User Response: Correct the CONTINUEIF clause. The column specification must be reduced and/or the value being compared must be shortened. The value being compared must be entirely within the input record.

DSNU340I *csect-name* - ERROR LOADING INDEX,
DUPLICATE KEY, INDEX=*index-name*,
TABLE=*table-name*, RID OF INDEXED
ROW=*rid-of-indexed-row*, RID OF
NON-INDEXED ROW=*rid-of-non-indexed-
row*

Explanation: A duplicate key was found while building the indicated index during the BUILD phase of the REORG or REBUILD INDEX utility. This violates the uniqueness rule for that index.

Severity: 8 (error)

System Action: All duplicate index entries of the indicated index are reported and the index is in RECOVERY PENDING status. Duplicate rows are present in the indexed table.

Utility processing continues with any other utility functions within the utility job step.

User Response: Duplicate rows are present in the indexed table. The system programmer should be informed, so that any applications that are dependent upon the uniqueness of the table rows are not initiated until corrective action has been taken.

Operator Response: Notify the system programmer.

System Programmer Response: Steps should be taken to inhibit any further processing until the index is repaired. If the nonunique keys are correct, DROP and recreate the index as nonunique. If the records with duplicate keys should not be in the table, use REPAIR DELETE to remove the erroneous rows. Use the RID values provided in this message as input to the REPAIR utility. After the duplicate data rows are removed or the unique index has been dropped, issue the -DISPLAY DATABASE command with RESTRICT against the target database. Use the REBUILD INDEX utility to recover any indexes that are in the REBUILD pending state. CHECK INDEX can be run to verify that the data and indexes are consistent.

Problem Determination: Use REPAIR LOCATE RID DUMP to view the records with duplicate keys. SQLSELECT may fail due to the inconsistent index. Use CHECK INDEX to check the validity of the index.

DSNU341I *csect-name* - **IMAGE COPY MUST BE TAKEN BEFORE REORG CAN BE RUN ON A DB2 CATALOG OR DIRECTORY TABLE SPACE**

Explanation: The DB2 catalog or directory table space being reorganized does not have an image copy that the RECOVER utility can use to recover the table space to currency. Before running the REORG utility, you must run the COPY utility to create an image copy. This prevents having to recover the DB2 catalog or directory table space to a prior point in time if a problem occurs during REORG processing.

Severity: 8

System Action: Processing terminates

User Response: Run the COPY utility to create an image copy of the DB2 catalog or directory table space. If more than one catalog or directory table space is to be reorganized, consider using the QUIESCE and COPY utilities for the set of table spaces to be reorganized.

Use the REPORT utility to view the recovery information related to the table space. The output from the REPORT utility should indicate either the absence of an image copy, or the presence of a REORG LOG NO SYSCOPY record.

DSNU342I *csect-name* **ERROR LOADING INDEX, ERROR = Xreason-code, INDEX = index-name**

Explanation: The LOAD, REORG or REBUILD INDEX utility encountered a processing error, which it could not correct, while extending the index identified by 'index-name'. Refer to Part 4, "Section 4. DB2 Codes," on page 773 for an explanation of the code given in 'reason-code'.

Severity: 8 (error)

System Action: The building of index entries for the indicated index is not completed. An SVC dump of the database services address space is requested for diagnostic purposes. The extension of other indexes associated with the tables being loaded is attempted. Any subsequent attempt to use the index directly or indirectly will cause the invoker to abend.

User Response: If the indexed table is used by more than one application, the system programmer should be informed so that applications that insert rows into, or delete rows from, the table or use the index directly are inhibited until corrective action is taken.

Normal corrective action would be to use the REBUILD INDEX utility option to reconstruct the index after the

processing problem identified by the reason code has been resolved. Alternatively, the index can be dropped and then created again, unless the index in question is the partitioning index.

Operator Response: The table space in question might need to be stopped and started for utility-only processing to inhibit attempted application use of the defective index.

System Programmer Response: If the index is used by more than one application, applications that either insert rows into, or delete rows from, the indexed table or use the index to access rows must be inhibited from executing. One way to accomplish this is to place the table space in question under utility only processing control via the -START and -STOP DATABASE commands until the REBUILD INDEX utility is executed.

Alternatively, the index can be dropped. Application execution can then proceed, and the index can be created again (unless the index was the partitioning index). If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem. Refer to Part 4, "Section 4. DB2 Codes," on page 773 to determine the processing error indicated by the reason code. For a discussion of how a table can be dropped and created again, or what to do if a partitioning index is damaged, refer to the discussion of LOAD processing in Part 2 (Volume 1) of *DB2 Administration Guide*.

DSNU343I *csect-name* - **BUILD PHASE STATISTICS. nnn DUPLICATE KEY ERRORS ENCOUNTERED**

Explanation: The count of duplicate key errors encountered during processing is 'nnn'.

Severity: 4 (warning) or 8 (error)

System Action: Processing continues. For the LOAD utility, the records causing the duplicate key errors will be deleted in a subsequent phase.

DSNU344I *csect-name* - **UNIQUE INDEX KEY DUPLICATES KEY OF INDEXED ROW AT RID rrrr INDEX = index-name TABLE = table-name RECNO = input-dataset-record-number RID = duprid**

Explanation: The input data set record indicated was loaded into table *table-name* at RID *duprid*, but it causes a unique index violation for index *index-name*. It duplicates the key value of a record already in the table at RID *rrrr*.

Severity: 4 (warning)

System Action: Processing continues. No index entry is created for the record at RID *duprid*. The record will be deleted in a subsequent phase of processing.

DSNU345I *csect-name* **UNIQUE INDEX KEY
DUPLICATES KEY FROM INPUT
DATASET RECORD *iiii* LOADED AT RID
rrrr INDEX = *index-name* TABLE =
table-name RECNO = *recno* RID = *duprid***

Explanation: Input data set record *recno* was loaded into table *table-name* at RID *duprid*, but it causes a unique index violation for index *index-name*. It duplicates the key value of another record in the load job: the record loaded at RID *rrrr* from input data set record *iiii*.

Severity: 4 (warning)

System Action: Processing continues. Index entries are not created for either record. Both records will be deleted in a subsequent phase of processing.

DSNU346I *csect-name* **RECORD(n),
CONCATENATED SQL/DS RECORD IS
TOO LARGE**

Explanation: A LOAD utility was executing with FORMAT SQL/DS input data. Multiple spanned segments of the input data were concatenated into one logical record for loading. The resultant concatenated record is too large to be processed. The maximum length allowed is 32764 bytes.

Severity: 4 or 8

System Action: When discard processing is specified, the input data set logical record is noted and is discarded in the DISCARD phase. The LOAD utility continues to process additional records in the input data set and the severity is 4. When discard processing is not specified, the severity is 8 and the LOAD utility terminates.

User Response: When discard processing is specified, examine the records in the DISCARDS data set after the LOAD utility completes. Correct the error in the discarded input data. Then run the LOAD utility with the RESUME YES option using the DISCARDS data set as input. When discard processing is not specified, correct the error in the input data set and rerun the job.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

DSNU347I *csect-name* **DEADLINE =
*yyyy-mm-dd-hh.mm.ss.mmmmmm***

Explanation: This message applies only to REORG with SHRLEVEL REFERENCE or CHANGE. It supplements message DSNU105I, which can appear for any utility (including REORG).

This message is issued in response to a -DISPLAY UTILITY command.

It is also issued by the REORG utility if the user specified SHRLEVEL REFERENCE or CHANGE and DB2 estimates that the switch phase will not start by the deadline specified by the DEADLINE phrase.

This message indicates the most recently specified values of the DEADLINE parameter to REORG. For this parameter, a previous invocation of the -ALTER UTILITY command might have specified a value. If no previous invocation of -ALTER UTILITY has specified a value, then the most recently specified value is the value that was specified with the invocation of the REORG utility.

yyyy-mm-dd-hh.mm.ss.mmmmmm indicates a timestamp, according to the most recently specified value of DEADLINE.

Severity: 0 (informational)

System Action: The message reflects the state of DB2 at the time of the -DISPLAY UTILITY command or the time when DB2 *estimated* that the switch phase would not start by the deadline specified by the DEADLINE phrase.

If this message was issued for -DISPLAY UTILITY, the system continues processing. If an -ALTER UTILITY command is then executed, a subsequent -DISPLAY UTILITY command would reflect the results (if any) of the -ALTER UTILITY command.

DSNU348I *csect-name* **BUILD PHASE STATISTICS.
NUMBER OF KEYS = *nnnnnnnn* FOR
INDEX *index-name* PART *part-num***

Explanation: This message is issued by the BUILD phase of the REBUILD INDEX utility to report the total number of index key entries used to build the indicated index partition.

Severity: 0 (informational)

System Action: This message indicates the number of index key entries submitted to the DB2 data manager to build the indicated index partition. Both unique and nonunique key entries are counted. Rejected key entries are not counted.

User Response: The user can verify that the number reported is consistent with expectations.

DSNU349I *csect-name* **BUILD PHASE STATISTICS.
NUMBER OF KEYS = *nnnnnnnn* FOR
*index-name***

Explanation: This message is issued by the BUILD phase of the LOAD, REORG or REBUILD INDEX utility. The message is repeated for each index built by the LOAD, REORG or REBUILD INDEX utility. It indicates the total number of index key entries used to build the indicated index.

Severity: 0 (informational)

System Action: This message indicates the number of index key entries that were submitted to the DB2 data manager to build the indicated index. Both unique and nonunique key entries are counted. Rejected key entries are not counted.

User Response: The user can verify that the number reported is consistent with expectations. For example, the user can determine if it matches the number of records loaded for the table indexed by the indicated index.

DSNU350I *csect-name* - **EXISTING RECORDS DELETED FROM TABLESPACE**

Explanation: A LOAD utility execution, in which REPLACE was specified, has deleted all records from the specified table space.

Severity: 0 (informational)

System Action: Processing continues.

DSNU351I *csect-name* - '*reorg-option*' **OPTION IS NOT APPLICABLE FOR A DB2 CATALOG OR DIRECTORY OBJECT. THE OPTION IS IGNORED.**

Explanation: The identified option does not apply for this DB2 catalog or directory object. Table spaces and indexes within the DB2 catalog and directory may be processed differently than other table spaces and indexes. Consequently, these table spaces and indexes may not make use of reorg option *reorg-option*.

Severity: 4 (warning)

System Action: The option is ignored and processing continues.

User Response: None is required. However, you can remove the option from the utility input statement.

DSNU352I **EXISTING RECORDS DELETED FROM TABLESPACE PARTITION x**

Explanation: A LOAD utility execution, in which PART 'x' REPLACE was specified, has deleted all data records from partition 'x'. Index records over partition 'x' will be deleted in a subsequent phase of processing.

Severity: 0 (informational)

System Action: Processing continues.

DSNU353I *csect-name* **RECORD 'n' WILL BE DISCARDED DUE TO CHECK CONSTRAINT** *constraint-name* **VIOLATION ON TABLE** *table-name*

Explanation: The discarded record violates the check constraint named *constraint-name* defined on table *table-name*. The record is not loaded and is discarded

during the DISCARD phase.

Severity: 4 (warning)

System Action: The LOAD utility continues to process additional records in the input data set.

User Response: After the LOAD utility completes, examine the record in the DISCARDS data set. Correct the error in the discarded input data. Submit a RESUME(YES) LOAD job with the DISCARDS data set as the input data set.

DSNU354I *csect-name* **RECORD 'n' VIOLATES CHECK CONSTRAINT** *constraint-name* **ON TABLE** *table-name*

Explanation: The LOAD utility cannot load record *n* into table *table-name* because the check constraint *constraint-name* would be violated. The record is not loaded.

Severity: 8 (error)

System Action: Processing terminates. An abend is requested so that the LOAD can be restarted after the error condition is corrected.

User Response: Find the failing record in the input data set, correct the condition that caused the check constraint to be violated, and restart the LOAD utility. You can optionally include a SYSDISC DD statement in the JCL input to hold copies of records that are not loaded.

DSNU355I *csect-name* **INDEXVAL PHASE STATISTICS - nnn DUPLICATE KEY ERRORS CORRECTED BY DELETING** *rrr* **DATA ROWS**

Explanation: This message reports the results of the INDEXVAL phase of the LOAD utility. Data rows which were added during the LOAD or RELOAD phase of this LOAD utility invocation have been deleted because they caused unique index violations in the BUILD phase. A total of '*rrr*' data rows were deleted to correct '*nnn*' unique index violations.

Unique index violations are counted in one of two ways. An input data set record which has a value for a uniquely indexed column that duplicates a value that existed in the index prior to the LOAD job is counted as one duplicate key error. Two input data set records which have like values for a uniquely indexed column are counted as two unique index errors (that is, each of the two input data set records is in error).

Severity: 4 (warning)

System Action: Processing continues.

User Response: Compare the number of duplicate key errors corrected in the INDEXVAL phase to the number of duplicate key errors detected in the BUILD phase (reported by message DSNU343I). If the counts

are unequal, notify the system programmer.

If the counts are equal, following the LOAD utility execution, examine the discards file or the LOAD error summary to determine which input data set records caused the unique index violations. Revise the input records so they will not introduce duplicate values into unique indexes and reapply the input records to the table space. Alternatively, if appropriate, make the index nonunique and reapply the rejected records to the table space.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5.

DSNU356I *csect-name* INDEXVAL PHASE COMPLETE, ELAPSED TIME = hh/mm/ss

Explanation: The INDEXVAL phase of the LOAD utility has completed normally. The elapsed time for the execution was 'hh' hours, 'mm' minutes, and 'ss' seconds.

Severity: 0 (informational)

DSNU357I *csect-name* - 'LOG NO' OPTION REQUIRED FOR DB2 CATALOG AND DIRECTORY TABLE SPACES

Explanation: The LOG NO option must be specified when reorganizing a DB2 catalog or directory table space.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Add the LOG NO option to the utility input statement.

DSNU358I *csect-name* - 'UNLOAD ONLY' OPTION NOT VALID FOR DB2 CATALOG OR DIRECTORY TABLE SPACE

Explanation: The UNLOAD ONLY option is not permitted for DB2 catalog or directory table spaces.

Severity: 8

System Action: Processing terminates.

User Response: Determine the purpose for using the UNLOAD ONLY option. There might be alternative ways of accomplishing the required function (for example, the UNLOAD PAUSE option).

DSNU359I KEYWORD 'SORTKEYS' SPECIFIED BUT NO INDEX OR FOREIGN KEYS EXIST, KEYWORD IS IGNORED

Explanation: The 'SORTKEYS' keyword was specified for a LOAD or REORG utility job; however, it was found that no index and no foreign keys were defined for any of the tables being loaded or reorganized. The keyword is ignored and processing continues normally.

Severity: 0 (informational)

System Action: Processing continues normally.

User Response: If an index or foreign keys were expected to be found for the table or tables being loaded or reorganized, determine the reason the index or foreign keys could not be found.

Problem Determination: Probably a user error. Determine if an index should be defined on any of the tables in the table space, or if foreign keys should be defined. If so, define the index or foreign keys; otherwise, remove the 'SORTKEYS' keyword from the utility statement if necessary.

DSNU360I *csect-name* - IN REORG WITH SHRLEVEL REFERENCE OR CHANGE, DATA SET *name* EXISTS, CONTEXT=c

Explanation: For the area (table space or partition) being reorganized, REORG with SHRLEVEL REFERENCE or CHANGE unloads data from the original data sets and reloads data into shadow data sets. REORG then exchanges the names of the original and shadow data sets, using temporary names during the renaming. The original name of a data set is in the form "*catname.DSNDBx.dbname.psname.I0001.Annn*". The shadow name of a data set is in the form "*catname.DSNDBx.dbname.psname.J0001.Annn*". The temporary name of a data set is in the form "*catname.DSNDBx.dbname.psname.T0001.Annn*". REORG uses such data sets for indexes as well as data.

During its initialization, REORG cannot execute if:

- Data sets with the temporary names already exist.
- DB2-managed data sets with the shadow names already exist.
- User-managed data sets with the shadow names do **not** already exist.

To exchange the names of the original and shadow data sets, REORG performs the following renaming:

- 1 In the switch phase, it renames the original data set from the original name to the temporary name
- 2 In the switch phase, it renames the shadow data set from the shadow name to the original name
- 3 In the utilterm phase, it renames the original

data set from the temporary name to the shadow name (for user-managed data sets). It deletes the temporary for DB2-managed data sets.

If a -TERM UTILITY command is issued after any renaming, or a restart of the REORG switch phase occurs after any renaming, the data set names revert back to their original form prior to the renaming:

- 4 The original data set from the shadow name to the temporary name
- 5 The shadow data set from the original name to the shadow name
- 6 The original data set from the temporary name to the original name

The context code indicates the specific type of error:

- 1 During the switch phase of REORG, on rename 1, REORG detected that a data set with a temporary name already exists. This error condition can arise for a DB2-managed or user-managed data set.
- 2 During the switch phase of REORG, on rename 2, REORG detected that a data set with a original name already exists. This error condition can arise for a DB2-managed or user-managed data set.
- 3 During the utilterm phase of REORG, on rename 3, REORG detected that a data set with a shadow name already exists. This error condition can arise for a user-managed data set.
- 4 During switch phase restart or a -TERM UTILITY during the switch phase, on rename 4 (while reverting back to the original name), -TERM UTILITY detected that a data set with a temporary name already exists. This error condition can arise for a DB2-managed or user-managed data set.
- 5 During switch phase restart or a -TERM UTILITY during the switch phase, on rename 5 (while reverting back to the original name), -TERM UTILITY detected that a data set with a shadow name already exists. This error condition can arise for a DB2-managed or user-managed data set.
- 6 During switch phase restart or a -TERM UTILITY during the switch phase, on rename 6 (while reverting back to the original name), -TERM UTILITY detected that a data set with a original name already exists. This error condition can arise for a DB2-managed or user-managed data set.
- 8 During initialization of REORG, REORG detected that a data set with a temporary name

already exists. This error condition can arise for a DB2-managed or user-managed data set.

Severity: 8 (error)

System Action: For context code 1, or 2, the utility job step that caused the function to be requested abends with code 00E4031B. The utility job is placed in the stopped state.

For context code 3, the utility job step that caused the function to be requested continues without performing this renaming.

For context code 4, 5, or 6, the object is left in a recovery pending state, -TERM UTILITY continues to undo renaming, and a message is issued. The objects and messages are as follows:

- If the data set is part of a nonpartitioned table space, the object is the table space, and the message is DSNU562I.
- If the data set is part of a partition of a table space, the object is the partition, and the message is DSNU560I.
- If the data set is part of a nonpartitioned index, the object is the index, and the message is DSNU557I.
- If the data set is part of a partition of a partitioned index, the object is the partition of the index, and the message is DSNU559I.

For context code 8, REORG does not execute.

User Response: For context code 1 or 2, you can choose between these actions:

- Delete the data set; then RESTART the utility.
- TERM the utility. Delete the data set before trying to execute REORG again with SHRLEVEL REFERENCE or CHANGE.

For context code 3, if you want to perform the renaming, delete the data set with the shadow name and then perform the renaming.

For context code 4, 5, or 6, execute the RECOVER or REBUILD INDEX utility; then delete the shadow and temporary data sets (if they still exist).

For context code 8, delete the data set and then execute REORG.

DSNU361I *csect-name* FOREIGN KEY HAS NO PRIMARY KEY FOR RELATIONSHIP=*r1* INPUT RECORD NUMBER=*nnnn*, RID=*Xrrrr*

Explanation: Input record *nnnn* caused a row to be loaded into table *table* at RID *rrrr* with no primary key for the relationship with the name *r1*.

Severity: 4 (warning)

System Action: Processing continues.

User Response: None required. The constraint violation described will be rectified later in processing.

DSNU362I *csect-name* - IN REORG WITH SHRLEVEL CHANGE, LOG HAS BECOME SHORT, BUT MAXRO IS DEFER, MEMBER=*member-name*, UTILID=*utilid*

Explanation: In execution of the REORG utility with SHRLEVEL CHANGE, if the value of MAXRO is DEFER, and the actual time for an iteration and the estimated time for the next iteration are both less than 5 seconds, then DB2 adds a 5 second pause to the next iteration. This pause limits the utility's consumption of processor time.

Within an execution of REORG, the first time that this situation occurs, DB2 produces this message, which announces the pause. On all later occurrences of this situation, DB2 still adds the pause, but DB2 sends the message only if DB2 has *not* sent the message (for this execution of REORG) within the past 30 minutes. This is a WTO message; it is sent to the console, but it is not an action message. It is not sent to SYSPRINT.

In a data sharing environment, *member-name* identifies the DB2 member. In a non-data-sharing environment, *member-name* is blank. *utilid* identifies the utility job step.

Severity: 0 (informational)

System Action: REORG continues execution, with a 5 second pause. If the conditions in the explanation above continue to be true, DB2 will continue adding 5 second pauses.

User Response: If you have been planning to wait for an appropriate time to execute the -ALTER UTILITY command to choose the value of MAXRO and thus cause REORG to finish, now might be an appropriate time. However, you are not required to take any action.

Operator Response: If you have been planning to wait for an appropriate time to execute the -ALTER UTILITY command to increase the value of MAXRO and thus cause REORG to finish, now might be an appropriate time. However, you are not required to take any action.

DSNU363I *csect-name* - ENFORCE PHASE STATISTICS - RELATIONSHIP *r1* FOREIGN KEYS CHECKED=*n* CONSTRAINT VIOLATIONS ENCOUNTERED=*m*

Explanation: This message provides statistics for the enforce phase of the load utility. For relationship 'r1', the number of foreign keys checked is 'n'. The number of constraint violations found is 'm'.

Severity: 0 (informational)

System Action: Processing continues.

534 Messages and Codes

DSNU364I *csect-name* PARTITIONS WILL BE LOADED IN PARALLEL, NUMBER OF TASKS = *nnnn*

Explanation: This message is issued by the RELOAD phase of the LOAD utility. The message indicates that the LOAD utility is able to load partitions in parallel. The number of utility tasks used to load partitions is indicated by *nnnn*.

Severity: 0

System Action: Processing of the RELOAD phase continues.

User Response: You can verify that the number of tasks reported is consistent with your expectations. For example, if 4 partitions are to be loaded, you might expect to see the number of tasks = 4.

DSNU365I *csect-name* - USER *auth-id* DOES NOT HAVE AUTHORITY ON REORG MAPPING TABLE

Explanation: The REORG utility was run with SHRLEVEL CHANGE and a mapping table, but user *auth-id* does not have authority to delete, insert, select, and update in the mapping table specified in the utility statement.

Severity: 8 (error)

System Action: Further utility processing is terminated.

User Response: Obtain authorization to delete, insert, select, and update in the mapping table specified in the utility statement.

DSNU366I *csect-name* - REORG MAPPING TABLE HAS WRONG COLUMNS

Explanation: A mapping table was specified for a utility job executing REORG with SHRLEVEL CHANGE. However, the table has the wrong set of columns. This message can arise for any parameters of CREATE TABLE that are missing from, added to, or different from the CREATE TABLE statement that appears for the mapping table in the REORG section of *DB2 Utility Guide and Reference*.

Severity: 8 (error)

System Action: REORG does not execute.

User Response: Create a mapping table with the correct set of columns, and no other columns, as specified under REORG in *DB2 Utility Guide and Reference*. Execute REORG.

DSNU367I *csect-name* - ENFORCE PHASE
STATISTICS - *n* ROWS DELETED FROM
TABLE *t*

Explanation: This message reports the results of the ENFORCE phase of the LOAD utility. Data rows added during the RELOAD phase of the LOAD utility have been deleted because they contained foreign keys which did not have a corresponding primary key. A total of *n* data rows were deleted from table *t*.

Primary errors may cascade and remove additional records. The count is the sum of both primary and secondary constraint violations.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Determine why no primary key exists for the deleted record.

Problem Determination: All primary errors are accompanied by a DSNU361I message which identifies the relationship and input record which does not have a primary key value. The report phase will report all secondary errors and indicate the primary error record which caused this record to be deleted.

The relevant parent table can be found by querying the SYSIBM.SYSRELS catalog table. The relevant columns can be found by querying the SYSIBM.SYSFOREIGNKEYS catalog table.

DSNU368I *csect-name* - REORG MAPPING TABLE
HAS WRONG INDEX

Explanation: A mapping table was specified for a utility job executing REORG with SHRLEVEL CHANGE. However, the table has the wrong index. This message can arise for any parameters of CREATE INDEX that are missing from, added to, or different from the CREATE INDEX statement that appears for the mapping table in the REORG section of *DB2 Utility Guide and Reference*. It can also arise for the existence of any other indexes on the mapping table.

Severity: 8 (error)

System Action: REORG does not execute.

User Response: Create a mapping table with the correct index, and no other indexes, as specified under REORG in *DB2 Utility Guide and Reference*. Execute REORG.

DSNU369I *csect-name* - ENFORCE PHASE
COMPLETE, ELAPSED TIME =
hh/mm/ss

Explanation: The ENFORCE phase of the LOAD utility has completed normally. The elapsed time for the execution was 'hh' hours, 'mm' minutes, and 'ss' seconds.

Severity: 0 (informational)

DSNU370I *csect-name* - THE LOCAL FORMAT
OPTION HAS BEEN USED WITH A
DATE OR TIME AND NO LOCAL EXIT
HAS BEEN INSTALLED.

Explanation: The Installation Application Programming Defaults Panel indicated that an exit for date or time was supplied, but the exit supplied by DB2 was not replaced.

Severity: 8 (error)

System Action: The statement cannot be executed.

User Response: Contact the system programmer about installation of the date or time exit.

System Programmer Response: To replace the DB2-supplied exit routine, an SMP USERMOD must be applied. If an SMP USERMOD is undesirable, the replacement module may be linked into a user library either included in the MVS LINKLIST or concatenated to the STEPLIB in the started task JCL for *ssnm*DBM1 (*ssnm* is the subsystem name).

DSNU371I *csect-name* - REORG MAPPING
TABLE'S TABLE SPACE MUST BE
SEGMENTED

Explanation: REORG with SHRLEVEL CHANGE specified a mapping table for a table space that is not segmented. The table space that contains the mapping table must be segmented.

Severity: 8 (error)

System Action: REORG does not execute.

User Response: Specify a mapping table that is in a table space that is segmented.

DSNU372I *csect-name* - CANNOT REORGANIZE
REORG MAPPING TABLE'S TABLE
SPACE

Explanation: REORG with SHRLEVEL CHANGE specified a mapping table that resides in the table space that is being reorganized. The table space that contains the mapping table must not be the table space that is being reorganized.

Severity: 8 (error)

System Action: REORG does not execute.

User Response: Specify a mapping table that is not in the table space that is being reorganized.

DSNU373I *csect-name* - IN -ALTER UTILITY OR REORG WITH SHRLEVEL REFERENCE OR CHANGE, DEADLINE HAS ALREADY OCCURRED, CONTEXT=*c*

Explanation: If a deadline is specified in the -ALTER UTILITY command or the REORG utility with SHRLEVEL REFERENCE or CHANGE, the deadline cannot occur before the time of execution of the -ALTER UTILITY or REORG that specified the deadline. Context codes are:

- 1 The error occurred on -ALTER UTILITY.
- 2 The error occurred on REORG.

Severity: 8 (error)

System Action: -ALTER UTILITY or REORG does not execute.

User Response: Execute -ALTER UTILITY or REORG with no deadline or with a deadline that has not already occurred. If you want to terminate an execution of REORG, use the -TERM UTILITY command.

DSNU374I *csect-name* - REORG WITH SHRLEVEL REFERENCE or CHANGE HAS BEEN TERMINATED, REASON=*c*

Explanation: REORG with SHRLEVEL REFERENCE or CHANGE has been terminated.

- 1 REORG with SHRLEVEL CHANGE specified LONGLOG TERM, and at the end of an iteration of log processing, the number of log records that the next iteration would process is not sufficiently lower than the number that the previous iterations processed.
- 2 DB2 estimated that the switch phase of REORG with SHRLEVEL REFERENCE or CHANGE would not start by the deadline specified in the DEADLINE phrase.

Severity: 8 (error)

System Action: REORG terminates.

User Response: For reason code 1, attempt a new invocation of reorganization later, perhaps when you expect that the application workload is lower or the maximum desired amount of time for applications to have read-only access is longer.

For reason code 2 on SHRLEVEL CHANGE, attempt a new invocation of reorganization later, perhaps when you expect to have a longer time available, you expect that the application workload is lower, or you expect that the maximum desired amount of time for applications to have read-only access is longer. For reason code 2 on SHRLEVEL REFERENCE, attempt a new invocation of reorganization later, perhaps when you expect to have a longer time available.

DSNU375I *csect-name* DISCARD PHASE STATISTICS - *nnn* INPUT DATA SET RECORDS DISCARDED

Explanation: Input data set records were rejected by the LOAD utility for one or several reasons. The rejected records have been placed in a discards data set. The number of records rejected is '*nnn*'. Message DSNU399I summarizes the errors causing the records to be rejected.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Examine the LOAD error summary and decide which of the discarded records, if any, should be corrected and reapplied to the table space.

DSNU376I *csect-name* DISCARD PHASE COMPLETE, ELAPSED TIME = *hh/mm/ss*

Explanation: The DISCARD phase of the LOAD utility has completed normally. The elapsed time for the execution was '*hh*' hours, '*mm*' minutes, and '*ss*' seconds.

Severity: 0 (informational)

DSNU377I *csect-name* - IN REORG WITH SHRLEVEL CHANGE, THE LOG IS BECOMING LONG, MEMBER=*member-name*, UTILID=*utilid*

Explanation: During log processing for REORG with SHRLEVEL CHANGE, the number of log records that the next iteration will process is not sufficiently lower than the number that the previous iterations processed. This situation means that during reorganization, the log is not being read quickly enough to catch up to the application writing the log. This is a WTO message; it is sent to the console, but it is not an action message. It is also sent to SYSPRINT.

DB2 refrains from taking the action specified in the LONGLOG phrase if any one of the following events occurs for this execution of REORG before the delay expires:

- An -ALTER UTILITY command is issued.
- A -TERM UTILITY command is issued.
- DB2 estimates that the time to perform the next iteration will be less than or equal to the time specified in the MAXRO phrase.
- REORG terminates for any reason (including the deadline).

member-name

Identifies the DB2 member in a data sharing environment. Blank in a non-data-sharing environment.

utilid Identifies the utility job step.

Severity: 4 (warning)

System Action: After a delay (specified by the DELAY phrase of the REORG utility or the -ALTER UTILITY command), REORG performs the action specified by the LONGLOG phrase of the REORG utility or the -ALTER UTILITY command.

User Response: No action is required. However, if the action specified by the LONGLOG phrase is not desired, the operator (or a user-written program that is triggered by the message) can take an action. For a list of possible actions, see the description of LONGLOG in the REORG section of *DB2 Utility Guide and Reference*.

Operator Response: No action is required. However, if the action specified by the LONGLOG phrase is not desired, the operator (or a user-written program that is triggered by the message) can take an action. For a list of possible actions, see the description of LONGLOG in the REORG section of *DB2 Utility Guide and Reference*.

DSNU378I *csect-name* - REORG WITH SHRLEVEL NONE HAS INAPPROPRIATE NOSYSREC KEYWORD, REASON=*c*

Explanation: REORG with SHRLEVEL NONE allows the following combinations of the SORTDATA and NOSYSREC keywords:

- Neither keyword
- SORTDATA alone (without NOSYSREC)
- SORTDATA NOSYSREC

These combinations do not trigger this message. However, NOSYSREC alone (without SORTDATA) is inappropriate and triggers this message with a reason code of 1.

Also, for REORG with SHRLEVEL NONE, if you specify UNLOAD PAUSE, UNLOAD ONLY, or UNLOAD EXTERNAL, NOSYSREC is inappropriate and triggers this message with a reason code of 2. If the two conditions (omission of SORTDATA and inclusion of UNLOAD PAUSE, ONLY, or EXTERNAL) are both true, NOSYSREC triggers this message with a reason code of 2.

Severity: 8 (error)

System Action: REORG does not execute.

User Response: Specify an invocation of REORG with appropriate parameters. Specifically, for reason code 1, if you want to execute REORG with SHRLEVEL NONE, add SORTDATA and/or remove NOSYSREC. For reason code 2, if you want to execute REORG with SHRLEVEL NONE, remove NOSYSREC, UNLOAD PAUSE, UNLOAD ONLY, or UNLOAD EXTERNAL .

DSNU379I *csect-name* - ALTER UTILITY, UTILID = *utilid*: SWITCH PHASE IN REORG HAS ALREADY STARTED, NO ALTER IS PERFORMED

Explanation: The -ALTER UTILITY command was applied to a job that is executing REORG with SHRLEVEL REFERENCE or CHANGE. However, nothing was altered, because REORG had already started its switch phase.

Severity: 4 (warning)

System Action: ALTER UTILITY has no effect.

DSNU380I *csect-name* TABLESPACE *database.tablespace-name* PARTITION *part-num* IS IN COPY PENDING

Explanation: An image copy is required to establish a new base from which the table space partition can be recovered. Otherwise, the results of running the RECOVER utility on that table space partition are unpredictable.

If the RECOVER TABLESPACE utility with the keyword TOCOPY is being used, the START_RBA or START_LRSN value of the associated full image copy might be outside the available recovery information. To verify this, look at the REPORT utility output. The RECOVER TABLESPACE utility will process the TOCOPY keyword and put the recovering object in copy pending status.

Severity: 4 (warning)

User Response: Take an image copy of the associated table space partition. If the message was issued after the COPY utility failed, correct all specified errors for the associated table space before attempting another image copy of that table space.

DSNU381I *csect-name* TABLESPACE *database.tablespace-name* IS IN COPY PENDING

Explanation: This message is issued after:

- A LOAD or REORG utility with the LOG(NO) option left the associated table space in an unrecoverable state.
- An image copy failed because broken pages were detected or an image copy was terminated.
- A partial recovery finished successfully.
- A MODIFY RECOVERY left the associated table space in an unrecoverable state.

If the RECOVER TABLESPACE utility with keyword TOCOPY is being used, the START_RBA or START_LRSN value of the associated full image copy might be outside the available recovery information. To verify this, look at the REPORT utility output. The RECOVER TABLESPACE utility will

DSNU382I • DSNU383I

process the TOCOPY keyword and put the recovering object in copy pending status.

An image copy is required to establish a new base from which the table space can be recovered. Otherwise, the results of running the RECOVER utility on that table space are unpredictable.

Severity: 4 (warning)

User Response: Take an image copy of the associated table space. If the message was issued after the COPY utility failed, correct all specified errors for the associated table space before attempting another image copy on that table space.

DSNU382I *csect-name* - REORG UTILITY, UTILID = *utilid* REQUESTED TO ALTER, PHASE = *utility-phase*

Explanation: This message is issued in response to an -ALTER UTILITY command. It acknowledges that the request for alteration was received and verified. At the time the -ALTER UTILITY request was received, REORG was in the utility job step identified by UTILID *utilid*.

Severity: 0 (informational)

System Action: DB2 has accepted the request to alter the indicated utility job step. The utility alters its parameter values.

User Response: This message is an acknowledgement that the request has been accepted and is in progress.

DSNU383I *csect-name* CURRENT ITERATION NUMBER = *nnnnnn* WRITE ACCESS ALLOWED IN CURRENT ITERATION = *www* ITERATION BEFORE PREVIOUS ITERATION: ELAPSED TIME = *ha:ma:sa* NUMBER OF LOG RECORDS PROCESSED = *nnnnna* PREVIOUS ITERATION: ELAPSED TIME = *hb:mb:sb* NUMBER OF LOG RECORDS PROCESSED = *nnnnnb* CURRENT ITERATION: ESTIMATED ELAPSED TIME = *hc:mc:sc* ACTUAL ELAPSED TIME SO FAR = *hd:md:sd* ACTUAL NUMBER OF LOG RECORDS BEING PROCESSED = *nnnnnd* CURRENT ESTIMATE FOR NEXT ITERATION: ELAPSED TIME = *he:me:se* NUMBER OF LOG RECORDS TO BE PROCESSED = *nnnnne*

Explanation: This message applies only during the LOG phase of REORG with SHRLEVEL CHANGE. It supplements message DSNU105I which can appear in any phase (including the LOG phase).

This message is issued in response to a -DISPLAY UTILITY command.

It is also issued by the REORG utility if the user specified SHRLEVEL REFERENCE or CHANGE and DB2 estimates that the switch phase will not start by the deadline specified by the DEADLINE phrase. This message provides the user with an estimate of how far the REORG utility has proceeded in the indicated utility job step.

nnnnnn The current iteration number

www 'YES' or 'NO' according to whether write access is allowed in the current iteration of log processing

For the iteration before the previous iteration:

ha:ma:sa
The elapsed time for the iteration

nnnnna The number of log records processed in the iteration.

These values are 00:00:00 and 0 if the current iteration number is 1 or 2.

For the previous iteration:

hb:mb:sb
The corresponding information.

nnnnnb The corresponding information.

These values are 00:00:00 and 0 if the current iteration number is 1.

For the current iteration:

hc:mc:sc
The estimated elapsed time

hd:md:sd
The elapsed time so far

nnnnnd The actual number of log records being processed

For the next iteration:

he:me:se
The currently estimated elapsed time

nnnnne The currently estimated number of log records to be processed

Severity: 0 (informational)

System Action: The message reflects the state of DB2 at the time of the -DISPLAY UTILITY command or the time when DB2 estimated that the switch phase would not start by the deadline specified by the DEADLINE phrase.

If this message was issued for -DISPLAY UTILITY, the system continues processing. A subsequent -DISPLAY UTILITY command reflects that processing.

DSNU384I *csect-name* - MAXRO = aaaaaaaaaa
 SECONDS LONGLOG = ////////////////////////////////////////////////////////////////// DELAY =
 bbbbbbbbbbb SECONDS

Explanation: This message applies only to REORG with SHRLEVEL CHANGE. It supplements message DSNU105I, which can appear for any utility (including REORG).

This message is issued in response to a -DISPLAY UTILITY command.

It is also issued by the REORG utility if the user specified SHRLEVEL CHANGE and DB2 estimates that the switch phase will not start by the deadline specified by the DEADLINE phrase.

This message indicates the most recently specified values of certain parameters to REORG. For each such parameter, a previous invocation of the -ALTER UTILITY command might have specified a value. If no previous invocation of -ALTER UTILITY has specified a value, the most recently specified value is the value that was specified with the invocation of the REORG utility.

aaaaaaaaaa

A number of seconds, according to the most recently specified value of MAXRO. A value of "DEFER" denotes that the log file will be deferred indefinitely.

////////// "CONTINUE," "TERM," or "DRAIN" according to the most recently specified value of LONGLOG

bbbbbbbbbb

A number of seconds, according to the most recently specified value of DELAY

Severity: 0 (informational)

System Action: The message reflects the state of DB2 at the time of the -DISPLAY UTILITY command or the time when DB2 estimated that the switch phase would not start by the deadline specified by the DEADLINE phrase.

If this message was issued for -DISPLAY UTILITY, the system continues processing. If an -ALTER UTILITY command is then executed, a subsequent -DISPLAY UTILITY command reflects the results (if any) of the -ALTER UTILITY command.

DSNU385I *csect-name* - LOG PHASE COMPLETE,
 ELAPSED TIME = hh/mm/ss

Explanation: This message is issued at the normal completion of the LOG phase of the REORG utility. The time that has elapsed between the beginning and the completion of this phase was:

hh hours
mm minutes
ss seconds

Severity: 0 (informational)

System Action: Processing continues to the next phase of the REORG utility.

DSNU386I *csect-name* - LOG PHASE STATISTICS.
 NUMBER OF ITERATIONS = //iiiiiii,
 NUMBER OF LOG RECORDS = rrrrrrrr

Explanation: This message is issued at the normal completion of the LOG phase of the REORG utility.

iiiiiii The number of iterations of log processing that were performed. This number includes one or more iterations during which applications have read/write access plus one final iteration during which applications have read-only access.

rrrrrrrr The number of log records that were read.

Application of some of these log records might be unnecessary. Therefore, the LOG phase might apply only a subset of these log records to the shadow copy of the table space or partition.

Severity: 0 (informational)

System Action: The LOG phase of the REORG utility is completed.

DSNU387I *csect-name* - SWITCH PHASE
 COMPLETE, ELAPSED TIME =
 hh/mm/ss

Explanation: This message is issued at the normal completion of the switch phase of the REORG utility. The time that has elapsed between the beginning and the completion of this phase was:

hh hours
mm minutes
ss seconds

Severity: 0 (informational)

System Action: Processing continues to the next phase of the REORG utility.

DSNU388I *csect-name* - BUILD2 PHASE
 COMPLETE, ELAPSED TIME =
 hh/mm/ss

Explanation: This message is issued at the normal completion of the BUILD2 phase of the REORG utility. The time that has elapsed between the beginning and the completion of this phase was:

hh hours
mm minutes
ss seconds

Severity: 0 (informational)

System Action: Processing continues to the next utility statement in the utility job step, if any.

DSNU389I *csect-name* - BUILD2 PHASE
STATISTICS. NUMBER OF
NONPARTITIONED INDEXES = *mmm*

Explanation: This message is issued at the normal completion of the BUILD2 phase of the REORG utility.

mmm The number of nonpartitioned indexes whose RIDs were corrected.

Severity: 0 (informational)

System Action: The BUILD2 phase of the REORG utility is completed.

DSNU390I *csect-name* INVALID CONVERSION FOR
FIELD *cccccccc*

Explanation: The input field type for column, 'cccccccc', is incompatible with its data type (as found in the catalog).

Severity: 8 (error)

System Action: Utility processing is terminated.

User Response: Correct the error, and resubmit the job. Refer to *DB2 Utility Guide and Reference* for compatible data types.

DSNU391I *csect-name* - SORTBLD PHASE
STATISTICS. NUMBER OF INDEXES =
mmm

Explanation: This message is issued at normal completion of the SORTBLD phase of the LOAD, REORG, or REBUILD INDEX utility. The number of indexes that were built is indicated as *mmm*.

Severity: 0 (informational)

System Action: The SORTBLD phase of either the LOAD, REORG, or REBUILD INDEX utility is completed.

DSNU392I *csect-name* - SORTBLD PHASE
COMPLETE, ELAPSED TIME =
hh:mm:ss

Explanation: This message is issued at the normal completion of the SORTBLD phase of the LOAD, REORG, and REBUILD INDEX utility. The time that has elapsed between the beginning of the phase and the completion of this phase was *hh* hours, *mm* minutes, and *ss* seconds.

Severity: 0 (informational)

System Action: Processing continues to the next phase of the LOAD, REORG, or REBUILD INDEX utility. If this is the last phase, processing continues to the next utility statement in the utility job step, if any.

DSNU393I *csect-name* SORTBLD PHASE
STATISTICS - NUMBER OF KEYS =
nnnnnnnn FOR INDEX *index-name* PART
part-num

Explanation: This message is issued by the SORTBLD phase of the LOAD, REORG, or REBUILD INDEX utility to report the total number of index key entries used to build the indicated index partition.

Severity: 0 (informational)

System Action: This message indicates the number of index key entries for the index partition being built. Both unique and nonunique key entries are counted. Rejected key entries are not counted.

User Response: You can verify that the number reported is consistent with expectations.

DSNU394I *csect-name* SORTBLD PHASE
STATISTICS. NUMBER OF KEYS =
nnnnnnnn FOR INDEX *index-name*

Explanation: This message is issued by the SORTBLD phase of the LOAD, REORG, or REBUILD INDEX utility. The message is repeated for each index built by the LOAD, REORG, or REBUILD INDEX utility. It indicates the total number of index key entries used to build the indicated index. If the index is a partitioning index, the total will equal the sum of the number of index key entries reported in prior DSNU393I messages.

Severity: 0 (informational)

System Action: This message indicates the number of index key entries for the index being built. Both unique and nonunique key entries are counted. Rejected key entries are not counted.

User Response: You can verify that the number reported is consistent with expectations. For example, you can determine if it matches the number of records loaded for the table indexed by the indicated index, which will have been reported in a DSNU303I message issued during the RELOAD phase.

DSNU395I *csect-name* INDEXES WILL BE BUILT IN
PARALLEL, NUMBER OF TASKS =
nnnn

Explanation: This message is issued by the RELOAD phase of the LOAD or REORG or UNLOAD phase of REBUILD INDEX utility. The message indicates that the LOAD, REORG, or REBUILD INDEX utility is able to build indexes in parallel. The number of utility tasks used to build the indexes is indicated by *nnnn*.

Severity: 0 (informational)

System Action: Processing of the RELOAD phase continues.

User Response: You can verify that the number of

tasks reported is consistent with expectations. For example, if 3 indexes are to be built, the user might expect to see number of tasks = 6.

DSNU396I *csect-name* **REPORT PHASE COMPLETE, ELAPSED TIME = hh/mm/ss**

Explanation: The REPORT phase of the LOAD utility has completed normally. The elapsed time for the execution was 'hh' hours, 'mm' minutes, and 'ss' seconds.

Severity: 0 (informational)

DSNU397I *csect-name* **NUMBER OF TASKS CONSTRAINED BY xxxxxxxx**

Explanation: This message indicates that while a utility is able to start subtasks to perform operations in parallel, the number of tasks it will use has been constrained by a lack of some resource. The constraining resource is specified by xxxxxxxx, which can have the following values and meanings:

VIRTUAL STORAGE

The utility could start additional tasks, but there is insufficient virtual storage in the address space in which the utility job is running to make it effective to do so.

VIRTUAL STORAGE BELOW

The utility could start additional tasks, but there is insufficient virtual storage below the line in the address space in which the utility job is running to make it effective to do so.

DD STATEMENTS

The utility could start additional tasks, but the user has specified DD statements for the data sets to be used by SORT for sort work data sets or for sort message data sets, and fewer sort work data set groups or sort message data sets have been specified than the maximum number of tasks the utility could otherwise start.

CONNECTIONS

The utility could start additional tasks, but there are not enough free threads available to DB2 to do so.

CPUS The utility could start additional tasks, but it would not be efficient to do so because it would overtax the available CPUs.

Severity: 0 (informational)

System Action: Processing of the phase continues.

User Response: No action is required. However, if you want to increase the number of tasks used by the utility in order to reduce the elapsed time of the utility job, then the possible actions to take depend on the value of xxxxxxxx in the message:

VIRTUAL STORAGE

Increase the amount of virtual storage available to the utility job by specifying a larger region size in the job JCL, altering the JES defaults for region size, or changing the system IEFUSI exit to allow a larger virtual region.

If the utility is using BSAM data sets for which the number of buffers have been specified (BUFNO specified in the DCB field of the DD statement for the data set), consider reducing the number of buffers.

VIRTUAL STORAGE BELOW

If possible, increase the amount of virtual storage below the line available to the utility job by specifying a larger region size in the job JCL or reducing the number of data sets allocated in the job step. It might not be possible to relieve this constraint.

DD STATEMENTS

Define additional groups of sort work data sets, or eliminate the SWnnWKmm DD statements and specify the SORTDEV keyword (and, optionally, the SORTNUM keyword) to allow SORT to use dynamic allocation of its work data sets.

If the limitation is due to sort message data sets rather than sort work data sets, define additional sort message DD statements or eliminate the UTPRInnn DD statements and allocate UTPRINT to SYSOUT so that the sort message data sets can be dynamically allocated.

CONNECTIONS

Increase the number of threads available to DB2, or submit the job during a period of reduced DB2 activity.

CPUS Submit the job to a member that has more processors.

DSNU398I *csect-name* **UNEXPECTED PROCESSING ERROR, REASON=X00E40318, ON TABLE tttttt**

Explanation: When attempting to load a record into table 'tttttt', an error was encountered. Refer to Part 4, "Section 4. DB2 Codes," on page 773 for an explanation of reason code '00E40318'.

Severity: 8 (error)

System Action: If the error was caused by a resource not being available, a DSNT500I message is issued.

The utility step is abended with a system X'04E' with an abend reason code of '00E40318'. If a DSNT500I message is not issued, an SVC dump is requested. A SYSABEND dump of batch storage is also requested.

The utility step is left in the stopped state.

User Response: If a DSNT500I message was issued, refer to its description under that message number in this manual. If the unavailable resource becomes available, the utility step is restartable.

If a DSNT500I message is not issued, the error is an internal error. Notify the system programmer.

Operator Response: An operator with SYSOPR authority can issue a TERM UTIL to free any held resources (this may not be necessary).

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU399I *csect-name* - **LOAD UTILITY ERROR SUMMARY REPORT**

Explanation: This message summarizes errors detected during the load job. Figure 1 shows the format of the report. It is issued only if unique index or referential constraint violations were detected. The report contains one line for each error. The errors are listed first by error severity and within that by *idsrn*.

ERROR SEVERITY	INPUT RECORD	Discard Heading	ERROR TYPE	TABLE NAME	FIELD/FANSET NAME	RELATED ERROR
sev	idsrn	ddsrn	type	name1	name2	idsrn2
.

Figure 1. LOAD Utility Error Summary Report

The *Discard Heading* is either DISCARD RECORD or blank, depending on whether discard processing is in effect.

The report fields have the following meanings:

sev The severity of the error reported on this line:

Severity	Type of Error	Explanation
1	Primary	Primary referential integrity errors and all nonreferential integrity errors.
2	Secondary	Secondary referential integrity errors (that is, errors that result from a primary referential integrity error in an ancestor).

idsrn The relative record number in the input data set of the record causing the error reported on this line.

ddsrn The relative record number in the input data set of the record causing the error reported on this line, if discard processing is in effect. Otherwise, *ddsrn* is blank.

type A description of the type of error reported on this line, as follows:

- Conversion
- Field specification
- Validation
- Part Specification
- Unexpected
- Column specification
- Referential integrity
- Check constraint
- Duplicate key.

name1 The name of the table for which the record causing the error was targeted, if this information is pertinent for the type of error reported on this line. Otherwise, *name1* is blank. This field has nonblank values for the following error types:

- Conversion
- Validation
- Column specification
- Referential integrity (primary).
- Check constraint

name2 The name of the field or fanset involved in the error reported on this line, if this information is pertinent for the type of error reported.

Otherwise, *name2* is blank. This field contains a field name for the following types of errors:

- Conversion
- Field specification
- Column specification.

For primary referential integrity errors, *name2* is a relationship name. For check constraint errors, *name2* is a check constraint name.

idsrn2 The input data set record number of a related error. For duplicate key errors, it gives the input data set record number of the record whose key is duplicated. For secondary referential integrity errors, it gives the input data set record number of the record whose primary referential integrity error cascaded to cause this secondary error. For other types of errors, this field is unused.

Severity: 4 (warning)

System Action: Processing continues.

DSNU400I *csect-name* **COPY PROCESSED FOR**
obj-type obj-qual.obj-name **NUMBER OF**
PAGES=nnnnnn **AVERAGE PERCENT**
FREE SPACE PER PAGE = ff.ff
PERCENT OF CHANGED PAGES =
pp.pp **ELAPSED TIME= hh/mm/ss**

Explanation: This is an informational message to report the copy statistics. This message is issued by the COPY utility, and it can also be issued from LOAD or REORG if a full image copy has been requested during a table space load or reorganization. The statistics

apply to pages included in the scope of the COPY request. This can either be a full table space, full index space (DSNUM(ALL)) or a partition (DSNUM(integer)). All the pages in the table space, index space, or partition can be copied (FULL(YES)), or only the changed pages can be copied (FULL(NO)). The message variables are:

ff.ff The average percentage of free space within the copied pages. This indicates the amount of change activity that can occur without significant impairment of reference performance.

nnnnnn The number of pages written out.

Image copies produced during LOAD or REORG will have more pages written than a full image copy produced by running the COPY utility on the same table space, because some pages will be written more than once.

pp.pp The percentage of changed pages. This indicates the amount of change activity that occurred since the last image copy or reorganization. The percentage of changed pages is obtained by dividing the number of changed pages by the number of pages in the object. Preformatted pages consisting of all zeros are included in the count of pages scanned. Since these preformatted pages are not copied to the output data set, the number of pages scanned is usually larger than the number of pages copied.

When this message is issued for image copies produced during LOAD or REORG, this percentage will always be reported as 100%, because the utility is resetting and reformatting the entire table space.

System Action: The COPY, LOAD or REORG utility continues processing this message is for information only. Message DSNU428I will be issued when the copy processing is complete.

User Response: Reported statistics could suggest that either a RUNSTATS or REORG utility should be run on the table space.

DSNU401I *csect-name* **CONCURRENT COPY COMPLETE, ELAPSED TIME= *hh:mm:ss***

Explanation: The DFSMS Concurrent Copy utility completed normally.

Severity: 0 (informational)

System Action: Processing continues to the next utility statement in the utility job step. If there are no more utility statements, the utility job step is normally terminated, and the resources are released to their prior availability state. The utility identifier (UTILID) of the utility job step becomes available for reuse.

User Response: No action is required.

DSNU402I *csect-name* **INCREMENTAL IMAGE COPY DISALLOWED FOR *obj-type* *obj-qual.obj-name* FULL IMAGE COPY WILL BE TAKEN**

Explanation: An incremental image copy for a table space or data set was requested. However, a full image copy is required. Possible reasons include:

- The request was for one of the DB2-maintained table spaces DSNDDB01.DBD01, DSNDDB06.SYSCOPY, or DSNDDB01.SYSUTILX.
- A LOAD or REORG utility was run on the table space or data set with no subsequent full image copy.
- No full image copy was found for the requested sites.
- Copy pending status was set for the requested table space or data set.
- The request was for an entire table space, but the most recent image copy for the table space is on the data set level.
- The previous image copy is a DFSMS concurrent copy.

The request for an incremental image copy is ignored, and a full image copy is taken.

Severity: 4 (warning)

System Action: The request to take an incremental image copy is treated as a request to take a full image copy.

User Response: The capacity of the target image copy data set might not be sufficient if its size was established assuming an incremental image copy. If this condition occurs, terminate and then resubmit the job step.

DSNU403I *csect-name* - **FULL AND INCREMENTAL COPIES OF THE SAME TABLESPACE ON THE SAME TAPE DISALLOWED DDNAME *ddname***

Explanation: The COPY utility has been invoked to take an incremental image copy of a TABLESPACE. The specified output data set is on a tape which contains another FULL or INCREMENTAL image copy of the same TABLESPACE. This is not allowed.

Severity: 8 (error)

System Action: The utility will terminate with a return code of 8, and will not take the image copy or update the SYSCOPY table.

User Response: Change the VOLSER for the image copy output data set or use the MODIFY RECOVERY utility to delete SYSIBM.SYSCOPY records which are no longer needed for the same TABLESPACE and tape volume.

Problem Determination: Use the SQL SELECT command to look at the SYSIBM.SYSCOPY table. If the

DSNU404I • DSNU409I

conflicting image copy data sets on the output tape are no longer needed, use MODIFY RECOVERY to eliminate the related SYSIBM.SYSCOPY records. If the data sets are still needed, you must place the new image copy on a different tape or you must take a FULL image copy.

DSNU404I *csect-name* LOCAL SITE AND RECOVERY SITE INCREMENTAL IMAGE COPIES ARE NOT SYNCHRONIZED FOR *obj-type obj-qual.obj-name*

Explanation: No incremental image copy can be made if

1. The incremental image copy is requested only for a site other than the current site.
2. The incremental image copies are requested for both sites but the most recent full image copy was made only for the current site.
3. The incremental image copies are requested for both sites and the most recent full image copies were made for both sites, but between the most recent full image copy and current request, all incremental image copies were made for current site only.

Severity: 8(error)

System Action: The utility will terminate with a return code of 8, and will not take the image copy or update the SYSCOPY table.

User Response: Take another full image copy of the TABLESPACE for both LOCAL site and RECOVERY site or change the request to make incremental image copy only for current site.

DSNU406I FULL IMAGE COPY SHOULD BE TAKEN FOR BOTH LOCAL SITE AND RECOVERY SITE FOR *obj-type obj-qual.obj-name*

Explanation: The requested full image is for one site only but history shows that there were image copies taken for both local site and recovery site and the table space is in copy pending status, or point in time recover has been done on the table space, or the table space is in copy pending status and the requested full image copy is for a site other than the current site. Be aware of the following situations:

1. If the requested copy is made for current site, then the other site can only do point in time recovery.
2. If the requested copy is for the site other than the current site, then the TABLESPACE will be in the same state as before COPY has been made.

Severity: 4 (warning)

System Action: COPY, LOAD, or REORG utility will continue to process the image copy.

User Response: Take another full image copy of the TABLESPACE for both LOCAL site and RECOVERY site to guarantee the correct recovery on both sites or check DSNZPARM to ensure that the current site is the site at which the image copy is being taken.

