatted dump to determine whether a problem is environmental or internal.

### Trace records

Trace record eye catchers in a formatted dump provide clues about which function resulted in an error. You might be able to take action to correct environmental problems immediately. Refer internal problems to IBM with appropriate documentation, such as system console logs and dumps.

ODBM trace records are written to one or more of the trace tables shown in the following table.

Table name	Number of tables	Table description
CSL	1	CSL activity, including errors
ERR	1	Errors
ODBM	1	ODBM activity
PLEX	1 per IMSplex	IMSplex activity, including errors

Table 12. Trace tables for ODBM trace records

OM trace records are written to one or more of the trace tables shown in the following table.

Table 13. Trace tables for OM trace records

Table name	Number of tables	Table description
CSL	1	CSL activity, including errors
ERR	1	Errors
ОМ	1	OM activity
PLEX	1 per IMSplex	IMSplex activity, including errors

RM trace records are written to one or more of the trace tables shown in the following table.

Table 14. Trace tables for RM trace records

Table name	Number of tables	Table description
CSL	1	CSL activity, including errors
ERR	1	Errors
PLEX	1 per IMSplex	IMSplex activity, including errors

Table 14. Trace tables for RM trace records (continued)

Table name	Number of tables	Table description
REPO	1	IMSRSC repository activity, including errors
RM	1	RM activity, including errors

SCI trace records are written to one or more of the trace tables shown in the following table.

Table name	Number of tables	Table description
CSL	1	CSL activity, including errors
ERPL	1	Parmlist errors
ERR	1	Errors
INTF	1	SCI interface activity
INTP	1	Interface parmlist
PLEX	1 per IMSplex	IMSplex activity, including errors
SCI	1	SCI activity, including errors

Table 15. Trace tables for SCI trace records

Each CSL trace record contains 32 bytes (the ERPL and INTP tables in the SCI address space contain records that are 256 bytes). The first byte is the trace code, which indicates the function that wrote the trace record. Examples of trace code functions include address space initialization, address space termination, the CSLOMCMD request, the CSLRMUPD request, and the CSLSCRQS request. The second byte is the trace subcode, which indicates the category of the trace record. Examples of trace subcode categories include begin request, end request, CQS error, and SCI error. Most trace records include a 2-byte module identifier of the module that wrote the trace record. The last 8 bytes are the STCK time stamp of when the trace record was written. Trace record mapping of the rest of the fields is unique to the trace subcode.

CSL address space trace codes and other common codes used in trace records are mapped by a macro following the naming convention of CSL*x*CODE macro, where *x* represents the CSL address space as shown in the following table.

Codes macro name	Description
CSLDCODE	ODBM codes
CSLOCODE	OM codes
CSLRCODE	RM codes
CSLSCODE	SCI codes
CSLZCODE	CSL codes common to multiple CSL address spaces

Table 16. CSL address space trace code mapping macros

CSL address space trace records are mapped by a macro following the naming convention of CSL*x*TRC macro, where *x* represents the CSL address space as shown in the following table.

Trace macro name	Description
CSLDTRC	ODBM trace records
CSLOTRC	OM trace records
CSLRTRC	RM trace records
CSLSTRC	SCI trace records
CSLZTRC	CSL trace records common to multiple CSL address spaces

Table 17. CSL address space trace record mapping macros

Trace record mapping is based upon the trace subcode, which identifies the category of trace record. One particular trace subcode can apply to many trace codes. Each trace record mapping also includes a pictorial representation in a comment block. Use the trace subcode to locate the trace record mapping in the CSL*x*TRC macro. Some trace codes are unique to a particular CSL address space, others are common to more than one CSL address space.

The CSL*x*CODE macro includes 2-byte module identifier codes that are used in trace records and messages when it is necessary to identify a CSL module. The module identifier represents the module that wrote the trace record. Module identifier codes are defined as follows:

```
CSL address spaces
X'0001'-X'6FFF'
CSLZ modules
X'7000'-X'77FF'
BPE modules
X'7800'-X'7FFF'
Not used
X'8000'
Reserved for BPE tracing
X'8001'-X'FFFF'
```

CSL request trace records sometimes contain a return code, reason code, and completion code from the request. CSL request return codes, reason codes, and completion codes are mapped by macros following the naming convention CSL*x*RR, where *x* represents the CSL address space as shown in the following table. These macros are in the IMS.SDFSMAC data set.

Table 18. CSL request return, reason, and completion codes mapping macros

Macro	Description
CSLDRR	ODBM return codes, reason codes, and completion codes
CSLORR	OM return codes, reason codes, and completion codes
CSLRRR	RM return codes, reason codes, and completion codes
CSLSRR	SCI return codes, reason codes, and completion codes

CSL trace records in formatted dumps contain eye catchers that identify the trace code, the trace subcode, and the module that wrote the trace record. The EPL and INTF trace tables in SCI contain parameter lists, tables, and other data areas that cross the SCI interface. These data areas are formatted in the SCI dump.

Related concepts:

Overview of the IMSRSC repository (System Definition)

## **Related reference:**

BPE configuration parameter member of the IMS PROCLIB data set (System Definition)

## **RM trace record example**

An example of an RM trace record with eye catchers is described.

## RM trace record with eye catchers

CEVTX:\*CQS SERVICE ERR RCQE 60110000 03000042 0000000C 00000304 00000008 0BC60C20 B6B1AF09 07C68F08

The trace code is in the first byte (X'60'), which the CSLRCODE macro documents as CQS Event Exit. The eye catcher for this is CEVTX. The trace subcode is in the second byte (X'11'), which the CSLRTRC macro documents as a miscellaneous CQS service error. The eye catcher for this is \*CQS SERVICE ERR. The asterisk at the beginning of the eye catcher indicates an error.

The CSLRTRC macro documents byte 5 for trace subcode X'11' as containing the service request X'03', which is the CQSCONN request.

The CSLRTRC macro documents byte 8 for trace subcode X'11' as containing the module ID X'0042', which the CSLRCODE macro defines as module CSLRCQE0. The module name is included in the eye catcher on RCQE. The CSLRTRC macro documents word 3 for trace subcode X'11' as containing the CQSCONN return code X'0000000C'. The CQSRRCON macro defines the CQSCONN return codes, reason codes, and completion codes. The CQSRRCON macro defines return code X'0000000C' as a list error.

The CSLRTRC macro documents word 4 for trace subcode X'11' as containing the CQSCONN reason code X'00000304'. The CQSRRCON macro defines reason code X'00000304' as no requests successful.

The CSLRTRC macro documents word 5 for trace subcode X'11' as containing the CQSCONN completion code X'00000008'. CQSRRCON macro defines completion code X'00000008' as no resource structure is defined. RM was unable to connect to the resource structure because it is not defined. This is probably an environmental problem where the resource structure was not correctly defined to CQS.

The CSLRTRC macro documents word 6 for trace subcode X'11' as containing the ECB address (X'0BC60C20').

# Chapter 8. DB - Database service aids

You can use service aids, such as the IMS test program (DFSDDLT0), as well as various diagnostic techniques, to analyze problems with IMS databases.

# Job control block trace

The job control block (JCB) trace is one of most useful diagnosis tools for any application problem that might occur. The trace is an easy way to determine the last five calls that were issued, and what their return codes were.

## Analyzing the JCB trace

Analyzing the JCB trace is a good way to identify application problems. For example, sometimes the application programmer forgets to handle a certain status code, even though it identifies an error situation. Seeing the call and its return code draws attention to this application error and makes it easier to resolve.

The JCB trace is always on (you do not need to do anything to turn it on), and is included in every IMS dump. The job control block portion of the dump is formatted under the heading, JCB. The JCB trace is a wrap-around area that consists of six 2-byte entries. The first entry begins at the offset of JCBTRACE in the JCB portion of the dump and is followed immediately by the remaining five entries. As the entries are inserted into the trace area, previous entries are shifted left.

In the first through fifth entries, the first byte identifies the DL/I call. The second byte in these entries contains the second character of the DL/I I/O status code (return code). The sixth entry contains information about the call that immediately preceded the call that was being processed when the abend occurred; this information can be useful in determining what occurred prior to the failure. The function of that prior call is identified in field JCBPREVF of the JCB, and the status code of the prior call is in field JCBPREVR.

If one of the 2-byte fields in the JCB trace contains X'0000', no call was made.

## **Example JCB trace**

The JCB trace might contain the following six fields: 0000 0000 0205 0305 0140 0140

This trace indicates that only four calls were made, the most recent of which was a get-unique call (either GU or GHU), as indicated by the first-byte code of X'01'. The status code for the most recent call was X'40'.

# DL/I test program - DFSDDLT0

The DL/I test program is an IMS application that issues calls to DL/I based on control statement information. For diagnostic purposes, this allows you a means of separating the application logic from DL/I logic to resolve problems.

Optionally, the DL/I test program compares the results of the calls with expected results provided in control statements. If the returned results do not match the expected results, the program can provide a SNAP of any combination of DL/I blocks, I/O buffer pool, subpools 0-127, and the entire region. The test program can also invoke the IMS SNAP call, by means of its control statements, during normal execution to provide diagnostic information on the DL/I calls that are executing correctly.

# **COMPARE statement SNAPs**

When a DL/I call does not produce the results you expect, you can use the COMPARE statement to compare the actual results of a call with the expected results. The normal output of this statement usually provides enough information to determine what is causing the problem.

When the output from a COMPARE statement does not provide enough information, you can use the SNAP option of the COMPARE statement to obtain additional diagnostic information. Specifically, the I/O buffer pool and the DL/I blocks are dumped. You can use the generated diagnostic output, in conjunction with *IMS Version 13 Messages and Codes, Volume 3: IMS Abend Codes* to determine the cause of the user abend you are diagnosing.

**Attention:** The COMPARE SNAP statement is a call to DL/I. Therefore, when a SNAP option is issued, some data in the captured area might be changed as a result. To prevent inadvertent change to data that is not involved in the problem, use a COMPARE SNAP statement only for the specific data that is involved in the problem.

Some control blocks are always dumped. Others are dumped only when you request them in the SNAP options.

The following control blocks are always dumped:

- The SCD
- The PST (save areas related to the current DL/I task are a part of the PST)
- The Retrieve trace area

The following SNAP option requests dump the control blocks or buffers listed:

- A request for the buffer pool dumps:
  - OSAM buffer pool prefix and buffer pool, if present
  - VSAM subpool prefix and buffer prefix and subpools
  - Header for the DL/I, dispatcher, scheduler, and latch trace tables
  - The DL/I trace table

- The dispatcher trace table
- The scheduler trace table
- The latch trace table
- Hierarchical direct (HD) trace table, if present
- Sequential buffering control blocks and buffer pools, if present
- A request for the current DB PCB or all PSB-related control block dumps:
  - Delete/replace work areas, when allocated
  - ENQ/DEQ trace table, if present
  - PSB and PSB work areas
  - PCB information, including JCB, DSGs, and level table
  - The block of SDBs, SDB expansion blocks, and generated SDBs
  - DMB directories
  - DMBs for the current PSB
  - PNTs associated with partition DMBs

If you also requested buffers, a request for the current DB PCB or all PSB-related control block dumps:

- Any HISAM/QSAM buffers
- Any VSAM LRECs for each qualifying DSG
- A request for the entire region, or subpools 0-127, dumps the entire region or the subpools.

A SNAP of the entire region or subpools is sent to a SNAP data set.

If the SNAP destination is the IMS log, the request is changed to a SNAP of all control blocks, regardless of other option specifications.

A region or subpool SNAP, when requested, appears before any additional SNAPs that were requested.

If the destination of the SNAP is the IMS log, you can select and format these records (type X'67FD') from the log by using the File Select and Formatting Print utility (DFSERA10) with formatting exit routine DFSERA30.

# **SNAPs on exceptional conditions**

IMS produces SNAPs of DL/I control blocks on the IMS log (or the CICS system log).

The SNAP call facility identifies calling routines that generate snap dumps. Supervisor call (SVC) dumps are generated only for the intended abend codes or status codes, and for unknown calling routines.

IMS produces SNAPs of DL/I control blocks on the IMS log (or the CICS system log) in the following exceptional situations:

- A pseudoabend condition is encountered in a DL/I module.
- A system or user abend occurs for either a message region or a batch message region.

Control block SNAPs are produced in the same format as those produced by a DL/I SNAP call specifying ALL or YYY as SNAP options.

The SNAP IMS log records are record type X'67', subrecord type X'FF'. You can select these log records from the IMS log with the File Select and Formatting Print utility (DFSERA10). You can format output selected from the log with the formatting edit routine DFSERA30.

Internal IMS functions can request the snapping of specific virtual storage areas by issuing a SNAP Specific call to DFSERA20.

The following IMS functions request or use the SNAP Specific facility:

- SBSNAP option, on completion of calls from IMS modules to the Sequential Buffering buffer handler
- SBESNAP option, during SB evaluation
- SB COMPARE option, when detecting a mismatch between the buffer content that the SB buffer handler was returning to the OSAM buffer handler and the content of the database block as it is stored on DASD

For IMS online regions and CICS, these SNAPs are written to the IMS log. For IMS batch regions, these SNAPs can be written to either the log or to a data set specified on another DD statement.

When written to the log, the IMS log records have a record type X'67' and a subrecord type X'E'. The value of the low-order half-byte of the subrecord type depends on the IMS function that requests the SNAP. The subrecord types are:

X'ED' SBESNAP option

**X'EE'** SBSNAP option

X'EF' SB COMPARE option

The formatting edit routine DFSERA30 can format output selected from the log. **Related reference**:

"Printing log records and trace table entries" on page 529 "Sequential buffering service aids" on page 224

# **DL/I** call image capture

DL/I call image capture (module DFSDLTR0) enables you to trace and record all DL/I calls issued by an application program. The trace output is in a format acceptable as input to the DL/I test program DFSDDLT0.

DL/I call image capture is a useful debugging tool because it allows you to rerun an application program and generate the DL/I calls necessary to duplicate the condition that caused the program failure. This run provides you with documentation to assist you in problem determination.

You can run the trace in either a batch or DB/DC environment.

### Related tasks:

"DL/I call image capture program" on page 218

# **Batch environment**

In a batch environment, you start DL/I call image capture using the DLITRACE control statement in the DFSVSAMP DD data set.

The control statement allows you to trace either all DL/I calls issued by an application program or a range of calls. The traced information can be put in a sequential data set, the IMS log data set, or into both concurrently.

# **Online environment**

In a DB/DC, DCCTL, or DBCTL environment, you start and terminate DL/I call image capture by issuing the /TRACE command from the master terminal (DB/DC and DCCTL only) or from the system console.

For example, to trace full-function database calls for a named PSB and send the output to an external data set, issue the following command: /TRACE SET ON PSB psbname OPTION LOG

# How to retrieve DL/I call image capture data from the log data set

If trace data is sent to the IMS log data set, you can retrieve it using the File Select and Formatting Print utility (DFSERA10) and the DL/I call image capture exit DFSERA50.

To use DFSERA50, you need to insert a DD statement defining the output data set in the DFSERA10 input stream. The default ddname for this DD statement is TRCPUNCH. The statement must specify LRECL=80.

# **DL/I** analysis

Debugging suggestions for a batch environment, including DL/I and DBB regions are described.

These debugging suggestions are useful in a batch environment. The information is valid for DL/I or DBB regions.

Before diagnosing abends in a batch region, review the external conditions. Verify that your environment is correct by asking the following questions:

- Are the JOBLIB/STEPLIB DD statements pointing to the correct libraries?
- Are the PSBLIBs and DBDLIBs at the same level as the JOBLIB/STEPLIB modules?
- If running with an ACBLIB, was the ACBGEN run under the same level of IMS you are currently running on?
- Were the databases correctly allocated and intact before starting the current run?

### Related tasks:

"Locating database-related traces" on page 165

# **IMS** abends

User abends and system abends are discussed.

In general, abend dumps have two causes:

- An abend issued by an IMS module (user abend)
- A program check within an IMS module (system abend)

All IMS abends are issued with the dump option.

# User abends

There are two methods by which an IMS module can issue an abend when an error condition is detected.

- The first method is the standard ABEND macro issued by the code at the point of error detection. With this method, the PSW, at entry to the abend, points at the code within the module that both detected the error and issued the abend.
- With the second method, the module that detects the error does not issue the abend, but instead passes the error indication back to the program request handler, which then issues a real abend. The PSW, at entry to the abend, now points to the program request handler rather than to the module that detected the error. The pseudoabend method is used by DL/I modules that abend an application program in a dependent region but do not abend the IMS control region in a DB/DC environment.

When the DL/I test program is used as the application program, the pseudoabend is passed back to the test program rather than to the program request handler. This allows the test program to request a formatted SNAP rather than only an abend dump.

# **Dump analysis introduction**

In a pseudoabend supervisor call (SVC) dump that is generated by module DFSERA20, you can find the failing program specification table (PST) by searching the save areas for the caller of module DFSERA20. In the save area flow, DFSERA20 is called INTERA20 and register 1 contains the failing PST address.

The SNAP call facility identifies calling routines that generate snap dumps. SVC dumps are generated only for the intended abend codes or status codes, and for unknown calling routines.

The following list provides general considerations for dump analysis:

- The first request block (RB) on the RB chain represents the IMS batch region controller (DFSRRC00). The second RB on the RB chain represents the batch program controller (DFSPCC30). Module DFSPCC30 always links to the application program that is named in the parameter field of the EXEC statement. Therefore, the application program must be represented by the third RB. However, if the application program uses an IMS service, and that service abends, the third RB points to the offending IMS routine.
- The last two SVRBs represent ABEND and ABDUMP. The register contents at the time of abend are usually found in the first abend SVRB. The IMS STAE work area (DFSFSWA0) and the RTM work area in z/OS are also used to hold the register contents at abend time.
- There are two PSTs in a batch environment. One is used for all application calls and the second is used for background write whenever it is activated.
- Each PST has a 20-level save area set as part of the PST. When the abend occurs, ABDUMP prints the save areas that are associated with the active PST.
- At abend time, the IMS STAE routine gets control to flush the database buffers and close the log data set. It builds six additional save areas and chains them to the last save area in the active PST. The IMS STAE routine is partially contained within module DFSPCC30 and has an entry ID starting with the characters PCE.
- Most IMS modules use register 12 as a base register.

# Dump analysis - detailed

To thoroughly analyze a dump, you need to understand the save area, DL/I call sequence, and the buffer handler request sequence. This section discusses each of these elements.

## Save areas

A DL/I call passes from the application program to the DL/I language interface (DFSLI000), to the program request handler (DFSPR000), to the batch nucleus (DFSBNUC0), and then to the DL/I call analyzer (DFSDLA00).

If everything works properly, the save area trace shows the contents of the registers at entry to the application program, the program request handler, and the DL/I analyzer. The DL/I analyzer passes the first save area in the PST to a DL/I module. This PST save area is the first save area below the save area that holds the contents of the registers at entry to the DL/I analyzer.

The contents of register 1 at entry to the DL/I analyzer is a pointer to the PST. This is the only register passed to the analyzer (the user call list pointer is passed to the analyzer in PSTIQPRM).

If the abend is a program check or an inline abend, the save area trace always gives a true indication of the flow of control between DL/I modules and the current depth of save area set usage. Most DL/I modules or X'01' with the low-order byte of register 14 on return to a higher-level module.

If the abend is a pseudoabend, the save areas below the analyzer might have been reused and therefore would not reflect the conditions at the time the abend condition was detected; for example, the DB Monitor might have been called by the analyzer.

**Note:** When pseudoabends are detected by some modules, the registers 14 to 12 at error, are stored at PSTSAVL+12. The high order byte in PSTSAVL+12 will contain a one-byte code for the module detecting the error. Here are the modules which will save registers and their corresponding codes in PSTSAVL+12:

X'AA ' DFSDLR00
X'BB' DFSDDLE0
X'CC' DFSDLD00
X'DD' DFSDXMT0
X'EE' DFSURGU0
X'FF' DFSRCHB0

Here is an example from the formatted PST of an abend U0853:

WD1	00000000	HSA	202C6BC8	LSA	2CD73B08	RET	AA049128	EPA	30B02F40	R0	30000355
R1	212AD040	R2	2CD78790	R3	2FB6F5B4	R4	8004911E	R5	2FB6FA8C	R6	01410254
R7	21748060	R8	2FB6F82C	R9	00000002	R10	30B053C0	R11	000401E0	R12	00047DC0

Since "RET" (PSTSAVL+12) contains X'AA', module DFSDLR00 detected this pseudoabend.

## **DL/I call sequence**

You can determine the current DL/I call and the sequence of calls leading up to the failure by scanning the DL/I trace table. Find the last entry made in the trace table by using the current entry pointer and then scanning backward in the table for the last entry made by the DL/I analyzer (entry code AA). This entry represents the current DL/I call.

You can determine the call sequence by continuing the backward scan, noting each entry made by the analyzer. Along with the call function, the analyzer also records the PCB address that was passed in the user's call list.

## Buffer handler request sequence

The buffer handler router traces each request to the buffer handler from a DL/I module. When the router receives the request, it passes the request to the OSAM buffer handler or the VSAM interface module. When the call is complete, control returns to the router. The router obtains the next available trace table entry and stores information describing the input and output for the buffer handler call.

By looking at all buffer handler entries between two DL/I analyzer DFSDLA00 entries (two specific DL/I calls), you can determine all requests made to the buffer handler to satisfy any specific DL/I call. A typical request to the buffer handler is a GET by relative byte address from the retrieve module. The entry made for this GET by relative byte address has a function code of E2, the RBA requested, and, if the request was satisfied (return code 0), the address of the segment read into the buffer pool.

# Generalized DL/I problem analysis

One method of problem analysis is discussed. Not all DL/I abends can be diagnosed using this sequence, but you can use the steps as a guide to DL/I debugging. All numbers are in hexadecimal.

- 1. The following approaches are valid if the IMS dependent region subtask appears in the dump.
  - Look at the user's call list for the current or last call. PSTIQPRM points to the call list. For all dependent region types, if the reentrant DL/I language interface, DFSLI000, is used, the user's call list address can be found in the contents of register 1 in the save area set at entry point to DFSPROX0-115 from the save area trace.
  - To find the last call parameters in a MPP or BMP dump, locate module DFSFSWA0 in the dump. Scan this module for ECP. At offset X'104' from ECP is a pointer to the parameters that made the last call to DL/I.
  - To find the PCBs in an MPP or BMP dump, find DIRCA in module DFSFSWA0. The word immediately following DIRCA contains the address of an area of storage obtained by the GETMAIN macro instruction. This area contains the PCB list and all non-GSAM PCBs. The format of this area is:
    - At offset X'14' is the beginning of the PCB list passed to the program.
    - Immediately following the end of the PCB list is a copy of the I/O PCB, if one exists.
    - The next PCB (and subsequent PCBs) follow the end of the I/O PCB.

- Because they exist elsewhere in the dump, GSAM PCBs are not copied here. The pointers to the GSAM PCBs can be found in the PCB list at offset X'14.'
- 2. If the abend occurred after the DL/I analyzer received the call, but before the application program got control back, the last call entry (code AA) in the DL/I trace table matches the current call. Use the technique described in "DL/I call sequence" on page 163 to determine the call sequence as far back as possible, noting the PCB address associated with each call.
- **3**. Compare the contents of PSTDBPCB to the PCB address in the last call entry in the trace table. If they are different, index maintenance is probably in control using its PCB within the PSB. Check the save area trace to verify this.
- 4. Find the current PCB from the address in the trace table, and then find the JCB. Starting at label JCBTRACE in the JCB are six 2-byte trace entries for the last six calls issued against this PCB. The oldest entry is at the beginning and the newest entry is at the end of JCBTRACE. The first byte of an entry is the encoded call function and the second byte is the last half of the status code for that call. For example, an 0140 is an entry for a GET UNIQUE call that resulted in a blank status code. This trace is maintained by the DL/I analyzer at the completion of the call.
- 5. Look at the contents of JCBLEV1C. If the call is a get or an insert, the retrieve module zeros this word at entry and then stores a pointer to each level table entry when it completes the call for that particular level. If the word is zero, retrieve is still trying to satisfy the call at the root level. Generally, JDBLEV1C reflects the lowest level satisfied during the current or last get or insert call.
- 6. Check each level table entry to see if it holds a valid current position. Valid position is indicated by the absence of the empty bit in FLAG1 (LEVEMPTY in LEVF1, bit 1 byte 1). If this bit is off (valid position), LEVSDB points to the SDB currently in use or the last one used for this level. At the same time, LEVTTR, which contains either a relative byte address (RBA) or a relative record number (RRN), should match the current position saved in the SDB (SDBPOSC). In addition, if the database is HISAM, LEVSEGOF matches SDBPOSN. This is the offset into the current relative record number.
- 7. Look at the key feedback area—level table position. The key feedback area contains the fully concatenated key of the segment currently positioned on. If a level table entry contains a valid position, the contents of the key feedback area for that level is the key (if any) of the segment whose SDB is pointed to by LEVSDB and whose database position is contained within LEVTTR and LEVSEGOF. The contents of the key feedback area are never cleared or blanked out. Therefore, unless the level table entry indicates it has a valid position, the residue in the key feedback area might not be meaningful.
- 8. Map the database structure involved in the failure. Starting with the root SDB, which you can find with a pointer in the JCB (JCBSDB1), take each SDB in the sequence it is found in the dump and examine the field SDBPARA. This field is a pointer to the parent SDB (the root SDB points at the PCB). Map the structure according to SDBPARA; the result should match the logical structure defined at PSBGEN time. When mapping the structure, note the contents of SDBTARG. If this field is nonzero, the segment is involved in either logical relationships or indexing. The code in the high-order byte indicates which is the case.
- **9**. Use the DL/I trace table to analyze the sequence of buffer handler calls. The buffer handler trace is the most useful debugging tool for DL/I. The trace is available in both batch and DB/DC environments, and the entries are identical
  - Get calls are the most common, so this section uses a get call as an example. In an attempt to satisfy a get call, the retrieve module must examine a segment or a series of segments to see if it meets the call requirements. All

segments must be requested from the buffer handler and the request must be in the form of an RBA, RRN, or a specific key request.

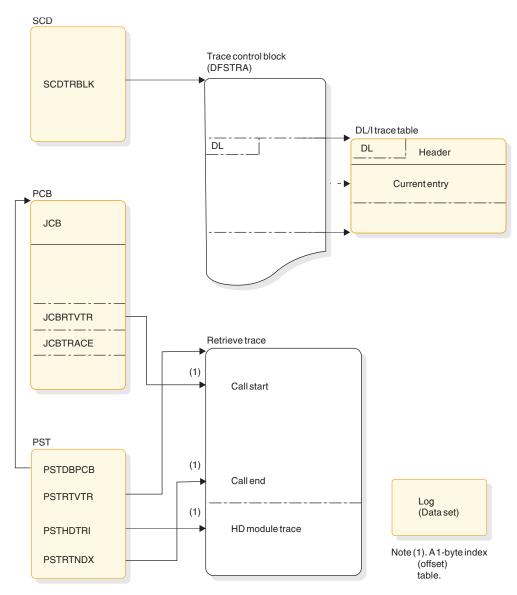

- The most common request from retrieve to the buffer handler is a byte locate. The parameters passed to the buffer handler are the function (byte locate), the RBA requested, and the data set in which the RBA exists. At exit to the buffer handler router, the next available trace entry is obtained and the code of the function requested is stored in the first byte. The buffer handler function codes are listed in the PST DSECT under PSTFNCTN. The byte locate function code is E2. The second byte of the trace entry is the relative PST number responsible for the request, which in batch is always an 01.
- Along with the function code, the DSG and RBA are placed into the entry. When the call to the buffer handler (OSAM or VSAM) is completed, the results are traced, again by the buffer handler router. The return code is stored in the third byte. The return codes are listed in the PST DSECT under PSTRTCDE. If the call is successful, the address of the segment within the buffer pool is stored at displacement C. This trace now shows each segment (RBA) requested by retrieve; by examining the buffer pools the contents of the segments and their prefixes can be seen. RBAs found in the trace table can be compared to position fields in the SDB and level table to accurately re-create the get call.

# Locating database-related traces

Locating Retrieve trace, JCBTRACE, DL/I trace and LOG data set are shown.

The following figure shows how to locate the following traces:

- Retrieve trace—records the flow through the retrieve module subroutines.
- JCBTRACE—traces the status of the prior six calls.
- DL/I trace—shows calls made to the call analyzer, buffer handler, and hierarchic direct space management, as well as information on Delete/Replace.
- LOG data set—records database changes, before and after images.

### **Related concepts**:

"DL/I analysis" on page 160

# **DL/I trace**

The DL/I trace table is a combined trace consisting of entries from DL/I calls, the DL/I buffer handler, DL/I OPEN/CLOSE, HD space management, lock activity (using PI or IRLM), OSAM, DFP interface, HALDB OLR trace, and ABENDU0427.

IMS always sets the DL/I and lock trace on at initialization except for batch, for which the default for traces is off. The trace level is set to high and it is written in memory.

The DL/I trace and the DL/I Call Image trace are different traces. The DLITRACE statement in IMS.PROCLIB member DFSVSMxx sets the DL/I Call Image trace on, the DL/I trace does not.

If the trace was written to the log, you can use the File Select and Formatting Print utility (DFSERA10) with an exit routine (DFSERA40 or DFSERA60).

- The Knowledge-Based Log Analysis (KBLA) panel interface.
- The File Select and Formatting Print utility (DFSERA10) with an exit routine (DFSERA40 or DFSERA60).

# Using the DL/I trace facility

The DL/I trace facility is an important diagnostic tool that can help you determine the cause of a problem. Frequently, a problem occurs as a result of the interaction between two separate tasks. Interpreting the DL/I trace entries can be the best way of determining what each task was doing, and when.

## Example for using the DL/I trace facility

An IMS Fast Path application receives an abend 1027, and the user reports the problem to the support staff. Some of the steps the diagnostician might take are:

- 1. Find the abend code in *IMS Version 13 Messages and Codes, Volume 3: IMS Abend Codes.* This information indicates that the return code is in register 15.
- 2. Register 15 in the dump contains a value of X'0D.'

*IMS Version 13 Messages and Codes, Volume 3: IMS Abend Codes* indicates that this return code indicates that an enqueue or dequeue call was issued by module DBFBENQ0, and the return code from DFSLRH00 was X'12,' which indicates an invalid call.

**3**. Look at the DL/I trace to determine what resource was involved (if the DL/I trace was on at the time of the abend). If the DL/I trace was not on, it might be necessary to create the problem again with the DL/I trace facility on.

The list of trace entry IDs in "DL/I trace formats" indicates that one of the trace entries is "Exclusive control ENQ/DEQ PI trace entry" ("The X'CA' trace entry for Fast Path calls" on page 180). This is a good place to start the DL/I trace analysis.

What you learn from the DL/I trace might help you to:

- Identify and resolve an application error.
- Review APAR descriptions to see if this problem has occurred previously.
- Report the problem to IBM Software Support.

### X'0C' trace entry

The X'0C' trace entry is shown.

```
TRACE ID = X'OC'
```

<pre>word 0 - byte 1 - X'0C' - DL/I OPEN/CLOSE trace entry for each data set. This entry shows a successful OPEN/CLOSE. For an error during OPEN/CLOSE, the data in ENTRY6 and ENTRY7, X'18' and X'1C' respectively, is shown in the</pre>
"error condition"
byte 2 – PST number
bytes 3-4 - Trace sequence number description.
word 1 - byte 1 - PSTFNCTN (See note below)
bytes 2-3 - DMB number
byte 4 - DCB number
word 2 - DCB address
word 3 - DD name
word 4 - DD name
word 5 – PSTDBPCB - database PCB address
<pre>word 6 - DMB address (Error condition) - Offset in DFSDLOC0 where error was detected.</pre>
word 7 — bytes 1-3 - PSTPSB-PSB address - database PCB address (Error condition) - Word "LKER" or reason codes described in message DFS07301
byte 4 - Not used

## X'31', X'32', X'34', X'B1', and X'B2' trace entries

The X'31', X'32', X'34', X'B1', and X'B2' trace entries are shown.

Example of X'31', X'32', X'34', X'B1', and X'B2' trace entries TRACE ID = X'31', X'32', X'34', X'B1', X'B2'

word 0 - byte 1 - X'31', X'32', X'34', X'B1', or X'B2' - Function code for HD space management (see note 1 below) byte 2 - PST number bytes 3-4 - Trace sequence number word 1 - bytes 1-2 - Length of request (see note 3 below) bytes 3-4 - Offset (requested or returned) word 2 - byte 1 - PSTTRNID (ID of module calling space management) byte 2 - PSTTRMSC (subcode of module calling the buffer handler see note 4 below) byte 3 - Not used byte 4 - PSTRTCDE (return code from space management) word 3 - byte 1 - Flag byte (X'80' - entry already in use) bytes 2-4 - PSTDATA (core address - see note 5 below) word 4 - PSTBYTNM (RBA or RRN - see note 6 below) word 5 - RBA of space given to caller word 6 - bytes 1-2 - DMB number byte 3 - DCB number byte 4 - Reserved

word 7 - MSG/ABEND feedback

Notes:

- 1. You need the X'32' entries to resolve this problem.
- 2. Numbers 3 and 4 are very important. In most cases, the segment was deleted by another task (see PST number), and this task (see PST number) tried to enqueue on the segment that waited while the other PST finished its processing. During the attempt, an FSE was found and abend U0832 resulted. An IMS internal error usually causes this problem.
- 3. The length of the segment that was freed.
- 4. The real storage address of the segment during the time of deletion.
- **5**. The PSTBYTNM is the key field in the trace table. Look for a X'32' entry with the PSTBYTNM field equal to the PSTBYTNM field found in the buffer trace.

#### X'60' trace entry

The X'60' trace entry is shown.

#### The X'60' trace entry

```
TRACE ID = X'60'
word 0 - byte 1 - X'60' OSAM START I/0
    byte 2 - Zero (no PST number)
    bytes 3-4 - Trace sequence number
word 1 - IOSB address
word 2 - START I/0 - DECB address
word 3 - START I/0 - RBN/M
word 4 - Buffer address
word 5 - Buffer data (offset X'40' into buffer)
word 6 - byte 1 - Request type
        - byte 2 - not used
        - byte 3 - 'M' DCBFDAD seek value (MBBCCHHR)
        - byte 4 - 'C' DCBFDAD seek value (MBBCCHHR)
word 7 - CHHR DCBFDAD seek value (MBBCCHHR)
```

# X'61' trace entry

The X'61' trace entry is shown.

#### The X'61' trace entry

```
TRACE ID = X'61'
    word 0 - byte 1 - X'61' OSAM POST
         byte 2 - Zero (no PST number)
     bytes 3-4 - Trace sequence number
word 1 - IOSB address
word 2 - DCB address
 word 3 - byte 1 - DFSA0S70 INTERNAL TRACE BYTE
              byte 2 - TOTAL I/O COUNT FOR THIS STARTIO
              bytes 3-4 - Sequence number of associated X'60' entry
word 4 - Buffer address
word 5 - Buffer data (offset X'40' into buffer)
word 6 - byte 1 - POST code
              byte 2 - not used
              byte 3 - 'M' DCBFDAD seek value (MBBCCHHR)
              byte 4 - 'C' DCBFDAD seek value (MBBCCHHR)
word 7 - CHHR DCBFDAD seek value (MBBCCHHR)
```

# X'62' trace entry

The X'62' trace entry is shown.

# The X'62' trace entry

```
TRACE ID = X'62'
word 0 - byte 1 - X'62' OSAM trace entry for OPEN/CLOSE/EOV
      - byte 2 - Zero (no PST number)
      - bytes 3-4 - Trace sequence number
word 1 - Not used
word 2 - DCB address
word 3 - DCBRELA
word 4 - byte 1
                 - Not used
        byte 2 - R15 return code
        bytes 3-4 - Not used
word 5 - OPEN/CLOSE/EOV error code (same as in message DFS07301)
word 6 - byte 1 - Caller's function
      - byte 2 - Not used
  - byte 3 - 'M' value from DCBFDAD
word 7 - byte 1 - 'CHHR' from DCBFDAD
```

# X'69' trace entry

TRACE ID = X'C4'

- word 0 byte 1 X'C4' DELETE/REPLACE used to provide diagnosisinformation for error conditions. This entry is written when an error is detected. byte 2 - PST number bytes 3-4 - Trace sequence number word 1 - byte 1 - ID invoking subroutine (see note 2 below; see note 3 below) byte 2 - ID of originating subroutine (see note 3 below) byte 3 - Subcode (set by originating subroutine - see note 3 below) byte 4 - Internal code for status code or pseudoabend (see note 3 below) word 2 - SDB for replace operation. DLTWS for delete operation. Register value 7. word 3 - Level table for replace operation. DLTWA address for delete operation. Register value 8. word 4 - Usually the PSDB address for segment. Register value 6. word 5 - byte 2 - DELETE/REPLACE return code byte 2 - Return offset from caller's CSECT word 6 - PSTDSGA - DSG address

# Notes:

- 1. Use only the entries for the PST that abended.
- 2. When a DELETE/REPLACE failure occurs, you need the X'C4' entries to solve the problem. You can usually find several X'C4' entries in a row in the trace table. Scan up the trace table to the first (lowest trace sequence number) entry. This entry is usually the key to why the failure occurred. Level 2 needs this information to resolve the problem.
- **3**. These 4 bytes, in word 2, in a DELETE/RELEASE error are documented in the *IMS Version 13 Messages and Codes, Volume 3: IMS Abend Codes* for the various abends. This is ENTRY1 field referred to in the DELETE/REPLACE module.

# **Related concepts:**

"Using the DL/I trace facility" on page 167

# X'C6' trace entry

The X'C6' trace entry is shown.

#### The X'C6' trace entry

```
TRACE ID = X'C6'
word 0 - byte 1 - X'C6' - Special promote lock trace entry
            byte 2 - PST number (see note 1 below)
            bytes 3-4 - Trace sequence number
word 1 - byte 1-2 - Not used
            - byte 3 - Special lock/unlock call (see note 1)
            - byte 4 - Level of this lock
words 2-3 - C'PROMOTE '
```

```
word 4 - REQ address
word 5 - QCB address
words 6-7 - Resource id (see note 2)
```

#### Notes:

1. See the following table for special lock or unlock calls.

Table 24. Special lock or unlock calls

Code (hex)	Special lock or unlock call	Description
X'08'	PROENQ	Lock call
X'10'	PRODEQ	Unlock call

2. Resource id is an 8-byte field:

bytes 1-4 - Complement of original RBA bytes 5-6 - DMB number byte 7 - DCB number byte 8 - C'Z' id suffix

# X'C7' trace entry not using IRLM

The X'C7' trace entry is shown when not using the IRLM.

# The X'C7' trace entry (when not using the IRLM)

TRACE ID = X'C7'

#### Notes:

- 1. The entry for the PST number that received abend U0777.
- 2. The addresses of the two conflicting PSTs.
- 3. The address of the PST that got received abend U0777.
- 4. The PSB and DMB name of the cause for the contention.

# X'C7' trace entry using IRLM

The X'C7' trace entry is shown when using the IRLM.

#### The X'C7' trace entry (when using the IRLM)

```
TRACE ID = X'C7'
word 0 - byte 1 - X'C7'
byte 2 - 00
bytes 3-4 - Trace sequence number
word 1 - Not used
words 2-5 (see note 1 below) - byte 1 - PST number
bytes 2-4 - PST address
words 6-7 (see note 2 below) - Resource ID
```

Notes:

- 1. PST number and address of PSTs in deadlock net. If number of PSTs in deadlock net is greater than 4, only 4 are shown.
- 2. Resource ID that is the cause of the deadlock.

# X'C8' trace entry

The following figure shows the X'C8' trace entry.

The X'C8' trace entry TRACE ID = X'C8'word 0 - byte 1 - X'C8' - Lock request manager entry (DFSLMGR0) byte 2 - PST number bytes 3-4 - Trace sequence number word 1 - byte 1 - Function - See macro DFSLMD for mapping of each byte in this word byte 2 - State (see note below) byte 3 - Class - the class is the relative PST number byte 4 - Flags word 2 - byte 1 - Return code from IRLM bytes 2-4 - Can be PST, CLB, or SRB address word 3 - Can be resource name address, token, or altered buffer mask word 4 - bytes 1-2 - Lock manager subcode (2 bytes). These bytes along with the return code from IRLM define the problem. bytes 3-4 - This is a feedback area from the RLPL and is used primarily by the IBM Support Center, if needed. words 5-7 - This is a feedback area from the RLPL and is used primarily by the IBM Support Center, if needed. Notes: The possible state settings and their meaning:

X'00' Unconditional release

- X'02' Read
- X'04' Share
- X'06' Update
- X'08' Exclusive

# X'C9' trace entry

The X'C9' trace entry is shown.

# The X'C9' trace entry

TRACE ID = X'C9'

word 0 - byte 1 - X'C9' - Lock request manager entry (DFSLMGR0) exit byte 2 - PST number bytes 3-4 - Trace sequence number word 1 - byte 1 - Function - See macro DFSLMD for mapping of each byte in this word. byte 2 - State (see note below ) byte 3 - Class - the class is the relative PST number byte 4 - Flags word 2 - byte 1 - Return code from IRLM bytes 2-4 - Can be PST, CLB, or SRB address word 3 - Can be resource name address, token, or altered buffer mask word 4 - bytes 1-2 - Lock manager subcode (2 bytes). These bytes along with the return code from IRLM define the problem. bytes 3-4 - This is a feedback area from the RLPL and is used primarily by the IBM Support Center, if needed. words 5-7 - This is a feedback area from the RLPL and is used primarily by the IBM Support Center, if needed.

**Notes:** The possible state settings and their meanings:

**X'00'** Unconditional release

**X'02'** Read

X'04' Share

X'06 ' Update

X'08' Exclusive

# X'CA' trace entry

The X'CA' trace entry is shown.

#### The X'CA' trace entry

TRACE ID = X'CA'

word 0 - byte 1 - X'CA' - Exclusive control ENQ/DEQ (PI - Program Isolation) trace entry byte 2 - PST number (see note 1 below) bytes 3-4 - Trace sequence number word 1 - byte 1 - Record type (see note 8 below) byte 2 - Class for Q command operation byte 3 - Requested function (Use PRM DSECT (PRMFNCTN) - see note 2 below) byte 4 - PRMLEVEL - Level of control requested (1 =Read only, 2=Share, 3=Update, 4=Exclusive - see note 3 below) word 2 - bytes 1-2 - Wait count (how many times this task had to wait - see note 7 below) bytes 2-4 - Waited for count (number of tasks waiting for this resource) word 3 - PITIME relative to 00:00:00 on PIDATE (SCDPITIME) word 4 - bytes 1-2 - Feedback from DFSFXC10 (Use PRM DSECT, PRMFBK field. See note 5 below) byte 3 - Return code from DFSFXC10 (see note 6 below) byte 4 - PSFUNCT (function codes DSECT) word 5 - Token from DFSFXC10 (pointer to control block enqueued resource) word 6 - RBA or RBN (see note 4 below) word 7 - bytes 1-2 - DMB number byte 3 - DCB number byte 4 - Not used

# Notes:

- 1. Use the entries for the PST in question. If you are checking a PI problem, you might have to find this entry and then scan up the trace table using the field in note 4 (below) as a search field to find the other PST that is using the resources.
- 2. The requested PI function.
- **3**. The level at which the resource was requested.
- 4. The RBA or RBN of the resource requested by PI (relates to X'04' in the X'CC' trace entry).
- 5. The 2 bytes of feedback from DFSFXC10 (X'0C' and X'0D' in PRM DSECT).
- 6. The return code. DFSFXC10 RETURN CODES: 0 Successful 4 Wait required usually has CB trace related to it 8 Pseudoabend, either lost deadlock (U0777) or out of ENQ/DEQ space (U0775) C Invalid call
- 7. If a resource (RBA or RBN) is currently owned and the task (PST) must wait, the "wait count" (2 bytes) is incremented in a X'CA' trace entry for the task

(PST) that owns the resource. The "waited for count" (2 bytes) is incremented to show that another task is waiting for the resource. This wait should also cause a X'CA', X'CB' pair of trace entries to show the wait occurred. (See the X'CB' trace entry for more details on PI waits.)

- 8. This shows the type of X'CA' record this is. (X'CA-08' trace entry follows.)
  - X'00' Standard trace PI record
  - X'01' Timing ACT/ENQ wait may have CB trace entry associated with it
  - X'04' Lock MGR trace record
  - X'08' DL/I call record see X'CA' X'08' trace entry

# X'CA' trace entry, subtype X'08'

The X'CA' trace entry, subtype X'08' is shown.

```
TRACE ID = X'CA'-X'08'
```

word 0 - byte 1 - X'CA'-X'08' - PI-DL/I call trace entry byte 2 - PST number bytes 3-4 - Trace sequence number word 1 - byte 1 - X'08' = DL/I call record bytes 2-4 - Not used word 2 - bytes 1-2 - Wait count (how many times this task had to wait) bytes 2-4 - Waited for count (number of tasks waiting for this resource) word 2 (alternate) - bytes 1-4 - name of module writing the trace record word 3 - PI time word 4 - PST account field for function (count of the time of calls) word 5 - DL/I call (GNP, ISRT, and so on) words 6-7 - Not used

The content of word 2 depends on the module that wrote the trace record. Word 2 either contains DLA0 or the wait counts for the task.

# X'C4' trace entry

The X'CA' trace entry for Fast Path calls is shown.

# The X'CA' trace entry for Fast Path calls

# X'CB' trace entry

The X'CB' trace entry is shown.

#### The X'CB' trace entry

TRACE ID = X'CB'

word 0 - byte 1 - X'CB' - PI - (Program Isolation) trace lock

Т

Т

Т

Т

elapsed time byte 2 - PST number bytes 3-4 - Trace sequence number words 1-2 - DMB Name for which the wait was performed word 3 - Same as PITIME IN X'CA'record word 4 - byte 1 - First byte of feedback from enqueue request byte 2 - PST owning resource at the time of wait bytes 3-4 - Trace sequence number on X'CA' record word 5 - Elapsed time for enqueue wait word 6 bytes 1-4 - word 8 bytes 1-3 - 7 bytes of resource ID word 7 - byte 4 - Post code

# X'CC' trace entry

The X'CC' trace entry is shown.

#### The X'CC' trace entry

TRACE ID = X'CC'

- word 0 byte 1 X'CC' Lock request handler
  - (DFSLRH00) entry
  - byte 2 PST number (see note 1 below)
  - bytes 3-4 Trace sequence number
- word 1 Block number on RBA (see note 2 below)
- word 2 PSTTOKEN The object of the request
- word 3 PSTLRPRM These bytes are described in the PSTLRPRM chart below. The first byte equates to byte 0, the second to byte 1, and so on (see note 3 below).
- word 4 bytes 1-2 Subcode from lock manager (IRLM) or PRMFBK
  - feedback for DFSFXC10.
  - byte 3 Register 15 return code
  - byte 4 Return code from lock manager or DFSFXC10
    - (Use DFSFXC10 return codes from the X'CA'
    - trace entry, note 6) (See note 5 below)
- word 5 byte 1 PSTLRSUB-DFSLRH00 abend subcode (see note 7 below)
- bytes 2-4 PSTABTRM System abend code (see note 6 below) word 6 - PSTDSGA - Address of the DSG used by this PST
- word 7 byte 1 Return register
  - bytes 2-4 Address within module where DFSLRH00 was called

# Notes:

- 1. The PST number for the task (PST).
- 2. The RBA or RBN of the resource for which a request was issued in a X'CA' trace entry. When some of the problem types occur, you can find the same field or the beginning RBA of the block in the traces for a different PST number.
- 3. Shows what the request was.
- 4. For PI, these 2 bytes are in the PRM DSECT at X'0C' and X'0D'.
- 5. For PI, follow the above. The DFSFXC10 return code is usually also placed in the register 15 return code field.
- 6. A key field when DFSLRH00 issues an abend (such as U0855, U03301, U03302). The abend is in hexadecimal, not in decimal (for example, 855= X'0357', 3302= X'0CE6'). Ignore the field if an abend was not issued from DFSLRH00.
- 7. For abends issued by DFSLRH00, this field contains the Lock Request Handler abend subcode.

You might need the X'CC' trace entry for several problem types including:

- Task was allowed to process even though a wait was requested.
- DFSLRH00 abends (such as U0855, U03302).
- Request not satisfied. These problems might indicate an internal IMS error.

The following table shows the PSTLRPRM chart (bytes 0 through 3).

Table 25. PSTLRPRM chart (bytes 0 through 3)

Byte 0 (hex)	Meaning			
11	Get local segment lock			
12	Get local data set busy lock			
13	Get local buffer update lock			
14	Get local Q command lock			
22	Get global buffer update lock			
23	Get global data set busy lock			
24	Get global data set extend lock			
25	Get global data set reference lock			
26	Get global command lock			
27	Get global command lock (CLB)			
30	Get local and global root locks			
31	Get local segment and global buffer update locks			
32	Get local-global data set busy locks			
33	Get local-global buffer update locks			
34	Get local Q command and global buffer update locks			
41	Release local segment lock			
42	Release local data set busy lock			
43	Release local buffer update lock			
44	Release local Q command lock			
52	Release global buffer update lock			
53	Release global data set busy lock			
54	Release global data set extend lock			
55	Release global data set reference lock			
56	Release global command lock			
57	Release global command lock (CLB)			
60	Release local and global root locks			
61	Release local and global data set busy locks			
62	Release local and global buffer update locks			
63	Release local segment and global buffer update locks			
70	Test local lock share or update state			
71	Test global lock share or update state			
72	Test local and global lock share or update			
73	Test feedback for local lock			
74	Test feedback for global lock			
75	Test feedback for local and global locks			
80	LRHGIRDX new root, LRHRRIDX old root			
81	Release alternate local and global root locks			
82	Get local segment and local and global buffer update locks			

Byte 0 (hex)	Meaning			
83	Release all subsystem global busy locks			
84	Release all subsystem locks			
90	Get Fast Path lock			
91	Release Fast Path lock			
92	Change ownership of Fast Path lock			
93	Force known locks for Fast Path			
94	Change locks to retain locks for Fast Path			
95	Change ownership of Fast Path UOW lock from release lock ITASK to PST dependent region (HSSP only)			
96	Change locks to retain locks for DL/I			
97	Invalid call if function is equal to or greater than 97			
Byte 1 (hex)	Meaning			
80	MODE=COND			
40	MODE=UNCOND			
10	Owning WU given on RRIDX			
00	Mode not applicable			
Byte 2(Hex)	Meaning			
01	STATE=READ			
02	STATE=SHARE			
03	STATE=UPDATE			
04	STATE=EXCL			
F0	STATE PRESET (Fast Path)			
00	STATE not applicable			
Byte 3 (hex)	Meaning			
80	CLB call if LRHPRMFL=X'80'			
C0	Fast Path request			
68	Root lock request			
40	'Single' request			
20	'Local' request			
10	'Get' request			
08	'P-Lock' request			
07	'Combined' request if <= X'07'			
01	LRHTTLKX, LRHTIBDX			
02	LRHGRIDU, LRHRRIDW			
03	LRHGSEGX, LRHRSEGX

# X'D0' trace entry

The X'D0' trace entry is shown.

# The X'D0' trace entry

Words 0 and 1 are common to all X'D0' trace entries. The format of words 2 through 7 depends on the content of the trace entry.

# Word 0

Byte 1 X'D0' - IRLM notify sent trace entryByte 2 PST number

# Bytes 3 and 4

Trace sequence number

# Word 1

Byte 1 Sub-route code:

- 4 VSAM buffer invalidation
- 8 VSAM write I/O error

#### 12 or 40

VSAM data set extension

- **16** OSAM buffer invalidation
- 20 OSAM write I/O error

#### 24 or 44

OSAM data set extension

28 Force snap

#### 32 or 36

Extended error queue element add or delete

48 Added RSR sharing partner

# Bytes 2 and 3

DMB number or PID for partition

Byte 4 DCB number

Format for buffer invalidation or write error notify: Words 2 - 7 use the following format in a trace record for a buffer invalidation or write error notification:

#### Word 2

RBN/RBA of buffer

# Word 3

Not used

# Word 4 Not used

# Word 5

Not used

# Word 6

Bytes 1 to 3 Not used

Byte 4 NCBFLAG

# Word 7

Not used

Format for OSAM data set extend: Words 2 - 7 use the following format in a trace record for an OSAM data set extension:

# Word 2

DCBHIBLK

# Word 3

DCBRLBLK

#### Word 4

DCBRBASN

#### Word 5

Volume serial number

# Word 6

Bytes 1 and 2 Volume serial number (continued)

Byte 3 Not used

Byte 4 NCBFLAG

# Byte 7 Not used

Words 2 - 7 use the following format in a trace record for a VSAM data set extension:

#### Word 2

VSILVL - VSI level number (current)

Word 3

VSIHRBA - Highest-used relative byte address (current)

# Word 4

VSIERBA - Highest-allocated relative byte address (current)

# Word 5

VSILVL - VSI level number (extent)

# Word 6

VSIHRBA - Highest-used relative byte address (extent)

# Word 7

VSIERBA - Highest-allocated relative byte address (extent)

# X'D1' trace entry

The X'D1' trace entry contains information about buffer invalidations or write errors.

Words 0 and 1 are common to all X'D1' trace entries. The format of words 2 through 7 depends on the content of the trace entry.

# Word 0

Byte 1 Trace entry code X'D1'

Byte 2 Not used (no PST number)

#### Bytes 3 and 4

Trace sequence number

#### Word 1

L

Byte 1 Sub-route code from the DFSNCB macro

#### Bytes 2 and 3

DMB number or PID for partition

# Byte 4 DCB number

Words 2 - 7 for a buffer invalidation or write error notification record use the following format:

# Word 2

RBN/RBA of buffer

# Word 3

Buffer prefix address

# Word 4

Byte 1 SB global serialization trace field:

X'80' Global serialization entered (SBH search started)

X'40' Waiting PST was posted.

# Byte 2 Not used

# Bytes 3 and 4

Number of invalidated buffers

#### Word 5

Last invalidated buffer address

# Word 6

# Bytes 1, 2, and 3

Not used

Byte 4 NCBFLAG

#### Word 7

Subsystem ID

Words 2 - 7 for an OSAM data set extent record use the following format:

#### Word 2

DCBHIBLK

#### Word 3

DCBRLBLK

# Word 4

DCBRBASN

#### Word 5

Volume serial number

# Word 6

Bytes 1 and 2 Volume serial number

Byte 3 Not used

Byte 4 NCBFLAG

#### Word 7

Subsystem ID

Words 2 - 7 for a VSAM data set extent record use the following format:

#### Word 2

VSILVL - VSI level number (current)

#### Word 3

VSIHRBA - Highest relative byte address (current)

# Word 4

VSILVL - VSI level number (extent)

# Word 5

VSIHRBA - Highest relative byte address (extent)

# Word 6

AMP address

# Word 7

Subsystem ID

#### X'D5' trace entry

The X'D5' trace entry contains information about coupling facility call requests.

X'D5' traces the completion or failure of each call request. If it finds an error, it logs error-related data and abnormally terminates with a dump. The module return and reason codes are also set in R0 and R15.

# TRACE ID = X'D5'

```
"CONN" - IXLCONN,
"DISC" - IXLDISC,
"FUNC" - invalid MAWP1 function,
"VRP " - IDAMDVRP
word 2 - bytes 1-4 - Type of request:
"DATA" - for IDAMDVRP,TYPE=DATA,
"INDE" - for IDAMDVRP,TYPE=INDEX,
"OSAM" - for IXLCONN, IXLDISC,
"RDRG" - for IXLCACHE,
"VSAM" - for IXLCACHE,
"VSAM" - for IXLCACHE,
word 3 - Return code from service (PSTIXLRF).
word 4 - Reason code from service (PSTIXLRF).
word 5 - Processing flags for DFSDMAW0 (MAWBFLGS).
ENTRY1 - IXCYENFFUNCTION FUNCTION CODE
ENTRY2-3 - Value DFSDENF0
ENTRY4-7 - Value of the STRUCTURE NAME
```

# X'D9' trace entry

I

Т

Т

L

The X'D9' trace entry is shown.

#### The X'D9' trace entry - words 0 through 2

Most X'D9' trace entries have the following information in the first three words, except for OLR command processing. The following figure shows words 0 through 2 of the X'D9' trace entry.

```
TRACE ID = X'D9'
```

# X'D9' trace entry: OLR output data set validation or creation and inactive data set deletion

The following figure shows words that are specific to the OLR output data set validation or creation and inactive data set deletion.

```
TRACE ID = X'D9'
```

# Notes:

- 1. When no error has occurred, the error message number in word 3 has a value of binary zero, and there is no further information in the trace entry beyond word 4.
- 2. For the following error message numbers, there is information that is specific to the particular error:

```
Unexpected error from system macro instruction:
      words 5-6 - Macro name.
      word 7 - bytes 1-2 - Return code.
               bytes 3-4 - Reason Code.
2991 - Output data set validation error:
      word 5 - Reason code from DFS2991I message text.
2992 - Unexpected error from CSI or catalog management, form 1:
      word 5 - Reason area from CSI or catalog management
      word 6 - byte 1 - Reason area type:
                  'C' catalog error
                  'D'
                       data set error
                  'I'
                       CSI call
2992 - Unexpected return code from CSI, form 2:
      word 5 - Return code from CSI call.
      word 6 - byte 1 - X'00'
               bytes 2-4 - Reason code from CSI call.
2993 - Unexpected device class:
      word 5 - byte 1 - UCB device class.
2994 - Unexpected IDCAMS return code creating a data set:
      word 5 - Return code from IDCAMS.
2995 - Unexpected IDCAMS return code deleting a data set:
      word 5 - Return code from IDCAMS.
2996 - Insufficient DASD space to create a data set:
      word 5 - bytes 1-2 - SVC 99 error reason
                           code.
                bytes 3-4 - Reserved.
      word 6 - SMS error reason code.
      word 7 - Number of blocks wanted.
2998 - Miscellaneous SVC 99 errors creating a data set:
      word 5 - SVC 99 error reason
                               code.
               bytes 3-4 - Reserved.
      word 6 - SMS error reason code.
      word 7 - Number of blocks wanted.
```

The following table shows the module ID and module subcode values for the X'D9' trace entries that represent the OLR output data set validation or creation process and the inactive data set deletion process.

Table 29. Module and subcode ID for X'D9'

Module ID	Module	Subcode	Meaning
A	DFSORA00	X'10'	Data set creation successful
A	DFSORA00	X'11'	Data set creation successful
А	DFSORA00	X'12'	Data set creation successful
A	DFSORA00	X'13'	Data set creation successful
A	DFSORA00	X'14'	Data set validation successful
A	DFSORA00	X'15'	Data set validation successful
A	DFSORA00	X'16'	Data set validation successful
A	DFSORA00	X'20'	Primary index was not a VSAM KSDS
A	DFSORA00	X'21'	VSAM data set did not have REUSE attribute

Table 29. Module and subcode ID for X'D9' (continued)

Module ID	Module	Subcode	Meaning
A	DFSORA00	X'22'	VSAM record length did not match input
А	DFSORA00	X'23'	VSAM control interval size did not match input
A	DFSORA00	X'24'	KSDS key offset or length size did not match input
A	DFSORA00	X'25'	Miscellaneous errors; another trace entry precedes this one
A	DFSORA00	X'C1'	Internal error: invalid DFSORA00 call
A	DFSORA00	X'C2'	Internal error: No data set in X'2930' log record
A	DFSORA00	X'C3'	Invalid input data set
A	DFSORA00	X'C4'	Multi-volume input, but no output data set
А	DFSORA00	X'C5'	Non-DASD data set
A	DFSORA00	X'C6'	Multi-volume data set to be recovered
A	DFSORA00	X'C7'	Non-DASD data set
A	DFSORA00	X'C8'	Data set not usable for OSAM
A	DFSORA00	X'C9'	Data set is a PDS or PDSE
A	DFSORA00	X'D1'	Data set is not VSAM
А	DFSORA00	X'D2'	Data set is not a VSAM KSDS
A	DFSORA00	X'D3'	VSAM data set did not have REUSE attribute
A	DFSORA00	X'D4'	VSAM record length did not match input
A	DFSORA00	X'D5'	VSAM control interval size did not match input
A	DFSORA00	X'D6'	KSDS key offset or length size did not match input
A	DFSORA00	X'D7'	Data set not usable for OSAM
A	DFSORA00	X'D8'	Data set is a PDS or PDSE
A	DFSORA00	X'D9'	Data set is not VSAM
A	DFSORA00	X'E2'	Data set is not a VSAM KSDS
А	DFSORA00	X'E3'	VSAM data set did not have REUSE attribute
A	DFSORA00	X'E4'	VSAM record length did not match input
A	DFSORA00	X'E5'	VSAM control interval size did not match input
A	DFSORA00	X'E6'	KSDS key offset or length size did not match input
A	DFSORA00	X'E7'	Data set not usable for OSAM
A	DFSORA00	X'E8'	Data set is a PDS or PDSE

Table 29. Module and subcode ID for X'D9' (continued)

Module ID	Module	Subcode	Meaning
A	DFSORA00	X'E9'	Data set is not VSAM
В	DFSORA10	X'C1'	Data set error reported by CSI
В	DFSORA10	X'C2'	No error information available from CSI
В	DFSORA10	X'C3'	Catalog error reported by CSI
В	DFSORA10	X'C4'	Unexpected return code 4 from CSI
В	DFSORA10	X'C5'	Unexpected return code 4 from CSI
В	DFSORA10	X'C6'	Unexpected return code from CSI
В	DFSORA10	X'C7'	Unexpected return code from DEVTYPE
В	DFSORA10	X'C8'	Data set not on volume
В	DFSORA10	X'C9'	Unexpected return code from OBTAIN
В	DFSORA10	X'D1'	Unexpected return code from OBTAIN
В	DFSORA10	X'D2'	Unexpected return code from TRKCALC
В	DFSORA10	X'D3'	Unexpected return code 12 fron GETDSAB
В	DFSORA10	X'D4'	Unexpected return code from GETDSAB
В	DFSORA10	X'D5'	Unexpected return code from SWAREQ
В	DFSORA10	X'D6'	Invalid data set name
D	DFSORA20	X'C1'	SVC 99 information reason returned
D	DFSORA20	X'C2'	Insufficient space on volume
D	DFSORA20	X'C3'	Data set in use
D	DFSORA20	X'C4'	Insufficient space, SMS
D	DFSORA20	X'C5'	SVC 99 error and SMS reason returned
D	DFSORA20	X'C6'	SVC 99 error code returned
D	DFSORA20	X'C7'	SVC 99 error code returned
D	DFSORA20	X'C8'	Unexpected return code from SVC 99
D	DFSORA20	X'C9'	SVC 99 information reason returned
D	DFSORA20	X'D1'	SVC 99 error code
D	DFSORA20	X'D2'	Unexpected return code from SVC 99
D	DFSORA20	X'D3'	Unexpected return code from IDCAMS

Table 29. Module and subcode ID for X'D9' (continued)

Module ID	Module	Subcode	Meaning
E	DFSORA30	X'C1'	Unexpected return code from IDCAMS
G	DFSORA40	X'C1'	GETMAIN failure

# X'D9' trace entry: fence value before an OLR IPOST/IWAIT

The following figure shows the remaining words of the X'D9' trace entries that are specific to the fence value before an OLR IPOST/IWAIT:

TRACE ID = X'D9'
word 3 - Can contain the address of the PST
to be posted.
words 4-5 - Contains DMBORFEN.
words 6-7 - Contains DMBAMFEN.

The following table shows the module ID and module subcode values for the X'D9' trace entries that represent the fence value before an OLR IPOST/IWAIT.

Table 30. Module and subcode ID for X'D9': fence value before an OLR IPOST/WAIT

Module ID	Module	Subcode	Meaning
J	DFSORP70	X'01'	IPOST for the OLR I/O fence
J	DFSORP70	X'02'	IWAIT for the OLR action module fence
J	DFSORP70	X'03'	IPOST for the OLR I/O fence
J	DFSORP70	X'04'	IWAIT for the OLR action module fence
L	DFSORP40	X'01'	IWAIT for the OLR action module fence
L	DFSORP40	X'02'	IPOST for the OLR action module fence
M	DFSPCSH0	X'01'	IWAIT for the OLR action module fence
M	DFSPCSH0	X'02'	IPOST for the OLR action module fence
M	DFSPCSH0	X'03'	IWAIT for the OLR action module fence
M	DFSPCSH0	X'04'	IPOST for the OLR action module fence
0	DFSDLOC0	X'01'	IPOST for the OLR I/O fence
0	DFSDLOC0	X'02'	IWAIT for the OLR I/O fence
R	DFSDLR00	X'01'	IPOST for the OLR action module fence
R	DFSDLR00	X'02'	IPOST for the OLR action module fence
R	DFSDLR00	X'03'	IWAIT for the OLR action module fence
R	DFSDLR00	X'04'	IPOST for the OLR action module fence

Module ID	Module	Subcode	Meaning
R	DFSDLR00	X'05'	IPOST for the OLR action module fence
R	DFSDLR00	X'06'	IWAIT for the OLR action module fence
R	DFSDLR00	X'07'	IWAIT for the OLR action module fence
R	DFSDLR00	X'08'	IWAIT for the OLR action module fence
S	DFSDVBH0	X'01'	IWAIT for the OLR I/O fence
S	DFSDVBH0	X'02'	IPOST for the OLR I/O fence
V	DFSDVSM0	X'01'	IPOST for the OLR I/O fence
V	DFSDVSM0	X'02'	IPOST for the OLR I/O fence

Table 30. Module and subcode ID for X'D9': fence value before an OLR IPOST/ WAIT (continued)

# X'D9' trace entry : next UOR determination

The following figure shows the remaining words of the X'D9' trace entries that are specific to the next UOR determination.

TRACE ID = X'D9'

word 3 - The total number of UORs performed.
word 4 - The execution span for this UOR.
word 5 - The proposed size for the next UOR.
word 6 - The total bytes moved during this UOR.
word 7 - The total locks held during this UOR.

#### X'D9' trace entry: OLR command processing

The following figure shows the X'9D' trace entry definitions used by the Online Reorganization (OLR) command processing:

```
TRACE ID = X'D9'
```

```
word 0 - byte 1 - X'D9' Online Reorganization (OLR)
                 trace entry.
         byte 2 - Zero - not used.
         bytes 3-4 - Trace sequence number.
word 1 - byte 1 - Module ID.
        byte 2 - Module subcode.
        byte 3 - Module function.
        byte 4 - FREESTOR error return code.
word 2 - Last 4 bytes of the IMS ID (SCDIMSNM+4)
        processing the command.
words 3-4 - Command VERB (INIT, UPD, TERM, and QRY
            if an type-2 command)
words 5-6 - Operation Manager name ('NONOMCMD' if OLR
            type-1 command.
word 7 - Address of storage not freed if FREESTOR
         failure.
```

For all X'D9' trace entries, the module ID, and usually the module subcode as well, indicate both the meaning of the trace entry and the format of the rest of the trace entry.

The following table shows the module ID values in X'D9' trace entries that represent OLR command processing.

Module ID	Module	Subcode	Meaning
С	DFSORC00	X'00'	OLR type-2 command issued
С	DFSORC00	X'01'	FREESTOR error during INIT error processing
С	DFSORC00	X'02'	FREESTOR error after sending command response
Р	DFSORC10	X'00'	OLR type-1 command issued
P	DFSORC10	X'01'	FREESTOR error during INIT processing cleanup

Table 31. Module and subcode ID for X'D9': OLR command processing

# X'D9' trace entry: OLR start

The following figure shows the remaining words of the X'D9' trace entries that are specific to the OLR start.

X'9D' trace entry - words specific to OLR start

```
TRACE ID = X'D9'
word 3 - The RBA of the cursor in the second CI
or block.
word 4 - Unused.
word 5 - Unused.
word 6 - Unused.
word 7 - Unused.
```

# X'D9' trace entry: start of a UOR

The following figure shows the remaining words of the X'D9' trace entries that are specific to the start of a UOR.

X'9D' trace entry - words specific to start of UOR TRACE ID = X'D9' word 3 - The first four bytes of the last committed cursor. word 4 - The start time of this UOR. word 5 - The execution span for this UOR. word 6 - The time that was waited before this UOR started. word 7 - Unused.

# X'D9' trace entry: UOR wait for timer

The following figure shows the X'D9' trace entries that are specific to the UOR wait for timer.

X'9D' trace entry - words specific to UOR wait for timer TRACE ID = X'D9'

> word 3 - Unused word 4 - The start time of this UOR.

# X'D9' Trace Entry: OLR Full-Block Logging

TRACE ID = X'D9'

Word 3 - Not used Word 4 - AMP Word 5 - Buffer prefix (IBFPRF for OSAM or IDABUFC for VSAM) Word 6 - Block number for OSAM or RBA for VSAM

The following table shows the module ID and module subcode values for the X'D9' trace entries that represent the OLR logging of a full-block of database changes in a single X'5050' log record rather than the logging of individual database changes in separate log records.

Module ID	Module	Subcode	Meaning
F	DFSDBH20	X'00'	After full-block logging during OSAM buffer steal
Н	DFSDBH30	X'00'	After full-block logging during OSAM buffer purge
S	DFSDBVH0	X'03'	After full-block logging by DL/I buffer handler router before purge
V	DFSDVSM0	X'03'	Before full-block logging during VSAM buffer purge
V	DFSDVSM0	X'04'	After full-block logging during VSAM buffer purge
-			

Table 32. Module and subcode ID for X'D9': OLR full-block logging

#### X'D9' Trace Entry: OLRK PNDX Store

TRACE ID = X'D9'

Word 3 - OLRK entry address Word 4 - Root RBA of the primary index entry. Word 5 byte 1 - x'80' entry for primary index entry or VSAM) byte 2 - x'80' queued onto chain by OLR

# X'D9' Trace entry: OLRK ILE Store

TRACE ID = X'D9'

Word 3 - OLRK entry address Words 4,5 - Key of ILDS record Word 6 byte 1 - segment code byte 2 - x'40' entry for ILDS entry byte 3 - x'80' queued onto chain by OLR

# X'D9' Trace entry: OLRK ILE Write

TRACE ID = X'D9'

Word 3 - OLRK entry address
Word 4,5 - Key of ILDS record
Word 6 byte 1 - segment code
 byte 2 - x'40' entry for ILDS entry
 byte 3 - x'40' written to KSDS by VSAM interface
 x'20' deleted off chain by OLR

# X'FB' Trace entry: PSTSTLOR.

INSERT LOGICAL RECORDS (KSDS) to the primary index database or INSERT LOGICAL RECORDS (KSDS) to the ILDS database for HALDB integrated online reorganization. See the previous OLRK ILE/ILDS Store/Write trace entries that are associated with this trace entry.

TRACE ID = X'FB'

- Word 3 Unused
- Word 4 Unused
- Word 5 Unused Word 6 - Unused
- Word 7 Unused
- woru / onuseu

# X'DA' trace entry

The X'DA' trace entry is shown.

