

DB2 9 has many new features. This presentation will discuss migrating to DB2 9 and preparing to use the new functions. We assume that you know DB2 V8 and DB2 9. We'll emphasize process and recommendations from many other customers, with pointers to more information. The content of this session focuses on the tasks of the person who installs DB2. Systems programmers and database administrators generally perform this task.

The primary stages of migration to a new version are planning, migration and implementation of the new improvements. This presentation will focus on the planning.

The key items are making sure that everyone is educated, with what they need to succeed. A detailed project plan and communication to all involved are crucial for success. Some of the preparation can occur very early, understanding, obtaining and installing the prerequisites. Applications can make needed changes over a longer period to make the process easier and less costly. Plans for monitoring virtual and real storage as well as performance are necessary. An early health check, communication of the needed changes and staging of the work will make the project more successful.

DB2 9 has a lot for everyone. Here are just a few of the strategic highlights.

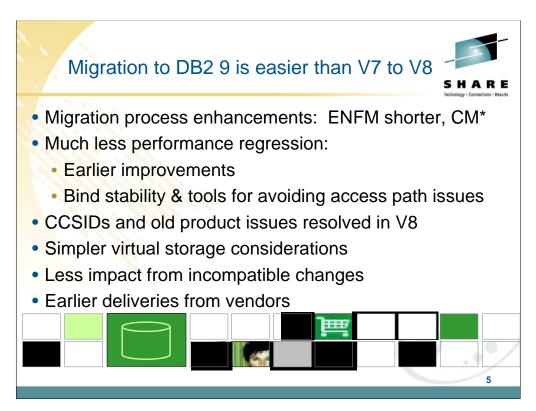

The business needs include CPU cycle reductions that deliver in most utilities, disk space reduction from index compression, improved query optimization, improved business agility via faster implementation cycles, and new pureXML™ that builds a strong foundation for SOA and XML initiatives. Kevin Campbell, an Application Architect at Univar USA said it better than I can, "This is not a bolt-on or band-aid approach, DB2 9 for z/OS is XML without compromise."

Database Administrators (DBAs) need improved database availability and performance including LOBs, reorganization, backup and recovery, and partitioning enhancements. DBAs also get more flexible trusted network context and role-based security to help with regulatory compliance. A wide range of enhancements improve ERP application and data warehouse functionality and performance. Large object (LOB) function is added with file reference variables and REORG, while performance is improved.

Application developers are most excited by PureXML, which adds a powerful SQL and XML interface to access XML data stored in a native format. Application developers need powerful new SQL enhancements including MERGE and TRUNCATE statements, INTERSECT and EXCEPT set operations, and spatial support for geographical data. Text handling is improved with the XML changes, many new built-in functions, and an upcoming text server. Improved SQL and data definition compatibility with other DB2 platforms makes porting much easier.

Common Challenges: DB2 for z/OS Migration Code page check and correction (V8) Current product and tool support Old COBOL or PL/I or tools Cleaning up incompatible change Real and virtual storage Commit intervals, Calls, ... Plan, monitor and manage performance

These are the key items that every customer should check first, to see the most common items that slow down a migration to V8. We will discuss each of these points in detail on later slides:
☐ Checking and cleaning up code page issues, if present. DSNTIJP8 provides the information. Run it on every subsystem.
□Related product and tool support requires looking at the documentation, migrating from out-of-service products to the supported levels, and getting
 Old COBOL or PL/I is a common example of this situation.
Compiles need to use current products. V8 does add some old
compiler capability, but DB2 9 is not expected to handle obsolete products.
 Omegamon V4 is needed for DB2 9. See detail later.
□Cleaning up incompatible changes takes time and a detailed understanding of your shop. Testing is needed.
□Real and virtual storage may improve a little or a lot. Planning is required.
☐Plan and monitor performance, as yours can improve substantially or degrade on migration. Be ready to do the needed work

DB2 9 migration has been easier for many customers and tends to be faster than DB2 V8. Many customers note that the process and the quality are solid.

Migration process enhancements

ENFM is shorter (10 minutes versus an hour), as only two table spaces need to be reorganized in this phase (versus 18 in V8 including the largest ones).

Drop back to CM* if needed (no single steps without a drop back).

Much less performance regression

More consumable performance improvements

Utility CPU improvements in CM

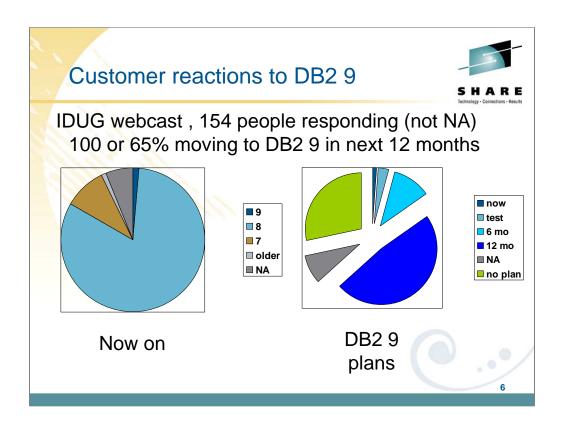

Bind stability to reduce concern about access path regression.

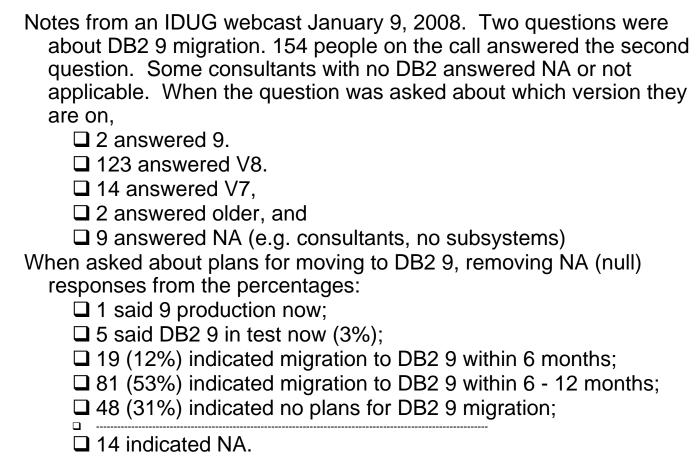

CCSIDs and old product issues resolved in V8 migration, not a problem.

Simpler virtual storage considerations – incremental improvements.

Less impact from incompatible changes

Many vendors are ready today.

DB2 9 for z/OS climbing sharply

- Largest Customers are migrating
 - 33% of top 100 27% of top 200
- How's the quality (comparison to V8)?
 - Lower overall PMR volume
 - Less Severity 1 APARs
 - Lower PE rate
- V8:
 - 100% of the top 100 Customers
 - More than 99% of the top 200 Customers
 - Better quality than V7
- V7 out of service June 30, 2008 target is V8

Now that DB2 9 has been generally available in the field for over two years, let's compare with V8 at the same point. For almost all of the key quality measures, DB2 9 is better. The most important issue for many customers is PTFs in Error (PEs), and the rate is lower on DB2 9. The PMR volume is lower and the number of field severity 1 problems is lower. V7 was widely regarded as a high quality version, and DB2 V8 total field experience is better than V7, with DB2 9 as the best of the three.

Some customers are still migrating to DB2 for z/OS Version 8. The largest DB2 customers have moved to Version 8. All of the largest 100 customers are running Version 8, and large customers are implementing DB2 9 development.

Part of the improvement in overall quality measures is due to more rigorous testing. Some of the improvement is due to the reduced amount of new function added in the service stream. Still these numbers represent the averages, and we know that our customers are not average. Individual customer results are highly skewed, so the average numbers might not reflect your individual experience.

DB2 V7 is now out of service after seven years of general availability. If you are still there, it is time to move now.

DB2 for z/OS V8 field update

- •100% of the top 100 Customers
- More than 98% of the top 200 Customers
- How's the quality (comparison to V7)?
 - Lower overall PMR volume
 - Less Sev 1 APARs
 - Quicker APAR closure time
 - Lower PE rate
 - **Less** multisystem outages
- V8 is better than V7 (out of service June 30, 2008)

Common Criteria security certification: EAL3+ DB2 for z/OS V8

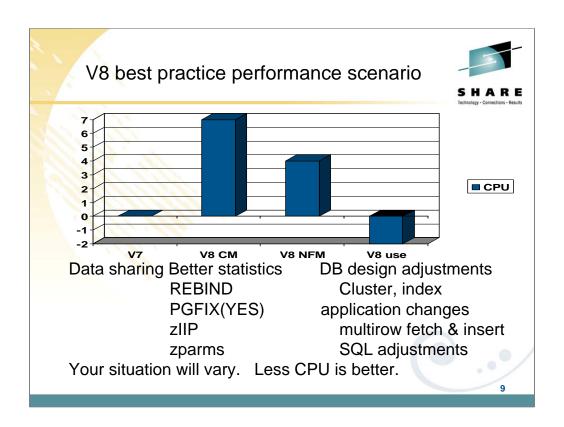

8

Some customers are still migrating to DB2 for z/OS Version 8. The largest DB2 customers have moved to Version 8. All of the largest 100 customers are running Version 8, and large customers are implementing DB2 9 development.

Now that DB2 V8 has been generally available in the field for over four years, let's compare with V7 at the same point. For almost all of the key quality measures, V8 is better. The most important issue for many customers is PTFs in Error (PEs), and the rate is lower on V8. The PMR volume is lower and the number of field severity 1 problems is lower. V7 was widely regarded as a high quality version, and DB2 V8 total field experience is better than V7.

Part of the improvement in overall quality measures is due to more rigorous testing. Some of the improvement is due to the reduced amount of new function added in the service stream. Still these numbers represent the averages, and we know that our customers are not average. Individual customer results are highly skewed, so the average numbers might not reflect your individual experience.

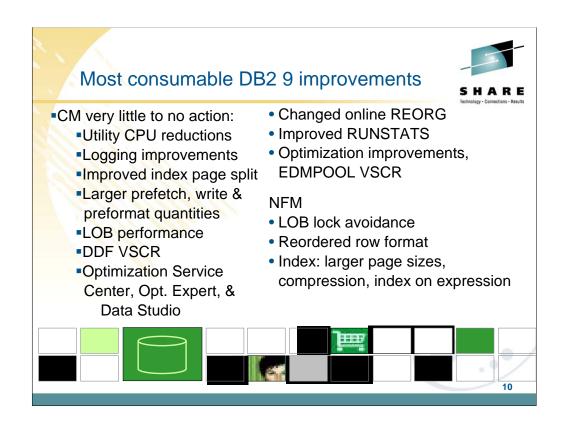

DB2 V7 is now out of service after seven years of general availability. If you are still there, it is time to move now.

Your situation and mileage will vary, but this is a common shape for a V8 performance plan, starting with zero for the V7 base line. When you move to V8, CPU time generally increases from 5% to 10%, shown here as 7. Start with long term page fix for buffer pools with high numbers of pages read and written. Reorg and collect improved statistics for non-uniform distribution of data on non-indexed columns. The V8 CM performance plan REBINDs the primary packages, and adjusts DSNZPARMs. The CM REBIND process provides most of the improved access paths. Data sharing batching helps in CM. During CM, a zIIP is added if your peak work load includes DRDA SQL, parallel query or LOAD, REORG and REBUILD.

In moving to NFM, some additional DSNZPARMS are adjusted and REBIND all plans and packages. Database designs start taking advantage of new clustering & indexing options, such as NOT PADDED for large varchar indexed columns. After making the design changes, REORG the data; REORG or REBUILD the indexes; get improved statistics & REBIND. The data sharing group is quiesced, and protocol 2 locking is used.

V8 use takes more advantage of the V8 performance improvements: MQTs, DPSI, more not-padded indexes, multi-row Fetch, cursor Update, cursor Delete, & Insert. Use other SQL improvements to reduce V8 CPU, less than V7. The work may grow, but some of the growth uses the zIIP.

Here are some highlights for items that deliver the most quickly and easily:

Very little to no action is required for the utility CPU reductions, logging improvements, improved index page split, larger prefetch, write & preformat quantities, some LOB performance, DDF virtual storage constraint relief. The first group delivers in CM.

The next items require some work. Changed online REORG and other utility improvements require process changes and use of SHRLEVEL(CHANGE).

Improved RUNSTATS statistics needs some analysis to determine where the value is greater than the cost of gathering the new statistics.

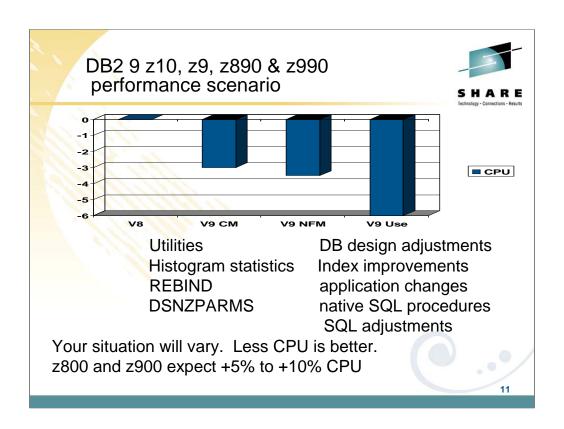

Optimization improvements are automatic for dynamic SQL, but require work to REBIND for static SQL. In both cases, we need baselines to check for regression. REOPT(AUTO) for dynamic SQL needs analysis to be sure the improvement is working. EDMPOOL virtual storage constraint relief also requires a REBIND.

Optimization Service Center takes some learning, but should be fast for those who have used Visual Explain in the past. See the new redbook, SG24-7421, DB2 9 for z/OS: New Tools for Query Optimization.

LOB lock avoidance requires a quiesce of all subsystems in NFM until APAR PK62027. Reordered row format requires a REORG in NFM and varying length columns, and use with small columns can reduce compression. See APARs.

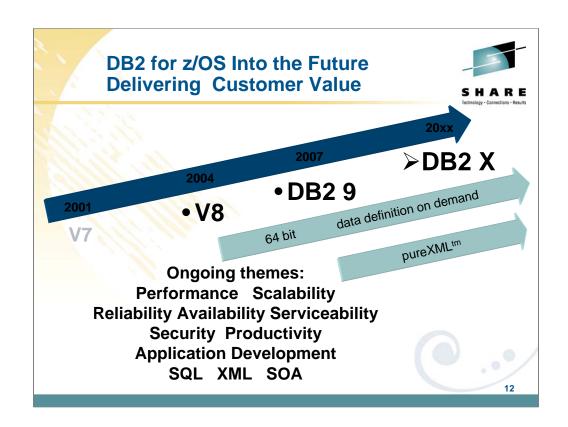

Index improvements for larger page sizes, compression, index on expression require database design work to determine where they are applicable. ALTERs, REORGs and creation of new indexes are needed.

10

If you have a z9, z990 or z890, this is expected to be a common shape for a DB2 9 performance plan, starting with zero for the V8 baseline. When you first move to DB2 9, total DB2 CPU time generally decreases from 0% to 5% for z9, z890 and z990 customers, shown here as a first step -3%. Utility CPU reductions help immediately. Some work will be about the same (+/-3%). Start with reorgs and collect improved histogram statistics when useful. The DB2 9 CM performance plan REBINDs the primary packages and adjusts DSNZPARMs. The REBINDs provide most of the improved access paths. On z800 or z900 the initial cpu expectation is +5 to +10% regression, more if there are many columns, so making adjustments is more important. In moving to NFM, some additional DSNZPARMS are adjusted and all plans and packages are rebound. The DB2 9 use line takes wider advantage of DB2 9 performance improvements. Database designs start taking advantage of new indexing options, such as compression, index on expression and larger pages. After making the design changes, REORG the data and REORG or REBUILD the indexes, get the improved statistics and REBIND. Native SQL procedures, added use of zIIP, and improved SQL continue the improvements in this phase.

Scenario: Customer mix of DB2 CPU time is 30% in utilities, 70% in SQL access. With 10% improvement for the utilities, we get a -3% net, assuming that SQL is the same as before. With optimization improvements, another -½% improvement shows up in DB2 9 NFM. Then as design adjustments, reorgs and rebinds are performed, we get improvements from varchar improvements, native SQL procedures and improved SQL, another -3%.

DB2 for z/OS V7 became generally available (GA) March 2001, and V8 delivered three years later, March 2004. DB2 9 became generally available in March 2007, three more years. We expect the next version will be roughly 3 years from DB2 9 GA to DB2 10 or DB2 X or whatever the name becomes, but the timing and packaging may change too.

The themes for future versions will continue to focus on core platform strengths of performance, scalability, reliability, stability, availability, resilience, and security. PureXML and Schema evolution or data definition on demand will be ongoing for a long time. In contrast, most of the 64 bit evolution should be completed in DB2 X.

The key interfaces for customers and vendors expand for both XML and for SQL. Information is a key leg of the SOA platform, and DB2 for z/OS provides many advantages for data management in SOA.

Standards, interoperability, portability and security along with secure access using the latest technologies are key touch points. Productivity improvements for application developers and for database administrators are very important as data grows in scale and complexity.