DSNU407I *csect-name* - DATA SET ALREADY USED FOR PREVIOUS IMAGE COPY DDNAME *ddname*

Explanation: A COPY, LOAD, or REORG utility has been invoked to take an image copy to a data set which is a duplicate of one already recorded in SYSCOPY. If the specified data set is cataloged, a matching DSNAME exists. If the specified data set is not cataloged, a matching DSNAME, DSVOLSER, and FILESEQNO exists.

Severity: 8 (error)

System Action: The utility will terminate with a return code of 8, and will not take the image copy or update the SYSCOPY table.

User Response: Change the name of the data set or use MODIFY utility to delete the old SYSCOPY record containing the duplicate data set.

DSNU408I *csect-name* - dsn EXISTS WITH -VOLUME=*vol*, FILE SEQUENCE-NUMBER=*fseq*, RBA=*rba*|*lrsn*, DATE=*date*, TIME=*time*

Explanation: If this message is issued after DSNU403I, it provides information from the SYSCOPY catalog table about the previously created image copy of the table space. If this message is issued after DSNU407I, it provides information from the SYSCOPY table about the duplicate data set that was detected during image copy processing.

For copies to DASD or MSS, *fseq* is 0; for copies of cataloged data sets, *vol* is (CATG).

Severity: 8 (error)

System Action: The utility terminates with return code 8 and does not take the image copy or update the SYSCOPY table.

User Response: Use the information provided to change the name of the data set or to locate the duplicate SYSCOPY record for deletion with the MODIFY RECOVERY utility.

DSNU409I *csect-name* NO hardware-or-software SUPPORT FOR *obj-type obj-qual.obj-name*

Explanation: This message is issued by the COPY or RECOVER utility for one of the following reasons.

- The COPY utility was invoked to take a DFSMS concurrent copy of a table space or index space that

resides on a device with no hardware or software support for the DFSMSdss DUMP command with the CONCURRENT option.

- The RECOVER utility invoked the DFSMSdss RESTORE command without the supporting software.

Severity: 4 (for RECOVER) or 8 (for COPY)

System Action: The RECOVER utility falls back to the previous image copy data set and continues. The COPY utility job terminates.

User Response: If a list of objects is specified in the COPY job, remove the object that has no hardware or software support from the list. Resubmit the job or use the DB2 COPY utility instead of the DFSMS Concurrent Copy utility.

DSNU410I *csect-name obj-type obj-qual.obj-name*
CONTAINED NO CHANGED PAGES

Explanation: An incremental image copy (COPY option FULL(NO)), which copies only changed pages, was requested. However, no changed pages were found.

Severity: 4 (warning)

This message reflects a warning condition that did not prevent subsequent processing.

System Action: This message indicates normal completion of the image copy utility. Processing continues to the next utility statement in the utility job step, if any. If there are no more utility statements, the utility job step is normally terminated, and the resources are released to their prior availability state. The UTILID of the utility job step becomes available for reuse.

Because no output was produced, the SYSIBM.SYSCOPY catalog table remains unchanged.

The requester may want to determine why the apparent assumption that a change occurred was not true.

Operator Response: The target copy data set identified by the DD statement nominated by the COPY COPYDDN option was not required. It was not tracked in the DB2 catalog table SYSIBM.SYSCOPY. It need not be kept for subsequent re-call.

DSNU411I *csect-name* **UNABLE TO LOGICALLY COMPLETE** *obj-type obj-qual.obj-name*
RETURN CODE *return-code* **REASON CODE** *reason-code*

Explanation: The DFSMSdss DUMP command with the CONCURRENT option encountered an error during the initialization of the target object being copied. The return code and reason code are from the DFSMSdss DUMP command.

Severity: 8

System Action: The utility job terminates.

User Response: See the return code and reason code in *z/OS DFSMSdss Storage Administration Reference* to determine the problem. Resubmit the job after resolving the problem.

DSNU412I *csect-name* **UNABLE TO PHYSICALLY COMPLETE** *obj-type obj-qual.obj-name*
RETURN CODE *return-code*

Explanation: The DFSMSdss DUMP command with the CONCURRENT option encountered an error during the backup process. The return code is from the DFSMSdss DUMP command.

Severity: 8

System Action: The utility job terminates.

User Response: See the return code description in *z/OS DFSMSdss Storage Administration Reference* to determine the problem. Resubmit the job after resolving the problem, or use the DB2 Copy utility instead of the DFSMS Concurrent Copy utility for the failed object.

DSNU413I *csect-name* - **CONCURRENT COPY SUCCESSFUL FOR** *obj-type obj-qual.obj-name*

Explanation: The DFSMS Concurrent Copy utility completed normally for the named object. This message is repeated for every copied object in the list.

Severity: 0 (informational)

System Action: Processing continues to the next object in the list. If there are no more objects, the utility ends normally with message DSNU401I.

User Response: No action is required.

DSNU414I *csect-name* **UNABLE TO RETRIEVE RESTART/REDO LRSN** *obj-type obj-qual.obj-name*

Explanation: This message is issued by the DB2 COPY utility when an error is encountered during the retrieval of a log record sequence number (LRSN).

This error can occur in these situations:

- Another DB2 in a data sharing group terminated abnormally while trying to update the table space or index space.
- A failure occurred while trying to communicate with other DB2s in the data sharing group.

Severity: 8

System Action: The utility job terminates.

User Response: Issue a -DISPLAY DATABASE command with the USE option to determine if any other DB2 systems hold a retained lock on the table space or index space (status = RSTR). If so, you must restart that DB2 system before the COPY job can be successfully run.

DSNU415I *csect-name* **INVALID OUTPUT BLOCK SIZE SPECIFIED DDNAME *ddname***

Explanation: Valid block sizes for an image copy or mergecopy data set are multiples of 4KB and less than the device limitation.

Severity: 8 (error)

System Action: Utility processing is terminated.

User Response: Correct the JCL statement, or use the default. Resubmit the request in a new utility job step. Refer to *DB2 Utility Guide and Reference* for a discussion of image copy and work data set constraints.

DSNU416I *csect-name* **THE OUTPUT IMAGE COPY DATA SET CANNOT BE PARTITIONED. DDNAME *ddname***

Explanation: The use of partitioned image copy data sets is restricted. The COPY, MERGECOPY, LOAD, or REORG utility job that was submitted has a partitioned output image copy data set, specified by the COPYDDN *ddname* or RECOVERYDDN *ddname* parameter.

Severity: 8 (error)

System Action: Utility processing is terminated. The image copy will not be taken or the merge will not be done, and the SYSIBM.SYSCOPY table will not be updated.

User Response: Correct the utility job by specifying a nonpartitioned data set as the output image copy data set.

DSNU417I *csect-name* **THE NUMBER OF VOLUMES USED BY THE IMAGE COPY DATA SET *data-set-name* HAS REACHED THE LIMIT**

Explanation: The image copy data set reached the limit of 255 volumes and another volume is required.

Severity: 8 (error)

System Action: The utility job is terminated.

User Response: You might want to use the DSNUM option of the COPY utility to identify a partition or data set within the table space to be copied, or specify a partition number to be loaded or reorganized if the copy is being produced from a LOAD or REORG. Refer to *DB2 Utility Guide and Reference* for a description of the COPY utility and the DSNUM option, and descriptions of the LOAD and REORG utilities and the PART option.

DSNU418I *csect-name* **CANNOT TAKE IMAGE COPY AT DATASET LEVEL FOR NONPARTITIONED TABLESPACE *obj-qual.obj-name* IN COPY PENDING STATUS**

Explanation: An image copy at the data set level was requested. However, it is not allowed for one of the following reasons:

- The table space is in copy pending status.
- The table space is not suitable for image copy at the data set level.

A copy of the entire table space is required.

Severity: 8 (error)

System Action: The COPY utility completes unsuccessfully with return code 8.

System Programmer Response: You must take a full image copy of the entire table space by specifying the DSNUM ALL option with the COPY utility.

DSNU420I *csect-name* **INCORRECT SHARE LEVEL SPECIFIED FOR TABLE SPACE *database-name.tablespace-name* DSNUM *dsnum***

Explanation: When copying a table space that is not recoverable, the share level (SHRLEVEL) must be REFERENCE.

If the object is an entire table space, 'DSNUM *dsnum*' is not displayed.

Severity: 8 (error)

System Action: Utility processing is terminated.

User Response: Correct the SHRLEVEL to REFERENCE, and resubmit the COPY utility in a new utility job step. Refer to *DB2 Utility Guide and Reference* for a discussion of COPY utility constraints.

DSNU421I *csect-name* - **START OF DFSMS MESSAGES**

Explanation: This message indicates the beginning of the DFSMS messages; DSNU422I indicates the end.

System Action: No action is required, but subsequent DFSMS messages might require action. See the DFSMS documentation for further information.

DSNU422I *csect-name* - **END OF DFSMS MESSAGE**

Explanation: This message indicates the end of the DFSMS messages; DSNU421I indicates the beginning.

System Action: No action is required, but preceding DFSMS messages might require action. See the DFSMS documentation for further information.

DSNU423I *csect name* **CANNOT TAKE CONCURRENT COPY WITH SHRLEVEL CHANGE OPTION FOR** *obj-type obj-qual.obj-name* **WITH GREATER THAN 4KB PAGE SIZE**

Explanation: The DFSMS Concurrent Copy utility is serialized at the extent level. The greater than 4KB page size condition might span more than one extent. This might cause the output data set to contain inconsistent data.

Severity: 8 (error)

System Action: The COPY utility completes unsuccessfully with return code 8.

System Programmer Response: You must take a concurrent copy with the SHRLEVEL REFERENCE option or a DB2 image copy if you prefer the SHRLEVEL CHANGE option.

Convert the data set attribute Control Interval size of the associated tablespace from the 4K Control Interval into the one that matches the page size. DB2 Utilities REORG Tablespace, LOAD with REPLACE, and RECOVER can be used to convert the table space.

DSNU424I *csect-name* **INCOMPATIBLE MAINTENANCE DETECTED. REFERENCE APAR NUMBER** *apar* **DO THE FOLLOWING:**

Explanation: This message indicates that there is a maintenance incompatibility detected across restart. This message is followed by the actions the user should take to resolve the incompatibility.

apar The number of the APAR with closing text that describes the incompatibility.

System Action: Utility execution is abended.

User Response: Refer to the action text in the message.

System Programmer Response: Refer to the APAR closing text.

DSNU425I *csect-name obj-type obj-qual.obj-name* **DOES NOT HAVE THE COPY YES ATTRIBUTE**

Explanation: The utility cannot process the identified index or index space because it was not defined with the COPY YES attribute. Without the COPY YES attribute, the index cannot be specified as a target for the RECOVER, COPY, or REPORT utilities. If the index needs to be rebuilt from the data in the table space, use the REBUILD INDEX utility instead.

Severity: 4 (warning) or 8 (error)

System Action: The RECOVER utility terminates processing with a return code of 8. The COPY utility

skips this object but continues processing the other objects in the list. The final COPY utility return code will be 8. The REPORT utility issues this message with a return code of 4 and continues processing other objects (if any).

User Response: Determine whether the index should be altered to have the COPY YES attribute. If so, alter the index then rerun the utility job. Otherwise remove the index from the utility statement.

DSNU426I *csect-name* **CANNOT COPY ONE PIECE OF NON-PARTITIONING** *obj-type obj-qual.obj-name*

Explanation: The copy of a nonpartitioning index at the data set level is not allowed.

Severity: 8 (error)

System Action: The COPY utility skips this object but continues processing the other objects in the list. The final COPY utility return code will be 8.

User Response: Either remove the DSNUM option so that it defaults to DSNUM(ALL) or modify your DSNUM option to DSNUM(ALL).

DSNU427I *csect-name* **OBJECTS WILL BE PROCESSED IN PARALLEL, NUMBER OF OBJECTS =** *nnnn*

Explanation: This message is issued by COPY or RECOVER utilities. The message indicates that COPY or RECOVER is able to process the objects in the list in parallel. The number of objects used is indicated by *nnnn*.

Severity: 0 (informational)

System Action: Processing of the utility continues.

User Response: You can verify that the number of objects processed is consistent with expectations.

DSNU428I *csect-name* **DB2 IMAGE COPY SUCCESSFUL FOR** *obj-type obj-qual.obj-name*

Explanation: The image copy of the object processed by the COPY, LOAD, or REORG utility has completed successfully and the image copy data set information has been recorded in the SYSIBM.SYSCOPY catalog table.

System Action: The COPY utility continues its processing on the next object in the list. The LOAD and REORG utilities continue processing in the subsequent phases.

DSNU429I *csect-name* **RECOVERY OF** *objecttype*
database-name.tablespace-name **MUST**
BE EXECUTED AT THE PARTITION
LEVEL

Explanation: You must recover the partitioned object at the partition level. You may receive this message if you are using COPY with the CONCURRENT option. The use of online REORG (SHRLEVEL REFERENCE or CHANGE) with the FASTSWITCH YES option has created a mixture of 'I0001' and 'J0001' instance nodes (fifth qualifier) for the underlying LDS's for the partitions of this object.

Severity: 0 (informational)

System Action: Utility processing continues.

DSNU430I *csect-name* - **ERROR ALLOCATING**
TEMPORARY FILTER FOR *obj-type*
obj-qual.obj-name **DSN=name**
CODE=X'reason-code'

Explanation: SVC 99 returned an error during the dynamic allocation of a temporary filter data set. This message is followed by text that explains the reason-code that is shown.

The COPY utility was specified with the CONCURRENT option, and has detected that the number of data sets to be processed will exceed the DFSMSdss DUMP command limitation of 255. The utility will dynamically allocate a temporary filter data set for the object and generate a DFSMSdss DUMP command with the FILTER option.

Severity: 8 (error)

System Action: Utility processing halts for this object.

The utility job completes with a return code of 8.

If the utility job step includes an OPTIONS control statement with the EVENT(ITEMERROR,SKIP) option, the utility will process the next item in the list.

User Response: Correct the error that is preventing dynamic allocation, and resubmit the utility job. In some cases where dynamic allocation may not be possible, consider using the FILTERDDN option on the COPY utility statement.

DSNU431I *csect-name* - **ERROR ALLOCATING**
TEMPORARY FILTER FOR *obj-type*
obj-qual.obj-name **DSNUM=name**
CODE=X'reason-code'

Explanation: An error returned during the dynamic allocation of a temporary filter data set. This message is followed by text that explains *reason-code*.

The RECOVER utility was run with the CURRENTCOPYONLY option and has detected that the number of data sets to be processed exceeds the DFSMSdss RESTORE command limitation of 255. DB2

dynamically allocates a temporary filter data set for the object and generates a DFSMSdss RESTORE command with the FILTER option.

Severity: 8 (error)

System Action: If the utility job step includes an OPTIONS control statement with the EVENT(ITEMERROR,SKIP) option, the utility processes the next item in the list. Otherwise, utility processing stops with return code of 8.

User Response: Correct the error that prevents dynamic allocation and resubmit the utility job. If dynamic allocation is not possible, remove, where possible, the CURRENTCOPYONLY option on the RECOVER utility statement.

DSNU432I *csect-name* - **ERROR DURING DFSS**
RESTORE OBJECT FOR *obj-type*
obj-qual.obj-name. **THE OBJECT IS NOT**
RECOVERED

Explanation: The RECOVER utility received an error notification from DFSS on object *obj-qual.obj-name*. The object has not been restored, but recovery of the other objects continues.

Severity: 4 (warning)

System Action: RECOVER processes the other objects.

When RECOVER completes, it displays all objects for which CURRENTCOPYONLY was specified.

User Response: Remove the CURRENTCOPYONLY keyword from the utility control statements.

DSNU434I *csect-name* - **TEMPLATE**
TEMPLATE-NAME HAS THE STACK
YES OPTION, WHICH IS NOT
SUPPORTED FOR CONCURRENT
COPY.

Explanation: The COPY utility attempted to execute a concurrent copy, using a TEMPLATE statement that contains the STACK YES option.

Severity: 8 (error)

System Action: If the utility job step includes an OPTIONS control statement with the EVENT(ITEMERROR,SKIP) option, the utility processes the next item in the list. Otherwise, utility processing stops with return code of 8.

User Response: Remove the STACK YES option from the TEMPLATE Statement, then resubmit the COPY job. Use the FILTERDDN option on the COPY statement to dump multiple objects to a concurrent copy dump data set.

DSNU440I *csect-name* **IMAGE COPY INFORMATION**

Explanation: This message gives statistical information about the results of running the COPY utility. It applies to a table space, partition, or data set, and is based on the information in the space page map at the time the utility is executed. The output contains the following information:

DBNAME

The name of the database to which the table space belongs.

TSNAME

The table space specified in the utility statement.

DSNUM

The partition or data set number of the table space. The value is ALL if information is about the entire table space.

nnKB PAGES

The total number of *nn*KB pages in the partition, data set, or entire table space. This value includes preformatted pages that contain all zeroes.

EMPTY PAGES

The total number of empty pages in the data set of the segmented table space, or entire segmented table space. Empty pages can result from deletes, or are pages that are not yet formatted. They are not copied by the utility.

CHANGED PAGES

The number of pages in the partition, data set, or table space that were changed since the last time an image copy was created. If an incremental image copy is taken, this value is the number of pages that are copied.

PERCENT OF CHANGED PAGES

The percent of changed pages in the table space, data set, or partition specified.

ICTYPE

The type of image copy recommended for the partition, data set, or table space specified. ICTYPE is based on the comparison between the percent of changed pages and the change limit values. ICTYPE values:

- I** If the percent of changed pages is greater or equal to the low CHANGELIMIT value and less than the high CHANGELIMIT value. An incremental image copy is recommended, or COPY takes one if the REPORTONLY option is not specified.
- F** If the percent of changed pages is equal to or greater than the high

CHANGELIMIT value. A full image copy is recommended, and COPY takes one if the REPORTONLY option is not specified.

NONE If no pages were changed. An image copy is not recommended, and COPY does not take one.

blank For the partition or data set if DSNUM ALL is specified, or if CONCURRENT is specified and the percent of changed pages is less than the CHANGELIMIT value.

Severity: 0 (informational)

System Action: Utility processing continues

User Response: If the message indicates, "INFORMATION CANNOT BE DETERMINED" for a table space, partition, or data set, examine the utility output for the DSNU441I message which lists the page numbers of the broken pages. See message DSNU441I for further instructions on repairing pages.

DSNU441I *csect-name* **BROKEN PAGE FOUND**
DBNAME = dbname TSNAME = tsname
DSNUM = dsnum PAGE = page

Explanation: The COPY utility found a broken space map page.

dbname

The name of the database to which the table space belongs.

tsname

The table space containing the broken page.

dsnum

The partition or data set number of the table space containing the broken page.

page

The hexadecimal page number of the broken page.

Severity: 8 (error)

System Action: Utility execution continues.

User Response: The data sets identified are in an indeterminate state. Use RECOVER, RECOVER PAGE, or the REPAIR utility to correct the broken page. Refer to Part 2 of *DB2 Diagnosis Guide and Reference*.

DSNU442I *csect-name* **CHANGELIMIT REPORT INFORMATION UNAVAILABLE FOR**
obj-type obj-qual.obj-name **WITH TRACKMOD NO**

Explanation: This message is issued in response to a COPY utility. The CHANGELIMIT option cannot produce statistical information for a table space or a partition that is defined with TRACKMOD NO, or before a copy has been taken after the TRACKMOD attribute has been changed from NO to YES.

DSNU443I • DSNU454I

Severity: 4 (informational)

System Action: If REPORTONLY is not specified then a full image copy will be taken.

User Response: To obtain complete statistical information run CHANGELIMIT REPORTONLY after a copy has been taken.

DSNU443I csect-name type CHANGE LIMIT MET FOR *obj-type obj-qual.obj-name*

Explanation: The COPY utility is indicating whether the percent of changed pages in the specified table space, partition, or data set meets the CHANGELIMIT values. *type* values:

NO If no CHANGELIMIT met.

INCREMENTAL

If the percent of changed pages is greater than the low CHANGELIMIT value and less than the high CHANGELIMIT value.

FULL If the percent of changed pages is greater than or equal to the the high CHANGELIMIT value.

Severity: The return codes are:

1 (informational)

If no CHANGELIMIT was met.

2 (informational)

If the percent of changed pages is greater than the low CHANGELIMIT and less than the high CHANGELIMIT value.

3 (informational)

If the percent of changed pages is greater than or equal to the high CHANGELIMIT value.

System Action: Utility processing continues.

User Response: If the REPORTONLY option is specified and the result of this job step is not used to conditionally execute other job steps, examine the utility messages for this table space, partition, or data set to determine if it has changed to such a degree that an image copy or other step should be performed.

DSNU445I csect-name *ictype* IMAGE COPY WILL BE TAKEN FOR *obj-type obj-qual.obj-name*

Explanation: The COPY utility is indicating whether the percent of changed pages in the table space meets the change limit value, and whether an image copy will be taken. *ictype* values:

NO If no CHANGELIMIT value met.

INCREMENTAL

If the percent of changed pages is greater than the low CHANGELIMIT value and less than the high CHANGELIMIT value.

FULL If the percent of changed pages is greater than or equal to the high CHANGELIMIT value.

Severity: 0 (informational)

System Action: Utility processing continues. An image copy is taken if a change limit is met. If the low CHANGELIMIT value is met, then an incremental copy is taken. If the high CHANGELIMIT value is met, then a full image copy is taken.

DSNU446I csect-name - CHANGELIMIT REPORT INFORMATION UNAVAILABLE FOR *obj-type obj-qual.obj-name*, A FULL IMAGE COPY MUST BE TAKEN

Explanation: The changelimit dataset statistical information was requested, but is unavailable. A full image copy is required. Possible reasons are as follows:

- The request was for one of the DB2-maintained table spaces: DSNDB01.DBD01, DSNDB06.SYSCOPY, or DSNDB01.SYSUTILX.
- A LOAD or REORG utility was run on the table space or data set with no subsequent full image copy.
- No full image copy was found for the requested sites.
- Copy pending status was set for the requested table space or data set.
- The request was for an entire table space, but the most recent image copy for the table space is on the data set level.
- The previous image copy is a DFSMS concurrent copy.

The statistical information report will not be generated. If REPORTONLY was omitted, then a FULL image copy is taken.

Severity: 4 (warning)

System Action: The request for CHANGELIMIT without REPORTONLY is treated as a request to take a full image copy. The request for CHANGELIMIT with REPORTONLY will not generate the report.

User Response: If REPORTONLY is specified, then submit a job to take a full image copy.

DSNU454I csect-name COPY MERGE COMPLETE. NUMBER OF COPIES = *iiii*, NUMBER OF COPIES MERGED = *cccccc*, TOTAL NUMBER OF PAGES MERGED = *ttttt*, ELAPSED TIME = *hh/mm/ss*

Explanation: This message marks the normal completion of the MERGECOPY utility. The variables are:

iiii The number of copies found.

cccccc The number of image copies that were merged. The number merged can be less than

the number found if a work data set was not specified using the MERGECOPY WORKDDN option.

ttttt The total number of pages that were merged.

The merged incremental copies were consolidated either into a single new incremental image copy or into a new full image copy, depending upon the MERGECOPY NEWCOPY option. The DB2 catalog table SYSIBM.SYSCOPY was updated to reflect the results.

This message may indicate that prior data set entries were deleted and, consequently, that backup data set resources were freed.

Severity: 0/4 (informational/warning)

System Action: Processing continues to the next utility statement in the utility job step, if any. If there are no more utility statements, the utility job step is normally terminated, and the resources are released to their prior availability state. The UTILID of the utility job step becomes available for reuse.

User Response: You can review the reported statistics to assess the effectiveness of performing incremental image copies. You can examine the SYSIBM.SYSCOPY catalog table to review the incremental and full image copies that are subject to DB2 recovery.

The full or incremental image copy data set identified by the DD statement specified in the COPYDDN option was recorded in SYSIBM.SYSCOPY. DB2 assumes that the image copy data set is now available for subsequent recovery. Ensure that the data set is available for recovery.

DSNU458I *csect-name* **NO IMAGE COPIES TO MERGE**

Explanation: This message is issued in response to a MERGECOPY request. The MERGECOPY utility was invoked to merge existing incremental image copies. However, in checking the DB2 catalog table SYSIBM.SYSCOPY, no incremental image copies were found.

Severity: 4 (warning)

A severity 4 condition is given to alert the invoker that processing did not proceed as defined. However, processing is proceeding; nothing was encountered that would invalidate further processing.

System Action: This message indicates the completion of the MERGECOPY utility. Processing continues to the next utility statement in the utility job step, if any. If there are no more utility statements, the utility job step is normally terminated, and the resources that were held become available for REFERENCE

processing. The UTILID of the utility job step becomes available for reuse.

The requester may want to determine why the assumption that incremental copies existed was not true.

Operator Response: The target copy data set identified by the DD statement nominated by the MERGECOPY COPYDDN option was not required. It was not tracked in the DB2 catalog table SYSIBM.SYSCOPY. It need not be kept for subsequent re-call.

DSNU459I **SYSCOPY P RECORD ENCOUNTERED FOR** *obj-type obj-qual.obj-name*, **PIT RBA = xxxxxx**

Explanation: The utility encountered a SYSCOPY P record which requires that the SYSCOPY record at the given RBA or LRSN be used. The utility properly traverses the SYSCOPY records following this SYSCOPY P record.

Severity: 0 (informational)

User Response: For further information on how the SYSCOPY records are traversed, see Part 4 (Volume 1) of *DB2 Administration Guide*.

DSNU460I *csect-name* **IMAGE COPIES INCONSISTENT. MERGECOPY REQUEST REJECTED**

Explanation: MERGECOPY was requested for an entire table space. However, the most recent image copy for the associated table space was on the data set level. In addition, if the associated table space was partitioned, this might indicate that any or all of its partitions were being reorganized or loaded without logging after the MERGECOPY starting point. The MERGECOPY starting point is the most recent full image copy for the entire table space.

Severity: 4 (warning)

A severity 4 condition is given to alert the user that processing did not proceed as defined. However, processing is proceeding; nothing was encountered that would invalidate further processing.

System Action: This message indicates the completion of the MERGECOPY utility. Processing continues to the next utility statement in the utility job step, if any. If there are no more utility statements, the utility job step is normally terminated, and the resources that were held become available for REFERENCE processing. The UTILID of the utility job step becomes available for reuse.

No output was produced and the SYSIBM.SYSCOPY catalog table remains unchanged.

User Response: A full image copy of the associated table space should be taken. However, if it is preferred

DSNU461I • DSNU471I

that a recovery be done on the data set level, a MERGECOPY job should be submitted by specifying 'DSNUM(data set number)' for each data set for which MERGECOPY is required.

DSNU461I *csect-name* PRIMARY FULL COPY DATA SET NOT FOUND, BACKUP WILL BE USED INSTEAD

Explanation: The primary full image copy cannot be found. The backup full image copy will be located and used for the merge process.

Severity: 0 (informational)

User Response: If the MERGECOPY utility can use the backup full image copy, the utility continues to process. If no backup full image copy can be used, the utility terminates.

DSNU462I *csect-name* MERGECOPY DISALLOWED FOR REQUESTED TABLE SPACE

Explanation: MERGECOPY was requested for table space DSNDB01.DB01, DSNDB01.SYSUTIL, or DSNDB06.SYSCOPY. MERGECOPY is not permitted for one of the following reasons:

- Only full image copies are allowed on these DB2-maintained tables.
- There is no record of the full image copies in the SYSIBM.SYSCOPY catalog; the copy information is in the DB2 log.

Severity: 8 (error)

System Action: Further utility processing is terminated.

System Programmer Response: Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for more information about MERGECOPY utility constraints.

DSNU463I *csect - THE xxxxxxxx* IMAGE COPY DATA SET *data-set-name* WITH DATE=*dddddd* AND TIME=*ttttt*, IS PARTICIPATING IN MERGECOPY.

Explanation: This informational message indicates the image copy that is used in the merge process. The variables have the following meanings:

xxxxxxx

PRIMARY or BACKUP, indicating a primary or backup image copy

data-set-name

The image copy data set name

dddddd

The image copy date

ttttt

The image copy time

Severity: 0 (informational)

User Response: The utility continues to process normally.

DSNU464I THIS IS A *sitetype*; *outputtype* WITH NEWCOPY NO IS NOT ALLOWED.

Explanation: The 'NEWCOPY NO' option to create incremental image copies is not supported for the current site. This error can be caused by:

- Running the MERGECOPY utility at *sitetype* LOCALSITE, but selecting the RECOVERYDDN with the 'NEWCOPY NO' option.
- Running the MERGECOPY utility at *sitetype* RECOVERYSITE, but selecting the COPYDDN with the 'NEWCOPY NO' option.

Severity: 8 (error)

System Action: The command cannot be executed.

User Response: Correct the error and resubmit the job. Refer to *DB2 Utility Guide and Reference* for detailed information.

DSNU470I TABLESPACE DSNDB01.SYSUTILX, ITS TABLES AND INDEXES CANNOT BE INCLUDED IN A LIST OF OBJECTS.

Explanation: This message is issued by the running utility when a control statement contains a list of objects, or references a LISTDEF, which includes any of the following SYSUTILX related objects: TABLESPACE DSNDB01.SYSUTILX, INDEXSPACE DSNDB01.DSNLUX01, INDEXSPACE DSNDB01.DSNLUX02, TABLE SYSADM.SYSUTIL, TABLE SYSADM.SYSUTILX, INDEX SYSADM.DSNLUX01 or INDEX SYSADM.DSNLUX02.

Severity: 8(error)

System Action: The utility job terminates.

User Response: Remove the invalid object from the control statement and run the utility against DSNDB01.SYSUTILX, its tables and indexes separately.

DSNU471I *csect-name - COPY PENDING ON* TABLESPACE *dbname.tablespace* PROHIBITS PROCESSING

Explanation: An attempt was made to execute a utility against a table space. Either the table space was in copy pending state or DSNDB06.SYSCOPY was in copy pending state.

Severity: 8 (error)

System Action: Utility processing is terminated.

User Response: Remove the table space from the copy pending state and resubmit the job.

Problem Determination: Refer to Part 4 (Volume 1) of

DB2 Administration Guide for a discussion of the database recovery function.

DSNU472I *csect-name* - **TABLESPACE**
tablespace-name **HAS WRITE ERROR**
RANGE OR IS IN DEFERRED
RESTART.

Explanation: The attempt to externalize table space 'tablespace-name' pages to the media has failed.

Severity: 4 (warning)

System Action: QUIESCE still continues but you cannot make an image copy of the table space. Processing continues for all indexes within the table space and continues to the next table space in the tablespace-list, if any.

User Response: Run DISPLAY DATABASE to determine what exception state, if any, would prevent image copy on the table space.

Problem Determination: Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for a discussion of the database recovery function.

DSNU473I *csect-name* - **UNABLE TO**
EXTERNALIZE TABLESPACE
tablespace-name **PAGES**

Explanation: The attempt to externalize TABLESPACE 'tablespace-name' pages to the media has failed.

Severity: 4 (warning)

System Action: QUIESCE still continues but the table space cannot be volume-dumped.

Problem Determination: The problem may be an I/O error.

DSNU474I *csect-name* - **QUIESCE AT RBA**
rrrrrrrrrr **AND AT LRSN** *xxxxxxxxxx*

Explanation: This message displays the log RBA and LRSN at the time of the quiesce. This value is unique for all quiesced table spaces in the list and is recorded in the START_RBA column of the SYSCOPY catalog table entry for each quiesced table space in the list.

Severity: 0 (informational)

System Action: Processing continues.

DSNU475I *csect-name* - **QUIESCE UTILITY**
COMPLETE, ELAPSED TIME=ttttt

Explanation: The message marks the normal completion of the QUIESCE utility. The elapsed clock time that the QUIESCE utility uses is shown by 'ttttt'.

Severity: 0 (informational)

System Action: Processing continues to the next utility statement in the utility job step, if any. If there are

no more utility statements, the utility job step is normally terminated, and the resources are released to their prior available state. The UTILID of the utility job step becomes available for reuse.

DSNU476I *csect-name* - **INDEX** *index-name* **HAS**
WRITE ERROR RANGE OR IS IN
DEFERRED RESTART

Explanation: The attempt to externalize index 'index-name' pages to the media failed.

Severity: 4 (warning)

System Action: QUIESCE processing continues.

User Response: Issue the DISPLAY DATABASE command to determine the exception state,

Problem Determination: Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for a discussion of the database recovery function.

DSNU477I *csect-name* - **QUIESCE SUCCESSFUL**
FOR *obj-type obj-qual.obj-name*

Explanation: The QUIESCE for this object was successful. If the object is a table space, then the quiesce for all of its indexes was successful. This message will also be issued for each index with the COPY YES attribute over the quiesced table space. This message will be repeated for every quiesced table space in list.

Severity: 0 (informational)

System Action: All data held in the DB2 buffer pool(s) for the table space and its indexes have been written out to the media if no message DSNU473 or DSNU479 were issued earlier. A SYSCOPY record of ICTYPE 'Q' has been recorded in the SYSCOPY catalog table for the table space and for each of its indexes with the COPY YES attribute. The START-RBA value in the SYSCOPY record(s) is the same for all objects quiesced during this invocation of the utility. This RBA/LRSN value will be printed in the message DSNU474 following this message. Processing continues to the next table space in the table space list, if any.

DSNU478I *csect-name* - **INDEX** *index-name* **HAS**
PENDING STATE

Explanation: Index 'index-name' has a PENDING state. This message is repeated for all PENDING stated indexes in a table space.

Severity: 8 (error)

System Action: QUIESCE stops processing but continues to check all table spaces and indexes for any additional table space or index that has a PENDING state. There is no update in SYSCOPY table for any table space in the list.

User Response: Issue the DISPLAY DATABASE

DSNU479I • DSNU484I

command to look at the utility status byte in the DBA table for a specified PENDING state.

Problem Determination: Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for a discussion of the database recovery function.

DSNU479I *csect-name* - **UNABLE TO EXTERNALIZE INDEX** *index-name* **PAGES**

Explanation: The attempt to externalize index 'index-name' pages to the media has failed.

Severity: 4 (warning)

System Action: QUIESCE still continues but the table space cannot be volume-dumped.

Problem Determination: The problem may be an I/O error.

DSNU480I *csect-name* - **UNABLE TO EXTERNALIZE TABLESPACE** *tablespace-name* **PARTITION** *partition-number* **PAGES**

Explanation: The attempt to externalize TABLESPACE 'tablespace-name' PARTITION 'partition-number' pages to the media failed.

Severity: 4 (warning)

System Action: QUIESCE still continues, but the table space cannot be volume-dumped.

Problem Determination: The problem might be an I/O error.

DSNU481I *csect-name* - **QUIESCE SUCCESSFUL FOR** *obj-type obj-qual.obj-name* **PARTITION** *partition*

Explanation: The QUIESCE for PARTITION 'partition-number' of this object was successful. If the object is a table space partition, then the quiesce for all of its indexes was successful. This message will also be issued for each index with the COPY YES attribute over the quiesced table space. This message is repeated for every quiesced table space in the list.

Severity: 0 (informational)

System Action: All data held in the DB2 buffer pool(s) for the table space and its indexes have been written out to the media if message DSNU480 or DSNU482 was not issued earlier. A SYSCOPY record of ICTYPE 'Q' was recorded in the SYSCOPY catalog table for the table space and for each of its indexes with the COPY YES attribute. The START-RBA value in this SYSCOPY record is the same for all objects quiesced during this invocation of the utility. This RBA value is printed in message DSNU474 following this message. Processing continues to the next table space in the table space list, if any.

DSNU482I *csect-name* - **UNABLE TO EXTERNALIZE INDEX** *index-name* **PARTITION** *partition-number* **PAGES**

Explanation: The attempt to externalize index 'index-name' 'partition-number' pages to the media failed.

Severity: 4 (warning)

System Action: QUIESCE still continues, but the table space cannot be volume-dumped.

Problem Determination: The problem might be an I/O error.

DSNU483I *csect-name* - **TABLESPACE** *tablespace-name* **PARTITION** *partition-number* **HAS WRITE ERROR RANGE OR IS IN DEFERRED RESTART.**

Explanation: The attempt to externalize table space 'tablespace-name' partition 'partition-number' pages to the media failed.

Severity: 4 (warning)

System Action: QUIESCE still continues, but you cannot make an image copy of the table space or partition. Processing continues for the index partition and all nonpartitioned indexes within the table space, and then proceeds to the next table space in the table space list, if any.

User Response: Issue DISPLAY DATABASE to determine what exception state, if any, would prevent image copy on the table space or partition.

Problem Determination: Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for a discussion of the database recovery function.

DSNU484I *csect-name* - **INDEX** *index-name* **PARTITION** *partition-number* **HAS WRITE ERROR RANGE OR IS IN DEFERRED RESTART**

Explanation: The attempt to externalize index 'index-name' pages partition 'partition-number' pages to the media failed.

Severity: 4 (warning)

System Action: QUIESCE processing continues.

User Response: Issue DISPLAY DATABASE to determine the exception state.

Problem Determination: Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for a discussion of the database recovery function.

DSNU500I *csect-name* **RECOVERY COMPLETE,
ELAPSED TIME = hh/mm/ss**

Explanation: This message is issued at the normal completion of the RECOVER utility. The time that elapsed since the beginning of the RECOVER utility to its completion was 'hh' hours, 'mm' minutes, and 'ss' seconds.

Severity: 0/4 (informational/warning)

System Action: This message indicates the normal completion of the RECOVER utility. Processing continues to the next utility statement in the utility job step, if any. If not, the utility job step is normally terminated, and the resources held become available for further processing. The UTILID of the utility job step becomes available for reuse.

User Response: The recovered data is now available for further processing.

Operator Response: The recovered resources are available for further processing.

DSNU501I *csect-name* **A PAGE HAS BEEN
STOPPED DURING RECOVERY. SEE
PREVIOUS DSNI012 MESSAGE**

Explanation: This message is issued at the normal completion of the RECOVER utility if the data manager subcomponent cannot apply all the log records for the page because of an inconsistent DB2 log.

Severity: 8 (error)

System Action: This message indicates that the RECOVER utility completed normally except for the page (or pages) that was indicated by the previous DSNI012 messages. The data manager subcomponent marked the pages as broken. All other pages were recovered successfully. Log apply was stopped at the point of the inconsistency in the DB2 log for that page.

User Response: For information about using the REPAIR utility to apply changes that should have been made by the log record in error, refer to *DB2 Utility Guide and Reference*. If you were recovering to the current point in time, resubmit the RECOVER job, and specify 'PAGE(page-number) CONTINUE'. This causes DB2 to retrieve the page from DASD, and apply log records starting after the faulty one.

DSNU502I *csect-name* **PAGE page number WAS
NOT FOUND IN ANY IMAGE COPY
DATA SET**

Explanation: The page specified for 'RECOVER page' was not found in any image copy data sets.

This is an informational message only. It does not indicate termination of processing.

Severity: 0 (informational)

System Action: The RECOVER utility continues processing. The assumption is that the page was inserted after the last image copy was made. The page is reset and recovered from the log, starting at the log RBA recorded in the SYSCOPY record for the last image copy data set.

DSNU503I *csect-name* **PAGE page-number IS
WITHIN PHYSICAL ERROR RANGE**

Explanation: The page specified for 'RECOVER page' is within the physical error range of the table space partition, index space partition, or data set. 'RECOVER page' cannot be effective in this case, because the page would still be within the physical error range and therefore inaccessible to the user.

Severity: 8 (error)

System Action: The RECOVER utility terminates with return code 8. No changes are made to the table space.

User Response: Resubmit the RECOVER utility specifying 'error range'.

DSNU504I *csect-name* **MERGE STATISTICS FOR
obj-type obj-qual.obj-name - NUMBER OF
COPIES = cc, NUMBER OF PAGES
MERGED = nnnnnn, ELAPSED TIME =
hh/mm/ss**

Explanation: This message is issued at the completion of the MERGE process for the MERGECOPY or RECOVER utility. The message indicates the number of image copies currently processed ('cc') and the total number of pages that were merged ('nnnnn'). The same page can be obtained from more than one incremental image copy. MERGE is repeated for MERGECOPY if all of the input image copy data sets cannot be allocated and a temporary work data set has been specified.

For the RECOVER utility, MERGE is executed whether or not there are incremental image copies participating. In this case, the number of copies ('cc') is one.

The elapsed time of the MERGE is 'hh/mm/ss', hours, minutes, and seconds, respectively.

System Action: The MERGECOPY or RECOVER utility continues processing; this message is for information only.

User Response: The statistics are indicative of the processing required. For MERGECOPY, it could indicate that next time more input image copy data sets should be allocated. For example, if there was more than one MERGE pass then this message will be issued more than once. For both MERGECOPY and RECOVER, it could indicate that more frequent invocation of MERGECOPY is appropriate.

DSNU505I *csect-name* **PAGE** *page-number* **IS BEYOND END OF** *obj-type*

Explanation: A page number was found to be beyond the end of the table space, index space, or the current data set.

Severity: 8 (error)

System Action: The RECOVER utility terminates with ABEND 04E reason code 00E40100. If RECOVER PAGE was specified, then the utility terminates with return code 8 and no changes are made to the object.

User Response: Check that the image copy data set(s) in use during the RECOVER contain valid pages. If running RECOVER with the PAGE option, then resubmit the utility with the correct page specified.

DSNU506I *csect-name* **OBJECT**
obj-qualifier.obj-name **DSNUM** *dsnum* **IS IN REORG PENDING STATE**

Explanation: This message is issued at completion of a utility when an object has the REORP state set.

The utility can set the REORP state if the table space contains a table that includes an identity column. It can also set the REORP state when a partitioned table space, which has had its limiting keys altered, is recovered to a point in time.

Severity: 0 (informational)

System Action: The utility continues processing.

DSNU507I *csect-name* **NO USABLE BACKUP FOR RECOVER**

Explanation: The RECOVER utility determined that a backup was required but not found. The utility encountered one of the following situations:

- An error occurred while processing the oldest available full image copy data set. This might be the only full image copy data set available.
- While scanning backward through the SYSCOPY table, a LOAD LOG(NO) or REORG log(NO) record type was found.

Any of the following is acceptable as a backup:

- A full image copy.
- A LOAD LOG(YES).
- A REORG LOG(YES).
- For RECOVER PAGE, an incremental image copy that contains the specified page.
- A 'no record found' return from the first request for a SYSCOPY record indicates that the object was entirely populated by 'inserts'. The object will be recovered from the DB2 log if its entire history lies within the scope of the log, that is, archive log data sets containing updates for the object have not been deleted.

Severity: 8 (error)

System Action: The RECOVER utility terminates.

User Response: Re-create the object that was to be recovered.

DSNU508I *csect-name* **IN FALL BACK PROCESSING TO PRIOR FULL IMAGE COPY**

Explanation: One of the following occurred:

- The RECOVER utility could not allocate the most recent full image copy data set. The prior full image copy is used.
Accompanying messages indicate why the image copy data set could not be allocated.
- PAGE or ERROR RANGE was specified and the recoverable point identified an image copy that was created by the DFSMSdss DUMP command with the CONCURRENT option. Such an image copy cannot be used to process PAGE or ERROR RANGE. A prior recoverable point is located.

System Action: The RECOVER utility continues processing, searching for the prior image copy.

DSNU509I *csect-name* - **NO ERROR RANGE TO RECOVER**

Explanation: The RECOVER utility was invoked to recover the existing ERROR RANGE. However, no ERROR RANGE was found.

Severity: 4 (warning)

System Action: This message indicates the completion of the RECOVER ERROR RANGE utility. Processing continues to the next utility statement in the utility job step. If there are no more utility statements, the utility job step is normally terminated.

DSNU510I *csect-name* **NO GOOD FULL IMAGE COPY DATA SET FOR RECOVERY OF**
obj-type obj-qual.obj-name

Explanation: It is not possible to locate a good image copy data set from which to recover. Either no back level image copy exists, an I/O error occurred while reading the back level image copies, or DB2 was unable to locate a suitable image copy. The return code that accompanies this message is 0 or 8 under the following conditions:

- The return code is 0 if a full image copy is not found in the SYSCOPY table during RECOVER initialization or during fall back processing. However, a LOG(YES) event was detected and recover continues from the log. Note that if you have performed a REORG after your last image copy, then no full image copy may be found in the SYSCOPY table.
- The return code is 8 if the RECOVER utility is in fall back mode and no base recoverable point (a full

image copy or LOG(YES) event) was found in the SYSCOPY table. Further utility processing is terminated.

Severity: 0 (informational) or 8 (error)

System Action: If the return code is 0, processing continues. If the return code is 8, further utility processing is terminated.

User Response: Notify the system programmer if the return code is 8. If the return code is 0, no action is required.

Operator Response: If the return code is 8, the object in question should be started for utility-only processing (if it is not in this state already) until corrective action is taken. If the return code is 0, no action is required.

System Programmer Response: If the return code is 8 and the object being recovered is a table space, the data must be repaired so that an image copy can be taken. An internal error might be involved, and system support might be required. If the return code is 8 and the object being recovered is an index space, then the REBUILD INDEX utility can be used to rebuild the index from the data. If the return code is 0, no action is required. Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for a discussion of database recovery procedures.

DSNU511I *csect-name* **RECOVERY INFORMATION INDICATES THAT** *obj-type*
obj-qual.obj-name **IS NOT IN A RECOVERABLE STATE**

Explanation: The requested recovery of an object would result in recovery entirely from the log. Because the object is also in copy pending status, recovery might fail in log apply in these situations:

- A previous MODIFY utility job deleted the last recoverable point indicated in the SYSCOPY catalog table.
- A previous MODIFY utility job deleted all SYSCOPY entries.

In either case, the MODIFY utility leaves the object in copy pending status and the RECOVER utility is unable to determine the reliability of recovery from the log.

Severity: 8 (error)

System Action: The RECOVER utility terminates with return code 8.

User Response: Determine the recoverability status of the object. SYSCOPY information is probably not useful as no recoverable point (FULL IMAGE COPY, REORG LOG(YES) or LOAD REPLACE LOG(YES)) was found by the RECOVER utility. User information might be the only indication about recoverability.

To allow RECOVER to execute, copy pending status must be turned off. It is safest to make a full image copy before attempting the recovery. Then run the

RECOVER utility with the TORBA or TOLOGPOINT option.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

DSNU512I *csect-name* **DATA SET LEVEL RECOVERY IS REQUIRED FOR** *obj-type*
obj-qual.obj-name

Explanation: Recovery was requested for an entire object. However, there is an image copy made for a specific data set associated with the object. Hence, the object must be recovered by data set.

Severity: 8 (error)

System Action: RECOVER completes unsuccessfully with a return code of 8.

User Response: Terminate the current RECOVER job. Then, submit a RECOVER job by specifying 'DSNUM(data set number)' for each data set for which recovery is required. Refer to *DB2 Utility Guide and Reference* for a discussion of RECOVERY utility constraints.

DSNU513I *csect-name* **RECOVER UTILITY LOG APPLY RANGE IS RBA xxx LRSN xxx TO RBA yyy LRSN yyy**

Explanation: The RECOVER utility issues this message one or more times to display the entire log range before applying updates. The RBA and LRSN values are equal in a non-data sharing environment. The RBA values will be zero in a data sharing environment for the catalog and directory objects that do not have DSNCB01.SYSLGRNX entries. This includes catalog table spaces DSNCB06.SYSCOPY and DSNCB06.SYSGROUP and all of their indexes, and all of the directory objects.

Severity: 0 (informational)

System Action: The RECOVER utility continues processing.

DSNU514I *csect-name* **RECOVERY DATA DOES NOT PERMIT DSNUM(ALL) RECOVERY OF** *obj-type obj-qual.obj-name*

Explanation: Recovery was requested for an entire object. If the object is a table space, then the latest activity on the entire table space was a REORG LOG (NO) or a LOAD LOG (NO). If the object is an index space, then the latest activity on the entire index space was a REORG INDEX or REBUILD INDEX. If full image copies have been taken at the data set level since then, recover the object on the data set level.

Severity: 8 (error)

System Action: RECOVER completes unsuccessfully with a return code of 8.

User Response: Submit a recover job by specifying DSNUM (data set number) for each data set requiring recovery. If the object is an index space, then the REBUILD INDEX utility may be used to rebuild the index. Refer to *DB2 Utility Guide and Reference* for a discussion of RECOVERY utility constraints.

DSNU515I *csect-name* **THE IMAGE COPY DATA SET** *dsn* **WITH DATE=***date* **AND TIME=***time* **IS PARTICIPATING IN RECOVERY OF** *obj-type obj-qual.obj-name*

Explanation: This message is issued by the RECOVER utility for each participating image copy data set before it opens the data set and begins the restore process. If an error occurs while processing, the utility searches for a new recoverable base.

This message is routed to SYSOUT.

Severity: 0 (informational)

System Action: RECOVER processing continues.

User Response: Refer to *DB2 Utility Guide and Reference* for a discussion of RECOVERY utility constraints.

DSNU516I *csect-name* **NO FULL IMAGE COPY AFTER LOAD OR REORG LOG(NO) OF** *obj-type obj-qual.obj-name*

Explanation: RECOVERY was requested for a data set of an object. If the object is a table space, then a full image copy was not taken after or during a LOAD or REORG without logging. The table space is in an unrecoverable state. If the object is an index space, then a full image copy was not taken after a REORG INDEX or REBUILD INDEX.

Severity: 8 (error)

System Action: RECOVER completes unsuccessfully with a return code of 8.

User Response: If the object is a table space, the data set is in an unrecoverable state. If the object is an index space, then the REBUILD INDEX utility may be used to rebuild the index. Notify the system programmer for corrective action.

System Programmer Response: The data should be repaired before a full image copy is taken. The recovery information for the object (use the REPORT RECOVERY utility) should be scrutinized. Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for a discussion of database recovery procedures.

DSNU517I *csect-name* - **SYSCOPY RECORD DELETED BY MODIFY UTILITY.** **DSN=***dsn*, **VOL=***SER=nnn*, **FILESEQNO=***fff*

Explanation: This message is repeated for each volume of a multivolume data set that is deleted.

The variables have the following meanings:

dsn The name of the image copy data set whose record was removed from the SYSCOPY table by the MODIFY utility.

nnn The serial number of the volume containing the data set.

fff The tape file sequence number. It will be zero for DASD data sets.

Severity: 0 (informational)

System Action: The MODIFY utility continues its termination processing.

System Programmer Response: Because DB2 no longer has any knowledge of the image copy data set, you may delete it and reuse the space. If the last full image copy was deleted, ensure that another one is taken as soon as possible.

DSNU518I *csect-name object-type object-qualifier.object-name* **CONTAINS BROKEN PAGE** *page-number*, **ERROR CODE** *error*

Explanation: A broken page, *page number*, was detected during execution of an image copy utility job. The copy step is terminated and the broken page is not copied to the output data set.

Severity: 8 (error)

System Action: COPY utility ends with a return code of 8.

User Response: The associated data set has not been copied. If the object is in the COPY-pending status, it is in an unrecoverable state. Notify the system programmer for corrective action.

System Programmer Response: Use either the RECOVER, RECOVER PAGE, or REPAIR utility to correct the broken page. Refer to Part 4 (Volume 1) of *DB2 Administration Guide*. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU519I *csect-name* **TOCOPY DATA SET NOT FOUND**

Explanation: The data set specified with the keywords TOCOPY, TOVOLUME, or TOSEQNO cannot be found in the SYSCOPY table for the object to be recovered.

This may be caused by a mismatch in granularities. If the RECOVER specifies a particular DSNUM, the data

set specified with the TOCOPY keyword may be for an image copy of this DSNUM or of the entire table space or index space. However, if the RECOVER is for the entire table space or index space, the specified data set must be for an image copy of the entire table space or index space.

This message may also be issued if TOVOLUME is specified for a cataloged data set.

RECOVER TOCOPY can issue DSNU519I even if the data set information was correct but the data set was not for this site. For example, if the DB2 subsystem is specified as LOCALSITE, but the TOCOPY data set information is for a RECOVERYSITE data set, this message will be issued.

Severity: 8 (error)

System Action: RECOVER processing is terminated.

User Response: Correct the input and resubmit the RECOVER job.

DSNU520I *csect-name* **RECOVER TO A PRIOR POINT IN TIME MIGHT LEAVE TABLE SPACE *table-space-name* INCONSISTENT**

Explanation: RECOVER DSNUM to a previous point in time (for example, using the TOLOGPOINT option) was specified for a nonpartitioned table space. You might have recovered a data set that has different compression characteristics than the replaced data set. For example, the data set to which you recovered might have been compressed with a different dictionary.

Severity: 4 (warning)

System Action: Processing continues.

User Response: The table space might be in an inconsistent state. If the dictionary was not built with the data set that was just recovered, the results are unpredictable and might jeopardize all the data in the entire table space.

Recover all of the data sets in the table space to the same point in time. Do not ignore this message unless all data sets in this table space were recovered to the same point in time. Otherwise, the state of this nonpartitioned table space is inconsistent and unpredictable.

DSNU521I *csect-name* - **RECOVER UTILITY FAILED. UNABLE TO READ REQUIRED LOG RECORDS.**

Explanation: Recovery was requested for a table space, index space, or data set. An attempt was made to apply changes from the DB2 log, but the necessary log records could not be read from the log data set. This message is accompanied by message DSNI007I.

Severity: 8 (error)

System Action: The RECOVER utility completes unsuccessfully with return code 8.

User Response: Consult the system programmer for corrective action.

Operator Response: Provide the console listing of the DSNI007I message for the system programmer.

System Programmer Response: Run the print log map (DSNJU004) utility. Find the data set that contains the requested RBA or LRSN from the output of the utility.

Problem Determination: If no listed data set contains the required RBA or LRSN, one of the following might have occurred:

- The data set was deleted from the bootstrap data set (BSDS) by the change log inventory (DSNJU003) utility. Rerun the utility to insert the missing data set name. DB2 must be stopped to run this utility.
- The BSDS was damaged. The BSDS can be restored using the dump and the most recent archive log data set. Run the change log inventory (DSNJU003) utility to supply changes that occurred during and after the last offload operation. Changes can be determined from the operator's console listing.

If a listed log data set contains the required RBA or LRSN, this message is preceded by one or more DSNJxxx error messages. See the explanation of those messages for the appropriate action.

DSNU522I *csect-name* **RECOVER CANNOT PROCEED FOR *obj-type* *obj-qual.obj-name* BECAUSE A NON-RECOVERABLE EVENT HAS BEEN ENCOUNTERED FROM SYSIBM.SYSCOPY WHICH HAS DBNAME=*dbname* TSNAME=*tsname* DSNUM=*dsnum* ICTYPE=*ictype* START_RBA=*X' rba'***

Explanation: Recovery was requested for an index, but activity on its table space (identified by the SYSIBM.SYSCOPY columns) prohibits recovery. The use of an index's full image copy by recovery is prohibited by a REORG or LOAD on its underlying table space.

Severity: 8 (error)

System Action: Utility processing is terminated. All objects in the RECOVER statement are left in the same state as before the RECOVER utility was invoked.

User Response: Use the REBUILD INDEX utility to rebuild the index from the table space. For more information about the recoverability of this index, run the REPORT RECOVERY utility on both the index and its table space.

DSNU523I *csect-name* - RECOVER UTILITY FAILED. NO FULL IMAGE COPY WAS AVAILABLE AND THE FIRST LOG RECORD WAS NOT THE REQUIRED INITIALIZATION RECORD.

Explanation: RECOVER was requested for a table space or a data set of a table space and no image copy was available. Recovery was attempted from the log and failed due to missing data set initialization records. Specifically, the log records which format space map and header pages were missing.

Severity: 8 (error)

System Action: RECOVER completes unsuccessfully with a return code of 8.

User Response: The associated data set has been reset to an empty state. Notify system programmer for corrective action.

System Programmer Response: Use the problem determination information given below to determine if a user error has occurred. If possible, correct the error and resubmit the RECOVER utility job for this table space or data set. Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for a discussion of possible recovery procedures.

Problem Determination: This message was preceded by message DSNU513I which identifies the log RBA range being applied. Run the print log map (DSNJU004) utility for the table space in question over the indicated log RBA range.

This will show what log records are present and may assist in determining if a log data set has been damaged or deleted, or if the BSDS has been damaged. If damage to table space DSNDB01.SYSLGRNX is suspected, recover it and attempt the earlier failing recovery again.

DSNU524I *csect-name* INVALID DATA SET OR PARTITION NUMBER num SPECIFIED FOR *obj-type obj-qual.obj-name*

Explanation: An invalid number was specified for the data set or partition of the object named in the utility statement.

Severity: 8 (error)

System Action: Further utility processing terminates.