#### X'DA' trace entry

TRACE ID = X'DA'

```
word 0 - byte 1 - X'DA' - VSAM JRNAD or UPAD exit
byte 2 - PST number
bytes 3-4 - Trace sequence number
word 1 - Word 3 of JRNAD or UPAD parameter list
word 2 - Word 4 of JRNAD or UPAD parameter list
word 3 - Word 5 of JRNAD or UPAD parameter list
word 4 - byte 1 - JRNAD or UPAD code (For an explanation of
these codes, see note 3 below)
word 4 bytes 2-4 - AMB address
word 5 - PLH STACK or VSAM FOOTSTEPS
(see notes 1 - 4 below)
word 6 - PLH STACK or VSAM FOOTSTEPS
(see notes 1 - 4 below)
word 7 - PLH STACK or VSAM FOOTSTEPS
(see notes 1 - 4 below)
```

#### Notes:

- If the trace contains the PLH stack entries, these entries are the module addresses of the last five VSAM record management modules that had control. If the trace contains the VSAM footsteps, each VSAM footstep is a 1 byte entry which contains VSAM diagnostic information.
- **2.** The PLH footsteps contain 1 byte of VSAM diagnostic data and is passed back to IMS in order from last to first footstep.
- **3**. This information might be valuable to the VSAM support representatives if you need their assistance.
- 4. For an explanation of these codes, see the following table.

Table 33. JRNAD and UPAD codes for X'DA' trace entry

	Code	
Code	(hexadecimal)	Meaning
JRNAD	0C	Logical records to be shifted in a KSDS
JRNAD	10	Cannot occur
JRNAD	14	Cannot occur
JRNAD	20	Control area split starting in a KSDS
JRNAD	24	Control interval read error
JRNAD	28	Control interval write error

Code	Code (hexadecimal)	Meaning
JRNAD	2C	Control interval to be written
JRNAD	30	Control interval to be read and marked exclusive
JRNAD	34	Control interval ownership to be established
JRNAD	38	Control interval to be marked exclusive
JRNAD	3C	Create a new control interval
JRNAD	40	Release exclusive use of control interval
JRNAD	44	Mark control interval prefix invalid
JRNAD	48	Control interval read completed
JRNAD	4C	Control interval write completed
JRNAD	50	CI or CA split
JRNAD	54	Control area reclaim start
JRNAD	58	Control area reclaim end
JRNAD	5C	Control area reclaim interrupted
JRNAD	60	Control area reclaim recovery start
JRNAD	64	Control area reclaim recovery end
JRNAD	68	Start of reuse reclaimed control area
JRNAD	6C	End of reuse reclaimed control area
UPAD	00	Wait requested on I/O or defer
UPAD	04	Post ECB (XMEM only)

Table 33. JRNAD and UPAD codes for X'DA' trace entry (continued)

# X'DB' through X'FA' trace entry

TRACE ID = X'DB' - X'FA'

The X'DB' through X'FA' trace entries are shown.

#### The X'DB' through X'FA' trace entries

word 0 - byte 1 - X'DB' through X'FA'PSTFNCTN - Buffer handler trace -This is the function from X'DB' thru X'FA' for which the trace was written (see note 1 below). byte 2 - PST number (see note 2 below) bytes 3-4 - Trace sequence number word 1 - bytes 1-2 - PSTDMBNM - DMB number. This field indicates which DMB is being used. The DMB directory (DDIR) gives the first DMB. byte 3 - PSTDCBNM - DCB number byte 4 - PSTRTCDE - Usually indicates an error if nonzero. If an error, PSTDATA may contain residual data from the last call (see note 3 below) word 2 - byte 1 - PSTTRMID - ID of the module calling the buffer handler byte 2 - PSTTRMSC - Subcode of the module calling the buffer handler byte 3 - PSTBHFLG - DL/I buffer handler flags byte 4 - PSTSUBCD - Buffer handler internal work byte word 3 - PSTDSGA - Address of the DSG word 4 - PSTDATA - Address in real storage of the requested data.

 May point to the last retrieved data address in a call (failed abend) (see note 4 below).
 word 5 - PSTBUFFA - Address of buffer header. OSAM uses IBFPRF DSECT. VSAM uses IDABUFC DSECT.
 word 6 - PSTISAMW - Work area
 word 7 - PSTBYTNM - Relative byte number of data or block number (see note 5 below).

#### Notes:

1. The IMS internal function that was being performed.

- 2. Use only the trace entries with the correct PST number.
- 3. Shows how the call completed. (X'00' means successful completion.)
- 4. Shows where the requested data is located in core only if the call completed successfully.
- 5. The RBA or block number that the call requested.

If the call failed, the PSTDATA field might contain the address of the last segment successfully retrieved.

Example: PSTRTCDE = X'04' (RBA past end of data set).

# Database function codes

The DL/I function codes are shown.

# Buffer handler function codes

PSTFNCTN is located at PST + X'1C4'.

The following table shows the buffer handler function codes.

Table 34. Buffer handler function codes

Code (hex)	PSTFNCTN	Caller's request function
DB	PSTSRCHP	Search pool for record in range
DD	PSTRELLR	Release record ownership
DE	PSTRSTAT	Retrieve buffer pool statistics
DF	PSTVERFY	Verify VSAM data set
E0	PSTVPUT	Put record to VSAM data set
E1	PSTBKLCT	Block Locate
E2	PSTBYLCT	Byte Locate
E3	PSTISRCH	Not used
E4	PSTIESDS	Create new ESDS/OSAM LRECL
E5	PSTPGUSR	Write LRECLS for user (PURGE)
E6	PSTBFALT	Mark record altered
E9	PSTFBSPC	Free space in buffer pool (BFPL)
EA	PSTOWTCK	Perform background write function
EB	PSTBYALT	Byte locate and mark altered
EC	PSTBFMPT	Mark buffers empty (BFPL)
ED	PSTCHKPT	Checkpoint
EE	PSTSTAPG	Batch STAE purge at ABEND

Table 34. Buffer handler function codes (continued)

Code (hex)	PSTFNCTN	Caller's request function
EF	PSTERRPG	Purge user for I/O error check
EF	PSTFRWRT	OSAM buffer forced write
F0	PSTSTLBG	Retrieve first LRECL by key
F1	PSTERASE	Erase logical record
F2	PSTSTLEQ	Retrieve by key EQ or GT
F3	PSTSTLCI	Retrieve key EQ or GT - repair CI
F4	PSTSTLIS	Retrieve by key REC to chain from insert logical record (KSDS)
F5	PSTBXFER	RSR DTT BQEL transfer
F6	PSTBPURG	RSR DTT Purge/Release BQEL
F7	PSTRSIAB	Reset invalidate all buffers trigger
F9	PSTCPYGU	Position by key for Image Copy
FA	PSTCPYGN	Get next record for Image Copy

The following table shows the space management function codes.

Code (hex)	PSTFNCTN	Caller's request function
31	PSTGTSPC	Get space for the segment
32	PSTFRSPC	Free space for the segment
34	PSTGTRAP	Get space close to root anchor PSTBYTNM. Request to turn off bit map bit. Refer to label PSTBTMPF.
35	PSTGZIDL	Get local serialization as a service to LRH00 during /ERE when IRLM as SLM is not there.
36	PSTRZIDL	Release local serialization
B1	PSTGTSPH	Request for space at BLOCK and OFFS B2-B5 are reserved for tracing PSTDATA. PSTOFFSET must point to the location requested.

Table 35. Space management function codes

The following table shows the Open/Close function codes.

Table 36. Open/Close function codes

Code (hex)	PSTFNCTN	Caller's request function
00	PSTOCCLS	This is a close call. This is the absence of PSTOCOPN (X'08') or PSTOCOPN is reset.
01	PSTOCDMB	The DDIR address is in register 2

Table 36. Open/C	Close function	codes (	(continued)
------------------	----------------	---------	-------------

Code (hex)	PSTFNCTN	Caller's request function
02	PSTOCPCB	The PCB address is loaded from PSTDBPCB to registers 1
04	PSTOCALL	OPEN/CLOSE all DMBs in the system
08	PSTOCOPN	This is an OPEN call
0C		Combine X'04' and X'08'
10	PSTOCDCB	OPEN/CLOSE DCB PSTDSGA = DSG
20	PSTOCLD	Open for load
21	PSTOCDMA	CLOSE and UNAUTHORIZE DMB address of DDIR in register 2
40	PSTOCDSG	OPEN/CLOSE DSG PSTDSGA = DSG
80	PSTOCBAD	The PSTOCBAD (X'80') is set to indicate to the caller that the requested function failed

The following table shows the index maintenance function codes.

Table 37. Index maintenance function codes

Code (hex)	PSTFNCTN	Caller's request function
A0	PSTXMDLT	Index maintenance for segment to be deleted
A1	PSTXMRPL	Index maintenance for segment to be replaced
A2	PSTXMISR	Index maintenance for segment to be inserted
A3	PSTXMUNL	Index maintenance for segment to be unloaded

The following table shows the block loader function codes.

Code (hex) **PSTFNCTN** Caller's request function 00 PSTRSVDB Reserve database resources 01 **PSTDMBRD** Read DMB from ACBLIB 02 PSTPSBRD Read PSB from ACBLIB READ INTENT and DMB 03 PSTINTRD name lists from ACBLIB 04 PSTENQ PI Processing is required 40 PSTEREFF Free DB resources (SCHED failed) 80 PSTFREDB Free DB resources (termination)

Table 38. Block loader function codes

# Buffer handler return codes

The buffer handler return codes, subcodes, and definitions are listed and defined.

# Buffer handler return codes

The following table describes the buffer handler return codes.

Table 39. Buffer handler return codes

Return code	Subcode	Definition
PSTCLOK	X'00'	Everything correct
PSTGTDS	X'04'	RBN beyond data set
PSTRDERR	X'08'	Permanent read error
PSTNOSPC	X'0C'	No more space in data set
PSTBDCAL	X'10'	Illegal call
PSTENDDA	X'14'	End of data set encountered — no record returned
PSTNDTFD	X'18'	Requested record cannot be found
PSTNWBLK	X'1C'	New block created in buffer pool
PSTNPLSP	X'20'	Insufficient space in pool.
PSTTRMNT	X'24'	User must terminate, no space in pool.
PSTDUPLR	X'28'	Logical record already in KSDS.
PSTWRERR	X'2C'	Permanent write error.
PSTBUFIN	X'30'	Buffer invalidate.
PSTBIDIN	X'34'	Unable to acquire BID lock.
PSTPDERR	X'38'	Unable to locate DDIR/PDIR entry.
PSTNOSTO	X'3C'	Storage not available.
PSTRRERR	X'40'	CF read and register error.
PSTCURER	X'44'	Space management OLR cursor error.
PSTCLSDS	X'48'	Attempt to access a closed data set.

# Space management and buffer handler module trace IDs

In space management and DL/I buffer handler trace entries, a 1-byte module ID identifies the calling module. A 1-byte subcode identifies the specific call within the module.

# Space management and DL/I buffer handler trace entries

The calling module places the module ID in field PSTTRMID and the subcode in field PSTTRMSC before making the call. The DL/I buffer handler and space management then move these PST fields to the appropriate traces.

The PSTTRMSC module subcodes are 0 through 9 and A through Z. If you need to find the point in the module where the call was made, look for the TIDSCx label that corresponds to the module subcode. Subcode 0 corresponds to label TIDSC0, subcode 1 to label TIDSC1, subcode A to TIDSCA, and so on.

The following table describes the ID, the calling module, and the module function

ID label	Module ID	Calling module	Module function			
TIDDLA00	А	DFSDLA00	Call analyzer			
TIDDLAS0	А	DFSDLAS0	Call analyzer SSA			
TIDORA00	А	DFSORA00	OLR data set creation/deletion

"X'DB' through X'FA' trace entry" on page 198

## Delete/Replace - DL/I trace information

The DELETE/REPLACE module provides meaningful information when abnormal conditions arise leading directly to errors detected by Delete/Replace. This information can be found in the Delete/Replace work area (DLTWA).

Abends initiated by the Delete/Replace module (780, 796, 797, 798, 799, 802, 803, 804, 806, 807, 808, and 811) are traced in the DL/I trace table in a series of entries identified by an X'C4' in the first byte (TRACE FUNCTION CODE).

The first X'C4' entry in the series is provided by the routine that encountered the problem. Each additional entry is provided by the routine that called the routine which in turn wrote the prior entry in the table. Examining these entries in reverse sequence reveals the order in which control was passed from one routine to another.

You can obtain a complete description of the trace table entry for Delete/Replace by assembling the following lines of code:

DSECTS CSECT DFSDLDC FUNC=DSECTS FND

The second word in the Delete/Replace trace entry (called Entry1) uniquely identifies a Delete/Replace abend, and should be used by IBM and customers when submitting APARs for better problem description. In some cases, the Entry1 word from the next trace entry along with the first Entry1 word uniquely identifies the abend. The Entry1 format is:

BYTE 0 ID of routine supplying this entry

- 1 ID of routine that encountered error
- 2 Subcode number of abend if multiples
- 3 Internal code for abend

Each routine within the Delete/Replace module has a unique 1-byte identification number. The IDs can be obtained from the assembly listings of each of the four source modules which make up the Delete/Replace call. In general they are:

X'01' to X'1F'-control and common subroutines (DFSDLDC0) X'20' to X'3F'-delete routines (DFSDLDD0) X'40' to X'5F'-replace routines (DFSDLDR0) X'60' to X'7F'-DLTWA build routines (DFSDLDW0)

Use the Entry1 word (the second word in the trace entry) when relating to a Delete/Replace problem in IMS with IBM Software Support.

# **Retrieve trace**

When an application program executes and a problem occurs (such as damaged data or unexpected results), you can use the Retrieve trace records to see how IMS responded to various calls in the application.

#### To set the Retrieve trace

To set the Retrieve trace on, use either of the following methods:

- At initialization time, IMS always turns the Retrieve trace on, except for batch.
- For DB/DC and DBCTL environments, use the /TRACE SET ON TABLE RETR command. If you start the DL/I trace by using the /TRACE SET ON TABLE DLI command, the Retrieve trace is not automatically turned on.

Note: The Retrieve trace cannot be turned on if the DL/I trace is not active.

To determine if the trace is in the dump, check field PSTDLR1 in the PST.

X'0700'

Indicates the trace is on.

#### X'07FC'

Indicates the trace is off.

Field PSTRTVTR of the PST contains the address of the trace table. The byte at PSTRTNDX contains the offset to the next entry in the table.

Every time an application issues a get or insert call, the retrieve module (DFSDLR00) is called. This module is very large and contains many subroutines. By looking at the Retrieve trace, you can see the flow of control through the various subroutines of the retrieve module. As each subroutine calls another, a 2-byte hexadecimal entry is inserted into the trace table. (Byte 1 of the trace entry is the ID of the calling subroutine; byte 2 is the ID of the subroutine that is called.)

The Retrieve trace table is filled from beginning to end. When the table becomes full, tracing starts at the beginning of the table, overlaying each old entry with the new entry.

The first entry in the trace table for a call is X'F1', which is paired with entries: X'2F' (UNQL), X'30' (ROOTISRT), or X'31' (QUAL). The presence of any of these entries indicates the beginning of a trace entry for a retrieve call.

Field JCBRTVTR in the JCB also contains Retrieve trace information. JDBRTVTR contains the offsets to the initial entries in the trace table for the previous four DL/I calls that are associated with a database. The offset to the last call is in the low-order byte, and all offsets are shifted left at the start of each new call.

#### Example of Retrieve Trace

The execution of an application results in an error message that indicates damaged data. You can refer to the Retrieve trace table and interpret the entries in order to determine if the problem is caused by:

- An application error
- A database design error
- An internal IMS DB problem

• An IMS system problem related to pointers

If you determine that the problem was caused by an application or database design error, you can use the Retrieve trace to debug and resolve the problem. Otherwise, you can do a keyword search. If the search results in a large number of problems, you can reduce the number of problems by including the name of the subroutine (listed in the following table) that you found in the Retrieve trace table.

Table 41. The subroutines of the retrieve module (DFSDLR00)

Hex ID	Subroutine title	Subroutine description		
01	BLDVKEY	Builds alternate parent's concatenated key in work area.		
02	CSIIGEXT	Reads root based on SSA qualification. If found, GE at level one. If not found, GE at level 0.		
03	DIVRSETU	Position (DIV) was not found at this level. Sets off EOC and sets on not posted first child and siblings.		
04	ENQDQ	Handles all enqueue and dequeue for retrieve.		
05	FNDLPNQ	Final physical root of LP SDB and enqueue it.		
06	FORTHISL	Tries to get a segment that satisfies the call at this level or higher.		
07	GEEXIT	Publishes GE status code or GB (if root SDBEOC on).		
08	GETPSDB	Gets the PSDB of the segment pointed to by JCBACSC.		
09	GETPRIME	Issues request for SETL to retrieve next higher root in database.		
0A	STLALTPS	Processes request for data by key when an alternate processing sequence is used.		
0B	ISRTMPOS	While positioning for insert, a matching segment was found; checks if permissible.		
0C	ISRTPOS	Checks for LC insert to locate alternate parent, validate insert, or establish position on alternate twin chain.		
0D	ISRTVER	Verifies segment in POSP points to segment in SDBPOSN for HDAM and HIDAM organizations.		
0E	KDTEST	Compares value in SSA to value in segment or to key feedback for requalification.		
0F	LCPTRTST	Used by CC=L processing to use PCL pointer, if any.		
10	LTW	Main driver for requalification to determine the acceptability of current position.		
11	LTWLRTN	Used by CC=L processing to see if on last or should use PCL pointer or continue trying (HS).		
12	LTWLTST	Used by CC=L processing to find the last segment.		
13	MOVEKEY	Moves key from segment to PCB key feedback.		
14	MVSEGUSE	Moves the requested segment from the I/O area to the user area.		
15	POSTCHLD	Captures child RBNs from input SDB prefix and places in SDBPOSN of dependent SDBs.		
16	POSTME	Places search starting position for segment in SDB.		
17	POSTTRY	Unqualified GN has found a segment. Posts the position and key.		
18	POSTCURP	Moves position from JCB work words into SDB and sets post code.		

Hex ID	Subroutine title	Subroutine description		
19	POSTSDBN	Stores location of next segment on chain in JCB work words.		
1A	READCUR	Locates current entry in passes SDB.		
1B	RDLPCONK	Locates logical parent using its key.		
1C	READNXT	Locates next segment from passes SDB.		
1D	RDPHYPR	Locates physical pair of segments when passed SDB address of its pair.		
1E	RESETMP	Initializes for unqualified call.		
1F	RESETQMP	Compares previous call position in level table to current qualification where POS=M.		
20	SCDCRSCK	Not first LR crossed and concatenated segment ISRT, builds concatenated key of LC physical parent.		
21	SETEOC	Sets EOC in requested SDB. If logical parent enqueues outstanding, locates each and dequeues.		
22	SETL	Provides interface to buffer handler for all external data requests.		
23	SETLBG	Issues request for SETL to get first root in database.		
24	SETPVEOC	Sets EOC on previous SDBs in the hierarchy having the same parent as the passed SDB.		
25	SSAEVAL	Examines a segment to see if it satisfies the qualification.		
26	SETCHEOC	Sets on SDBEOC of dependent SDBs.		
27	STECHISB	Sets SDBEOC on for input SDB and siblings having same physical parent.		
28	SETLMIKY	SETL to find key equal to or greater than key determined as minimum value for SSA.		
29	STNPHISB	Sets EOC (if in use) and not posted for siblings of input SDB.		
2A	THISLVOK	Found one at this level that satisfies the call. Uses it and checks for more levels in call.		
2B	UNQGN	Gets next sensitive segment without violating parentage.		
2C	VLEXP	Processes variable length segment and user data compaction.		
2D	WIPEDN	Clears level table below level passed to bottom of table or below entry currently cleared.		
2E	XDFTEST	Qualification is secondary index. Checks index entries to validate the position.		
2F	UNQL	Master driver for calls without SSAs.		
30	ROOTISRT	Routine for positioning to insert at physical root of database.		
31	QUAL	Driver for qualified retrievals.		
32	HSAMRTN	HSAM I/O interface routine.		
33	RETRY	Retry routine for processing option GOT.		
34	ISRTCHCK	Use two keys in DSG for root insert.		
35	VALIDATE	Validate an EPS.		
36	PARTCKRC	Check results of the validate.		
37	HDTARGET	PHDAM/HDAM get a key equal or greater.		
38	HDNEXT	PHDAM/HDAM get next.		

Table 41. The subroutines of the retrieve module (DFSDLR00) (continued)

Hex ID	Subroutine title	Subroutine description
39	HDTARGET	PHDAM/HDAM get a first.
3A	OLRTRACE	Trace IWAIT/IPOST for OLR fence.
F1	INIT	Initialization.

Figure 62. Example of a retrieve trace

# **Online Recovery Manager trace**

The Online Recovery Manager trace (ORTT) records the control flow that is related to /RECOVER command processing.

# Starting the Online Recovery Manager trace

The /TRACE SET ON TABLE ORTT command activates the trace and sends the entries to an internal table.

You can format the table using the Offline Dump Formatter under IPCS, using either the VERBX command or the IMS Dump Formatter panels.

If a SNAP dump is taken, the table is formatted as part of the IMS dump.

If you add the OPTION LOG parameter to the /TRACE command, IMS sends the output to an external data set. You can use the File Select and Formatting utility (DFSERA10) with exit DFSERA60 to format the trace entries.

# Program isolation-related problem analysis

When invalid segment data is retrieved, or an unexpected user abend occurs during concurrent updates to a single database by more than one processing region under the protection of program isolation, improper enqueue or dequeue logic has been followed in IMS. Tools are available to properly document this occurrence. Correct and adequate documentation might depend on the ability to reproduce the error condition and on the availability of IBM Software Support.

## Limiting locking resources used by an application program

In order to avoid resource problems that can be caused by runaway applications, you can limit the number of locks an application can have by using the LOCKMAX parameter.

## LOCKMAX parameter

The LOCKMAX parameter can be specified on the PSBGEN statement or at execution time. The parameter has the following format: LOCKMAX=n, where n is a number between 0 and 255. 0 is the default and specifies no maximum lock limit.

## Using the LOCKMAX parameter

The number that is specified indicates units of 1000; for example, a specification of LOCKMAX=5 means that the application cannot have more than 5000 locks at one time.

Assemble the current DSECT describing the log record for the correct field offset because the offset for a field might change. For type X'37' log records, use the DFSXFER DSECT and select records that contain X'30' in the subtype field (such as type X'3778').

**Restriction:** Although the LOCKMAX parameter allows you to limit the amount of resources that are used by an application, it cannot be used to initially specify the amount of resources to be used by an application. Use traditional methods for specifying these resources through the PSB.

## Determining a value for the LOCKMAX parameter

To decide what value to use for the LOCKMAX parameter, analyze over a period of time the X'37', X'41', and X'5937' commit log records to determine the maximum number of locks being held per unit of work by the application.

Each of these log records contains a "high water lock count" or maximum lock count, which is the maximum number of locks held by the application. The X'41' log record shows a zero for the number of locks held, except in DL/I and DBB batch cases involved in block-level data sharing.

#### **Related reference:**

"Log records" on page 499

## Exceeding the LOCKMAX parameter value

When an application exceeds the value specified for the LOCKMAX parameter, a pseudoabend of type U3301 results. Modules DFSLRHOO and DBFLRHOO set this pseudoabend when the return codes and feedback from either PI or IRLM indicate that the lock request failed because granting the lock would exceed the LOCKMAX parameter value.

# Program isolation trace

The program isolation (PI) trace traces all calls to the IMS enqueue/dequeue module (DFSFXC10) and writes the trace entries to the system log as type X'67FA' records.

Entries with IDs X'C7', X'C8', X'C9', X'CA', X'CB', and X'CC' are PI entries.

In a DB/DC environment, you start the trace by entering the /TRACE command at the master terminal operator's console. For batch or DB/DC environments, you specify LOCK=OUT on the OPTIONS statement at system initialization time.

Save the log tape and submit it as APAR documentation. If you cannot ship the log tape with the APAR, you can use the File Select and Formatting Print utility (DFSERA10) with exit DFSERA40 to select and format records related to the problem from the log tape.

You can find the layout of PI trace log record X'67FA' by assembling macro ILOGREC.

In analyzing the trace output, you see not only PI trace information but also lock manager trace information.

#### Related concepts:

"DL/I trace formats" on page 167

#### Related reference:

"Format of X'67' log record" on page 523

## DL/I call image capture program

The DFSDLTR0 program, which operates independently, traces and records all DL/I calls issued by an application or multiple applications. The output is in a format acceptable as input to the DL/I test program DFSDDLT0.

This allows you to create the scenario that might have caused the problem. By inserting compare statements requesting SNAP documentation of DL/I control blocks before and after the suspected failure, the information collected helps in diagnosing the problem.

#### Related tasks:

"DL/I call image capture" on page 159

# Log analysis (database related)

The IMS log is one of the most useful of all IMS service aids. Understanding log records and what information they contain can be very beneficial.

#### Log record analysis

For all changes, write a copy of the segment before it is changed as well as a copy of the segment after it is changed, if applicable. This process not only facilitates backout and recovery, but it also is useful for diagnosis.

Analyzing log records is helpful whenever you suspect bad data or a pointer problem. Determine where the error is by referring to error messages or to the contents of the dump. When you identify the location of the problem, use the File Select and Formatting utility (DFSERA10) to print the log records for the block in error. Refer to the following table to interpret the contents of the log records. You can determine what changes to the data have been made, and in what sequence the changes were made. This information is helpful in identifying the source of the error.

Sometimes, the error is caused by an internal IMS problem; other times, the error results from incorrect data that is entered by a user or by an application.

To obtain a complete listing of all control blocks, DB, DC, and log records, assemble module DFSADSCT.

CICS puts a header on log records. To obtain the log records when running with CICS, the DD statement pointing to the CICS journal must specify DCB=RECFM=VB. This allows the File Select and Formatting utility to remove the header.

## Example of log analysis

An abend is issued against a database. You have used other diagnostic tools to analyze the call. Now you must look at the database. Follow these steps when looking at the database:

- 1. Analyze the buffer to identify what seems to be wrong. (See the following figure.) The first indication that something is wrong is usually found in the buffer.
- 2. Look at the changes to that buffer (block) on the log.
- 3. Determine if the bad data is actually on the database.
- 4. If required, determine if the image copy is propagating the bad block.

The following figure shows the general areas of database analysis: Application, Buffer, Database, Image Copy, and Log.

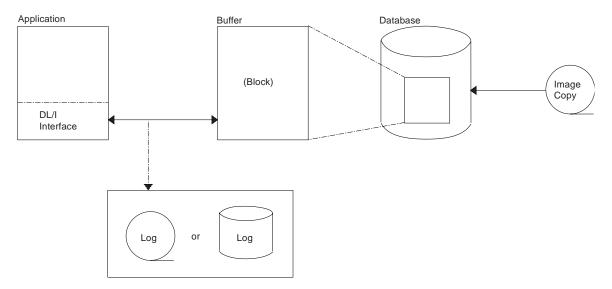

Figure 63. General areas of database (DB) analysis

# Database change log record DSECT

You can use the following table to assist you in the analysis of output from log record type X'50'.

If any differences are detected in the mapping of the DSECT, you can obtain a current copy by assembling the macro ILOGREC.

Table 52. Database change log record DSECT.

UNDO/F	REDO data section (I	DLOGDATA DSEC	CT)
00	DLOGDFLG	1	X'80' Last data element in this section X'40' Data is compressed using $z/OS$ services

## Table 52. Database change log record DSECT (continued).

Offset	Field	Length	Description
01	DLOGDFUN	1	Describe physical function being logged by this request X'80' Physical insert X'40' Physical replace X'20' Physical delete X'10' Space management create X'08' Free space element
02	DLOGDOFF	2	Offset of data in buffer
04	DLOGDLEN	2	Length of data (DLOGDDAT)
06	DLOGDDAT	variable	Variable length data
00		2 variable	Compressed data format in DLOGDDAT Expanded data length Compressed data
	DBCKCHN	6	Back chain <sup>2</sup>
	DBLGSEG	8	Logical logger sequence number <sup>2</sup>

Table 52. Database change log record DSECT (continued).

Notes:

1. To find each section, add the offset to the beginning of the log record.

2. The log back chain and logical logger sequence number are at the end of the log record.

# Sequential buffering service aids

When you receive a message or abend that indicates a problem with sequential buffering (SB), several diagnostic tools are available. Some of these tools are useful for diagnosing other IMS database-related problems.

## Useful tools for diagnosing IMS data-related problems

- DL/I trace table entries
- Dump formatting of IMS control blocks
- SNAPs of IMS control blocks during pseudoabends

The //DFSSTAT statistics report is also a useful tool for evaluating a potential sequential buffering problem.

SB provides additional problem determination tools, which are described in this section:

- SBSNAP and SBESNAP options
- SB IMAGE CAPTURE option and the SB Test program (DFSSBHD0 utility)
- The SB COMPARE option

For most invocations of SB pseudoabend buffer handler functions, entries in the DL/I trace tables are provided. The SB trace table entries are:

X'6F' Search/read by RBN

- X'6C' Refresh SB buffer after a write
- X'69' Invalidate SB buffers
- X'6A' Evaluate SB buffering
- X'6B' Describe why SB was or was not used for the application

In addition, the X'D1' DL/I trace table entry created by DFSNOTB0 contains some information about invalidation of SB buffers.

#### **Related concepts:**

## SBSNAP option

The SBSNAP option generates a SNAP of the relevant control blocks and areas involved in the calls of the OSAM buffer handler to the SB buffer handler.

Use the SBSNAP option when you receive a message saying that either Sequential Buffering:

- Has been activated when you do not expect it to be
- · Has not been activated when you expect it to be activated

IMS monitors the physical I/O being done by individual applications and then uses SB I/O reference pattern-analysis algorithms to select the most efficient method of data access. When you suspect a problem with these algorithms, the SBSNAP option provides diagnostic output you can analyze. The information that is provided in the SNAPs provides an indication of why SB chose between issuing a random read of one single block and a sequential read of multiple consecutive blocks.

As a result of analyzing SBSNAP output, you might realize you need to reorganize the database, redesign the database, or set different thresholds for the SB definition. The SBSNAP option is also useful when you are tuning your usage of SB after you've installed IMS or migrated to a new version.

To activate the SBSNAP option, provide a SBSNAP control statement in the //DFSCTL file. (See *IMS Version 13 System Definition* for detailed information.)

SNAPs are written to the IMS log as type X'67EE' records. You can format and print these records by using the File Select and Formatting Print utility (DFSERA10) with exit routine DFSERA30.

The SBSNAP option often creates a very large amount of SNAP output. You might therefore decide to limit the SNAP to a specific short period of the application execution. To limit the SBSNAP option to one period of the application execution, use the START and STOP keywords on the SBSNAP control statement. The syntax for these keywords is:

START=n STOP=

where n and m are the numbers of calls made to the SB buffer handler by the executing application.

To determine what values to use for n and m, look at the SPBSTCNB fields in the DL/I trace table and, if available, SNAP dumps (created by SBESNAP option). For each application, IMS maintains these call numbers in the SBPST, in the SBPSTCNB field. This field is periodically written to:

- The X'6A' DL/I trace table entry
- SNAPs that are created by the optional SBESNAP facility

Specifying START=n activates the SBSNAP option during the n the call to the SB buffer handler; specifying STOP=m deactivates the SBSNAP option during the mthe call to the SB buffer handler.

## **SBESNAP** option

You activate the SBESNAP option by providing a SBESNAP control statement in the //DFSCTL file.

The SBESNAP option SNAPs the control blocks that are necessary for understanding the reason the SB evaluation logic did or did not recommend use of SB.

SNAPs are written to the IMS log as type X'67FD' records. You can format and print these records by using the File Select and Formatting Print utility (DFSERA10)with exit DFSERA30.

# Testing algorithms using the SB Test utility (DFSSBHD0)

When you run the SB IMAGE CAPTURE option of the DFSSBHD0 utility, the same sequential buffering (SB) handler call sequence (which is issued during the processing of a specific application) captures on the IMS log all internal IMS calls to the SB buffer handler You can use this utility to investigate and test behaviors of various algorithms.

The DFSSBHD0 utility with the SB IMAGE CAPTURE option is useful for investigating:

- The SB I/O reference pattern analysis algorithms
- The impact of changes to user-specifiable SB parameter values (the BUFSETS parameter value)

Running the same SB buffer handler call sequence multiple times is useful in the following situations:

- You need to use the SBSNAP option but do not know when to Start or Stop the SBSNAP option.
- You want to experiment with different SB algorithm parameters and observe the impact of these changes on the //DFSSTAT statistics.
- You want to test changes to the SB I/O reference pattern analysis algorithms and observe the impact of these changes on the //DFSSTAT statistics.

You activate the SB IMAGE CAPTURE option by providing a SBIC control statement in the //DFSCTL file.

## **SB COMPARE option**

You activate the SB COMPARE option when you suspect that the SB buffer handler returns incorrect block images into the buffers of the OSAM buffer handler. When you activate the SB COMPARE option, the SB buffer handler performs a self-check

to see whether this suspicion is correct and provide problem determination information when the SB buffer handler really returns incorrect data.

When the SB COMPARE option is active, the SB buffer handler compares each block image that is returned to the OSAM buffer handler with the corresponding block image that is stored on DASD. When the comparison detects a mismatch between the two block images, the SB buffer handler invokes the SNAP-specific function, which produces a SNAP that describes the mismatch and contains:

- Relevant buffers and control blocks of DL/I
- The OSAM buffer handler
- The SB buffer handler

Module DFSSBSN0 then issues an abend (for batch) or a pseudoabend (for DB/DC, DBCTL, and CICS).

**Exception:** In a data-sharing environment, the SB buffer handler sometimes returns a back-level block image to the OSAM buffer handler. Therefore, in data sharing, the SB COMPARE option does not issue abends or pseudoabends.

You activate the SB COMPARE option by providing a SBCO control statement in the //DFSCTL file. Refer to *IMS Version 13 System Definition* for more information on the SBCO control statement in the //DFSCTL file.

SNAPs are written to the IMS log as type X'67EF' records. You can format and print these records by using the File Select and Formatting Print utility (DFSERA10) with exit DFSERA30.

## GSAM control block dump - DFSZD510

When a GSAM error occurs or when a DUMP or SNAP call is issued to a GSAM PCB, a formatted dump of the GSAM control blocks is written to the file that is defined as DDNAME IMSERR or SYSPRINT. You can use this GSAM control block dump (named DFSZD510) to diagnose GSAM problems.

## Example of when to use a GSAM control block dump

Some situations in which you would use a GSAM control block dump are when you receive a message identifying a GSAM error, or when you are having problems repositioning a GSAM data set when you are trying to restart an application that previously failed.

The following control blocks are included in the dump:

- GSAM pointer table (GPT)
- GSAM load table (GLT)
- GSAM data set control block (GB)
- GSAM queue control block (GQCB)
- GSAM buffer control block (GBCB)
- IMS program communication block (PCB)
- Data event control block (DECB)
- Request parameter list (RPL)

To produce a DSECT that shows the layout of the GSAM control blocks, assemble macro IGLI.

# Example of a formatted GSAM control block dump

In this example, key eye catchers are shown (in bold text) so that those sections of the dump are easier to find. Each problem is different, but diagnosing almost all GSAM problems involve at least these key areas of the dump.

# Recovering from Sx37 abends on GSAM data sets

When an application program is inserting records into a GSAM DASD data set and space on the data set is exceeded, an Sx37 abend occurs. The proper restart procedure depends on the physical characteristics of the GSAM data set and how IMS checkpointed the position in the data set.

## **Recovering non-SMS-managed data sets**

When an Sx37 abend occurs in a non-SMS-managed data set, you typically solve the problem by copying the data set and allocating more space for the copy.

You can copy the data set with the IEBGENER utility or another utility that reads and writes logical records. Do not do this for blocked GSAM BSAM DASD data sets if you plan to restart by using the copy. You must copy the physical records, not only the logical records. You can use the IEBGENER utility for this task, but you must specify different DCB parameters. A blocked data set has a record format of FB or VB.

To recover from an Sx37 abend on a blocked non-SMS-managed GSAM data set:

- 1. Copy the file to a larger data set by using the IEBGENER utility.
- 2. Specify RECFM=U for the record format for both the input and output data sets. This parameter copies the physical records as they exist. No reblocking is done. The copy must be to a like device type with the same track size. If the data set resides on multiple volumes, only the last volumes of data can be copied. GSAM keeps position by relative volume, by relative track within the volume, and by relative physical block within the track.
- **3**. Change the RECFM parameter for the copied file to its original value: FB or VB. You can change the parameter by using any program that opens the data set, including the IEBGENER utility. Execute the IEBGENER utility with a SYSUT1 DD statement with DISP=SHR and a SYSUT2 DD statement with DISP=MOD. The SYSUT2 DD statement must specify RECFM=*xx*, where *xx* is

the original GSAM data set record format value. This value causes the IEBGENER utility to open the data set for output. The IEBGENER utility does not copy any records to the data set, but it rewrites the DSCB with the updated RECFM value at close time.

You can now use the copy to restart the program from a checkpoint.

# Example JCL for copying a multivolume GSAM data set after an Sx37 abend

The following JCL describes how to copy a multivolume GSAM data set after an Sx37 abend occurs, which includes the following basic steps:

- 1. Uncatalog the data set that received the Sx37 abend.
- 2. Allocate a temporary data set for the last volume portion of the data set by using the original LRECL and BLOCKSIZE values, RECFM=U, and the new space allocation.
- **3.** Copy the portion of the original data set from the last volume into the newly allocated temporary data set.
- 4. Delete the portion of the original data set that resides on the last volume.
- 5. Rename the temporary data set to the original name.
- 6. Catalog the data set again, using the new volume label if the data set has moved, and reset the RECFM keyword to its original value. The IEBGENER utility is recommended for this step because the data set has to be opened for the RECM reset to take effect.

```
7. Submit the XRST job.
```

```
//B37COPY JOB (IMS, xxxxxx), 'GSAM TEST',
       REGION=0M,
//
11
       CLASS=A, MSGCLASS=A, MSGLEVEL=(1,1)
//* 1. Uncatalog multivolume data set.
//*
    The data set needs to be uncataloged before we can copy the
//*
    the last volume of a multivolume data set
//UNCALG EXEC PGM=IEFBR14
       DD DSN=DBDC.IMS.GSAMTEST,DISP=(OLD,UNCATLG),UNIT=SYSDA
//DD1
/*
//* 2. Allocate a new temporary data set with a bigger space allocation
//* for the last volume portion of a multivolume data set.
//ALLOC EXEC PGM=IEFBR14
//SYSPRINT DD SYSOUT=A

```

## **Recovering SMS-managed data sets**

When the GSAM data set resides on SMS-managed volumes and is a non-striped data set, you can extend the existing data set if the maximum number of volumes (59) is not exceeded.

Extending an SMS-managed, non-striped GSAM data set:

When you convert GSAM data sets to SMS-managed data sets, consider converting to SMS-managed striped data sets, or at minimum, converting to striped data sets, before the maximum number of volumes (59) for a data set is reached.

Attention: If the installation must use non-striped data sets for GSAM databases, and a data set full condition forces you to add a new volume to the data set, be aware that the maximum number of volumes for a data set is 59 volumes. As you approach this limit, copy the data set by using a larger space allocation value before the data set volume limit is reached. If the volume limit is reached and an abend occurs, you will be unable to perform a GSAM XRST. The copy of the data set using the larger space allocation must be completed after a job that has ended normally. After the data set is copied, GSAM XRST cannot be done using checkpoints taken before the data set was copied.

To extend an SMS-managed, non-striped GSAM data set:

1. Under SMS, add extra volumes to the storage group, if necessary, and increase the number of volumes allowed for the DATACLAS keyword.

2. Using IDCAMS, enter the command ALTER dsn ADVOL(\*) to indicate that additional volumes are available to the data set.

#### Converting an SMS-managed, non-striped data set to a striped data set:

Convert SMS-managed, non-striped data sets to SMS-managed, striped data sets before you execute jobs that might abend with Sx37 abends because they exceed the maximum number of volumes (59).

If an Sx37 abend occurs for an SMS-managed, non-striped data set due to the number of volumes for the data set exceeding 59 volumes, the data set cannot be recovered and an XRST cannot be completed.

The recovery cannot be completed because the SMS-managed, non-striped data set must be copied to an SMS-managed, striped data set with a larger primary and secondary allocation space parameter. When copying SMS-managed data sets, the copy process uses all the new space that is defined, starting with the first volume, which results in the checkpointed data record being moved not only to a different volume, but also having a different relative track and record (TTRZ, or TTTRZ for large format data sets). The copy process thus invalidates the restart position saved in the X'18' log record.

Migration from GSAM/BSAM non-striped data sets, which use TTRZ (or TTTRZ for large format data sets) for repositioning, to striped data sets, which use relative block number (RBN), results in an XRST failure or possibly an XRST reposition on the wrong data record. You cannot process a GSAM/BSAM non-striped data set, have an error condition occur, copy the data set to a striped data set, and then attempt to perform an XRST command. You must convert GSAM/BSAM non-striped data sets to striped data sets when you learn that your GSAM/BSAM databases are SMS-managed data sets and there is any chance that a job accessing that database might abend with an Sx37 number of volumes exceeded condition and that an XRST command is required.

To convert to an SMS-managed, non-striped data set to a striped data set:

- 1. Copy the non-striped data set to a new striped data set and use the same block size and device type.
- **2**. Specify the RECFM=U record format for both the input and the output data set to avoid any reblocking.
- **3**. When using DFSMS striped data sets, the restriction regarding maintaining the same number of records on the copied from and copied to volumes does not apply because with striped data sets, GSAM uses the RBN for NOTE/POINT, not the TTRZ (or TTTRZ for large format data sets).

In addition, GSAM supports DFSMS striped (extended format) data sets for both VSAM and BSAM.

#### Related concepts:

Processing GSAM databases (Application Programming)

# **Chapter 9. DBRC - Database Recovery Control service aids**

Diagnostic service aids, including RECON record types, DBRC internal trace, DBRC external trace are described.

# **Diagnosing from a RECON list**

You can use the LIST command to list the contents of all or part of the RECON data set.

You can list:

- The copy1 RECON data set
- RECON records for a particular change-accumulation group or for all change accumulation groups
- RECON records for a particular log data set or for all log data sets
- RECON records for a particular database data set or for DBDS groups
- Databases
- Subsystems
- Interim log records

Because some information is not printed when you issue the LIST.RECON command, you can issue the PRINT command for the access services method that you are using to list all information in hexadecimal format.

## **RECON record types**

The records in the RECON data set store information about logging activity and events that can affect the recovery of the database.

## Content description of the keys in RECON records

To view the layout of the entire RECON record, see the following table. Consider these points as you examine the records:

- The RECON key size is 32 bytes.
- The last three bytes of the key contain either of the following values:
  - Reserved, and contain zeros.
  - First byte=0 and the last 2 bytes=key segment number.
- Time stamps have the following characteristics:
  - Time stamps are 12 bytes.
  - The symbolic UTC format is:
    - YYYYDDDFHHMMSSTHMIJUAQQS

An example of the UTC format is: 2004006F211432800000032D

- DSPTIMES (DFSTIMES) contains time stamp structure information.

The following table shows the RECON record types.

## **DBRC** internal trace

DBRC internal trace is a useful tool for diagnosing problems that are possibly related to DBRC. The trace is always enabled.

## Types of problems DBRC internal trace can diagnose

The DBRC internal trace can help diagnose many different types of problems, such as:

- RECON data set contention
- RECON data set errors that are indicated by messages
- System abends in which the PSW is pointing to DBRC
- DBRC abends
- Whether DBRC or some other IMS component is causing the problem

Sometimes a problem occurs as a result of the interaction between two different modules performing different tasks. Interpreting trace entries is the best way to determine what each module was doing and when. For example, for RECON data set errors, it is important to know which DBRC modules manipulated the RECON data set and when.

You generally look at the DBRC trace output under the direction of an IBM Software Support representative, who will guide you in collecting data in specific trace fields and in interpreting that data. The DBRC trace entries that follow help you interpret trace data.

## Example of DBRC internal trace

A user receives abend code xxx. The PSW is pointing to DBRC. The user reports the problem to an IBM support representative. Some of the steps that the user diagnostician might take under the guidance of the IBM representative are:

- 1. Locate the DBRC trace in the trace using the TRACETBL eye catcher.
- **2**. Use the sample trace to verify that you have found the trace and to help you navigate through the trace table entries.
- **3**. Find DBRC and IMS control blocks and data areas by using addresses from selected trace table entries.
- 4. Determine the events that occurred before the abend.
- 5. Use the information in the trace and data areas to understand what caused the abend.

Some DBRC functions have the capability of generating additional trace entries that can aid in problem analysis. An IBM representative can assist you in enabling one or more of these expanded trace options through the use of the CHANGE.RECON command.

The CHANGE.RECON command supports a TRACEOPT parameter that allows you, under the direction of an IBM representative, to select expanded DBRC trace options.

## CHANGE.RECON

►►—TRACEOPT-

 $\lfloor (n(,m...)) \rfloor$ 

n,m,... DBRC TRACEOPT options

TRACEOPT is an optional parameter that you use only under the direction of an IBM Software Support representative for the purpose of gathering documentation for problem analysis. The IBM Software Support will provide the sub-options for the TRACEOPT parameter.

# **DBRC** trace input

When called, DSPTRACE receives a 16-byte parameter list.

## Contents of the parameter list

- An 8-character identifier that becomes the first 8 characters of the trace entry.
- A 4-byte control block pointer that points to a DFSBRLSB or the DSPRQB.
- A 4-byte block area pointer. 64 bytes of data from the block area are inserted in the trace entry. If the pointer is 0, the trace entry is 64 bytes long. Otherwise, the trace entry is 128 bytes long.

# Locating the DBRC trace

The DBRC trace is in the IMS-formatted portion of an IMS-formatted dump. There are four ways you can locate the DBRC trace.

## Method 1

Find the trace in the DBRC section of the IMS offline formatted dump.

#### Method 2

Find any DSPxxxxx module in the Save Area trace of the dump. For most DSPxxxxx modules marked ENTERED VIA CALL, register 5 contains the address of the request level control block (RQB). Offset X'38' in the RQB contains the address of router storage. Offset X'1C' in router storage contains the address of the DBRC trace.

In certain situations, register 5 does not point to the RQB. If this is the case, use method 3 or method 4.

#### Method 3

The trace is in subpool 0. If the dump has an index, look in the index to locate subpool 0. Scan this portion of the dump for eye catcher "TRACETBL," which identifies the beginning of the trace.

## Method 4

If you are looking at a dump online, search for eye catcher TRACETBL or GETFEED. If you search for the GETFEED eye catcher, you might first find it within DBRC modules. Search until you find the GETFEED eye catcher in the DBRC trace. Scroll to the beginning of the trace.

#### Related reference:

"Unformatted DBRC internal trace example" on page 252

# **DBRC trace output**

Trace output normally resides in subpool 0 storage, but you can direct output to a Generalized Trace Facility (GTF) data set.

The DBRC internal trace is a wraparound trace. That is, after the trace table is full, tracing starts at the beginning of the table, and each new entry overlays an old entry.

An entry with the identifier "TRACENXT" marks the next entry to be used, which is the logical end of the trace table.

## Related reference:

# Module call, module return, and DSPSTACK trace entries

With few exceptions, DBRC modules call module DSPSTGET to obtain initial work space and additional temporary work space (with the DSPGFSTK macro). Upon exit, DSPSTFRE releases the space obtained for the module. This centralized temporary storage management allows DBRC to track the flow of modules, starting with the first call out of DSPCRTR0 (entry point to DBRC).

Three trace entries accomplish this:

- Words 1 and 2 show the following items:
  - An arrow indicating whether the module is being called or is returning.
  - The nesting level of the module being called or returned to. Nesting levels are shown in one or two decimal digits, up to 99. (Nesting level 0 is DSPUIN00)
  - The last five characters of the module name being called or returning.
- DSPSTACK-additional work space trace entry (the result of the currently active module issuing the DSPGFSTK macro that calls DSPSTGET).

The following figure illustrates this processing flow:

- 1. Module A calls module B, which in turn calls DSPSTGET to obtain initial work space.
- 2. Module B issues macro DSPGFSTK to obtain additional work space.
- **3**. Module B calls DSPSTFRE to release all temporary storage.
- 4. Module B returns control to module A.

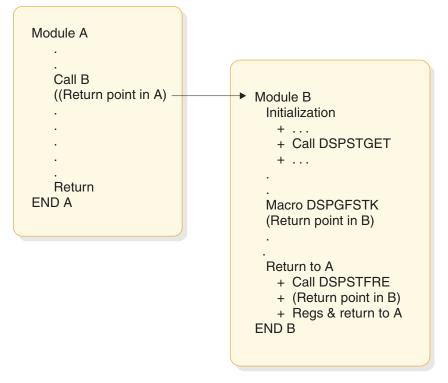

Figure 64. DBRC trace processing flow

"DBRC internal trace" on page 240 illustrates the format of the trace entries associated with this module flow. Each entry occupies one line (8 words) in the DBRC internal trace table. References to specific addresses and locations in modules A and B refer to the diagram above.

# One-line trace entry produced when module A calls module B

The following figure shows a one-line trace entry that is produced when module A calls module B. A one-line trace entry that is produced when module B calls DSPSTGET to obtain initial work space storage after being called by module A.

```
words 6-7 - Trace time stamp
```

# One-line trace entry produced when module B returns to module A

The following figure shows a one-line trace entry that is produced when module B calls DSPSTFRE to release all of its temporary storage before returning to module A.

# **DSPSTACK** trace entry

The following figure shows a one-line trace entry that is produced when module B issues macro DSPGFSTK, which calls DSPSTGET to obtain additional temporary storage.

words 0-1 - Identifier DSPSTACK word 2 - Return point address in the module B to which DSPSTGET returns after acquiring additional temporary storage for the module. word 3 - Entry point address of module B word 4 - Save area address of the module (B) word 5 - Beginning address of the additional temporary storage obtained for module B

```
words 6-7 - Trace time stamp
```

# BGNCABN0, DSPCABN0, BGNRETRY, DSPCRTR0, and CRTR0XIT trace entries

DBRC internal trace is a useful tool for diagnosing problems that are possibly related to DBRC. The trace is always enabled.

In DBRC, the following modules have specific trace calls inserted in their processing flow:

- DSPCABN0
- DSPCRTR0
- DSPURI00

The following figures show the layout of the entries issued from BGNCABN0, DSPCABN0, and DSPCRTR0.

```
words 0-1 - Identifier BGNCABN0
word 2 - A(DSPRQB)
words 3-5 - Zeros
words 6-7 - Time stamp
```

This is normally followed by either DSPCABNO or a BGNRETRY entry.

The following figure shows that DBRC terminated because of an unrecoverable error.

```
words 0-1 - Identifier DSPCABN0
word 2 - A(DSPRQB)
words 3-5 - Zeros
words 6-7 - Time stamp
```

This is the last logical entry in the trace table.

The following figure shows that DBRC recovered from an abend condition and is beginning to execute a retry sequence of code.

```
words 0-1 - Identifier BGNRETRY
word 2 - A(DSPRQB)
words 3-5 - Zeros
words 6-7 - Time stamp
```

The following figure shows that the router made a trace call before passing control to the next DBRC routine that is scheduled to process the request identified by a DFSBRLSB.

```
Line 1:
  words 0-1 - Identifier DSPCRTR0
  word 2 - A(DFSBRLSB)
  words 3-5 - Data from DFSBRLSB: function flags, exit flags, address
      of DSPGDB (These fields are the same as the fields
           that are displayed in the DSPCRTR0 entry, but they
           might have been modified by the request.)
  words 6-7 - Time stamp
Line 2:
    word 0 - Address of BRLBPRNT field in DFSBRLSB
    words 2-7 - Data from DFSBRLSB (next 60 bytes after
           field BRLBPRNT)
Line 3:
    words 0-7 - Data from DFSBRLSB (continued from previous
           line)
```

The following figure shows the function requested in the DSPCRTR0 trace entry completed.

```
Line 1:
    words 0-1 - Identifier CRTR0XIT
    word 2 - A(DFSBRLSB)
    words 3-5 - Data from DFSBRLSB: function flags,
        exit flags, address of DSPGDB. (These
        are the same fields displayed in the
        DSPCRTR0 entry, but they might have been
        modified by the request.)
    words 6-7 - Time stamp
Line 2:
    words 0-4 - DFSBRLSB prefix
    words 5-7 - First 12 bytes of DFSBRLSB
Line 3:
    words 0-7 - DFSBRLSB (continued from previous line)
```

# **DSPURI00 trace entries**

A trace entry with the identifier DSPURI00 indicates the beginning of a series of trace calls that show what occurs as DSPURI00 processes an I/O request.

All trace calls from DSPURI00 result in 96-byte trace entries. There are nine separate calls to the trace routine in DSPURI00. The pointer to the DSPRQB follows the trace identifier. The following table shows the 8-character identifier and block-area pointer for each call.

8-character identifier	Block-area pointer	Explanation
DSPURI00	MODIRCAR	DSPURI00 receives control and the function-code value from DSPIRCAR indicates the type of call. (See "DSPURI00 entry trace entry" on page 247.)
OPENER1	FILRESLT(I)	DSPURI00 starts a physical open of a RECON data set.
OPENER2	FILRESLT(I)	DSPURI00 completes a physical open of a RECON data set.
OPENXA8	FILRESLT(I)	DSPURI00 encountered a VSAM OPEN failure with reason code X'A8'.
GETFEED	FILRESLT(I)	After DSPURI00 issues an I/O request, the GETFEED procedure is called to trace specific information related to the I/O operation. Some of this information comes from DSPVFILE, some from the VSAM RPL, some from the record key and some from the I/O parameter block, DSPIOPAR. In addition, the RPL request is translated into a character printable code that describes the I/O operation. See "GETFEED trace entry for one RECON" on page 248.
CLOSER1	FILRESLT(I)	DSPURI00 starts a true close of the RECON data set.
CLOSER2	FILRESLT(I)	DSPURI00 completes a true close of the RECON data set.

Table 54. Calls to the trace routine in DSPURI00

8-character identifier	Block-area pointer	Explanation
VSAMERR	FILRESLT(I)	A VSAM error occurred and the routine to print a VSAM error message was entered.
RDOPTERR	RILRESLT(I)	An invalid read integrity option was specified. An error message was issued.
DSPURI00	ENDIRCAR	DSPURI00 returns to its caller. Relevant exit condition information, if applicable, is traced. (See "DSPURI00 exit trace entry" on page 250.)

Table 54. Calls to the trace routine in DSPURI00 (continued)

The sequence of trace entries identified by DSPURI00, OPENER1, OPENER2, and GETFEED shows DSPURI00 receiving control and doing a physical open of one RECON data set. When DSPURI00 opens the second RECON data set, another sequence of OPENER1, OPENER2, and GETFEED entries follow the entries for the first RECON data set.

The DSPIRCAR data area includes a 1-byte function code and a 3-byte flag field. The function codes are alphabetic characters that identify what operation DSPURI00 does. The flag bytes further identify the type of operation. Pertinent information is extracted from the DSPIRCAR data area and placed in a modified IRCAR area, along with other processing information, to produce both the entry and exit traces within DSPURI00.

The GETFEED trace entry maps 64 bytes of information about the I/O operation. The last two lines of the entry contain this data.

The exit trace entry is similar to the entry trace. It is written upon return from DSPURI00, but only if one or more of the following conditions is true:

- This was a request to locate a specific RECON record.
- The request did not complete successfully (RC greater than 0 was returned).
- The copy 1 or 2 RECON status changed on this entry to DSPURI00.

#### DSPURI00 entry trace entry

```
Line 1:
      words 0-1 - DSPURI00
      word 2 - RQB address
      words 3-5 - Binary zeros
      words 6-7 - Time stamp
Line 2:
      words 0-1 - MODIRCAR
      word 2 - c1c2
      word 3 - Func
      words 4-7 - 16-byte entry message
Line 3:
      words 0-5 - Key, blank, or repl ddname (key area)
      word 6 - addr
      word 7 - leng
time stamp
       Trace time stamp.
c1c2
       The DD statement number (1-3) of the copy 1 and copy 2 RECON, if any,
        on entry to DSPURI00.
```

func Function and option bits received from caller in DSPIRCAR.

#### 16-byte entry message

EBCDIC message readable at the right end of the trace entry, such as LOGICAL OPEN, END MULT, UPDATE, and others. Class and sequential locate requests and configuration requests have a modifier at the end of their message:

- F Locate first
- L Locate last
- NX Locate next
- **P** Locate previous
- NG Locate not-greater-than
- DSNS Supply dsnames of RECONs in DSPIRCAR
- STAT Supply status of all RECONs in DSPIRCAR
- **DUAL** Enter dual mode
- **REPL** Replace RECON*x* with spare (where x = 1-3, see key area)

#### key area

For all locate, change, insert, and delete requests, contains the 32-byte key of the record involved. For replace requests, contains the ddname of the RECON to be replaced.

addr Address of a record to be changed or inserted.

**leng** Length of a record to be changed or inserted.

## **GETFEED trace entry for one RECON**

```
Line 1:
       words 0-1 - GETFEED
       word 2 - DSPRQBA
       words 3-5 - Binary zeros
       words 6-7 - Time stamp
Line 2:
       word 0 - RPLFDBWD
       word 1 - FILLRECL
       word 2 - FILNEWCA
word 3 - FILNEWEX
       word 4 - FILCICNT
       word 5 - FILCACNT
       word 6 - FILEXCNT
       word 7 - FILMAX
Line 3:
       word 0 - FILCISZ
       word 1 - bytes 1-2 - FILFLAGS
                bytes 3-4 - FILOPERR
       word 2 - FILBUFPT
       word 3 - FILRCDPT
       word 4 - FILRCDLN
       word 5 - bytes 1-2 - SEGMENT NUMBER
                byte 3 - RECON NUMBER
                byte 4 - RPLREQ
       word 6 bytes 1-4 and word 7 bytes 1-2 - PRINTABLE
                                                 RPLREQ
       word 7 - bytes 3-4 - NOT USED
```

dsprqba

Address of the DSPRQB.

time stamp Trace time stamp.

## RPLFDBWD

RPL feedback word.

## FILLRECL

Logical record length.

## FILNEWCA

Starting high-used relative byte address (RBA).

### FILNEWEX

Starting high-allocated RBA.

#### FILCICNT

RECON changed counter value.

## FILCACNT

Current high-used RBA.

## FILEXCNT

Current high-allocated RBA.

### FILMAX

VSAM maximum record size.

#### FILCISZ

Data control interval (CI) size.

## FILFLAGS

RECON processing status flags (open, reserved, empty).

#### FILOPERR

Open SVC reason code if RC is not 0.

## FILBUFPT

Pointer to header record buffer.

## FILRCDPT

Pointer to the record in the VSAM I/O buffer or user area.

#### FILRCDLN

Length of record.

#### SEGMENT NUMBER

Record segment number.

#### **RECON COPY NUMBER**

Recon number used in this request.

## RPLREQ

RPL request type.

#### **RPL REQUEST PRINTABLE CODE**

English word that is later translated into a printable code used to make a request to VSAM.

#### **RPL REQ PRINTABLE CODE**

This is translation of the RPLREQ field into a printable code that is close to being the English word for the request made to VSAM. The following table shows the translated RPLREQ printable codes.

Table 55. Translated RPLREQ printable codes

Printable code	Hexadecimal	RPLEQ	RPL request
GET	00	GET	Retrieve a record
PUT	01	PUT	Write a record
CHECK	02	CHECK	Wait for completion
POINT	03	POINT	Position for access
ENDREQ	04	ENDREQ	Terminate a request
ERASE	05	ERASE	Delete a record
VERIFY	06	VERIFY	Synchronize end of data
****	07	Not used	Not used
DATPRE	08	DATA PREFORMAT	
IDXPRE	09	INDEX PREFORMAT	
FORCIO	0A	Force I/O	
GETIX	0B	GET INDEX	
PUTIX	0C	PUT INDEX	
SCHBFR	0D	SCHBFR	Search Buffer
MRKBFR	0E	MRKBFR	Mark Buffer
WRTBFR	0F	WRTBFR	Write Buffer
CNVTAD	10	CNVTAD	
MNTACQ	11	MNTACQ	
ACQRNG	12	ACQRANGE	
TRMRPL	13	TERMRPL	
VERREF	14	VERIFY REFRESH	

## **DSPURI00 exit trace entry**

```
Line 1:

words 0-1 - DSPURI00

word 2 - RQB address

words 3-5 - Binary zeros

words 6-7 - Time stamp

Line 2:

words 0-1 - ENDICAR

word 2 - c1c2

word 3 - Func

words 4-7 - 16-byte entry message

Line 3:

words 0-5 - Key, blank, or repl ddname (key area)

word 6 - addr

word 7 - 1nrc
```

#### time stamp

Trace time stamp.

- **c1c2** The DD statement number (1-3) of the copy 1 and copy 2 RECON, if any, on exit from DSPURI00.
- func Function and option bits received from caller in DSPIRCAR.

#### 16-byte exit message

For locate requests, contains either the message RECORD WAS FOUND or

RECORD NOT FOUND, depending on the outcome of the search. Otherwise, contains a repeat of MODIRCAR contents.

#### key area

For a successful locate request, contains the 32-byte key of the RECON record returned to caller. Otherwise, contains a repeat of MODIRCAR contents.

- addr Address of the record found for a successful locate. Otherwise, 0.
- **Inrc** Length of the record found for a successful locate, or the return code to be passed back to the module that called DSPURI00.

# Trace entries related to parallel RECON access

When parallel RECON access is enabled, trace entries that are related to parallel access processing are created. Trace calls are made when unexpected conditions occur during processing.

Layout of the DSPURI80 trace entry:

The trace entry is created when DBRC detects that VSAM has shunted data for a RECON data set.

```
Line 1:

words 0-1 - Identifier DSPURI80

word 2 - A(DSPRQB)

words 3-5 - Zeros

words 6-7 - Time stamp

Line 2:

word 0 - Index into FILE data for data set with shunted I/O data

words 1-2 - DDNAME of RECON data set with shunted I/O data

words 3-7 - Zeros

Line 3:

words 0-7 - Zeros
```

Layout of the DSPRSYNC trace entry:

The trace entry is created when a non-zero return code is returned by an z/OS Resource Recovery Services ATRCMIT request or ATRBACK request.

```
Line 1:

words 0-1 - Identifier DSPRSYNC

word 2 - A (DSPRQB)

words 3-5 - Zeros

words 6-7 - Time stamp

Line 2:

word 0 - Requested RRS request (1=commit, 2=backout)

word 1 - Return code from ATRCMIT request or ATRBACK request

words 2-7 - Zeros

Line 3:

words 0-7 - Zeros
```

# DBRC group services entries

When DBRC is registered with SCI, module DSPRLX10 makes trace calls in response to group services requests. These calls can be requests to send notifications to other DBRC instances, event notifications, or requests or messages from other DBRC instances.

Requests without an accompanying message are traced in the DSPRLX10 trace entry. Entries with messages are traced in the DSPRLX1M trace entry.

```
Layout of the DSPRLX10 trace entry:
Line 1:
 words 0-1 - Identifier DSPRLX10
 word 2
          – A(DFSBRLSB)
 words 3-5 - Data from DFSBRLSB: function flags, exit flags, address of DSPGDB.
                 (These fields are the same as the fields that are
     displayed in the DSPCRTRO entry, but they might have been modified by
                 the request.)
 words 6-7 - Time stamp
Layout of the DSPRLX1M trace entry:
Line 1:
 words 0-1 -Identifier DSPRLX1M
          – A(DFSBRLSB)
 word 2
 words 3-5 - Data from DFSBRLSB: function flags, exit flags, address of DSPGDB.
                 (These fields are the same as the fields that are
      displayed in the DSPCRTRO entry, but they might have been modified by
                 the request.)
 words 6-7 - Time stamp
Line 2:
 words 0-1 - 'DSPRLMSG'
 word 3 - Message type
word 4 - message subtype
 words 5-7 - Zeros
Line 3:
 words 0-3 - Message sender ID
 word 4 - Message sequence number
 word 5
           - Message ID that is being responded to
 words 6-7 - First two words of message specific data
```

# Unformatted DBRC internal trace example

The module-call entries, module return entries, DSPURI00 trace entries, and other entries (such as GETFEED, DSPCRTR0, and CRTR0XIT) are shown in this trace example.

#### **Related tasks**:

"Locating the DBRC trace" on page 241

# **DBRC** external trace

If you start the Generalized Trace Facility (GTF) and issue the CHANGE.RECON TRACEON command, the DBRC trace (DSPTRACE) creates an external trace record and issues the GTRACE macro to invoke GTF.

## **DBRC** external trace records

The GTRACE macro passes the address and length of a DBRC external trace record to GTF. A DBRC external trace record is put in the user data area of a GTF trace record.

If more than two DBRC jobs run concurrently, the GTF data set or buffer can contain multiple trace records. Therefore, DBRC external trace records contain either the IMS subsystem ID or a job name. In a DB/DC or DBCTL environment, the SSID is added to the trace record. In other IMS environments, a job name is

added to the trace record. The following table shows the format of these records.

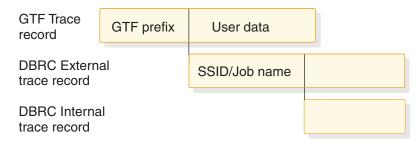

Figure 65. Format of DBRC external trace records

The GTF cataloged procedure is supplied in SYS1.PROCLIB with member name GTF or GRFSNP. If you want the DBRC trace records to be put in the GTF data set, specify MODE=EXT on the EXEC parameter and USR on the GTF option in the cataloged procedure. For detailed information about invoking GTF and its cataloged procedure, see *z/OS MVS Diagnosis: Tools and Service Aids*.

You can format and print DBRC trace records in the GTF data set by using the GTFTRACE subcommand of IPCS. You must specify the exit AMDUSRF2 on this subcommand. For detailed information about using IPCS, see *z*/OS *MVS Interactive Problem Control System (IPCS) User's Guide*.

"DBRC trace output" on page 242

# Examples of DBRC router processing and RECON I/O error processing output

Formatted and unformatted output for DBRC router processing and RECON I/O error processing are shown.

## **DBRC** external trace output

The following two examples show the unformatted and formatted output for DBRC router processing and RECON I/O error processing.

In the following figure:

- DBRCJOB1 is the job name.
- TIME is the time stamp of the trace entry.
- DSPCRTR0 passed control to the next routine to process the request identified by the DFSBRLSB.
- RQB is the address of the request level control block.
- LSB is the address of the DFSBRLSB.
- FUNC indicates the function flags (from the BRLBFFLG field of the DFSBRLSB).
- EXIT indicates the exit flags (from the BRLBEFLG field of the DFSBRLSB).

In the following figure, a SHOWCB macro instruction is executed after the I/O request is issued.

- IMS1 is the SYSID.
- TIME is the time stamp of the trace entry.
- DSPURI00 has control.
- RQB is the address of the request level control block.
- A locate was done. For a locate, a flag and record key are also shown in the trace record.
- RSCD is the VSAM reason code.

# Chapter 10. BPE-based DBRC service aids

BPE-based DBRC service aids help you analyze problems in BPE-based DBRC.

# **BPE-based DBRC trace records**

BPE-based DBRC trace records are written to one or more trace tables, and provide information that can help you determine the source of errors.

Trace record eye catchers in a formatted dump provide information about which function resulted in an error. You might be able to correct environmental problems immediately. Refer internal problems to IBM Software Support with appropriate documentation, such as system console logs and dumps.

BPE-based DBRC trace records are written to one or more of the trace tables shown in the following table.

Table name	Number of tables	Table description
ERR	1	Used to trace errors that occur within the DBRC address space. Specify as TRCLEV=(ERR,level,DBRC,PAGES=num_pages). The default number of pages for this table is 2. The ERR trace entry is 32-bytes long.
GRPS	1	Used for DBRC group services messages and notification tracing. Specify as TRCLEV=(GRPS,level,DBRC,PAGES=num_pages). The default number of pages for this table is 8.
MODF	N = 1 - 256	Used for DBRC module flow tracing. Specify as TRCLEV=(MODF,level,DBRC,PAGES=num_pages). The default number of pages for this table is 8.
RQST	<i>N</i> = 1 - 256	Used for general DBRC request processing. Specify as TRCLEV=(RQST,level,DBRC,PAGES=num_pages). The default number of pages for this table is 8.

Table 56. Trace tables for BPE-based DBRC trace records . .

Trace entries have the following general format:

0 1 2 3 4 (WD1) 8	. , . ,	10	LL-B LL-1	
CD SC  THD   DTRCALLI	ER   client	ID   user data	STCK	Í

## Field name

Represents

- CD 1-byte trace code field that indicates the function that wrote the trace record.
- SC 1-byte trace subcode field that indicates the category of the trace record.
- THD 2-byte thread sequence number.

#### WD1 - WD2

2-word trace identifier (DTRCALLR).

WD3 The client ID. **STCK** 2-word system clock (STCK) that indicates the time when the trace entry was created.

The first four words and the last two words are common fields, and the rest of the information is specific to each entry.

DBRC address space trace records are mapped by macro DSPBDTR.

Trace record mapping is based on the trace subcode, which identifies the category of trace record. One particular trace subcode can apply to many trace codes. Each trace record mapping also includes a pictorial representation in a comment block.

Use the trace subcode to locate the trace record mapping in the DSPBDTR macro. The DSPBCODE macro includes 2-byte module identifier codes that are used in trace records when it is necessary to identify a DBRC module. The module identifier represents the module that wrote the trace record. The DBRC module identifiers are defined in macro DSPBCODE.

The following example shows the format of a 64-byte trace entry (MODF or GRPS trace table):

0 1 2 3	4	8	С	10	14	18	1C	1F
+  CD SC  THD	WD1	WD2	WD3	WD4	WD5	WD6	WD7	++
WD8	WD9	WD10	WD11	WD12	WD13		STCK	
20	24	28	2C	30	34	38		3F

The following example shows the format of a 128-byte trace entry (RQST trace table):

0 1 2 3 4	8	С	10	14	18	1C	1F
CD SC  THD   WD1	WD2	WD3	WD4	WD5	WD6	WD7	+ 
WD8   WD9	WD10	WD11	WD12	WD13			+   +
							+   +
						STCK	+   +

# Trace record examples for BPE-based DBRC

These examples show formatted BPE-based DBRC trace record examples.

## **DBRC I/O services trace**

In the following example, the trace code is in the first byte (X'72'), which the DSPBDTR macro documents as I/O services. The eye catcher is IOSRV. The trace subcode is in the second byte (X'02'), which the DSPBDTR macro documents as RECON data set true open start. The eye catcher is True 0PEN start. The 8-byte identifier in the right eye catcher for corresponding subcode is in word 1 - 2.

**Important:** An asterisk at the beginning of a subcode eye catcher indicates an error.

Code	Subcode	Trace Entry	Trace Data
IOSRV:	True OPEN start	72020000 D6D7C5D5 C5D9F140 C9D4E2F1 0BD61000 00000000 00000000 00000000	OPENER1

When the identifier is DSPURI00, the block-area pointer eye catcher follows the eye catcher for subcode in the left eye catcher. In the following example, the trace subcode is in the second byte (X'01'), which the DSPBDTR macro documents as "Enter DSPURI00." The eye catcher is Enter URI00. The block-area pointer eye catcher that follows is MODIRCAR. The 16-byte entry message for DSPURI00 is in word 12 - 15. The eye catcher is LOGICAL CLOSE.

Code	Subcode	Trace Entry	Trace Data
IOSRV:	Enter URI00 MODIRCAR	72010000         C4E2D7E4         D9C9F0F0         C9D4E2F1         OBDC0000         00000000	LOGICAL CLOSE

#### **DBRC** module flow trace

The following example shows a DBRC module flow trace.

