# Implementing Enhanced Document Security

A higher level of document security has been implemented in IBM® FileNet® Image Services. This document provides instructions for establishing the new security for document classes, documents, folders, and WorkFlo queues on all relational database management systems supported by Image Services: Oracle, DB2, and MS SQL Server.

This upgrade is not mandatory. The procedures described in this document are optional for systems that use single-byte character sets, such as US7ASCII, for indexing.

| Important | Enhanced Document Security is only supported on site-con- |
|-----------|---|
|           | trolled (full-use) relational databases.                  |

# **Document revision history**

| IS version | Date      | Comment  |
|------------|-----------|--|
| 4.1        | Feb. 2010 | Added trigger file descriptions and updated command names. |
| 4.0        | Mar. 2005 | Initial release.   |

### **Accessing IBM FileNet documentation**

To access documentation for IBM FileNet products:

1 Navigate to the Information Management support page (www.ibm.com/software/data/support).

- 2 On the Support Overview page, select **FileNet Image Ser**vices under the **Product related links** heading, then select the item **FileNet Image Services**.
- 3 On the FileNet Image Services page, click **Product documentation** under the heading **Use and maintain**.
- 4 On the Product Documentation page, locate the document you need, then click the icon in the appropriate release column to access the document.

## **IBM FileNet education**

IBM provides various forms of education. Please visit the IBM Information Management support page at (<u>www.ibm.com/</u><u>software/data/support</u>).

# Feedback

We value your opinion, experience, and use of our products. Please help us improve our products by providing feedback or by completing a consumability survey.

### **Documentation feedback**

Send comments on this publication or other IBM FileNet Image Services documentation by e-mail to <u>com-</u> <u>ments@us.ibm.com</u>. Be sure to include the name of the product, the version number of the product, and the name and part number of the book (if applicable). If you are commenting on specific text, include the location of the text (for example, a help topic title, a chapter and section title, a table number, or a page number).

### Product consumability feedback

Help us identify product enhancements by taking a Consumability Survey (<u>http://www-306.ibm.com/software/data/info/</u> **consumability-survey/**). The results of this comprehensive survey are used by product development teams when planning future releases. Although we are especially interested in survey responses regarding the most recent product releases, we welcome your feedback on any of our products.

The survey will take approximately 30 minutes to complete and must be completed in a single session; there is no option to save a partially completed response.

# Background

FileNet Image Services (IS) supports Read, Write, and Append/Execute security access rights for document classes, documents, folders, and WorkFlo queues. The security information for each of these entities is contained in a field that is twelve bytes long and that must be encrypted before it is written to the index database. This security information must be decrypted whenever it is read or queried.

The FileNet algorithm that encrypts and decrypts the security information stores data in the high order bit (the 8th-most significant bit) of each byte in the security information field. This is acceptable when the Image Services system is using the single-column US7ASCII character set because the high order bit of each byte is not being used by the character set. However, if a different character set is being used, the high order bit for encrypting and decrypting the security attributes might conflict with the character translation used by the Oracle, DB2, or MS SQL Server relational database management system.

As a result, the security attributes might not be assigned correctly, and Image Services might interpret unexpected access privileges as ANYONE when they are retrieved from the database.

## The New Security Schema

Three new integer columns were added to the FileNet reserved area of the index (or WorkFlo queue) database during the upgrade to Image Services 4.0 SP3 or later to support the enhanced security schema. These new columns will be used to hold the appropriate security information, independent of any character set constraints. An added benefit of using integer data is that no encryption is required.

| Table Name          | Database          | Previous Security Ac-<br>cess Column Name | New Security Access<br>Column Names                         |
|---------------------|-------------------|---|---|
| DOCTABA             | INX               | f_accessrights                            | f_accessrights_rd<br>f_accessrights_wr<br>f_accessrights_ax |
| DOCUMENT_CLASS      | INX               | f_accessrights                            | Same as above   |
| FOLDER              | INX               | f_accessrights                            | Same as above   |
| FOLDER_TABS *       | INX               | f_accessrights                            | Same as above   |
|                     |                   |   |   |
| WQS_WORK-<br>SPACES | Workflow<br>Queue | ws_access<br>(workspace security)         | ws_access_rd<br>ws_access_wr<br>ws_access_ax                |
| WQS_QUEUES          | Workflow<br>Queue | q_descacc<br>(description security)       | q_descacc_rd<br>q_descacc_wr<br>q_descacc_ax                |
|                     |                   | q_contentacc<br>(content security)        | q_contentacc_rd<br>q_contentacc_wr<br>q_contentacc_ax       |

\* FOLDER\_TABS is an obsolete table.

