

Import Content

I Import Content

A. **Command Line IMPort (CLIMP)**

1. The command line utility is located on the VMWARE session in the following directory:
 - a. E:\lms_install\bin
2. Included in that directory are:
 - a. SCORM Package files such as “netgValid.zip”
 - b. The climp.bat utility must be run from a Windows command prompt.
 - c. And the climp.properties file which has been customized for your environment. Here are the details of that file:
 - 1) cm=http://lms.mindspan.com
 - 2) cmp=wasadmin.
 - 3) cmu=password
 - 4) ftp=:lms.mindspan.com
 - 5) ftpu=anonymous
 - 6) ftp=password
 - 7) e=georgep@ibm.com¹
3. From a command line navigate to the directory listed above and run climp.bat specifying the properties file and the content file as an argument.
 - a. Climp -p climp.properties -u netgValid.zip²
4. You should receive the following message: “Course Package: netgValid.zip successfully imported.

B. **Authoring Assembly Tool**

1. After authoring courses package the course
2. Then post to the LMS

C. **In order to successfully import content to the LMS by use of the Authoring and Assembly Tool (AAT), or the CLIMP utility SSO through the use of LTPA keys must be defined in the Websphere Application Server security settings.**

1. If SSO through the use of LTPA can not be used there is a work around

¹ Just a reminder, you must specify an e-mail notification address when you use the CLIMP utility or Authoring Tool to import a course package, and this is the only way to get the status of the import operation. Before you import anything, you need to specify an e-mail server on the LMM

² If the package already exists on the ftp server, the upload option is not required, example: **climp -p climp.properties netgvalid.zip**
