Preface

About IBM Business Analytics

IBM Business Analytics software delivers complete, consistent and accurate information that decision-makers trust to improve business performance. A comprehensive portfolio of [business intelligence](#), [predictive analytics](#), [financial performance and strategy management](#), and [analytic applications](#) provides clear, immediate and actionable insights into current performance and the ability to predict future outcomes. Combined with rich industry solutions, proven practices and professional services, organizations of every size can drive the highest productivity, confidently automate decisions and deliver better results.

As part of this portfolio, IBM SPSS Predictive Analytics software helps organizations predict future events and proactively act upon that insight to drive better business outcomes. Commercial, government and academic customers worldwide rely on IBM SPSS technology as a competitive advantage in attracting, retaining and growing customers, while reducing fraud and mitigating risk. By incorporating IBM SPSS software into their daily operations, organizations become predictive enterprises – able to direct and automate decisions to meet business goals and achieve measurable competitive advantage. For further information or to reach a representative visit <http://www.ibm.com/spss>.

Technical support

Technical support is available to maintenance customers. Customers may contact Technical Support for assistance in using IBM Corp. products or for installation help for one of the supported hardware environments. To reach Technical Support, see the IBM Corp. web site at <http://www.ibm.com/support>. Be prepared to identify yourself, your organization, and your support agreement when requesting assistance.

Designing and configuring applications

IBM® SPSS® Decision Management provides a framework for building configurable, content-driven applications that automate and prioritize decisions using models and rules, and integrate with existing IT infrastructures to deploy results in real time.

The capabilities available in each application, and the basic look and feel, are determined by the application designer who configures the application template XML file and other associated files.

This guide describes the steps for configuring and customizing an application template to meet specific requirements as defined by the business user. A basic understanding of SPSS Decision Management applications is assumed before configuring your own. For more information, click the Help link in each application, or see the application guides which can be found in the IBM® SPSS® Collaboration and Deployment Services installation directory after installation (for example, *C:\Program Files\IBM\SPSS\Collaboration and Deployment Services\4.2\help\en\DecisionManagement*).

The Application Designer:

- Determines which capabilities are available to solve the business problem, such as the ability to build and score predictive models, the ability to define business rules, and the ability to combine rules and models in an end-to-end predictive application. These capabilities are configured in the application template XML.
- Defines and customizes the user interface text, style sheets, and graphics that determine the look and feel of the application.
- Specifies the dimensions that define the business problem. These dimensions provide the context in which rules and models are applied. Dimensions are configured in the application template XML. Some applications, such as a IBM® SPSS® Rules Management or IBM® SPSS® Modeler Advantage, may not use dimensions.

The Application Administrator:

- Configures data and other settings for the application. For details, see the *Administering Applications* chapter of each application guide.

The Business User or Analyst:

- Builds predictive models to gain insight into your company's business problems by discovering patterns in your data.
- Defines the range of possible solutions to the business problem (such as campaigns and offers available) and specifies how records are selected and allocated for each using business rules.

- Experiments with different combinations (performs “what if” analysis) to identify the best solution.
- Deploys the application and monitors the results.

About IBM SPSS Decision Management

IBM® SPSS® Decision Management brings the benefit of predictive analytics to real business problems, allowing you to build custom applications tailored to your customers or industry. While applications are typically configured to solve very specific problems, all are based on a common set of capabilities:

- Automate decisions using business rules.
- Add insight using predictive models.
- Use prioritization or simulation to reach the best decision based on the above.

A number of packaged applications are available, tailored to solving specific business problems. Please contact your sales representative for more information.

Available documentation

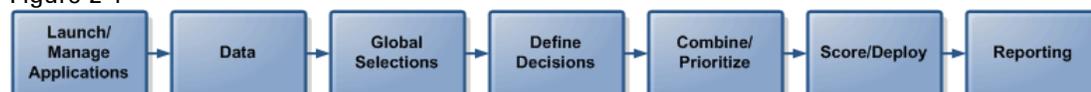

Documentation is included on the DVD for each product or application, or provided in a separate download file for each language and application (for example, *SPSS_Decision_Mgmt_61_doc_en.zip*). Documentation is also available in the IBM® SPSS® Collaboration and Deployment Services installation directory after installation (for example, *C:\Program Files\IBM\SPSS\Collaboration and Deployment Services\4.2\help\en\DecisionManagement*).

Configuring the application template

Configuring applications

All IBM® SPSS® Decision Management applications are formed from a combination of seven possible basic steps, as shown in the following figure. Think of each step as a screen or tab in the user interface. Some simple applications might only include two or three steps, while others might include all seven.

Figure 2-1

Each application is defined by an XML template that defines the capabilities and dimensions available to the business user. Each template defines a different application, as presented to business users on the *Applications launch page*. Users can then launch these applications to create their own projects. For more information, see the application guides.

XML templates

An application template includes a single **PredictiveApplication** element, which specifies the name and version of the application template used, the name of the application to use in the user interface, and other attributes. The **PredictiveApplication** element can have the following child elements:

- **InterfaceControl element.** Specifies the items displayed in the user interface. This element is key to any application. For example, it includes the `InterfacePages` element that controls which tabs are included in an application's user interface.
- **EntityDimension element.** Specifies the entity dimension for the application (the dimension that defines the entity of interest). Typically this is the thing being managed or allocated, such as customers, products, shipments, or claims.
- **Dimension element.** Specifies the dimensions or factors that can be used in solving the business problem, such as campaigns, channels and offers. The dimensions define the possible decisions, recommendations, or actions that can be taken on each record or entity processed by the application.
- **Optimization element.** Specifies how optimization is performed, including the algorithm used and the objective function that determines what value is being optimized.
- **Deployment element.** Specifies options for deploying the application, such as the label used.

A number of additional elements are available, as defined in the XML schema. Many of these other elements are typically handled by the application UI, and are not included in the application template in most cases. [For more information, see the topic Element Reference in Appendix A on p. 63.](#)

Sample application template

```

<?xml version="1.0" encoding="UTF-8"?>
<PredictiveApplication xmlns="http://com.spss.pasw.dms/workspace" templateName="ClaimsManagement"
templateVersion="1" appsVersion="6.1" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <InterfaceControl>
    <InterfacePages>
      <DataStep stepIncluded="true"/>
      <GlobalSelectionStep stepIncluded="true"/>
      <DefineStep stepIncluded="true" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:type="typeDecisionHierarchyDefineStep">
        <SelectionSection enabled="true" enableModels="true"/>
        <AggregateRuleSection enabled="true"/>
        <PredictiveModelSection enabled="true"/>
        <AllocationRuleSection enabled="false"/>
        <PlanningSection enableInteractionPoints="true" enableStartEndDates="true"/>
      </DefineStep>
      <CombineOptimizeStep stepIncluded="true" hasInteractionPointSection="true"
lockInteractionPointSection="false" enableSimulation="true" enableTest="true">
        <CombineOptimizeMethod/>
      </CombineOptimizeStep>
      <DeployScoreStep stepIncluded="true">
        <RealTimeScoring enableInteractiveQuestions="true"/>
      </DeployScoreStep>
      <ReportStep stepIncluded="true"/>
    </InterfacePages>
    <InterfaceFeature id="Collaboration"/>
    <InterfaceFeature id="UploadDownload"/>
  </InterfaceControl>
  <EntityDimension name="Claim"/>
  <Dimension name="Claim Area"></Dimension>
  <Dimension name="Action" parentDimension="Claim Area"></Dimension>
  <Optimization algorithm="None">
    <ObjectiveFunction/>
  </Optimization>
  <Deployment>
    <OutputAttribute referenceType="DimensionMember" name="Claim Area"
returnValue="Claim Area.Allocation-Value">Claim Area</OutputAttribute>
    <OutputAttribute referenceType="DimensionMember" name="Action"
returnValue="Action.Allocation-Value">Action</OutputAttribute>
  </Deployment>
</PredictiveApplication>

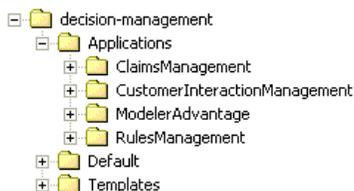

```

Creating an application

The process for creating your own application includes the following general steps:

- ▶ Create an application template (XML file) in the *Templates* directory.
- ▶ Create an application directory inside the *Applications* directory. Modify certain files in the directory to define the application shortcut displayed on the launchpad and to customize the look and feel of the application, if desired, by overriding the default settings.

All files are stored and edited on the machine where IBM® SPSS® Collaboration and Deployment Services is installed (for example, *C:\Program Files\IBM\SPSS\Collaboration and Deployment Services\4.2\components\decision-management*).

Important: Before starting, it is recommend that a backup copy of the entire *decision-management* directory be created.

To create an application

You can install prebuilt applications with IBM® SPSS® Decision Management. Rather than creating an application from scratch, it's easiest to copy an existing prebuilt application that best matches your desired application and then modify it to fit your needs.

1. Copy an existing application template XML file and give it a new file name. This example uses the file name *YourApp.xml*. XML templates are stored in the *Templates* directory shown in the [previous figure](#).
2. Open the XML template you renamed. Change the value for `templateName` to the file name you gave the new XML template in step 1 (you don't need to include the file extension):

```
templateName="YourApp"
```

Tip: Although XML files can be edited using any text editor, a number of XML editing tools are available that have options to display annotations and/or validate the XML markup.

3. Configure the rest of the XML application template to meet your needs, and save the file. See the rest of this chapter for more information.
4. Each application has a corresponding folder in the *Applications* directory. Copy the folder for an application that best matches your application and give it a new name— usually the same as your application template file name (for example, copy the *ClaimsManagement* folder and rename as *YourApp*). You do not need to stop any servers while doing this.

Rather than copying an entire folder, you can also create your own new folder and copy over only the pieces you plan to customize.

5. Each application directory contains a file called *appGroup.xml*. The file defines the location of various resources specific to an application. Edit your application's *appGroup.xml* file. For example:

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<ApplicationGroups xmlns:ns2="http://com.spss.pasw.dms/dataset" xmlns="http://com.spss.pasw.dms/appGroups">
<Group mustDisplay="true" template="YourApp">
```

```

<CssFileSpec>/Applications/YourApp/CSS/branded.css</CssFileSpec>
<MessageFileSpec>/Applications/YourApp/Message/</MessageFileSpec>
<ScreenTextFileSpec>/Applications/YourApp/ScreenText/</ScreenTextFileSpec>
<CoachTextFileSpec>/Applications/YourApp/CoachText/</CoachTextFileSpec>
<TermFileSpec>/Applications/YourApp/Terminology/</TermFileSpec>
<HelpFileSpec>/Applications/ClaimsManagement/HelpLinks/HelpLinks.properties</HelpFileSpec>
</Group>
</ApplicationGroups>

```

Where:

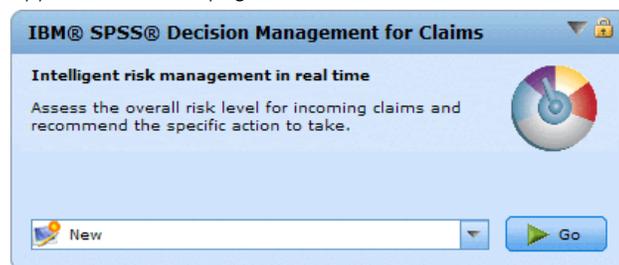

- `mustDisplay="true"` determines whether a shortcut to the new application appears on the launch page for all users by default. Users can then choose to remove the shortcut if they wish, unless an administrator has locked it.
- `TitleEntry`, `ShortDescription`, and `LongDescription` are used in the *Applications launch page* shortcut box, if the values cannot be read from the application's *description.xml* file.
- `CssFileSpec`, `MessageFileSpec`, `ScreenTextFileSpec`, `CoachTextFileSpec`, `TermFileSpec`, and `HelpFileSpec` can point to the location of customized user interface files, if applicable. The customized files will override the default files. These sections are only required if you customize one or more files in those folders. In this example, almost all files are being customized. A typical application might only customize some CSS, coach text, and screen text, in which case *appGroup.xml* would only contain those lines and the default settings would be applied for everything else. For complete details and instructions, see [Chapter 3](#) after completing the steps in this chapter.

A separate help system is provided for each packaged application, along with a generic help system that describes all features supported by the SPSS Decision Management. The `HelpFileSpec` can be used to specify which of these help systems is used. To provide custom help for a specific application, coach text is recommended. Coach text is distinct from help, and is more easily customized. [For more information, see the topic Coach text in Chapter 3 on p. 43.](#)

6. Each application directory contains a file called *description.xml*. The file defines the text displayed in the *Applications launch page* shortcut box:

Figure 2-2

Application launch page shortcut box

The file contains sections for English, German, and Japanese. You can add a different language section of your choice, using a language code according to W3C standards (see the table under [Language support on p. 42](#) for examples). Edit your application's *description.xml* file. For example:

```
<en>
  <TitleEntry>App for Handling Claims</TitleEntry>
  <ShortDescription>Intelligent risk management in real time</ShortDescription>
  <LongDescription>Assess the overall risk level for incoming claims and recommend the specific action to take.</LongDescription>
</en>
```

Tip: While configuring your application(s), you may find it convenient to share the entire *decision-management* directory so you can edit the files from any other machine on your network. See your operating system documentation for details about sharing directories.

7. When you finish configuring your application, enter the following URL in a supported web browser to launch SPSS Decision Management and verify your work. You should see the SPSS Decision Management login screen.

http://hostname:port/DM

Where *hostname* is the name or IP address of the machine where IBM SPSS Collaboration and Deployment Services is installed and *port* is your application server port number.

Configuring the user-interface

The user interface for an application is defined by the `InterfaceControl` element in the XML template.

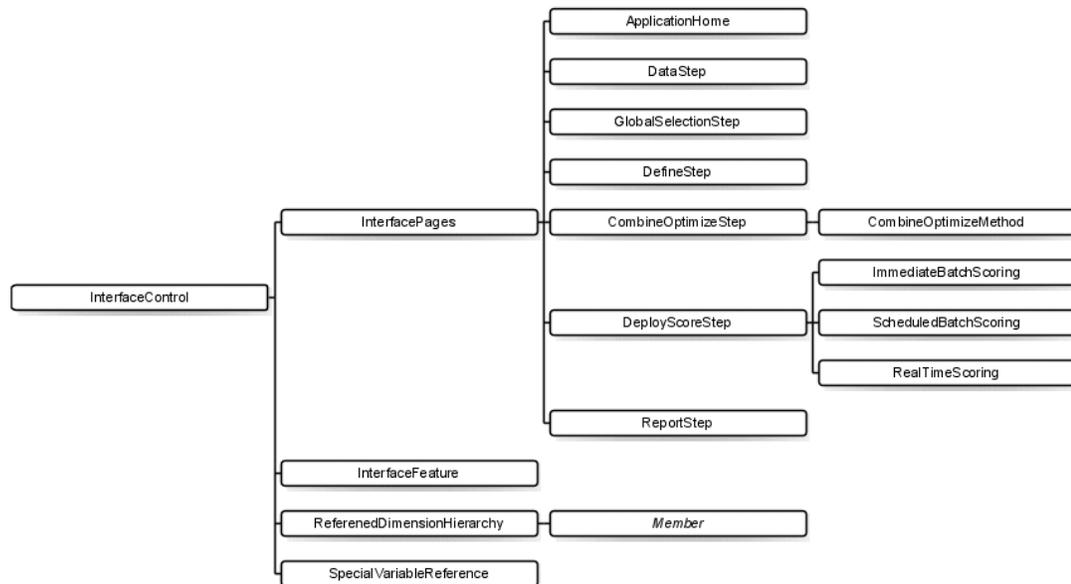

```
<InterfaceControl>
  <InterfacePages>
    <ApplicationHome stepIncluded="true" showGallery="true"/>
    <DataStep stepIncluded="true"/>
    <GlobalSelectionStep stepIncluded="true"/>
    <DefineStep stepIncluded="true" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="typeDecisionHierarchyDefin
      <PlanningSection enableInteractionPoints="true" enableStartEndDates="true"/>
      <SelectionSection enabled="true" enableModels="true"/>
      <AllocationRuleSection enabled="true"/>
      <AggregateRuleSection enabled="false"/>
      <PredictiveModelSection enabled="false"/>
    </DefineStep>
    <CombineOptimizeStep stepIncluded="true">
      <CombineOptimizeMethod enableNumReturnsByIP="true" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="f
    </CombineOptimizeStep>
    <DeployScoreStep stepIncluded="true">
      <RealTimeScoring enableInteractiveQuestions="true"/>
    </DeployScoreStep>
    <ReportStep stepIncluded="true"/>
  </InterfacePages>
  <InterfaceFeature id="Collaboration"/>
  <InterfaceFeature id="UploadDownload"/>
```

```
</InterfaceControl>
```

The first-level children of `InterfacePages` represent the main tabs in the user interface. You can set them to `true` or `false` to control which tabs make up your application. [For more information, see the topic XML templates on p. 3.](#)

The `InterfaceFeature` element defines capabilities that are available to the application, such as building and reuse models and rules, ability to collaborate with other users through IBM® SPSS® Collaboration and Deployment Services Repository, and the ability to upload and download files.

Figure 2-3
InterfaceControl element

When configuring applications, keep the following guidelines in mind:

- You can only have one of each tab type in an application.
- You can only have one of each “widget” within an application (for example, if your application has a Score tab it can only include one `RealTimeScoring` section).
- If more than one allocation method is enabled on the Define tab, the Combine/Prioritize step can be used to determine how final decisions or recommendations are determined. For example if both the `AggregateRule` and `PredictiveModel` sections are enabled, a combine matrix (`CombineOptimizeMethod`) can be used to reconcile cases where rules and models may return different decisions. If only one allocation method is enabled on the Define tab, the Combine/Prioritize step is not needed.

The following table describes some of the general items that can be configured on each tab of an application.

Tab/Screen	Configurable Items
Home	<ul style="list-style-type: none"> ■ Whether screen is included in the application ■ Whether Gallery is included

Tab/Screen	Configurable Items
Data	<ul style="list-style-type: none"> ■ Whether tab is included in the application ■ Whether user can derive new attributes
Global Selections	<ul style="list-style-type: none"> ■ Whether tab is included in the application ■ Whether business user can create rules, or only the administrator ■ Whether models are on or off (if on, can also indicate whether global selections will apply to model build operations or not)
Define/Modeling/Rules	<ul style="list-style-type: none"> ■ Whether tab is included in the application ■ Whether tab includes a decision hierarchy (for customer interaction management or claims management applications), model-only (for modeling applications), or rules-only (for rules management applications) ■ Other options are also available depending which tab-type you use. <p>Note that <code>AggregationRuleSection</code> and <code>PredictiveModelSection</code> may not both be enabled when using more than 2 dimensions.</p>
Combine/Optimize	<ul style="list-style-type: none"> ■ Whether tab is included in the application ■ Whether prioritization or a combine (decision) matrix is used ■ Whether Test feature is included ■ Whether Simulation feature is included <p>Note that the <code>MatrixCombine</code> method may not be used with more than 2 dimensions.</p>
Score/Deploy	<ul style="list-style-type: none"> ■ Whether tab is included in the application ■ Whether immediate batch scoring (including scoring options) or real-time deployment (including ability to specify interactive questions) is used
Reporting	<ul style="list-style-type: none"> ■ Whether tab is included in the application ■ Whether results summary report is included on the Home screen

Defining dimensions

Application dimensions define the factors or outcomes that can be used in solving the business problem, such as campaigns, channels and offers. These are configured using the `EntityDimension` and `Dimension` elements in the XML template.