# **Prerequisites**

#### **Image Services version**

Before you begin this update, verify that your Image Services system meets the following minimum software requirement:

IS 4.1.2 FP6 or higher IS 4.1.1 FP10 or higher

### Avoiding ORA-1555 "Snapshot Too Old" messages (Oracle only)

During the migration you might see ORA-1555 errors in the event log. These messages indicate that Oracle undo (rollback) records are being overwritten because either the undo\_retention parameter is not set large enough (with System Managed Undo) or the rollback segment is too small (with traditional rollback segments.).

To avoid this error, for System Managed Undo, you can either increase the undo\_retention parameter, increase the undo tablespace, or both. If you use traditional rollback segments, enlarge the rollback segment space.

Important This error is not an issue for DB2 or MS SQL Server because there are no rollback segments or undo tablespaces. The "Snapshot Too Old" error does not apply to these relational databases.

For the purposes of this update, you can double the undo\_ retention setting or double the size of the rollback segments.

After the migration is successful, return the undo\_retention setting or rollback segments to their original values.

## Verifying the security schema currently in use

A parameter in the IS configuration database (CDB) file indicates whether the newly enhanced multi-column security has been enabled:

- 1 = original single-column security is in effect.
- 2 = enhanced multi-column security is in effect.

This parameter was automatically added to the CDB file in IS 4.0 SP3 and higher releases. The default value is 1.

To determine the current state of the CDB parameter, enter:

#### fn\_util mlb\_get\_state

The current security state displays:

```
multi_cols_security = 1
```

The original single-column security is still in effect. Continue with the following sections to enable the enhanced multi-column security.

multi\_cols\_security = 2

The enhanced multi-column security is already in effect.

# Backing up the IS server

#### Stopping the Image Services software

| Server Types | Perform the steps in this section on <b>all</b> Image Services servers.   |
|--------------|---|
|              | Beginning with Application servers, then Storage Library<br>servers, and finally the Root/Index server, stop the IS software<br>on all servers in the system. Follow the steps in the appro-<br>priate section: |

- <u>"On UNIX Servers:" on page 13</u>
- <u>"On Windows Servers:" on page 14</u>

#### **On UNIX Servers:**

1 Make sure the Image Services software is completely shut down on all servers by entering at each server:

initfnsw -y stop killfnsw -DAy

2 Make sure no fnsw processes are running. Enter:

ps -elf | grep fnsw

Kill any remaining fnsw processes:

#### kill -9 <ProcessID>

3 Make sure no MasterSnmpd processes are running. (You only need to perform this step on HP-UX and Solaris servers.)

On HP-UX and Solaris servers, enter:

#### ps -elf | grep MasterSnmpd

Kill any remaining MasterSnmpd processes:

#### kill -9 <ProcessID>

4 If the Image Services Toolkit is also installed on this UNIX server, shut down all IS Toolkit applications, then enter:

#### wal\_purge

5 Skip to the next section, <u>"Backing up the current Image Ser-</u> vices software and data" on page 14.

#### **On Windows Servers:**

- 1 Open a Command Prompt window.
- 2 Make sure the Image Services software is completely shut down on all servers by entering at each server:

```
initfnsw -y stop
killfnsw -D -y
```

The killfnsw command also stops the IS ControlService.

**3** Stop the SNMP process by entering:

net stop "SNMP"

### Backing up the current Image Services software and data

| Server Types | Perform the steps in this section on <b>all</b> Image Services servers. |
|--------------|---|
|              | As a safeguard, make a backup of the current Image Services             |
|              | software and data using your preferred method.                          |

For complete information on performing a system backup, refer to the "Backup" chapter of either the:

- <u>System Administrator's Companion for UNIX</u>
- <u>System Administrator's Companion for Windows</u>
   <u>Server</u>

# **Updating the Index Database**

**Server Types** Perform the steps in this section on these Image Services servers:

Root/Index server during a Dual server update.

Root/Index/Storage Library server during a Combined server or

Entry server update.

**Application** server with WorkFlo Queue services, SQL services,

or VWServices.

### Stopping Archive Logging (optional)

On Oracle and DB2 systems, you can optionally stop Archive Logging, if it is currently active. For each database record that is modified during this upgrade, an entry is written in the archive log. To reduce the size of the archive log, consider stopping Archive Logging for the duration of this upgrade.

The Database Adminstrator is responsible for turning off Archive Logging.

### Starting the relational database

Verify that the relational database is up and running. If necessary, ask the Database Administrator to start the RDBMS database.

### **Creating trigger files**

Create any or all of the following trigger files to facilitate your migration.

The trigger files are completely independent of each other and can be used in any combination.