DB2	for z/OS	Version A	vailability Su	ummary	A R
Ver sion	PID	Generally Available	Marketing Withdrawal	End of Service	
V3	5685-DB2	Dec. 1993	February 2000	March 2001	
V4	5695-DB2	Nov. 1995	Dec. 2000	Dec. 2001

9	5635-DB2	March 2007			
					13

All statements regarding the future direction and intent of IBM are subject to change or withdrawal without notice and represent goals and objectives only. This table summarizes the latest versions of DB2. As of August 2007, DB2 V7 was generally available for more than six years and has been out of service for a few months. If you need service, a contract is available. DB2 V8 has been generally available for over four years. If you are currently running V7, then it's time to finish your migration to V8. I generally think of five years after general availability as the end of practical life for a DB2 release. Migration to DB2 9 is only from DB2 for z/OS V8. There is no standard ability to skip a version. A few customers are still running older versions, but the end of service is past. In general, you can expect versions to be in service for five years and end of service to be announced a year in advance. Extended service at extra cost is available for three more years. If you want to search for these products by version number, the PID number is useful. Almost all of the largest DB2 customers are running V8 or DB2 9 now. End of service of Version 7 was June 2008, after end of service for all of the operating systems that support processors other than System z or zSeries.

To see current DB2 availability notices, start at ibm.com/software/db2zos Click on Support, then on Product Life Cycle. ibm.com/software/data/db2/zos/support/plc/

x1 – IBM eServer[™] zSeries® 990 (z990) compatibility or exploitation feature required (no longer orderable)

* Statements regarding IBM future direction and intent represent goals and objectives only, and are subject to change or withdrawal without notice.

This chart summarizes much of the information about z/OS that you need to know. Server and DASD hardware support, end of service dates, coexistence, and planned availability dates are shown here for existing and planned releases through z/OS R9.

z/OS 1.8 was announced and became available in September 2006. 1.8 is required for some DB2 9 function. z/OS 1.9 became available in September 2007.

z/OS 1.6 is out of service as of September 2007. 1.4 and 1.5 are out of service as of March 2007. z/OS (and z/OS.e) 1.7 planned end of service is September 2008, with extended service available for additional cost.

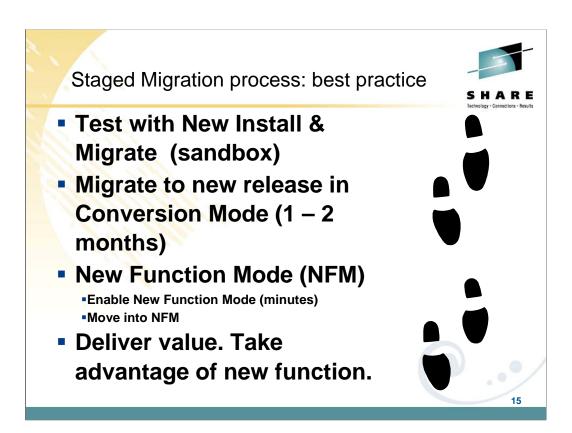

Only service-supported releases can coexist in the same sysplex

* All statements regarding IBM future direction and intent are subject to change or withdrawal without notice, and represents goals and objectives only.

This chart notes the support for z/OS with various processors.

Note the z/OS end of service dates as well. End of service for z/OS 1.3 was March 2005. Check the latest information by going to the z/OS web page, then to Support and then to the z/OS marketing and service announce, availability, and withdrawal dates

http://www.ibm.com/servers/eserver/zseries/zos/support/zos eos dates.html

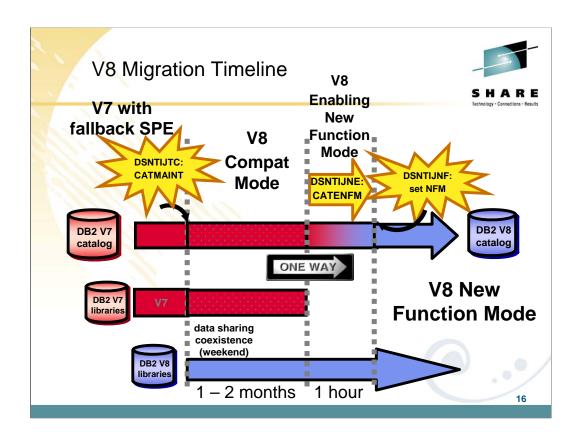

The process of migration will take four major steps.

Use a new install or a migration on a separate subsystem and practice migration there. Test the function you want to use. This will ensure that you are ready to move forward.

Migrate to the new release in Conversion Mode (CM). You are using the new code but almost no new function. Conversion mode is NOT no new function mode, but does have very limited new function. The primary objective is making the full migration smooth, so we prefer to avoid problems, but if they can't be avoided, then CM is much better than NFM

The third step is a few minutes for Enabling New Function Mode (ENFM), typically a one hour process, moving directly to the next, New Function Mode or NFM.

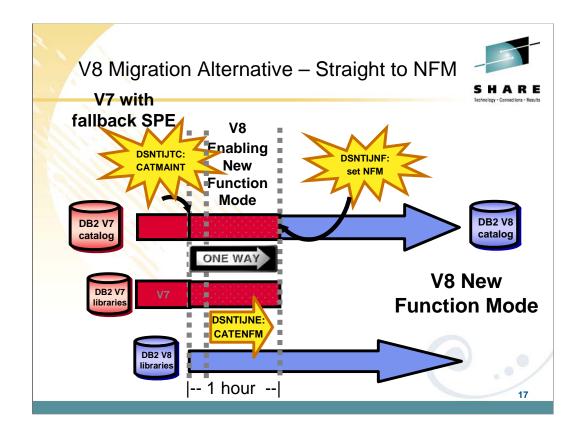

After you are running New Function Mode (NFM), then one or more projects are used to deliver the value of V8 or 9, improving performance, availability and new capabilities in SQL, XML and utilities.

This is an overview of the V8 migration process. There are two steps which modify the catalog, CATMAINT to change into Compatibility Mode (CM), and also CATENFM for Enabling New Function Mode (ENFM), which contains the major catalog changes to long names and Unicode, using a technique of an online (read only or shrlevel reference) reorg. The DB2 9 migration process is similar.

Keep the time for data sharing coexistence fairly short, such as over a weekend or one week. Compatibility mode will often be one or two months, but is not used for some vendors, such as SAP. Once you move to ENFM, you don't go back to CM or to V7. ENFM will generally be on the order of an hour (5 GB catalog size). Then you turn the switch and are taking advantage of New Function Mode, NFM.

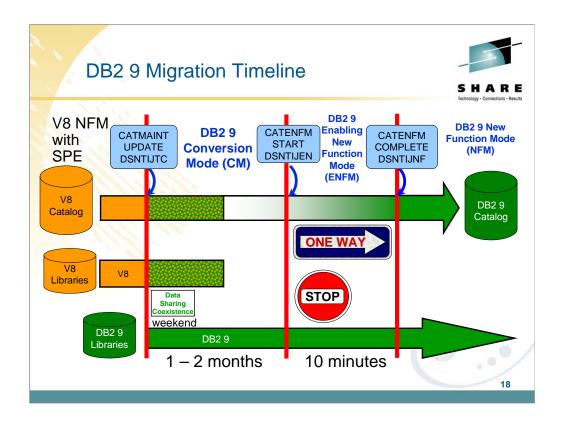

How long should you stay in CM? Generally after more than one or two months, you have adjusted to the improved access paths, storage changes and improved utilities, so that fallback is not feasible. At that point, moving forward to NFM can eliminate some of the restrictions and operational problems. You are running almost exactly the same code, so problems in NFM are generally in new function, found in test.

Some customers will use an alternative migration process, migrating immediately from V7 to V8 NFM. This process means that fallback to V7 is not possible, so thorough testing is needed. The advantages are

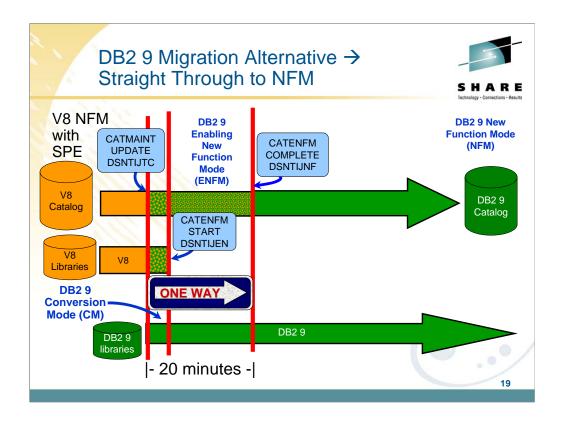

- single window for the migration
- test in only one mode, NFM
- faster delivery of improved value in performance, function and availability

Some vendors, such as SAP, use this process. Customers who cannot allow multiple windows for migration need to consider this alternative and the work and controls needed to migrate while processing continues.

The time line is not to scale. Customers should spend only a few minutes in ENFM and then move immediately to NFM.

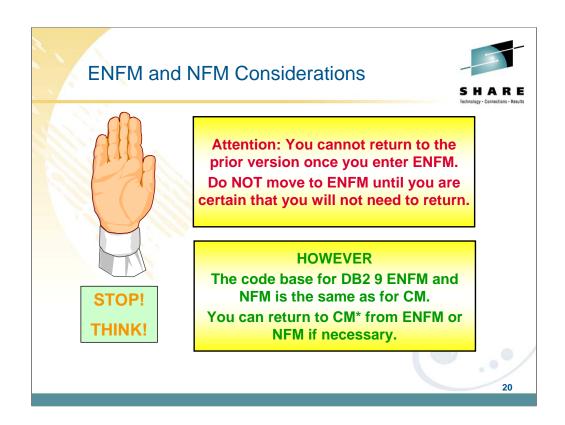

The ONE WAY situation is a bit more flexible, with more opportunity to drop back. There are two new modes to denote drop back processes. You can drop back from NFM to ENFM as before, but the label for the drop back mode is now ENFM*. It is also possible to drop back from ENFM or NFM to CM*, but not to V8 or to coexistence.

Some customers will use an alternative migration process, migrating immediately from V8 to DB2 9 NFM. This process means that fallback to V8 is not possible, so thorough testing is needed. The advantages are

- single window for the migration
- test in only one mode, NFM
- faster delivery of improved value in performance, function and availability

Some vendors, such as SAP, use this process. Customers who cannot allow multiple windows for migration need to consider this alternative and the work and controls needed to migrate while processing continues.

In DB2 V8, you cannot return to CM when you get to ENFM. In DB2 9, you can return to CM* from ENFM. We have heard a lot of concern about this step which does not have an easy reversal, but have never experienced a problem that could be resolved by this return. It still makes the process easier to explain as always being able to get back to the prior state or a reasonable facsimile thereof.

DB2 9 migration continues the best practice migration technique, with small, safe steps. Every step can be backed off. Customers move first to conversion mode, and can move back to V8 from there. The next step, ENFM, changes the catalog, and customers can go back to CM* from there. The * is our note that the subsystem has moved before. The customer can move to NFM and then can go back to ENFM* or even to CM*. Most customers move directly to NFM at the end of the 10 minute ENFM, so there are two steps to the process.

DB2 9 Modes – An Overview

CM Conversion Mode (previously called compatibility mode) - This is the DB2 mode DB2 9 migrated from V8 and is started for the first time. It will still be in CM when migration job DSNTIJTC has completed. Very little new function can be executed in CM. Data sharing systems can have V8 and DB2 9 members in this mode, called coexistence. Coexistence should be very short, such as a weekend or a week. DB2 can only migrate to CM from V8 NFM. This mode is not compatibility, but the ability to fall back. We try to move most (but not all) problems for migration from NFM to CM, so that fallback can be used, if necessary. ENFM Enabling New Function Mode - This mode is entered when CATENFM START is executed (the first step of job DSNTIJEN). DB2 remains in this mode until all the enabling functions are completed. Data sharing systems can only have DB2 9 members in this mode. NFM New Function Mode - This mode is entered when CATENFM COMPLETE is executed (the only step of job DSNTIJNF). This mode indicates that all catalog changes are complete and new function can be used.

ENFM* This is the same as ENFM but the * indicates that at one time DB2 was at NFM. Objects that were created when the system was at NFM can still be accessed but no new objects can be created. When the system is in ENFM* it can not fallback to V8 or coexist with a V8 system.

CM* This is the same as CM but the * indicates that at one time DB2 was at ENFM and possibly NFM. Objects that were created in NFM can still be accessed. When DB2 is in CM* it can not fallback to V8 or coexist with a V8 system. Functionally, CM* is very similar to ENFM.

2

DB2 9 builds upon the structure from V8 The modes are almost the same, but DB2 9 clarifies the situation if you drop back after moving to ENFM or NFM. There are two more modes with names CM* and ENFM*, and the restrictions are clarified a little more. The process is very similar to the best practice that successful customers have used for years. It is possible to move from NFM or ENFM to CM*.

While the first mode was labeled as "Compatibility Mode" or CM, it is not compatible. CM does help with the conversion, but the incompatibilities have been moved to this mode, where possible, since fallback is simple from this stage. This change removed problems in moving to ENFM and NFM.

I think of NFM as New Value Mode, the opportunity to deliver the value of the new version.

What works in Conversion Mode?

- Logging improvements, improved index page split
- DSN1COMP index compression estimate
- Larger prefetch, write and preformat quantities
- LOB performance other than LOB lock avoidance
- Command enhancements: REFRESH, DISPLAY, START, STOP, & MODIFY TRACE qualifications and ACCESS DATABASE
- Virtual storage use above the 2 GB bar DDF & EDMPOOL (when bound)
- Package BIND stability (PLANMGMT & EXCHANGE)
- Optimization improvements (when bound)
- Optimization Service Center & Optimization Expert (work with V8 if PTFs are applied)
- Most utility enhancements and CPU reductions (see next slide)

22

New functions are available only in new-function mode, unless explicitly stated otherwise in the product documentation. A few general exceptions exist for utilities and for optimization. The following specific improvements are available in conversion mode:

- Logging improvements
- •Improved index page split
- •Larger prefetch, write and preformat quantities
- •LOB performance other than LOB lock avoidance
- •Virtual storage use above the 2 GB bar DDF & EDMPOOL (when bound)
- Package BIND stability (PLANMGMT & EXCHANGE)
- Optimization improvements (when bound)
- •Optimization Service Center & Optimization Expert (work with V8 if PTFs are applied)
- •Utility CPU reductions and most other utility improvements that do not depend on SQL changes. See the following slide and web for detail.
- •http://www.ibm.com/support/docview.wss?rs=64&uid=swg21307783

DB2 9 Conversion Mode versus New Function Mode

Utility enhancements available in both CM and NFM are:

CPU reductions

- Parallel unload, reload and log apply processing by the REORG utility Removal of the BUILD2 phase for REORG at the partition level Log Phase addition for REORG SHRLEVEL REFERENCE PART REORG SHRLEVEL REFERENCE for LOB table spaces
- CHECK INDEX SHRLEVEL REFERENCE with Parallelism
- Histogram Statistics for RUNSTATS
- CHECK LOB SHRLEVEL CHANGE

- CHECK DATA SHRLEVEL CHANGE
 REPAIR LOCATE SHRLEVEL CHANGE
 REBUILD INDEX SHRLEVEL CHANGE
 MODIFY RECOVERY support for the RETAIN option
- Object level recovery from a system-level backup by the RECOVER Utility BACKUP SYSTEM & RESTORE SYSTEM system-level backups to tape
- Skipping locked rows for transaction updates by the UNLOAD Utility
- TEMPLATE switching support based on size for image copy datasets

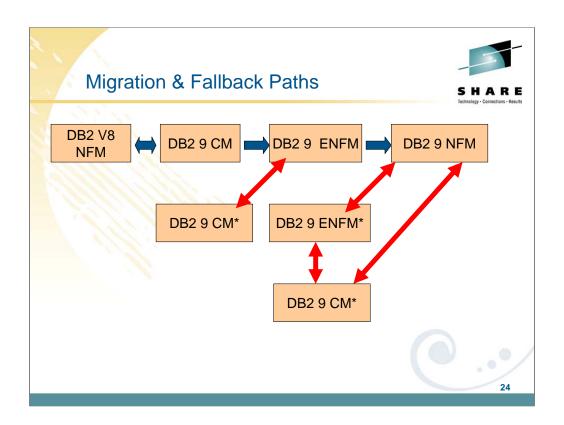

Other utility enhancements are only available for DB2 9 NFM, such as...

- LBI (large Block Interface) support for sequential datasets on tape
 Recover to Point in Time (PIT) with consistency (defaults as new behavior)
 Clones effectively provide LOAD REPLACE SHRLEVEL CHANGE
 Online Load (LOAD RESUME YES SHRLEVEL CHANGE) without logging using NOT LOGGED

DB2 9 has many utility enhancements available in both Conversion Mode (CM, previously called Compatibility Mode) and New Function Mode (NFM), Some exceptions are only available for NFM, and not for CM.

Utility enhancements available in both CM and NFM are:

- Parallel unload, reload and log apply processing by the REORG utility
- Removal of the BUILD2 phase for REORG at the partition level
- Log Phase addition for REORG SHRLEVEL REFERENCE PART
- REORG SHRLEVEL REFERENCE for LOB table spaces
- CHECK INDEX SHRLEVEL REFERENCE with Parallelism
- Histogram Statistics for RUNSTATS
- CHECK LOB SHRLEVEL CHANGE
- CHECK DATA SHRLEVEL CHANGE
- REPAIR LOCATE SHRLEVEL CHANGE
- REBUILD INDEX SHRLEVEL CHANGE
- MODIFY RECOVERY support for the RETAIN option
- Object level recovery from a system-level backup by the RECOVER Utility
- BACKUP SYSTEM & RESTORE SYSTEM system-level backups to tape
- Skipping locked rows for transaction updates by the UNLOAD Utility
- TEMPLATE switching support based on size for image copy datasets Other Utility enhancements are only available for DB2 9 NFM, such as...
 - LBI (large Block Interface) support for sequential datasets on tape
 - Recover to Point in Time (PIT) with consistency (defaults as new behavior)
 - Clones effectively provide LOAD REPLACE SHRLEVEL CHANGE
- Online Load (LOAD RESUME YES SHRLEVEL CHANGE) without logging can be accomplished by altering the table space to NOT LOGGED, running the Online Load, altering the table space back to LOGGED, and taking an image copy.