```
<EntityDimension name="Claim"/>
<Dimension name="Claim Area"></Dimension>
  <Dimension name="Action" parentDimension="Claim Area"></Dimension>
```

- The `EntityDimension` element defines the thing being processed by the application, such as customers, claims, or packages. In practical terms, this is what each row in the Project Data Model represents.
- The `Dimension` elements define the factors or outcomes that can be used in solving the business problem, such as campaigns, channels and offers. In practical terms, these are the possible recommendations or decisions that can be returned for each entity, and are displayed on the dimension tree on the Define tab in the application UI.

- Dimensions can be nested using the parentDimension attribute.
- If no dimensions are specified, there will not be a dimension tree on the Define tab, and the application will only be able to produce rules or models. No specific outputs or recommendations will be returned, as none have been defined.

Optionally, you can specify properties for each dimension, such as name, description, or category. Any properties will be displayed in the Dimension Properties dialog box, which can be accessed by clicking the “information” icon for the dimension on the Define tab.

```
<Dimension name="Claim Area">
  <Property>Name</Property>
  <Property>Category</Property>
  <Property>Organization</Property>
  <Property>Group</Property>
  <Property>Description</Property>
</Dimension>
```

Figure 2-4
Dimension properties

Configuring the optimization equation

The prioritization equation is defined in the Optimization element, and displayed on the Prioritize tab in the application.

```
<Optimization algorithm="Heuristic">
  <ObjectiveFunction Domain="double" Functor="-" Name="Expected Profit">
    <Expression xmlns="http://com.spss.pasw.dms/rules" Domain="double" Functor="*">
      <Expression Domain="double" Functor="variableReference">
        <Expression>
          <Value>value</Value>
        </Expression>
        <Expression>
          <Value>Variable</Value>
        </Expression>
        <Expression>
          <Value>Prob.to Respond</Value>
        </Expression>
        <Expression>
          <Value>Value</Value>
        </Expression>
      </Expression>
    </ObjectiveFunction>
  </Optimization>
```

```

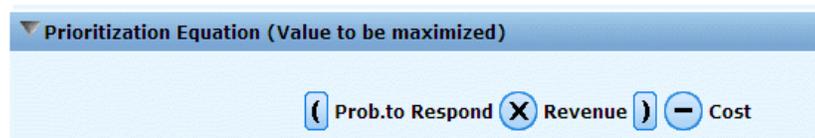

<Expression Domain="double" Functor="variableReference">
  <Expression>
    <Value>value</Value>
  </Expression>
  <Expression>
    <Value>Variable</Value>
  </Expression>
  <Expression>
    <Value>Revenue</Value>
  </Expression>
  <Expression>
    <Value>Value</Value>
  </Expression>
</Expression>
</Expression>
<Expression xmlns="http://com.spss.pasw.dms/rules" Domain="double" Functor="variableReference">
  <Expression>
    <Value>value</Value>
  </Expression>
  <Expression>
    <Value>Variable</Value>
  </Expression>
  <Expression>
    <Value>Cost</Value>
  </Expression>
  <Expression>
    <Value>Value</Value>
  </Expression>
</Expression>
</ObjectiveFunction>
</Optimization>

```

In the current release, the only supported algorithm is Heuristic (or None).

The resulting equation is displayed on the Prioritize tab in the user interface:

Figure 2-5
Prioritization equation

Understanding prefix notation

Expressions in IBM® SPSS® Decision Management are defined in *Prefix* notation (also known as *Polish* notation). *Infix* and *Prefix* notations are two different but equivalent ways of writing expressions. The *Infix* column displays formulas people are used to, and the *Prefix* column displays the equivalent notation that would be used in SPSS Decision Management expressions.

All parentheses are implied in the *Prefix* column; they've been included to make the table easier to read by showing the order of evaluation.

Infix Notation	Prefix (Polish) Notation
$((A * B) + (C / D))$	$(+ (* A B) (/ C D))$
$((A * (B + C)) / D)$	$(/ (* A (+ B C)) D)$
$(A * (B + (C / D)))$	$(* A (+ B (/ C D)))$

It would be coded as follows:

"_"

"*"

ProbabilityToRespond

Revenue

Cost

The actual expression starts with the `ObjectiveFunction` element that specifies the storage data type of the result, its name, and the initial `Functor`—which is our *Prefix* notation for subtraction.

```
<ObjectiveFunction Domain="double" Functor="-" Name="Predicted Profit">
```

Unless otherwise specified, the subtraction functor will be applied to all expressions with this objective function.

The next operation specifies multiplication as the functor, overriding the default. Within this expression, two variable references are defined, inserting the values of the Prob.to Respond and Revenue variables and multiplying them together.

```
<Expression xmlns="http://com.spss.pasw.dms/rules" Domain="double" Functor="*">
  <Expression Domain="double" Functor="variableReference">
    <Expression>
      <Value>value</Value>
    </Expression>
    <Expression>
      <Value>Variable</Value>
    </Expression>
    <Expression>
      <Value>Prob.to Respond</Value>
    </Expression>
    <Expression>
      <Value>Value</Value>
    </Expression>
  </Expression>
  <Expression Domain="double" Functor="variableReference">
    <Expression>
      <Value>value</Value>
    </Expression>
    <Expression>
      <Value>Variable</Value>
    </Expression>
    <Expression>
      <Value>Revenue</Value>
    </Expression>
```

```

    </Expression>
    <Expression>
      <Value>Value</Value>
    </Expression>
  </Expression>
</Expression>

```

In other words, the example expression is referencing a simple value of a Variable named ProbabilityToRespond in order to use its output field named Value in this spot of the equation.

A third variable reference inserts the value of the Cost variable. Because it is a child of the top-level ObjectiveFunction element (and not the multiplication expression) its value is subtracted.

```

<Expression xmlns="http://com.spss.pasw.dms/rules" Domain="double" Functor="variableReference">
  <Expression>
    <Value>value</Value>
  </Expression>
  <Expression>
    <Value>Variable</Value>
  </Expression>
  <Expression>
    <Value>Cost</Value>
  </Expression>
  <Expression>
    <Value>Value</Value>
  </Expression>
</Expression>

```

Defining equations using the expression builder

As a shortcut to building expressions While the prefix notion takes a bit of time to learn, you can build expressions using the Expression Builder, and then copy the resulting code.

For example, suppose you want to define the following equation:

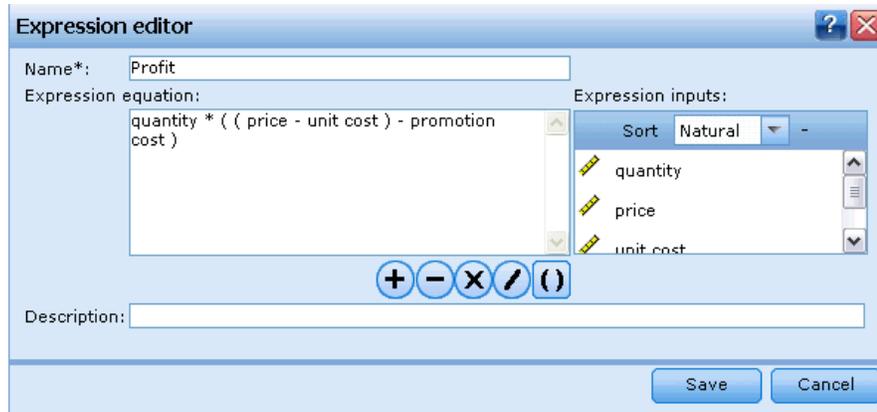

```
profit = quantity * (price - unit cost - promotion cost)
```

Create a project using any valid application template. (This can be a custom template, or a sample application such as IBM® SPSS® Decision Management for Customer Interactions or IBM® SPSS® Decision Management for Claims.)

On the Data tab, choose a data source that includes the fields you want to use in your equation, and choose this for the Project Data Model. (For this example you would need fields named quantity, price, unit cost, and promotion cost. You don't need any real data — you just need these fields to exist in the data model so you can choose them in the Expression Editor.)

From the Define tab, choose Expression Manager, and then Add expression.

Figure 2-6
Defining an expression

Specify the desired expression.

Save the project and download to a local drive, for example profitexpression.str.

Change the filename extension to *.zip (for example, profitexpression.zip) and extract using a tool that can handle this type of file. (Stream files are compressed *.zip files and can be extracted to access the component parts, which include a primary file named ClementineStream.xml along with a number of *.dat files.)

Open the extracted file `\data\0001.dat` in an XML or text editor, and search for an expression element such as the following:

```
<Expression Functor="*" Domain="double">
  <Expression Domain="long"><Attribute>quantity</Attribute></Expression>
  <Expression Functor="-" Domain="double">
    <Expression Functor="-" Domain="double">
      <Expression Domain="long"><Attribute>price</Attribute></Expression>
      <Expression Domain="double"><Attribute>unit cost</Attribute></Expression>
    </Expression>
    <Expression Domain="double"><Attribute>promotion cost</Attribute></Expression>
  </Expression>
</Expression>
```

Copy the expression code into your XML template, replace the attributes with variable references, and add variable definitions and output attributes as needed (see below).

Defining variables

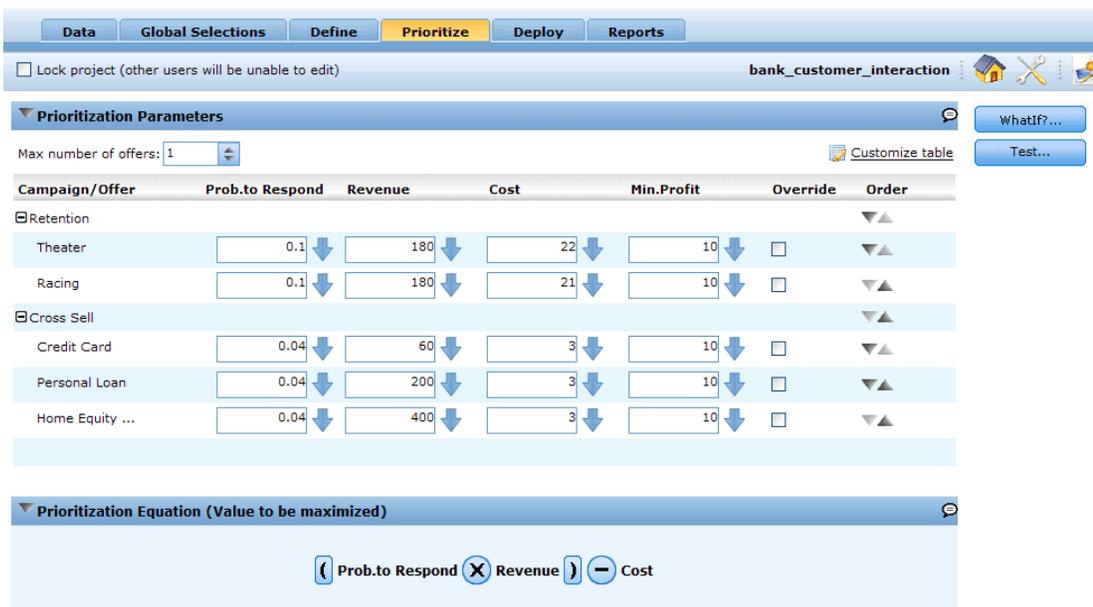

Define any variables that will be used as inputs to the optimization. Any variable referenced in the optimization function must be defined in a Variable element which can be a child of either EntityDimension or Dimension. In practical terms, the location of the variable definition determines the level at which the input is specified (though the user can change this on the Prioritize tab).

For example, suppose you are prioritizing campaigns and offers based on expected profit, computed as follows:

$$\text{expected profit} = \text{probability to respond} * \text{revenue} - \text{cost}$$

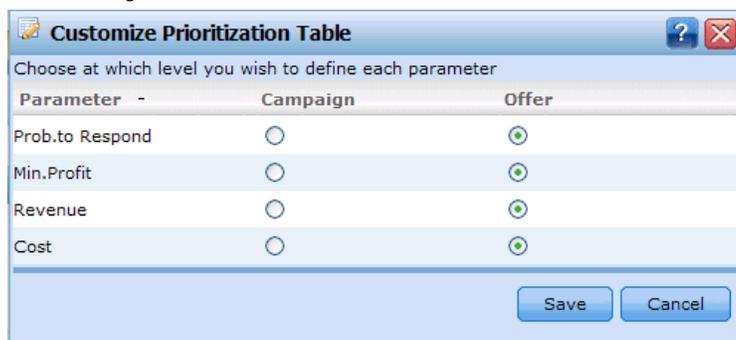

To do this, the required inputs (probability, revenue, and cost) must be specified for each campaign or offer, as appropriate. In the user interface, you specify these inputs on the Prioritize tab.

Figure 2-7
Prioritize tab

If you want the same value to be used for all offers within a campaign, you can specify that input at the campaign level. To do this, select Customize table on the Prioritize tab. (Offer is the child of campaign, thus by specifying at the campaign level then the value is applied to all offers within that campaign.) Alternatively, you can specify different inputs for each offer, then

Figure 2-8
Customizing the table

In the XML template, the same inputs are defined as variables on the relevant dimension.

```

<Dimension name="Offer">
  <Variable name="Prob.to Respond" dataType="double" simulateName="Offers Accepted" simulateAction="sum" optimizationInputItem="true" prompt="">
    <ValueSource xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="ConstantValueSource">
      <Value>0</Value>
    </ValueSource>
  </Variable>
  <Variable name="Revenue" dataType="double" optimizationInputItem="true" prompt="">
    <ValueSource xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="ConstantValueSource">
      <Value>0</Value>
    </ValueSource>
  </Variable>
  <Variable name="Cost" dataType="double" simulateAction="sum" simulateName="Total Cost" optimizationInputItem="true" prompt="">
    <ValueSource xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="ConstantValueSource">
      <Value>0</Value>
    </ValueSource>
  </Variable>
</Dimension>

```

Alternatively, if you want to specify one or more inputs at the Campaign level, you can add these as variables on the Campaign dimension instead. Moving the variable definition from Offer to Campaign is the same as selecting Campaign in the UI.

```

<Dimension name="Campaign">
  <Variable name="Prob.to Respond" dataType="double" simulateName="Offers Accepted" simulateAction="sum" optimizationInputItem="true" prompt="">
    <ValueSource xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="ConstantValueSource">
      <Value>0</Value>
    </ValueSource>
  </Variable>
</Dimension>

```

Defining constraints

Variables can also be referenced in constraints. The same general rule applies — you have to define the variable before you can use it. But in this case the variable definition and constraint may both be children of the dimension to which they apply (though I don't know if it always has to work this way).

Configuring scoring output for deployment

For applications that will be deployed for batch or real-time scoring, the `Deployment` element in the XML template specifies which model outputs are available to the scoring service. These can include:

- The final allocations or decisions for each dimension, whether determined via rules, prioritization, or combine matrix.
- Outputs from the models and rules within the stream, which typically serve as inputs to those decisions.
- Any prioritization variables defined.
- Input fields, Annotations, and “Return with” fields specified for each dimension.

Each output is defined using a separate `OutputAttribute` element within the `Deployment` element of the XML template. Outputs defined in this manner can be selected for inclusion in the result set when creating the scoring configuration. [For more information, see the topic IBM SPSS Decision Management and the Scoring Service in Chapter 4 on p. 54.](#)

Figure 2-9
Sample `OutputAttribute` specification

```
<Deployment>
  <OutputAttribute referenceType="DimensionMember" name="Claim Area"
    returnValue="Claim Area.Allocation-Value">Claim Area</OutputAttribute>
  <OutputAttribute referenceType="DimensionMember" name="Action"
    returnValue="Action.Allocation-Value">Action</OutputAttribute>
</Deployment>
```

Comments

- When scoring within the workspace (using the Score Now functionality which is enabled by specifying `ImmediateBatchScoring enableScoringOptions="true"` under the `DeployScoreStep` element in the template), any `OutputAttribute` elements specified in the template are ignored. All fields in the stream will be available for scoring, including model outputs as well as inputs.
- To view the available fields in any stream, you can open the stream file in IBM® SPSS® Modeler, open the terminal node at the end of the stream, and select the Format tab. Any of the fields listed can be included in scoring output. (When you save an application, a IBM® SPSS® Modeler stream file (*.str) is automatically created in the IBM® SPSS® Collaboration and Deployment Services Repository.)
- If any of the outputs defined in `Deployment` element are not recognized by the score provider, null values will be returned for that output. (This can happen, for example, if the specified output does not exist in the stream.)
- Some streams may contain an additional field named *entity*. This is for internal use only and should not be referenced or included in output.

Returning the allocations for each dimension

The allocations for each dimension typically represent the “final answer” returned by the application, such as the offer to be presented to a customer, or the action to take on a claim. A separate allocation field is returned for each dimension. These fields can be configured for scoring in the `Deployment` element as follows:

```
<Deployment>
  <OutputAttribute referenceType="DimensionMember" name="Claim Area"
    returnValue="Claim Area.Allocation-Value">Claim Area</OutputAttribute>
  <OutputAttribute referenceType="DimensionMember" name="Action"
    returnValue="Action.Allocation-Value">Action</OutputAttribute>
</Deployment>
```

Where:

- `referenceType` is `DimensionMember`.

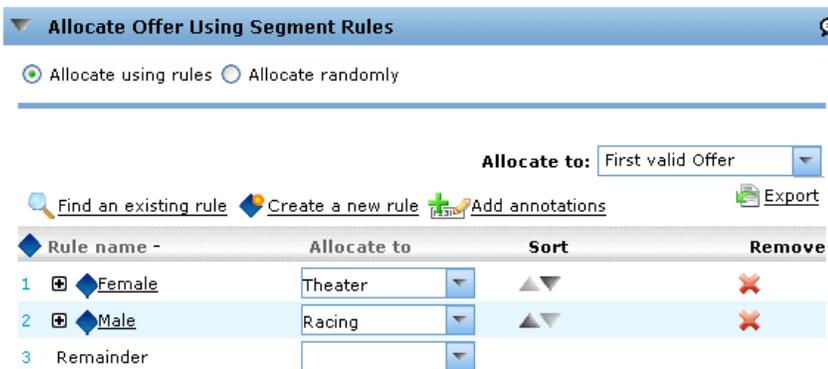

- `name` is the name of the dimension being allocated.
- `returnValue` is the name of the field being returned. By convention this matches the name of the dimension, with `.Allocation-Value` appended.

Outputs from models and rules

Each model or rule used in an allocation returns one or more output fields. When combined with the final allocation for each dimension, these outputs may be useful in understanding how a particular result was determined. For example, if a claim is referred for investigation based on the total number of risk points, you might want to know which rules contributed to the total. The available fields depend on the dimensions being allocated, and the types rules and models used, as detailed below.

Allocation using segment rules

Figure 2-10
Allocation using segment rules

When used in an allocation (`<AllocationRuleSection enabled="true" />`), segment rules return the following fields:

- `<<Dimension>>.Allocation-Segment`. The list of index values for all segments returning a value of `true`.
- `<<Dimension>>.Allocation-Segment Name`. The list of names for all segments returning a value of `true`, in the same order as the `Allocation-Segment` field.

These fields can be configured for scoring in the `Deployment` element, as follows:

```
<Deployment>
  <OutputAttribute referenceType="DimensionMember" name="Offer"
    returnValue="Offer.Allocation-Segment">Segment</OutputAttribute>
  <OutputAttribute referenceType="DimensionMember" name="Offer"
    returnValue="Offer.Allocation-Segment Name">Segment Name</OutputAttribute>
</Deployment>
```

Where:

- `referenceType` is `DimensionMember`.

- name matches the name of the dimension being allocated.
- returnValue matches the name of the field being returned.

Allocation using random percentages

Figure 2-11
Random allocation

	Probability	Allocate to	
1	40	Theater	✘
2	60	Racing	✘
3	Remainder(0%)		

When used in an allocation, random percentage rules (`<AllocationRuleSection enabled="true" />`) return the following field:

- `<<Dimension>>.Allocation-Segment Name`. The list of names for all segments returning a value of *true*.

This field can be configured for scoring in as follows:

```
<Deployment>
  <OutputAttribute referenceType="DimensionMember" name="Offer"
    returnValue="Offer.Allocation-Segment Name">Offer Segment Name</OutputAttribute>
</Deployment>
```

Allocation using aggregated point totals

Figure 2-12
Allocation based on aggregated point rules

The screenshot shows a configuration interface for rules. At the top, there's a title bar 'Use Rules to Decide Which Action is Triggered'. Below it, a 'Remainder' dropdown is set to 'Apply when no rules hit'. There are several action buttons: 'Find an existing rule', 'Create a new rule', 'Add annotations', 'OR', 'Split OR', and 'Export'. The main area contains two tables.

Rule name -	Risk points	Sort	Remove
1 Police Intervention	1	▲▼	✖
2 Multiple Claims	3	▲▼	✖
3 Cost over 5k	2	▲▼	✖
4 Cost over 3k	1	▲▼	✖
5 Material and Injury Claim	1	▲▼	✖
6 Remainder	0		

Below the first table, there are buttons for '+ Add Action' and '+ Add annotations'. The second table is for allocation:

Sum of Points>= ↓	Allocate to	Remove
1 5	Refer	✖
2 3	Standard	✖
3 0	Fast Track	

Rules that allocate decisions based on aggregated point totals (<AggregateRuleSection enabled="true"/>) return the following fields:

- <<Dimension>>.Allocation.Rule-Value. The final allocation returned by the rule.
- <<Dimension>>.Allocation.Rule.Aggregate-Value. The aggregated point total across all segments that returned a value of *true*. This is the sum of the values listed for Aggregate-Segment Points.
- <<Dimension>>.Allocation.Rule.Aggregate-Segment. The list of index values for all segments returning a value of *true*.
- <<Dimension>>.Allocation.Rule.Aggregate-Segment Name. The names of all segments returning *true*, in the same order as the Aggregate-Segment field
- <<Dimension>>.Allocation.Rule.Aggregate-Segment Points . The 'points' list for all segments returning *true*, in the same order as the Aggregate-Segment field
- <<Dimension>>.Allocation.Rule-Threshold. The index of the segment to which the record was allocated based on the sum of points.
- <<Dimension>>.Allocation.Rule-Threshold Segment. The minimum number of points needed to be included in that segment.
- <<Dimension>>.Allocation.Rule-Threshold Test Value. The aggregate value tested. This should match the total points returned for Aggregate-Value.

These fields can be configured for scoring as follows:

```
<Deployment>
  <OutputAttribute referenceType="DimensionMember" name="Action"
```

```

returnValue="Action.Allocation.Rule-Value">Rule Action</OutputAttribute>
<OutputAttribute referenceType="DimensionMember" name="Action"
returnValue="Action.Allocation.Rule-Aggregate-Value">Total Risk Points</OutputAttribute>
</Deployment>

```

Allocation based on model scores

Figure 2-13

Allocation using model scores

The screenshot shows the 'Define' tab of the 'insurance_claims_management' application. The main workspace contains a table for model configuration and a table for action allocation.

Model	Target	Measure	Remove
fraud_model.strfraudulent		Propensity	

Propensity >=	Allocate to	Remove
1 0.5	Refer	
2 0.3	Standard	
3 0	Fast Track	

When used in an allocation, predictive models (`<PredictiveModelSection enabled="true" />`) return the following fields:

- `<<Dimension>>.Allocation.Model-Value`. The probability, propensity, or confidence value returned by the model.
- `<<Dimension>>.Allocation.Model-Threshold`. The index of the segment to which the record was allocated based on model value.
- `<<Dimension>>.Allocation.Model-Threshold Segment`. The minimum value needed to be included in that segment.
- `<<Dimension>>.Allocation.Model-Threshold Test Value`. The model value tested. This should match the value returned for `Model-Value`.

These fields can be configured for scoring as follows:

```

<Deployment>
  <OutputAttribute referenceType="DimensionMember" name="Action"
    returnValue="Action.Allocation.Model-Value">Model Action</OutputAttribute>
  <OutputAttribute referenceType="DimensionMember" name="Action"
    returnValue="Action.Allocation.Model-Threshold">Model Threshold</OutputAttribute>
</Deployment>

```

Outputs from prioritization

Outputs from prioritization include the result of the prioritization equation, such as profit, as well as any prioritization variables or constraints.

Prioritization equation

The result of the prioritization equation is output to a field named `<<objective function>>-Value`. This field can be configured for scoring as follows:

```
<Deployment>
  <OutputAttribute referenceType="Objective" name="Expected Profit"
    returnValue="Expected Profit-Value">Expected Profit</OutputAttribute>
</Deployment>
```

Where:

- `referenceType` is `Objective`.
- `name` matches the value of the `Name` attribute specified for the `ObjectiveFunction` element.
- `returnValue` matches the name of the field being returned. By convention this is the name of the `ObjectiveFunction` element, with `-Value` appended.

Prioritization variables

Variables can be configured for scoring as follows:

```
<Deployment>
  <OutputAttribute referenceType="Variable" name="MaxOffersNum"
    returnValue="MaxOffersNum.Variable-Value">Max Offer</OutputAttribute>
  <OutputAttribute referenceType="Variable" name="Min.Profit"
    returnValue="Min.Profit.Variable-Value">Min Profit</OutputAttribute>
</Deployment>
```

Where:

- `referenceType` is `Variable`.
- `name` matches the name of the variable.
- `returnValue` is the name of the variable with `.Variable-Value` appended.

Input fields, annotations, and “Return with” fields

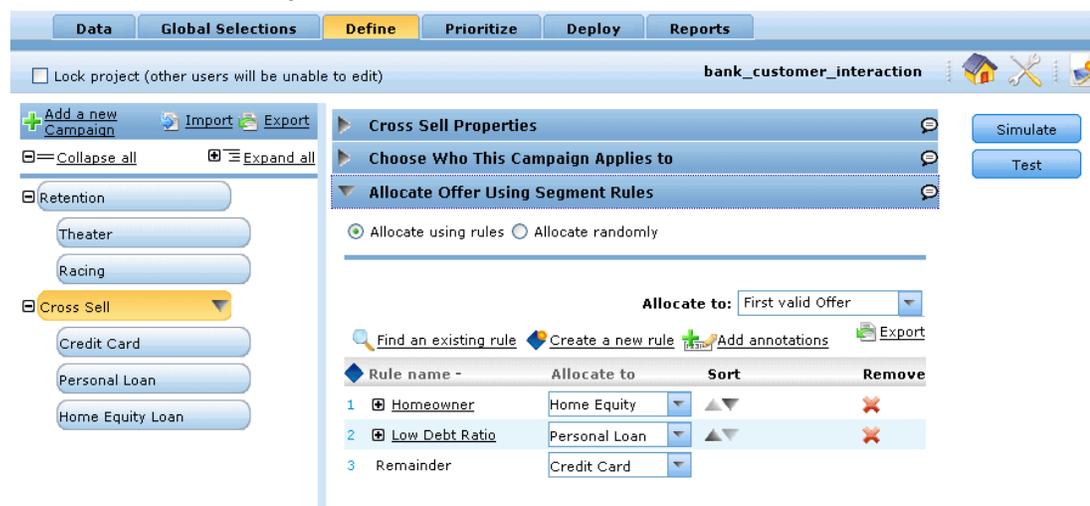

Fields read in from the data source (model inputs) are always available to the scoring service, and do not need to be defined in the XML template. No `OutputAttribute` specification is required to use these fields in scoring.

The same is true for annotations and “Return with” fields specified on the Define tab in the application, and associated with a specific dimension or rule segment. Once defined, these are automatically available to the scoring service and do not need to be specified in the XML template.

Example: IBM SPSS Decision Management for Customer Interactions output configuration

When scoring IBM® SPSS® Decision Management for Customer Interactions, available output fields include the campaigns and offers returned for each customer, along with allocation and prioritization outputs that may be useful in determining why a particular recommendation was made.

Figure 2-14
IBM SPSS Decision Management for Customer Interactions

Outputs for this application can be configured in the Deployment element as follows:

<Deployment>

```
<OutputAttribute referenceType="DimensionMember" name="Campaign"
  returnValue="Campaign.Allocation-Value">Campaign</OutputAttribute>
```

```
<OutputAttribute referenceType="DimensionMember" name="Offer"
  returnValue="Offer.Allocation-Value">Offer</OutputAttribute>
```

```
<OutputAttribute referenceType="DimensionMember" name="Offer"
  returnValue="Offer.Allocation-Segment">Segment</OutputAttribute>
```

```
<OutputAttribute referenceType="DimensionMember" name="Offer"
  returnValue="Offer.Allocation-Segment Name">Segment Name</OutputAttribute>
```

```
<OutputAttribute referenceType="DimensionMember" name="Offer"
  returnValue="Offer.Allocation-Annotation">Annotation</OutputAttribute>
```

```
<OutputAttribute referenceType="DimensionMember" name="Offer"
  returnValue="Offer.$ReturnWithVariable">Age Youngest Child</OutputAttribute>
```

```
<OutputAttribute referenceType="Objective" name="Expected Profit"
  returnValue="Expected Profit-Value">Expected Profit</OutputAttribute>
```

```
<OutputAttribute referenceType="Variable" name="MaxOffersNum"
  returnValue="MaxOffersNum.Variable-Value">Max Offer</OutputAttribute>
```

```
<OutputAttribute referenceType="Variable" name="Min.Profit"
  returnValue="Min.Profit.Variable-Value">Min Profit</OutputAttribute>
```

```
<OutputAttribute referenceType="Variable" name="Prob.to Respond"
  returnValue="Prob.to Respond.Variable-Value">Prob to Respond</OutputAttribute>
```

```

<OutputAttribute referenceType="Variable" name="Revenue"
  returnValue="Revenue.Variable-Value">Revenue</OutputAttribute>
<OutputAttribute referenceType="Variable" name="Cost"
  returnValue="Cost.Variable-Value">Cost</OutputAttribute>
</Deployment>

```

This configuration might return the following scores:

Field	Customer 1	Customer 2
Campaign	Cross Sell	Cross Sell
Offer	Personal Loan	Home Equity Loan
Segment	2	1
Segment Name	Low Debt Ratio	Homeowner
Annotation	Congratulations, you have qualified for a low interest loan	Congratulations, you have qualified for a home equity loan
Age Youngest Child		
Expected Profit	200	400
Max Offer	2	2
Min Profit	10	10
Prob to Respond	0.19	0.09
Revenue	200	400
Cost	3	3

Reviewing this output, the following can be determined:

- Customer 1 received the *Personal Loan* offer; customer 2 received the *Home Equity Loan* offer. These outcomes were determined by the *Low Debt Ratio* and *Homeowner* rules, which were the second and first segments in the allocation set, respectively.
- The annotations are returned with each offer, and are specific to that offer.
- The *Expected Profit* field lists the value returned by the prioritization equation, and is used to determine whether the offer is made. The other fields include the variables and constraints used in this calculation.

Example: IBM SPSS Decision Management for Claims output configuration

When scoring IBM® SPSS® Decision Management for Claims, available output fields include the final claim area and action returned for each claim, along with rule and model outputs that may be useful in determining why a particular recommendation was made.

Figure 2-15
Allocation based on aggregated point rules

Use Rules to Decide Which Action is Triggered

Remainder:

Rule name -	Risk points	Sort	Remove
1 <input type="checkbox"/> <u>Police Intervention</u>	1	▲▼	<input type="checkbox"/>
2 <input type="checkbox"/> <u>Multiple Claims</u>	3	▲▼	<input type="checkbox"/>
3 <input type="checkbox"/> <u>Cost over 5k</u>	2	▲▼	<input type="checkbox"/>
4 <input type="checkbox"/> <u>Cost over 3k</u>	1	▲▼	<input type="checkbox"/>
5 <input type="checkbox"/> <u>Material and Injury Claim</u>	1	▲▼	<input type="checkbox"/>
6 Remainder	0		

Sum of Points>= ↓	Allocate to	Remove
1 5	Refer	<input type="checkbox"/>
2 3	Standard	<input type="checkbox"/>
3 0	Fast Track	

Outputs for this application can be configured in the `Deployment` element as follows:

<Deployment>

```
<OutputAttribute referenceType="DimensionMember" name="Claim Area"
  returnValue="Claim Area.Allocation-Value">Claim Area</OutputAttribute>
```

```
<OutputAttribute referenceType="DimensionMember" name="Action"
  returnValue="Action.Allocation-Value">Action</OutputAttribute>
```

```
<OutputAttribute referenceType="DimensionMember" name="Action"
  returnValue="Action.Allocation.Rule-Value">Rule Action</OutputAttribute>
```

```
<OutputAttribute referenceType="DimensionMember" name="Action"
  returnValue="Action.Allocation.Rule.Aggregate-Value">Aggregate Value</OutputAttribute>
```

```
<OutputAttribute referenceType="DimensionMember" name="Action"
  returnValue="Action.Allocation.Rule.Aggregate-Segment">Rule Segment</OutputAttribute>
```

```
<OutputAttribute referenceType="DimensionMember" name="Action"
  returnValue="Action.Allocation.Rule.Aggregate-Segment Name">Rule Segment Name</OutputAttribute>
```

```
<OutputAttribute referenceType="DimensionMember" name="Action"
  returnValue="Action.Allocation.Rule.Aggregate-Segment Points">Rule Segment Points</OutputAttribute>
```

```
<OutputAttribute referenceType="DimensionMember" name="Action"
  returnValue="Action.Allocation.Rule-Threshold">Rule Threshold</OutputAttribute>
```

```
<OutputAttribute referenceType="DimensionMember" name="Action"
  returnValue="Action.Allocation.Rule-Threshold Segment">Rule Threshold Segment</OutputAttribute>
```

```
<OutputAttribute referenceType="DimensionMember" name="Action"
  returnValue="Action.Allocation.Rule-Threshold Test Value">Rule Threshold Test Value</OutputAttribute>
```

```
<OutputAttribute referenceType="DimensionMember" name="Action"
  returnValue="Action.Allocation.Model-Value">Model Action</OutputAttribute>
```

```
<OutputAttribute referenceType="DimensionMember" name="Action"
  returnValue="Action.Allocation.Model-Threshold">Model Threshold</OutputAttribute>
```

```

<OutputAttribute referenceType="DimensionMember" name="Action"
  returnValue="Action.Allocation.Model-Threshold Segment">Model Threshold Segment</OutputAttribute>
<OutputAttribute referenceType="DimensionMember" name="Action"
  returnValue="Action.Allocation.Model-Threshold Test Value">Model Threshold Test Value</OutputAttribute>
</Deployment>

```

This configuration might return the following scores:

Field	Claim 1	Claim 2
Claim Area	Automotive	Automotive
Action	Standard	Standard
Rule Action	Standard	Standard
Aggregate Value	3.0	3.0
Rule Segment	2	1 4 5
Rule Segment Name	Multiple Claims	Police Intervention Cost Over 3K Claim Type
Rule Segment Points	3	1 1 1
Rule Threshold	2	2
Rule Threshold Segment	2	2
Rule Threshold Test Value	3.0	3.0
Model Action	Fast Track	Standard
Model Threshold		0.3
Model Threshold Segment	0	2
Model Threshold Test Value	0.06	0.51

Reviewing this output, the following can be determined:

- The final action recommended by the application for both claims is to use standard processing.
- For both claims, the recommended action based on rules was also to use standard processing. Each claim had a total of three risks points assigned, though different rules fired in order to reach this total.
- For Claim 1, the rule segment named *Multiple Claims* fired *true*. Three risk points were assigned for this segment, as specified on the Define tab in the application.
- For Claim 2, three different segments fired *true* (*Police Intervention*, *Cost Over 3K*, *Claim Type*). These were the first, fourth, and fifth segments in the set, respectively. A single risk point was assigned for each of these segments, again as specified on the Define tab.
- The Rule Threshold value of two indicates the claim needed at least two risk points to be assigned this action. (Claims with fewer than two risk points are allocated to *Fast Track*.)
- The allocation based on models was *Fast Track* for Claim 1, and *Standard* for Claim 2. Claim 1 failed to cross the Model Threshold value of 0.3 for standard processing, thus it is allocated to Segment 0 and no threshold value is shown.

Prompting the user for scoring parameters

In cases where certain parameters may be provided at score time, the scoring configuration will prompt the user as needed. Such parameters can be defined in the XML template as follows:

```
<Variable name="MaxOffersNum" dataType="integer" optimizationInputItem="true" prompt="Max Offer">
  <ValueSource xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:type="ConstantValueSource">
    <Value>1</Value>
  </ValueSource>
</Variable>
```

In this case the scoring configuration will prompt the user to specify Max Offer.

Optionally, this variable can be defined as a translatable string, as follows:

```
<Variable name="MaxOffersNum" dataType="integer" optimizationInputItem="true" prompt="$Scim/Max Offer">
```

For this to work, the value \$Scim/Max Offer would need to be defined as a translatable key in IBM® SPSS® Collaboration and Deployment Services, and values provided for the relevant languages.

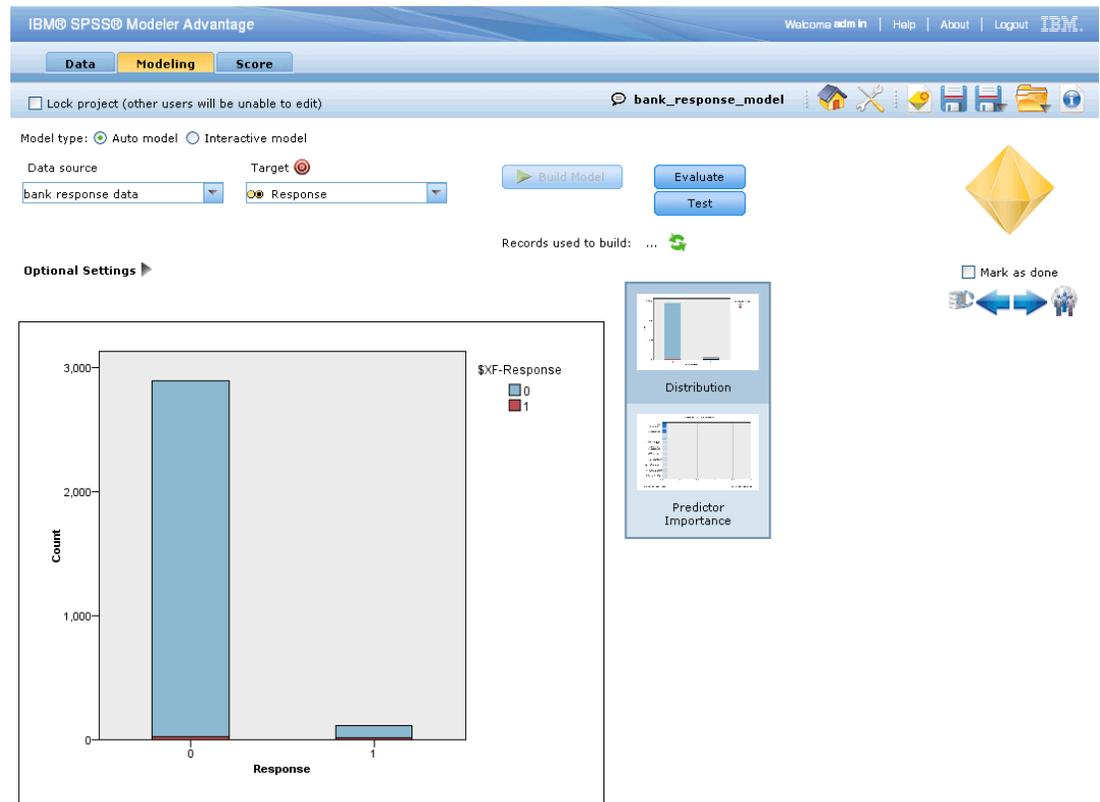

Application template examples

This section provides sample XML for four different application template examples.

IBM SPSS Modeler Advantage Template

IBM® SPSS® Modeler Advantage is an easy-to-use application that puts the power of predictive modeling in the hands of business users. Using predictive models, you can identify patterns based on what has happened in the past, and use them to predict what is likely to happen in the future. For more information, see the *IBM SPSS Modeler Advantage User's Guide*.

Figure 2-16
IBM SPSS Modeler Advantage

The template for IBM SPSS Modeler Advantage is shown below.

