## Email Supervision and Control: New Capabilities for Regulatory Compliance

High volume email communication puts organizations at significant risk of either accidentally or intentionally distributing sensitive information inside or outside the company. Furthermore, for some organizations, there is a mandatory requirement to monitor electronic communications by employees, to report on those communications, and to make the messages available to regulators on demand. CA Email Control for the Enterprise can help companies control risk and comply with monitoring obligations.

CA Email Control for the Enterprise protects and controls sensitive information from being distributed throughout the organization as a result of accidental, negligent, or malicious communication. The solution provides the ability to define flexible corporate policies to intelligently control email through the accurate detection of sensitive content and the monitoring of email communication flow. Policies

can be created to meet the message monitoring and data security requirements of all organizational stakeholders including security, compliance, legal, and finance.

CA Email Control for the Enterprise is integrated with IBM Content Collector for Email, a separately orderable product that provides advanced capabilities that enable organizations to identify and archive content based on business value. CA Email Control for the Enterprise supports and complements this value-based archiving approach by stopping noncompliant email prior to sending, thereby, limiting risk to the organization. For compliant email messages, IBM Content Collector archives and stores the messages according to retention policies and makes the messages available for post-send supervision and reporting using CA Email Control for the Enterprise.