**Important:** An asterisk at the beginning of a subcode eye catcher indicates an error.

**Module A calls module B:** The following two-line trace entry is produced when module A calls module B. A two-line trace entry is produced when module B calls DSPSTGET to obtain initial workspace storage after being called by module A. The trace code is in the first byte (X'77'), which the DSPBDTR macro documents as "Request processing." The eye catcher is RQST. The trace subcode is in the second byte (X'1A'), which the DSPBDTR macro documents as Process Flow. The eye catcher is Module entry. The 8-byte identifier in the right eye catcher for the corresponding subcode is in word 1 - 2. Word 3 represents the client ID, which is IMS1 in this example.

Code Subcode	Trace Entry		Trace Data
RQST : Module entry		F1C4 E2E2F0F1 C9D4E2F1 8BD8C38C 0BDF5258 0BE97370 0BE97518 0000 00000000 00000000 00000000 0000000	->1DSS01
	words 1-2 word 3 word 4 word 5 word 6 word 7 words 14-15	<ul> <li>Identifier that consists of:</li> <li>An arrow (-&gt;) indicating that the module is being</li> <li>The nesting level of module B. Nesting levels are one or two decimal digits, up to 99 (nesting level</li> <li>Last five characters of the module name being call Client ID.</li> <li>Offset in module A of call to module B.</li> <li>Entry point address of module B.</li> <li>Save area address of the calling module (A).</li> <li>Beginning address of module B).</li> <li>Trace time stamp.</li> </ul>	shown in 0 is DSPUIN00). ed.

**Module B calls module A:** The following two-line trace entry is produced when module B calls DSPSTFRE to release all of its temporary storage before returning to module A. The trace code is in the first byte (X'77'), which the DSPBDTR macro documents as Request processing. The eye catcher is RQST. The trace subcode is in the second byte (X'1B'), which the DSPBDTR macro documents as Process Flow. The eye catcher is Module exit. The 8-byte identifier in the right eye catcher for corresponding subcode is in word 1 - 2.

Code Subcode	Trace Entry		Trace Data
RQST : Module exit		60C4 E2E2F0F1 C9D4E2F1 0BD8C38C 00000236 0BE97370 0BE97518 0000 00000000 00000000 00000000 0000000	<-DSS01
	words 1-2	<ul> <li>Identifier that consists of:</li> <li>An arrow (-&gt;) indicating that the module is ret</li> <li>The nesting level of module A. Nesting levels a one or two decimal digits, up to 99 (nesting le</li> <li>Last five characters of the module name returni</li> </ul>	re shown in vel 0 is DSPUIN00).
	word 3	Client ID.	
	word 4	Offset in module A to which module B returns.	
	word 5	Offset in module B where it returns to module A.	
	word 6	Save area address of module A that called module	Β.
	word 7	Beginning address of the temporary storage being by module DSPSTFRE.	released for module E
	words 14-15	Trace time stamp.	

**DSPSTACK trace entry:** The following example shows a two-line trace entry that is produced when module B issues macro DSPGFSTK, which calls DSPSTGET to obtain additional temporary storage. The trace code is in the first byte (X'78'), which the DSPBDTR macro documents as System related. The eye catcher is SYS. The trace subcode is in the second byte (X'15'), which the DSPBDTR macro documents as Additional work space. The eye catcher is DBRC stack rqst. The 8-byte identifier in the right eye catcher for corresponding subcode is in word 1 - 2.

Code Subcode	Trace Entry		Trace Data
SYS : DBRC stack rqst		D7E2 E3C1C3D2 C9D4E2F1 8BE0B9AE 0BE0B710 0BF4D7C8 0BE98910 0000 00000000 00000000 00000000 000000	DSPSTACK
	words 1-2	Identifier DSPSTACK.	
	word 3	Client ID.	
	word 4	Return point address in the module B to which DSF acquiring additional temporary storage for the mo	
	word 5	Entry point address of module B.	
	word 6	Save area address of module B.	
	word 7	Beginning address of the additional temporary sto for module B.	orage obtained
	words 14-15	Trace time stamp.	

## DBRC request user exit trace

The following example shows a trace taken before the DBRC request user exit routine is called. The trace subcode is in the second byte of the trace (X'1C'). which the DSPBDTR macro documents as "Before calling user exit," as indicated in the left eye catcher field. The "BRQ0" that follows refers to the module name (DSPBRQ00) that issues the trace call. The 1-byte BRQX\_Flags field is located in the first byte of the second word of the trace. The eye catcher field on the right contains "DBRC IS BYPASSED," corresponding to the flag code (X'80' in this trace). The "END" that follows is the user exit function (BRQX\_Func), which is located in the first byte of the first word (X'02' in this trace).

**Important:** An asterisk at the beginning of a subcode eye catcher indicates an error.

Code	Subcode	Trace Entry	Trace Data
RQST:	Before exit call BRQ(	771C0000         02030010         80000000         C9D4E2F1         0A8B0558           0000000         0A8FDE40         0A8B056C         0A91A798         0000008           07142002         0001000         00000000         00000000         00000000           00C57B78         00000001         0C083000         00000000         00000000	0000000 0000000 0000000

## **DBRC** group services trace

DBRC group services generates trace entries of two types: group services request or group services send. This type of entry means that global services is requested to do something by either its own DBRC or one of the other DBRC instances in the same IMSplex. The 8-byte identifier in the right eye catcher for corresponding request type is in word 5-6, which represents the DBRC job name.

#### Group services request:

The following example shows a group services request entry.

 Code
 Subcode
 Trace Entry
 Trace Data

 GRPSV:REQ - DBRCUP
 73270000 00000058 00800000 12248000 00000000 C4C2D9F8 C3E2C2C2 F4F70038 DBR8CSBB
 DBR8CSBB

 1197A6B8 C4D5465B BC96000D 00000000 00000000 00000000 C4D5465B C5AFF4C0
 DBR8CSBB

The following tables describes useful fields and their possible values:

Word 1 Eye catcher **Request type** X'50' INIT Initialize global services. Another DBRC is telling this DBRC that RECON data set X'51' NOTQUIESCE access is allowed. X'52' QUIESCE This DBRC wants exclusive RECON data set access. X'53' QUACK Another DBRC acknowledges this DBRC's request for exclusive RECON data set access. X'54' ENDQUIESCE This DBRC releases RECON data sets to other DBRCs again. X'55' **ENDQUACK** Another DBRC acknowledges renewed RECON data set access. X'56' GOTQUIESCE Another DBRC wants exclusive RECON data set access. X'57' GOTENDQUIES Another DBRC releases its exclusive RECON data set access. X'58' DBRCUP A new DBRC joined the IMSplex. X'59' DBRCDOWN A DBRC left the IMSplex. X'5A' SCIUP Local SCI is active. X'5B' **SCIDOWN** Local SCI is down. X'5C' **RCNLOSS** This DBRC wants to notify other DBRCs of a RECON loss. X'5D' RESEND Another DBRC wants this DBRC to resend its last request. X'5E' **GRP2DONE** Local processing complete for request types 56 or 57. X'5F' GOTRCNLOSS RECON loss notification from another DBRC. X'60' ID Another DBRC informs this DBRC of its SSID.

Table 57. Word 1 eye catchers for the group services request

#### Table 58. Words 4 -10 request types for the group services request

Word	Request type
Word 4	Message sequence number.
	Meaningful only for requests from other DBRCs (request types 51, 53, 55, 56, 5D, 5F, 60). Each DBRC assigns a sequence number to every new request that it sends. If a request is resent, it contains the same sequence number that was originally assigned to it.
Words 5-6	For requests from other DBRCs, the job name of the other DBRC.

Table 58. Words 4 -	10 request types	for the group services	request (continued)

Word	Request type
Words 7-10	The SCI token associated with the request. Can be used to distinguish between
	DBRCs if the job name is not unique.

#### Group services send:

The following example shows a group services send entry. This type of entry means that group services is sending a message to another DBRC.

Code Subcode	Trace Entry	Trace Data
GRPSV:SEND - NOTQUIESCE	73280000 0000001 0000000 0000002 0000000 0000000 0000000	

The following list describes useful fields and their possible values:

Table 59. Word 1 eye catchers for the group services request

Word 1	Eye catcher	Message type			
X'01'	NOTQUIESCE	RECON access is allowed.			
X'02'	RCNLOSS	RECON loss notification.			
X'03'	QUIESCE	Request for exclusive RECON access.			
X'04'	QUIESCECLS	Request for exclusive RECON access and that the recipient close the RECON data sets.			
X'05'	QUACK	Acknowledge the request for exclusive RECON access.			
X'06'	ENDQUIESCE	Release exclusive RECON access by this DBRC.			
X'07'	ENDQUACK	Acknowledge release of exclusive RECON access.			
X'08'	RESEND	Request resend of another DBRC's last request.			
X'09'	ID	Send SSID to another DBRC.			

Table 60. Words 3 and 4 message types for the group services request

Word	Request type			
Word 3	Message sequence number.			
Word 4	If the message is a response to a message from another DBRC, this is the sequence number of the other DBRC's message.

# Chapter 11. Data communication service aids

Data communication service aids, such as Terminal communication task trace and DC Trace are described.

# Terminal communication task trace

When an output device (such as a terminal, line, or node) hangs, you can use the terminal communication task trace to diagnose the problem.

You can use information you find in the terminal communication task trace to build keywords for your search string, or you can use the information when you are reviewing existing APAR descriptions to determine whether they describe the problem you are experiencing.

All IMS terminal communication tasks are dispatched by the IMS communication analyzer (module DFSICIO0). This module traces its own flow, as well as the flow through device-dependent modules, by using register 0 of the save area of the communication analyzer. (For this reason, this trace is often referred to as the REG0 trace.) The communication analyzer uses the high-order 2 bytes of register 0 to trace the analyzer entry point, and uses the low-order 2 bytes to trace the device-dependent module entry point.

In the DC section of the IMS dump, find the save area sets that hold data about the various IMS processes that were executing prior to the dump. If one of these save areas sets is for DFSICIO0, you can then look at the corresponding register 0 to find the communication task trace entries.

## **Related reference:**

"Log records" on page 499

# Analyzer entry points

The high-order 2 bytes of register 0 (for module DFSICIO0) identify the analyzer entry points.

# **Entry points**

# Analyzer entry point (hex)

## Processing description

- 1 Process an input segment from a terminal.
- 2 Perform a logical read operation to the terminal.
- **3** Determine which system function is to be performed next for this line and terminal (or node).
- 4 Issue a GET NEXT call to message queue.
- 5 Perform a logical write operation to the terminal.
- **6** WRITE successful; dequeue message or call the device-dependent module at DD1.
- 7 Notify master terminal of I/O error; cancel input; return output message to queue.
- 8 Return output message to queue; cancel input.

- 9 Generate an error message; cancel input; return output message to queue.
- A Idle the line; cancel output; return output message to queue.
- **B** Resend the last message sent from a given logical terminal (LTERM).
- C Idle the line.

The low-order 2 bytes of register 0 identify the entry points for the device-dependent modules (DDMs), as listed below:

#### DDM entry point (hex) Processing description

- 1 WRITE/SEND setup: Set up output buffer to write current buffer.
- 2 WRITE/SEND interruption: Error check last output operation.
- 3 READ/RECEIVE setup: Set up to perform a poll or read.
- 4 READ/RECEIVE interruption: Error check, determine terminal responding, and deblock input segment.
- 5 Cleanup: Restore control blocks after DFSICI00 error.
- **6** Build: Move output message from a queue buffer (MFS buffer) to a line buffer.
- 7 Logon: VTAM OPNDST/CLSDST processing.
- 8 Prepare for output: VTAM
- **F** MFS output format control (DFSCOFC0) was entered.

# **Trace records**

Example trace records for the terminal communication task trace are described.

The entries in the first 2 bytes indicate the processing that the analyzer (DFSICIO0) has completed. The entries in the last 2 bytes indicate the processing that the device-dependent modules (DDMs) have completed. As new entries are added, existing entries shift to the left. When the 2-byte area fills, the oldest entry is overwritten by the next-oldest entry. Therefore, the right-most entry of each 2-byte portion of register 0 identifies the most recent analyzer or device-dependent module activity.

The following figure shows the format of a sample terminal communications task trace record.

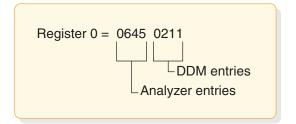

Figure 66. Example of a terminal communication task trace entry

The sample terminal communication task trace entry in the figure indicates that the analyzer entries are 6, 4, and 5; DDM entries are 2, 1, and 1. An analysis of this trace data would yield the flow information shown in the following table.

Entry point	Trace ID	Processing description			
2	DDM2	A write interrupt occurred.			
6	A06	A write completed successfully.			
1	DDM1	Another buffer was required.			
4	A04	Room in the buffer is allowed for another message segment. (GN was issued to the message queue.)			
1	DDM1	This segment was placed in the buffer, filling it or an EOM was detected. Setup for the write operation was completed.			
5	A05	An output operation was requested.			

Table 61. Example processing flow for a terminal communication task trace entry

## Trace output

You can find the terminal communication task trace in any IMS dump, either in register 0 (corresponding to module DFSICIO0) or in the CLB section of the dump for the terminal involved in the problem.

If you look at the CLB section of the dump, the information in field CLBTEMP1 is the same as what is in register 0. Fields CLBTEMP4 and CLBTEMP5 contain the Julian date and time at which the IMS task (ITASK) associated with the line or node returned to the IMS dispatcher (module DFSIDSP0). This information is useful when diagnosing a hung or lost terminal. In an IMS control region dump, you can determine when the last activity occurred on the line or node and what processing path was taken.

# DC trace

The data communication (DC) trace enables you to obtain information about the program flow within the communications analyzer and between the analyzer and the device dependent modules (DDMs).

#### **Related reference:**

Diagnosing Message Format Service problems (Diagnosis)

# Starting the trace

To start the DC trace for any terminal in the IMS network, enter one of the /TRACE commands from the master terminal or the z/OS console.

Specify at least level 3 in the command because buffer contents are usually required for complete diagnosis. If you specify level 4, the trace writes a save area set for certain entries (C00-C12, D05, AER1, and AER2).

• For VTAM terminals:

/TRACE SET ON NODE P1 LEVEL 1 2 3 4 MODULE DDM MFS ALL

For ISC links:

/TRACE SET ON NODE P1 LEVEL=1|2|3|4 MODULE DDM|MFS|ALL

or

/TRACE SET ON NODE P1 USER P2

• For logical LINKs:

/TRACE SET ON LINK P1,..., Pn ALL LEVEL 1 2 3 4 MODULE DDM MFS ALL

• For UNITTYPE:

```
/TRACE SET ON UNITTYPE P1,...,Pn LEVEL 1|2|3|4 MODULE DDM|MFS|ALL
UPDATE MSLINK NAME(linkname/linkname*/*) START(TRACE)
```

**Note:** The type-2 command UPDATE MSLINK NAME(*linkname*) START(TRACE) uses the same level and module settings that were used the last time the /TRACE SET (ON) LINK command was issued. If a /TRACE SET (ON) LINK command has not been issued since the last cold start, this command defaults to MODULE=ALL and LEVEL=4.

• For an XRF environment:

/TRACE SET ON NODE xxx TAKEOVER

/TRACE SET ON LINE xxx TAKEOVER

/TRACE SET ON LINK xxx TAKEOVER

UPDATE MSLINK NAME(linkname) START(TRACE) SET(TKOTRC((Y))

#### Tip:

- The /TRACE SET ON NODExxx TAKEOVER command starts the trace for the specified terminals during takeover only.
- You can enter this command only from the active system in an XRF environment.
- After a terminal has switched successfully, the trace is automatically turned off for that terminal.
- Because this command is recovered across restart and takeover, you need to enter it only once. After a cold start, you must enter the command again.
- Tracing occurs only if the session was active at the time of the takeover.
- If you enter a /TRACE command with and without the TAKEOVER keyword, the last command you entered is in effect.
- You can issue this command for VTAM nodes and MSC links during takeover.
- The /TRACE SET OFF NODE xxx TAKEOVER, /TRACE SET OFF LINE xxx TAKEOVER, /TRACE SET OFF LINK xxx TAKEOVER or UPDATE MSLINK NAME (*linkname*) STOP(TRACE) SET(TKOTRC(N)) command turns off the trace anytime before takeover.

# Stopping the trace

To stop the DC trace, enter one of the /TRACE SET OFF commands from the master terminal or the z/OS console.

• For VTAM terminals:

/TRACE SET OFF NODE P1

For ISC links:

/TRACE SET OFF NODE P1

/TRACE SET OFF NODE P1 USER P2

or

- For logical LINKs: /TRACE SET OFF LINK P1,...,Pn ALL
- For UNITTYPE:

```
/TRACE SET OFF UNITTYPE P1,...Pn
UPDATE MSLINK NAME(linkname|linkname*|*) START(TRACE)
```

• For an XRF environment:

/TRACE SET OFF NODE xxx TAKEOVER

/TRACE SET OFF LINE xxx TAKEOVER

/TRACE SET OFF LINK xxx TAKEOVER UPDATE MSLINK NAME(linkname) STOP(TKOTRC)

# Printing the trace records

To format and print the trace records, use the File Select and Formatting Print utility (DFSERA10).

The DC trace snaps DC control blocks and I/O buffers to the OLDS/WADS as X'6701' log records. These records are archived to the system log data set (SLDS).

To format and print the trace records, use the following method:

## • File Select and Formatting Print utility (DFSERA10)

To use the File Select and Formatting Print utility (DFSERA10), specify E=DFSERA30 to format the records before printing. The following example shows the JCL you might use to print DC trace records.

```
// JOB jobname
//S EXEC PGM=DFSERA10
//SYSPRINT DD SYSOUT=A
//SYSUT1 DD DSN=DSN of SLDS,.....
//SYSIN DD *
CONTROL CNTL
OPTION PRINT 0=5,V=6701,L=2,T=X,E=DFSERA30
//
```

where

O = Offset L = Length V = Value T = Type E = Exit

Even if the DC trace was started for many terminals, you can print trace entries for a specific terminal by using the following OPTION statement.

```
CONTROL CNTL DDNAME=....
OPTION PRINT 0=5,T=X,L=1,V=67,C=M
OPTION PRINT 0=89,T=C,L=8,V=xxxxxxx,C=E,E=DFSERA30
```

where xxxxxxx = terminal (node) name

A trace record might span several X'6701' log records. If you use the OPTIONS statements, only the first log record is printed.

#### **Related reference:**

"Content of the trace records"

# Content of the trace records

You can evaluate DC trace records while debugging errors, building keywords, or evaluating APAR descriptions.

You can evaluate DC trace records during any of the following tasks:

• Debugging user errors in exit routines or user modifications relating to communications

- Debugging errors in other entities in the communication network (such as programmable terminals or other host processors)
- · Building a keyword string to search for known problems
- Evaluating existing APAR descriptions to isolate problems that are most like the one you are experiencing

The first line of each trace record shows the ID:

ID= xxx SEGNO= mm RECNO= nnnnnnn TIME HH.MM.SS.TT DATE YY.DDD

*xxx* can be any of the following trace record identifiers (IDs):<sup>1</sup>

## ID Description

- A xx Communication analyzer activity (DFSICIO0)
- AERx Access method error
- C xx Communication analyzer activity (DFSCIOC0 in DFSICIO0)
- CI04 TM shared queues re-read error detected
- CIO2 Device-dependent module (DDM) SDC read for output
- CIO3 Device-dependent module (DDM) conditional SDC wash output

## CMEA

- Before calling Message Control/Error exit DFSCMUX0
- **CMEB** After calling Message Control/Error exit DFSCMUX0
- CMEI Message Control/Error exit interface processing
- COFC Entry to the output format control, MFS-supported devices (DFSCOFC0)
- CRTU Output User Creation user exit routine failure
- CTTR ISC TCPIP Trace ABORT.
- **CVCT** VTAM trace. This log record is written even though DC trace is not active on the terminal/link.
- **CVCV** XRF class 2 takeover trace. This log record is written for XRF class 2 terminals during takeover, even though DC trace is not active on the terminal.
- D xx Device-dependent module (DDM) activity
- DDxx Output processing by DFSCOFC0
- DSIM SIMLOGON attempt of a dynamic terminal
- ESIM SIMLOGON error for a dynamic terminal
- FERR MFS-block fetch error
- FESx Front-end switch user exit routine activity
- FEXT Before field edit exit routine
- FMTx Message Format Service activity (MFS)

## HCSW

XRF class 1 takeover trace. This log record is written for XRF class 1 terminals during takeover, even though DC trace is not active on the terminal.

T

<sup>1.</sup> An asterisk (\*) in this list is a wildcard character, meaning that any character can replace the asterisk.

ICLR	Message router activity
INIT	Device-dependent module (DDM) for ISC TCP/IP that sends session initiation requests.
IRxx	Device-dependent module (DDM) for ISC TCP/IP that reads input messages that use the IBM CICS Transaction Server for z/OS IPIC protocol.
IWxx	Device-dependent module (DDM) for ISC TCP/IP that builds output messages that use the CICS IPIC protocol.
MFSP	MFS activity to detect change in the content of a protected field that is in the input from a 3270 or SLU2 device. Set MFSPFV=Y in the DFSDCxxx member of the IMS PROCLIB data set to configure this option. This log record is written even though DC trace is not active on the terminal.
MSGS	
	Device-dependent module (DDM) for ISC TCP/IP that sends messages that use the CICS IPIC protocol.
MTRP	Block verification error
RESP	Device-dependent module (DDM) for ISC TCP/IP that sends ACK/NAK messages that use the CICS IPIC protocol.
SDC1	Device-dependent module (DDM) SDC output read error
SDC2	Device-dependent module (DDM) SDC message reread error
SEXT	Before segment edit exit routine
SGNX	Signon user exit routine failure
SPCL	Close spool data set
SPOP	Open spool data set
SPRE	Read spool data set
SPWR	Write spool data set
TERM	Device-dependent module (DDM) for ISC TCP/IP that sends session termination requests.
TRCE	Non-SNA 3270 error
VTPO	Non-posting of ECB trace (DFSVTPO0)
Excepti	on: MSC has its own analyzer module and entry types.
	ble below shows the types of data communication (DC) trace records and ach trace record contains. Some of the acronyms used in the table are:
SEG	Segment (DECAREA buffer)
MFS	MFS input work/MFS output work/MFS protect work
QBUF	Queue buffer
IOPUF	
	TP buffer
S25	Save area 2-5
SALL	Save area all

			/TRACE option		

#### Notes:

- 1. See "Diagnosing line and terminal problems" on page 282 for more information on this trace code.
- 2. Fast Path EMHB buff traces (if present) with I/O buffers
- 3. Module return code saved in CLBTEMP4
- 4. Return codes from DFSFFRH0 (block fetch), MFSTRACE (when in MFSTEST) or MFSBPCA (when not in MFSTEST); MFSTRACE=MFSTEST trace parameters, MFSBPCA=MFS Buffer Pool Control Area:

#### Offset in hex

- 0 Current pool space in use
- 4 Maximum space used
- 5 Status flag

X'80'	I/O active for a task
X'40'	Task(s) queued for I/O
X'20'	A task dequeued and posted

- 9 Error status
  - X'BB' BLDL error X'FF' READ error
- A Block name for BLDL error
- 10 BLDL return code on error
- 12 Sense from read error
- 14 CSW status from read error
- 16 Block name for read error
- 20 List for BLDL macro
- 5. Besides CIB and CTB:

#### PARMLIST

Parameter list to be passed to EXIT

FIELD Field data before exit

6. Besides CIB and CTB:

#### PARMLIST

Parameter list to be passed to EXIT

#### SEGMENT

Segment data before exit

- 7. SEXT is logged if TRAP 1 is set by /TRACE and a buffer overwrite occurs.
- 8. MTRP is logged if TRAP 1 is set by /TRACE and a buffer overwrite occurs. In addition to the blocks, the DIF/DOF, MID/MOD, MFBP, and FRE are traced. If in output, R9 is also traced.
- **9**. The MSNB control block content is traced by DFSICIO0 if the /DEQ LTERM, /DEQ NODE, or the /DEQ MSNAME command is entered with the PURGE or PURGE1 keywords.
- 10. The CRTU trace entry is mapped in "Format of 6701 log record with CRTU identifier" on page 283.
- 11. The VTPO trace entry is mapped in "Format of the 6701 log record with VTPO identifier" on page 284.

#### **Related tasks**:

"Printing the trace records" on page 273

## **Diagnosing line and terminal problems**

Use trace record identifiers to help in diagnosing line and terminal problems.

The trace records with the following identifier are useful in diagnosing line and terminal problems:

#### A01 TERMINAL INPUT READY FOR IMS PROCESSING

#### I TP BUF

Contains input device segment 6 to 36 bytes from the beginning of the buffer. The data is preceded by a 2-byte length and 2 bytes of zeros.

#### A02 PRIOR TO ISSUING VTAM I/O REQUEST. (LOGICAL READ)

CLB For remote 3270:

#### X'0001'

Special poll (read sense/status)

X'0401'

Read initial (general poll)

#### X'0082'

Write initial

#### X'0084'

Write continue

Offset X'0C' contains the address in TP BUF to read into or write from.

#### I TP BUF

The input TP buffer contains data to be written if this is an output operation. For VTAM nodes, the RPL begins at offset X'08'.

#### A05 PRIOR TO ISSUING VTAM I/O REQUEST. (LOGICAL WRITE)

**CLB** Refer to the information for record A02.

#### O TP BUF

The output TP buffer contains data to be written if this is an output operation. For VTAM nodes, the RPL begins at offset X'08'.

#### A07 GENERATE 'UNABLE TO RECEIVE/OUTPUT' MESSAGE

See the preceding D02 or D04 record for the cause.

#### A09 GENERATE ERROR MESSAGE

See the preceding D02, D04, or D07 record for the cause.

#### AER2 SHOULD NOT OCCUR ERROR HAS OCCURRED

**CLB** Offset X'3E' contains the error message number in hexadecimal. All available control blocks and buffers are logged. This record is produced even if the trace is not set on.

#### CRTU OUTPUT USER CREATION EXIT ROUTINE FAILURE

#### CVCT VTAM DEVICE SUPPORT TRACE

**CLB** Normally offset X'1C' contains the complemented IMS message key of an IMS master terminal message. All available control blocks and buffers are logged. This record is produced even if the trace is not set on.

#### I TP BUF of O BUF

The VTAM RPL begins at offset X'08'.

#### CVCV XRF CLASS 2 TAKEOVER TRACE

This log record is written for XRF class 2 terminals during takeover, even though DC trace is not active on the terminal. This record can be used to diagnose subsequent session failures when used in conjunction with CVCT records.

#### D02 VTAM HAS POSTED I/O COMPLETE. (LOGICAL WRITE INTERRUPT)

CLB

#### Offset X'00' =

Post code

• X'40' for VTAM = normal completion

Other key fields are DECFLAGS and DECERRST. For VTAM, key fields are CLBVFLAG and CLBLOST.

#### **O TP BUF**

For VTAM nodes, the VTAM RPL begins at offset X'08'.

- D04 VTAM HAS POSTED I/O COMPLETE. (LOGICAL READ INTERRUPT)
  - **CLB** Refer to the information for record D02.
  - **IOB** Refer to the information for record D02.

#### I TP BUF

The input TP buffer contains data read from the terminal if the last operation was a read or poll. For VTAM nodes, the RPL begins at offset X'08'.

#### D07 DEVICE DEPENDENT INITIALIZATION/TERMINATION

**CLB** Refer to information for record D02.

#### O TP BUF

The VTAM RPL begins at offset X'08'.

#### HCSW

XRF CLASS 1 TAKEOVER TRACE

This log record is written for XRF class 1 terminals during takeover, even though DC trace is not active on the terminal. This record can be used to diagnose subsequent session failures when used in conjunction with CVCT records.

**VTPO** REJECTED POSTING OF ECB

#### Format of 6701 log record with CRTU identifier

A map of the formatted CRTU log record, including offset, hex code, and a description is shown.

Table 63. Map of formatted CRTU log record

Offset	Hex code	Description	
+0	Н	Length of buffer	
+2	XL5	Internal use	
+7	Х	DFSCRTU0 return code (see below)	
+8	XL68	Internal use	

Table 63. Map of formatted CRTU log record (continued)

Offset	Hex code	Description	
+4C	CL8	Input Lterm name	
+54	XL52	Internal use	

#### DFSCRTU0 return codes (decimal):

The DFSCRTU0 return codes and their meanings are listed.

NO DFSINSXO WITH SHARED QUEUES). DUPLICATE LTERM/SMB NAME. 16 NO USER DESCRIPTOR COULD BE LOCATED 20 FOR USE IN CREATING USER STRUCTURE. 24 INVALID INPUT LTERM NAME. 28 DFSINSXO REJECTED USER-CREATION REQUEST. STORAGE COULD NOT BE OBTAINED TO CREATE 32 USER STRUCTURE. STATIC USER ALREADY EXISTS. INSERT EXIT PRAMETER ERROR: INVALID LTERM NAME, BAD FORMAT. AVAILABLE. LATCHING ERROR OCCURRED. STORAGE MANAGER ERROR - DFSPOOL. ERROR IN ADDING DYNAMIC SMB TO HASH TABLE. 60 INSERT EXIT (DFSINSXO) PARAMETER ERROR: INVALID DYNAMIC TRANSACTION DATA. LOCAL CNT FOUND, BUT DESTINATION REGISTERED TO RESOURCE MANAGER AS A TRANSACTION. LOCAL SMB FOUND, BUT DESTINATION REGISTERED TO RESOURCE MANAGER AS AN LTERM. DESTINATION REGISTERED TO RESOURCE MANAGER AS A CPIC TRANSACTION, APPC DESCRIPTOR, OR MSNAME. DESTINATION COULD NOT BE VALIDATED IN RESOURCE MANAGER DUE TO AN RM INTERFACE ERROR.

'ENVIRONMENT' INCORRECT (for example, NO ETO,

- 84 SMB CREATION REQUESTED, BUT DESTINATION WAS ALREADY REGISTERED TO RESOURCE MANAGER AS AN LTERM, CPIC TRANSACTION, APPC DESCRIPTOR, OR MSNAME.
- SMB CREATION REQUESTED, BUT SHARED QUEUES IS NOT 88 ACTIVE.

#### Format of the 6701 log record with VTPO identifier

If an APPC or OTMA message is discarded because of a send type error, IMS does not log a type 6701–CMEA/CMEB record for the error.

The lack of type 6701–CMEA/CMEB records makes debugging for the Message Control/Error exit routine (DFSCMUX0) difficult. It does log type 6701-CMEA/CMEB records for errors related to other devices, however. The following table shows the VTCB posting in DFSVTPO0.

4

36

40

48

52 56

64

68

72

76

80

Offset	Hex code	Description
+0		
	Х	Function code
	X'00'	VTCB is to be posted
	X'04'	VTCB is to be released
	X'08'	Check if ACB can be closed
	X'0C'	Delete a VTCB
	X'10'	Stacked logon for static CLB
	X'14'	NSEXIT for static CLB
	X'18'	NSEXIT for dynamic CLB
	X'1C'	LOSTERM for static CLB
	X'20'	LOSTERM for dynamic CLB
+1		
	Х	Type of checking RQD for post
	X'04'	Post if node is active
	X'08'	Post if node not active
	X'0C'	Post if idle and not active
	X'10'	Hard post the node
	X'14'	Post an MSC LLB
+2		
	Х	Conditional data for posting
	X'80'	Type is ISC parallel session
	X'40'	Type is MSC LLB
	X'20'	Z-NET cancel in progress
		On detection of an error, this byte contains one
	N/1011	of the following reject codes:
	X'01'	VTCB not specified
	X'02'	Inspection failed—check subcode
	X'03'	Node not idle
	X'04'	RQR failed—check subcode
	X'05'	Node active—check subcode
	X'06'	Node not alive—check subcode
	X'07'	Invalid request
	X'08'	MSC link already posted
	X'09'	MSC send outstanding
	X'0A'	Node already dispatched
	X'20'	No VTCB to delete
	X'30'	CINIT rejected by PLU (NSX)
	X'31'	VTAM error (NSX)
	X'40'	Stacked logon procedure failure

Table 64. VTCB posting in DFSVTPO0.

Offset	Hex code	Description
+3		
	Х	Posting-rejection subcode <sup>1</sup>
	X'01'	Node already dispatched (RQR)
	X'02'	Node already posted (RQR)
	X'03'	Unpostable I/O (RQR)
	X'04'	Clear issued (RQR)
	X'05'	Inact performed (RQR)
	X'01'	SPQB not found (INSPECT)
	X'01 X'02'	
		No match on CLB ADDR (INSPECT)
	X'03'	VOPEN not on (INSPECT)
	X'04'	VTCB not found by scan (INSPECT)
	X'05'	No match on VTCBs (INSPECT)
	X'06'	CIDs do not match (INSPECT)
	X'07'	VOPEN not set (INSPECT)
	X'08'	Temporary VTCB (INSPECT)
	X'01'	No /idle node CMD (POSTRTN)
	X'02'	Node inoperable (POSTRTN)
	X'03'	Node dispatched (POSTRTN)
	X'04'	Line already posted (POSTRTN)
	X'05'	V2SND is set (POSTRTN)
	X'06'	Not XRF sync mode (POSTRTN)
	X'07'	Not SCIP exit with clear (POSTRTN)
	X'08'	SCIP exit bindrace done (POSTRTN)
-4	0F	Post code
-4		
-1	v	NCEVIT flag

		Reason code for CTBRTERM
+7	Х	
F7	A	
		Notify reason code
+8	F	
		VTCB address
+C	CL8	
		VTAM node name
. 1.4	F	
+14	F	
		CID
+18	CL8>	
		SPQB name if parallel session
+20	0F	
		CLBNCID for a stacked logon
+20	F	0
1 20	T	Sense data (NSEXIT)
		Sense uala (INSEALL)
Note:		
. This byte	contains an additional qu	alifier subcode.
	*	

Table 64. VTCB posting in DFSVTPO0 (continued).

## Example of DC trace output

INTERNAL TRACE RECORD

An example of a Data Communication (DC) trace record is shown. This example shows part of a normal VTAM terminal logon flow.

## **Diagnosing problems in the Queue Control Facility Message Requeuer**

The Queue Control Facility Message Requeuer (MRQ) processor module (DFSQMRQ0), which is part of the IMS Transaction Manager, provides diagnostic information for diagnosing errors while running the IBM IMS Queue Control Facility for z/OS (QCF).

Although problems can be diagnosed separately in the QCF product by using SCRAPLOG records and in the Queue Control Facility processor module by using 6701-MRQE diagnostic records, QCF and the Queue Control Facility processor work together to allow inserting and loading, querying, recovering, deleting and unloading, recovering, and viewing messages on the IMS message queue data sets and shared message queue structures.

In this topic, the information about SCRAPLOG records also applies to SCRAPSEL and SCRAPCAN records. The SCRAPSEL, SCRAPCAN, and SCRAPLOG data sets are generated by the IQCSELCT, IQCCANCL, and IQCINSRT modules of QCF, respectively, and are identical in both format and function.

- QCF functions help you accomplish the following tasks:
  - Message queue recovery when you want to return messages to the IMS queue for reprocessing.
  - Application recovery when you want to return messages to the IMS queue for reprocessing.
  - IMS queue maintenance (you can query, browse, unload, and load IMS nonshared queue environments).
  - Message queue migration and fallback.
  - Stress, regression, and application testing when transaction data is needed to simulate production loads or application input.
- A queue overflow protection function monitors queue usage and takes action to prevent queue utilization from reaching critical thresholds (non-shared queues environment).
- An ISPF front-end enables you to select QCF functions and selection criteria to complete the following tasks:
  - Query messages (or IMS status) on the queue
  - Unload (delete) messages from the queue
  - Load messages onto the IMS message queues
  - Release or terminate waiting tasks (nonshared queue environment)
  - Maintain the tables associated with queue overflow protection (nonshared queue environment)

## IBM IMS Queue Control Facility for z/OS interface

You can invoke the IBM IMS Queue Control Facility for z/OS functions through either a user control card input or a TSO/ISPF interface. The functions are Browse, Query, Load/Insert, Queue Overflow Protection, Recover, and Unload.

The following figure describes the IMS Queue Control Facility interface to IMS.

Т

1

1

QCF V2.1

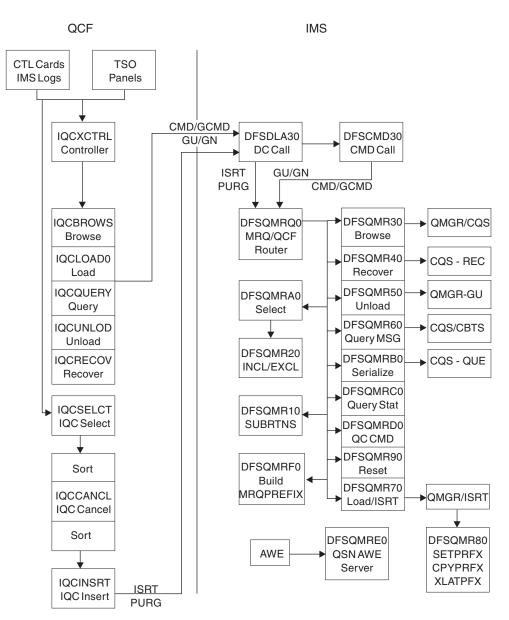

Figure 67. IMS Queue Control Facility interface to IMS

The functions are processed by function routines within IMS Queue Control Facility, and passed to corresponding function routines in IMS through a BMP application program interface (API). GCMD calls are used to invoke the function, and the messages, query, and status data is exchanged through GCMD, ISRT/PURGE, and GU/GN calls.

The IMS Queue Control Facility function routines interface with the IMS Queue Manager and Common Queue Server (CQS) routines.

By using the standard AIB interface, errors detected are recorded with an AIB return code = 000000F0, a unique AIBREASN code for each error, a TPCBSTAT code of MR, and a 6701-MRQE log record is written to the IMS online log data set (OLDS). The AIBREASN codes are printed in the reports (Browse, Query, Load, Recover, and Unload) and are documented in the DFSMRAEQ macro.

L

I

I

After the error is reported and logged, IMS Queue Control Facility and IMS skip to the next message, function, or terminate the BMP, depending on the error. The IMS Queue Control Facility routines in IMS do not abend. To diagnose the error, the 6701-MRQE log records should be printed and analyzed. The API calls may also be traced by IMS Queue Control Facility (Trace control card), or within IMS by issuing the /TRACE SET ON PROGRAM MRQPSB. The IMS Queue Control Facility trace sends output to the QCFPRINT DD data set. The IMS trace logs type 6701 records to the OLDS.

## SCRAPLOG diagnostic records

By analyzing SCRAPLOG records, you can sometimes determine that a logical terminal (LTERM) to which messages are to be requeued does not exist. In this case, you can fix the problem and run the job again so that the messages are requeued.

As part of diagnosing problems with the Queue Control Facility/Message Requeuer, you use SCRAPLOG records. The SCRAPLOG record consists of a X'100' or X'140' MRQ prefix that is mapped by DFSMRQPF, followed by the actual message that is being inserted. The message is either a 4002 record (a message from a DUMPQ or SNAPQ checkpoint) or a 01 (input) or 03 (output) message record. IMS messages are mapped by the QLOGMSGP macro.

#### Sample QCF record from scraplog data set

An example showing a message that is scrapped by QCF and written to the SCRAPLOG data set is shown.

The first X'140' byte is the QCF prefix, mapped by the DFSMRQPF macro. Offset X'88' into DFSMRQPF is the AIBREASN code = 00001084 = message is nonrecoverable (in other words, INQUIRY=NORECOV on the IMS TRANSACT macro TRAN31B0).

The rest of the data is the message (offset 04 = X'03' = type 03 output message), mapped by macro QLOGMSGP.

### Key fields of SCRAPLOG records and their offsets

Key fields of SCRAPLOG records, including offset, label, length, value and a description will help you in diagnosing problems.

The following table shows key fields of the QCF records and their offsets.

Label	Length	Value	Description
MSGMRQID	08	\$QCFMSG	Prefix ID (First character is 5B, which causes DFSERA30 to print as 5B rec.)
MRPREDST	08	TRAN31B0	Destination name
MRPRETRN	04	000000F0	AIBRETRN code, always this value for QCF errors
MRPREASN	04	00001084	AIBREASN code = message non recoverable
	MSGMRQID MRPREDST MRPRETRN	MSGMRQID     08       MRPREDST     08       MRPRETRN     04	MSGMRQID08\$QCFMSGMRPREDST08TRAN31B0MRPRETRN04000000F0

Table 65. Key fields in QCF records and their offsets

The following table shows the key fields in messages.

Table 66. K	ey fields in message	s (offset 0140=offset 0	0 into message)

Label	Length	Value	Description
MSGLRLL	02	0361	Length of message
MSGLCODE	01	01	Log code, 01=input message, 03=output message
MSGPRFLL	02		Length of total message prefix (user segments start at this offset)
MSGODSTN	08	TRAN31B0	Message destination name
	MSGLRLL MSGLCODE MSGPRFLL	MSGLRLL     02       MSGLCODE     01       MSGPRFLL     02	MSGLRLL020361MSGLCODE0101MSGPRFLL0202

#### Sample JCL for printing SCRAPLOG records

Use SCRAPLOG records in combination with 6701-MRQE records to effectively diagnose QCF problems.

The following figure shows sample JCL for printing SCRAPLOG records.

#### Sample JCL for printing SCRAPLOG records

//SCRAPPRT JOB //\* PRINT IQCSELCT SCRAPSEL //JOBLIB DD DISP=SHR, DSN=IMS610. RESLIB //SELECT EXEC PGM=DFSERA10,REGION=512K //SYSPRINT DD SYSOUT=A //SYSUT1 DD DSN=QCF.SCRAPSEL,DISP=SHR //SYSIN DD \* CONTROL CNTL OPTION PRINT E=DFSERA30 END /\* //CANCEL EXEC PGM=DFSERA10,COND=EVEN,REGION=256K //\* PRINT IQCCANCL SCRAPCAN //SYSPRINT DD SYSOUT=A //SYSUT1 DD DSN=QCF.SCRAPCAN,DISP=SHR

//SYSUT1 DD DSN=MRQ.SCRAPLOG,DISP=SHR
//SYSIN DD *
CONTROL CNTL
OPTION PRINT E=DFSERA30
END
/*
```

## 6701-MRQE diagnostic records

An IMS error detected while QCF is requeuing messages results in the logging of a 6701-MRQE diagnostic record.

The message that is being requeued is then discarded (and written to the SCRAPLOG), and the QCF BMP (IQCINSRT) proceeds to the next message. Each type of error is accompanied by a unique reason code that is set in the application interface block reason code field (AIBREASN).

When the IQCINSRT step completes, a report of messages scrapped and grouped by reason code is produced. A report of messages scrapped and grouped by destination name is also produced.

OPTION PRINT 0=9,V=MRQE,L=4,T=C,C=E,E=DFSERA30
END
/*
```

## Control blocks logged at time of error (and their mapping macros)

The following table shows the 6701-MRQE diagnostic record control blocks and data areas that are logged if they are available at the time of the error.

Block	Description	Mapping macro	
AIB	Application interface block	DFSAIB	
	AIBRETRN, AIBREASN codes	DFSMRAEQ	
CMDMSGP	Command call buffer for browse, load, QSN, query, recover, or unload command	DFSMRQCW (OCO)	

Table 67. Control blocks and data areas logged at time of error for 6701-MRQE records

Block	Description	Mapping macro		
DFSSQQRY	Query buffer	CQSQRYQT		
I/O AREA	Input/Output area	QLOGMSGP		
MRQCMDWK	Command call buffer for browse, load, QSN, query, recover, or unload command	DFSMRQCW (OCO)		
MRQPREFX	QCF prefix buffer	DFSMRQPF		
MRQWORK	MRQ/QCF work area	Mapping macro		
MRSELROW	Include/Exclude work area	DFSMRQCT (OCO)		
MRSELWK	Select work buffer	DFSMRQSW (OCO)		
РСВ	Program communication block	IDLI TPCBBASE=0,CALLER=IMS		
PST/EOB Partition specification table / end of block		IDLI PSTBASE=0		
PSTDCA	DL/I call parameter area	No DSECT		
QMBA	Queue manager buffer area	DFSQMGR FUNC=QDSECT		
QSAPWKAD	Queue manager work area	QSAPWKAD		
QTPDST Queue manager destination block		ICLI CNTBASE=0, or IAPS SMBBASE=0 (CNT/LNB or SMB) DSECT for QAB/TIB not provided		
REG14-12	Registers 14 through 12	No DSECT		
WORKMSG	Work message buffer	QLOGMSGP		

Table 67. Control blocks and data areas logged at time of error for 6701-MRQE records (continued)

#### Normal errors and their AIBREASN codes

Some errors might be normal. It is important to determine the AIBREASN code, destination name, and other characteristics of the message to determine whether or not the error is normal.

For example, the following AIBREASN codes are considered normal:

#### AIBREASN

Explanation

#### 00001080

Message destination is an LU 6.2 synchronous logical unit (LU) name and as such is considered nonrecoverable.

#### 00001084

Message destination is nonrecoverable either because the destination transaction code name was defined as NORECOV or the message was received from a LU 6.2 LU in synchronous conversation mode, which implies nonrecoverable.

#### 00001088

Message was already canceled by IMS. Most likely the cause of this is an output message that was canceled when the application program abended or issued a ROLL or ROLB call.

#### 000010A4

The message being passed by IQCINSRT is an internal IMS message that is not recoverable.

#### 00002014

The message is being purged (enqueued to a temporary destination) and the temporary destination name of the message is an inquiry type LTERM.

#### Abnormal errors that can be expected

Some errors might be expected. It is important to determine the AIBREASN code, destination name, and other characteristics of the message to determine whether or not the error is expected.

For example, when a source or destination name is not found, an error might occur if the system was redefined and the resource name was deleted.

## Obtaining diagnostics in addition to SCRAPLOG and 6701-MRQE

When the 6701-MRQE diagnostic records and the SCRAPLOG records do not provide enough diagnostic detail to adequately diagnose a problem, you can obtain additional diagnostic details by issuing the /TRACE SET ON PROGRAM command. /TRACE SET ON *pgmname* causes the logging of additional 6701-MRQB records when the QCF BMP is processing.

When the 6701-MRQE diagnostic records and the SCRAPLOG records do not provide enough diagnostic detail to adequately diagnose a problem, you can obtain additional diagnostic details by issuing the following command: /TRACE SET ON PROGRAM pgmname

where *pgmname* is the name of the appropriate MRQPSB.

6701-MRQB diagnostic records are almost identical to 6701-MRQE records, with the exception of MRQB appearing where MRQE normally does. The *pgmname* value is the default QCF PSBNAME. This value might have been overridden on the MSGQUEUE MRQPSBN parameter at system definition. To determine if your installation has overridden the name, either consult with your IMS system administrator or issue the IMS command /DISPLAY PROGRAM MRQPSB.

If PROGRAM MRQPSB displays as an invalid name, your installation has overridden the default MRQPSB. Consult with your system administrator for the correct name for your installation.

The records that are contained in this program are in addition to the existing program trace records logged by DFSDLA30. Records logged by DFSDLA30 are types 6701-LA3A and 6701-LA3B, which contain the TPCB, I/O AREA (64 bytes), and PST control blocks.

With the program trace set on, for each ISRT call to insert a message (or segment of a message), there is an LA3A, MRQB, and LA3B record. For each PURG call (which completes and enqueues a message) there is one LA3A and LA3B log record. If an error is detected while processing either call, an additional MRQE record is logged. The MRQE records are logged regardless of whether the program trace is on when an error is detected.

#### **Related tasks:**

"IMS transaction trace" on page 306

## Determining when messages are successfully requeued

Messages that are successfully requeued by the Queue Control Facility/Message Requeuer are logged to the OLDS with an identical 01 (input) or 03 (output) log record as the original, except when MSGCFLG3=MSGC3MRQ (that is, message+19=45) is set to indicate that this message was requeued by the Queue Control Facility/Message Requeuer.

This flag is propagated to other messages that originate from this message. (That is, if the message is an input transaction message the flag is propagated to the output response messages when the transaction message is processed. Or, if the message is an MSC message, it is propagated to messages in other IMS/MSC systems when the message is sent across the MSC link.)

The following figure shows an input transaction to TRANCODE=TRAN31V0 from LTERM=IMSUS02 that was requeued by QCF.

#### Sample log record showing successfully requeued message

## Diagnosing message routing problems

User exits are consolidated into user exit DFSMSCE0. Several traces, messages, and information fields in the message prefix area can be used to diagnose message routing problems in the user exits and in IMS.

## DFS070 UNABLE TO ROUTE MESSAGE RSN=xxyy

Message DFS070 is issued when any one of three conditions occur.

- IMS attempts to enqueue a message.
- These TM/MSC exits attempt to reroute a message:
  - DFSMSCE0-Message Routing.
  - DFSMSTR0-Terminal Routing.
- A /FORMAT command is entered and an error is encountered while routing a message.

#### DFS070 diagnostic message

Diagnostic messages from DFS070 are described.

Here is an example of the DFS070 diagnostic message: DFS070 UNABLE TO ROUTE MESSAGE RSN=0104

The RSN code identifies the module that issued the message (01 = DFSICIO0) and the reason for the error (04 = Prefix buffer length is too large).

In this case DFSICIO0 called the message generator (DFSCLMR0) with R1 = 00680046.

```
Where x'00680046' = module identifier, reason code,message key
x'0068' = 0104 (decimal)
01 = Module that issued message = DFSICI00
04 = Prefix buffer length is too large
x'0046 = 70 (decimal) = DFS070 MESSAGE KEY
```

The following table shows:

- The label used for the module identifier
- The module identifier
- The module function or name

The labels shown in the following table can be used to scan the module source code to locate where the message was issued from.

Table 68. DFS070 module identifier table

Label	Default module identifier	Function (module name)
MSUK	00	Unknown module or DFSMSCEC requestor
MSTR	01	DC Communication Manager (DFSICIO0)
MSTRAP	02	LU 6.2 Receive LU Manager (DFSRLM10)
MSTROT	03	OTMA Receive LU Manager (DFSYTIB0)
MSPR	04	DC Call Handler (DFSDLA30)
MSLR	05	MSC Analyzer (DFSCMS00)
MSFM	06	/FORMAT Command Processor (DFSICLK0)
MSTE	08	IMS Termination (DFSTRM00)
MSINIT	10	IMS Initialization (DFSIINB0)

The following table shows:

- The label used for the reason code
- The reason code value
- The description of the error

The labels shown in the following table can be used to scan the module source code to locate where the message was issued from.

Table 69. DFS070 reason (RSN) codes table

Label	Reason code decimal/ hexadecimal	Description
PFXUPRER	02/02	User requested 2 user prefix segments (code 8E). Programmer response: The routine that was setting up to call the DFSMSCE0 user exit determined that a user prefix segment had already been obtained. The programmer may need to turn on the DFSMSCE0 trace to determine which routine is setting the field, MSCEUPR (DFSMSCEP) or the flag MSCEB2RET (DFSMSCEB).

	Reason code decimal/					
Label	hexadecimal	Description				
PFXIPRER	03/03	User requested two Workload router prefix segments (code 8F).				
		Programmer response: The routine that was setting up to call the DFSMSCE0 user exit determined that a user prefix segment had already been obtained. The programmer may need to turn on the DFSMSCE0 trace to determine which routine is setting the field MSCEUPR (DFSMSCEP) or the flag MSCEB2RET (DFSMSCEB).				
PFTOOBIG	04/04	Prefix buffer length is too large.				
		Programmer response: The user prefix segment size field MSCEUPRL (DFSMSCEP) or the workload router prefix segment size field MSCEIPRL (DFSMSCEP) is greater than 512. The programmer may need to turn on the DFSMSCE0 trace to determine which routine is setting the field MSCEUPR or MSCEIPR (DFSMSCEP) to a value larger than 512.				
GBPFER	05/05	DFSPOOL error on get prefix buffer.				
		Programmer response: Failure to get storage for the user prefix segment or the workload router prefix segment through the DFSPOOL macro from the HIOP pool.				
URCERR1	06/06	User exit return code negative.				
		Programmer response: User exit DFSMSCE0 returned a negative return code.				
URCERR2	07/07	DFSBCB error getting BCB block.				
		Programmer response: User exit DFSMSCE0 returned a negative return code returned an invalid return code.				
GMSBERR	08/08	DFSBCB error getting BCB block.				
		Programmer response: Failure to get storage for the MSEB block through the DFSBCB macro.				
LRBADSID	09/09	Bad SYSID detected.				
		Programmer response: In getting the address for the LNB that is associated with either the origin SID or the SID that is specified by the caller, a bad SYSID was detected.				
IPFX	10/0A	Queue Manager insert prefix error.				
		Programmer response: In an effort to update the MESSAGE PREFIX (01/03) log record, a prefix update call was made (DFSQMGR0) to add the user prefix segment or the workload router segment, or both. The prefix update routine was unable to add the segment.				
ICLR1ERR	11/0B	Non zero return code from DFSICLR1 (DFSICLR0).				
AVMLKERR	12/0C	Destination is an invalid type for AVM/ISC link.				

Table 69. DFS070 reason (RSN) codes table (continued)

	Reason code decimal/					
Label	hexadecimal	Description				
MSCEFL1E	15/0F	DFSMSCEC user exit routing flag is in error.				
		Programmer response: An invalid option was requested for the user routing exit flag 1 (MSTRFL1/MSLRFL1/ MSPRFL1). Refer to the DFSMSCEP macro for valid options Check the user exit parameter in the 6701-MSCE record to determine which option was requested. These options are usually set by IMS code.				
USRXIFER	16/10	DFSUSRX interface error.				
		Programmer response: The macro DFSMSCEC invoking DFSUSRX0 through the DFSUSRX macro received a non-zero return code. The value is in field MSCEBRC in the DFSMSCEB block. Possible values returned are:				
		<ol> <li>04 the user exit routine specified has not been defined (the address in UXDT is zero)</li> </ol>				
		2. Unable to get an interface block using the DFSBCB macro. DFSBCB return code is in field, MSCEBSSRC in the DFSMSCEB block.				
IONAMCHG	18/12	User exit changed the destination name of the I/O PCB message.				
		Programmer response: The user exit (DFSMSCE0) set flag MSPR2CHG in field MSPRFL2 to request that the destination name MSPRDEST be changed. The PCB is the I/O PCB that cannot be changed. Check the user exit parameter in the 6701-MSCE record to determine which option was requested.				
IOROUTE	19/13	User exit requested reroute I/O PCB message.				
		Programmer response: The user exit DFSMSCE0 requested routing option of MSPR2RMT, /MSPR2LSQ, /MSPR2SRC, /MSPR2NDR in field MSPRFL2. This is invalid if the PCB is the I/O PCB.				
		Refer to the user exit parameter in the 6701-MSCE record to determine which command was requested.				
CMDINV	20/14	User exit changed the destination name to a command (suc as: /CMDVERB).				
		Programmer response: The user exit DFSMSCE0 changed the destination name to a command.				
		Refer to the user exit parameter in the 6701-MSCE record to determine which command was requested.				
SQGINV	21/15	User Link receive exit override MSNAME in segment because destination is not an MSNAME.				
		Programmer response: User exit DFSMSCE0 in a shared queues group link receive exit failed due to the destination not being an MSNAME.				
REGFAIL	22/16	Local shared queue registration (DFSSQIF FUNC=INFRM) failed for the transaction when the user exit requested MSLR2LSQ=1 or MSTR2LSQ=1.				

Table 69. DFS070 reason	(RSN) codes table	(continued)
-------------------------	-------------------	-------------

Label	Reason code decimal/ hexadecimal	Description				
NOTRANCD 23/17		Terminal routing exit routed the message to a remote IMS (MSTR2RMT=1) but the destination type at MSTRDEST is an unsupported TRANCODE (such as remote routing is not allowed for LTERM or FAST PATH exclusive TRANCODE).				
DSIDINV	24/18	The Terminal, Link Receive or the Program Routing exit returned an invalid destination SYSID (for example, either field MSTRDSID, MSLRDSID, or MSPRDSID is invalid).				
DMSNINV	25/19	The Terminal, Link Receive, or Program routing exit returned an invalid destination MSNAME (for example: either field, MSTRDMSN, MSLRDMSN, or MSPRDMSN is invalid).				
SSIDINV	26/1A	The Link Receive exit rerouted an intermediate message (MSLR1INT=1) to this local IMS by setting MSLR2LOC=1, but the message had an invalid return (source) SYSID so this IMS could not accept it locally.				
RMT2INV 27/1B		The Terminal, Link Receive, or Program routing exit indicated routing the message to a remote MSC link by setting MSTR2RMT, MSLR2RMT, or MSPR2RMT; however, the exit did not set either of the corresponding destination SYSID or MSNAME fields (for example, either MSTRDSID, MSLRDSID, or MSPRDSID was left set to zero, or MSTRDMSN, MSLRDMSN, or MSPRDMSN was left set to blanks).				
SRC2INV	28/1C	The Program routing exit requested the message be routed to the source MSC system by setting MSPR2SRC=1 however the message cannot be routed because either:				
		<ul><li>MSC is not available.</li><li>Or the source SYSID is not valid because the application</li></ul>				
		program has not issued a get unique (GU).				
		• The application program is a non-message driven BMP.				
NDR2INV	29/1D	The Program Routing exit requested a direct routing message be overridden by setting MSPR2NDR=1; however, either:				
		• MSC is not available.				
		<ul> <li>This is not a direct routed message with a MSNAME destination.</li> </ul>				
		• The overriding name in the front of the I/O area is not valid.				
RMT2FSR	30/1E	The Terminal routing exit indicated to route the message to a remote MSC link by setting MSTR2RMT=1, but the input ISC node was set to process the message as a Front End Switch message by the user Front End Switch exit (DFSFEBJ0). Front End Switch messages cannot be routed to MSC links.				
RSPROUTE	31/1F	The Link receive exit requested that a response message (MSLR1RSP=1) be rerouted by either setting one of the MSLRFL2 reroute flags. Response messages may not be rerouted.				

Table 69. DFS070 reason (RSN) codes table (continued)

Label	Reason code decimal/ hexadecimal					
INBCHGID	33/21	CHANGEID not supported.				
		Programmer response: The user exit (DFSMSCE0) did not use the DFSMSCSV macro or generate module entry code. IMS initialization expects a branch instruction around the character information of entry code.				
		Refer to the sample version of the provided user exit DFSMSCE0's use of DFSMSCSV for more information.				
INBIDLNG	35/23	Character string 'VECTOR' not present.				
		Programmer response: The user exit (DFSMSCE0) did not use the DFSMSCSV macro or generate module entry code. IMS initialization expects the entry code to contain a length of the module entry code at a given offset.				
		Refer to the sample version of the provided user exit DFSMSCE0's use of DFSMSCSV for more information.				
INBNVECT	35/23	Character string 'VECTOR' not present.				
		Programmer response: The user exit DFSMSCE0 did not us the DFSMSCSV macro or module entry code to provide the character string "VECTOR" in its entry code.				
		Refer to the sample version of the user exit DFSMSCE0's us of DFSMSCSVfor more information.				
PFXUINVA	36/24	Upon return from the user exit IMS detected that the user prefix at MSCEUPR is invalid.				
		Possible causes are:				
		• Length not in range of 5 to 512 bytes.				
		• Address of prefix is invalid. Must be address obtained by IMS or within HIOP pool.				
		• Length has been changed (MSCEBUPRL).				
		• Address of user exit prefix has changed (MSCEBUPR).				
		• Prefix code not 8E.				
		The programmer may need to turn on the DFSMSCE0 trace to trace the fields MSCEBUPR and MSCEBUPRL within the DFSMSCEB block.				

 Table 69. DFS070 reason (RSN) codes table (continued)

Label	Reason code decimal/ hexadecimal	Description					
PFXIINVA	37/25	Upon return from the user exit, IMS detected the Workload Router prefix at MSCEIPR is invalid.					
		Programmer response:					
		• Length not in range of 5 to 512 bytes.					
		• Address of prefix is invalid. Must be address obtained by IMS or within HIOP pool.					
		• Length has been changed (MSCEBIPRL).					
		<ul> <li>Address of workload router prefix has changed (MSCEBIPR).</li> </ul>					
		• Prefix code is not 8F.					
		The programmer may need to turn on the DFSMSCE0 trace to trace the fields MSCEBIPR and MSCEBIPRL within the DFSMSCEB block.					
EXIOVLAY	38/26	User exit overlaid the 512 byte user work area buffer.					
		Programmer response: The user exit DFSMSCE0 appears to have overlaid the 512 byte workarea.					
		The overlay character string SCDSMCON is inserted at the end of the 512 byte workarea MSEBIBOV before calling the user exit DFSMSCE0 and is checked on return.					
		Refer to the user exit DFSMSCEB in the 6701-MSCE record to help determine the overlay.					
EXBOVLAY	39/27	User exit overlaid the MSEB BCB block name (Overlay Check).					
		Programmer response: The user exit (DFSMSCE0) appears have overlaid the DFSMSCEB block. The DFSBCB system service inserts a character string (MSEB) at the end of the DFSMSCEB block. IMS will abend when the DFSMSCEB block is returned by way of a DFSBCB release request. The DFS070 message will assist in determining when the overla occurred.					
		Refer to the user exit parameter in the 6701-MSCE record t help determine the overlay.					
EXPOVLAY	40/28	User exit overlaid the parameter list (Overlay Check).					
		Programmer response: The user exit DFSMSCE0 appears to have overlaid the user exit parameter list (DFSMSCEP). Th overlay character string SCDSMCON is inserted at the end of the parameter list DFSMSCEP before calling the user exit DFSMSCE0 and is checked on return.					
		Refer to the user exit parameter in the 6701-MSCE record t help determine the overlay.					

Table 69. DFS070 reason (RSN) codes table (continued)

Codes 41 thru 52, shown in the following table, apply to the /FORMAT command.

	Reason code decimal/	
Label	hexadecimal	Description
FMFND	41/29	The CNT for the terminal to be formatted was not found.
FMRCNT	42/2A	The specified terminal is a remote LTERM.
FMDLNB	43/2B	The specified terminal is a dynamic MSNAME (LNB).
FMMFST	44/2C	The destination terminal (different from the input terminal) is not MFS-formatted.
FMLRESMD	45/2D	The destination terminal is in line response mode.
FMTRESMD	46/2E	The destination terminal is in terminal response mode.
FMCONV	47/2F	Conversation is active on the destination terminal (when LTERM was specified in the command).
FMINP	48/30	The terminal is in input mode only.
FMEXCL	49/31	The terminal was in exclusive mode (when LTERM was specified in the command).
FMQBUF	50/32	The call to Queue Manager failed for a PUT LOCATE call.
FMIPREF	51/33	The INSERT PREFIX call to Queue Manager failed.
FMMSGNR	52/34	The call to enqueue the message failed.

Table 70. DFS070 reason (RSN) codes table for the /FORMAT command

## DFSMSCE0 TM/MSC Message Routing exit trace

The DFSMSCE0 TM/MSC Message Routing exit trace can be activated individually for each exit entry point that processes a message routing request. This trace is useful for diagnosing problems in both the user exit and in IMS.

The DFSMSCE0 TM/MSC Message Routing Exit trace writes a 6701-MSEA log record when the exit is entered, and a 6701-MSEB log record when the exit returns to IMS to process the reroute request. The following information is traced:

- Exit parameter area, DFSMSCEP
- 512 byte work area
- Message
- Message prefix
- Message segment being inserted
- Other work area storage

#### Displaying DFSMSCE0 trace status

Use the /DISPLAY TRACE EXIT command to display the DFSMSCE0 trace status.

To display the DFSMSCE0 trace status, issue the following command: /DISPLAY TRACE EXIT

The display will show ON, OFF, or N/A for each DFSMSCE0 trace entry point.

#### Starting and stopping the DFSMSCE0 trace

To start or stop the DFSMSCE0 trace, issue one of the /TRACE commands.

/TRACE SET (ON|OFF) EXIT (DFSMSCE0) (ALL|TRBT|TRVT|TR62| TROT|LRTR|LRLT|LRIN| LRDI|PRCH|PRIS)

Any combination of TRBT, TRVT, TR62, TROT, LRTR, LRLT, LRIN, LRDI, PRCH, and PRIS is valid.

#### DFS081 trace exit command unsuccessful RSN=xxyy message

Message DFS081 is issued for a variety of reasons. The module identifier and function name are listed as well as the reason codes and descriptions.

This message is issued when one or more of the following scenarios occurs:

- IMS attempts to enqueue a message.
- The following user exits attempt to reroute a message:
  - The TM/MSC message routing exit, DFSMSCE0.
  - The Terminal Routing exit, DFSMSTR0.
- A /FORMAT command was entered.
- An error was encountered while routing the message.

Table 71. DFS081 module identifier table

	Module identifier	ifier			
Label	(decimal)	Function (module name)			
ICLN	01	Trace Command Processor (DFSICLN5)			

The following table shows:

I

- The label used for the reason code
- The reason code value
- The description of the error

The labels shown in the following table can be used to scan the module source code to locate where the message was issued from.

Table 72. DFS081 reason (RSN) codes table

	Reason code decimal/	
Label	hexadecimal	Description
EXTIKW	01/01	Invalid keyword for trace exit
EXTIPT	02/02	Invalid parameter type for trace exit command.
EXTNPT	03/03	No parameter type was specified for trace exit command.
EXTMPT	04/04	Multiple parameter types for trace exit command.
EXTMCB	05/05	Missing DFSMSCB control block for the trace exit DFSMSCE0 command.
EXTIPS	06/06	Invalid parameter subtype for the trace exit command.
EXTENS	07/07	Trace exit is not supported for this environment.
EXTENL	09/09	Required exit is not loaded for start trace command.
EXTSCF	10/0A	System command failure.
EXTIPL	11/0B	Invalid parameter length.

#### DFS070 diagnostic message:

This is an example of the DFS070 diagnostic message. DFS070 UNABLE TO ROUTE MESSAGE RSN=0104

The RSN code identifies the module that issued the message (01 = DFSICIO0) and the reason for the error (04 = Prefix buffer length is too large).

In this case DFSICIO0 called the message generator (DFSCLMR0) with R1 = 00680046.

```
Where x'00680046' = module identifier, reason code,message key
x'0068' = 0104 (decimal)
01 = Module that issued message = DFSICIO0
04 = Prefix buffer length is too large
x'0046 = 70 (decimal) = DFS070 MESSAGE KEY
```

The following table shows:

- The label used for the module identifier
- The identifier
- The module function or name

The labels shown in the following table can be used to scan the module source code to locate where the message was issued from.

#### Contents of the DFSMSCE0 trace records

DFSMSCE0 records are type X'6701' with a trace ID of MSEA (entry) or MSEB (exit).

Refer to the DFSMSCEB macro for contents of the MSCEB block.

#### PROGRAM ROUTING

- MSCEB (Message routing exit interface block) (CHNG/ISRT call)
- PCB (CHNG/ISRT call)
- MESSAGE PREFIX (CHNG/ISRT call)
- MESSAGE SEGMENT (ISRT call) maximum of 256 bytes

#### LINK RECEIVE

- MSCEB (Message routing exit interface block)
- MESSAGE PREFIX

#### TERMINAL ROUTING

- MSCEB (Message routing exit interface block)
- MESSAGE SEGMENT maximum of 256 bytes

**Important:** To assist in diagnosing DFSMSCE0 exit problems, the MSCEB block will maintain the following information:

- 8-byte eye catcher 'DFSMSCEB'
- 4-byte Routing exit type: TRTB|TRVT|TR62|TR0T|LRTR|LRLT|LRIN|LRDI|PRCH|PRIS
- 4 byte Address of ECB
- 4 byte Address of interface block

• 4 byte Address of DFSMSCE0 exit parameter list

# Diagnosing routing errors by using the transaction trace or program trace

The transaction trace or program trace can be used to diagnose routing error problems that are related to the user program routing exit DFSMSCE0.

By setting this trace on for a transaction or program, IMS logs a 6701-LA3A record at entry to DFSDLA30, and a 6701-LA3B when DFSDLA30 returns to the application program. In addition IMS logs a 6701-MSEA record when the exit is entered, and a 6701-MSEB when the exit returns to IMS. IMS also logs a 6701-MSCE error record, for each DFSMSCE0 related routing error.

Module DFSDLA30 receives control for every user application program call to a TPPCB (such as an I/O TPPCB or an alternate TPPCB). The DFSMSCE0 routing exit can be tailored to receive control for the first ISRT call of each new message to an I/O TPPCB or alternate TPPCB, or for each CHNG call to a alternate modifiable TPPCB.

For example, if the transaction trace is active for TRANA, and a TRANA message is processed and the user application program issues a ISRT to an alternate TPPCB, and the DFSMSCE0 exit is being used to route ISRT calls, IMS traces the following records with this command:

/TRACE SET ON TRANSACTION transaction\_name

6701-LA3A - DFSDLA30 called to process ISRT call
6701-MSEA - DFSMSCE0 called to process ISRT route
6701-MSEB - DFSMSCE0 returns
6701-MSCE - Logged if routing error detected, even if tran/prog trace is not active
6701-LA3B - DFSDLA30 returns (ISRT/route processed)

To trace the DL/I portion of data communication for a specific program, issue the following command:

/TRACE SET ON PROGRAM program\_name

For program routing exit (DFSMSCE0) call errors, TPPCB status, AIBRETRN, and AIBREASN codes are set.

## TPCB STATUS, AIBRETRN, and AIBREASN codes for DFSDLA30 routing errors

The TPCB STATUS, AIBRETRN, and AIBREASN codes for DFSDLA30 routing errors are listed and described.

TPCB STATUS, AIBRETRN, and AIBREASN codes for DFSDLA30 routing errors are given in the following format:

TPCBSTAT AIBRETRN AIBREASN COMMENTS

A1 00000104 MSERQINV(0560) EXIT ROUTE REQUEST INVALID (DFSMSCE0)

The complete list of return and reason codes is available in the DFSAIBEQ macro.

# Diagnosing routing problems by using the DC LINE/NODE/LINK TRACE

The DC trace traces line, node, and MSC link activity. It can be used in conjunction with the DFSMSCE0 exit trace to diagnose message routing problems in the terminal routing, input message routing, and link receive exits.

These traces log 6701 log records with a variety of trace IDs (such as: 6701-A01). If any of these traces is active, IMS logs a 6701-MSEA record when the message routing exit is called and a 6701-MSEB log record when the exit returns. For example, if the node trace is active, the following trace records are logged:

- 6701-A01 DC analyzer (DFSICIO0) is called to process the message LINK the DFSMSCE0 trace will log X'6701' records with a trace ID of MSEA (entry) or MSEB (exit) for terminal routing or link receive. Refer to DFSMSCEB macro for the contents of the MSCEB block.
- 6701-MSEA DFSMSCE0 called to process the message
- 6701-MSEB DFSMSCE0 returns
- 6701-MSCE Logged if routing error detected, even if the line, node, or link trace is not active
- 6701-A03 DC Analyzer determines what to do next

## Using 01/03 log record trace

The 01/03 log record trace reflects the user exit routines called and the user options requested by the varies user exits.

