# Logistics Management Overview

---

Logistics Management enables access to delivery plans. The *Sterling Supply Chain Applications Product Concepts* introduces concepts regarding delivery plans and shipping.

The *User Guide* builds on that guide and explains how to use the inventory consoles to implement delivery decisions.

The Logistics Management module consists of the following components:

- **Plan Console Screens**
- **Inbound Shipment Console Screens**
- **Outbound Shipment Console Screens**

## Plan Console Screens

---

The Plan Console is used to manage delivery plans and individual loads contained in a plan.

### 2.1 Delivery Plan

A delivery plan is a complete sequence of movements needed to deliver one or more orders from one or multiple origins to one or multiple destinations. A delivery plan is comprised of shipments, loads, origins, stops, and destinations.

#### **Shipment**

A shipment is a delivery of one or more orders and order lines from a single shipper to a single consignee. A shipment can be carried through multiple loads and by multiple carriers.

#### **Load**

A load carries one or more complete shipments (never a partial shipment) between two points. A load has one origin and one destination, but it can have multiple intermediate stops. Shipments can be added to a load at its origin or any intermediate stop and can be dropped off at the load destination or any intermediate stop.

#### **Origin**

An origin is the node the load originally ships from.

#### **Stop**

A stop is any location where a shipment is picked up or dropped off. A load has a stop sequence that determines its travel route.

### **Destination**

A destination is the last node or address in the load's travel route where all remaining shipments in a load are dropped off.

## **2.2 Delivery Route Models**

The following diagram illustrates some of the most common delivery route models.

**Model 1 – Single Shipment, Single Load.**  
For simple shipments.

**Model 2 – Many Shipments, Consolidate & Break Into loads**

Allows multiple origins to consolidate (for example, at port) and be moved by second transport as a single load. Then broken back into initial structures to complete separate voyages.

**Model 3 – Many Shipments, Single load**

Records a single load that makes stops to drop-off x amount of shipments.

**Model 4 – Many Shipments, Intermediate Drop-Off & Pick-Up**

Allows efficient use of available transport resources to create loads in transit.

**Model 5 – Single Origin, Multiple Shipments, Break**

Shipments are shipped from an origin as a single load and subsequently broken at 'nearest' point to different destinations. Separate loads make final delivery.

**Model 6 –Single Shipment, Merge at one Origin**

Example of a merge in transit where components are sourced from disparate sites and merged at the source of the high value component.

**Model 7 – Single Shipment, Interline loads**

Although a single origin/destination pair, the load, for cost/optimum performance reasons, moves with more than one carrier

Once the delivery plan is created you can view the shipments included in the plan and created loads containing the shipments for delivery.

**Note:** For the delivery plan map to display correctly, the YFS\_ZIP\_CODE\_LOCATION table needs to be populated using the US\_ZipcodeLocation.sql script provided in \$YFS\_HOME/database/FactorySetup/Optional/ZipCodeLocation. This script has all of the United States’ zip codes along with latitude and longitude data. It is advised to review your system requirements and determine the actual zip codes you need to load to the database.