User Response: Correct the data set/partition number, or verify that the object name is specified correctly. Then resubmit the utility statement in a new utility job step. Refer to *DB2 Utility Guide and Reference* for a description of the particular utility options.

DSNU525I *csect-name* RECOVERY DATA DOES NOT PERMIT DSNUM(ALL) RECOVERY OF *obj-type obj-qual.obj-name*

Explanation: Recovery was requested for an entire object. However, the object is not recoverable at that level for one of the following reasons:

- The object was recovered to a point in time (for example, TOLOGPOINT was specified), which required fall back processing. However, no subsequent image copy was taken to establish a base for recovery.
- A partition of the object was recovered to a point in time after the last full image copy of the object was taken.

Severity: 8 (error)

System Action: The RECOVER utility completes unsuccessfully with return code 8.

User Response: Submit the RECOVER job with DSNUM specified for each data set for which recovery is required. Refer to *DB2 Utility Guide and Reference* for information about the RECOVER utility.

DSNU526I *csect-name* - NO FULL IMAGE COPY AFTER PARTIAL RECOVERY OF *obj-type obj-qual.obj-name*

Explanation: Recovery was requested for a data set of an object. However, an earlier point-in-time recovery (for example, using the TOLOGPOINT option) was specified and no subsequent image copy was taken to establish a base for recovery. The object is in a nonrecoverable state.

Severity: 8 (error)

System Action: The RECOVER utility completes unsuccessfully with return code 8.

User Response: The associated data set is in a nonrecoverable state. Consult the system programmer for corrective action.

System Programmer Response: You can use the RECOVER utility with the TOCOPY, TORBA, or TOLOGPOINT option to force recovery to an earlier point in time. You can use the DSN1COPY utility to restore the data set to an earlier image copy. Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for a discussion of database recovery procedures.

DSNU527I *csect-name* DB2 OBJECT REBUILT TO AN INDETERMINATE POINT

Explanation: The image copy data set specified with the TOCOPY keyword of the REBUILD utility was one of the following:

- An image copy dataset made with the SHRLEVEL CHANGE option. In this mode, changes might have been made to the object while image copy was in

progress. If a change was made to a page before image copy processed the page, the update will be in the copy data set. If a change was made to a page after image copy processed it, the change will not appear in the copy data set. The data set may contain partial updates from some transactions.

- An image copy dataset made during the LOAD REPLACE utility. An image copy produced during LOAD REPLACE will not contain updates made to the table space to correct unique index violations during the INDEXVAL phase or referential constraint violations during the ENFORCE phase. Therefore, it is not recommended as a REBUILD y point.

If the object REBUILT is a table space, then indexes on the table space are placed in REBUILD pending status and dependent table spaces, if any, are placed in check pending status. The indexes placed in REBUILD pending are identified by message DSNU557I, and the dependent table spaces placed in check pending are identified by message DSNU563I.

Severity: 4 (warning)

System Action: The utility terminates normally.

User Response: Based on the explanation above, determine if the REBUILD y is satisfactory. Rebuild the indexes identified by message DSNU557I in the job output. Run CHECK DATA on the table spaces identified by message DSNU563I to correct any referential constraint violations.

Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for a discussion of database REBUILD procedures.

DSNU528I NO FULL IMAGE COPY WAS AVAILABLE AND THERE ARE NO UPDATES TO APPLY FROM THE DB2 LOG FOR TABLESPACE
tablespace-name **DSNUM** *dsnum*

Explanation: Recovery was requested for a table space or a data set of a table space and no image copy was available. If *dsnum* is 0, then recovery was requested at the table space level. Recovery was attempted from the log, but no log records were applied because no SYSLGRNX records corresponding to the recovery scope were found.

Severity: 8 (error)

System Action: The associated data set was reset to an empty state and the data set was placed in REBUILD PENDING status. If REBUILD was processing a TABLESPACE list, only the associated data set was reset to an empty state but all data sets in the list were placed in REBUILD PENDING status.

User Response: If the TORBA or TOLOGPOINT option was specified, use the information in the problem determination section to verify that it is a valid RBA or LRSN. Correct the error and resubmit the REBUILD utility for the table space.

System Programmer Response: Use the information in the problem determination section to determine if a user error occurred. Correct the error and resubmit the REBUILD utility for the table space. Also refer to Part 4 (Volume 1) of *DB2 Administration Guide* for a discussion of possible recovery procedures.

Problem Determination: Execute the REPORT RECOVERY utility for the table space at the appropriate table space or data set level (that is, DSNUM). The output shows the recovery points (SYSCOPY records) and the update log ranges (SYSLGRNX records) that exist for the table space.

DSNU529I *csect-name* **INVALID SPECIFICATION OF TORBA = xxx**

Explanation: 'xxx' is the log RBA specified for the RECOVER utility TORBA keyword. The RBA is not within the scope of the log.

Severity: 8 (error)

System Action: The RECOVER utility terminates with a return code of 8 without making any changes to the object to be recovered.

User Response: Correct the input and resubmit the job. Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for a discussion of database recovery procedures.

Problem Determination: The listing produced by the print log map (DSNJU004) utility will show the current extent of the DB2 log.

DSNU530I *csect-name* - **MULTIPLE DATA SETS FOUND FOR THE COPY DATA SET SPECIFICATION**

Explanation: DB2 issues this message during the RECOVER or COPYTOCOPY utility when the specification of the input image copy dataset is ambiguous and does not uniquely identify an image copy. Multiple image copies were found in SYSIBM.SYSCOPY for the object with the same data set name.

Severity: 8 (error)

System Action: Processing halts for this object.

RECOVER completes unsuccessfully with a return code of 8.

For the COPYTOCOPY utility, if the utility job step includes an OPTIONS control statement with the EVENT(ITEMERROR,SKIP) option, the utility will process the next item in the list.

User Response: Two or more DSNU531I messages will follow this message providing more information about each duplicate data set. Select the correct data set from the DSNU531I messages.

Rerun the RECOVER job, specifying a unique

DSNU531I • DSNU535I

combination of TOVOLUME and TOSEQNO.

Rerun the COPYTOCOPY job, specifying an unique combination of FROMVOLUME and FROMSEQ.

DSNU531I *csect-name - dsn* **EXISTS WITH - VOLUME=vol, FILE SEQUENCE NUMBER=fseq, RBA=rba, DATE=date, TIME=time**

Explanation: DB2 issues this message two or more times to document the duplicate data sets detected by the RECOVER utility during TOCOPY processing, or by the COPYTOCOPY utility during FROMCOPY processing. See the explanation for message DSNU530I.

Severity: 8 (error)

System Action: RECOVER completes unsuccessfully with a return code of 8.

For COPYTOCOPY, if the utility job step includes an OPTIONS control statement with the EVENT(ITEMERROR,SKIP) option, the next item in the list will be processed.

User Response: Use the information provided in all of the DSNU531I messages to determine the correct data set for this recovery. 'rba', 'date' and 'time' are provided for each data set to assist in the selection. The DSNU531I message for the data set you select will provide the correct 'vol' and 'fseq' values to be specified on the TOVOLUME and TOSEQNO keywords respectively.

Rerun the RECOVER job specifying TOCOPY and TOVOLUME(vol-ser). Include the TOSEQNO(fseq) keyword if it is necessary to distinguish an unique data set.

Rerun the COPYTOCOPY job specifying FROMCOPY and FROMVOLUME(vol-ser). Include the FROMSEQNO(fseq) keyword if it is necessary to distinguish a unique data set.

DSNU532I *csect-name - RECOVER obj-type obj-qual.obj-name* **START**

Explanation: This message is issued when there is more than one object in the list. It indicates that the recover of a particular object is starting. If the PARALLEL keyword has been specified, then the restore phase messages for different objects in the list may be intermingled.

This message is routed to SYSPRINT.

Severity: 0 (informational)

System Action: RECOVER processing continues.

DSNU533I *csect-name - obj-type obj-qual.obj-name* **IS A DUPLICATE OF obj-type obj-qual.obj-name**

Explanation: The utility found a duplicate object in the list. The object name may indicate a partition or piece number.

Severity: 8 (error)

System Action: The utility job terminates processing.

User Response: Correct the object list. Resubmit the job if needed.

DSNU534I *csect-name* **TARGET RECOVERY POINT IS NOT A QUIESCE POINT**

Explanation: The RECOVER utility attempted to recover to a point in time (for example, using the TOLOGPOINT option) and one of the following conditions has been detected:

- The table space set is not being recovered to a quiesce point or to a common image copy SHRLEVEL(REFERENCE) point.
- Not all table spaces in the table space set have the same quiesce point.
- A table space in the set contains a dependent table with a referential constraint that was defined after the specified quiesce point.

A table space set is a group of table spaces that are referentially related or it can be a base table space and its associated LOB table spaces.

Severity: 4 (warning)

User Response: If possible, recover the table space set to a quiesce point or a common image copy SHRLEVEL(REFERENCE) point. Otherwise, use the CHECK DATA utility to check and correct referential violations. Use the CHECK DATA utility on the base table space and the CHECK LOB utility on the LOB table space(s) to validate the LOB columns.

DSNU535I *csect-name - FOLLOWING* **TABLESPACES RECOVERED TO A CONSISTENT POINT**

Explanation: This message will be issued by the RECOVER utility when it determines that a table space set (a group of referentially related table spaces or a base table space and its lob table spaces) were recovered to a quiesce or to a common image copy SHRLEVEL(REFERENCE) point. All table spaces in the table space set will be listed after this message heading.

Severity: 0 (informational)

System Action: No action is taken.

DSNU536I *csect-name* - RELATIONSHIP *r* ON
TABLE *t* CREATED AFTER QUIESCE
POINT

Explanation: The relationship named 'r' was created on the dependent table, 't', after the quiesce point used for recovering to a point in time. The table space in which 't' resides is set to check pending beginning with the first record of 't'.

Severity: 4 (warning)

System Action: No action is taken.

User Response: Refer to Part 2 (Volume 1) of *DB2 Administration Guide* for the failure analysis procedure for the check pending state.

DSNU537I *csect-name obj-type obj-qual.obj-name* IS
NOT ALLOWED IN THE LIST

Explanation: The RECOVER or COPY utility found a directory or catalog table space in a list with other table spaces or with user-defined indexes.

The table spaces that the COPY utility will not allow in a list with other table spaces are DSNDB01.SYSUTILX, DSNDB06.SYSCOPY, and DSNDB01.SYSLGRNX.

However, these table spaces may be specified with their IBM-defined indexes in a list.

You cannot recover more than one directory or catalog table space in a list. Directory and catalog table spaces must be recovered individually in a particular order because the recovery of some objects depends on information derived from others. The correct order is documented in Part 4 (Volume 1) of *DB2 Administration Guide*. IBM-defined indexes may be specified with their associated directory or catalog table space in a list.

Severity: 8 (error)

System Action: The utility job terminates.

User Response: Remove the directory and catalog object names from the list. Then submit the COPY or RECOVER job again.

DSNU538I RECOVER ERROR RANGE OF
DSN=*dataset name* ON
VOLUME=*volser* FROM
CCHH=X'*ccccchhh*' TO
CCHH=X'*ccccchhh*' CONTAINS
PHYSICAL ERROR

Explanation: This message indicates that the error range involved in the error range recover '*dataset name*' is the data set which has the physical error. The data set resides on DASD volume '*volser*' and the error range is from track address X'*ccccchhh*' to track address X'*ccccchhh*'.

If the error range of a data set covers more than one extent or more than one volume, then there will be one message per extent per volume.

Severity: 8 (error)

System Action: Physical I/O error is detected during error range recover, processing terminated with return code 8.

System Programmer Response: A DSNU086 message is issued to the console by DB2 while running error range recovery; this indicates that the physical error is not recovered. User must run ICKDSF or equivalent service utility to recover the physical error then re-run the error range recover again.

Problem Determination: Use the information provided by this message to run ICKDSF and then run error range recover again.

DSNU539I *csect-name* - RECOVER PROCEEDS AT
THE *site-type* SYSTEM

Explanation: The RECOVER process continues at the RECOVERY SITE system, and/or the TRACKER SITE system. DB2 issues this message for informational purposes only.

Severity: 0 (informational)

System Action: The utility continues.

DSNU540I *csect-name* DYNAMIC ALLOCATION
FOR DATA SET *data-set-name* WILL
WAIT FOR UNIT TO BECOME
AVAILABLE

Explanation: A request to dynamically allocate a data set for a BATCH UTILITY job was refused because a unit was not available. The request was repeated after setting an indicator in the dynamic allocation parameter list to cause the job to wait until a unit becomes available.

Severity: 0 (informational)

System Action: Processing continues after a unit becomes available and is allocated.

DSNU541I UNABLE TO ALLOCATE THE PRIMARY
COPY DATASET *data-set-name*,
BACKUP COPY IS USED

Explanation: If RECOVER or MERGECOPY has an allocation error on the primary copy data set, it will locate the backup copy data set for the same system (local or recovery). The utility continues.

Severity: 0 (informational)

DSNU542I *csect-name* - UNABLE TO OPEN THE
PRIMARY COPY DATASET
dataset-name, BACKUP COPY IS USED

Explanation: If RECOVER or MERGECOPY has an open error in the primary copy data set, it will deallocate that copy data set and try to allocate the backup copy

DSNU543I • DSNU547I

data set for that same system (local or recovery). The utility continues.

Severity: 0 (informational)

DSNU543I *csect-name* - I/O ERROR READING PAGE *page_number* IN THE PRIMARY COPY DATASET *dataset-name*, BACKUP COPY IS USED

Explanation: If RECOVER or MERGECOPY has an I/O error when reading a page, with the specified page number, from the primary copied data set, it will locate the backup copied data set in that same system (local or recovery) and continue reading pages starting from the page number in error.

Severity: 0 (informational)

DSNU544I *csect-name* - UNABLE TO OPEN THE COPY DATASET *dataset-name* FOR THE RECOVERY OF *obj-type* *obj-qualifier.obj-name*, RC= *reason-code*

Explanation: RECOVER was unable to open the data set 'dataset-name'. because of 'reason-code' from the open abend. The 'reason-code' is taken from field SDWAABCC in the SDWA.

Severity: 0 (informational)

System Action: The RECOVER utility continues processing, searching for the prior image copy or applying log records.

DSNU545I *csect-name* - I/O ERROR READING PAGE *page-number* IN THE COPY DATASET *dataset-name* DURING RECOVERY OF *obj-type* *obj-qual.obj-name*

Explanation: An I/O error was detected while reading page 'page-number' from copy dataset 'dataset-name'. The message is issued when 1) The data set is the primary copy data set and there is no backup data set. 2) Open error is from the backup copy data set.

Severity: 0 (informational)

System Action: The RECOVER utility continues processing, searching for the prior image copy or applying log records.

DSNU546I LOGONLY RECOVER CANNOT PROCEED BETWEEN BEGINNING RBA 'xxxxxxxxxxxxx' AND ENDING RBA 'yyyyyyyyyyyyy' ON DSNUM *dsnum* BECAUSE A NON-RECOVERABLE EVENT HAS BEEN ENCOUNTERED FROM SYSIBM.SYSCOPY WHICH HAS DBNAME=*database-name* TSNAME=*space-name* DSNUM=*dsnum* ICTYPE=*x* START_RBA=X'zzzzzzzzzzz'.

Explanation: A nonrecoverable event (for example, LOAD LOG(NO), REORG LOG(NO)) occurred within the log range between the beginning log RBA or LRSN and ending log RBA or LRSN for the RECOVER LOGONLY utility.

This message is issued by the following CSECT: DSNUCASA

Severity: 8 (error)

System Action: The RECOVER utility completes unsuccessfully with return code 8.

System Programmer Response: Find a proper prior point in time as a target recovery point and rerun the RECOVER utility job with the TORBA, TOCOPY, or TOLOGPOINT option. For a discussion of database recovery procedures, refer to Part 4 (Volume 1) of *DB2 Administration Guide*.

DSNU547I LOGONLY RECOVER CANNOT PROCEED BECAUSE THE STARTING RBA=X'xxxxxxxxxxxx' IN THE HEADER PAGE PGNO=X'xxxxxx' FOR *obj-type* *obj-qual.obj-name* IS INVALID.

Explanation: One of the following occurred:

- The data set was restored from an earlier release backup that does not have a starting RBA or LRSN in the header page.
- The TORBA or TOLOGPOINT option is specified to an RBA or LRSN that is lower than the starting RBA or LRSN in the header page.

Severity: 8 (error)

System Action: The RECOVER utility job terminates with return code 8.

System Programmer Response: Use the RECOVER utility without the LOGONLY option, if possible, or change the RBA or LRSN of the TORBA or TOLOGPOINT option to a valid RBA or LRSN value.

DSNU548I DBID=X'xxxx' and PSID=X'xxxx' IN THE
HEADER PAGE OF *obj-type*
obj-qual.obj-name DO NOT MATCH THE
DB2 CATALOG.

Explanation: The DBID and PSID in the header page do not match the DB2 catalog. It is likely that the wrong data sets were restored.

Severity: 8 (error)

System Action: The RECOVER utility job terminates with return code 8.

System Programmer Response: Find the correct data sets and rerun the job.

DSNU549I RECOVER *obj-type obj-qual.obj-name*
dsnum USES ONLY DB2 LOGS
STARTING FROM
LOGPOINT=X'xxxxxxxxxxxx'.

Explanation: The RECOVER utility issues one message for each DB2 object that uses only DB2 logs to recover. In a non data-sharing environment, the LOGPOINT value is specified by an RBA; in a data sharing environment it is specified by an LRSN.

Severity: 0 (informational)

System Action: RECOVER utility processing continues.

DSNU550I *csect-name* INDEX NAME= *index-name*
IS EMPTY

Explanation: While attempting to REBUILD the indicated index, it was determined that the table upon which the index is based is empty.

Severity: 4 (warning)

System Action: Utility processing proceeds to the next utility request, if any.

DSNU551I *csect-name* INDEX NAME= *index-name*
PART=*part-num* IS EMPTY

Explanation: While attempting to REBUILD the indicated index partition, it was determined that the partition upon which the specified index partition is based is empty.

Severity: 4 (warning)

System Action: Utility processing proceeds to the next utility request, if any.

DSNU552I *csect-name* RECOVER CANNOT
PROCEED BECAUSE THE
starting/ending LOGPOINT *xxx* IS NOT
WITHIN THE RECOVERY RANGE OF
xxx AND *xxx* FOR *obj-type*
obj-qual.obj-name

Explanation: The starting or ending LOGPOINT found for this recovery job is outside the available recovery information. A LOGPOINT value is an RBA or LRSN. The RECOVER utility cannot process this request.

Severity: 8

System Action: The RECOVER utility terminates.

User Response: Use the recovery information that is available from the REPORT utility. Execute the RECOVER utility within the available recovery range.

DSNU553I *csect-name* INVALID PARTITION
NUMBER=*nnnn* SPECIFIED FOR INDEX
NAME=*iiii*

Explanation: An invalid partition number *nnnn* was specified for index *iiii* in the utility statement.

Severity: 8 (error)

System Action: Further utility processing is terminated.

User Response: Correct the partition number or verify that the index name is specified correctly, and resubmit the utility statement in a new utility job step. Refer to *DB2 Utility Guide and Reference* for a description of the particular utility options.

DSNU554I *csect-name* - DUPLICATE INDEX
NAMES EXIST IN THE SPECIFIED
INDEX NAME LIST

Explanation: When attempting to CHECK or REBUILD the indicated indexes, it was determined that duplicate index names were specified in the index name list.

Severity: 8 (error)

System Action: The utility job terminated.

User Response: Correct the index-name(s) in the index name list and resubmit the job.

DSNU555I *csect-name* UNLOAD PHASE
STATISTICS, NUMBER OF
RECORDS=*xxxx*

Explanation: This message is issued at the normal completion of the UNLOAD phase of the REBUILD INDEX utility. It gives the number of records that were unloaded (*xxxx*) for the specified table space.

Severity: 0 (informational)

DSNU556I *csect-name* RECOVER CANNOT PROCEED FOR *obj-type obj-qual.obj-name* BECAUSE A SYSCOPY RECORD HAS BEEN ENCOUNTERED WHICH HAS DBNAME= *dbname* TSNAME= *tsname* DSNUM= *dnum* ICTYPE= *ictype* STARTRBA=X'*rba*' LOWDSNUM= *lowdsnum* HIGHDSNUM=*highdsnum*.

Explanation: A SYSCOPY record has been encountered that prohibits recovery processing. If the ICTYPE column is a:

R,S,W, or X

Then a SYSCOPY record for a REORG or LOAD REPLACE that redistributed data across partitions has been encountered. The partitions that were affected by the ALTER INDEX that changed the limit keys must be recovered in the same list. An STYPE=S indicates that the CATENFM Utility was run, and a point-in-time recovery prior to the CATENFM process is not allowed unless the entire system (including the DB2 catalog and directory) are recovered to the same point.

A

An attempt has been made to recover an index to a point in time prior to a first Alter Table Column that altered the index key column. This is not allowed.

- An STYPE=R indicates that a table space partition was rotated and a point in time recovery prior to the rotation is not allowed. If the object being recovered is an index partition or a LOB table space belonging to the rotated partition, then those objects cannot be recovered prior to the rotation.
- An STYPE=V indicates that an ALTER TABLE COLUMN occurred on an indexed column for a numeric data type change. The index should be rebuilt rather than recovered.
- An STYPE=C indicates that an ALTER took place that added a column to a table and the column was not added to the index in the same commit scope. The index should be rebuilt rather than recovered.
- An STYPE=P indicates that the index was ALTERed to have the PADDED attribute. The index should be rebuilt rather than recovered.
- An STYPE=N indicates that the index was ALTERed to have the NOT PADDED attribute. The index should be rebuilt rather than recovered.

F

An attempt has been made to recover an index to a prior point in time and more than sixteen

Alter Table Columns have been done that altered the index key since that time. This is not allowed.

Severity: 8 (error)

System Action: The Recover Utility terminates with RC8.

User Response: Run the REPORT RECOVERY Utility, and analyze the report of the recovery information for the object.

If rev="tech" a SYSCOPY record for a REORG or LOAD REPLACE that redistributed partition data was encountered, then add the missing partitions to the recover list using the LOWDSNUM and HIGHDSNUM values as a guide.

DSNU557I *csect-name - obj-type obj-qual.obj-name* IS IN REBUILD PENDING STATE

Explanation: If the REBUILD utility issued this message, the corresponding table space to this index was REBUILDed to a point in time with keyword TOCOPY, TOLOGPOINT, or TORBA. Thus, the index was placed in REBUILDy pending status.

If the REBUILD INDEX utility issued this message, the index is in REBUILD pending status. Either duplicate index entries existed during the BUILD phase of the REBUILD INDEX, or invalid KEY/RIDs, which do not belong to the partition of the cluster index, were detected. The duplicate index entries or invalid KEY/RID entries must be resolved before starting the REBUILD INDEX utility again to REBUILD the index and remove the index from REBUILD pending status.

If the REORG utility with SHRLEVEL REFERENCE or CHANGE (or -TERM UTILITY) issued this message, the index is in REBUILD pending status. During the renaming of a data set during REORG, either a data set with the source name did not yet exist or a data set with the target name already existed.

Severity: 4 (warning) or 8 (error)

User Response: If the REBUILD or REORG utility (or -TERM UTILITY) issued this message, use the REBUILD INDEX utility to REBUILD this index.

If the REBUILD INDEX utility issued this message, take one of the following actions:

- Resolve the duplicate index entries or invalid keys and rerun the REBUILD INDEX utility.
- Use the REPAIR SET NORCVRPEND utility or the START DATABASE FORCE command to reset the REBUILD pending status. However, these two options will not correct the index.

DSNU558I *csect-name* **ALL INDEXES OF TABLESPACE= *table space-name* ARE IN REBUILD PENDING**

Explanation: The REBUILD TORBA, TOLOGPOINT, or TOCOPY utility issues this message to inform the user of the state of all indexes belonging to the REBUILDED table space. All indexes were put in REBUILD pending status to prevent data and index inconsistency. All indexes should be REBUILDED before they are used.

System Action: The REBUILD utility completed successfully.

Severity: 4 (warning)

User Response: REBUILD or rebuild all indexes of the REBUILD table space.

DSNU559I *csect-name - obj-type obj-qual.obj-name* **PARTITION *partition number* IS IN REBUILD PENDING STATE**

Explanation: If the REBUILD utility issued this message, one partition of a partitioned table space is being rebuilt to a point in time with keyword TOCOPY, TOLOGPOINT, or TORBA. The corresponding index for that partition was placed in rebuild pending status.

If the REBUILD INDEX utility issued this message, the index or the partition of a cluster index is in rebuild pending status. Either duplicate index entries existed during the BUILD phase of the REBUILD INDEX or INDEX PART, or invalid KEY/RIDs, which do not belong to the partition of the cluster index, were detected. The duplicate index entries or invalid KEY/RID entries must be resolved before starting the REBUILD INDEX utility again to rebuild the index and remove the index from rebuild pending status.

If the REORG utility with SHRLEVEL REFERENCE or CHANGE (or -TERM UTILITY) issued this message, one partition of a partitioned index was placed in rebuild pending status. During the renaming of a data set during REORG, either a data set with the source name did not yet exist or a data set with the target name already existed.

Severity: 4 (warning) or 8 (error)

User Response: If the REBUILD or REORG utility (or -TERM UTILITY) issued the message, rebuild this index with the REBUILD INDEX utility.

If the REBUILD INDEX utility issued this message, take one of the following actions:

- Resolve duplicate index entries or invalid keys and rerun the REBUILD INDEX utility.
- Use the REPAIR SET NORCVRPEND utility or START DATABASE FORCE command to reset the rebuild pending status. However, these two options will not correct the index.

DSNU560I *csect-name - TABLESPACE= database.tablespace PART= partition number* **IS IN RECOVERY PENDING STATE**

Explanation: The table space partition of a table space on which the utility was running is in recovery pending status. A RECOVER TABLESPACE at the partition level is required.

Severity: 4 (warning)

System Action: No action is taken.

User Response: Take one of the following actions:

- Run the RECOVER TABLESPACE utility on the table space partition.
- Run the LOAD REPLACE utility on the table space partition.
- Use the REPAIR SET NORCVRPEND utility or the START DATABASE FORCE command to reset the recovery pending status. However, these two options will not correct the table space.

DSNU561I *csect-name - obj-type obj-qual.obj-name* **PARTITION *part-number* IS IN CHECK PENDING**

Explanation: This message is issued to report the check pending state of the specified partition.

Severity: 4 (warning)

User Response: If the object is a table space partition with referential relationships, then run the CHECK DATA utility to check for referential integrity violations.

If the object is a base table space partition, then run the CHECK DATA utility to validate the auxiliary columns.

If the object is an index space partition, then run the CHECK INDEX utility to verify that the index keys are consistent with the data in the table space partition.

Correct all errors before attempting to use the object again.

DSNU562I *csect name - TABLESPACE database.tablespace* **IS IN RECOVERY PENDING**

Explanation: The table space against which the utility was running is in recovery pending status. A RECOVER TABLESPACE is required.

Severity: 4 (warning)

System Action: No action is taken.

User Response: Take one of the following actions:

- Run the RECOVER TABLESPACE utility on the table space.
- Run the LOAD REPLACE utility on the table space.

DSNU563I • DSNU567I

- Use the REPAIR SET NORCVRPEND utility or the START DATABASE FORCE command to reset the recovery pending status. However, these two options will not correct the table space.

DSNU563I *csect name- obj-type obj-qual.obj-name* IS IN CHECK PENDING

Explanation: This message is issued to report the check pending state of the specified object.

Severity: 4 (warning)

User Response: If the object is a table space with referential relationships, then run the CHECK DATA utility to check for referential integrity violations.

If the object is a base table space with LOB columns, then run the CHECK DATA utility to validate the auxiliary columns.

If the object is a LOB table space, then run the CHECK LOB utility to validate the structure of the LOB table space.

If the object is an index space, then run the CHECK INDEX utility to verify that the index keys are consistent with the data in the table space or table space partition.

Correct all errors before attempting to use the object again.

DSNU564I *csect -* RESTART NOT ALLOWED FOR *obj-type obj-qual.obj-name*

Explanation: Restart of the RECOVER utility is not allowed for one of the following reasons:

1. During the RESTORE phase, access to image copies failed. Therefore, RECOVER determined an earlier point of recovery to search for available image copies. RECOVER might not be able to recreate the original failures for restart.
2. The utility uses the LOGONLY option and was previously restarted with RESTART(CURRENT). It cannot now be started with RESTART(PHASE).

Severity: 8 (error)

System Action: The utility job terminates. If RECOVER acts on a list of objects, the restarted job terminates with the first object for which restart is not allowed.

User Response: For case 1, execute REPORT RECOVERY on the object and also collect the output from the previous execution of RECOVER TABLESPACE. Using those two outputs and the console log, determine the reason for the failure during the RESTORE phase. Correct the reason for the failure, if necessary. Terminate the outstanding utility then rerun the RECOVER TABLESPACE without RESTART.

For case 2, restart the utility with RESTART(CURRENT) or restore the data sets and rerun the RECOVER job from the beginning.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1,

DSNU565I *csect-name* CHECK CONSTRAINT *constraint-name* ON TABLE *table-name* WAS CREATED AFTER THE TARGET RECOVERY POINT

Explanation: The check constraint *constraint-name* was created on table *table-name* after the target recovery point. The target recovery point is the specified time or RBA in the point-in-time recovery. The associated table space was placed in check pending status because the RECOVER utility cannot determine whether check integrity was maintained. Data in the table might have constraint violations.

Severity: 4 (warning)

System Action: RECOVER processing continues.

User Response: Refer to Part 2 (Volume 1) of *DB2 Administration Guide* for information about resolving the check pending status.

DSNU566I *csect-name* RESTORE OF *obj-type obj-qual.obj-name* FROM DATA SET *data-set-name* COMPLETED, ELAPSED TIME = *hh:mm:ss*

Explanation: This message is issued at the successful completion of the RESTORE phase of the RECOVER utility when the DFSMSdss RESTORE command is issued. The *data-set-name* identifies the DFSMS concurrent copy that was being restored. The elapsed time of the RESTORE is shown in hours, minutes, and seconds.

System Action: RECOVER utility processing continues.

User Response: No action is required.

DSNU567I *csect-name* TABLESPACE=*dbname.tsname* PART NUMBER = *partition number* IS IN REORG PENDING STATE

Explanation: A SYSCOPY record for a range of partitions has been encountered. The RECOVER TABLESPACE utility was executed against an object which was the target of a partition rebalancing. The RECOVER utility will set all of the partitions involved in the partition rebalancing to REORG PENDING for one of the following reasons:

- Recovery of a table space to a point in time prior to the resetting of the REORG PENDING state by the REORG utility.
- Recovery of a table space to currency, when the table space is in REORG PENDING state.

Severity: 4 (warning)

System Action: The RECOVER utility completed successfully.

User Response: Execute REORG with SHRLEVEL NONE on the partitions in REORG PENDING status to rebalance the partitions and to remove the REORG PENDING state.

DSNU568I *csect-name obj-type obj-qual.obj-name* **IS IN INFORMATIONAL COPY PENDING**

Explanation: An image copy of the index is required to establish a new base from which the index can be recovered. This is an advisory state, so the index is available for read or write access.

Severity: 0 (informational)

User Response: Take an image copy of the index.

DSNU569I *csect-name* **RESTORE OF** *obj-type obj-qual.obj-name* **FROM DATA SET** *data-set-name* **FAILED WITH RETURN CODE** *return-code*

Explanation: This message is issued in the RESTORE phase of the RECOVER utility. The DFSMSdss RESTORE command was issued to restore the DFSMS concurrent copy named *data-set-name*. The return code is from DFSMSdss RESTORE.

Severity: 4 (warning)

System Action: The RECOVER utility searches for the next recoverable point. DFSMSdss issues ADR messages to the job output to indicate the reason for the return code.

User Response: You might want to investigate why this DFDSS RESTORE command failed. Collect any console messages. Look up the return code and any ADR messages in the appropriate DFSMSdss manual.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 85,

DSNU570I *csect-name obj-type obj-qual.obj-name* **PARTITION** *part-num* **IS IN INFORMATIONAL COPY PENDING**

Explanation: An image copy of the index partition is required to establish a new base from which the index partition can be recovered. This is an advisory state, so the index is available for read or write access.

Severity: 0 (informational)

User Response: Take an image copy of the index partition or of the entire index, depending on your

backup and recovery procedures.

DSNU571I *csect-name* **ALL** *site* **SYSCOPY RECORDS FOR** *obj-type= obj-qual.obj-name* **PARTITION=***part-num* **HAVE BEEN DELETED**

Explanation: The MODIFY RECOVERY utility deleted all of the SYSCOPY table records for the specified table space or index space partition. Any related SYSLGRNX rows are deleted if DSNUM ALL is specified. The 'part-num' of specified table space or index space is no longer recoverable at the 'site'. The 'site' can be 'LOCALSITE' or 'RECOVERYSITE'.

Severity: 4 (warning)

System Action: Utility processing continues.

System Programmer Response: The 'part-num' of specified table space or index space is no longer recoverable at the 'site' after this message is received. Use the COPY utility to create one or more copies for the 'site' to establish a base for future recovery.

DSNU572I *csect-name* **ALL** *site* **SYSCOPY RECORDS FOR** *obj-type= obj-qual.obj-name* **HAVE BEEN DELETED**

Explanation: The MODIFY RECOVERY utility deleted all of the SYSCOPY table records for the specified table space or index space. Any related SYSLGRNX rows are deleted if DSNUM ALL is specified. The table space or index space is no longer recoverable at the 'site'. The 'site' can be 'LOCALSITE' or 'RECOVERYSITE'.

Severity: 4 (warning)

System Action: Utility processing continues.

System Programmer Response: The table space or index space is no longer recoverable at the 'site' after this message is received. Use the COPY utility to create one or more copies for the 'site' to establish a base for future recovery.

DSNU573I *csect-name* **NO BACKUP COPIES FOUND FOR THIS TABLESPACE OR DATASET**

Explanation: The MODIFY RECOVERY utility was unable to locate any SYSCOPY records older than the specified AGE or prior to the specified DATE. No records have been deleted.

Severity: 4 (warning)

System Action: Processing completes normally.

DSNU575I *csect-name* - **MODIFY COMPLETED SUCCESSFULLY**

Explanation: This message reports the successful completion of the MODIFY utility. The requested cleanup of old SYSIBM.SYSCOPY entries was completed.

Severity: 0 (informational)

System Action: The MODIFY utility completed normally.

DSNU577I *csect-name* **MODIFY HAS NOT DELETED ALL SYSCOPY RECORDS AS REQUESTED.**

Explanation: If MODIFY RECOVERY is invoked with a partition-number (DSNUM), and the table space level recoverable point is older than the user specified DATE or AGE, all SYSCOPY records after the table space level recoverable point cannot be deleted.

Severity: 4 (warning)

System Action: Processing continues normally.

DSNU578I *csect-name* **SYSLGRNX INFORMATION FOR MEMBER** *member-name*

Explanation: In the data sharing environment, the SYSLGRNX records reported with DSNU513 are grouped by the respective member name. Each group member has header message DSNU578 to identify the member. This message precedes DSNU513.

System Action: The RECOVER utility continues with the LOGAPPLY phase.

DSNU579I *csect-name* **RECOVER UTILITY LOG APPLY AT LOGPOINT** *xxx*

Explanation: This message shows the progress of the LOGAPPLY phase of the RECOVER utility. The highest LOGPOINT that was applied is *xxx*. The value of logpoint is RBA in a non data-sharing environment and LRSN in a data sharing environment.

System Action: The LOGAPPLY phase continues normally.

DSNU580I *csect-name* **REPORT UTILITY COMPLETE, ELAPSED TIME=hh/mm/ss**

Explanation: The message is issued at the normal completion of the REPORT utility. The time that elapsed since the beginning of the REPORT utility to its completion was 'hh' hours, 'mm' minutes, and 'ss' seconds.

Severity: 0 (informational)

System Action: This message indicates the normal completion of the REPORT utility. Processing continues

to the next utility statement in the utility job step, if any. If not, the utility job step is normally terminated, and the resources held become available for further processing. The UTILID of the utility job step becomes available for reuse.

DSNU581I *csect-name* **REPORT RECOVERY**
obj-type obj-qual.obj-name

Explanation: This message indicates the beginning of the recovery information report for a table space or index space.

Severity: 0 (informational)

System Action: Utility processing continues.

DSNU582I *csect-name* **REPORT RECOVERY**
obj-type obj-qual.obj-name **SYSCOPY ROWS**

Explanation: This is the header message for the SYSCOPY section of the REPORT RECOVER output. This section displays the SYSCOPY rows for the table space or index space. Whether the information is displayed at the partition level is determined by the DSNUM specification in the REPORT RECOVERY input statement. The fields in the SYSCOPY row are:

- TIMESTAMP
- ICTYPE

The following delimiters may be present around the ICTYPE value: * * - Non image copy syscopy entry <
> - Image copy prior to rebalancing of table space partitions () - Image copy prior to LOG(NO) event. Note that for image copies of indexes, the LOG(NO) event may have occurred on its underlying table space.

- DSNUM
- FILESEQNO
- START_RBA
- SHRLEVEL
- DEVTYPE
- ICBACKUP
- DSNAME
- STYPE
- PIT_RBA
- DSVOLSER
- HIGHDSNUM
- LOWDSNUM

For description of the fields, see SYSIBM.SYSCOPY table in Appendix C of *DB2 SQL Reference*.

Severity: 0 (informational)

DSNU583I *csect-name* **SYSLGRNX ROWS FROM REPORT RECOVERY FOR** *obj-type obj-qual.obj-name*

Explanation: This is the header message for the SYSLGRNX section of the REPORT RECOVERY output. This section displays the SYSLGRNX rows for

the table space, index space, or partition as specified in the REPORT RECOVERY input statement. The fields in the SYSLGRNX row are:

- UCDATE - Modification date
- UCTIME - Modification time
- START RBA - Starting RBA
- STOP RBA - Stopping RBA
- START LRSN - Starting LRSN
- STOP LRSN - Stopping LRSN
- DSNUM - Partition number
- MEMBER - Data sharing member

An invalid SYSLGRNX record is marked with '***' at the end. The invalid SYSLGRNX record cannot be used for recovery because the range is outside recovery. If records are marked with '***', then a DSNU594 message should have been issued prior to this.

A SYSLGRNX record created after the last FULL IMAGE COPY, LOAD REPLACE LOG YES, or REORG LOG YES is marked with '*' at the end.

Severity: 0 (informational)

System Action: Processing continues normally.

DSNU584I *csect-name* **REPORT RECOVERY**
obj-type obj-qual.obj-name **BSDS**
VOLUMES

Explanation: Message for the BSDS VOLUMES section of the REPORT RECOVERY output. This section contains BSDS volumes for the archive log (1 or 2) records associated with the table space or index space specified in the REPORT RECOVERY input statement. The output contains the following information:

START TIME	END TIME	START RBA	END RBA	UNIT	VOLSER	DATA SET NAME
start	end	rba	rba	device	volume	data set name
timestamp	timestamp					

An archive log record created after the last FULL IMAGE COPY, LOAD REPLACE LOG YES, or REORG LOG YES is marked with '*' at the end.

System Action: Processing continues normally

DSNU585I *csect-name* **REPORT RECOVERY**
obj-type obj-qual.obj-name **CURRENT**

Explanation: The message is issued in response to the CURRENT option of REPORT RECOVERY utility. It indicates that only the information since the last recoverable point for the specified table space or index space is reported.

Severity: 0 (informational)

System Action: Normal utility processing continues.

DSNU586I *csect-name* **REPORT RECOVERY**
obj-type obj-qual.obj-name **SUMMARY:**

Explanation: This is the header message for the SUMMARY section of the REPORT RECOVERY utility. All the volumes to be used by the RECOVER utility are summarized.

The volume name is marked with '*' at the end if any archive log record in the volume was created after the last FULL IMAGE COPY, LOAD REPLACE LOG YES, or REORG LOG YES.

System Action: Processing continues normally

DSNU587I *csect-name* **REPORT TABLESPACE SET**
WITH TABLESPACE *dbname.tsname*

Explanation: Header message for the REPORT TABLESPACESET output. The output contains all table spaces, tables, and dependent tables associated with the table space specified in the REPORT TABLESPACESET input statement.

Severity: 0 (informational)

System Action: Utility processing continues normally.

DSNU588I *csect-name* **NO DATA TO BE**
REPORTED

Explanation: The message is issued when no data can be found for a section of the REPORT output.

Severity: 0 (informational)

System Action: Utility processing continues.

DSNU589I *csect-name* **REPORT RECOVERY**
obj-type obj-qual.obj-name **COMPLETE**

Explanation: The message is issued at the normal completion of reporting the RECOVERY information for the table space or index space by the REPORT RECOVERY utility.

Severity: 0 (informational)

System Action: This message indicates the normal completion of the REPORT RECOVERY utility. Processing continues to the next utility statement in the utility job step, if any. If not, the utility job step is normally terminated, and the resources held become available for further processing. The UTILID of the utility job step becomes available for reuse. The output from REPORT RECOVERY is now available for RECOVER utility use.

DSNU590I *csect-name object* **RESOURCE NOT**
AVAILABLE - object-name REASON =
X'reason-code'

Explanation: A required object *object-name* could not be accessed for the reason shown in *reason-code*. The

required object can be a database, table space, or index space. If the object is in a stopped state and has partitions, then the stopped state applies to one or more of the partitions.

Severity: 8 (error) or 4 (warning)

System Action: If the return code is 8, utility processing is terminated. If the return code is 4, utility processing continues to the next request.

User Response: Determine the cause for unavailability. The -DISPLAY DATABASE command can be used to determine the status. After ensuring the object is available, resubmit the job.

DSNU591I *csectname* **AN UNSUCCESSFUL COMPLETION OF A LOG READ, REASON=X'***reason-code*'

Explanation: The log manager subcomponent of DB2 detected an error during a LOG READ of SYSCOPY record for DSNDB06.SYSCOPY, DSNDB01.DBD01 or DSNDB01.SYSUTIL.

Severity: 4 (warning)

System Action: Processing continues.

Problem Determination: Look up the reason code in Part 4, "Section 4. DB2 Codes," on page 773 of this book for problem determination.

DSNU592I *csect-name* **REPORT RECOVERY INFORMATION FOR DATA SHARING MEMBER** *member-name*

Explanation: The REPORT RECOVERY utility displays this message as the heading for SYSLGRNX and BSDS records or BSDS summary information for each data sharing member. Records for this member follow, if there is data to report.

Severity: 0 (Informational)

System Action: Utility processing continues.

DSNU593I *csect-name* **REPORT RECOVERY ENVIRONMENT INFORMATION: MINIMUM RBA: *rba1* MAXIMUM RBA: *rba2* MIGRATING RBA: *rba3***

Explanation: The REPORT utility issues this message to display recovery environment information used by the RECOVER utility. The maximum and minimum RBAs give the range of possible recovery points on the log before the start of data sharing. The migrating RBA is the RBA at the time of migration from DB2 Version 3 to Version 4. If there is data to report, other messages from the REPORT utility follow to display SYSCOPY, SYSLGRNX and BSDS records.

Severity: 0 (Informational)

System Action: Utility processing continues.

DSNU594I *csect-name* **DB2 ENCOUNTERED SYSLGRNX RECORDS THAT CANNOT BE USED FOR RECOVERY.**

Explanation: The utility found one or more SYSLGRNX records that cannot be used for recovery because the range is outside recovery. Invalid SYSLGRNX records are marked with '***' at the end of the record under message DSNU583I.

Severity: 4 (REPORT - warning) or 8 (RECOVER - error)

System Action: REPORT utility processing continues. RECOVER utility terminates.

System Programmer Response: Run the RECOVER utility with the TOCOPY option.

DSNU595I *csect-name* **ERROR IN GETTING THE HIGHEST MEMBER ID IN DATA SHARING.**

Explanation: The REPORT utility could not find a valid highest member ID. The highest member is the last member to join a data sharing group. This message is issued only in a data sharing environment.

Severity: 8 (error)

System Action: The REPORT utility abends.

System Programmer Response: This might be an internal DB2 problem. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU596I *csect-name* **ERROR IN GETTING THE MEMBER NAME FOR MEMBER ID**

Explanation: The REPORT utility could not find a valid member name for the member ID, or the member ID supplied is invalid. This message is issued only in a data sharing environment.

Severity: 8 (error)

System Action: The REPORT utility abends.

System Programmer Response: This might be a DB2 internal problem. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU597I *csect-name* **INVALID SYSLGRNX INFORMATION FROM REPORT RECOVERY**

Explanation: This is the header message for the invalid SYSLGRNX records section of the REPORT RECOVERY output. This section lists SYSLGRNX records containing information that is invalid for recovery purposes.

Severity: 0 (Informational)

System Action: Utility processing continues.

User Response: Examine the invalid SYSLGRNX records with a zero member ID which were generated before enabling data sharing. The MODIFY utility can be used to delete the invalid SYSLGRNX records.

DSNU599I *csect-name obj-type obj-qual.obj-name*
**HAS BEEN RECOVERED TO A
 CONSISTENT POINT IN TIME WITH
 obj-type obj-qual.obj-name**

Explanation: This message is issued when an index and its underlying table space have been recovered to a consistent point in time. A consistent point in time is a common QUIESCE point or a common SHRLEVEL REFERENCE copy set (objects were copied in the same list with SHRLEVEL REFERENCE specified). The index is available for read and write access when the recover completes.

Severity: 0 (informational)

System Action: Recover processing continues.

DSNU600I *csect-name INDEX creator.index-name*
POINTS TO A DIFFERENT DATABASE.

Explanation: A specified index does not point to a table in the database selected. For a RUNSTATS Format 1 invocation, the database is the one specified (or defaulted) in the TABLESPACE parameter. For a RUNSTATS Format 2 invocation, the database is the one which contains the first index in the index-name list.

Severity: 8 (error)

System Action: All remaining RUNSTATS invocation parameters are validated and the executing utility job terminates. Work performed by previous utilities in the job step remains in effect. Subsequent utility control statements are flushed. No record of the utility job step is retained in the system; therefore, it cannot be restarted.

User Response: Ensure that all indexes in the list point to the same database and resubmit the RUNSTATS job.

Problem Determination: Refer to catalog table SYSIBM.SYSINDEXES to determine the table upon which the index is based. This table must be in the database and table space targeted by the RUNSTATS utility.

DSNU601I *csect-name INDEX creator.index-name*
**POINTS TO A DIFFERENT
 TABLESPACE.**

Explanation: A specified index does not point to a table in the table space selected. The table space is either the one specified in the TABLESPACE parameter or the one which contains the table pointed to by the first specified index.

Severity: 8 (error)

System Action: All remaining RUNSTATS invocation parameters are validated and the executing utility job terminates. Work performed by previous utilities in the job step remains in effect. Subsequent utility control statements are flushed. No record of the utility job step is retained in the system; therefore, it cannot be restarted.

User Response: Ensure that all indexes in the list point to tables in the targeted table space and resubmit the RUNSTATS job.

Problem Determination: Refer to catalog table SYSIBM.SYSINDEXES to determine the table upon which the index is based. Using the table-name found in SYSIBM.SYSINDEXES, refer to catalog table SYSIBM.SYSTABLES to determine the containing table space.

DSNU602I *csect-name* **STATISTICS ARE NOT
 COLLECTED FOR NONPARTITIONED
 INDEX** *creator.index-name*

Explanation: For a LOAD or REORG utility when a nonpartitioned index exists, inline statistics performs a complete index scan. Statistics are collected for the entire nonpartitioned index. This warning message will be issued if the PART keyword & STATISTICS keyword are specified for LOAD/REORG utilities. This is because statistics are not collected on a logical part basis.

System Action: This message will be issued for each nonpartitioned index, when INDEX ALL is specified.

Severity: 4 (warning)

User Response: Run the runstats utility on the object.

DSNU603I *csect-name* - **OBJECT=object-name HAS
 AN INCOMPLETE DEFINITION**

Explanation: The identified object (TABLE or TABLE SPACE) does not have a complete definition. This can be caused by one of these errors:

- Not defining any tables in the table space (RC=4).
- Not creating the accompanying partitioned index if the table space is partitioned (RC=8).

Severity: 8 (error) or 4 (warning)

System Action: If the return code is 8, utility processing terminates. If the return code is 4, utility processing continues to the next request.

User Response: Complete the table space definition by creating at least one table in the table space, or create the accompanying partitioned index if the table space is partitioned.

Problem Determination: Issue an SQL SELECT statement on the catalog to determine if the tables or a partitioned index was not created for the table space.

DSNU604I *csect-name* object IS EMPTY

Explanation: The object currently to be scanned by the RUNSTATS utility contains no records. The 'object' can be TABLESPACE or INDEXSPACE.

Severity: 0 (informational)

System Action: The object currently to be scanned is recorded in the catalog as empty. The statistics for the object are updated and RUNSTATS continues to the next object, if there is one.

DSNU605I *csect-name* ERROR OCCURRED IN ACCESSING TABLESPACE
database-name.tablespace-name

Explanation: A previous error makes it impossible for RUNSTATS to scan TABLESPACE 'creator.tbspname'.

Severity: 8 (error)

System Action: The executing utility job step terminates. Work performed by previous utilities in the job step remains in effect. Subsequent utility control statements are flushed. No record of the utility job step is retained in the system; therefore, it cannot be restarted.

User Response: Examine prior error messages for error identification. If the error can be corrected, resubmit the RUNSTATS utility in a new utility job step. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Prior messages identify this error. See the information about these messages for additional problem determination.

DSNU606I *csect-name* USER NOT AUTHORIZED TO ACCESS TABLESPACE
database-name.tablespace-name

Explanation: This user is not authorized to execute the RUNSTATS utility against TABLESPACE 'creator.tbspname'.

Severity: 8 (error)

System Action: The executing utility job step terminates. Work performed by previous utilities in the job step remains in effect. Subsequent utility control statements are flushed. No record of the utility job step is retained in the system; therefore, it cannot be restarted.

User Response: Contact your system administrator to obtain the proper authority, or have another user with the required authority execute the utility for you.

DSNU607I *csect-name* ERROR OCCURRED ACCESSING INDEXSPACE
creator.index-name

Explanation: A previous error makes it impossible for RUNSTATS to scan INDEXSPACE 'creator.indexspacename'.

Severity: 8 (error)

System Action: The executing utility job step terminates. Work performed by previous utilities in the job step remains in effect. Subsequent utility control statements are flushed. No record of the utility job step is retained in the system; therefore, it cannot be restarted.

User Response: Examine prior error messages for error identification. If the error can be corrected, resubmit the RUNSTATS utility in a new utility job step.

Problem Determination: Prior messages identify this error. See the documentation for these messages in this manual for additional problem determination. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU608I *csect-name* USER NOT AUTHORIZED TO ACCESS INDEXSPACE
creator.index-name

Explanation: This user is not authorized to execute the RUNSTATS utility against INDEXSPACE 'creator.indexspacename'.

Severity: 8 (error)

System Action: The executing utility job step terminates. Work performed by previous utilities in the job step remains in effect. Subsequent utility control statements are flushed. No record of the utility job step is retained in the system; therefore, it cannot be restarted.

User Response: Contact your system administrator to obtain the proper authority, or have another user with the required authority execute the utility for you.

DSNU609I *csect-name* TABLE *table-name* IS IN A DIFFERENT TABLESPACE

Explanation: A table listed in the table name list of the RUNSTATS TABLE keyword was not found in the specified table space.

Severity: 8 (error)

System Action: The executing utility job step terminates. Work performed by previous utilities in the job step remains in effect. Subsequent utility control statements are flushed. No record of the utility job step is retained by the system; therefore it cannot be restarted.

User Response: Ensure that all tables in the list are in the specified table space and resubmit the utility.

Problem Determination: Refer to the catalog table SYSIBM.SYSTABLES to determine the table space in which the table is located.

DSNU610I *csect-name catalog-table-name*
CATALOG UPDATE FOR *object-name*
SUCCESSFUL

Explanation: This message indicates that the updating of the statistics columns in the CATALOG TABLE 'catalog-table-name' was successful.

Severity: 0 (informational)

System Action: Processing continues with the next catalog table.

DSNU611I *csect-name COLUMN column-name* **NOT FOUND FOR TABLE** *creator.table-name*

Explanation: A column name, given as an operand of the COLUMN keyword, was not found in the specified table.

Severity: 8 (error)

System Action: Validation of the utility invocation statement is completed and the executing utility job step is terminated.

User Response: Ensure that the column name given in the message is correct for the table specified.

Problem Determination: Check that the column name specified in the utility invocation statement is identical to that found in the SYSIBM.SYSCOLUMNS catalog table. Correct any errors and reissue the utility job.

DSNU612I *csect-name SYSTABLESPACE*
CATALOG STATISTICS FOR
tspc-name NACTIVE = nactive
NACTIVEF = nactive

Explanation: The RUNSTATS utility issues this message to report the statistics collected for table space *tspc-name*.

nactive

The number of active pages in the table space

This message is routed to SYSPRINT.

Severity: 0 (informational)

System Action: RUNSTATS processing continues.

User Response: Refer to *DB2 Utility Guide and Reference* for information about RUNSTATS statistics.

DSNU613I *csect-name SYSTABLEPART CATALOG*
STATISTICS FOR *table-space-name*
PARTITION *part-num*

:

CARD	= cardinality
CARDF	= cardinality
NEARINDREF	= nearindref
FARINDREF	= farindref
PERCACTIVE	= peractive
PERCDROP	= percdrop
PAGESAVE	= pagesave
SPACE	= space
SPACEF	= space
PQTY	= pqty
SQTY	= sqty
DSNUM	= dsnum
EXTENTS	= extents

Explanation: The RUNSTATS utility issues this message to report the statistics collected. If the *part-num* equals 0, the statistics apply to the entire table space. If the *part-num* is not 0, the statistics apply to the specified partition of the table space.

cardinality

The number of rows in the reported partition number

nearindref

The number of rows that were relocated near their original page

farindref

The number of rows that were relocated far from their original page

peractive

The percentage of space occupied by actual data from active tables

percdrop

The percentage of space occupied by rows of data from dropped tables

pagesave

The percentage of pages saved in the table space or partition by using data compression

space

The space currently allocated for all extents, measured in kilobytes.

pqty

The primary space allocation for the dataset in 4K blocks.

sqty

The secondary space allocation for the dataset in 4K blocks.

dsnum

The number of data sets.

extents

The number of extents for the last data set of the object.

This message is routed to SYSPRINT.

DSNU614I • DSNU616I

Severity: 0 (informational)

System Action: RUNSTATS processing continues.

User Response: Refer to *DB2 Utility Guide and Reference* for information about RUNSTATS statistics.

DSNU614I *csect-name* SYSTABLES CATALOG STATISTICS FOR *table-name*

:

CARD	= cardinality
CARDF	= cardinality
NPAGES	= npages
NPAGESF	= npages
PCTPAGES	= pctpages
PCTROWCOMP	= pctrowcomp
AVGROWLEN	= avgrowlen
SPACEF	= space

Explanation: The RUNSTATS utility issues this message to report the statistics collected for the specified table. The statistics follow:

cardinality

The number of rows in the table.

For a LARGE table space, the value of CARD is set to -1.

npages

The number of pages on which rows of the table appear.

pctpages

The percentage of total pages of the table space that contain rows from this table.

pctrowcomp

The percentage of rows compressed within the total number of active rows in the table.

avgrowlen

The total number of bytes divided by the number of rows.

space The space currently allocated for all extents, measured in kilobytes.

RUNSTATS uses floating point fields to report these statistics.

This message is routed to SYSPRINT.

Severity: 0 (informational)

System Action: RUNSTATS processing continues.

User Response: Refer to *DB2 Utility Guide and Reference* for a discussion of RUNSTATS statistics.

DSNU615I *csect-name* SYSCOLUMNS CATALOG STATISTICS FOR *column-name*

:

COLCARD	= cardinality	
COLCARDF	= cardinalityHIGH2KEY	= high2key
LOW2KEY	= low2key	

Explanation: The RUNSTATS utility issues this message to report the statistics collected for column '*column-name*'. Message DSNU619I is issued to identify the table.

cardinality

The number of distinct values in the column

high2key

The second highest value of the column

low2key

The second lowest value of the column

If the values for 'high2key' and 'low2key' are null, the invoker of RUNSTATS is not authorized to read the table.

For a LARGE table space, the value of COLCARD is set to -1.

RUNSTATS uses floating point fields to report these statistics.

This message is routed to SYSPRINT.

Severity: 0 (informational)

System Action: Processing continues.

User Response: Refer to *DB2 Utility Guide and Reference* for a description of RUNSTATS statistics.

