Agenda

- IMS Parallel Reorganization V3 Objectives
- IPR Driver V3 – How does it work?
- The Future of IPR Driver

IMS Parallel Reorganization V3 Objectives

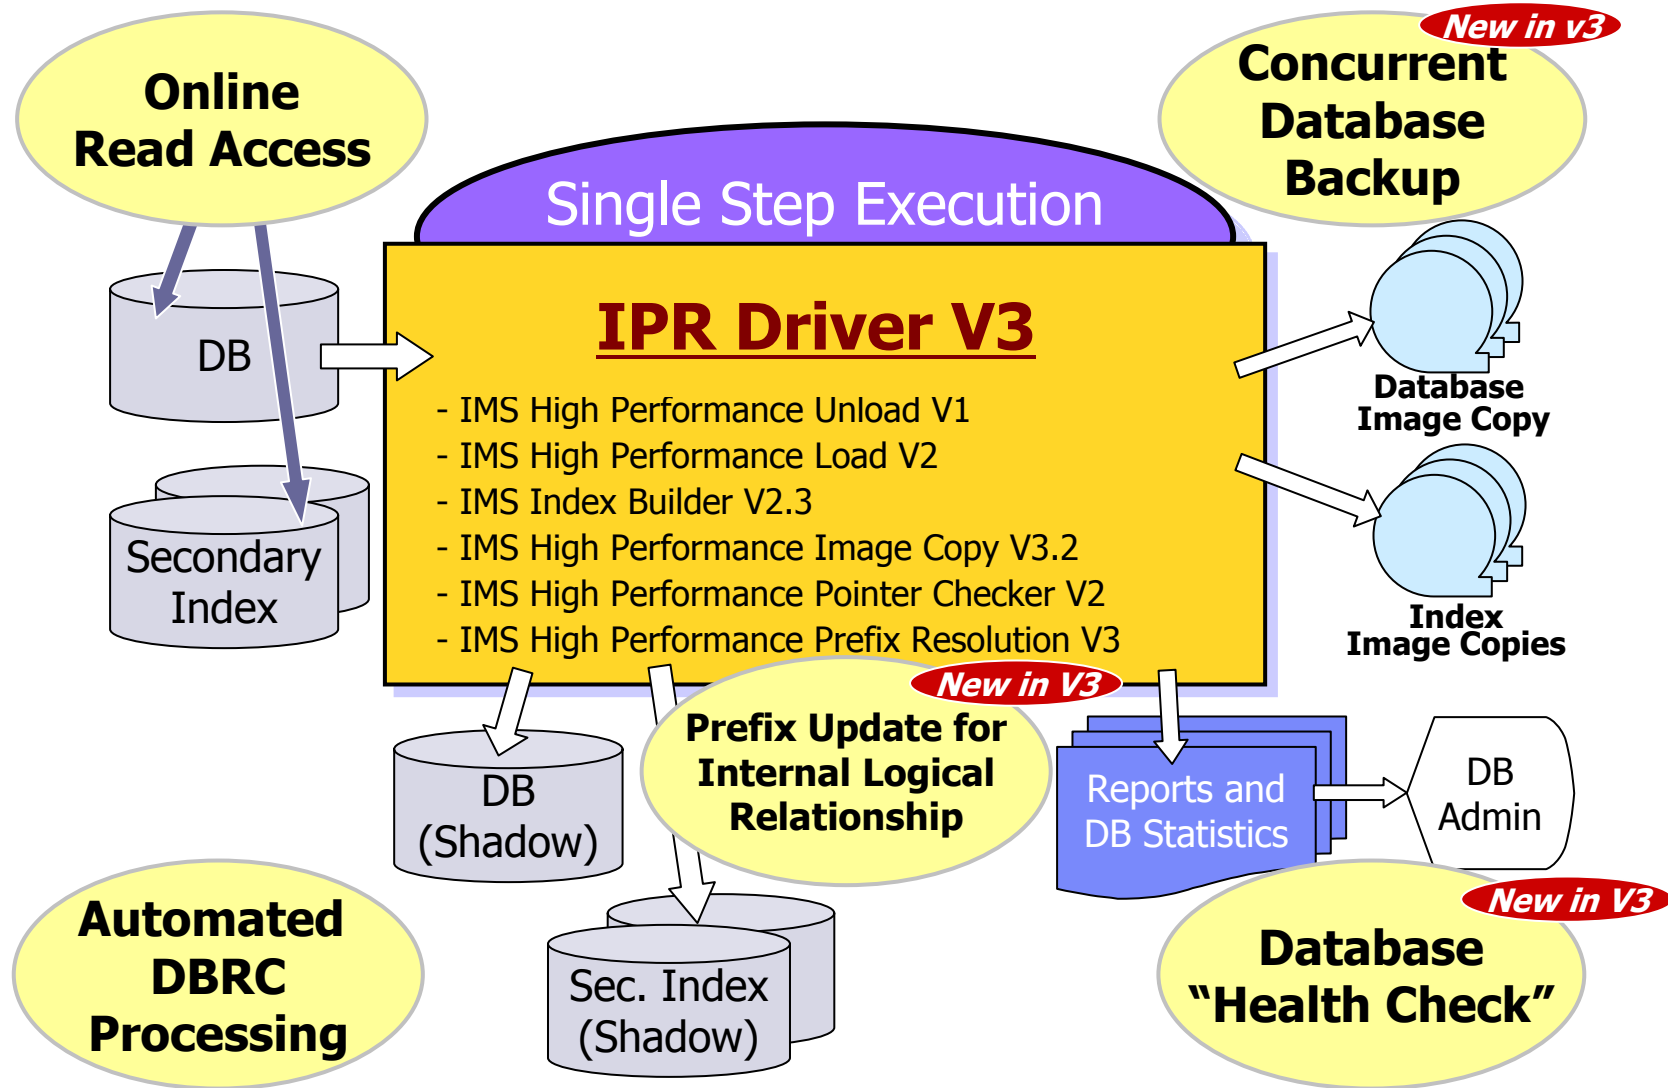

IMS Parallel Reorganization Driver (IPR Driver)

- Current IPR Driver (V3)
 - Drives multiple IBM IMS Tools in a single job step
 - Enables offline or read-only reorganization
 - Can reorganize a non-partitioned full-function database that has no external logical relationship
 - Can reorganize a HALDB partition, a sequence of partitions, and the entire HALDB
 - Can take image copy with optional pointer check during the reorganization