CM is the mode when DB2 9 is started for the first time from DB2 V8 New Function Mode (NFM). Limited new function can be executed in CM. This is the only mode that permits fallback to DB2 V8. CM does help with the conversion, but most incompatibilities occur in this mode, where possible, since fallback is simple from this stage.

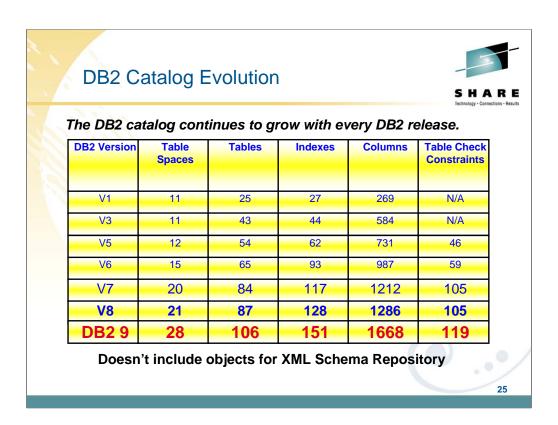

Enabling New Function Mode (ENFM) is the mode that is entered when CATENFM START is executed which is the first step of DSNTIJEN. ENFM can fall back to a Conversion Mode which is identified as CM*.

New Function Mode (NFM) is the mode that DB2 enters once CATENFM COMPLETE is run. This is the only step of job DSNTIJNF. New functions can be used at this time. Fallback can occur to Enabling New Function Mode which will be identified as ENFM* or to Conversion Mode which will be identified as CM*.

Enabling New Function Mode Star (ENFM*) is the same as ENFM but indicates that at one time DB2 was in NFM.

Conversion Mode Star (CM*) is the same as CM but indicates that at one time DB2 was in either ENFM or NFM. You can not fallback to DB2 V8 from CM*.

DB2 9 migration modes are C, C*, E, E*, or N in message DSN7100I

The DB2 catalog continues to add new catalog table spaces, tables, columns, indexes and check constraints in each new version.

The newer table spaces are segmented, while the older ones are simple. Some use techniques that are unique to the catalog.

What is the Migration Planning Workshop (MPW)? • This offering enables customers to understand the breadth of features delivered in DB2 for z/OS versions. • Many resources are brought together in a single offering. • The migration process is explained. • Leave the session with materials that you can use to start your installation / migration immediately, or in the future. • Your questions are given attention, typically in a small group setting. While most MPWs are small, multi-company events, they can be delivered for individual companies or even user groups.

Who should attend? An MPW contains content that is appropriate to: •
Application Developers • Database Administrators • System Administrators
• Architects • IT decision makers • Project Managers

The morning session provides information for all parties. The afternoon is more migration focused, and therefore a better fit for Database Administrators, System Administrators, and Project Managers. A typical agenda provides a DB2 9 for z/OS Overview in the morning and DB2 9 Migration (• Preparations • Planning • Process) in the afternoon.

What you can expect? • An understanding of the features delivered with DB2 9 and how they can benefit your enterprise. • Clarity of the migration process. • References for many subjects, including: Migration, Fallback, Prerequisites & preparations. You will leave with Presentation materials, Checklists, Project plan framework, Related documentation, Networking and Contacts.

Migration Strategy: Test and Production

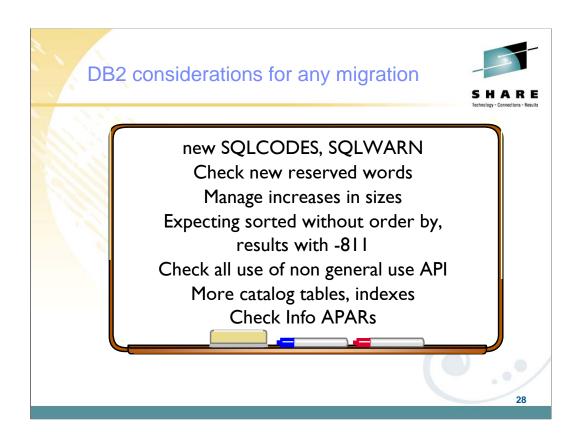

- Short time for data sharing coexistence
- One to two months for conversion mode
 - Not able to use most new performance, function
- Minutes for enabling new function mode
- Move to new function mode
 - Stage in new function
- Test to QA to Production
 - ► Better controls for not using new function
 - ► Still don't want long gap test to production
 - Vendor support may affect strategy, e.g. NFM certified
 - Improved granularity, stage by modes

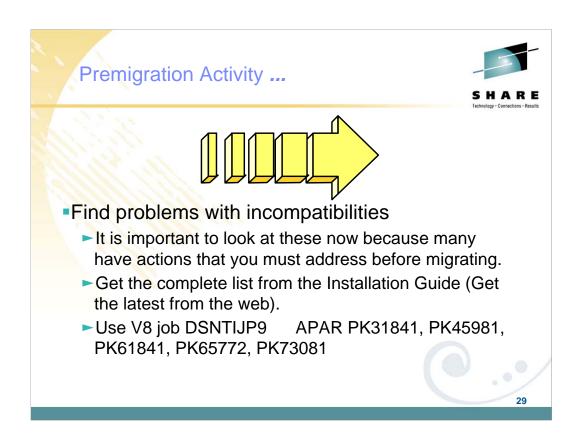

27

In the past we have recommended a short time for data sharing coexistence, and that is still true. A short period for ENFM is also recommended highly. Support from vendors may affect the migration staging. One concern for conversion mode is that most new performance improvements cannot be used, and some regression is possible, as always.

The timing for moving from test to QA to production has more options to consider. There are better controls for not using new function, but a long gap between test and production levels is not advisable. Now you have more granularity in the migration and can move mode by mode. Some customers are migrating both test and production to CM, then changing to NFM in a short time.

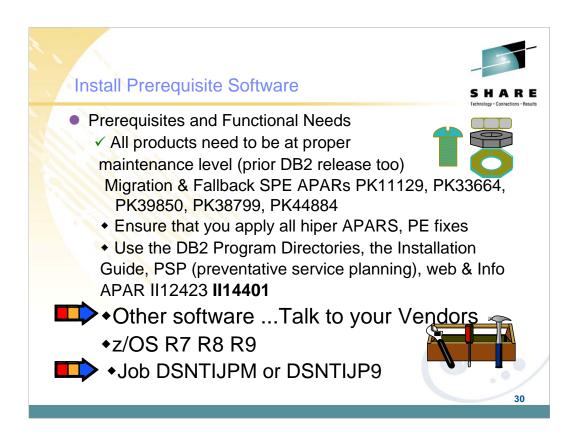

Whenever you move from one release to another, there are some changes to manage. It is possible, but rare to find SQL which processed in the prior release that will not run on the new one. If you have users who test the boundaries, instead of reading the limits, then this is more common. Reserved words are handled in context when possible, but new reserved words can cause problems in SQL that worked on the prior release. Check for APARs. The Info APAR for DB2 9 migration is II14401. Some catalog tables grow. There are many more catalog tables and indexes. The concern for V8 was often the long names and Unicode, but the catalog growth for that was generally 10% or less. As you REBIND, the SPT01 and SYSPKAGE table spaces often grow 50%. Error information changes more frequently, note any dependencies upon error information. There are always new SQLCODEs, and we still find a few applications that do not have tests for other cases. Additional complexity means that storage sizes increase in DB2 & application address spaces. If you are expecting sorted results without order by or results to come with a negative SQLCODE, then surprises are possible. If you use an interface identified as a Product-Sensitive Programming Interface, it must be checked. If the technique not in DB2 books, then it's not an interface.

Read these pages of the DB2 Installation Guide carefully. Many items need to be addressed before migration. Check the items several times, including just before running CATMAINT.

General REBIND advice: When to REBIND depends upon complexity of the SQL, how well tuned the statements are, and your experiences with improvements & regression. For simple cases, a rule of thumb is that the statistics need to change by 10% or 20% or cross a key threshold to make a difference in the access path.

Real Time Statistics address when to run REORG, RUNSTATS & COPY. Read Administration Guide. Some rules of thumb & threshold techniques discussed in the book may be useful for REBINDs. One of the best times for RUNSTATS & REBIND is after REORG. If you update statistics & the differences are large or cross a boundary, then REBIND is more likely to make a difference. Statistics history tables may help in the decision. After REBIND, check access path & processing estimates.

You need to know what functions will be used first. Many functions have additional prerequisites. Read the section of Release Guide carefully to see if you need to upgrade other software. The most successful policy is to keep software at similar levels. z/OS should be current & in service. Some functions need later releases. z/OS V1R7 is minimum for DB2 9 and the minimum in service today.

IBM & other vendor software must be checked for levels required & needed for the function you want. Some APARs require vendor changes. Contact your vendors.

DB2 9 incompatibilities

- Installation Guide for details
 - Chapter 2. Preparing your system to install or migrate DB2
 Changes to DB2 that might impact your migration to DB2 9
 conversion mode
 - Application and SQL release incompatibilities
 - ➤ Utility release incompatibilities
 - ➤ Command release incompatibilities
 - >Storage release incompatibilities
 - >Other release incompatibilities
 - >Functions that are no longer supported
 - >Functions that are deprecated
 - ➤ Preparing a data sharing group or distributed environment for migration
 - Chapter 5. Installing or migrating DB2
 - >Migrating your DB2 subsystem to new-function mode
 - >Implications of converting to DB2 9 new-function mode
- **▶** Application Programming and SQL front
 - > Application and SQL release incompatibilities

31

For detailed product dependencies and incompatibility descriptions, see

- Application Programming and SQL Guide (APSG)
- Installation Guide
- Program Directories
- •Web page for DB2 9 books:

http://www.ibm.com/support/docview.wss?rs=64&uid=swg27011656

•Release incompatibilities are divided into incompatibilities in conversion mode and incompatibilities in new-function mode and are documented in lists in two separate sections in the Installation Guide. Here are links to the two topics that contain these lists:

Parent topic for conversion mode incompatibilities:

Changes to DB2® that might impact your migration to DB2 9 conversion mode:

http://publib.boulder.ibm.com/infocenter/dzichelp/v2r2/index.jsp?topic=/com.ibm.db29.doc.inst/dmigcn2.htm

Parent topic for new-function mode incompatibilities:

http://publib.boulder.ibm.com/infocenter/dzichelp/v2r2/index.jsp?topic=/com.ibm.db29.doc.inst/dmigcn2.htm Conversion considerations:

The Installation Guide section is about 18 pages long. Some of the items expected to be the most common are noted here, but your database administrators and application programmers should review the full list, as some practice might be common at your shop.

Application programmers should review the entire section in the APSG, about 9 pages long, with the primary changes that are anticipated to require changes. The following slides have the highlights.

DB2 9 removed function

- ➤ DB2-managed stored procedures → WLM-managed SPs
- ➤ Create simple table space → create segmented or partition by growth
- ➤ Temp databases & table spaces → work files
- Very old plans and packages (V3 and before) → REBIND
- ➤ AIV Extender → Content Management
- ➤ Text, Net Search Extenders → new text search
- Net.Data → WebSphere, REXX, command line proc., ...
- ➤ DB2 Estimator → capacity planning products
- ➤ Visual Explain → Optimization Service Center, Data Studio
- ➤ Old JDBC / SQLJ driver → Current driver
- ➤ Java stored procedures → non-resettable JVMs
- ➤ Online help → Information Center
- ➤ Parameters removed RELCURHL, DBPROTCL, STORPROC, ...

3

DB2 9 for z/OS supports migration only from V8 NFM. Customers not yet running V8 should plan to migrate to DB2 for z/OS, V8 as preparation for migration to DB2 9. IBM added many data server capabilities in DB2 9 for z/OS and reduced or removed support for some functions: AIV Extender is removed. Text Extender is removed. Net Search Extender is removed. Net.data, which was stabilized at the V7 level, is removed. WebSphere is the strategic IBM solution for delivering DB2 data to Web applications. For some situations a scripting language, such as REXX or the Command Line Processor which comes with DB2 9 can provide the needed function. DB2 Estimator, available via Web download for DB2 V8, will not be provided for DB2 9 for z/OS.

DB2-managed stored procedure support is removed. Workload Manager (WLM) managed stored procedure address spaces is the strategic solution for stored procedure support. Simple table space creation support is removed. DB2 9 for z/OS no longer implicitly creates simple table spaces nor allows customers to create simple table spaces. However, DB2 9 for z/OS continues to support simple table spaces created in previous versions.

The Online help facility is replaced, replaced by the Information Management Software for z/OS Solutions Information Center (Information Center). JDBC/SQLJ Driver for OS/390 and z/OS support is removed. All Java application programs and Java routines that are currently written to work with the JDBC/SQLJ Driver for OS/390 and z/OS need to be modified to work with the IBM DB2 Driver for JDBC and SQLJ (formerly known as the DB2 Universal JDBC Driver). Java stored procedures no longer run in resettable JVMs. Plans and packages must be rebound on DB2 9 to benefit from optimizer enhancements. Plans & packages DB2 V3 & before, will be automatically rebound when accessed by DB2 9. See the Installation Guide section "Functions that are no longer supported" for more information and additional items. Temporary databases move to work files, authorization

needs to be permitted on the work files.

DB2 9 deprecated function

- Private protocol → DRDA (help in DSNTP2DP, PK64045)
- ➤ Plans containing DBRMs → packages PK62876
- ➤ ACQUIRE(ALLOCATE) → ACQUIRE(USE)
- ➤XML Extender → XML type
- ➤Old Plan table formats → DB2 V8 or 9 format (59 columns)
- ➤ DB2 MQ XML user-defined functions and stored procedures
 → XML functions
- ➤ DB2 Management Clients feature (DB2 Administration Server, Control Center, & Development Center) → IBM Data Studio application & administration services
- ➤msys for Setup DB2 Customization Center → install panels
- ➤ BookManager use for DB2 publications → Info Center, pdf
- ➤ Simple table spaces → segmented or partitioned by growth

33

The above features are still included in DB2 9 and may be dropped from future versions. Note the direction indicated to the right of the arrows, as these are the functions provided to replace the existing function. If you are using any of these functions, you are advised to move to the new function. For plan table format upgrades, use the Optimization Service Center or see the ALTERs in edited sample member DSNTESC.

See the Installation Guide section, "Functions that are deprecated" and the announcement material for more information on these changes. http://www.ibm.com/common/ssi/rep_ca/8/897/ENUS206-098/ENUS206-098.PDF

DB2 9 migration process changes, APARs

- Enterprise PL/I change JCL error DSNTEP2
- PK63659
- Rebind required for V3 and earlier plans & packages
- ➤ Best process is rebind all in CM or NFM, top 10% in CM
 - Highly recommended to rebind all V8 and below
- ➤ PDSE is required for SDSNLOAD. PDSE service needed.
- Premigration job DSNTIJP9 APAR PK31841 ..PK61841
- >SPE PK11129, PK33664, PK39850, PK38799, PK44884
- ➤Info APARs: Install II14401, II12423, DDF II14203, XML II14426, Unicode II13048 & II13049, zIIP II14219, DFSORT II14047, II14213 & II13495, Performance II13579, Storage II10817, Parallel II12836, LOBs II14334, DSNUTILS sec. id. II13133, Coprocessor II13782, PDSE II14067, II14255, II14403 ...

34

All DSNTEP2 programs on any version can be affected by a PL/I run time change, if the JCL does not reflect LRECL=133. This was being overridden by the DCB, but will be an error. A temporary bypass is available in PK63659, so the JCL problems need to be fixed.

Plans and packages must be rebound on DB2 9 to benefit from optimizer enhancements. DB2 V3 and earlier plans & packages will be automatically rebound when accessed by DB2 9. A much better process is to rebind all plans on the new version. If there is not adequate time to rebind in DB2 9 CM, see if you can rebind the most frequently accessed packages. If any plans have not been bound on V8, rebind them.

PDSE is documented as required on V8, but some customers noted that a PDS could be used (as long as the largest load module remained under 16MB). The PDSE is the only option for DB2 9, as there are program objects and larger load modules.

The premigration job DSNTIJPM on DB2 9 is shipped as DSNTIJP9 in APAR PK31841 for V8. Running this job on every subsystem helps find the work needed before migration. The SPE for DB2 9 is PK11129 and PK33664 on V8. Get all the service in this chain.

There are many useful information APARs. These are the ones I use the most. For secondary ids used with DSNUTILS, read II13133.

DB2 9 default and process changes

- BIND ISOLATION defaults to CS. Query catalog RR
 - Not changed for distributed, REBIND
- BIND CURRENTDATA defaults to NO. Query Yes.
 - Not changed for REBIND
- ➤ DB2-managed data set secondary extent allocation default YES, even for migration
- ➤ Work files → much more 32K space needed, avoid small files
- Varying length data change row format PK78958, PK78959
- ➤ DB2 disables DATA CAPTURE CHANGES for SYSROUTINES during migration (DSNTIJTC) and SYSPACKSTMT during ENFM (DSNTIJEN) PK72214
- ➤ Need to find and complete or delete incomplete definitions
- ➤ Online REORG processes change
- ➤ Configure shared virtual storage (128 GB for each DB2)

35

The default value for bind option CURRENTDATA changes from YES to NO for the BIND PLAN and the BIND PACKAGE subcommands, as well as the CREATE TRIGGER for trigger packages, and the CREATE PROCEDURE and the ALTER PROCEDURE ADD VERSION SQL statements for SQL PL procedure packages. CURRENTDATA NO is the best option for performance. The default value for bind option ISOLATION is changed from RR to CS for the BIND PLAN and the remote BIND PACKAGE subcommands. For the BIND PACKAGE subcommand, the current default (plan value) stays. The default change does not apply to distributed. Although you can specify DBPROTOCOL(PRIVATE) for the DBPROTOCOL parameter of the BIND option, DB2 issues a new warning. All BIND statements for plans and packages that are bound during the installation or migration process specify the ISOLATION parameter explicitly, except for routines that do not fetch data. The current settings are maintained for compatibility.

