

## The Only Complete Life Cycle Management Tool for IBM Cognos 8.x / 10.

All New User Experience

MotioCI™ v2.0 is a major advance in functionality that enables IBM Cognos® teams to more effectively produce and maintain high quality BI content.

Building on the widely adopted MotioCI™ architecture, v2.0 delivers market leading features with comprehensive version control for all aspects of an IBM Cognos® environment. This includes the ability to exclusively 'lock' BI artifacts while under development and promote distinct versions (or entire baselines) into upstream environments.

MotioCI™ v2.0 is the first and only life-cycle management system to truly support governance, risk management and compliance. Every BI author, manager and director can be assured that every aspect of the IBM Cognos® platform is monitored for governance, control & traceability.

MotioCI v2.0 has raised the bar yet again, and continues to be the 'gold standard' for 3rd party tools aimed at increasing the productivity of BI development teams.

**The Motio Continuous Integration Server** is a patent-pending, server based application which augments IBM Cognos® environments with versioning, tracking and testing capabilities. MotioCI is the only complete platform which helps enforce best practices methodology by providing automated version control and testing of BI content. MotioCI empowers BI development and support staff by proactively detecting BI content or performance issues and enabling them to quickly correlate these problems back to the changes which caused them.

**New User Interface** v2.0 brings a new interface to allow users to tailor layouts for a better user experience.

**Studio Integration & Exclusive Locking.** v2.0 now delivers full report locking in the IBM Cognos® Studios. Users have the ability to 'check-out' reports, work on them and the 'check-in' the modified specification. Other authors can still view the studio artifact and will receive automated messages alerting them to the state of the lock. New iconography within the Studio makes it easy for users to manage the process.

**Version Any Artifact.** The Version Control module in v2.0 is like nothing else in the market. Any Content Store object can now be automatically versioned. In addition, the 'My Folders' can also be versioned.

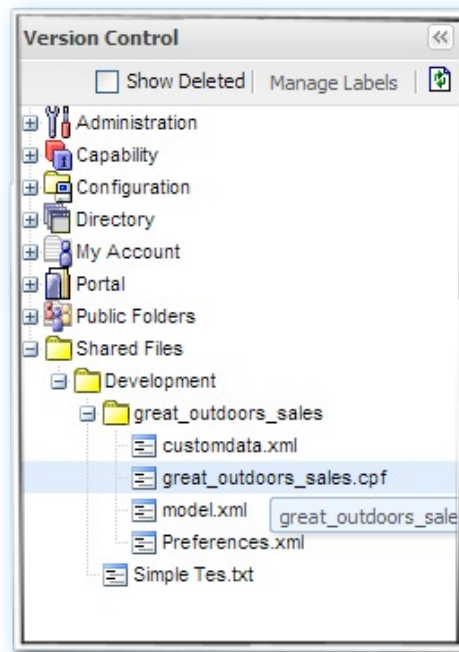

**Version Framework Models.** For the first time IBM Cognos® users can have one product to version artifacts inside and *outside* of the Content Store.

**Version All Properties.** Moving way beyond versioning studio specifications MotioCI v2.0 can version every property inside IBM Cognos BI.

**Promote All Objects.** In compliance management traceability is the watch word. MotioCI v2.0 is the only product that provides automated forward and backwards traceability for every object. The days of having to zip & promote IBM artifacts are over.

**Full Featured Labeling.** This new feature brings the power of tagging to help MotioCI users with promotions, reporting, sorting & accelerating key tasks. A simple, but powerful addition.

**Defect Tracking Integration.** v2.0 now delivers an API to integrate easily to 3rd party defect tracking systems. This will dramatically reduce dual entry in systems and provides traceability between systems such as JIRA®, Trac®, Bugzilla® & IBM Rational ClearQuest® .

**Zero-Touch Version Control™.** As BI authors make changes to IBM Cognos® artifacts (Reports, Queries, Analysis Objects, Packages), MotioCI automatically tracks these changes and versions the specifications and more.

**Timeline Manager** allow administrators & managers see who did what and when. The timeline viewer can target 'problem areas', or look at trends over time.

**Automated Testing Framework for IBM Cognos®:** MotioCI provides powerful regression & stress testing capabilities for IBM Cognos®. Customers can create tests to ensure report specifications adhere to corporate standards for look-n-feel, naming conventions, parameters and more. Tests can

also be developed to ensure that, when executed, reports produce the expected results and execute within the expected period of time.

**Continuous Verification of the Cognos Artifacts and the Outputs They Produce:** The MotioCI continuous integration capabilities allow customers to apply all configured test suites automatically, at regular intervals (e.g. "run all tests every 2 hours"). This enables MotioCI to act as a "smoke detector" for IBM Cognos environments; proactively notifying project stakeholders when a problem surfaces rather than relying on the end users to discover it.
