A Business Partner Solution for the Cross Industry Sector
Accessible Production for Your eDiscovery Solution

Integro
PDF Exporter for IBM eDiscovery

Technology Description

A key challenge in eDiscovery is managing the document production process. IBM InfoSphere eDiscovery Manager (eDM) and IBM InfoSphere eDiscovery Analyzer (eDA) are excellent tools to facilitate this process. However, there are times when producing information from eDM or eDA in PDF format is advantageous. Integro's PDF Exporter for IBM eDiscovery provides a solution for this challenge. The utility allows legal or IT personnel to export responsive content from InfoSphere eDiscovery Manager into .NSF format. From there, the .NSF can be opened inside the Lotus Notes interface and then an action is provided to convert all content in the exported .NSF to PDF files on the hard drive, external media or a file share.

Features & Benefits

- Ability to easily export eDM and eDA search results in PDF format.
- High fidelity conversion to PDF.
- Easy and intuitive to use.

Value Proposition

Currently, InfoSphere eDiscovery Manager supports export of discovered email in .NSF format. Integro's Domino to PDF conversion utility allows your organization to automatically and seamlessly convert an exported .NSF file into a series of PDFs on your file system. PDFs are a widely used standard in the eDiscovery process and ensure that all parties who need access to produced content are able to quickly and easily use it. Also, many matter legal management systems leverage PDFs natively. Integro's PDF Exporter automates what would otherwise be a very manual and labor intensive conversion process, when email content needs to be produced in PDF format.
