IBM Information Server Blade Demo

Imagine if you could organize your information resources so they enable your business users to access enterprise information consistently, accurately and on demand...

You could:
• Attain true business insight
• Enable new applications more quickly
• Expand to new business opportunities
• And obtain more value from your existing enterprise information
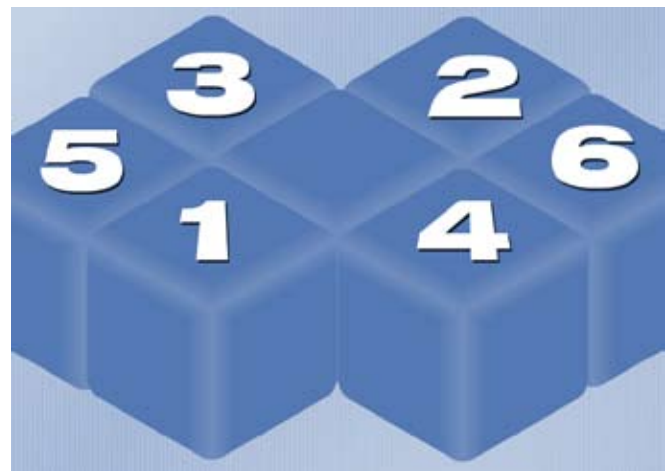

You can bring all these results to your business … with IBM Information Server.

In a typical business environment, data resides in many different formats and locations, making it difficult to deliver integrated information where and when it's needed.

Organizations must sift through and integrate massive volumes of data in order to deliver complete and trusted information.
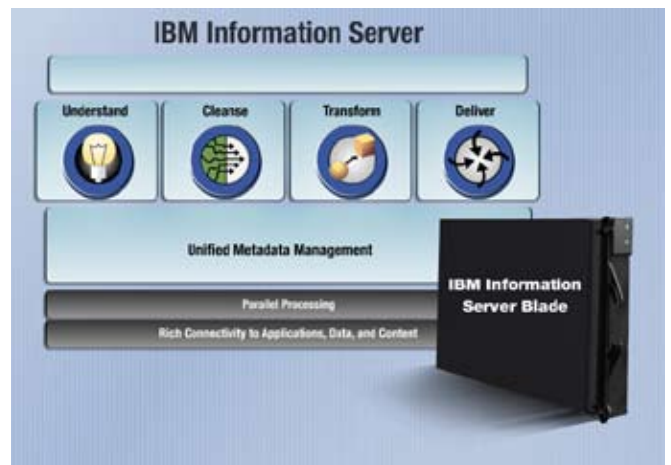

And it's only getting worse. Analysts estimate that the amount of digital information organizations manage will increase by as much as six times over the next three years.

At the same time, these same organizations are seeking more flexibility and efficiency in their IT systems – in total cost of ownership, energy and physical space consumption, and manageability.

So how is it possible for these organizations to get more value out of this growing volume of information?

IBM has the answer – the IBM Information Server Blade.

This new offering provides all the data integration power of IBM Information Server pre-loaded and pre-configured on a high density IBM H-S-21 Blade Center with Dual-Core Intel Xeon processors.

Providing endless scalability for addressing your most complex data integration challenges against any volume of data – all in the most energy-efficient, high density hardware environment available.

The IBM Information Server Blade combines seamless integrated grid management, using Tivoli Load Leveler, with native parallel processing technology, allowing workloads to be easily managed across blades – and new blades can be simply snapped in to add incremental linear processing power

This allows you to provide the information your business needs, anywhere and anytime, while lowering your total cost of ownership and improving your flexibility – all in an environmentally-friendly way.

So what if you could deliver true business insight to everyone? A consistent view of enterprise data? And more value and efficiency from your deployed systems?

You can … with IBM Information Server Blade.

You don't have to imagine the possibilities … simply contact your IBM client representative or visit the IBM Information Integration Website.