DB2-managed data set secondary extent allocation default setting is YES and is changed by installation CLIST from NO to YES. In migration mode, the input migration value for this field is overridden to YES, so you need to reset it to NO if you want to continue to disable secondary extent optimization. Define much more 32K space, moving over from 4K.

REORG and LOAD REPLACE utilities automatically convert table spaces to a new reordered row format (RRF) if there is no VALIDPROC or EDITPROC. If you use the REORG SHRLEVEL CHANGE utility, you might need to change your operating procedures if you run concurrent REORG TABLESPACE SHRLEVEL CHANGE PART x on the same table space. Configure 128 GB of shared virtual storage for each DB2 subsystem on the MVS image for memory shared between DB2 DDF and DBM1.

DB2 9 Prerequisites: See Program Directories

- Processor requirements:
 - Processor that supports z/Architecture, including IBM System z10, z9, zSeries z990, z890, z900, z800 or later
 - DB2 9 will generally require increased real storage for a workload compared to DB2 V8
- Base Software Requirements:
 - z/OS V1.7
 - DFSMS Version 1 Release 7
 - Language Environment Base Services
 - z/OS Version 1 Release 7 Security Server (RACF)
 - IRLM V2.2
 - z/OS Unicode Services & appropriate conversion definitions
 - DB2 Utilities Suite or equivalent function

36

These prerequisites apply whether you are migrating or installing. The best source for current information is the Program Directory. Be sure that the products are in support by checking on the web.

This is the first slide of several noting the primary prerequisites for DB2 9. The System z processors are required, with no changes from those needed by V8, although performance is better with the later processors. These are the base needs for DB2 9. The following slides note the optional and functional requirements.

IRLM V2.2 comes with DB2 9. Some of the basic operation of a DBMS is provided by utility functions, such as backup, recovery, reorganization, loading and unloading data, gathering statistics and checking data, indexes and large objects. You should ensure that these functions are provided either by ordering DB2 Utilities Suite for z/OS, Version 9, (5655-N97), or by obtaining equivalent function elsewhere.

DB2 9 Prerequisites: Current software

- Migrate only from DB2 V8 NFM, expand BSDS
- DB2 9 for Linux, UNIX, Windows FP1 or V8.1 FP13 (V8.2 FP6 is the same as V8.1 FP13)
- DB2 9 Connect FP1 or V8.1 FP13
- IMS V10, V9, V8
- CICS V4, V3, V2.3
- Enterprise COBOL V3.4 Move to V4 recommended
- Enterprise PL/I V3.4 Move to V3.8 recommended
- IBM Tivoli OMEGAMON XE for DB2 Performance Expert on z/OS, V4 or Performance Monitor, PK36297

37

These are the primary changes in levels for DB2 9 over those in DB2 V8. Current products are required, and some of the product levels needed by DB2 V8 are now out of service. The general rule is to stay within the service interval for all products if you want service.

The DB2 for luw and DB2 Connect levels need fixpaks to function correctly. Fixpak 2 has just delivered, and some customers will need those fixes.

If you are not on current levels of COBOL, move to V3.4, as all others are out of service as of April 2007. If you are not on current levels of PL/I, move to V3.6, as all levels before V3.4 go out of service this year or earlier.

The Omegamon level needed is V4, with APAR PK36297 to support new function. The older V3, DB2 PM and DB2 PE products do not support DB2 9.

DB2 9 Prerequisites: z/OS 1.8 for:

- RACF Access Control Module and roles
- RACF user-mapping plug-in Enterprise Identity
 Mapping
- Coprocessor with C or C++
- Volume-based BACKUP, RESTORE SYSTEM
 & RECOVER enhancements

- RACF SAF User-mapping plug-in Enterprise Identity Mapping (EIM) requires z/OS V1.8 with trusted context. See redbook SG24-6480-01 appendix C for more detail on EIM.
- For full RACF support of roles (not limited to ownership checks for roles only), RACF Access Control Module (DSNXRXAC) requires z/OS V1.8.
- The C and C++ compilers which come with z/OS 1.8 are required to use the DB2 coprocessor, instead of the precompiler for application development.
- See the next page for volume-based BACKUP and RESTORE.

DB2 9 Requirements for Dependent Functions

- Volume based utilities require:
 - z/OS 1.8
 - DFSMShsm 1.8
 - DFSMSdss 1.8
 - FlashCopy Version 2
- Group Buffer Pool Batching:
 - CF level 15 or 14 recommended when using System Managed Duplexing for lock or SCA structures
 - CFLEVEL 15 structure sizes grow
 - CF level 13 recommended for castout and lock table cleanup enhancements
 - CF level 12 for improved V8 and 9 performance GBP batching

39

These are

highlights only, not

a complete list!

See Program

Directories.

z/OS V1.8, DFSMShsm, DFSMSdss and FlashCopy V2 is required for DB2 9 function in System level Utilities: BACKUP SYSTEM, RESTORE SYSTEM, and RECOVER. z/OS V1.7, DFSMShsm, DFSMSdss and FlashCopy V2 is needed for System level utilities: BACKUP SYSTEM and RESTORE SYSTEM (if you cannot currently satisfy one or more of the preceding program requirements you can use V8 DB2 functions in the BACKUP SYSTEM and RESTORE SYSTEM utilities.

z/OS V1.7, DFSMSdss (and FlashCopy V2 is highly recommended, although not technically required, for performance reasons) for Utilities: CHECK INDEX, CHECK DATA, and CHECK LOB.

Use the latest Coupling Facility (CF) level for the best performance.

CFLEVEL 15 is the current level and is needed for some of the z/OS 1.9 improvements, but it does cause growth in structure sizes. See WSC FLASH01572 for more.

CF level 14 is recommended when using System Managed Duplexing for lock or SCA structures. Coupling Facility (CF) level 13 is recommended for castout enhancement and lock table clean up enhancement. Coupling Facility (CF) level 12 is required for Group Buffer Pool (GBP) Batching.

DB2 9 Functional Software Requirements

- WebSphere Application Server for z/OS V6.1 for trusted context
- WebSphere MQ for z/OS V6.1
- z/OS XML System Services (z/OS XML) & SDK5
- Java SDK 1.4.2
- DB2 QMF components of DB2 9 for z/OS
- ... details in Program Directories on the web

If you use WebSphere Application Server for z/OS, trusted contexts require V6.1.

IBM WebSphere MQ V5.3.1 or later is required for MQListener.

XML System Services (XMLSS). XMLSS requires either z/OS V1.8 or z/OS Version V1.7 with APAR OA16303. In addition, use of XML schemas requires 31-bit SDK for z/OS, Java 2 Technology Edition, Version 5 (5655-N98) (SDK5)

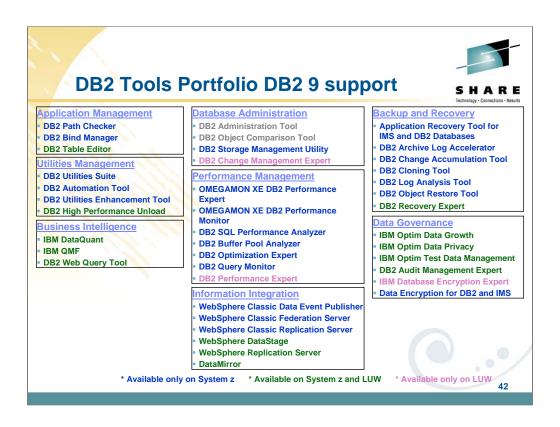

IBM SDK for z/OS, Java 2 Technology Edition, Version 1.4 (SDK1.4.2) is required for Application Execution: Applications or stored procedures written in Java, such as those using the JDBC or SQLJ interfaces to DB2.

Here are just a few of the DB2 partners that have announced that they are ready to run with DB2 9 for z/OS. These are images of the web pages from IBI, BMC, CA, ESRI, Compuware, CDB, Software Engineering, SoftBase, DataMirror and Relational Architects. Talk to your vendors about DB2 9.

Of course, if your tool vendor is IBM, you can check on the web for the precise release and PTF levels of the Information Management Tools releases and service needed to work with DB2 9 for z/OS. Note that the matrix lists some levels of tools with an X in the NS or not supported column. See the later version, with an X under T for toleration or under E for exploit or the ability to use those new improvements.

http://www.ibm.com/support/docview.wss?rs=434&uid=swg21256800

IBM offers a broad portfolio of DB2 Tools for z/OS across numerous functional categories. We continue to fulfill our commitment to provide new tools and enhanced function to meet your requirements. new Tools-- DB2 Recovery Expert for z/OS and DB2 Cloning Tool for z/OS.. We enhanced DB2 SQL Performance Analyzer to include Easy Explain functionality and to integrate with the OMEGAMON XE DB2 performance tools that were announced in 2005 along another new tool, DB2 Thread Expert. In addition we continue to provide new releases for tools to increase the value they bring to your DB2 environment. We also continue to grow our portfolio of multiplatform tools that support DB2 in the Linux UNIX and Windows environments. All DB2 Tools exploit Version 8. IBM tools make the same commitment to support DB2 9. See slides 82 and 83 for the tools web site for the release levels and APARs needed for DB2 9.

Old COBOL?

- ✓ Understand the options DB2 CICS V3
 - Compiler and Run-Time Migration Guide
 - No compiles OS/VS COBOL or VS COBOL II CICS V3 also
 - Run Old COBOL modules
- ✓ Set strategy & plan for Enterprise COBOL V4
 - → Use V8 precompiler?, NEWFUN(NO)?
- ✓ Plan staging and Migrate

43

DB2 9 supports current Enterprise COBOL V3.4 and V4. Older compilers are no longer supported. OS/VS COBOL has been out of support since 1994. VS COBOL II support ended in 2001. Only LE runtime is supported. End of support for Enterprise COBOL V3.2 was October 2005, V3.3 was April 2007 so your target should be V4.

http://www.ibm.com/servers/eserver/zseries/zos/le/history/cobmvs.html

The key resource is the COBOL Migration Guide, GC27-1409. Here is where to get it from the web:

http://www.ibm.com/software/awdtools/cobol/zos/library/

http://publibfp.boulder.ibm.com/epubs/pdf/igy3mg40.pdf

Key questions and guidance are in the first chapter. Most customers will stage migration. Do you have Enterprise COBOL V4 or V3.4 now? Is that the release developers use? Old load modules are not a problem. Precompiling is the challenge, so if new development and changes to old programs switch to the new compiler, then that is a possible migration strategy.

DB2 generates COBOL code that we expect to fail on the old compilers, although we have not tested. Programs that use the DB2 9 precompiler or coprocessor require current Enterprise COBOL V3.4 or V4.

http://www.ibm.com/support/docview.wss?rs=64&uid=swg21166881

Old PL/I?

- ✓ Understand the options
 - Compiler and Run-Time Migration Guide
 - Run Old PL/I modules
- ✓ Set strategy & plan for Enterprise PL/I V3.7
 - ✓ Support requires at least V3.4 now
 - → Use V8 precompiler?, NEWFUN(NO)?
- ✓ Plan staging and Migrate

DB2 for z/OS supports only current PL/I compilers. Every compiler prior to V3.4 is out of service in 2007, including OS PL/I V2.3, IBM PL/I for MVS™ & VM V1R1.1, V2, and V3R1 to R3.

http://www.ibm.com/servers/eserver/zseries/zos/le/history/plimvs.html The Program Directory lists compilers you can use for **PL/I**:

The key resource is the Enterprise PL/I for z/OS Compiler and Run-Time Migration Guide *Version 3 Release 3*, GC27-1458-02. Get it from the web:

http://www.ibm.com/software/awdtools/pli/plimvs/support/http://publibfp.boulder.ibm.com/epubs/pdf/ibm3m101.pdf

There are some basic choices to make. Key questions and guidance are in the first chapter. Most customers will stage migration to new compilers to improve programmer productivity and avoid migration costs. Do you have Enterprise PL/I V3.2 or V3.3 now? Is that the release developers use? Old load modules are not a problem. Precompiling is the challenge, so if new development and changes to old programs switch to the new compiler, this migration strategy improves costs and productivity.

http://www.ibm.com/support/docview.wss?rs=64&uid=swg21191789

DFSort and DB2 for z/OS Utilities Suite

- >V8 removed prerequisite for external sort product
- >V8 only uses DFSort: SORT, MERGE functions only
- Sort 32K page & improve reliability & performance
- >DFSort is part of standard z/OS install
- ➤ DB2 for z/OS Utilities Suite has license to use DFSort when invoked by Utilities
- ➤ Must have access to DFSort R14 plus APAR PQ68263 applied. See Info APARs II14047, II14213 & II13495
- ➤DB2 9 requires APAR PQ92594
- >z/OS 1.10 DFSORT PARMLIB changes requires PK59399
- >Must update DB2 space statistics for sort space

45

The requirement for an external sort package was removed. You do not need a DFSORT license for use by DB2 for z/OS Utilities Suite V8. The base DB2 for z/OS has never used a sort product. If you use DFSORT for other purposes, then you do need a DFSORT license. You must update the DB2 space statistics to accurately reflect the data volumes in order for DFSORT to accurately allocate space. This support was delivered by APAR PQ68263 (PTF UQ90054) on RSU 0312. With APAR PK04076 (UK03983), MSGDSNU1640I will be issued when the utility is unable to locate DFSORT code at APAR PQ68263 maintenance level. So DFSORT is mandatory and you have to use it for the utilities. However, there is good news. You already have DFSORT installed. You may not be using it, but it is there. DFSORT is always shipped and installed with z/OS. However, no license is required for the DB2 utilities to use DFSORT. The only action a customer must take is to add the DFSORT load libraries to link list after the OEM sort libraries or add a steplib/joblib to the DB2 utilities batch JCL. DB2 for z/OS Version 8 has a license to use DFSORT so the customer does not need a license for any external sort product. However, no non-DB2 task can use DFSORT without being licensed. Use of DFSORT other than by DB2 would require a license. Maintenance for DFSORT is shipped with z/OS. If a customer has problems with DB2's use of DFSORT, they open an ETR with DB2 Level 2 support, just as they do today for any other DB2 related issue. The DB2 V8 requirement for DFSORT R14 or above is described in the following places: URL for informational APAR II14047 describing DB2 use of DFSORT

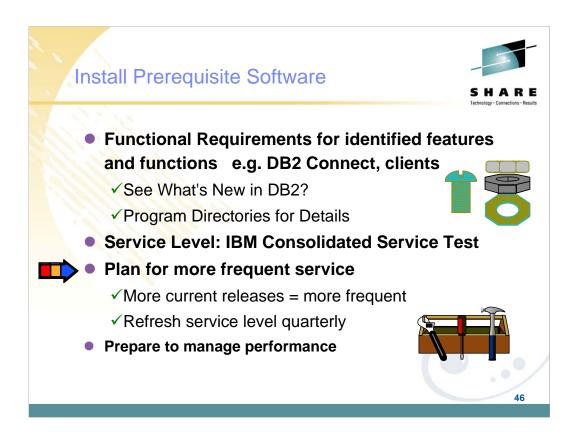

DB2 Installation Guide (All manuals can be found at

http://www.ibm.com/support/docview.wss?rs=64&uid=swg27011656

DB2 for z/OS Version 8: Everything You Wanted to Know... and More (SG24-6079)

(Download from IBM RedBook web site) DB2 v8 Program Directory

http://www.elink.ibmlink.ibm.com/public/applications/publications/cgibin/pbi.cgi?CTY=US&FNC=SRX&PBL=GI10-8566-03#

IBM and other vendor software must be checked for levels required and needed for the function you want. Some APARs require vendor changes. DB2 Connect: See next page and the web.

ibm.com/software/data/db2/db2connect/

Use IBM Consolidated Service Test levels to help provide a well tested set of products at a recommended service level.

ibm.com/servers/eserver/zseries/zos/servicetst/

Customers who are relatively current on service encounter fewer problems overall. Refreshing the service level each quarter makes it easier to avoid encountering old problems.

The recommended level for DB2 Connect is as current as possible to improve availability, resolve problems and deliver the changes needed in Java, stored procedure and web services environments.

DB2 Connect V8.1 FP13 is the same as V8.2 FP6. If you are moving to DB2 9 for z/OS, then the minimum level is DB2 Connect 9 FP1 or DB2 V8 FP13. If you are not at the minimum levels, then it's time to migrate to the most current level you can. If you have the license, that would be DB2 9 fixpak 4 today. Otherwise that would be DB2 8 fixpak 16, also known as DB2 8.2 fixpak 9 at times. If you get current now, then migration to DB2 9 for z/OS will not encounter the same problem. So if a client is down level, then get it migrated to current.

If you have a specific set of problems, then you can check the fixpak levels to see where those problems are resolved. But then you still need to test to make sure that the problem is resolved without introducing any new ones. Later fixpaks generally resolve a lot more problems. If you are migrating, find a good one and move to that level. Running with code that is out of support or missing a few thousand fixes is problematical. DB2 Connect V7 is not supported, and generally does not work. We don't generally separate CM from NFM on our discussions of fixpaks. Some new function comes in CM. See the web for fixpak information.