IMS Tools running under IPR Driver V3

- High Performance Database Tools
 - **IMS High Performance Unload V1** + PTF UQ93748 (required)
 - **IMS High Performance Load V2** (required)
 - **IMS Index Builder V2.3** + PTF UQ93283
(required if `INDEXBLD=YES` and the database has a secondary index)
 - **IMS High Performance Prefix Resolution V3**
(required if `PREFIXRES=YES` and the database has an internal logical relationship)
 - **IMS High Performance Image Copy V3.2** (required if `IC=YES`)
 - **IMS High Performance Pointer Checker V2** + PTF UQ93559
(required if `IC=YES` and `HASH` pointer checking is needed)
- Other database management tools
 - **IMS Library Integrity Utilities V1**
(required if `DECODEDBD=YES` or `DECODESXD=YES`)

IPR Driver V3 – Big Picture

IPR: IMS Parallel Reorganization

IPR Driver V3 Functions

- **Stopping the database or making it read-only before reorg**
 - IMS /DBR or /DBD DATABASE command is issued by IPR Driver
- **Reorganizing database data sets into "shadow" data sets**
 - Unload, Reload, and Index-Builder tasks run concurrently
 - Image copies can be taken during reorg, with optional HASH pointer check
 - **Type-A Image Copy**
- New** ■ **Updating segment prefixes after the database reload**
 - For the database that has internal logical relationship
 - **Concurrent Prefix Update**
- New** ■ **Taking image copies with optional HASH check after the prefix update**
 - **Type-B Image Copy**
- **Stopping the database at the completion of READ-ONLY reorg**
 - IMS /DBR DATABASE command is issued by IPR Driver
- **Performing post-reorganization process**
 - Original and "shadow" data sets names are swapped
 - DBRC is notified of the reorg completion and the image copy

IPR Driver Objectives

- IPR Driver development objectives are:
 - To run multiple reorganization tasks concurrently in a single job step
 - To make JCL statements simpler for easier coding and modification
 - To reduce the CPU time and elapsed time required to reorganize a database

We believe that these objectives have been almost attained in V3.

Then...

- What are still needed?
- What will be the future of IPR Driver?
- Before discussing these topics, let's look at how the IPR Driver V3 works

IPR Driver V3

How does it work?

JCL Statements for Type-A Image Copy (a sample)

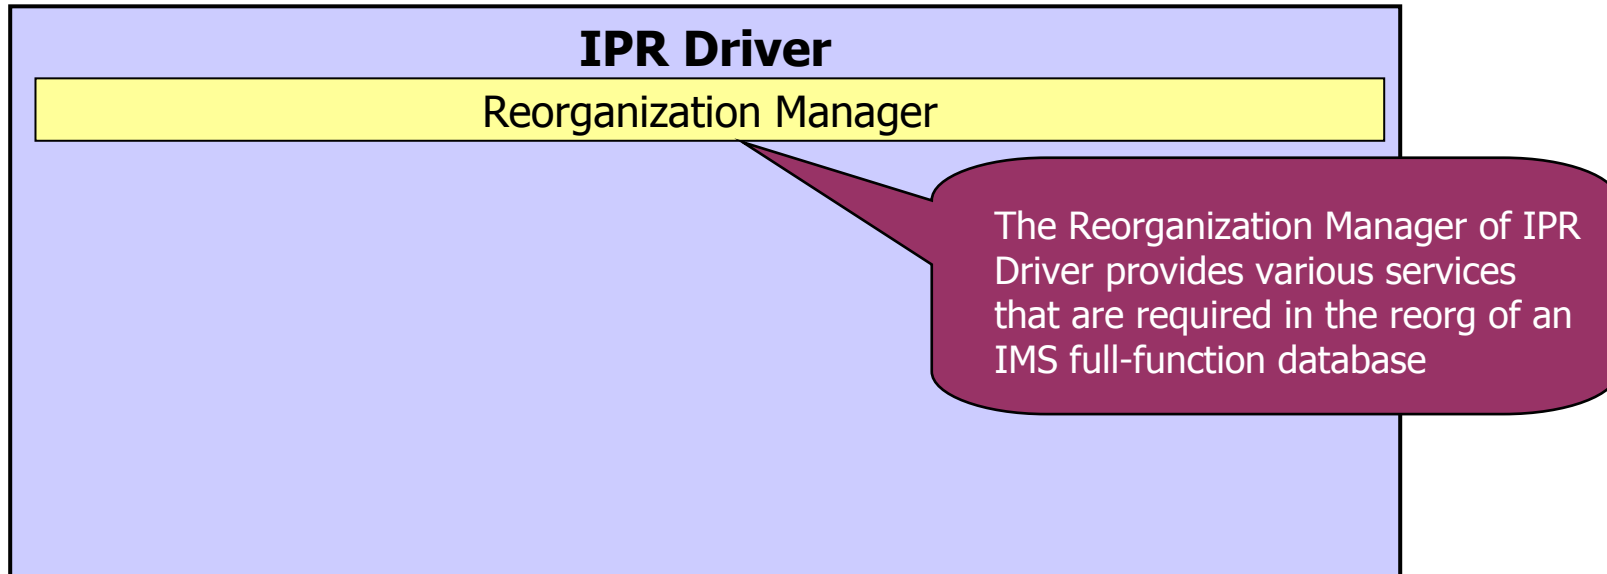

```
//IPR          EXEC PGM=HPSGMAIN,PARM='DBD=YOURDBD,DBRC=Y'  
//STEPLIB     DD DISP=SHR,DSN=TOOLS.LIBRARY  
//           DD DISP=SHR,DSN=IMS.SDFSRESL  
//IMS        DD DISP=SHR,DSN=IMS.DBDLIB  
//IMSDALIB   DD DISP=SHR,DSN=IMS.DALIB  
//HPSIN      DD *  
(REORG)  
  IMSCMD=YES  
  DBSHARE=YES  
  IC=YES  
  INDEXBLD=YES  
  NAMESWAP=YES  
  DELOLDDS=YES  
/*  
//ICEIN      DD *  
  GLOBAL     HDPC=(Y,HISTORY),ICHLQ=IMSICA  
/*  
//HISTORY    DD DISP=SHR,DSN=HDPC.HISTORY
```

The control statements for IPR Driver, IPR Unload, IPR Reload, Index Builder, and High Performance Prefix Resolution can be specified in **HPSIN**.