DSNU616I *csect-name* SYSCOLDIST CATALOG STATISTICS FOR *column-name*, *column-name*, *column-name* ...

: CARDINALITY = cardinality

FREQUENCY	COLVALUE
frequency	X "hex_string"
frequency	X "hex_string"
...	...
frequency	X "hex_string"

Explanation: The RUNSTATS utility issues this message to report the statistics collected for the indexed column '*column-name*'. If more than one column is listed, then the statistics collected and the column values reported represent the concatenation of those columns.

The value for CARDINALITY is the number of distinct

values for the listed columns. This statistic appears only if the KEYCARD option was specified.

The values under FREQUENCY are the same as those that are inserted into the DB2 catalog. Consider each 'frequency' as a four-digit number with an implied decimal point two places to the left of the final digit. The resulting number is the percentage of total rows in the table that contain a particular value for the named index columns.

Frequency is associated with the occurrence of a single value which is listed under COLVALUE.

Frequencies for the most frequent values are collected by default, or if the FREQVAL option is specified and given a COUNT value greater than zero. If the default is taken, then the ten most frequently occurring values are reported in descending order of frequency.

If fewer than ten values appear, then there are fewer than ten distinct values in the index.

If no values appear, then the values are uniformly distributed.

If frequencies appear but column values do not, then the invoker of RUNSTATS is not authorized to read the table. Message DSNU619I is issued to identify the table.

This message is routed to SYSPRINT.

Severity: 0 (informational)

System Action: Processing continues.

User Response: Refer to *DB2 Utility Guide and Reference* for a description of RUNSTATS statistics.

DSNU617I *csect-name* **SYSINDEXES CATALOG**
STATISTICS FOR *index-name*

:

CLUSTERED	= clustered
CLUSTERRATIO	= clusterratio
CLUSTERRATIOF	= clusterratio
FIRSTKEYCARD	= firstkeycard
FIRSTKEYCARDF	= firstkeycard
NLEAF	= nleaf
NLEVELS	= nlevels
SPACEF	= space

Explanation: The RUNSTATS utility issues this message to report the statistics collected for index 'index-name'.

clustered

Whether the table is actually clustered by this index (YES or NO)

cluster-ratio

The percentage of data rows that are in clustering order for this index

float-cluster-ratio

A number between 0 and 1 that when multiplied by 100 gives the percentage of data rows in the partition that are in clustering order for this index

first-key

The number of distinct values of the first key column

full-key

The number of distinct values of the key

nleaf

The number of active leaf pages in the index

nlevels

The number of levels in the index tree

space

The space currently allocated for all extents, measured in kilobytes.

For a LARGE table space, the values of FIRSTKEYCARD and FULLKEYCARD are set to -1. RUNSTATS uses floating point fields to report these statistics.

This message is routed to SYSPRINT.

Severity: 0 (informational)

System Action: Processing continues.

User Response: Refer to *DB2 Utility Guide and Reference* for a description of RUNSTATS statistics.

DSNU618I *csect-name* **SYSINDEXPART CATALOG**
STATISTICS FOR *index-name*
PARTITION *part-num*

:

CARD	= cardinality
CARDF	= cardinality
NEAROFFPOS	= near-off
NEAROFFPOSF	= near-off
FAROFFPOS	= far-off
FAROFFPOSF	= far-off
LEAFDIST	= leafdist
SPACEF	= space
DSNUM	= dsnum
EXTENTS	= extents
LEAFNEAR	= leafnear
LEAFFAR	= leaffar
PSEUDO_DEL_ENTRIES	= pseudo_del_entries

Explanation: The RUNSTATS utility issues this message to report the statistics collected for index 'index-name'. If 'part-num' equals 0, the statistics apply to the entire index. If 'part-num' is not 0, the statistics apply to the specified partition of the index.

cardinality

The number of rows in the partition or index.

near-off

The number of rows pointed to that are near but not at their optimal positions.

far-off

The number of rows pointed to that are far from their optimal positions.

leafdist

100 times the average distance in page IDs between successive leaf pages during a sequential access of the index.

space

The space currently allocated for all extents, measured in kilobytes.

dsnum

The number of data sets.

extents

The number of extents for the last data set of the object.

leafnear

The number of leaf pages physically near the previous leaf page for successive active leaf pages.

leaffar

The number of leaf pages located physically far away from the previous leaf pages for successive active leaf pages accessed in an index scan.

pseudo_del_entries

The number of entries that are logically deleted.

For a LARGE table space, the values of CARD, NEAROFFPOS, and FAROFFPOS are set to -1. RUNSTATS uses floating point fields to report these statistics.

This message is routed to SYSPRINT.

Severity: 0 (informational)

System Action: Processing continues.

User Response: Refer to *DB2 Utility Guide and Reference* for a description of RUNSTATS statistics.

DSNU619I *csect-name* - **USER *auth_id* DOES NOT HAVE PRIVILEGE ON TABLE *table_name***

Explanation: The RUNSTATS utility issues this message to report that authorization ID '*auth_id*' does not have privilege on table '*table_name*'. Some column values reported by messages DSNU615I, DSNU616I, DSNU625I, and DSNU626I contain the null value.

Severity: 0 (informational)

System Action: RUNSTATS processing continues.

User Response: To obtain the key values, the user must be granted authority on the table. The RUNSTATS utility can be rerun with the report option.

DSNU620I *csect-name* **RUNSTATS CATALOG STATISTICS STATTIME = *timestamp***

Explanation: The RUNSTATS utility issues this message to report the timestamp value when statistics were collected. The value '*timestamp*' is common to all of the statistic tables that were updated.

Severity: 0 (informational)

System Action: Processing continues.

User Response: Refer to *DB2 Utility Guide and Reference* for a description of the RUNSTATS statistics.

DSNU621I *csect-name* **RUNSTATS COMMIT/ROLLBACK FAILED**

Explanation: The RUNSTATS utility updated the catalog with gathered statistics and has tried either to commit those changes or to perform rollback processing to remove them following an error. The commit or rollback failed.

Severity: 8 (error)

System Action: RUNSTATS processing is terminated. Subsequent utility control statements in the utility job step are executed.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: This is an internal error.

DSNU622I *csect-name* **CATALOG ACCESS FOR *object-name* NOT SUCCESSFUL, REASON=*reason-code***

Explanation: Due to catalog access error for object *object-name* and reason code *reason-code*, the catalog update, insert, or select was not successful for the object when inline statistics was employed.

Severity: 4 (warning)

User Response: Run the RUNSTATS utility against the object.

DSNU623I *csect-name - catalog-table-name* **CATALOG NOT UPDATED WITH AGGREGATE STATISTICS FOR *object-name* BECAUSE SOME PARTITIONS HAVE NO VALID STATISTICS**

Explanation: Aggregate statistics were requested, but partition statistics do not exist for every partition. Without partition statistics, the aggregate statistics cannot be calculated. The statistics for '*object-name*' are not updated in the specified DB2 catalog table.

One possible cause for this message is that someone

altered the length of a varying-length column and then tried to run RUNSTATS with the PART option.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Run the RUNSTATS utility to collect statistics for:

- The entire table space, table, column or index, or
- Every partition.

DSNU624I *csect-name* **SYSTABSTATS CATALOG STATISTICS FOR** *table-name*
PARTITION *part-num*

:

CARD or CARDF = cardinality
NPAGES = npages
PCTPAGES = pctpages
NACTIVE = nactive
PCTROWCOMP = pctrowcomp

Explanation: The RUNSTATS utility issues this message to report the statistics collected for the specified partition of the table space containing the table. The statistics follow:

cardinality

The number of rows in the table space partition

npages

The number of pages on which rows of the table space partition appear

pctpages

The percentage of total pages of the table space partition that contain rows from this table

nactive

The number of active pages in the table space partition

pctrowcomp

The percentage of rows compressed within the total number of active rows in the partition

This message is routed to SYSPRINT.

Severity: 0 (informational)

System Action: RUNSTATS processing continues.

User Response: Refer to *DB2 Utility Guide and Reference* for information about RUNSTATS statistics.

DSNU625I *csect-name* **SYSCOLSTATS CATALOG STATISTICS FOR** *column-name*
PARTITION *part-num*

:

COLCARD = cardinality
HIGHKEY = highkey

HIGH2KEY = high2key
LOW2KEY = low2key
LOWKEY = lowkey

Explanation: The RUNSTATS utility issues this message to report the statistics collected for column 'column-name' partition 'part-num' of a table. Message DSNU619I is issued to identify the table.

cardinality

The number of distinct values in the column for the partition

highkey

The highest value of the column in the partition

high2key

The second highest value of the column in the partition

low2key

The second lowest value of the column in the partition

lowkey

The lowest value of the column in the partition

If the values for 'highkey', 'high2key', 'low2key', and 'lowkey' are null, the invoker of RUNSTATS is not authorized to read the table.

This message is routed to SYSPRINT.

Severity: 0 (informational)

System Action: Processing continues.

User Response: Refer to *DB2 Utility Guide and Reference* for a description of RUNSTATS statistics.

DSNU626I *csect-name* **SYSCOLDISTSTATS CATALOG STATISTICS FOR** *column-name, column-name, column-name ...*
PARTITION *part-num*

: CARDINALITY = cardinality

FREQUENCY	COLVALUE
frequency	X "hex_string"
frequency	X "hex_string"
...	...
frequency	X "hex_string"

Explanation: The RUNSTATS utility issues this message to report the statistics collected for the indexed column 'column-name' partition 'part-num'. If more than one column is listed, then the statistics collected and the column values reported represent the concatenation of those columns.

The value for CARDINALITY is the number of distinct values for the listed columns. This statistic appears only if the KEYCARD option was specified.

The values under FREQUENCY are the same as those

that are inserted into the DB2 catalog. Consider each 'frequency' as a four-digit number with an implied decimal point two places to the left of the final digit. The resulting number is the percentage of total rows in the table that contain a particular value for the named index columns.

Frequency is associated with the occurrence of a single value which is listed under COLVALUE.

Frequencies for the most frequent values are collected by default, or if the FREQVAL option is specified and given a COUNT value greater than zero. If the default is taken, then the ten most frequently occurring values, plus the lowest and highest values in the partition (if not already included in the ten greatest frequencies), are reported in descending order of frequency.

If fewer than ten values appear, then there are fewer than ten distinct values in the index.

If no values appear, then the values are uniformly distributed.

If frequencies appear but column values do not, then the invoker of RUNSTATS is not authorized to read the table. Message DSNU619I is issued to identify the table.

This message is routed to SYSPRINT.

Severity: 0 (informational)

System Action: Processing continues.

User Response: Refer to *DB2 Utility Guide and Reference* for a description of RUNSTATS statistics.

DSNU627I *csect-name* **SYSINDEXSTATS CATALOG STATISTICS FOR** *index-name* **PARTITION** *part-num*

:

CLUSTERRATIO or CLUSTERRATIOF = cluster-ratio
 FIRSTKEYCARD or FIRSTKEYCARDF = first-key
 FULLKEYCARD or FULLKEYCARDF = full-key
 NLEAF = nleaf
 NLEVELS = nlevels
 KEYCOUNT or KEYCOUNTF = keycount

Explanation: The RUNSTATS utility issues this message to report the statistics collected for partition *part-num* of index *index-name*.

cluster-ratio

The percentage of data rows in the partition that are in clustering order for this index

first-key

The number of distinct values of the first key column in the partition

full-key

The number of distinct values of the key in the partition

nleaf The number of active leaf pages in the index partition

nlevels

The number of levels in the index tree in the partition

keycount

The number of index keys (entries) in the partition

This message is routed to SYSPRINT.

Severity: 0 (informational)

System Action: Processing continues.

User Response: Refer to *DB2 Utility Guide and Reference* for a description of RUNSTATS statistics.

DSNU628I *csect-name* **STATISTICS WILL NO LONGER BE COLLECTED ON RESTART**

Explanation: Since inline statistics is not restartable, Statistics will not be collected on restarting the LOAD/REORG utility. The error message will be issued on restart of a LOAD/REORG utility with STATISTICS keyword specified.

Severity: 4 (warning)

User Response: Run the runstats utility on the object after the utility execution.

DSNU629I *csect-name* **INLINE STATISTICS IS NOT SUPPORTED FOR** *object-name*

Explanation: The collection of inline statistics is not supported on the following directory and catalog tablespaces : DSNDB06.SYSDBASE, DSNDB06.SYSDBAUT, DSNDB06.SYSGROUP, DSNDB06.SYSPLAN, DSNDB06.SYSVIEWS, DSNDB06.SYSSTATS, and DSNDB01.DBD01

This error message will be issued on execution of a REORG or REBUILD INDEX utility on a catalog object when the STATISTICS keyword is specified.

Severity: 4 (warning)

User Response: Remove the keyword STATISTICS from the utility job statement and rerun the utility. Run the RUNSTATS utility afterwards.

DSNU630I *csect-name* - **SYSLOBSTATS CATALOG STATISTICS FOR** *LOB table space* **AVGSIZE =** *avgspace* **FREESPACE =** *freespace* **ORGRATIO =** *orgratio*

Explanation: The RUNSTATS utility issues this message to report statistics collected for the LOB table space.

AVGSIZE

Average size of a LOB in the LOB table space.

FREESPACE

Amount of free space in the LOB table space.

ORGRATIO

The ratio of organization in the LOB table space. A value of 1 indicates perfect organization of the LOB table space. The greater the value exceeds 1, the more disorganized the LOB table space.

System Action: RUNSTATS processing continues.

DSNU631I *csect-name - catalog-table-name*
**CATALOG NOT UPDATED WITH
 AGGREGATE STATISTICS FOR
 object-name BECAUSE ERROR FROM
 SORT COMPONENT RC=*n***

Explanation: The aggregate statistics cannot be calculated because of an error from the SORT routine. An MVS sort returned a non-zero return code *n*.

The statistics for *object-name* are not updated in the DB2 catalog table that was specified.

Severity: 4 (warning)

System Action: Processing continues, but the statistics for *object-name* are not updated in the DB2 catalog table that was specified.

User Response: Determine the cause of the error from the SORT routine. Run the RUNSTATS utility to collect statistics for:

- The entire tablespace, table, column, or index, or
- Every partition

DSNU638I *csect - UTILITY NOT ALLOWED TO
 RUN ON TABLESPACE = tttttttt IN
 ROSHARE READ DATABASE =
 dddddddd*

Explanation: An attempt to execute STOSPACE utility on a table space defined in a ROSHARE READ database failed. The STOSPACE utility is only allowed to execute in a ROSHARE OWNER or a nonshared database.

Severity: 4 (warning)

System Action: Processing continues to the next table space or index space in the storage group, if any.

User Response: Resubmit the utility job on the system in which the database was defined with the ROSHARE OWNER attribute.

DSNU639I *csect - UTILITY NOT ALLOWED TO
 RUN ON INDEX SPACE = iiiiitii IN
 ROSHARE READ DATABASE =
 dddddddd*

Explanation: An attempt to execute the STOSPACE utility on an index space defined in a ROSHARE READ

database failed. The STOSPACE utility is only allowed to execute in a ROSHARE OWNER or nonshared database.

Severity: 4 (warning)

System Action: Processing continues to the next table space or index space in the storage group, if any.

User Response: Resubmit the utility job on the system in which the database was defined with the ROSHARE OWNER attribute.

DSNU640I *csect-name DATA SET= nnn OF
 TABLESPACE= tttttttt IN DATABASE=
 dddddddd HAS BEEN MIGRATED BY
 HSM*

Explanation: The STOSPACE utility has found that a DB2 data set has been migrated by the Data Facility Hierarchical Storage Manager. The amount of storage space used cannot be determined for DATA SET 'nnn' of TABLESPACE 'ttttttt' in DATABASE 'ddddddd'. The space allocation information in the catalog will not include the storage used by the migrated data set.

Severity: 0 (informational)

System Action: Processing continues to the next data set in the storage group, if any.

System Programmer Response: If required, the data set may be recalled using HSM, and the STOSPACE utility may be run again.

DSNU641I *csect-name DATA SET= nnn OF
 INDEXSPACE= iiiiitii IN DATABASE=
 dddddddd HAS BEEN MIGRATED BY
 HSM*

Explanation: The STOSPACE utility has found that a DB2 data set has been migrated by the Data Facility Hierarchical Storage Manager. The amount of storage space used cannot be determined for DATA SET 'nnn' of INDEXSPACE 'iiiiitii' in DATABASE 'ddddddd'. The space allocation information in the catalog will not include the storage used by the migrated data set.

Severity: 0 (informational)

System Action: Processing continues to the next data set in the storage group, if any.

System Programmer Response: If required, the data set may be recalled using HSM, and the STOSPACE utility may be run again.

DSNU642I *csect-name UNABLE TO ACCESS DBD
 FOR DATABASE = dddddddd,
 TABLESPACE = tttttttt*

Explanation: A database descriptor control block could not be accessed by the STOSPACE utility. Information in the DBD is required before space allocation data can be obtained from the appropriate

DSNU643I • DSNU646I

ICF catalog. Storage space used by table space 'tttttt' in database 'ddddddd' cannot be determined.

Severity: 4 (warning)

System Action: Processing continues with the next storage group.

User Response: Determine the cause for unavailability. The database may be stopped or the DBD may be marked as invalid. The -DISPLAY DATABASE command can be used to determine the status.

System Programmer Response: Determine if the reason for the DBD unavailability may require system corrective action.

Problem Determination: A DSNT501I message may have been sent to the operator console. If so, see the problem determination section for message DSNT501I in the Chapter 18, "DSNT... Messages," on page 417.

DSNU643I *csect-name* **UNABLE TO ACCESS DBD FOR DATABASE = ddddddd, INDEXSPACE = tttttt**

Explanation: A database descriptor control block could not be accessed by the STOSPACE utility. Information in the DBD is required before space allocation data can be obtained from the appropriate ICF catalog. Storage space used by index space 'tttttt' in database 'ddddddd' cannot be determined.

Severity: 4 (warning)

System Action: Processing continues with the next storage group.

User Response: Determine the cause for unavailability. The database may be stopped or the DBD may be marked as invalid. The -DISPLAY DATABASE command can be used to determine the status.

System Programmer Response: Determine if the reason for the DBD unavailability may require system corrective action.

Problem Determination: A DSNT501I message may have been sent to the operator console. If so, see the problem determination section for message DSNT501I in the Chapter 18, "DSNT... Messages," on page 417 section.

DSNU644I *csect-name* **USER user-name NOT AUTHORIZED FOR STOSPACE UTILITY**

Explanation: Utility processing for the user indicated on the job statement failed, because the user is not authorized to execute the STOSPACE utility.

Severity: 8 (error)

System Action: Utility processing is terminated without invoking the requested utility or utilities.

User Response: Contact the systems programmer for assistance with your security classification.

System Programmer Response: If the USER specified on the job statement is incorrect, correct it, and resubmit the job. To run the STOSPACE utility, the user must either have SYSADM authority or have been granted the STOSPACE privilege. Use the SQL GRANT command to give the user the desired authority.

DSNU645I *csect-name* **NO STORAGE GROUPS NAME FOUND**

Explanation: You requested the STOSPACE utility to report on all storage groups, but no storage group was found.

Severity: 4 (warning)

This condition does not prevent subsequent processing.

System Action: This message indicates completion of the STOSPACE utility. Processing continues to the next utility statement in the utility job step, if any. If not, the utility job step is normally terminated. Resources are released to their prior availability state. The UTILID of the utility job step becomes available for reuse.

User Response: This message indicates that there are no storage groups defined. Consult the system programmer to determine the reason for this condition.

System Programmer Response: This message indicates either that no storage groups were defined by the installation process (or by subsequent SQL procedures) or they have all been dropped. If this is an error, the required storage groups must be re-created with the CREATE STOGROUP SQL statement.

DSNU646I *csect-name* **STORAGE GROUP NAME nnnnnnnn NOT FOUND**

Explanation: This message is issued by STOSPACE when one of the requested storage groups is not found.

The following circumstances may exist:

1. When an inconsistency occurs between SYSIBM.SYSSTOGROUP at the beginning of STOSPACE execution and SYSIBM.SYSSTOGROUP during or at the end of processing. The inconsistency may be due to a storage group being dropped during the processing of STOSPACE utility.
2. The storage group name is misspelled.

Severity: 4 (warning)

System Action: Processing proceeds normally to the next storage group if any.

User Response: Verify the existence or spelling of the storage group names by referring to SYSIBM.SYSSTOGROUP. Submit another request with the correct storage group designated.

DSNU647I *csect-name* **UNAVAILABLE REASON X**
reason-code **UNAVAILABLE TYPE X**
type-code, TABLESPACE NAME=
table-space-name **NOT FOUND**

Explanation: The indicated table space was not available for processing by the STOSPACE utility. The reason for its unavailability is given in 'reason-code'. The type of unavailability is given in 'type-code'.

This message may be issued when an inconsistency between SYSIBM.SYSSTABLESPACE and SYSIBM.SYSTABLEPART has been detected. The inconsistency may be due to a table space being dropped during the processing of the STOSPACE utility.

Severity: 4 (warning)

System Action: Processing continues to the next table space in the storage group, if any.

User Response: Use the 'reason-code' and 'type-code' to determine why the resource was unavailable. When the problem has been resolved, resubmit the STOSPACE request.

System Programmer Response: Determine if the 'reason-code' and 'type-code' require system corrective action.

Problem Determination: See the Problem Determination section for message DSNT500I on page 468.

DSNU648I *csect-name* **UNAVAILABLE REASON X**
reason code, UNAVAILABLE TYPE X
type-code, INDEX NAME=index-name
NOT FOUND

Explanation: The indicated index was not available for processing by the STOSPACE utility. The reason for its unavailability is given in 'reason-code'. The type of unavailability is given in 'type-code'.

This message may be issued when an inconsistency between SYSIBM.SYSINDEXES and SYSIBM.SYSINDEXPART has been detected. The inconsistency may be due to an index being dropped during the processing of the STOSPACE utility.

Severity: 4 (warning)

System Action: Processing continues to the next index in the storage group, if any.

User Response: Use the 'reason-code' and 'type-code' to determine why the resource was unavailable. When the problem has been resolved, resubmit the STOSPACE request.

System Programmer Response: Determine if the 'reason-code' and 'type-code' require system corrective action.

Problem Determination: See the Problem

Determination section for message DSNT500I on page 468.

DSNU650I *csect-name control-statement-text*

Explanation: Each control statement is returned to the invoker as a part of the normal output. If an error occurred while processing the statement, a separate error message follows this message.

Severity: 0 (informational)

System Action: The processing of the utility request continues normally.

DSNU651I *csect-name* **SET NOCOPYPEND**
OPERATION SUCCESSFUL

Explanation: This message reports the successful completion of the REPAIR SET TABLESPACE NOCOPYPEND utility operation. The COPY PENDING restriction has been removed from the specified table space.

Severity: 0 (informational)

System Action: The REPAIR SET statement has completed normally.

DSNU652I *csect-name* **VERIFY OPERATION**
SUCCESSFUL

Explanation: This message is issued during REPAIR utility processing in response to a VERIFY control statement. It indicates the verification requested was successful, permitting a subsequent REPLACE request to take effect.

Severity: 0 (informational)

System Action: The requested verification was successful. If this is the only verification required for the subsequent REPLACE control statement, the REPLACE control statement takes effect. If there are other verification control statements, they must also complete successfully before the subsequent REPLACE control statement takes effect.

DSNU653I *csect-name* **REPLACE OPERATION AT**
OFFSET *hex-data* WITH DATA *hex-data*
FAILED. ATTEMPTED TO REPLACE
CRITICAL NON-DATA INFORMATION
ON THE PAGE *page-num* WITH
INCORRECT INFORMATION.

Explanation: The REPAIR utility job with the LOG YES option was unable to replace certain critical, nondata information in the page for one of these reasons:

- Some critical information on any page at the indicated offset cannot be replaced by this method.

DSNU654I • DSNU659I

- The page is a header page and some of the information at the indicated offset cannot be replaced by this method.
- The information can be replaced only by using the LOG NO option.

Severity: 8 (error)

System Action: REPAIR resumes executing at the next LOCATE statement. Later control statements in the same LOCATE block are not executed.

User Response: Correct the REPAIR control statements and resubmit the request in a new utility job step.

User Response: Check the OFFSET option on the REPLACE statement to be sure it does not cause critical information to be replaced. If the replacement is intentional, use the LOG NO option.

DSNU654I *csect-name* VERIFY OPERATION FAILED, DATA IS *hex-data*

Explanation: The verify operation requested on the control statement failed. The actual data is given as 'hex-data'.

Severity: 4 (warning)

System Action: All REPAIR REPLACE actions subject to the current LOCATE scope are ignored. Processing continues at the next LOCATE request, if any.

User Response: Determine why the data (as reported in the message) does not match the expectations of VERIFY option. Make the appropriate correction, and resubmit the REPAIR request in a new utility job step.

Problem Determination: The REPAIR DUMP option can help you determine the correct verification data. Refer to *DB2 Utility Guide and Reference* for REPAIR processing constraints.

DSNU655I *csect-name* DELETE OPERATION SUCCESSFUL

Explanation: This message is issued during the REPAIR utility in response to a DELETE control statement.

Severity: 0 (informational)

System Action: The data record specified on the previous LOCATE statement and all of its related INDEX entries have been deleted from the system. Processing continues.

DSNU656I *csect-name* REPLACE OPERATION SUCCESSFUL, DATA WAS *hex-data*

Explanation: This message is issued by the REPAIR utility in response to a REPLACE control statement request. The message indicates that replacement of the data occurred and that the replaced data had the

indicated hexadecimal value ('hex-data').

Severity: 0 (informational)

System Action: The REPAIR utility located the indicated record, performed all requested verifications, and replaced the data in the record at the indicated offset with the new data as defined by the REPLACE control statement.

System Programmer Response: If a changed record is recovered before an image copy is made, and the REPAIR utility was run with LOG NO, the repair must be reapplied. If the REPAIR utility was run with LOG YES, no image copy is required before recovering the data after the repair.

DSNU657I *csect-name* REPLACE RESET OPERATION SUCCESSFUL

Explanation: This message is issued by the REPAIR utility in response to a REPLACE RESET control statement request. The message indicates that the broken page indicator has been reset.

Severity: 0 (informational)

System Action: The REPAIR utility has reset the broken page indicator for the specified page. Although the reset indicator has been committed, it has not been logged. If the page is recovered before an image copy is made, the REPAIR RESET must be reapplied.

However, to make the repair persist across subsequent RECOVER operations, an image copy should be taken subsequent to the completion of the REPAIR utility.

DSNU658I *csect-name* MULTIPLE RECORDS FOUND WITH SPECIFIED KEY

Explanation: The specified key is not unique. Several DSNU660I messages, giving possible RID values for this KEY, follow this message.

Severity: 8 (error)

System Action: Processing continues normally.

User Response: Change the LOCATE statement to locate the desired RID, and resubmit the request in a new utility job step.

DSNU659I *csect-name* REPAIR LEVELID OPERATION DISALLOWED.

Explanation: The REPAIR utility with the LEVELID clause is not allowed. Possible reasons are:

- The data set was in use at the time the REPAIR utility was run.
- The page set has outstanding log apply activity (an indoubt UR has interest in the page set or the page set has pages in the logical page list (LPL)).

Severity: 8 (error)

System Action: Processing ends with this operation.

User Response: The REPAIR LEVELID operation for the given index space or table space cannot continue at this stage. If the page set is in use, you should not attempt to run REPAIR LEVELID. If the page set has log apply activity outstanding (in-doubt UR or pages in LPL), the log apply activity must complete before using REPAIR LEVELID. Submit other REPAIR control statements in a different job step.

DSNU660I *csect-name* **POSSIBLE RID** *rid*

Explanation: 'rid' is one of several records that map to the specified KEY.

Severity: 8 (error)

System Action: Other records also mapping to the specified KEY are identified by other DSNU660I messages. This message is preceded by message DSNU658I. Processing continues normally.

User Response: Change the LOCATE statement to locate the desired RID, and resubmit the request in a new utility job step. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU661I *csect-name* **RECORD NOT FOUND IN PAGE, MAXID=** *hex-data*

Explanation: A RID was either specified or obtained from the clustering index via the specified KEY. The PAGE indicated in the RID did not contain the RECORD indicated in the RID.

Severity: 8 (error)

System Action: Processing proceeds to the next LOCATE statement, if there is one.

User Response: Either change the LOCATE statement to locate a valid RID or KEY, or use LOCATE PAGE and resubmit the REPAIR statements in a new utility job step. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU662I *csect-name* **NO RECORD FOUND WITH SPECIFIED KEY**

Explanation: A KEY was specified on the LOCATE statement, but no entry exists in the clustering index for that KEY.

Severity: 8 (error)

System Action: Processing begins at the next LOCATE statement, if there is one.

User Response: Correct the LOCATE statement, and resubmit the REPAIR statements in a new utility job step.

DSNU663I *csect-name* **PAGE** *hex-page-number* **NOT FOUND**

Explanation: The page identified a record identifier (RID) or KEY does not exist in the specified table space.

Severity: 0 (informational) when issued by DUMP PAGES(n). 8 (error) when issued by LOCATE PAGE(n).

System Action: Processing begins at the next LOCATE statement, if there is one.

User Response: Correct the LOCATE statement, and resubmit the REPAIR statements in a new utility job step.

DSNU664I *csect-name* **INVALID OFFSET OR LENGTH FOR** *xxxxx*

Explanation: 'xxxxx' is 'RECORD' or 'PAGE'. The specified or default values for OFFSET and LENGTH combine to extend beyond the specified record or page.

Severity: 4 (warning)

System Action: Processing continues at the next LOCATE statement, if there is one.

User Response: Correct the OFFSET and/or LENGTH specification, and resubmit the REPAIR statements in a new utility job step. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU665I *csect-name* **NO RECORD ASSOCIATED WITH SPECIFIED RID**

Explanation: A record identifier (RID) was specified on the LOCATE statement, but that RID is not associated with any record in the specified table space. If DELETE processing returns this message, the RID may exist but be invalid for DELETE.

Severity: 8 (error)

System Action: Processing begins at the next LOCATE statement, if there is one. Subsequent utilities in the same job step will not be executed.

User Response: Correct the LOCATE statement, and resubmit the REPAIR statements in a new utility job step.

Problem Determination: REPAIR DELETE will issue this message for RIDs which are internal and do not directly represent user data. The DUMP keyword may be used to view the RID, if it exists. These internal records may only be repaired using the REPLACE keyword.

DSNU666I *csect-name* **NO INDEX EXISTS**

Explanation: The KEY for this table space is not a full clustering key. The statement is invalid.

Severity: 8 (error)

System Action: Processing continues at the next LOCATE statement, if there is one.

User Response: Correct the LOCATE statement to use the clustering index, or change LOCATE by PAGE or RID. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU668I *csect-name* **UNABLE TO CONVERT KEY TO format**

Explanation: 'format' specifies the data type to which the KEY specification must be converted. The conversion has failed.

Severity: 8 (error)

System Action: Processing begins at the next LOCATE statement, if there is one.

User Response: Correct the LOCATE statement to specify a KEY either of the indicated data type or of a compatible data-type. Then resubmit the REPAIR statements in a new utility job step. Refer to *DB2 Utility Guide and Reference* for a discussion of conversion constraints.

DSNU669I *csect-name* **INDEX NOT FOUND FOR SPECIFIED TABLESPACE**

Explanation: An index was specified on the LOCATE KEY statement via the INDEX keyword, but no index by that name was found related to the specified TABLESPACE.

Severity: 8 (error)

System Action: Processing begins at the next LOCATE statement, if there is one.

User Response: Correct the LOCATE statement and resubmit the REPAIR statements in a new utility job step.

Problem Determination: Valid index names can be found in the SYSIBM.SYSINDEXES catalog table.

DSNU670I *csect-name* **PAGE X page-id IS A BROKEN PAGE**

Explanation: The indicated page located by the REPAIR utility has been marked broken by the data manager. The 'page id' is given in hexadecimal. This page is not accessible until the broken page indicator is reset by the REPAIR REPLACE RESET option.

Severity: 4 (warning)

System Action: The message reports that the page in which the REPAIR utility is requested to REPLACE some data is broken.

User Response: Determine the cause of the broken page with the assistance of the system programmer. When it is repaired, use the REPAIR RESET option.

System Programmer Response: Determine the cause of the broken page. It could be an internal error and require support center assistance. The REPAIR DUMP option can be used to determine the contents of the page for failure analysis. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU672I *csect-name* **INDEX USED HAS MULTIPLE-FIELD KEY**

Explanation: A REPAIR LOCATE KEY operation was attempted against a table space using an index that has a multiple-field key. LOCATE KEY does not support multiple-field keys.

Severity: 8 (error)

System Action: Processing begins at the next LOCATE scope, if any.

User Response: Change the LOCATE statement to specify PAGE and RID, and resubmit the REPAIR statements in a new utility job step.

DSNU673I *csect-name* **REPAIR LOCATE RID LOCATED A NON-DATA PAGE**

Explanation: The LOCATE RID option of the REPAIR utility was used to process a nondata page.

Severity: 8 (error)

System Action: Processing continues at the next LOCATE statement. Otherwise, processing stops.

User Response: To process nondata pages, use the LOCATE PAGE option in the REPAIR control statements and resubmit the new utility job step. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU676I *csect-name* - **ROWID=rowid VERSION=version IS NOT FOUND IN AUXILIARY INDEX**

Explanation: The REPAIR utility was unable to locate the ROWID *rowid* and VERSION *version* in the index on the auxiliary table.

System Action: Utility returns completion code=8.

Programmer Response: Correct the ROWID or VERSION. Only ROWID and VERSION values previously generated by DB2 can be used. The most

likely source values of a ROWID and VERSION are messages DSNU743I, DSNU805I, and DSNU806I from the CHECK DATA or CHECK LOB utilities.

DSNU678I *csect-name* **VERIFY, REPLACE, DUMP, OR DELETE BEFORE LOCATE**

Explanation: The REPAIR utility was requested to VERIFY, REPLACE, or DUMP or DELETE a page or record and that page of record could not be located.

Severity: 8 (error)

System Action: Processing begins at the next LOCATE statement, if there is one. Subsequent utilities in the same job step will not be executed.

User Response: Correct the REPAIR control statements, and resubmit the request in a new utility job step. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU679I *csect-name* **MULTIPLE 'DELETE'S PER 'LOCATE' NOT ALLOWED**

Explanation: The REPAIR utility was requested to DELETE the same record more than once. Only one DELETE is allowed per LOCATE RID or LOCATE KEY.

Severity: 8 (error)

System Action: Processing begins at the next LOCATE scope, if any. Subsequent utilities in the same job step are not executed.

User Response: Remove all but one DELETE control statement from each LOCATE scope which is intended to delete a record. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU680I *csect-name* **PAGE** *hex-page-number*

Explanation: This message is issued as an identifier at the top of each page dumped by the REPAIR DUMP PAGES facility. 'hex-page-number' identifies the page which is about to be dumped.

Severity: 0 (informational)

System Action: Processing continues.

DSNU681I *csect-name* **SET NOCHECKPEND OPERATION SUCCESSFUL**

Explanation: This message reports the successful completion of the REPAIR SET TABLESPACE NOCHECKPEND utility operation. The check pending restriction has been removed from the specified table space.

Severity: 0(informational)

System Action: The REPAIR SET statement has completed normally.

DSNU682I *csect-name* **SET NORCVRPEND OPERATION SUCCESSFUL**

Explanation: This message reports the successful completion of the REPAIR SET NORCVRPEND utility operation. The RECOVERY PENDING restriction has been removed from the specified table space, from the specified index, or from all indexes of the specified table space.

Severity: 0 (informational)

System Action: The REPAIR SET statement has completed normally.

DSNU683I *csect-name* **REPAIR LEVELID OPERATION SUCCESSFUL.**

Explanation: The REPAIR utility with the LEVELID clause completed successfully.

Severity: 0 (informational)

System Action: Processing completed successfully.

User Response: Submit any other REPAIR control statements in a different job step.

DSNU684I *csect-name* - **SET NOAUXCHKP OPERATION SUCCESSFUL**

Explanation: This message reports the successful completion of the REPAIR SET NOAUXCHKP utility operation. The auxiliary check pending (ACHKP) state has been removed for the specified base table space.

System Action: Utility returns completion code=0.

DSNU685I *csect-name* **SET NORBDPEND OPERATION SUCCESSFUL**

Explanation: This message reports the successful completion of the REPAIR SET NORBDPEND utility operation. The three restrictions REBUILD PENDING, REBUILD PENDING STAR and PAGESET REBUILD PENDING have been removed from the specified index or from all indexes of the specified table space.

Severity: 0 (informational)

System Action: The REPAIR SET statement has completed normally.

DSNU686I *csect-name* - **SET NOAUXWARN OPERATION SUCCESSFUL**

Explanation: This message reports the successful completion of the REPAIR SET NOAUXWARN utility operation. The AUX WARNING state has been removed for the specified table space.

Severity: 0 (informational)

DSNU687I • DSNU703I

System Action: Utility returns completion code=0.

Programmer Response: None.

DSNU687I *csect-name* - **ROWID=rowid**
VERSION=version LOB DELETED

Explanation: The LOB with the ROWID *rowid* and VERSION *version* was successfully deleted from the specified LOB table space.

System Action: Utility returns completion code=0.

Programmer Response: None

DSNU688I *csect-name* **SET NOARBDPEND**
OPERATION SUCCESSFUL

Explanation: The REPAIR utility successfully reset an object that was in an advisory rebuild pending (ARBD) state.

Severity: 0 (informational)

System Action: No action required.

User Response: No response required.

DSNU689I *csect-name* **SET NOAREORPENDSTART**
OPERATION SUCCESSFUL

Explanation: The REPAIR utility successfully reset an object that was in an advisory reorg pending (AREO*) + state.

Severity: 0 (informational)

System Action: No action required.

User Response: No response required.

DSNU691I *csect-name* - **LOB WITH ROWID=rowid**
VERSION=version NOT FOUND

Explanation: The REPAIR utility was unable to find a LOB with the ROWID of *rowid* and VERSION *version*.

System Action: Utility returns completion code=8.

Programmer Response: Either the ROWID is incorrect, or the index on the auxiliary table is broken. In the first case correct the ROWID as specified on the **LOCATE ROWID** statement. If the index on the auxiliary table is broken, execute the REBUILD INDEX utility to rebuild the index.

DSNU700I *csect-name nnnn* **INDEX ENTRIES**
UNLOADED FROM INDEX=iiii
PARTITION=pppp

Explanation: The CHECK utility UNLOAD phase unloaded *nnnn* records from the index named *iiii* and partition *pppp*.

Severity: 0 (informational)

System Action: Processing continues.

DSNU701I *csect-name nnnn* **INDEX ENTRIES**
UNLOADED FROM iiii

Explanation: The CHECK Utility UNLOAD phase unloaded *nnnn* records from the index named *iiii*.

Severity: 0 (informational)

System Action: Processing continues.

DSNU702I *csect-name* **INVALID INDEX**
SPECIFICATION. INDEX=iiii

Explanation: All tables referenced by the INDEXES in the CHECK or REBUILD utility must be in the same table space. Index 'iiii' is not over a table in the table space specified with the TABLESPACE keyword.

Severity: 8 (error)

System Action: Utility processing is discontinued.

User Response: Correct the index name and/or the TABLESPACE parameters such that a single table space is involved, and rerun the utility job.

Problem Determination: To CHECK or REBUILD ALL INDEXES in a table space, use the TABLESPACE keyword, but do not use the list option. This is one way to correct this error. If you want to correct the list of indexes specified in the index name list, the following procedure will locate the table space name related to the index 'iiii'.

The index name 'iiii' reported in the message is of the form 'creator.name'. Obtain the TBCREATOR and TBNAME columns from the DB2 catalog table SYSIBM.SYSINDEXES where columns CREATOR and NAME have the values reported in the message. Obtain the DBNAME and TSNAME columns from the DB2 catalog table SYSIBM.SYSTABLES, where columns CREATOR and NAME have the values obtained from TBCREATOR and TBNAME of SYSIBM.SYSINDEXES.

The values for DBNAME and TSNAME must be the same for all indexes specified in the index name list and must be the same as the table space name specified on the TABLESPACE keyword (if provided).

DSNU703I *csect-name* **INVALID INDEX**
SPECIFICATION. INDEX=iiii

Explanation: All tables referenced by the indexes in the CHECK or REBUILD utility must be in the same table space. Index 'iiii' is not over a table in the same table space as the prior indexes listed in the index name list.

Severity: 8 (error)

System Action: Utility processing is discontinued.

User Response: Correct the index name and/or the TABLESPACE parameters such that a single table space is involved, and rerun the utility job.

Problem Determination: To CHECK or REBUILD ALL INDEXES in a table space, use the TABLESPACE keyword, but do not use the list option. This is one way to correct this error. If you want to correct the list of indexes specified in the index name list, the following procedure will locate the table space name related to the index 'iiii'.

The index name 'iiii' reported in the message is of the form 'creator.name'. Obtain the TBCREATOR and TBNAME columns from the DB2 catalog table SYSIBM.SYSINDEXES, where columns CREATOR and NAME have the values reported in the message. Obtain the DBNAME and TSNAME columns from the DB2 catalog table SYSIBM.SYSTABLES, where columns CREATOR and NAME have the values obtained from TBCREATOR and TBNAME of SYSIBM.SYSINDEXES.

The values for DBNAME and TSNAME must be the same for all indexes specified in the index name list and must be the same as the table space name specified on the TABLESPACE keyword if provided.

DSNU705I *csect-name* **UNLOAD PHASE COMPLETE, ELAPSED TIME=tttt**

Explanation: The unload phase of the CHECK or REBUILD INDEX utility is complete.

Severity: 0 (informational)

System Action: Processing continues.

DSNU706I *csect-name* **ROW IS IN WRONG PARTITION RID=rrrr, INDEX=iiii, KEY=kkkk, CORRECT PART=pppp, WRONG PART=wwwww**

Explanation: The row at RID 'rrrr' resides in the wrong partition. The partitioning KEY 'kkkk' for partitioning INDEX 'iiii' indicates that the row at RID 'rrrr' should reside in partition 'pppp', however the rid indicates that the row contains partition 'wwwww'.

Severity: 4 (warning)

System Action: Utility processing continues.

User Response: Run RECOVER TABLESPACE utility to recover the data or run REPAIR DELETE utility to delete the row 'rrrr' followed by CHECK INDEX and CHECK DATA utility if referential constraints are involved.

Problem Determination: The inconsistency between the table space partition number of a row and the index space partition number of the row's clustering key may be due to a DB2 internal error, but is most likely due to a user using the DSN1COPY service aid to populate a target table space with data from a source table space when the clustering key values on the source and target table spaces are not identical.

DSNU707I *csect-name* **INDEX ENTRY POINTS TO WRONG TABLE. OBID=oooo, RID=rrrr, INDEX=**

Explanation: The CHECK utility CHECKIDX phase found that index 'iiii' contains an entry for key 'kkkk' that points to record at RID 'rrrr', but the record belongs to the table with OBID 'oooo'.

Severity: 4 (warning)

System Action: CHECK utility processing continues.

User Response: Run the REBUILD INDEX utility for index 'iiii'.

DSNU708I *csect-name* **INDEX IS NOT UNIQUE. INDEX=iiii, KEY=kkkk**

Explanation: The CHECK utility CHECKIDX phase found that unique index 'iiii' contains a nonunique key, 'kkkk'.

Severity: 4 (warning)

System Action: CHECK utility processing continues.

User Response: Drop the unique index, and delete the duplicate rows. Re-create the index.

DSNU709I *csect-name* **NO INDEX ENTRY FOR ROW. RID=rrrr, INDEX=iiii, KEY=kkkk**

Explanation: The CHECK utility CHECKIDX phase found that index 'iiii' is missing an entry for the row at RID 'rrrr' with key 'kkkk'.

Severity: 4 (warning)

System Action: CHECK utility processing continues.

User Response: Run the REBUILD INDEX utility for index 'iiii'.

DSNU710I *csect-name* **INDEX ENTRY CONTAINS INVALID ZERO REPRESENTATION. RID=rrrr, INDEX=iiii, KEY=kkkk**

Explanation: The CHECK utility CHECKIDX phase found that index 'iiii' has an entry that contains a negative zero. The index entry is for the row at RID 'rrrr' with key 'kkkk'.

Severity: 4 (warning)

System Action: CHECK utility processing continues.

User Response: Run the REBUILD INDEX utility for index 'iiii'.

DSNU711I *csect-name* **NO ROW FOR INDEX ENTRY. RID=rrrr, INDEX=iiii, KEY=kkkk**

Explanation: The CHECK utility CHECKIDX phase found that the index 'iiii' contains an entry that has no row. The index entry contained RID 'rrrr' and key 'kkkk'.

DSNU712I • DSNU721I

but RID 'rrrr' is not a valid record.

Severity: 4 (warning)

System Action: CHECK utility processing continues.

User Response: Run the REBUILD INDEX utility for index 'iiii'.

DSNU712I *csect-name* **INDEX OUT OF SEQUENCE.**
INDEX=iiii, KEY=kkkk

Explanation: The CHECK utility CHECKIDX phase found that index 'iiii' is not in correct sequence.

Severity: 4 (warning)

System Action: CHECK utility processing continues.

User Response: Run the REBUILD INDEX utility for index 'iiii'.

DSNU713I *csect-name* **KEYS MISMATCH. RID=rrrr,**
INDEX=iiii, KEY=kkkk, DATA KEY=jjjj

Explanation: The CHECK utility CHECKIDX phase found that index iiii contains an entry for the row at rid rrrr that is inconsistent. KEY kkkk does not match DATA KEY jjjj.

Severity: 4 (warning)

System Action: CHECK utility processing continues.

User Response: Run the REBUILD INDEX utility for index 'iiii'.

DSNU715I *csect-name* **MULTIPLE INDEX ENTRIES**
FOR ROW. RID=rrrr, INDEX=iiii,
KEY=kkkk

Explanation: The CHECK utility CHECKIDX phase found that index 'iiii' has multiple index entries for the row at RID 'rrrr' with key 'kkkk'.

Severity: 4 (warning)

System Action: CHECK utility processing continues.

User Response: Run the REBUILD INDEX utility for index 'iiii'.

DSNU717I *csect-name nnnn* **ENTRIES CHECKED**
FOR INDEX=iiii PARTITION=pppp

Explanation: The CHECK utility completed checking index iiii partition pppp and processed nnnn index entries. This message is issued once for each index partition checked.

Severity: 0 (informational)

System Action: Processing continues.

DSNU718I *csect-name* **NO INDEXES FOUND FOR**
TABLESPACE tttt

Explanation: A utility has been invoked with the TABLESPACE keyword specifying a table space containing tables that have no indexes.

Severity: 4 (warning)

System Action: This message indicates completion of the utility. Processing continues to the next utility statement in the job step, if any. If there are no utility statements following, the job step is terminated normally and the UTILID of the job step becomes available for reuse.

User Response: If the table space specification is in error, correct it and resubmit the utility. If the table space specification is correct, and the table space contains no indexed tables, this is a normal indication and no response is necessary.

DSNU719I *csect-name nnnn* **ENTRIES CHECKED**
FOR INDEX iiii

Explanation: The CHECK utility has completed checking index 'iiii' and has processed 'nnnn' index entries. This message will be issued once for each index checked.

Severity: 0 (informational)

System Action: Processing continues.

DSNU720I *csect-name* **CHECKIDX PHASE**
COMPLETE, ELAPSED TIME = tttt

Explanation: The CHECK utility CHECKIDX phase is complete.

Severity: 0 (informational)

System Action: Processing continues.

DSNU721I *csect-name - USER auth-id* **DOES NOT**
HAVE DELETE AUTHORITY ON TABLE

Explanation: The CHECK DATA utility was run with DELETE YES, but user *auth-id* does not have authority to delete from a table specified in the utility statement or from one of its descendents.

Severity: 8 (error)

System Action: Further utility processing is terminated.

User Response: Obtain authorization to delete from the tables specified in the utility statement and any of its descendents that are affected.

DSNU722I *csect-name* - **USER** *userid* **DOES NOT HAVE INSERT AUTHORITY ON EXCEPTION TABLE**

Explanation: The CHECK DATA utility was run with FOR EXCEPTION specified but user 'userid' does not have authority to insert into an exception table specified in the utility statement.

Severity: 8 (error)

System Action: Further utility processing is terminated.

User Response: Obtain authorization to insert into all of the exception tables specified in the utility statement.

DSNU725I *csect-name* **DUPLICATE TABLESPACE** *tsp* **NAMES EXIST IN THE TABLESPACE LIST**

Explanation: This message is issued by the CHECK DATA utility when a duplicate table space 'tsp' is found in the table space list. An entry in the list for the same table space with a partition specified is also considered a duplicate. This is because all partitions are the default when no partition is specified for a partitioned table space. The CHECK DATA utility proceeds and the duplicate entry is skipped.

Severity: 4 (warning)

System Action: Processing continues.

DSNU726I *csect-name* **SCOPE PENDING IS ACTIVE, BUT THE ENTIRE TABLE SPACE** *tsp* **MUST BE CHECKED**

Explanation: This message is issued by the CHECK DATA utility when checking with the option SCOPE PENDING. Table space *tsp* is in check pending status, but the utility is checking all rows in dependent tables or tables defined with check constraints in that table space.

Severity: 4 (warning)

System Action: The utility continues processing.

DSNU727I *csect-name* **TABLESPACE** *tsp* **IS NOT CHECK PENDING**

Explanation: This message is issued when 'CHECK DATA TABLESPACE *tsp* SCOPE PENDING' is specified and the CHECK DATA utility finds that the table space is not in a check pending state. The CHECK DATA utility skips table space 'tsp' and will continue with any other table space specified. The catalog fields that reflect the extent of a check pending state are updated to ensure that they indicate that no check is required.

Severity: 4 (warning)

System Action: Processing continues.

DSNU728I *csect-name* **INVALID EXCEPTION TABLE** *table2* **FOR** *table1*

Explanation: This message is issued when the CHECK DATA utility finds an exception table is invalid. The exception table named 'table2' which was specified for rows from table, 'table1', is invalid. Either 'table2' was missing columns of 'table1' or 'table2' contained incompatible column attributes. The CHECK DATA utility will terminate processing after all exception tables have been examined.

Severity: 8 (error)

System Action: The CHECK DATA utility will terminate processing after all the exception tables have been examined.

User Response: Refer to Part 2 (Volume 1) of *DB2 Administration Guide* for a definition of the CREATE TABLE command with the LIKE operand to correct the invalid exception table.

DSNU729I *csect-name* **TABLE** *table-name* **NOT SPECIFIED IN THE 'FOR EXCEPTION' CLAUSE**

Explanation: The CHECK DATA utility did not find a required table listed in the FOR EXCEPTION clause. All tables with constraints in the table spaces being checked and their descendants must be listed in the FOR EXCEPTION clause of CHECK DATA utility.

Severity: 8 (error)

System Action: The CHECK DATA utility terminates processing after all the required tables are examined.

User Response: Examine the utility input statement to determine the reason for the missing table named in the message. Correct the input statement to include the missing table and resubmit the job. Refer to *DB2 Utility Guide and Reference* for information about the FOR EXCEPTION clause of the CHECK DATA utility and use of exception tables.

DSNU730I *csect-name* **CHECKING TABLE** *tab*

Explanation: This message is issued when the CHECK DATA utility begins to process a table. The name of table being checked is 'tab'.

Severity: 0 (informational)

System Action: Processing continues.

DSNU731I *csect-name* **EXCEPTION LIMIT REACHED**

Explanation: The EXCEPTION limit specified on the CHECK utility statement has been reached.

Severity: 8 (error)

System Action: The CHECK utility terminates processing.

User Response: If required, increase the exception limit and resubmit the job.

DSNU732I NO TABLE TO BE CHECKED FOR TABLESPACE *tsp*

Explanation: The CHECK DATA utility determined that none of the tables in table space *tsp* has a constraint defined. Therefore, no table in that table space is checked.

This message is issued by the following CSECT: DSNUKINP

Severity: 4 (warning)

System Action: Utility processing continues.

DSNU733I *csect-name* ROW (RID=*rrrrrr*) HAS NO PARENT FOR *rel*

Explanation: This message is issued when the CHECK DATA utility finds a row in a dependent table without a parent. The row with RID, '*rrrrrr*', has no parent for the relationship named '*rel*'. This message is always preceded by a DSNU730I message that identifies the table in error.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Refer to Part 2 (Volume 1) of *DB2 Administration Guide* for a discussion of the check pending operation.

DSNU735I *csect-name* DUPLICATE TABLESPACE *tsp* PARTITION *part* NAMES EXIST IN THE TABLESPACE LIST

Explanation: This message is issued by the CHECK DATA utility when a duplicate table space '*tsp*' and partition '*part*' is found in the table space list. An entry in the table space list with a partition specified is considered to be a duplicate when another entry for the same table space with no partition specified (defaults to all partitions for a partitioned table space) is found. In this case, the table space list entry with no partition specified has priority and the entry with a partition specified is skipped. The CHECK DATA utility proceeds and the duplicate entry is skipped.

Severity: 4 (warning)

System Action: Processing continues.

DSNU736I *csect-name* SCOPE PENDING IS ACTIVE, BUT THE ENTIRE TABLE SPACE *tsp* PARTITION *part* MUST BE CHECKED

Explanation: This message is issued by the CHECK DATA utility when checking with the option SCOPE PENDING. Table space *tsp* partition *part* is in check pending status, but the utility is checking all rows in that table space partition.

Severity: 4 (warning)

System Action: The utility continues processing.

DSNU737I *csect-name* TABLESPACE *tsp* PARTITION *part* IS NOT CHECK PENDING

Explanation: This message is issued when 'CHECK DATA TABLESPACE *tsp* PART *part* SCOPE PENDING' is specified and the CHECK DATA utility finds that the table space partition is not in a check pending state. The CHECK DATA utility skips table space '*tsp*' partition '*part*' and continues with any other table space specified. The catalog fields that reflect the extent of a check pending state are updated to ensure that they indicate that no check is required.

Severity: 4 (warning)

System Action: Processing continues.

DSNU739I *csect-name* CHECK TABLE *tab* COMPLETE, elapsed time=*t1*

Explanation: This message is issued when the CHECK DATA utility finishes processing a table. The elapsed clock time that the check of table '*tab*' consumed is '*t1*'.

Severity: 0 (informational)

DSNU740I *csect-name* CHECKING TABLE *tab* PARTITION *part*

Explanation: This message is issued when the CHECK DATA utility begins to process a table of a partitioned table space in which a single partition was specified. The name of the table and the number of the partition being checked are identified in the message.

Severity: 0 (informational)

System Action: Processing continues.

DSNU741I *csect-name nn* ROWS DELETED FROM TABLE *tab*

Explanation: This message is issued by the CHECK DATA utility when the DELETE YES option is specified. The number of rows deleted from TABLE *tab* is the number of rows that contain referential integrity violations or check constraint violations, plus their

descendent rows. The number of rows deleted from TABLE *tab* is equal to the number of rows inserted into the corresponding exception table.

Severity: 4 (warning)

System Action: Processing continues.

DSNU742I *csect-name* ROW (RID=*rrrrr*) VIOLATES CHECK CONSTRAINT *constraint-name* ON TABLE *table-name*

Explanation: The CHECK DATA utility found that the row with RID=*rrrrr* in table *table-name* violated check constraint *constraint-name*.

Severity: 4 (warning)

System Action: Processing continues

User Response: Refer to Part 2 (Volume 1) of *DB2 Administration Guide* for a discussion of the check pending operation and recovery procedures.

DSNU743I *csect-name* - LOB WITH ROWID=*rowid* VERSION=*version* IS INVALID

Explanation: The CHECK LOB utility found that the LOB column with *rowid* ROWID and VERSION *version* was marked as invalid.

System Action: LOB table space is set Aux Warning. Utility returns completion code=4.

Programmer Response: The LOB column must be updated or the row containing the LOB column deleted using SQL to remove the invalid indication.

DSNU745I *csect-name* - ROWID=*rowid* VERSION=*version* RID=*rid* MISSING IN LOB TABLE SPACE=*lob-table-space-name*

Explanation: The CHECK INDEX utility found an index entry key with ROWID *rowid* and VERSION *version* in the index, but not in the LOB table space named *lob-table-space-name*.

System Action: The utility returns completion code=4. The index is set Recover Pending.

Programmer Response: Use REBUILD INDEX or RECOVER to correct the index on the auxiliary table.

DSNU747I *csect-name* - ROWID=*rowid* VERSION=*version* MISSING IN INDEX=*index-name*

Explanation: The CHECK INDEX utility found a LOB with ROWID *rowid* and VERSION *version* in the LOB table space but not in the index on the auxiliary table, *index-name*.