SOAP UDFs. 4 new SOAP UDFs to allow for a) optional SOAP parms for std security hdr for passing auth info, b) support for HTTPS, c) detailed error messages when UDF is not successful. Long-running readers threshold parameter default. IFCID 313.

Ship "v7 COBOL precompiler" with v8. Allow easier migration to v8, allow usage of old COBOL or PL/I compilers

Add new MQ UDFs to support traditional Request/Reply scenarios

MQListener will support logical message grouping (available with MQ v6.0). This is a customer requirement that will allow MQ messages to be processed in a logical order and will prevent application issues arising from processing messages in a undefined order

allow ALTER SET DATA TYPE to increase a varchar length in CM

SORTNUM elimination. Difficult to determine SORTNUM (number of sort data sets), V8 migration consideration for some customers who were using non IBM sort. Enabled by 2 Zparms:

UTSORTAL to enable predictable sort space allocation, IGNSORTN to ignore SORTNUM A limit was placed on LOAD/REORG to process a max of 254 parts on a compressed table space. This limit was put in place to prevent very large amounts of real storage consumption which can cause an LPAR wide outage. A new ZPARM is being added to raise this limit. By default DB2 will

enforce the 254 part limit but customers with sufficient real can exploit the new zparm Add support for BATCHPIPES SUBSYS to TEMPLATE U

Allow RESTART(LIGHT) to not wait for INDOUBT UR

IDENTITYOVERRIDE keyword to LOAD utility. LOAD utility does not allow data unloaded from a table with identity columns with GENERATED ALWAYS to be reloaded and preserve the original identity column values. Additionally, a LOAD REPLACE with an empty input data set (used as a fast way to empty a table space) against a table space that has identity columns defined with GENERATED ALWAYS requires each table and column to be specified which is error-prone.

OSC Fixpack 4 is available on the web, providing support for DB2 V8.

http://www.ibm.com/software/data/db2/zos/downloads/osc.html

OE V1.2 was announced on March 4, GA on March 14th. OE V1.2 Fixpack 1 provides coexistance mode and fixes. http://www.ibm.com/software/data/db2imstools/db2tools/opti-expert-zos/

DB2 9 Post GA Deliveries APAR PKxxxxx PK52522, PK52523 BIND package stability changes BIND change to convert plans with DBRMs to packages PK62876 BIND private protocol help PK64045 Text search server Accessories Suite 1.2 New XML function & performance (next pages) II14426 PK41001, z/OS 1.8 APAR OA17314 Incremental FlashCopy Trusted context enhancements PK44617, PK47579 New storage class Zparm for online CHECK utilities PK41711 (Needed when PPRC is used) ALTER TABLE ALTER COLUMN DROP DEFAULT PK56392 Allow RESTORE SYSTEM without log truncation PK51979 Spatial phase II PK51020, PK54451, ... LOAD COPYDICTIONARY PK63324, PK63325

PK62027

49

DB2 9 has been generally available for about two years now, and some new function has delivered in the service stream. Delivery in APARs is used when the need is urgent and the function can be delivered with a very small risk of disruption to existing customers. The delivery criteria become stronger as more customers move to the version. A text search server delivered in Accessories Suite 1.2 at the end of 2007. XML performance improvements and new XMLTABLE and XMLCAST functions are very important for early XML applications and consistency. Incremental FlashCopy makes use of the new z/OS capability. Trusted context enhancements are needed by early users. A new storage class parameter is needed when PPRC is used and is provided for online CHECK utilities.

Protocol(3) without data sharing group quiesce

ALTER TABLE ALTER COLUMN DROP DEFAULT extends the capability to ALTER a default. DB2 allows RESTORE SYSTEM recovery without requiring log truncation. Many new spatial functions deliver compatibility with the DB2 for LUW function. Changes come in DB2 to work with new fixpacks of OSC, OE and Data Studio. BIND stability changes deliver the capability to keep two or three versions of packages and the ability to switch from the current access paths to the older ones. This function can help you with regression from a REBIND.

Plans containing DBRMs, rather than using packages, are deprecated. That is to say we expect plans containing DBRMs to disappear some time in the future. To help with migration from DBRMs to packages, a change to BIND is shipped which can perform the conversion to packages.

The capability to copy a dictionary from one partition to another using the LOAD utility as added. APAR PK62027 avoids the need to quiesce the data sharing group to get the new LOB lock avoidance.

49

DB2 9 Pos	GA Deliveries APAR PKxxxxx
• PK62161	add rows to accounting & statistics
• PK75643	parameter OPTIOWGT default to enable
• PK62178	default 10,000 maximum implicit DB
• PK70060	work file allocation
• PK70269	USS pipes for LOAD
• PK78958 PK7	3959 RRF & compressed table spaces
• PK80925	-ACCESS command wildcards
 PK79228 PK7 	9327 parameter group attach like V8
 PK72214 	install stop change data capture
• PK49348	REOPT(AUTO) change

DB2 9 has been generally available for about two years now, and some new function has delivered in the service stream. Delivery in APARs is used when the need is urgent and the function can be delivered with a very small risk of disruption to existing customers. The delivery criteria become stronger as more customers move to the version.

Rather than creating 60,000 databases implicitly, changes in PK62178 allow default to 10,000 and allow you to set the number.

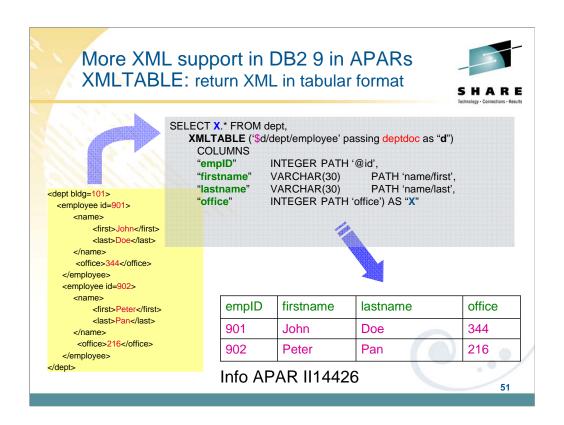

If you want to pipe information to the LOAD utility, look at PK70269.

PK72214 changes install to stop changed data capture for catalog tables as needed, asking you to restart them after switching to DB2 9 and ENFM.

Changes are in process for the combination of compressed table spaces and RRF. Some customers with many short varchars, e.g. varchar(1) found that compression was not effective with RRF, so the default is changed to not convert to RRF.

-ACCESS only worked for specific names, but it's being changed to allow wild cards and ranges.

OPTIOWGT was generally recommended, and becomes the default with PK75643. If you have multiple members of a data sharing group in a single LPAR and prefer the V8 group attach logic, parameters are added to control the random group logic.

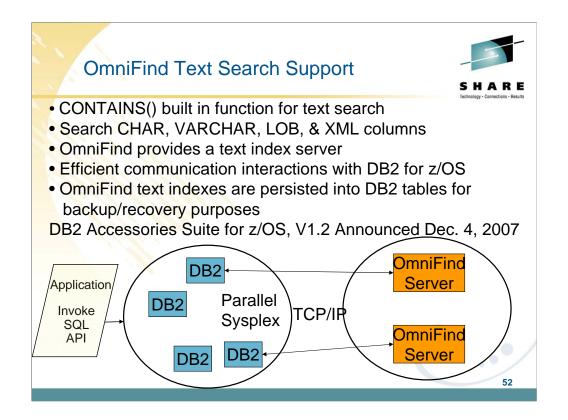

XML is having strong acceptance among early customers, but we are seeing many needed changes. We are expecting to see several come in DB2 9 as APARs. Check marks indicate that PTFs are delivered.

- ✓ PK57786 XML query performance XMLAGG
- ✓ PK55585 XPath function, phase 1
- ✓ PK55831 XPath function, phase 2
- ✓ PK51573 XMLTABLE, XMLCAST
- ✓ PK56337 XPATH performance
- PK57409 XMLTABLE enhancement

The ability to return data from XML in the form of a table is one. The ability to cast explicitly is another. Some additional XPath functions are a third.

✓ PK58914 XMLTABLE performance enhancement

Some customers and vendors are using XML extensively and we want you to be aware of the recent and upcoming changes. See Information APAR II14426 to check for updates and many more.

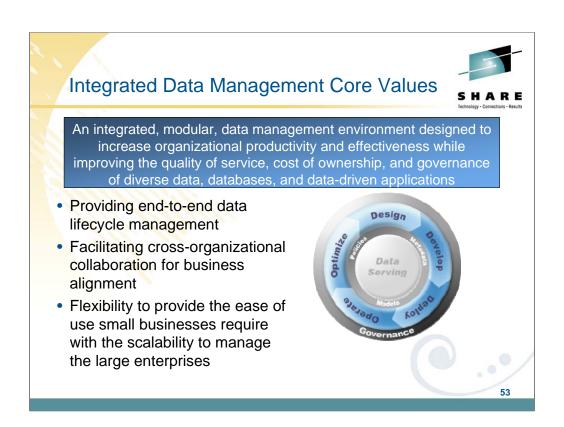

We have added a new built-in function, CONTAINS() to allow better text searching. This is the basic architecture of our solution. A specialized text search engine on a separate server is expected to come in DB2 9, but will deliver after general availability. While the server is separate, the text indexes are saved into DB2 tables to provide improved backup and recovery and consistency with DB2 data.

See Peggy Zagelow's IOD session 1696 for the details.

For the announcement, see DB2 Accessories Suite for z/OS, V1.2, part of Announcement 207-319, dated December 4, 2007.

http://www.ibm.com/common/ssi/rep_ca/9/897/ENUS207-319/ENUS207319.PDF

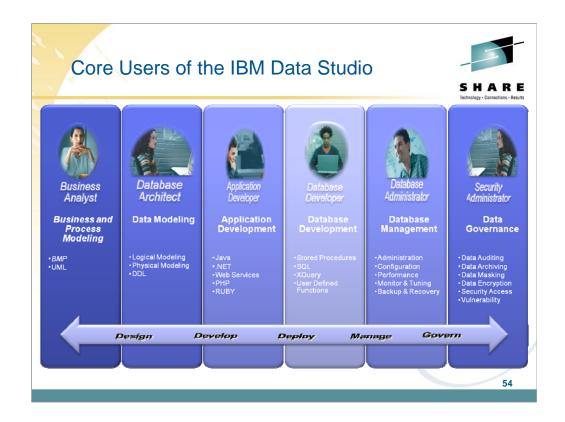

IBM Data Studio is for designers, developers, and administrators who work across the entire data life cycle and across the full set of IBM relational DBMS: DB2 for LUW, DB2 for z/OS, DB2 for i and IDS. Almost every customer needs the tools included with DB2, and many need the additional ones...

DB2 is changing to deliver the needed interfaces, usually new stored procedures.

See the IBM Data Studio web page for all the changes in IBM Data Studio. Watch closely, as this area is changing fast.

http://ibm.com/software/data/studio

Choosing service timing requires judgement, not simple rules. The best practice for service means an understanding of your business drivers and constraints. These scales are not the same. Timing for moving preventive service into production is a careful balance between potential problems caused by PTFs containing an error (PEs) & potential problems avoided by applying the maintenance sooner. About 70% of PEs are found within four months after the PTF is closed. Currently, about 6 PEs are found every month across all versions. Green bars reflect the percentage of PEs yet to be found. Systems programming work load & availability of windows for installing service can affect timing.

I recommend upgrading service levels two or three times a year. Use current CST recommended service level, all service plus a two to four month later level for hipers & PE fixes. Stage that level through development systems & production. Match your levels with CST, across operating system & key subsystems. Enhanced HoldData provides a much faster way to discover missing hipers and PEs without fixes.

http://www.ibm.com/servers/eserver/zseries/zos/servicetst/mission.html http://service.boulder.ibm.com/390holddata/390holddata.html

Consolidated Service Test provides a way to leverage more IBM testing and experience from many customers across a much broader set of products, including z/OS, IMS, CICS, DB2, WebSphere and many tools. This technique is working for very large, very small and in between customers. If you don't have an extensive test suite - like most customers, then this technique can help a lot in reducing research and finding a stable service level.

Effective June 15, 2007, the DB2 for z/OS Version 8 SUP tape is available worldwide for new customer orders. This SUP tape was built differently than prior SUPs, such that its build in May integrated PTFs COR-closed through December 2006, which had also completed a Consolidated Service Test (CST) cycle. Once PTFs complete a CST cycle, they are assigned a Recommended Service Upgrade (RSU) status. Our DB2 for z/OS Version 8 SUP tape contains CST tested PTFs which were marked "RSU 0703" (they completed CST testing in March 2007). This SUP build integrated a total of 964 PTFs (the delta since our December 2005 SUP), which is nearly 1,000 fewer PTFs our new customers need to deal with during their DB2 V8 installation experience. For additional information on CST and RSU, please see: http://www.ibm.com/servers/eserver/zseries/zos/servicetst/mission.html Installing two or three CST levels a year means more current service, but not too current. If you want a process that has proven track record for success and can reduce your work, then look at the CST. Use current CST recommended service level: all service plus a two to four month later level for hipers & PE fixes. Stage that level through development systems & production. Match your levels with CST, across operating system & key subsystems. Enhanced HoldData provides a much faster way to discover missing hipers and PEs without fixes.

Premigration Activity ... Manage Performance

Prepare to manage performance

- Save accounting reports
- Save critical access paths
 - ► Be sure you have PLAN_TABLE access paths & DSN_STATEMNT_TABLE & DSN_FUNCTION_TABLE for critical applications (or Visual Explain reports).
 - ► Run EXPLAIN on queries before migrating.
 - ► Add new columns to PLAN TABLE
- Differentiate by plans & packages

58

Save critical access paths & accounting data! Changes can cause unwanted access path changes. Identify important queries, plans & packages. Be sure plan tables contain access paths & costs. ALTER current plan tables to add new columns. EXPLAIN REBIND may change access paths, so extract plans & run EXPLAIN under a dummy collection, a different application or program name.

Keep accounting reports for crucial queries & applications. If you have a problem & send in long accounting reports & explain data, we find the issue quickly. If you don't have data, then we guess.

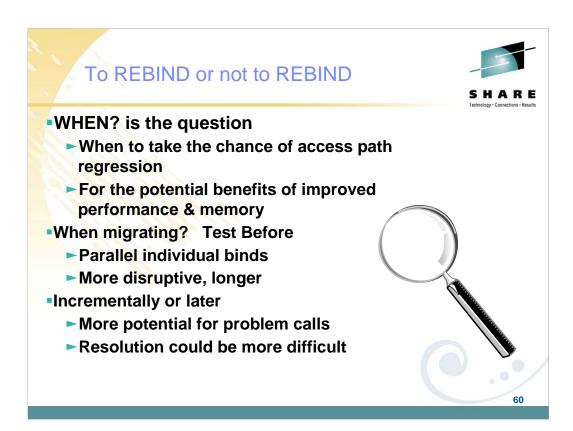

Monitoring & managing are more difficult with few plans. Never ending threads & plan reuse accumulate EDMPOOL & working storage. Each COMMIT needs package accounting. Recycle threads. Finding unused packages & cleaning up mistakes are difficult unless ownership is known. Performance monitoring may require analyzing everything in a CICS region instead of just one plan. Plan is a required short name. Package name is optional, long, multipart and not always easy to find. Best practice is to differentiate by plan within a CICS region, having at least 5 to 20 plans within a region. You can work faster & make changes on a more granular basis.

Practice Three Rs of DB2 REORG Real time statistics Performance, space RUNSTATS After significant change REBIND Recheck Explain and run time performance MODIFY, COPY

This practice starts with the basics, but performing the three Rs effectively can avoid a wide range of problems. In other cases, they are the steps needed to resolve a problem. These steps are needed to keep clustering effective, maintain free space, avoid index splits, keep sequential prefetch performance high, ... Using real time statistics to drive the process is being used more and more.

After the REORG is completed or during the process, gather the updated statistics. Balance the cost of gathering the information with the improved information for optimization. Improved statistics can mean improved access paths – ones that were not available before.

Using the improved information means using dynamic SQL or rebinding. After the rebind, checking the explains and the run time performance for regression can avoid problems. Do you want to rebind only in NFM or do you rebind some packages in CM too. How long will you be in CM? The longer the period, the more you will want or need to rebind in CM.

To rebind or not to rebind, "When?" is the question: Whether 'tis nobler in the mind to suffer the slings and arrows of outrageous access paths, Or to take arms against a sea of troubles, And by rebinding, end them? To die: to sleep; No more; and by a sleep to say we end the heart-ache and the thousand natural shocks that old plans are heir to. 'tis a consummation devoutly to be wished To die, to sleep. To sleep: perchance to dream: ay, there's the rub; For in that sleep of death what dreams may come when plans have shuffled off this mortal coil, must give us pause: There's the respect that makes calamity of so long life for old plans and packages; [Apologies to the Bard and to Hamlet 3.1.]