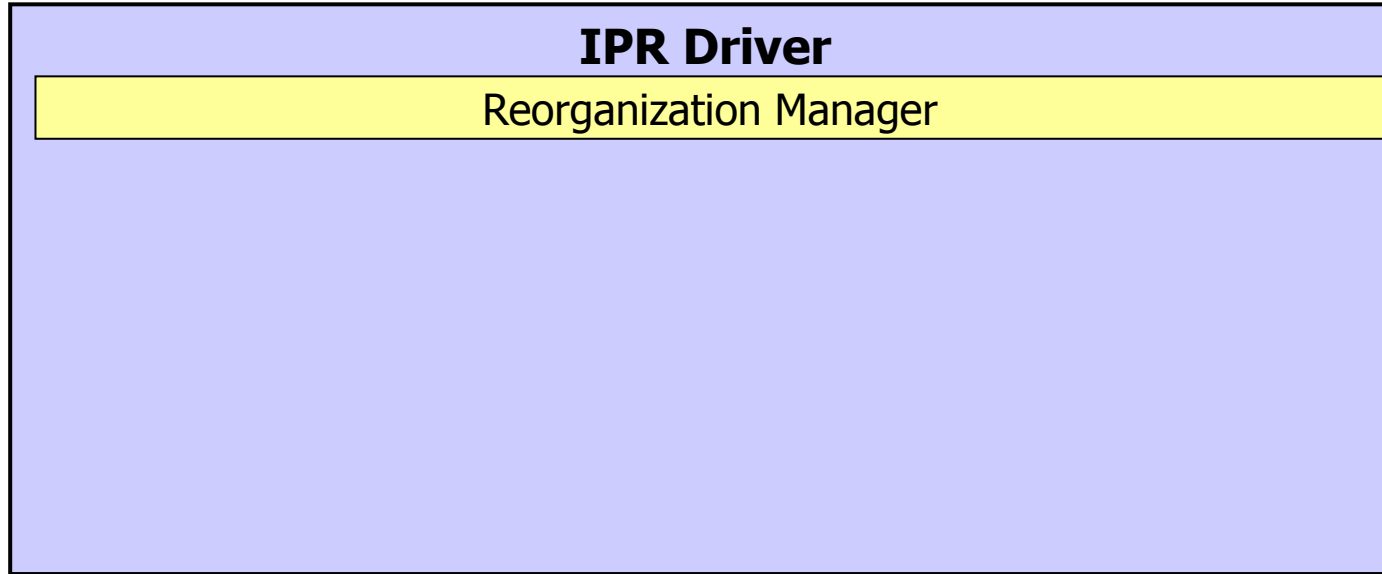

The control statements for High Performance Image Copy can be specified in **ICEIN**.

All SYSOUT streams for reports and statistics can be allocated dynamically
➤ You do not need to know the DD names for various utility outputs