System Action: Utility returns completion code=4. The index is set Recover Pending.

Programmer Response: Use REBUILD INDEX to correct the index on the auxiliary table.

DSNU749I *csect-name* CHECK DATA COMPLETE, ELAPSED TIME=*t1*

Explanation: This message is issued when the CHECK DATA utility is complete. The elapsed clock time that the CHECK DATA utility consumed is 't1'.

Severity: 0 (informational)

System Action: Processing ends.

DSNU750I *csect-name* CATMAINT *operation* PHASE *phase-number* STARTED

Explanation: The CATMAINT utility phase *phase-number* processing started for the indicated operation.

Severity: 0 (informational)

System Action: Utility processing continues normally.

DSNU751I *csect-name* CATALOG *operation* OF TABLE - *table-name*

Explanation: This message is issued the first time data is operated upon for the designated table.

Severity: 0 (informational)

System Action: Utility processing continues normally.

DSNU752I *csect-name* CATMAINT *operation* PHASE *phase-number* COMPLETED

Explanation: The CATMAINT utility PHASE *phase-number* processing completed for the indicated operation.

Severity: 0 (informational)

System Action: Utility processing continues normally.

DSNU756I *csect-name* CATALOG TABLE IS EMPTY - *table-name*

Explanation: This message is issued when the named table is empty.

Severity: 0 (informational)

System Action: Utility processing continues normally.

DSNU759I *csect-name* INCORRECT UNLOAD DATASET HAS BEEN DETECTED

Explanation: This message indicates an inconsistency between the release level of the unloaded catalog and the DB2 release that is running the CATMAINT utility.

Severity: 8 (error)

System Action: Utility processing terminates.

DSNU760I • DSNU768I

User Response: Review the JCL for the job to ensure that the correct unload data set is specified. Verify that the correct level of DB2 is up.

DSNU760I *csect-name* **SPECIFIED USER NOT DEFINED WITH INSTALLATION SYSADM AUTHORITY**

Explanation: The utility can be run only under a user defined with the installation SYSADM authority.

Severity: 8 (error)

System Action: Utility processing terminates.

User Response: Rerun the utility with the proper authorization.

DSNU762I *csect-name* **DUPLICATE RECORD DETECTED FOR TABLENAME - table-name SEQNO OF THE INPUT RECORD IS - seqno FOLLOWING IS UP TO 119 BYTES OF RECORD BEING INSERTED**

Explanation: An object created in the target catalog has the same name as an object being migrated from the source catalog.

Severity: 8 (error)

System Action: Utility abends.

User Response: User data should not be in the target catalog before running the CATMAINT utility. Free or drop the object from the target catalog and rerun the CATMAINT utility.

DSNU764I *csect-name* **FOLLOWING IS UP TO 119 BYTES OF RECORD FOR TABLE table-name, SEQNO seqno BEING PROCESSED AT THE TIME OF ERROR**

Explanation: An abend occurred during the execution of the CATMAINT utility, during the processing of the table, 'table-name', with a sequence number of 'seqno'. The cause of the abend is one of the following:

- The record sequence number was invalid.
- An unexpected return code was received from DSNUEXLO.
- The table name was not found in the load table (DSNUELTB).
- The parent record could not be positioned.
- The position OBID was zero (DSNUELTB has incorrect value).
- The record action code is incorrect.

Following this message, up to the first 119 bytes of the record in question is displayed.

Severity: 8 (error)

System Action: Utility abends.

User Response: Verify that the record in the unloaded data set is correct.

DSNU765I *csect-name* **THE DB2 CATALOG IS NOT AT THE REQUIRED LEVEL. CATALOG NOT UPDATED**

Explanation: The DB2 catalog is not at the proper catalog level to migrate the catalog. This error can occur due to the following reasons:

- Attempting to migrate the catalog from a DB2 release that does not support migration
- Attempting to migrate DB2 Stored Procedures prior to a catalog migration

Severity: 8 (error)

System Action: Utility processing terminates

User Response: Depending on the migration error, perform the necessary actions:

- If the catalog is not at the correct level for a migration, fall back to the previous release. Migrate only from DB2 releases that support migration.
- Prior to attempting a Stored Procedure migration, migrate the DB2 catalog to the current release. After migrating the DB2 catalog, then you can migrate the Stored Procedures.

DSNU766I *csect-name* **THE CATALOG HAS ALREADY BEEN MIGRATED. NO ACTION WILL BE TAKEN**

Explanation: The catalog was already successfully migrated. There is no reason to rerun the catalog migration job. Therefore, no action is taken to update the DB2 catalog.

Severity: 0 (informational)

System Action: Processing ends.

DSNU767I *csect-name* **DB2 SYSTEM MUST BE STARTED ACCESS(MAINT)**

Explanation: In order for the utility to execute, the DB2 subsystem must be started with ACCESS(MAINT). This message indicates that the subsystem was not started in this manner.

Severity: 8 (error)

System Action: -STOP DB2, and then -START DB2 with ACCESS(MAINT).

DSNU768I *csect-name* **CATMAINT CONVERT COMPLETE FOR INDEX index-name**

Explanation: The conversion is complete for index index-name.

Severity: 0 (informational)

System Action: Processing continues with the next index.

DSNU769I *csect-name* **THE BUILD PHASE FAILED FOR INDEX *index-name* REASON *reason***

Explanation: The CATMAINT CONVERT build phase failed for index *index-name*. This message and others identify the actions that should be taken.

Severity: 8 (error)

Operator Response: Note the reason code and the index name. See the Problem Determination section for an explanation of the collected data.

System Action: Utility processing continues with the next index and will terminate with return code 8.

User Response: Correct the problem indicated by the reason code. Either resubmit the CATMAINT CONVERT job or recover the index that failed.

Problem Determination: The reason the build phase failed is identified by the reason code, which is described in Part 4, "Section 4. DB2 Codes," on page 773.

DSNU770I *csect-name - DBD type* **STARTED FOR DATABASE *database***

Explanation: This message marks the start of the REPAIR DBD type utility. In the message, 'type' can be DIAGNOSE, REBUILD, or TEST. The database name specified in the REPAIR statement is 'database'.

Severity: 0 (informational)

System Action: Utility processing continues normally.

DSNU771I *csect-name - DBD type* **COMPLETE FOR DATABASE *database***

Explanation: This message marks the completion of the REPAIR DBD type utility. In the message, 'type' can be DIAGNOSE, REBUILD, or TEST. The database name specified in the REPAIR statement is 'database'.

Severity: 0 (informational)

System Action: Utility processing continues normally.

DSNU772I *csect-name - THE object-type qualifier.object-name* **IS UNAVAILABLE IN THIS RELEASE**

Explanation: This message indicates that the specified object has a dependency on a release from which fall back has occurred, and cannot be operated upon in the current release.

Severity: 8 (error)

System Action: Utility processing terminates.

User Response: Check the IBMREQD column of the catalog table associated with the specified object type. If the value in the catalog table is the release dependency mark for a release of DB2 from which fall back has occurred, the utility is not operational for the current release of the targeted database.

DSNU773I *csect-name - database* **IS A SYSTEM DATABASE AND CANNOT BE PROCESSED**

Explanation: The database indicated is not eligible for processing by the type of the REPAIR DBD utility involved.

Severity: 8 (error)

System Action: Utility processing terminates.

User Response: Ensure that the utility control statement specifies the correct database.

DSNU774I *csect-name - SPECIFIED DATABASE database* **NOT FOUND**

Explanation: The database indicated by the utility control statement was not found in catalog table SYSIBM.SYSDATABASE.

Severity: 8 (error)

System Action: Utility processing terminates.

User Response: Ensure that the database indicated by the utility control statement exists in SYSIBM.SYSDATABASE.

DSNU775I *csect-name - DROP OF DATABASE dbname* **FAILED WITH SQLCODE = *sqlcode***

Explanation: An error was encountered while using the REPAIR DBD DROP utility to drop DATABASE 'dbname'. The SQL error code is indicated by 'sqlcode'.

Severity: 8 (error)

System Action: DATABASE 'dbname' is not dropped.

User Response: For a description of the SQL error code that was issued, refer to Part 2, "SQL return codes," on page 11.

DSNU776I *csect-name* **CATMAINT operation ERROR - *error-text***

Explanation: The CATMAINT utility halted because the catalog contains view(s) on the SYSCOLDIST and/or SYSCOLDISTSTATS catalog tables.

Severity: 0 (informational)

System Action: Utility processing halts.

User Response: Remove the views on these catalog tables. Then retry the failing CATMAINT *operation*. This

DSNU777I • DSNU783I

message is followed by an abend04E RC00E40601. See the problem determination text of RC00E40601 for additional information.

DSNU777I *csect-name* **CATMAINT** *operation*
STATUS *status-msg*

Explanation: The CATMAINT utility is processing CATMAINT *operation*. *status-msg* indicates where CATMAINT is in the *operation* process.

Severity: 0 (informational)

System Action: Utility processing continues normally.

DSNU778I *csect-name* - **ERROR PROCESSING**
SQL STATEMENT - SQL CODE IS:
sql-code **SQL MESSAGE TOKENS:**
message-token(s) **THE FOLLOWING IS**
THE PROBLEM SQL STATEMENT:
sql-statement

Explanation: There was a utility abend in the DB2 database services address space (ssnmDBM1) during CATMAINT UPDATE processing. The *message-tokens* displayed are those found in the SQLERRMT field of the SQLCA, separated by commas, for the indicated SQLCODE *sql-code*. The problem SQL statement *sql-statement* is also displayed.

Severity: 0 (informational).

System Action: Utility processing abends.

User Response: This message is followed by an abend04E RC00E40601. The *sql-code*, *message-tokens*, and *sql-statement* listed in this message are probably sufficient to diagnose and correct the problem. See the problem determination text of RC00E40601 for additional information.

DSNU780I *csect-name* **DSNUTILB LEVEL** *rel1*
INVALID WITH SUBSYSTEM LEVEL *rel2*

Explanation: JCL has been submitted which executes level 'rel1' of DSNUTILB against a level 'rel2' DB2 subsystem. The levels must match.

Severity: 8 (error)

System Action: The utility terminates with a return code of 8.

User Response: Determine the DB2 subsystem against which you wish to execute. Determine which STEPLIB data set contains the corresponding DSNUTILB load module. Correct the JCL to specify the correct data set on the STEPLIB DD statement and the correct DB2 subsystem on the EXEC statement and resubmit the job.

DSNU781I *csect-name* **RESTART OF LEVEL** *rel1*
UTILITY AT LEVEL *rel2* **INVALID**

Explanation: JCL has been submitted which attempts to RESTART a stopped utility. The utility began processing at level 'rel1' and cannot be restarted at level 'rel2'.

System Action: The utility job is abended with reason code X'00E40018'.

User Response: Either restart the utility at the same level it was originated or terminate the utility with the TERM command and resubmit it at the new level. Refer to *DB2 Command Reference* for special TERM command considerations.

DSNU782I *csect-name* **UNABLE TO RECOVER**
DUE TO ACTIVITY AT ANOTHER
SYSTEM LEVEL

Explanation: The RECOVER utility is unable to recover the specified table space. Activity at another system level has left all image copies for this table space inconsistent with the DB2 LOG.

Severity: 8 (error)

System Action: The utility terminates with a return code of 8.

User Response: The table space, in its entirety can not be recovered. Individual data sets may be recoverable using the DSNUM() keyword.

DSNU783I *csect-name* **INDEXES DSN SCT02,**
DSNLUX01, DSNLUX02 and DSNLLX02
HAVE SUBPAGES VALUE GREATER
THAN 1 AND CANNOT BECOME
GROUP BUFFER POOL DEPENDENT.

Explanation: CATMAINT CONVERT TO TYPE 1 DIRECTORY alters the indexes DSN SCT02, DSNLUX01, DSNLUX02, and DSNLLX02 to type 1 with more than one subpage. In a data sharing environment, there cannot be inter-DB2 R/W interest on type 1 indexes with more than one subpage (they cannot become *group buffer pool dependent*). This means that any read or update request that causes inter-DB2 R/W interest on these directory indexes is denied with a 'resource unavailable' condition.

For directory indexes, only type 2 indexes can have full R/W sharing among data sharing members.

Severity: 4 (warning)

System Action: Processing continues.

User Response: With very few exceptions, indexes on the directory will have inter-DB2 R/W interest if there are two or more members in your DB2 data sharing group. Use CATMAINT CONVERT TO TYPE 2 DIRECTORY to convert the indexes to type 2 if you plan to have two or more DB2 members.

DSNU784I *csect-name* **CATMAINT operation - CATALOG CONTAINS UNSUPPORTED OBJECTS: *error-text* OBJECT NAME - *object-name*, CREATOR - *creator***

Explanation: The CATMAINT utility halted because the catalog contains an unsupported object/item (indicated by *error-text*):

- CATALOG CONTAINS TYPE 1 INDEXES

Severity: 8 (error)

System Action: Utility processing halts. No SYSABEND dump or SVC dump is requested.

User Response: Any unsupported objects/items should be removed from the DB2 catalog in the previous release. The DSNTIJPM and DSNTESQ jobs can be used to identify any unsupported objects that are found in a subsystem. Remove any unsupported objects in the DB2 catalog and retry the failing CATMAINT *operation*. This message is followed by an abend 04E RC 00E40601.

DSNU785I *csect-name* - **PAGE=*page-number* IS INVALID FOR REASON=*reason-code*, EXPECTED VALUE=*expected-value*, ACTUAL VALUE=*actual-value***

Explanation: The CHECK LOB utility found the LOB table space page numbered *page-number* was invalid for reason *reason-code*. *reason-code* can be in the form: *reason1*, *reason2*. This reason code is supplied for serviceability only.

System Action: Utility returns completion code=4. LOB table space is set *check pending*.

Programmer Response: Notify the system programmer.

System Programmer Response: Notify the IBM Service Representative. Be prepared to provide the message number, reason code, and dump of the LOB table space page.

DSNU787I *csect-name* - **LOB WITH ROWID=*rowid* VERSION=*version* PAGE=*page* IS IN ERROR FOR REASON=*reason-code* EXPECTED VALUE=*expected-value* ACTUAL VALUE=*actual-value***

Explanation: The CHECK LOB utility found that the LOB with ROWID *rowID* and VERSION *version* is in error for reason *reason-code*. The error was found in page *page* of the LOB table space. This reason code is supplied for serviceability only.

EXPECTED VALUE is the *expected-value* of the condition that is checked by the CHECK LOB utility. ACTUAL VALUE is the *actual-value* of the condition.

System Action: Utility returns completion code=4. LOB table space is set *check pending*.

Programmer Response: Notify the system programmer.

System Programmer Response: Notify the IBM Service Representative. Be prepared to provide the message number and reason code.

DSNU790I *csect-name* *utility-name* *option* **IS NOT ALLOWED WHEN THERE ARE OUTSTANDING UTILITIES STARTED FROM PRIOR RELEASES.**

Explanation: The utility to be executed may have conflicts with other outstanding utilities started from prior releases.

utility-name is the name of the utility that detected the conflict.

option is the option specified to the utility that detected the conflict.

System Action: The request is rejected.

User Response: Use the DISPLAY UTILITY command to see what utilities are outstanding. Issue the TERM UTILITY command on the same release as the release on which the outstanding utility was started.

DSNU795I *csect-name* - **CHECKLOB PHASE COMPLETE - ELAPSED TIME=*time***

Explanation: The CHECK LOB utility CHECKLOB phase was completed with the elapsed time of *time*.

Severity: 0 (informational)

System Action: The CHECKLOB phase is completed.

DSNU796I *csect-name* - **REPRTLOB PHASE COMPLETE - ELAPSED TIME=*time***

Explanation: The CHECK LOB utility REPRTLOB phase was completed with the elapsed time of *time*.

Severity: 0 (informational)

System Action: The REPRTLOB phase is completed.

DSNU805I *csect-name* - **TABLE=*table_name* COLUMN=*column_name* IS OUT OF SYNCH ROWID=*rowid* VERSION=*version***

Explanation: The CHECK DATA utility found a base table row with ROWID, *rowid*, in table, *table_name*. The LOB column named *column_name* in the base table is out of synch with the LOB table space. The *version* reported is from the index on the auxiliary table.

System Action: If **AUXERROR REPORT** was specified, this error is reported only. The base table space is set to a Aux Check Pending state.

If **AUXERROR INVALIDATE** was specified, the LOB column is set invalid. The base table space is set to an Aux Warning state.

Utility returns completion code=4.

Programmer Response: CHECK DATA relies on information in LOB table space and in the auxiliary index being correct. Before running CHECK DATA to check auxiliary columns, first run CHECK LOB and then run REBUILD INDEX or CHECK INDEX. CHECK LOB ensures the validity of the LOB table space. REBUILD INDEX or CHECK INDEX ensures the validity of the auxiliary index.

If **AUXERROR REPORT** was specified, run the CHECK DATA utility with **AUXERROR INVALIDATE** to set the base table column invalid.

If **AUXERROR INVALIDATE** was specified, use SQL to update the LOB column or delete the base table row. Rerun the CHECK DATA utility with **AUXERROR INVALIDATE** specified. If all Auxiliary Column Check errors were corrected, Aux Warning will be reset.

The REPAIR utility can be used to reset the Aux Warning state.

DSNU806I *csect-name* - **TABLE=table_name**
COLUMN=column_name WAS SET
INVALID ROWID=rowid
VERSION=version

Explanation: The CHECK DATA utility with **AUXERROR INVALIDATE** specified, set the LOB column named *column_name* invalid. The LOB column was in the row with ROWID, *rowid* in the table named *table_name*. The version for the LOB column was *version*.

System Action: Utility returns completion code=4. The base table space is set to a Aux Warning state.

Programmer Response: None

Use SQL to update the LOB column or delete the base table row. Rerun the CHECK DATA utility with **AUXERROR INVALIDATE** specified. If all Auxiliary Column Check errors were corrected, Aux Warning will be reset.

The REPAIR utility can be used to reset the Aux Warning state.

DSNU807I *csect-name* - **TABLE=table_name**
COLUMN=column_name WAS SET
VALID ROWID=rowid VERSION=version

Explanation: The CHECK DATA utility with **AUXERROR INVALIDATE** specified, set the LOB column named *column_name* valid. The LOB column was in the row with ROWID, *rowid* in the table named *table_name*. The version for the LOB column was *version*.

System Action: Utility returns completion code=4.

Programmer Response: None. If all Auxiliary Column Check errors were corrected, Aux Warning will be reset.

DSNU809I *csect-name* - **TABLE=table_name**
COLUMN=column_name IS MISSING IN
INDEX index-name ROWID=rowid
VERSION=version

Explanation: The CHECK DATA utility found a record in the table named *table-name* in the row with a ROWID of *rowid*. The column named *column-name* did not have an index entry in the on the auxiliary index named *index-name*. The version for the LOB column was *version*.

System Action: If **AUXERROR REPORT** was specified, this error is reported only. The base table space is set to an Aux Check Pending state.

If **AUXERROR INVALIDATE** was specified, the LOB column is set invalid. The base table space is set to an Aux Warning state.

Utility returns completion code=4.

Programmer Response: CHECK DATA relies on information in LOB table space and in the auxiliary index being correct. Before running CHECK DATA to check auxiliary columns, first run CHECK LOB and then run REBUILD INDEX or CHECK INDEX. CHECK LOB ensures the validity of the LOB table space. REBUILD INDEX or CHECK INDEX ensures the validity of the auxiliary index.

If **AUXERROR REPORT** was specified, run the CHECK DATA utility with **AUXERROR INVALIDATE** to set the base table column invalid.

If **AUXERROR INVALIDATE** was specified, use SQL to update the LOB column or delete the base table row. Rerun the CHECK DATA utility with **AUXERROR INVALIDATE** specified. If all Auxiliary Column Check errors were corrected, Aux Warning will be reset.

The REPAIR utility can be used to reset the Aux Warning state.

DSNU811I *csect-name* - **TABLE=table_name**
COLUMN=column_name IS INVALID
ROWID=rowid VERSION=version

Explanation: The CHECK DATA utility found a record in the table named *table-name* in the row with ROWID *rowid*. The column named *column-name* was marked invalid by a prior execution of the CHECK DATA utility with **AUXERROR INVALIDATE** specified. The version for the LOB column was *version*.

System Action: Utility returns completion code=4. The base table space is set to a Aux Warning state.

Programmer Response: If **AUXERROR INVALIDATE** was specified, use SQL to update the LOB column or delete the base table row. Rerun the CHECK DATA utility with **AUXERROR INVALIDATE** specified. If all Auxiliary Column Check errors were corrected, Aux Warning will be reset.

The REPAIR utility can be used to reset the Aux Warning state.

DSNU813I *csect-name* - **LOB IN TABLE SPACE=*lob_table_space_name* WITH ROWID=*rowid* AND VERSION=*version* HAS NO BASE TABLE ROW**

Explanation: The CHECK DATA utility found a LOB in the LOB table space named *lob_table_space_name* but did not find a row in the base table for this LOB. The LOB has a ROWID of *rowid* and version of *version*.

System Action: Utility returns completion code=4.

Programmer Response: CHECK DATA relies on information in the index on the auxiliary table and LOB table space being correct. Before running CHECK DATA to check auxiliary columns, first run CHECK LOB and then run REBUILD INDEX or CHECK INDEX. CHECK LOB ensures the validity of the LOB table space. REBUILD INDEX or CHECK INDEX ensures the validity of the auxiliary index.

The LOB can be deleted using the REPAIR utility. Specify LOCATE ROWID VERSION DELETE.

DSNU814I *csect-name* - **TABLE=*table_name* COLUMN=*column_name* IS ZERO OR NULL BUT ENTRY IN INDEX *index-name* FOUND ROWID=*rowid* VERSION=*version***

Explanation: The CHECK DATA utility found a record in the table named *table-name* in the row with a ROWID of *rowid*. The column named *column-name* was indicated null or zero length, but an index entry with the same ROWID was found in the index on the auxiliary table named *index-name*. The version for the LOB column was *version*.

System Action: This is an informational message only. The fact that a LOB column entry exists in the index on the auxiliary table when the LOB column is marked null or has a null length does not hinder LOB column processing.

If **AUXERROR INVALIDATE** was specified, the LOB column is not set invalid for this error.

Utility returns completion code=4.

Programmer Response: CHECK DATA relies on information in the index on the auxiliary table and LOB table space being correct. Both CHECK LOB, to ensure the validity of the LOB table space, and RECOVER INDEX or CHECK INDEX, to ensure the validity of the index on the auxiliary table, should be executed in that order prior to the execution of CHECK DATA with auxiliary column checking.

The LOB can be deleted from the LOB table space by using **REPAIR LOCATE TABLESPACE ROWID DELETE**

DSNU815I *csect-name* - **TABLESPACE *table-space-name* IS IN AUX CHECK PENDING STATE**

Explanation: The CHECK DATA utility found *auxiliary check* errors. **AUXERROR REPORT** was specified, so errors were left as found.

Auxiliary check pending is a prohibitive state.

Previous error messages report the errors found.

System Action: Utility returns completion code=8.

Programmer Response: Use the CHECK DATA with **AUXERROR INVALIDATE**. This will modify the *auxiliary check* errors so they can be corrected and set the state of the table space to *auxiliary warning*.

After running CHECK DATA with **AUXERROR INVALIDATE**, use SQL to update the LOB column or delete the base table row. Rerun the CHECK DATA utility with **AUXERROR INVALIDATE** specified. If all *auxiliary check* errors were corrected, *auxiliary warning* will be reset.

The *auxiliary check pending* state can also be reset using REPAIR with **SET NOAUXCHKP**. Resetting *auxiliary check pending* with REPAIR will have unpredictable results.

DSNU816I *csect-name* - **TABLESPACE *table-space-name* IS IN AUX WARNING STATE**

Explanation: The CHECK DATA utility found *auxiliary check* errors. **AUXERROR INVALIDATE** was specified, so LOB columns in error were marked invalid.

Auxiliary warning is a non-prohibitive state. Updating the LOB column or deleting the row containing the LOB column by SQL is permitted. Valid LOBs may be accessed, however any attempt to retrieve an invalid modified LOB column by SQL will result in a -904 return code.

Previous error messages report the errors found.

Severity: 0 (informational)

System Action: Processing continues.

Programmer Response: Use SQL to update or delete the LOB columns in error. Use CHECK DATA with **AUXERROR INVALIDATE** to verify all errors were corrected and to reset the *auxiliary warning* state.

The *auxiliary warning* state can also be reset using REPAIR with **SET NOAUXWARN**.

DSNU830I *csect-name* - **INDEX=*index-name* IS IN REBUILD PENDING STATE**

Explanation: If the RECOVER utility issued this message, the corresponding table space to this index was recovered to a point in time with keyword TOCOPY,

DSNU831I • DSNU860I

TOLOGPOINT, or TORBA. Thus, the index was placed in rebuild pending status.

If the REBUILD INDEX utility issued this message, the index is in rebuild pending status. Either duplicate index entries existed during the BUILD phase of the REBUILD INDEX, or invalid KEY/RIDs, which do not belong to the partition of the cluster index, were detected. The duplicate index entries or invalid KEY/RID entries must be resolved before starting the REBUILD INDEX utility again to rebuild the index and remove the index from rebuild pending status.

If the REORG utility with SHRLEVEL REFERENCE or CHANGE (or -TERM UTILITY) issued this message, the index is in rebuild pending status. During the renaming of a data set during REORG, either a data set with the source name did not yet exist or a data set with the target name already existed.

Severity: 4 (warning) or 8 (error)

User Response: If the RECOVER or REORG utility (or -TERM UTILITY) issued this message, use the REBUILD INDEX utility to rebuild this index.

If the REBUILD INDEX utility issued this message resolve the duplicate index entries or invalid keys and rerun the REBUILD INDEX utility.

DSNU831I *csect-name* ALL INDEXES OF TABLESPACE= *table space-name* ARE IN REBUILD PENDING

Explanation: The RECOVER TORBA, TOLOGPOINT, or TOCOPY utility issues this message to inform the user of the state of all indexes belonging to the recovered table space. All indexes were put in rebuild pending status to prevent data and index inconsistency. All indexes should be rebuilt before they are used.

System Action: The RECOVER utility completed successfully.

Severity: 4 (warning)

User Response: Use the REBUILD utility with the ALL option to rebuild all indexes over the recovered table space.

DSNU832I *csect-name* - INDEX= *creator.index-name* PART= *partition number* IS IN REBUILD PENDING STATE

Explanation: If the RECOVER utility issued this message, one partition of a partitioned table space is being recovered to a point in time with keyword TOCOPY, TOLOGPOINT, or TORBA. The corresponding index for that partition was placed in rebuild pending status.

If the REBUILD INDEX utility issued this message, the index or the partition of a cluster index is in rebuild pending status. Either duplicate index entries existed during the BUILD phase of the REBUILD INDEX or

INDEX PART, or invalid KEY/RIDs, which do not belong to the partition of the cluster index, were detected. The duplicate index entries or invalid KEY/RID entries must be resolved before starting the REBUILD INDEX utility again to rebuild the index and remove the index from rebuild pending status.

If the REORG utility with SHRLEVEL REFERENCE or CHANGE (or -TERM UTILITY) issued this message, one partition of a partitioned index was placed in rebuild pending status. During the renaming of a data set during REORG, either a data set with the source name did not yet exist or a data set with the target name already existed.

Severity: 4 (warning) or 8 (error)

User Response: If the RECOVER or REORG utility (or -TERM UTILITY) issued the message, rebuild this index with the REBUILD INDEX utility.

If the REBUILD INDEX utility issued this message resolve duplicate index entries or invalid keys and rerun the REBUILD INDEX utility.

DSNU833I *csect-name* - UNABLE TO RECOVER *object_type object_name* DUE TO ALTER COLUMN

Explanation: RECOVER utility is unable to recover the index or index space as requested because an ALTER COLUMN VARCHAR has been performed. The current column definition is no longer consistent with the image copy and log records which would be used to perform the requested recovery.

Severity: 8 (error)

User Response: Use the REBUILD INDEX utility to rebuild the index from the tablespace.

DSNU834I *csect-name* - UNABLE TO RECOVER *object_type object_name* DSNUM *dsnum* DUE TO ALTER COLUMN

Explanation: RECOVER utility is unable to recover the index or index space partition as requested because an ALTER COLUMN VARCHAR has been performed. The current column definition is no longer consistent with the image copy and log records which would be used to perform the requested recovery.

Severity: 8 (error)

User Response: Use the REBUILD INDEX utility to rebuild the index partition from the tablespace.

DSNU860I *csect-name* DIAGNOSE UTILITY COMPLETE

Explanation: This message is issued in response to the normal completion of the DIAGNOSE utility.

Severity: 0 (informational)

System Action: This message indicates the normal completion of the DIAGNOSE utility. Processing continues to the next utility statement in the utility job step.

DSNU861I *csectname* **DISPLAY MEPL**

Explanation: This is the header message for output of the DIAGNOSE DISPLAY MEPL function. The contents of the MEPL is dumped to SYSPRINT.

Severity: 0 (informational)

System Action: This message indicates the beginning of DIAGNOSE DISPLAY MEPL processing.

DSNU862I **DISPLAY AVAILABLE UTILITIES. MAP:**
bit-map

Explanation: This message is the end-result of a DIAGNOSE DISPLAY AVAILABLE control statement. It displays the utilities that are available on this subsystem. The message contains a machine-readable bit-map, and precedes a table of utility names. They are two representations of the same information. An available utility is represented by the utility name that appears in the table and a "1" in the corresponding bit position in the bit-map. An unavailable utility is represented by a blank table entry and a "0" in the corresponding bit position in the bit-map.

Utilities may be unavailable if separately-priced features JDB771K and/or JDB771M are not installed, or installed improperly.

The table position and bit position are fixed for any given utility, and maintenance cannot alter them. Bit positions correspond to table entries when you read the table across each row, left to right, starting with the top row. For example, bit 1 corresponds to CATMAINT, bit 2 to CHECK, and bit 9 to OPTIONS.

The following example shows the partial output of this message. Due to space constraints, the sample has been truncated. The actual table contains eight columns of identity names:

DSNU862I DSNUDIAG - DISPLAY AVAILABLE UTILITIES.
MAP: 11111111111111111100000000000000

```

-----
|CATMAINT|CHECK   |COPY    |DIAGNOSE|...
|OPTIONS |QUIESCE|REBUILD|RECOVER  |...
|STOSPACE|TEMPLATE|UNLOAD  |         |...
-----

```

Severity: 0 (informational)

System Action: The DIANGOSE DISPLAY AVAILABLE utility control statement has completed normally.

DSNU863I *csect-name* **DISPLAY OBD**
dbname.tsname

Explanation: This message is the heading message for DIAGNOSE DISPLAY OBD output.

Severity: 0 (informational)

System Action: This message indicates the start of the output for the DIAGNOSE DISPLAY OBD function.

DSNU864I *csect-name* **DISPLAY OBD, DBID=nn**
OBID=nn OBD TYPE=type

Explanation: This message is the heading message for the OBD being displayed.

Severity: 0 (informational)

System Action: This message identifies the OBD being displayed.

DSNU865I *csect-name* **DISPLAY OBD**
dbname.tsname **COMPLETE**

Explanation: This message is issued in response to normal completion of DISPLAY OBD processing.

Severity: 0 (informational)

System Action: This message indicates the end of DISPLAY OBD processing.

DSNU866I *csect-name* **DISPLAY SYSUTIL JOB**
INFORMATION

Explanation: This message is the header message for the SYSUTIL JOB INFORMATION section of the DIAGNOSE DISPLAY SYSUTIL output. This section displays the job information area of the SYSUTIL record and contains information which identifies the utility the SYSUTIL record is referencing.

Severity: 0 (informational)

System Action: This message identifies the SYSUTIL JOB INFORMATION section of the DIAGNOSE DISPLAY SYSUTIL output.

DSNU867I *csect-name* **DISPLAY SYSUTIL**
CHECKPOINT/RESTART INFORMATION

Explanation: This message is the header message for the SYSUTIL UTILITY CHECKPOINT/RESTART INFORMATION section of the DIAGNOSE DISPLAY SYSUTIL output. This section displays the utility checkpoint/restart area of the SYSUTIL record and contains information pertaining to utility processing needed for the restart of the utility.

Severity: 0 (informational)

System Action: This message identifies the SYSUTIL UTILITY CHECKPOINT/RESTART INFORMATION section of the DIAGNOSE DISPLAY SYSUTIL output.

DSNU868I *csect-name* **DISPLAY SYSUTIL UTILITY
DEPENDENT AREA**

Explanation: This message is the header message for the SYSUTIL UTILITY DEPENDENT INFORMATION section of the DIAGNOSE DISPLAY SYSUTIL output. This section displays the utility dependent area of the SYSUTIL record and contains information particular to the utility which the SYSUTIL record is referencing.

Severity: 0 (informational)

System Action: This message identifies the SYSUTIL UTILITY DEPENDENT INFORMATION section of the DIAGNOSE DISPLAY SYSUTIL output.

DSNU869I *csect-name* **DISPLAY SYSUTIL
COMPLETE**

Explanation: This message is issued in response to normal completion of DISPLAY SYSUTIL processing.

Severity: 0 (informational)

System Action: This message indicates the end of DISPLAY SYSUTIL processing.

DSNU870I *csect-name* **NO SYSUTIL RECORD
FOUND**

Explanation: This message is issued if no SYSUTIL records are found when DISPLAY SYSUTIL is specified.

Severity: 4 (warning)

System Action: This message indicates the end of DISPLAY SYSUTIL processing.

DSNU871I *csectname* **DISPLAY DBET DATABASE
dbname**

Explanation: This message is the heading for display output of the database exception table (DBET) entry associated with database *dbname*.

Severity: 0 (informational)

System Action: DIAGNOSE DISPLAY DBET processing started for the named database.

DSNU872I *csectname* **DISPLAY DBET TABLE
SPACE tsname**

Explanation: This message is the heading for display output of the database exception table (DBET) entry associated with table space *tsname*.

Severity: 0 (informational)

System Action: DIAGNOSE DISPLAY DBET processing started for the named table space.

DSNU873I *csectname* **DISPLAY DBET INDEX
index-name**

Explanation: This message is the heading for display output of the database exception table (DBET) entry associated with index *index-name*.

Severity: 0 (informational)

System Action: DIAGNOSE DISPLAY DBET processing started for the named index.

DSNU874I *csectname* **NO DBET ENTRY FOUND
FOR THE SPECIFIED OBJECT**

Explanation: There is no database exception table (DBET) entry associated with the specified object.

Severity: 4 (warning)

System Action: Processing continues normally.

DSNU875I *csectname* **DIAGNOSE WAIT AT
MESSAGE=msgno INSTANCE=nn CORR
ID=id1 CONN ID=id2 REPLY TO CONT**

Explanation: The DIAGNOSE WAIT function was invoked to wait at a specified message 'msgno' on the nn'th time that message was issued. The CORR ID is the correlation identifier of the thread associated with the waiting application. The CONN ID is the connection identifier of the thread.

Severity: 4 (warning)

System Action: Processing is stopped until the user responds to this message.

User Response: See operator response.

Operator Response: After diagnosis procedure in progress is completed, reply to this message to continue execution. Any reply is valid.

DSNU876I *csectname* **DIAGNOSE WAIT AT
TRACEID=X'trcid' INSTANCE=nn CORR
ID=id1 CONN ID=id2 REPLY TO CONT**

Explanation: The DIAGNOSE WAIT function was invoked to wait at a specified traceid 'trcid' on the nn'th time that traceid was encountered. The CORR ID is the correlation identifier of the thread associated with the waiting application. The CONN ID is the connection identifier of the thread.

Severity: 4 (warning)

System Action: Processing is stopped until the user responds to this message.

User Response: See operator response.

Operator Response: After diagnosis procedure in progress is complete, reply to this message to continue execution. Any reply is valid.

DSNU877I event modulename+offset

Explanation: Event 'event' occurred at module 'modulename' plus 'offset'. The DIAGNOSE utility issues this message to aid in diagnosing utility problems.

Severity: 0 (informational)

System Action: Processing continues normally.

DSNU900I csect-name - DBD X'xxxx'
COMPARISON STARTING

Explanation: This message marks the start of a DBD comparison for the REPAIR DBD TEST or REPAIR DBD DIAGNOSE utility. The DBID of the DBD being compared against the DB2 Catalog is 'xxxx'.

Severity: 0 (informational)

System Action: DBD checking continues normally.

DSNU901I csect-name - OBD X'xxxx' obd-type HAS
THE FOLLOWING DIFFERENCES

Explanation: This message marks the start of an OBD comparison for the REPAIR DBD TEST or REPAIR DBD DIAGNOSE utility. This message is displayed when a difference in the OBDs has been detected. The OBD of the OBD being compared against the DB2 catalog is 'xxxx'. The type of OBD being displayed is 'obd-type'.

Severity: 0 (informational)

System Action: DBD checking continues normally.

DSNU902I csect-name - EXISTING OBD AT
OFFSET X'xxxxxxxx' IN EXISTING DBD

Explanation: Following this message is a hexadecimal dump of the OBD as it exists in the DSNDB01.DBD01 page set. In the message, 'xxxxxxxx' is the hexadecimal offset from the beginning of the existing DBD as it appears later in the REPAIR DBD DIAGNOSE output.

Severity: 0 (informational)

System Action: DBD checking continues normally.

DSNU903I csect-name - REBUILT OBD AT OFFSET
X'xxxxxxxx' IN REBUILT DBD

Explanation: Following this message is a hexadecimal dump of the OBD that was rebuilt from the DB2 Catalog. In the message, 'xxxxxxxx' is the hexadecimal offset from the beginning of the rebuilt DBD as it appears later in the REPAIR DBD DIAGNOSE output.

Severity: 0 (informational)

System Action: DBD checking continues normally.

DSNU904I csect-name - EXISTING VALUE X'xx.xx'

Explanation: This message shows a hexadecimal string which is the value of a field in the OBD as it exists on the DSNDB01.DBD01 page set. The hexadecimal string is 'xx.xx'.

Severity: 0 (informational)

System Action: DBD checking continues normally.

DSNU905I csect-name - REBUILT VALUE X'xx.xx'

Explanation: This message shows a hexadecimal string which is the value of a field in the OBD which was rebuilt from the DB2 catalog. The hexadecimal string is 'xx.xx'.

Severity: 0 (informational)

System Action: DBD checking continues normally.

DSNU906I csect-name - EXISTING VALUE 'cc.cc'

Explanation: This message shows a character string which is the value of a field in the OBD as it exists on the DSNDB01.DBD01 page set. The character string is 'cc.cc'.

Severity: 0 (informational)

System Action: DBD checking continues normally.

DSNU907I csect-name - REBUILT VALUE 'cc.cc'

Explanation: This message shows a character string which is the value of a field in the OBD which was rebuilt from the DB2 catalog. The character string is 'cc.cc'.

Severity: 0 (informational)

System Action: DBD checking continues normally.

DSNU908I csect-name - EXISTING OBD IS obd-type

Explanation: This message shows the OBD type of the OBD which exists on the DSNDB01.DBD01 page set.

Severity: 0 (informational)

System Action: DBD checking continues normally.

DSNU909I csect-name - REBUILT OBD IS obd-type

Explanation: This message shows the OBD type of the OBD which was rebuilt from the DB2 catalog.

Severity: 0 (informational)

System Action: DBD checking continues normally.

DSNU910I *csect-name* - EXISTING DBD

Explanation: Following this message is a hexadecimal dump of the DBD which exists on the DSNDB01.DBD01 page set.

Severity: 0 (informational)

System Action: DBD checking continues normally.

DSNU911I *csect-name* - REBUILT DBD

Explanation: Following this message is a hexadecimal dump of the DBD which was rebuilt from the DB2 Catalog.

Severity: 0 (informational)

System Action: DBD checking continues normally.

DSNU912I *csect-name - phase-completion-message*
-- *nn* **ERRORS WERE FOUND**

Explanation: This message marks the end of a processing phase in the DBD comparison for a REPAIR DBD TEST or REPAIR DBD DIAGNOSE utility. In the message, 'nn' indicates the number of errors detected while processing. Informational and warning messages are not added into the error count.

Severity: 0 (informational)

System Action: DBD checking continues normally.

DSNU913I *csect-name - OBD X'xxxx'*
COMPARISON COMPLETE -- nn
ERRORS WERE FOUND

Explanation: This message marks the end of an OBD comparison for the REPAIR DBD TEST or REPAIR DBD DIAGNOSE utility. This message is displayed only when a difference has been detected. If there is no difference, this message will not be displayed. The OBID of the OBD being compared against the DB2 catalog is 'xxxx'. The number of errors in this OBD is 'nn'. Informational and warning messages are not added into the error count.

Severity: 0 (informational)

System Action: DBD checking continues normally.

DSNU914I *csect-name - DBD X'xxxx'*
COMPARISON COMPLETE -- nn
ERRORS WERE FOUND

Explanation: This message marks the end of a DBD comparison for the REPAIR DBD TEST or REPAIR DBD DIAGNOSE utility. The DBID of the DBD being compared against the DB2 catalog is 'xxxx'. The total number of errors found in this DBD is 'nn'.

Severity: 0 (informational)

System Action: DBD checking completed.

DSNU915I *csect-name - OBD X'obid' E-X'xxxxxxx'*
R-X'yyyyyyyy' obd-description

Explanation: This message is used when listing the OBDs in the REPAIR DBD DIAGNOSE utility. The OBID of the OBD being listed is 'obid'. The offset to the OBD within the EXISTING DBD which is displayed later in the output is 'xxxxxxx'. The offset to the OBD within the REBUILT DBD which is displayed later in the output is 'yyyyyyyy'. A short description of the state of the OBD is 'obd-description'.

Severity: 0 (informational)

System Action: DBD checking completed.

DSNU916I *csect-name - OBDS DIFFER AT OFFSET*
X'xxxxxxx' field-name - INFORMATION
NOT IN DB2 CATALOG

Explanation: This message indicates the value of a field in the OBD differs from the DBD which exists on the DSNDB01.DBD01 page set and the DBD rebuilt from the DB2 catalog. This is information which is not kept in the DB2 catalog. This is an acceptable difference and does not indicate that the OBD is damaged. The hexadecimal offset from the beginning of the OBD is 'xxxxxxx'. The name of the field is 'field-name'.

Severity: 0 (informational)

System Action: DBD checking continues normally.

DSNU917I *csect-name - DBDS DIFFER AT OFFSET*
X'xxxxxxx' field-name - INFORMATION
NOT IN DB2 CATALOG

Explanation: This message indicates that the value of a field in the DBD differs from the DBD which exists on the DSNDB01.DBD01 page set and the DBD rebuilt from the DB2 Catalog. This is information which is not kept in the DB2 catalog. This is an acceptable difference and does not indicate that the DBD is damaged. The hexadecimal offset from the beginning of the DBD is 'xxxxxxx'. The name of the field is 'field-name'.

Severity: 0 (informational)

System Action: DBD checking continues normally.

DSNU919I *csect-name - DBD X'xxxx' OBD X'yyyy' -*
details

Explanation: This message gives detailed information about the specified OBD. The DBID of the DBD is 'xxxx'. The OBID of the OBD is 'yyyy'. A description of the error is 'details'.

Severity: 0 (informational)

System Action: DBD checking continues normally.

DSNU920I *csect-name* - OBDS DIFFER AT OFFSET
X'xxxxxxxx' field-name

Explanation: This message indicates that the value of a field in the OBD differs from the DBD which exists on the DSNDB01.DBD01 page set and the DBD rebuilt from the DB2 catalog. The DB2 Catalog and DBD/OBD are inconsistent. The hexadecimal offset from the beginning of the OBD is 'xxxxxxxx'. The name of the field is 'field-name'.

Severity: 4 (warning)

System Action: DBD checking continues normally.

DSNU921I *csect-name* - OBD X'xxxx' MISSING IN
EXISTING DBD

Explanation: This message indicates that an OBD which was rebuilt from the DB2 catalog does not exist in the DBD which exists on the DSNDB01.DBD01 page set. The DB2 catalog and DBD/OBD are inconsistent. The OBID of the missing OBD is 'xxxx'.

Severity: 4 (warning)

System Action: DBD checking continues normally.

DSNU922I *csect-name* - OBD X'xxxx' MISSING IN
REBUILT DBD

Explanation: This message indicates that an OBD in the DBD which exists on the DSNDB01.DBD01 page set does not exist in the DBD which was rebuilt from the DB2 catalog. The DB2 catalog and DBD/OBD are inconsistent. The OBID of the missing OBD is 'xxxx'.

Severity: 4 (warning)

System Action: DBD checking continues normally.

DSNU923I *csect-name*—OBDDTYPE FOR OBD
X'xxxx' DOES NOT MATCH —NO
FURTHER CHECKING DONE FOR THIS
OBD

Explanation: The object descriptor (OBD) that exists on the DSNDB01.DBD01 page set is different from the type of OBD that was rebuilt from the DB2 catalog. No further processing can be done because the fields of one OBD type are different from the fields of another. The DB2 catalog and database descriptor (DBD)/OBD are inconsistent. The object identifier (OBID) of the OBD that is inconsistent is 'xxxx'.

Severity: 4 (warning)

System Action: Checking for OBD X'xxxx' stops. Checking of the DBD continues normally.

DSNU924I *csect-name*—DBDS DIFFER AT OFFSET
X'xxxxxxxx' field-name

Explanation: The value of a field in the database descriptor (DBD) differs from the value of the corresponding field in the DBD that exists on the DSNDB01.DBD01 page set and differs from the value of the corresponding field in the DBD that was rebuilt from the DB2 catalog.

xxxxxxxx

The hex offset from the beginning of the DBD.

field-name

The name of the field.

Severity: 0 (informational)

System Action: Checking of the DBD continues normally.

DSNU925I *csect-name*—OBDDFILE AT OFFSET
X'xxxxxxxx' IN EXISTING DBD HAS
OBID X'nnnn' WHICH IS NOT A FILE
OBD

Explanation: The field that points to the first FILE OBD (OBDDFILE) in the database descriptor (DBD) that exists on the DSNDB01.DBD01 page set does not point to a FILE OBD. The DB2 catalog and DBD/OBD (object descriptor) are inconsistent.

xxxxxxxx

The hex offset from the beginning of the existing DBD.

nnnn The object identifier (OBID) of the OBD which should be a FILE OBD.

Severity: 4 (warning)

System Action: Checking of the DBD continues normally.

DSNU926I *csect-name*—OBDDFILE AT OFFSET
X'xxxxxxxx' IN REBUILT DBD HAS
OBID X'nnnn' WHICH IS NOT A FILE
OBD

Explanation: The field that points to the first FILE OBD (OBDDFILE) in the database descriptor (DBD) that was rebuilt from the DB2 catalog does not point to a FILE OBD. The DB2 catalog and DBD/OBD (object descriptor) are inconsistent.

xxxxxxxx

The hex offset from the beginning of the rebuilt DBD.

nnnn The object identifier (OBID) of the OBD that should be a FILE OBD.

Severity: 4 (warning)

System Action: Checking of the DBD continues normally.

DSNU927I *csect-name*—OBD X'xxxx' IS A HOLE IN EXISTING DBD

Explanation: The object descriptor (OBD) that exists on the DSNDB01.DBD01 page set has been logically deleted, OBDHOLE = '1'B. The DB2 catalog and database descriptor (DBD)/OBD are inconsistent. The object identifier (OBID) of the OBD that is a hole is 'xxxx'.

Severity: 4 (warning)

System Action: Checking of the DBD continues normally.

DSNU928I *csect-name*—OBD X'xxxx' IS A HOLE IN REBUILT DBD

Explanation: The object descriptor (OBD) that was rebuilt from the DB2 catalog has been logically deleted, OBDHOLE = '1'B. The DB2 catalog and database descriptor (DBD)/OBD are inconsistent. The object identifier (OBID) of the OBD that is a hole is 'xxxx'.

Severity: 4 (warning)

System Action: Checking of the DBD continues normally.

DSNU929I *csect-name*—OBD FIELD *field-name* HAS VALUE OUT OF RANGE AT OFFSET X'xxxxxxxx' IN OBD X'nnnn'

Explanation: The object descriptor (OBD) field 'field-name' has an unexpected value. The DB2 catalog and database descriptor (DBD)/OBD are inconsistent.

field-name The name of the field in the OBD.
xxxxxxxx The hex offset from the beginning of the OBD.
nnnn The object identifier (OBID) of the OBD.

Severity: 4 (warning)

System Action: Checking of the DBD continues normally.

DSNU930I *csect-name*—INDEX *index-name* (OBD X'xxxx') MUST BE REBUILT

Explanation: The index 'index-name' must be either recovered or dropped and recreated to ensure that the index is consistent with the description in the INDEX FANSET OBD. The object descriptor (OBD) is not damaged. However, if the index is not either recovered or dropped and recreated, incorrect output can be produced when the index is used as an access path.

index-name The name of the index found in SYSIBM.SYSINDEXES.
xxxx The object identifier (OBID) of the OBD.

Severity: 8 (error)

System Action: Checking of the DBD continues normally.

DSNU931I *csect-name* - OBDDMAX FIELD OF DBD IS TOO LARGE

Explanation: The OBDDMAX field (maximum number of ID in the DBD) is too large. It is larger than the largest possible number of ID based upon the DBD size.

Severity: 8

System Action: Checking of the DBD continues but using the largest possible number of ID instead of the incorrect OBDDMAX.

DSNU932I REPAIR CAN NOT DROP THE DATABASE.

Explanation: The system cannot drop the database because the name that was specified for the database and the DBID that was specified do not match.

System Action: The utility job is halted.

User Response: Correct the utility statement, and resubmit the job.

DSNU935I *csect-name* DATABASE *database-name* IS NOT STARTED FOR UTILITY PROCESSING ONLY

Explanation: This message is issued when the REPAIR utility with the DBD option is run on a database that is not started for utility processing only.

Severity: 8

System Action: REPAIR DBD terminated.

User Response: Stop the database. Then start the database with the ACCESS(UT) option. Resubmit the REPAIR DBD job.

DSNU936I *csect-name* DATABASE *database-name* IS IN USE

Explanation: This message is issued when the REPAIR utility with the DBD option is run on a database that is in use by others.

Severity: 8

System Action: REPAIR DBD terminated.

User Response: Wait until all users are finished, then resubmit the REPAIR DBD job.

DSNU938I *csect-name*—OBD X'xxxx' HAD DIFFERENCES WHICH WERE NOT IN A NAMED FIELD

Explanation: There is a difference between the object descriptor (OBD) in the database descriptor (DBD) that

exists on the DSNDB01.DBD01 page set and the DBD that was rebuilt from the DB2 catalog. This difference does not exist in a named field. Therefore, the detailed search by field name fails to find the difference. The DB2 catalog and DBD/OBD are inconsistent. The object identifier (OBID) of the OBD in error is 'xxxx'.

Severity: 4 (warning)

System Action: Checking of the DBD continues normally.

DSNU939I *csect-name*—**DBD HEADER HAD DIFFERENCES WHICH WERE NOT IN A NAMED FIELD**

Explanation: There is a difference between the DBD header in the DBD that exists on the DSNDB01.DBD01 page set and the DBD that was rebuilt from the DB2 catalog. This difference does not exist in a named field. Therefore, the detailed search by field name fails to find the difference. The DB2 catalog and database descriptor (DBD)/object descriptor (OBD) are inconsistent.

Severity: 4 (warning)

System Action: Checking of the DBD continues normally.

DSNU940I *csect-name* **AUTHID OR LUNAME NOT BLANK FOR FOLLOWING SYSPROCEDURES ROW:**

Explanation: A SYSPROCEDURES row contains an AUTHID or LUNAME value. AUTHID and LUNAME are not supported attributes for DB2 Version 6 stored procedures. DSNU944I messages follow that show the contents of the SYSPROCEDURES row.

System Action: The SYSPROCEDURES row is not migrated. SYSPROCEDURES migration continues with the next row.

System Programmer Response: Execute a CREATE PROCEDURE statement to add the stored procedure definition. A schema name may be specified in place of AUTHID and LUNAME in the stored procedure definition.

DSNU941I *csect-name* **CREATE PROCEDURE FAILED WITH SQLCODE=*sqlcode* SQLSTATE=*sqlstate***

Explanation: The migration of a SYSPROCEDURES row has failed. The SQLCODE and SQLSTATE values indicate the type of error that occurred.

System Action: The SYSPROCEDURES row is not migrated. The SYSPROCEDURES migration continues with the next row.

System Programmer Response: Check the stored procedure attributes and parameters that are listed in

the DSNU942I message, which follows this message.

Execute a CREATE PROCEDURE statement with correct attributes and parameters to add the stored procedure definition.

DSNU942I *csect-name* **create_procedure_statement**

Explanation: This message follows message DSNU941I when the migration of a SYSPROCEDURES row fails. This message contains the CREATE PROCEDURE statement that DB2 used for migration of the SYSPROCEDURES row.

System Action: The SYSPROCEDURES row is not migrated. SYSPROCEDURES migration continues with the next row.

System Programmer Response: Use the CREATE PROCEDURE statement in this message and the SQLCODE and SQLSTATE information in message DSNU941I to diagnose the error.

DSNU944I *csect-name* **sysprocedures_column_name - sysprocedures_column_value**

Explanation: This message lists a column value for a SYSPROCEDURES row that could not be migrated. This message follows message DSNU940I.

System Action: The SYSPROCEDURES row is not migrated. SYSPROCEDURES migration continues with the next row.

DSNU945I *csect-name* **CREATE SUCCESSFUL FOR PROCEDURE *procedure_name***

Explanation: A SYSPROCEDURES row with a value of *procedure_name* in column PROCEDURE has been successfully migrated.

System Action: SYSPROCEDURES migration continues normally.

DSNU971I *csect-name* **TABLESPACE *dbname.tsname* IS CHECK PENDING OR AUX CHECK PENDING CORRELATION-ID *id1* CONNECTION-ID *id2* LUW-ID *id3***

Explanation: This message is sent to the console when TABLESPACE *tsname* is set to CHECK pending or auxiliary CHECK pending state. The CORRELATION-ID *id1* is the correlation identifier of the thread requesting CHECK pending or auxiliary CHECK pending status. Correlation IDs beginning with 'Onn', where *nn* is a number from 01 to 28, identify system agents. The CONNECTION-ID *id2* is the correlation identifier of the thread. The LUW-ID *id3* is the logical-unit-of-work identifier of the thread. If the LUW-ID is an '*', the thread has no LUW-ID. If it is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which

DSNU972I • DSNU994I

can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Refer to Part 2 (Volume 1) of *DB2 Administration Guide* for a discussion of the CHECK pending operation.

DSNU972I *csect-name* **CATALOG UPDATING FAILURE WHILE SETTING OR RESETTING CHECK PENDING CORRELATION-ID *id1* CONNECTION-ID *id2***

Explanation: When the check pending state is set on or off, the updating of the catalog tables (SYSTABLESPACE, SYSTABLES, and SYSTABLEPART) fails. The CORRELATION-ID, 'id1', is the correlation identifier of the thread associated with the application requesting that the check pending state be set on or off. The CONNECTION-ID, 'id2', is the correlation identifier of the application. Correlation IDs beginning with '0nn', where 'nn' is a number from 01 to 28, identify system agents.

Severity: 0 (informational) or 4 (warning)

System Action: Processing continues.

Problem Determination: The utility being processed requested the setting of check pending either on or off. The updating of the STATUS column of SYSTABLESPACE, and of the CHECKFLAG and CHECKRID columns of SYSTABLES and SYSTABLEPART failed. Processing continues normally. However, those columns for the rows being updated now contain invalid values. Subsequent utility processing ignores these values, and the next setting or resetting of check pending for that table space corrects the error in one of the following ways:

- If the table space is set to check pending and the catalog fields are in error, the scope of check pending is escalated in the catalog. (The STATUS column of SYSTABLESPACE is set to 'P', and the CHECKFLAG and CHECKRID columns of SYSTABLES and SYSTABLEPART are set to 'C' and binary zeros.)
- If the table space is set to not check pending and the catalog fields are in error, the scope of check pending is set off in the catalog. (The STATUS column of SYSTABLES is set to an 'A', and the CHECKFLAG and CHECKRID columns of SYSTABLES and SYSTABLEPART are set to blanks.)

After the catalog fields are corrected, the setting or resetting of check pending continues as specified.

