

TOC**INDEX****VIEW****E55 V8 Sysplex Terminal Management**
Bill Stillwell, IBM Dallas Advanced Technical Support

The Common Service Layer (CSL) of IMS V8 enhances the manageability and recoverability of VTAM terminal sessions in a shared queues environment, increasing the availability benefits of shared queues. This presentation looks at Sysplex Terminal Management, how IMS exploits of the infrastructure provided by the CSL and the Resource Manager address space. Specifically addressed are resource type consistency, resource name uniqueness, resource status recovery, and global callable services.

To maximize your understanding of this session, please consider first attending E54, V8 Resource Manager/Coordinated Online Change, to understand basics of the V8 Resource Manager.