The question is not whether to REBIND, but rather when to REBIND. Planned rebinds avoid surprises. A fix may need to rebind everything. Performance gains in a new version often occur at REBIND. When you rebind, performance is

- 1. Same: Most common case is plus or minus 5%, which is usually ignored
- 2. Worse: Least common, but usual regression causes are new access path or increased parallelism. If you compare to the prior access plan, then you can find most problems easily. If you wait until a BIND occurs, analysis is more difficult; you are less likely to have all of the performance & plan data. Use a tool or compare access paths to find problems.
- 3. Better: Many of the V8 performance improvements only occur if you bind. Some SQL is likely to benefit from optimization improvements, such as index use, joins, subquery transformations or UNION improvements. When you find a problem errors or performance the fix is often to REBIND. Best practice for migration is to test binds before migration & bind at migration time (comparing before and after). Use a tool for comparison and the task is simpler, but simple comparisons of cost estimates catch many problems.

http://www.ibm.com/support/docview.wss?rs=64&&uid=swg21078662

Plan to REBIND packages

Old plans and packages have more to gain, less to lose BIND changes coming for Bind stability, to eliminate private protocol and DBRMs bound into plans

CM - how long? Very little new value

- Most optimizations included
- Rebind key packages at least

New function mode

- Adjust database design, applications
 - ► Improved index options: compression, larger page sizes, on expression, New SQL
 - ► Native SQL procedures, more zIIP
 - Rebind after changes
- Rebind all plans and packages once CM or NFM (may stage)

61

Best practice for migration is to test binds before migration & bind at migration time (comparing before and after). Use a tool for comparison and the task is simpler, but simple comparisons of access path differences catch most problems. There are a number of good tools on the market. For the best chance of improvements with the lowest risk of regression, rebind the oldest plans and packages. If there was a problem that resulted in a plan or package error, then the only way to resolve the issue is to rebind (or free and bind). Use a dummy collection for the test bind and save the old package to revert back if needed. Since most of the improvements in optimization are already functional in CM, most customers bind the key packages and plans during conversion mode. If CM is a very short period, or you do not need the improvements, then you might wait for new function mode to rebind. If you stay in CM for a long time, then you will want to rebind more of the packages and plans.

In new function mode, all of the optimization improvements can be made. Often you will want to look at performance challenges for your customer and see how they can be resolved. such as compression, index on expression and larger pages. After making the design changes, REORG the data and REORG or REBUILD the indexes, get the improved statistics and REBIND. Native SQL procedures, added use of zIIP, and improved SQL continue the improvements in this phase.

http://www.ibm.com/support/docview.wss?rs=64&uid=swg21078662

Optimization

Addressing

SQL – static or dynamic - performance regression for new BIND or REBIND Who? Administrators, performance Impacts: CPU, elapsed time, productivity Substantial impact when access path is bad

Solution

Aspects of success:
Large reduction in regression
If regression occurs, easy switch to old
access paths
Reduce, almost eliminate effort

Less fear of BIND, REBIND Allow optimizations to be more aggressive, automation, parallelism,

Save CPU, IO, elapsed time

Easier migrations to new versions, ...

62

Unexpected changes in access paths lead to performance regressions

Regressions typically seen during migration to a new release

Also seen during the lifetime of a release after

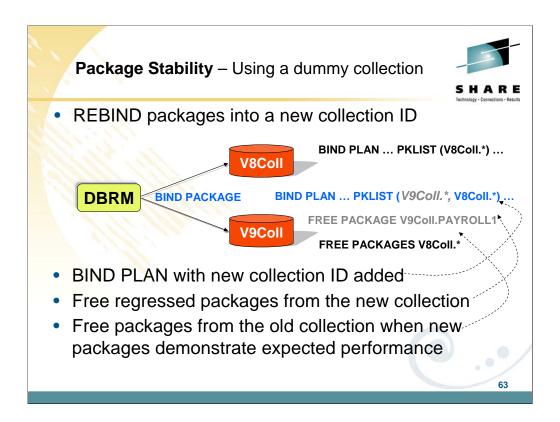

maintenance fixes are applied

changes in data and/or schema: growth, need for REORG, getting current statistics, ...

changes in the applications require REBIND or BIND REPLACE

Both Static and Dynamic SQL affected

Static SQL regressions seen after BINDs and REBINDs Dynamic SQL even more exposed

This part is a technique that can be used today with a dummy collection used to REBIND packages for comparisons.

Package or Bind Stability APAR PK52523

PLANMGMT(BASIC | EXTENDED)

- BASIC retains 2 copies: Current and Previous
- EXTENDED retains 3 copies: Current, Previous, Original
- PLANMGMT new subsystem parameter
 - Can provide default for command options
- Fallback to an older access path REBIND PACKAGE (HRCOLL.SALPKG) SWITCH(PREVIOUS | ORIGINAL)
 - Conceptually, this can do a "ROLLBACK" of a prior REBIND

64

SHARE

These APARs (PK52522 for preconditioning and PK52523) support the following function:

1. A new REBIND PACKAGE option called PLANMGMT that can be used to control whether REBIND PACKAGE saves old package copies. This option has three possible settings - OFF, BASIC and EXTENDED.

PLANMGMT(OFF) - No change to existing behavior. A package continues to have one active copy PLANMGMT(BASIC) - A package has one active copy, and one additional old copy (PREVIOUS) is preserved.

PLANMGMT(EXTENDED) - A package has one active copy, and two additional old copies (PREVIOUS and ORIGINAL) are preserved.

Preserving old copies has no impact on query performance. However, using the PLANMGMT(BASIC) option can double the disk consumption in table space SPT01, and using the PLANMGMT(EXTENDED) option can triple it. The extra space is needed to maintain old copies. In addition, using the BASIC or EXTENDED option adds a 10-40% CPU overhead to the performance of the REBIND PACKAGE command.

- 2. A new system parameter called PLANMGMT for specifying the default setting of PLANMGMT option of REBIND PACKAGE. Possible settings are: OFF, BASIC and EXTENDED. The default value of this parameter is OFF. To use a setting other than OFF, update your DB2 9 subsystem parameter (DSNZPxxx) modules, then either use the SET SYSPARM command or stop and start DB2 for the change to take effect.
- 3. A new REBIND PACKAGE option called SWITCH to allow users to revert a package to an older copy, effectively undoing a prior REBIND invocation.

SWITCH(PREVIOUS) - The PREVIOUS copy is activated

SWITCH(ORIGINAL) - The ORIGINAL copy is activated

4. A new FREE PACKAGE option called PLANMGMTSCOPE to allow users to free older copies that are no longer necessary.

PLANMGMTSCOPE(ALL) - Free the entire package including all copies. This is the default.

PLANMGMTSCOPE(INACTIVE) - Free all old copies

Package or BIND Stability PK52523

- At REBIND, save old copies of packages
 - Catalog tables
 - Directory (SPT01 table space)
- Two flavors
 - BASIC and EXTENDED
 - REBIND options
 - Default new DSNZPARM
- REBIND PACKAGE ...
 - PLANMGMT (BASIC) 2 copies: Current & Previous
 - PLANMGMT (EXTENDED)
 3: Current, Previous, & Original
- Most bind options can be changed at REBIND.

- REBIND PACKAGE ...
 - SWITCH(PREVIOUS)
 Switch between current & previous
 - SWITCH(ORIGINAL)
 Switch between current & original

Switch between current & ongi

- FREE PACKAGE ...
 - SCOPE(ALL) Free package completely
 - SCOPE(INACTIVE) Free old copies
- Each copy invalidated separately
- Cost of stability
 - 2-3 X size in SPT01
 - 30% CPU overhead for REBIND
 - No impact on statement runtime processing, fast switch

65

- PK52523 has the main function. PK52522 is the pre-conditioning APAR. Both of these have PTFs now. The DB2 books and the online Information Center document this functionality so customers can already read about it online.
- 2. The old copies are primarily saved in the SPT01 table space and it will grow in size. For BASIC, the overhead is 2x. For extended, it is 3x.
- 3. We have a few solutions to mitigate this disk space increase:
 - (a) Users could use FREE PACKAGE ... PLANMGMTSCOPE to selectively free old copies of packages that they think are stable
 - (b) In DB2 X, we expect to implement an 'access path comparison' function that will not save an old copy if it's the same as the new copy.

Convert plans with DBRMs to packages

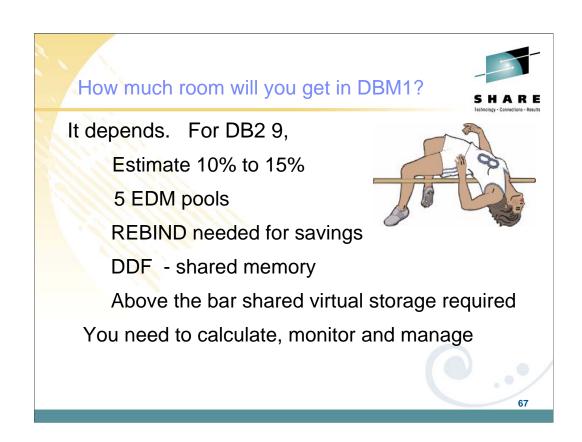

- Convert from DBRMs in PLAN to packages
- Specify the collection id for the packages
- ■REBIND plan option: COLLID
- Default collection idDSN_DEFAULT_COLLID_planname
- Able to specify plan name, list of plans, *
- APAR PK62876 ptf UK43291 DB2 9
- ■See new book on packages SG24-7688 chapter 4

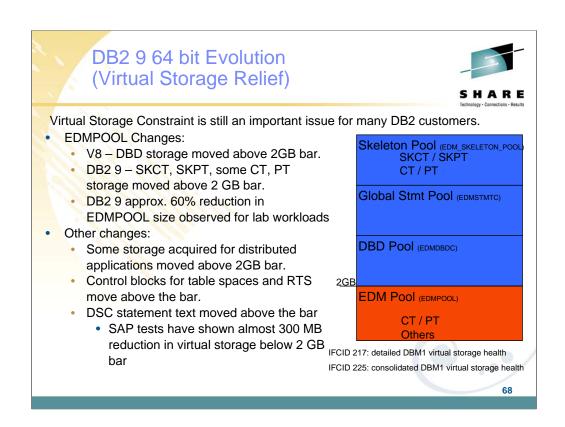

PK62876 BIND changes for eliminating acquire(allocate), plans with DBRMs

- •New Rebind plan option: COLLID(collection_id|*): Trigger DBRM to Package conversion by specifying collection ID for the packages, which are converted from DBRMs.
- •REBIND PLAN(X) COLLID(*). "*" is the default value as: DSN_DEFAULT_COLLID_X (X is the plan name) This command will allow customer to convert DBRMs bound with plan X into packages under collection ID: DSN_DEFAULT_COLLID_X automatically.
- REBIND PLAN(x) COLLID(collection_id): CollID option is used if user intends to convert DBRMs bound with plan x into packages. As shown in this example: users can specify collection id as y for the new packages converted from DBRMs. If there are both DBRMs and package list in plan x, newly converted package entries will be inserted into the front of the existing packagelist. Same behavior applies to *, but using DSN_DEFAULT_COLLID_X instead of letting user specify.
- REBIND PLAN (X1, X2, X3) COLLID (collection_id|*) Rebind multiple plans which may contain DBRMs. Bind all Plans specified here in SYSPLAN table, and do conversion, until no plans specified here have DBRMs bound within.
- REBIND PLAN (*) COLLID (collection_id|*) All plans in SYSIBM.SYSPLAN table.
- REBIND PLAN (x) COLLID (collection_id|*) PKLIST(Z) In this case: If plan has been bound with both DBRMs and package list, the DBRMs will be converted into packages, and the new entries will be inserted into the front of the existing package list.
- REBIND PLAN (x) COLLID (collection_id|*) NOPKLIST. Three cases :
- •1. Plan x does not have DBRMs, then the existing pklist will be deleted. No other change required.
- •2. Plan x only has DBRMs, DBRMs will be converted into packages accordingly, and NOPKLIST will be ignored.
- •3. Plan x has both DBRMs and PKLIST, the existing pklist will be deleted, while the new pklist converted from the DBRMS will be bound into plan x.

You still need to do the calculations, monitor and manage storage. DB2 9 improvements are generally about 10% to 15% more storage moved out from below the bar, with two more parts of the EDMPOOL, some of dynamic statement cache, and use of 64 bit storage for the DDF address space, with some above-the-bar storage shared with the DBM1 address space. You need to configure the 128 GB virtual shared area above the 2 GB bar. EDM virtual storage savings only occur if you rebind packages. Note that plans containing DBRMs are deprecated. Watch for some improvements in migration techniques for plans containing DBRMs.

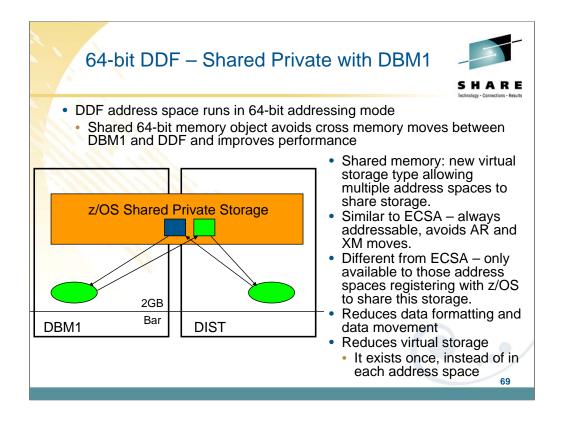

Objective was 10-15% relief. EDMPOOL – you can estimate DB2 9 EDM pool size from V8 stats as follows: (#pgs for SKCT/SKPT)*0 + (#pgs PT/CT)*70%. Rough ROT is V8 EDM pool size can be reduced by 60%. Extensive use of SQL SPs can drive up EDM pool usage since these pkgs are larger. General recommendation, keep this the same in DB2 9. EDM_SKELETON_POOL – added in DB2 9.

For SAP SD transaction with 360 user threads, the total DBM1 virtual storage below 2GB was 1091MB in V8 and 819MB in DB2 9 for almost 300MB reduction. Most of that comes from local dynamic statement cache storage going down from 466MB to 172MB. Net of 1% real storage increase overall. For TPCE for example, 532 pages below 2GB were used for PT in V8. In DB2 9, 763 pages are used below 2GB and 316 pages are used above 2GB. So there is an increase in below 2GB virtual storage usage for PT in DB2 9. 1268 pages used for SKPT in V8 are all moved above 2GB in DB2 9 with a total of 1329 pages. EDM pool pages used below 2GB therefore dropped from 532+1268 to 763, or 58%.

EDM LRU latch contention relief (LC24). Previously one LRU chain in EDM pool with only one corresponding latch. Now split into three pools each with 3 latches: 1) SKCT/SKPT above 2GB 2) CT/PT above 2GB 3) CT/PT below 2GB

DBM1, the following are moved above the bar in DB2 9

- •Parse trees peak below-the-bar storage for full prepare reduced 10%
- •EDM fixed pools: V8 customer dumps show as much as 50m will be moved. Allows larger above the bar EDM pools
- •SKPTs / SKCTs (primarily static SQL). Also part of the CTs/PTs; New EDM pool for skeletons; Savings in below the bar 10m to 300m
- •Page set blocks, RTS blocks: up to 10's of MB savings
- •Local SQL statement cache: rough ROT: about 60% moves above bar
- •Thread-related storage: Certain Run Time Structures, space block DMTR 10's of MB or more in savings
- •Average V8 customer may see another 200 MB of relief: RID Pool, Sort Pool, compression dictionaries, castout buffers and others already above the bar (V8).

Skeletons above the bar: For customers that use heavy package and plan activity such as banks, this is the most significant DBM1 below the bar storage relief in DB2 9. For customers that use very few or small packages, such as SAP environments, the savings is smaller.

LI702 – move spaceblk (SPA) above the bar. SPA to be split into 2, 1 above, 1 below. Only a few, non-complex RTs are being considered for DB2 9. Simple insert, delete Expected results will vary by SQL mix. (-5 to 30%)?

Has storage key & fetch protection

Defaults to 2TB size

DB2 requires a minimum of 128GB configured or DB2 9 will not run

Even if not running DIST Set by HVSHARE in Parmlib

Migration - data sharing group

- V8 and 9 CM members in group for short time (coexistence)
- MUST apply fallback SPE to all members first
- First member migrated must be successful before migrating other members
 - •Run CATMAINT only for the first member
- ► Use Data Sharing book for migration
- Migrate all members before using new function
- Restrict execution of packages & plans bound on new version to migrated members
- Group quiesce in DB2 9 NFM for locking protocol 3 (LOBs)
- ► CFLEVEL 16, 15, 14, 13, 12 for best performance

70

Remember to work with new DB2 9 function only on a group that has migrated to 9 NFM. Therefore, it is best to migrate all of your members and test with existing applications before implementing any new features or functions.

If you have multiple releases in a group for more than a week, then you need to have much better controls in place and be able to test your processes more thoroughly.

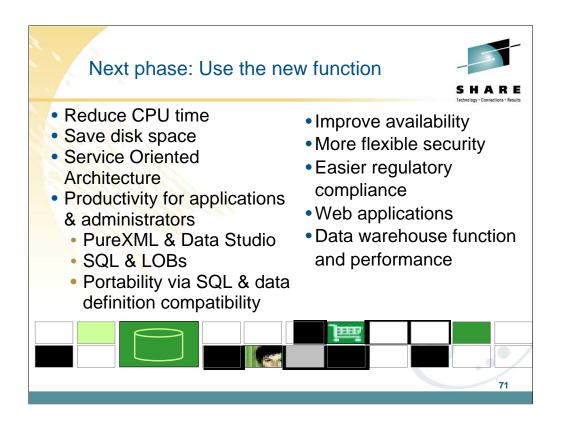

Persistent structure size changes, group attach improvements, restart light and enhanced constraint management are more complex if multiple releases are involved.

The minimum CFLEVEL is to have a level that is in service. Most data sharing customers will want to be at CFLEVEL 15, 14, 13 or 12. There is quite a bit of information about CFLEVEL on the web:

http://www.ibm.com/servers/eserver/zseries/pso/cftable.html

The need for a group quiesce is removed in APAR PQ62027.

Get the detailed steps from the Installation Guide & Data Sharing: Planning & Administration.