Usually message DSNT500I or DSNT501I is also issued, because the probable cause of the error is RESOURCE UNAVAILABLE. If the reason for the failure

was not RESOURCE UNAVAILABLE, an SVC dump is requested and processing continues normally. To determine the cause of the failure, refer to the dump listing and the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5, 32

DSNU973I *csect-name* **CHECK PENDING, AUX CHECK PENDING OR BOTH HAS BEEN RESET FOR TABLESPACE *dbname.tsname* CORRELATION-ID *id1* CONNECTION-ID *id2* LUW-ID *id3***

Explanation: This message is sent to the console when CHECK pending, auxiliary CHECK pending or both states were reset for TABLESPACE *tsname*. The CORRELATION-ID *id1* is the correlation identifier of the thread requesting that the CHECK pending state, the auxiliary CHECK pending state or both states be reset. Correlation IDs beginning with '0nn', where *nn* is a number from 01 to 28, identify system agents. The CONNECTION-ID *id2* is the correlation identifier of the thread. The LUW-ID *id3* is the logical-unit-of-work identifier of the thread. If the LUW-ID is an '*', the thread has no LUW-ID. If it is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of the logical-unit-of-work-id in any DB2 command that accepts a logical-unit-of-work-id as input.

Severity: 0 (informational)

System Action: Processing continues.

User Response: Refer to Part 2 (Volume 1) of *DB2 Administration Guide* for a discussion about clearing the CHECK pending status.

DSNU993I *csect-name* **IMAGE COPY RESTORE TERMINATED**

Explanation: Catalog and directory initialization (image copy restore) did not complete successfully.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Examine other error messages associated with this job.

DSNU994I *csect-name* **IMAGE COPY RESTORE COMPLETED SUCCESSFULLY**

Explanation: Catalog and directory initialization (image copy restore) completed successfully.

Severity: 0 (informational)

DSNU995I *csect-name* **VSAM PUT
ERROR,RPLERREG = return-code,
RPLERRCD = reason-code**

Explanation: VSAM PUT failed with the indicated *return-code* and *reason-code*.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Notify system programmer.

System Programmer Response: Follow standard VSAM diagnostic procedure. Refer to *z/OS DFSMS: Macro Instructions for Data Sets*. See also *MVS/DFP V3R3 Diagnosis Guide* for more information about the VSAM procedures.

DSNU996I *csect-name* **VSAM OPEN ERROR,
ACBERRFLG = error-code**

Explanation: VSAM OPEN failed with the indicated *ACB error-code*.

Severity: 8 (error) if error is greater than or equal to 128; otherwise, 4 (warning)

System Action: Processing terminates if the error code is greater than or equal to 128; otherwise, processing continues normally.

User Response: Notify the system programmer.

System Programmer Response: Follow standard VSAM diagnostic procedure. Refer to *z/OS DFSMS: Macro Instructions for Data Sets*. See also *MVS/DFP V3R3 Diagnosis Guide* for more information about the VSAM procedures.

DSNU997I *csect-name* **OUTPUT DATA SET NAME
= data-set-name**

Explanation: The indicated *data-set-name* is used for output.

Severity: 0 (informational)

DSNU998I *csect-name* **INPUT DATA SET NAME =
data-set-name**

Explanation: The indicated *data-set-name* is used for input.

Severity: 0 (informational)

DSNU999I *csect-name* **START OF IMAGE
COPYRESTORE FOR JOB job-name
step-name**

Explanation: The catalog and directory initialization (image copy restore) started.

Severity: 0 (informational)

DSNU1000I *csect-name* - **PROCESSING CONTROL
STATEMENTS IN PREVIEW MODE**

Explanation: The PREVIEW option has been specified either on the OPTIONS control statement or as a JCL parameter. Control statements will be previewed in this execution for TEMPLATE and LISTDEF use but the utility control statements will not be executed. PREVIEW via JCL parameter will continue to the end of the job step. PREVIEW via OPTIONS PREVIEW will continue until the end of the job step or another OPTIONS control statement.

Severity: 0 (informational)

System Action: Utility control statements are previewed but not executed.

User Response: If the return code is 8, PREVIEW detected errors which must be corrected. If the return code is 4, PREVIEW detected potential problems, but the previewed statements are valid.

Examine the preview output shown in informational messages DSNU1010I, DSNU1020I, DSNU1021I, DSNU1022I, DSNU1023I and DSNU1025I, plus any error messages. Correct any statements that are in error and remove the PREVIEW option to execute the control statements.

DSNU1001I *csect-name* - **LISTDEF list-name
CLAUSE IDENTIFIES NO NEW
OBJECTS: clause-type object-type
qualifier.name**

Explanation: An INCLUDE or EXCLUDE clause of a LISTDEF control statement returned no new objects. This means either that the INCLUDE or EXCLUDE clause evaluated to no objects at all, or that it did not return any objects which were not already included or excluded by previous INCLUDE or EXCLUDE clauses. In either case, the total number of objects covered by the LISTDEF did not change as a result of this clause.

Severity: 4 (warning)

System Action: Utility processing continues.

User Response: Correcting the clause in error will eliminate this message in the future.

DSNU1002I *csect-name* - **INVALID KEYWORD
SPECIFIED ON CLAUSE: clause-type
object-type qualifier.name**

Explanation: An INCLUDE or EXCLUDE clause of a LISTDEF control statement has an invalid keyword specified.

Catalog and directory objects may only be specified via their TABLESPACE or INDEXSPACE names. DATABASE, TABLE and INDEX may not be specified. Catalog and directory object names may not contain pattern matching characters. They must be included or excluded explicitly using their complete names. Those

DSNU1003I • DSNU1011I

include or exclude clauses may not contain the keywords RI, BASS, LOB, ALL.

Severity: 8 (error)

System Action: Utility processing stops.

User Response: Correct the invalid LISTDEF clause and rerun the utility.

DSNU1003I *csect-name* - INVALID LIST FOR *utility-name* UTILITY

Explanation: The list name referenced on this control statement is not valid for the specified utility. The list either contains no objects or contains objects which cannot be processed by this specific utility.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the LISTDEF in error, and resubmit the utility job. Refer to *DB2 Utility Guide and Reference* for the correct option specifications.

DSNU1004I *csect-name* - DUPLICATE *object-type* *object-name* FOUND IN SYSIN *dd-name*

Explanation: Duplicate LISTDEF or TEMPLATE statements (duplicate names) were detected in the SYSIN, listdef, or template dataset.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Eliminate the duplicate LISTDEF or TEMPLATE names and resubmit the utility job. Refer to *DB2 Utility Guide and Reference* for the correct option specifications.

DSNU1005I *csect-name* - UTILITY *name* NOT ALLOWED IN *dd-type* DD *dd-name*

Explanation: The utility parser detected a control statement other than TEMPLATE in the SYSTEMPL data set or LISTDEF in the SYSLISTD data set.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Remove the invalid control statements and resubmit the utility job. Refer to *DB2 Utility Guide and Reference* for the correct option specifications.

DSNU1006I *csect-name* - *object-type* *object-name* NOT FOUND

Explanation: A utility control statement used a LIST or TEMPLATE that was not found in SYSIN or either of the SYSTEMPL or SYSLISTD data sets. These DD names may vary if OPTIONS LISTDEFDD or OPTIONS TEMPLATEDD were specified.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Provide the missing LISTDEF or TEMPLATE definition in SYSIN prior to its use and resubmit the utility job. If the definition utility exists in another data set, provide the SYSTEMPL or SYSLISTD DD card for the data set. Refer to *DB2 Utility Guide and Reference* for the correct option specifications.

DSNU1007I *csect-name* - DATE/TIME VALUES MAY CHANGE BEFORE EXECUTION

Explanation: PREVIEW processing has detected DSN date/time variables on a TEMPLATE control statement being used. These values may change before the actual utility execution, resulting in different data set names.

Severity: 4 (warning)

System Action: Preview processing continues normally.

DSNU1008I *csect-name* - LISTDEF *name* CONTAINS NO OBJECTS

Explanation: The indicated LISTDEF list definition expands to contain no objects.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the LISTDEF definition and resubmit the utility job. Refer to *DB2 Utility Guide and Reference* for the correct option specifications.

DSNU1009I *csect-name* - TEMPLATE *name* DSN= *dataset-name*

Explanation: PREVIEW processing has expanded a referenced TEMPLATE data set name to the value shown. If the data set name contains date/time variables, the date/time values might change before actual utility execution.

Severity: 8 (error)

System Action: PREVIEW processing continues.

User Response: If the data set names shown are not acceptable, correct the TEMPLATE control statements, and resubmit the utility job. Refer to *DB2 Utility Guide and Reference* for the correct option specifications.

DSNU1011I WORKFILE NOT ALLOWED IN LISTDEF

Explanation: A workfile database cannot be used in a LISTDEF list because utilities do not process them.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the LISTDEF in error, and resubmit the utility job. Refer to *DB2 Utility Guide and*

Reference for the correct option specifications.

DSNU1012I *csect-name* - LISTDEF MUST BEGIN WITH AN INCLUDE CLAUSE

Explanation: A LISTDEF control statement begins with an EXCLUDE clause. The LISTDEF control statement must begin with an INCLUDE clause.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the LISTDEF in error, and resubmit the utility job. Refer to *DB2 Utility Guide and Reference* for the correct option specifications.

DSNU1013I *csect-name* - dd-type DD CARD dd-name NOT FOUND

Explanation: An OPTIONS control statement specifies a DD name '*dd-name*' that does not exist in the JCL.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the DD name on the OPTIONS statement or include the missing JCL DD card, and resubmit the utility job. Refer to *DB2 Utility Guide and Reference* for the correct option specifications.

DSNU1014I *csect-name* - INDEXSPACE name NOT FOUND

Explanation: The specified INDEXSPACE does not exist.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the operand in error, and resubmit the utility job. Refer to *DB2 Utility Guide and Reference* for the correct option specifications.

DSNU1015I *csect-name* - ERROR ALLOCATING DATA SET DSN=*name* CODE=*X'reason-code'*

Explanation: An error was returned by SVC 99 during TEMPLATE data set dynamic allocation. This message is followed by text which explains the reason-code shown.

Severity: 8 (error)

System Action: Utility processing for the current object halts. If a list is being processed, utility processing of the next object will proceed or halt based on the OPTIONS ITEMERROR control statement. By default, execution will HALT.

User Response: Correct the error preventing dynamic allocation, and resubmit the utility job. In some cases,

TEMPLATE dynamic allocation may not be possible and a JCL DD card may be required. See DYNALLOC (SVC 99) text unit documentation for limitations.

DSNU1016I *csect-name* - TEMPLATE DSN VARIABLE *var-name* HAS NO VALUE

Explanation: A utility has attempted to build a data set name based on a TEMPLATE that specifies DSN variables. The variable shown has no value in this particular use. For example, **PART** when the object is not partitioned or **ICTYPE** when an image copy is not being allocated.

Severity: 8 (error)

System Action: Utility processing for the current object halts. If a list is being processed, utility processing of the next object will proceed or halt based on the OPTIONS ITEMERROR control statement. By default, execution will HALT.

User Response: Correct the TEMPLATE DSN specification to eliminate the invalid variable or use a different TEMPLATE, and resubmit the utility job. Refer to *DB2 Utility Guide and Reference* for the correct option specifications.

DSNU1017I *csect-name* - TEMPLATE DSN VARIABLE *var-name* TRUNCATED TO *value*

Explanation: While performing dynamic allocation of a TEMPLATE data set the DSN variable shown was truncated to the value shown.

Severity: 4 (warning)

System Action: Utility processing continues.

DSNU1018I *csect-name* - USER *user-id* NOT AUTHORIZED TO ACCESS CATALOG TABLE *qualifier.name*

Explanation: The user executing the utility does not have the required authority to access the catalog table shown. This access is required to expand the LISTDEF control statement being used.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: GRANT the required authority to access the DB2 catalog to the user executing the utility. Refer to the LISTDEF section of *DB2 Utility Guide and Reference* for valid authorities.

DSNU1019I *csect-name* - INVALID TEMPLATE NAME *template-name*

Explanation: A TEMPLATE control statement specifies an invalid TEMPLATE name. The names UTPRINT,

SORTLIB and any name starting with SORTWK or SYS may not be used.

Severity: 8 (error)

System Action: Utility processing terminates.

User Response: Correct the TEMPLATE name in error, and resubmit the utility job. Refer to *DB2 Utility Guide and Reference* for the correct option specifications.

DSNU1020I *csect-name* - **EXPANDING LISTDEF**
list-name

Explanation: PREVIEW processing is performing the catalog lookup necessary to expand the specified LISTDEF.

Severity: 0 (informational)

System Action: PREVIEW processing continues.

DSNU1021I *csect-name* - **PROCESSING** *clause-type*
CLAUSE *object-type qualifier.name*

Explanation: PREVIEW processing is expanding the specified clause of a LISTDEF. A DSNU1022I message follows this message to indicate how many objects are identified by each INCLUDE or EXCLUDE clause and message DSNU1023I to show the final expanded list..

Severity: 0 (informational)

System Action: PREVIEW processing continues.

DSNU1022I *csect-name* - **CLAUSE IDENTIFIES** *n*
OBJECTS

Explanation: PREVIEW processing has expanded one INCLUDE or EXCLUDE clause of a LISTDEF control statement. The clause expanded to the indicated *n* number of objects. The sum of the values shown on the DSNU1022I messages may not match the quantity shown on DSNU1023I due to INCLUDEs, EXCLUDEs and list overlap.

Severity: 0 (informational)

System Action: PREVIEW processing continues.

DSNU1023I *csect-name* - **LISTDEF** *name* **CONTAINS**
n **OBJECTS**

Explanation: PREVIEW processing has finished expanding a LISTDEF. The final list contains the indicated number of objects. The value shown may not match the sum of previous DSNU1022I quantities due to INCLUDEs, EXCLUDEs and list overlap.

Severity: 0 (informational)

System Action: PREVIEW processing continues.

DSNU1024I *csect-name* - **OPTIONS EVENT**
WARNING HAS SET RETURN CODE TO
return-code

Explanation: Utility processing has ended with WARNING messages and a return code of 4. However, due to a previous OPTIONS EVENT WARNING control statement, the return code has been changed to the indicated return code.

Severity: 0 (informational) or 8 (warning)

System Action: Utility processing halts if WARNING RC8 was specified, or continues if WARNING RC0 was specified.

User Response: Use OPTIONS WARNING RC0 only on repetitive utility executions where WARNING messages are expected and acceptable.

DSNU1025I *csect-name* - *name* **IS A DD NAME**

Explanation: PREVIEW processing has checked the current utility control statement for TEMPLATE dynamic allocation and has found the specified name refers to a JCL DD card, not a template. In all cases the presence of a DD card takes precedent over any TEMPLATE of the same name.

Severity: 0 (informational)

System Action: PREVIEW processing continues.

User Response: If a TEMPLATE and DD card have the same name, the DD card always takes precedence. If the indicated name should not reference a DD card, perform one of the following actions:

- Remove the DD card
- Change the TEMPLATE name on the TEMPLATE control statement and the utility control statement that refers to it

If the reference to the DD card is correct, no action is necessary. Refer to *DB2 Utility Guide and Reference* for the correct option specifications.

DSNU1026I *csect-name* - **LIST** *using-list* **REUSES**
LIST *used-list*

Explanation: A LISTDEF list is INCLUDING or EXCLUDING another list that has already been used in expansion of this clause. This "circular reference" is not allowed. For example, the following specification is not allowed: LISTDEF A INCLUDE LIST B LISTDEF B INCLUDE LIST A

Severity: 8 (error)

System Action: Utility processing does not initiate.

User Response: Correct one or more LISTDEF control statements to eliminate the circular reference and resubmit the utility job. Refer to *DB2 Utility Guide and Reference* for the correct option specifications.

DSNU1027I *csect-name* - PROCESSING CONTINUES DUE TO OPTIONS ITEMERROR SKIP

Explanation: An error has occurred during utility processing, indicated by previous error messages. However, because an OPTIONS ITEMERROR SKIP control statement is in force, processing continues.

Severity: 8 (error)

System Action: Utility processing continues on the current utility control statement only. Subsequent utility control statements in the same job step will not be processed.

User Response: Correct the previous error, and resubmit the utility for the objects in error. If the utility experiencing an error is QUIESCE and a single quiesce point is required for the entire list, the entire list must be resubmitted.

DSNU1028I *csect-name* - INVALID KEYWORD kkkkkkkk FOR DASD TEMPLATE

Explanation: A DASD TEMPLATE control statement cannot include the tape TEMPLATE keyword kkkkkkkk.

Severity: 8 (error)

System Action: Utility processing does not initiate.

User Response: DB2 uses the UNIT operand to determine the data set type. Either remove the tape keyword from the TEMPLATE control statement, or correct the UNIT operand to refer to a tape unit. Refer to *DB2 Utility Guide and Reference* for the correct option specifications.

DSNU1029I *csect-name* - INVALID KEYWORD kkkkkkkk FOR TAPE TEMPLATE

Explanation: A tape TEMPLATE control statement cannot include the DASD TEMPLATE keyword kkkkkkkk.

Severity: 8 (error)

System Action: Utility processing does not initiate.

User Response: DB2 uses the UNIT operand to determine the data set type. Either remove the DASD keyword from the TEMPLATE control statement, or correct the UNIT operand to refer to a DASD unit. Refer to *DB2 Utility Guide and Reference* for the correct option specifications.

DSNU1030I *csect-name* - QUALIFIER qqqqqqqq TOO LONG

Explanation: The TEMPLATE DSN qualifier 'qqqqqqqq' is greater than eight characters.

Severity: 8 (error)

System Action: Utility processing for the current

object halts. If a list is being processed, utility processing of the next object will proceed or halt based on the OPTIONS ITEMERROR control statement. By default execution will HALT.

User Response: Correct the TEMPLATE DSN expression and resubmit the utility job. Refer to *DB2 Utility Guide and Reference* for the correct option specifications.

DSNU1031I *csect-name* - DSN name TOO LONG

Explanation: The TEMPLATE DSN operand results in a data set name '*name*' that is too long for the type of data set being allocated.

Severity: 8 (error)

System Action: Utility processing for the current object halts. If a list is being processed, utility processing of the next object will proceed or halt based on the OPTIONS ITEMERROR control statement. By default execution will HALT.

User Response: Correct the TEMPLATE DSN operand in error, and resubmit the utility job. Refer to *DB2 Utility Guide and Reference* for the correct option specifications.

DSNU1032I *csect-name* - INVALID QUALIFIER qualifier IN TEMPLATE name

Explanation: The TEMPLATE DSN qualifier either contains invalid characters or does not start with an alpha character.

Severity: 8 (error)

System Action: Utility processing for the current object halts. If a list is being processed, utility processing of the next object will proceed or halt based on the OPTIONS ITEMERROR control statement. By default, execution will HALT.

User Response: Correct the TEMPLATE DSN operand in error, and resubmit the utility job. A common cause of this error message is leaving the trailing period off of a TEMPLATE DSN variable name. All TEMPLATE DSN variable names are of the form &xyz. and must contain the trailing period. Refer to *DB2 Utility Guide and Reference* for the correct option specifications.

DSNU1033I *csect-name* - PROCESSING LIST ITEM: object-type qualifier.name

Explanation: While processing a LISTDEF list, utility processing has begun on the indicated object.

Severity: 0 (informational)

System Action: Utility processing continues.

DSNU1034I *csect-name - primary-secondary* **SPACE**
units quantity **TOO LARGE FOR DATA**
SET *name*

Explanation: The TEMPLATE PRIMARY or SECONDARY SPACE quantity indicated is too large. It is not possible to dynamically allocate a data set larger than 16 777 215 units.

Severity: 8 (error)

System Action: Utility processing for the current object halts. If a list is being processed, utility processing of the next object will proceed or halt based on the OPTIONS ITEMERROR control statement. By default, execution will HALT.

User Response: The DB2-calculated required space is too large to be dynamically allocated in the units shown. If the primary allocation is too large, use the PCTPRIME keyword to reduce the primary and increase the secondary. If the secondary allocation is too large, use the NBRSECND keyword to increase the number of secondary allocations. It is not possible to use TEMPLATE dynamic allocation for data sets larger than 16x(16 777 215) MB. If an object requires a data set of this size it must be processed individually using a DD card, not a template.

DSNU1035I *csect-name - statement-type*
STATEMENT PROCESSED
SUCCESSFULLY

Explanation: DB2 issues this message following the successful execution of an OPTIONS, LISTDEF, or TEMPLATE utility control statement.

Severity: 0 (informational)

System Action: DB2 processed and retained the options or definitions specified on the control statement for use on subsequent utility control statements.

DSNU1036I *csect-name -* **UNABLE TO ESTIMATE**
SPACE REQUIREMENTS FOR
dataset-use

Explanation: While processing a TEMPLATE control statement which does not include a SPACE keyword, DB2 could not calculate the default data set size. DB2 bases default calculations on the size of existing data sets. In this situation, DB2 could not determine the size of existing data sets because one or more of those existing data sets are:

- in-stream data sets,
- members of partitioned data sets,
- on tape,
- or results sets generated by DECLARE CURSOR executed with an EXEC SQL utility statement.

Severity: 8 (error)

System Action: DB2 halts utility processing for the

current object. If the utility is processing a list of objects, utility processing of the next object will proceed or halt based on the OPTIONS ITEMERROR control statement. By default, processing will HALT.

User Response: Add the SPACE keyword and its operands to the TEMPLATE control statement in error and rerun the utility. If the utility is the LOAD utility, you must add SPACE keywords for all TEMPLATE control statements referenced in the LOAD, except for the input data set.

DSNU1037I *csect-name -* **PREVIEW PROCESSING**
CONTINUES DUE TO JCL PARAMETER

Explanation: An OPTIONS utility control statement has attempted to turn off PREVIEW processing. PREVIEW processing continues because the PREVIEW JCL parameter has been specified. This parameter applies to the entire job step and can not be overridden by an OPTIONS control statement.

Severity: 0 (informational)

System Action: Utility processing continues in PREVIEW mode.

User Response: If PREVIEW processing must be turned off in the middle of a utility job step, remove the PREVIEW JCL parameter. Activate or deactivate PREVIEW processing by using the OPTIONS utility control statement, not the PREVIEW JCL parameter.

DSNU1038I *csect-name -* **DATASET ALLOCATED.**
TEMPLATE=*template-name*
DDNAME=*dd-name* **FILE**
SEQUENCE=*file-sequence*
DSN=*ds-name*

Explanation: The data set that was indicated in the message has been successfully allocated based on a TEMPLATE control statement. *file-sequence* will only be shown for tape datasets.

Severity: 0 (informational)

System Action: Processing continues.

DSNU1040I *csect-name -* **UNABLE TO LOCATE DSN**
dsname **ON RESTART**

Explanation: DB2 could not find data set *dsname* when the utility was restarted. The data set is required for restart to continue.

System Action: The utility step abends. The utility job step is in the stopped state.

User Response: Refer to the DB2 abend code x'00E400C3' for more information.

DSNU1041I *csect-name* - **UNABLE TO CREATE GDG BASE** *name reason*

Explanation: A TEMPLATE could not allocate a generation data group (GDG) data set, but the base GDG did not exist. The utility was unable to define the GDG base.

Severity: 8 (error)

System Action: Utility processing halts for the current object. If a list is in process, utility processing of the next object will proceed or halt based on the OPTIONS ITEMERROR control statement. By default, execution will HALT.

User Response: Review the reason value to determine why the GDG base could not be defined. The possible reasons and suggested responses include:

- **UNABLE TO LOAD IDCAMS PROGRAM.** Ensure that the utility can invoke the IDCAMS program. Ensure that the utility can invoke the IDCAMS program.
- **IDCAMS ABEND xxx.** Use xxx, the abend code from the IDCAMS program, to determine why the IDCAMS program abended.
- **ERROR IN IDCAMS.** Review the IDCAMS message output that is listed between messages DSNU1042I and DSNU1043I to determine why the GDG base could not be defined.

DSNU1042I *csect-name* - **START OF IDCAMS MESSAGES**

Explanation: This message indicates the beginning of the IDCAMS messages or other related non-DB2 messages. DSNU1043I indicates the end.

User Response: No action is required, but subsequent IDCAMS messages may require some action. See the *z/OS MVS System Messages Volumes 1-10* or other appropriate documentation for more information.

DSNU1043I *csect-name* - **END OF IDCAMS MESSAGES**

Explanation: This message indicates the end of the IDCAMS or other related non-DB2 messages. DSNU1042I indicates the beginning.

User Response: No action is required, but preceding messages may require some action. See the *z/OS MVS System Messages Volumes 1-10* for more information.

DSNU1044I *csect-name* - **PROCESSING ddname AS EBCDIC**

Explanation: The utility control statement input data set begins with an EBCDIC character and is assumed for the duration of this job step to contain only EBCDIC characters.

Severity: 0 (informational)

System Action: Processing of EBCDIC utility control statements continues.

User Response: If processing of utility control statements as EBCDIC is incorrect make sure the first character in the input data set is UNICODE, specifically UTF-8 CCSID 1208. This will cause the entire input data set to be processed as UNICODE.

DSNU1045I *csect-name* - **PROCESSING ddname AS UNICODE UTF-8**

Explanation: The utility control statement input data set begins with a UNICODE character, specifically UTF-8 CCSID 1208, and is assumed for the duration of this job step to contain only UNICODE characters.

Severity: 0 (informational)

System Action: Processing of UNICODE utility control statements continues.

User Response: If processing of utility control statements as UNICODE is incorrect make sure the first character in the input data set is EBCDIC. This will cause the entire input data set to be processed as EBCDIC.

DSNU1050I *csect-name* - **INVALID SUBSTRING NOTATION IN EXPRESSION string ON TEMPLATE template name**

Explanation: Invalid substring notation was detected on the TEMPLATE DSN operand. The portion of the DSN operand which is in error and the TEMPLATE name on which it occurred are shown.

Severity: 8 (error)

System Action: Utility processing is terminated.

User Response: Correct the TEMPLATE control statement which is in error. Common causes of this error are incorrect syntax of the (s,l) clause and values of "s" or "l" which fall outside of the variable value at the time of execution.

DSNU1100I *csect-name* **RECORD 'n' FOR PARTITION m WILL BE DISCARDED DUE TO field-name CONVERSION ERROR FOR table-name**

Explanation: The load utility found the input data provided for a field to be incorrect. The corresponding input data set record 'n' from the input data set specified for partition m will be placed in the DISCARDS data set.

Severity: 4 (warning)

System Action: The input data set record is noted and will be discarded in the DISCARD phase. The LOAD utility continues to process additional records in the input data set.

User Response: Following the completion of the current LOAD utility invocation, examine the record in the DISCARDS data set for partition *m*. Correct the error in the discarded input data. Submit a RESUME(YES) LOAD invocation with the DISCARDS data set as the input data set. Refer to *DB2 Utility Guide and Reference* for a definition of LOAD input field column specifications.

DSNU1101I *csect-name* RECORD 'n' FOR PARTITION *m* WILL BE DISCARDED DUE TO INVALID *field-name* COLUMN SPECIFICATION

Explanation: The load utility calculated the location of an input data value using the field specifications supplied and VARCHAR length fields present within the input data set record. The calculated position for the field was determined to be incorrect.

Severity: 4 (warning)

System Action: The input data set record number is noted and will be discarded in the DISCARD phase. The LOAD utility continues to process additional records in the input data set.

User Response: Following the completion of the current LOAD utility invocation, examine the record in the DISCARDS data set for partition *m*. Correct the error in the discarded input data, if one exists. Otherwise, correct the input field specification. Submit a RESUME(YES) LOAD invocation, which uses the DISCARDS data set and the verified LOAD utility statement and field specifications. Refer to *DB2 Utility Guide and Reference* for a definition of LOAD input field column specifications.

DSNU1102I *csect-name* RECORD 'n' FOR PARTITION *m* WILL BE DISCARDED DUE TO ERROR = X'*reason-code*' FROM EXIT ROUTINE *procedure-name* FOR *table-name*

Explanation: The exit routine provided by your installation blocked the load of record 'n' for partition *m* into the table indicated. The reason-code was set by the exit routine.

Severity: 4 (warning)

System Action: The input data set record number is noted and will be discarded in the DISCARD phase. The record in error is placed in the DISCARDS data set. The LOAD utility continues to process additional records in the input data set.

User Response: Following the completion of the current LOAD utility invocation, examine the record in the DISCARDS data set for partition *m*. Correct the error in the discarded input data, if one exists. Ensure that the exit routine provided is correct. Submit a RESUME(YES) LOAD invocation, which uses the DISCARDS data set and the verified LOAD utility

statement and field specifications. Refer to *DB2 Utility Guide and Reference* for a definition of LOAD input field column specifications.

System Programmer Response: Verify that the validation routine is correct.

DSNU1103I *csect-name* RECORD 'n' FOR PARTITION *m* WILL BE DISCARDED DUE TO PART OR HIGH KEY VALUE SPECIFICATION(S)

Explanation: The discarded record does not belong to the partition *m* being loaded. For a LARGE table space, this might be because the key is higher than the high key value specified for the last partition.

Severity: 4 (warning)

System Action: The input data set record number is noted and will be discarded in the DISCARD phase. The LOAD utility continues to process additional records in the input data set.

User Response: Following the completion of the current LOAD utility invocation, examine the record in the DISCARDS data set for partition *m*. Correct the error in the discarded input data, if one exists. Submit a RESUME(YES) LOAD invocation with the DISCARDS data set as the input data set. Refer to Part 2 of *DB2 Utility Guide and Reference* for a definition of LOAD input field column specifications.

System Programmer Response: Verify that the validation routine is correct.

DSNU1104I *csect-name* RECORD 'n' FOR PARTITION *m* WILL BE DISCARDED DUE TO WHEN SPECIFICATION(S)

Explanation: The discarded record does not satisfy the WHEN selection expression provided for partition *m*.

Severity: 4 (warning)

System Action: The input data set record is noted and will be discarded in the DISCARD phase. The LOAD utility continues to process additional records in the input data set.

User Response: Following the completion of the current LOAD utility invocation, examine the record in the DISCARDS data set for partition *m*. Correct the error in the discarded input data, if one exists. Submit a RESUME(YES) LOAD invocation with the DISCARDS data set as the input data set. Refer to *DB2 Utility Guide and Reference* for a definition of LOAD input field column specifications. If FORMAT UNLOAD was specified on the load statement, the WHEN specifications are built internally. This ensures that the rows are loaded back into the same object from which they were unloaded. Refer to *DB2 Utility Guide and Reference* for a description of the FORMAT UNLOAD option of LOAD.

DSNU1105I *csect-name* RECORD 'n' FOR PARTITION *m* WILL BE DISCARDED DUE TO UNEXPECTED ERROR

Explanation: The LOAD of input data set record number 'n' for partition *m* was attempted but was not successful due to an unexpected error.

Severity: 8 (error)

System Action: If the error was caused because a resource was not available, a DSNT500I message will be issued.

The utility step will be abended with a system X'04E' and an abend reason code of '00E40318'. If a DSNT500I message is not issued, an SVC dump will be requested. A SYSABEND dump of batch storage is also requested.

User Response: If a DSNT500I message was issued, refer to the description under that message number. If the unavailable resource becomes available, the utility step is restartable.

If there is no DSNT500I message, the error is an unexpected internal error and you should consult your system programmer.

Operator Response: An operator with SYSOPR authority can issue a TERM UTIL to free any held resources if that is necessary.

System Programmer Response: Refer to *DB2 Command Reference* for information about the TERM UTIL command. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU1106I *csect-name* RECORD 'n' FOR PARTITION *m* WILL BE DISCARDED DUE TO INVALID *field-name* COLUMN SPECIFICATION FOR *table-name*

Explanation: The load utility calculated the location of an input data value using the field specifications supplied and VARCHAR length fields present within the input data set record 'n' for partition *m*. The calculated position for the field was determined to be incorrect.

Severity: 4 (warning)

System Action: The input data set record number is noted and will be discarded in the DISCARD phase. The LOAD utility continues to process additional records in the input data set.

User Response: Following the completion of the current LOAD utility invocation, examine the record in the DISCARDS data set for partition *m*. Correct the error in the discarded input data, if one exists. Otherwise, correct the input field specification. Submit a RESUME(YES) LOAD invocation, which uses the DISCARDS data set and the verified LOAD utility statement and field specifications. Refer to *DB2 Utility*

Guide and Reference for a definition of LOAD input field column specifications.

DSNU1107I *csect-name* - UNIQUE INDEX KEY DUPLICATES KEY OF INDEXED ROW AT RID *rrrr* INDEX = *index-name* TABLE = *table-name* RECNO = *input-dataset-record-number* FOR PART = *m* RID = *duprid*

Explanation: The input data set record indicated was loaded into table 'table-name', partition *m*, at RID 'duprid', but it causes a unique index violation for index 'index-name'. It duplicates the key value of a record already in the table at RID 'rrrr'.

Severity: 4 (warning)

System Action: Processing continues. No index entry is created for the record at RID 'duprid'. The record will be deleted in a subsequent phase of processing.

DSNU1108I *csect-name* UNIQUE INDEX KEY DUPLICATES KEY FROM INPUT DATASET RECORD *iiii* FOR PART *m* LOADED AT RID *rrrr* INDEX = *index-name* TABLE = *table-name* RECNO = *recno* RID = *duprid*

Explanation: Input data set record 'recno' was loaded into table 'table-name', partition *m*, at RID 'duprid', but it causes a unique index violation for index 'index-name'. It duplicates the key value of another record in the load job: the record loaded at RID 'rrrr' from input data set record 'iiii'.

Severity: 4 (warning)

System Action: Processing continues. Index entries are not created for either record. Both records will be deleted in a subsequent phase of processing.

DSNU1109I *csect-name* RECORD 'n' FOR PARTITION *m* WILL BE DISCARDED DUE TO CHECK CONSTRAINT *constraint-name* VIOLATION ON TABLE *table-name*

Explanation: The discarded record violates the check constraint named *constraint-name* defined on table *table-name*. The record is not loaded and is discarded during the DISCARD phase.

Severity: 4 (warning)

System Action: The LOAD utility continues to process additional records in the input data set.

User Response: After the LOAD utility completes, examine the record in the DISCARDS data set for partition *m*. Correct the error in the discarded input data. Submit a RESUME(YES) LOAD job with the DISCARDS data set as the input data set.

DSNU1110I *csect-name* RECORD 'n' FOR PARTITION *m* VIOLATES CHECK CONSTRAINT *constraint-name* ON TABLE *table-name*

Explanation: The LOAD utility cannot load record *n* into table *table-name* partition *m* because the check constraint *constraint-name* would be violated. The record is not loaded.

Severity: 8 (error)

System Action: Processing terminates. An abend is requested so that the LOAD can be restarted after the error condition is corrected.

User Response: Find the failing record in the input data set for partition *m*, correct the condition that caused the check constraint to be violated, and restart the LOAD utility.

DSNU1111I *csect-name* FOREIGN KEY HAS NO PRIMARY KEY FOR RELATIONSHIP=*r1* INPUT RECORD NUMBER=*nnnn*, PART *m*, RID=*X'rrrr'*

Explanation: Input record 'nnnn' for partition *m* caused a row to be loaded into table 'table' at RID 'rrrr' with no primary key for the relationship with the name 'r1'.

Severity: 4 (warning)

System Action: Processing continues.

User Response: None required. The constraint violation described will be rectified later in processing.

DSNU1112I *csect-name* DISCARD PHASE STATISTICS - *nnn* INPUT DATA SET RECORDS DISCARDED FOR PARTITION *m*

Explanation: Input data set records were rejected by the LOAD utility for one or several reasons. The rejected records have been placed in a discards data set. The number of records rejected for partition *m* is 'nnn'. Message DSNU399I summarizes the errors causing the records to be rejected.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Examine the LOAD error summary and decide which of the discarded records, if any, should be corrected and reapplied to the table space.

DSNU1113I *csect-name* - LOAD UTILITY ERROR SUMMARY REPORT

Explanation: This message summarizes errors detected during the load job. Figure 2 shows the format of the report. It is issued only if unique index or referential constraint violations were detected.

ERROR SEVERITY	INPUT RECORD	PART	Discard Heading	ERROR TYPE	TABLE NAME	FIELD/FANSET NAME	RELATED ERROR
sev	idsrn	pno	ddsrn	type	name1	name2	idsrn2
.

Figure 2. LOAD Utility Error Summary Report

The report contains one line for each error. The errors are listed first by error severity and within that by *idsrn*.

The *Discard Heading* is either DISCARD RECORD or blank, depending on whether discard processing is in effect.

The report fields have the following meanings:

sev The severity of the error reported on this line:

Severity	Type of Error	Explanation
1	Primary	Primary referential integrity errors and all nonreferential integrity errors.
2	Secondary	Secondary referential integrity errors (that is, errors that result from a primary referential integrity error in an ancestor).

idsrn The relative record number in the input data set, for the partition identified by *pno*, of the record causing the error reported on this line.

pno The partition number for the input data set of the record causing the error reported on this line.

ddsrn The relative record number in the input data set of the record causing the error reported on this line, if discard processing is in effect. Otherwise, *ddsrn* is blank.

type A description of the type of error reported on this line, as follows:

- Conversion
- Field specification
- Validation
- Part Specification
- Unexpected
- Column specification
- Referential integrity
- Check constraint
- Duplicate key.

name1 The name of the table for which the record causing the error was targeted, if this information is pertinent for the type of error reported on this line. Otherwise, *name1* is blank. This field has nonblank values for the following error types:

- Conversion
- Validation

Column specification
Referential integrity (primary).
Check constraint

name2 The name of the field or fanset involved in the error reported on this line, if this information is pertinent for the type of error reported. Otherwise, *name2* is blank. This field contains a field name for the following types of errors:

- Conversion
- Field specification
- Column specification.

For primary referential integrity errors, *name2* is a relationship name. For check constraint errors, *name2* is a check constraint name.

idsrn2 The input data set record number of a related error. For duplicate key errors, it gives the input data set record number of the record whose key is duplicated. For secondary referential integrity errors, it gives the input data set record number of the record whose primary referential integrity error cascaded to cause this secondary error. For other types of errors, this field is unused.

Severity: 4 (warning)

System Action: Processing continues.

DSNU1114I *csect-name* (RE)LOAD PHASE
STATISTICS NUMBER OF RECORDS
LOADED = *nnnn* FOR TABLE
table-name

Explanation: When the SHRLEVEL CHANGE option is selected, DB2 issues this message upon normal completion of the (RE)LOAD phase of the LOAD utility. It indicates the number of records loaded into TABLE *table-name* from the source record data set (that is, the data set identified by the JCL DD statement identified in the INDDN option for the LOAD. This message is repeated for each TABLE loaded by the current LOAD utility statement

Severity: 0 (informational)

System Action: Processing of the RELOAD phase continues.

User Response: Verify that the number of record loaded reported is consistent with expectations. For example, if four records are processed, the user should expect to see NUMBER OF RECORD LOADED = 4.

DSNU1115I *csect-name nnnn* RESTART PHASE NOT
ALLOWED IN THE (RE)LOAD PHASE,
PHASE CHANGED TO CURRENT

Explanation: This message is issued when the RESTART PHASE is requested for a LOAD SHRLEVEL CHANGE utility. RESTART PHASE is not allowed for LOAD SHRLEVEL CHANGE.

Severity: 4 (warning)

System Action: Processing of the RELOAD phase continues.

User Response: No action is necessary. If another RESTART is required, use the RESTART option instead of RESTART PHASE.

DSNU1116I *csect-name* FOREIGN KEY HAS NO
PRIMARY KEY FOR RELATIONSHIP=*r1*
INPUT RECORD NUMBER=*nnnn*

Explanation: Input record *nnnn* has no primary key for the relationship with the name *r1*. The row is not loaded.

Severity: 4 (warning)

System Action: Processing continues.

User Response: None required.

DSNU1117I *csect-name* - UNIQUE INDEX KEY
DUPLICATES KEY OF INDEXED
RECORD AT RID *rrrr* INDEX =
index-name TABLE = *table-name*
RECNO = *input-dataset-record-number*

Explanation: The input data set record was loaded into table *table-name* at RID *duprid*, but it causes a unique index violation for index *index-name*. It duplicates the key value of a record already in the table at RID *rrrr*.

Severity: 4 (warning)

System Action: Processing continues. No index entry is created for the record at RID *duprid*.

DSNU1118I *csect-name* (RE)LOAD PHASE
STATISTICS - *nnnn* DUPLICATE KEY
ERRORS ENCOUNTERED

Explanation: This message is issued by the (RE)LOAD phase of the LOAD utility when the SHRLEVEL CHANGE option is used. The number of duplicate key errors that were encountered during processing is *nnnn*.

Severity: 0 (informational)

System Action: Processing continues.

DSNU1120I AUX TABLE NOT DEFINED FOR LOB
TABLE SPACE *dbname.tsname*

Explanation: The LOB table space *dbname.tsname* has been created, but no auxiliary table has been created in it.

Severity: 8 (error)

System Action: Utility operation is terminated with return code 8.

User Response: Complete the definition of the LOB table space before resubmitting the utility.

DSNU1121I *csect-name* (RE)LOAD PHASE STATISTICS - NUMBER OF RECORDS LOADED = *nnnn* FOR TABLE *table-name* PART *m*

Explanation: When the SHRLEVEL CHANGE option is selected, DB2 issues this message upon normal completion of the (RE)LOAD phase of the LOAD utility. It indicates the number of records that were loaded into part *m* of table *table-name* from the source record data set. The message repeats for each INTO TABLE PART clause in the LOAD utility statement.

Severity: 0 (informational)

System Action: Processing continues.

User Response: Verify that the number of records loaded reported is consistent with expectations.

DSNU1122I JOB *job-name* PERFORMING *util-type* WITH UTILID *util-id* UNABLE TO DRAIN *object-name*. RETRY *n* OF *m* WILL BE ATTEMPTED IN *s* SECONDS

Explanation: A utility with the RETRY option specified has been unable to drain a tablespace, tablespace part, or index. The utility will make another attempt to acquire the drain after a delay.

Severity: 0 (informational)

System Action: The utility job continues.

User Response: The utility job attempts to acquire a restrictive access to the referenced object, and will retry if unsuccessful. Optionally, the user may determine who has claims on the object via the -DIS DATABASE command with CLAIMERS option, and cancel or end those threads.

DSNU1123I LOGICAL PARTITIONS WILL BE LOADED IN PARALLEL, NUMBER OF TASKS = *nnnn*

Explanation: This message is issued by the BUILD2 phase of the REORG utility. The message indicates that the REORG utility is able to update logical partitions in parallel. The number of utility tasks used to update logical partitions is indicated by :mv.nnnn:emv..*:p. This message is issued by the following CSECT(s): .*DSNURBD2

Severity: 0

System Action: Processing of the BUILD2 phase continues.

Programmer Response: You can verify that the number of tasks reported is consistent with expectations. For example, if 4 logical partitions are to

be updated, the user might expect to see number of tasks = 4.

DSNU1124I *csect-name* - UNIQUE INDEX KEY DUPLICATES KEY OF INDEXED RECORD AT RID *rrrr* INDEX = *index-name* TABLE = *table-name* RECNO = *input-dataset-record-number* FOR PART = *m*

Explanation: The input data set record indicated for PART *m* of table *table-name* causes a unique index violation for index *index-name*. It duplicates the key value of a record already in the table at RID *rrrr*. The record was not loaded.

Severity: 4 (warning)

System Action: Processing continues.

DSNU1125I *csect-name* FOREIGN KEY HAS NO PRIMARY KEY FOR RELATIONSHIP=*r1* INPUT RECORD NUMBER=*nnnn*,FOR PART *m*

Explanation: Input record *nnnn* for partition *m* for table *table* has no primary key for the relationship with the name *r1*. The row is not loaded.

Severity: 4 (warning)

System Action: Processing continues.

User Response: None required.

DSNU1126I *csect-name* PARTITION *n* IS SPECIFIED IN MORE THAN ONE INTO TABLE PART CLAUSE, PARTITION PARALLELISM IS DISALLOWED

Explanation: LOAD partition parallelism was requested via INDDN or INCURSOR following INTO TABLE PART clauses. However, the same partition was specified on more than one INTO TABLE PART clause. Partition parallelism is not supported for this case.

Severity: 8 (error)

System Action: Utility operation is terminated with return code 8.

User Response: Correct the LOAD statement in one of the following ways:

- Specify a different partition number on each INTO TABLE PART clause
- Remove the parallelism by removing the INDDN or INCURSOR keywords from the INTO TABLE PART clauses.

DSNU1128I *csect-name* FEWER PAGES THAN PARTS FOR REBALANCE

Explanation: In attempting to rebalance partitions during REORG, it is estimated that there are fewer total pages than the number of partitions being rebalanced.

Severity: 8 (error)

System Action: Remove the REBALANCE keyword from the REORG until there is sufficient data to populate pages for every partition.

DSNU1129I *csect-name* - PARTITION RANGE NOT CONTIGUOUS - REBALANCE IGNORED

Explanation: The partition range that was specified on a REORG REBALANCE does not represent a set of contiguous logical partitions. Due to a series of ALTER TABLE ADD PART and ALTER TABLE ROTATE PART statements, the physical partition numbers do not match the logical partition numbers.

The physical partition numbers that were specified as the REORG partition range do not represent a contiguous set of logical partitions. For example, physical partitions 1 and 2 might represent logical partitions 2 and 4.

Severity: 8 (error)

System Action: The REORG terminates with return code 8.

User Response: Use the DISPLAY DATABASE command to identify a range of physical partition numbers that represent a contiguous set of logical partitions, and resubmit the REORG REBALANCE while specifying that physical partition range. Alternatively, omit the partition range on the REORG REBALANCE so that the entire table space is reorganized.

DSNU1130I *csect-name* - NOT ALL PARTITIONS POPULATED BY REBALANCE - PROCESSING TERMINATES

Explanation: The table space that is being reorganized has many rows with duplicate partitioning key values, and there were insufficient unique values to allow distributing rows across all partitions during a rebalance.

Severity: 8 (error)

System Action: The utility is terminated with return code 8. For REORG SHRLEVEL NONE, the table space is left in the recover pending restricted state.

User Response: If the REORG was REORG SHRLEVEL NONE, recover the table space to the point in time before the REORG.

DSNU1141I *csect-name* INVALID DELIMITER CHARACTER *x*

Explanation: The delimiter character *x*, which was specified as the operand of a COLDEL, CHARDEL, or DECPT keyword, is not a valid delimiter.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Review the rules for valid delimiters as stated in the *DB2 Utility Guide and Reference*. Correct the keyword and resubmit the job.

DSNU1142I *csect-name* RECORD *n* DELIMITER MISMATCH FOR COLUMN *colname*

Explanation: A column or character delimiter character that marks the end of input for column *colname* was not found before the end of the record.

Severity: 8 (error)

System Action: Processing terminates. An abend is requested so that the LOAD can be restarted after the error is corrected.

User Response: Find the failing record in the input data set, correct the condition that caused the error, and restart the LOAD utility.

DSNU1143I *csect-name* RECORD *n* WILL BE DISCARDED DUE TO DELIMITER MISMATCH FOR COLUMN *colname*

Explanation: A column or character delimiter character that marks the end of input for column *colname* was not found before the end of the record. The record is not loaded, and is discarded during the DISCARD phase.

Severity: 4 (warning)

System Action: The LOAD utility continues to process records in the input data set.

User Response: After the LOAD utility completes, examine the records in the discard data set. Correct the errors in the discarded input data, and submit a LOAD RESUME YES job with the DISCARD data set as the input.

DSNU1145I *csect-name* FORMAT DELIMITED REQUIRES ONE INTO TABLE

Explanation: LOAD FORMAT DELIMITED supports loading only a single table. LOAD FORMAT DELIMITED was specified in a LOAD statement with more than one INTO TABLE clause.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Correct the LOAD statement and resubmit the utility.

DSNU1178I *csect-name* - **SUM OF INPUT COLUMN LENGTHS FOR CURSOR** *cursor-name* **IS TOO LARGE**

Explanation: The size of the record that would be loaded for cursor *cursor-name* is greater than 32767 bytes.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Decrease the number of columns or the lengths of individual columns so the sum of the lengths of the columns (including 2 bytes for each nullable column) does not exceed 32767.

DSNU1201I *csect-name* - **PARTITIONS WILL BE UNLOADED IN PARALLEL, NUMBER OF TASKS =** *nnnn*

Explanation: The message indicates that the UNLOAD utility is able to unload partitions in parallel. The number of utility tasks used to unload partitions is indicated by *nnnn*.

Severity: 0 (informational)

System Action: Processing of the UNLOAD phase will continue.

DSNU1202I *csect-name* - **SAMPLING LIMIT HAS BEEN REACHED FOR TABLE** *table-name*

Explanation: In the UNLOAD statement, the LIMIT option is specified for table *table-name* and the number of unloaded rows from the table has reached the specified LIMIT value.

Severity: 0 (informational)

System Action: No more rows will be unloaded from the table, but the unloading operation will continue for the previously unloaded tables if they exist.

DSNU1203I *csect-name* - **GENERATION OF LOAD STATEMENT IS BYPASSED FOR TABLE** *table-name*

Explanation: The PUNCHDDN specification is omitted in a UNLOAD statement when partition parallelism is activated. The LOAD statement will not be generated for the indicated table.

Severity: 0 (informational)

System Action: The UNLOAD job will continue.

DSNU1211I *csect-name* - **INPUT DATA SET IS NOT AN IMAGE COPY**

Explanation: The input data set specified by the FROMCOPY or FROMCOPYDDN option of the UNLOAD utility was not identified as an image copy data set.

Severity: 8 (error)

System Action: The utility job terminates.

User Response: Specify the correct image copy data set name to the FROMCOPY option, or to the DD-name that is referred to by the FROMCOPYDDN option.

DSNU1212I *csect-name* - **INVALID FIELD NAME** *field-name* **FOR TABLE** *table-name*

Explanation: The specified field name in the field specification list of the UNLOAD utility is:

- Not a column name of the specified table, or
- An existing column name for the CONSTANT option.

The field name is not valid.

Severity: 8 (error)

System Action: The utility job terminates.

User Response: For a CONSTANT field, specify a non-existing field name. Otherwise, specify the field name as a column name of the indicated table.

DSNU1213I *csect-name* - **INVALID FIELD TYPE FOR FIELD** *field-name* **FOR TABLE** *table-name*

Explanation: The specified field type in the field specification list of the UNLOAD utility is incompatible with the base type of the corresponding column of the table.

Severity: 8 (error)

System Action: The utility job terminates.

User Response: Specify only a compatible type allowed for the unload operation in the field specification list.

DSNU1214I *csect-name* - **INVALID FIELD POSITION SPECIFICATION FOR FIELD** *field-name*, **TABLE** *table-name*

Explanation: For a UNLOAD statement, specified field positions are not in ascending order in the field specification list of the indicated table.

Severity: 8 (error)

System Action: The utility job terminates.

User Response: Specify the field positions in the ascending order in the field specification list. If a certain order of the output fields is desired, change the order of

the field in the list so that the field positions are in the ascending order.

DSNU1217I *csect-name* - **CONFLICTING FIELD POSITION AND/OR LENGTH SPECIFICATION FOR FIELD *field-name*, TABLE *table-name***

Explanation: For a UNLOAD statement, the specified field position for the indicated field caused a conflict with the previous field. This is caused either by

- The position value specified for the field is too small.
- The length specification for the previous field is too large.

Severity: 8 (error)

System Action: The utility job terminates.

User Response: Specify the correct position or length parameters in the field specification list so that there are enough space for the output fields.

DSNU1218I *csect-name* - **LOGICAL RECORD LENGTH OF OUTPUT RECORD EXCEEDED THE LIMIT FOR TABLE *table-name***

Explanation: The maximum length of the output records exceeded the physical limit for the UNLOAD utility.

Severity: 8 (error)

System Action: The utility job terminates.

Problem Determination: This problem will most likely occur when BLOB, CLOB, or DBCLOB columns are selected from a table to be unloaded.

User Response: Consider one or more of the following options that can reduce the length of the output record, if possible:

- Use the NOPAD option.
- Unload only the necessary fields using the field specification options.
- Specify the LENGTH option with TRUNCATE and/or STRIP options for the applicable fields.

If the above options can not be applied, you will have to use an application to unload the data from the table.

DSNU1219I *csect-name* - **THE NUMBER OF RECORDS IN ERROR REACHED THE LIMIT *nnnn***

Explanation: For the UNLOAD utility, the number of records in error reached the specified MAXERR limit.

Severity: 8 (error)

System Action: The utility job terminates.

Problem Determination: This problem will occur when

the number of errors in the output record formatting, including data conversion errors, detected by the UNLOAD utility reached the limit specified by the MAXERR option. For each record in error, the corresponding message has been issued. The records in error will not be unloaded to the output data set. This message is issued only once, even though there can be a situation in which the number of individual error messages exceeds the specified MAXERR value. This situation occurs only when the UNLOAD utility is running in the partition parallel mode and the multiple tasks have reached the MAXERR value concurrently.

User Response: Investigate the individual error message and determine the cause of the errors. The corrective action will differ by the type of the error. In certain situations, this condition may be anticipated. In this case, the total number of records unloaded before the job terminates can be adjusted by changing the MAXERR option value.

DSNU1220I *csect-name* - **UNLOADING LOB COLUMNS FROM IMAGE COPY IS NOT SUPPORTED FOR TABLE *table-name***

Explanation: For the UNLOAD utility, one or more BLOB, CLOB, and/or DBCLOB columns are selected on the indicated table when the source object is an image copy data set.

Severity: 8 (error)

System Action: The utility job terminates.

Problem Determination: When the source object of the UNLOAD utility is an image copy, selection of a LOB column is not supported.

User Response: Specify a field selection list that does not include any BLOB, CLOB, or DBCLOB column from the indicated table.

DSNU1221I *csect-name* - **UNLDDN IS NOT SPECIFIED OR SPECIFIED TEMPLATE *template-name* IS INVALID FOR MULTIPLE TABLE SPACES**

Explanation: For the UNLOAD utility, the output data set specification is invalid when the source objects consist of multiple table spaces.

Severity: 8 (error)

System Action: The utility job terminates.

Problem Determination: When the source objects of the UNLOAD utility consist of multiple table spaces, an output data set corresponding to each table space is required.

User Response: Include an appropriate TEMPLATE statement in the unload job step that contains the table space name as a variable. If the table space is selected from different databases, the database name must also

be included as a variable. Specify the template name to the UNLDDN option.

DSNU1222I *csect-name* - **TEMPLATE** *template-name*
**SPECIFIED FOR PUNCHDDN IS
INVALID FOR MULTIPLE TABLE
SPACES**

Explanation: For the UNLOAD utility, the specification of output data set to store the generated LOAD statement is invalid when the source objects consist of multiple table spaces.

Severity: 8 (error)

System Action: The utility job terminates.

Problem Determination: When the source objects of the UNLOAD utility consist of multiple table spaces, an output data set corresponding to each table space is required.

User Response: Include an appropriate TEMPLATE statement in the unload job step that contains the table space name as a variable. If the table space is selected from different databases, the database name must also be included as a variable. Specify the template name to the PUNCHDDN option. The TEMPLATE should be different from the one used for UNLDDN.

DSNU1223I *csect-name* - **TABLESPACE
SPECIFICATION IS MISSING FOR
FROMCOPY OR FROMCOPYDDN**

Explanation: For the UNLOAD utility, the FROMCOPY or FROMCOPYDDN option is used but the TEMPLATE specification is missing.

Severity: 8 (error)

System Action: The utility job terminates.

Problem Determination: When the source objects of the UNLOAD utility is an image copy, the TABLESPACE option is required to specify the table space name of the image copy.

User Response: Add the TABLESPACE option in the UNLOAD statement to specify the table space name of the image copy.

DSNU1224I *csect-name* - **TABLE** *table-name* **IS NOT
IN THE TABLE SPACE** *table-space-name*

Explanation: The indicated *table-name* given in a FROM TABLE option is not in the table space specified by the TABLESPACE option.

Severity: 8 (error)

System Action: The utility job terminates.

Problem Determination: There is an unmatched between the TABLESPACE and FROM TABLE specifications or the specified table was dropped.

Dropped tables are not supported by the UNLOAD utility.

User Response: Correct either the TABLESPACE or the FROM TABLE specification to select a table in the specified table space. If the table was dropped, remove the FROM TABLE option for the dropped table.

DSNU1225I *csect-name* - **TABLESPACE KEYWORD
IS NOT SPECIFIED. AT LEAST ONE
FROM TABLE SPECIFICATION IS
REQUIRED.**

Explanation: There is no TABLESPACE nor FROM TABLE specification in a UNLOAD statement. The source object for unloading can not be identified.

Severity: 8 (error)

System Action: The utility job terminates.

User Response: If the TABLESPACE specification is omitted, specify at least one FROM TABLE option to identify the source object. Instead of a TABLESPACE specification, the LIST option can be used, if a LISTDEF statement defines a list of objects. When the LIST option is used, the FROM TABLE option can not be specified.