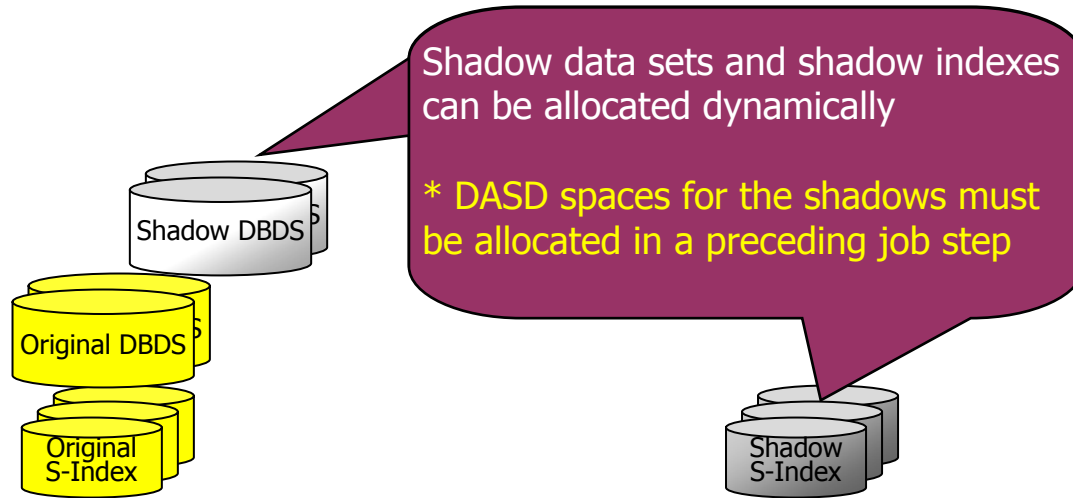

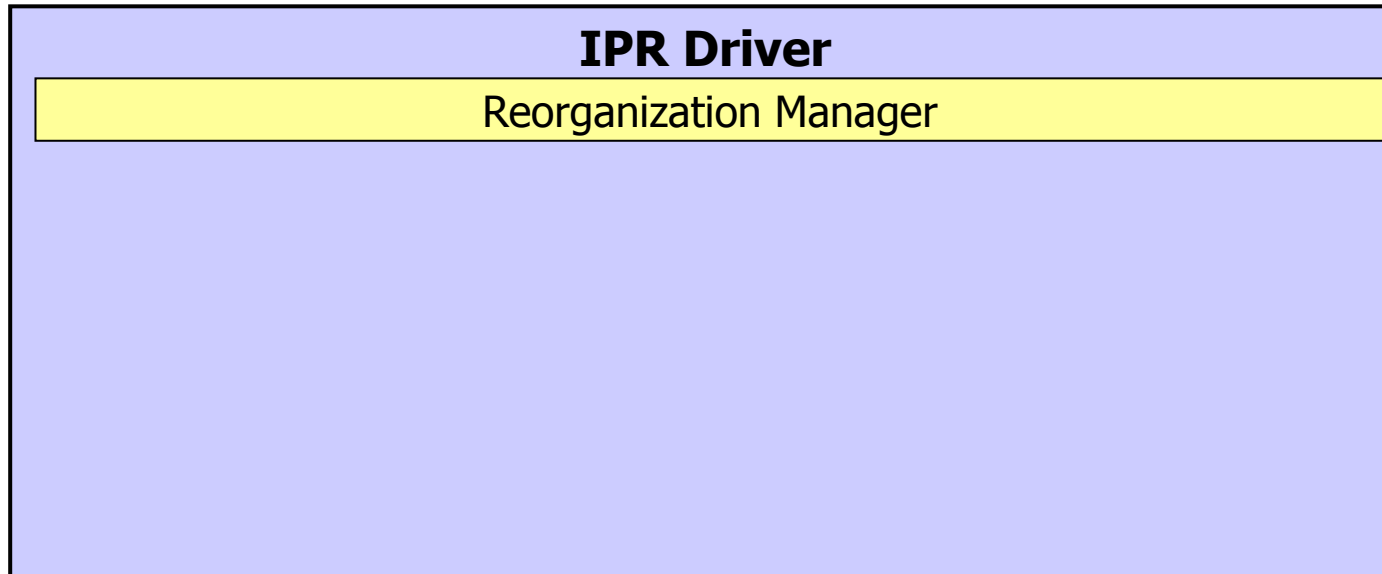

IPR Driver V3 Type-A Image Copy – Process Flow

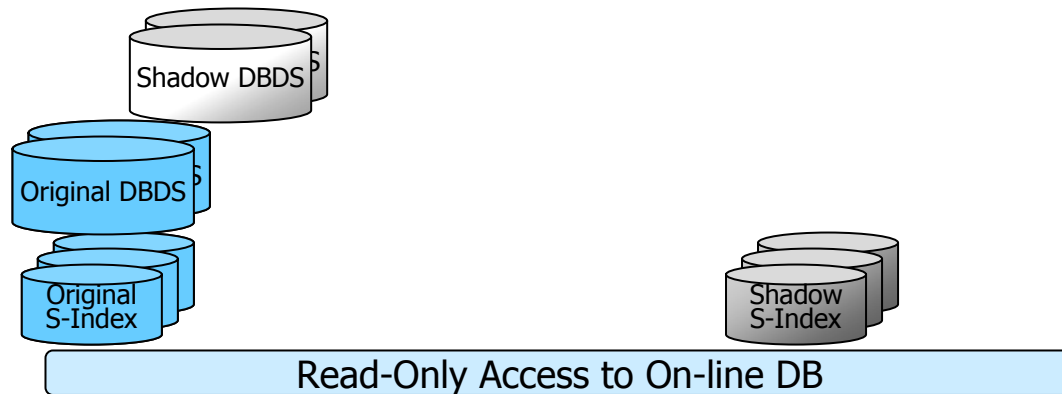

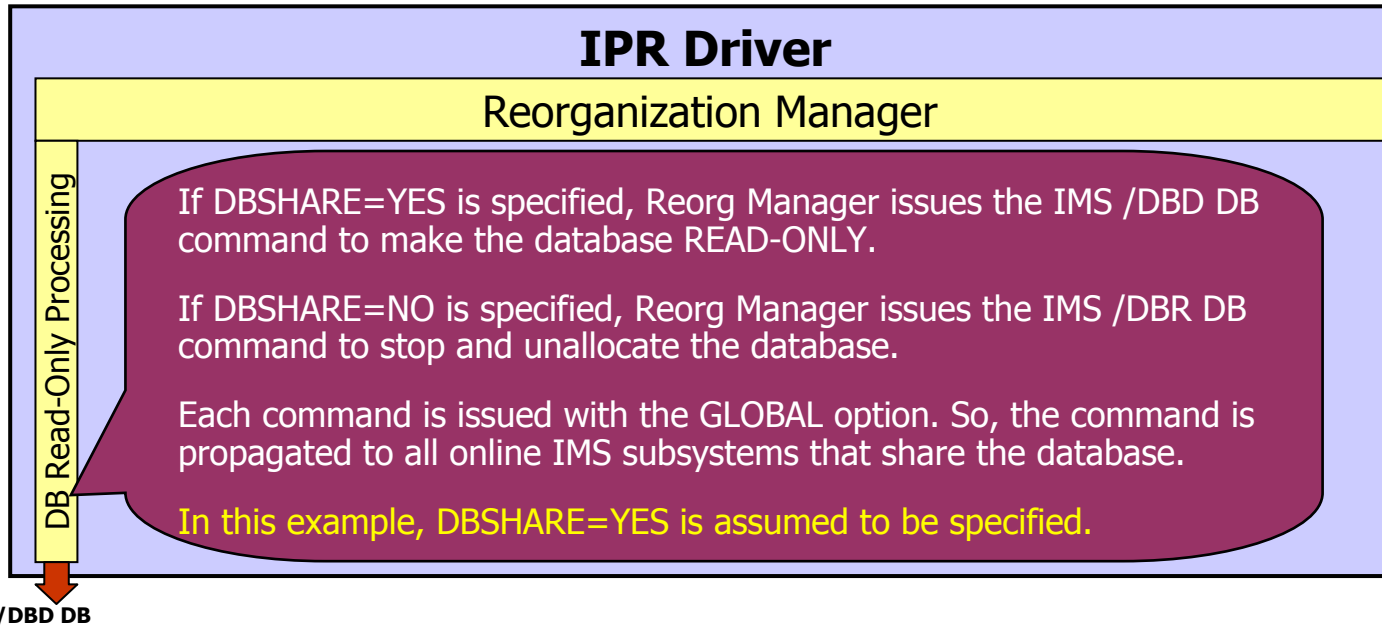

IPR Driver V3 Type-A Image Copy – Process Flow

IPR Driver V3 Type-A Image Copy – Big Picture

The /STA DB command is not issued automatically by IPR Driver. The user must issue the command for each IMS online subsystem.

JCL Statements for Type-B Image Copy for a database that has no logical relationship

```
//IPR          EXEC PGM=HPSGMAIN , PARM=' DBD=YOURDBD , DBRC=Y '  
//STEPLIB     DD DISP=SHR , DSN=TOOLS . LIBRARY  
//           DD DISP=SHR , DSN=IMS . SDFSRESL  
//IMS        DD DISP=SHR , DSN=IMS . DBDLIB  
//IMSDALIB   DD DISP=SHR , DSN=IMS . DALIB  
//HPSIN      DD *  
(REORG)  
  IMSCMD=YES  
  DBSHARE=YES  
  IC=YES  
  ICTYPE=B  
  INDEXBLD=YES  
  NAMESWAP=YES  
  DELOLDDS=YES  
/*  
//ICEIN      DD *  
  GLOBAL     HDPC=(Y , HISTORY) , ICHLQ=IMSICA  
/*  
//HISTORY    DD DISP=SHR , DSN=HDPC . HISTORY
```

This is the only difference.

JCL Statements for Concurrent Prefix Update and Type-B Image Copy

```
//IPR      EXEC PGM=HPSGMAIN, PARM='DBD=SAMPLEDB, DBRC=Y'
//STEPLIB  DD DISP=SHR, DSN=TOOLS.LIBRARY
//         DD DISP=SHR, DSN=IMS.SDFSRESL
//IMS      DD DISP=SHR, DSN=IMS.DBDLIB
//IMSDALIB DD DISP=SHR, DSN=IMS.DALIB
//DFSURCDS DD DISP=SHR, DSN=DFSURCDS
//DFSURWF1 DD DISP=(NEW, PASS, DELETE), DSN=&&DFSURWF1,
//         UNIT=SYSALLDA, SPACE=(CYL, (n, m)),
//         DCB=(RECFM=VB, LRECL=800, BLKSIZE=2400)
//HPSIN    DD *
(REORG)
  IMSCMD=YES
  DBSHARE=YES
  IC=YES
  INDEXBLD=YES
  NAMESWAP=YES
  PREFIXRES=YES
  DELOLDDS=YES
(PREFIXRES)
  UPDLPC=NO
/*
//ICEIN    DD *
  GLOBAL   HDPC=Y, ICHLQ=IMSICA
/*
```

You do not need to specify the ICTYPE control statement.

If IC=YES and **PREFIXRES=YES** are specified and the database has an internal logical relationship, ICTYPE=B is implicitly set.