This is the largest and most important phase of migration. You will spend more time in this phase than in all of the others combined. This is the phase where you deliver the largest improvements to your customers.

What are your most strategic and most pressing needs in the areas of business, applications and administration? That question and the efforts needed should determine the schedule and order for using the new function. Some of the simpler changes for performance are noted on slide 9.

Customer Experiences

- Customer experiences say pay attention to:
 - Read the web, books, Info APARs, PSP
 - Have a plan that includes performance
 - Run premigration job DSNTIJPM
 - -Use V8 DSNTIJP9 job
 - On every subsystem
 - Current maintenance for DB2, z/OS & CF
 - Get the latest books: library, red books, ...

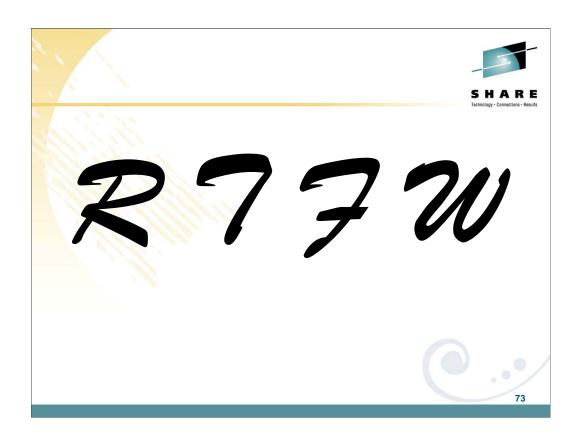

Most of these were mentioned before. They are mentioned again because other customers missed them. Many customer problems dealt with items on the foil titled Premigration Action. Run the premigration job. Check CATMAINT messages.

Programmers must add colons for all host variables. Make sure DBAs understand the new authorizations and meaning of schema names. Check for release dependent objects on fallback or coexistence.

Having current service & books saves time & avoids problems.

Check other early customer experiences here.

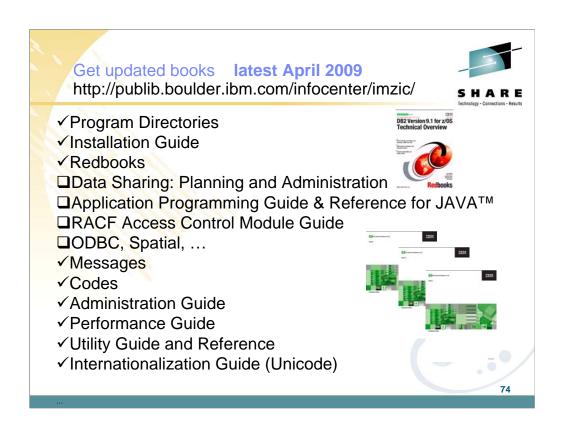

ftp://ftp.software.ibm.com/software/data/db2/zos/presentations/migration/
ftp://ftp.software.ibm.com/software/data/db2/zos/presentations/customer-experience/

RTFW is the acronym for Read the Friendly Web. Let's take a short walk on the wild, wild web. The problem with the web is not too little information, but rather too much information. The experience is a bit like trying to take a drink from a fire hose. So I'd like to help a bit by narrowing the search with the twenty five cent tour of a few of my favorite DB2 web sites. A lot more information has been added in the past month or two, with many new books and web pages.

Let's start with the DB2 family. I'll generally show the short form or alias of the URL, omitting http://

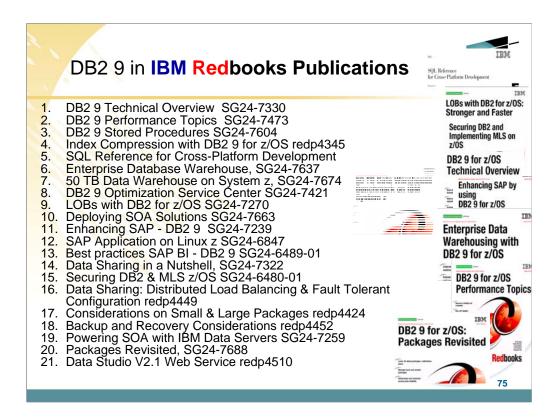

Here are some tips for avoiding the 404. You don't need www in front of ibm.com in most situations. There is often something after www, such as the -306 in www-306 when you get the URL back from the browser. Remove the hyphen and number when you save the URL, since that number changes more quickly than the rest of the URL.

For installation, you need many books. Some are optional, for example the data sharing book is not needed if you don't use data sharing. If you use data sharing, then part of the install process is in that book. Part of the Java install process is in the Java book. Part of the ODBC install process is in the ODBC book. If you use RACF access control, then you need the RACF Access Control Module Guide. You can get most of the books from the DB2 Library web page. The books were updated in December 2007 and February, March, June, and August 2008, with some coming later, so get the latest ones. Some of the Redbooks may be helpful. You may need books from the z/OS Library as well.

http://www.ibm.com/support/docview.wss?rs=64&uid=swg27011656 http://www.ibm.com/support/docview.wss?rs=64&uid=swg27011658 http://www.ibm.com/systems/z/os/zos/bkserv/r9pdf/

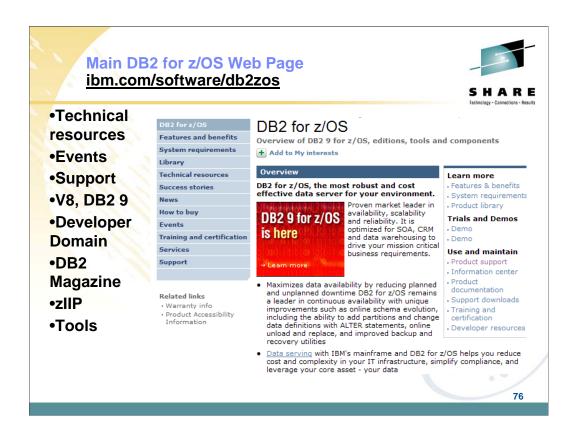

Be sure to use the latest information to save time and problems. Some of the IBM Redbooks publications have always been updated and added lately (next page).

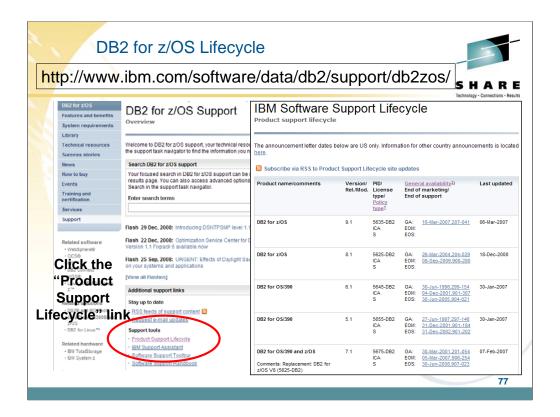

DB2 library more information http://www.ibm.com/software/data/db2/zos/library.html

Many IBM Redbooks publications, Redpapers and one cross-platform book on DB2 9 are published, in addition to the standard library, with more in the works. Check for updates.

This is the main DB2 for z/OS web page. You can get to the other DB2 for z/OS pages from here, so I often call this my home page. This page changes frequently, so look at the highlighted NEW items. Do you want to look in a DB2 book? Click on Library to see books on DB2 and QMF Version 8 (about 40), Version 7, 6 or even 5. V6 and V5 are out of service. You can check the latest changes by looking at the Information Updates or go to the Information Center. From this page, you can look for conferences (Events), specific classes (Education), or services. If you want to see the latest on DB2 9 or DB2 Version 8, click on the DB2 9 or the V8 link. If your primary concern is application development, the Developer Domain is for you. DB2 Magazine covers a broad range of topics about DB2. The latest machines System z9, z990 and z890 are on the System z page. Click DB2 and IMS Tools to see the wide range of help we provide.

Customers can track product availability on their own from this site. Start on the main DB2 for z/OS support web page, then click on the Product Support Lifecycle.

See this page for all the changes in IBM Data Studio. Watch closely, as this area is changing fast. IBM Data Studio is an Integrated Data Management Environment. Learn how IBM Data Studio can increase productivity and reduce development cost throughout the data lifecycle.

IBM Data Studio is an Integrated Data Management Environment. Learn how IBM Data Studio can increase productivity and reduce development cost throughout the data lifecycle.

IBM Data Studio Developer: An Integrated Development Environment for creating and testing database and pureQuery applications.

IBM Data Studio pureQuery Runtime: A high-performance Java data access platform -- improves security and manageability of Java application connections to databases.

http://www.ibm.com/software/data/studio/

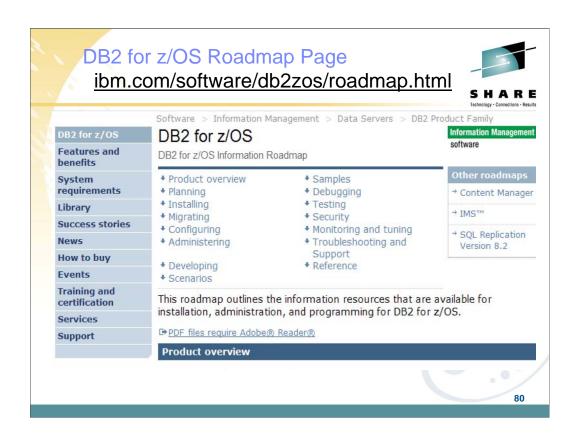

See zIIP information on the web. This web site has the most current information, & pointers to more resources. The zIIP is for customers who are concerned about costs for growth. One big cost reduction is hardware cost, which is much less than a standard processor. The biggest cost reductions are in software, as IBM does not charge for software running on the specialty processors. The zIIP fits some customers very well, but will not apply for all. As a specialty processor, not all work can use the zIIP, which will only process work running under an enclave SRB. Most applications cannot run in SRB mode. The specifics of the software charging need to be considered. Customers must be current on hardware (System z9), current on software (z/OS 1.6 or later, DB2 V8 or later) and have a work load peak using the types of work eligible for zIIP:

Remote SQL processing of DRDA network-connected applications over TCP/IP: These DRDA applications include ERP (e.g. SAP or PeopleSoft), CRM (Siebel), and business intelligence running on other platforms. Remote SQL is expected to provide the primary benefits to customers, as it is commonly part of the peak load. Stored procedures and UDFs run under TCBs, so they are not generally eligible for zIIP, except for the call, commit and result set processing. DB2 9 remote native SQL Procedure Language is eligible for zIIP.

Parallel queries: If the work comes in remotely over DRDA using TCP/IP, then the initial work is eligible as remote work. After the initial time, the parallel processing threads are eligible and can process on the zIIP.

DB2 utility index processing: Functions of the LOAD, REORG and REBUILD DB2 utilities that perform index maintenance are eligible for zIIP. This is not a common peak capacity constraint, but could be useful in reducing CPU charges.

The best way to estimate the eligible work is to apply the needed z/OS and DB2 service, to run your work load and to take measurements. Use DB2 accounting with any product which can provide DB2 accounting reports, such as Omegamon.

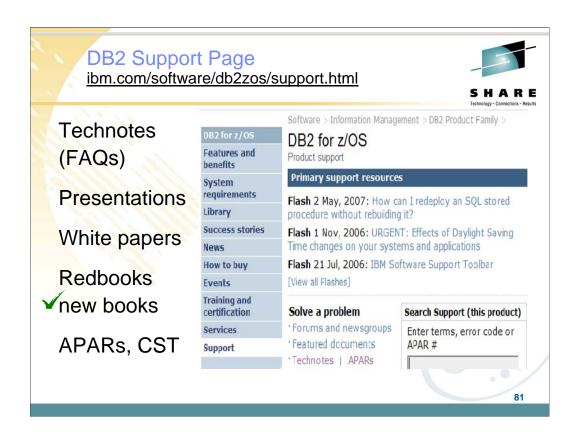

Don't you wish you could find all of the different kinds of information about DB2 for z/OS in one place? I think you'll be happy to learn about a new Web page called the DB2 for z/OS Information Roadmap. Information roadmaps are being developed by many IBM product teams in an effort to simplify the lives of users by providing a single place to find all sorts of useful information resources, such as: Product information from the official library IBM Redbooks Articles in a variety of different online publications, including the DB2 Magazine, presentations, support information like answers to frequently asked questions or technotes, web pages with high-level descriptions of different products that DB2 works with and more. We tried to provide a simple way to get to many of the best resources for various tasks. This will be a great resource to people just starting to use a DB2 capability that they haven't yet used.

The information roadmap is organized according to different tasks that you might perform, such as migrating, configuring, administering, and debugging. Although the information roadmap is available for Version 8, it is available to anyone with Web access, and many of the resources are relevant and useful to users who aren't yet on Version 8.

I encourage you to check out the new DB2 for z/OS Information Roadmap: http://www.ibm.com/software/data/db2/zos/roadmap.html

You can also start from the main DB2 for z/OS web page and click on the Information Roadmap news item or http://www.ibm.com/software/db2zos

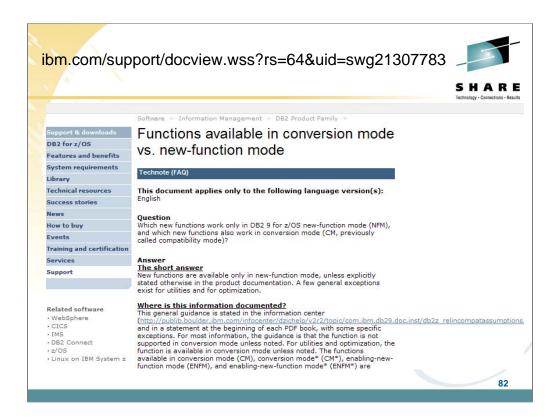

Do you need Answers to Frequently Asked Questions? Product Information? Technical Presentations? Redbooks? White Papers? Support for all of these is on this web page. Click Support on DB2 web pages. From this page, you access roughly 800 Technotes or answers to Frequently Asked Questions, technical presentations from recent conferences, a dozen white papers, and over 50 Redbooks. For more presentations, see the Events page. The Consolidated Service Test (CST) documents IBM recommended service level for a range of z/OS products.

To search for the presentation you want, put a word or two into the Additional search terms or Order by date – newest first.

There are new and updated redbooks on Powering SOA with IBM Data Servers, LOBs with DB2 for z/OS: Stronger and Faster, V8 Performance Topics, Data Sharing in a Nutshell, Data Integrity, Stored Procedures: Through the Call and Beyond, Design Guidelines for High Performance and Availability, Disaster Recovery, and Security Improvements.

ibm.com/software/db2zos/support.html

See this web page for more detail on what works in what mode.

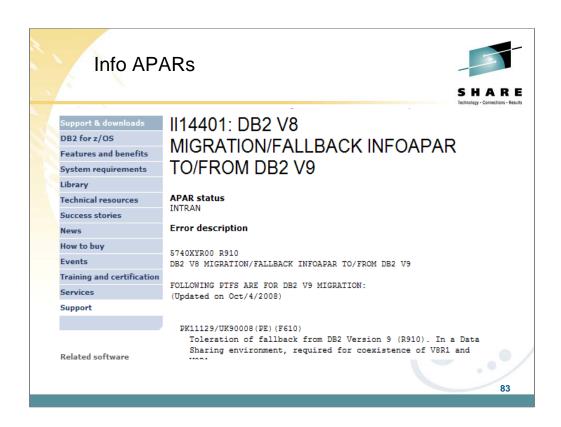

Question: Which new functions work only in DB2 9 for z/OS new-function mode (NFM), and which new functions also work in conversion mode (CM, previously called compatibility mode)?

Short answer: New functions are available only in new-function mode, unless explicitly stated otherwise in the product documentation. A few general exceptions exist for utilities and for optimization.

Where is this information documented?

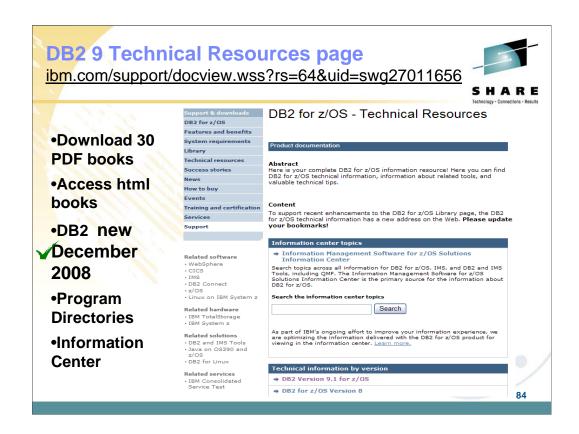

This general guidance is stated in the information center, and will be updated there.

http://www.ibm.com/support/docview.wss?rs=64&uid=swg27011656 http://publib.boulder.ibm.com/infocenter/imzic/

http://www.ibm.com/support/docview.wss?rs=64&context =SSEPEK&q1=ii14401&uid=isg1II14401

This informational APAR describes the needed service for successful migration from DB2 V8 to DB2 9.

This is the Technical Resources page for DB2. I clicked Technical Resources to get here. There are about 40 PDF books and about the same number of books in html or BookManager format. Choose the style you want. I generally download the PDF books to my computer. From this page you can get books on DB2 and QMF, including both the library and program directories. If you need to look for some tools that can be downloaded, such as Estimator or Visual Explain, click on Downloads. You can also get to the Information Center from here.