A double word trace to reflect the user routing request is included in the Transaction Management Router Segment of the 01/03 log records. The trace reflects:

BYTE 1 -	user parameter list (DFSMSCEP) flag 1 indicates the user routing exits called.
BYTE 2-3 -	User Terminal Routing flags 2 and 3 (DFSMSCEP MSTRFL2 and MSTRFL3) indicates the user Terminal Routing options.
BYTE 4-5 -	User Link Receive Routing flags 2 and 3 (DFSMSCEP MSLRFL2 and MSLRFL3) indicates the user LINK Routing options.
BYTE 6-7 -	User Program Routing flags 2 and 3 (DFSMSCEP MSPRFL2 and MSPRFL3) indicates the user Program Routing options.

BYTE 8 - Currently unused

## **IMS transaction trace**

The IMS transaction trace writes entries to the IMS log at entry to and exit from the DC call analyzer (DFSDLA30).

#### Starting the trace

To start the trace, issue one of the two following /TRACE commands.

To trace the DL/I portion of data communication for a specific transaction: /TRACE SET ON TRAN transaction name  $% \left( \frac{1}{2}\right) =0$ 

To trace the DL/I portion of data communication for a specific program: /TRACE SET ON PROGRAM program name

#### Content of the trace records

DFSDLA30 records are type X'6701' with a trace ID of LA3A (entry) or LA3B (exit). They contain:

- PCB
- Maximum of 64 bytes of the I/O area
- MODNAME
- PST
- SMB of the transaction (if the program in the IMS control region is an MPP or a message driven BMP)

The PCB and PST areas are always logged. The I/O area, MODNAME, and SMB are additional areas that are logged when available and applicable to the call type:

- The I/O area can be logged only on entry or exit. For example, a GN call logs the I/O area on exit, while an ISRT call logs the I/O area on entry. Depending on the call type, the I/O area can be logged on both entry and exit.
- The MODNAME is logged only on an entry trace.
- The SMB is logged on both the entry and exit traces.

Field PSTSYNFC in the PST contains the following calls:

- 04 ABTERM IN PROGRESS
- **08** SYNC POINT PHASE 1
- **0C** SYNC POINT PHASE 2
- **10** PURGE TP PCBS
- 14 PHASE 1 SYNC POINT ENQ OUTPUT TO TEMP DEST
- 18 ROLB CALL
- 1C INVALID ABENDU0820
- 20 ABORT

Field PSTFUNCT in the PST contains the following calls:

- **01** GU
- **03** GN
- 41 ISRT
- 50 SETO
- 67 INOY
- ----
- 83 CHNG
- 85 CHKP
- 87 CMD
- 88 GCMD
- 89 ROLB

## **Receive-any buffer analysis**

While talking with level 1 or level 2 IBM Software Support representatives, you might need to determine if you are out of receive-any (RECANY) buffers. Use either the IMS IPCS panel interface or the manual procedure to help you determine if this is the case. As you proceed through the steps, write down the information you gather.

### IMS IPCS Dump Formatter panel

The IMS IPCS Dump Formatter provides a panel-driven interface to perform analysis.

Using this IMS IPCS Dump Formatter panel, choose the RECANY (receive any) selection in the EDA/TM (Enhanced Dump Analysis/Transaction Manager) option, shown in the following figure, to create an output that contains the RECANY information.

Figure 68. IPCS Dump Formatter EDA/TM option

## Manual process to determine receive-any buffers space issues

While talking with level 1 or level 2 IBM Software Support representatives, you might need to determine if you are out of receive-any (RECANY) buffers. As you proceed through the steps, write down the information you gather.

- 1. Find the address of the first RECANY buffer.
  - a. SCD+X'91C' = pointer to the first RECANY buffer (SCDRECPT)
  - b. SCD+X'920' = size of each RECANY buffer (SCDRCSIZ)
  - c. SCD+X'922' = number of RECANY buffers (SCDRCANY)
- 2. Offset X'04' in the RECANY buffer points to the next RECANY buffer. You can follow the chain of RECANY buffers using the pointer at offset X'04'.
- **3**. Examine offset X'90' in each RECANY buffer (4 bytes). This field contains either an address of a CLB or zeros. If it contains a CLB address, the buffer is in use. If it contains zeros, in most cases the buffer is available.
- 4. If the buffer is tied to a CLB, the data you find in the following fields in the CLB is helpful in problem diagnosis.
  - a. CLB+X'00'-> Event Control Block (ECB) (4 bytes)
  - b. CLB+X'20'-> VTAM CID of the session (CLBCID) (4 bytes)
  - c. CLB+X'24'-> QE for queued receive-any buffers (CLBQE) (4 bytes)
  - d. CLB+X'30' = Flag bytes (CLBFLAG1) (4 bytes)
  - e. CLB+X'68'-> Input buffer (CLBINBUF) (4 bytes)
  - f. CLB+X'6C'-> Output buffer (CLBOUTBF) (4 bytes)

- g. CLB+X'70' = QE for responses (CLBQERES) (4 bytes)
- h. CLB+X'74' = Flag bytes (CLBVFLAG) (4 bytes)

## Finding the active save set

To analyze data communication (DC) problems, you need to find the active save set at the time of abend.

Use the following steps to locate the active save set.

- 1. Locate the registers at entry to abend (error registers). Register 13 points to the address of the active save set.
- 2. The active save sets begin under eye catcher \*\*\* SAVE AREA SET\*\*\*.
- 3. Find the save area (SA) address that matches the address in error register 13.

#### Example of a Save Area Set

If error register 13 contains 320548, you would analyze the save set flow as shown the following figure. The registers in this save set are the registers that are saved on entry to each module.

\*\*\*SAVE AREA SET\*\*\*\*

```
EP DFSICIOO
SA 22FE930
EP DFSCFEIO
SA 22E930
EP DFSCFEPO
SA 22E990
EP DFSCIOCO
SA 229490
EP DFSQMGRO
SA 22D990
EP DFSAOS80
SA 320548
```

## **IMS VTAM interface**

The basic functions of an IMS DC operation are establishing communications, sending and receiving messages, and terminating communications. The execution of these functions is shared among the elements that make up the network: the terminal, the controller, the VTAM system, the IMS system, and the application.

The communications analyzer (DFSICI00) uses the request parameter list (RPL) block to communicate with VTAM, and VTAM returns its status to IMS in the RPL. Therefore, it is important to analyze the RPL.

## IBM 3270 error recovery analysis

When the IBM 3270 detects an error, it sends the processor one of four sense-status messages.

- Intervention required, such as printer out of paper
- DEVICE END, which indicates the end of an operation
- DEVICE BUSY, normally caused by an operational error
- Hardware I/O error within the 3270 complex, such as a data check, control check, or equipment check

If IMS receives a sense-status message other than a DEVICE END, it issues message DFS973I.

## **Diagnosing Message Format Service problems**

The number of physical terminals traced and the number of lines traced can affect completeness of trace records and sequence of trace entries.

- Completeness of the trace record, (that is, whether or not all module activity related to a particular I/O action is traced), is affected if only one physical terminal (PTERM) is traced. The device-dependent module occasionally can change the current PTERM pointer before returning to the analyzer. Because the trace switch is kept in the CTB and is checked upon entry of a particular code, some module trace entries might be missing if the current CTB is not always maintained.
- Sequence of entries can be broken if more than one line is traced at a time. In this case, entries for a particular line have to be related by CLB.

Trace records with the following identifiers are useful in diagnosing MFS problems.

#### DD6M

EDIT SEGMENT INTO TP BUFFER

CIB MOD/DOF name

MFS SEG

SEGMENT created by MFS from output message and MOD/DOF

#### D01/DDM1

PREPARE TO WRITE TO TERMINAL

**CIB** Offset X'00' contains 8-byte MOD name.

Offset X'0C' contains 8-byte DOF name.

A05 PRIOR TO ISSUING VTAM I/O REQUEST (NORMALLY A WRITE)

#### O TP BUF

Contains the data to be written to the terminal and the RPL for VTAM devices. Refer to the previous A05 record.

A01 TERMINAL INPUT READY FOR IMS PROCESSING

#### I TP BUF

Contains input "device segment" 6 to 36 bytes from the beginning of the buffer. The data is preceded by a 2-byte length and 2 bytes of zeros.

#### FMT2 ENTRY TO MFS INPUT PROCESSING

**CIB** Offset X'00' contains MID name.

Offset X'22' indicates if PFK or PA key is used.

- **X'80'** PA key
- **X'40'** PFK key
- X'21' PA or PFK number

## FMT1 MESSAGE TO BE EDITED BY BASIC EDIT, NOT MFS

## FMT3 MFS HAS COMPLETED A MESSAGE SEGMENT

#### MFS SEG

Shows input segment created by MFS.

#### MFS I WK

Shows complete input message (all segments) and internal segment control information used by DFSCFEI0.

#### MFS P WK

1

This trace record is displayed only when the content of a protected field that is returned from a 3270 or SLU2 device is altered.

Offset 4 contains the address of the altered field in the input buffer.

Offset 8 contains MOD name.

Offset x'10' contains DOF name.

Offset x'2C' points to the protected field entry (PFVENTRY).

## PFVENTRY

Offset 0 points to the next entry.

Offset 4 is the length of the entry, which consists of an 8-byte header length and data length.

Offset 6 is the address of the device field buffer of the protected field.

Offset 8 is the original content of protected field.

- **ICLR** A message satisfied MSGDEL=NONIOBCB for its destination PTERM and was deleted. The relevant control blocks are traced:
  - Destination CTT
  - Telecommunication program communication block (TP PCB)
  - Destination CLB
  - Destination CTB

This trace record is produced when any trace level is active for the destination PTERM.

**Note:** To examine the segments placed in the message queue, see X'01' and X'03' log records. X'01' log records contain input message segments. X'03' log records contain output message segments.

## Related tasks:

DC trace (Diagnosis)

## Message Format Service module traces

The Communications Interface Block (CIB) contains two module traces: CIBSTRAC and CIBTRACE.

# **CIBSTRAC** trace

CIBSTRAC is located in the CIB + X'50'. This 4-byte trace entry contains information indicating which MFS modules received control and in what order. The following figure shows the format.

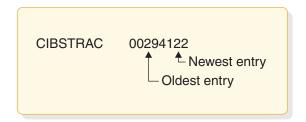

Figure 69. Example of CIBSTRAC trace

The leftmost nonzero digit shows the oldest entry and the high-order 4 bits of the rightmost byte show the newest. You can ignore the rightmost digit because it is always the same as the digit to its left. The trace entries are described in the following list.

## Value (hex)

Meaning

- 1 Entry to DFSCFEQ0 (MFS resource cleanup).
- 2 Entry to DFSCFEI0 (MFS input editing occurred).
- **3** See value 8. Value 3 usually follows value 8 and is obtained by ORing 1 and 2.
- 4 INIT or DDFIN entry to DFSCFEO0 (either initial entry or after DDM6 finished current segment).
- 5 CONT entry to DFSCFEO0 (4 ORed with 1; after successful WRITE, next output segment was requested).
- 6 PAGEPOS entry to DFSCFEO0 (4 ORed with 2; entry after paging request).
- 7 DDNEXT entry to DFSCFEO0 (4 ORed with 3; DDM6 wanted next segment).
- 8 Entry to DFSCFEP0 (3 in the next slot; DFSCFEP0 flushed input message by calling DFSCFEQ0. After returning to DFSCFEP0, page position was established and exit to analyzer D was made. (Entry 8 was shifted left by DFSCFEQ0 entry and entry 1 was written. After returning to DFSCFEP0 1 was ORed with 2.)

5 in the next slot; DFSCFEP0 flushed input message by calling DFSCFEQ0. After returning to DFSCFEP0, message dequeue routine was entered. Entry 8 was shifted and entry 1 was written by calling DFSCFEQ0. After returning to DFSCFEP0, DEQ routines ORed 1 with 4 resulting in 5.

- 9 Entry to DFSCFEP0 and exit to analyzer 3 entry. (8 ORed with 1).
- A Entry to DFSCFEP0 (page position established) (8 ORed with 2).
- **C** Entry to DFSCFEP0 and message dequeue requested. (8 ORed with 4).
- **F** Noninitial entry to DFSCFEI0

# **CIBTRACE** trace

CIBTRACE is located in the extended CIB at CIB+X'70'. If the CIBSEXT flag is on (X'80'), an extended CIB exists. The following figure shows the format.

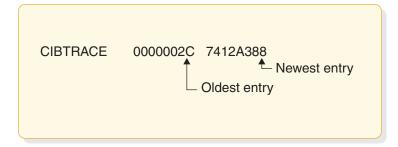

Figure 70. Example of CIBTRACE trace

The leftmost nonzero digit shows the oldest entry and high-order 4 bits of the rightmost byte show the newest. You can ignore the rightmost digit since it is always the same as the digit to its left. The trace entries are described in the following list.

## Value (hex)

Meaning

- **0** ENDMSG entry to DFSCFEI0 (Tests for EOT and spanned operation). If spanned, ENQWORK; if not, set EOM and setup for spanned operation.
- 1 CPP100 entry to DFSCFEI0. Data was moved to message field.
- 2 CPP10 entry to DFSCFEI0. Field was padded with fill character or literal has been moved into field.
- **3** GETLBUF entry to DFSCFEI0. Acquire next line buffer. Return at entry GETLBUF2 with address of line buffer segment in register 1.
- 4 NOFIT entry to DFSCFEI0. Sets up for spanned operation.
- 7 GETWORK entry to DFSCFEI0. Acquire work buffer and initialize work buffer header. Moved data from QBUF to work buffer.
- 8 REFRESH2 entry to DFSCFEI0. DIF table was cleared and setup.
- 9 ENQWORK entry to DFSCFEI0. Segment in work buffer was moved to QBUF for processing.
- **A** FINQBUF entry to DFSCFEI0. Compress nulls out of segmenting work buffer.
- **B** NULLFDE entry to DFSCFEI0. Process all NULLFDEs.
- C PROCQBUF entry to DFSCFEI0. Return to analyzer to process QBUF.
- **D** GETQBUF entry to DFSCFEI0. Branches to analyzer entry C0 to acquire a QBUFFER.
- **F** ISRTNULL entry to DFSCFEI0. Inserts all null segments and processes them for move data.

# Tracing errors in module DFSCNXA0

DFSCNXA0 is the interface module between IMS and VTAM for all logon processing and abnormal session termination processing. It is often the first module to be notified when a failure occurs on a session and is always the first to get control when a node connects to IMS.

The session attributes are verified and the IMS session control blocks are built before the connection request is passed on to signon processing in IMS. The module consists exclusively of calls to VTAM exit routines.

# Location codes for DFSCNXA0 error messages

Message DFS3672I contains the location codes of the DFSCNXA0 error messages and the message also identifies the exit routine in which the error occurred.

Message DFS3672I contains the location codes listed in the following table.

Session failures might occur that do not cause any DFS messages to be issued by DFSCNXA0. In these cases, only message DFS3672 appears.

The format of the DFS3672I message is as follows: DFS3672I SESSION ERROR. TYPE=*aaa* CODE=*bb* QUAL.=*cc* MSG=*dddd* 

where

*aaa* is the VTAM exit which was driven when the error occurred.

*bb* is the location code of the error.

*cc* is the location qualifier of the error.

Table 73. Location codes for DFSCNXA0 error messages

Location code	Location code			
(decimal)	(hexadecimal)	Msg# (DFS)	Exit	Explanation
19	13	3862	LOG	Non-master terminal initiating a session on the alternate system.
20	14	3100	LOG	Node in FP input mode.
21	15	3645	LOG	Generic Resource name used but VGR for ISC was disabled.
147	93	3645	LOG	Parsing for userdata failed for AUTOSIGN terminal
151	97	3644	LOG	Could not get SOPB storage for AUTOSIGN terminal
22	16	3645	SCIP	Generic Resource name used but VGR for ISC was disabled.
1	1	N/A	LOST	No CID in VTAM parameter list.
2	2	N/A	LOST	CLB not found.
3	3	N/A	LOST	Stacked logon chaining error.
4	4	N/A	LOST	CLBs do not match (stacked logon situation).
5	5	N/A	LOST	CLBs do not match (nonstacked situation).
3 4	3 4	N/A N/A N/A	LOST LOST	CLB not found. Stacked logon chaini CLBs do not match situation). CLBs do not match

Location code (decimal)	Location code (hexadecimal)	Msg# (DFS)	Exit	Explanation
1	1	N/A	NSXT	No CLB in USERFLD of NIB (Cleanup RU).
2	2	N/A	NSXT	No CID.
3	3	N/A	NSXT	CLB not found (Cleanup RU).
4	4	N/A	NSXT	CLB addresses do not match.
5	5	N/A	NSXT	IMS APPLID not found in resolve in-doubt vector list.
7	7	N/A	NSXT	Polarity mismatch on MSC link.
8	8	N/A	NSXT	Polarity mismatch on MSC link.
10	А	N/A	NSXT	Not Cleanup, NSPE, or Notify—RU is invalid.
11	В	N/A	NSXT	Invalid session key for NSPE.
12	С	N/A	NSXT	Invalid vector key for NOTIFY.
13	D	N/A	NSXT	Invalid session key for NOTIFY.
21	15	2061	NSXT	NSPE/NOTIFY processed.
22	16	2061	NSXT	NSPE/NOTIFY processed, AHDR not cleaned up.
23	17	2061	NSXT	CLB not found (NOTIFY RU).
1	1	N/A	RELQ	VTCB not found.
2	2	N/A	RELQ	Terminal defined with NORELRQ option.
3	3	N/A	RELQ	No CID in nonparallel-session VTCB.
4	4	N/A	RELQ	No CID in any parallel-session VTCBs.
1	1	1915	SCIP	No pointer to RPL.
2	2	1917	SCIP	Node not found.
3	3	3862	SCIP	VTCB not found (XRF Alt.).
4	4	3862	SCIP	Invalid temporary VTCB (XRF Alt.).
5	5	3862	SCIP	BIND not on surveillance link (XRF Alt.).
6	6	3101	SCIP	BIND not from same APPLID.
7	7	3101	SCIP	BIND rejected after setting VLGFF.
8	8	2104	SCIP	Non-LU 6.1 node.
9	9	3111	SCIP	Node stopped.
10	А	3101	SCIP	Logoff requested.
11	В	3101	SCIP	SPQB already allocated. Another 3672 (code=2D) is sent, after the -resp is sent.
12	С	3101	SCIP	BIND not from same APPLID.

Table 73. Location codes for DFSCNXA0 error messages (continued)

Location code	Location code			
(decimal)	(hexadecimal)	Msg# (DFS)	Exit	Explanation
13	D	3101	SCIP	BIND rejected after setting CLBVLGFF flag.
14	Е	2104	SCIP	CLEAR for non-ISC node.
15	F	970	SCIP	UNBIND entry message sent (after posting).
16	10	1931	SCIP	ASR processing begins.
17	11	2104	SCIP	SDT for non-ISC node.
18	12	1915	SCIP	Invalid command in RPL.
22	16	79	SCIP	Queues not available.

Table 73. Location codes for DFSCNXA0 error messages (continued)

# Codes related to ISC processing

The codes in the following table relate to ISC processing—either as a result of LOGON or SCIP exits being driven. This is reflected in the DFS3672 message with 'I' appended to the exit type.

Table 74. Codes related to ISC processing

Location code (hexadecimal)	Msg# (DFS)	Exit	Explanation
1	79	ISC	IMS shutting down.
2	1914	ISC	Bad INQUIRE return code.
3	1914	ISC	Bad INQUIRE feedback.
4	2066	ISC	USERFLD is zeros.
5	2066	ISC	First structured field not 0.
6	2066	ISC	User field length = 0.
7	2066	ISC	Primary Session Qualifier length $= 0$ .
8	2066	ISC	Primary Session Qualifier length > 8.
9	2066	ISC	Secondary Session Qualifier length = 0.
А	2066	ISC	Secondary Session Qualifier length > 8.
В	3107	ISC	SPQB found but allocated.
С	3107	ISC	SPQB CRB pointer <> 0.
D	2049	ISC	VTCB not found and no dynamic terminals.
Е	3101	ISC	No available VTCBs.
F	3107	ISC	Session initialization already begun.
10	3101	ISC	Second SCIP entry for same session.
11	3105	ISC	No CNTs on SPQB.
12	3107	ISC	Nonzero CID for existing session.
13	3111	ISC	Session blocked (3STOP).
14	3111	ISC	Session stopped.

Location code	Location code			
(decimal)	(hexadecimal)	Msg# (DFS)	Exit	Explanation
21	15	3107	ISC	Ran out of CLBs.
22	16	3101	ISC	SPQB CRB pointer = 0.
23	17	1916	ISC	LOGON, but previous session was secondary.
24	18	1916	ISC	SCIP, but previous session was primary.
25	19	2066	ISC	User data length from INQUIRE = 0.
26	1A	3663	ISC	LU type in BIND = '0602' (LU 6.2)
27	1B	3107	ISC	SPQB found but allocated.
28	1C	3107	ISC	SPQB CRB pointer <> 0.
29	1D	3101	ISC	Second logon entry for same session.

Table 74. Codes related to ISC processing (continued)

The codes in the following table might occur during ISC BINDRACE processing.

Location code (hexadecimal)	Msg# (DFS)	Exit	Explanation
29	N/A	ISC	SESSIONC not issuable—VTAM terminating.
2A	N/A	ISC	SESSIONC issued.
2B	N/A	ISC	SESSIONC not issuable—VTAM terminating.
2C	N/A	ISC	BIND not received.
2D	N/A	ISC	SESSIONC issued.
	(hexadecimal) 29 2A 2B 2C	(hexadecimal)         (DFS)           29         N/A           2A         N/A           2B         N/A           2C         N/A	(hexadecimal)(DFS)Exit29N/AISC2AN/AISC2BN/AISC2CN/AISC

Table 75. Codes related to ISC BINDRACE processing

## Codes related to MSC errors

Codes related to MSC and MSC SCIP errors are listed, including their location codes, DFS message number, exit, and an explanation.

The codes in the following table relate to MSC errors.

Table 76. Codes related to MSC errors

Location code (decimal)	Location code (hexadecimal)	Msg# (DFS)	Exit	Explanation
51	33	3101	MSC	CID already present.
52	34	3213	MSC	3213 message issued. Code=4.
53	35	3213	MSC	3213 message issued. Code=8.
54	36	3213	MSC	3213 message issued. Code=24.
55	37	3213	MSC	3213 message issued. Code=32.

The codes in the following table relate to MSC SCIP errors.

Table 77. Codes related to MSC SCIP errors

Location code (decimal)	Location code (hexadecimal)	Msg# (DFS)	Exit	Explanation
71	47	N/A	MSC	CID already present.
72	48	N/A	MSC	No USERFLD provided.
73	49	N/A	MSC	RPL not initialized.

## Codes related to dynamic logon

Dynamic login codes, their locations, DFS message number, exit and explanation are listed.

Table 78. Codes related to dynamic logon errors

Location code (decimal)	Location code (hexadecimal)	Msg# (DFS)	Exit	Explanation
81	51	2264	LOG	Do not accept logons.
82	52	3862	LOG	Nonexistent VTCB trying to logon to alternate system.
83	53	2037	LOG	/STA DC not done.
84	54	2104	LOG	Invalid temporary VTCB exists.
85	55	3862	LOG	Invalid temporary VTCB exists.
86	56	3862	LOG	Logon not for XRF link.
87	57	3111	LOG	Node stopped.
88	58	2264	LOG	Logons not accepted and SIMLOG not in effect.
89	59	3862	LOG	In backup but not preopen.
90	5A	3862	LOG	In backup preopen but backup session not allowed.
91	5B	2037	LOG	/STA DC not done.
92	5C	79	LOG	Queues not available.
93	5D	3111	LOG	Node not started.
94	5E	79	LOG	Shutting down and MTO logging not on.
95	5F	3111	LOG	Node stopped.
96	60	3101	LOG	Node logging off.
97	61	3101	LOG	Session terminating.
98	62	3101	LOG	CID already exists.
99	63	3111	ISC	Node stopped on temporary VTCB.

## Codes related to existing ISC session errors

ISC session error codes are listed, including their location, DFS message number, exit, and explanation.

Table 79. Codes related to existing ISC session errors

Location code (decimal)	Location code (hexadecimal)	Msg# (DFS)	Exit	Explanation
111	6F	3645	ISC	QSAVE could not be gotten.
112	70	3645	ISC	Parsing failed.
113	71	3645	ISC	Dynamic terminals not allowed.

## Codes related to user-logon-exit routine processing

User-logon-exit routine processing codes are listed, including their location, DFS message number, exit, and explanation.

Location code (decimal)	Location code (hexadecimal)	Msg# (DFS)	Exit	Explanation
121	79	3645	LOG	Could not get QSAVE for signon parameters.
122	7A	3645	LOG	Parsing failed.
123	7B	3645	LOG	User logon exit rejected logon.
124	7C	3645	LOG	User logon exit rejected logon.
125	7D	3645	LOG	Invalid ALOT or ASOT value from user logon exit routine
126	7E	3645	N/A	User logon exit routine erased all descriptors.
127	7F	3645	LOG	A dynamically created logging-on STSN VCTB must have user data.
128	80	3645	LOG	Existing dynamic logging-on STSN VTCB must have user data.

Table 80. Codes related to user-logon exit routine processing

## Codes related to logon errors

Logon error codes are listed, with their locations, DFS message number, exit, and explanation.

Table 81. Codes related to logon errors

Location code (decimal)	Location code (hexadecimal)	Msg# (DFS)	Exit	Explanation
141	8D	3645	N/A	Dynamic terminals not allowed.
142	8E	3646	N/A	Inconsistent attributes.
143	8F	3646	N/A	Inconsistent attributes.
144	90	3645	N/A	Could not get SOPB storage.
145	91	3645	N/A	Parsing of userdata failed.
146	92	3645	N/A	Terminal is the primary or secondary master terminal for the alternate system in an XRF environment.
148	94	3644	N/A	Could not get SOPB storage.
149	95	3644	N/A	Could not get SOPB storage.

Location code	Location code			
(decimal)	(hexadecimal)	Msg# (DFS)	Exit	Explanation
150	96	2066	LOG	The LUTYPE in BIND/CINIT conflicts with static ISC block LUTYPE.
161	A1	3671	N/A	Invalid descriptor specified in userdata.
162	A2	3651	N/A	No default descriptor found.
163	A3	3671	N/A	User logon exit routine returned invalid descriptor.
164	A4	3644	N/A	Could not get SOPB storage.
165	A5	3651	N/A	No default descriptor found.

## Codes related to logon descriptor processing

Logon descriptor processing codes are listed along with their location, DFS message number, exit, and explanation.

Table 82. Codes related to logon descriptor processing

Location code (decimal)	Location code (hexadecimal)	Msg# (DFS)	Exit	Explanation
181	B5	3663	LOG	LU type must be < 7.
182	B6	3663	LOG	LU type must be $\geq 0$ .
183	B7	3663	LOG	Invalid LU type specified.
184	B8	3663	LOG	Invalidly-specified non-SNA 3270 VTAM device. Make sure mode-table is properly defined and referenced.
185	В9	3663	LOG	Invalid LU 1 or NTO device type.

## Codes related to logging-on device characteristics

Logging-on device characteristic codes are listed along with their location, DFS message number, exit and explanation.

Table 83. Codes related to logging-on device characteristics

Location code (decimal)	Location code (hexadecimal)	Msg# (DFS)	Exit	Explanation
191	BF	3646	LOG	Invalid SLU 1 device logging on.
192	C0	3646	LOG	Device LU type does not match descriptor.
193	C1	3646	LOG	Non-SNA 3270 VTAM logon descriptor invalid for the logging-on device.
194	C2	3646	LOG	Invalid SLU P or 3600 type device mismatch with the logon descriptor

Table 83. Codes related to logging-on device characteristics (continued)

Location code (decimal)	Location code (hexadecimal)	0	Exit	Explanation
195	C3	3646	LOG	TS type or LU type mismatch.

# **Qualifier codes**

Qualifier codes for ETO parsing errors, VTCB creation errors, screen-attribute errors, are listed with their location codes, DFS message number, exit, and explanation.

## Codes related to ETO parsing errors

#### Codes related to ETO parsing errors

The Qualifier codes in the following table relate to ETO parsing errors that are associated with message DFS3645I.

Location code (decimal)	Location code (hexadecimal)	Msg# (DFS)	Exit	Explanation
1	1	N/A	N/A	Invalid logon descriptor name—no name specified.
2	2	N/A	N/A	Invalid logon descriptor name—name is greater than 8 characters.
3	3	N/A	N/A	Invalid logon descriptor name—no name specified.

Table 84. Qualifier codes related to ETO parsing errors

## Codes related to VTCB creation errors

## Codes related to VTCB creation errors

The Qualifier codes in the following table relate to VTCB creation errors that are associated with a DFS3644 message.

Table 85. Qualifier codes related to VTCB creation errors

Location code (decimal)	Location code (hexadecimal)	Msg# (DFS)	Exit	Explanation
1	1	N/A	N/A	QSAVE not gotten.
2	2	N/A	N/A	VTCB could not be created.
3	3	N/A	N/A	Could not put VTCB into hash table.

## Codes related to screen-attribute errors

## Codes related to screen-attribute errors

The Qualifier codes in the following table relate to screen-attribute errors (associated with a DFS3646I message).

Location code (decimal)	Location code (hexadecimal)	Msg# (DFS)	Exit	Explanation
1	1	N/A	N/A	No Device Characteristics Table. Run the MFS DCT (DFSUTB00) utility.
2	2	N/A	N/A	No match for screen size and feature. Update MFS DCT (DFSUTB00) for the missing entry.
3	3	N/A	N/A	Screen size control byte incorrectly specified. The byte itself might be invalid. If X'7F' is specified, then a valid screen size must also be specified.

Table 86. Qualifier codes related to screen-attribute errors

# **APPC/IMS diagnostic aids**

APPC/IMS diagnostic aids include LU manager trace, LU 6.2 module-to-code cross references, APPC/MVS verb-to-code cross references, DDFS1959e message information, diagnostic information for APP and OTMA with shared queues, and information on SNAPs and dumps.

# LU manager trace

The LU manager trace records the flow of control through the IMS LU 6.2 components. Analyzing the trace entries together with the MVS/ESA APPC trace entries is useful in determining the problem.

## Starting the LU manager trace

The /TRACE SET ON TABLE LUMI command activates the trace and sends the entries to an internal table.

You can format the table using the Offline Dump Formatter under IPCS, using either the VERBX command or the IMS Dump Formatter panels.

If a SNAP dump is taken, the table is formatted as part of the IMS dump.

If you add the OPTION LOG parameter to the /TRACE command, IMS sends the output to an external data set. You can use the File Select and Formatting utility (DFSERA10) with exit DFSERA60 to format the trace entries.

#### Related concepts:

"Formatting IMS dumps offline" on page 531

## Formatting the LU manager trace

The general format of an LU manager trace record is shown. Each record is 8 words long. Word 0 holds standard information for each record.

# LU manager trace example

The following LU manager trace example shows calls to DFS62FD0 caused by /DISPLAY commands, a clean address space caused by a non-LU 6.2 transaction ending, and a synchronous LU 6.2 transaction being executed.

## LU manager trace example

The trace has been formatted by the File Select and Formatting utility (DFSERA10) with exit DFSERA60, which places the module number after word 7.

OPTION PRINT 0=5,V=67FA,EXITR=DFSERA60 END

END

# LU 6.2 module-to-code cross-reference table

You can use the module number, module name, and description to associate code xx in message DFS1959E and the module number in trace records X'7Bxx' and X'7Cxx' with a module.

Table 89. LU 6.2 module-to-code cross-reference table

Module number (decimal)	Module number (hexadecimal)	Module	Description
01	01	DFSSLUM0	Synchronous output LU manager
02	02	DFSAPPC0	DFSAPPC message switch processor
03	03	DFSCMD00	LU 6.2 command interface
04	04	DFSALM00	Asynchronous output LU manager
05	05	DFSRLM00	Receive LU manager server
06	06	DFSRLM10	Receive LU manager receiver
08	08	DFSAPP10	DFSAPPC keyword parser
09	09	DFSATB00	APPC/MVS verb execution/trace
10	0A	DFS6LUS0	LU 6.2 services interface 1
11	0B	DFS6LUS1	LU 6.2 services interface 2
12	0C	DFS6LUS2	LU 6.2 services interface 3
16	10	DFSRAC60	RACF interface module
21	15	DFS6RST0	LU 6.2 restart processor
22	16	DFS6CKP0	LU 6.2 checkpoint processor
24	18	DFSGIDC0	Read and build LU 6.2 descriptors
31	1F	DFS6ECT0	LU 6.2 z/OS cross-system coupling facility message processor
32	20	DFS62FD0	LU 6.2 Find destination routine (QABs/TIBs)
33	21	DFSLUDI0	LU 6.2 User Destination exit
34	22	DFSLIEE0	LU 6.2 User Data Edit exit
35	23	DFSHCI00	XRF takeover processing
36	24	DFS6QFX0	LU 6.2 Nonrecoverable message cleanup
37	25	DFSHAV70	XRF termination/takeover
38	26	DFS62FD1	LU 6.2 Find destination routine (LUBs/DESCs)
40	28	DFSCMLC0	MSC SQ APPC/OTMA Message Router
41	29	DFSCMS00	MS Analyzer

# APPC/MVS verb-to-code cross-reference table

You can use the verb number, verb name, and verb description to associate the ATB call number in trace records X'7Cxx' with an APPC/MVS verb.

Table 90. APPC/MVS verb-to-code cross-reference table

Verb number		
(hexadecimal)	Verb name	Verb description
01	ATBALLC	Allocate a conversation
02	ATBCFM	Send a confirmation request
03	ATBCFMD	Send a confirmation reply
04	ATBDEAL	Deallocate a conversation.
05	ATBDFTP	Define TPID
06	ATBFLUS	Empty the local LU's send buffer
07	ATBGTA2	Get conversation attributes
08	ATBGETC	Accept conversation
09	ATBGETP	Get TP properties
0A	ATBGETT	Get conversation type
0B	ATBPTR	Enter receive state
0C	ATBRCVI	Receive data, if available
0D	ATBRCVW	Wait to receive data
0E	ATBRTS	Enter send state
0F	ATBSEND	Send data
10	ATBSERR	Send error
11	ATBASOC	Associate TPID
12	ATBCMAS	Clean address space

Verb number		
(hexadecimal)	Verb name	Verb description
13	ATBMIGRP	Join z/OS cross-system coupling facility message group
14	ATBSASA	Set address space attributes
15	ATBCMTP	Clean TPID
16	ATBCNTL	APPC/MVS control call
17	ATBCONN	Connect address space to scheduler
18	ATBDCON	Disconnect address space from scheduler
19	ATBEXAI	Extract conversation information
1A	ATBIDEN	Identify scheduler to APPC/MVS
1B	ATBUNID	Unidentify scheduler from APPC/MVS
1C	ATBIDN4	Identify scheduler to APPC/MVS
1D	ATBUID4	Unidentify scheduler from APPC/MVS
1E	ATBVERS	Version service
1F	ATBALC5	Allocate a conversation
20	ATBSTO5	Set timeout value
21	ATBLEAVE	Leave XCF message group

Table 90. APPC/MVS verb-to-code cross-reference table (continued)

# DFS1959E message information

APPC/IMS issues message DFS1959E when a severe internal error occurs.

The message format is: DFS1959E SEVERE IMS INTERNAL FAILURE, REASON CODE=xxyy

Variable xx is a decimal number that identifies the module. Variable yy is an internal reason code.

If you receive this message, contact IBM Software Support with the module number and reason code supplied in the message, and, if requested, output from the LU manager trace.

The following lists provide an explanation of the reason codes listed in the DFS1959E message. Contact IBM Software Support for actions to take in response to these IMS internal failures.

The following two reason codes are module INDEPENDENT. xx denotes the specific IMS module performing the macro call:

- RC Description
- **xx98** Failure in DFSPOOL to acquire storage for PL/AS variables using the DFSLUMGT macro.
- **xx99** Failure in DFSPOOL to release storage for PL/AS variables using the DFSLUMRL macro.

## **Related reference:**

"LU 6.2 module-to-code cross-reference table" on page 336

## DFSALM00

APPC/IMS issues message DFS1959E when a severe internal error occurs. If you receive this message, contact IBM<sup>®</sup> Software Support with the module number and reason code supplied in the message. Reason codes for message DFSALM00 are given. The DFSALM00 reason code is module dependent.

#### RC Description

- 0401 Failure to clear asynchronous control block work pending bit.
- 0402 Failure to get LUMP pool buffer using DFSPOOL macro.
- 0403 Failure to free LUMP pool buffer using DFSPOOL macro.
- 0408 Missing LUNAME from LU 6.2 message prefix.
- 0409 Missing TPNAME from LU 6.2 message prefix.
- **0410** Unsupported sync level specified in asynchronous control block or LU 6.2 message prefix.
- **0411** Invalid conversation type specified in asynchronous control block or LU 6.2 message prefix.
- 0412 Invalid control data in message segment from GU call.
- 0413 Invalid control data in message segment from GN call.
- 0414 No data, redundant DFSQMGR Get Next call. RC=4.
- 0415 Unknown return code on DFSQMGR Get Next call.
- 0416 Missing LU 6.2 prefix on DFSQMGR Get Unique call.
- 0417 Queue already in read status on DFSQMGR Get Unique call. RC >= X'C'.
- **0418** Failure to dequeue output message. "No message on queue status" is indicated. DFSQMGR Dequeue call, RC=8.
- **0419** Unknown return code from dequeue call. DFSQMGR Dequeue call, RC is other than 0 or 8.
- **0421** Unknown return code from DFSLIEE0 LU 6.2 user edit exit. RC is other than 0, 4, or 8.

## DFSAOSW0

APPC/IMS issues message DFS1959E when a severe internal error occurs. If you receive this message, contact IBM<sup>®</sup> Software Support with the module number and reason code supplied in the message. Reason codes for message DFSAOSW0 are given.

## RC Description

- 7101 Unknown request code.
- 7109 Zero TIB address for send output.
- **7110** Failure in QUERY of DFSXCF macro.
- 7116 Zero header address for send output.
- 7121 Failure to get AWE storage using DFSBCB macro.
- 7133 Transaction not found for notify.
- 7134 Other than transaction found for notify.
- 7136 Wrong message number in SEND DFS MESSAGE function.

- 7144 z/OS cross-system coupling facility parameter length too large.
- 7144 Unknown subfunction for Common XCF Communications.
- 7150 Failure to get LUMP storage using DFSPOOL macro.
- 7190 Failure in QUERY in DFSXCF macro.

## DFSAPPC0

APPC/IMS issues message DFS1959E when a severe internal error occurs. If you receive this message, contact IBM<sup>®</sup> Software Support with the module number and reason code supplied in the message. Reason codes for message DFSAPPC0 are given.

- RC Description
- **0201** DFSQMGR Get Unique call failure, RC not 0.
- 0202 DFSQMGR Get Next call failure, RC not 0 and QTP1EOM=0.
- **0203** DFSQMGR Enqueue call failure, RC not 0.
- **0204** DFSQMGR Dequeue call failure, RC not 0.
- 0205 DFSQMGR Insert Move call failure, RC not 0.
- 0206 DFSQMGR Insert Move call failure, RC not 0.
- **0207** DFSQMGR Cancel Input call failure, RC not 0.
- 0208 Failure to read DFSAPPC message from shared queues.
- 0209 DFSQMGR Insert Move without LU62 MSG PREFIX call failure, RC not 0.
- 0210 DFSQMGR Get Next call failure, RC not 0 and QTP1EOM=0.
- **0211** DFSQMGR Get Next call failure, RC not 0.
- **0212** DFSQMGR Get Unique call failure, RC not 0.
- 0250 Failure to find or create asynchronous control block.
- **0260** Router call failure. DFSICLR0 call, RC not 0.
- **0270** DFSUSE FUNC=NOUSE call failure, RC not 0.

## DFSATB00

APPC/IMS issues message DFS1959E when a severe internal error occurs. If you receive this message, contact IBM<sup>®</sup> Software Support with the module number and reason code supplied in the message. Reason codes for message DFSATB00 are given.

#### RC Description

0901 Calling module requesting unsupported APPC/MVS verb name.

#### DFSCMD00

APPC/IMS issues message DFS1959E when a severe internal error occurs. If you receive this message, contact IBM<sup>®</sup> Software Support with the module number and reason code supplied in the message. Reason codes for message DFSCMD00 are given.

## RC Description

- **0301** DFSQMGR Get Unique call failure, RC not 0.
- **0302** DFSQMGR Get Next call failure, RC not 0.
- **0304** DFSQMGR Dequeue call failure, RC not 0.

- 0306 DFSQMGR Insert Locate call failure, RC not 0.
- 0321 Failure to get LUMP pool buffer using DFSPOOL macro.
- 0322 Failure to free LUMP pool buffer using DFSPOOL macro.

## DFSCMLC0

APPC/IMS issues message DFS1959E when a severe internal error occurs. If you receive this message, contact IBM<sup>®</sup> Software Support with the module number and reason code supplied in the message. Reason codes for message DFSCMLC0 are given.

## RC Description

- **4001** Failure in LUMIF GU call through DFSCMAP0. Type 6701-MSS1/MSS2 records were logged.
- **4002** Failure in processing a remote keyed message. Type 6701-MSS1/MSS2 records were logged.
- **4003** Failure in an INSERT call. Type 6701-MSS1/MSS2 records were logged.
- **4004** Failure in DFSICLR0 message router. Type 6701-MSS1/MSS2 records were logged.
- **4005** DFSCOND0 was called to process an error scratchpad area segment for a APPC or OTMA client in conversation mode and an error (RC=08) was returned. Type 6701-MSS1/MSS records were logged.
- **4006** Conversation scratch pad (SPA) message did not have the correct SPA message flags in the message prefix MSGMSFL1 and MSGMSFL2 flags. Type 6701-MSS1/MSS2 records were logged.
- **4007** DFSCONM0 was called to process a normal scratch pad segment for a APPC or OTMA client in conversation mode and an error (RC=0C) was returned. Type 6701-MSS1/MSS2 records were logged.

#### DFSCMS00

APPC/IMS issues message DFS1959E when a severe internal error occurs. If you receive this message, contact IBM<sup>®</sup> Software Support with the module number and reason code supplied in the message. Reason codes for message DFSCMS00 are given.

- RC Description
- 4101 Failure in LUMIF GU call using DFSCMAP0.
- **4102** Failure in LUMIF GU call using DFSCMAP0.
- **4103** Failure in LUMIF GU call using DFSCMAP0.

## DFSHCI00

APPC/IMS issues message DFS1959E when a severe internal error occurs. If you receive this message, contact IBM<sup>®</sup> Software Support with the module number and reason code supplied in the message. Reason codes for message DFSHCI00 are given.

#### **RC** Description

**3501** Failure to get AWE storage using DFSBCB.

## DFSRLM00

APPC/IMS issues message DFS1959E when a severe internal error occurs. If you receive this message, contact IBM<sup>®</sup> Software Support with the module number and reason code supplied in the message. Reason codes for message DFSRLM00 are given.

## RC Description

- **0501** AWE extension not a FMH5 Attach request.
- **0502** Synchronous control block creation failure using DFS62DST FUNC=FIND. This could be storage related.
- **0503** Error freeing XAWE. Unknown storage pool.
- **0504** Error freeing XAWE using STORAGE macro.
- 0505 AWE not an FMH5 Attach request.
- **0506** Error posting DFSRLM10 using DFSSERVR macro.
- 0507 Failure in Identify Protected Conversation Context.
- 0508 Blank or zero LUNAME received

## DFSRLM10

APPC/IMS issues message DFS1959E when a severe internal error occurs. If you receive this message, contact IBM<sup>®</sup> Software Support with the module number and reason code supplied in the message. Reason codes for message DFSRLM10 are given.

#### RC Description

- **0601** Failure in DFS62FD0 releasing a synchronous control block (DFS62DST FUNC=RELEASE).
- **0602** Failure in DFSICLF0 FindDest routine looking up trancode. RC >= X'10'.
- 0603 Failure in DFSRAC60. DFSRAC6 FUNC=RACINIT RC not 0.
- **0604** Failure in DFSRAC60. DFSRAC6 FUNC=FRACHECK RC>= X'44'.
- **0605** Failure in DFSTM0 building a CPI-C dynamic SMB RC not 0.
- **0606** Failure in DFSICLR0 message router. Enqueue to SMB RC not 0.
- **0607** Failure to get LUMP pool buffer using DFSPOOL macro.
- 0608 Failure to free LUMP pool buffer using DFSPOOL macro.
- **0609** Failure in DFSQMGR updating message to nonrecoverable RC not 0.
- **0610** Failure in DFSTM0 to ENQ prefix to CPIC dynamic SMB RC not 0.
- **0611** Failure in DFSQMGR to insert Data for SMB or DFSAPPC DFSQMGR Insert Move call failure, RC not 0.
- 0612 Failure in DFSCMD00 processing IMS command. RC not 0.
- **0613** Failure in DFSAPPC0 processing Message Switch RC not 0.
- **0614** Failure in DFSQMGR to cancel a message in progress. RC not 0.
- 0615 Failure in DFSQMGR to enqueue message for Cmd or DFSAPPC. RC not 0.
- **0616** Failure in DFSQMGR to update APPC Message Prefix. RC not 0.
- **0617** Failure in DFSHEIL0 unrecognized return code from Fast Path RC other than 0, 4, 8, or 12.

- **0618** Failure in DFSBCB to free AWE.
- **0619** Failure in DFS6LUS0 RLUM reposted and not running conversational transaction.
- **0620** Failure in DFSQMGR to update modname RC not 0.
- **0621** Failure in DFSQMGR to update a message to response mode.
- **0622** Failure in DFSQMGR to cancel a message, RC not 0.
- 0623 Failure in DFSQMGR to delete a message, RC not 0.
- **0624** Failure in DFS62FD0 getting an asynchronous control block (DFS62DST FUNC=FIND).

## **DFSSLUM0**

APPC/IMS issues message DFS1959E when a severe internal error occurs. If you receive this message, contact IBM<sup>®</sup> Software Support with the module number and reason code supplied in the message. Reason codes for message DFSSLUM0 are given.

#### RC Description

- **0101** Failure in DFSQMGR Get Unique or GN call. RC not 0 and QTP1EOM=0.
- 0103 Failure in DFSQMGR Dequeue or Cancel call. RC not 0.
- **0107** Failure to get AWE using DFSBCB macro.
- **0108** QMGR GU call failed with RC08.
- **0111** DFSSLUM0 has been called to deliver a message with zero length to the front-end IMS system. A DFS2224 message will be sent instead.
- **0121** Failure to get LUMP pool buffer using DFSPOOL macro.
- 0122 Failure to free LUMP pool buffer using DFSPOOL macro.

## DFS6CKP0

APPC/IMS issues message DFS1959E when a severe internal error occurs. If you receive this message, contact IBM<sup>®</sup> Software Support with the module number and reason code supplied in the message. Reason codes for message DFS6CKP0 are given.

- RC Description
- **2201** Invalid checkpoint type specified in parameter list. Should be ALL or STATUS.
- **2202** Data block too large for log record.

## DFS6ECT0

APPC/IMS issues message DFS1959E when a severe internal error occurs. If you receive this message, contact IBM<sup>®</sup> Software Support with the module number and reason code supplied in the message. Reason codes for message DFS6ECT0 are given.

- RC Description
- **3101** Error freeing XAWE using DFSBCB macro.
- **3102** Error freeing XAWE using STORAGE macro.
- **3104** Invalid AWE request.
- 3105 Failure in DFSTM0 to connect all dependent regions FUNC=CONALL.

- **3107** Failure in DFSBCB to get AWE storage
- **3109** Error detected in DFS6IDC0 building user descriptors.
- **3110** Error getting CIOP storage using DFSPOOL macro.
- **3111** Error freeing CIOP storage using DFSPOOL macro.
- **3112** VTAM MODIFY USERVAR failed during activation of XRF alternate.
- 3113 VTAM VARY NET TERM failed for termination of primary system.
- 3114 Error Posting asynchronous control block using DFSSERVR macro.
- 3115 Error Checking synchronous control block using DFSSERVR macro.
- 3116 VTAM MODIFY USERVAR failed for activation of primary system.

## DFS6IDC0

APPC/IMS issues message DFS1959E when a severe internal error occurs. If you receive this message, contact IBM<sup>®</sup> Software Support with the module number and reason code supplied in the message. Reason codes for message DFS6IDC0 are given.

#### RC Description

- 2401 Unable to obtain storage for BPAM buffer using STORAGE macro.
- 2402 Unable to release storage for BPAM buffer using STORAGE macro.
- 2403 Unknown DFS warning message number.
- **2404** Failure to get LUMP pool buffer using DFSPOOL macro.

When this reason code is issued, the error message is followed by a U0732 abend.

2405 Failure to free LUMP pool buffer using DFSPOOL macro.

## DFS6LUS0

APPC/IMS issues message DFS1959E when a severe internal error occurs. If you receive this message, contact IBM<sup>®</sup> Software Support with the module number and reason code supplied in the message. Reason codes for message DFS6LUS0 are given.

- RC Description
- 1004 No synchronous control block given in SEND service call.
- 1007 TIB was released while the task was waiting to synchronize.
- **1008** TIB\_SYNC\_PTR was changed, but not to zero.
- **1010** Unknown service call in main program.
- 1012 Unable to get storage for LU 6.2 message prefix using DFSBCB macro.
- **1013** Unable to create an asynchronous control block using DFS62DST FUNC=FIND.
- **1015** No LUM block given in BLDPRE service call.
- **1016** Unable to find asynchronous control block or create a new one in CHNG service call. DFS62DST FUNC(FIND).
- 1018 Conversation-id zero at send time.
- **1020** Return Code X'1C' from Queue Manager Get Unique call.
- 1022 Unable to free storage for LU 6.2 message prefix using DFSBCB macro.

1

- Expect input LU 6.2 msg prefix in COPYPF62 service call.
- Expect input synchronous/asynchronous control block in COPYPF62 service call.
- Invalid TPN=DFSSIDE in CHNG service call.
- Unable to find LU 6.2 descriptor entry in BLDPRE service call using DFS62DST macro.
- Failure in DFSBCB to get AWE.
- Failure in DFSBCB to free AWE.
- Failure to get LUMP pool buffer using DFSPOOL macro.
- Failure in SENDMSG using DFSXCF macro.
- 1064 Failure to free LUMP pool buffer using DFSPOOL macro.

## DFS6LUS1

APPC/IMS issues message DFS1959E when a severe internal error occurs. If you receive this message, contact IBM<sup>®</sup> Software Support with the module number and reason code supplied in the message. Reason codes for message DFS6LUS1 are given.

## RC Description

- Unknown service call in main program.
- No message prefix or synchronous/asynchronous control block given in INQY service call.
- Unable to clean up TP.
- Unable to clean up in the address space.
- 1125 No synchronous control block is given in TIBINFO service call
- Unable to find the asynchronous or restart synchronous control block in GETQABTIB service call.
- DFSLUS1 cannot find TIB/QAB.
- Unable to post RLM back in CONVCONT service call.
- 1133 Unable to find LU 6.2 descriptor entry in INQY service call.
- No message prefix supplied in GETQABTIB service call.
- DFSQMGR Get Unique or Insert Move call failed in MSGROUTE service call.
- Unable to find or to create a synchronous control block in FPGU service call.
- 1143 Unable to free a synchronous control block (DFS62DST FUNC=RELEASE).
- Return code from ATBRCVW in PH1 service call (abort synchpoint).
- Return code from ATBGTA2 in PH1 service call (abort synchpoint).

## DFS6LUS2

APPC/IMS issues message DFS1959E when a severe internal error occurs. If you receive this message, contact IBM<sup>®</sup> Software Support with the module number and reason code supplied in the message. Reason codes for message DFS6LUS2 are given.

RC Description

- **1201** No PCB given in READSQ service.
- **1202** No control block given in READSQ service.
- **1203** Invalid control block type in READSQ service.
- **1204** DFSQMGR Get Unique failure in READSQ service.
- 1205 DFSQMGR Enqueue failure in READSQ service.
- **1206** DFSQMGR Dequeue failure in READSQ service.
- 1207 Failure to get LUMP pool buffer using DFSPOOL macro.
- **1208** Failure to free LUMP pool buffer using DFSPOOL macro.
- 1209 Failure to get MSEB storage using DFSBCB macro.
- 1210 Failure to free MSEB storage using DFSBCB macro.
- **1211** Failure to get HIOP storage using DFSPOOL macro.
- **1212** Failure to free HIOP storage using DFSPOOL macro.
- 1224 CQS not available in READSQ service.

## DFS6QFX0

APPC/IMS issues message DFS1959E when a severe internal error occurs. If you receive this message, contact IBM<sup>®</sup> Software Support with the module number and reason code supplied in the message. Reason codes for message DFS6QFX0 are given.

- RC Description
- **3601** Failure in creating a restart control block.
- **3602** Failure in DFSCIR to create restart ITASK.
- 3603 Failure in IXCTL to run under restart ITASK.
- **3604** Failure in DFSCIR to delete restart ITASK.
- 3682 Issue /STO APPC if APPC/IMS was started; then issue /STA APPC.

## DFS6RST0

APPC/IMS issues message DFS1959E when a severe internal error occurs. If you receive this message, contact IBM<sup>®</sup> Software Support with the module number and reason code supplied in the message. Reason codes for message DFS6RST0 are given.

## RC Description

- **2101** Log record type not X'22', X'23', or X'24'.
- 2102 Log record code not X'40'.

## DFS62FD0

APPC/IMS issues message DFS1959E when a severe internal error occurs. If you receive this message, contact IBM<sup>®</sup> Software Support with the module number and reason code supplied in the message. Reason codes for message DFS62FD0 are given.

## RC Description

- **3201** Failure in DFSBCB to release LU block.
- **3202** Failure in DFSBCB to release asynchronous control block.
- **3203** Failure in DFSBCB to get asynchronous control block.

- **3204** Failure in DFSBCB to release asynchronous control block. (Second location within module.)
- **3205** Failure in DFSTCBTB FUNC=LOCATE.
- **3206** Failure in DFSCIR to create ITASK.
- 3207 Failure in DFSBCB to get synchronous control block.
- 3208 Failure in DFSCIR to delete ITASK for asynchronous message.
- **3209** Failure in DFSCIR FUNC=DTASK to release duplicate ITASK for asynchronous message.
- 3210 Synchronous control block to be released not found in chain.
- 3211 Input parameter list is invalid, unknown type.
- 3213 DFSCS failed adding synchronous control block to chain.
- 3216 IMODULE DELETE failed while releasing asynchronous control block.
- 3217 Blank LUNAME or nonblank SIDENAME with TPNAME='DFSSIDE'.
- 3220 Invalid parameters on module entry.
- 3221 Invalid parameters on module entry.
- 3222 Failure to free HIOP storage using DFSPOOL macro.
- 3223 Failure to free HIOP storage using DFSPOOL macro.
- 3224 Failure to free MSEB storage using DFSBCB macro.

## DFS62FD1

APPC/IMS issues message DFS1959E when a severe internal error occurs. If you receive this message, contact IBM<sup>®</sup> Software Support with the module number and reason code supplied in the message. Reason codes for message DFS62FD1 are given.

#### RC Description

- 3801 Input parameter list is invalid, unknown type.
- **3802** Failure in DFSBCB FUNC=GET to get LU block.
- **3803** Failure in DFSBCB FUNC=REL to release LU block.
- 3804 Failure in DFSBCB FUNC=GET to get descriptor.
- **3805** Failure in DFSCS for inserting descriptor into table.
- **3806** IMODULE DELETE failed for delete of restart synchronous control block hash table.
- **3807** Failure in DFSBCB FUNC=GET to get synchronous control block.
- **3808** Failure in DFSBCB FUNC=REL to release restart asynchronous control block.

## DFSLUM00

APPC/IMS issues message DFS1959E when a severe internal error occurs. If you receive this message, contact IBM<sup>®</sup> Software Support with the module number and reason code supplied in the message. Reason codes for message DFSLUM00 are given.

#### RC Description

**5101** Failure in DFSQMGR Get Unique for notify message.

- **5102** Failure in DFS62FD0 finding an asynchronous control block for notify message.
- 5109 Unknown return code from z/OS clean address space call.
- 5110 Unknown return code from z/OS unidentify call.
- 5111 IXCLEAVE unsuccessful.

## DFSHAV70

APPC/IMS issues message DFS1959E when a severe internal error occurs. If you receive this message, contact IBM<sup>®</sup> Software Support with the module number and reason code supplied in the message. Reason codes for message DFSHAV70 are given.

#### RC Description

- **3709** Unknown return code from z/OS clean address space call.
- **3710** Unknown return code from z/OS unidentify call.
- **3711** IXCLEAVE unsuccessful.

## DFSXLUM0

APPC/IMS issues message DFS1959E when a severe internal error occurs. If you receive this message, contact IBM<sup>®</sup> Software Support with the module number and reason code supplied in the message. Reason codes for message DFSXLUM0 are given.

- RC Description
- 5009 Unknown return code from z/OS clean address space call.
- **5010** Unknown return code from z/OS unidentify call.
- 5011 IXCLEAVE unsuccessful.

# DFS1965E APPC/MVS call failures

The APPC/IMS diagnostic aids include DFS1965E APPC/MVS call failures. If you receive this message, contact IBM<sup>®</sup> Software Support with the module number and reason code supplied in the message.

A call to APPC/MVS had an unexpected return code. The call for FUNCTION=*aaaaaaaa* was issued, and a return code xx from APPC/MVS was the result. Return code xx denotes the specific IMS module performing the APPC call. Error return codes that represent anticipated conditions are handled by IMS, and do not result in this message. This message is produced when an unexpected result is encountered, which might represent an abnormal condition in some system component.

- RC Description
- xx90 Synchronous call failure
- xx91 Asynchronous call failure

# Diagnostics for use with synchronous APPC and OTMA with shared queues

Synchronous APPC and OTMA message processing in the shared queues environment introduces additional diagnostic considerations for the message flow.

In addition to the APPC and OTMA traces already used, other facilities include:

- IMS Resource Recovery Trace
- z/OS Resource Recovery Trace
- z/OS APPC Trace
- Console memory dumps of the z/OS Resource Recovery Services and APPC address and data spaces.

If IMS is using z/OS cross-system coupling facility for communication, a memory dump of the RRS address space is unavailable.

## Related tasks:

"Resource Recovery Services trace" on page 633

# **SNAPs and dumps**

For errors that do not result in an abend, IMS writes a X'67D0' log record or produces an SDUMP, depending on the error. The minimum data dumped for LU 6.2 problems are the control blocks that are associated with the task in error and the appropriate trace tables.

# **OTMA diagnostic aids**

OTMA diagnostic aids include OTMA trace, module-to-code cross references, verb-to-code cross references, DFS1296E message information, log records, and SNAPs and dumps.

# **OTMA trace**

The OTMA trace records the flow of control through IMS OTMA. Turn on the OTMA trace only if the IBM support representative requests it.

## Starting the OTMA trace

The /TRACE SET ON TABLE OTMT command activates the trace and sends the entries to an internal table.

You can format the table using the Offline Dump Formatter under IPCS, using either the VERBX command or the IMS Dump Formatter panels.

If a SNAP dump is taken, the table is formatted as part of the IMS dump. If you add the OPTION LOG parameter to the /TRACE command, IMS sends the output to an external data set. You can use the File Select and Format utility (DFSERA10) with exit routine DFSERA60 to format trace entries.

## **Related concepts:**

"Formatting IMS dumps offline" on page 531

## Format of OTMA trace records

Each record of the OTMA trace record format is eight words long, and word 0 holds standard information.

Table 91. OTMA trace record format.

49	31	OTMAYPRX	OTMA Destination Resolution user exit
50	32	DFSYDRU0	OTMA default DRU exit routine DFSYDRU0
51	33	OTMAIOED	OTMA Input/Output Edit user exit

Table 111. OTMA module-to-code cross-reference table

I

I

# OTMA verb-to-code cross-reference table

The OTMA verb-to-code cross-reference table consists of verb numbers, verb name, and a description. You can use this information to associate the z/OS cross-system coupling facility call number in trace record X'5B' xx with a z/OS XCF verb.

Verb number		
(hexadecimal)	Verb name	Verb description
01	IXCCREAT	Defines a member to XCF
02	IXCJOIN	Enables a member to join a group
03	IXCQUERY	Return information about groups and members
04	IXCMSGO	Sends a message to another active member
05	IXCMSGI	Receives a message on an active member
06	IXCLEAVE	Disassociates a member from XCF

Table 112. z/OS XCF verb-to-code cross-reference table

# **DFS1269E** message information

OTMA issues message DFS1269E when a severe internal error occurs. If you receive this message, contact the IBM Support Center with the module number and reason code supplied in the message, and, if requested, output from the OTMA trace.

The message format is: DFS1269E SEVERE IMS INTERNAL FAILURE, REASON CODE=*xxyy* 

Variable *xx* is a decimal number that identifies the module. To determine the module associated with the code, see Table 111 on page 364. Variable *yy* is an internal reason code.

The following two reason codes are module independent. Variable *xx* represents the specific IMS module issuing the macro call.

#### Reason code

Description

- *xx*98 Failure in DFSPOOL to acquire storage for a variable with the DFSYMAGT macro.
- *xx*99 Failure in DFSPOOL to release storage for a variable with the DFSYMARL macro.

Other reason codes are module dependent.

## OTMA log records

To activate OTMA logging, use one of the /TRA SET ON commands.

To activate OTMA logging, enter one of the following trace commands from the master terminal or the z/OS console.

/TRA SET ON tmember client1. /TRA SET ON tmember client1 tpipe tpipe1.

# SNAPs and dumps

For errors that do not result in an abend, IMS writes log record X'67D0', or produces an SDUMP, depending on the error. The minimum data dumped for OTMA problems are the control blocks that are associated with the task in error and the appropriate trace tables.

# Diagnosing Fast Path problems related to print data set options: IMS Spool API support

IMS provides an expansion of the DL/I application program interface that allows applications to interface directly to JES and create print data sets on the JES spool. These print data sets can then be made available to print managers and spool servers to serve the needs of the application.

# Understanding parsing errors

The IMS Spool API support provides feedback to the application program when IMS detects errors in the print data set options included on either the CHNG calls or SETO calls. This section describes the high-level processing of the parameters associated with the CHNG and SETO calls, including some examples of errors and the types of feedback information that can be expected.

Error codes provides a summary of the error codes that can be expected to be returned if the application provides a feedback area. It might be useful for the application to develop ways to display these errors by sending a message to an IMS printer or some other technique that allows examination of the parameter lists and feedback area without having to look at a dump. This section discusses each error code and provides some examples of when the error code might be expected. This discussion applies to these calls when used with the IMS Spool API support.

When diagnosing multiple parsing error return codes, the first code returned should be the most meaningful. Errors detected with incorrect length fields or previously invalid keywords can result in valid keywords being reported as errors.

## Keywords

The parameter lists used with CHNG and SETO calls contain two types of keywords. The two types are those keywords valid for the calls (that is, IAFP, PRTO, TXTU, and OUTN), and the keywords provided as operands of the PRTO keyword (for example, CLASS, FORMS).

This separation of keywords is used to determine what type of keyword validation IMS should perform. When looking for valid keywords on the calls, one set of keywords is valid, and when looking at keywords following the PRTO keyword, another set of keywords are valid. For this reason, incorrectly specified length fields may cause one scan to terminate prematurely and keywords to be invalid because they are incorrectly positioned in the call list.

## Status codes

We can deduct what might be the source of the error code by looking at the status code returned for the call. As a general rule, a status code of AR is given when the keyword is associated with the call and a status code of AS is given when the keyword is invalid as a PRTO option. There might be exceptions to this rule, but in general this will hold true.

## Error code examples

These examples describe errors and the resulting error codes.

Some length fields are omitted from the examples when they are unnecessary to the example. Feedback and options lists that are shown on multiple lines are contiguous, as they are in the working storage of an application.

Subsections:

- "Error code (0002)"
- "Error code (0004)"
- "Error code (0006)" on page 368
- "Error code (0008)" on page 368
- "Error code (000A)" on page 368
- "Error code (000C)" on page 369
- "Error code (000E)" on page 369

#### Error code (0002)

This code indicates that an invalid keyword was discovered within the call options. The error code of (0002) indicates that the keyword scan being performed is associated with keywords that are valid for the call. For example:

```
CALL = SETO

01

OPTIONS LIST = PRTO=04DEST(018),CLASS(A),TXTU=SET1

FEEDBACK = TXTU(0002)

STATUS CODE = AR
```

In this example, the options list contains both the keywords PRTO and TXTU. The TXTU keyword is not valid for the SETO call.

Another example of an error code of (0002) in the feedback is created when the length field that represents the PRTO options is specified as shorter than the actual length of the options. For example:

```
CALL = CHNG

01

OPTIONS LIST = IAFP=NOM,PRTO=OFDEST(018),LINECT(200),CLASS(A),

COPIES(80),FORMS(ANS)

FEEDBACK = COPIES(0002),FORMS(0002)

STATUS CODE = AR
```

In this example, the length field of the PRTO options (001F) is too short to contain all the options. As a result, IMS finds the keywords COPIES and FORMS outside the PRTO options list area and indicates that these keywords are not allowed as keywords on the CHNG call.

#### Error code (0004)

This error code indicates that an option variable that follows a keyword in the options list for the CALL is not within the length limits for the option. An example of this type of error is the OUTN keyword. The name of the OUTPUT JCL statement must be from 1- to 8-characters. For example:

CALL = CHNG

OPTIONS LIST = IAFP=NOM,OUTN=OUTPUTDD1

```
FEEDBACK = OUTN(0004)
STATUS CODE = AR
```

The operand for the OUTN keyword is 9 bytes and exceeds the maximum value.

## Error code (0006)

This error occurs when IMS is scanning for valid keywords that are associated with the call and encounters the PRTO keyword. On interrogation of the length field associated with the PRTO keyword, IMS discovers that the total length of the options list for the call is too short to contain all of the operands within the PRTO keyword. For example:

```
CALL = CHNG

0400 05

OPTIONS LIST = 0800IAFP=NOM,PRT0=0ADEST(018),LINECT(200),CLASS(A),

COPIES(3),FORMS(ANS)

FEEDBACK = PRT0(0006),LINECT(0002),CLASS(0002),COPIES(0002),

FORMS(0002)

STATUS CODE = AR
```

This example provides an options list that is hexadecimal, 48 (decimal 72) bytes long and the correct length for the options list. The length field of the PRTO keyword incorrectly indicates a length of hexadecimal 5A. The length of the PRTO options exceeds the length of the entire options list so the PRTO keyword is ignored and the rest of the options list scanned for valid keywords. The feedback area contains the PRTO(0006) as we would expect to indicate a length error for this keyword, but we also find that the PRTO keywords are reported to be in error (0002). This is because the keywords beyond the first PRTO keyword, up to the length specified in the options list length field have been scanned in search of valid keywords for the call. The status code of AR tells us that the keywords are considered invalid for the call and not the PRTO keyword.

## Error code (0008)

This error is returned when IMS finds that one of the options for the IAFP keyword has not been specified correctly. For example:

```
CALL = CHNG
00
OPTIONS LIST = IAFP=N0Z,PRT0=0BDEST(018)
FEEDBACK = IAFP(0008) INVALID VARIABLE
STATUS CODE = AR
```

The message option of the IAFP keyword has been incorrectly specified as 'Z'. This results in the error code (0008).

#### Error code (000A)

This error indicates that not all of the necessary keywords have been specified for this call. For example:

CALL = CHNG

OPTIONS LIST = TXTU=SET1

FEEDBACK = TXTU(000A)

STATUS CODE = AR

For this call, a valid keyword of TXTU was specified but the call also requires that the IAFP keyword be specified if the TXTU keyword is used. Since the IAFP keyword is missing, the error code of (000A) is returned when the TXTU keyword is found.

#### Error code (000C)

The error code is reporting a condition in which a set of mutually exclusive keywords are used in the same call options list. A clue to the problem being with the call options and not the PRTO options is given by issuing of the status code of AR and not the status code of AS. For example:

```
CALL = CHNG
00
OPTIONS LIST = IAFP=A00,PRTO=0BCOPIES(3),TXTU=SET1
FEEDBACK = TXTU(000C)
STATUS CODE = AR
```

In this case, the call options list contains both the keywords of PRTO and TXTU. These options are mutually exclusive and cannot be used in the same options call list. The result is error code of (000C) returned along with status code of AR.

#### Error code (000E)

This error code indicates that while parsing the actual print data set descriptors, an error was detected with one or more of the operands. For the most part, IMS does not do any checking for these print descriptors. Instead IMS uses z/OS services (SJF) to do the validation of the print descriptors. When SJF is called, the validation requested is the same as for the TSO OUTDES command. For this reason, IMS is insensitive to changes in output descriptors and the valid descriptors for your system are a function of the z/OS release level.

You can obtain a list of the valid descriptors and the proper syntax by using the TSO HELP OUTDES command.

IMS must first establish that the format of the PRTO options is in a format such that SJF services can be requested. If not, IMS returns status code AS and error code of (000E) and a descriptive error message. If the error has been detected during the SJF process, the error message from SJF includes information of the form, (R.C.=xxxx,REAS.=yyyyyyyy) and an error message indicating the error. The return codes and reason are further identified in the *z/OS MVS Programming: Authorized Assembler Services Reference Vol 1*.

The range of some variables are controlled by the JES initialization parameters. Values for the maximum number of copies, allowable remote destination, classes, and form names are examples of variables influenced by the JES initialization parameters.

The following examples show parsing errors and the resulting error messages: CALL = CHNG 01

OPTIONS LIST = IAFP=A00, PRTO=OBCOPIES((3), (8, RG, 18, 80))

FEEDBACK = PRTO(000E) (R.C.=0004,REAS.=00000204) COPIES/RG VALUE MUST BE NUMERIC CHARACTERS STATUS CODE = AS

For this example, the COPIES parameter has the incorrect value 'RG' specified as one of its operands. The error message indicates that the values for these operands must be numeric.

CALL = CHNG 00 OPTIONS LIST = IAFP=A00,PRTO=0AXYZ(018) FEEDBACK = PRTO(000E) (R.C.=0004,REAS.=000000D0) XYZ STATUS CODE = AS

This example includes an invalid PRTO operand. The resulting reason code of X'000000D0' indicates that the operand shown (XYZ) is invalid.

# Debugging and diagnostic aids provided by IMS Spool API

In addition to providing feedback related to parsing errors, the IMS Spool API also provides other aids you can use in your diagnosis.

While debugging suspected problems with either the IMS Spool API or the application using the support, keep in mind that multiple services are involved in providing the total environment. Certain JES specifications might affect which options and specifications can be used by the IMS Spool API on behalf of an application program.

## Internal trace table

Each dependent region that uses the IMS Spool API creates a trace table that is used to trace module flow and significant events during IMS Spool API processing. This trace table is of the internal wrap around type, is always active for IMS Spool API functions, and cannot be written to an external device. It appears in any dumps that are produced by the dependent region. The first four words of the trace table are the header and contain the following information.

#### Word one

This is the trace table eye catcher. The eye catcher is IWB.

#### Word two

This is the offset from the beginning of the trace table (that is, trace table header) to the last entry traced. Since the entry is an offset, relocation of the trace table does not affect the use of this word to obtain the address of the last trace entry. The offset value is added to the relocated trace table address to obtain the last trace entry. If the value is zero, no entries have been traced.

## Word three

This is the offset from the beginning of the trace table (the header) to the last trace entry in the table.

#### Word four

Reserved.