DSNU1226I *csect-name* - **THE NUMBER OF
OBJECTS IS TOO LARGE**

Explanation: The number of source objects for the UNLOAD utility is too large. Overflow in some of the internal data structures occurred.

Severity: 8 (error)

Problem Determination: This problem will most likely occur when the LIST option is used and the corresponding LISTDEF definition is expanded to a large number of objects.

System Action: The utility job terminates.

User Response: Divide the UNLOAD job step into two or more job steps and, in each job step, use a LISTDEF that expands to less number of objects.

DSNU1227I *csect-name* - **THE CONTENT OF THE
IMAGE COPY DATA SET IS
INCONSISTENT WITH TABLE SPACE**
table-space

Explanation: For the UNLOAD utility, the data set specified by the FROMCOPY or the FROMCOPYDDN option is not corresponding to the table space.

Severity: 8 (error)

System Action: The utility job terminates.

User Response: Specify a correct image copy data set name for the table space, or specify the correct table space name for the image copy.

DSNU1228I *csect-name* - A ROWID COLUMN *column-name*, TABLE *table-name* IS SELECTED FOR UNLOAD BUT THE PAGE SET HEADER PAGE IS MISSING IN THE SPECIFIED IMAGE COPY DATA SET

Explanation: For the UNLOAD utility, a ROWID column is selected for unloading from an image copy, but the required information to form the ROWID can not be retrieved because the page set header page is not included in the specified image copy data set.

Severity: 8 (error)

System Action: The utility job terminates.

Problem Determination: The problem will most likely occur when a piece of copy data set, not the first one, is specified to the FROMCOPY option.

User Response: Use the FROMCOPYDDN, instead of FROMCOPY, to specify a DD name where the first piece of copy that contain the page set header page is concatenated to the source image copy data set.

DSNU1229I *csect-name* - ERROR IN LOADING DICTIONARY FOR TABLE SPACE *table-space*

Explanation: For the UNLOAD utility, an error was detected in loading the dictionary for decompression while reading an image copy data set.

Severity: 8 (error)

System Action: The utility job terminates.

Problem Determination: Possibly the image copy data set is corrupted.

User Response: If the right image copy data set is specified to the FROMCOPY or FROMCOPYDDN, it will be required to take a new image copy for the table space by running the COPY utility or using other alternative methods.

DSNU1230I *csect-name* - INCONSISTENT STRIP CHAR LENGTH FOR FIELD *field-name*, TABLE *table-name*

Explanation: An invalid strip character was specified for the indicated field of the table.

Severity: 8 (error)

System Action: The utility job terminates.

Problem Determination: For an SBCS or MIXED character field, the strip character, if specified, must be an SBCS character; for a DBCS field, it must be a DBCS character.

User Response: Specify the correct strip character applicable to the field.

DSNU1231I *csect-name* - LENGTH OF OUTPUT RECORD IS TOO LONG FOR TABLE *table-name*

Explanation: An output record for the indicated table exceeded the physical limit.

Severity: 4 (warning)

System Action: The record in error will not be unloaded to the output data set. The UNLOAD utility continues until the total number of records in error reaches the value specified by the MAXERR option (the default is 1).

If the total number of records reaches the MAXERR value, the UNLOAD utility issues the DSNU1219I message and terminates with the return code 8.

Problem Determination: This message is issued only when the NOPAD option is specified in the UNLOAD statement and most likely when BLOB, CLOB, or DBCLOB columns are selected for unload from the table. It is also possible that, if the expansion of output strings occurs due to the encoding scheme specified for the output, the total length of some output records becomes longer than expected.

User Response: Consider the following options to reduce the size of the output records:

- Unload only the necessary fields using the field specification options.
- Specify the LENGTH option with TRUNCATE and/or STRIP options for the applicable fields.

If the above options can not be applied, you will have to use an application to unload the data from the table.

DSNU1232I *csect-name* - COMPRESSED ROW IS IGNORED BECAUSE THE DICTIONARY IS NOT AVAILABLE FOR TABLE *table-name*

Explanation: The UNLOAD utility encountered a compressed row when unloading the data from an image copy data set but the dictionary for decompression has not been loaded for the table space.

Severity: 4 (warning)

System Action: The record in error will not be unloaded to the output data set. The UNLOAD utility continues until the total number of records in error reaches the value specified by the MAXERR option (the default is 1). If the total number of records reaches the MAXERR value, the UNLOAD utility issues the DSNU1219I message and terminates with the return code 8.

Problem Determination: This message is issued when a copy of pieces (not the first piece) of a compressed table space is specified in the FROMCOPY or FROMCOPYDDN option of the UNLOAD utility.

DSNU1233I • DSNU1236I

User Response: To unload compressed rows from the copy of pieces, use COPYDDN option to specify a DD name under which the first copy of pieces that contains the compression dictionary is concatenated.

DSNU1233I *csect-name* - **DATA IS TOO LONG FOR FIELD** *field-name*, **TABLE** *table-name*

Explanation: The space for the field in an output record is not enough to unload the data from the corresponding column of a row in the indicated table.

Severity: 4 (warning)

System Action: The record in error will not be unloaded to the output data set. The UNLOAD utility continues until the total number of records in error reaches the value specified by the MAXERR option (the default is 1).

If the total number of records reaches the MAXERR value, the UNLOAD utility issues the DSNU1219I message and terminates with the return code 8.

Problem Determination: This message is issued when the space of a field in an output record is limited by the LENGTH specification for the field or the POSITION specification for the next field.

User Response: Apply appropriate values to the LENGTH and/or POSITION parameters in the field specification list to accommodate the data in the output records. Alternatively, specify TRUNCATE option to the field, if applicable. Specifying the STRIP option, if applicable, can also reduce the length of data if the data contains leading or trailing blanks.

DSNU1234I *csect-name* - **NUMERIC CONVERSION ERROR OCCURRED FOR FIELD** *field-name*, **TABLE** *table-name*

Explanation: The UNLOAD utility encountered an error when it tried to convert a data of one numeric type to another.

Severity: 4 (warning)

System Action: The record in error will not be unloaded to the output data set. The UNLOAD utility continues until the total number of records in error reaches the value specified by the MAXERR option (the default is 1).

If the total number of records reaches the MAXERR value, the UNLOAD utility issues the DSNU1219I message and terminates with the return code 8.

Problem Determination: This message is issued most likely when an overflow occurs in converting a data of one numeric type to another. For example, an attempt to convert an INTEGER 32768 to a SMALL INT causes an overflow.

User Response: To eliminate any numeric overflow error, specify the same numeric data type for the output

as the base type of the columns in the table. Convert numeric types only when it is known that the range of the source data fits in the allowable range of the specified numeric type for the output.

DSNU1235I *csect-name* - **CCSID SUBSTITUTION IS ATTEMPTED WITH NOSUBS OPTION FOR FIELD** *field-name*, **TABLE** *table-name*

Explanation: While the UNLOAD utility is running with the NOSUBS option, a CCSID substitution is attempted in the CCSID translation process for the indicated field.

Severity: 4 (warning)

System Action: The record in error will not be unloaded to the output data set. The UNLOAD utility continues until the total number of records in error reaches the value specified by the MAXERR option (the default is 1). If the total number of records reaches the MAXERR value, the UNLOAD utility issues the DSNU1219I message and terminates with the return code 8.

User Response: If it is desired to eliminate any CCSID substitution, specify an appropriate CCSID that has the corresponding entries to the original CCSID, if available. To allow the default CCSID substitution, remove the NOSUBS option.

DSNU1236I *csect-name* - **POSITION SPECIFICATION CAUSES FIELD OVERLAP FOR FIELD** *field-name*, **TABLE** *table-name*

Explanation: For the UNLOAD utility, the space for an output field was overlapped by the indicated field to which the POSITION parameter is specified.

Severity: 4 (warning)

System Action: The record in error will not be unloaded to the output data set. The UNLOAD utility continues until the total number of records in error reaches the value specified by the MAXERR option (the default is 1). If the total number of records reaches the MAXERR value, the UNLOAD utility issues the DSNU1219I message and terminates with the return code 8.

Problem Determination: This message will be issued only when the NOPAD option is specified in the UNLOAD statement. The POSITION specification for the field caused a conflict with the positioning and/or the length of a previous field.

User Response: Consider the following options to eliminate this situation:

- Remove the POSITION specifications from the field specification list.
- Adjust the POSITION parameter for the field to preserve enough space for the previous fields.

- Adjust the LENGTH, possibly with the TRUNCATE option, of the previous fields, if applicable.

DSNU1237I *csect-name* - ERROR IN CCSID
CONVERSION FOR FIELD *field-name*,
TABLE *table-name*

Explanation: The CCSID translation process detected a code point or form exception while the UNLOAD utility was running.

Severity: 4 (warning)

System Action: The record in error will not be unloaded to the output data set. The UNLOAD utility continues until the total number of records in error reaches the value specified by the MAXERR option (the default is 1). If the total number of records reaches the MAXERR value, the UNLOAD utility issues the DSNU1219I message and terminates with the return code 8.

User Response: If the specified CCSID for output is incorrect, correct the CCSID specification. If a valid CCSID is specified, notify the system programmer.

System Programmer Response: Verify the contents of SYSSTRINGS. If necessary, insert a row into SYSSTRINGS for the translation. For an SBCS translation, the row must contain a translate table or the name of a user-provided translate procedure. For a DBCS translation, the row must contain the name of a user-provided translate procedure.

DSNU1238I TABLE *table2* IS NOT IN SAME
TABLESPACE AS TABLE *table1*

Explanation: All source tables for a single UNLOAD utility statement must be in the same table space.

Severity: 8 (error)

System Action: Utility processing terminates.

User Response: Remove the FROM TABLE control statement that specifies *table2* from the current UNLOAD request. Create another UNLOAD utility statement that contains the FROM TABLE control statement for *table2* so that all source tables in a single UNLOAD request are from the same table space. Resubmit the job.

DSNU1250I *csect-name* - ERROR IN CCSID
CONVERSION FOR *object-type*.
SOURCE CCSID=*ccsid*, TARGET
CCSID=*ccsid*

Explanation: The CCSID translation process failed for *object-type*. The values of *object-type* and the cause of the error for each type are:

- SBCS PAD CHAR
- DBCS PAD CHAR
- VERIFICATION

- HEADER CONST
- *field-name*

Severity: 8 (error)

System Action: The utility terminates.

User Response: If the CCSID that is specified in the utility control statement is incorrect, correct the CCSID specification. If a valid CCSID is specified, notify the system programmer.

System Programmer Response: Check the SYSSTRINGS catalog table to determine whether a row exists for the CCSID conversion. If a row does not exist, and OS/390 V2R9 is installed, refer to *z/OS C/C++ Programming Guide* for additional conversions that are supported. If no conversions are available, contact your IBM service representative to request support for the conversion.

DSNU1251I *csect-name* - ERROR IN CCSID
CONVERSION FOR *object-type* IN FIELD
field-name OF TABLE *table-name*.
SOURCE CCSID=*ccsid*, TARGET
CCSID=*ccsid*

Explanation: The CCSID translation process failed for *object-type*. The values of *object-type* and the cause of the error for each type are:

- STRIP CHAR

Severity: 8 (error)

System Action: The utility terminates.

System Programmer Response: Check the SYSSTRINGS catalog table to determine whether a row exists for the CCSID conversion. If a row does not exist, and OS/390 V2R9 is installed, refer to *z/OS C/C++ Programming Guide* for additional conversions that are supported. If no conversions are available, contact your IBM service representative to request support for the conversion.

User Response: If the CCSID that is specified in the utility control statement is incorrect, correct the CCSID specification. If a valid CCSID is specified, notify the system programmer.

DSNU1252I THE PARTITION VARIABLE IN THE
TEMPLATE DSN WAS SPECIFIED BUT
PARTITION PARALLELISM IS NOT
ACTIVATED

Explanation: A utility control statement for the UNLOAD utility contains a template name in the UNLDDN option. The template contains a variable that represents a partition number. However, the source object is either a non-partitioned table space or an image copy that does not support partition parallelism.

Severity: 4 (warning)

System Action: UNLOAD processing continues. For

the indicated table space, a single output data set is allocated, and the unloaded data is placed in that data set.

DSNU1254I *csect-name* **FORMAT DELIMITED
REQUIRES ONE AND ONLY ONE FROM
TABLE**

Explanation: UNLOAD FORMAT DELIMITED supports unloading only from a single table. FORMAT DELIMITED was specified either with:

- Multiple FROM TABLE specifications, or
- No FROM TABLE specifications, with a table space that contains more than one table.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Correct the UNLOAD statement and resubmit the utility.

DSNU1300I *csect-name* **MODIFY STATISTICS
COMPLETED SUCCESSFULLY**

Explanation: This message reports the successful completion of the MODIFY STATISTICS utility operation.

Severity: 0 (informational)

DSNU1301I *csect-name n*
**SYSIBM.SYSCOLDIST_HIST ROWS
WERE DELETED**

Explanation: This message displays the number *n* of SYSIBM.SYSCOLDIST_HIST rows that were deleted by the MODIFY STATISTICS utility.

Severity: 0 (informational)

DSNU1302I *csect-name n*
**SYSIBM.SYSCOLUMNS_HIST ROWS
WERE DELETED**

Explanation: This message displays the number *n* of SYSIBM.SYSCOLUMNS_HIST rows that were deleted by the MODIFY STATISTICS utility. The rows were deleted based on the AGE criteria or the DATE criteria that the user specified.

Severity: 0 (informational)

DSNU1303I *csect-name n*
**SYSIBM.SYSINDEXES_HIST ROWS
WERE DELETED**

Explanation: This message displays the number *n* of SYSIBMS.SYSINDEXES rows that were deleted by the MODIFY STATISTICS utility. The rows were deleted based on the AGE criteria or the DATE criteria that the user specified.

Severity: 0 (informational)

DSNU1304I *csect-name n*
**SYSIBM.SYSINDEXPART_HIST ROWS
WERE DELETED**

Explanation: This message displays the number *n* of SYSIBM.SYSINDEXPART_HIST rows that were deleted by the MODIFY STATISTICS utility. The rows were deleted due to the AGE criteria or the DATE criteria that the user specified.

Severity: 0 (informational)

DSNU1305I *csect-name n*
**SYSIBM.SYSINDEXSTATS_HIST ROWS
WERE DELETED**

Explanation: This message displays the number *n* of SYSIBM.SYSINDEXSTATS_HIST rows that were deleted by the MODIFY STATISTICS utility. The rows were deleted due to the AGE criteria or the DATE criteria that the user specified.

Severity: 0 (informational)

DSNU1306I *csect-name n*
**SYSIBM.SYSLOBSTATS_HIST ROWS
WERE DELETED**

Explanation: This message displays the number *n* of SYSIBM.SYSLOBSTATS_HIST rows that were deleted by the MODIFY STATISTICS utility. The rows were deleted due to the AGE criteria or the DATE criteria that the user specified.

Severity: 0 (informational)

DSNU1307I *csect-name n*
**SYSIBM.SYSTABLEPARTS_HIST ROWS
WERE DELETED**

Explanation: This message displays the number *n* of SYSIBM.SYSTABLEPARTS_HIST rows that were deleted by the MODIFY STATISTICS utility. The rows were deleted due to the AGE criteria or the DATE criteria that the user specified.

Severity: 0 (informational)

DSNU1308I *csect-name n*
**SYSIBM.SYSTABLES_HIST ROWS
WERE DELETED**

Explanation: This message displays the number of SYSIBM.SYSTABLES_HIST rows that were deleted by the MODIFY STATISTICS utility. The rows were deleted due to the AGE criteria or the DATE criteria that the user specified.

Severity: 0 (informational)

DSNU1309I *csect-name n*
**SYSIBM.SYSTABSTATS_HIST ROWS
WERE DELETED**

Explanation: This message displays the number *n* of SYSIBM.SYSTABSTATS_HIST rows that were deleted by the MODIFY STATISTICS utility. The rows were deleted due to the AGE criteria or the DATE criteria that the user specified.

Severity: 0 (informational)

DSNU1310I *obj-type
dbname.tsname DSNUM dsnum*
**THE IMAGE COPY FOR
RESIDES ON A TAPE VOLUME BUT IS
NOT PREALLOCATED VIA JCL AND
TAPEUNITS IS 0**

Explanation: The specification of TAPEUNITS=0 restricts the utility from using tape units that are not preallocated via JCL.

Severity: 8 (error)

System Action: Processing stops for this object.

User Response: Either change the value on the TAPEUNITS keyword and resubmit the job, or preallocate the image copy and resubmit the job.

DSNU1400I *csect-name - COPYTOCOPY UTILITY
NOT SUPPORTED FOR obj-type
obj-qual.obj-name DSNUM n*

Explanation: COPYTOCOPY cannot make copies of:

- DSNDB01.SYSUTILX, DSNDB01.DBD01, or DSNDB06.SYSCOPY table spaces, or any of their indexes.
- An image copy that was taken using the COPY utility with the CONCURRENT option.

Severity: 8 (error)

System Action: Processing halts for this object. If the utility job step includes an OPTIONS control statement with the EVENT(ITEMERROR,SKIP) option, COPYTOCOPY processes the next item in the list.

User Response: If the unsupported object is a restricted catalog or directory object listed in the explanation, use another method to make all image copies for this object.

If the unsupported object is an image copy made with the CONCURRENT option, then make a primary local image copy by running the COPY utility without the CONCURRENT option. Rerun COPYTOCOPY to make additional image copies.

DSNU1401I *csect-name - UNABLE TO LOCATE
IMAGE COPY FOR obj-type
obj-qual.obj-name DSNUM n*

Explanation: One of the following conditions prompted this error code:

- The COPYTOCOPY utility attempted to make additional image copies from the referenced object. However, SYSIBM.SYSCOPY does not contain a record of the referenced object.
- UNLOAD utility could not find a record in SYSIBM.SYSCOPY for the image copy dataset that was requested.

Severity: 8 (error)

System Action: Processing halts for this object.

User Response: Make a primary local image copy by running the COPY utility, then run COPYTOCOPY to make additional image copies.

DSNU1402I *csect-name - copy-type FOR obj-type
obj-qual.obj-name DSNUM n WITH
START_RBA rba ALREADY EXISTS*

Explanation: COPYTOCOPY attempted to make an image copy that already exists.

Severity: 8 (error)

System Action: The utility does not make the image copy for the specified object type. COPYTOCOPY makes the remaining types of image copies. If there is a list of objects to be copied, COPYTOCOPY processes the next object in the list.

User Response: Run the REPORT utility to determine the image copy types that you need. Modify your COPYTOCOPY job, and rerun it as needed.

DSNU1403I *csect-name - copy-type DATA SET ds
WITH START_RBA rba IS IN USE BY
COPYTOCOPY FOR obj-type
obj-qual.obj-name DSNUM n*

Explanation: The COPYTOCOPY utility issues this message before it opens an image copy data set and begins the copying process.

Severity: 0 (informational)

System Action: COPYTOCOPY processing continues.

DSNU1404I *csect-name - COPYTOCOPY
PROCESSING COMPLETED FOR
obj-type obj-qual.obj-name DSNUM n
ELAPSED TIME = elapsed time
NUMBER OF PAGES COPIED = n*

Explanation: COPYTOCOPY issues this message at the normal completion of an object. The time that elapsed since the beginning of processing the object to

its completion was *hh* hours, *mm* minutes, and *ss* seconds.

Severity: 0 (informational)

System Action: The COPYTOCOPY utility completed normally for this object. Processing continues.

DSNU1405I *csect-name - site-type* **SITE PRIMARY
IMAGE COPY DOES NOT EXIST FOR
obj-type obj-qual.obj-name** **DSNUM** *n*

Explanation: The COPYTOCOPY utility attempted to make a backup image copy for the site, but the primary image copy does not exist.

Severity: 8 (error)

System Action: The utility cannot make the site backup copy. If the utility job includes an OPTIONS control statement with the EVENT(ITEMERROR,SKIP) option, COPYTOCOPY processes the next item on the list.

User Response: Modify your COPYTOCOPY job, COPYDDN or RECOVERYDDN option, to include the ddname for the primary copy.

DSNU1406I *csect-name - COPYTOCOPY*
**COMPLETED. ELAPSED TIME =
elapsed_time**

Explanation: DB2 issues this message at the normal completion of the COPYTOCOPY utility. The time that elapsed since the beginning of the COPYTOCOPY utility to its completion was *hh* hours, *mm* minutes, and *ss* seconds.

Severity: 0 (informational)

System Action: Processing continues to the next utility statement in the utility job step, if any. If not, the utility job step halts, and the UTILID of the utility job step becomes available for reuse.

DSNU1407I *csect-name - MISMATCH BETWEEN
THE NUMBER OF PAGES READ=count
AND THE NUMBER OF PAGES
ORIGINALLY COPIED=count FOR
INPUT DATA SET dsname* **OBJECT
NAME obj-type obj-qual.obj-name
DSNUM** *n*

Explanation: The COPYTOCOPY or RECOVER utility issues this message when it detects that the number of pages read from the input image copy does not match the original number of pages copied by the COPY utility. The utility retrieves the number of pages originally copied from the COPYPAGESF column of the SYSIBM.SYSCOPY record for the input image copy data set.

Severity: 8 (error)

System Action: The COPYTOCOPY utility terminates

processing of this object. The RECOVER utility attempts to continue by falling back to the previous full image copy, if any. If the utility job step includes an OPTIONS control statement with the EVENT(ITEMERROR,SKIP) option, COPYTOCOPY processes the next item in the list.

User Response: Report to IBM Center. Provide output of COPYTOCOPY job, the data set referenced in the message, and run REPORT utility on the object and provide its output.

DSNU1408I *csect-name - SOURCE DATA SET
dsname* **DOES NOT** *obj-type
obj-qual.obj-name* **DSNUM** *n*

Explanation: The COPYTOCOPY or RECOVER utility issues this message when the DBID or PSID of the source data set does not match the DBID or PSID of the table space or index space for which the copy is made. This error can occur if the data set was reused.

Severity: 4 (warning)

System Action: RECOVER attempts to continue processing by falling back to the previous full image copy, if any.

COPYTOCOPY searches for the next available image copy data set with the same START_RBA value as the START_RBA value registered in SYSIBM.SYSCOPY for dsname. If COPYTOCOPY finds a data set, it uses that data set. Otherwise, COPYTOCOPY issues message DSNU1401I.

If FROMCOPY is specified, processing of this object halts.

User Response: Determine why the data set was reused for the image copy data set that is registered in SYSIBM.SYSCOPY.

If FROMCOPY is specified, correct the COPYTOCOPY utility control statement. Specify a source data set that is an image copy of the table space or index space for which you want additional image copies.

DSNU1409I *csect-name - tttt* **ERRORS ON DATA
SET NAME=dsname** *obj-type
obj-qual.obj-name* **DSNUM** *n*

Explanation: DB2 detected I/O errors on the named object. *tttt* is either 'READ' or 'WRITE'.

Severity: 4 (warning)

System Action: If FROMCOPY is specified, processing is terminated. Otherwise, processing will continue. The utility will attempt to use the next available image copy data set that matches COPYTOCOPY job specification with the same START_RBA as the data set named in error. If it fails to find one, processing of this object is terminated.

User Response: There may be an IOS message on

the MVS console SYSLOG indicating the type of I/O error that occurred. If an IOS message was issued, follow the Problem Determination directions for the message.

DSNU1410I *csect-name* - **INCREMENTAL IMAGE COPY DISALLOWED FOR** *obj-type*
obj-qual.obj-name **DSNUM** *n*. **FULL IMAGE COPY WILL BE USED**

Explanation: An incremental image copy is disallowed for the specified object type. The utility ignores the request, and creates a full image copy if available.

Severity: 4 (warning)

System Action: The system treats the request to copy an incremental image copy as a request to copy a full image copy.

User Response: The capacity of the target image copy data set may not be sufficient if its size was established assuming an incremental image copy. If this condition occurs, halt the utility and resubmit the job step with the appropriate size.

DSNU1411I *csect-name* - *ut_name* **DOES NOT SUPPORT RESTART(PHASE). PHASE CHANGED TO CURRENT.**

Explanation: This utility does not support the RESTART(PHASE).

Severity: 0 (informational)

System Action: The utility overrides RESTART(PHASE) with RESTART(CURRENT).

DSNU1450I *csect-name* **CHARACTER CONVERSION FROM CCSID** *from-ccsid* **TO CCSID** *to-ccsid* **FAILED WITH ERROR CODE** *error-code* **FOR TABLE** *dbid.obid* **COLUMN** *column-number*

Explanation: A conversion error occurred during the conversion of a string to a different coded character set. The error occurred during the processing of the utility statement.

from-ccsid

identifies the coded character set of the string to be converted.

to-ccsid

identifies the coded character set to which it must be converted.

error-code

indicates the type of error as defined as follows:

- 8** Length exception (for example, expansion required for PC MIXED data exceeds the maximum length of the string).

12 Invalid code point.

16 Form exception (for example, invalid MIXED data).

20 Translate procedure error (for example, an error during Unicode/390 stage 2 conversions or an exit set the length control field of the string to an invalid value).

24 the conversion services have not been setup correctly or the conversion is not supported.

dbid.obid

gives the database id and the table obid of the object with the conversion error. This could be either the target or the source of the conversion.

column-number

gives the column number of the failing object. This could be either the target or the source of the conversion.

System Action: The utility job is terminated.

User Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem. The user may generate a dump by adding the DIAGNOSE ABEND statement in the utility job and re-running the utility. If the error can be fixed, correct the error and resubmit the utility, else issue the TERM utility command to terminate the utility.

DSNU1502I *csect-name* - **RECOVER OF** *obj-type*
obj-qual.objname *dsnum n* **WILL PROCEED TO LOG POINT X'***rba/lrsn***'**

Explanation: DB2 issues this message if the RECOVER utility statement includes the TOLASTCOPY or TOLASTFULLCOPY keyword. The message provides information on the point in time that the object was recovered to. In a data sharing environment, the log point identified is an LRSN. Otherwise, the log point identified is an RBA.

Severity: 0 (informational)

System Action: The RECOVER utility statement continues processing.

DSNU1510I *csect-name* - **LOG APPLY PHASE COMPLETE, ELAPSED TIME:**
HH.MM.SS

Explanation: This message is issued at the normal completion of the LOG APPLY phase of the RECOVER utility. The time that has elapsed between the beginning and completion of this phase was:

hh hours

mm minutes

DSNU1511I • DSNU1606I

ss seconds

Severity: 0 (informational)

System Action: Processing continues.

DSNU1511I *csect-name* - FAST LOG APPLY WAS NOT USED FOR RECOVERY

Explanation: The RECOVER utility issues this message to notify the user that FAST LOG APPLY was not used. FAST LOG APPLY is not used for the following reasons:

- The ZPARM DSN6SYSP LOGAPSTG has 0 or insufficient storage specified.
- The storage that is used by currently active RECOVER jobs exceeds what was specified in the DSN6SYSP LOGAPSTG ZPARM.

Severity: 0 (informational)

System Action: The RECOVER utility continues processing.

DSNU1600I *csect-name* - BACKUP SYSTEM UTILITY FOR *object* STARTING, COPY POOL = *copy-pool-name*, TOKEN = *X'token'*

Explanation: Backup of the indicated object, either data or logs, to the indicated copy pool and with the indicated token is starting.

Severity: 0 (informational)

System Action: Backup of the indicated object has started.

System Programmer Response: None.

DSNU1601I *csect-name* - BACKUP SYSTEM UTILITY IS NOT RESTARTABLE. RESTART IGNORED. A NEW BACKUP WILL BE INITIATED

Explanation: The BACKUP SYSTEM utility cannot be restarted. The restart is ignored and a new backup is done.

Severity: 0 (informational)

System Action: The restart is ignored, and a new BACKUP SYSTEM request is initiated.

System Programmer Response: None.

DSNU1602I *csect-name* - BACKUP SYSTEM UTILITY COMPLETED, ELAPSED TIME = *hh:mm:ss*

Explanation: The BACKUP SYSTEM utility cannot be restarted. The restart is ignored, and a new backup is done.

Severity: 0 (informational)

System Action: None.

System Programmer Response: None.

DSNU1603I *csect-name* - RESTORE SYSTEM UTILITY RESTART FAILED BECAUSE THE MEMBER-ID,*member-id*, ON WHICH THE RESTART HAS BEEN ISSUED IS DIFFERENT FROM THE MEMBER-ID, *member-id*, ON WHICH THE RESTORE WAS ORIGINALLY DONE

Explanation: A group RESTORE in a data sharing environment is already in the log apply phase. The RESTORE was originally issued and owned by a member other than the one that issued the restart, which is not allowed.

Severity: 8 (error)

System Action: The restart fails.

System Programmer Response: Issue the restart job from the member that was indicated in the message.

DSNU1604I *csect-name* - RESTORE SYSTEM PHASE LOG APPLY STARTED AT LOG POINT = *log-point-value*

Explanation: The RESTORE SYSTEM utility has begun applying logs beginning at the log-point-value in order to arrive at the point in time indicated by the log point at which the logs were truncated via the SYSPITR parameter on the conditional restart command, CRESTART CREATE.

Severity: 0 (informational)

System Programmer Response: None.

DSNU1605I *csect-name* - BACKUP SYSTEM UTILITY FAILED BECAUSE DB2 IS NOT IN VERSION 8 NEW FUNCTION MODE OR LATER

Explanation: The BACKUP SYSTEM utility can be run only when DB2 is in VERSION 8 'new function mode' or later.

Severity: 8 (error)

System Action: The utility is terminated.

System Programmer Response: Complete the conversion of DB2 to 'new function mode' before attempting to run the BACKUP SYSTEM utility.

DSNU1606I *csect-name* - RESTORE SYSTEM UTILITY STARTING, COPY POOL = *copy-pool-name*, TOKEN = *X'token'*

Explanation: Restore of the indicated copy pool with the indicated token is starting.

Severity: 0 (informational)

System Action: None.

System Programmer Response: None.

DSNU1607I *csect-name* - RESTORE SYSTEM UTILITY REQUIRES INSTALL SYSADM AUTHORITY TO RUN. THE CALLER HAS INSUFFICIENT AUTHORITY

Explanation: The invoker of the RESTORE SYSTEM utility lacks the install SYSADM authority required to run the utility.

Severity: 8 (error)

System Action: The utility is terminated.

System Programmer Response: Ensure that the RESTORE SYSTEM utility is run by an administrator with install SYSADM authority.

DSNU1608I *csect-name - system-utility* SYSTEM UTILITY FAILED. REQUIRED DFSMSHSM SERVICES NOT AVAILABLE.

Explanation: The system that attempted to run the BACKUP SYSTEM or RESTORE SYSTEM utility does not have the version of z/OS that contains the version of DFSMSHSM that is required by those utilities.

Severity: 8 (error)

System Action: The utility is terminated.

System Programmer Response: Ensure that the required version of the z/OS operating system is installed on the system on which the BACKUP SYSTEM and RESTORE SYSTEM utilities are to be run.

DSNU1609I *csect-name* - BACKUP SYSTEM UTILITY REQUIRES SYSADM OR SYSCTRL AUTHORITY TO RUN. THE CALLER HAS INSUFFICIENT AUTHORITY

Explanation: The invoker of the BACKUP SYSTEM utility lacks the SYSADM or SYSCTRL authority required to run the utility.

Severity: 8 (error)

System Action: The utility is terminated.

System Programmer Response: Ensure that the BACKUP SYSTEM utility is run by an administrator with SYSADM or SYSCTRL authority.

DSNU1610I *csect-name* - AN INCOMPLETE BACKUP SYSTEM HISTORY ENTRY HAS BEEN FOUND IN THE BSDS, INDICATING THERE MAY BE AN INVALID DATA AND LOG VERSION IN COPYPOOL = *copy-pool-name* FOR TOKEN = *X'token'*. DFSMSHSM WILL BE CALLED TO DELETE THE VERSION

Explanation: During Backup System processing, an incomplete backup history entry was found in the BSDS. For example, an incomplete entry can exist if DB2 or z/OS goes down before backup processing can complete. Such an entry indicates that a data and log version may exist in the indicated copy pool for the indicated token.

Severity: 0 (informational)

System Action: Backup System will invoke DFSMSHsm to delete the version of the data and logs before proceeding with the current backup.

System Programmer Response: None.

DSNU1611I *csect-name* - A FAILURE HAS OCCURRED DURING BACKUP SYSTEM PROCESSING. DFSMSHSM IS BEING CALLED TO DELETE THE INCOMPLETE VERSION IN COPYPOOL = *copy-pool-name* FOR TOKEN = *X'token'*

Explanation: A failure that was previously indicated during Backup System processing has created an incomplete version. The copy pool and token with the incomplete version are indicated in the message text. This incomplete version must be deleted.

Severity: 0 (informational)

System Action: Backup System will invoke DFSMSHsm to delete the incomplete version.

System Programmer Response: None.

DSNU1612I *csect-name* - RESTORE SYSTEM UTILITY FAILED BECAUSE THE SYSTEM IS NOT IN SYSTEM RECOVER-PENDING STATE.

Explanation: The RESTORE SYSTEM utility cannot be run unless the proper preparation has been made. That preparation includes truncation of logs and performing a conditional restart of the appropriate system(s) so as to place them in the System RECOVER-PENDING state. This procedure is detailed in the Part 4 (Volume 1) of *DB2 Administration Guide* under 'System point in time recovery'.

Severity: 8 (error)

System Action: The utility is terminated.

System Programmer Response: Review the

procedures for preparing systems for running the RESTORE SYSTEM utility found in Part 4 (Volume 1) of *DB2 Administration Guide* under 'System point in time recovery'.

DSNU1614I *csect-name* - **BACKUP SYSTEM UTILITY FOR *object* COMPLETED SUCCESSFULLY, COPY POOL = *copy-pool-name*, TOKEN = X'*token*', ELAPSED TIME = *hh:mm:ss***

Explanation: The backup of the indicated object, data or logs, has completed successfully.

Severity: 0 (informational)

System Action: None.

System Programmer Response: None.

DSNU1616I *csect-name* - **THE CALL TO DFSMSHsm TO RESTORE SYSTEM FAILED. PLEASE SEE MESSAGE ARC1806E IN THE OUTPUT FOR DETAILS. COPY POOL = *copy-pool-name*, TOKEN = X'*token*'. A RETRY WILL BE ATTEMPTED IF AN APPROPRIATE BACKUP VERSION CAN BE IDENTIFIED.**

Explanation: The call to DFSMSHsm to RESTORE SYSTEM with the indicated copy pool name and token failed during DFSMSHsm processing. DFSMSHSM will have issued message ARC1806E indicating the cause of the error. This message can be found in the job log of the RESTORE SYSTEM utility.

If this is the first attempt by the RESTORE SYSTEM utility to do the RESTORE, a second attempt will be made if there is another appropriate Backup version recorded in the BACKUP SYSTEM history BSDS record. An appropriate Backup version is one for which data backup completed before the log truncation point indicated in the SYSPITR parameter of the conditional restart command, CRESTART CREATE. Messages indicating the progress of a subsequent attempt will be issued, just as for the first attempt.

If the second attempt fails, no further attempts will be made and the request will be failed.

Severity: 8 (error)

System Action: If this is the first attempt to do the RESTORE and there is another appropriate Backup available, a second attempt will be made. Otherwise the utility will terminate.

System Programmer Response: Correct the problem identified in message ARC1806E and rerun the utility.

Problem Determination: The job log will contain the ARC1806E message that is issued by DFSMSHsm. This message will contain information indicating the cause of the failure in DFSMSHsm.

DSNU1618I *csect-name* - **RESTORE SYSTEM UTILITY FAILED BECAUSE THERE ARE NO BACKUP SYSTEM HISTORY ENTRIES IN THE BSDS**

Explanation: There are no BACKUP SYSTEM history entries in the BSDS. Without these records no Restore can be done. Backups of the target system(s) must be taken before any RESTOREs can be done.

Severity: 8 (error)

System Action: The utility is terminated.

System Programmer Response: None.

DSNU1619I *csect-name* - **RESTORE SYSTEM UTILITY FAILED, BECAUSE THERE ARE NO BACKUP SYSTEM HISTORY ENTRIES IN THE BSDS WITH A DATA COMPLETION LRSN/RBA PRIOR TO THE LOG TRUNCATION POINT**

Explanation: BACKUP SYSTEM history entries exist in the BSDS. However, none of them indicate a data Backup completion LRSN/RBA with a value less than the log truncation point. This log point is indicated in the SYSPITR parameter of the conditional restart command, CRESTART CREATE, used to truncate the logs.

Severity: 8 (error)

System Action: The utility is terminated.

Problem Determination: The logs have been truncated to a point before which there are any backups available. The procedure for BACKUP and RESTORE of DB2 systems is described in the Part 4 (Volume 1) of *DB2 Administration Guide* under 'System point in time recovery'. Please review these procedures.

DSNU1621I *csect-name - utility-name* **UTILITY FAILED BECAUSE THE SYSTEM IS IN SYSTEM RECOVER-PENDING STATE**

Explanation: When the system is in RECOVER-PENDING state, no utility other than RESTORE is allowed to run. An attempt was made to run a utility while the system was in RECOVER-PENDING state.

Severity: 8 (error)

System Action: The utility is terminated.

System Programmer Response: Review the need to run the utility and, if appropriate, resubmit your job after the system has been restored.

DSNU1623I *csect-name* - THE TERM UTILITY REQUEST IS REJECTED BECAUSE THE SYSTEM IS IN SYSTEM RECOVER-PENDING STATE

Explanation: The TERM request is rejected. The only utility that is allowed to run while the system is in the system RECOVER-pending state is the RESTORE utility.

Severity: 4 (warning)

System Action: The TERM request is ignored.

DSNU1624I *csect-name - system-utility* SYSTEM UTILITY FAILED BECAUSE ONE OR MORE NON-DORMANT MEMBERS ARE IN A FAILED OR NOT NORMALLY QUIESCED STATE. THOSE MEMBERS ARE: *member-id*

Explanation: The BACKUP or RESTORE of the members of a data sharing group requires that all members be active or normally quiesced. If any members are found not to be in either of these states, the BACKUP or RESTORE cannot continue.

Severity: 8 (error)

System Action: The utility is terminated.

System Programmer Response: Determine why these systems are in a problem state, and whether they can be moved out of this state. Once all members have been returned to either the active or normally quiesced state, resubmit the job.

DSNU1626I *csect-name - system-utility* SYSTEM UTILITY FAILED BECAUSE RESTORE SYSTEM IS ALREADY RUNNING OR ANOTHER TASK IS PROCESSING IN A MANNER THAT PREVENTS THIS TASK FROM SERIALIZING PROPERLY

Explanation: The attempt to acquire the serialization lock failed. In the case of RESTORE SYSTEM, this can only occur if RESTORE SYSTEM is already running. In the case of BACKUP SYSTEM, this can occur if any of the following events are in process:

- System checkpoint
- Data set extensions
- Writing 32K pages
- Writing close page set control log records (PSCRs)
- Creating data sets (for table spaces, indexes, and so on)
- Deleting data sets (for dropping tables spaces, indexes, and so on)
- Renaming data sets (for online reorganizing of table spaces, indexes, and so forth during the switch phase)

Severity: 8 (error)

System Action: The utility is terminated.

System Programmer Response: If it is the RESTORE SYSTEM utility that is being invoked, the only other utility that can be running is RESTORE SYSTEM. If it is the BACKUP SYSTEM utility that is being invoked, any system activity that provokes any of the processes listed in the Explanation above could be the cause of the failure. If possible, determine which utility is responsible and resubmit this job once that utility completes. You may also resubmit your job at a later, less busy time.

DSNU1627I *csect-name* - RESTORE SYSTEM PRE-LOG APPLY COMPLETED SUCCESSFULLY, COPY POOL = *copy-pool-name* TOKEN = *X'token'* ELAPSED TIME = *hh:mm:ss*.

Explanation: Restoration of the data from the indicated copy pool with the indicated token has completed successfully.

Severity: 0 (informational)

System Action: Continue with log apply phase.

System Programmer Response: None.

DSNU1628I *csect-name* - RESTORE SYSTEM PHASE LOG APPLY COMPLETED, ELAPSED TIME = *hh:mm:ss*

Explanation: The log apply phase of the RESTORE SYSTEM completed in the amount of time that was indicated.

Severity: 0 (informational)

DSNU1629I *csect-name* - DB2 PUT ONE OR MORE OBJECTS INTO THE RECOVER-PENDING STATE, REBUILD-PENDING STATE, OR LOGICAL PAGE LIST DURING THE LOG APPLY PHASE.

Explanation: During the log apply process, objects were put into one of the exception states that is indicated in the message. Before these objects can be used, they must be processed again after the Restore completes.

Severity: 0 (informational)

System Action: None.

System Programmer Response: Process those objects in the RECOVER-PENDING or REBUILD-PENDING states with the REBUILD or RECOVER utilities as appropriate. See the Utility Guide and Reference for further details.

To recover pages from the LPL, use the -START DATABASE command with the SPACENAM option, the RECOVER utility, or the LOAD utility.

Problem Determination: Use the DISPLAY DATABASE command to identify which objects are in the exception states indicated in the message.

DSNU1631I *csect-name* - BACKUP SYSTEM UTILITY FAILED BECAUSE THE DFSMSHsm CALL FAILED WITH RC = X'*hsm-rc*'. PLEASE SEE THE JOB LOG FOR DFSMSHsm MESSAGES INDICATING THE CAUSE OF THE ERROR

Explanation: The call to DFSMSHsm to perform the Backup failed with the return code indicated in the message. The job log will contain error messages issued by DFSMSHsm that will indicate the cause of the error.

Severity: 8 (error)

System Action: The utility is terminated.

System Programmer Response: Review the output and, in particular, the DFSMSHsm messages to determine the cause of the failure.

Problem Determination: The DFSMSHSM message appearing in the job log will indicate the cause of the failure.

DSNU1632I *csect-name* - DISPLAY REQUEST WITH MEMBER SPECIFICATION WAS MADE BUT THE SYSTEM IS IN SYSTEM RECOVER-PENDING STATE. THE MEMBER SPECIFICATION IS IGNORED AND ONLY THOSE UTILITIES RUNNING ON THE SYSTEM FROM WHICH THE DISPLAY COMMAND WAS ISSUED WILL BE DISPLAYED

Explanation: When a system is in the system RECOVER-PENDING state it isn't possible to determine which utilities are executing on members in a data sharing group other than the member on which the DISPLAY command is running. The MEMBER specification is ignored and only those utilities executing on the system on which the command is running are displayed.

Severity: 0 (informational)

System Action: Display any utilities running on the system on which the command is running.

DSNU1633I *csect-name* - BACKUP SYSTEM UTILITY FAILED BECAUSE UNABLE TO WRITE BSDS RECORD DUE TO VSAM ERROR: RC = X'*return code*', RSN = X'*reason code*

Explanation: The attempt to update or insert the BACKUP SYSTEM history BSDS record failed due to an error during VSAM processing. The VSAM return and reason codes are indicated in the message.

Severity: 8 (error)

System Action: The utility is terminated.

System Programmer Response: The return and reason code in the message will identify the VSAM error that occurred when attempting to write out the BSDS record. Correct the problem and resubmit the job.

DSNU1634I *csect-name* - RESTORE SYSTEM UTILITY FAILED BECAUSE THE SYSTEM IS IN TRACKER MODE AND LOGONLY WAS NOT SPECIFIED

Explanation: The RESTORE SYSTEM utility cannot be run on a tracker system unless the LOGONLY keyword is specified.

Severity: 8 (error)

System Programmer Response: Change the RESTORE SYSTEM utility control statements to include the LOGONLY parameter.

DSNU3330I *csect-name* - The *utility-name* UTILITY IS PART OF A SEPARATELY LICENSED FEATURE WHICH WAS NOT FOUND ON THIS SYSTEM.

Explanation: DB2 could not find the specified utility in the load library concatenation specified in the submitted JCL. The specified utility is part of an optional feature of DB2.

Severity: 8 (error)

System Action: Utility processing does not initiate.

User Response: Obtain and install one of the optional utility features (JDB771K or JDB771M) that contains the utility you wish to execute.

DSNU3331I *csect-name* - THERE ARE *n* DAYS REMAINING IN THE TRIAL PERIOD FOR THE *utility-name* UTILITY

Explanation: The specified utility is part of an optional feature of DB2, and it will remain active for a 90-day trial period. This message displays the number of days remaining in the trial period.

Severity: 0 (informational)

System Action: Utility processing continues.

User Response: To continue executing the utility after the trial period, obtain and install one of the optional utility features (JDB771K or JDB771M) that contains the utility.

DSNU3332I *csect-name* - **THE EVALUATION
PERIOD FOR THE *utility-name* UTILITY
HAS EXPIRED**

Explanation: The specified utility is part of an optional feature of DB2, and it has remained active for a 90-day trial period. The trial period has expired.

Severity: 8 (error)

System Action: Utility processing does not initiate.

User Response: Obtain and install one of the optional utility features (JDB771K or JDB771M) that contains the utility you wish to execute.

Chapter 20. DSNV... messages

DSNV029E LOAD MODULE *module-name* DOES NOT HAVE AMODE(31) ATTRIBUTE

Explanation: During DB2 startup, Agent Services establishes the tasking structure for the control and resource manager address spaces. Three load modules, DSNVEUS3, DSNVEUS4, and DSNVRCT, are loaded and attached as the control programs for each subtask created. All three load modules must have been link-edited with the attributes AMODE(31) and RMODE(ANY). At least one of the modules did not have the 31-bit addressing attribute when it was loaded. The 'module-name' in the error message is the alias name of the first load module whose addressing mode was invalid.

System Action: DB2 startup is terminated.

System Programmer Response: Verify that all installation and maintenance activities against these modules were executed using SMP, that the JCLIN for SMP includes the correct AMODE and RMODE control statements, and that the Linkage Editor provided with the Data Facility Product (DFP) for the version of MVS being used was invoked by SMP for the link-edits. Correct the procedure or JCL which caused the error and rerun the necessary SMP jobs.

Operator Response: Notify the system programmer of the failure.

Problem Determination: A DB2 dump was requested to a SYS1.DUMP data set.

Load module names and aliases are as follows:

Load module	Alias
DSNVEUS3	DSNVEU3I
DSNVEUS4	DSNVEU4I
DSNVRCT	DSNVRCTI

The MVS service aid AMBLIST provides Linkage Editor module attributes in the summary section of the LISTLOAD function output.

DSNV086E DB2 ABNORMAL TERMINATION REASON=*xxxxxxx*

Explanation: The DB2 subsystem is being abended, because an error that cannot be corrected has occurred. This message, which is not automatically deleted from the operator console, is issued during DB2 abnormal termination. 'REASON' is the subsystem termination reason code. If DB2 abnormal termination is invoked multiple times, the subsystem termination reason code that accompanies this message is the reason associated with the first invocation. For additional information, look up the reason code in Part 4, "Section 4. DB2 Codes," on page 773.

System Action: Abnormal termination processing continues.

Operator Response: Notify the system programmer, and restart DB2.

System Programmer Response: This message is accompanied by one or more dumps. Obtain a copy of SYS1.LOGREC after DB2 completely terminates; also obtain a copy of the SVC dump(s). If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5.

DSNV400I ARCHIVE LOG WITH MODE(QUIESCE) CURRENTLY ACTIVE

Explanation: An -ARCHIVE LOG MODE(QUIESCE) command is currently active. This message follows the DSNV401I message as part of the -DISPLAY THREAD command report.

System Action: This message is issued as information only. The message indicates that the -ARCHIVE LOG MODE(QUIESCE) command has not completed, and consequently, updates against DB2 resources have been temporarily suspended. This may result in active threads being suspended awaiting termination of the quiesce period. DB2 processing otherwise continues normally.

DSNV401I DISPLAY THREAD REPORT FOLLOWS

Explanation: This message is always generated as the title for the DISPLAY THREAD command report output. It precedes the other messages generated by this command.

System Action: Processing continues normally.

DSNV402I ACTIVE THREADS-

Explanation: This message precedes the listing of active threads.

The series of messages DSNV402I through DSNV405I provide the formatted report for the -DISPLAY THREAD TYPE(ACTIVE) when the status of active threads is requested.

The series of messages DSNV444I through DSNV448I augment the formatted report for the -DISPLAY THREAD TYPE(ACTIVE) when LOCATION, LUWID, or DETAIL keywords are used to show distributed activity.

System Action: Processing continues normally.

DSNV403I **NAME ST A REQ**
 ID AUTHID PLAN ASID TOKEN

Explanation: This message displays the column headings for the list of threads generated by the -DISPLAY THREAD TYPE(ACTIVE) or -DISPLAY THREAD TYPE(INACTIVE) command.

The message number and subsystem recognition character are not included in this message.

System Action: Processing continues normally.

DSNV404I *name status act-ind req-ct corr-id auth-id*
 pname asid token

Explanation: This message provides the status information on an active or inactive thread and is part of the response to the -DISPLAY THREAD command. Information provided is:

name A 1- to 8-character variable representing the 'connection name' used to establish the thread. For distributed database access threads, this field contains the following:

- For threads using system-directed access and for threads using application-directed access from a DB2 Version 3 or later requester, this variable displays the connection name of the thread at the requesting location.
- For threads using application-directed access from a non-DB2 requester or from a DB2 Version 2 Release 3 requester, this variable displays the constant SERVER.
- If the thread has a status of PT, the connection name contains blanks if the thread of the originating task is running on the same DB2. This helps to show that these parallel tasks are related to the originating task above. If the parallel task is running on a different DB2 for the originating task, then the connection name will be supplied and the entry will be followed by DSNV443I.

If the thread has a status of D, the connection name might be either the connection name for the allied address space or the DB2 subsystem name.

status A 1- or 2- character connection status code with the following values:

- D** The thread is in the process of termination as a result of the termination of the associated allied task. If this thread is also the last (or only) DB2 thread for the address space, the associated allied task is placed in a wait state.
- DA** The database access thread slot is currently not associated with a remote

connection and is available to be assigned to a type 2 inactive thread.

- DI** The thread is disconnected from an execution unit. There is no TCB associated with the DB2 thread. This state is only valid when 'connection name'=RRSAF.
 - N** The thread is in either IDENTIFY or SIGNON status.
 - PT** A parallel task thread was established (plan allocated).
 - QD** The thread is queued for termination as a result of the termination of the associated allied task. If this thread is also the last (or only) DB2 thread for the address space, the associated allied task is placed in a wait state.
 - QT** The CREATE THREAD request was queued. The associated allied task is placed in a wait state.
 - R2** A distributed thread is performing a remote access on behalf of a request from another location. The thread is currently a type 2 inactive thread and is waiting for an agent to become available to process.
 - RA** The distributed thread is performing a remote access on behalf of a request from another location.
 - RK** A distributed thread is performing remote access on behalf of a request from another location. The thread is performing an operation that invoked Kerberos services. This status is displayed until Kerberos services returns control to DB2.
 - RN** A distributed thread is performing a remote access on behalf of a request from another location. The request actually accesses data at yet another (DB2) location, so the thread was suspended because DB2 must first connect to the partner location (establish DB2 system conversations with the partner).
- When another DB2 site is being contacted for the first time using system-directed access, DB2 must establish DB2 system conversations with the partner location. A request is presented to a DB2 DDF service task that establishes a system conversation. The thread is suspended until the request is processed. If the thread remains in this status for an extended period of

time, the DB2 service task that establishes the system conversations might be busy processing other requests. The DB2 DISPLAY LOCATION command ('DISPLAY LOCATION(*) DETAIL') shows you conversation activity for this DB2 system conversation (SYSCON-O) service task.

RQ A distributed thread is performing a remote access on behalf of a request from another location. The thread is suspended because the maximum number of active database access threads (as described by the MAX REMOTE ACTIVE value of the DSN6SYSP macro in the DB2 startup parameter, usually DSNZPARM) was reached. Database access agents (DBAAs) are queued until other DBAAs deallocate or go inactive, providing an available slot. The DBAA resumes when a slot becomes available, and the DBAA is next in the queue. Alternatively, you should consider increasing the MAX REMOTE ACTIVE value.

RX The distributed thread is executing an XA transaction on behalf of a request from another location.

SP A thread is executing within a stored procedure. This status is displayed until the stored procedure terminates and returns control to DB2.

SW A thread is waiting for a stored procedure to be scheduled. This status is displayed until the stored procedure begins execution.

T An allied, nondistributed thread was established (plan allocated).

TN An allied thread was distributed to access data at another DB2 location, but it was suspended because DB2 must first connect to the partner location (establish DB2 system conversations with the partner).

When another DB2 site is being contacted for the first time using system-directed access, DB2 must establish DB2 system conversations with the partner location. A request is presented to a DB2 DDF service task that establishes a system conversation. The thread is suspended until the request is processed. If the thread remains in this status for an extended period of

time, the DB2 service task that establishes the system conversations might be busy processing other requests. The DB2 DISPLAY LOCATION command ('DISPLAY LOCATION(*) DETAIL') shows you conversation activity for this DB2 system conversation (SYSCON-O) service task.

TR An allied thread was distributed to access data at another location.

act-ind An asterisk if the thread is active within DB2; blank otherwise.

req-ct A wraparound counter to show the number of DB2 requests.

corr-id A 1- to 12-character variable representing the recovery 'correlation-id' associated with the thread.

For distributed database access threads, this field contains the following:

- While the thread is being created:
 - '028.DBAA nn' - Where nn ranges from 01 to 99. This indicates that the DBAA is in its connection processing, which consists of establishing the DBAA thread, and validating and verifying the user's ID. Refer to the "Controlling Access to a DB2 Subsystem" chapter in Part 3 (Volume 1) of *DB2 Administration Guide* for descriptions of the authorization checks that might be performed.
 - RACF requests are serialized on one of the DB2 RACF service tasks, which might increase the validation time when multiple DBAAs are being created concurrently.
- After the thread is created:
 - For threads using system-directed access and threads using application-directed access from a DB2 requester, this variable displays the correlation-id name of the thread at the requesting location.
 - For threads using application-directed access from a non-DB2 requester, this variable displays the first twelve characters in the DDM external name (EXTNAM) parameter of the DDM EXCSAT command received as part of the SQL CONNECT.

authorization ID

The authorization ID associated with a signed-on connection. If not signed-on, this field is blank.

pname A 1- to 8-character variable representing the

plan name associated with the thread. For distributed database access threads, this field contains the following:

- For threads using system-directed access and threads using application-directed access from a DB2 Version 3 or later requester, this variable displays the plan name being executed at the requesting location.
- For threads using application-directed access from a non-DB2 requester or from a DB2 Version 2 Release 3 requester, this field displays the constant DISTSERV.

For RRSF connected threads that did not specify a plan name at connect time, the value ?RRSF is displayed. If a thread was not established, this field is blank.

If you receive a system plan in this field, see the information about system plans in message DSNT376I.

- asid* A 1- to 4-character hexadecimal number representing the ASID of the home address space.
- token* A 1- to 6-character number representing the thread token assigned to the thread. For threads with a status value of 'N', this value will be 0.

The message number and subsystem recognition character are not included in this message.

System Action: Processing continues normally.

System Programmer Response: If you have active threads with QD or D status codes, use the information in message DSN3201I to diagnose a possible DB2 problem.

DSNV405I DISPLAY ACTIVE REPORT COMPLETE

Explanation: This message follows messages DSNV402I through DSNV404I augmented by the series of messages DSNV444I through DSNV448I when LOCATION and/or DETAIL keywords are used to show distributed activity. It indicates that the -DISPLAY THREAD TYPE(ACTIVE) report has completed successfully.

The message number and subsystem recognition character are not included in this message.

System Action: Processing continues normally.

DSNV406I INDOUBT THREADS-

Explanation: This message precedes the listing of indoubt threads.

The series of messages DSNV406I through DSNV409I,

DSNV446I, DSNV449I through DSNV453I, DSNV457I through DSNV464I, DSNV466I, DSNV467I provides the formatted report for the -DISPLAY THREAD TYPE(INDOUBT) command when the status of indoubt threads is requested.

System Action: Processing continues normally.

DSNV407I COORDINATOR STATUS RESET URID AUTHID

Explanation: This message displays the column headings for the list of threads generated by the DISPLAY THREAD TYPE (INDOUBT) command, or for the list of Postponed Abort URs generated by the DISPLAY THREAD TYPE(POSTPONED) or DISPLAY THREAD TYPE(*) command.

The message number and the subsystem recognition character are not included in this message.

System Action: Processing continues normally.

DSNV408I *coordinator status reset urid authid*

Explanation: This message lists status information on an indoubt thread or for a Postponed Abort UR.

coordinator

The name of the two-phase commit coordinator.