```
<?xml version="1.0" encoding="UTF-8"?>
<!--
```

```

A detailed description of the XML template that makes up a typical modeling application follows. Descriptions of all elements are available in the [XML templates appendix](#) on p. 3.

Refer back to the preceding XML example while reading the following information.

- ▶ The `templatename` element specifies the name of the application template. You don't need to include the file extension. This attribute is required.

```
templateName="ModelerAdvantage"
```

- ▶ The `templateVersion` and `appsVersion` elements are for internal use when applying patch fixes from SPSS Inc. You should never modify these settings.

```
templateVersion="1" appsVersion="6.1"
```

- ▶ The `ApplicationHome` element indicates whether the Home page and the model gallery section will be included in the application. These attributes are optional. The default is `true`.

```
ApplicationHome stepIncluded="true" showGallery="true"
```

- ▶ The following elements indicate which tabs will appear in the user interface. In this modeling application, only the Data, Modeling, and Score tabs will be included. The Selections, Combine, and Reports tabs will not. These attributes are all optional. The default is `true`. For a detailed description of the various tabs in the user interface, see the user's guides.

(C) Copyright IBM Corp. 2010, 2011

US Government Users Restricted Rights - Use, duplication or disclosure restricted by GSA ADP Schedule Contract with IBM Corp.

->

```

<PredictiveApplication xmlns="http://com.spss.pasw.dms/workspace" templateName="ModelerAdvantage"
templateVersion="1" appsVersion="6.1">
  <InterfaceControl>
    <InterfacePages>
      <ApplicationHome stepIncluded="true" showGallery="true"/>
      <DataStep stepIncluded="true"/>

```

- ▶ As part of the `DefineStep` element, `typeModelingDefineStep` indicates that the Define tab will be of the modeling type. For other application types, you might use `typeRulesManagementDefineStep` or `typeDecisionHierarchyDefineStep`.

- ▶ As part of the `DeployScoreStep` element, the `ImmediateBatchScoring` element indicates that scoring options will be included in the interface. This attribute is optional.

`ImmediateBatchScoring enableScoringOptions="true"`

- ▶ The `InterfaceFeature` element identifies major features to include in the user interface. This flexibility is valuable if you want to block certain users from certain functionality. At least one value is required. Possible values are described in the following table.

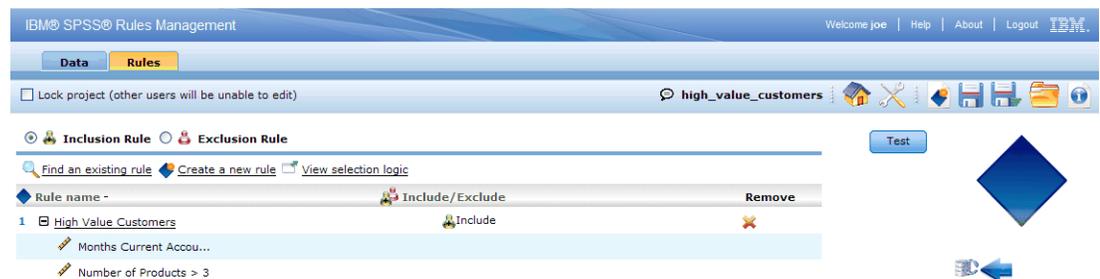

Note that inclusion of `UploadDownload` and `Collaboration` enables all other features.

Possible values	Features enabled
<code><InterfaceFeature id="ModelExport"></code>	Ability to save models to the IBM® SPSS® Collaboration and Deployment Services Repository
<code><InterfaceFeature id="ModelBuild"></code>	Ability to build models in IBM® SPSS® Decision Management applications other than IBM SPSS Modeler Advantage
<code><InterfaceFeature id="RuleExport"></code>	Ability to save rules to the IBM SPSS Collaboration and Deployment Services Repository
<code><InterfaceFeature id="RuleReference"></code>	Ability to reference rules stored in the IBM SPSS Collaboration and Deployment Services Repository
<code><InterfaceFeature id="ModelReference"></code>	Ability to reference models stored in the IBM SPSS Collaboration and Deployment Services Repository
<code><InterfaceFeature id="UploadDownload"></code>	Ability to open files from or save files to the user's local file system
<code><InterfaceFeature id="Collaboration"></code>	The ability to reference or save objects to the IBM SPSS Collaboration and Deployment Services Repository

IBM SPSS Rules Management template

IBM® SPSS® Rules Management provides a central tool for creating and editing shared rules, which can be used throughout applications to select and process records, and to automate decisions accordingly.

Figure 2-17
Rules management application

The template for SPSS Rules Management is shown below.

IBM SPSS Decision Management for Customer Interactions template

IBM® SPSS® Decision Management for Customer Interactions decides which promotions to offer customers when they contact your organization, and delivers recommendations to a call center, Web site, or store location in real time. By combining the logic of business rules with the insight gained through predictive modeling, the application identifies the most profitable decision for each customer. For more information, see the *IBM SPSS Decision Management for Customer Interactions* guide.

        <CombineOptimizeMethod enableNumReturnsByIP="true" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="typeCombineOptimizeMethod">

```

- ▶ This application's XML also defines a top-level entity dimension (`Customer`), and two main dimension members (`Campaign` and `Offer`). Note that variable names are defined for the dimensions. These are hard-coded in the XML application template rather than defined in the screen text properties files.

Applications can only have one level of children per dimension (on the Define tab, the user interface cannot display more than one level under each dimension).

```
<ReportStep stepIncluded="true"/>
.
.
.

</Function>
.
.
.

<Expression Domain="double" Functor="variableReference">
```

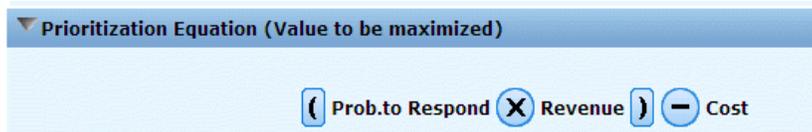

- ▶ The `Optimization` element defines the equation used to “value” each potential result by the optimization algorithm as it strives to find the solution with the minimum or maximum value. For this release, the only supported algorithm is `Heuristic`, which indicates that the “greedy” prioritization form of optimization will be used. You can also specify `None` to disable the use of the optimization.

```
<Expression>
.
.
.
```

The `Optimization` element contains the `ObjectiveFunction`. If you want to customize the objective function (the prioritization equation) used in an application, contact your SPSS representative if you have questions.

The equation used in the sample SPSS Decision Management for Customer Interaction is displayed on the Prioritize tab in the user interface:

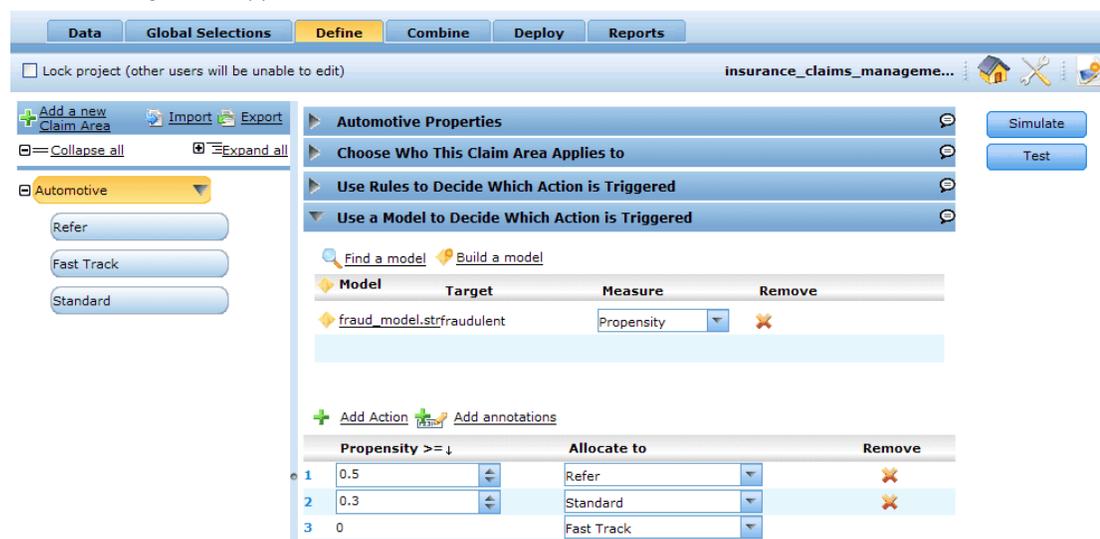

Figure 2-19
Prioritization equation

IBM SPSS Decision Management for Claims template

Using IBM® SPSS® Decision Management for Claims, organizations can harness the power of predictive analytics to process incoming claims in real time. For example, claims can be set on a “fast track” for immediate payment, processed in the normal manner, or referred to the special investigations unit. For more information, see the *IBM SPSS Decision Management for Claims* guide.

Figure 2-20
Claims management application

The template for SPSS Decision Management for Claims is shown below.

Customizing the user interface

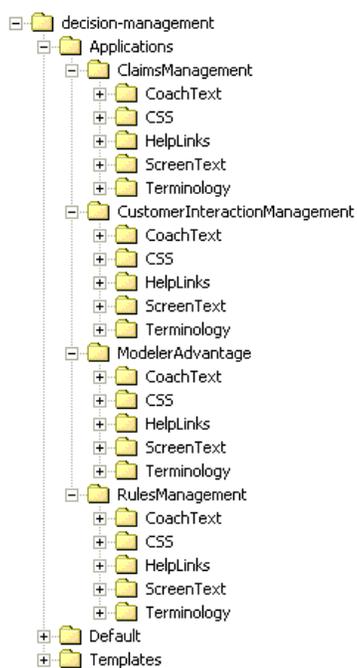

File locations

IBM® SPSS® Decision Management provides a framework for customizing the appearance of your applications. You can modify various files to customize the look and feel and the text displayed in the user interface. The process for modifying these files is described in this chapter. We recommend using a simple text editor such as Microsoft® Notepad to edit all *.css* and *.properties* files.

The default user interface files for SPSS Decision Management are installed in the IBM® SPSS® Collaboration and Deployment Services installation directory, for example *C:\Program Files\IBM\SPSS\Collaboration and Deployment Services\4.2\components\decision-management\Default*. To customize all applications, modify files in the *Default* directory. To customize one application and leave all others with the default settings, copy **only** the required directories and files from *Default* to a new application directory. For example, if you only want to customize CSS and coach text for a certain application, you only need to copy those folders – and you only need to copy the specific files and settings you want to customize. Settings in your application directory override those in *Default*.

For example, if you have four different applications—all with a unique look and feel—the directory structure might look like this:

Figure 3-1
Example directory structure

Important: Before you begin, we recommend making a backup copy of the entire *decision-management* directory.

General steps for customizing an application

After creating an application template as described in the previous chapter, follow these general steps to customize the look and feel of your application. The remaining sections in this chapter provide complete details for these general steps.

1. In the *Applications* directory, create a new folder for your application (for example, *YourApp*) as discussed in the previous chapter.
2. Copy all folders and files (or only the files you plan to customize) from an existing application and paste into your new application's directory. Choose an existing application that most closely resembles the application you want to create. For example, if you installed the prebuilt IBM® SPSS® Decision Management for Claims you can copy the contents of the *ClaimsManagement* directory into your new *YourApp* directory.
3. Open the *Default* directory and copy any other elements you want to customize, and paste them into your application's directory. For example, if you want to create custom terminology, copy the *Terminology* directory.

Your application folder only needs to contain the files you want to customize. All other files will be read from *Default*. Even within each file, you only need to include the portions you want to customize. For example, if customizing screen text, *ScreenText_en.properties* only needs to contain the text you are customizing. All other text will be read from *Default*. In other words, any item or file not explicitly defined or contained within your application directory will be handled by the *Default* directory.

4. Copy the *appGroup.xml* file and *description.xml* file from an existing application and paste it into your new application's folder (for example, into *YourApp*).

Edit the *appGroup.xml* file to reference the folders containing any files you plan to customize in your application's folder (see [Chapter 2](#) for details). Edit the *description.xml* file to specify the text used in your application's shortcut box on the *Applications launch page* (see [Chapter 2](#) for details).

5. Use the instructions in this chapter to customize your application's user interface.

Tip: When customizing files on the machine where IBM SPSS Collaboration and Deployment Services is installed, you can share the *decision-management* directory to edit the files from any other machine on your network. See your operating system documentation for details about sharing directories and files.

Note that you cannot customize the Login screen.

User interface text

You can customize all text displayed in your application to tailor the product for your company's needs. Such text includes:

Coach text: Coach text is brief, helpful, easily customizable text that appears throughout the user interface when you click the small coach text icon:

Coach text is separate from the full, browsable help system. The full help system is available by clicking the help icon on any screen or dialog:

The help system contains general information about the user interface and is not customizable, whereas the coach text can be personalized to be very specific to your application, industry, or company. Coach text is stored in *CoachText_en.properties* files, where *en* is the language.

Messages: Message text consists of all messages in the application, including errors, warnings, and information messages. Messages are stored in *Messages_en.properties* files, where *en* is the language.

Screen text: Screen text is text used on user interface elements such as tabs, buttons, dialog titles, and field labels. Screen text is stored in *ScreenText_en.properties* files, where *en* is the language. Note that the text used in shortcut boxes on the *Applications launch page* is handled in a special way with a *description.xml* file (see [Chapter 2](#) for details).

Terminology: Terminology refers to a custom list of terms used in your application. You can use terminology to replace certain terms such as *model* or *score* with terms more familiar to your users. Each term has a unique ID that can be referenced from other areas of the application such as coach text, message text, and screen text. Terminology definitions are stored in *Terminology_en.properties* files, where *en* is the language.

Language support

User interface text is stored in property files in the IBM® SPSS® Collaboration and Deployment Services installation directory (for example, *C:\Program Files\IBM\SPSS\Collaboration and Deployment Services\4.2\components\decision-management\Default\ScreenText*).

The property files shipped with IBM® SPSS® Decision Management are provided in multiple languages. Each file name includes the language code according to W3C definition standards (*_en*, *_de*, or *_ja*). If you need another language, you can create your own properties files with the proper language code and translate the content from the shipped files. Make sure you save

the files in ASCII format. The following table provides some example language codes. You can perform a simple Internet search to find other language codes.

Each user can easily change the language of his or her application without having to restart any servers. For example, German-speaking users, English-speaking users, and Japanese-speaking users can all be using the same application in their own language. From the Tools menu in your browser, go to Internet Options or Options, switch to the desired language, and then refresh the screen.

Language	Language code	Example file name
Chinese	zh	<i>CoachText_zh.properties</i>
Dutch	nl	<i>CoachText_nl.properties</i>
English	en	<i>CoachText_en.properties</i>
French	fr	<i>CoachText_fr.properties</i>
German	de	<i>CoachText_de.properties</i>
Italian	it	<i>CoachText_it.properties</i>
Japanese	ja	<i>CoachText_ja.properties</i>
Spanish	es	<i>CoachText_es.properties</i>

The following sections include the syntax of each properties file you can customize, including examples. As a precaution, save a copy of all original files before proceeding (we recommend saving a copy of the entire *decision-management* directory). This allows you to revert to the original files in the future, if necessary.

Note that each application directory includes a *description.xml* file that defines the text used in shortcut boxes on the *Applications launch page*. This file works differently than properties files, in that content for all languages is included within the file. For example, the English section for the IBM® SPSS® Decision Management for Claims is defined as follows:

```
<en>
  <TitleEntry>Claims Management</TitleEntry>
  <ShortDescription>Intelligent risk management in real time</ShortDescription>
  <LongDescription>Assess the overall risk level for incoming claims and recommend the specific action to take.</LongDescription>
</en>
```

English, German, and Japanese sections are included. To add your own language, simply create a new section (for example, `<fr>`) and customize the text to meet your needs.

If text in *description.xml* is missing or not configured correctly and cannot be read by the application, the application will then read it from *appGroup.xml*.

Coach text

Certain areas of the user interface provide coach text. Each area has a unique name identifying it in the coach text properties file. Entries in the coach text properties file are listed in the order they appear in the user interface. Follow the instructions in this section to customize the coach text in all applications or in one specific application. See [File locations on p. 40](#) for details about file locations.

Important: Do not modify any IDs in the coach text properties files. Only modify text after the equals sign (=). For example, in HOME_DATASTEP_TITLE=Data, HOME_DATASTEP_TITLE is the ID and should never be modified.

To customize coach text across all applications

1. Open the file *Default\CoachText\CoachText_en.properties*, where *en* is the desired language.
2. Make the desired changes, save, and close. Note that any customizations made to coach text in an application override the default coach text.

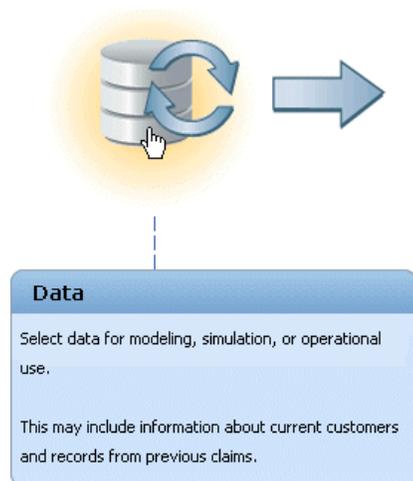

To customize coach text in one application

1. Open the file *Applications\YourApp\CoachText\CoachText_en.properties*, where *YourApp* is the name of your application's folder and *en* is the desired language. If this file does not yet exist, copy it from *Default/CoachText* and remove all sections from it except for those you plan to customize.
2. Make the desired changes, save, and close.

Examples

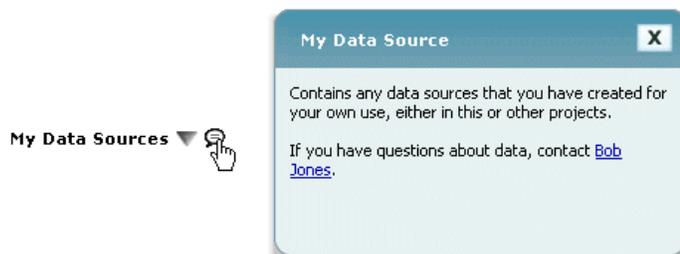

- To change the special “hover” style coach text used for the Data step icon on the Home page, modify the following lines in the coach text properties file. Modify the text after HOME_DATASTEP_TITLE= to change the title of the coach text window, or modify the text after HOME_DATASTEP_CONTENT= to change the main text displayed in the coach text window.