# Log records produced by the IMS Spool API

The IMS Spool API produces log records to record the significant events during IMS Spool API processing. A log record of the type X'68' is written for each data set that is opened. This log record contains the information necessary for identification of the data set. If any significant event occurs during spool processing, a diagnostic log record, 67D0 is produced to record diagnostic information about the error or event. The writing of the 67D0 records is normally associated with the DFS0013E message sent to the IMS MTO for these errors.

## Special abend processing

The IMS Spool API places control blocks in both extended common storage area (ECSA) and dependent region private storage. When a dependent region dump is produced, and IMS abnormal termination routines are allowed to execute, the following control block relocation is performed to provide diagnostic information in the dependent region dump.

The master control block for the dependent region and any active data set control blocks in ECSA are copied to the dependent region. These control blocks are copied without modification and the ECSA address of each print data set control block, IAFPDCB, is appended to the front of each relocated block.

A dummy module, DFSIAFD0, is loaded into the dependent region to serve as a place holder for the addresses of the relocated IMS Spool API control blocks. Obtain the address of module DFSIAFD0 by checking the dependent regions Job Pack Queue for the Contents Directory Entry (CDE) that represents module DFSIAFD0. The first three words of this dummy module contain the address of the relocated control blocks as follows.

#### Word one

This is the address of the relocated master control block (IAFPMCB) for the dependent region. The ECSA address of the master control block is appended in front of the relocated control block area. The eye catcher for the block is **IAFPMCB**.

## Word two

This is the address of the first relocated IMS Spool API data set control block for a print data set (IAFPDCB). When this block is copied to the dependent region, the ECSA address of the original block is appended to the front of the relocated block. This is so that the chaining of the blocks can be verified. Any additional IAFPDCB control blocks are relocated following the first relocated block with the ECSA address of each block appended to the front of each relocated block. The eye catcher for the block is **IAFPDCB**.

#### Word three

This is the address of the trace table for the IMS Spool API. The eye catcher for the trace table is **IWB**.

## Service error log record 67D0

The IMS Spool API creates Service Error log records, log record type 67D0, whenever a service error or unexpected condition is encountered. The 67D0 log record contains the service in error and detailed information about the system status at the time the error is detected. When problem determination is being

attempted for suspected IMS Spool API errors, obtain the 67D0 log records from the IMS systems log. If the IMS Spool API issues message DFS0013E, a service error log record is also written.

In addition to the errors reported through message DFS0013E, service error log records are written if the IMS Spool API code encounters inconsistent control block structures or is unable to properly process print data sets during abend processing. These service error log records are printed using the File Select and Formatting Print utility (DFSERA10).

Some examples of events that cause service error log records 67D0 to be produced are:

- Error during storage obtain/free
- Open or Close errors
- Allocation or deallocation errors
- Errors during Output Descriptor processing
- BSAM write errors
- Invalid IAFP Control Block encountered
- · Unable to process print data sets due to abending dependent region
- OTMA experiences a severe internal error or rejects a synchronous callout ICAL call from an IMS application

The writing of these service error log records occurs automatically.

# Chapter 12. DRA - Database Resource Adapter service aids

In a Database Control (DBCTL) environment, if you think the coordinator controller (CCTL) did not cause the problem, then start your analysis here.

This section provides service aids and tips that can help you analyze problems in a Database Control (DBCTL) environment.

The DRA is the interface between DBCTL and the CCTL. The functions of the DRA are to:

- Request connection to and disconnection from DBCTL.
- Tell the CCTL when DBCTL has failed or when the operator has requested a shutdown.
- Manage threads.

## DRA dumps

The DRA creates a dump when a DRA request fails or when DRA processing fails. A DRA request failure produces either a system abend or an IMS pseudoabend. A DRA processing failure produces a system abend.

For either type of failure, the DRA first tries to create a z/OS SDUMP. If that fails, the DRA creates a SNAP dump. In some situations, the DRA creates a SNAP dump without attempting to create an SDUMP. For certain types of pseudoabends, the DRA creates neither an SDUMP nor a SNAP dump.

To determine what type of dump the DRA created, check field PAPLRETC in the DFSPAPL (the parameter list that passes information between the CCTL and the DBCTL). The field PAPLRETC has the format *hhsssuuu*, where *hh* indicates the type of dump.

The following table shows the values for *hh* and indicates which dumps the DRA creates for different types of failures.

Table 113. Determining the type of dump created by the DRA

hh	Type of dump	Failures
X'80'	SDUMP or SNAP	An SDUMP is created for all IMS abend codes not listed in this table, and for all z/OS abend codes that can be retried. If the SDUMP fails, a SNAP dump is created.
X'84'	SNAP	A SNAP dump is created for IMS abend codes U0260, U0261, and U0263.
X'88'	No	No SDUMP or SNAP dump is created for the following codes:
		• IMS abend codes U0775, U0777, U2478, U2479, U3303
		<ul> <li>z/OS abend codes that can be retried (for example, S222 and S13E)</li> </ul>
		DRA return codes

# **DRA SDUMP** output

The DRA creates a dump when a DRA request fails or when DRA processing fails. The DRA first tries to create a z/OS SDUMP.

DRA SDUMP output contains:

- IMS control region
- DLISAS address space
- Key 0 and key 7 CSA
- Selected parts of DRA private storage, including the address space control block (ASCB), task control block (TCB), and request blocks (RBs)

A DRA SDUMP has its own SDUMP option list. To add to the SDUMP option list of a DRA, you can use the CHNGDUMP parameter. However, you cannot use the CHNGDUMP parameter to delete areas from the list.

You can format the IMS control blocks by using the Offline Dump Formatter (ODF). The ODF does not format DRA storage. You can use IPCS to format the z/OS blocks in the private storage of the CCTL.

# SNAP dump output

The SNAP dump data sets are dynamically allocated whenever a SNAP dump is needed. A parameter in the DRA startup table defines the SYSOUT class.

SNAP dump output contains:

- Selected parts of DRA private storage, including the address space control block (ASCB), task control block (TCB), and request blocks (RBs)
- Thread blocks of the DBCTL

## **Recovery tokens**

In a DBCTL environment, you need to correlate the information that is produced by the CCTL with information that is produced by the DBCTL. The link between the CCTL and DBCTL is the recovery token, which uniquely identifies each unit of recovery (UOR).

## **Recovery token details**

The recovery token appears in the DRA dump (both SDUMPs and SNAP dumps) and in the dump title. The recovery token contains a mixture of EBCDIC and hexadecimal data as shown:

CCTL subsystem ID 8 bytes (EBCDIC)

Unique UOR ID (created by the CCTL) 8 bytes (hexadecimal)

# Analyzing DRA problems

To analyze DRA problems, first investigate any external conditions that might have caused the problem. If you can eliminate external causes, an unexpected DBCTL return code or another IMS function might have caused the problem.

Follow these steps to analyze the problem.

- 1. Did external conditions cause the problem?
  - For CCTL external problems, check the status of applications or transactions. DBCTL and the DRA do not control these resources.

- For DBCTL external problems, check the status of databases, PSBs, and dependent regions (BMPs and CCTLs) by using the /DISPLAY commands.
- For DRA external problems:
  - Make sure you are using the correct DRA startup table for this DBCTL/CCTL session. Values such as Fast Path buffer allocations and minimum/maximum thread specifications can cause scheduling and resource problems.
  - Become familiar with the CCTL control exit.

The DRA calls the control exit to notify the CCTL of certain events, such as a DRA failure, an identify failure, a DBCTL failure, and so on. The DRA passes this information in a parameter list (DFSPAPL). The CCTL responds by passing back a return code in field PAPLRETC to tell the DRA what action to perform. Understanding which actions the CCTL is allowed to request can help you distinguish between valid actions and failures.

- The DRA does not issue any messages that report the actions it performed.
- If an external condition caused the problem, stop here and fix the problem. Otherwise, continue with the next step.
- 2. You reach this point by eliminating external reasons as the cause of the problem. Determine if DBCTL returned a nonzero return code, indicating that the request from the CCTL was not successfully completed.
  - If yes, take a z/OS online dump of the CCTL and contact IBM Software Support.
  - If no, then other functions might be involved in the problem. Use the appropriate section in this information to analyze the problem. Keyword procedures are useful in narrowing the problem to a specific cause.

To determine the source of problems in a DBCTL environment, create a dump of the CCTL address space. Dumps that are produced by SDUMP and by specifying the DUMP option on the CCTL /SHUTDOWN command are acceptable for problem diagnosis. If IBM Software Support needs to analyze the CCTL dump, send the unformatted dump so that they can obtain DBCTL DRA storage.

"Selecting the keywords" on page 34

# Chapter 13. FP - Fast Path service aids

Service aids for Fast Path include diagnosis, control interval, external trace, and locating control blocks.

# **Diagnosing Fast Path problems**

Before diagnosing problems in Fast Path, you must understand the structure of its dumps, especially the dependent region dumps.

When a dependent region abends, the structure of the dump varies, depending on a number of conditions. For example, if you requested and were able to perform offline dump formatting, the structure of the dump is different than if you had not requested offline dump formatting. Furthermore, if the dependent region that abends is an MPP executing in mixed mode, the structure of the dump might be different from that of an IFP region. The recommended approach is to request and use the offline dump formatting option.

# **ABENDU1026** analysis

To analyze ABENDU1026 failures, you determine the documentation to obtain, and how to find and interpret diagnostic data from the documentation. Gather the necessary data before searching an IBM Software Support database or calling the IBM Software Support.

Several modules issue ABENDU1026 to indicate conditions that should not occur. The dependent region abends, but the IMS control region continues processing. Message DFS2712I accompanies ABENDU1026.

This analysis is based on using a dump that you can format with the Offline Dump Formatter (ODF). The following tables describes where to find ODF information.

For information about	Refer to		
Obtaining dumps that are suitable for input to the ODF	"Input for the IMS Offline Dump Formatter" on page 532		
Running the ODF	IMS Version 13 Database Utilities		
Using the ODF to solve problems	"Formatting IMS dumps offline" on page 531		

Table 114. Locating information about the Offline Dump Formatter (ODF)

Before beginning the analysis, you need the following information:

- A copy of the DFS2712I message
- A dump formatted by the ODF
- A copy of IMS Version 13 Messages and Codes, Volume 3: IMS Abend Codes

If an authorized program analysis report (APAR) is necessary, you might also need the following information:

- · The last successful image copy of the database encountering the problem
- The IMS logs from the time of the last successful image copy to the point of failure

• A copy of the Fast Path trace, if Transaction Retry was invoked

The following example procedure takes you through the analysis of an actual ABENDU1026 until you have collected enough data to search an IBM software support database or call the IBM Support Center.

This example procedure uses the sample message DFS2712I in the following figure. Message DFS2712I is sent to the console. Save a printed copy of the message.

DFS2712I DFS2712I DFS2712I	ABEND SUBCODE: 0	BFMRCUO 053 B21ARO
DFS2712I DFS2712I DFS2712I DFS2712I DFS2712I DFS2712I DFS2712I DFS2712I DFS2712I	MLTE: 02A923BC 02919E6 02A923CC 0290331 02A923DC 0301800 02A923EC 0000000 02A923FC 02A92470 02A9240C 0000000 02A9241C 0000000	0         00005A08         00001008         00040400           0         001C0008         029328B4         00060000           0         0000000         00000000         02A92178           0         0072F70A         00000000         40800000           0         00000000         00000000         00000000

DFS2712I DFS2712I DFS2712I DFS2712I	R4-R7 02A923BC R8-R11 00000004	00000053 02919E60 02A92010 008138D4 00000008 00005A00 02903310 0070B040 0086DF20 0070767C 80818C62 00000018

Use the following steps to analyze ABENDU1026:

- 1. Locate the module name and subcode associated with the abend. This information appears in the first few lines of message DFS2712I. In the previous example, the module name is DBFMRCU0 and the subcode is 0053.
- 2. To find the meaning of the subcode, look up ABENDU1026 in *IMS Version 13 Messages and Codes, Volume 3: IMS Abend Codes.* Find module DBFMRCU0 and subcode 0053.

The description of subcode 0053 is: MLTE segment code (Reg4 + X'1E') is not equal to the DSEGCODE of the segment pointed to by register 2.

This means that the segment code in field MLTESGCD in MLTE (a Fast Path control block) does not match the segment code of the segment in the buffer (DSEGCODE). Therefore, your next step is to determine what the mismatched values are.

**3.** Check *IMS Version 13 Messages and Codes, Volume 3: IMS Abend Codes* again to determine which registers you must examine.

The important registers are:

Register 8 = MLTESGCD

Register 2 = Address of the segment; DSEGCODE is the first byte

In the previous example, the register contents appear at the bottom of message DFS2712I.

  - 6. In the example above, the module flow, reading from the top down, is DBFMCLX0, DBFMGNX0, DBFMPUG0, and DBFMRCU0, which is where the abend occurred. Notice that other modules follow DBFMRCU0 in the flow. You can ignore these modules now. However, they might be important later in the problem analysis.
  - 7. Information from other sources might help you while searching the IBM software support database or talking with the IBM Support Center representative.

If an MPP or an IFP received the ABENDU1026, the Transaction Retry function should have retried the transaction.

Look in your MTO log for messages DFS0663I, DFS0784I, DFS0785I, DFS0787I, and other messages associated with a retry to find out what happened.

After you complete these steps, you have most of the following information:

- The abend code (ABENDU1026).
- The subcode (SUBCODE053).
- The module name (DBFMRCU0).
- The save area flow leading to the abend.
- The field in error (MLTESEGCD or DSEGCODE). You might not be sure which field is incorrect.
- Any messages produced by a transaction retry (for example, MSGDFS0663I).

With this information you are ready to search the database or contact IBM Software Support.

# Fast Path Transaction Retry

Fast Path Transaction Retry (FPTR) is designed for IMS Fast Path users who cannot run the Fast Path trace permanently on their system because of its impact on performance, but want to have the trace turned on when Fast Path failures occur.

Fast Path problems can be resolved much faster when trace information is available to show the logic flow of a call or transaction.

FPTR is activated only when certain Fast Path failures occur. FPTR automatically allocates a trace data set, turns on the trace, and retries the transaction. If no abend occurs on the retry, FPTR issues a message, turns off the trace, and the system continues processing. If an abend does occur on the retry of the transaction, Fast Path trace writes the trace data, FPTR turns off the trace, and the system continues with Fast Path trace inactive. FPTR is not invoked for abends in BMP regions.

When you report certain IMS Fast Path problems to the IBM Support Center, you will be asked if the Transaction Retry function failed. The following topics will help you determine what information to report.

## **Processing flow**

A summary of the processing flow of FPTR follows:

- The ESTAE exit of the dependent region controller receives control for abends U1026 and U1027, and all system abends except 122 and 222.
- The ESTAE exit provides debugging information including:
  - Name of abending module
  - Last applied APAR of the abending module
  - Date and time of assembly of module

If the failing module cannot be identified, a message informs the operator.

- The ESTAE exit decides if the transaction can be retried. If so, the ESTAE requeues the failing input message for retry and produces a dump of the first abend.
- Message DFS554A is sent to the master terminal.
- The retry process starts in an eligible dependent region.
  - FPTR dynamically allocates a trace data set and starts Fast Path trace.
  - FPTR writes message DFS0785A to the master terminal and the JES2 job log.
- When the retry of the transaction is complete, FPTR deallocates the trace data set and spools the contents of the trace data set to the SYSOUT class specified in the MSGCLASS parameter on the JOB statement of the dependent region.

## System programmer tasks

The system programmer should:

- Print the job log.
- Print the spooled trace data set information.
- Save and analyze the above information.
- Contact IBM Software Support for assistance, if needed.

# DEDB control interval (CI) problem assistance aids

When you print portions of the DEDB, the control intervals (CIs) have these identifying characteristics.

After you have performed the analysis described in "ABENDU1026 analysis" on page 377, review the contents of the various control blocks. Included in message DFS2712I is a dump of the control block that is related to the logical inconsistency. This control block is in the format of one of the control intervals (CIs). You can (possibly with help from IBM Software Support) obtain the RBA of the affected CI from the buffer. You can then use this RBA:

- When you extract the CI from the image copy of the DEDB
- When you choose the criteria for selecting and printing the IMS log records (with DFSERA10)

The acronyms used in this topic are:

DOVF Dependent overflow

IOVF Independent overflow

## **RAP BLOCK**

Root-anchor point block

**SDEP** Sequential dependent

## **CI** type identification

Each CI has an identifier at X'02' in the CI, with the exception of the first and second CIs. The first is the IMS control CI and the second contains the DMAC control block for this area.

CI Type

Identifier

REORG CI 00

```
    RAP 01
    DOVF 02
    IOVF (SPACE MAP) 04
    IOVF 08
    SDEP 10
```

# **DEDB CI formats**

These are the CI types and the data that is common to all CIs (except the SDEP CI).

**CI 0** The IMS control CI.

0	8	10	18	1C 20	28	32
Creation	Restart	EREstart	RBA of	Characters	Cisize	Org
Date/Time	Date/Time	Date/Time	Last CI	DBF1.000	- 7	"D"

**CI 1** The DMAC control block for this area is located here.

The Error Queue Element (EQE) list is also located in this CI. This list is 44 bytes long and immediately precedes the trailer information, (for example, CUSN, RBA, RDF and CIDF). The following figure shows the EQE list format: FLG (1 byte), EQE CNT (3 bytes), 10 available EQE entries (40 bytes).

	FLG *	EQE CNT	EQE entry		EQE entry	
bytes	1	3	4		4	
			10 entries			

\* A flag setting of X'80' indicates that there are more than 10 EQEs or an error in the second Cl.

Figure 71. EQE list in CI 1

## RAP CI

The following figure shows the RAP CI.

0 FSEAP	2 0203	4 RBA of current overflow CI	8 Segments,	FSEs and Scraps	
	(02) -	Indicates CUSN is in this CI.			

## First DOVF CI

The first DOVF CI has the format shown in the following figure.

0	2	4	8	
FSEAP	0203	RBA of current	Segments,	FSEs and Scraps
		overflow CI		
	(02) -	Same as RAP CI	these two	bits combined
	(01) -	Look here for space	ce make	the O3 in byte 3.

**Exception:** From here on, the key bits are shown, but byte 3 is not shown.

#### Other DOVF CIs

All DOVF CIs except the first one have the format shown in the following figure.

0 2 4 8 FSEAP 02 RBA of next DOVF CI with space, last contains zeros

## **First IOVF CI**

The CI shown in the following figure is a space map and is the first in each group of 120 CIs. The 119 CIs that follow are data CIs.

0 2 4 6 8 (119 words mapping next 119 CIs) 0000 04 8000xxxx offset 8000xxxx free and offset to next free to 1st 4000uow# allocated free 2000uow# used by reorg 40000000 no free space in this space map CI

#### Other IOVF CIs

The following figure is a data CI - 119 data CIs follow each space map CI.

0	2	4	8
FSEAP	0802	4000uow#	Segments, FSEs and Scraps (allocated, to UOW number; 0 is the first UOW).
0008	0802	80000000	FSE (CI not allocated).

(02) indicates CUSN is in this CI

#### SDEP CI

**Exception:** SDEP CIs do not contain FSEs and have no FSEAP or CUSN. User segments have a time stamp added at the end. The following figure shows the SDEP CI.

0 0000	2 3 1000	4 Partner name	8 Segments inserted sequentially and cannot be updated
	• •	Time stamp exis SDEP CI is full	

#### **FSEAP**

FSEAP is the offset of the first FSE in the CI. Fast Path FSEs are chained from the highest RBA, in order, to the lowest RBA in the CI.

FSE---X'8offssss' off=offset of next FSE in CI ssss=size (length) of the free space including the FSE.

 $X\,{}^{\prime}8000ssss{}^{\prime}$  indicates this is the last FSE on the chain in this CI.

If the CI is empty, the FSE is X'15' bytes less than the CI size, or X'13' less than the CI size if no CUSN exists. The RDF and CIDF are X'7' bytes less than the CI size. Here are some examples:

CI	512 X'200'	1024 X'400	2048 X'800'	4096 X'1000'
FSE	800001EB	800003EB	800007EB	80000FEB
RDF	0001F9	0003F9	0007F9	000FF9
CIDF	01F90000	03F90000	07F90000	0FF90000

**Scraps** Scraps are less than 4 bytes. They begin with X'7n' if less than 8 segment types, or X'Fn' if more than 8. For example,

1 byte-X'71' or X'F1' 2 bytes-X'72' or X'F2' 3 bytes-X'73' or X'F3'

#### Data Common to All CIs

The last X'0D' bytes of a CI all have the same use. The last line of a CI looks like this in a dump.

The bytes with bbbbbs do not print and will show as blanks in the dump. The fields from -D to -1 are:

CUSN	-D,C	These 2 bytes represent updates to the CI. The 02 bit in byte 3 of a CI indicates a CUSN exists in the CI.
RBA	-B,A,9,8	These 4 bytes are the beginning RBA of the CI.
RDF	-7,6,5	
CIDF	-4,3,2,1	

**Recommendation:** Use the RBA of the CI when you select log records to format and print with the DFSERA10 utility.

SDEP CIs do not contain FSEs and do not have a CUSN. SDEP CIs end at -B (the RBA). Data can occupy the space up to that location.

#### Analyzing control interval (CI) contention

When CI contention occurs in a DEDB, Fast Path passes both lock requests to program isolation (PI) modules. The PI trace, if active, traces the locks. To format the PI trace records (log record type X'67FA'), use the File Select and Formatting Print utility (DFSERA10) with exit DFSERA40. For information about running this utility, see *IMS Version 13 System Utilities*.

Using the trace records, find the RBA field of the CI. The digits in the CI RBA field are shifted right 8 bits. For example, an RBA of 00468000 is displayed as 00004680.

You must translate the value in the DMB field to a relative DMAC number. (DMAC numbers are relative to the DATABASE definitions.)

For example, if the first DMAC is X'FFFE', the second DMAC is X'FFFD', the third DMAC is X'FFFC', and so on. Because databases are chained alphabetically in the DDIR, if the DMB field is X'FFF6', you calculate the relative DMAC number as follows:

X'FFFF' - X'FFF6' = X'19' = 25 (decimal)

This calculation means that X'FFE6' is the 25th area relative to the first area of the first DEDB in the DDIR.

# Locating Fast Path control blocks and tables

Many of the Fast Path control blocks are extensions of IMS full-function control blocks. The names of these Fast Path control blocks are the same as in full-function.

The acronyms for these Fast Path control blocks start with "E."

#### Example:

**SCD** System Contents Directory (full-function IMS)

ESCD Extended System Contents Directory (Fast Path)

To view the layout of the Fast Path control blocks for your system, assemble DFSADSCT from IMS.ADFSSMPL and use XREF(FULL).

The following table shows the Fast Path control blocks and work areas that appear as a load list in an IMS dump. This information is relevant when you are working on an abend U1011 in module DBFINI20. Message DFS2703A generally accompanies the abend. Abend U1011 results from either a GEN problem or a storage fragmentation problem.

		1
Load list name	Fast Path block/work area	Appearance in dump
DFSEPnnn		IMS STM task
	Fast Path EPSTs (nnn=000-999)	
DBFCONT1	ECNTs/MSDBs	IMS STM task
DBFCONT3	DMHRs/buffers	IMS STM task
DBFCONT4	DEDB blocks	IMS STM task
DBFCONT5	OTHREADs	IMS STM task
DBFCONT6	BALGs	IMS STM task
DBFCONT7	Miscellaneous buffers	IMS STM task
AREALIST	AREA list	IMS STM task

Table 115. Fast Path control blocks and work areas that appear in IMS dumps

At Fast Path initialization, modules DBFINI21, DBFINI23, DBFINI24, DBFINI25, DBFINI26, and DBFINI27 calculate the amount of contiguous ECSA storage that is needed to load the buffers, buffer headers, MSDBs, and other related control blocks into separate work areas named DBFCONT*x*.

If module DBFINI2*x* cannot obtain a large enough contiguous block of storage, abend U1011 is issued, along with an error message. When this abend occurs, you can restart IMS, or you can stop other jobs that might prevent module DBFINI2*x* from obtaining the necessary storage.

The following table describes the control block structures that are defined during IMS startup. This table can help you determine which control blocks are needed in your Fast Path environment.

Table 116. Control blocks that are allocated during IMS startup

	With	Without	Without	
Control block/table	MSDB/DEDB	DEDB	MSDB	Without MSDB/DEDB
ECNT DBFCONT1	Х	Х	Х	Х
BHDR DBFCONT1	Х	Х		
MSDB DBFCONT1	Х	Х		
DMHR DBFCONT3	Х	Х	Х	
BUFF DBFCONT3	Х	Х	Х	

Control block/table	With MSDB/DEDB	Without DEDB	Without MSDB	Without MSDB/DEDB
DEDB blocks (DMCBs, DMACs, MRMBs, segment names, and field names) DBFCONT4	X		Х	
OTHR DBFCONT5	Х		Х

LBUF DBFCONT7	Х	Х	Х	Х
FPAL AREALIST	Х		Х	

Table 116. Control blocks that are allocated during IMS startup (continued)

# Locating IMS blocks and work areas by using load list elements

IMS loads IMS blocks and work areas using the IMS IMODULE facility. IMS generates a load list element from which you can obtain the unique name and location of each work area.

#### Load list areas

Load list areas are areas that appear formatted as the load list in an IMS control region dump. Global areas are in the common storage area (CSA).

Table 117. Load list area	s.
---------------------------	----

Load list name	IMS block/work area	Pool type
DFSABSxx	Abend Diagnostic Area, xx=PST number	Global
DFSBFSPP	DL/I Buffer Handler Pool	Global
DFSBLK0x	SCD, x=same as nucleus suffix	Global
DFSBWLOG	BG Write Log Work Area	Local
DFSCBTHD	Control block table header that points to the storage pools defined in DFSCBT00	Global <sup>1</sup>
DFSCBT10	Storage pool headers for the pools defined in DFSCBT00	Global <sup>1</sup>
DFSDLWxx	Retrieve Work Area, xx=PST number	Global
DFSDMBRS	Resident DMBs	Global
DFSDSET	OLDS Data Set Entry Table	Local
DFSEOVOS	OSAM DCB Work Area	Global

DFSISIT	Ident Table and ISI Storage	Global
DFSLCD	Logger LCD	Global <sup>2</sup>
DFSLCDST	IMS Monitor Logger LCD	Global
DFSLLOG	X'06' and X'42' Log Records	Local
DFSLOCP	Storage Management Local Pool	Local
DFSLOGxx	Log Work Area, xx=PST number	Global

Table 117. Load list areas (continued).

Load list name	IMS block/work area	Pool type
DFSLXBC	Link Extension Blocks for MSC CTC	Global
DFSLXBM	Link Extension Blocks and I/O Buffers for MSC MTM links	Global
DFSMFDDH	MFS Pool Dynamic Directory Hash Table	Local <sup>4</sup>
DFSMFDDP	MFS Pool Dynamic Directory Prime Area	Local <sup>4</sup>
DFSMFDD0	MFS Pool Dynamic Directory Entry Area	Local <sup>4</sup>
DFSMFPDS	MFS Pool PDS Directory Indexes	Local <sup>4</sup>
DFSMFSTG	MFS Pool Staging Buffers	Local <sup>4</sup>
DFSMTCLB	CLB (ECB) for DFSCMTIO	Global
DFSMTIOT	Monitor TIOT Table	Global
DFSMTMH	MSC Main Storage-to-Main Storage Queue Header	Local <sup>3</sup>
DFSMTMW	MSC Main Storage-to-Main Storage Window	Local <sup>3</sup>
DFSOBFPL	OSAM Buffer Pool	Global <sup>2</sup>
DFSOBFWA	OSAM Buffer Pool Work Area	Local
DFSOLRnn	OLDS Read DCB where nn must be numeric	Local
DFSOSDEB	OS/VS2 "Fake" OSAM DEB	Global
DFSPCWAP	Communications Work Pool	Local
DFSPDBWP	Database Work Pool	Global
DFSPDMB	DMB Pool	Global
DFSPFBP	MFS Pool	Local
DFSPFWA	Prefetch Work Area, ECB and Save Sets	Local
DFSPPSBW	PSB and PSB Work Pool	Global
DFSPQBUF	Queue Manager Buffers	Local
DFSPSBRS	Resident PSBs	Global
DFSPSTQE	Scheduler Sequence Queue	Global
DFSPSTxx	SAP Work Area, xx=PST number	Global
DFSPTPDB	Communications Pool	Local
DFSPWKAP	Working Storage General Pool	Global <sup>2</sup>
DFSRSTEB	Restart ECB and Save Sets	Local
DFSRSTWA	Restart Work Area	Local
DFSSBBUF	Sequential buffering: SBUF	Local
DFSSBCA1	Sequential buffering: SCAR	Global
DFSSBDCB	Sequential buffering: SDCB	Local
DFSSBDSE	Sequential buffering: EDSG	Local
DFSSBDSG	Sequential buffering: SDSG	Local
DFSSBITA	Sequential buffering: ITASK storage for overlapped I/O	Global
DFSSBPSS	Sequential buffering: SBPSS	Global
DFSSBPST	Sequential buffering: SBPST	Local
DFSSBRAN	Sequential buffering: SRAN	Local

Table 117. Load list areas (continued).

Load list name	IMS block/work area	Pool type
DFSSBSBU	Sequential buffering buffers	Local
DFSSBSCD	Sequential buffering: SBSCD	Global
DFSSBWO	Sequential buffering: DFSSBWO	Local
DFSSLX	SCD Latch Extension	Global
DFSSSCT	Subsystem Control Table	Local <sup>3</sup>
DFSSTAEB	STAE Work Area	Local
DFSSTPEB	Stop Region ECB, Save Sets and Work Area	Local
DFSSTPWA	Stop Region Message Work Area	Local
DFSTRMWK	Modify/Terminate Task Save Sets, ECB and Work Area	Local
DFSTSAV	Temporary Save Sets	Local
DFSVRFXL	Fixlist for EXCPVR	Local
DFSXCWxx	Exclusive Control Enqueue/Dequeue Work Area, xx=01-99	Global <sup>2</sup>
DFSZIBxx	ZIB/FAQE Pool, xx=01-99	Global

#### Notes:

- A large number of storage pools are defined in module DFSCBT00. The contents directory element (CDE) name for storage in a given control block table (CBT) pool is #xxxxyyy, where xxxx is the pool name, and yyy is a number from 001 to 999. See Table 118 for a description of the CBT pools.
- When you use the local storage option (LSO), all these areas are obtained from local storage. When you use Fast Path and LSO, DFSLCD, DFSDBUFF, and DFSXCWxx remain in global storage. When you select LSO = S, DFSLCD and DFSPWKAP remain in global storage.
- **3**. IMS constructs these areas at abend time. They consist of copies of the subject areas preceded by one word containing the original address of the area.
- 4. IMS builds these areas in extended private storage.

#### **Control block table pools**

Modules DFSBCB00, DFSBCB30, and DFSBCB90 support get/release requests for blocks in specific storage pools, referred to as 'CBT' pools.

nc point

Table 118. CBT pool names and descriptions

CBT pool	Description		
CMWU	Save sets/ECB for ITASKs which do not require a PST		
CSAG	Callable services anchor block (ECSA storage)		
CSAL	Callable services anchor block (E-private storage)		
DBPB	Database purge block		
DBRC	DBRC work area		
DDIR	Database directories		
DDRE	DMB directory extension		
DESC	LU 6.2 descriptor block		
DG2W	Dispatcher work area section 2 (global storage)		
DL2W	Dispatcher work area section 2 (local storage)		
DPST	Dependent region PST: The following blocks are associated with the dependent region structure:		
	D1WA, DG2W, EPST, FSRB, GQMW, IDT, IOSB, IRLM, KLSD, LCRE, SAP, SLOG, STTR, XPST.		
D1WA	Dispatcher work area section 1		
EPST	Fast Path PST extension		
EQEL	Recoverable in doubt structure queue elements		
EZS	External subsystem storage		
FEIB	Front-end message switch interface block		
FNCB	Used by Fast Path for global command notifies		
FPB6	Fast Path 64-bit buffer manager pool		
FPCP	Used by Fast Path for local commands		
FSRB	Fast Path wake up/sleep SRBs		
GESE	Represents a defined external subsystem		
GIOB	IOB for batch		
GOWA	OSAM channel programs for batch		
GQMW	Global queue manager work area		
GS24	Global 24-bit save area		
GSAV	Global save area		
IAFP	IMS advanced future print block		
IDT	Block used to keep track of identified regions		
IEQE	In-flight/in-doubt data buffers		
IOSB	I/O supervisor block for OSAM		
IRLM	Dependent region block, if IRLM is used		
KLSD	LSO=X,Y block for each dependent region		
LCLL	Local common latch list element (E-private storage)		
LCRE	Local Recovery element (persists across restart)		
LG24	Below the 16MB line dynamic SAP save sets		
LGND	Block used to hold logon descriptor representations		
LGWA	Log work area		
LGWX	Log work area extension (private)

#### Fast Path external trace

The Fast Path external trace is a tool for diagnosing problems with Fast Path DL/I calls.

Unexpected DL/I status codes or abends such as U1026 are examples of problems with Fast Path DL/I calls. Fast Path external trace is best suited for diagnosing problems that can be easily recreated, and is not intended to be run routinely because the overhead and output volume of the trace can be large. Fast Path external trace is intended for use primarily by IBM Software Support, but users might also find it useful. IBM Software Support specialists might ask you to capture Fast Path external trace data for analysis by IBM specialists.

Fast Path external trace traces only dependent region activity; you cannot use it to collect data on control region processes. Because most Fast Path DL/I call flow is normally processed in the dependent region, this limitation is not serious. However, if you specify the PARDLI=1 option, DL/I processing is performed under the CTL TCB, which limits the usefulness of Fast Path external trace.

**Recommendation:** Do not trace PARDLI=1 execution. Create the problem again, if possible, without specifying the PARDLI=1 option.

The Fast Path trace entries are documented in "Fast Path trace entries" on page 661.

#### Trace activation

You can activate trace using the Fast Path Transaction Retry, the CCTL DRA thread, or using the /TRA SET ON TABLE FAST command.

• The Fast Path Transaction Retry function normally attempts to activate Fast Path external trace when a transaction is retried in an MPP or IFP region after an abend in Fast Path code. In this case, the trace is activated internally for the dependent region that is executing the retry and not for other dependent regions. The trace is deactivated after one retry attempt. The Fast Path Transaction Retry function dynamically allocates an FPTRACE DD statement as a JES SPOOL file and closes and deallocates an FPTRACE DD statement when the trace is deactivated at the end of the retry operation. The intent of the Fast Path Transaction Retry function is to provide first-failure data capture.

- A CCTL DRA thread can also request that Fast Path external trace be activated for a particular thread during the create thread process.
- The trace can also be activated with a /TRA SET ON TABLE FAST command. The Fast Path external trace writes diagnostic data to a FPTRACE DD statement in the dependent region JCL. After the trace is activated, the presence or absence of the FPTRACE DD statement determines whether data is traced for each active dependent region, including CCTL DRA threads. A spool file (SYSOUT=*x*) can be used for a FPTRACE DD statement, or a DASD file can be used. DCB attributes are forced to LRECL=133,BLKSIZE=133,RECFM=FA by IMS when the DCB is opened.

#### **Recommendations:**

- Use a spool file (SYSOUT=*x*) rather than a disk file. A certain amount of data related to the trace activation itself is traced (written to FPTRACE) before the determination is made that the trace is active or inactive.
- Do not include an FPTRACE DD statement in your standard dependent region JCL. Add it only as required and then remove it after the trace data is collected.

#### Trace deactivation

The trace is deactivated with a /TRA SET OFF TABLE FAST command.

#### **Diagnostic data**

Data is formatted as it is written. No offline formatting of the trace data is required.

#### Trace point identifiers

The FP trace captures module flows, and at certain points, logic flows within modules. In most cases, there is a trace point at entry to a module and another at exit from the module. There might be additional trace points within the module. Each trace point has a unique 4-character identifier. To indicate nesting within call flows, using this unique 4-character identifier, the identifier is shifted right at each level. Each trace entry is prefixed by the identifier located in columns 1-13. The relative position of the identifier within columns 1-13 indicates nesting level, for example:

```
IRC1......
.MCL0.....
```

Because the identifier has 4-characters and 13 positions are available, 9 levels of nesting are possible. Output lines with no identifier in columns 1-13 are continuations of the previous entry. The module entry and exit trace entries differ by only one character. Usually, the module exit identifier is the same as the module entry identifier, except for one character. Normally, the first character of the identifier is shifted up one alphabetically, for example:

```
.MCL0.....
```

#### Trace point time stamps

Trace point time stamps are labeled with TOD=*xxxxxxx*. The hexadecimal digits are the middle 4-bytes of an 8-byte STCK time stamp. The high order digit is approximately 1 second.

**Note:** Fields that are labeled TIME and DATE within trace entries refer to the compile date and time of the module involved, and are not related to trace time.

#### Trace initialization entries

Entries COT1 to TRAN at the beginning of the trace file refer to FP Trace initialization and can be ignored. These entries are produced if a FPTRACE DD statement is specified, even if the trace is not enabled.

#### Key trace point data items

The data that is traced for each trace point varies. However, each field has a label to make it easier to determine the contents of the entry. Some of the common and useful labels include:

#### Ra#b,Rab,

Registers a-b follow.

**CALL** DL/I call function.

#### TOKN

UOR recovery token.

#### MODU

Module entry point address.

- **EPST** EPST address of the dependent region.
- **SSA** The first 30 bytes of the call SSA. Might contain residual data for short SSAs.

#### Fast Path external trace examples

The following examples show the Fast Path external trace.

### Trace entries from COT1 to SIEX are tracing the initialization of FPTRACE

#### Chapter 14. IMS Connect service aids

The service aids for IMS Connect include the IMS Connect Dump Formatter and trace options.

**Related tasks:** 

"Collecting data about IMS Connect problems" on page 19

#### IMS Connect Dump Formatter

An IBM Software Support representative might ask you to use the IMS Offline Dump Formatter to diagnose an IMS Connect problem. The IMS Connect Dump Formatter enables you to format various IMS Connect internal control blocks under the ISPF IPCS environment.

#### Accessing the IMS Connect Dump Formatter

You access the IMS Connect Dump Formatter from the IMS Offline Dump Formatter ISPF panels.

To access the IMS Connect Dump Formatter:

1. On the IPCS Component Analysis panel, select DFSAAMPR. The IMS Dump Formatting Primary Menu panel opens.

DFSAAMPR IMS DUMP FORMATTING PRIMARY MENU OPTION ===>	
<ul> <li>0 INIT - IMS formatting initialization and co</li> <li>1 BROWSE - Browse Dump data set (IPCS norm)</li> <li>2 HI-LEVEL - IMS Component level formatting</li> <li>3 LOW-LEVEL - IMS ITASK level formatting</li> <li>4 ANALYSIS - IMS dump analysis</li> <li>5 USER - IMS user formatting routines</li> <li>6 OTHER COMP - Other IMS components (BPE, CQS)</li> <li>7 OTHER PROD - Other IMS-related products</li> <li>E EDA - IMS chanced Dump Analysis</li> <li>T TUTORIAL - IMS dump formatting</li> <li>K EXIT - Exit IMS dump formatting</li> </ul>	**************************************
Use PFKeys to scroll up and down if needed.	, for matting.

Figure 72. IMS Dump Formatting Primary Menu panel

- 2. On the IMS Dump Formatting Menu panel, type 6 for Other Components and press Enter.
- 3. On the Other Components panel, type 6 for IMS Connect and press Enter.

#### Initializing a dump by using the IMS Connect Dump Formatter

Before you can format a dump, you must initialize it. After you initialize a dump, you can use the options on the IMS Connect Dump Formatting Menu to browse the dump data set, perform high-level or low-level IMS Connect formatting, or perform IMS Connect BPE formatting.

To initialize a dump:

1. Open the IMS Connect Dump Formatting Menu panel, as shown in the following figure.

```
----- IMS CONNECT DUMP FORMATTING MENU
                                                        ------
OPTION ===>
     INIT - Show BPE status and initialize dump
BROWSE - Browse dump data set (IPCS norm)
  0 INIT
                                                       *****
  1
  2 HI-LEVEL - IMS Connect component level formatting *USERID - IMSDUMP
  3 LOW-LEVEL- IMS Connect level formatting
                                                       *DATE - 00/08/23

- 5. Press F3 to return to the IMS Connect Dump Formatting Menu.

#### IMS Connect traces

You can trace two types of information about IMS Connect: information about the messages that are processed by IMS Connect and information about the IMS Connect subsystem.

The information about the messages that are processed by IMS Connect is captured by the IMS Connect Recorder Trace facility. Information about the IMS Connect subsystem is captured by the Base Primitive Environment (BPE) tracing services. The information that is captured by both types of traces is stored in BPE trace tables.

**Recommendation:** Use the BPE trace tables to store information that is captured by the IMS Connect Recorder Trace facility. The IMS Connect Recorder Trace facility can store information in either a BPE trace table or in an IMS Connect-managed Recorder Trace data set (HWSRCDR).

#### IMS Connect Recorder Trace facility

When the IMS Connect Recorder Trace facility is active, IMS Connect takes a snapshot of the first 670 bytes of messages at key points during IMS Connect processing. The first 670 bytes of most messages include the message header and the message data. Included in the information that is captured by the IMS Connect Recorder Trace facility are elements such as:

- Time stamps
- The client ID
- The user message exit routine

When the BPE trace level is set to MEDIUM, or when the HWSRCDR trace data set is used to capture the trace data, IMS Connect takes a snapshot of each input and output message at the following points:

• Immediately before a message is passed to a user message exit routine by IMS Connect

• Immediately after a message is returned to IMS Connect by a user message exit routine

When the BPE trace level is set to HIGH, the trace information includes a complete snapshot of the message. The recorder trace record also includes a message type code that identifies the source or destination type. IMS Connect takes a snapshot of each complete message, including the message prefixes, at the following points:

ID Type of message Trace point TR ISC, MSC, ODBM, OTMA, or OM A TCP/IP message was received by IMS Connect. TS ISC, MSC, ODBM, OTMA, or OM A TCP/IP message was sent by IMS Connect. An XCF message was received from IR OTMA OTMA by IMS Connect. IS OTMA An XCF message was sent to OTMA by IMS Connect. SR ISC, MSC, ODBM, or OM An SCI message was received by IMS Connect. SS An SCI message was sent by IMS ISC, MSC, ODBM, or OM Connect.

Table 119. IMS Connect recorder trace points with BPE trace level HIGH

**Recommendation:** Setting the trace level to HIGH can cause a significant impact to IMS Connect performance. Do not set the trace level to HIGH except when troubleshooting problems with connectivity.

If you use the BPE External Trace facility for the IMS Connect Recorder Trace, BPE manages the trace data sets. You must perform certain setup tasks, such as defining the GDG base and specifying the EXTTRACE parameter in the BPE configuration member in the IMS.PROCLIB data set. You can then start the IMS Connect Recorder Trace facility by issuing the BPE command UPDATE TRACETABLE NAME(RCTR) OWNER(HWS) LEVEL(MEDIUM) EXTERNAL(YES) or by specifying TRCLEV=(RCTR,MEDIUM,HWS) in the BPECFG member of the IMS.PROCLIB data set and restarting IMS Connect. To view the results of the trace, you can use the BPE Dump Formatter.

If you use a data set that is managed by IMS Connect, it must be a single, fixed-block data set with a fixed logical record length. The data set must be identified by an HWSRCORD DD statement in the IMS Connect startup JCL. When this data set fills, the IMS Connect Recorder Trace facility is disabled. Starting a new trace overwrites any existing trace data in the data set. To change the data set, you must shut down IMS Connect. From an IMS perspective, you can manage this trace data set in the same way as the IMS Monitor Trace (IMSMON) data set.

#### IMS Connect subsystem traces

The IMS Connect subsystem traces are captured by using BPE services. Subsystem traces trace events that occur within the IMS Connect address space and write them to BPE-managed trace tables. Specific types of events are captured in specific trace table types by IMS Connect or BPE. For example, TCP/IP activity is captured in the IMS Connect TCPI trace table type and BPE dispatcher events are captured in the BPE DISP trace table type.

1

1

Т

Т

T

BPE traces of the IMS Connect are enabled either by issuing the UPDATE TRACETABLE command or by including a TRCLEV parameter for IMS Connect in the BPECFG configuration member and restarting IMS Connect support.

For more information about configuring BPE and preparing for IMS Connect diagnosis, see *IMS Version 13 System Definition*.

#### Enabling and starting all IMS Connect traces at the same time

You can enable tracing for all trace table types, excluding the Recorder Trace facility trace table (RCTR), by specifying an asterisk in the first position of the TRCLEV parameter in the BPECFG file member, for example TRCLEV=(\*,HIGH,HWS). When the TRCLEV parameter is specified in the BPECFG file, the IMS Connect traces run continuously and resume every time IMS Connect starts.

**Recommendation:** Do not run IMS Connect Recorder trace facility continuously. The IMS Connect Recorder Trace facility can affect performance and should be used only when detailed information is needed about a specific problem with IMS Connect message handling. Remember to disable the IMS Connect Recorder Trace after the problem is resolved.

To enable all traces except the Recorder Trace facility, specify the following parameters:

TRCLEV=(\*,HIGH,HWS)

BPE exempts the Recorder trace (RCTR) from wildcard arguments, so it must be enabled with the following trace level configuration statement: TRCLEV=(RCTR,MEDIUM,HWS)

**Recommendation:** Start the IMS Connect Recorder Trace with the command, rather than with the TRCLEV parameter. Only use the TRCLEV parameter when you are diagnosing problems that prevent you from issuing commands.

BPE traces can be started and stopped by using BPE commands. If you start a trace by using the UPDATE TRACETABLE command, the traces are only active for the current execution of IMS Connect. The trace tables that are used by BPE to store the trace information, such as the RCTR trace table, are also managed by using BPE commands.

"Formatting a BPE trace entry" on page 11

#### Configuring BPE for an external trace of IMS Connect

Before you can start a BPE external trace for IMS Connect, you must first configure BPE and the external trace data set.

The following steps configure the external trace data sets and BPE for an external BPE trace of IMS Connect.

1. Define the generation data group (GDG) base.

//STEP1 EXEC PGM=IDCAMS
//SYSPRINT DD SYSOUT=A
//SYSIN DD \*
DEFINE GENERATIONDATAGROUP (NAME(IMSTESTL.RCTR.GDG01) -

```
NOEMPTY -
SCRATCH -
LIMIT(255))
```

//

- 2. In the BPECFGxx member of the IMS.PROCLIB data set, specify the following parameters for IMS Connect:
  - EXTTRACE
  - TRCLEV

In the EXTTRACE statement, specify the data set name of the generation data set group that you created in Step 1 and specify HWS in the COMP() parameter to identify IMS Connect as the BPE component to which this EXTTRACE statement applies.

EXTTRACE(GDGDEF( DSN(IMSTESTL.RCTR.GDG01) UNIT(SYSDA) VOLSER(000000) SPACE(1) SPACEUNIT(CYL) BLKSIZE(32760) ) COMP(HWS) )

When the Recorder Trace (TRCLEV type parameter RCTR) trace level is set to MEDIUM, message data is recorded before a message is sent to a user message exit and after the exit returns a message.

You can set the trace level to HIGH to enable additional trace points. When these trace points are enabled, a trace record is also written when IMS Connect sends a message to or receives a message from a TCP/IP endpoint, a DRDA client, an SCI client, or OTMA via XCF. These records are not collected when the trace level is set to any value other than HIGH or when IMS Connect uses internal tracing.

**Recommendation:** Use the BPE External Trace with the TRCLEV parameter HIGH only when troubleshooting IMS Connect client or OTMA-related problems. A large amount of trace data is recorded when the trace level is set to HIGH.

In the TRCLEV parameter, you must specify EXTERNAL=YES to enable the External Trace facility:

TRCLEV=(RCTR,MEDIUM,HWS,EXTERNAL=YES)

**Tip:** If TRCLEV=(RCTR,MEDIUM,HWS,EXTERNAL=YES) is specified in the BPECFG member, the Recorder trace resumes every time IMS Connect restarts. If you do not want the Recorder trace to resume when IMS Connect restarts, issue the BPE command F hwsjobname,UPD TRTAB NAME(RCTR) LEVEL(MEDIUM) EXTERNAL(YES)

If BPE is correctly configured for an external IMS Connect Recorder trace, BPE issues message BPE0044I BPE EXTERNAL TRACE FUNCTION NOT ACTIVE. You can now start the trace.

T

#### Starting an external trace for IMS Connect

You can start an external trace of IMS Connect by modifying the IMS Connect startup procedure or by issuing the BPE UPDATE TRACETABLE command.

Before you can start a BPE external trace for IMS Connect, you must first define a generation data group (GDG) base and code an EXTTRACE statement for IMS Connect in the BPECFGxx member of the IMS.PROCLIB data set.

Start the IMS Connect Recorder Trace by using one of the following methods.

 Include BPECFG=BPECFGxx in the IMS Connect startup procedure, where BPECFGxx is the BPE PROCLIB member that contains the EXTTRACE statement for IMS Connect, and restart IMS Connect. The BPE external trace starts when IMS Connect is started and BPE issues the following message:

BPE0046I EXTERNAL TRACE DATA SET IMSTESTL.RCTR.GDG01.G0001V00 OPENED ON VOL=000000

• While IMS Connect is running, issue the BPE command UPDATE TRACETABLE. For example:

F HWS1,UPDATE TRACETABLE NAME(RCTR) OWNER(HWS) LEVEL(MEDIUM) EXTERNAL(YES).

When the command completes successfully, the following messages are issued: BPE0032I UPDATE TRACETABLE COMMAND COMPLETED BPE0046I EXTERNAL TRACE DATA SET IMSTESTL.RCTR.GDG01.G0003V00 OPENED ON VOL=000000

**Note:** If EXTERNAL(NO) is specified on either the UPDATE TRACETABLE command or in the TRCLEV parameter in the BPECFGxx PROCLIB member, IMS Connect writes the Recorder Trace data to the in-core trace tables. IMS Connect writes to the in-core trace tables by default.

**Recommendation:** Use the BPE Trace facility. If the BPE Trace facility is in use, setting the trace level to HIGH captures records when messages are passed to and from TCP/IP clients and OTMA in addition to the normal trace records. If the HWSRCDR trace data set is used, these additional trace records are not captured.

#### **Related tasks**:

Starting and stopping BPE external tracing (System Administration)

#### **Related reference:**

BPE configuration parameter member of the IMS PROCLIB data set (System Definition)

#### Stopping an external BPE trace of IMS Connect

Stop an external BPE trace of IMS Connect by issuing the BPE command UPDATE TRACETABLE.

For example, F HWS1, UPDATE TRACETABLE NAME(RCTR) OWNER(HWS) LEVEL(NONE) EXTERNAL(NO).

**Note:** To deallocate the GDG data set, you must specify EXTERNAL(NO) on the UPDATE TRACETABLE command.

After the successful execution of the UPDATE TRACETABLE command, BPE issues the following messages.

BPE0032I UPDATE TRACETABLE COMMAND COMPLETED BPE0046I EXTERNAL TRACE DATA SET IMSTESTL.RCTR.GDG01.G0001V00 CLOSED ON VOL=000000 BPE0044I BPE EXTERNAL TRACE FUNCTION NOT ACTIVE

#### Related tasks:

Starting and stopping BPE external tracing (System Administration)

#### Displaying the status of an external trace of IMS Connect

Display the status of an external BPE trace of IMS Connect by issuing the BPE command DISPLAY TRACETABLE.

For example, F HWS1, DISPLAY TRACETABLE NAME (RCTR).

If the BPE external trace of IMS Connect is active, BPE displays the following messages:

BPE0030ITABLEOWNERLEVEL#PAGESEXT#ENTRIES#CYCLESBPE0000IRCTRHWSMEDIUM300YES40BPE0032IDISPLAYTRACETABLECOMMANDCOMPLETED

If the BPE external trace of IMS Connect is inactive, BPE displays the following messages:

BPE0030ITABLEOWNERLEVEL#PAGESEXT#ENTRIES#CYCLESBPE0000IRCTRHWSNONE300NO00BPE0032IDISPLAYTRACETABLECOMMANDCOMPLETED

#### Formatting the trace data from an external trace of IMS Connect

The following example shows the JCL that can be used to format the trace data from an external trace of IMS Connect.