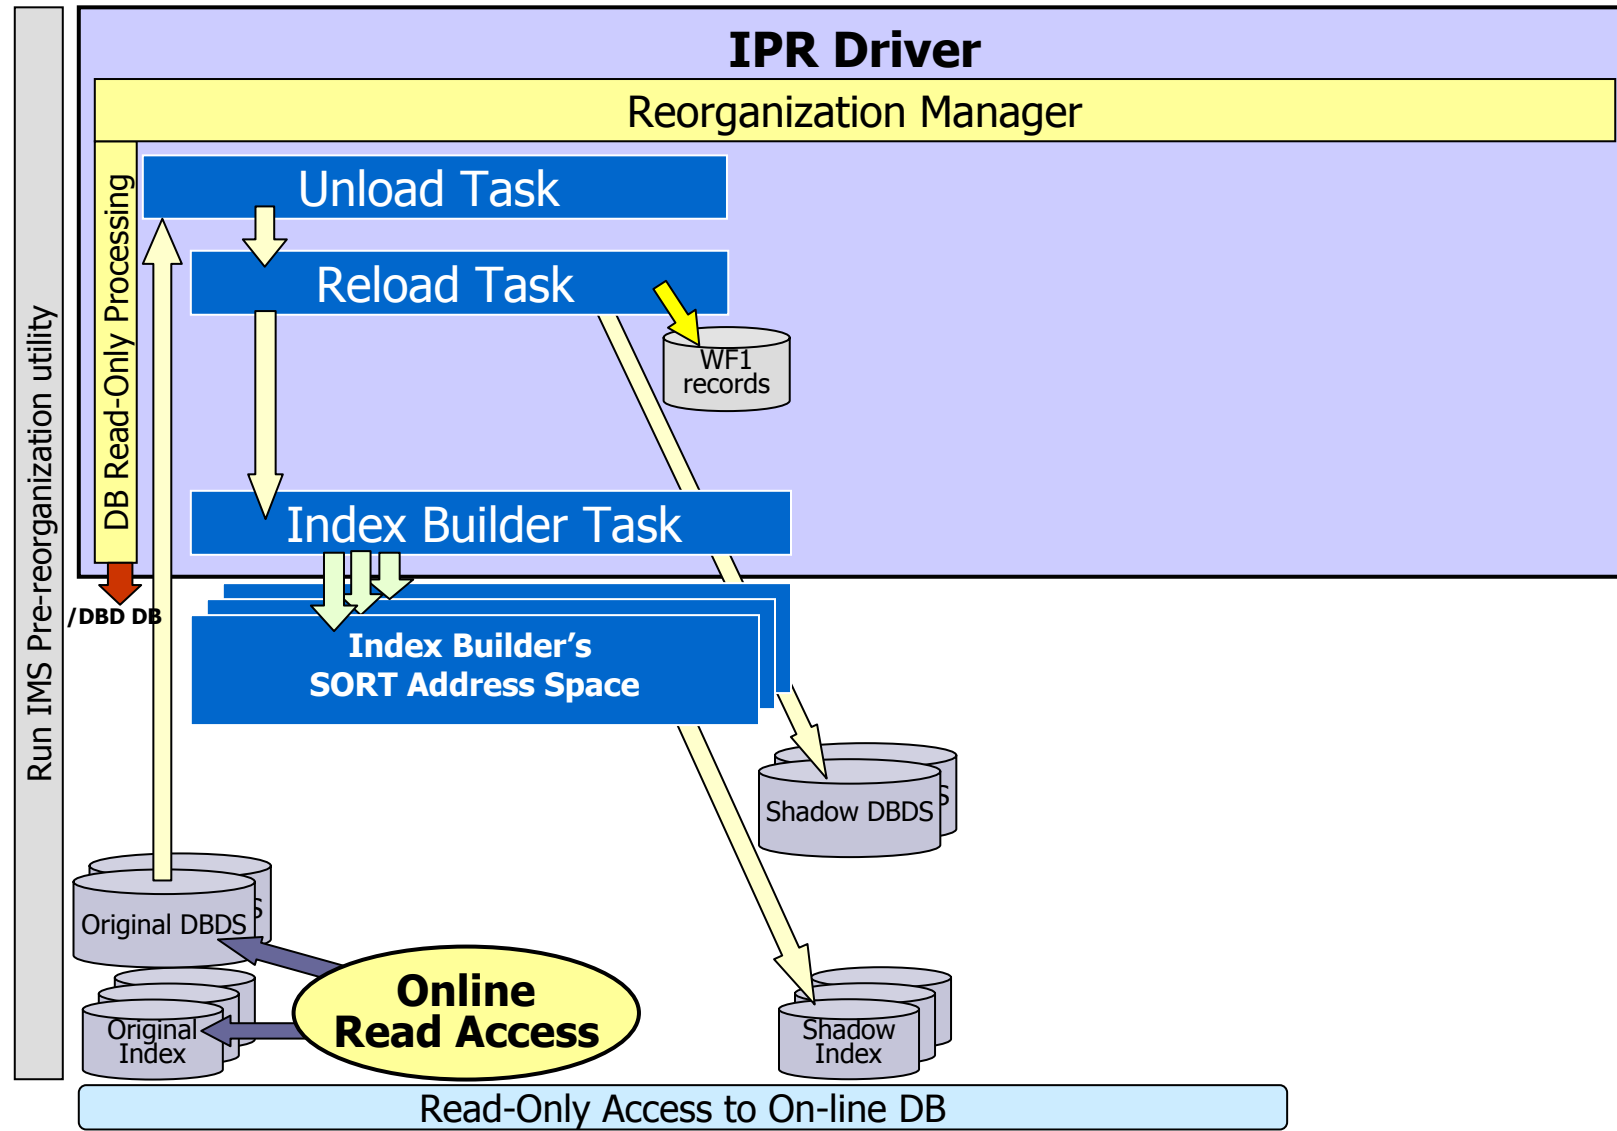

Concurrent Prefix Update and Type-B Image Copy – Process Flow

Run IMS Pre-reorganization utility

