Session Abstract

C02   N+N Upgrades and Floating BMPs
Anders Öhrnberg

Can you upgrade a member of your sysplex or do you still have to take down everything? This session provides an overview of the functions that are available to upgrade one lpar at a time in a sysplex environment. The topic discusses how Volvo uses floating BMPs within a sysplex environment to speed up an upgrade (to decrease downtime) and to upgrade one IMS system at the time in a sysplex using functions such as Symbolic Alias Facility and Symbolic variables. The topic also discusses how Volvo uses IMSGROUP, DFSVC000 and other functionality.