```
//STEP01 EXEC PGM=IKJEFT01,REGION=0M,COND=(0,LT)
//STEPLIB DD DISP=SHR,DSN=IMSBLD.I11RTS19.CRESLIB
//SYSTSPRT DD
               SYSOUT=*
//IPCSPRNT DD
               SYSOUT=*
//IPCSPARM DD DISP=SHR,DSN=SYS1.PARMLIB
//SYSTSIN DD *
 ALLOC F(IPCSDDIR) DA('IMSTESTL.DDIR') SHR REUSE
 ALLOC F(INFILE)
                  DA('IMSTESTL.RCTR.GDG01.G0001V00') SHR REUSE
 IPCS NOPARM
 SETDEF DSN('IMSTESTL.RCTR.GDG01.G0001V00')
 SETDEF NOPROBLEM PRINT NOTERMINAL
 VERBX BPETRFM0 'TRACE(TYPE(ALL))'
 END
11
```

**Related tasks:** 

"Formatting a BPE trace entry" on page 11

#### Tracing to the HWSRCDR data set

If you are not using BPE to manage the output of the IMS Connect Recorder Trace facility, you can enable and start a recorder trace that is managed by IMS Connect.

To trace to the HWSRCDR data set:

- 1. Allocate an HWSRCDR data set.
- 2. Include an HWSRCORD DD statement in the IMS Connect startup JCL.
- 3. Issue one of the following commands:
  - IMS Connect WTOR command RECORDER OPEN

T

- IMS Connect z/OS command UPDATE MEMBER TYPE(IMSCON) START(TRACE)
- IMS Connect type-2 command UPDATE IMSCON TYPE(CONFIG) START(RECORDER)

#### Recorder log record mappings

IMS Connect trace recorder logs are mapped with the HWSUSTAT DSECT or the HWSLRCTR DSECT.

If the IMS Connect trace facility is activated with the HWSRCDR internal data set, standard record log records are written that are mapped with the HWSUSTAT DSECT.

If the IMS Connect trace facility is activated with an external, BPE-managed data set and the trace level is set to HIGH, extended log records are also written in addition to the standard log records. These additional records contain more information, including a complete snapshot of the message, and are mapped with the HWSLRCTR DSECT.

Both DSECTS are in the HWSUSTAT macro in the IMS.SDFSMAC data set.

#### Standard recorder log record mapping

When the IMS Connect line trace facility is activated by the IMS Connect WTOR command *nn*RECORDER OPEN, the IMS Connect type-2 command UPDATE IMSCON TYPE(CONFIG) START(RECORDER), or the z/OS modify command UPDATE MEMBER TYPE(IMSCON) START(TRACE), IMS Connect writes the log records to the HWSRCDR data set. If the trace facility is activated with a BPE data set, these records are written to the specified BPE data set instead.

The following examples provide mapping information to help you navigate and interpret the contents of the HWSRCDR data set, or an external BPE data set that contains the HWSUSTAT log records. The DSECT for this mapping is located in the HWSUSTAT macro of the IMS.SDFSMAC data set. The DSECT name is HWSUSTAT. When the trace level for an external data set is set to HIGH, the data set contains both standard log records (mapped by the HWSUSTAT DSECT) and extended log records (mapped by the HWSLRCTR DSECT).

# Chapter 15. IRLM - Internal resource lock manager service aids

Several service aids can help you analyze internal resource lock manager (IRLM) problems. Additionally, IRLM generates diagnostic messages that begin with the prefix DXR.

#### IRLM dumps

IRLM uses the SDUMP system services of z/OS when failures occur.

IRLM uses the SDUMP system services of z/OS in the following situations:

- Within the IRLM address space
- While executing IRLM code or IMS code within the IMS address space
- While executing IRLM code for exits from SLM within the IMS address space

SDUMP dumps the IRLM address space to a SYS1.DUMPxx data set without formatting it. When dump processing completes, you can format the dump offline by specifying IRLM on the VERBEXIT subcommand in IPCS. If more than one IRLM is active in the system at the time the dump was taken, you must also specify the z/OS subsystem name (IRLMNM in the IRLM procedure). IRLM dump formatters that are shipped with a particular release of IRLM are specific to that release. If multiple IRLM releases are active, IPCS must be configured to have access to the appropriate IRLM PDS. The release of the IRLM in the dump must match the release of the IRLM in the IPCS STEPLIB.

To access z/OS component trace entries for IRLM, use the IPCS CTRACE or VERBX command. To see the syntax of the VERBX command for displaying traces, enter: IPCS VERBX IRLM 'help'.

#### **Examples:**

• If only one IRLM is in the dump, this command formats the IRLM address space:

VERBX IRLM 'SUBsys=IRLM' or VERBX IRLM or VERBX IRLM 'SUB=IRLM'

 If more than one IRLM is in the dump, this command formats the KRLM address space:
 VERBX IRLM 'SUBsys=KRLM' or
 VERBX IRLM 'SUB=KRLM'

If you want to format dumps online during the abnormal termination process, you must change the FMTO parameter to request a SNAP dump.

**Tip:** Under the direction of IBM Software Support, you can use the Modify DIAG command to take diagnostic dumps.

#### SYS1.LOGREC records

The internal resource lock manager (IRLM) generates a software LOGREC record when the IRLM detects a program error.

You can use the z/OS IFCEREP1 service aid to obtain a listing of the SYS1.LOGREC data set that contains the LOGREC entries for the IRLM.

#### z/OS component trace

Use the z/OS TRACE CT command to start, stop, or modify an internal resource lock manager (IRLM) diagnostic trace.

IRLM does not support all the options that are available on the TRACE command.

You can use the TRACE CT command to trace interactions with a DBMS, member and group events, z/OS locking components, and so on.

The following example shows trace output for a lock request using the DBM and SLM sublevel traces.

The z/OS Interactive Problem Control System (IPCS) subcommand that produced this output is: CTRACE COMP(IRLE) SUB((DBM)) FULL

### Chapter 16. MSC - Multiple Systems Coupling service aids

Various types of traces are available to help you diagnose Multiple Systems Coupling (MSC) problem in a non-Database Control (DBCTL) environment.

#### Multiple Systems Coupling communication task trace

The flow through an MSC communication task is similar to that through the terminal communication task. The register 0 trace is read in the same manner, and most of the MSC analyzer and MSC DDM entry points provide the same functions as the terminal communications analyzer and DDMs.

The entry points for the MSC analyzer and device-dependent modules (DDMs) are:

#### DDM entry point

Analyzer

- AM01 Process input from a link
- AM02 Perform read or read of the link
- AM03 Determine what to do next on the link
- AM04 Not used
- AM05 Perform write or send to the link
- AM06 Dequeue the message after a good write or send
- AM07 Not used
- AM08 Return a message to the message queues for later transmission
- AM09 Generate an error message
- AM10 Quiesce the link
- AM11 Not used
- AM12 Wait for the completion of asynchronous I/O or the enqueue of a message

#### Multiple Systems Coupling device-dependent module

A Multiple Systems Coupling (MSC) device-dependent module performs all of the functions unique to a type of link.

The functions the device-dependent module performs at each entry point are:

#### DDM entry point MSC

- DM01 Setup output buffer for a write or send operation
- DM02 Error check last output operation
- DM03 Setup to obtain input from the link
- DM04 Error check an input operation
- DM05 Not used
- DM06 Not used

DM07 Connect or disconnect the link

DM0I An access method is entered from the device-dependent module

Several entry points are not used to preserve a commonality between coupling communication and terminal communication functions.

The following table summarizes the MSC communication task trace.

Table 120. Multiple Systems Coupling communication task trace

Traced by	Entry point	Function	Trace indent
DFSCMS00	DFSCMA01	Process Input	AM01
DFSCMS00	DFSCMA02		AM02
DFSCMS00	DFSCMA03	What's Next?	AM03

# Multiple Systems Coupling traces

Multiple Systems Coupling traces include MSC Message Processing trace, Main storage-to-main storage access method trace, and Main storage-to-main storage save set trace.

### MSC Message Processing Trace—BUFMSTRA

The MSC message processing trace records the SYSIDs of the last four IMS systems that processed the MSC message (that is, a BMP or MPP issued a GET UNIQUE to the message queue). The trace is located in the MSC message prefix at label BUFMSTRA within the BUFMS DSECT. The trace contains up to four 1-byte SYSID entries. The low-order byte contains the most recent entry. The initial entry contains the SYSID of the system to which the inputting terminal is attached. Each additional entry results in a shift left (the high-order byte is shifted out).

The SYSID is increased to 2 bytes and it is traced in field MSGMETRA of the MSC extension in DSECT MSGMSCE. If the SYSID is less than 256, it is traced both in field BUFMSTRA and MSGMETRA for compatibility. If the SYSID is greater than 255, it is only traced in MSGMETRA; field BUFMSTRA contains zeros.

#### Main storage-to-main storage access method trace

The main storage-to-main storage access method trace records information related to the main storage-to-main storage access method, DFSMTMA0, and the main storage-to-main storage device-dependent module, DFSDN540. The trace is located in global storage pointed to by the "MTMWINDOW" and copied to module DFSMTMTR during abend processing. The following locates the trace:

- TTOP—Table beginning
- TPTR—Next entry to be used
- TBOT—Table end

The trace is a wraparound trace. Each entry is 192 bytes long and contains information such as function, return code, and control blocks. The TRACEMAP DSECT contains further details on entry contents. TRACEMAP is embedded in macro INTFMTMA. Trace operation is controlled by a global SETC labeled within DFSMTMA0. The default assembly value is ON.

#### Main storage-to-main storage save set trace

DSECT SAVWORK describes a key work area used by DFSMTMA0. This work area is chained into the standard IMS save set chain with a SAVE ID of MTMWORKAREA. The trace appears in the save set chain even when the trace is set. The SAVWORK DSECT is embedded within macro INTFMTMA.

# **Diagnosing link problems**

Turn traces on for the appropriate lines from either the IMS master terminal or, if you are using type-2 commands, from the Operations Manager (OM) API. Trace all terminals on a line.

For example, use either of the following commands:

 /TRACE SET ON LEVEL 4 MODULE ALL LINK or UPDATE MSLINK NAME(linkname|linkname\*|\*) START(TRACE) **Note:** The type-2 command UPDATE MSLINK NAME(*linkname*) START(TRACE) uses the same level and module settings that were used the last time the /TRACE SET (ON) LINK command was issued. If a /TRACE SET (ON) LINK command has not been issued since the last cold start, this command defaults to MODULE=ALL and LEVEL=4.

• /TRACE SET OFF LINK x or UPDATE MSLINK NAME(linkname) STOP(TRACE)

Two report types are generated:

#### Summary

Contains the average response time, in milliseconds (msec), of the total number of send and receive data values for each link trace.

**Detail** Contains the individual response times, in milliseconds (msec), for every send and receive data value for each MSC link that has been traced.

The formatting of this record is available only if the IMS input log contains X'6701' records that are generated by the /TRACE SET ON LINK command or the type-2 command UPDATE MSLINK NAME(linkname).

For diagnosing link problems, the trace records with the following identifiers are helpful.

AM01 RECEIPT OF DATA FROM PARTNER SYSTEM

This entry is invoked because the link is stopped (using either the /PSTOP command, the UPDATE MSLINK *linkname* STOP command, or because of an I/O error.

Assemble a copy of DFSADSCT and refer to the BUFMS DSECT in the listing.

I TP BUF

Contains the segments received.

BUFTFLAG

Indicates more about what was received (that is, first segment).

O TP BUF

Contains the data set last sent to the partner.

**Q** BUF

Contains the segments received so far.

I WP BUF

Contains the MSC prefix/work buffer.

0 WP BUF

Contains the MSC prefix/work buffer.

#### AM02 ERROR - CHECK LAST OUTPUT OPERATION

### I WP BUF

Contains the MSC prefix/work buffer.

## O WP BUF

Contains the MSC prefix/work buffer.

AM03 MSC ANALYZER 'WHAT NEXT'

If this entry is invoked from a device-dependent module, it is because the device-dependent module has nothing else to do.

Example: EOT received to ACK. Neither side sending; therefore, let the analyzer decide what to do.

Example: A data block containing only the message prefix was received (no segment could fit in the remaining buffer space). The device-dependent module goes to AM03 because there might be output that can be sent. Data response to data is okay.

If this entry is invoked from another analyzer entry point, it is because that function is complete.

Example: After the dequeue of an output message, ENTRY 6 goes to AM03 to see if more output can be initiated.

#### CLBCNTQB

Is a QCB for a destination that has messages queued to be sent across the link.

#### **CLB3INP** and/or CTBAINP

Indicates that the device-dependent module is not able to send any output data.

#### CTBAERR

Indicates that an error message is to be sent to the partner.

#### I WP BUF

Contains the MSC prefix/work buffer.

# 0 WP BUF

Contains the MSC prefix/work buffer.

AM05 MSC ANALYZER ENTRY 5

This entry is invoked from the device-dependent module to send a message.

#### **O TP BUF**

Contains the data last sent to the partner.

I WP BUF

Contains the MSC prefix/work buffer.

0 WP BUF

Contains the MSC prefix/work buffer.

AM06 LAST OUTPUT OPERATION SUCCESSFUL

This entry is invoked from the device-dependent module when the previous output was successful.

#### CTBAEOM=1

Indicates that the previous output included the last piece of the message, and that the message is to be dequeued.

#### CTBAEOM=0

Indicates that the last piece of the message has not been sent. No dequeue is to take place. The device-dependent module is dispatched at DM01 to attempt to continue transmitting.

AM08 CANCEL MESSAGE ENQUEUE OPERATION

There is a probable contention situation, and this partner must yield. The output message in progress is returned ("washed back") to the queues to be sent later.

#### 0 TP BUF

Contains the data that the device-dependent module was attempting to transmit.

#### AM09 GENERATE AN ERROR MESSAGE

#### I WP BUF

Contains the MSC prefix/work buffer.

#### **O** WP BUF

Contains the MSC prefix/work buffer.

#### AM10 LINK SHUTDOWN: OPERATOR INTERVENTION REQUIRED

This entry is invoked because the link is PSTOPPED (either using the /PSTOP command, the UPDATE MSLINK NAME(*linkname*) STOP(COMM) command, or because of an I/O error). Find the previous device-dependent module interrupt entry (DM02, DM04 or DM07) to determine why the device-dependent module went to AM10.

General cleanup is performed: Queue buffers and I/O buffers are released.

#### AM12 NORMAL 'LINK IDLE' CONDITION

This entry is invoked when the device-dependent module has nothing else to do under normal conditions.

Example: MTM link is attention driven. There is no outstanding READ as with BSC. When the device-dependent module has no more data to send and no pending acknowledgment, it becomes idle to wait for a POST by either the enqueue of output or an attention from the partner. This entry is different from AM10 because the analyzer does not complete a general cleanup.

#### CM00 GET A WORK BUFFER

This analyzer entry is called when the device-dependent module needs additional space to perform message editing. An example is the collecting of all pieces of a SPA.

#### CM01 REPOSITION QUEUE BUFFER

This analyzer entry is called when the device-dependent module wants to ensure that the queue buffer is in storage. This entry is currently not used.

#### CM02 GET NEXT

This analyzer entry is called when the device-dependent module needs the next output segment of a message.

#### CM03 DEQUEUE MESSAGE

This analyzer entry is called when the device-dependent module wants to dequeue a message (rather than let the analyzer do it). An example is the emergency restart of a link. The device-dependent modules exchange message sequence numbers. If one device-dependent module determines that a message in its queues has already been received by the partner, the message is dequeued to prevent it from being sent twice.

#### CM04 WASH OUTPUT MESSAGE

This analyzer entry is called when the device-dependent module wants to return an in-process message to the queues. An example is a permanent I/O error. The device-dependent module washes any output in progress and is sent again after the error recovery sequence completes.

#### CM05 DETERMINE IF QUEUED OUTPUT IS PRESENT ON A LINK

This analyzer entry is called when it must be determined if there is any (more) queued output to be sent across the link emergency restart processing. If one device-dependent module determines that a message in its queue has already been received by the partner, the device-dependent module issues a get unique (GU) call (for positioning) followed by a DEQUEUE (CM03) to get rid of the message.

#### CM06 GET NEW MESSAGE

The system issues a get unique (GU) call to get a new output message.

#### CM07 FREE INPUT QUEUE BUFFER

This analyzer entry is called when the device-dependent module wants to cancel an input queue buffer. An example is permanent I/O error. The device-dependent module discards all input segments that, up to the point of failure, have been collected in queue buffers. The message is lost on this system, and the ABORT sequence sent to the partner tells the partner that the message must be sent again later.

#### CM08 FREE A WORK BUFFER

This analyzer entry is called when the device-dependent module wants to free an extra work buffer. This entry is currently not used because the buffer mentioned in the CM00 description is automatically freed by the analyzer.

#### CM09 GET A PREFIX/WORK BUFFER

The system obtains a prefix or work buffer.

#### CM10 FREE A PREFIX/WORK BUFFER

The system frees a prefix or work buffer.

#### CM11 QUEUE ERROR

The system processes a QMGR message queue error and issues message DFS082.

#### CM12 GLOBAL WASH

The system issues a CANCEL OUTPUT call to clear the global queue in a shared-queues environment.

#### CM13 INSERT MESSAGE

The system inserts an input message to the message queue.

CM14 ENQUEUE A MESSAGE

The system enqueues an input message to the message queue.

CM15 REREAD MESSAGE

The system reads an output message from the shared queues again.

CM16 GET MESSAGE BY DRRN

The system gets the message with the specified device relative record number (DRRN).

CM17 GET LINK INPUT/OUTPUT BUFFERS

The system obtains link I/O buffers.

CM18 FREE LINK INPUT/OUTPUT BUFFERS

The system frees link I/O buffers.

DM01 WRITE SETUP

The device-dependent module is entered here when the MSC analyzer finds output to be sent and the link is available (CLB3INP off).

Assemble a copy of DFSADSCT and refer to the BUFMS DSECT in the listing.

**Q** BUF

Contains the segments to be sent.

0 TP BUF

Contains the data stream ready to be sent.

I TP BUF

Contains any data received from the partner.

### DM02 WRITE INTERRUPT

The device-dependent module is entered here at the completion of a logical write operation.

#### DECSDECB

Contains the completion code.

#### BUFTYPE

Contains more information about the type of completion (MTM).

**O TP BUF** 

Contains the data stream sent to the partner.

I TP BUF

Contains any data received from the partner.

#### I WP BUF

Contains the MSC prefix/work buffer.

#### 0 WP BUF

Contains the MSC prefix/work buffer.

DM03 READ SETUP

The device-dependent module is entered here when the MSC analyzer determines there is no output that can be sent. MTM and CTC are attention driven, and no I/O is initiated here.

# DM04 READ INTERRUPT

The device-dependent module is entered here at the completion of a logical read operation.

#### DECSDECB

Contains completion code.

#### BUFTYPE

Contains more information about the type of completion (MTM).

#### DECTYPE

Indicates the type of the last operation.

#### I TP BUF

Contains the data just read.

#### **O** TP BUF

Contains any data sent to the partner in response to a previous read completion.

#### I WP BUF

Contains the MSC prefix/work buffer.

# 0 WP BUF

Contains the MSC prefix/work buffer.

#### DM07 RESTART

The device-dependent module is entered here from the MSC analyzer whenever the link is not active (CRB1ACT is not equal to X'11').

#### DECTYPE

Indicates the type of the last operation attempted.

#### DECSDECB

If I/O is completed, this indicates status.

### I TP BUF

Contains the last data read.

# O TP BUF

Contains the data to write or the data last written.

#### I WP BUF

Contains the MSC prefix/work buffer.

#### **O WP BUF**

Contains the MSC prefix/work buffer.

# DM0I ENTRY TO ACCESS METHOD

This record is traced at entry to the access method from the device-dependent module.

#### DECTYPE

Indicates the type of operation.

#### **O TP BUF**

If output, contains data to be written.

# Diagnosing link problems by using MSC link statistics

You can use MSC link statistics to diagnose link performance problems; determine the message sizes that are sent and received on an MSC link and use this information to determine the link and message queue buffer sizes to use; run benchmarks to determine how many parallel MSC links are needed, and to provide comparisons to use for diagnosing performance problems; and determine the amount of MSC work (such as messages and I/Os) and resources that are being used.

MSC link statistics are kept in the MSC work area, and are pointed to by field CLBMSCWA of the link LLB. This work area is called the DFSMSCWA area. Link statistics from the DFSMSCWA area are logged at checkpoint with type X'4513' log records. Each X'4513' log record is for a separate link. To assemble DSECTs of these three areas (the LLB, the DFSMSCWA work area, and the X'4513' log records), assemble the following source:

CSECT ICLI CLBBASE=0 M DFSMSCWA FUNC=DSECT M DFSL4513 FUNC=DSECT M END

Map CLB/LLB MAP DFSMSCWA work area Map 4513 log record

The DFSMSCWA area contains two areas for statistics:

#### MAIN statistics area

A continuous record of link statistics for logging. Statistics start recording at IMS restart (cold or warm). This area is not reset unless a statistics field overflows. When a statistics field overflows, the field is reset to zero, and a flag is set to indicate that the counter overflowed. The flag remains on until the next IMS checkpoint (and statistics records are logged) and then is reset.

#### **COPY** area

A mirror of the main area. This area is for the QUERY MSLINK SHOW STATISTICS command. The copy area is copied from the main area whenever the query statistics are reset. Query statistics are reset at IMS checkpoints if the reset mode is RESET,CHKPT, or by the command UPDATE MSLINK NAME() START(STATISTICS OPTION(RESET). The QUERY command always uses the difference of the MAIN statistics area minus the COPY area, so copying MAIN to COPY resets the QUERY (COPY) statistics without affecting the logging (main area).

The following table shows the key labels for statistics in the DFSMSCWA area.

Table 121. Descriptions of key	labels for statistics in the DFSMSCWA area
--------------------------------	--

Area	Label	Description
LLB - Logical link control block	CLBMSCWA	Points to DFSMSCWA
	CLBNAME2	Logical link name
DFSMSCWA - MSC work area for the logical link	MSCWA_ID	Beginning, = characters = DFSMSCWA
	STAT_FLAG1	Start of main statistics
	MSCWA_STARTTIM	Start main general statistics
	MSCWA_SEND#	Start main send statistics

Area	Label	Description	
	MSCWA_REC#	Start main receive statistics	
	MSCPY_STARTTIM	Start copy general statistics	
	MSCPY_SEND#	Start copy send statistics	
	MSCPY_REC#	Start copy receive statistics	
DFSL4513 - Log X'4513' area	ST4513	Beginning	
	ST4513_TYPE	Log record code = X'4513'	
	ST4513_LNKNAME	Logical link name	
	ST4513_LNKNUM	Logical link number	
	ST4513_FLAG1	Main statistics reset flags from DFSMSCWA STAT_FLAG1	
	ST4513_STARTTIM	Start main general statistics from DFSMSCWA MSCWA_STARTTIM	
	ST4513_SEND#	Start main send statistics from DFSMSCWA MSCWA_SEND#	
	ST4513_REC#	Start main receive statistics from DFSMSCWA MSCWA_REC#	

Table 121. Descriptions of key labels for statistics in the DFSMSCWA area (continued)

Three categories of link statistics are kept for each logical link:

- General statistics, such as statistics start time, ITASK dispatch counts, ITASK processing times, and the rate and number of logger check writes.
- Send statistics, such as messages sent, byte count sent, send message sizes, Queue Manager get counts and times, and send I/O times.
- Receive statistics, such as messages received, byte count received, receive message sizes, Queue Manager insert counts and times, and receive I/O times.

# MSS1 and MSS2 records

MSS1 and MSS2 records are created as a result of ABORT processing when an I/O error (correctable or not) occurs. All available control blocks are snapped, regardless of any trace options in effect on the link involved.

These records are followed by a type X'03' record containing the message that was sent to the master terminal as a result of the error.

The following table shows the significant control blocks snapped in MSS1 and MSS2 records.

Link type	Control blocks
СТС	POST code (first word of LLB) DECTYPE LLB, LTB(S), LCB, LXB, CRB, CTT, LNB control blocks IOSB MSCWA (MSC work area) I_WP_BUF, O_WP_BUF
	I/O buffers (input and output). In non-bandwidth mode, the I/O buffers include I_TP_BUF and O_TP_BUF. In bandwidth mode, the input and output I/O buffers include
	• I_BUFHDR, O_BUFHDR Send and receive buffer header
	BUFRSP Response data
	BUFMSG Message data
	<ul><li>BUFERR Error message data</li><li>BUFRST Restart data</li></ul>
	BUFQUI Shutdown data
	BUFUNK Unknown data
MTM	POST code (first word of LLB) DECTYPE LLB, LTB(S), LCB, LXB, CRB, CTT, LNB control blocks MSCWA (MSC work area) I_WP_BUF, O_WP_BUF
	<ul> <li>I/O buffers (input and output). In non-bandwidth mode, the I/O buffers include I_TP_BUF and O_TP_BUF. In bandwidth mode, the input and output I/O buffers includ</li> <li>I_BUFHDR, O_BUFHDR Send and receive buffer header</li> <li>BUFRSP Response data</li> <li>BUFMSG Message data</li> <li>BUFERR Error message data</li> <li>BUFRST Restart data</li> <li>BUFQUI Shutdown data</li> <li>BUFUNK Unknown data</li> </ul>

Table 122. Significant fields in MSS1 and MSS2 records

Link type	Control blocks
TCP/IP	POST code (first word of LLB) LLB, LTB(S), LCB, LXB, CRB, CTT, LNB control blocks MSCWA (MSC work area) I_WP_BUF, O_WP_BUF SCIWORK (SCI work area)
	I/O buffers (input and output). In non-bandwidth mode, the I/O buffers include I_TP_BUF and O_TP_BUF. In bandwidth mode, the input and output I/O buffers include
	• I_BUFHDR, O_BUFHDR Send and receive buffer heade
	BUFRSP Response data
	BUFMSG Message data
	BUFERR Error message data
	BUFRST Restart data
	BUFQUI Shutdown data
	BUFUNK Unknown data
	DFSAWE, the input AWE from the CSL SCI Input messag exit. This AWE chain is initially queued to the LXBAWEHDR, then moved over to CLBQE by the TCPIP post handler DFSTCP20 for processing by the DDM. The AWE is mapped by the DFSAWEXI macro. The AWXI_MBRPLPTR field contains the DFSMSDIR paramet list from SCI.
	DFSMSDIR, the parameter list of doubleword parameters containing the length and address of the parameters that are passed between MSC and IMS Connect through the S interface.
	ICONDATA, the data from IMS Connect, pointed to by th DFSMSDIR parameter MDIR_ICONMSGPTR. This data is mapped by the BUFMS macro, starting at BUFMSHDR.
VTAM	POST code (first word of LLB) LLB, LTB(S), LCB, LXB, CRB, CTT, LNB control blocks MSCWA (MSC work area) I_WP_BUF, O_WP_BUF RPLs (request parameter list)
	I/O buffers (input and output). In non-bandwidth mode, the I/O buffers include I_TP_BUF and O_TP_BUF. In bandwidth mode, the input and output I/O buffers include
	• I_BUFHDR, O_BUFHDR Send and receive buffer heade
	BUFRSP Response data
	BUFMSG Message data
	BUFERR Error message data
	BUFRST Restart data
	BUFQUI Shutdown data
	BUFUNK Unknown data

Table 122. Significant fields in MSS1 and MSS2 records (continued)

# Related reference:

"MSS3 and MSS4 records" on page 432  $\,$ 

# MSS3 and MSS4 records

The MSS3 and MSS4 records capture link control blocks when links are started and stopped. MSS3 captures information when links are stopped. MSS4 captures information when the links are started.

MSC always logs the MSS3 and MSS4 records for diagnostics, even when a link trace is not active.

# MSS3

The MSS3 record is a snapshot of the MSC link incore trace buffer for CTC, VTAM, and TCP/IP links taken each time a link stops, either normally or due to an error.

The MSC link incore trace buffer, which is a wrap-around type buffer, contains data from selected fields in the link and I/O control blocks. MSC writes the data to the buffer each time a link is dispatched to do work and each time the link exits after completing the work. When the buffer is full, MSC wraps around and overwrites the oldest data in the buffer. Module DFSCMS80 contains the DSECTS of the selected fields that are written to the MSC link incore trace buffer.

The MSS3 record captures data from the following control blocks:

- LLB (logical link block)
- LTBs (link terminal blocks), input and output
- CRB (communication restart block)
- LXB (link extension block)
- I/O control blocks:
  - For CTC-type links: IOSB, IOB, and IEDB
  - For TCP/IP type links: SCIWORK
  - For VTAM type-links: input and output RPLs (request parameter lists)
- R0 trace word

# MSS4

The MSS4 record is a snapshot of link control blocks taken each time a link is started. The MSS4 record captures the following control blocks:

- LLB
- MSCWA
- LTBs, input and output
- I/O buffers, input and output
- LXB
- CRB
- I/O control blocks:
  - For CTC-type links: IOSB
  - For TCP/IP type links: SCIWORK
  - For VTAM type-links: RPLs, input and output
- LNB (link name block for the MSNAME)
- CTT (communication terminal table block)

# Channel-to-channel access method trace stack (LXB trace)

The LXB trace stack is designed to be used in conjunction with the module listings to provide a detailed trace of instruction flow through the channel-to-channel (CTC) access method.

The trace stack is located in the LXB at label LXBCTRAC, 288 (X'E4') bytes into the LXB, and is 50 bytes long. The only modules that manipulate the LXB trace stack are the CTC access method modules, DFSCMC00, DFSCMC10, DFSCMC40, and DFSCMC50. The code that manipulates the LXB trace stack is unconditionally operative. (That is, it is not conditionally assembled and the function is not controlled by the operator command.) If level 3 or 4 of the IMS trace command is in effect, the LXB is included among the areas traced to the log.

Most LXB trace stack entries are 2 bytes long; a few are 1 byte long. Usually, each invocation of one of the access method modules causes a trace entry to be placed in the LXB trace stack. In order to create a trace entry, the module first moves (pushes) the trace stack 2 (or 1) bytes backward (toward low storage), thereby deleting the oldest portions of the trace stack. The module then inserts the new entry at the high (storage address) end of the trace stack. In rare instances, when the asynchronous modules DFSCMC40 and DFSCMC10 interrupt execution of another CTC access method module, the trace entries might overlap and thus might not be meaningful.

The format and meaning of the possible LXB trace entries follow:

# Byte 1, bit 0

If on, this is a 2-byte entry; otherwise it is a 1-byte entry.

# Byte 1, bits 1-3

This identifies the module and, if applicable, the routine within the module that made the entry in the LXB.

# Value Meaning

- 1 DFSCMC40, attention DIE routine
- 2 DFSCMC10, channel-end appendage
- 3 DFSCMC10, abnormal-end appendage
- 4 DFSCMC40, I/O request DIE routine
- 5 DFSCMC10, shutdown appendage
- 6 DFSCMC50, shutdown processing routine
- 7 DFSCMC00, MSC analyzer

#### Byte 1, bits 4-7

This identifies what processing was performed. The meaning of the bits, as shown below, is dependent on the routine that made the entry in the LXB.

#### Byte 2

This is an input byte that the routine keys on. This is also dependent on the routine and is described below.

# DFSCMC00 (MSC analyzer)

The DFSCMC00 module manipulates the LXB trace stack.

# Byte 1, bits 4-7

# Value Meaning

- 0 No I/O operation was queued; contention exists for the CTC adapter
- 1 WRITE channel program was queued
- 2 ACK channel program was queued
- 3 WRACK channel program was queued
- 4 READ channel program was queued; contention exists for use of the CTC adapter
- 5 STARTUP channel program was modified to be a WRITE channel program
- **6** Old STARTUP channel program was modified to be a WRITE channel program
- 7 WRITE channel program was not queued; write-pending switch was set
- 8 Error return was given

# Byte 2

This contains the operation code (found in DECTYPE+1).

# DFSCMC50 (shutdown processing routine)

The module DFSCMC50 manipulates the LXB trace stack.

# Byte 1, bits 4-7

# Value Meaning

- 1 Normal STACK operation was performed
- 2 Normal SHUTDOWN operation was performed
- 3 Abnormal SHUTDOWN occurred

#### Byte 2

This contains the operation code (found in DECTYPE+1).

# **DFSCMC40** (attention DIE routine)

The only modules that manipulate the LXB trace stack are the CTC access method modules, DFSCMC00, DFSCMC10, DFSCMC40, and DFSCMC50. The values and meaning of DFSCMC40 are listed.

# Byte 1, bits 4-7

IOSB was passed to IOS to perform a read.

# Value Meaning

- 0 Error was previously posted
- 1 IOSB was passed to IOS
- 2 IOSB on queue was modified to perform a read
- 3 LLB was posted with ACK received
- 4 LXB was posted with STARTUP complete; the link is available for a WRITE operation
- 5 LXB was posted with an error
- 6 LLB was posted with an error

- 7 During STARTUP processing, a control command was received after this routine used a no-operation command
- 8 Attention interrupt was received during SHUTDOWN processing; UCB was already cleared
- 9 Attention interrupt was received during SHUTDOWN processing; this routine did not reset UCBQISCE switch
- **A** Attention interrupt was received during SHUTDOWN processing; this routine did not reset UCBQISCE switch
- **B** Attention interrupt was received during SHUTDOWN processing; this routine scheduled an IOSB
- **C** Attention interrupt was received during SHUTDOWN processing; this routine set LXBC2XS switch
- **D** LXBC2SD switch was set after an attention interrupt because a WRITE command was received; READ operation was not done
- **E** Read-pending or response-received switch was set
- **F** Attention interrupt was received during SHUTDOWN processing; SHUTDOWN channel program was aborted

#### Byte 2

The command byte is sensed from the channel-to-channel adapter (found at IOSCTCMD), except when an I/O error prevented retrieval of the command byte, in which case byte 2 is absent.

# DFSCNC40 (I/O request DIE routine)

The only modules that manipulate the LXB trace stack are the CTC access method modules, DFSCMC00, DFSCMC10, DFSCMC40, and DFSCMC50. The values and meaning of DFSCNC40 are listed.

#### Byte 1, bits 4-7

#### Value Meaning

- **0** Second entry into this routine was taken; nothing was done
- 1 LXBCLIB switch was reset
- 2 IOSB on queue was modified to perform a WRITE operation (this is always a 1-byte entry)

# DFSCMC10 (channel-end appendage)

The only modules that manipulate the LXB trace stack are the CTC access method modules, DFSCMC00, DFSCMC10, DFSCMC40, and DFSCMC50. The values and meaning of DFSCMC100 are listed.

# Byte 1, bits 4-7

# Value Meaning

- 0 Nothing was done
- 1 LXB was posted with STARTUP complete; the link is available for a WRITE operation
- 2 LXB was posted with STARTUP complete; STARTUP message was received
- 3 During STARTUP processing, no-operation command was scheduled

- 5 LXB was posted; message received
- 6 LLB was posted; message received
- 8 During STARTUP processing, control command was scheduled
- 9 LLB was posted; an error occurred on message that was written
- A LLB was posted; an error occurred on message that was received
- **B** LXB was posted; an error occurred on message that was received

#### Byte 2

This contains the first command code in the just-completed channel program (pointed to by IOSVST).

# DFSCMC10 (abnormal-end appendage)

The only modules that manipulate the LXB trace stack are the CTC access method modules, DFSCMC00, DFSCMC10, DFSCMC40, and DFSCMC50. The abnormal values and meaning of DFSCMC100 are listed.

### Byte 1, bits 4-7

### Value Meaning

- 2 Not a permanent error; control is given to an ERP
- 3 Error was declared permanent
- 4 Serial channel error
- 5 MIH detected error before retry

#### Byte 2

This contains the value in IOSCOD.

# DFSCMC10 (shutdown appendage)

The only modules that manipulate the LXB trace stack are the CTC access method modules, DFSCMC00, DFSCMC10, DFSCMC40, and DFSCMC50. The shutdown values and meaning of DFSCMC100 are listed.

# Byte 1, bits 4-7

#### Value Meaning

- 1 Completion was normal; a new I/O operation was scheduled
- 2 Completion was normal; LLB was posted
- 3 Completion was abnormal; UCB was already cleared
- 4 Completion was abnormal; this routine has cleared UCB and posted LLB
- 5 Completion was abnormal; this routine will restart I/O
- 6 Completion was abnormal; this routine has restarted I/O
- 7 Completion was normal; UCB was already cleared

### Byte 2

This contains the first command code in the just-completed channel program (pointed by IOSVST).

# LXB trace stack example

This example shows a printout of the LXB portion of an internal trace record.

The LXB trace stack begins at AE90E8 and contains 29 entries. Following the figure is a list of the meanings of the routines that made each entry.

#### Printout of the LXB trace stack

DFSERA30 - FORMATTED LOG PRINT INTERNAL TRACE RECORD LXB AE9004 000000 807F0BC9 00093660 00AE9350 00AE92B0 00091E90 00AE991C 17000000 7F0C0000 80082194 012141CE 60000054 0A000000 AE9024 0008229C 000820C6 000020 80000000 520821CE AE9044 000040 30000005 022140C6 600000CE 09000000 30000005 47000000 20000001 00000000 AE9064 000060 00000000 00000000 00000000 00000000 0000000 0000000 0000000 0000000 AE9084 000080 TO AE90C4 0000C0 SAME AS ABOVE F1044193 17F10441 00000000 0C419317 AE90E4 0000F0 9337E218 D243F510 A314A8C3 419101A2 AE9104 000100 02F30C41 93179101 A502F004 F30C4193 17F10441 93170000 0000000 00B66218 Entry Meaning X'OC' The first byte of this entry, the oldest entry in the trace stack, has been pushed off the trace stack. Ignore this entry. X'41' DFSCMC40 (I/O request DIE). LXBCLIB was reset. X'9317' DFSCMC40 (attention DIE). Operation code X'17' (ACK) was received from the other system. The LLB was posted X'7F1C0000' (ACK received). X'F104' DFSCMC00. Operation code X'04' (WRITE) was received. The WRITE channel program was queued. X'41' DFSCMC40. (I/O request DIE). LXBCLIB was reset. WRITE operation was completed. X'9317' DFSCMC40 (attention DIE). Operation code X'17' (ACK) was received from the other system. The LLB was posted X'7F1C0000' (ACK received). X'F104' DFSCMC00. Operation code X'04' (WRITE was received). The WRITE channel program was queued. X'41' DFSCMC40 (I/O request DIE). LXBCLIB was reset. WRITE operation was completed. X'9337' DFSCMC40 (attention DIE). Operation code X'37' (STACK) was received from the other system. The LLB was posted X'7F1C0000' (ACK received). X'E218' DFSCMC50 (SHUTDOWN processing). Operation code X'18' (SHUTDOWN) was received. Normal SHUTDOWN was performed. X'D243' DFSCMC10 (SHUTDOWN appendage). Channel command X'43' (enable compatibility) completed normally. The LLB was posted.

#### X'F510'

DFSCMC00. Operation code X'10' (STARTUP) was received. The start-link channel program was queued.

#### X'A314'

DFSCMC10 (channel-end appendage). Channel command X'14' (sense command byte) of the start-link channel program completed normally. The disable compatibility no-operation command was scheduled.

### X'A8C3'

DSFCMC10 (channel-end appendage). Channel command C'X3' (disable compatibility no-operation) completed normally. The startup control command was scheduled.

**X'41'** DFSCMC40 (I/O request DIE). LXBCLIB was reset. Channel end was received from the startup control.

#### X'9101'

DFSCMC10 (attention DIE). Operation code X'01' (WRITE) was received from the other system. The IOSB was passed to IOS to initiate a READ.

#### X'A202'

DFSCMC10 (channel-end appendage). Channel command X'02' (read) completed normally. The LXB was posted X'7F080000'(startup complete, startup message received).

#### X'F30C'

DFSCMC00. Operation code X'0C' (WRACK) was received. ACK with data (WRACK) channel program was queued.

X'41' DFSCMC40 (I/O request DIE). LXBCLIB was reset. WRACK operation has completed.

#### X'9317'

DFSCMC40 (attention DIE). Operation code X'17' (ACK) was received from the other system. The LLB was posted X'7F0C0000' (ACK received).

#### X'9101'

DFSCMC40 (attention DIE). Operation code X'01' (WRITE) was received from the other system. The IOSB was passed to IOS to initiate a READ operation.

#### X'A502'

DFSCMC10 (channel-end appendage). Channel command X'02' (read) was completed. The LXB was posted X'7F0C0000' (message received).

#### X'F004'

DFSCMC00. Operation code X'04' (WRITE) was received. No I/O was scheduled. Contention exists between this WRITE operation and the WRITE operation received from the other system in the preceding 9101 entry. The device-dependent module has not yet received control in response to the LXB post traced by the preceding A502 entry.

#### X'F30C'

DFSCMC00. Operation code X'0C' (WRACK) was received. ACK with data (WRACK) channel program was queued.

The ACK acknowledges the data received from the other system in the preceding 9101 entry. The data is the data that was not sent in the preceding F004 entry.

X'41' DFSCMC40 (I/O request DIE). LXBCLIB was reset.

#### X'9317'

DFSCMC40 (attention DIE). Operation code X'17' (ACK) was received from the other system. The LLB was posted X'7F1C0000' (ACK received).

#### X'F104'

DFSCMC00. Operation code X'04' (WRITE) was received. The WRITE channel program was queued.

X'41' DFSCMC40 (I/O request DIE). LXBCLIB was reset. WRITE operation was completed.

X'9317'

DFSCMC40 (attention DIE). Operation code X'17' (ACK) was received from the other system. The LLB was posted X'7F1C0000' (ACK received).

# MSC routing trace - BUFMSVID

The MSC routing trace is located in the MSC message prefix at label BUFMSVID within the BUFMS DSECT. The low-order byte in the trace contains the most recent entry, and each additional entry results in a shift left (the high-order byte is shifted out).

This trace records the MSVID (as specified in the IMSCTRL macro during system definition) of the last eight IMS systems through which messages were routed. It is initialized when a terminal sends a message or when an application program does an ISRT of a message, and it is updated for each intermediate system and the destination system.

This trace records the primary MTO's local SYSID of the last eight IMS systems through which messages were routed. It is initialized when a terminal sends a message or when an application program does an ISRT of a message, and it is updated for each intermediate system and the destination system. The MSC routing trace is located in the MSC message prefix extension at label MSGMEVID in DSECT MSGMSCE. The low-order byte in the trace contains the most recent entry, and each additional entry results in a shift left (the high-order byte is shifted out). If the SYSID is equal to or greater than 255, it is traced both in field BUFMEVID and MSGMEVID. IF the SYSID is less than 255, it is only traced in MSGMEVID; BUFMEVID contains zeros.

# Chapter 17. ODBA - Diagnosing hung threads and UORs

Use the following steps to configure your system to gather data that IBM Software Support can use to determine why IMS threads or UORs are hanging on your system.

1. Turn on the following IMS table traces by using the following IMS commands:

/TRACE SET ON TABLE RRST OPTION LOG /TRACE SET ON TABLE DISP /TRACE SET ON TABLE SCHD

These traces are sent to the IMS OLDS, unless IMS external trace data sets are used. For a test environment, data sent to the OLDS files is appropriate. For production systems, use IMS external tracing. For more information about IMS external tracing, see Diagnostic setup recommendations for IMS (System Definition).

- **2**. If it is not already active with the following options, turn on the MVS SYSRRS CTRACE:
  - a. Place the following lines in the CTIRRSxx PARMLIB member: TRACEOPTS ON BUFSIZE(1000M) OPTIONS('EVENTS(URSERVS,LOGGING,CONTEXT,EXITS,STATECHG,RRSAPI,RE START)')
  - b. Issue the following MVS Command:
    - TRACE CT,ON,COMP=SYSRRS,PARM=CTIRRSxx
  - c. Issue the following MVS Command to display the trace setting: DISPLAY TRACE, COMP=SYSRRS
  - d. The display output for the SYSRRS portion appears as follows:

IEE843I 13.17.07 TRACE DISPLAY 479 SYSTEM STATUS INFORMATION ST=(ON,1000K,09000K) AS=ON BR=OFF EX=ON MO=OFF MT=(ON,500K) COMPONENT MODE BUFFER HEAD SUBS

```
SYSRRS ON 1000M
ASIDS *NONE*
JOBNAMES *NONE*
OPTIONS EVENTS(URSERVS,LOGGING,CONTEXT,EXITS,STATECHG,
RRSAPI,RESTART)
```

**Recommendation:** The MVS CTRACE should always be active on any system using IMS with RRS. The MVS trace command should be added to the MVS COMMNDxx SYS1.PARMLIB member to ensure that it is always activated at IPL time. No performance impacts have been reported with the SYSRRS CTRACE using the above options.

After this trace is activated on your system, future operational dumps of IMS must include the RRS address space in the list of jobs to be dumped along with the RRS data spaces (DSPNAME=('rrsjname'.\*). Doing so ensures that the RRS control blocks and traces can be accessed for diagnostic purposes.

 Turn GTF trace on with the TRACE=SYS,DSP,JOBNAMEP options. When GTF Trace prompts for the JOBNAME, specify the JOBNAME for the stored procedure address space and IMS CTL Region. Set the GTF trace dataset to 1200 cylinders.

The GTF Messages should appear similar to the following: START GTFxx.GTF HASP100 GTFxx.GTF ON STCINRDR HASP373 GTFxx.GTF STARTED **\*01 AHL100A SPECIFY TRACE OPTIONS** R 01, TRACE=SYS, DSP, JOBNAMEP IEE600I REPLY TO 01 IS; TRACE=SYS, DSP, JOBNAMEP \*02 ALH101A SPECIFY TRACE EVENT KEYWORDS - JOBNAME= R 02, JOBNAME=(spasname, cltname) IEE600I REPLY TO 02 IS; JOBNAME=(spasname, cltname) \*03 ALH102A CONTINUE TRACE DEFINITION OR REPLY END R 03,END END IEE600I REPLY TO 03 IS;END AHL103I TRACE OPTIONS SELECTED-SYS, DSP AHL103I JOBNAME=(spasname,cltname) \*04 AHL125A RESPECIFY TRACE OPTIONS OR REPLY U R 04,U IEE600I REPLY TO 04 IS;U

4. Set the following SLIP trap to capture dumps for RRS related events:

SLIP SET,C=U0711, JL=(imsctl,imsdli,rrsjname,???SPW2), SDATA=(CSA,PSA,RGN,SQA,SUM,TRT,LPA,ALLNUC), ID=U711,DSPNAME=('rrsjname'.\*),END

The variables in the preceding example are defined in the following list.

*imsctl* The IMS control region jobname

imsdli The IMS DLI region jobname

rrsjname

The RRS region jobname

- 5. Use IMS Display commands for hung threads:
  - DIS ACTIVE
  - DIS CCTLDIS UOR
  - DI2 008
- 6. If a hung ODBA thread or UOR occurs, take a dump of the system so that IBM Software Support can see the related control blocks and access the RRS traces. Use a single dump command as indicated below and not separate dumps for each job.

DUMP TITLE=(DUMP IMS/SPAS/RRS)
JOBNAME=(cltname,spasname,dlijname,rrsjname),
SDATA=(CSA,PSA,RGN,SQA,SUM,TRT,LPA,ALLNUC,GRSQ),
DSPNAME=('rrsjname'.\*),END

The variables in the preceding example are defined in the following list.

# ctlname

The IMS CTL Region jobname

#### tspasname

The stored procedure address space jobname

#### dlijname

The IMS DLI region jobname

#### rrsjname

The RRS region jobname

Tune DUMP MAXSPACE and the SYS1.DUMP space allocation to ensure that your system has sufficient space for the dump.

- 7. It is important for IBM Software Support to receive all of the requested diagnostic information as a complete unit from a single occurrence with all data centered around the time of the thread or UOR hang. This information typically includes:
  - Dump data sets obtained
  - IMS OLDS or SLDS
  - MVS SYSLOG
  - LOGREC data set
  - JES JOBLOG for cltname, spasname

After taking the dump, you can free the hung thread using the recommendations in Stopping Db2 for z/OS stored procedure threads (Application Programming).

# Chapter 18. RSR - Remote Site Recovery service aids

The RSR tracking process creates a local log that mirrors the activity at the currently active system.

These topics describe the Fast Path tracker trace Entries that can help you analyze problems in a Remote Site Recovery (RSR) environment.

In some cases, however, the tracking system might not receive copies of all log records before takeover. This might happen if there is a tracking session failure before takeover occurs while the active system is still processing transactions normally. If there is a tracking session failure before takeover, subsequent attempts to start Finance, SLU P, and ISC sessions or MSC links might result in resynchronization errors.

The MTO is notified of both non-MSC errors and MSC errors, as follows:

- Message DFS2948 notifies the MTO of non-MSC errors.
- Either message DFS3211 or message DFS3212 notifies the MTO of MSC errors.

Use the remote takeover message information in conjunction with the received log data to determine the last terminal or MSC message recorded by the tracking process. Then input or output any messages that were lost.

# Determining the last recorded non-MSC message

You can determine the last input or output non-MSC or non-Fast Path message recorded using RSR tracking and it status within the new active IMS following takeover.

- 1. Print these log records for information:
  - X'01'
  - X'03'
  - X'31'
  - X'35'
  - X'36'
  - X'37'
  - X'63'
  - X'66'
- 2. Determine the last input or output message. First look for the last X'66' or X'63' log record for the terminal.

ISC parallel sessions qualify the node name in the log record with user ID. If a X'63' log record is last, that log record indicates whether the session was started cold (without message numbers) or warm (with last input/output message numbers).

If a X'66' log record is last, that log record indicates the message sequence number and whether the message was input or output. The X'66' log record marks an attempt to commit the message for recovery and restart, if necessary. Additional log records will indicate the exact status of the message.

**3**. Determine the last committed input message by inspecting the last X'66' log record marked as input for the specific terminal. It is followed by X'01' and

X'35' log records for the input message. The X'35' log record considers the input message (log record X'66') committed, or made recoverable, for input processing on nonresponse mode transactions.

**Restriction:** Nonconversational response mode transactions are not restartable. That is, they must be submitted again to IMS if any failure occurs prior to completion of transaction processing. Therefore, the input is not considered committed until the transaction processing is complete and output is available to send to the terminal (see output process that follows).

4. Before the terminal begins the output process, completion of the input transaction processing results in X'03', ending with X'3730'. The X'3730' commits the transaction changes, including making the output message available for the terminal. The X'3730' also commits the associated nonconversational response mode input transaction, as described previously.

To determine the last committed output message sent to the terminal, begin with the last X'66' marked as output. This output message is committed, that is dequeued, with the X'36' log record that follows, reflecting successful receipt by the terminal.

For Fast Path messages, use the following procedure to determine the last input or output message recorded using RSR tracking.

- 1. Print these log records for information:
  - X'5901'
  - X'5903'
  - X'5936'
  - X'5937'
  - X'63'
  - X'66'
- 2. Determine the last input or output message. First look for the last X'66' or X'63' log record for the terminal.

ISC parallel sessions qualify the node name in the log record with user ID.

If a X'63' log record is last, that indicates whether the session was started cold (without message numbers) or warm (with last input/output message numbers).

If a X'66' log record is last, that log record will indicate the message sequence number and whether the message was input or output. The X'66' log record marks an attempt to commit the message for recovery and restart, if necessary. Additional log records will indicate the exact status of the message.

- **3**. Fast Path input is always considered nonrestartable and must be resubmitted to IMS if any failure occurs before transaction input processing is complete and the output message is made available to the terminal output process.
- 4. To determine the last Fast Path input transaction received and committed, begin with the last X'66' log record that is marked as input for the specific terminal. It is followed by a X'5901' log record with the input message and a X'5937' log record indicating input transaction processing complete. The input and all changes have been committed.
- 5. To determine the last committed output message to the terminal, begin with the X'5903' log record for the output message followed by the X'5937', which makes it available for the terminal output process. This is the same X'5937' log record that also commits the input above. This is followed by a X'66' log record indicating an attempt to deliver output to the terminal. This output is committed (dequeued) when also followed by the X'5936' log record.

# Determining the last recorded MSC message

MSC links keep track of the sending and receiving of data on a message by message basis.

Each message block sent across an MSC link is appended with a sequence number. The IMS receiving system updates its receive count with each message block received, and records (logs) each message successfully received and enqueued to the message queue. Similarly, the sending system updates its sending count with each message block sent and logs the sequence number of the last message successfully sent and dequeued.

Across link restarts, RSR takeovers, or IMS failures, these sequence numbers are exchanged and used to resynchronize the message traffic, to continue sending and receiving messages at the same point. Therefore, messages are not lost or duplicated.

The key to the success of this concept is the logging of the messages that were sent and received across the link, and enqueued on the receiving side and dequeued from the sending side. There are primarily five log records used to resynchronize this message traffic:

- 01 Input message to IMS input transaction or message switch
- 03 Transaction Output, program-to-program switch or error message (DFSxxxx)
- 35 Enqueue message
- 36 Dequeue message
- 66 Message sequence recovery

If log records are lost and not processed by the tracking system prior to a remote takeover, message resynchronization can result in the loss or duplication of messages. This can be evidenced by error messages that are issued by IMS when the links are restarted, such as DFS3211 and DFS3212, DFS2145, and DFS2948.

Should link resynchronization fail after an RSR takeover, it might be possible to analyze which messages were lost or duplicated, from the information in the DFS error message issued by IMS at the time of error, and from the 01, 03, 35, 36, and 66 log records.

# Fast Path tracker trace entries

Use Trace record 9E01 - DBFDT210 redo record processor module entry through Trace record 9F74 - DBFDT400 write to analyze the Fast Path tracker trace entries.

Trace entry: Fast Path tracker log router interface (9E)

Table 141. Database tracking trace entries for X'D4' trace entry (continued)

Notes to Table 141 on page 455:

1. AWE functions for DFSDT240 (trace code X'0005'):

# X'0015'

Open/authorize/NUSID for database succeeded

### X'0017'

Stream does not apply (open/authorize/NUSID failed)

X'0018'
Process TDBC queue
X'001A'
Add DDIR through online change
X'001E' Database might need OFR
X'0020' OLR output data set creation succeeded
X'0021'
OLR output data set creation failed
AWE functions for DFSDT300 (trace code X'0006'):
X'0001'
Initialize DLI/SAS queue server
X'0002'
Terminate DLI/SAS queue server
X'0003'
Open/authorize/NUSID for database
X'0004'
Close database
X'0005'
End database tracking, written to disk
X'0006'
End database tracking, initial call
X'0007' Stream complete, initial call
*
X'0008' Stream complete, written to disk
X'0009' Load balancing
Ŭ
X'000A' OFR needed
X'000B'
OFR complete, initial call
X'0010'
OFR complete, written to disk
X'001F'
Create OLR output data sets
X'0020'
OLR cursor active, written to disk
X'0021'
OLR cursor inactive
Functions for DFSDT180, database stop (trace code X'0008'):
X'0000'
Initiate database stop

2.

3.

X'0001'

Database stop complete

X'0002'

Database might need OFR

## X'0003'

Log the TDBC state

## X'0004'

Call DFSLRETR to record tracking suspend point

### X'0005'

Database started

4. Events for wait/post/resume for routed record (X'000F'):

### X'0000'

Wait because of OFR-pending.

## X'0001'

Posted because database is up to date already; OFR not needed.

### X'0002'

Posted because OFR was started.

#### X'0003'

Posted because stop is complete.

#### X'0004'

Posted at end-OFR (should not occur).

### X'0005'

Posted because database is up to date at restart (should not occur).

#### X'0006'

Posted for unknown reason when starting database (should not occur).

#### X'0007'

Posted because of error starting OFR.

#### X'0008'

Posted because the log router reported an exceptional condition that prevented OFR from starting.

#### X'0009'

Resumption after being posted.

## Related concepts:

"DL/I trace" on page 166

# Buffer handler trace entries at the database tracker

Trace entries are written for buffer handler calls at the database tracker just as they are at the active site.

These entries are described in "X'DB' through X'FA' trace entry" on page 198. However, there are differences in these trace entries when they are written by the database tracker:

- Word 3 contains the RBA or RBN of the data in the CI or block rather than PSTDSGA.
- Word 6 contains the right half of the log sequence number (LSN) rather than PSTISAMW.

# Log router trace data

The log router (LRTT) trace entries are documented in Trace record 3701 - data set services control routine entry through Trace record 3788 - create active stream begin takeover. Field lengths are in bytes.

## 3740

#### Module:

DFSLRCAS Create Active Stream Routine

## Explanation:

Record cut on create new Stream to DFSLRCAS (Level - Low)

## Trace Subcode:

LRCAS New Strm

Table 165. Trace record 3740 - DFSLRCAS create active stream new stream	Table 165. Trace re	cord 3740 - DFSLRC	AS create active stre	am new stream
---	---------------------	--------------------	-----------------------	---------------

Offset	Туре	Length	Description
4	Fixed	4	Addr of STB block
8	Character	8	Instance name
16	Fixed	4	Conversation token
20	Fixed	4	Initial Routing Position

#### 3741

#### Module:

DFSLRCAS Create Active Stream Allocate Conversation

### **Explanation:**

Record cut on allocate conversation to exist stream (Level - Low)

## Trace Subcode:

LRCAS All Conv

Table 166. Trace record 3741 - DFSLRCAS create active stream allocate conversation

Offset	Туре	Length	Description
4	Fixed	4	Addr of STB block
8	Character	8	STB active Instance name
16	Fixed	4	Conversation token
20	Fixed	4	Routing Position

## 3742

## Module:

DFSLRCAS Create Active Stream Set Position

#### **Explanation:**

Record cut on set the current position (Level - Low)

#### Trace Subcode:

LRCAS Set Pos

Offset	Туре	Length	Description
4	Fixed	4	Addr of STB block

Table 167. Trace record 3742 - DFSLRCAS create active stream set position (contin	iued)
---	-------

Offset	Туре	Length	Description
8	Fixed	4	STB routing prilog token
12	Character	8	STB last routed LSN

#### 374F

# Module:

DFSLRASC Active Stream Control Routine

### Explanation:

Record cut on entry to DFSLRASC (Level - Medium)

### Trace Subcode:

### LRASC Entry

Table 168. Trace record 374F - DFSLRASC active stream control entry

Offset	Туре	Length	Description	
4	Fixed	1	Entry Function	
5	Character	3	Spares	
8	Address	4	STB Address	
12	Address	4	SAA Address	
16	Address	4	SRA Address	
20	Character	8	Active Instance Name	

## 3750

#### Module:

DFSLRORH Online Forward Recovery Request Handler

### **Explanation:**

Record cut on entry to and exit from DFSLRORH (Level - Low)

## Trace Subcode:

LRORH Request

Table 169.	Trace record	l 3750 - initiate	online forward	recovery (OFR)

Offset	Туре	Length	Description
4	Address	4	OFB address
8	Address	4	OFRL address
12	Fixed	4	OFR identifier
16	Fixed	4	Return code
20	Fixed	4	DBRC return code

## 3751

#### Module:

DFSLROIC Online Forward Recovery Controller

### Explanation:

Record cut after OFR ITASK created (Level - Low)

## Trace Subcode:

LROIC Start

Offset	Туре	Length	Description
4	Address	4	OFB address
8	Address	4	OFRL address
12	Fixed	4	OFR identifier
16	Address	4	ECB address
20	Fixed	4	Current OFR count

## Table 170. Trace record 3751 - create the OFR ITASK

## 3752

## Module: DFSLROPR Online Forward Recovery Processor

## Explanation:

Record cut at entry to DFSLROPR (Level - Low)

#### Trace Subcode:

LROPR Request

Table 171.	Trace record	' 3752 - O	FR processor	request

Offset	Туре	Length	Description
4	Address	4	OFB address
8	Address	4	OFRL address
12	Address	4	Buffer address if AWLGFUNC=002E, AWE address otherwise
16	Fixed	2	AWLGFUNC
18	Bit	1	
			OFB_FLAGS
		1	
	1		ofb_started
	.1		ofb_in_merge
	1		ofb_terminated
	1		ofb_restarted
	1		ofb_pending
	1		ofb_terminating
	11		*
20	Fixed	2	Index to POS_SS entry if AWLGFUNC=002E, 0 otherwise

#### 3753

## Module:

DFSLROPR Online Forward Recovery Processor

## **Explanation:**

Record cut at exit from DFSLROPR (Level - Low)

## Trace Subcode: LROPR Exit

Offset	Туре	Length	Description	
4	Address	4	OFB address	
8	Address	4	OFRL address	
12	Address	4	Buffer address if AWLGFUNC=002E, AWE address otherwise	
16	Fixed	2	AWLGFUNC	

Table 172. Trac	ce record 3753 -	OFR processor e	exit (continued)
-----------------	------------------	-----------------	------------------

Offset	Туре	Length	Description
18	Bit	2	OFB_flags
20	Fixed	4	OFR identifier

# Module:

DFSLRORH Online Forward Recovery Request Handler

### **Explanation**:

Record cut for each log descriptor (LDSD) (Level - Low)

## Trace Subcode:

LRORH Log Desc

Table 173.	Trace record 3754 - log	descriptors obtained from DBRC

Offset	Туре	Length	Description
4	Address	4	OFR identifier
8	Character	8	LDSD_ssid
16	Character	4	LDSD_first_LSN(5:8)
20	Character	4	LDSD_last_LSN(5:8)
24	Bit	1	LDSD_flags
26	Fixed	2	LDSD_mergeID
28	Character	4	LDSD_prilog_time(5:8)

### 3756

### Module:

DFSLRORM Online Forward Recovery Read Next Data set

## **Explanation**:

Record cut for each log descriptor (LDSD) (Level - Low)

## Trace Subcode:

LRORM Log Desc

Table 174. Trace record 3756 - log descriptors obtained from DBRC
---

Offset	Туре	Length	Description	
4	Address	4	OFR identifier	
8	Character	8	LDSD_ssid	
16	Character	4	LDSD_first_LSN(5:8)	
20	Character	4	LDSD_last_LSN(5:8)	
24	Bit	1	LDSD_flags	
26	Fixed	2	LDSD_mergeID	
28	Character	4	LDSD_prilog_time(5:8)	

## 3757

#### Module:

DFSLRORM - Online Forward Recovery Read Next Data Set

### Explanation:

During OFR, DBRC returned a start point for a stream that was earlier than the stream's current routed position. (Level - Low)

## Trace Subcode:

LRORM Startpoint Error

Offset	Туре	Length	Description
4	Fixed	4	pos_old_ptoken
8	Character	4	pos_old_LSN(5:8)
12	Fixed	4	pos_new_ptoken
16	Character	4	pos_new_LSN(5:8)
20	Fixed	2	ofb_flags(0-15)
22	Fixed	2	index to OFRL_entity
28	Character	8	DB/Area name

Table 175. Trace record 3757 - log descriptors obtained from DBRC

### Module:

DFSLROPR - Log Router Online Forward Recovery Processor

#### **Explanation**:

During OFR, the record ID (first LSN in buffer) of the next buffer to process is after the start LSN in the startpoints list (ofrsp\_start\_lsn) and the process has not yet reached this start LSN. (Level - Low)

## Trace Subcode:

LRORM Startpoint Missed

Table 176. Trace record 3758 - start points list error detected

Offset	Туре	Length	Description
4	Fixed	4	pos_ptoken
8	Character	8	pos_LSN
16	Fixed	4	index to OFRL_entity
20	Character	4	ofrsp_start_lsn(5:8)
24	Character	4	lgb_record_ID(5:8)

#### 3760

#### Module:

DFSLRARC Auto Archive Controller

#### **Explanation:**

Record cut on entry to DFSLRARC for archive request (Level - Medium)

# Trace Subcode:

LRARC Request

Offset	Туре	Length	Description
	Fixed	2	AWLGFUNC='3E'x
	Character	1	*
	Character	1	AWLGAtype

## Chapter 19. SYS - System service aids

Various tools, utilities, and traces can help you analyze IMS system problems. **Related reference**:

"Sequential buffering service aids" on page 224

## Log records

To diagnose some problems, you need to examine the content of log records to determine what was going on in the system before the problem occurred. By knowing the layout of the log records, you can set up a DFSERA10 job that will produce the specific log records that you need to examine.

In addition, the content of the log records frequently contains information that you can use in your keyword string or when reviewing existing APAR descriptions and comparing them to your own situation.

You can obtain individual log record DSECTs by assembling the ILOGREC macro, and including a RECID format statement for the log record that you want. For example:

- ILOGREC RECID=01 to format the DSECT for an IMS TYPE01 log record
- ILOGREC RECID=56 to format the DSECT for an IMS TYPE56 log record

For Fast Path log record formats, you can assemble mapping macros DBFLSRT, DBFLGRQ, DBFLGRIM, DBFLGROM, DBFLGRSD, DBFLGSYN, and DBFBMSDB.

The following table describes the IMS log records, including the conditions that cause the records to be written.

	Mapping	DSECT	
Туре	macro name	name	Why written (issuing module)
X'01'	QLOGMSGP	QLOGMSGP	Data was put in a message queue buffer. Caller is data communication. (DFSQLOG0)
X'02'	DFSLOG02	CMLOG	A /LOG command or a command that alters data required for restart was successfully completed. (DFSICLP0)
X'03'	QLOGMSGP	QLOGMSGP	Data was put in a message queue buffer. Caller is DL/I. (DFSQLOG0)

Table 208. IMS log records used to analyze IMS problems

Table 208. IMS	log records	used to	analyze IM	IS problems	(continued)
----------------	-------------	---------	------------	-------------	-------------

Туре	Mapping macro name	DSECT name	Why written (issuing module)
X'04'	DFSLOG04	DFSLOG04	Relays information to the RSR tracking site for one of the following conditions:
			X'01' Start planned takeover (DFSICM30, DFSRST00)
			X'02 Sharing started (DFSRDBS0)
			<b>X'03'</b> Subsystem recovery complete (DFSBACK0, DFSFDR00, DFSRLP00)
			X'04' Subsystem stopped sharing (DBFLBEV0)
			X'05' Invalidate all buffers (DFSRDBS0)
			X'06' Sharing needs to be reevaluated (DFSRDBS0)
			X'07' Merge other logs (DBFLBEV0)
			X'08' Batch backout update UOR (DFSBACK0, DFSDBDR0, DFSRBLB0, DFSRBOI0)
			X'09' Log buffers purged (DFSTRM00)
			X'FF' Idling record (DFSLLRI0)
X'06'	DFSLOG06	ACLOGREC	IMS was started or stopped, or FEOV was issued. The VTAM TPEND exit routine was entered or the IRLM failed in an IMS XRF complex. A /SWITCH command was processed in an IMS XRF complex. A /START command connected IMS to VTAM. Data sharing capability was quiesced. (DFSFLLG0, DFSFDLM0, DFSICA20, DFSICL40, DFSRDSH0)
X'07'	DFSLOG07	DLREC	An application program terminated. (DFSRBLB0, DFSRBOI0, DFSSABN0, DFSDABN0, DFSDLA30, DFSTMAD0)
X'08'	DFSLOG08	LINTREC	An application program was scheduled. (DFSSMSC0, DFSSBMP0, DFSDASP0, DFSDLA30, DFSTMAD0)
X'09'	SBLOGREC	SBLOGREC	An application potentially using sequential buffering terminated. The following subcodes, contained within the log record, identify the type of statistics written in the log record. (DFSSBTD0) X'01' Sequential buffering summary statistic for the PST. X'02' Sequential buffering detailed statistics for each SDSG.
X'0A07'	DFSLOG0A	LOAREC	A CPI-communications driven application program terminated. (DFSSABN0)
X'0A08'	DFSLOG0A	LOAREC	A CPI-communications driven application program was scheduled. (DFSSMSC0)
X'10'	DFSLOG10	SCREC	A security violation occurred. (DFSICIO0, DFSCMD30, DFSICLZ0, DFSTMAD0)
X'11'	LCONVERS	LCONVERS	A conversational program started. (DFSCON00)
X'12'	LCONVERS	LCONVERS	A conversational program terminated. (DFSCON20)
X'13'	DFSLOG13	LOG13	This log record contains conversational CCBs at logon for static non-ISC terminal, signon for ETO user, or static ISC allocation. (DFSRMD00)
X'18'	DFSLOG18	XLOG18	A user program established intent to use extended checkpoint and then issued a CHKP call. The user program issued a CHKP by issuing an XRST call with eight blank characters as a checkpoint ID value. (DFSZSC00)
X'20'	DFSLOG20	ILRDOC	A database was opened. (DFSDLOC0)
X'21'	DFSLOG20	ILRDOC	A database was closed. (DFSDLOC0)
X'22'	DFSLOG22	DFSLOG22	A type-2 command completed successfully and is recoverable across a restart. (DBFCPRC0, DBFRTS00, DFSCPDD0, DFSCPSM0, DFSDBS00, DFSIC160, DFSID160, DFSIU070, DFSIU090, DFSIU100, DFSIU110, DFSIU120, DFSIU160, DFSPGS00, DFSTRS00)

Туре	Mapping macro name	DSECT name	Why written (issuing module)
X'23'	DFSLOG23	LOG23DSC	The listed databases were open when a batch application requested a checkpoint. (DFSRDBL0)
X'24'	DFSLOG24	ERLGDSCT	The buffer handler detected an I/O error. (DFSDVSM0, DBFMER00)
X'25'	DFSLOG25	EEQLOG	An EEQE was created or deleted. (DFSTOLG0)
X'26'	DFSLOG26	IOTBUF	An I/O toleration buffer was created. (DFSTOLG0)
X'27'	DFSLOG27	DBXLOG	A data set was extended, according to these subcodes:X'01'Data set extend phase 1. (DFSDVSM0)X'02'Data set extend phase 2. (DFSDBHI0)
X'28'	DFSLOG28	PH1DC	The IMS restart facility updated the sequence numbers of input messages for response mode non-Fast Path transactions from STSN devices. (DFSFXC40)
X'29'	DFSLOG29	DFSLOG29	<ul> <li>The progress of a HALDB online reorganization is represented in the following subcodes:</li> <li>X'00' The OLR command was received. (DFSORC00, DFSORC10)</li> <li>X'03' IMS catalog activity record. (DFS3SMF)</li> <li>X'10' Ownership of the reorganization for a partition was established through DBRC. (DFSORP60)</li> <li>X'11' Conditional ownership established. An attempt to establish ownership will be made. (DFSORP60)</li> <li>X'20' The UPDATE OLREORG command updated either the RATE option or the [NO]DEL option for a HALDB partition. (DFSORC00, DFSORC10)</li> <li>X'30' The output data sets were successfully validated or created. One record includes all output data sets. (DFSORA00, DFSDBL0)</li> <li>X'40' Cursor active. Initialization of the reorganization of the partition was completed successfully, two sets of data sets exist, and copying is about to begin. The partition is now in cursor-active status. (DFSORP60, DFSORP70)</li> <li>X'50' The cursor was updated, but the unit of reorganization was not committed. (DFSORP20)</li> <li>X'70' Cursor inactive. Copying from the input to the output data sets has completed. The output data sets become active, and the input data sets become inactive. (DFSORP60, DFSORP70)</li> <li>X'71' Conditional cursor inactivate. An attempt to reset the cursor will be made. (DFSORP60)</li> <li>X'90' Ownership of the reorganization for a partition was relinquished. This is followed by the X'07' log record for OLR ITASK termination. (DFSORP60)</li> </ul>
X'30'	QLOGMSGI	QLOGMSGI	A message prefix was changed. (DFSQLOG0)
X'31'	QLOGGETU	~ QLOGGETU	A GU was issued for a message. (DFSQLOG0)
X'32'	QLOGREJE	QLOGREJE	A message was rejected. It was presumed to have been the cause of an application program abend. (DFSQLOG0)
X'33'	QLOGFREE	QLOGFREE	The queue manager released a record. (DFSQLOG0)
X'34'	QLOGCANC	QLOGCANC	A message was canceled. (DFSQLOG0)
X'35'	QLOGENQU	QLOGENQU	A message was enqueued or re-enqueued. (DFSQLOG0)
X'36'	QLOGDEQS	QLOGDEQS	A message was dequeued or saved or deleted. (DFSQLOG0)

Table 208. IMS log records used to analyze IMS problems (continued)

Table 208. IMS log records used to analyze IMS problems (continued)

Туре	Mapping macro name	DSECT name	Why written (issuing module)
X'37'	DFSXFER QLOGXFER	DFSXFER QLOGXFER	Records marked as NO INPUT and NO OUTPUT are written by the sync point coordinator when all resource managers have completed Phase 1. (DFSFXC30, DBFSLG20)
			Records marked as NO INPUT and NO OUTPUT (for example, X'3730') are also written by the DBCTL sync point processor after receiving a phase 2 commit request. (DFSDSC00)
			Phase 2 DC processing. One or more output messages were transferred from a queue block anchored off the PST temporary output queue to a permanent destination. There is a X'37' record for each destination that has messages transferred. (DFSQLOG0)
X'38'	QLOGRELI	QLOGRELI	An input message was put back on the input queue when the application abnormally terminated. (DFSQLOG0)
			Records marked as "Release with no input message" (for example, X'3801') are written by the DBCTL sync point processor (DFSDSC00) after receiving an abort request.
			A Protected Conversation has been put in doubt, and the input message has been moved to an RRE until the unit of work is aborted or committed.
			This record is logged for each message returned to its original anchor block (SMB or CNT) after QCF has abnormally terminated.
X'39'	QLOGRELO	QLOGRELO	The output queue was freed during cleanup processing of a RELEASE call. (DFSQLOG0)
X'3A'	QLFXFREE	QLFXFREE	A bitmap record was replaced after a queue record was freed at the end of DFSQFIX0 processing. (DFSQFIX0)
X'3B'	QLFXRERR	QLFXRERR	An invalid message record or a nonrecoverable message response was detected during queue validation. (DFSQFIX0)
X'3C'	QLFXBERR	QLFXBERR	A control block was changed during validation by DFSQFIX0. (DFSQFIX0)
X'3D'	QLFXQBLK	QLFXQBLK	A QBLK record was altered during DFSQFIX0 processing. (DFSQFIX0)

Туре	Mapping macro name	DSECT name	Why written (issuing module)
X'40'	DFSCHKPT	LOG01	<ul> <li>A checkpoint was taken. Table 211. X'2911' log record layout (continued)

## X'2920': UPDATE OLREORG command

The UPDATE OLREORG command was processed. The X'2920' log record is written once for each HALDB partition affected by the UPDATE OLREORG command.

The following table describes the X'2920' log record layout.

Length		
(decimal)	Field name	Field description
2	HORLENG	Length of this record, including this length field and the sequence number.
2	HORRSV1	X'0000' Reserved.

### X'2930': output data set information

The output data sets have been successfully validated or created. This X'2930' log record contains various characteristics of all of the output data sets, both those that were preexisting and those that were automatically created.

There is enough information to recreate any of these output data sets. The following table describes the X'2930' log record layout.

Table 213. X'2930' log record layout

Length (decimal)	Field name	Field description
2	HORLENG	Length of this record, including this length field and the sequence number.

Table 214. X'2930' log record layout — repeated data set fields (continued)

## X'2931': conditional output data set information

The type X'2931' log record contains conditional output data set information based on the contents of the 2930 log record.

The output data sets have been successfully validated or created but the OLR start time has not been set and Cursor Active has not been set in the RECON. The 2931

L

L

L

T

log record is a copy of the 2930 log record and contains the same information as the 2930 except for the USID and the USN which are excluded.

#### X'2940': cursor-active status set

The cursor is active. Initialization of the reorganization of the partition was completed successfully, two sets of data sets exist, and copying is about to begin. The reorganization was recorded through DBRC as being in a cursor-active status.

The following table describes the X'2940' log record layout.

Length Offset (hex.) (decimal) Field name **Field description** 00 2 HORLENG Length of this record, including this length field and the sequence number 2 02 HORRSV1 X'0000' Reserved 04 1 HORTYPE X'29' Record type 05 1 HORSTYPE X'40' Record sub-type 2 06 HORPSTNO PST number 8 08 RSE name or IMS ID HORRSENM 8 DBD name 10 HORDBD 18 8 HORPSB PSB name C'0' 18 1 HORPSB0 7 19 HORPART Partition name 20 4 HORDUSN Update sequence number (USN) 24 4 HORDUSID Update set ID (USID) 28 1 HORAFLG1 Flags: ".... 0...." 76	п	HORMKEY	PHIDAM cursor root key. The length $n$ is the length of the root key.

### Table 216. X'2950' log record layout (continued)

## X'2970': cursor-active status reset

The cursor is inactive. Copying from the input to the output data sets has completed. The reorganization was recorded through DBRC as no longer being in a cursor-active status.

The following table describes the X'2970' log record layout.

Offset (hex.)	Length (decimal)	Field name	Field description
00	2	HORLENG	Length of this record, including this length field and the sequence number
02	2	HORRSV1	X'0000' Reserved
04	1	HORTYPE	X'29' Record type
05	1	HORSTYPE	X'70' Record sub-type
06	2	HORPSTNO	PST number
08	8	HORRSENM	RSE name or IMS ID
10	8	HORDBD	DBD name
18	8	HORPSB	PSB name

			<ul><li>B' 1'</li><li>This log record was created by an IMS doing data sharing with the IMS doing the HALDB Online Reorganization.</li></ul>
			B'0' The database is not RSR covered.
			B'1' The database is RSR covered.
			<b>B'0.'</b> The A-thru-J or X data sets are the input data sets.
			<b>B'1.'</b> The M-thru-V or Y data sets are the input data sets.
			<b>B'1'</b> The NOREL option is now in effect.
			<b>B'1'</b> The REL option is now in effect.
29	12	HORCITIM	Time stamp of cursor inactive

## X'2971': conditional reset of the cursor active

OLR has completed copying all data from the input data sets to the output data sets. Following this log record an attempt to reset cursor active in the RECON will be made.

The following table describes the X'2971' log record layout.

Table 218. X'2990' log record layout

Offset (hex.)	Length (decimal)	Field name	Field description
00	2	HORLENG	Length of this record, including this length field and the sequence number
02	2	HORRSV1	X'0000'

25	8	HORSEGCT	Number of segments copied				

## Format of X'67' log record

A physical log record consists of one or more subrecords. Each subrecord is followed by its associated data.

The following figure shows the layout of the X'67' log record.

Table 219. X'2990' log record layout

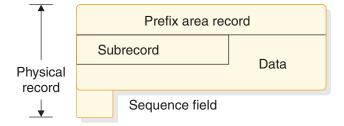

Figure 76. X'67' log record layout

#### **Related tasks:**

"Program isolation trace" on page 218

## Log record prefix area format

The log record prefix area formats for X'67' and X'67FA' records are shown, including the offset, length, and a brief description.

Table 220. Log record prefix area format for X'67'

Offset (hexadecimal)	Length (decimal)	Description
00	2	Length of record, including sequence number
02	2	Reserved
04	1	X'67' record type
05	1	X'FB' X'FD' X'FF'
06	2	Reserved
08	4	Requestor identification
0C	2	Record segment number
0E	2	Reserved
10	4	Time
14	4	Date
18	4	Reserved
1C	4	Condition indicator

For X'67FA' records, the order of the fields from offset X'08' through X'14' is shown in the following table.

Offset (hexadecimal)	Length (decimal)	Description
08	4	Date
0C	4	Time
10	2	Table identification
12	2	Flag bytes

Table 221. Log record prefix area format for X'67FA' records

### Log subrecord and data area

The X'67' log subrecord uses the data format given in the following table.

Offset (hexadecimal)	Length (decimal)	Description
00	8	Element identification
08	2	Reserved
0A	2	Element data length, excluding descriptor
0C	4	Main storage address of data when logged; zero when continued from previous element

#### Table 223. Log data area format

Offset (hexadecimal)	Length	Description
10	variable	Logged data

### Log sequence field format

The log sequence field format is described in the following table.

Table 224. Log sequence field format

Offset (hexadecimal)	Length (decimal)	Description
n	8	STCK time stamp representing the time the log record was written. The time stamp is not necessarily on a word boundary.
n+8	8	Sequence number within the IMS control region.

## Format of OTMA X'6701' log records

OTMA uses the X'6701' log record to document the sending and receiving of certain types of messages, such as messages associated with the processing of synchronous callout requests.

In shared queues environments, OTMA and APPC also use X'6701 log records to document the receipt of certain messages in a front-end IMS system that are sent from a back-end IMS system via a z/OS cross-system coupling facility (XCF).

#### Format of synchronous callout log records:

Т

L

L

L

Synchronous callout messages are non-recoverable OTMA messages that are initiated by an ICAL call through the AIBTDLI interface. These messages do not go through the IMS message queue structure.

The processing of a synchronous callout request and its corresponding response involves the exchange of a number of different message types, such at a resume tpipe request message, the callout request message, the ACK or NAK message to the callout request, the response message, and so forth.

For each possible type of message that is exchanged in the processing of a synchronous callout request and its response, a simplified X'6701' log record is written that contains an ID that identifies the type of message the log record documents.

The message-type identifier for each message type is displayed in the ID= field in the log records. Message types are identified by the following ID= values that are shown in alphabetical order:

- **YACK** ACK that is either received by OTMA for a callout request or sent by OTMA for a callout response
- **YCRT** CANCEL RESUME TPIPE request that OTMA received from the client, usually as a result of the timeout of a RESUME TPIPE request
- YNAK

1

T

Т

Т

Т

T

1

1

Т

NAK that is either received by OTMA for a callout request or sent by OTMA for a callout response

- YOUT Synchronous callout request that OTMA sent to the client
- **YPSI** ACK or NAK that OTMA received from the client is sent to a wrong IMS system, or delayed ACK or NAK that is received by OTMA
- YRSP Response to the synchronous callout that OTMA received from the client
- YRTR RESUME TPIPE request that OTMA received from the client

In the output log records, all the messages for a particular synchronous callout request share the same correlation ID and the message types are recorded in the order in which they occur in the flow during synchronous callout processing.

In the flow of a typical synchronous callout interaction, the message types occur in the following order:

- 1. YRTR
- 2. YOUT
- **3**. YACK or YNAK (received by OTMA for callout request)
- 4. YRSP
- 5. YACK or YNAK (sent by OTMA for callout response)
- 6. YCRT

#### Examples of formatted X'6701' log records

The X'6701' log records for each message type in OTMA callout processing have a similar format. The format shown in following examples is representative of the format of all OTMA X'6701' log records for synchronous callout processing.

#### YOUT example of the OTMA X'6701' log record

The following example shows an X'6701' log record with ID = YOUT. The YOUT record is written when a synchronous callout message is sent to an OTMA client, such as IMS Connect.

#### YACK example of the X'6701' log record

L

I

I

Т

I

The following example shows an X'6701' log record with ID = YACK. The YACK record is written when a synchronous callout message is sent to an OTMA client, such as IMS Connect.

After a synchronous callout message is received and an acknowledgment is sent back to OTMA, OTMA writes the following X'6701' log record with ID = YACK:

INTERNAL TRACE RE	CORD ID	= YACK SEGNO=00 REG	CNO = 00000830 TIME	12:48:22.303 DATE	2008.234?

# Format of the TIB3 X'6701' log record for OTMA and APPC messages in a shared queues environment:

When AOSLOG=Y is specified in the DFSDCxxx member of the PROCLIB data set of a front-end IMS system in a shared queues group, the front-end IMS system writes an X'6701 log record for certain messages that are received from a back-end IMS via a z/OS cross-system coupling facility (XCF). The log records for these messages are identified by a value of TIB3 in the ID= field of the log record for the message.

A front-end system writes an X'6701' log record for OTMA or APPC messages in the following cases:

- Response message returned from the back-end system by XCF for transactions with synchronization levels of NONE, CONFIRM, and SYNCPT.
- Error message returned from the back-end system by XCF for transactions with all synchronization levels of NONE, CONFIRM, and SYNCPT.

#### Example of a formatted X'6701' log record with ID = TIB3

The following example shows an X'6701' log record with ID = TIB3.

# Printing log records and trace table entries

You can use the File Select and Formatting Print utility (DFSERA10) to print both log records from the IMS log data set and the externalized trace table entries that are recorded in the DFSTRAxx data set.

Formatting of the DFSTRAxx trace entries is similar to formatting trace records that are contained on the IMS log; however, the external trace data set contains only records with an ID of X'67FA'.

Figure 77 on page 530 and Figure 78 on page 530 show examples of unformatted and formatted log records. Unformatted log records include the prefix area record, the subrecord, data, and a table offset in hexadecimal. The formatted record contains the data area with its actual offset address and the table offsets.

# Log Merge utility

The Log Merge utility can merge up to nine IMS system logs. Each log is the output of a uniquely identified IMS system that is running during the same time span.

The Log Merge utility (DFSLTMG0) produces one data set that is used as input to the Log Transaction Analysis utility by merging the system log data sets (SLDS) from two or more IMS systems.

# Formatting IMS dumps offline

Two methods are available for formatting IMS dumps offline: interactive formatting, performed through a series of panels which provide formatting choices, and formatting by using JCL.

# **Overview of the IMS Offline Dump Formatter**

The IMS Offline Dump Formatter (ODF) is a formatting option that reduces IMS control region abnormal termination processing.

During abend processing, IMS calls the SDUMP system service of z/OS to create a dump data set. Because SDUMP dumps the requested address spaces without formatting them, the processing time of an abnormal termination is shortened. After abend processing finishes, you can use the IMS Offline Dump Formatter to format (and print) either the complete dump or only those sections needed to analyze the problem.

One advantage of the IMS ODF is that you can make multiple formatting passes at the dump. This means you can first format a summary and then go back one or more times to format the control blocks that will help you most to analyze the problem IMS encountered.

Other advantages of the Offline Dump Formatter include:

• An integrated IMS dump that contains the address spaces of the IMS control region, DBRC, DL/I, and IRLM address spaces.

Also, the formatting modules are included in the dump data set. This ensures that the modules used for formatting the dump match the level of the dumped IMS control blocks. If you specify the REFRESH parameter on the user control statement for IPCS, you will get a new copy of the modules from the program library.

- You can use a z/OS stand-alone dump, SVC dump, or SYSMDUMP to produce the dump data set for the ODF to format.
- After formatting, you can either print the dump or use interactive aids such as IPCS and ISPF browse to view the dump.

Formatting dumps offline is the recommended option. If you want to format dumps online during abnormal termination, you must change the FMTO parameter to request a SNAP dump.

You cannot use the ODF to format z/OS trace and control block areas, the IRLM control blocks, or the VSAM modules.

## Input for the IMS Offline Dump Formatter

The dump data set you use for input to the IMS Offline Dump Formatter must include Key 0 and Key 7 CSA, the CVT, and SQA. CSA is not required for batch or CICS-local DL/I. The dump must be machine readable.

The most common input data sets are taken by SDUMPs, because the IMS control region automatically takes an SDUMP when one of its address spaces fails.

Even if a primary SDUMP request fails, the data dumped to the point of failure can still allow successful dump formatting. Some of this information might not be included in the data sets from a secondary SDUMP request, because on the secondary request only the address space that abends is dumped.

SYSMDUMPs, stand-alone dumps (SADMP), and sumps that are taken by the z/OS DUMP command usually produce acceptable input data sets.

For details of the SDUMP support job stream, refer to *IMS Version 13 System Definition*.

## Invoking the IMS Offline Dump Formatter

To use the IMS Offline Dump Formatter, you must have an acceptable dump in a data set, a proper IMSDUMP entry in the IPCS exit control table and the IMS execution library with the dump formatting modules needed to be allocated to IPCS with the ddname ISPLLIB.

You then invoke the IMS Offline Dump Formatter by executing a VERBX control statement from IPCS, or through the interactive panels.

# Solving IMS problems by using the IMS Offline Dump Formatter

You can learn about how to approach IMS problems using IPCS and the IMS Offline Dump Formatter and how to choose FMTIMS parameters to format a system dump.

## Approaching the problem

The recommended diagnostic approach with the IMS Offline Dump Formatter is:

- 1. Use IEBGENER or IPCS COPYDMP to transfer the dump from the SYS1.DUMPxx data set to your own data set.
- **2**. Get an overview of the problem by formatting the dump with the subset option SUMMARY.
- **3**. Use the abend code or reason for abnormal termination, the CALLER=id, and the TCB=id from the dump title to determine the needed subset options.

- 4. Format the dump again with the subset options you determined in the previous step. Use the MIN qualifier (where possible) to reduce the output size. You can always format the data again if you need more information. You might also need to format the z/OS trace and control block areas, the IRLM control blocks, or the VSAM modules. These blocks cannot be formatted with the IMS Offline Dump Formatter.
- 5. The formatted output is spooled. You can either print the output or use ISPF to browse it.
- 6. Do additional IMS subset formatting on following jobs if necessary.
- 7. If you still cannot locate or fix the problem, keep the dump data set because you need it when discussing the problem with an IBM Software Support representative.

## Using IPCS and the IMS offline dump formatter

You can interactively format IMS dumps offline by using a series of panels that provide formatting choices.

## Method 1

Run the IMS Offline Dump Formatter as an IPCS verb exit to format and print the dump. You can then use IPCS to view unformatted dump storage referenced in your printed dump.

## Method 2

Format, but do not print the dump. Invoke split screen mode on your terminal. On one half of the screen, use ISPF browse to view the formatted control blocks. On the other half, use IPCS to view any unformatted storage referenced in the formatted control blocks.

## **Choosing FMTIMS parameters**

Identify the general problem area before you attempt to choose FMTIMS parameters. If you are unsure of the problem area, format the dump with the SUMMARY option.

The following table shows the FMTIMS parameters that are recommended for general types of problems. For example, if you suspect the problem is with your logger, specify the DISPATCH, LOG, and SYSTEM parameters on the FMTIMS statement.

To use the following table, locate your problem area in the top row. Then read that column to find the suggested formatting options (marked with an X) for that problem.

Parameters	Problem area							
	Checkpoint/ Restart	DB	DC	FP	Log	System/other	Batch	CICS
CBT		Х	Х			Х	Х	Х
CBTE			Х					
DB		Х					Х	Х
DBRC		Х				Х	Х	Х

Table 225. FMTIMS parameters for general problems

Parameters	Problem area								
	Checkpoint/ Restart	DB	DC	FP	Log	System/other	Batch	CICS	
DC			Х				2		
DEDB		Х		Х					
DISPATCH	Х	Х	Х	Х	X	Х	3		
EMH		Х	X	х					
LOG					X		Х		
MSDB		Х		x					
QM			Х				2		
RESTART	х						2		
SAP			X						
SAVEAREA <sup>1</sup>	х	X	X	x	Х	Х	2		
SB		Х				Х	Х	Х	
SCD <sup>1</sup>	х	Х	Х	х	Х	х	х	х	
SPST	х			х			2		
SUBS						х	2		
SUMMARY <sup>1</sup>	х	Х	Х	х	Х	x	х	х	
UTIL			Х	х			2		

Table 225. FMTIMS parameters for general problems (continued)
---

Notes:

1. You can use the single parameter (SYSTEM) to get the three areas (SAVEAREA, SCD, SUMMARY).

2. This parameter is ignored for batch.

3. (DISPATCH, MIN) is ignored for batch.

See "Solving IMS problems by using the IMS Offline Dump Formatter" on page 532 for a list of the modules formatted with each of the parameters. See "Syntax restrictions on the FMTIMS statement" on page 549 to understand the syntax rules for FMTIMS statements.

## Using the dump title to choose FMTIMS parameters

When you are deciding which areas to format for your problem, you can use the CALLER and TCB fields of the dump title (described in "Dump title" on page 561) as a guide. Unless one or both of these fields specify "unknown," they should indicate why a dump was taken.

The following table shows the options you can choose based on valid CALLER and TCB information in the dump title.

CALLER=	TCB=	Recommended FMTIMS options <sup>1</sup>
CTL	CTL LOG ESS LSD LSM RDS RST STC STM	DC <sup>2,</sup> Dispatch <sup>2,</sup> QM <sup>2,</sup> Summary, System <sup>2</sup> Dispatch <sup>2,</sup> SPST, System <sup>2,</sup> SUBS, Summary Dispatch, Log, Restart, Summary, System Dispatch <sup>2,</sup> MSDB, Savearea, SCD <sup>2,</sup> Summary Dispatch <sup>2,</sup> MSDB, Savearea, SCD <sup>2,</sup> Summary Restart, Savearea, SCD <sup>2,</sup> Summary Restart, Savearea, SCD <sup>2,</sup> Summary CBT, Dispatch <sup>2,</sup> Savearea, SCD <sup>2,</sup> Summary CBT, Dispatch <sup>2,</sup> Savearea, SCD <sup>2,</sup> Summary
CURR <sup>3</sup>	DYA	Dispatch <sup>2,</sup> System <sup>2</sup>
DBRC	DBR	DBRC <sup>2,</sup> System <sup>2</sup>
DL/I	DLI STC	DB <sup>2,</sup> Dispatch <sup>2,</sup> SB <sup>2,</sup> System <sup>2</sup> CBT, Dispatch <sup>2,</sup> Savearea, SCD <sup>2,</sup> Summary
DP	BMP DEP	DB <sup>2,</sup> System <sup>2</sup> DB <sup>2,</sup> System <sup>2</sup>
FP	BMP DEP <sup>4</sup> XFP	DB <sup>2,</sup> DEDB, MSDB, System <sup>2</sup> DB <sup>2,</sup> DEDB, MSDB, System <sup>2</sup> DB <sup>2,</sup> SPST, System <sup>2</sup>
LOG	LOG	Log <sup>2,</sup> System <sup>2</sup>

Table 226. FMTIMS parameters based on CALLER and TCB fields

Notes:

1. When you have a WAIT or LOOP problem, add SAVEAREA to your list of FMTIMS options.

2. Use the MIN qualifier for these options.

3. Normally dynamic allocation.

4. Can be either the MPP or the BMP region.

If CALLER=CURR, the current address space and IMS control region are dumped. This occurs when no CALLER parameter is provided or no IMSDUMP parameter list is passed and DFSFDMP0 cannot match the caller's TCB address and address space ID (ASID) with the TCBs in the IMS TCB table. You can still format the dump data set using the abend number and PSW as a guide in solving the problem. Dynamic allocation also causes CURR to be placed in the CALLER= field. In this case, format the areas listed in the above table.

If CALLER=DP, the abend occurred under the task of a dependent region address space.

If CALLER=IRLM, you need to use the IRLM Offline Dump Formatter to format the IRLM modules.

If CALLER=TRAP, a diagnostic trap for an address space abended.

## **Offline Dump Formatter parameters**

The Offline Dump Formatter provides the option of choosing an 80-column output format in addition to the default value of 120/132 columns. This option allows viewing of formatter output on an 80-column-width screen without needing to shift left or right.

The 80-column format mode is normally selected when the IMS Offline Dump Formatter is run under IPCS and the IPCS default is set to TERMINAL NOPRINT or TERMINAL PRINT. This allows dump and z/OS formatting to be similar under IPCS. To select the 80-column format mode, add an "H" to the IMSDUMP formatter verb parameter string between the IMS job name and the FMTIMS keyword. The following are examples of 80-column format option requests under IPCS.

VERBX IMSDUMP 'imsname,R,H,D' VERBX IMSDUMP 'imsname,H,FMTIMS SCD' VERBX IMSDUMP 'imsname,D,H,R,FMTIMS (AUTO,MIN)'

## Sample FMTIMS statements

You might be able to identify a problem area more precisely by using the CALLER= and TCB= identification from the dump title along with the abend number and explanation. For example, you might see CALLER=CTL in the dump title and have an abend code that shows an error in the checkpoint restart processing. In this case, you can try specifying the statement: FMTIMS (RESTART, SAVEAREA, (SCD, MIN), SUMMARY)

Following is a list of possible subsets you could format for specific error situations. This list is not exhaustive and is not meant to represent every possible error situation.

## IMS control region problems (CALLER=CTL)

An IMS control region address space task abended. A common definition is SYS—System Services.

#### SYS/CHKPT

System Service Checkpoint Restart Processing

FMTIMS (SUMMARY, SAVEAREA, (SCD, MIN), RESTART)

## SYS/CNTRL

System Service Control

FMTIMS (SUMMARY, SAVEAREA, (SCD, MIN), (DISPA, MIN))

#### SYS/ESS

System Service External Subsystem Support

FMTIMS ((SYSTEM,MIN),SPST,(DISPA,MIN),SUBS)

#### SYS/INIT

System Service Initialization

FMTIMS (SUMMARY, SAVEAREA, (SCD, MIN))

#### SYS/QMGR

System Service Message Queue Management

FMTIMS (SUMMARY, SAVEAREA, (SCD, MIN), (DISPA, MIN), QM)

## SYS/SCHD

System Service Scheduling

FMTIMS ((SYSTEM,MIN),SPST,(DISPA,MIN))

## SYS/SMGR

System Service Storage Management

FMTIMS ((SYSTEM,MIN),SPST,CBT)

## DBRC problems (CALLER=DBRC)

A DBRC address space task abended. You would use the same FMTIMS statement for all of the following problems with Database Recovery Control:

## DBRC/CMD

Database Recovery Control Command Processing

## DBRC/CNTRL

Database Recovery Control Processor

#### **DBRC/EXIT**

Database Recovery Control Exit Processing

### **DBRC/SER**

Database Recovery Control Services

FMTIMS ((SYSTEM,MIN),(DBRC,MIN))

### Data communication problems (CALLER=CTL)

An IMS data communication task abended under the CTL TCB.

#### DC/CMD

Data Communication Command Processing

FMTIMS ((SYSTEM,MIN),DC)

#### DC/CNTRL

Data Communication Control

## FMTIMS ((SYSTEM,MIN),(DC,MIN),(DISPA,MIN),(QM,MIN))

## DC/CONV

Data Communication Conversational Processing

FMTIMS ((SYSTEM,MIN),(DC,MIN))

## DC/LMGR

Data Communication Line Manager

FMTIMS ((SYSTEM,MIN),(DC,MIN))

#### DC/MFS

Data Communication Message Format Services

FMTIMS ((SYSTEM,MIN),(DC,MIN))

## DC/TPCALL

Data Communication DL/I Telecommunications

Call Processing

FMTIMS ((SYSTEM,MIN),(DC,MIN),(DB,MIN))

## DL/I problems (CALLER=DL/I or CALLER=DP)

A DL/I address space task abended.

### **DB/ACSMTH**

Database Access Method Interface

FMTIMS ((SYSTEM,MIN),(DB,MIN))

## **DB/ANAL**

Database Call Analyzer

FMTIMS ((SYSTEM,MIN),(DB,MIN))

#### **DB/CMGR**

Database Call Resource Management

FMTIMS ((SYST,MIN),(DB,MIN),(DISPA,MIN),(SB,MIN))

#### **DB/DBCALL**

Database Call Action Processing

FMTIMS ((SYSTEM,MIN),(DB,MIN))

## **DB/INTRF**

Database Application/Scheduling Interface

FMTIMS ((SYSTEM,MIN),(DB,MIN),(DISPATCH,MIN))

## Fast Path problems (CALLER=FP)

A Fast Path task abended.

#### FP/CNTRL

Fast Path Control FMTIMS ((SYSTEM,MIN),(DB,MIN),SPST)

### **FP/DEDB**

Fast Path Data Entry Database Processing FMTIMS ((SYSTEM,MIN), (DB,MIN), (DEDB,MIN))

## FP/EMH

Fast Path Expedited Message Handling Call Analyzer FMTIMS ((SYSTEM, MIN), (DB, MIN), (EMH, MIN))

#### **FP/MSDB**

Fast Path Main Storage Database Call Analyzer FMTIMS ((SYSTEM,MIN), (DB,MIN), (MSDB,MIN))

## Log problems (CALLER=LOG)

An IMS control region address space log TCB task abended. Log is part of SYS—System Services.

## SYS/LOG

System Service Logging

FMTIMS ((SYSTEM,MIN),(LOG,MIN))

## Other problems

If you suspect that the failure was in VSAM, you do not need to run AMBLIST to secure a listing of VSAM modules IDA019L1 and IDA0192A of the failing system. Data Facility Products (DFP) formats the entry points for these modules. IMS includes LPA modules in offline dump data sets only if LPALIB is listed in the SDUMP options for your system. However, this is not recommended because the LPA modules occupy so much space in the dump data sets.

z/OS MVS Diagnosis: Tools and Service Aids describes how to generate a z/OS trace.

## Dump contents returned for different FMTIMS options

You can specify different FMTIMS options to add different types of information to a formatted IMS system dump.

The options are listed in alphabetical order. FMTIMS options can be specified on the FMTIMS statement in any order. The requested options are printed in the order stated under "Formatted dump output order" on page 564.

Some options state they "are ignored for batch." If the dump was taken because batch processing (IMS DB or CICS) failed, the control blocks for these options are either meaningless or not included in the dump data set. Therefore, the control blocks are not formatted even if you specify that option on the FMTIMS statement.

Most options can be specified with the MIN qualifier. Whenever possible, specify this qualifier to reduce the number of control blocks formatted. You can always format the dump data set again if you need the additional information.

#### ALL

Causes a full, formatted dump.

(ALL,MIN) formats the dump as if each option were specified with the MIN qualifier.

#### AOI

Formats the storage for the Type 2 Automated Operator Control blocks.

#### **AUTO**

Provides an optimal subset of the IMS dump formatting options without having to first analyze the dump and without having to understand the content or use of all of the IMS dump formatting options.

This option uses the failing ITASK type information to choose one of the formatter's functional areas, and selects the appropriate dump formatter options.

#### CBT

Formats storage management area control blocks, including:

- Control Block Table Header
- Individual Control Block Table entries

Output is the same if (CBT,MIN) is specified.

## CBTE, cbteid

Formats all the IPAGEs for the identified CBTE type (cbteid), including:

- Individual Control Block Table entries
- All IPAGE storage of the requested CBTE type

For example, if you specify (CBTE,DPST), all DPST IPAGEs are formatted.

This option can be repeated as needed and has no defaults. The requested IPAGEs must be part of the dump data set. MIN is not valid for the CBTE option.

#### CLB/LLB

Permits formatting of an individual Communication Line Block or Link Line Block and its subordinate blocks. Select this option by the following:

- Address
- Node name
- LTERM name
- Communication ID

Select the LLB by address or link number.

The CLB/LLB format creates eye catchers and index entries similar to the following:

```
**CLB/LLB REQUESTED CLB/LLB
```

**DB** Formats areas and control blocks used for IMS Database functions. The following table shows the areas formatted under the (DB) and (DB,MIN) FMTIMS options.

Table 227. Formatted are	as under the F	MTIMS options	DB and DB,MIN

(DB)	(DB,MIN)
PSB Directory	same
DMB Directory	same
Intent List	not formatted
BFSP	same
DL/I Trace	same
Fast Path Trace (if Fast Path is active)	same
OSAM Pool Control Blocks and buffers	OSAM Pool Control Blocks only
Program Isolation blocks	same
All PSTs and related control blocks, including PCBs, SDBs, Savearea set, alternate DL/I DECB, DSGLRKEY, hierarchical holder, delete work area, RPLI, VSAM PLH, and retrieve trace	Active PSTs, with the same related control blocks
If Fast Path is present: EPSTs and related control blocks, including EPCBs, ESRTs, EMHBs, message buffers, XCRBs, DMHRs, and DEDB buffers	If Fast Path is present: EPSTs and related control blocks, including EPCBs, ESRTs, EMHBs, XCRBs, and DMHRs
VSAM buffer pool control blocks	same
RLPL for IRLM requests	same

In a DL/I–SAS environment, DPST formatting does not format related control blocks if the DL/I address space was not included in the dump data set.

#### DBRC

Formats records used by DBRC in its processing, including:

- DFSRCWKB block
- DFSBRLSB block
- Dump Router storage
- Global Data block

- GDBDLTAR block
- GDBDSAAR block
- GDBRECAR block
- GDBLISAR block
- DSPEXIAG block
- DSPEXOPM block
- VFYWSPAC block
- DSPOCPAG block
- DSPJCLAR block
- GDBGPDAR block
- GDBRUPAR block
- GDBOLCAR block
- GDBMNPTR block
- GDBESAVE block
- GDBISAVE block
- GDBCSAVE block
- GDBRSAVE block
- DSPCMPAG block
- DSPVFILE block
- DBRC Internal Trace

Output is the same if (DBRC,MIN) is specified. DBRC blocks must be present in the dump data set to be formatted.

**DC** Formats the data communication areas listed in the following table. This option is skipped if the CTL address space is not included in the dump data set.

#### Table 228. Data communication areas formatted by DC and DC,MIN

	( <b>D C L</b> ( <b>D L</b> ) <sup>1</sup>		
(DC)	(DC,MIN) <sup>1</sup>		
All CLBs, LXBs, and LCBs, with subordinate control blocks:	Active CLBs, LXBs, and LCBs, with the sam subordinate control blocks except that curren CTB or LTB and CNT are not formatted.		
<ul> <li>Current CTB or LTB, and CNT</li> </ul>			
Allocated I/O buffers			
CIB, if using MFS processing			
• CCB, if using conversational processing			
MFS work buffers			
• ECNT, EMHB, and message buffer, if the CTB shows a Fast Path terminal			
SMB table	not formatted		
CTT table	not formatted		
SPQBs and the CNTs chained off unallocated SPQBs	not formatted		
Note:			

- 1. (DC,MIN) formats control blocks only for those lines, nodes, and links that meet at least one of the following criteria:
  - a. MSC links
  - b. Nodes in OPNDST or CLSDST processing
  - c. Lines or nodes with allocated input, output, or receive any buffers
  - d. CLBs that have an active SAP

Both DC options are ignored for batch.

#### DEDB

Formats the DEDB control blocks and areas. The areas included are listed in the following table.

Table 229. DEDB control block areas formatted by DEDB and DEDB,MIN

(DEDB)	(DEDB,MIN)
ALDS	same
DMCBs, SGTs, FDTs, and MRMBs for open DEDBs	same
DMACs and ADSC for open DEDB areas	same
XCRBs, DMHRs, and buffers	XCRBs and DMHRs only
SRBs and ESRBs	same

#### DISPATCH

Formats areas relating to the IMS Dispatcher and its functions. The following table shows the areas formatted under this FMTIMS option.

Table 230. Areas formatted by DISPATCH and DISPATCH, MIN

(DISPATCH)	(DISPATCH,MIN)	
Dispatcher work areas	not formatted	
Dispatcher Trace	same	
Scheduler Trace	not formatted	
Latch Trace	same	

(DISPATCH,MIN) is ignored for batch.

#### **DPST**, jobname

DPST, N, dependent region number

#### **DPST,A,**address

Permits formatting of an individual Dependent Region Partition Specification Table and its subordinate blocks for PSTs related to MPPs, BMPs, IFPs, and batch DL/I. You can specify one of the following choices:

- job name
- Dependent region number
- DPST address

Output follows the DB formatting output in the dump formatter. The eye catchers and index entries appear as follows:

\*\*DPSTS REQUESTED DPSTS

#### EMH

Formats the Expedited Message Handler areas that are used by IMS Fast Path, as shown in the following table. The CTL address space must be included in the dump data set for this option to be formatted.

Table 231. Areas formatted by EMH and EMH, MIN

ЕМН	EMH,MIN
RCTEs	same
BALGs, EMHBs, and message buffers	BALGs and EMHBs only

#### LOG

Formats control blocks and areas used by the IMS logger. The areas included shown in the following table. These areas, except for the WADS and the DLOG trace, are repeated in the dump when the IMS Monitor is active.

Table 232. Areas formatted by LOG and LOG, MIN

LOG	LOG,MIN
LCD	same
Restart Log Work Area	same
WADS and the data necessary to manage it	WADS only
OLDS prefix and the buffer associated with it	OLDS prefix only
Log DSET, which defines all OLDS currently available for use	same
Message work areas and Logger message areas	same
DLOG trace	same

#### MSDB

Formats the Main Storage Databases used by IMS Fast Path. The areas included are listed in the following table.

Table 233. Main storage databases formatted by MSDB and MSDB,MIN

MSDB	MSDB,MIN
MSDB headers	same
all MSDBs	not formatted

#### POOL, NAME, poolid

Invokes formatting of the storage manager control blocks and the pool storage for any of the following pools:

- ALL
- CESS
- CIOP
- DBWP
- DLDP
- DLMP
- DPSB
- EMHB
- EPCB
- FPWP
- -----
- HIOP
- MFBP
- PSBW
- QBFL
- QBUF
- SPAP
- LUMC
- LUMP

NAME is an optional keyword indicating the pool name parameter. If NAME is omitted, the first parameter is assumed to be the pool name.

The poolid is a required 4-character pool name of an existing storage manager pool or the keyword ALL. If ALL is specified, the following storage pools are formatted:

- HIOP
- CIOP
- CESS
- SPAP
- EMHB
- FPWP
- QBUF
- OBFL
- DLMP
- DPSB
- DBWP
- MFBP
- EPCB
- LUMP
- LUMC

ALL triggers the formatting of any storage manager trace table entries along with the storage manager control blocks and pool storage.

MIN is an optional keyword. If MIN is specified for one of the dynamic pools (HIOP, CIOP, EMHB, FPWP, CESS, SPAP, LUMC, LUMP) only the storage manager pool header and block headers are formatted. If MIN is omitted, the pool header control block is formatted along with the blocks and block headers representing the dynamic storage pool.

**QM** Formats the control blocks and areas of the IMS queue manager. The formatter skips this option if the CTL address space is not included in the dump data set. The areas included are shown in the following table.

Table 234. Areas formatted by QM and QM,MIN

QM	QM,MIN
Qpool Prefix	same
Qpool Buffer Prefix	same
Qpool Buffer	not formatted

Both QM options are ignored for batch.

#### RESTART

Formats the IMS restart control blocks and related areas, including:

- Checkpoint ID table
- SIDXs and their subordinate blocks:
  - All LCREs for the SIDX entry being processed
  - All RREs for the SIDX entry being processed
- All RPSTs for the SIDX entry being processed
- FRB, if present

Output is the same if (RESTART,MIN) is specified. Both RESTART options are ignored for batch.

### SAP, ECBADR, ecbaddr

#### SAP, ADDRESS, sapaddr

The SAP option can be invoked using either the SAP address or the SAP's ECB address (providing that the ECB is a valid ITASK and has a prefix pointing to a SAP). The SAP option request can be placed either on the IMSDUMP verb line after FMTIMS or in the DFSFRMAT data set. The following examples show SAP option requests:

VERBX IMSDUMP'imsjname,II,N,FMTIMS (SAP,ADDRESS,20864C0)'
VERBX IMSDUMP'imsjname,FMTIMS SCD,(SAP,ECBADR,3064250)'

For compatibility reasons, the MIN qualifier is allowed, but the output is the same. Individual SAP option formatting is also available on the IMS Low Level panel of the IMS IMS Dump Formatter dialog. The ADDRESS parameter can be omitted because ADDRESS is the default TYPE for the SAP option.

Individual SAP/save area formatting allows complete formatting of SAP/save areas when additional information is required. The output from individual SAP formatting is the same as the SAVEAREA option output. Individual SAP formatting provides the following eye catcher/index entry:

\*\*SAPS REQUESTED SAPS

### SAVEAREA

Formats the save area information, including:

• Formatted SAPs and any UEHBs anchored off the SAPs.

**Restriction:** The UEHBs cannot be formatted if the CTL address space is not included in the dump data set.

- Formatted Save Area Sets associated with each SAP.
- Unformatted dump of the IPAGEs containing the SAPs.

If the DL/I address space is not in the data set, then the DL/I SAPs are not formatted. If the CTL address space is not in the data set, then the non-DL/I SAPs are not formatted. Output is the same if (SAVEAREA,MIN) is specified. Both SAVEAREA options are ignored for batch.

The SAVEAREA also comes with a summary option that allows a faster overview scan of the IMS ITASK status within a dump. The SAVEAREA SUMmary output reduces the SAP/Savearea formatting to minimal data while adding keyword scan capability and automatic computation of the exit offsets. This reduces keystroke resources required to overview the ITASK status and ITASK module flow. The SAVEAREA SUMmary and individual SAP formatting provides the following eye catcher/index entry:

\*\*SSS SAP/SAVE CONDENSED SUMMARY

SAVEAREA SUMmary formatting contains the following scannable keywords with their associated meanings:

**RUN** ITASKs that are active are given a RUN indicator. Abend and loop analysis is usually concerned only with running ITASKs.

#### LATCHREQ

ITASKs that are waiting for an IMS SLX latch (not checkpoint restart LATE latches) are given a LATCHREQ indicator. Enabled wait problem analysis often requires analyzing ITASKs that are waiting for latches.

#### LATCHOWN

ITASKs that own an IMS SLX latch (not checkpoint restart LATE

latches) are given a LATCHOWN indicator. Enabled wait problem analysis often requires analyzing ITASKs that own SLX latches.

### **ITASK type**

The ITASK type is in the summary and is scannable. The ITASK type names are not at the end of the scan list, however. The ITASK type is preceded by the label "type". The possible type names can be gotten from the DFSCIR macro prolog.

**SB** Formats the control blocks, areas, and buffers of the Sequential Buffering function (SB) of IMS. This option also formats those DL/I control blocks which are important for debugging the SB function.

The SB information is divided into four sections. The following table shows which sections are formatted with the SB and SB,MIN options.

Table 235. Sections formatted by SB and SB,MIN

SB,MIN	
same	
same <sup>2</sup>	
same <sup>2</sup>	
not formatted	
	same same <sup>2</sup> same <sup>2</sup>

### Note:

- 1. The DL/I address space must be included in the dump data set for these areas to be formatted.
- 2. Formatted only if you requested a conditional SB activation for that application or PST.

The SB information is divided into the following sections:

- 1. Subsystem Overview of SB—provides an overview of SB control blocks from an IMS subsystem point-of-view. The SDCBs appear in the order in which they are anchored in the SBSCD. Each SDCB is followed by its SDSGs. The section contains the following information:
  - SB section of the SCD
  - SBSCD, including the SBHE blocks
  - SDCBs
  - SDSGs
- 2. PST Overview of SB—formats the SB control blocks (and other IMS control blocks significant to SB) for each active PST. These blocks are sorted in hierarchical order. For example, the first DBPCB and its JCB, DSGs, EDSGs, and SDSGs; then the second DBPCB with its subordinate blocks, and so on. The section contains the following information:
  - SB and buffer-handler sections of the PST
  - PST DECB prefix
  - SB extensions to the PST
  - SB work area
  - SBPARMS
  - DBPCBs and their JCBs, DSGs, ESDGs, and SDSGs
- **3**. Sorted SB Blocks—contains SB control blocks (and other IMS control blocks significant to SB) sorted according to their virtual storage address. The section contains the following information:
  - DBPCBs

- DCB with its OSAM extensions
- DSGs
- ESDGs
- JCBs
- OV-IO DECB prefix
- PST DECB prefix
- SB extensions to DCBs
- SB extensions to DSGs
- SB extensions to the PST
- SB work area
- SBPARMS
- SBUFs
- SCARs
- SRANs
- 4. Sorted SB Buffers—contains the SB buffers of each SB buffer pool. The SB buffers of one SB buffer pool are contiguous in storage and are formatted as one entity. The buffer pools are then sorted by virtual storage address.

#### SCD

Formats the IMS SCD and related areas. The areas included are listed in the following table.

Table 236. Areas formatted by SCD and SCD,MIN

(SCD)	(SCD,MIN)
SCD	same
Latch Extensions	same
Scheduler Sequence Queues	not formatted
Synchronous APPC/OTMA Shared Message Queue SCD Extension	same
Fast Path SCD Extension, if Fast Path is active	same
Formatted dumps of the batch key 7 SCD	same
LU 6.2 SCD extension	same

#### SPST

Formats the system PSTs, which are ITASKs used by IMS. This includes:

- Global system PSTs
- Local control region address space PSTs
- Local DL/I address space PSTs
- Areas related to the above PSTs, including LWA and IRLMA

Some SPSTs are not formatted if the CTL address space is not in the dump data set. Output is the same if (SPST,MIN) is specified. Both SPST options are ignored for batch.

#### SUBS

Formats the areas and control blocks that IMS uses to manage subsystems, including:

- Subsystem trace
- Global ESET block

Output is the same if (SUBS,MIN) is specified. Both SUBS options are ignored for batch.

### SUMMARY

Formats the current diagnostic section.

The SUMMARY data areas are not formatted if the SDWA address space is not part of the dump data set. (For abends and batch processing, the SDWA address is saved by the ESTAE module. For online processing, the dump must be taken by DFSOFMD0, and the SDWA parameter must be passed at DFSDUMP time.)

The areas formatted with this option include:

- Failing PSW
- Abend code
- Module name
- Registers at time of abend
- 256 byte instruction area—128 bytes above and below the failing PSW
- 16 register storage areas—512 bytes above and 256 bytes below the registers at time of abend
- SDWA address space of IMS
- Failing SAP and its UEHB
- Failing ITASK when the ITASK is a DPST, system PST, CLB, or LLB (dependent region errors, some systems services errors, terminal process errors, and MSC errors)

The SUMMARY option names the ITASK type when it is determined, even if it is not one of the ITASK types that provide for additional formatting. The ITASK type name is two to four characters. If it is unknown, the type name is "UNKN".

Output is the same if (SUMMARY,MIN) is specified.

#### SYSPST

Permits formatting of an individual system partition specification table and some of its subordinate blocks. Select this option by address or system PST name. This option creates eye catchers and index entries similar to the following:

\*\*SYSPSTS

REQUESTED SYSTEM PSTS

#### SYSTEM

Formats the SUMMARY, SAVEAREA, and SCD areas as one group. The areas and control blocks formatted are the same as if each of the options were invoked separately.

(SYSTEM,MIN) is formatted as though each of the options were specified with MIN.

See the individual options for a list of the areas formatted.

#### TRACE, NAME, table-id

Gets a new search module that invokes the normal trace format control module (DFSATRA0) to format trace tables separately. This option enables viewing of trace table data without having to format the entire option that usually includes the formatted trace table. The TRACE option request uses the 2-character trace table EBCDIC ID code from the Trace Selection panel. The IMS Dump Formatter ISPF panels also accept an option of "ALL" to format all IMS trace table traces. The IMS Dump Formatter dialog TRACE SELECTION panel provides a selectable list of IMS trace tables with the trace name, internal ID, and description. The following examples are TRACE format requests, followed by comments for each. In each case, the NAME keyword can be omitted because NAME is the default TYPE parameter. The following example is a request for the DL/I trace table.

FMTIMS...(TRACE,NAME,DL),...

The following is a request for the dispatcher trace table and the DL/I trace table with a MIN option that is ignored.

FMTIMS...,(TRACE,NAME,DL,MIN),(TRACE,NAME,DS)...

### UTIL

Formats the control blocks for the IMS Partial Database Reorganization utility, including:

- Common area
- Database table
- Segment table
- Action table

The output is the same if (UTIL,MIN) is specified. Both UTIL options are ignored for batch.

## Related concepts:

"Dump formatting options" on page 570

## Invoking the IMS Offline Dump Formatter under IPCS

You can invoke the Offline Dump Formatter under IPCS by using a VERBX command or by using menus.

## Using a VERBX command

Enter FMTIMS and the valid IMS format options after the job name and any refresh, debug, half line, and nonheader options. The following is an example. VERBX IMSDUMP, 'imsname,D,H,R,FMTIMS (SAP,ADDRESS,1234580)'

# Syntax restrictions on the FMTIMS statement

The format control data set requires adherence to ten syntax rules, but the sequence in which you apply the rules does not matter.

The control statements in the format control data set must follow the following syntax rules:

- The first record must contain "FMTIMS".
- A comma (,) must separate parameters from their qualifiers (MIN or cbteid).
- The number of leading blanks on both the initial record and on subsequent records is not limited.
- The last 8 bytes of all records are ignored by the formatter; you can use them for sequence numbers or any other purpose.
- A comma after the last parameter on any record indicates continuation to the next record. You can split a parameter and its qualifier, but you cannot split the spelling of a parameter over two records. For example: FMTIMS ((SYSTEM,MIN),(LOG,

MIN))

is acceptable, but the following is not: FMTIMS ((SYS

TEM,MIN),(LOG,MIN))

Notice that you can insert blanks between the last parameter in a record and the end of that record.

- The order in which the options are specified in the control statement data set has no effect on the dump formatting output order.
- Blanks imbedded within the parameters on a given record cause the formatter to assume the control statement is ended.
- The options can be uppercase or lowercase EBCDIC; they are translated to uppercase before being processed.
- Options can be specified by any unique number of the option's lead characters. If a non-unique abbreviation is passed, the first matching option is chosen. The FMTIMS verb cannot be abbreviated.
- Enclose an option that has a qualifier in parentheses.

# Contents formatted for FMTIMS options

FMTIMS options can be specified on the FMTIMS statement in any order.

## Contents formatted for FMTIMS options

The options are listed in alphabetical order.

Some options state they "are ignored for batch." If the dump was taken because batch processing (IMS DB or CICS) failed, the control blocks for these options are either meaningless or not included in the dump data set. Therefore, the control blocks are not formatted even if you specify that option on the FMTIMS statement.

Most options can be specified with the MIN qualifier. Whenever possible, specify this qualifier to reduce the number of control blocks formatted. You can always format the dump data set again if you need the additional information.

### ALL

Causes a full, formatted dump.

(ALL,MIN) formats the dump as if each option were specified with the MIN qualifier.

#### AOI

Formats the storage for the Type 2 Automated Operator Control blocks.

#### AUT0

Provides an optimal subset of the IMS dump formatting options without having to first analyze the dump and without having to understand the content or use of all of the IMS dump formatting options.

This option uses the failing ITASK type information to choose one of the formatter's functional areas, and selects the appropriate dump formatter options.

#### CBT

Formats storage management area control blocks, including:

- Control Block Table Header
- Individual Control Block Table entries

Output is the same if (CBT,MIN) is specified.

#### CBTE, cbteid

- Formats all the IPAGEs for the identified CBTE type (cbteid), including:
- Individual Control Block Table entries

• All IPAGE storage of the requested CBTE type

For example, if you specify (CBTE,DPST), all DPST IPAGEs are formatted.

This option can be repeated as needed and has no defaults. The requested IPAGEs must be part of the dump data set. MIN is not valid for the CBTE option.

### CLB/LLB

Permits formatting of an individual Communication Line Block or Link Line Block and its subordinate blocks. Select this option by the following:

- Address
- Node name
- LTERM name
- Communication ID

Select the LLB by address or link number.

The CLB/LLB format creates eye catchers and index entries similar to the following:

\*\*CLB/LLB REQUESTED CLB/LLB

**DB** Formats areas and control blocks used for IMS Database functions. The following table shows the areas formatted under the (DB) and (DB,MIN) FMTIMS options.

Table 237. Formatted areas under the FMTIMS options DB and DB,MIN
---

(DB)	(DB,MIN)
Data Base Tracker Blocks	same
Coupling Facility Block	same
PSB Directory	same
DMB Directory	same
Intent List	not formatted
BFSP	same
DL/I Trace	same
Fast Path Trace (if Fast Path is active)	same
OSAM Pool Control Blocks and buffers	OSAM Pool Control Blocks only
Program Isolation blocks	same
All PSTs and related control blocks, including PCBs, SDBs, Savearea set, alternate DL/I DECB, DSGLRKEY, hierarchical holder, delete work area, RPLI, VSAM PLH, and retrieve trace	Active PSTs, with the same related control blocks
If Fast Path is present: EPSTs and related control blocks, including EPCBs, ESRTs, EMHBs, message buffers, XCRBs, DMHRs, and DEDB buffers	If Fast Path is present: EPSTs and related control blocks, including EPCBs, ESRTs, EMHBs, XCRBs, and DMHRs
VSAM buffer pool control blocks	same
RLPL for IRLM requests	same

In a DL/I–SAS environment, DPST formatting does not format related control blocks if the DL/I address space was not included in the dump data set.

## DBRC

Formats records used by DBRC in its processing, including:

- DFSRCWKB block
- DFSBRLSB block
- Dump Router storage
- Global Data block
- GDBDLTAR block
- GDBDSAAR block
- GDBRECAR block
- GDBLISAR block
- DSPEXIAG block
- DSPEXOPM block
- VFYWSPAC block
- DSPOCPAG block
- DSPJCLAR block
- GDBGPDAR block
- GDBRUPAR block
- GDBOLCAR block
- GDBMNPTR block
- GDBESAVE block
- GDBISAVE block
- GDBCSAVE block
- GDBRSAVE block
- DSPCMPAG block
- DSPVFILE block
- DBRC Internal Trace

Output is the same if (DBRC,MIN) is specified. DBRC blocks must be present in the dump data set to be formatted.

**DC** Formats the data communication areas listed in the following table. This option is skipped if the CTL address space is not included in the dump data set.

Table 238. Data communication areas formatted by DC and DC,MIN

(DC)	(DC,MIN) <sup>1</sup>
All CLBs, LXBs, and LCBs, with subordinate control blocks:	Active CLBs, LXBs, and LCBs, with the same subordinate control blocks except that current
Current CTB or LTB, and CNT	CTB or LTB and CNT are not formatted.
Allocated I/O buffers	
CIB, if using MFS processing	
• CCB, if using conversational processing	
MFS work buffers	
• ECNT, EMHB, and message buffer, if the CTB shows a Fast Path terminal	
SMB table	not formatted
CTT table	not formatted
SPQBs and the CNTs chained off unallocated SPQBs	not formatted

Table 238. Data communication areas formatted by DC and DC,MIN (continued)

(DC)	(DC,MIN) <sup>1</sup>	

Note:

- 1. (DC,MIN) formats control blocks only for those lines, nodes, and links that meet at least one of the following criteria:
  - a. MSC links
  - b. Nodes in OPNDST or CLSDST processing
  - c. Lines or nodes with allocated input, output, or receive any buffers
  - d. CLBs that have an active SAP

Both DC options are ignored for batch.

#### DEDB

Formats the DEDB control blocks and areas. The areas included are listed in the following table.

Table 239. DEDB control block areas formatted by DEDB and DEDB,MIN

(DEDB)	(DEDB,MIN)
ALDS	same
DMCBs, SGTs, FDTs, and MRMBs for open DEDBs	same
DMACs and ADSC for open DEDB areas	same
XCRBs, DMHRs, and buffers	XCRBs and DMHRs only
SRBs and ESRBs	same

### DISPATCH

Formats areas relating to the IMS Dispatcher and its functions. The following table shows the areas formatted under this FMTIMS option.

Table 240. Areas formatted by DISPATCH and DISPATCH,MIN

(DISPATCH)	(DISPATCH,MIN)	
Dispatcher work areas	not formatted	
Dispatcher Trace	same	
Scheduler Trace	not formatted	
Latch Trace	same	

(DISPATCH, MIN) is ignored for batch.

#### **DPST,** jobname

DPST,N,dependent region number

## DPST,A,address

Permits formatting of an individual Dependent Region Partition Specification Table and its subordinate blocks for PSTs related to MPPs, BMPs, IFPs, and batch DL/I. You can specify one of the following choices:

- job name
- Dependent region number
- DPST address

Output follows the DB formatting output in the dump formatter. The eye catchers and index entries appear as follows:

\*\*DPSTS REQUESTED DPSTS

EMH

Formats the Expedited Message Handler areas that are used by IMS Fast Path, as shown in the following table. The CTL address space must be included in the dump data set for this option to be formatted.

Table 241. Areas formatted by EMH and EMH,MIN

ЕМН	EMH,MIN
RCTEs	same
BALGs, EMHBs, and message buffers	BALGs and EMHBs only

#### LOG

Formats control blocks and areas used by the IMS logger. The areas included shown in the following table. These areas, except for the WADS and the DLOG trace, are repeated in the dump when the IMS Monitor is active.

Table 242. Areas formatted by LOG and LOG, MIN

LOG	LOG,MIN
LCD	same
Restart Log Work Area	same
WADS and the data necessary to manage it	WADS only
OLDS prefix and the buffer associated with it	OLDS prefix only
Log DSET, which defines all OLDS currently available for use	same
Message work areas and Logger message areas	same
DLOG trace	same

#### MSDB

Formats the Main Storage Databases used by IMS Fast Path. The areas included are listed in the following table.

Table 243. Main storage databases formatted by MSDB and MSDB,MIN

MSDB	MSDB,MIN
MSDB headers	same
all MSDBs	not formatted

### POOL, NAME, poolid

Invokes formatting of the storage manager control blocks and the pool storage for any of the following pools:

- AIOP
- ALL
- CESS
- CIOP
- CMDP
- DBWP
- DLDP
- DLMP
- DPSB
- DYNP

- EMHB
- EPCB
- FPWP
- HIOP
- MFBP
- PSBW
- QBFL
- QBUF
- SPAP
- LUMC
- LUMP

NAME is an optional keyword indicating the pool name parameter. If NAME is omitted, the first parameter is assumed to be the pool name.

The poolid is a required 4-character pool name of an existing storage manager pool or the keyword ALL. If ALL is specified, the following storage pools are formatted:

- AIOP
- HIOP
- CIOP
- CMDP
- CESS
- DYNP
- SPAP
- EMHB
- FPWP
- QBUF
- QBFL
- DLMP
- DPSB
- DBWP
- MFBP
- EPCB
- LUMP
- LUMC

ALL triggers the formatting of any storage manager trace table entries along with the storage manager control blocks and pool storage.

MIN is an optional keyword. If MIN is specified for one of the dynamic pools (AOIP, CESS, CIOP, CMDP, DYNP, EMHB, FPWP, HIOP, LUMC, LUMP, or SPAP) only the storage manager pool header and block headers are formatted. If MIN is omitted, the pool header control block is formatted, along with the blocks and block headers that represent the dynamic storage pool.

**QM** Formats the control blocks and areas of the IMS queue manager. The formatter skips this option if the CTL address space is not included in the dump data set. The areas included are shown in the following table.

Table 244. Areas formatted by QM and QM,MIN

QM	QM,MIN
Qpool Prefix	same
Qpool Buffer Prefix	same
Qpool Buffer	not formatted

Both QM options are ignored for batch.

#### RESTART

Formats the IMS restart control blocks and related areas, including:

- Checkpoint ID table
- SIDXs and their subordinate blocks:
  - All LCREs for the SIDX entry being processed
  - All RREs for the SIDX entry being processed
- All RPSTs for the SIDX entry being processed
- FRB, if present

Output is the same if (RESTART, MIN) is specified. Both RESTART options are ignored for batch.

#### SAP, ECBADR, ecbaddr

#### SAP, ADDRESS, sapaddr

The SAP option can be invoked using either the SAP address or the SAP's ECB address (providing that the ECB is a valid ITASK and has a prefix pointing to a SAP). The SAP option request can be placed either on the IMSDUMP verb line after FMTIMS or in the DFSFRMAT data set. The following examples show SAP option requests:

VERBX IMSDUMP'imsjname, II, N, FMTIMS (SAP, ADDRESS, 20864C0)'

VERBX IMSDUMP'imsjname, FMTIMS SCD, (SAP, ECBADR, 3064250)'

For compatibility reasons, the MIN qualifier is allowed, but the output is the same. Individual SAP option formatting is also available on the IMS Low Level panel of the IMS IMS Dump Formatter dialog. The ADDRESS parameter can be omitted because ADDRESS is the default TYPE for the SAP option.

Individual SAP/save area formatting allows complete formatting of SAP/save areas when additional information is required. The output from individual SAP formatting is the same as the SAVEAREA option output. Individual SAP formatting provides the following eye catcher/index entry: \*\*SAPS

**REQUESTED SAPS** 

#### SAVEAREA

Formats the save area information, including:

Formatted SAPs and any UEHBs anchored off the SAPs.

Restriction: The UEHBs cannot be formatted if the CTL address space is not included in the dump data set.

- · Formatted Save Area Sets associated with each SAP.
- Unformatted dump of the IPAGEs containing the SAPs.

If the DL/I address space is not in the data set, then the DL/I SAPs are not formatted. If the CTL address space is not in the data set, then the non-DL/I SAPs are not formatted. Output is the same if (SAVEAREA, MIN) is specified. Both SAVEAREA options are ignored for batch.

The SAVEAREA also comes with a summary option that allows a faster overview scan of the IMS ITASK status within a dump. The SAVEAREA SUMmary output reduces the SAP/Savearea formatting to minimal data while adding keyword scan capability and automatic computation of the exit offsets. This reduces keystroke resources required to overview the ITASK status and ITASK module flow. The SAVEAREA SUMmary and individual SAP formatting provides the following eye catcher/index entry:

\*\*SSS SAP/SAVE CONDENSED SUMMARY

SAVEAREA Summary formatting contains the following scannable keywords with their associated meanings:

**RUN** ITASKs that are active are given a RUN indicator. Abend and loop analysis is usually concerned only with running ITASKs.

### LATCHREQ

ITASKs that are waiting for an IMS SLX latch (not checkpoint restart LATE latches) are given a LATCHREQ indicator. Enabled wait problem analysis often requires analyzing ITASKs that are waiting for latches.

#### LATCHOWN

ITASKs that own an IMS SLX latch (not checkpoint restart LATE latches) are given a LATCHOWN indicator. Enabled wait problem analysis often requires analyzing ITASKs that own SLX latches.

### **ITASK type**

The ITASK type is in the summary and is scannable. The ITASK type names are not at the end of the scan list, however. The ITASK type is preceded by the label "type". The possible type names can be gotten from the DFSCIR macro prolog.

**SB** Formats the control blocks, areas, and buffers of the Sequential Buffering function (SB) of IMS. This option also formats those DL/I control blocks which are important for debugging the SB function.

The SB information is divided into four sections. The following table shows which sections are formatted with the SB and SB,MIN options.

Table 245. Sections formatted by SB and SB,MIN

SB	SB,MIN
Subsystem overview	same
PST overview <sup>1</sup>	same <sup>2</sup>
Sorted blocks <sup>1</sup>	same <sup>2</sup>
Sorted buffers <sup>1</sup>	not formatted

#### Note:

- 1. The DL/I address space must be included in the dump data set for these areas to be formatted.
- 2. Formatted only if you requested a conditional SB activation for that application or PST.

The SB information is divided into the following sections:

- 1. Subsystem Overview of SB—provides an overview of SB control blocks from an IMS subsystem point-of-view. The SDCBs appear in the order in which they are anchored in the SBSCD. Each SDCB is followed by its SDSGs. The section contains the following information:
  - SB section of the SCD
  - SBSCD, including the SBHE blocks

- SDCBs
- SDSGs
- 2. PST Overview of SB—formats the SB control blocks (and other IMS control blocks significant to SB) for each active PST. These blocks are sorted in hierarchical order. For example, the first DBPCB and its JCB, DSGs, EDSGs, and SDSGs; then the second DBPCB with its subordinate blocks, and so on. The section contains the following information:
  - SB and buffer-handler sections of the PST
  - PST DECB prefix
  - SB extensions to the PST
  - SB work area
  - SBPARMS
  - DBPCBs and their JCBs, DSGs, ESDGs, and SDSGs
- **3.** Sorted SB Blocks—contains SB control blocks (and other IMS control blocks significant to SB) sorted according to their virtual storage address. The section contains the following information:
  - DBPCBs
  - DCB with its OSAM extensions
  - DSGs
  - ESDGs
  - JCBs
  - OV-IO DECB prefix
  - PST DECB prefix
  - SB extensions to DCBs
  - SB extensions to DSGs
  - SB extensions to the PST
  - SB work area
  - SBPARMS
  - SBUFs
  - SCARs
  - SRANs
- 4. Sorted SB Buffers—contains the SB buffers of each SB buffer pool. The SB buffers of one SB buffer pool are contiguous in storage and are formatted as one entity. The buffer pools are then sorted by virtual storage address.

#### SCD

Formats the IMS SCD and related areas. The areas included are listed in the following table.

Table 246. Areas formatted by SCD and SCD,MIN

(SCD)	(SCD,MIN)
SCD	same
Latch Extensions	same
Scheduler Sequence Queues	not formatted
Synchronous APPC/OTMA Shared Message Queue SCD Extension	same
Fast Path SCD Extension, if Fast Path is active	same

Table 246. Areas formatted by SCD and SCD,MIN (continued)

(SCD)	(SCD,MIN)
Formatted dumps of the batch key 7 SCD	same
LU 6.2 SCD extension	same

#### SPST

Formats the system PSTs, which are ITASKs used by IMS. This includes:

- Global system PSTs
- Local control region address space PSTs
- Local DL/I address space PSTs
- · Areas related to the above PSTs, including LWA and IRLMA

Some SPSTs are not formatted if the CTL address space is not in the dump data set. Output is the same if (SPST,MIN) is specified. Both SPST options are ignored for batch.

#### SUBS

Formats the areas and control blocks that IMS uses to manage subsystems, including:

- Subsystem trace
- Global ESET block

Output is the same if (SUBS,MIN) is specified. Both SUBS options are ignored for batch.

#### SUMMARY

Formats the current diagnostic section.

The SUMMARY data areas are not formatted if the SDWA address space is not part of the dump data set. (For abends and batch processing, the SDWA address is saved by the ESTAE module. For online processing, the dump must be taken by DFSOFMD0, and the SDWA parameter must be passed at DFSDUMP time.)

The areas formatted with this option include:

- Failing PSW
- Abend code
- Module name
- Registers at time of abend
- 256 byte instruction area—128 bytes above and below the failing PSW
- 16 register storage areas—512 bytes above and 256 bytes below the registers at time of abend
- SDWA address space of IMS
- Failing SAP and its UEHB
- Failing ITASK when the ITASK is a DPST, system PST, CLB, or LLB (dependent region errors, some systems services errors, terminal process errors, and MSC errors)

The SUMMARY option names the ITASK type when it is determined, even if it is not one of the ITASK types that provide for additional formatting. The ITASK type name is two to four characters. If it is unknown, the type name is "UNKN".

Output is the same if (SUMMARY,MIN) is specified.

## SYSPST

Permits formatting of an individual system partition specification table and some of its subordinate blocks. Select this option by address or system PST name. This option creates eye catchers and index entries similar to the following:

\*\*SYSPSTS

REQUESTED SYSTEM PSTS

### SYSTEM

Formats the SUMMARY, SAVEAREA, and SCD areas as one group. The areas and control blocks formatted are the same as if each of the options were invoked separately.

(SYSTEM,MIN) is formatted as though each of the options were specified with MIN.

See the individual options for a list of the areas formatted.

#### TRACE, NAME, table-id

Gets a new search module that invokes the normal trace format control module (DFSATRA0) to format trace tables separately. This option enables viewing of trace table data without having to format the entire option that usually includes the formatted trace table. The TRACE option request uses the 2-character trace table EBCDIC ID code from the Trace Selection panel. The IMS Dump Formatter ISPF panels also accept an option of "ALL" to format all IMS trace table traces. The IMS Dump Formatter dialog TRACE SELECTION panel provides a selectable list of IMS trace tables with the trace name, internal ID, and description. The following examples are TRACE format requests, followed by comments for each. In each case, the NAME keyword can be omitted because NAME is the default TYPE parameter. The following example is a request for the DL/I trace table.

FMTIMS...(TRACE,NAME,DL),...

The following is a request for the dispatcher trace table and the DL/I trace table with a MIN option that is ignored.

FMTIMS...,(TRACE,NAME,DL,MIN),(TRACE,NAME,DS)...

#### UTIL

Formats the control blocks for the IMS Partial Database Reorganization utility, including:

- Common area
- Database table
- Segment table
- Action table

The output is the same if (UTIL,MIN) is specified. Both UTIL options are ignored for batch.

"Formatted dump contents"

"Table of control block definitions" on page 75

## Formatted dump contents

The title for a formatted dump varies, depending on the parameters provided. The output includes eye catchers and an index to help you locate individual control blocks.

# **Dump title**

The contents of the dump titles that are created by the dump assist module (DFSFDMP0) and the initialization routines vary, depending on the internal DFSDUMP parameters provided and the SDUMP errors met.

The following examples show five possible dump title formats.

## Title format 1

DFSFDMP0 issued the SDUMP and passed the SDWA parameter. The CALLER parameter was either passed to DFSFDMP0 or the routine generated the parameter using the IMS TCB table.

ljjjjjjjj ABEND SYS sss USER uuuu-rrr, DATE.TIME: ddd.tttttt, CALLER=cccc, TCB=xxx, MODULE=mmmmmmmmm,i

*l* Length of title in hexadecimal - here 91 decimal.

*jjjjjjj* Job name.

- sss System abend code.
- *uuuu* User abend code.
- *rrr* Optional user abend reason code.
- *ddd* Julian day of year.
- *tttttt* Time, in the form HHMMSS.

*cccc* DFSDUMP caller parameter or blanks.

xxx Abending TCB or 'UNK'.

ттттттт

Abending module or 'UNKNOWN', using the SDWA.

*i* Indicator if primary (P) or secondary (S) request.

## Title format 2

DFSFDMP0 issued the SDUMP, but did not have an SDWA. The CALLER parameter was either passed to DFSFDMP0 or the routine generated the parameter by using the IMS TCB table.

*ljjjjjjj DATE.TIME: ddd.ttttt*, IMS DUMP REQUESTED, CALLER=*cccc*, TCB=*xxx*, REASON=*rrr*,*i* 

- *l* Length of title in hexadecimal here 80 decimal.
- *jjjjjjj* Job name.
- *ddd* Julian day of year.
- *tttttt* Time, in the form HHMMSS.
- *cccc* DFSDUMP caller parameter or blanks.
- *xxx* Abending TCB or 'UNK'.
- *rrr* Optional user reason code.
- *i* Indicator if primary (P) or secondary (S) request.

# Title format 3

*l* Length of title in hexadecimal - here X'5D'.

*jjjjjjj* DBCTL job name.

DRAthd

Abend component of DRA:

**DRA** DRA control processing abended.

#### DRATHD

DRA thread abended.

- *t* Abend type:
  - **S** System abend.
  - U User abend.

*nnnn* Abend code for:

Hex System abend.

Decimal

User abend.

#### *mmm...m*

Message text (up to 40 characters) that describes the error. See the possible error messages following this example.

#### RTKN =

16-byte recovery token (present only for DRA thread abends).

- *rrr...r* First 8 bytes of the recovery token in characters. It identifies the ID of the CCTL region.
- *xxx...x* Second 8 bytes of the recovery token in hexadecimal.

The possible error messages for mmm...m follow. The issuing module precedes the message text.

#### DFSPRRA0,

# Title format 4

The SNAP call facility identifies calling routines that generate snap dumps. Supervisor call (SVC) dumps are generated only for the intended abend codes or status codes, and for unknown calling routines.

This dump is created by DFSERA20 when a SNAP dump is requested. The title is the format:

nnnnnnn IMS USER ABEND uuuu, DATE.TIME: ddd.ttttt,i

nnnnnnn

IMS name.

- *uuuu* The user abend code or UNK if a SNAP was requested, but there was no abend set.
- *ddd* Julian day of year.

*tttttt* Time, in the form HHMMSS

*i* Indicator if primary (P) or secondary (S) requested.

## Title format 5

This dump is created by DFSERA20 when a SNAP dump is requested. The format is generated for dumps that are taken when an unexpected DL/I status code is returned during HALDB Online Reorganization. The title is the format: *nnnnnnn* UNEXPECTED STATUS CODE *cc*, DATE.TIME: *ddd.tttttt*, *i* 

### nnnnnnn

IMS name.

- *cc* The unexpected status code returned during HALDB Online Reorganization.
- *ddd* Julian day of year.
- *tttttt* Time in the form HHMMSS.
- *i* Indicator if primary (P) or secondary (S) requested.

cc is the unexpected status code returned during HALDB Online Reorganization.

## Eye catchers

To help you locate areas that are dumped, eye catchers are printed near the major control blocks in the formatted dump. Eye catchers are also useful when you are using IPCS to view the formatted dump. Examples of eye catchers are:

\*\*SCD

System Contents Directory Area

- \*\*SSA SAP and Save Area
- \*\*SB-1 Subsystem Overview for Sequential Buffering

Eye catchers are also listed at the top of the formatted dump.

## Index

The formatted dump also contains an index at the end that is created by the z/OS Index Service routine. Index entries are created each time an eye catcher is processed during formatting, and after the Offline Dump Formatter finishes processing.

Entry length is limited to 40 decimal characters.

#### Formatted dump output order

The following list shows the order in which the Offline Dump Formatter prints control blocks. If you specify **FMTIMS ALL** and all necessary data is available to the formatter, you get all of the areas listed. The order does not change when you specify subset options, but only the areas you specify are formatted. Descriptive information has been added for some control blocks where it is useful.

#### **ODF** Initialization Messages

These messages appear when the formatter is unable to find particular address spaces in the dump data set.

## Eye catchers

Eye catchers of the areas that you requested to be formatted on this pass of the formatter.

An eye catcher could be included in this list even if the Offline Dump Formatter was unable to format the control block, because the list is built from the parameters you include in the FMTIMS statement.

## Diagnostic Area

Contains the PSW, system and user completion codes, save area ID of the module that was executing, and registers in use when abnormal termination occurred.

#### **Instruction Area**

Contains the area of storage from 128 bytes before to 128 bytes after the address of the failing instruction in the PSW.

#### **Register Area**

This area contains 512 bytes above and 256 bytes below each register value in the passed SDWA. The address space ID (ASID) used is the one passed in the SDWA.

### System Diagnostic Work Area

The mapping DSECT is IHASDWA.

#### Referenced SAP

The mapping DSECT is ISAP.

## System Contents Directory

The mapping DSECT is ISCD.

#### SCD Latch Extension

The mapping DSECT is ISCD.

#### Scheduler Sequence Queues

Controls the status of each region. The mapping DSECT is ISCD.

## Synchronous APPC/OTMA Shared Message Queue SCD Extension

The mapping DSECT is DFSCSCD.

#### **FP ESCD**

The mapping DSECT is DBFESCD.

## **Control Block Table**

Contains entries of control blocks that macro DFSCBTS uses for tracking. The mapping DSECT is DFSCBTS.

#### **Control Block Table Pools**

All IPAGEs for CBTE types requested with the (CBTE, cbteid) option.

#### Save Area Trace

#### SAPs with their Active UEHBs

#### Save Area Prefix

All SAPs are SNAPed. Each SAP is followed by its save area set. At the end of this section, all of the SAP IPAGEs are dumped.

#### IMS Task Dispatch Work Area

The mapping DSECT is IDSPWRK.

#### DBRC Task Dispatch Work Area

If present in the system, it is mapped.

#### IMS Control Task Dispatch Work Area

Contains the same information as the IMS log task dispatch work area.

#### Dependent Region Dispatch Work Area

For every dependent region in IMS, the dispatcher work area is mapped.

#### Dispatcher Trace Data

DSECT IDSPWRK contains the function codes associated with the dispatcher and an explanation of each code.

#### Scheduler Trace Data

Scheduler trace data is mapped by DFSSCHED. The trace entries contain scheduler function codes.

## Latch Trace Data

The trace entries contain latch and unlatch function codes. The mapping DSECT is IDLIVSAM TRACENT.

#### **Timer Work Areas**

These are control blocks used by the internal IMS timers.

## System PSTs

These are system work areas for any online or batch region. The mapping DSECT is IPST.

### **Restart Work Areas**

See RESTART "Solving IMS problems by using the IMS Offline Dump Formatter" on page 532 for a list of these areas.

#### Log Control Directory

Contains information about the IMS log. The mapping DSECT is LCDSECT.

#### Log Work Areas

#### Log Buffers

Each log buffer contains buffer information and the log control DECB. The mapping DSECT is LCDSECT.

#### **Open Record**

Contains the type 06 log record. The mapping DSECT is ILOGREC.

#### **Control Record**

Contains the type 42 log record. The mapping DSECT is ILOGREC.

#### Monitor Log Directory

Contains the same information as the log control directory.

#### **DLOG Trace Data**

Trace table used to show IMS logging activity. The mapping DSECT is ILOGREC (67FA).

### Subsystem Control Table

## Attach Work Areas

### **PSB Directory**

A SNAP of the PSB directory. The mapping DSECT is PDIR.

#### DMB Directory

A SNAP of the DMB directory. The mapping DSECT is DDIR.

#### Intent List

The DL/I address space must be in the dump data set for this list to be formatted.

## Fast Path Trace

## Dependent Region PST formatting

For each DPST:

- PST
- Savearea
- PDIR
- Intent List
- PSB prefix
- PSB Index Maintenance, Index I/O, I/O, SSA, and User Parms work areas
- SMB
- DB PCB blocks
- · Delete work area
- Retrieve Trace
- HD Space Trace
- FLDS
- RPL
- IRLM area
- PST log work area
- Fast Path EPST and chain addresses, ECNTs, EMH message, EPCBs, XCRBs, and DMHR

#### BFSP

Formats the buffer pool prefix. The mapping DSECT is BFSP.

#### BFUS

Formats the subpool prefix. The mapping DSECT is BFUS. The mapping DSECT is RPLI.

## DL/I Data

A dump of the DL/I lock activity and program isolation trace table. The mapping DSECT is IDLIVSAM TRACENT.

## Lock Activity Trace Data

See DL/I Data.

## **Program Isolation Data**

Includes the QEL, QCB and REQ areas. The mapping DSECT is XC00.

#### **OSAM Control Blocks**

The system attempts to follow the main pool, the subpool header, and the buffer prefix, and to dump the buffer. However, if an error is encountered during formatting, the entire buffer pool is SNAPed from the last valid subpool address.

#### DL/I Trace Table

## Sequential Buffering Blocks

Sequential Buffering information is grouped into the following four sections.

(See the explanation of the (SB) FMTIMS option "Solving IMS problems by using the IMS Offline Dump Formatter" on page 532 for a complete list of the blocks dumped in each section.)

- 1. Subsystem Overview for Sequential Buffering
- 2. PST Overview of Sequential Buffering control blocks
- 3. Formatted Sequential Buffering control blocks
- 4. Sequential Buffering buffers

#### **DEDB Formatting**

Fast Path EMH Formatting

#### Fast Path MDSB Formatting

#### Communication Line Blocks and Subordinate Blocks<sup>2</sup>

For each CLB line, all the control blocks associated with that line are formatted.

## CTB<sup>2</sup>

The mapping DSECT is ICLI CTBBASE=0.

## Input Buffer<sup>2</sup>

A SNAP of the input buffer, if input is active.

## Output Buffer<sup>2</sup>

A SNAP of the output buffer, if output is active.

#### CCB<sup>2</sup>

Present if a conversation is active or held. The mapping DSECT is ICLI CCBBASE=0.

#### CIB<sup>2</sup>

Present if MFS is in use. The mapping DSECT is ICLI CIBBASE=0.

## Communication Terminal Table<sup>2</sup>

Defines terminal characteristics. The mapping DSECT is ICLI CTTBASE=0.

## SPQB Entries<sup>2</sup>

Entries on the subpool queue block chain. Unallocated CNTs are also formatted here.

## SMB Table<sup>2</sup>

This table defines transaction characteristics in the IMS system. The mapping DSECT is IAPS SMBBASE=0.

## Queue Manager Pool Prefix and Buffers<sup>2</sup>

The mapping DSECTs are ICLI POOLBASE=0, ICLI BFRBASE=0, and QPOOL. The buffer prefix list contains the address of each buffer's prefix, status byte, and first and last pending and current device relative record number (DRRN).

## **Batch Utility Areas**

#### **DBRC Work Areas**

<sup>2.</sup> These areas are not dumped in a DBCTL environment.

### LUM Trace

Allows LU 6.2 activities to be analyzed with the MVS/ESA APPC trace entries by the LU manager.

#### **Related reference:**

"Contents formatted for FMTIMS options" on page 550

## Edited command buffer format

The edited command buffer is logged in the X'02' log record and is passed to the AOI user exit. You can use the edited command buffer to determine if any recoverable commands were issued for the resource you are analyzing.

## Edited command buffer examples

For example, if you are analyzing a hung terminal problem, look at any log records, including X'02' records, that apply to that terminal.

However, finding the applicable log records might be difficult. If the problem is repeatable, you can use the /LOG command to mark the log when certain activities are started or stopped. The /LOG command writes a comment to a X'02' log record. This narrows the range of log records you need to examine.

**Example:** If transaction XYZ results in a hung terminal, use the /LOG command to write a comment to a X'02' log record before the transaction is started and after the terminal is hung, as follows:

/LOG START XYZ TRAN THAT RESULTED IN HUNG TERMINAL. /LOG TERMINAL IS NOW HUNG.

Look for these comments in the X'02' log record edited command buffers to determine the range of log records to examine.

The following figure shows the layout of the edited command.

FL	000	N	FL	Ke	yword abbreviati	on	F		FL
A G 1	CCC	К	A G 2	C N T	Parameter or password	D D L	A G 2	//	A G 3

Figure 79. Edited command layout

#### Figure Number

Description

#### FLAG1

X'FE' to denote the beginning of the edited command. If any parameter contains an error, the command action modules set this byte to X'FC'. An exception is DFSICL40 processing of "ALL" expanded parameters.

- CCC First 3 characters of entered command.
- NK Hexadecimal value of number of keywords in the condensed buffer.

### FLAG2

One of the following:

- X'FC' Parameter that follows found in error.
- X'FF' 3-byte keyword abbreviation follows.
- **X'FE'** Count (CNT) field and parameter follow.
- C'(' Count (CNT) field and password follow.

#### **Keyword Abbreviation**

First 3 characters of entered command. Consult DFSCKWDO to obtain the abbreviation; it is sometimes the first 3 characters of any keyword.

**CNT** Count of number of characters in parameter or password immediately following the CNT. It can be a comma, period, blank, or left parenthesis.

## Parameter or Password

Exists exactly as entered from the terminal.

**DDL** The delimiter entered after the parameter or password. It may be X'80' if the keyword "ALL" was expanded to individual parameters.

#### FLAG3

Period indicating end of command.

**Exception:** Only parameter passwords are present in the condensed buffer; command passwords are not present.

## IMS Dump Formatter

The IMS Dump Formatter provides ISPF dialog support for IMS Offline Dump Formatter requests, and simplifies the process of making requests by providing menus for format option selection, help members for online options, automatic terminal and spool output control, and a configuration panel to provide interactive assistance in defining the IMS environment.

The IMS Dump Formatter menu is available from the component analysis section of the IPCS dialogs (IPCS ISPF selection 2.6).

## Dump formatting options

General formatting options are available for IMS and z/OS memory dumps.

- Offline IMS or z/OS formatting from a SYS1.DUMPxx (SDUMP) data set
- Offline IMS or z/OS formatting from a SYSMDUMP data set
- Online IMS or z/OS formatting directed to either a SYSABEND or SYSUDUMP SYSOUT class
- Online z/OS formatting directed to either a SYSABEND or SYSUDUMP spinoff dump SYSOUT class

The dumping options that are in effect in an IMS environment depend on:

- Whether execution is online or batch.
- Whether the error might terminate IMS.
- The FMTO EXEC parameter that is specified.
- The SOD EXEC parameter that is specified (online execution only).
- Whether a SYSABEND, SYSUDUMP, or SYSMDUMP is chosen.
- The z/OS dump options chosen for SDUMP, SYSABEND, SYSUDUMP, and SYSMDUMP.

• Whether the Dump Override Table (DFSFDOT0) contains any entries. DFSFDOT0, and its relationship to the various dumps, is explained in *IMS Version 13 Exit Routines*.

## **FMTO** options

The FMTO options and their effect on the dumps produced are summarized in the following table, and the following codes are used:

## **Option Effect on dump produced**

- **TE** Error would terminate IMS.
- NT Error would not terminate IMS.

FDDL Formatted dump delete list processing.

- Y Yes
- **S** Yes, but only if SDUMP fails.
- N No
- Not applicable, or not attempted.

In the following table:

- The default is FMTO=D.
- SYSABEND, SYSUDUMP, and SYSMDUMP are mutually exclusive.
- z/OS formatting always accompanies IMS online formatting.
- Spinoff dumps can occur in addition to SDUMPs.

FMTO value	IMS online formatting SYSABEND SYSUDUMP			format SYSA	z/OS online formatting SYSABEND SYSUDUMP		IMS offline formatting SDUMP		IMS offline formatting SYSMDUMP		IMS spinoff dump SYSABEND SYSUDUMP	
	TE	NT	FDDL	TE	NT	TE	NT	TE	NT	TE	NT	
D	S	_	S	S	_	Y	Y	S	_	_	Y	
x	S	—	S	S	_	Y	N	S	_	_	Y	
M	N	_	N	S	_	Y	Y	S	_	_	Y	
R	N	_	N	S	—	Y	N	S	_	_	Y	
Т	Y	_	Y	Y	_	N	Y	Y	_	_	Y	
P	Y	_	N	Y	_	Ν	Y	Y	_	_	Y	
F	Y		N	Y		N	N	Y			Y	
N	N		N	Y	—	N	Y	Y	_		Y	
Z	N		N	Y	_	N	N	Y	_		Y	

## **SDUMPs**

If SDUMP is used, be aware of these additional considerations:

• If SDUMP is requested by the FMTO option, it is attempted first. If SDUMP is successful, no other dump (except a spinoff dump) is generated.

• If SDUMP fails, if IMS online formatting is requested, and if a SYSABEND or SYSUDUMP DD statement is present, a dump with IMS and z/OS online formatting is generated for terminating errors.

The formatted dump delete list (FDDL) consists of IMS module and control block names, and a dump or delete action indicator. For a module, the delete process removes storage occupied by the module. This causes the module to be omitted from the storage image portion of the dump. However, the module/save ID is printed in the dump. For a control block, the delete process similarly removes storage and storage image output if the block was successfully formatted.

- If SDUMP fails, IMS online formatting is not requested, and a SYSABEND or SYSUDUMP DD statement is present, a dump with z/OS online formatting is generated for terminating errors.
- If SDUMP fails and a SYSMDUMP DD statement is present, a machine readable dump is generated for terminating errors.

## SYSMDUMPs

If SYSMDUMP is used, be aware of these additional considerations:

- SYSMDUMP DD statements should be present in the IMS, DBRC, and DLISAS procedures.
- The SYSMDUMP DD statement must specify DISP=MOD, because it is possible for multiple tasks to generate dumps during the processing of an error.
- The SYSMDUMP data set must be refreshed (for example, scratched and reallocated) before it can be reused. If this is not done, new dumps are appended to the end of the data set and may not be accessible to the Offline Dump Formatting utility.
- Do not use SYSMDUMP in place of SYSABEND or SYSUDUMP.

## Spinoff dumps

If spinoff dumps are used, be aware of these additional considerations:

- If a spinoff dump SYSOUT class is specified (SOD EXEC parameter in the IMS control region), a spinoff dump is generated for nonterminating errors.
- Spinoff dumps allow the dump data set to be released to JES for immediate printing. (This can be useful when external subsystems are supported.)
- Spinoff dumps are only generated for those tasks that do not terminate IMS.
- If a SYSABEND or SYSUDUMP DD statement is not provided, the first dump is not printed. For subsequent dumps, the dump data set is dynamically allocated using the spinoff dump class.
- The spinoff dump class (SOD execute parameter) should be the same as the SYSABEND or SYSUDUMP SYSOUT class.

If the classes are different, the first dump goes to the class specified on the SYSABEND or SYSUDUMP DD statement. The dump data set is then dynamically deallocated to free the dump for printing and then dynamically reallocated using the spinoff dump class. Therefore, all subsequent dumps go to the spinoff dump class.

- The only valid SYSABEND or SYSUDUMP DD statement parameter used for spinoff dump is the SYSOUT class. Other parameters are ignored.
- Spinoff dumps use the default output limit established during JES definition. Incomplete spinoff dumps can result if the limit specified is too low.

## z/OS dump options

To create IMS dumps that are useful in diagnosing problems, specify the proper dump options for each type of z/OS dump used for IMS.

Use the z/OS operator command DISPLAY DUMP, OPTIONS to determine the dump options currently in effect on your system.

If the current dump options do not include the options listed in this section, the defaults that are obtained from SYS1.PARMLIB (members IEAABD00, IEADMP00, and IEADMR00) must be altered. Use the z/OS operator command CHNGDUMP to change dump options.

Table 248. z/OS dump options

Type of dump	z/OS dump options
SDUMP	SDUMP=(CSA,PSA,RGN,SQA,SUM,TRT,GRSQ)
SYSABEND	<ul> <li>SYSABEND,SDATA=(CB,DM,ENQ,ERR,IO,LSQA,SUM,TRT)</li> <li>SYSABEND,PDATA=(JPA,LPA,PSW,REGS,SA,SPLS)</li> </ul>
SYSUDUMP	<ul> <li>SYSUDUMP,SDATA=(CB,ERR,SUM)</li> <li>SYSUDUMP,PDATA=(JPA,LPA,PSW,REGS,SA,SPLS)</li> </ul>
SYSMDUMP (online system only)	SYSMDUMP=(CSA,LSQA,RGN,SQA,SUM,SWA,TRT)
SYSMDUMP (batch system only)	SYSMDUMP=(LSQA,RGN,SQA,SUM,SWA,TRT)

## IMS online system dump options

In an online IMS environment, the following dumps are possible:

• SDUMP to a SYS1.DUMPxx data set. SDUMP can then be formatted using the Offline Dump Formatter utility.

This dump can be generated both for errors that cause IMS to terminate (*terminating errors*) and for errors that do not cause IMS to terminate (*nonterminating errors*).

- SYSABEND or SYSUDUMP with IMS or z/OS formatting performed online. This dump is generated for terminating errors only if SDUMP fails or was not requested.
- SYSMDUMP to a data set. SYSMDUMP can then be formatted using the Offline Dump Formatting utility.

This dump is generated for terminating errors only if SDUMP fails or was not requested.

• Spinoff dump to SYSABEND or SYSUDUMP with z/OS formatting performed. This dump is generated for nonterminating errors and can be generated in addition to SDUMP.

## Online system dependent region dump options

Except for SDUMPs, the dumping options for the dependent regions are controlled by the following:

• The spinoff dump SYSOUT class (SOD EXEC parameter in the DFSMPR and IMSFP procedures)

• The presence or absence of a SYSABEND or SYSUDUMP DD statement in the dependent region JCL. These DD statements are mutually exclusive; provide only one.

Do not use SYSMDUMP in IMS dependent regions.

## MPP, IFP, and BMP dependent regions

In the online IMS environment, the following dumps are useful for MPP, IFP, and BMP dependent regions:

- SYSABEND or SYSUDUMP (with z/OS formatting performed online).
- Spinoff dump to SYSABEND or SYSUDUMP (with z/OS formatting). This dump is available only for MPP and IFP dependent regions.
- SDUMP to a SYS1.DUMPxx data set. (SDUMP can then be formatted using the Offline Dump Formatter utility.) An SDUMP is produced in the dependent region for certain IMS system errors involving DL/I or Fast Path. In this instance, the SDUMP is controlled by the FMTO specification for the control region.

## Spinoff dumps in dependent regions

If spinoff dumps are used, some additional considerations are necessary:

- Spinoff dumps allow the dump data set to be released to JES for immediate printing. (This can be useful for "never-ending" MPP or IFP regions.)
- If a SYSABEND or SYSUDUMP DD statement is not provided, the first dump is not be printed. For subsequent dumps the dump data set is dynamically allocated using the spinoff dump class.
- The spinoff dump class (SOD EXEC parameter) should be the same as the SYSABEND or SYSUDUMP SYSOUT class.

If the classes are different, the first dump goes to the class specified on the SYSABEND or SYSUDUMP DD statement. The dump data set is then dynamically deallocated to free the dump for printing and then dynamically reallocated using the spinoff dump class. Therefore, all subsequent dumps go to the spinoff dump class.

- The only valid SYSABEND or SYSUDUMP DD statement parameter used for a spinoff dump is the SYSOUT class. Other parameters are ignored after the first dump.
- Spinoff dumps use the default output limit established during JES definition. Incomplete spinoff dumps can result if the limit specified is too low.
- If the COBOL DEBUG option is used, dumps cannot be generated.

## Batch system dumps

In the batch IMS environment, the following dumps are possible:

- SYSMDUMP to a data set. (SYSMDUMP can then be formatted using the Offline Dump Formatting utility.) This dump is only generated for terminating errors.
- SYSABEND or SYSUDUMP (with IMS or z/OS formatting performed online). This dump is only generated for terminating errors.

## FMTO options for batch dumps

The FMTO options for batch dumps, and their effect on the dumps produced, are different from the FMTO options described in "FMTO options" on page 571. The FMTO options for batch dumps are summarized in Table 247 on page 571.

When using Batch FMTO options, remember the following:

- If a SYSMDUMP DD statement is present, a machine readable dump is generated for terminating errors.
- If IMS online formatting is requested and a SYSABEND or SYSUDUMP DD statement is present, an IMS online formatted dump is generated for terminating errors.
- If IMS online formatting is not requested and a SYSABEND or SYSUDUMP DD statement is present, a z/OS online formatted dump is generated for terminating errors.
- The default is FMTO=D.
- SYSABEND, SYSUDUMP, and SYSMDUMP are mutually exclusive.
- z/OS formatting always accompanies IMS online formatting.

In the following table, the following codes are used:

## **Option Effect on dump produced**

- **TE** Error would terminate IMS.
- **NT** Error would not terminate IMS.

FDDL Formatted dump delete list processing.

- Y Yes
- N No

## Table 249. Batch FMTO options

FMTO Value	8		z/OS C Format SYSAB SYSUE	ting SEND	Format	IMS Offline Formatting SYSMDUMP	
	TE	NT	FDDL	TE	NT	TE	NT
D	Y	—	Y	Y	—	Y	—
х	Y	—	Y	Y	_	Y	_
М	Ν	—	N	Y	_	Y	_
R	Ν	—	N	Y	_	Y	_
Т	Y	—	Y	Y	_	Y	_
Р	Y	_	N	Y	_	Y	_
F	Y	—	N	Y	_	Y	_
N	N	—	N	Y	—	Y	—
Z	Ν	—	N	Y	_	Y	_

If SYSMDUMP is used, be aware of these additional considerations:

• The SYSMDUMP DD statement should specify DISP=MOD.

• If DISP=MOD is used, then the SYSMDUMP data set must be refreshed (for example, scratched and reallocated) before it can be reused. If this is not done, new dumps are appended to the end of the data set and might not be accessible to the Offline Dump Formatting utility.

## **IMS Dump Formatter menus**

You can use the options on the IMS Dump Formatting Menu to browse the dump data set, and perform high-level or low-level IMS formatting.

To use the menus:

- 1. Go to the IPCS Component Analysis panel.
- 2. Select DFSAAMPR. The IMS Dump Formatting Primary Menu panel appears.