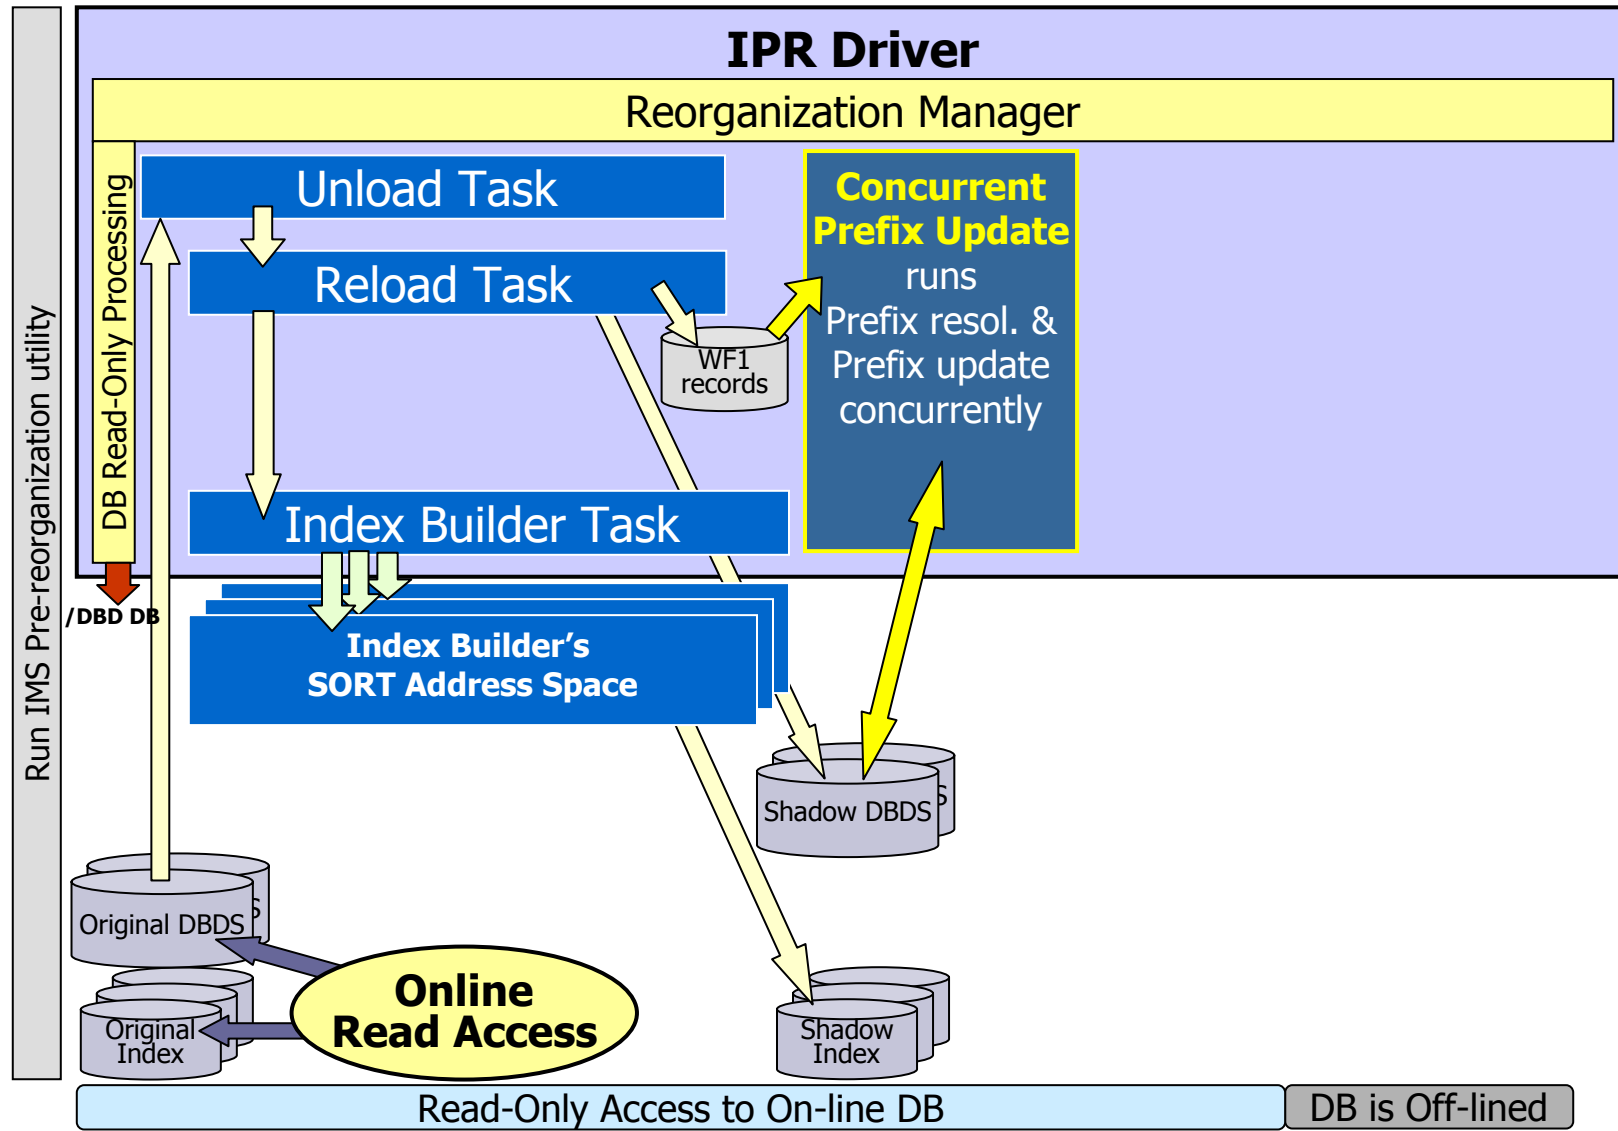

IMS Pre-reorganization utility must be run in a separate job step.