```
HOME_DATASTEP_TITLE=Data
HOME_DATASTEP_CONTENT=Select data for modeling, simulation, or operational use.  
This may include information about current customers and results from previous claims.
```

- You can include simple HTML elements in coach text such as links, bold and italic text, etc. For example, to include an e-mail link so users can easily contact someone in your organization, include something like the following in the coach text properties file. The link in this example opens a new, blank e-mail message when the user clicks it from coach text on the Data tab.

```
DATA_SOURCE_MY_TITLE=My Data Source
DATA_SOURCE_MY_CONTENT=Contains any data sources that you have created for your
own use, either in this or other projects.<br/><br/>If you have questions about
data, contact <a href="mailto:bobjones@sdbank.com">Bob Jones</a>.
```

Message text

You can customize the text used in warning, error, and informational messages. Follow the instructions in this section to customize the message text in all applications or in one specific application. See [File locations on p. 40](#) for details about file locations.

Important: Do not modify any IDs in the message properties files. Only modify text after the equals sign (=). For example, in LOGIN_FAILED=Login unsuccessful, LOGIN_FAILED is the ID and should never be modified.

To customize messages across all applications

1. Open the file *Default\Message\Message_en.properties*, where *en* is the desired language.
2. Make the desired changes, save, and close. Note that any customizations made to messages in an application override the default messages.

To customize messages in one application

1. Open the file *Applications\YourApp\Message\Message_en.properties*, where *YourApp* is the name of your application's directory and *en* is the desired language. If this file does not yet exist, copy it from *Default/Message* and remove all sections from it except for those you plan to customize.
2. Make the desired changes, save, and close.

Example

To change the error message displayed when a user fails to log in to IBM® SPSS® Decision Management, modify the following line in the appropriate message properties file. Only modify the text after LOGIN_FAILED=.

For example, you may want to include the name of an administrator users should contact at your company for login-related issues.

```
DELETE_RULE=Are you sure you want to delete this rule?<br/><br/>If
you have questions about rules, see our rules administrator <a
href="mailto:janedoe@sdbank.com">Jane Doe</a> in office L318.
```

Screen text

Text such as dialog headings, field labels, tab labels, and button labels can be customized. Follow the instructions in this section to customize screen text in all applications or in one specific application. See [File locations on p. 40](#) for details about file locations.

Important: Do not modify any IDs in the screen text properties files. Only modify text after the equals sign (=). For example, in `TOOLTIP_NEW_MODEL=New model`, `TOOLTIP_NEW_MODEL` is the ID and should never be modified.

To customize screen text across all applications

1. Open the file `Default\ScreenText\ScreenText_en.properties`, where *en* is the desired language.
2. Make the desired changes, save, and close. Note that any customizations made to screen text in an application override the default screen text.

To customize screen text in one application

1. Open the file `Applications\YourApp\ScreenText\ScreenText_en.properties`, where *YourApp* is the name of your application's directory and *en* is the desired language. If this file does not yet exist, copy it from `Default/ScreenText` and remove all sections from it except for those you plan to customize.
2. Make the desired changes, save, and close.

Example

To change the name of the main section headings on the Data tab, modify the following values in the appropriate screen text properties file.

```
#####
# Screen text used on Data tab
#####
Project_Data_Model=Project Data Model
Data_source=Data source
```

Terminology

You can customize terminology used in your applications to fit your business needs. You can also add new terms. Each term has a unique ID that can be referenced in other areas of the application such as coach text windows, messages, and screen text. Follow the instructions in this section to create custom terms in all applications or one specific application. See [File locations on p. 40](#) for details about file locations.

To add custom terminology across all applications

1. Open the file *Default\Terminology\Terminology_en.properties*, where *en* is the desired language.
2. Modify or add one or more terminology definitions. Each term must have a unique ID.
3. Insert the appropriate terminology tag into the desired coach text, screen text, or messages properties files. Use the syntax `<#:DataStep>`, where *DataStep* is the ID from the terminology properties file.

To add custom terminology to one application

1. Open the file *Applications\YourApp\Terminology\Terminology_en.properties*, where *YourApp* is the name of your application's directory and *en* is the desired language. If this file does not yet exist, copy it from *Default\Terminology* and remove all sections from it except for those you plan to customize.
2. Modify or add one or more terminology definitions.
3. Insert the appropriate terminology tag into the desired coach text, screen text, or messages properties files located in your application's directory (for example, *Applications\YourApp*).

Example

The prebuilt applications included with the product use terminology variables for all tab names in the user interface. For example, the IBM® SPSS® Decision Management for Claims defines the following terminology variables in its *Terminology_en.properties* file:

```
#####
# Variables for names of tabs in UI
#####
ApplicationHome=Home
DataStep=Data
GlobalSelectionStep=Global Selections
DefineStep=Define
CombineOptimizeStep=Combine
DeployScoreStep=Deploy
ReportStep=Reports
```

And then the SPSS Decision Management for Claims uses those terminology variables in its *ScreenText_en.properties* file:

```
#####
# Name of each step/tab in the UI. These may differ per application type
#####
ApplicationHome=<#:ApplicationHome>
```

```
DataStep=<#:DataStep>
GlobalSelectionStep=<#:GlobalSelectionStep>
DefineStep=<#:DefineStep>
CombineOptimizeStep=<#:CombineOptimizeStep>
DeployScoreStep=<#:DeployScoreStep>
ReportStep=<#:ReportStep>
```

To change the name of the *Combine* tab to *Prioritize*, simply change `CombineOptimizeStep=Combine` to `CombineOptimizeStep=Prioritize` in the *Terminology_en.properties* file. The new tab name will then be used in every spot where the terminology variable is inserted (for example, it is also used in the coach text for the SPSS Decision Management for Claims, as shown below).

```
#####
# Following entries are for hover-style coach text on Home screen
#####

HOME_DATASTEP_TITLE=<#:DataStep>
HOME_DATASTEP_CONTENT=Select data for modeling, simulation, or operational
use.<br/><br/>This may include information about current customers and
records from previous claims.

HOME_GLOBALSELECTIONSTEP_TITLE=<#:GlobalSelectionStep>
HOME_GLOBALSELECTIONSTEP_CONTENT=Choose claims you want to include or exclude
from the application.<br/><br/>For example, all claims relating to floods or
windshield damage may be excluded due to special handling requirements.

HOME_DEFINESTEP_TITLE=<#:DefineStep>
HOME_DEFINESTEP_CONTENT=Define the types of claims and possible actions along
with the rules and models for determining the likelihood of fraud.

HOME_COMBINEOPTIMIZESTEP_TITLE=<#:CombineOptimizeStep>
HOME_COMBINEOPTIMIZESTEP_CONTENT=Specify how rules and models are combined to
determine the recommended action for each claim.

HOME_DEPLOYSCORESTEP_TITLE=<#:DeployScoreStep>
HOME_DEPLOYSCORESTEP_CONTENT=Validate your current configuration and mark it
ready to be deployed.
```

Look and feel

You can change the appearance of your applications by modifying graphics files and cascading style sheets (.css). Experience with graphics and style sheets is recommended for modifying elements such as:

- Colors
- Borders
- Background properties
- Size and position of elements
- Margins and padding
- Fonts and text properties

Figure 3-2
Application with custom look and feel

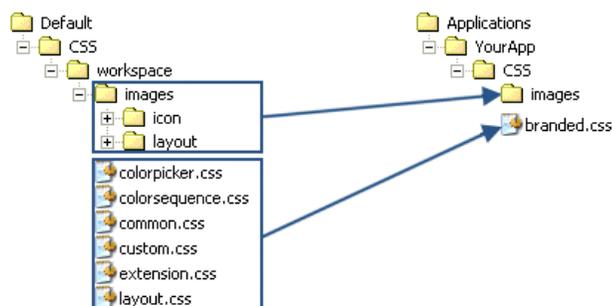

Note that styles cascade. The default styles and images are applied unless any are customized in your application, in which case they override the default. For example, if the only portion of your application you want to customize is the font, you can either change the values in the following section of the default CSS (*layout.css*) to change the font for all applications, or copy the section from *layout.css* to the custom CSS for your application (*branded.css*) to only change the font there. In the latter scenario, the *branded.css* file for your application would only need to contain the following section, and all other styles and settings will be applied from the default styles.

```
body,table td,select,pre,.gwt-Button {
    font-family: Verdana, Arial, Helvetica, sans-serif;
    font-size: 12px;
}
```

The following figure illustrates the process of customizing a single application, while leaving the default alone. This is the recommended method. To customize graphics, copy the graphics you want to customize from the default images folders to the images folder in your application directory, then modify them (or create new images files in your application directory of the correct file name, size, and folder location). To customize *.css* settings, open any or all of the default *.css* files and copy the sections you want to customize into your application's *branded.css* file.

Figure 3-3
Copying graphics and CSS settings from default

The same general process should be used for [customizing user interface text](#).

Customizing style sheets and graphics

Graphics and style sheets are stored in the IBM® SPSS® Collaboration and Deployment Services directory, for example *C:\Program Files\IBM\SPSS\Collaboration and Deployment Services\4.2\components\decision-management\Default\CSS*). Use the following steps to modify the style sheets and/or graphics for your application.

To customize CSS and graphics across all applications

1. In the *Default\CSS* folder, modify settings in one or more CSS files.
2. In the *Default\CSS\images* folder, edit any graphics files (*.gif*) in graphics software of your choice to make any desired changes, or replace the graphics with your own. Note that if you change the dimensions of a graphic, you also need to search the CSS for the graphic file name and update the defined pixel dimensions.

To customize CSS and graphics in one application

1. In the *CSS* folder of the application you want to customize (for example, *Applications\YourApp\CSS*), open the file *branded.css*.
2. Copy any sections you want to change from the default CSS files (*common.css*, *custom.css*, *extension.css*, *layout.css*) into *branded.css*. Note that you can only customize *colorpicker.css* across all applications (you cannot have unique settings per application). The file defines which colors are available for labels in the user interface.
3. Modify sections in *branded.css* as desired, save, and close.
4. Open your application's *appGroup.xml* file and set the `<CssFileSpec>` value to your application's *branded.css* stylesheet. Without this setting, your application would apply all default styles. For example:

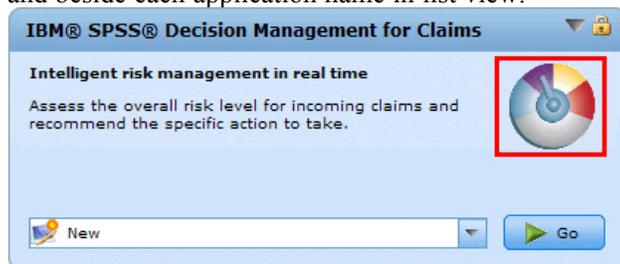

```
<CssFileSpec>/Applications/YourApp/CSS/branded.css</CssFileSpec>
```

Note: Changes aren't always reflected in the user interface immediately. You may need to wait a few minutes and refresh your web browser.

Examples

To change the graphics used on the applications launch page

On the *Applications launch page*, small graphics are used in the shortcut box for each application and beside each application name in list view:

The process for customizing these graphics is a bit different than for other graphics. You must modify settings in the default *custom.css* file (*Default\CSS\workspace\custom.css*). The shortcut graphics for each prebuilt application are defined in the CSS as follows:

```

cursor: hand;
  cursor: pointer;
}

.quickLaunch-page-layout {
  width: 98%;
  padding-top: 5px;
  padding-left: 5px;
  padding-right: 5px;
}

.launcher_customerinteractionmanagement_icon {
  width: 57px;
  height: 51px;
  background: url("images/icon/LAUNCHER_customer_interactions.gif")
    no-repeat scroll 0 0;
}

.launcher_claimsmanagement_icon {
  width: 58px;
  height: 58px;
  background: url("images/icon/LAUNCHER_claims_processing.gif") no-repeat
    scroll 0 0;
}

```

```
.launcher_rulesmanagement_icon {
    width: 43px;
    height: 44px;

    .launcher_YourApp_icon {
        width: 58px;
        height: 45px;
        background: url("images/icon/LAUNCHER_YourApp.gif") no-repeat
        scroll 0 0;
    }
}
```

And the small graphics for the list view are defined as follows:

```
width: 19px;
height: 23px;
background: url("images/icon/object_model_A.gif");
}

.model-dl-stream-icon {
    width: 18px;
    height: 18px;
    background: url("images/icon/object_model_DL.gif");
}

.pa-stream-icon {
    width: 21px;
    height: 19px;
    background: url("images/icon/object_project.gif");
}

.rule-stream-icon {
    width: 15px;
    height: 17px;
    background: url("images/icon/object_rule.gif");
    vertical-align: middle;
}

.ruleset-stream-icon {
    width: 20px;
    height: 16px;