If you use any of these trigger files, they must be created in the following directory:

WIN

#### /fnsw/local/tmp/mlb

C:\fnsw\_loc\tmp\mlb

The trigger files are:

**migrate\_all\_rows**: The existence of this file forces the remigration of all document security records regardless of whether they were previously migrated.

**progress\_log**: The existence of this file causes the migration process to store its progress to a log file.

**commit\_interval**: If this trigger file exists, it must contain an integer value that indicates how many database records should be updated before committing them to the database. If this trigger file does not exist, the migration process updates 1000 records at a time.

For example, if the doctaba table in the index database contains exactly 2,000,000 rows, and the commit\_interval

file contains a value of 10,000, then the database transactions will be committed to the database exactly 200 times.

2,000,000 / 10,000 = 200

### Copying the security information

Copy the current security information to the new database columns by entering:

#### fn\_util mlb\_mig\_sec\_cols

The size of the database and the hardware/network configuration determine the amount of time this command might run. For example, a database containing a million rows might take a few minutes or so to finish. Also, the command typically performs faster on a local database than on a remote database.

Unless you created a progress\_log trigger file, progress is not shown on the screen, so please be patient. The system prompt displays when the migration is finished.

The **fn\_util mlb\_mig\_sec\_cols** command copies the security information for all the database tables listed in <u>"The New</u> <u>Security Schema" on page 10</u>. The original security information is not changed in any way. After the migration is completed, and after the enhanced schema is enabled, any new security information will be added only in the new database columns.

### Stopping and restarting the migration

You can safely interrupt the migration at any time and resume processing at a later time.

When you run the mlb\_mig\_sec\_cols more than once, the migration always starts from the beginning of the database and checks every row in each table. However, if the old security is

the same as the new multi-column security, the database is not updated for that row. Thus, the impact on performance is not as significant.

### Viewing the system event log

View the system event log to make sure the **fn\_util mlb\_mig\_ sec\_cols** command completed successfully. Use the **vl** (view log) command by entering:

vI

**Note** Oracle only: ORA-1555 errors during the migration indicate that Oracle undo (rollback) records are being overwritten. You can either increase the undo\_retention setting in the Oracle initial-ization parameter file, or contact the Database Administrator to temporarily increase the size of the rollback segments.

For the purposes of this update, you can double the undo\_ retention setting or double the size of the rollback segments.

After the migration is successful, return the UNDO\_RETEN-TION setting or rollback segments to their original values.

See Oracle documentation for more information.

### Enabling multi-column security

When the migration is finished, enable the new multi-column security by entering:

#### fn\_util mlb\_enable

This command sets the multi\_cols\_security indicator in the Configuration Database to "2" – enabled.

#### Verifying the new security schema

To verify that the new security schema has been enabled successfully, enter:

#### fn\_util mlb\_get\_state

You should see:

multi\_cols\_security = 2

A value of "2" indicates that the new multi-column security has been enabled.

### **Restarting Archive Logging (Oracle and DB2 only)**

On Oracle or DB2 systems, if you stopped Archive Logging at the beginning of this procedure, you can start it again now.

The Database Administrator is responsible for starting Archive Logging.

#### Updating additional relational databases

Return to the beginning of this section, <u>"Updating the Index</u> <u>Database" on page 15</u>, and repeat the procedure on each Image Services server that has a relational database.

After you have updated all the servers with relational databases, continue with the next section.

# Starting the Image Services software

### Perform the steps in this section on **all** Image Services servers. Server Types Beginning with the Root/Index server, start the IS software on all servers in the system. 1 Start the Image Services Task Manager. On UNIX servers: As fnsw user, open the FileNet Image Services Task Manager window by entering: Xtaskman & On Windows servers: From the Taskbar, point to Programs, FileNet Image Services, Server Applications, and click the Task Manager icon. 2 To bring up the FileNet software, click **Start**. System messages display in the Current Status pop-up window as FileNet software starts up. 3 When the FileNet software is up and the **Close** button is highlighted, click the Close button to close the Current Status window. 4 View the Event Log window to make sure there are no error messages.

- 5 After viewing the Event Log, chose **Exit** from the File menu to close the Event Log.
- 6 Repeat the steps in this section on each Image Services server.

### Backing up the system

After you have finished defining security for document classes, documents, and WorkFlo queues, you need to make a full system backup.

Important Backups that were made prior to this security update cannot be restored after you have changed the security schema, unless you want to revert to the single-column security schema. It is essential that you make new backups of all Image Services software and data now.

For complete information on performing a system backup, see the "Backup" chapter of these documents:

- <u>System Administrator's Companion for UNIX</u>
- <u>System Administrator's Companion for Windows</u>
   <u>Server</u>.

### **Returning to production mode**

The new Document Security upgrade has been successfully implemented. You can return the FileNet Image Services system to normal operation.