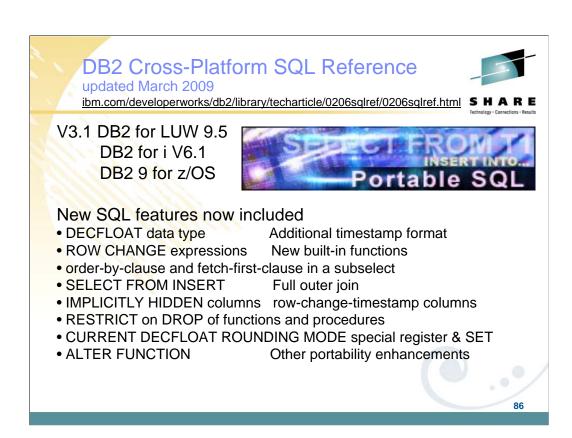

Watch this web page and see the dates next to each book for the latest updates.

http://www.ibm.com/support/docview.wss?rs=64&uid=swg27011656

DB2 Connect makes your company's host data directly available to your personal computer and LAN-based workstations. It connects desktop and palm-top applications to your company's mainframe and minicomputer host databases for access to your enterprise information no matter where it is. **DB2 Connect** provides the application enablement and robust, highly scalable communication infrastructure for connecting Web, Windows, UNIX, Linux and mobile applications to z/OS and AS/400 data. **DB2 Connect** is included in many of the DB2 products.

http://www.ibm.com/software/data/db2/db2connect/

This is the web page for the SQL Reference for Cross-Platform Development. It has four versions of the cross-platform SQL Reference and pointers to the base product SQL Reference books as well. If you want to write programs that work well across the DB2 family, then this is the book to download and use.

These books publish frequently, so you need to choose the one for the proper combination of DB2 platforms and versions. The latest book is Version 3.1 for platforms DB2 9 for z/OS, DB2 for I V6.1, and DB2 9.5 for Linux, UNIX and Windows. The addition of newer versions of the DB2 products means the following great SQL features are now included:

DECFLOAT data type
 Additional timestamp format

• ROW CHANGE expressions New built-in functions

• order-by-clause and fetch-first-clause in a subselect

• SELECT FROM INSERT Full outer join

• IMPLICITLY HIDDEN columns row-change-timestamp columns

RESTRICT on DROP of functions and procedures

• CURRENT DECFLOAT ROUNDING MODE special register & SET statement

ALTER FUNCTION Other portability enhancements

Other books are for DB2 for z/OS Version 7 and Version 8. http://www.ibm.com/developerworks/db2/library/techarticle/0206sqlref.html http://ftp.software.ibm.com/ps/products/db2/info/xplatsql/pdf/en_US/cpsqlrv31.pdf http://ttp.software.ibm.com/ps/products/db2/info/xplatsql/pdf/en_US/cpsqlrv3.pdf http://www.ibm.com/developerworks/data/library/techarticle/db2common/?S_TACT=105AGX11&S_CMP=LP

There are many excellent conferences coming up. Use the Events page to see which one you can attend: http://www.ibm.com/software/data/db2/zos/events.html

If you missed a conference or two, then check for recent presentations from previous conferences. More than 150 presentations are on the web, some with audio as well. 2008 conferences:

<u>conference</u> <u>dates</u> <u>location</u> <u>web location</u>

Share Aug 10 - 15 San Jose, CA www.share.org

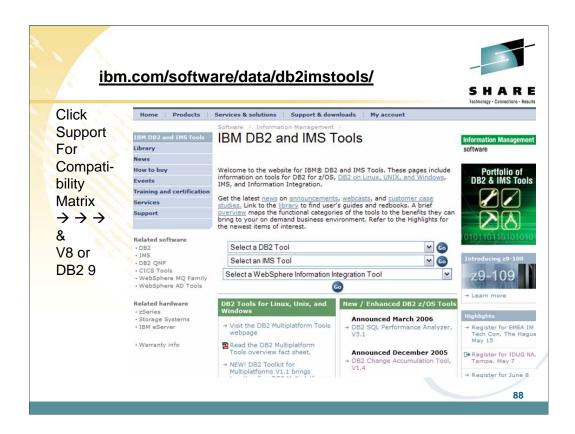

IDUG Europe Oct 13 - 17 Warsaw, Poland www.idug.org

IBM IOD NA Oct 26 – 31 Las Vegas, NV

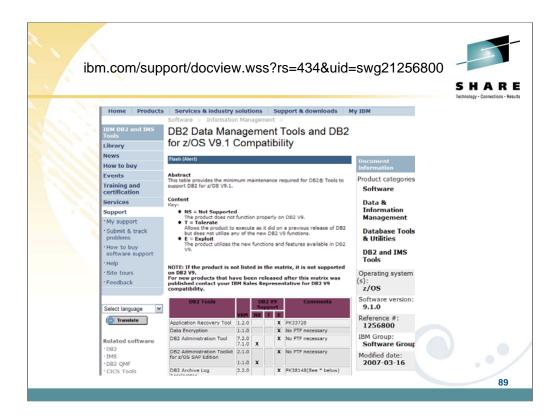

ibm.com/events/InformationOnDemand

IBM Technical Conferences

http://www.ibm.com/services/learning/ites.wss?pageType=page&c=a0001438

This is the primary web page for DB2 and IMS tools. If you want to know exactly which levels of each tool work with DB2 for z/OS Version 8 or with DB2 9 for z/OS, then go to the Support page for the tools. You may find the item directly on the Support page. Or click Technotes (FAQs) and search for items that include DB2 9 or V8 and PTF. Select the item DB2 Data Management Tools and DB2 for z/OS V8.1 or DB2 9 compatibility. This table provides the minimum maintenance required for DB2 Tools to support DB2 for z/OS V8. The Support page has a wide range of other detail about these products.

This is the resulting page today, looking for the Information Management Tools releases and service needed to work with DB2 9 for z/OS. Note that the matrix lists some levels of tools with an X in the NS or not supported column. See the later version, with an X under T for toleration or under E for exploit or the ability to use those new improvements.

There is extensive help for applications and porting to DB2 on the web, with suggestions for the process and many resources, including a migration toolkit. The dramatically improved DB2 family compatibility in DB2 for z/OS V7, V8 and DB2 9 makes porting to DB2 for z/OS from other platforms much easier.

http://www.ibm.com/developerworks/db2/products/db2zos/

http://www.ibm.com/developerworks/db2/zones/porting/

http://www.ibm.com/software/data/db2/migration/

DeveloperWorks has many discussions of techniques. Here is the URL for the main DeveloperWorks page:

http://www.ibm.com/developerworks/db2/

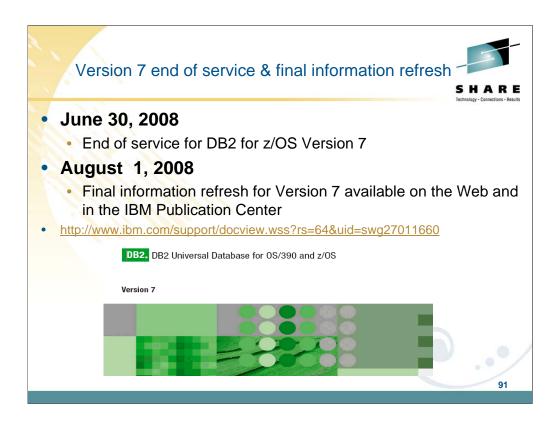

There is also a DeveloperWorks page on DB2 for z/OS.

http://www.ibm.com/developerworks/db2/products/db2zos/

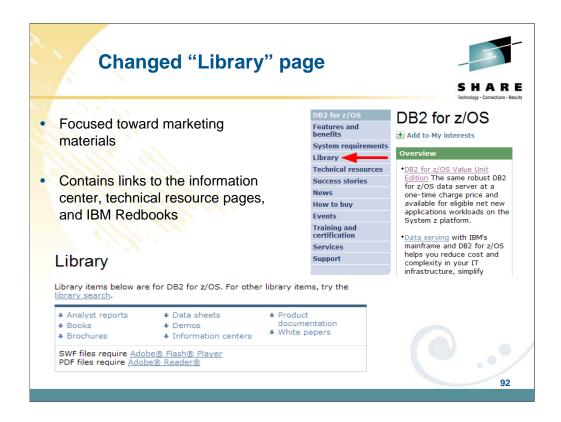

http://www.ibm.com/developerworks/db2/library/techarticle/dm-0807stolze2/

For migration information for specific databases, try

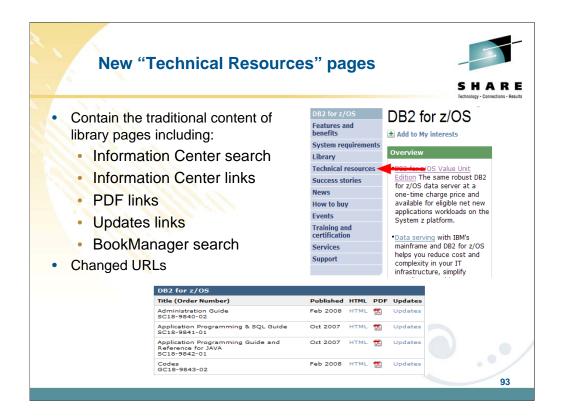

http://www.ibm.com/developerworks/ondemand/migrate/db.html

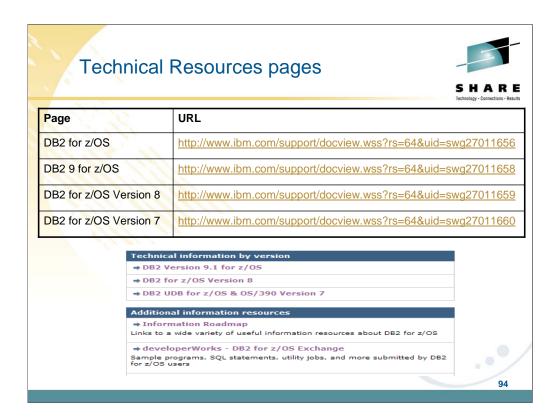

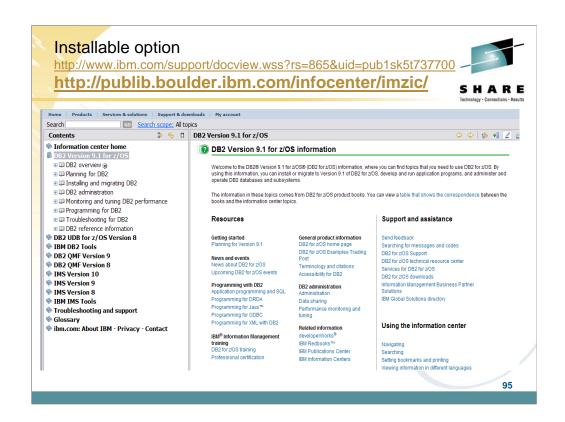

Incorporates updates for approved DCRs, verified defects, and comments received by db2zinfo up to the cutoff date.

Incorporates updates for approved DCRs, verified defects, and comments received by db2zinfo up to the cutoff date.

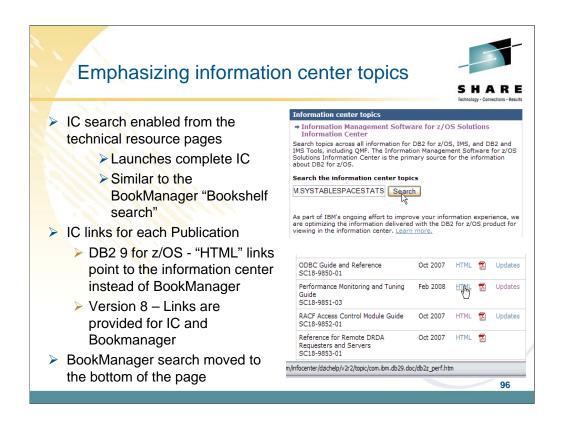

This is the Information Center, with a wide spectrum of information and access to books for DB2 for z/OS, DB2 tools, QMF, IMS, IMS tools and more. You can get to this page from the Library page, by clicking Information Center. The Information Center provides information across the books and across multiple products.

If you click "Troubleshooting and Support", then expand under "Searching knowledge base" and click "Web search:...", you'll find a helpful Web search page. From this page, you can search IBM support, DeveloperWorks, or even the whole Internet using Google.

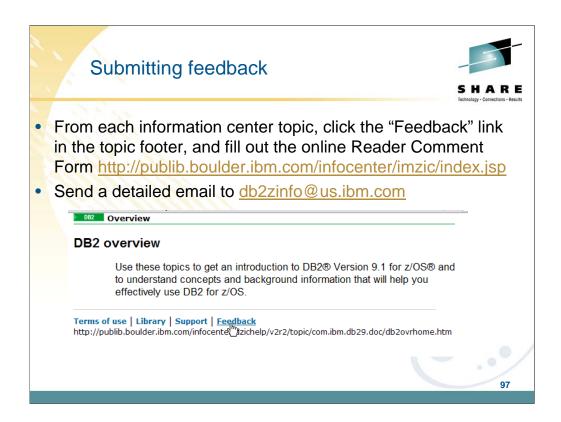

The latest change in this area is an installable Information Center, so that you can use the facility even when the internet is not accessible. http://www.ibm.com/support/docview.wss?rs=865&uid=pub1sk5t737700

There is a lot of new information on the web, and the information has been reorganized.

The easiest way to see the information is from the events page, then clicking on presentations from previous conferences. See the performance presentations, a course on DB2 9 with slides and audio (very big downloads).

Here are the topics for the items, and the suffix of URL

XML 156 SQL 157 scalability 151 data sharing 152

Partitioning and clones 150 availability 153 log detail 154

Security 155 reordered row format & no log 158

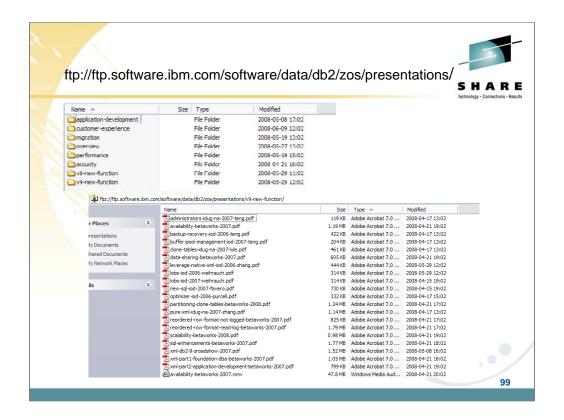

Migration suffix 181, also

ftp://ftp.software.ibm.com/software/data/db2/zos/presentations/migration

The ftp site (next slide) can also be used to access these

ftp://ftp.software.ibm.com/software/data/db2/zos/presentations/

//ftp.software.ibm.com/software/data/db2/zos/presentations/v9-new-function/reordered-row-format-read-log-betaworks-2007.pdf

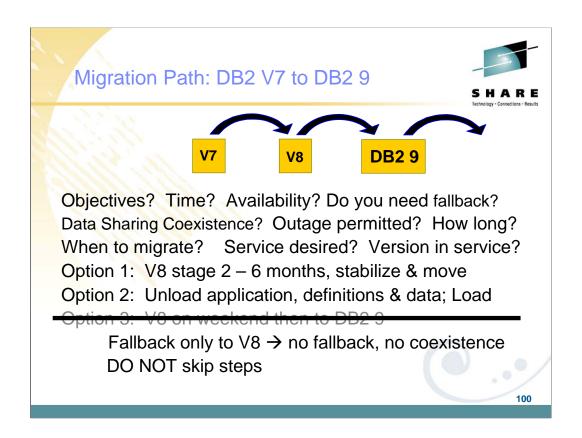

The ftp server has moved and has been reorganized. Now, if you use the url above, you'll see categories for new function in V8, new function in DB2 9, application development, customer experience, migration, performance, security and overview (none of the above).

If you move to one of the topics (DB2 9 new function in this example), you can check the individual presentations. Many have slides in pdfs and audio with the slides in .wmv files.

Here are slides from the 2008 road show:

http://www.ibm.com/support/docview.wss?rs=865&uid=swg27013016

Do you want to migrate from V7 to DB2 9? We have a number of questions to ask. V8 provided a massive reengineering of the DB2 structure, memory and catalog, so it is particularly difficult to skip. The first question is the objective in terms of time you expect to save, need for availability and safety. If you need data sharing coexistence, then V7 to DB2 9 is not an option. In essence, if you need fallback, V7 to DB2 9 is not an option, since the only fallback would be to V8. Fallback to a version you have not run might not be an improvement.

The next questions are timing and service. Do you want support? DB2 9 became generally available March 2007. When can you migrate to it? DB2 V7 went out of service June 2008. Migrating to DB2 V8 is faster, easier and smoother.

The best option, option 1 would be to move to V8, stabilize and adjust, move into NFM for a few months at least, and then migrate to DB2 9. If an application, the definitions and data can be unloaded and reloaded, then you can skip versions. You don't have subsystem coexistence or fallback. So option 2 takes more work and requires more testing, but the migration can be more granular, if your applications permit. An option that we cannot recommend is a fast jump from V7 to DB2 9. You do not have migration or coexistence. Our experience from other customer situations is that skipping migration steps can cause significant problems.

In short, the safest process, by far, is the one tested by years of work in the lab and thousands of customer experiences. You can choose your own path, but the shortcut can be the longest way. Your own path has much more risk. An unsupported path adds risk and can add a lot of cost.

All statements regarding IBM's future direction or intent are subject to change or withdrawal without notice, and represent goals and objectives only. This information may contain examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious and any similarity to the names and addresses used by an actual business enterprise is entirely coincidental.

IBM MAY HAVE PATENTS OR PENDING PATENT APPLICATIONS COVERING SUBJECT MATTER IN THIS DOCUMENT. THE FURNISHING OF THIS DOCUMENT DOES NOT IMPLY GIVING LICENSE TO THESE PATENTS.