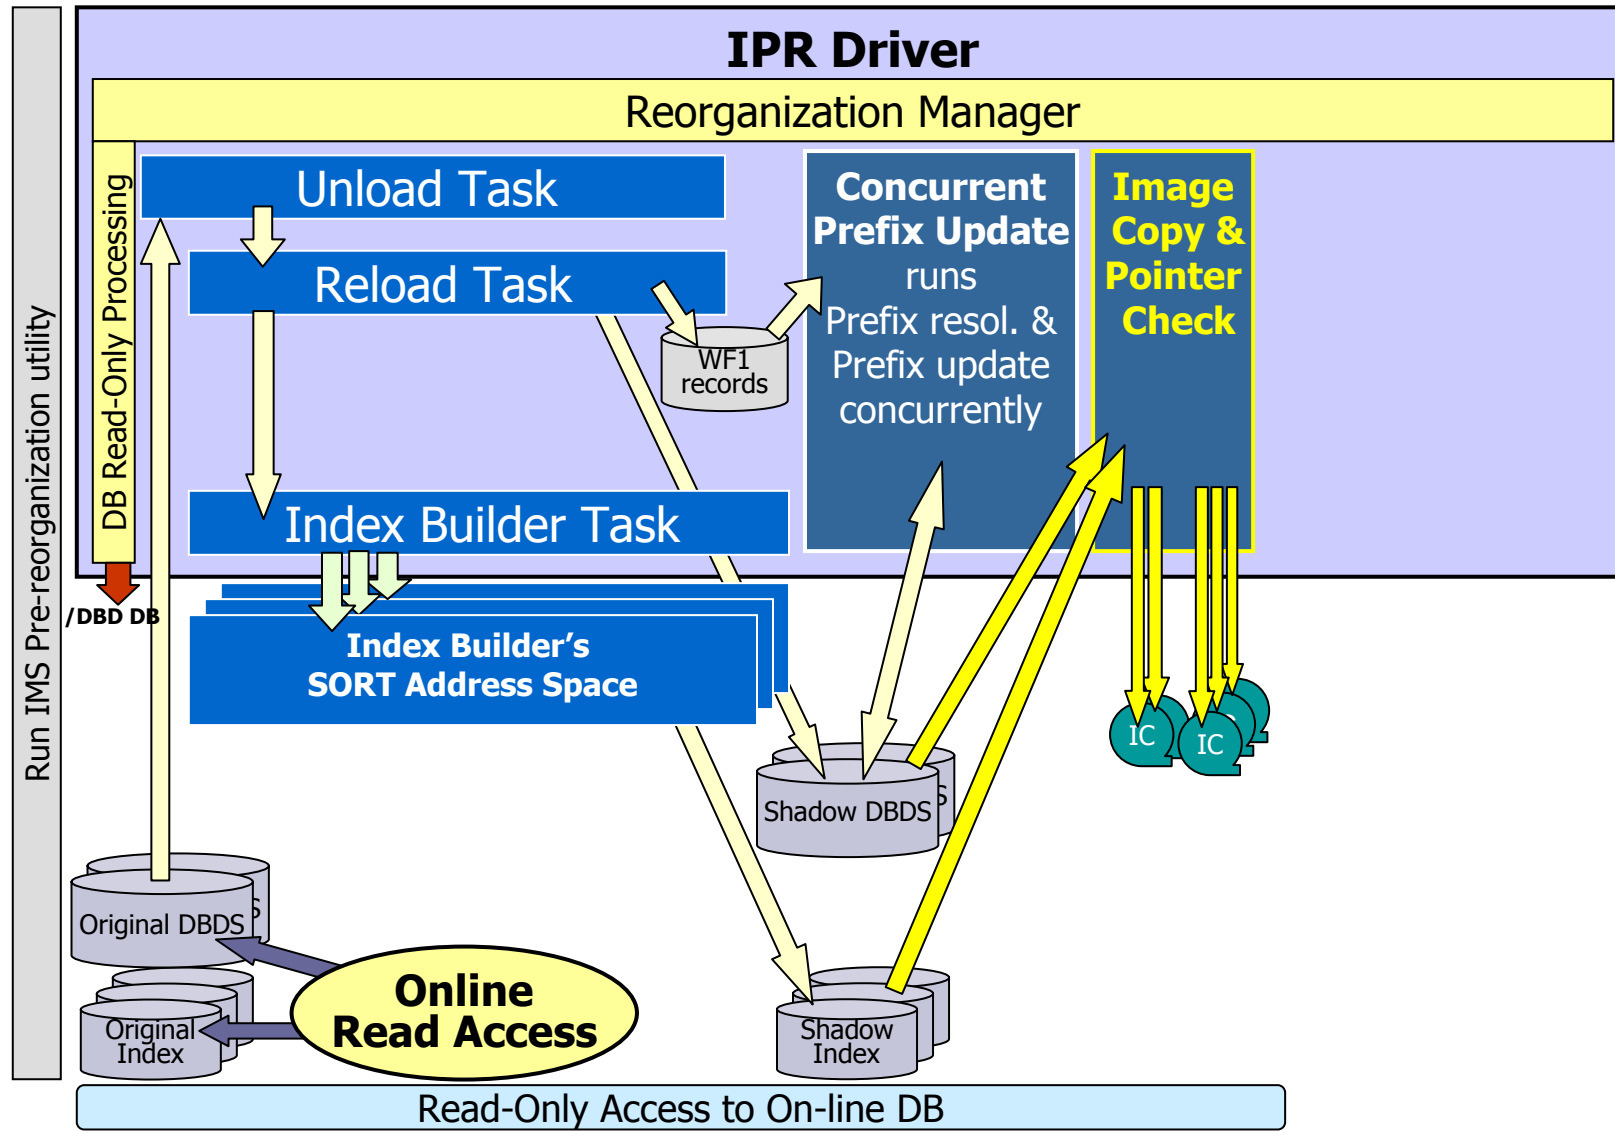

Concurrent Prefix Update and Type-B Image Copy – Process Flow

Concurrent Prefix Update and Type-B Image Copy

The Future of IPR Driver

The Future Direction

- More automation, less manual intervention
- More consolidation of administrative data
- More autonomic capabilities

More automation, less manual intervention

- More automation, less manual intervention
 - Name Swap Enhancements
 - Automated /STA DB after reorg completion
 - Internal IDCAMS invocation
 - Other requirements under evaluation
- More consolidation of administrative data
- More autonomic capabilities

Name Swap Enhancements

■ Requirements

- MR0425026140: Optional rename method
- MR0823043817: Route IPR IDCAMS "name swapping" SYSOUT to separate dataset
- MR0823042318: IPR control statement to impose shadow index datasets have '.x' suffix

Optional rename method

■ Requirement

- The old input data sets should be renamed to the shadow names so that they can be reused

■ Solution

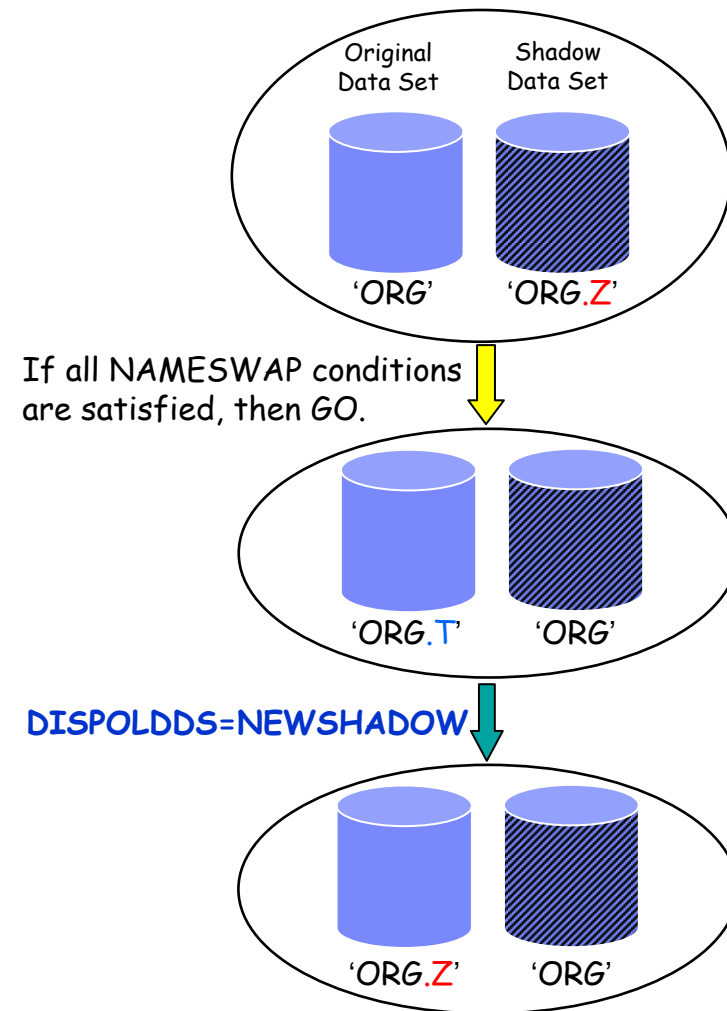

- Introducing a new control statement:

DISPOLDDS=DELETE | NEWSHADOW | TEMPNAME

- Default is DISPOLDDS=TEMPNAME
- Installation default option can be set for DISPOLDDS
- DISPOLDDS specifies the disposition of the original data sets after a successful reorganization
- DISPOLDDS=TEMPNAME is equal to DELOLDDS=NO
- DISPOLDDS=DELETE is equal to DELOLDDS=YES

Optional Rename Method – DISPOLDDS=NEWSHADOW

- If DISPOLDDS=NEWSHADOW is specified, the old data sets are renamed to the shadow data set names
- If the database is VSAM and the REUSE attribute is specified, the old data sets that are renamed to the shadow names can be used as the new shadow data sets for the next run of IPR Driver

Route "name swapping" SYSOUT to separate data set

■ Requirement

- Route a sequence of IDCAMS commands for "manual name swapping" to separate data set, not print it in the report SYSOUT

■ Solution

- Introducing a new DD statement:

HPSGSWAP

- Defines the optional output data set that will contain the IDCAMS command stream for data set name swapping.
- The command stream is produced only when manual name swapping is necessary.
- The data set is intended to be used as the SYSIN for IDCAMS
- No command stream will be produced if the automated name swapping is performed

Impose shadow indexes have suffix – Background

- Background of the requirement
 - IPR Driver cannot know the name of the original indexes and cannot produce the IDCAMS statements for renaming the shadow indexes to the original names if both of the following conditions are met:
 - DBRC is inactive
 - Shadow index data sets are specified in the JCL stream
 - that is, INDEXBLD=YES,NEW and DYNALLOC=(xxx,xxx,NO)

Impose shadow indexes have suffix – Solution

■ Solution

- Introducing a new control statement

SINDEXSUF=YES | NO

- Default is SINDEXSUF=NO
- Installation default option can be set for SINDEXSUF
- SINDEXSUF specifies whether or not each shadow index name is assumed to be the original name plus a suffix
- If SINDEXSUF=YES, the IDCAMS statements for renaming shadow indexes to those original names are produced even if the original names are not known from either RECON or dynamic allocation members

Requirement: Automated /STA DB after reorg completion

■ Requirement

- MR0510041741: IPR should verify completion of DBR and STA, with retry capability

Note: IPR Driver already has the automated /DBR command processing with retry capability

Automated /STA DB – Planned Solution

■ Planned Solution

- Using Tools Online System Interface (TOSI) for IMS command processing
- Implementing both /DBR and /STA DB capabilities by using TOSI
- Continuing to support /DBR and /DBD DB capabilities through E-MCS console

* TOSI is used to issue its action commands and IMS commands. TOSI is started during IMS initialization. TOSI allows clients to start and stop full function database resources and issue IMS commands that need to interact with online DB/DC IMS or CICS DBCTL systems that own the target databases.

* TOSI is used in QCF V2.

Requirement: Internal IDCAMS Invocation

■ MR0502015556

- Eliminate need for IDCAMS step. Utility should be directed to DD statement which contains IDCAMS control cards (delete/define and allocate statements). Needs to be treated as an option based on control cards or a CC override to what is stated as being the default.

Internal IDCAMS Invocation – Planned Solution

■ Planned Solution

- Checking the attributes and gathering statistics of the input database and secondary indexes
- Allocating spaces for the shadow data sets automatically in the IPR Driver job step
- If a specific DD statement is coded in the IPR Driver JCL stream, it is used as SYSIN for IDCAMS to allocate space for the shadow data sets

Internal IDCAMS Invocation – Issues and Concerns

■ Issues and Concerns

- Volume selection in non-SMS environment
 - A solution: If enough space is left on the volumes where the original data sets are allocated, IPR allocates the space for shadows on the same volumes
- Multi-volume OSAM data sets
 - How to select volumes for each of such data sets

Other requirements under evaluation

- MR090104463: HP Load Capability to invoke Image Copy & Pointer Checker during Load
- MR1015043419: Interface to Program Restart Facility for BMP control

Direction – consolidation & autonomic capabilities

- More automation, less manual intervention
 - Name Swap Enhancements
 - Automatic /STA DB after reorg completion
 - Internal IDCAMS invocation
 - Other requirements under evaluation
- More consolidation of administrative data
 - Attend the Bob's session tomorrow!
- More autonomic capabilities
 - Attend the Bob's session tomorrow!

IMS Tools Product Portfolio

Database Administration

- IMS Library Integrity Utilities
- IMS HALDB Conversion and Maintenance Aid
- IBM Data Encryption for IMS and DB2 Databases
- IMS Sequential Randomizer Generator
- IMS HD Compression- Extended

Performance Management

- IMS Buffer Pool Analyzer
- IMS Performance Analyzer
- IMS Problem Investigator
- Tivoli OMEGAMON XE for IMS for z/OS
- IMS Network Compression Facility

Recovery Management

- IMS DEDB Fast Recovery
- **IMS HP Image Copy**
- IMS HP Change Accumulation
- IBM Application Recovery Tool for IMS and DB2 Databases
- IMS Database Recovery Facility

Utilities Management

- **Full Function Databases**
 - IMS HP Unload
 - IMS HP Load
 - IMS Index Builder
 - IMS HP Prefix Resolution
 - IMS Parallel Reorg
 - IMS HP Pointer Checker
- **Fast Path Databases**
 - IMS HP Fast Path Utilities
- **Administration**
 - IMS Database Repair Facility
 - IMS Database Control Suite

Application Management

- IMS Connect
- **IMS Connect Extension**
- IMS MFS Reversal Utilities
- IMS Batch Terminal Simulator
- IMS Batch Backout Manager
- IMS Program Restart Facility

Information Integration

- IMS DataPropagator
- DB2 II Classic Federation for zOS
- DB2 II Event Publisher for IMS

TM/Online System Management

- IMS ETO Support
- IMS Queue Control Facility
- **IMS Parameter manager**
- IMS HP Sysgen Tool
- IMS Command Control Facility
- IMS Workload Router (MLC)