```
DFSAAMPR ----- IMS DUMP FORMATTING PRIMARY MENU
                                                                               ------
OPTION ===>
    0 INIT

# IMS components formatting panels

The IMS components Common Queue Server (CQS), Database Recovery Facility (DBRC), IMS Connect, Open Database Manager (ODBM), Operations Manager (OM), Repository Server (REPO), Resource Manager (RM), and Structured Call Interface (SCI), run under the Base Primitive Environment (BPE) system services, rather than the IMS system services. These components use the BPE formatter, and their format options are selected separately from the IMS Dump Formatter.

BPE direct external trace lets any component that is running under the BPE system services write ad hoc data of variable length directly to the BPE data set. To use BPE direct external trace, you must enable it when you create the trace table definition. See "Setting up IMS for diagnostics" in *IMS Version 13 System Definition*.

#### To access the BPE External Trace Formatting panels:

- 1. Select Other IMS components formatting from the IMS Dump Formatting Primary menu panel, type 6 and press **Enter**. The IMS Components panel appears.
- 2. Select the component that you are formatting or select B for the BPE formatting panel, and press **Enter**.
- **3**. Type 4 to access the BPE external trace formatting panel, and press **Enter**. The BPE External Trace Formatting panel opens. From this panel, you can select the specific component formatting to be done (for example, BPE or CQS). Dump initialization for these components is done through the BPE status and initialization panel under option 0 after step 2.

```
-- IMS BPE EXTERNAL TRACE FORMATTING MENU --

## **Related concepts:**

Base Primitive Environment overview (System Administration)

## Using the other IMS-related products formatting panels

IMS provides a selection for calling the dump formatters for products that are separate from IMS, but are still related to IMS.

Select Other IMS-related products formatting from the IMS dump formatting primary menu panel, type 7, and press **Enter** You are then presented with a list of all possible products. However, you can only use the formatters of those products that are installed on your system. Each product's formatter will provide a dump initialization panel; you should not use the panel from option 0 on the primary menu.

Figure 92. IMS Dump Formatting Primary Menu panel

## **IMS IPCS symbols**

IMS offline dump formatting creates IPCS symbols for selected key IMS control blocks. IMS creates and lists the IPCS symbols when the job name of an address space using BPE is supplied in the BPE initialization panel (for example, a CQS, OM, RM, or SCI address space).

The Interactive Formatter helps create these symbols and then uses them to make Offline Dump Formatter requests easier by providing known starting points, including starting points for CLISTs. The dump formatter also sets symbols for the registers (R0-R15) and PSW (DFSPSW) at abend for abend dumps. This allows you to quickly locate areas in storage pointed to by the registers and PSW when you are in IPCS browse mode.

# Using IMS enhanced dump analysis

You use the IMS Enhanced Dump formatting menu to browse and select formatting options for database, Fast Path, Transaction Manager and System dumps. There is also a tutorial available about the formatter and how to use the filtering tool.

1. Select option E from the IMS dump formatting primary menu. The IMS Enhanced Dump Formatting Menu displays, as shown in the following figure.

OPTION ===>	IMS ENHANCED DUMP FORMATTING MENU
1 BROWSE 2 DB 3 FP 4 TM 5 SYS 6 DBRC T TUTORI/ X EXIT	<ul> <li>Browse dump dataset (IPCS norm)</li> <li>Full Function Data Base</li> <li>Fast Path Data Base</li> <li>Transaction Management and DC</li> <li>Systems</li> <li>Database Recovery Control</li> <li>AL - IMS Dump Formatter Tutorial</li> <li>Exit EDA dump formatting menu</li> </ul>
Enter END o	or RETURN command to terminate IMS component

Figure 93. IMS Enhanced Dump Formatting Menu

In this panel, the control blocks are organized by function for ease of use. For example, EPST (the extended partition specification table) is located under option 3 for Fast Path.

- **2**. To review tutorial information about the formatter and about how to use the filtering tool, type T and press **Enter**.
- **3**. To use a filtering tool to identify filtering criteria, type on of the options 2, 3, 4, or 5 and press **Enter**.

An example of a filtering panel is shown in the following figure.

```
----- Generic Filtering Panel ------
Explanation of the fields:
   Offset (required)
                           - Offset of the field in the block.
                             (hex)
   Length (default = 1) - Length of field in the control
                            block. (decimal)
   Cond
            (default = EQ) - Type of compare to be done. (EQ,NE,
                            GT,GE,LT,LE)
   Bit
            (default = N) - Should comparison be a bit mask?
                             (Y or N)
            (default = X) - Is the value type decimal, hex, or
   Туре
                            char (D,X,A)?
   Value
            (required)
                           - Value of the field to be compared
                            at given offset.
   Oua1
                           - Qualify filter to search in
                            sub-blocks.
                           - How to combine multiple conditions.
   AND/OR
                            If blank, only the first condition
                            will be executed.
                                       (up to four conditions allowed).
```

Figure 94. Sample filtering panel

- 4. You can overwrite the generic filtering panel default values. For example, you can select criteria that presents two separate conditions. By selecting AND you indicate that both conditions must be true
  - a. You want all the blocks starting at OFFSET 1C that have a value of X'08.'

b. You want all the blocks starting at OFFSET A4 that have a non-zero value. These values are shown in the following figure.

\_\_\_\_ AND/OR (A/0) QUAL ====>

Figure 95. Sample filtering criteria

# Formatting log records for use with log analysis tools

You can use the IMS Dump Formatter to recreate the final part of an IMS log from the information that is available in an IMS dump.

The log records in the log buffers of a dump are copied to a VB file that can be analyzed by the File Select and Formatting Print utility (DFSERA10) or other log analysis tools. Log records can then be put in increasing log sequence number (LSN) order and be manipulated with the DFSERA10 utility.

1. Select option E (EDA - IMS Enhanced Dump Analysis) from the IMS Dump Formatting primary menu.

The WRITE option writes the contents of the log records that are within the buffers of the dump to a data set.

## Formatting a dump for analysis

You can use the IMS Dump Formatter to format a dump for analysis.

To format a dump for analysis:

- 1. Start IPCS with the IMS Dump Formatter.
- 2. Select the dump you want to browse.
- **3**. From the IPCS Primary Option Menu, select Option 2.6, ANALYSIS.COMPONENT.
- 4. From the Component Analysis Panel, select DFSAAMPR.
- 5. From the IMS Dump Formatting Primary Option Menu, select Option 0, INIT.
- 6. From the IMS Dump Contents Status Panel, enter the job name of either the IMS control/batch region or the IMS DLISAS region.
- 7. Press the Enter key and then PF3 to return to the IMS Dump Formatting Primary Option Menu.
- **8**. Select an option from the Primary Option Menu. HILEVEL is a good starting point because it provides a broad diagnostic overview of the problem.

# Formatting IMS dumps online

One of the tools available for problem diagnosis is the IMS formatted dump, which formats the control blocks and data areas in an IMS region.

## **Abnormal Termination**

When an abnormal termination occurs and dumping is to be performed, CSECT DFSABND0 gets control from the SCP and gives control to IMS routines to do the dumping. To assist you in locating areas that are dumped, eye catchers are supplied in the formatted dump. See "Eye catchers" on page 564 for eye catcher examples.

**Exception:** Address spaces using BPE (for example, CQS, OM, RM, and SCI) do not provide any online dump formatting output.

## Formatted dump for the CTL address space

You can use DSECT mapping macros (when applicable) to analyze control address space areas when they are dumped. The various CTL areas are listed and described.

## CTL address space areas

The following is a list of the control address space areas that are dumped (in the order in which they are dumped) and, where applicable, the DSECT mapping macros that are most useful in analyzing them. For a list of the areas dumped when LSO=S, see "Formatted dump for the DL/I address space" on page 591. Descriptive information has been added for some control blocks where it would be useful.

#### Diagnostic Area

Contains the PSW, system and user completion codes, save area ID of the module that was executing, and registers in use when abnormal termination occurred.

#### **Instruction Area**

Contains the area of storage from 128 bytes before to 128 bytes after the address of the failing instruction in the PSW.

## System Diagnostic Work Area

The mapping DSECT is IHASDWA.

#### U0113 Area

Present when an abend caused the dump.

#### **Referenced Sap**

The mapping DSECT is ISAP.

#### System Contents Directory

The mapping DSECT is ISCD.

#### SCD Extension

The mapping DSECT is DBFESCD.

#### SCD Latch Extension

The mapping DSECT is ISCD.

## Scheduler Sequence Queues

Controls the status of each region. The mapping DSECT is ISCD.

## FP ESCD

The mapping DSECT is DBFESCD.

#### **Control Block Table**

Contains entries of control blocks that macro DFSCBTS uses for tracking. The mapping DSECT is DFSCBTS.

#### Save Area Prefix

All SAPs are SNAPed except those owned by the DL/I address space. Each SAP is followed by its save area set. At the end of this section, all of the SAP IPAGES are dumped.

#### IMS Task Dispatch Work Area

The mapping DSECT is IDSPWRK.

#### DBRC Task Dispatch Work Area

If present in the system, it is mapped.

## IMS Control Task Dispatch Work Area

Contains the same information as the IMS log task dispatch work area.

#### Dependent Region Dispatch Work Area

For every dependent region in IMS, the dispatcher work area is mapped.

#### Dispatcher Trace Data

DSECT IDSPWRK contains the function codes associated with the dispatcher and an explanation of each code.

#### Scheduler Trace Data

Scheduler trace data is mapped by DFSSCHED. The trace entries contain scheduler function codes.

#### Latch Trace Data

The trace entries contain latch and unlatch function codes. The mapping DSECT is IDLIVSAM TRACENT.

#### System PSTs

These are system work areas for any online or batch region. The mapping DSECT is IPST.

#### Checkpoint ID Table

The mapping DSECT is BCPT.

#### LCRE

The mapping DSECT is DFSLCRE.

#### SIDX

The mapping DSECT is DFSSSIE.

#### RRE

The mapping DSECT is DFSRRE.

#### Log Control Directory

- Contains information about the IMS log, for example:
- DCB1—the primary log DCB
- DCB2—the secondary log DCB (if dual logs were specified)
- Log ITASK—the status information

The mapping DSECT is LCDSECT.

#### Log Buffers

Each log buffer contains buffer information and the log control DECB. The mapping DSECT is LCDSECT.

#### Log Trace

Contains entries which show IMS internal logging activity if the log trace is active. The trace entries are described by the "IDLIVSAM TRACENT" macro.

#### **Open Record**

Contains the type 06 log record. The mapping DSECT is ILOGREC.

#### **Control Record**

Contains the type 42 log record. The mapping DSECT is ILOGREC.

## Monitor Log Directory

Contains the same information as the log control directory and is used for logging data to the IMS Monitor data set.

#### **DLOG Trace Data**

Trace table used to show IMS logging activity. The mapping DSECT is ILOGREC (67FA).

### SUBS Trace Data

Trace table used by IMS to show IMS activity in attaching or detaching subsystems. The mapping DSECT is ILOGREC (67FA).

## Global ESET Block

The mapping DSECT is DFSGESE.

### **PSB Directory**

A SNAP of the PSB directory. The mapping DSECT is PDIR.

## DMB Directory

A SNAP of the DMB directory. The mapping DSECT is DDIR.

#### Fast Path Trace

#### **Dependent Region PST**

See Dependent Region PST Formatting "Formatted dump contents" on page 560 for a list of the areas formatted here.

#### OSAM I/O Control Blocks

The system attempts to dump the IOSB and IOMA blocks.

#### Sequential Buffering Blocks

Sequential Buffering information is grouped into the following three sections. (See the explanation of the (SB) FMTIMS option "Solving IMS problems by using the IMS Offline Dump Formatter" on page 532 for a complete list of the blocks dumped in each section.)

- 1. Subsystem Overview for Sequential Buffering
- 2. PST Overview of Sequential Buffering control blocks
- 3. Formatted Sequential Buffering control blocks

## **DEDB Formatting**

## Fast Path EMH Formatting

#### Fast Path MDSB Formatting

## Data Communication Control Blocks

These areas are noted in a DBCTL environment. For each CLB (line), all the control blocks associated with that line are formatted.

#### CLB

These areas are noted in a DBCTL environment. The mapping DSECT is ICLI CLBBASE=0.

#### СТВ

These areas are noted in a DBCTL environment. The mapping DSECT is ICLI CTBBASE=0.

## **Input Buffer**

These areas are noted in a DBCTL environment. A SNAP of the input buffer, if input is active.

#### **Output Buffer**

These areas are noted in a DBCTL environment. A SNAP of the output buffer, if output is active.

### CCB

These areas are noted in a DBCTL environment. Present if a conversation is active or held. The mapping DSECT is ICLI CCBBASE=0.

## CIB

These areas are noted in a DBCTL environment. Present if MFS is in use. The mapping DSECT is ICLI CIBBASE=0.

#### **Communication Terminal Table**

These areas are noted in a DBCTL environment. Defines terminal characteristics. The mapping DSECT is ICLI CTTBASE=0.

### **SPQB Entries**

These areas are noted in a DBCTL environment. Entries on the subpool queue block chain. Unallocated CNTs are also formatted here.

#### SMB Table

These areas are noted in a DBCTL environment. This table defines transaction characteristics in the IMS system. The mapping DSECT is IAPS SMBBASE=0.

## Queue Manager Pool Prefix and Buffers

These areas are noted in a DBCTL environment. The mapping DSECTs are ICLI POOLBASE=0 and ICLI BFRBASE=0.

## **Buffer Prefix List**

These areas are noted in a DBCTL environment. Contains the address of each buffer's prefix, status byte, and first and last pending and current device relative record number (DRRN).

#### **QPOOL** Prefix

These areas are noted in a DBCTL environment. Contains the main QPOOL prefix formatted. The mapping DSECT is QPOOL.

### **IRLM Control Blocks**

The IRLM Subsystem RLMCB block are formatted here if the IMS system is running with IRLM.

### Format/Dump/Delete List

Contains module names, module IDs, and module dump data that are not in the storage dump listing.

## Formatted dump for the DL/I address space

One of the tools available for problem diagnosis is the IMS formatted dump, which formats the control blocks and data areas in an IMS region. Dumped areas within the DL/I address space are listed and descriptive information has been added for some control blocks where it would be useful.

## Dumped areas within the DL/I address space

## System Contents Directory

The mapping DSECT is ISCD.

#### SCD Latch Extension

The mapping DSECT is ISCD.

## Scheduler Sequence Queues

Controls the status of each region. The mapping DSECT is ISCD.

### Save Area Trace

#### Save Area Prefix

All SAPs belonging to the DL/I address space are SNAPed. A SAP is marked "ACTIVE" if the ITASK associated with it is active. Each SAP is followed by its save area set. At the end of this section, all of the SAP IPAGES are dumped.

## DLS Task Dispatch Work Areas

The mapping DSECT is IDSPWRK.

#### DBRC Task Dispatch Work Area

If present in the system, it is mapped.

#### Dependent Region Dispatch Work Area

For every dependent region in IMS, the dispatcher work area is mapped.

#### Dispatcher Trace Data

DSECT IDSPWRK contains the function codes associated with the dispatcher and an explanation of each code.

#### Latch Trace Data

The trace entries contain latch and unlatch function codes. The mapping DSECT is IDLIVSAM TRACENT.

## System PSTs

These are system work areas for any online or batch region. The mapping DSECT is IPST.

## **PSB Directory**

A SNAP of the PSB directory. The mapping DSECT is PDIR.

### DMB Directory

A SNAP of the DMB directory. The mapping DSECT is DDIR.

## Intent List

This is a SNAP of the intent list.

### Partition Specification Table

Formats the PST. The mapping DSECT is IPST.

#### PDIR

Formats the PDIR, whose address is in the PST. The mapping DSECT for PDIR is PDIR.

## **PSB** Prefix

A SNAP of the PSB prefix, which contains the following:

- Index Maintenance Work Area
- Index I/O Work Area
- Segment Work Area
- I/O Work Area
- SSA Work Area
- User PARMS Area

#### **Buffer Handler Pool**

The system attempts to format buffer handler blocks in the order in which they are chained on the queue. However, if an error is encountered during the formatting, the entire pool is dumped as is (unchained).

The pool contains the following:

- **BFSP** Formats the buffer pool prefix. The mapping DSECT is BFSP.
- **BFUS** Formats the subpool prefix. The mapping DSECT is BFUS.
- **RPLI** Formats the DL/I RPL block. The mapping DSECT is RPLI.

#### DL/I Data

A dump of the DL/I lock activity and program isolation trace table. The mapping DSECT is IDLIVSAM TRACENT.

### Lock Activity Trace Data

See DL/I DATA.

#### **Program Isolation Data**

Includes the QEL, QCB, and REQ areas. The mapping DSECT is XC00.

#### **OSAM Control Blocks**

The system attempts to follow the main pool, the subpool header, and the buffer prefix, and to dump the buffer. However, if an error is encountered during formatting, the entire buffer pool is SNAPed from the last valid subpool address.

The pool contains the following:

#### MAINPOOL

Formats the main pool header. The mapping DSECT is IBPOOL.

## SUBPOOL

Formats the subpool header. The mapping DSECT is ISUBPL.

### **Buffer Prefix**

Formats the buffer prefix. The mapping DSECT is IBFPRF.

Buffer Physical data not mapped.

### OSAM I/O Control Blocks

The system attempts to dump the IOSB and IOMA control blocks. The mapping DSECT is QPOOL.

### Sequential Buffering Blocks

Sequential Buffering information is grouped into the following three sections. (See the explanation of the (SB) FMTIMS option "Solving IMS problems by using the IMS Offline Dump Formatter" on page 532 for a complete list of the blocks dumped in each section.)

- 1. Subsystem Overview for Sequential Buffering
- 2. PST Overview of Sequential Buffering control blocks
- 3. Formatted Sequential Buffering control blocks

## Fast Path DEDB Formatting

#### Fast Path EMH Formatting

#### Fast Path MDSB Formatting

#### **IRLM Control Blocks**

The IRLM Subsystem RLMCB block is formatted here if the IMS system is running with IRLM.

## Format/Dump/Delete List

Contains module names, module IDs, and module dump data that are not in the storage dump listing.

## SNAP call facility

The SNAP call facility (DFSERA20) produces SNAP dumps of DL/I control blocks and identifies calling routines that generate SNAP dumps. Supervisor call (SVC) dumps are generated only for the intended abend codes or status codes, and for unknown calling routines.

The SNAP call facility produces SNAP dumps of DL/I control blocks for the following items:

- External DL/I SNAP calls. The DL/I test program, DFSDDLT0, issues SNAP calls when it detects unequal conditions based on compare statements.
- Exceptional conditions, such as pseudoabends in DL/I modules and message or batch region abends.
- Internal SNAP requests from DL/I modules.
- SNAP specific requests from other IMS modules.

GSAM modules issue SNAP calls for GSAM databases. See "GSAM control block dump - DFSZD510" on page 227 for a description of the GSAM SNAP.

When a SNAP call is performed for a Fast Path region abend, module DFSERA20 bypasses some dumps:

- For a Fast Path database (an MSDB or DEDB), module DFSERA20 bypasses the DMB dump.
- For a DB PCB that refers to a Fast Path database, module DFSERA20 bypasses the DMB, DB PCB, JCB, and SDB dumps.

SNAP output consists of buffer pools and all PSB-related control blocks. Optionally, you can request subpools 0-127 in addition to the buffers and blocks.

SNAP output for exceptional conditions is always directed to the IMS log. In all other cases, IMS sends SNAP output to a data set identified on the PRINTDD DD statement. If this data set is not already open, it is opened and closed for each SNAP request. If you do not supply a PRINTDD statement, IMS sends the SNAP output to the IMS log as X'67FD' log records. When neither a SNAP data set nor the IMS log can be used for SNAPs, all SNAP actions are bypassed.

The File Select and Formatting Print utility (DFSERA10) extracts X'67FD' log records, and the exit routine (DFSERA30) formats them.

Status codes are not set for SNAP calls.

"Log records" on page 499

# /DIAGNOSE command SNAP function

The /DIAGNOSE command SNAP function provides a non-intrusive alternative to creating a console dump. Use of this command can decrease the time that is required to generate problem determination data for IBM Software Support.

The /DIAGNOSE command SNAP function takes a current snapshot of system resources at any time without negatively impacting IMS. This system resource information is displayed on the issuing LTERM. Optionally, the resource information can be sent to one of the following data sets:

- Online data set (OLDS)
- SYSOUT data set
- Trace data sets (as type X'6701' log records)

The /DIAGNOSE command SNAP function captures information for the following resources:

- A specific IMS control block. For example, the command /DIAGNOSE SNAP BLOCK(CSCD) captures storage information for the APPC/OTMA SMQ SCD Extension control block.
- One of the following user-defined resources:
  - User-defined database
  - Communication line
  - Logical link
  - Logical link path
  - Node
  - Program
  - Transaction
  - Logical terminal (LTERM)
- User

- Primary control blocks for a dependent region.
- Any area of storage within the control region address space (by specifying the address of that storage area).
- Prolog information for an IMS load module. The command /DIAGNOSE SNAP MODULE(*modname*) identifies the entry point address and captures prolog information for the specified IMS module. The prolog information contains the current maintenance level for a module on your system, which can help you to determine whether any maintenance is missing.
- A user-defined shared queues structure. The command /DIAGNOSE SNAP STRUCTURE(*structurename*) captures storage information for the DFSSQS control block storage for the specified shared queues structure.

You might also use the /DIAGNOSE command SNAP function to:

- Show filtered resource information captured by the SNAP function.
- Specify a limit for the number of lines of formatted SNAP data to display in response to the command.
- Specify the control blocks to be captured by the SNAP function.

The /DIAGNOSE command is a standard type-1 command.

/DIAGNOSE SNAP command (Commands)

# Type-1 trace table interface

For each trace, you can learn about the trace identifier, the events that are traced, and, if the trace is documented in this information, the topic where you can find more information. You use the trace identifier as an eye catcher to locate a trace in a dump.

The common trace table interface consists of the traces shown in the following table.

Trace	Table type	ID	Traced events	Where described
	ALL	ALL	All IMS table traces	
Common Service Layer trace	CSLT	CS	The interaction of IMS with the CSL	"Common Service Layer trace" on page 603
DASD log trace	DLOG	DG	DASD logging	See "DASD log" in "IMS type-1 trace function codes" on page 599
Dispatcher trace (online only)	DISP	DS	Dispatcher activities	"Dispatcher trace" on page 608
DL/I and lock	DLI/I and LOCK	DL	DL/I calls, DL/I buffer handler, DL/I OPEN/CLOSE, Delete/Replace, HD space management, lock activity using PI or IRLM, OSAM, DFP interface, ABENDU0427	"DL/I trace" on page 166

Table 250. Trace tables in the common trace interface

Trace	Table type	ID	Traced events	Where described
Enhanced Command Trace	OCMD	OC	Activity related to commands that originate from OM	Not available
External subsystem trace (online only)	SUBS	SU	Subsystem activities	"External subsystem trace" on page 617
Fast Path Trace		FT	Fast Path activity	"Fast Path trace" on page 659
Force trace	FORCE	FO	Internal trace for IMS initialization	Not in use
Intercommunications trace	IDCO	IC	VTAM exit activity	"Starting the trace" on page 271
Latch trace (online only)	LATC	LA	Latch activities	"Latch trace" on page 650
Log router trace	LRTT	LR	Log router activity	"Log router trace data" on page 459
LU trace	LUMI	LU	LU 6.2 activity	"LU manager trace" on page 326
Multiple Systems Coupling Trace	MSCT	MS	MSC activities. Not yet used.	Not applicable
ODBA trace	ODBA	OD	ODBA events	Not available
Online Recovery Manager trace	ORTT	OR	ORS activity	"Online Recovery Manager trace" on page 210
Operations Manager (OM) commands	OCMD	OC	Activity related to commands received from OM	Not available
OTMA trace	OTMT	OA	OTMA activity	"OTMA trace" on page 349
z/OS Resource Recovery Services (RRS)	RRST	RR	RRS activity in dependent region(s)	"Resource Recovery Services trace" on page 633
Queue manager trace	QMGR	QM	Queue manager activity	"Queue manager trace" on page 655
Security trace	SECT	SE	Security events	Not available
Scheduler trace (online only)	SCHD	SC	Scheduler activities	"Scheduler trace" on page 647
Shared queues interface trace	SQTT	SQ	Shared queues interface activities.	"Shared queues interface trace" on page 658
Storage Manager trace	STRG	SM	Storage Manager activities	"Storage manager trace" on page 649
Transport Manager Subsystem (TMS)	Not available	TS	TMS activity	Not available

Table 250. Trace tables in the common trace interface (continued)

# Finding type-1 trace tables in a dump

If you do not write the trace to the log data set, IMS formats trace tables as part of an IMS dump.

## How to locate trace tables

The following figure shows where to find the location of each of the traces in a dump.

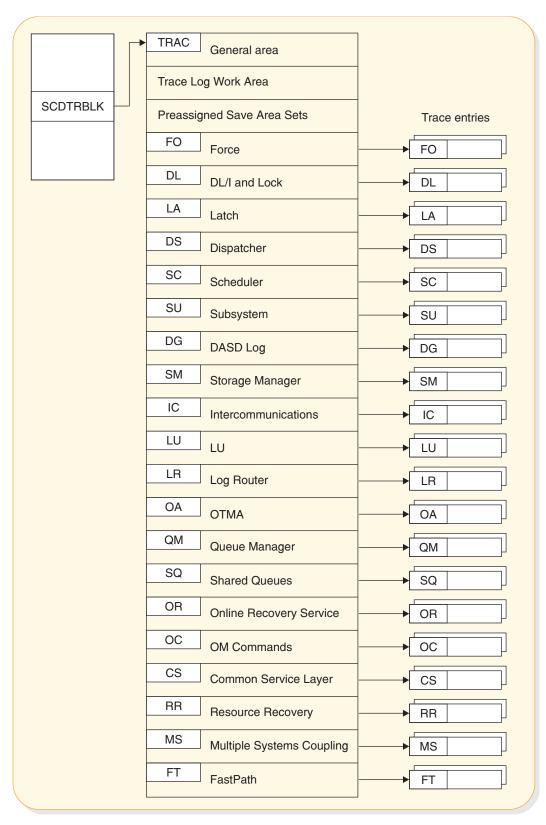

Figure 96. How to locate trace tables

# Format of type-1 trace records

By examining the trace records, you can determine the function that was being traced as well as the order in which a series of system operations took place.

In the example trace record in the following figure, the number in the trace sequence field in each entry identifies where that trace entry fits in the sequence of system operations. In addition, each trace entry provides pertinent information about that function.

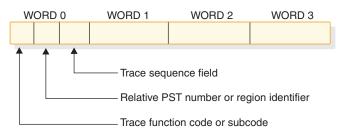

Figure 97. General trace record format

You can find the format of the trace entries by assembling macro IDLIVSAM TRACENT. Assembling IDLIVSAM after each system definition ensures that you have a current mapping of the trace record formats.

## IMS type-1 trace function codes

You use trace function codes to help you diagnose performance problems or other problems with IMS.

The following table shows some of the important functions that are traced by the common trace interface and their location in the trace tables. These function codes are a subset of all trace function codes.

You can also find a one-line description of each trace code in macro DFSTRAE0.

Trace table	Function code	Description
DL/I and lock	X'0C'	DL/I OPEN/CLOSE for each data set
	X'30'	IWAIT called with IXCTL=YES option
	X'31'	Get space for the segment
	X'32'	Free space for the segment
	X'34'	Get space close to root anchor
	X'35'	HD space management GET /ERE local serialization lock
	X'36'	HD space management release local serialization lock /ERE
	X'60'	(OSAM) I/O operation initiated
	X'61'	(OSAM) I/O operation posted
	X'62'	(OSAM) OPEN/CLOSE/EOV complete
	X'69'	Sequential buffering: invalidate SB buffers
	X'6A'	Sequential buffering: buffering evaluation
	X'6B'	Sequential buffering: description why SB was/was not used
	X'6C'	Sequential buffering: refresh SB buffers after a write

Table 251. Trace function codes

Table 251. Trace function codes (continued)

Frace table	Function code	Description
	X'6F'	Sequential buffering: search/read call issued by OSAM Buffer Handler
	X'80'	Database authorization request
	X'81'	Database change authorization request
	X'82'	Database re-authorization request
	X'AA'	DL/I call analyzer entry for each database call
	X'AB'	(VSAM) ABEND U0427
	X'B1'	Demand space set by backout or DELETE/REPLACE
	X'B2'	Free space for backout
	X'C4'	DELETE/REPLACE
	X'C7'	(PI) Exclusive control deadlock detection
	X'C8'	Lock request manager (DFSLMGR0) entry
	X'C9'	Lock request manager (DFSLMGR0) exit

### **Common Service Layer trace**

The Common Service Layer trace (CSLT) provides information about the interactions between IMS and the Common Service Layer, including how IMS interacts with the Operations Manager (OM), the Resource Manager (RM), and the Structured Call Interface (SCI).

You can turn on the Common Service Layer trace during online operation by using the /TRACE command. Each trace entry is X'20' bytes long. You can specify trace output destination and tracing volume on the /TRACE command.

If you send the output to the common trace table, you can format the table using the Offline Dump Formatter under IPCS, using either the VERBX command or the IMS Dump Formatter panels. If you send the output to an external data set, you can use the File Select and Formatting Print utility (DFSERA10) with exit routine DFSERA60 to format the trace entries.

To locate the common service layer trace in a dump, look for eye catcher \*\*CSTR.

### Format of Common Service Layer trace records

The Common Service Layer trace function and subfunction codes are listed, and the trace (low level) record format these functions with these subfunction codes (SC) are shown.

Subfunction codes (SC)	Function
X'01'	Process flow
X'02'	Storage error
X'03'	Load or delete error
X'05'	Parameter validation error
X'09'	AWE error
X'0A'	Latch error
X'0F'	Miscellaneous MVS service error
X'11'	CQS service error
X'12'	SCI service error
X'13'	RM service error
X'14'	OM service error
X'15'	Unknown function
X'16'	Parameter list version error
X'50'	SCI Input exit
X'51'	SCI Notify exit
X'80'	Terminal logon
X'81'	Terminal logoff
X'82'	User signon
X'83'	User signoff
X'84'	DFSRMAM0 query interface
X'85'	DFSRMUP0 update interface
X'86'	RM resource entry
X'90'	Miscellaneous RM directive processing errors

Table 252. Common Service Layer trace function and subfunction codes

### Subfunction code trace record format

The following diagram shows the format of the trace records for each of the subfunction codes listed above. Each trace record has a trace function code of X'A2' and is X'20' bytes long.

Word 0 –	byte 1 - Trace function code
-	byte 2 - Trace function subcode
-	byte 3-4 - Trace record sequence number
Words 1-5 -	Contains information about the activity being traced.
	The information recorded in this part of the trace record
	depends on the trace function subcode of the trace record.
Words 6-7 -	Timestamp (STCK value)

The data in words 1-5, which is specific to each trace entry, is described in the following diagrams:

Trace function subcode = X'01' Description: Process flow (Begin Process and Normal Process) - byte 1 - Service code Word 1 - byte 2 - Object type - bytes 3-4 - Module identifier Word 2 - Not used Word 3 - Not used Word 4 - Not used Word 5 - Thread ECB address Trace function subcode = X'01' Description: Process flow (End Process) Word 1 - byte 1 - Service code - byte 2 - Object type - bytes 3-4 - Module identifier Word 2 - Not used Word 3 - Not used Word 4 - Return code - Reason code Word 5 Trace function subcode = X'02' Description: Storage Request Error Word 1 - byte 1 - Service code - byte 2 - Object type - bytes 3-4 - Module identifier Word 2 - Return code - Storage length Word 3 Word 4 - Storage address Word 5 - Thread ECB address Trace function subcode = X'03'Description: Module LOAD/DELETE Error Word 1 - byte 1 - Service code - byte 2 - Object type - bytes 3-4 - Module identifier Word 2 - Return code Word 3 - bytes 1-2 - Target module identifier - bytes 3-4 - Not used - Not used Word 4 Word 5 - Thread ECB address Trace function subcode = X'04' Description: Proclib/Execute Parameter Error Word 1 - byte 1 - Service code

### **Dispatcher trace**

When you use the /TRACE SET ON TABLE DISP command, IMS enables the dispatcher trace to an internal table. This internal table is formatted in any dump that is formatted by IMS.

When you use OPTION LOG, IMS sends the entries to the log as type X'67FA' records. You can select and format these log entries by using the utility DFSERA10 with exit DFSERA30.

The following table shows the general format of a dispatcher trace entry.

Table 253. Dispatcher trace record format.

WC	ORD	0	WORD 1	WORD 2	WORD 3	WORD 4	WORD 5	WORD 6	WORD 7
Ι	Т	SEQ NUM							TIME STAMP

#### where represents

- I One-byte trace ID field. This byte indicates the type of the trace entry.
- **T** One-byte TCB ID. This byte indicates the IMS TCB type which made the trace entry.

The dispatcher trace formatting usually includes the functional area. If you need this information because the trace is in a raw format, the codes can be obtained by assembling the following macro statement DFSKDT FUNC=EQUATES.

#### **SEQ NUM**

Two-byte trace sequence number assigned by the IMS trace component.

#### TIME STAMP

Bytes 3 through 6 of the system clock (STCK) at the time the trace entry was created.

Words 1 through 6 contain data specific to each trace entry, as described below: The letter A followed by parentheses () indicates "address of" in all dispatcher trace entries listed below.

```
= X'01'
TRACE ID
 DESC = FRR driven attempting to schedule a RESUME SRB
              in IPOST common (DFSIPOTC)
      word 1 - A(Target ECB being IPOSTed). If high X'80' on,
                  this indicates recursive FRR entry

### **ITASK ECB posting**

The post exit routine and the IMS posting routine add all ECBs to the posted queue. When an IMS TCB waits for work, IMS issues a z/OS SUSPEND. This task is reactivated by a RESUME invoked by the post exit posting routine or the IMS posting routine.

### System post codes

The subset of the system post codes are listed and described.

### System post codes

The following table lists only a subset of the possible post codes.

Table 254. System post codes

Code	Description
X'40', C'BTR'	PST posted by scheduler as a result of BMP termination (Subqueues 4, 5)
Х'40', С'СНК'	PST posted by checkpoint (Subqueues 3, 4, 5, 6)
X'40', C'SMB'	PST posted by SMB enqueue when a message is received that can be processed by the PST (Subqueue 3 or 6)
X'40', C'CMD'	PST posted by command processor when /START PGM, /START TRAN, or a similar command is entered (Subqueues 3, 6)
X'40', C'ABD'	PST posted by DFSCPY00 as a result of an abend in a dependent region (Subqueues 3, 4, 5, 6)
X'40', C'PRG'	PST posted by scheduler to stop region when checkpoint purge (that is, all messages processed) is complete—this is used if MPP issued last message (Subqueue 3)
X'40', C'STP'	PST posted by DFSSTOP0 when the region is waiting in scheduler and is to be stopped (Subqueues 3, 4, 5)
X'40', C'DLG'	PST posted by DFSRDLG0 when dynamic log is free (Subqueues 3, 4, 5, 6)
X'40', C'CF4'	PST posted by DFSASK00 as a result of an abend in a dependent region (Subqueues 3, 4, 5, 6)
X'40', C'DEQ'	Terminate control processor ECB posted by DFSRST00 at restart completion
X'40', C' TO'	PST posted after ISWITCH to IMS control region TCB
X'40', C'RET'	PST posted after ISWITCH return to dependent region TCB

### External subsystem trace

You enable the external subsystem trace by using the /TRACE SET ON TABLE SUBS command. When you specify OPTION LOG, IMS writes the trace externally as type X'67FA' records.

The External Subsystem (ESS) trace entries help you analyze problems for either:

- A connection problem between the IMS control region and the external subsystem (for example, Db2 for z/OS)
- · Any problem between the IMS dependent region and the external subsystem

The following figure illustrates the external subsystem (ESS) trace record format. Each of the sixteen words is 4 bytes long. Words 0 and 1 hold the standard ESS trace record prefix. The Module ID and Sub function (WORD 1) determines what information appears in words 2 through 15.

- Standard Prefix -

Figure 98. External subsystem (ESS) trace record format

#### where represents

- I This 1-byte field contains the hexadecimal trace record ID. Two possible ID values are X'57' and X'58'. The X'57' record ID is created by a module that executes in the IMS control region (for example, the ESS mother task DFSIESI0). The X'58' record ID is created by a module that executes in an IMS dependent region (for example, DFSESCT0).
- **R** This 1-byte field is reserved.

### SEQ NUM

This 2-byte field contains the hexadecimal trace record sequence number assigned by the IMS trace component.

### MOD ID

This 2-byte field contains a hexadecimal value that identifies the module that created the trace record. Each ESS module has an associated module ID. Macro DFSESFC contains the complete list of IDs.

### SUB FUNC

This 2-byte field contains a hexadecimal value that identifies the subfunction that created the trace record within the module. For example, if a module creates a trace record in each of five internal subroutines, each subroutine has a unique SUB FUNC ID.

The following table shows:

- The ID of the module that created the trace record
- The ID of the subfunction (within the module) that created the record
- The name of the module that created the record
- A description of the event being traced

Table 255. Module ID and subfunction table

"Type-1 trace table interface" on page 595 shows an example of an external subsystem trace with both X'57' and X'58' record IDs. The ESS trace is called the subsystem (SST) trace in a dump.

### **Resource Recovery Services trace**

The Resource Recovery Services trace (RRST) provides information about relevant z/OS Resource Recovery Services (RRS) events in the IMS dependent region. Use the trace under direction of IBM Software Support when problems are suspected in the RRS area.

You enable the Resource Recovery Services trace by using the /TRACE SET ON TABLE RRST command. When you specify OPTION LOG, IMS writes the trace externally as type X'67FA' records.

#### **Related concepts:**

"Diagnostics for use with synchronous APPC and OTMA with shared queues" on page 348

#### **Related reference:**

"IMS type-1 trace function codes" on page 599

### Format of Resource Recovery Services trace records

z/OS Resource Recovery Services trace (RRST) records contain standard fields, and all RRS calls are associated with subfunction codes.

	One-byte trace ID field. This byte indicates the type of the trace entry. One-byte trace sub function code.
byte 3-	4 Two-byte trace sequence number assigned by the IMS trace component.
	One-byte numeric Resource Recovery Service call code (see the RRS call table below). One-byte LCREGFLG. Two-byte RRS return code.
v	Two-byte PST number - PSTPSTNR. Not used.
Word 4 Not used. Word 5 Not used. Word 6 Not used.	Four-byte LCRERRSF.
Word 7 byte 1-4	Bytes 3 through 6 of the system clock (STCK) at the time the trace entry was created.

The following table shows the RRS calls that are associated with the subfunction codes:

Subfunction code	Function	
X'00'	ATRBACK	
X'01'	ATRCMIT	
X'02'	ATRDINT	
X'03'	ATREINT	
X'04'	ATREINT5	
X'05'	ATREND	
X'06'	ATRIBRS

# **RRST trace examples**

The RRST trace in an OTMA and an APPC environment are depicted. The traces were gathered with tracing volume set to HIGH.

### **RRST** trace in an OTMA environment

## **RRST entries for OTMA modules**

The formats of OTMA trace entries for z/OS Resource Recovery Services related events are shown in the following diagrams.

#### TRACE ID = X'5A00'

TRACE ID = X'5A00'

Word 1	- byte 0 - 2A, module number for DFSYLUS0
	- byte 1 - 01, OTMA GU was invoked
	- byte 2 - DLAFLAG1
	- byte 3 - DLAFLAG4
Word 2	- Back-end YTIB CLB address
Words 3-6	- RRS parent UR token
Word 7	- Time stamp (short)

#### TRACE ID = X'5A00'

TRACE ID = X'5A00'

Word 1	<ul> <li>byte 0 - 2A, module number for DFSYLUS0</li> <li>byte 1 - 02, Fastpaht GU was invoked</li> <li>byte 2 - DLAFLAG1</li> <li>byte 3 - DLAFLAG4</li> </ul>
Word 2	- Front-end IMS YTIB CNT address
Words 3-6	- RRS parent UR token
Word 7	- Time stamp (short)

### $TRACE \ ID = X'5A00'$

TRACE ID = X'5A00'	
Word 1	- byte 0 - 2A, module number for DFSYLUS0
	- byte 1 - 03, Back-end IMS issued a DFS2224 message
	- byte 2 - DLAFLAG1
	- byte 3 - DLAFLAG4
Word 2	- Front-end IMS YTIB CLB address (CNT address for
	fastpath transaction)
Words 3-6	- RRS parent UR token
Word 7	- Time stamp (short)

### TRACE ID = X'5A00'

TRACE ID = X'5A00'	
Word 1	- byte 0 - 2D, module number for DFSYSLM0
	- byte 1 - 01, back-end XCF send succeed
	- byte 2 - AOS_FLAGS
	- byte 3 - 0
Word 2	<ul> <li>Back-end YTIB address</li> </ul>
Words 3-6	- RRS parent UR token
Word 7	- Time stamp (short)

## TRACE ID = X'5A00'

- byte 0 - 2D, module number for DFSYSLM0
- byte 1 - 02, back-end XCF send failed
- byte 2 - AOS_FLAGS
- byte 3 - 0
- Back-end YTIB address
- RRS parent UR token
- Time stamp (short)

#### TRACE ID = X'5A00'

TRACE ID = X'5A00'	
Word 1	- byte 0 - 25, module number for DFSYPSIO
	- byte 1 - 01, OTMA Protected Trans was submitted
	- byte 2 - 0

	- byte 3 - 0
Word 2	- Front-end YTIB CLB address
Words 3-6	- Context token
Word 7	- Time stamp (short)

#### TRACE ID = X'5A00'

TRACE ID = X'5A00' Word 1	<ul> <li>byte 0 - 28, module number for DFSYTIB0</li> <li>byte 1 - 01, OTMA input message is about to engueue</li> </ul>
Word 2 Words 3-6 Word 7	<ul> <li>byte 2 - 0</li> <li>byte 3 - YTIB_MSG_TYPE</li> <li>Front-end YTIB_CLB_address</li> <li>RRS parent UR token</li> <li>Time stamp (short)</li> </ul>

#### TRACE ID = X'5A00'

TRACE ID = X'5A00'	
Word 1	- byte 0 - 28, module number for DFSYTIBO
	- byte 1 - 02, response from back-end is received
	- byte 2 - YTIB_MSG_STATUS_3
	- byte 3 - YTIB MSG TYPE
Word 2	- Front-end YTIB CLB address
Words 3-6	- RRS parent UR token
Word 7	- Time stamp (short)

## z/OS Resource Recovery Services entries logged by OTMA modules

RRS entries logged by OTMA modules are depicted.

#### TRACE ID = X'5A00'

TRACE ID = X'5A00'	
Word 1	- byte 0 - 2A, module number for DFSYLUSO
	- byte 1 - 06, XCF good Send or - 05, XCF bad Send
Word 2	- A(ECB)
Words 3-6	- LUP_UR_TOKEN (AWRRURTK)
Word 7	- Time stamp (short)

## Trace entries logged by z/OS Resource Recovery Services related modules

Trace entry records for DFSRGSF0 and TOKEN Tracing are depicted.

### TRACE ID = X'A0A6' DFSRGSF0 Entry record

TRACE ID = X'A0A6' DFSRGSF0 Entry record

TRACE ID	=	X'AOA6' DFSRGSF0 Entry record
Word	1	- byte 0 - 72, module number for DFSRGFS0
		- bytes 1-2 - Function, SEE AWRRFUNC
		- byte 3 - A6 Module entry
Word	2	- A(TIB)
Word	3	- A(ECB) - from AWRRECB
Word	4	- bytes 0-2 - PST number
Word	5	- Number of queued AWEs
Word 7		- Time stamp (STCK)

# TRACE ID = X'A0A7' DFSRGSF0 Exit record

TRACE ID = $X'A0A7'$	DFSRGSF0 Exit record
Word 1	- byte 0 - 72, module number for DFSRGFS0
	- bytes 1-2 - Function, SEE AWRRFUNC
	- byte 3 - A7 Module exit
Word 2	- A(TIB)
Word 3	- A(ECB) - from AWRRECB

Word 4 - bytes 0-1 - Highest number of AWEs - bytes 2-3 - Number greater of AWEs than TCBs Word 5 - Trace return code (AWRRETCD) Word 7 - Time stamp (STCK) TRACE ID = X'A0A8' DFSRGSF0 Error Occurred TRACE ID = X'A0A9' DFSRGSF0 ABEND Occurred

## TRACE ID = X'A0AA' TOKEN Tracing record

```
TRACE ID = X'A0AA' TOKEN Tracing record
Word 1 - byte 0 - 72, module number for DFSRGFS0
- bytes 1-2 - Function, SEE AWRRFUNC
- byte 3 - AA - Token trace record
Word 2 - bytes 0-1 - PST Number
- bytes 2-3 - Token id (CX=Context,IN=Interest,
UR=Unit of recovery)
Words 4-7 - TOKEN
```

# Scheduler trace

When you use the /TRACE SET ON TABLE SCHD command, IMS enables the scheduler trace. When you specify OPTION LOG, IMS sends these entries to the log as type X'67FA' records.

## Scheduler trace record formats

The following code samples show the formats of the scheduler trace records for function codes X'41' through X'48'.

## Scheduler trace record format for function code X'41'

```
TRACE ID = X'41'
word 0 - byte 1 - X'41' Scheduling starts, traced by DFSSBMP0
byte 2 - PST number
bytes 3-4 - Trace sequence number
word 1 - SCHD must be addressable by caller
word 2 - Reserved
word 3 - SAPCNTRL
words 4-5 - Reserved
word 6 - Module identifier
word 7 - Store clock value
```

### Scheduler trace record format for function code X'42'

TRACE ID = X'42'
word 0 - byte 1 - X'42' Block mover, traced by DFSSBMP0,
DFSSBMP0, DFSSMSC0
byte 2 - PST number
bytes 3-4 - Trace sequence number
word 1 - byte 1 - PDIRCODE
byte 2 - PDIROPTC
byte 3 - PSTSCHDF
byte 4 - PSTCODE1
word 2 - PSTPSB
word 3 - PSTSMB
words 4-5 - Reserved
word 6 - Module identifier
word 7 - Store clock value

## Scheduler trace record format for function code X'43

```
word 2 - PSTPSB
word 3 - SAPCNTRL
words 4-5 - Reserved
word 6 - Module identifier
word 7 - Store clock value
```

## Scheduler trace record format for function code X'44'

TRACE ID = X'44'

word 0 - byte 1 - X'44' IRC started byte 2 - PST number bytes 3-4 - Trace sequence number word 1 - SSIMCOMP word 2 - Reserved word 3 - SAPCNTRL words 4-5 - Reserved word 6 - Module identifier word 7 - Store clock value

# Scheduler trace record format for function code X'45'

TRACE ID = X'45'
word 0 - byte 1 - X'45' TMS00 started
 byte 2 - PST number
 bytes 3-4 - Trace sequence number
word 1 - A(PST)
word 2 - Sync point function code (COMMIT/P1/P2/BACKOUT)
word 3 - Caller of TMS00
word 4 - TPI (first four bytes)
word 5 - TPI (last four bytes)
word 6 - Module identifier

word 7 - Store clock value

## Scheduler trace record format for function code X'46'

TRACE ID = X'46'

- word 0 byte 1 X'46' TMS00 finished
  - byte 2 PST number
  - bytes 3-4 Trace sequence number
- word 1 A(PST)
- word 2 Sync point function code (COMMIT/P1/P2/BACKOUT)
- word 3 Return code
- word 4 TPI (first four bytes)
- word 5 TPI (last four bytes)
- word 6 Module identifier
- word 7 Store clock value

## Scheduler trace record format for function code X'47'

TRACE ID = X'47'
word 0 - byte 1 - X'47' APPC extract call made
byte 2 - PST number
bytes 3-4 - Trace sequence number

- word 1 Function code (FPRETRY/PUSER)
- word 2 Abend code (PSTABTRM)
- word 3 Return code from DFSTMR00
- word 4 Return code from APPC extract call
- word 5 Reserved
- word 6 Module identifier
- word 7 Store clock value

## Scheduler trace record format for function code X'48'

TRACE ID = X'48'
word 0 - byte 1 - X'48' Scheduling failed
 byte 2 - PST number
 bytes 3-4 - Trace sequence number
word 1 - byte 1 - PDIRCODE

byte 2 - PDIROPTC
byte 3 - PSTSCHDF
byte 4 - PSTCODE1
word 2 - PSTPSB
word 3 - PSTSMB
words 4-5 - Reserved
word 6 - Module identifier
word 7 – Store clock value

# Storage manager trace

The storage manager trace writes a record each time it is called to allocate a pool, get a buffer, or release a buffer. The storage manager traces requests from the following pools: AOIP, CESS, CIOP, CMDP, DYNP, EMHB, FPWP, HIOP, LUMC, LUMP, and SPAP.

You can enable the storage manager trace during IMS initialization with the STRG= option in the DFSVSMxx PROCLIB member, or online using the /TRACE command. The /TRACE SET ON TABLE STRG command activates the trace and

sends the output to an internal trace table. When you specify OPTION LOG on the /TRACE command, IMS sends the output to the system log or external trace data set.

You can format the internal trace table using the Offline Dump Formatter under IPCS with either the VERBX command or the IMS Dump Formatter panels. To format the trace records, any storage manager control blocks, and pool storage, you can specify ALL as the POOL ID, as shown in the following example. FMTIMS ...(POOL,NAME,ALL),...or you can specify FMTIMS (TRACE, NAME, SM).

To locate the storage manager trace in a formatted dump, look for eye catcher \*\*SMTR.

To locate the trace tables in an unformatted dump, look for the trace identifier SM in the trace table header record.

The following tables show the format of each storage manager trace record.

Table 258. TRACE ID = X'5F03' (get trace record)

WORD 0	WORD 1	WORD 2	WORD 3	WORD 4	WORD 5	WORD 6	WORD 7
Control Information	Pool Name	Variable Pool Size	Variable Pool Address Fixed Pool Upper Limit	0	Caller's Return Address	Return Code	0

# Latch trace

When you use the /TRACE SET ON TABLE LATC command, IMS traces events related to its internal serialization services (latch manager, use manager, and system locate control function) to an internal table.

The following table shows the general format of a latch trace entry.

Table 261. Format of a latch trace entry.

WORD 0		WORD 1	WORD 2	WORD 3	WORD 4	WORD 5	WORD 6	WORD 7	
Ι	S	~	ENTRY TYPE						

where:

- I One-byte trace ID field. This byte indicates the type of the trace entry. It is always X'70' for latch trace entries.
- **S** One-byte trace subtype field. This field is used for latch manager trace entries to denote the latch function being traced. It is not currently used for Use Manager trace entries.

#### **SEQ NUM**

Two-byte trace sequence number assigned by the IMS trace component.

#### ENTRY TYPE

For Use Manager trace entries only: 4-byte printable character string, indicating the type of entry.

Words 2 through 6 contain data specific to each trace entry.

#### **Related reference:**

#### Latch manager trace entries

The sub functions GET, GETU, REL, and RCOV are listed.

#### Sub Function: X'01' Get latch (GET)

#### Sub Function: X'02' - Upgrade latch (GETU)

#### Sub Function: X'03' - Release latch (REL)

Sub Function: X'04' - Recover latch (RCOV)

#### Use manager trace entries

Eleven entry types are listed and described.

#### Entry Type: USE

Entry Type: USE Description: Inuse request trace entry word 1 -- 'USE' word 2 -- Block type word 3 -- Call ID word 4 -- Work ID word 5 -- Block address word 6 -- SAP address word 7 -- Caller's return address

## Entry Type: LOK

Entry Type: LOK Description: Lock request trace entry

word	1	 'LOK'	
word	2	 Block type	
word	3	 Call ID	
word	4	 Work ID	
word	5	 Block address	
word	6	 SAP address	
word	7	 Caller's return a	ddress

## Entry Type: CON

Entry Type: CON Description: Connect request trace entry

address

## Entry Type: MRG

Entry Type: MRG Description: Merge request trace entry

word	1	'MRG'
word	2	Block type
word	3	Call ID
word	4	Work ID
word	5	Block address
word	6	SAP address
word	7	Caller's return address

## **Entry Type: INQ**

Entry Type: INQ Description: Inquiry request trace entry

word word word word	2 3 4 5 6	   Block type Call ID Work ID Block address SAP address
word	7	 Caller's return address

### **Entry Type: NUSE**

Entry Type: NUSE Description: Nouse request trace entry

word	1	'NUSE'
word	2	Block type
word	3	Call ID
word	4	Work ID
word	5	Block address
word	6	SAP address
word	7	Caller's return address

## Entry Type: NLOK

Entry Type: NLOK Description: Unlock request trace entry

word	1	 'NLOK'	
word	2	 Block type	
word	3	 Call ID	
word	4	 Work ID	
word	5	 Block address	
word	6	 SAP address	
word	7	 Caller's return	address

## Entry Type: NCON

Entry Type: NCON Description: Disconnect request trace entry

word 1 -- 'NCON'
word 2 -- Block type
word 3 -- Call ID
word 4 -- Work ID
word 5 -- Block address
word 6 -- SAP address
word 7 -- Caller's return address

## Entry Type: RCOV (SAP level)

Entry Type: RCOV (SAP level) Description: Use recovery performed at the SAP (ITASK) level trace entry

word	1	 'RCOV'
word	2	 'SAP'
word	3	 Block Type
word	4	 SAP address
word	5	 Ø
word	6	 Ø
word	7	 Caller's return address

#### Entry Type: RCOV (TCB level)

Entry Type: RCOV (TCB level) Description: Use recovery performed at the TCB level trace entry

- word 1 -- 'RCOV'
- word 2 -- 'TCB'
- word 3 -- Block Type
- word 4 -- Ø word 5 -- TCB address
- word 6 -- Ø word 7 -- Caller's return address

## Entry Type: RCOV (address space level)

Entry Type: RCOV (address space level) Description: Use recovery performed at the address space level trace entry

י י א	01011		 coorcij periorinea at the	`
WO	rd	1	 'RCOV'

WO	rd	6	 Ø	
WO	rd	7	 Caller's return address	

## System locate control function entries

Entry types for SLCO, SLC1, and a latch trace example are depicted.

## Entry Type: SLC0

Entry Type: SLC0

Description: Locate a block and issue a use manager inuse call against it

word 1 -- 'SLCO' word 2 -- Block Type word 3 -- Work ID word 4 -- Call ID word 5 -- '' word 6 -- SAP address word 7 -- Caller's return address

# Entry Type: SLC1

Entry Type: SLC1

Description: Locate a block and issue a use manager nouse call against it

word 1 -- 'SLC1' word 2 -- Block Type word 3 -- Work ID word 4 -- Call ID word 5 -- '' word 6 -- SAP address word 7 -- Caller's return address

# Queue manager trace

The queue manager trace provides information about relevant queue manager functional and exceptional events. Use the trace under the direction of IBM support personnel when problems are suspected in the queue manager area.

## Turning on the queue manager trace

You can turn on the queue manager trace in two ways:

- During IMS online initialization with the QMGR parameter in the DFSVSMxx IMS.PROCLIB member.
- During online operation, with the /TRACE command.

You can specify trace output destination and tracing volume on both the QMGR parameter and the /TRACE command.

If you send output to the common trace table, you can format the table using the Offline Dump Formatter under IPCS, using either the VERBX command or the IMS Dump Formatter panels. If you send the output to an external data set, you can use the File Select and Formatting Print utility (DFSERA10) with exit routine DFSERA60 to format the trace entries.

To locate the queue manager trace in a formatted dump, look for eye catcher \*\*QMGR. To locate the trace table in an unformatted dump, look for the trace identifier QM in the trace table header record.

### Medium level trace record format - X'20"

"Medium level trace record format - X'20"" depicts the trace (medium level) record format of the following function with subfunction code X'20':

**FUNCTION: ENTRY TO QUEUE MANAGER** Subfunction Code: X'20'

word	0	Control information
word		PCB Contents (WORD 1)
word	2	A(QTPPCB)
word	3	PCB contents (WORD 3)
word	4	PCB contents (WORD 4)
word	5	PCB contents (WORD 5)
word	6	PCB contents (WORD 6)
word	7	Time stamp

#### Medium level trace record format - X'22'

This figure depicts the trace (medium level) record format of the following function with subfunction code X'22':

FUNCTION: Special- Not Applicable
Subfunction Code: X'22'

word 0 -- Control information word 1 -- Varies by use word 2 -- Varies by use word 3 -- Varies by use word 4 -- Varies by use word 5 -- Varies by use word 6 -- Varies by use word 7 -- Time stamp

#### Low level trace record format - X'08', X'15', X'1B'

"Low level trace record format - X'08', X'15', X'1B'" depicts the trace (low level) record format of the following functions with these subfunction codes (SC):

SC FUNCTION

X'08 '

X'15' MESSAGE REROUTE

X'1B' INSERT MOVE SPANNABLE

FUNCTION: See above list Subfunction Code: See above list

word	0	Control information
word	1	A(ECB)
word	2	A(QTPPCB)
word	3	byte 1 - Current call type
		byte 2 - Prior call type
		byte 3 - (unused)
		byte 4 - (unused)
word	4	Caller's ID (WORD 1)
word	5	Caller's ID (WORD 2)
word	6	byte 1 - Length of user segment
		byte 2 - Length of user segment
		byte 3 - (unused)
		byte 4 - (unused)
word	7	Time stamp

## Low level trace record format - X'0A'

"Low level trace record format - X'0A'" depicts the trace (low level) record format of the following function with subfunction code X'0A':

**FUNCTION:** INSERT LOCATE Subfunction Code: X'OA'

word	0	 Control information
word	1	 A(ECB)
word	2	 A(QTPPCB)
word	3	 byte 1 - Current call type
		byte 2 - Prior call type
		byte 3 - (unused)
		byte 4 - (unused)
word	4	 Caller's ID (WORD 4)
word	5	 Caller's ID (WORD 2)
word	6	 Length of requested message area
word	7	 Time stamp

### Low level trace record format - X'16'

"Low level trace record format - X'16'" depicts the trace (low level) record format of the following function with subfunction code X'16':

FUNCTION: RELEASE Subfunction Code: X'16'

> word 0 -- Control information word 1 -- A(ECB) word 2 -- A(QTPPCB) word 3 -- byte 1 - Current call type byte 2 - Prior call type byte 3 - (unused) byte 4 - (unused) word 4 -- Caller's ID (WORD 1) word 5 -- Caller's ID (WORD 2) word 6 -- Contents of DECAREA word 7 -- Time stamp

## Shared queues interface trace

The shared queues interface trace provides information about errors associated with the interface between IMS and CQS.

Examples of errors that are traced are:

- CQS Request errors
- CQS Inform errors
- Service errors

Storage errors

Use this trace under the direction of IBM Software Support when problems are suspected in the interface between IMS and CQS.

You can turn on the shared queues interface trace in two ways:

- During IMS online initialization, with the SQTT parameter in the DFSVSMxx IMS.PROCLIB member.
- During online operation, with the /TRACE command.

Each trace entry is X'20' bytes long.

You can specify trace output destination and tracing volume on both the SQTT parameter and the /TRACE command.

The /TRACE SET ON TABLE SQTT command activates the trace and sends the output to an internal trace table that consists of 126 entries. If you specify OPTION LOG on the /TRACE command, IMS sends the output to the system log or an external trace data set in groups of 126. Other parameters control the volume of output.

You can format trace table entries with the Offline Dump Formatter under IPCS, using either the VERBX parameter or the IMS Dump Formatter panels. You can use the File Select and Formatting Print utility (DFSERA10) with exit routine DFSERA60 to format the trace entries written to an external data set.

To locate the shared queues interface trace in a dump, look for eye catcher \*\*SQTT.

To display the status of the trace, use the /DISPLAY TRACE command.

#### **Related reference:**

"IMS type-1 trace function codes" on page 599

### Fast Path trace

When you use the /TRACE SET ON TABLE FPTT command, IMS enables the Fast Path trace. The Fast Path trace resides in the internal IMS trace tables, with the OPTION LOG parameter causing the trace to also be written to the IMS logs.

If the OPTION LOG parameter is not specified (or the OPTION NOLOG parameter is specified), the trace resides only in the IMS internal trace tables and is formatted through the IMS Dump Formatter. If the OPTION LOG parameter is specified, the trace will also reside on the logs and can be formatted with DFSERA60 for log type X'67FA' or through the IMS Dump Formatter.

### Trace formats

Fast Path reserves X'9C' and X'9D' trace entries. X'9C' is reserved for tracing notifies and X'9D' is reserved for all other Fast Path traces.

## X'9C' trace format

The following table shows the format of the X'9C' trace entry. Following the table are the trace IDs and descriptions of content of trace entry.

Table 262. Format of the Fast Path X'9C' trace entry

# **Fast Path trace entries**

Fast Path trace entries are listed, including Trace ID, Module name, and Trace point.

## Trace entries for Fast Path

The following table describes the Fast Path trace entries.

Table 264. Fast Path trace entries

Trace ID	Module	Trace point	Comments				
ALOC	DBFALOC0	Entry	FP trace data set allocation				
ALOX	DBFALOC0	Exit	FP trace data set allocation				
RTYE	DBFALOC0	EMHB Present	FP trace data set allocation				
RTYS	DBFALOC0	No EMHB Present	FP trace data set allocation				
ALOP	DBFALOC0	Trace data set already allocated	FP trace data set allocation				
BBIN	DBFBBIN0	Entry, Exit (Shift)	MSDB Binary Search				
OFSE	DBFBBIN0	Binary Search	MSDB Binary Search				
BIN1	DBFBBIN0	Binary Search Entry, Exit (Shift)	MSDB Binary Search				
BCHG	DBFBCHG0	Entry	MSDB FLD Call Change				
RCHG	DBFBCHG0	Exit	MSDB FLD Call Change				
BOFL	DBFBCHG0	Overflow	MSDB FLD Call Change				
BCL0	DBFBCL10	Entry	MSDB Call Handler				
RCL0	DBFBCL10	Exit	MSDB Call Handler				
IRC2	DBFBCL10	Copy Call Data	MSDB Call Handler				

Table 264. Fast Path trace entries (continued)

Trace ID	Module	Trace point	Comments
BDLT	DBFBDLT0	Entry	MSDB Delete Call
CDLT	DBFBDLT0	Delete OK	MSDB Delete Call
RDLT	DBFBDLT0	Exit	MSDB Delete Call
BENQ	DBFBENQ0	Entry	MSDB Resource Locking
NQ16	DBFBENQ0	Function 16 = Enqueue	MSDB Resource Locking
ENQ1	DBFBENQ0	Resource Locked, call Lock Manger	MSDB Resource Locking
ENQ2	DBFBENQ0	Resource Locked	MSDB Resource Locking

## IMS shutdown trace table

When IMS begins shutdown processing, IMS populates a trace table for the shutdown activity. The shutdown trace table is included in a dump of the IMS control region, and can help you determine which module is preventing IMS shutdown from completing.

The shutdown trace table is written to memory and contains 64 one-byte entries.

You can find the IMS shutdown trace table in a formatted dump from the pointer to DGA\_SDTT in the Diagnostic Anchor Block (DGA), which is pointed to by SCDDGA in the System Contents Directory (SCD) control block. Each entry is one byte and contains the ID of the module entry or exit point. The table structure is defined in the DFSSDTT macro. Entries are written to the shutdown trace table in the same sequence in which they arrived. When the end of the table is reached, new entries are wrapped to the start of the table and overwrite the oldest existing entries.

The following table shows the trace value for each module entry or exit point. Unused shutdown trace table entries contain zeroes.

Module name	Entry	Exit: RC=0
DBFTERM0	X'40'	X'80'
DBFTERM1(EP)	X'41'	X'81'
DFSCPCP0	X'42'	X'82'

### Programming interface information

This information is intended to help programmers, operators, and system support personnel diagnose IMS problems. This information also documents Diagnosis, Modification or Tuning Information provided by IMS.

Diagnosis, Modification or Tuning information is provided to help you diagnose, modify, or tune IMS. Do not use this Diagnosis, Modification or Tuning information as a programming interface.

Diagnosis, Modification or Tuning Information is identified where it occurs, either by an introductory statement to a section or topic, or by the following marking: Diagnosis, Modification or Tuning Information.

## Trademarks

IBM, the IBM logo, and ibm.com<sup>®</sup> are trademarks or registered trademarks of International Business Machines Corp., registered in many jurisdictions worldwide. Other product and service names might be trademarks of IBM or other companies. A current list of IBM trademarks is available on the web at "Copyright and trademark information" at http://www.ibm.com/legal/copytrade.shtml.

Adobe, the Adobe logo, and the PostScript logo are either registered trademarks or trademarks of Adobe Systems Incorporated in the United States, and/or other countries.

Linux is a registered trademark of Linus Torvalds in the United States, other countries, or both.

Microsoft, Windows, Windows NT, and the Windows logo are trademarks of Microsoft Corporation in the United States, other countries, or both.

Java and all Java-based trademarks and logos are trademarks or registered trademarks of Oracle and/or its affiliates.

UNIX is a registered trademark of The Open Group in the United States and other countries.

#### Terms and conditions for product documentation

Permissions for the use of these publications are granted subject to the following terms and conditions.

#### Applicability

These terms and conditions are in addition to any terms of use for the IBM website.

#### Personal use

You may reproduce these publications for your personal, noncommercial use provided that all proprietary notices are preserved. You may not distribute, display or make derivative work of these publications, or any portion thereof, without the express consent of IBM.

#### **Commercial use**

You may reproduce, distribute and display these publications solely within your enterprise provided that all proprietary notices are preserved. You may not make derivative works of these publications, or reproduce, distribute or display these publications or any portion thereof outside your enterprise, without the express consent of IBM.

#### Rights

Except as expressly granted in this permission, no other permissions, licenses or rights are granted, either express or implied, to the publications or any information, data, software or other intellectual property contained therein.

IBM reserves the right to withdraw the permissions granted herein whenever, in its discretion, the use of the publications is detrimental to its interest or, as determined by IBM, the above instructions are not being properly followed.

You may not download, export or re-export this information except in full compliance with all applicable laws and regulations, including all United States export laws and regulations.

IBM MAKES NO GUARANTEE ABOUT THE CONTENT OF THESE PUBLICATIONS. THE PUBLICATIONS ARE PROVIDED "AS-IS" AND WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO IMPLIED WARRANTIES OF MERCHANTABILITY, NON-INFRINGEMENT, AND FITNESS FOR A PARTICULAR PURPOSE.

## **IBM Online Privacy Statement**

IBM Software products, including software as a service solutions, ("Software Offerings") may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software Offering uses cookies to collect personally identifiable information, specific information about this offering's use of cookies is set forth below.

This Software Offering does not use cookies or other technologies to collect personally identifiable information.

If the configurations deployed for this Software Offering provide you as customer the ability to collect personally identifiable information from end users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent. For more information about the use of various technologies, including cookies, for these purposes, See IBM's Privacy Policy at http://www.ibm.com/privacy and IBM's Online Privacy Statement at http://www.ibm.com/privacy/details the section entitled "Cookies, Web Beacons and Other Technologies" and the "IBM Software Products and Software-as-a-Service Privacy Statement" at http://www.ibm.com/software/info/product-privacy.