    .launcher_list_YourApp_icon {
        width: 16px;
        height: 16px;
        background: transparent
        url("images/icon/LAUNCHER_list_YourApp.gif") no-repeat;
    }
}
```

- If you want to customize the graphic for an existing prebuilt application, simply modify the graphics defined in the css (for example, to customize the IBM® SPSS® Modeler Advantage graphics, edit *LAUNCHER_modeler_advantage.gif* and *LAUNCHER_list_modeler_advantage.gif*).

- ▶ If you want to create new graphics for a new application, add your graphics to the default icon folder and then add new CSS settings. For example, if your XML application template file name is *YourApp.xml*, you would add the appropriate CSS settings to *custom.css* as shown above. Be sure the `width` and `height` definitions are correct for your new graphics.

To change the colors available in the color picker

- ▶ To customize the colors available in the color picker, modify the file *Default\CSS\workspace\colorpicker.css*. The color picker is used for label colors on the Deploy tab and the matrix on the Combine tab of certain applications. You can change existing color values or add as many new colors as you like. Note that you can only customize these colors in the default CSS for all applications—you cannot customize them per application.

You can use the name of a color or the hex value (for example, red is #FF0000).

Scoring Service configuration

Scoring includes the process of generating real-time values by supplying predictive models with input data. In general, to use a model for generating scores:

- ▶ Select a model from the IBM® SPSS® Collaboration and Deployment Services Repository to use for scoring.
- ▶ In IBM® SPSS® Collaboration and Deployment Services Deployment Manager, define a scoring configurations for the model.
- ▶ Supply the configured model with data and generate scores.

Scoring is now a component of IBM® SPSS® Collaboration and Deployment Services. This chapter provides brief information specific to IBM® SPSS® Decision Management regarding the IBM SPSS Collaboration and Deployment Services Scoring Service.

For complete information about scoring, see the *Scoring* chapter of the *IBM® SPSS® Collaboration and Deployment Services Deployment Manager User's Guide (UsersGuide.pdf)*. The guide is included on the IBM SPSS Collaboration and Deployment Services installation disc and installed with IBM SPSS Collaboration and Deployment Services.

IBM SPSS Decision Management and the Scoring Service

The general process for scoring IBM® SPSS® Decision Management applications is as follows:

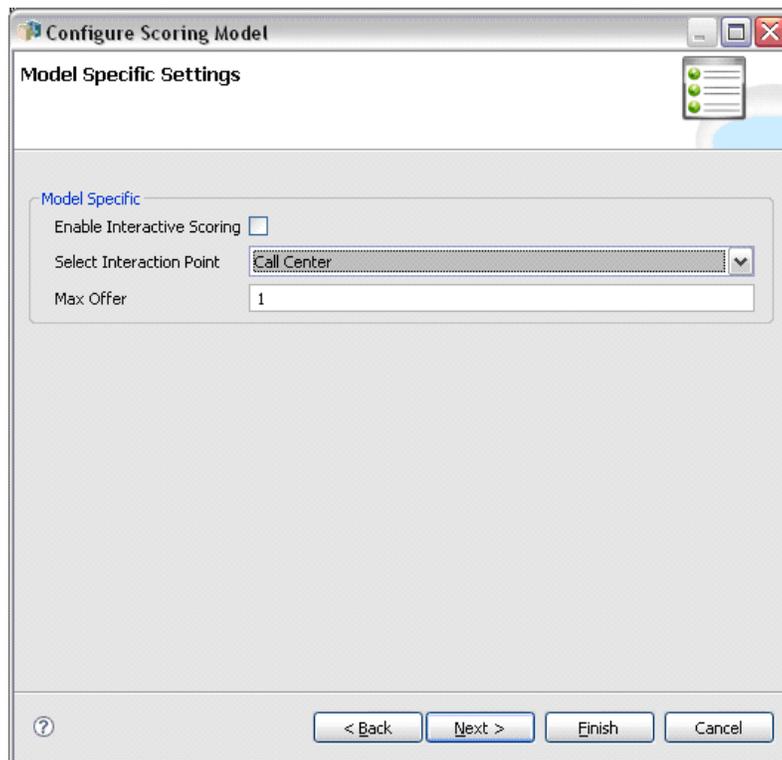

- ▶ A IBM® SPSS® Modeler stream (.str file) is automatically created in the repository when the end user saves a SPSS Decision Management application workspace.
- ▶ The SPSS Modeler stream can then be used with the Scoring Service. In IBM® SPSS® Collaboration and Deployment Services Deployment Manager, create a scoring configuration. When creating the scoring configuration, some SPSS Decision Management-specific dialogs must be completed to enable interactive scoring, select interaction points (if configured), and set global variables (such as *Max Offers*, for example).

Creating a Scoring Service Configuration

You need to use Deployment Manager to create a scoring configuration. For complete instructions, see the help in Deployment Manager. Keep the following SPSS Decision Management-specific points in mind when creating scoring configurations.

Model Specific Settings

Figure 4-1
Creating a Scoring Service configuration in IBM SPSS Collaboration and Deployment Services
Deployment Manager

Enable Interactive Scoring. If your application (stream) supports interactive scoring, you can select this option to choose whether interactive scoring is enabled for the scoring configuration. If enabled, and if the Scoring Service does not have all the inputs needed, a *MissingDataException* will be returned that identifies the missing data (fields), and the interactive question that can be used to prompt for the needed values. The caller can then prompt for the missing data and call the Scoring Service again (passing all data). Interactive scoring is configured on the Deploy tab in the SPSS Decision Management application (see below).

- While *MissingDataException* can identify multiple pieces of missing data, it does not necessarily identify all missing data. *MissingDataException* will communicate which data is missing at the current stage of processing.
- If Enable Interactive Scoring is not enabled, you get a *MissingDataException* without any interactive questions.

Select Interaction Point. If your application uses multiple interaction points, you can select which interaction point the configuration should use in the Model Specific Settings dialog box. Interaction points specify where an item such as a campaign or offer applies. Options might include a call center, web site, ATM, or in-store location. Administrators can predefine the interaction points available for selection by business users. The interaction points defined are

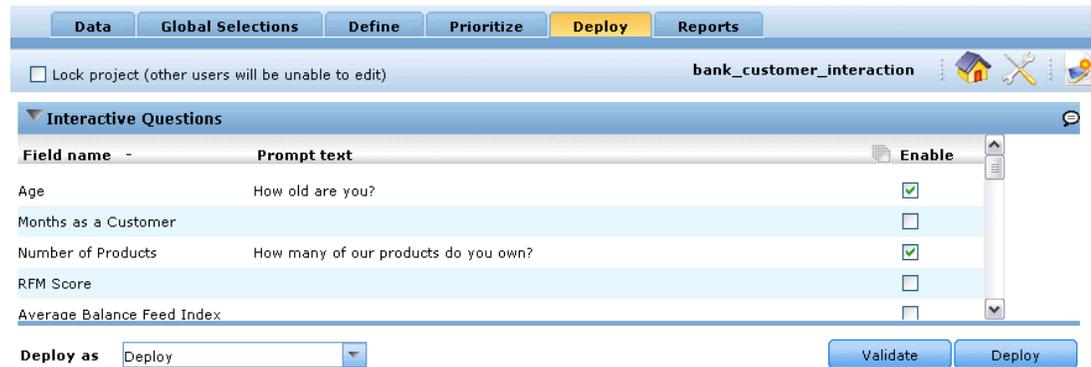

displayed to business users on the Define tab, in the properties section. You can create multiple scoring configurations in Deployment Manager—one for each interaction point.

Max Offer. Note that *Max Offer* is an example of a field that might be displayed in the Deployment Manager dialog. It's actually a variable defined for the entity dimension in your application's XML template file.

Configuring Model Specific Settings in IBM SPSS Decision Management

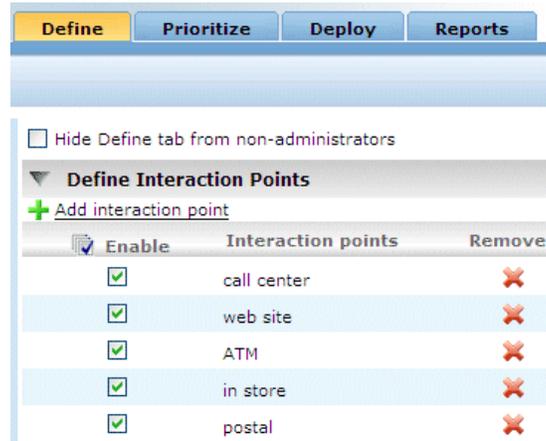

The model specific settings displayed in the scoring configuration are defined in SPSS Decision Management. Interactive scoring is performed on a per-field basis, and is configured on the Deploy tab.

Figure 4-2
Configuring interactive questions on the Deploy tab in the application

The available interaction points, if any, are configured for each application by an administrator.

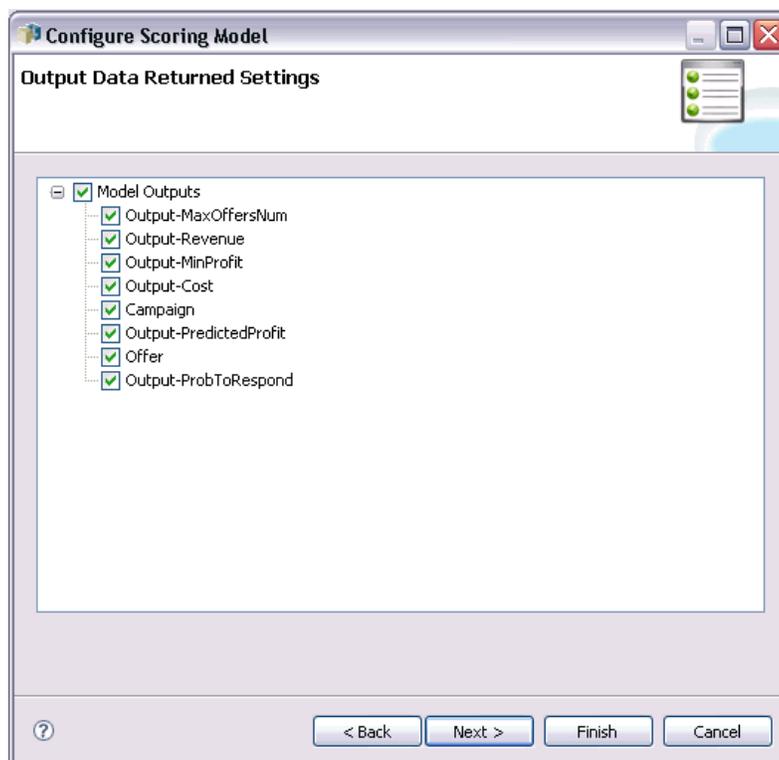

Figure 4-3
Defining interaction points in IBM SPSS Decision Management

Choosing Model Outputs

In the scoring configuration, you can choose which model outputs to include with the results. The available outputs are defined in the `Deployment` element in the XML template. [For more information, see the topic Configuring scoring output for deployment in Chapter 2 on p. 16.](#)

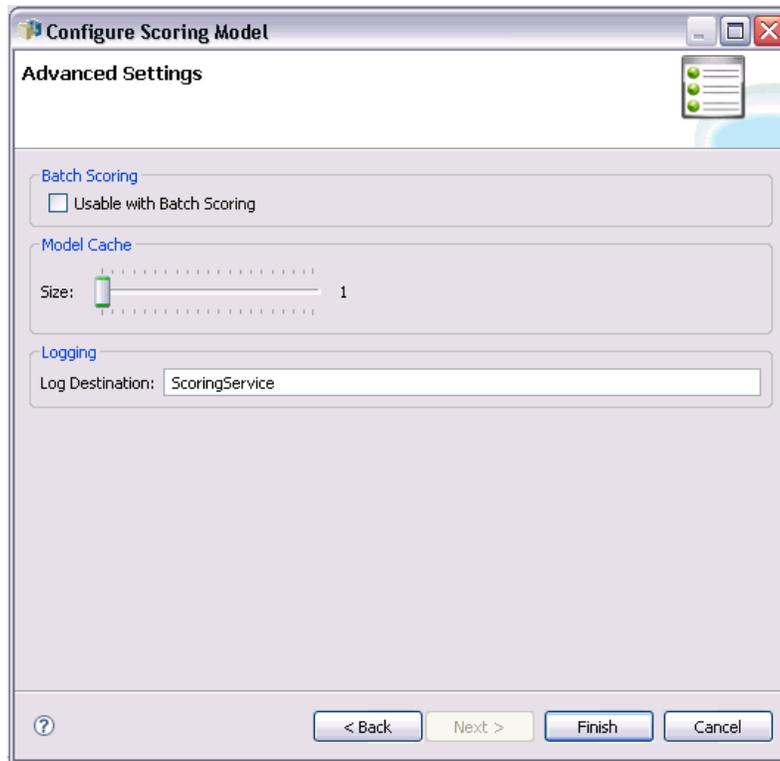

Figure 4-4
Choosing model outputs

Advanced Settings

Under Advanced Settings, you can specify options for batch scoring, caching, and logging.

Figure 4-5
Advanced scoring settings

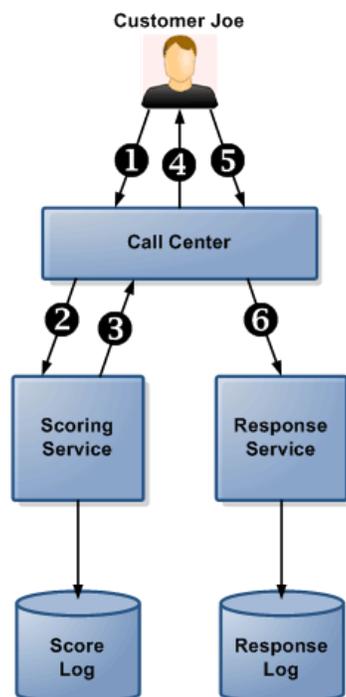

- **Usable with Batch Scoring.** If enabled, the user will have the option to select a text data file (in .csv format) when scoring the stream using IBM® SPSS® Collaboration and Deployment Services Deployment Portal or a similar tool.
- **Model Cache.** Specifies the number of images of a stream that are prepared and pre-loaded into the cache. This determines the number of concurrent scores that can be done without blocking any request, and may improve performance by avoiding the overhead of loading and preparing models.
- **Log Destination.** Specifies the name of the queue where scores are logged.

Response Service

The Response Service supplements the Scoring Service. It's a web service allowing client applications such as call center interfaces to send responses to the service to be logged. For example, a bank might have a call center interface that presents specific offers to the call center agent. The agent can then make the appropriate offer to the bank customer, and the customer's answer (response) is sent to the Response Service and logged. The following figure presents the flow of a complete example.

Figure 4-6
Example use of Scoring Service and Response Service

1	Customer Joe calls.
2	The call center sends Joe's customer ID to the Scoring Service. If logging is turned on in the scoring configuration (optional), this information is sent to the score log. Note that score logging is distinct from response logging.
3	The Scoring Service determines the best offer for customer Joe (<i>Gold Card</i> , for example) and sends the offer back to the call center. This information is also written to the score log (if enabled); Views and Queries can be written against the score log.
4	The call center operator presents the <i>Gold Card</i> offer to customer Joe.
5	Joe says yes to the offer.
6	The call center sends Joe's "yes" response to the Response Service and this response is logged. Queries can be written against the response log, or against both logs.

For more information about the Response Service and hooking it up to your front-office application, contact your SPSS representative.

Using rules from ILOG Business Rule Management System

Rules created in a Business Rules Management System such as ILOG can be referenced and used in IBM® SPSS® Decision Management applications as follows:

- ▶ In SPSS Decision Management, the administrator downloads a *.ZIP* file containing the metadata for a particular project, including an XML schema that describes the project data model as well as a WSDL template.
- ▶ An expert user reads the XML schema into an external tool such as ILOG Rules Studio, uses it to create rules for use with the SPSS Decision Management project, and deploys each rule as a Web service.
- ▶ In IBM® SPSS® Collaboration and Deployment Services Deployment Manager, the administrator creates an external rule reference for each rule to be used in SPSS Decision Management. Each rule reference is saved as an object in IBM® SPSS® Collaboration and Deployment Services Repository.
- ▶ Referenced rules are accessible in the SPSS Decision Management project, where they can be browsed and used in the same manner as other models and rules. For more information, see the *User's Guide* for the SPSS Decision Management application.

Downloading project metadata

Rules created in a Business Rules Management System such as ILOG can be referenced and used in IBM® SPSS® Decision Management applications, provided they have been developed to support the same data model used in the current SPSS Decision Management project, and can be deployed as a Web service for use the application. To accomplish this, the SPSS Decision Management administrator can download a *.ZIP* file with metadata for the current project. The downloaded file is saved locally on the system used by the administrator to trigger the download.

Figure 5-1
Download metadata icon

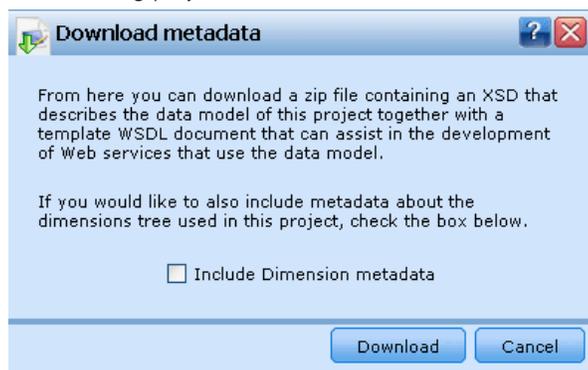

The following files are included in the *.ZIP* file:

- **XML schema definition (*.XSD)**. Contains definitions of the field types in the data model for the current SPSS Decision Management project. This file can be imported into an external development tool such as ILOG Rules Studio in order to develop rules for use with the current project.
- **Web service description language template (*.WSDL)**. Included to assist in development of Web services that use the data model. The *.WSDL* file is provided as a template that can be used to build Web services responsible for mediating messages between the SPSS Decision Management application and an external rule service. Details on the mediating Web service can be manually supplied by the integrator.

Include dimension metadata. If a dimension tree has been defined for the project on the Define tab, dimension tree metadata can optionally be included.

Figure 5-2
Downloading project metadata

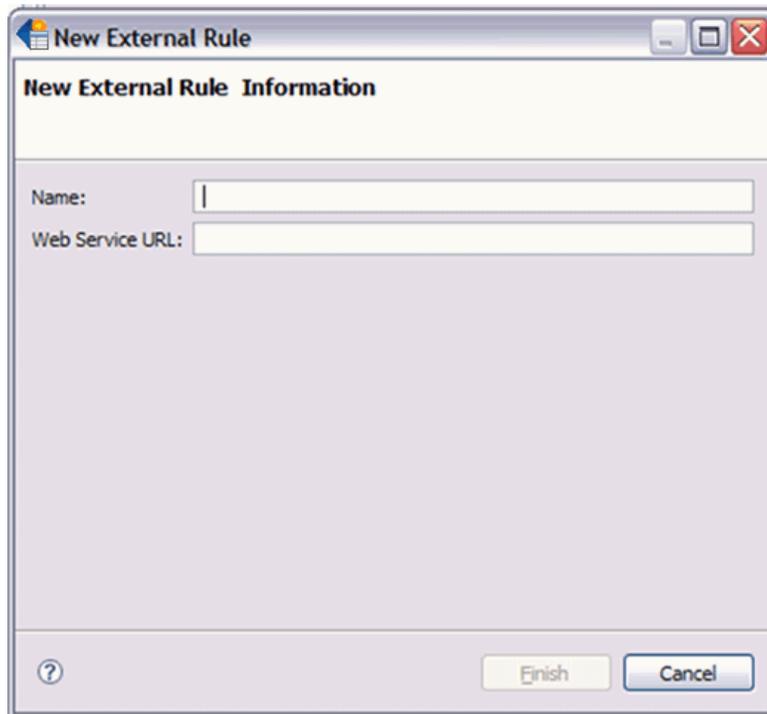

Creating external rule references

In IBM® SPSS® Collaboration and Deployment Services Deployment Manager, the New External Rule dialog box defines a reference to an external rule accessed through a Web service for use in IBM® SPSS® Decision Management applications. For example, this makes it possible to support ILOG rules in SPSS Decision Management.

- ▶ To create an external rule reference, in Deployment Manager, click on an item in the content repository and from the menus choose:
File > New > External Rule...

Figure 5-3
Creating a new external rule reference

The image shows a software dialog box titled "New External Rule". The dialog has a subtitle "New External Rule Information". It contains two text input fields: "Name:" and "Web Service URL:". At the bottom, there are three buttons: a help button (question mark), an "Finish" button, and a "Cancel" button.

Name. Specify a name for the external rule reference.

Web Service URL. Enter the URL of the web service where the rule is deployed, for example *http://myRuleServer:8080/theRestOfTheURL*. The URL will be validated automatically to ensure it meets the appropriate naming conventions.

Using external rules in applications

Once defined in IBM® SPSS® Collaboration and Deployment Services Deployment Manager, external rules can be browsed and used in IBM® SPSS® Decision Management applications in much the same manner as other models and rules. For more information, see the *User's Guide* for the SPSS Decision Management application.

XML Schema

Element Reference

This section provides a reference for all the elements in the XML schema used to configure and customize applications.

Each topic lists the valid attributes for an element and its parent and child elements. These elements are listed in the table of contents as a child of this topic (Element Reference) rather than as a child of the parent topic.

Attribute Element

A reference to an attribute that will provide the value

Table A-1
Attributes for Attribute

Attribute	Use	Description	Valid Values
Category	optional	Indicates that only records with the given category are considered. Only valid when usage attribute is count.	<i>string</i>
dataType	required	Storage type of the attribute	<i>string</i>
description	optional	Optional attribute description	<i>string</i>
isAnalytic	optional	Indicates if this attribute is analytic or not	<i>boolean</i>
isOperational	optional	Indicates if this attribute is operational or not	<i>boolean</i>
isSelected	optional	Indicates selection state for this attribute	<i>boolean</i>
maximumValue	optional	A maximum value restriction for this attribute	<i>string</i>
minimumValue	optional	A minimum value restriction for this attribute	<i>string</i>
miningType	optional	The data mining type of this attribute	<i>string</i>

Attribute	Use	Description	Valid Values
name	required	Name of the attribute	<i>string</i>
Usage	optional	Indicates the usage in a constraint. If count, the usage is the number of output records. If sum, the usage is the sum of the value of the output records. If value, the default, the usage is the value of the current record.	<i>string</i>

</xs:element>
```

Table A-6
Extended Types

Type	Description
typeDataSetExpression	A derived attribute expression definition stored locally

Parent Elements[DataSet Element](#)**Child Elements**[Category Element](#)**Category Element**

Categorical values defined for this attribute

XML Representation

```
<xs:element name="Category" type="xs:string" minOccurs="0" maxOccurs="unbounded"/></xs:element>
```

Parent Elements[Attribute Element](#)**Table Element**

The table used in this data set

Table A-7
Attributes for Table

Attribute	Use	Description	Valid Values
loginId	optional	Optional ID to be used if a login is required, passwords will not be saved	<i>string</i>
loginRequired	optional	Indicates whether credentials are required for table access or not	<i>boolean</i>
tableName	required	Name of the selected table at the source	<i>string</i>

XML Representation

```
<xs:element name="Table" type="typeDataTable">
  <xs:attribute name="tableName" type="xs:string" use="required"/></xs:attribute>
  <xs:attribute name="loginRequired" type="xs:boolean" use="optional" default="false"/></xs:attribute>
  <xs:attribute name="loginId" type="xs:string" use="optional"/></xs:attribute>
</xs:element>
```

Table A-8
Extended Types

Type	Description
ExcelFileTable	An Excel file-based table definition
FlatFileTable	A flat file-based table definition
DimensionsFileTable	A SAS save file-based table definition
SASFileTable	A SAS save file-based table definition

Type	Description
SpssFileTable	An SPSS save file-based table definition
DatabaseTable	A database-based table definition
PevTable	An Enterprise View-based table definition
CognosTable	An Cognos-based table definition

Parent Elements

[DataSet Element](#)

Expression Element

Optional passing of expressions defined by an application into a task

Table A-9

Attributes for Expression

Attribute	Use	Description	Valid Values
Category	optional	Indicates that only records with the given category are considered. Only valid when usage attribute is count.	<i>string</i>
dataType	required	Storage type of the attribute	<i>string</i>
description	optional	Optional attribute description	<i>string</i>
editable	optional	Flag controlling editability in non-administrator interfaces	<i>boolean</i>
isAnalytic	optional	Indicates if this attribute is analytic or not	<i>boolean</i>
isOperational	optional	Indicates if this attribute is operational or not	<i>boolean</i>
isSelected	optional	Indicates selection state for this attribute	<i>boolean</i>
maximumValue	optional	A maximum value restriction for this attribute	<i>string</i>
minimumValue	optional	A minimum value restriction for this attribute	<i>string</i>
miningType	optional	The data mining type of this attribute	<i>string</i>

Category Element

Categorical values defined for this attribute

XML Representation

```
<xs:element name="Category" type="xs:string" minOccurs="0" maxOccurs="unbounded"></xs:element>
```

Parent Elements

[Expression Element](#)

DataSetAttribute Element

The attributes from this data set referenced by this expression

XML Representation

```
<xs:element name="DataSetAttribute" type="xs:string" minOccurs="0" maxOccurs="unbounded"></xs:element>
```

Parent Elements

[Expression Element](#)

Definition Element

Definition of the local derived attribute expression

XML Representation

```
<xs:element name="Definition" type="xs:string"></xs:element>
```

Parent Elements

[Expression Element](#)

Mapping Element

The mapping required to make this data set compatible with the application

XML Representation

```
<xs:element name="Mapping" type="typeDataSetMapping" minOccurs="0">
  <xs:sequence>
    <xs:element name="AttributeMapping" type="typeAttributeMapping"
      maxOccurs="unbounded"></xs:element>
  </xs:sequence>
</xs:element>
```

Parent Elements[DataSet Element](#)**Child Elements**[AttributeMapping Element](#)**AttributeMapping Element**

The mapping of these attributes to the primary attributes

Table A-10
Attributes for AttributeMapping

Attribute	Use	Description	Valid Values
fromName	required	Source attribute on the 'left' side of this mapping (from the primary data set)	<i>string</i>
toName	required	Attribute from this table mapped on the 'to' (right) side of this mapping	<i>string</i>

XML Representation

```
<xs:element name="AttributeMapping" type="typeAttributeMapping" maxOccurs="unbounded">
  <xs:attribute name="fromName" type="xs:string" use="required"></xs:attribute>
  <xs:attribute name="toName" type="xs:string" use="required"></xs:attribute>
</xs:element>
```

Parent Elements[Mapping Element](#)**Expression Element**

An expression

Table A-11
Attributes for Expression

Attribute	Use	Description	Valid Values
Domain	optional	Resulting data type domain for this expression	<i>string</i>
Functor	optional	Optional functor involved in this expression	<i>string</i>
Name	optional	Alias name of this expression	<i>string</i>

XML Representation

```

<xs:element name="Expression" type="typeExpression" abstract="false">
  <xs:choice>
    <xs:element ref="Expression" minOccurs="0" maxOccurs="unbounded"/></xs:element>
    <xs:element ref="Attribute"/></xs:element>
    <xs:element ref="Value"/></xs:element>
  </xs:choice>
  <xs:attribute name="Name" type="xs:string" use="optional"/></xs:attribute>
  <xs:attribute name="Domain" type="xs:string" use="optional"/></xs:attribute>
  <xs:attribute name="Functor" type="xs:string" use="optional"/></xs:attribute>

```

Parent Elements

[Function Element](#), [Function Element](#), [ObjectiveFunction Element](#), [Expression Element](#), [Expression Element](#)

Child Elements

[Attribute Element](#), [Expression Element](#), [Value Element](#)

Member Element

Dimension members held in this association

Table A-12

Attributes for Member

Attribute	Use	Description	Valid Values
name	required	Dimension member referenced	<i>string</i>
returnWith	optional	indicator of if this member has a 'return with' additional measure or not	<i>boolean</i>
reused	optional	indicator of if this member is used in more than one reference hierarchy or not	<i>boolean</i>

XML Representation

```

<xs:element name="Member" type="typeReferencedMember">
  <xs:sequence>
    <xs:element name="Child" type="typeReferencedDimension" minOccurs="0" maxOccurs="unbounded">
      <xs:sequence>
        <xs:element ref="Member" maxOccurs="unbounded"/></xs:element>
      </xs:sequence>

</xs:element>

```

Parent Elements

[Member Element](#)

Child Elements

[Member Element](#)

VariableValue Element

Variable Values defined for this member (used in task submission only)

Table A-14
Attributes for VariableValue

Attribute	Use	Description	Valid Values
interactionPoint	optional	Optional Interaction Point for this variable value, Variable name plus Interaction Point name (may be empty) unique in a value series	<i>string</i>
name	required	Variable referenced by name	<i>string</i>

XML Representation

```
<xs:element name="VariableValue" type="typeVariableValue" minOccurs="0" maxOccurs="unbounded">
  <xs:sequence>
    <xs:element name="Value" type="typeValueSource"></xs:element>
  </xs:sequence>
  <xs:attribute name="name" type="xs:string" use="required"></xs:attribute>
  <xs:attribute name="interactionPoint" type="xs:string" use="optional" default=""></xs:attribute>
</xs:element>
```

Parent Elements

[Member Element](#)

Child Elements

[Value Element](#)

Value Element

The value for this variable reference

XML Representation

```
<xs:element name="Value" type="typeValueSource"></xs:element>
```

Table A-15
Extended Types

Type	Description
ConstantValueSource	A constant value source
AttributeValueSource	An Entity attribute value source
LocalRuleValueSource	A local rule value source
ReferencedRuleModelValueSource	Referenced rule or model value source

Parent Elements

[VariableValue Element](#)

PredictiveApplication Element

Definition of an IBM SPSS Decision Management predictive application

Table A-16

Attributes for PredictiveApplication

Attribute	Use	Description	Valid Values
appsVersion	optional	Version of DM that last modified this Application Workspace. Format is expected to be (major).(minor).	<i>string</i>
cacheHandle	optional	Runtime tracking of the associated cache handle for this object	<i>string</i>
groupTemplate	optional	Deprecated as of DM 6.1. The Application Group definition file spec to use for controlling common presentation aspects of an object from this group	<i>string</i>
modifiedByOtherApplication	optional	Indicates whether this application has been modified by another application framework or not	<i>boolean</i>
name	optional	Deprecated as of DM 6.1. Application name to display in the application	<i>string</i>
objectOrigin	optional	Runtime information on the origin of this workspace Stream	<i>string</i>
previousVersion	optional	Previous version of the Application Template used to create this Application Workspace	<i>string</i>
priorityDimension	optional	Dimension considered to be the Priority Dimension	<i>string</i>
templateName	required	File name of the XML template that defines this Application Workspace, set by the application designer	<i>string</i>
templateVersion	required	Version of the Application Template used to create this Application Workspace	<i>string</i>

Attribute	Use	Description	Valid Values
testMode	optional	For internal use only. Indicates application should be executed in test mode.	<i>boolean</i>
testModeInteractionPoint	optional	For internal use only. Indicates the interaction point when running in test mode.	<i>string</i>

XML Representation

Build Element

Settings used in last Build task submittal

Table A-88

Attributes for Build

Attribute	Use	Description	Valid Values
allowAutoDataPrep	optional	Defines whether auto data preparation should be a supported option.	<i>boolean</i>
allowAutoPartition	optional	Defines whether auto partitioning should be a supported option.	<i>boolean</i>
autoDataPrep	optional	Add auto data preparation to build task	<i>boolean</i>
autoDataPrepObjective	optional	Guidance for the auto data prep objective	Balance Speed Accuracy Custom
autoPartition	optional	Add auto partition to build task	<i>boolean</i>
isAutoBuild	optional	Indication of if this is an auto-build or not	<i>boolean</i>
maxBuildTime	optional	Optional restriction on the auto-model build time	<i>int</i>
responseSought	optional	The target response value for the task	<i>string</i>
sourceDataSetName	optional	The name of the source data set.	<i>string</i>
target	required	The model build target field	<i>string</i>

TargetDataTable Element

Target table, real class will be DatabaseTable, FlatFileTable, etc.

Table A-136
Attributes for *TargetDataTable*

Attribute	Use	Description	Valid Values
loginId	optional	Optional ID to be used if a login is required, passwords will not be saved	<i>string</i>
loginRequired	optional	Indicates whether credentials are required for table access or not	<i>boolean</i>
tableName	required	Name of the selected table at the source	<i>string</i>

XML Representation

```
<xs:element name="TargetDataTable" type="dataset:typeDataTable">
  <xs:attribute name="tableName" type="xs:string" use="required"></xs:attribute>
  <xs:attribute name="loginRequired" type="xs:boolean" use="optional" default="false"></xs:attribute>
  <xs:attribute name="loginId" type="xs:string" use="optional"></xs:attribute>
</xs:element>
```

Table A-137
Extended Types

Type	Description
ExcelFileTable	An Excel file-based table definition
FlatFileTable	A flat file-based table definition
DimensionsFileTable	A SAS save file-based table definition
SASFileTable	A SAS save file-based table definition
SpssFileTable	An SPSS save file-based table definition
DatabaseTable	A database-based table definition
PevTable	An Enterprise View-based table definition
CognosTable	An Cognos-based table definition

Selection Element

Optional selection rule for this test

Table A-172
Attributes for Selection

Attribute	Use	Description	Valid Values
editable	optional	Flag controlling editability in non-administrator interfaces	<i>boolean</i>
hasLocalExpressionReferences	optional	Set during an edit to indicate whether the rule has local expression references in it or not. When true, this rule cannot be exported.	<i>boolean</i>
mimeType	required	File MIME type of this rule	<i>string</i>
name	optional	Name of the element	<i>string</i>
outputDataType	optional	Output field data type	<i>string</i>
outputField	optional	Output field to use from the rule	<i>string</i>
patchAction	optional	This field is used to control the apply process for version patch templates	none modify add remove
usageDescription	optional	Optional additional descriptive text for this rule	<i>string</i>

XML Representation

```

<xs:element name="Selection" type="typeLocalRule" minOccurs="0">
  <xs:attribute name="name" type="xs:string" use="optional"/></xs:attribute>

Extended Types

Extended types extend elements in an XML document by adding attributes and child elements. To use an extended type in an XML document, you specify the extended type with the `xsi:type` attribute for the element. Then you can use the attributes and elements defined by the extended type.

AttributeValueSource Type

An Entity attribute value source

XML Representation

```

<xs:complexType name="AttributeValueSource">
  <xs:sequence>
    <xs:element name="Attribute" type="typeAttributeReference"></xs:element>
  </xs:sequence>
</xs:complexType>

Parent Elements[Primary Element](#)**Child Elements**[Attribute Element](#), [Expression Element](#), [Mapping Element](#), [Table Element](#)**Attribute Element**

The attributes of the given data set at the point of last refresh

Table A-219
Attributes for Attribute

Attribute	Use	Description	Valid Values
Category	optional	Indicates that only records with the given category are considered. Only valid when usage attribute is count.	<i>string</i>
dataType	required	Storage type of the attribute	<i>string</i>
description	optional	Optional attribute description	<i>string</i>
isAnalytic	optional	Indicates if this attribute is analytic or not	<i>boolean</i>
isOperational	optional	Indicates if this attribute is operational or not	<i>boolean</i>
isSelected	optional	Indicates selection state for this attribute	<i>boolean</i>
maximumValue	optional	A maximum value restriction for this attribute	<i>string</i>
minimumValue	optional	A minimum value restriction for this attribute	<i>string</i>
miningType	optional	The data mining type of this attribute	<i>string</i>
name	required	Name of the attribute	<i>string</i>
Usage	optional	Indicates the usage in a constraint. If count, the usage is the number of output records. If sum, the usage is the sum of the value of the output records. If value, the default, the usage is the value of the current record.	<i>string</i>

Parent Elements

Secondary Element

Child Elements

Attribute Element, Expression Element, Mapping Element, Table Element

Attribute Element

The attributes of the given data set at the point of last refresh

Table A-231
Attributes for Attribute

Attribute	Use	Description	Valid Values
Category	optional	Indicates that only records with the given category are considered. Only valid when usage attribute is count.	<i>string</i>

Attribute	Use	Description	Valid Values
dataType	required	Storage type of the attribute	<i>string</i>
description	optional	Optional attribute description	<i>string</i>
isAnalytic	optional	Indicates if this attribute is analytic or not	<i>boolean</i>
isOperational	optional	Indicates if this attribute is operational or not	<i>boolean</i>
isSelected	optional	Indicates selection state for this attribute	<i>boolean</i>
maximumValue	optional	A maximum value restriction for this attribute	<i>string</i>
minimumValue	optional	A minimum value restriction for this attribute	<i>string</i>
miningType	optional	The data mining type of this attribute	<i>string</i>
name	required	Name of the attribute	<i>string</i>
Usage	optional	Indicates the usage in a constraint. If count, the usage is the number of output records. If sum, the usage is the sum of the value of the output records. If value, the default, the usage is the value of the current record.	<i>string</i>

Parent Elements[Secondary Element](#)**typeCurrentStateReportItem Type**

Specifies on the report used for displaying the current state of a deployed application

Table A-239
Attributes for type *CurrentStateReportItem*

Attribute	Use	Description	Valid Values
author	optional	Author of the object version	<i>string</i>
brokenLink	optional	Indicates whether the object version can be found in the repository or not	<i>boolean</i>
dateCreated	optional	Date the version was created in the repository	<i>string</i>
description	optional	Description defined for the object version and user's language code	<i>string</i>
displayName	optional	The name to display to the user for this report	<i>string</i>
editable	optional	Flag controlling editability in non-administrator interfaces	<i>boolean</i>
groupName	optional	Optional report group name	<i>string</i>
id	required	ID of the repository object	<i>string</i>
isLocked	optional	runtime communication of object lock state	<i>boolean</i>
keywords	optional	Keywords defined for the object version	<i>string</i>
label	required	Version label of the repository object	<i>string</i>
marker	optional	Version marker for the repository object	<i>string</i>
mimeType	optional	File MIME type of the repository object	<i>string</i>
modelID	optional	ID of the model in the build cache, used to track model refresh and those being created by auto-model process	<i>any</i>
name	optional	Name of the element	<i>string</i>
parameters	optional	Optional parameters to pass to the report when it runs	<i>string</i>
parentObjectId	optional	Tracking of the parent object ID	<i>string</i>
patchAction	optional	This field is used to control the apply process for version patch templates	none modify add remove

Attribute	Use	Description	Valid Values
path	optional	Full path of the object in the repository	<i>string</i>
usageDescription	optional	Additional description text that can be assigned by the user interface, but not part of repository information	<i>string</i>

XML Representation

Table A-249
Attributes for *DataSet*

Attribute	Use	Description	Valid Values
compatibility	optional	The compatibility level of this data set	complete partial none

Attribute	Use	Description	Valid Values
deployUsage	optional	Indicates whether this data set will be used to Deploy the application or not	<i>boolean</i>
editable	optional	Flag controlling editability in non-administrator interfaces	<i>boolean</i>
isCompatible	optional	Runtime flag used to track compatibility of this data set with another 'primary' data set	<i>boolean</i>
modelUsage	optional	Indicates whether this data set will be selectable when doing a model build or refresh in the application or not	<i>boolean</i>
name	required	Alias name for this data set	<i>string</i>
rescanRequired	optional	Runtime flag used to track if the data scan refresh is required on this data set or not	<i>boolean</i>
scanComplete	optional	Runtime flag used to track if the data scan has been performed on this data set or not	<i>boolean</i>
scoreUsage	optional	Indicates whether this data set will be selectable when Scoring in the application or not	<i>boolean</i>
testUsage	optional	Indicates whether this data set will be selectable when doing a Test or Simulate in the application or not	<i>boolean</i>

Attribute Element

The attributes of the given data set at the point of last refresh

Table A-250
Attributes for Attribute

Attribute	Use	Description	Valid Values
Category	optional	Indicates that only records with the given category are considered. Only valid when usage attribute is count.	<i>string</i>
dataType	required	Storage type of the attribute	<i>string</i>
description	optional	Optional attribute description	<i>string</i>
isAnalytic	optional	Indicates if this attribute is analytic or not	<i>boolean</i>

Attribute	Use	Description	Valid Values
isOperational	optional	Indicates if this attribute is operational or not	<i>boolean</i>
isSelected	optional	Indicates selection state for this attribute	<i>boolean</i>
maximumValue	optional	A maximum value restriction for this attribute	<i>string</i>
minimumValue	optional	A minimum value restriction for this attribute	<i>string</i>
miningType	optional	The data mining type of this attribute	<i>string</i>
name	required	Name of the attribute	<i>string</i>
Usage	optional	Indicates the usage in a constraint. If count, the usage is the number of output records. If sum, the usage is the sum of the value of the output records. If value, the default, the usage is the value of the current record.	<i>string</i>

<xs:element name="AnalyticEngine" type="xs:string" minOccurs="0"></xs:element>
```

Parent Elements

[typeDecisionRule Type](#)

Segment Element

The Segment expressions for this Decision List rule

Table A-258
Attributes for Segment

Attribute	Use	Description	Valid Values
description	optional	Optional segment description	<i>string</i>
isExcluded	optional	Optional indicator of whether this segment should default to an Exclude when used in selection or not	<i>boolean</i>

Attribute	Use	Description	Valid Values
localLock	optional	Optional indicator of if an Admin has locked this segment in the rule, only has meaning to UI supporting this feature	<i>boolean</i>
segmentName	optional	Alias name for this segment	<i>string</i>
sharedObjectReferences	optional	Optional attribute (default false) indicates of if this segment references objects in the repository or not	<i>boolean</i>

XML Representation

```

<xs:element name="Segment" type="typeDecisionSegment" minOccurs="0" maxOccurs="unbounded">
  <xs:sequence>
    <xs:choice>
      <xs:element name="Expression" type="typeExpression">
        <xs:choice>
          <xs:element ref="Expression" minOccurs="0" maxOccurs="unbounded"></xs:element>
          <xs:element ref="Attribute"></xs:element>
          <xs:element ref="Value"></xs:element>
        </xs:choice>
      </xs:element>
      <xs:element name="ObjectReference"></xs:element>
    </xs:choice>

</xs:element>
```

Parent Elements

[Segment Element](#)

Child Elements

[Attribute Element](#), [Expression Element](#), [Value Element](#)

ObjectReference Element

A reference to a repository object and column used, object ID content of this element

Table A-260
Attributes for ObjectReference

Attribute	Use	Description	Valid Values
column	required	The output column of the referenced repository object	<i>string</i>
label	required	Version label referenced	<i>string</i>
mimeType	optional	File MIME type of the repository object	<i>string</i>
name	optional	Optional Application View name for display	<i>string</i>

Attribute	Use	Description	Valid Values
outputQualifier	optional	Optional output qualifier to be used during execution	<i>string</i>
usage	optional	Additional display information for the user interface	<i>string</i>

XML Representation

```
<xs:element name="ObjectReference">
  <xs:attribute name="label" type="xs:string" use="required"></xs:attribute>
  <xs:attribute name="name" type="xs:string"></xs:attribute>
  <xs:attribute name="usage" type="xs:string" use="optional"></xs:attribute>
  <xs:attribute name="outputQualifier" type="xs:string" use="optional"></xs:attribute>
  <xs:attribute name="mimeType" type="xs:string" use="optional"></xs:attribute>
  <xs:attribute name="column" type="xs:string" use="required"></xs:attribute>
</xs:element>
```

[Segment Element](#)

Related Elements

[ApplicationView Element](#), [ApplicationView Element](#)

ValueOutput Element

Allocated output values produced by ‘match’ of the expression above, optional for rule types that have their overall output implied as in the Segment and Selection rules. Value is content of this element. Any output of the rule not specified is implied to have a null value.

Table A-261
Attributes for ValueOutput

Attribute	Use	Description	Valid Values
field	required	The field name of the output	<i>string</i>

XML Representation

```
<xs:element name="ValueOutput" type="typeValueOutput" minOccurs="0" maxOccurs="unbounded">
  <xs:attribute name="field" type="xs:string" use="required"></xs:attribute>
</xs:element>
```

Parent Elements

[Segment Element](#)

Remainder Element

The optional definition of a remainder

Table A-262
Attributes for Remainder

Attribute	Use	Description	Valid Values
segmentName	optional	Alias name for this segment	<i>string</i>

XML Representation

```
<xs:element name="Remainder" type="typeRemainder" minOccurs="0">
  <xs:sequence>
    <xs:element name="ValueOutput" type="typeValueOutput" minOccurs="0"
      maxOccurs="unbounded"></xs:element>
  </xs:sequence>
  <xs:attribute name="segmentName" type="xs:string"></xs:attribute>
</xs:element>
```

Parent Elements

[typeDecisionRule Type](#)

Child Elements

[ValueOutput Element](#)

ValueOutput Element

Output values associated with the remainder situation for a rule. Value is content of this element, and any output of the rule not specified is implied to have a null value.

Table A-263
Attributes for ValueOutput

Attribute	Use	Description	Valid Values
field	required	The field name of the output	<i>string</i>

XML Representation

```
<xs:element name="ValueOutput" type="typeValueOutput" minOccurs="0" maxOccurs="unbounded">
  <xs:attribute name="field" type="xs:string" use="required"></xs:attribute>
</xs:element>
```

Parent Elements

[Remainder Element](#)

typeExpressionRule Type

A simple expression

Table A-264
Attributes for typeExpressionRule

Attribute	Use	Description	Valid Values
description	optional	Optional description of this rule	string
outputQualifier	optional	The qualifier to be used in the execution plan for naming the measures	string
usageType	optional	The User Perspective of the usage of this rule, communication between the application designer and the business user who will apply the rule	Segment SegmentSet Selection ExcludeSet IncludeSet Allocation Aggregation Matrix Expression Arbitration Threshold

XML Representation

DataSet Element

Optional information on data set used to define this rule

Table A-266
Attributes for DataSet

Attribute	Use	Description	Valid Values
compatibility	optional	The compatibility level of this data set	complete partial none
deployUsage	optional	Indicates whether this data set will be used to Deploy the application or not	<i>boolean</i>
editable	optional	Flag controlling editability in non-administrator interfaces	<i>boolean</i>
isCompatible	optional	Runtime flag used to track compatibility of this data set with another 'primary' data set	<i>boolean</i>

Attribute	Use	Description	Valid Values
modelUsage	optional	Indicates whether this data set will be selectable when doing a model build or refresh in the application or not	<i>boolean</i>
name	required	Alias name for this data set	<i>string</i>
rescanRequired	optional	Runtime flag used to track if the data scan refresh is required on this data set or not	<i>boolean</i>
scanComplete	optional	Runtime flag used to track if the data scan has been performed on this data set or not	<i>boolean</i>
scoreUsage	optional	Indicates whether this data set will be selectable when Scoring in the application or not	<i>boolean</i>
testUsage	optional	Indicates whether this data set will be selectable when doing a Test or Simulate in the application or not	<i>boolean</i>

[Attribute Element](#), [Expression Element](#), [Mapping Element](#), [Table Element](#)

Attribute Element

The attributes of the given data set at the point of last refresh

Table A-267
Attributes for Attribute

Attribute	Use	Description	Valid Values
Category	optional	Indicates that only records with the given category are considered. Only valid when usage attribute is count.	<i>string</i>
dataType	required	Storage type of the attribute	<i>string</i>
description	optional	Optional attribute description	<i>string</i>
isAnalytic	optional	Indicates if this attribute is analytic or not	<i>boolean</i>
isOperational	optional	Indicates if this attribute is operational or not	<i>boolean</i>
isSelected	optional	Indicates selection state for this attribute	<i>boolean</i>
maximumValue	optional	A maximum value restriction for this attribute	<i>string</i>
minimumValue	optional	A minimum value restriction for this attribute	<i>string</i>
miningType	optional	The data mining type of this attribute	<i>string</i>

Attribute	Use	Description	Valid Values
name	required	Name of the attribute	<i>string</i>
Usage	optional	Indicates the usage in a constraint. If count, the usage is the number of output records. If sum, the usage is the sum of the value of the output records. If value, the default, the usage is the value of the current record.	<i>string</i>

[DataSet Element](#)

Expression Element

Optional passing of expressions defined by an application into a task

Table A-327

Attributes for Expression

Attribute	Use	Description	Valid Values
Category	optional	Indicates that only records with the given category are considered. Only valid when usage attribute is count.	<i>string</i>
dataType	required	Storage type of the attribute	<i>string</i>
description	optional	Optional attribute description	<i>string</i>
editable	optional	Flag controlling editability in non-administrator interfaces	<i>boolean</i>
isAnalytic	optional	Indicates if this attribute is analytic or not	<i>boolean</i>
isOperational	optional	Indicates if this attribute is operational or not	<i>boolean</i>
isSelected	optional	Indicates selection state for this attribute	<i>boolean</i>
maximumValue	optional	A maximum value restriction for this attribute	<i>string</i>
minimumValue	optional	A minimum value restriction for this attribute	<i>string</i>
miningType	optional	The data mining type of this attribute	<i>string</i>

Category Element

Categorical values defined for this attribute

XML Representation

```
<xs:element name="Category" type="xs:string" minOccurs="0" maxOccurs="unbounded"/></xs:element>
```

Parent Elements

[Expression Element](#)

DataSetAttribute Element

The attributes from this data set referenced by this expression

XML Representation

```
<xs:element name="DataSetAttribute" type="xs:string" minOccurs="0" maxOccurs="unbounded"/></xs:element>
```

Parent Elements

[Expression Element](#)

Definition Element

Definition of the local derived attribute expression

XML Representation

```
<xs:element name="Definition" type="xs:string"/></xs:element>
```

Parent Elements

[Expression Element](#)

Mapping Element

The mapping required to make this data set compatible with the application

XML Representation

```
<xs:element name="Mapping" type="typeDataSetMapping" minOccurs="0">  
  <xs:sequence>  
    <xs:element name="AttributeMapping" type="typeAttributeMapping"  
      maxOccurs="unbounded"/></xs:element>  
  </xs:sequence>  
</xs:element>
```

Parent Elements[DataSet Element](#)**Child Elements**[AttributeMapping Element](#)**AttributeMapping Element**

The mapping of these attributes to the primary attributes

Table A-328
Attributes for AttributeMapping

Attribute	Use	Description	Valid Values
fromName	required	Source attribute on the 'left' side of this mapping (from the primary data set)	<i>string</i>
toName	required	Attribute from this table mapped on the 'to' (right) side of this mapping	<i>string</i>

XML Representation

```
<xs:element name="AttributeMapping" type="typeAttributeMapping" maxOccurs="unbounded">
  <xs:attribute name="fromName" type="xs:string" use="required"></xs:attribute>
  <xs:attribute name="toName" type="xs:string" use="required"></xs:attribute>
</xs:element>
```

Parent Elements[Mapping Element](#)**Input Element**

The required inputs for this rule

Table A-329
Attributes for Input

Attribute	Use	Description	Valid Values
dataType	required	Data type of this referenced field	<i>string</i>
fieldName	required	Project data model attribute referenced as input	<i>string</i>
maxValue	optional	The maximum value for range measures	<i>string</i>
measureType	optional	The measure type used in modeling for this field	<i>string</i>
minValue	optional	The minimum value for range measures	<i>string</i>

XML Representation

```

<xs:element name="Input" type="typeField" minOccurs="0" maxOccurs="unbounded">
  <xs:sequence>
    <xs:element name="Category" type="xs:string" minOccurs="0" maxOccurs="unbounded"></xs:element>
  </xs:sequence>
  <xs:attribute name="fieldName" type="xs:string" use="required"></xs:attribute>
  <xs:attribute name="dataType" type="xs:string" use="required"></xs:attribute>
  <xs:attribute name="measureType" type="xs:string" use="optional"></xs:attribute>
  <xs:attribute name="maxValue" type="xs:string" use="optional"></xs:attribute>
  <xs:attribute name="minValue" type="xs:string" use="optional"></xs:attribute>
</xs:element>

```

Parent Elements

[typeRandomRule Type](#)

Child Elements

[Category Element](#)

Category Element

The categorical values this field may return

XML Representation

```

<xs:element name="Category" type="xs:string" minOccurs="0" maxOccurs="unbounded"></xs:element>

```

Parent Elements

[Input Element](#)

Output Element

The outputs produced by an execution of this rule

Table A-330
Attributes for Output

Attribute	Use	Description	Valid Values
dataType	required	Data type of this referenced field	<i>string</i>
fieldName	required	Project data model attribute referenced as input	<i>string</i>
maxValue	optional	The maximum value for range measures	<i>string</i>
measureType	optional	The measure type used in modeling for this field	<i>string</i>
minValue	optional	The minimum value for range measures	<i>string</i>

XML Representation

```
<xs:element name="Output" type="typeField" maxOccurs="unbounded">
  <xs:sequence>
    <xs:element name="Category" type="xs:string" minOccurs="0" maxOccurs="unbounded"></xs:element>
  </xs:sequence>
  <xs:attribute name="fieldName" type="xs:string" use="required"></xs:attribute>
  <xs:attribute name="dataType" type="xs:string" use="required"></xs:attribute>
  <xs:attribute name="measureType" type="xs:string" use="optional"></xs:attribute>
  <xs:attribute name="maxValue" type="xs:string" use="optional"></xs:attribute>
  <xs:attribute name="minValue" type="xs:string" use="optional"></xs:attribute>
</xs:element>
```

Parent Elements[typeRandomRule](#) [Type](#)**Child Elements**[Category Element](#)**Category Element**

The categorical values this field may return

XML Representation

```
<xs:element name="Category" type="xs:string" minOccurs="0" maxOccurs="unbounded"></xs:element>
```

Parent Elements[Output Element](#)**AnalyticEngine Element**

Runtime executable representation of the rule

XML Representation

```
<xs:element name="AnalyticEngine" type="xs:string" minOccurs="0"></xs:element>
```

Parent Elements[typeRandomRule](#) [Type](#)**Choice Element**

Choice holds the Offer to be extended in the element and a 'relativeAbundance' indicator influencing how the random value is selected as an attribute

Table A-331
Attributes for Choice

Attribute	Use	Description	Valid Values
relativeAbundance	optional	The N of M (total) influence on the random allocation	<i>double</i>

XML Representation

```
<xs:element name="Choice" type="typeChoice" maxOccurs="unbounded">
  <xs:sequence>
    <xs:element name="OutputValue" type="typeValueOutput" maxOccurs="unbounded"/></xs:element>
  </xs:sequence>
  <xs:attribute name="relativeAbundance" type="xs:double"/></xs:attribute>
</xs:element>
```

Parent Elements

[typeRandomRule Type](#)

Child Elements

[OutputValue Element](#)

OutputValue Element

Output values produced by execution of the expression above

Table A-332
Attributes for OutputValue

Attribute	Use	Description	Valid Values
field	required	The field name of the output	<i>string</i>

XML Representation

```
<xs:element name="OutputValue" type="typeValueOutput" maxOccurs="unbounded">
  <xs:attribute name="field" type="xs:string" use="required"/></xs:attribute>
</xs:element>
```

Parent Elements

[Choice Element](#)

typeRulesManagementDefineStep Type

The Rules Management define step configuration

Table A-333
Attributes for *typeRulesManagementDefineStep*

Attribute	Use	Description	Valid Values
enableSimulation	optional	Controls presentation of the Define-style Simulation action	<i>boolean</i>
enableTest	optional	Controls presentation of the Test action	<i>boolean</i>
stepCompleted	optional	Indicates whether the user has marked this panel as completed or not	<i>boolean</i>
stepHidden	optional	The 'hidden' state for this panel	<i>boolean</i>
stepIncluded	optional	The logical 'included or not' flag for this panel	<i>boolean</i>
stepLocked	optional	The locked state for this panel	<i>boolean</i>

XML Representation

```
<xs:complexType name="typeRulesManagementDefineStep"></xs:complexType>
```

Related Types

[typeDecisionHierarchyDefineStep Type](#), [typeModelingDefineStep Type](#)

typeThresholdRule Type

An allocation rule defined by a series of threshold tests against a rule or model output

Table A-334
Attributes for *typeThresholdRule*

Attribute	Use	Description	Valid Values
description	optional	Optional description of this rule	<i>string</i>
numericThreshold	optional	Indicates how the threshold test is to be performed. Value of 'true' will cause a greater-than-or-equals numeric comparison in the test order specified; a 'false' will be an equals string comparison.	<i>boolean</i>
outputQualifier	optional	The qualifier to be used in the execution plan for naming the measures	<i>string</i>

Attribute	Use	Description	Valid Values
thresholdType	optional	The data type of all threshold values in this rule.	<i>string</i>
usageType	optional	The User Perspective of the usage of this rule, communication between the application designer and the business user who will apply the rule	Segment SegmentSet Selection ExcludeSet IncludeSet Allocation Aggregation Matrix Expression Arbitration Threshold

XML Representation

```

```

<xs:element name="Category" type="xs:string" minOccurs="0" maxOccurs="unbounded"></xs:element>

```

Parent Elements

[Input Element](#)

Output Element

The outputs produced by an execution of this rule

Table A-357
Attributes for Output

Attribute	Use	Description	Valid Values
dataType	required	Data type of this referenced field	<i>string</i>
fieldName	required	Project data model attribute referenced as input	<i>string</i>
maxValue	optional	The maximum value for range measures	<i>string</i>
measureType	optional	The measure type used in modeling for this field	<i>string</i>
minValue	optional	The minimum value for range measures	<i>string</i>

XML Representation

```
<xs:element name="Output" type="typeField" maxOccurs="unbounded">
  <xs:sequence>
    <xs:element name="Category" type="xs:string" minOccurs="0" maxOccurs="unbounded"></xs:element>
  </xs:sequence>
  <xs:attribute name="fieldName" type="xs:string" use="required"></xs:attribute>
  <xs:attribute name="dataType" type="xs:string" use="required"></xs:attribute>
  <xs:attribute name="measureType" type="xs:string" use="optional"></xs:attribute>
  <xs:attribute name="maxValue" type="xs:string" use="optional"></xs:attribute>
  <xs:attribute name="minValue" type="xs:string" use="optional"></xs:attribute>
</xs:element>
```

Parent Elements

[RuleObject Element](#)

Child Elements

[Category Element](#)

Category Element

The categorical values this field may return

XML Representation

```
<xs:element name="Category" type="xs:string" minOccurs="0" maxOccurs="unbounded"></xs:element>
```

Parent Elements

[Output Element](#)

AnalyticEngine Element

Runtime executable representation of the rule

XML Representation

```
<xs:element name="AnalyticEngine" type="xs:string" minOccurs="0"></xs:element>
```

Parent Elements

[RuleObject Element](#)

ObjectReference Element

A reference to a rule or model object

Table A-358
Attributes for *ObjectReference*

Attribute	Use	Description	Valid Values
label	required	Version label referenced	<i>string</i>
contentType	optional	File MIME type of the repository object	<i>string</i>
name	optional	Optional Application View name for display	<i>string</i>
outputQualifier	optional	Optional output qualifier to be used during execution	<i>string</i>
usage	optional	Additional display information for the user interface	<i>string</i>

XML Representation

```
<xs:element name="ObjectReference" type="typeRepositoryObject">
  <xs:attribute name="label" type="xs:string" use="required"/></xs:attribute>
  <xs:attribute name="name" type="xs:string"/></xs:attribute>
  <xs:attribute name="usage" type="xs:string" use="optional"/></xs:attribute>
  <xs:attribute name="outputQualifier" type="xs:string" use="optional"/></xs:attribute>
  <xs:attribute name="contentType" type="xs:string" use="optional"/></xs:attribute>
</xs:element>
```

Parent Elements

[ReferencedValue Element](#)

Threshold Element

An ordered set of threshold tests and associated allocations

Table A-359
Attributes for *Threshold*

Attribute	Use	Description	Valid Values
thresholdValue	required	Threshold value to test	<i>string</i>

XML Representation

```
<xs:element name="Threshold" type="typeThresholdAllocation" minOccurs="0" maxOccurs="unbounded">
  <xs:sequence>
    <xs:element name="ValueOutput" type="typeValueOutput" maxOccurs="unbounded"/></xs:element>
  </xs:sequence>
  <xs:attribute name="thresholdValue" type="xs:string" use="required"/></xs:attribute>
</xs:element>
```

Parent Elements

[typeThresholdRule Type](#)

Child Elements[ValueOutput Element](#)**ValueOutput Element**

Allocated output values produced by ‘match’ of the expression above, optional for rule types that have their overall output implied as in the Segment and Selection rules. Value is content of this element. Any output of the rule not specified is implied to have a null value.

Table A-360
Attributes for ValueOutput

Attribute	Use	Description	Valid Values
field	required	The field name of the output	<i>string</i>

XML Representation

```
<xs:element name="ValueOutput" type="typeValueOutput" maxOccurs="unbounded">
  <xs:attribute name="field" type="xs:string" use="required"></xs:attribute>
</xs:element>
```

Parent Elements[Threshold Element](#)**Remainder Element**

The optional definition of a remainder

Table A-361
Attributes for Remainder

Attribute	Use	Description	Valid Values
segmentName	optional	Alias name for this segment	<i>string</i>

XML Representation

```
<xs:element name="Remainder" type="typeRemainder" minOccurs="0">
  <xs:sequence>
    <xs:element name="ValueOutput" type="typeValueOutput" minOccurs="0"
      maxOccurs="unbounded"></xs:element>
  </xs:sequence>
  <xs:attribute name="segmentName" type="xs:string"></xs:attribute>
</xs:element>
```

Parent Elements[typeThresholdRule Type](#)

Child Elements[ValueOutput Element](#)**ValueOutput Element**

Output values associated with the remainder situation for a rule. Value is content of this element, and any output of the rule not specified is implied to have a null value.

Table A-362

Attributes for ValueOutput

Attribute	Use	Description	Valid Values
field	required	The field name of the output	<i>string</i>

XML Representation

```
<xs:element name="ValueOutput" type="typeValueOutput" minOccurs="0" maxOccurs="unbounded">
  <xs:attribute name="field" type="xs:string" use="required"/></xs:attribute>
</xs:element>
```

Parent Elements[Remainder Element](#)**VariableReferenceBoundary Type**

A variable reference Constraint Boundary

Table A-363

Attributes for VariableReferenceBoundary

Attribute	Use	Description	Valid Values
value	required	The value or reference defining this boundary	<i>string</i>

XML Representation

```
<xs:complexType name="VariableReferenceBoundary"/></xs:complexType>
```

Notices

This information was developed for products and services offered worldwide.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user's responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not grant you any license to these patents. You can send license inquiries, in writing, to:

IBM Director of Licensing, IBM Corporation, North Castle Drive, Armonk, NY 10504-1785, U.S.A.

For license inquiries regarding double-byte character set (DBCS) information, contact the IBM Intellectual Property Department in your country or send inquiries, in writing, to:

Intellectual Property Licensing, Legal and Intellectual Property Law, IBM Japan Ltd., 1623-14, Shimotsuruma, Yamato-shi, Kanagawa 242-8502 Japan.

The following paragraph does not apply to the United Kingdom or any other country where such provisions are inconsistent with local law: INTERNATIONAL BUSINESS MACHINES PROVIDES THIS PUBLICATION "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. Some states do not allow disclaimer of express or implied warranties in certain transactions, therefore, this statement may not apply to you.

This information could include technical inaccuracies or typographical errors. Changes are periodically made to the information herein; these changes will be incorporated in new editions of the publication. IBM may make improvements and/or changes in the product(s) and/or the program(s) described in this publication at any time without notice.

Any references in this information to non-IBM Web sites are provided for convenience only and do not in any manner serve as an endorsement of those Web sites. The materials at those Web sites are not part of the materials for this IBM product and use of those Web sites is at your own risk.

IBM may use or distribute any of the information you supply in any way it believes appropriate without incurring any obligation to you.

Licensees of this program who wish to have information about it for the purpose of enabling: (i) the exchange of information between independently created programs and other programs (including this one) and (ii) the mutual use of the information which has been exchanged, should contact:

IBM Software Group, Attention: Licensing, 233 S. Wacker Dr., Chicago, IL 60606, USA.

Such information may be available, subject to appropriate terms and conditions, including in some cases, payment of a fee.

The licensed program described in this document and all licensed material available for it are provided by IBM under terms of the IBM Customer Agreement, IBM International Program License Agreement or any equivalent agreement between us.

Any performance data contained herein was determined in a controlled environment. Therefore, the results obtained in other operating environments may vary significantly. Some measurements may have been made on development-level systems and there is no guarantee that these measurements will be the same on generally available systems. Furthermore, some measurements may have been estimated through extrapolation. Actual results may vary. Users of this document should verify the applicable data for their specific environment.

Information concerning non-IBM products was obtained from the suppliers of those products, their published announcements or other publicly available sources. IBM has not tested those products and cannot confirm the accuracy of performance, compatibility or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

All statements regarding IBM's future direction or intent are subject to change or withdrawal without notice, and represent goals and objectives only.

This information contains examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious and any similarity to the names and addresses used by an actual business enterprise is entirely coincidental.

If you are viewing this information softcopy, the photographs and color illustrations may not appear.

Trademarks

IBM, the IBM logo, [ibm.com](http://www.ibm.com), and SPSS are trademarks of IBM Corporation, registered in many jurisdictions worldwide. A current list of IBM trademarks is available on the Web at <http://www.ibm.com/legal/copytrade.shtml>.