- If the thread is an allied thread, the coordinator name is either the IMS connection name, the CICS connection name, RRS (for Resource Recovery Services attachment facility connected threads) or the location name of the local DB2 (if it is not one of the above). DSNV449I is displayed if the coordinator is IMS or CICS.
- If the thread is a database access thread, the coordinator name takes one of four forms:
 - location:luname -- where "location" is the coordinator's relational database name and "luname" is the coordinator's SNA LU name.
 - location:port -- where "location" is the coordinator's relational database name and "port" is the coordinator's TCP/IP port number for two-phase commit resynchronization.
 - <luname>luname -- where "luname" is the coordinator's SNA LU name.
 - nnn.nnn.nnn.nnn:port -- where "nnn.nnn.nnn.nnn" is the coordinator's IP address and "port" is the coordinator's TCP/IP port number for two-phase commit resynchronization.
- If the thread is distributed, message DSNV467I is included in the display. This

message shows the logical unit of work id and the local token that identifies the distributed thread.

status The status of the thread.

A status of ABORTED is not displayed unless DB2 believes a participant using PN protocols might be indoubt. If the status of a thread for a logical unit of work at a participant is INDOUBT, COMMITTED-H, or ABORTED-H, and the coordinator is a DB2 location that has not cold started, then the lack of any information about the thread in a DISPLAY THREAD(INDOUBT) report indicates that the decision at the coordinator was to abort the logical unit of work. In all other cases, a DSNV408I message for the thread is displayed.

- INDOUBT: The thread is indoubt and continues to appear in the display until all indoubt resolution responsibilities are complete. Additional detail lines that might appear in the report are:
 - DSNV450I and DSNV446I: The names of downstream participants who might be indoubt.
 - DSNV452I or DSNV453I: A heuristic action was taken at a downstream participant. DSNV452I or DSNV453I continues to appear in the display until DB2 resolves the indoubt status with the coordinator. If the coordinator decision is the same as the heuristic decision of the partner, then the detail line is no longer displayed. If the coordinator status is COMMITTED and the heuristic decision of the participant is ABORTED, then the message continues to appear in the display until it is deleted with the RESET INDOUBT command. The database administrators at all involved locations need to know that heuristic damage occurred and at which location.
 - DSNV466I: For a database access thread participant, the elapsed time that the thread was indoubt.
- COMMITTED: The thread is committed. This status is displayed when DB2 is the coordinator and has downstream participants that might be indoubt. The thread appears in the display until all downstream participants complete indoubt resolution. Detail lines DSNV450I and DSNV446I list the downstream participants that have pending resolution. Database locks held for the thread were released.

If a participant resolved the indoubt thread with a heuristic decision, and the decision was ABORT (rollback), detail line DSNV453I

is displayed. This detail line contains the name of the participant and the heuristic decision that it made. Since the coordinator committed and the participant aborted, this indicates heuristic damage. This line continues to appear in the display until it is deleted with the RESET INDOUBT command. The database administrators at all involved locations need to know that heuristic damage occurred and at which location.

- COMMITTED-H: The indoubt thread was heuristically resolved with the RECOVER INDOUBT command. The thread continues to appear in the display until the coordinator is informed of the heuristic decision, and all downstream participants, if any, complete indoubt resolution. Detail lines DSNV450I and DSNV446I list the downstream participants that have pending resolution. Additional detail lines that might appear in the report are:
 - DSNV451I is displayed if resolution with the coordinator is not complete. All database locks were released.
 - DSNV461I is displayed if resolution with the coordinator completed and heuristic damage was detected after the coordinator aborted the logical unit of work. This line continues to appear in the display until it is deleted with the RESET INDOUBT command.
- ABORTED-H: The indoubt thread was heuristically resolved with the RECOVER INDOUBT command. The thread continues to appear in the display until the coordinator is informed of the heuristic decision. Additional detail lines that might appear in the report are:
 - DSNV451I is displayed if resolution with the coordinator is not yet complete. All database locks were released.
 - DSNV461I is displayed if resolution with the coordinator completed and heuristic damage was detected after the coordinator committed the logical unit of work. This line continues to appear in the display until it is deleted with the RESET INDOUBT command.
- ABORTED: This is a coordinator status and DB2 has one or more downstream participants using the Presumed Nothing (PN) protocol that might be indoubt. The thread appears in the display until all downstream PN participants complete indoubt resolution. Detail lines DSNV450I and DSNV446I list the downstream

participants that have pending resolution. Database locks held for the thread were released.

If a participant resolved the indoubt thread with a heuristic decision, and the decision was COMMIT, detail line DSNV452I is displayed. This detail line contains the name of the participant and the heuristic decision that it made. Since the coordinator aborted and the participant committed, this indicates heuristic damage. This line continues to appear in the display until it is deleted with the RESET INDOUBT command. The database administrators at all involved locations need to know that heuristic damage occurred and at which location.

- ABORT-P: This line represents a Postponed Abort UR. Objects for which this UR has backout work pending are inaccessible (Restart Pending) until the abort is completed (for example, by means of the -RECOVER POSTPONED command).
- ABORT-PSTRT: This line represents a Postponed Abort UR that is currently undergoing -RECOVER POSTPONED processing or automatic DB2 backout processing (requested by restarting with system parameter LBACKOUT = AUTO).

Additional detail lines might appear in an indoubt thread report, as follows:

- Cold Start: When a coordinator cold starts, indoubt participants cannot achieve automatic resolution. A DB2 participant includes message DSNV463I in the display, indicating coordinator cold start and requesting heuristic resolution. Message DSNV458I is included in the display if the coordinator cold started. This message contains information that can be used to identify the thread. This information is provided by the coordinator. A DB2 coordinator provides the connection-name used to establish the thread at the DB2 coordinator and the correlation-id used by that connection.

When a participant cold starts, the coordinator cannot fulfill its indoubt resolution responsibility. A DB2 coordinator displays message DSNV462I indicating participant cold start. The thread continues to be displayed in the report, even after resolution with all other indoubt participants, if any. The RESET INDOUBT command must be used to purge this thread from the report. The reason for this is that the cold starting participant might have been coordinating downstream participants that are now indoubt. The database administrator at these participants might need to know the

status of the thread at the coordinator so correct heuristic decisions can be made.

- Protocol Errors: A communications protocol error might occur during sync point processing and during indoubt resolution processing. These protocol errors are permanent and prevent completion of the automatic indoubt resolution process.

An indoubt display thread report shows these protocol errors, as follows:

- A DB2 coordinator detecting a sync point protocol error by a participant, such that the coordinator believes that the participant might be indoubt, adds this thread to the indoubt thread display, if the decision is to commit. Message DSNV460I is included in the display indicating the protocol error and the potential need for heuristic action at the participant. The thread continues to be included in the report until the entry is purged with the RESET INDOUBT command. If the participant is actually indoubt, the database administrator at the participant needs to know the status of the thread so that the correct heuristic decision can be made.
- A DB2 participant detecting a sync point protocol error by a coordinator when the participant is indoubt adds this thread to the indoubt thread display. Message DSNV459I is included in the display, indicating the protocol error and requesting heuristic resolution. The thread continues to be included in the report until the thread is resolved with the RECOVER INDOUBT command. The DBA at the participant might need to contact the coordinator to determine the status of the thread.
- If a DB2 coordinator detects an indoubt resolution protocol error by a participant, message DSNV457I is included in the indoubt report, indicating the error and requesting heuristic action at the participant. The thread continues to be included in the report until the entry is purged with the RESET INDOUBT command. The database administrator at the participant needs to know the status of the thread so that the correct heuristic decision can be made.
- If a DB2 participant detects an indoubt resolution protocol error by a coordinator, and the thread status is INDOUBT, message DSNV464I is included in the indoubt report, indicating the error and requesting heuristic action. The thread continues to be included in the report

until the thread is resolved with the RECOVER INDOUBT command.

- reset** This column contains YES if the RESET INDOUBT command must be used to purge this thread from the indoubt display.
- urid** The RBA of the DB2 recovery log. This point is the beginning of recovery logging for this thread.
- authid** The primary authorization-id associated with the thread.

System Action: Processing continues.

DSNV409I DISPLAY INDOUBT REPORT COMPLETE

Explanation: This message follows messages DSNV406I through DSNV408I and indicates that the -DISPLAY THREAD TYPE(INDOUBT) report was generated successfully.

The message number and subsystem recognition character are not included in this message.

System Action: Processing continues normally.

DSNV410I NO CONNECTION FOUND FOR NAME=connection-name

Explanation: The -DISPLAY THREAD TYPE(ACTIVE) or TYPE(INACTIVE) command was unable to find any connection associated with 'connection-name'. This message is generated once for each requested connection name that was not found.

System Action: Command processing continues.

DSNV411I NO THREADS FOUND FOR NAME=connection-name

Explanation: The -DISPLAY THREAD TYPE(ACTIVE) or TYPE(INACTIVE) command was unable to locate any threads associated with 'connection-name'. This message is generated once for each connection name for which no threads were found.

System Action: Command processing continues.

DSNV412I csect-name NO INDOUBT THREADS FOUND FOR NAME=connection name

Explanation: In this message, 'csect-name' is the name of the command program CSECT that issued the message. 'NAME' is the connection name specified on the command.

The named command was unable to locate any indoubt threads associated with the 'connection name'. This message is generated once for each 'connection name' for which no threads were found.

System Action: Command processing continues.

DSNV413I csect-name verbname pkwname TERMINATED, DEFAULT UNAVAILABLE

Explanation: This message indicates that the command 'verbname' abnormally terminated because the command was entered from an MVS console and a required parameter was not supplied with the command.

csect-name

The name of the command program CSECT that issued the message.

verbname

The command verb as entered by the requester. The error depends on which command was entered.

- DISPLAY THREAD - neither the 'connection-name', LOCATION, nor LUWID was specified.
- RECOVER INDOUBT - neither 'connection-name' nor LUWID was specified.

pkwname

The command primary keyword as entered by the requester.

System Action: Command processing terminates.

Operator Response: Reenter the command specifying one of the required parameters.

DSNV414I THREAD xxx COMMIT SCHEDULED

Explanation: In this message, 'xxx' is the recovery identifier specified with the -RECOVER INDOUBT command to identify the indoubt thread and is one of the following:

ID= The recovery correlation-id specified with the command.

NID= The recovery network-id specified with the command.

LUWID = Luwid=token indicates the luwid and token that identify the thread specified with the command.

System Action: The thread specified on the -RECOVER INDOUBT command is scheduled for COMMIT recovery action.

DSNV415I THREAD xxx ABORT SCHEDULED

Explanation: In this message, 'xxx' is the recovery identifier specified with the -RECOVER INDOUBT command to identify the indoubt thread and is one of the following:

ID= The recovery correlation-id specified with the command.

NID= The recovery network-id specified with the command.

LUWID = The luwid=token indicates the luwid and token that identify the thread specified with the command.

DSNV416I • DSNV422I

The thread specified on the -RECOVER INDOUBT command is scheduled for ABORT recovery action.

System Action: Command processing continues.

DSNV416I THREAD NID=*net-node.number* IS INVALID

Explanation: In this message, 'net-node' is the recovery 'network-id' specified with the command.

The -RECOVER INDOUBT command (NID=*net-node.number*) determined that the input format for the specified network-id is invalid.

System Action: Command processing continues.

Operator Response: Prior to reentering the command, ensure that the network-id entered is in the correct format as specified on the -RECOVER INDOUBT command.

DSNV417I THREAD *xxx* NOT FOUND

Explanation: In this message, '*xxx*' is the recovery identifier specified with the -RECOVER INDOUBT command to identify the indoubt thread and is one of the following:

ID= The recovery correlation-id specified with the command

NID= The recovery network-id specified with the command

LUWID =
The luwid or token specified with the command

The -RECOVER INDOUBT command was unable to locate the specified thread to be scheduled for recovery. Either the thread identifier is incorrect, or the thread no longer is in an indoubt state.

System Action: Command processing continues.

Operator Response: Before reentering the command, ensure that the thread still is in an indoubt state.

DSNV418I RECOVER INDOUBT REJECTED FOR ID= *correlation-id*

Explanation: In this message, 'ID=' indicates the recovery 'correlation-id' specified with the command.

The -RECOVER INDOUBT command determined that more than one 'network-id' is associated with the specified 'correlation-id'. No recovery action is taken against the indoubt threads associated with the 'correlation-id'.

System Action: Command processing continues.

Operator Response: To indicate the specific indoubt thread to be scheduled for resolution, the 'network-id' associated with the thread must be specified.

DSNV419I NO CONNECTIONS FOUND

Explanation: The -DISPLAY THREAD command found no active or inactive connections within the system. This message is generated when the command requests thread information for all (TYPE=*), active (TYPE=ACTIVE), or inactive (TYPE=INACTIVE) connections within the system, but no active or inactive connections currently exist.

System Action: Command processing continues.

DSNV420I NO INDOUBT THREADS FOUND

Explanation: The -DISPLAY THREAD command found no indoubt threads within the system. This message is generated when the command requests information about all (*) threads currently residing within an indoubt state (TYPE=INDOUBT) within the system, but no threads currently exist within this state.

System Action: Command processing continues.

DSNV421I DISPLAY TERMINATED WITH MAX LINES

Explanation: This message indicates the -DISPLAY THREAD TYPE(ACTIVE) or the DISPLAY THREAD TYPE(INACTIVE) report was truncated. The report was generated in response to a command from an MVS console and more than 254 response messages were generated. Only 254 response messages are returned.

The message number and subsystem recognition character are not included in this message.

System Action: The truncated report is written to the MVS console.

Operator Response: Reissue the -DISPLAY THREAD request specifying a specific connection name, location, luwid, or a combination of these, as appropriate, to further reduce the display.

DSNV422I DISPLAY INDOUBT TERMINATED WITH MAX LINES

Explanation: This message indicates the -DISPLAY THREAD TYPE(INDOUBT) report was truncated. The report was generated in response to a command from an MVS console and more than 254 response messages were generated. Only 254 response messages are returned.

The message number and subsystem recognition character are not included in this message.

System Action: The truncated report is written to the MVS console.

Operator Response: Reissue the -DISPLAY THREAD request specifying a specific connection name.

DSNV423I DISPLAY THREAD MESSAGE POOL SIZE EXCEEDED

Explanation: The virtual storage requirement needed to generate a -DISPLAY THREAD response display exceeded the maximum size of the message buffer pool.

System Action: Processing is terminated.

User Response: Reissue the -DISPLAY THREAD request specifying TYPE(INDOUBT), TYPE(ACTIVE), or TYPE(INACTIVE) and a specific connection name, location, luwid, or a combination of these, as appropriate, to further reduce the display.

Operator Response: Refer to the User Response.

DSNV424I INACTIVE THREADS-

Explanation: This message precedes the listing of inactive threads.

The series of messages DSNV402I through DSNV405I provide the formatted report for the -DISPLAY THREAD TYPE(INACTIVE) when the status of inactive threads is requested.

The series of messages DSNV444I through DSNV448I augment the formatted report for the -DISPLAY THREAD TYPE(INACTIVE) when LOCATION, LUWID, or DETAIL keywords are used to show idle distributed threads.

System Action: Processing continues normally.

DSNV425I DISPLAY INACTIVE REPORT COMPLETE

Explanation: This message follows messages DSNV424I, DSNV403I and DSNV404I, which are augmented by the series of messages DSNV444I through DSNV448I when LOCATION and/or DETAIL keywords are used to show idle distributed threads. It indicates that the -DISPLAY THREAD TYPE(INACTIVE) report completed successfully.

The message number and subsystem recognition character are not included in this message.

System Action: Processing continues normally.

DSNV426I *csect-name* THREAD *token* HAS BEEN CANCELED

Explanation: This message is issued in response to the CANCEL THREAD command. The thread is scheduled for termination.

System Action: The specified thread is scheduled for termination. The termination of the thread does not occur unless processing is occurring within DB2.

DSNV427I *csect-name* INVALID THREAD *token* SPECIFIED

Explanation: This message is issued in response to the CANCEL THREAD command. No thread with the specified *token* was found.

System Action: The specified thread is not canceled.

User Response: Determine the correct *token* of the thread you want to cancel and reissue the command. You can use the -DISPLAY THREAD command to display all thread activity.

DSNV428I *csect-name* THREAD *token* WAS PREVIOUSLY CANCELED

Explanation: The thread with the specified token was previously canceled by either the CANCEL THREAD or CANCEL DDF THREAD command, or is already in the process of termination.

The CANCEL command terminates the thread only if the thread is processing in DB2 or is currently suspended by DB2. The thread might not be processing in DB2 in these situations:

- The thread is processing in the application and has not made a request to DB2. The DISPLAY THREAD command indicates this.
- The user placed the thread on an MVS resource using the ENQUE command. The CANCEL command has no effect on the thread until ENQUE completes and the thread returns to DB2.
- The thread is processing in VTAM and is waiting for a response from a partner. The DISPLAY THREAD DETAIL command indicates this. The thread does not terminate until VTAM returns to DB2. VTAM commands, which will terminate the session or LU, can be used to cause VTAM to return to DB2.

**DSNV429I V429 CALLING PROCEDURE=*proc*,
LOAD MODULE=*loadmod*,
PROC=*jclproc*, ASID=*asid*,
WLM_ENV=*wlmenv***

Explanation: This message appears in the output of the DISPLAY THREAD command when a thread is running a stored procedure.

proc The name of the stored procedure the SQL application is running.

loadmod The MVS load module associated with the stored procedure. This field will contain blanks until the load module name has been determined.

jclproc The name of the JCL PROC used to start the address space where the stored procedure is running. This field will contain blanks until the stored procedure has been assigned to a specific stored procedure address space.

asid The MVS ASID of the address space where the stored procedure is running. This field will contain 0000 until the stored procedure has been assigned to a specific stored procedure address space.

wlmenv The name of the WLM application environment where the stored procedure is running. If it is running in the DB2-established stored procedure address space, this field will contain blanks.

System Action: The DISPLAY THREAD command continues processing.

DSNV431I POSTPONED ABORT THREADS

Explanation: This message precedes the listing of Postponed Abort URs.

The series of messages DSNV431I, DSNV407I, DSNV408I and DSNV432I provide the formatted report for the -DISPLAY THREAD TYPE(POSTPONED) command. The series also provides a section of the formatted report for -DISPLAY THREAD TYPE(*).

DSNV432I DISPLAY POSTPONED ABORT REPORT COMPLETE

Explanation: This message follows messages DSNV431I and DSNV408I and indicates that the -DISPLAY THREAD TYPE(POSTPONED) report was completed successfully, or that the section of the -DISPLAY THREAD TYPE(*) report for Postponed Abort URs has been completed successfully.

System Action: Processing continues normally.

DSNV433I NO POSTPONED ABORT THREADS FOUND FOR NAME = *connection name*

Explanation: The -DISPLAY THREAD command found no postponed abort URs for the named connection. This message is generated when the command requests information about threads for the given connection name currently residing within a postponed abort state, but none currently exist within this state.

System Action: Command processing continues.

DSNV434I *csect-name* NO POSTPONED ABORT THREADS FOUND

Explanation: This message is issued by the RECOVER POSTPONED command, automatic online backout processing (invoked by restarting with system parameter LBACKOUT=AUTO), and also by the DISPLAY THREAD TYPE(POSTPONED) command. It indicates that no postponed abort threads were found to process. The '*csect-name*' is the name of the command program CSECT that issued the message.

System Action: The command (or auto-resolution processing) completes normally.

DSNV435I *action* OF POSTPONED ABORT URS HAS BEEN SCHEDULED

Explanation: This message is issued by the RECOVER POSTPONED command, and also by automatic online backout processing (invoked by restarting with system parameter LBACKOUT=AUTO). It indicates that postponed abort URs exist and their backout processing will proceed asynchronously.

ACTION

Description of request

RESOLUTION

Indicates that backout processing for the postponed units of recovery has been requested.

CANCELLATION

Indicates that the CANCEL option was specified on the RECOVER POSTPONED command and that the backout process will be canceled.

System Action: The command (or auto-resolution processing) completes normally.

DSNV436I PGM=*collection.package*, SEC=*section*, STMNT=*statement*

Explanation: This message appears in the output of a DISPLAY THREAD report when a detail display is specified. If DB2 is currently processing an SQL statement, this message identifies the program which contains that statement and displays the SQL statement being executed.

collection

The collection ID associated with *package*. If the SQL statement being executed is associated with a DBRM that was directly bound as part of the plan, and is not associated with a package, then *collection* is not applicable and is indicated by an asterisk (*).

package

The package or DBRM member.

section

The SQL section number associated with the package or DBRM.

statement

The SQL statement number associated with the package or DBRM.

The message number and subsystem recognition character are not included in this message. However, V436 is included in the message text to identify the message.

System Action: Command processing continues.

DSNV437I **V437-WORKSTATION=wsname, USERID=user-id, APPLICATION NAME=appl-name**

Explanation: This message appears in the output of a DISPLAY THREAD report when a non-detail display is specified. If the appropriate information is provided by the client system, this message is issued and identifies more specific information regarding the identity of the end-user associated with this thread.

wsname

The client end-user workstation name.
If not provided by the client system, this field contains an asterisk.

user-id The client end-user user-id.

If not provided by the client system, this field contains an asterisk.

appl-name

The client end-user application name.
If not provided by the client system, this field contains an asterisk.

This message number and subsystem recognition character are not included in this message. However, V437 is included in the message text to identify the message.

System Action: Command processing continues.

DSNV439I *csect-name* **NOBACKOUT OPTION INVALID FOR THREAD 'token'**

Explanation: This message is issued in response to the CANCEL THREAD command with the NOBACKOUT option. The NOBACKOUT option will not be honored because the canceled thread is part of a global transaction.

System Action: The specified thread is not canceled.

DSNV440I **V440-XID=xid**

Explanation: The thread is managed by an XA transaction manager, such as Websphere, which identifies the transaction with an *xid*. The XID is provided to allow correlation with the XA transaction manager. DB2 uses both the logical unit of work identifier, *luwid*, and the XA transaction identifier, *xid*, to coordinate and recover transactions. DB2 is a participant in an XA transaction that is executing on behalf of an XA transaction manager.

The XID is provided in its hexadecimal representation, and consists of the following elements:

- A 4-byte *Format ID*.

- A 4-byte *Global Transaction Identifier length (gtrid_length)*.
- A 4-byte *Branch Qualifier length (bqual_length)*.
- Variable-length data that is composed of at most two contiguous components: A *Global Transaction Identifier (gtrid)*, and a *Branch Qualifier (bqual)*. The *gtrid_length* element specifies the number of bytes (1-64) that constitute the *gtrid*, starting at the first byte of the data element. The *bqual-length* element specifies the number of bytes (up to 64) that constitute *bqual*, starting at the first byte after *gtrid*.

The message number and subsystem recognition character are not included in this message. However, V440 is included in the message to identify the message.

System Action: Command processing continues.

DSNV441I **V441-ACCOUNTING=ACCTNG**

Explanation: This message appears in the output of the DISPLAY THREAD report when a detail display is specified. If the appropriate information is provided by the client system, this message is issued and identifies more specific information regarding the identity of the end-user that is associated with this thread.

acctng The client end-user accounting information. If the appropriate information is provided by the client system, and if DB2 recognizes the client's format of the information, DB2 will display the user provided portion of the accounting information.

The message number and subsystem recognition character are not included in this message. However, V441 is included in the message text to identify the message.

System Action: Command processing continues.

DSNV443I **V443-PARALLELISM COORDINATOR=member-name, ORIGINATING TOKEN=token**

Explanation: This message follows a DSNV404I message for each parallel task thread that is running on an assisting DB2. This message gives the DB2 member name and the originating task's thread token.

member-name

The coordinating DB2 member where the originating task thread is running.

token The originating task thread token.

The message number and subsystem recognition character are not included in this message. However, V443 is included in the message text to identify the message.

System Action: Command processing continues.

DSNV444I V444-luwid=token ACCESSING DATA AT.

Explanation: This message follows a DSNV404I message for each thread that was distributed to other locations when a nondetail display is specified. This message gives the logical-unit-of-work identifier for the distributed thread, followed by an equal sign (=) and a token, which can be used in place of luw-id in any DB2 command that accepts luw-id as input. Message DSNV446I follows with the names of the locations associated with this 'luw-id'.

luwid=token

The global logical unit of work id and the local token that identifies the thread. If the thread becomes indoubt, a new token is assigned for the indoubt thread.

The message number and subsystem recognition character are not included in this message. However, V444 is included in the message text to identify the message.

System Action: Command processing continues.

DSNV445I V445-luwid=token ACCESSING DATA FOR location

Explanation: This message follows a DSNV404I message for a database access thread. This message displays the logical-unit-of-work identifier assigned to the database access thread.

luwid=token

The global logical unit of work id and the local token that identifies the thread. If the thread becomes indoubt, a new token is assigned for the indoubt thread.

location

Identifies the requesting site. The value specified in *location* is one of the following:

- The relational database name of the requester or the VTAM LU name of the requester (<luname>), a colon (":") delimiter, and the LU name of the requester for SNA connections.
- The dotted decimal IP address of the requester (nnn.nnn.nnn.nnn) for TCP/IP connections.

The message number and subsystem recognition character are not included in this message. However, V445 is included in the message text to identify the message.

System Action: Command processing continues.

DSNV446I V446--location-i location-j ...

Explanation: This message is a continuation of message DSNV444I or message DSNV450I and provides a list of 'location-i'.

location-i

Identifies the name of a remote DBMS at which data is being accessed or where a thread is indoubt.

The *location-i* string includes two or three tokens delimited by a colon (":"):

- The first token is the partner location name.
- The second token is the partner LU name for an SNA connection, or the dotted decimal IP address for a TCP/IP connection (nnn.nnn.nnn.nnn).
- The third token only appears if the second token is an IP address in which case the third token is a port number.

When the message appears after message DSNV450I, the port number represents a resync port number. Otherwise the message appears after a DSNV444I message in which case it represents an SQL port number.

A 'location-i' identifier is repeated for each DBMS where data is being accessed or where a thread is indoubt.

The message number and subsystem recognition character are not included in this message. However, V446 is included in the message text to identify the message.

System Action: Command processing continues.

DSNV447I V447--LOCATION SESSID A ST TIME

Explanation: This message forms the heading for the listing of distributed active or inactive threads in message DSNV448I. Items in this part of the heading are:

LOCATION

Heading for the associated location names

SESSID

Heading for the associated VTAM-defined session identifiers

A

Heading for the associated active indicators

ST

Heading for the associated status indicators

TIME

Heading for the associated time stamps

See message DSNV448I for descriptions of these items.

The message number and subsystem recognition character are not included in this message. However, V447 is included in the message text to identify the message.

System Action: Processing continues normally.

DSNV448I V448--location sessid active status time

Explanation: This message follows the DSNV4471 message for a database access thread or distributed allied thread when a detail display is specified. This message is displayed for each conversation connected to the thread. It lists detailed information about the conversations associated with the thread.

location

If displaying an allied thread, the location is the name of the server; otherwise, it is the name of the requester. The name can be any of the following: the relational database name of the partner, the VTAM LU name of the partner (<luname>), or the dotted decimal IP address of the partner (nnn.nnn.nnn.nnn).

sessid There are two possible values for this field:

- For VTAM partners, this field contains the VTAM-defined session instance identifier of the session on which the conversation is executing. Zeros if the session identifier is not applicable.

VTAM does not supply the entire session id to DB2. The first two digits of the session id are incorrect. Therefore, the session id as presented in this message is not acceptable in VTAM commands. The VTAM DISPLAY NET,ID=db2-luname,SCOPE=ACT command must be used to obtain the full session ID. The DISPLAY NET command lists all sessions (SID) for the DB2 logical unit. Scan the DISPLAY NET output for the complete SID.

- For TCP/IP connections, this field contains the local DB2 TCP/IP port number, followed by the partner's TCP/IP port number. The two port numbers are separated by a colon (e.g 5001:28191).

active One of the following:

- V** The conversation is active within VTAM or TCPIP.
- W** The conversation is suspended in DB2 waiting for VTAM or TCP/IP notification that the function is complete.

Blank, otherwise.

status Status of the conversation.

This information is presented as two characters, each of which has significance.

First Character

- A** Conversation in allocation.
- C** Session limits are being negotiated with the partner (CNOS) prior to conversation allocation.
- D** Conversation in deallocation.
- R** Receiving
 - At the requesting site, this indicates that the conversation is receiving a response from a request.
 - At the server site, this indicates that the conversation is receiving or waiting for a request.
- S** Sending
 - At the requesting site, this indicates that the conversation can send requests to the server.
 - At the server site, this indicates that the conversation is sending or preparing to send a response.
- X** Exchanging log name information with the partner before conversation allocation to determine if the partner supports protected conversations. If the thread remains in this status for an extended period of time, the DB2 service task that exchanges log names might be busy processing other requests. The DB2 DISPLAY LOCATION command ('DISPLAY LOCATION(*) DETAIL') shows you conversation activity for this (RESYNC) service task.
Blank, otherwise.

Second Character

- 1** Unprotected conversation using system-directed access is active.
- 2** Unprotected conversation using application-directed access is active.
- 3** Protected conversation using system-directed access is active.
- 4** Protected conversation using application-directed access is active.
Blank otherwise.

time The time stamp (yydddhmmssth) of the last message sent or received on the conversation.

The message number and subsystem recognition character are not included in this message. However, V448 is included in the message text to identify the message.

System Action: Command processing continues

DSNV449I V449-HAS NID=*nid* AND ID=*correlation-id*

Explanation: This message is a detail line, which might be displayed with a DISPLAY THREAD TYPE (INDOUBT) report.

nid The network-id assigned by IMS or CICS or, if the connection type is RRSAF, the RRS unit of recovery ID (URID)

correlation-id
The correlation-id assigned by IMS or CICS or if the connection type is RRSAF, the correlation-id assigned by the connected application

The message number and subsystem recognition character are not included in this message. However, V449 is included in the message text to identify the message.

System Action: Processing continues normally.

DSNV450I V450-HAS PARTICIPANT INDOUBT AT

Explanation: This message is a detail line which might be displayed with a DISPLAY THREAD TYPE (INDOUBT) report. This message is followed by one or more DSNV446I messages that name the 'locations' where indoubt participant threads are located. The 'luwid' of the indoubt thread is displayed in the preceding DSNV408I message.

The message number and subsystem recognition character are not included in this message. However, V450 is included in the message text to identify the message.

System Action: The thread remains indoubt and processing continues normally.

Operator Response: See message DSNL406I for more information. The indoubt participants displayed can also result from an abnormal termination of this DB2 subsystem.

DSNV451I V451-RESYNC WITH COORDINATOR STILL PENDING

Explanation: This message is a detail line which might be displayed with a DISPLAY THREAD TYPE (INDOUBT) report. When an indoubt thread is manually resolved with the RECOVER INDOUBT command, this message is included in the report if indoubt resolution with the coordinator was not complete. The 'coordinator' and the 'luwid' of the indoubt thread are displayed in the previous DSNV408I message.

The message number and subsystem recognition character are not included in this message. However, V451 is included in the message text to identify the message.

System Action: The thread remains indoubt and

processing continues normally.

DSNV452I V452-HEURISTIC COMMIT BY PARTICIPANT AT LOCATION *location*

Explanation: This message is a detail line which might be displayed with a DISPLAY THREAD TYPE (INDOUBT) report. A decision was made at the participant to force the indoubt thread to commit without waiting for automatic resynchronization to be performed. The 'luwid' of the thread is displayed in the preceding DSNV408I message.

location
The 'location' where the HEURISTIC COMMIT was performed. The 'location' is either the relational database name (location-name), the logical unit name (<luname>), or the dotted decimal IP address (nnn.nnn.nnn.nnn) of the participant.

The message number and subsystem recognition character are not included in this message. However, V452 is included in the message text to identify the message.

System Action: Processing continues normally.

Operator Response: See message DSNL402E for more information.

DSNV453I V453-HEURISTIC ABORT BY PARTICIPANT AT LOCATION *location*

Explanation: This message is a detail line which might be displayed with a DISPLAY THREAD TYPE (INDOUBT) report. A decision was made at the participant to force an indoubt thread to abort without waiting for automatic resynchronization to be performed. The 'luwid' of the thread that was forced to abort is displayed in the preceding DSNV408I message.

location
The 'location' where the HEURISTIC ABORT was performed. The 'location' is either the relational database name (location-name), the logical unit name (<luname>), or the dotted decimal IP address (nnn.nnn.nnn.nnn) of the participant.

The message number and subsystem recognition character are not included in this message. However, V453 is included in the message text to identify the message.

System Action: Processing continues normally.

Operator Response: See message DSNL403E for more information.

**DSNV454I LOCATION OR LUWID KEYWORD
INVALID WHEN DDF NOT STARTED**

Explanation: The -DISPLAY THREAD TYPE(ACTIVE) command was issued with the keyword LOCATION or LUWID and it was found that the distributed data facility (DDF) was not started. The LOCATION or LUWID keyword can be used only if DDF is in operation.

System Action: Command processing is complete.

**DSNV456I INVALID PARAMETER WITH LUWID
KEYWORD *luwid-parameter***

Explanation: The -DISPLAY THREAD TYPE(ACTIVE), -DISPLAY THREAD TYPE(INACTIVE), or the -RECOVER INDOUBT command was issued with the keyword LUWID and its required parameter list. However, one of the parameters was syntactically invalid as a logical-unit-of-work identifier.

System Action: Command processing is complete.

Operator Response: The syntax of the DISPLAY THREAD and RECOVER INDOUBT commands is described in *DB2 Command Reference*. Reenter the command specifying valid LUWID values.

**DSNV457I V457-RESYNC PROTOCOL ERROR
WITH PARTICIPANT *location***

Explanation: This message is a detail line which might be displayed with a DISPLAY THREAD TYPE (INDOUBT) report. Manual resolution of an indoubt thread at the participant location might be required. A protocol error was detected during attempted automatic indoubt resolution with the participant. The 'luwid' of the thread that might require manual resolution at the participant is displayed in the preceding DSNV408I message.

location

The 'location' where manual resolution might be needed. The 'location' is either the relational database name (location-name) of the participant or the logical unit name (<luname>) of the participant.

The message number and subsystem recognition character are not included in this message. However, V457 is included in the message text to identify the message.

System Action: Processing continues normally.

Operator Response: See message DSNL414E for more information.

**DSNV458I V458-CONNECTION-NAME
connection-name CORRELATION-ID
*correlation-id***

Explanation: This message is a detail line which might be displayed with a DISPLAY THREAD TYPE (INDOUBT) report. It is displayed only if message DSNV463I is also displayed.

connection-name

The connection-name assigned by the coordinator if the coordinator is another DB2 system. The constant SERVER if the coordinator is not a DB2 system.

correlation-id

The correlation-id assigned by the coordinator if the coordinator is another DB2 system. The first 12 characters of the EXTNAME parameter of the EXCSAT command sent by the coordinator if the coordinator is not a DB2 system.

The message number and subsystem recognition character are not included in this message. However, V458 is included in the message text to identify the message.

System Action: Processing continues normally.

Operator Response: See message DSNV463I for more information.

**DSNV459I V459-SYNCPOINT PROTOCOL ERROR
WITH COORDINATOR**

Explanation: This message is a detail line which might be displayed with a DISPLAY THREAD TYPE (INDOUBT) report. Manual resolution of an indoubt thread at this location is required. A protocol error was detected during sync point processing with the coordinator. The 'coordinator' and the 'luwid' of the thread that requires manual resolution are both displayed in the preceding DSNV408I message.

The message number and subsystem recognition character are not included in this message. However, V459 is included in the message text to identify the message.

System Action: Processing continues normally.

Operator Response: See message DSNL412I for more information.

**DSNV460I V460-SYNCPOINT PROTOCOL ERROR
WITH PARTICIPANT *location***

Explanation: This message is a detail line which might be displayed with a DISPLAY THREAD TYPE (INDOUBT) report. Manual resolution of an indoubt thread at the participant location might be required. A protocol error was detected during sync point processing with the participant. The 'luwid' of the thread

that might require manual resolution at the participant is displayed in the preceding DSNV408I message.

location

The 'location' where manual resolution might be needed. The 'location' is either the relational database name (location-name) of the participant or the logical unit name (<luname>) of the participant.

The message number and subsystem recognition character are not included in this message. However, V460 is included in the message text to identify the message.

System Action: Processing continues normally.

Operator Response: See message DSNL413I for more information.

DSNV461I V461-RESYNC WITH COORDINATOR SHOWS HEURISTIC DAMAGE

Explanation: This message is a detail line which might be displayed with a DISPLAY THREAD TYPE (INDOUBT) report. Indoubt resolution with the coordinator completed. Heuristic damage was detected at this location because the heuristic decision made at this location is different than the decision made at the coordinator. The 'coordinator' and the 'luwid' of the thread are displayed in the previous DSNV408I message. The 'status' field in the previous DSNV408I message shows the heuristic decision made at this location. This message continues to appear until it is deleted with a RESET INDOUBT command.

The message number and subsystem recognition character are not included in this message. However, V461 is included in the message text to identify the message.

System Action: The thread remains indoubt and processing continues normally.

Operator Response: See message DSNL400E and DSNL401E for more information.

DSNV462I V462-COLD START BY PARTICIPANT AT LOCATION *location*

Explanation: This message is a detail line which might be displayed with a DISPLAY THREAD TYPE (INDOUBT) report. There was an indoubt thread at the participant whose 'luwid' is displayed in the preceding DSNV408I message. DB2 has coordinator responsibility for the indoubt thread and the participant informed DB2 that it performed a cold start operation and lost all knowledge of indoubt threads. There might be heuristic damage at the participant. The RESET INDOUBT command must be used to purge this message from the indoubt report. The reason for this is that the cold-starting participant might have been coordinating downstream participants that are now indoubt. The database administrator at these participants might need

to know the status of the thread at the coordinator, so that correct heuristic decisions can be made.

location

The 'location' where the cold start was performed. The 'location' is either the relational database name (location-name), the logical unit name (<luname>), or the dotted decimal IP address (nnn.nnn.nnn.nnn) of the participant.

The message number and subsystem recognition character are not included in this message. However, V462 is included in the message text to identify the message.

System Action: Processing continues normally.

Operator Response: See message DSNL420E for more information.

DSNV463I V463-COORDINATOR HAS COLD STARTED

Explanation: This message is a detail line which might be displayed with a DISPLAY THREAD TYPE (INDOUBT) report. Manual resolution of an indoubt thread at this location is required. The coordinator for a thread that is indoubt at DB2 was cold started and therefore lost all knowledge of indoubt threads. The 'coordinator' and the 'luwid' of the thread for which manual resolution is required are displayed in the preceding DSNV408I message.

The message number and subsystem recognition character are not included in this message. However, V463 is included in the message text to identify the message.

System Action: Processing continues normally.

Operator Response: See message DSNL411I for more information.

DSNV464I V464-RESYNC PROTOCOL ERROR WITH COORDINATOR

Explanation: This message is a detail line which might be displayed with a DISPLAY THREAD TYPE (INDOUBT) report. Manual resolution of an indoubt thread at this location is required. A protocol error was detected during attempted automatic indoubt resolution with the coordinator. The 'coordinator' and the 'luwid' of the thread that requires manual resolution are both displayed in the preceding DSNV408I message.

The message number and subsystem recognition character are not included in this message. However, V464 is included in the message text to identify the message.

System Action: Processing continues normally.

Operator Response: See message DSNL404E for more information.

DSNV465I V465-THREAD HAS REMAINED IN A PREPARED STATE FOR hh:mm:ss

Explanation: This message might be displayed with a DISPLAY THREAD TYPE (ACTIVE) report. The thread was 'prepared' for the specified period of time. This means that DB2 is the participant in the logical unit of work and completed the first phase of commit and is waiting for the commit or abort decision to be transmitted from the coordinator for the specified period of time. The thread is identified in the preceding DSNV404I message. This message does not appear in a report until the thread was in the prepared state for 60 seconds.

hh:mm:ss

The length of time the thread was prepared (expressed in hours, minutes and seconds). The maximum number of hours reported is 65535, which is roughly 7.5 years. After this time period elapses, the count is reset to zero.

The following actions might be taken to resolve this thread by manual means (that is, take heuristic action) if it is necessary to release locks held by this thread.

- Use the -CANCEL DDF THREAD command to force the thread from the prepared state to the indoubt state. When the thread is indoubt, it appears in the display generated by issuing the DISPLAY THREAD command for type indoubt threads.
- Determine the proper decision (commit or abort) by contacting the coordinator 'location' shown in the display of indoubt threads.
- Use the RECOVER INDOUBT command to heuristically commit or abort the thread.

The message number and subsystem recognition character are not included in this message. However, V465 is included in the message text to identify the message.

This message is issued by the following CSECT: DSNVDTM

System Action: Processing continues normally.

DSNV466I V466-THREAD HAS BEEN INDOUBT FOR hh:mm:ss

Explanation: This message is a detail line which might be displayed with a DISPLAY THREAD TYPE (INDOUBT) report. The thread entered the indoubt state at the specified time. This means that DB2 is the participant in the logical unit of work and completed the first phase of commit and is waiting for the commit or abort decision to be transmitted from the coordinator. However, DB2 lost communications with the coordinator. The thread is identified in the preceding DSNV408I message.

hh:mm:ss

The length of time the thread was indoubt (expressed in hours, minutes and seconds). The maximum number of hours reported is 65535, which is roughly 7.5 years. After this time period elapses, the count is reset to zero.

The following actions might be taken to resolve this thread by manual means (that is, take heuristic action) if it is necessary to release locks held by this thread.

- Determine the proper decision (commit or abort) by contacting the coordinator 'location' shown in the display of indoubt threads.
- Use the RECOVER INDOUBT command to heuristically commit or abort the thread.

The message number and subsystem recognition character are not included in this message. However, V466 is included in the message text to identify the message.

System Action: Processing continues normally.

DSNV467I V467-HAS LUWID *luwid=token*

Explanation: This message is a detail line, which might be displayed with a DISPLAY THREAD TYPE (INDOUBT) report.

luwid=token

The global logical unit of work id and the local token that identifies the thread.

The message number and subsystem recognition character are not included in this message. However, V467 is included in the message text to identify the message.

System Action: Processing continues normally.

DSNV471I V471-*luwid=token*

Explanation: This message follows a DSNV404I message and indicates the agent is currently not associated with a remote location. The agent is available to be assigned to process;

- the completion of a queued receive request on a type 2 inactive thread, or
- a request that a new connection be established, after MAX REMOTE ACTIVE has been reached.

This message displays the logical-unit-of-work identifier assigned to the agent.

luwid=token

The global logical unit of work id and the local token that identifies the agent.

The message number and subsystem recognition character are not included in this message. However, V471 is included in the message text to identify the message.

DSNV473I • DSNV479I

This message is issued by the following CSECT:
DSNVDTM

System Action: Command processing continues.

DSNV473I ACTIVE THREADS FOUND FOR MEMBER: *memname*

Explanation: This message precedes the listing of active threads found on another member of a data sharing group as the result of the SCOPE(GROUP) keyword.

Message DSNV473I and the series of messages DSNV403I through DSNV405I provide the formatted report for the -DISPLAY THREAD TYPE(ACTIVE) SCOPE(GROUP) when the status of active threads is requested.

The series of messages DSNV444I through DSNV448I augment the formatted report for the -DISPLAY THREAD TYPE(ACTIVE) SCOPE(GROUP) when LOCATION, LUWID, or DETAIL keywords are used to show distributed activity.

memname

Member name for which thread information is being displayed.

System Action: Processing continues normally.

DSNV474I INDOUBT THREADS FOUND FOR MEMBER: *memname*

Explanation: This message precedes the listing of indoubt threads found on member *memname* as the result of the SCOPE(GROUP) keyword.

Messages DSNV474I, DSNV403I, DSNV404I and DSNV409I provide the formatted report for the -DISPLAY THREAD TYPE(INDOUBT) SCOPE(GROUP) command when the status of indoubt threads is requested.

memname

Member name for which thread information is being displayed.

System Action: Processing continues normally.

DSNV475I INACTIVE THREADS FOUND FOR MEMBER: *memname*

Explanation: This message precedes the listing of inactive threads found on member *memname* as the result of SCOPE(GROUP) keyword.

Messages DSNV475I, DSNV403I, DSNV404I and DSNV425I provide the formatted report for the -DISPLAY THREAD TYPE(INACTIVE) SCOPE(GROUP) when the status of inactive threads is requested.

The series of messages DSNV444I through DSNV448I augment the formatted report for the -DISPLAY THREAD TYPE(INACTIVE) SCOPE(GROUP) when

LOCATION, LUWID, or DETAIL keywords are used to show idle distributed threads.

memname

Member name for which thread information is being displayed.

System Action: Processing continues normally.

DSNV476I POSTPONED ABORT THREADS FOUND FOR MEMBER: *memname*

Explanation: This message precedes the listing of Postponed Abort units of recovery found on another member of a data sharing group as the result of the SCOPE(GROUP) keyword.

Messages DSNV476I, DSNV403I, DSNV404I and DSNV432I provide the formatted report for the -DISPLAY THREAD TYPE(POSTPONED) SCOPE(GROUP) command.

memname

Member name for which thread information is being displayed.

System Action: Processing continues normally.

DSNV478I SCOPE(GROUP) DISPLAY TERMINATED DUE TO IRLM TRUNCATION

Explanation: This message displays as a result of the -DISPLAY THREAD command when the SCOPE(GROUP) keyword is specified and IRLM has truncated the responses gathered from other members. This is a DB2 internal error.

System Action: The -DISPLAY THREAD report is terminated and processing abnormally terminates.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: This is an internal error.

DSNV479I SCOPE(GROUP) DATA UNAVAILABLE IRLM RETURN CODE: *retcode* IRLM REASON DATA: *reason*

Explanation: This message displays as a result of the -DISPLAY THREAD command when the SCOPE(GROUP) keyword is specified and the IRLM NOTIFY to other members has returned a bad return code.

retcode Return code from IRLM on the Notify request.

reason Reason code diagnostic information from IRLM on the Notify request.

DSNV480I V480-DB2 IS PARTICIPANT FOR RRS
URID=*rrs-urid*

Explanation: This message is a detail line that could be displayed with a DISPLAY THREAD TYPE(ACTIVE) report when the Recoverable Resource Services Unit of Recovery ID (RRS URID) keyword is specified on the command. The RRS URID=*rrs-urid* identifies the RRS URID of the RRS Unit of Recovery that this thread is a participant in.

The message number and subsystem recognition character are not included in this message. However, V480 is included in the message text to identify the message.

System Action: Command processing continues normally.

DSNV481I V481-DB2 IS COORDINATOR FOR RRS
URID=*rrs-urid*

Explanation: This message is a detail line that could be displayed with a DISPLAY THREAD TYPE(ACTIVE) report when the Recoverable Resource Services Unit of Recovery ID (RRS URID) keyword is specified on the command. The RRS URID=*rrs-urid* identifies the RRS URID of the RRS Unit of Recovery that this thread is a coordinator for.

This message is a detail line that also could be displayed with a DISPLAY TYPE(INDOUBT) report when the RRSURID keyword is specified on the command. The RRS URID=*rrs-urid* identifies the RRS URID of the RRS Unit of Recovery that this thread is a coordinator for. When this message appears in an INDOUBT thread report, the preceding DSNV408I message tells the status of the DB2 Unit of Recovery that contains the RRS Unit of Recovery. If manual recovery of the RRS Unit of Recovery is required, the outcome of the DB2 Unit of Recovery can determine whether to COMMIT or ROLLBACK the RRS Unit of Recovery.

The message number and subsystem recognition character are not included in this message. However, V481 is included in the message text to identify the message.

System Action: Command processing continues normally.

Chapter 21. DSNW... messages

DSNW001I ASYNCHRONOUSLY GATHERED DATA IS BEING FORMATTED IN THIS DUMP

Explanation: The subsystem formatting exit is not using DB2 summary dump records for formatting. The formatted control blocks may not contain the same values as they did at the time of the error.

System Action: Dump formatting continues.

System Programmer Response: If you want DB2 summary dump records to be used, do not specify the 'SUMDUMP=NO' operand on the dump control statement.

DSNW002I SUMMARY DUMP RECORDS ARE BEING FORMATTED IN THIS DUMP

Explanation: The subsystem formatting exit is using DB2 summary dump record information to format its control blocks.

System Action: Dump formatting continues.

System Programmer Response: If you do not want DB2 summary dump records to be used in formatting, specify the 'SUMDUMP=NO' and 'SUBSYS=subsystem name' on the dump control statement. Both operands are required.

DSNW004I ONE OR MORE INVALID OPERANDS WERE FOUND ON THE DSNWDMP CONTROL CARD. SUBSYSTEM FORMATTING TERMINATED

Explanation: An invalid operand was found on the dump control statement. The operand was not 'SG', 'LG', 'SA', 'AA', or 'ALL'.

System Action: Control returns to AMDPRDMP or IPCS to terminate the exit.

System Programmer Response: Correct the dump control statement operand specified by message DSNW007I.

DSNW005I DUMP FORMATTER WORK BUFFER (DSNWDBUF) CANNOT BE LOCATED

Explanation: The subsystem formatting exit could not locate its work buffer.

System Action: Control returns to AMDPRDMP or IPCS to terminate the exit.

System Programmer Response: Increase the region size.

DSNW006I THE ERLY BLOCK CANNOT BE ACCESSED OR IT IS INVALID

Explanation: The subsystem formatting exit could not locate its anchor block.

System Action: Control returns to AMDPRDMP or IPCS to terminate the exit.

System Programmer Response: Specify 'SUBSYS=subsystem name', 'SUMDUMP=NO' on the dump control statement. The subsystem name should have between 1 and 4 characters.

DSNW007I THE FOLLOWING OPERAND SPECIFIED ON THE DSNWDMP CONTROL CARD IS INVALID: xxxx

Explanation: The specified operand was not one of the valid dump control statement operands.

System Action: Control returns to AMDPRDMP or IPCS to terminate the exit.

System Programmer Response: Check the dump control statement operands.

DSNW008I THE SCOM CANNOT BE ACCESSED OR IT IS INVALID

Explanation: An error was encountered while trying to retrieve the SCOM.

System Action: Control returns to AMDPRDMP or IPCS to terminate the exit.

System Programmer Response: If 'SUMDUMP=NO' was specified on the dump control statement, omit this operand, and resubmit the job. Otherwise, specify this operand on the dump control statement, and resubmit the job.

DSNW009I THE ADDRESS SPACE REQUESTED IS NOT AVAILABLE

Explanation: The DB2 control blocks for the address space specified on the 'SA=asid' dump operand could not be located.

System Action: Formatting continues if other dump operands were specified.

System Programmer Response: Check the ASID specified on the 'SA=' dump operand. The ASID must be specified in hexadecimal.

DSNW010I THE TRACE RMFT CANNOT BE ACCESSED OR IT IS INVALID

Explanation: The DB2 trace table could not be located.

System Action: Formatting of the DB2 trace table is bypassed, and formatting continues of any other requested dump segment.

System Programmer Response: If 'SUMDUMP=NO' was specified on the dump control statement, omit this operand. Otherwise, specify this operand on the dump control statement. In either case, resubmit the job.

DSNW011I A LARGER REGION SIZE IS REQUIRED FOR THIS JOB

Explanation: The subsystem formatting exit could not obtain a large enough work buffer to process the summary dump records.

System Action: Subsystem formatting continues.

System Programmer Response: Rerun the job, specifying a larger region size in the JCL.

DSNW013I DMPW NOT FOUND IN SUMMARY DUMP

Explanation: The subsystem formatting exit was unable to locate the DMPW control block in the summary record portion of the dump data set. Because the DMPW provides the main anchor block for the dump formatter, processing is terminated.

System Action: Control returns to AMDPRDMP or IPCS to terminate the exit.

System Programmer Response: If this is not a DB2 dump data set, specify 'SUBSYS=xxxx,SUMDUMP=NO' on the dump control statement (where xxxx is the 1- to 4-character subsystem name), so that the subsystem formatting exit does not attempt to use summary dump data.

DSNW014I REQUIRED SUMMARY DUMP RECORDS ARE NOT IN THIS DUMP. WILL ATTEMPT TO FORMAT FROM NON- SUMMARY DUMP

Explanation: Expected data could not be found in the summary dump. This message is issued for information only. Dump formatting continues. However, it will take longer, because a greater volume of data COMMAND PQUIT must be analyzed.

System Action: Formatting is attempted using the full dump instead of the summary dump.

System Programmer Response: Though processing continues, this message is an indication of a problem, and should be pursued as such.

DSNW015I SSCVT NOT LOCATED. CHECK THE SUBSYSTEM NAME ON THE CONTROL CARD

Explanation: In a search through the SSCVT chain, a match of the subsystem name in the SSCVTs and the

subsystem name on the control statement was not found.

System Action: Formatting for the named subsystem is not done.

Operator Response: Check the 'SUBSYS=' operand on the control statement.

System Programmer Response: Correctly specify the subsystem name on the control statement.

DSNW016I THE RMVT CANNOT BE ACCESSED OR IT IS INVALID

Explanation: The subsystem formatting exit could not locate the RMVT. The RMVT is required for formatting the DB2 trace table and a number of other DB2 control blocks.

System Action: Formatting of the DB2 trace table is bypassed, and formatting of other requested dump segments continues.

System Programmer Response: If 'SUMDUMP=NO' was specified on the dump control statement, omit this operand. Otherwise, try specifying this operand on the dump control statement. In either case, resubmit the job.

DSNW017I MAXIMUM STACK LEVEL EXCEEDED

Explanation: This condition is usually caused by the DB2 control block formatter looping. The stack array is depleted and can no longer accommodate control blocks.

System Action: Dump formatting is terminated.

System Programmer Response: Examine the control block chains to see if they are looping. If those chains are not looping, increase the dimension of the stack array.

DSNW018I SUBSYS= NOT SPECIFIED ON THE CONTROL CARD OR MISSING. REQUIRED IF SUMDUMP=NO SPECIFIED

Explanation: The 'SUMDUMP=NO' option was specified, but either the 'SUBSYS=' operand is missing, or it was incorrectly specified.

System Action: Dump formatting is terminated.

Operator Response: Run the dump printing job after the error has been corrected.

DSNW020I UNSUCCESSFUL SEARCH FOR THE ERLY CONTROL BLOCK

Explanation: The 'ERLY' control block could not be located in the dump.

System Action: Dump formatting is terminated.

Operator Response: Check that the 'SUBSYS=' operand was correctly specified, and rerun the job.

System Programmer Response: This message can mean that the 'ERLY' control block has been overlaid. Examine the full dump to determine whether the subsystem is present. If it is, you may be able to determine why the control block could not be located.

DSNW022I THE RESIDENT TRACE WAS NOT ACTIVE AT THE TIME OF DUMP

Explanation: Trace table formatting has been attempted, but no trace table existed at the time of the dump.

System Action: Dump formatting continues with any other control blocks that were to be formatted.

DSNW023I THE TRACE TABLE ENTRY IS OUT OF SEQUENCE OR OVERLAID

Explanation: A trace entry is overlaid by another trace entry of a different timestamp. This message is issued to flag an unrecognized trace entry. This can occur when the oldest entry in the table is the second half of a double entry.

System Action: Formatting of the trace table continues.

DSNW024I TRACE TABLE

Explanation: The trace table follows.

System Action: Trace table formatting follows.

DSNW025I DUMP ACCESS ERROR ACCESSING THE TRACE TABLE IN THE DUMP

Explanation: A nonzero return code was returned from the storage access routine when accessing the trace table.

System Action: Trace table formatting is bypassed.

System Programmer Response: Check the address and ASID of the trace table.

DSNW026I CONTROL BLOCK SUMMARY (ALL ADDRESS SPACES)

DSNW027I CONTROL BLOCK SUMMARY (SINGLE ADDRESS SPACE)

DSNW028I CONTROL BLOCK SUMMARY (LONG FORM GLOBAL)

DSNW029I CONTROL BLOCK SUMMARY (SHORT FORM GLOBAL)

Explanation: Messages DSNW026I through DSNW029I provide descriptive information regarding the type of formatting being produced.

System Action: Dump formatting continues.

DSNW030I DUMP ACCESS ERROR ACCESSING THE CONTROL BLOCK STRUCTURE TABLE IN THE DUMP

Explanation: The control block structure table cannot be accessed from the dump.

System Action: Control block formatting is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNW032I DUMP ACCESS ERROR ACCESSING ANCHOR CONTROL BLOCK

Explanation: The anchor control block cannot be accessed from the dump.

System Action: Control block formatting is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNW033I BEGINNING FORMATTING

Explanation: Formatting of DB2 control blocks is beginning.

DSNW034I TRACE TABLE AND GLOBAL BLOCKS ALREADY DUMPED

Explanation: An indicative dump is being requested. The DB2 trace table and the global blocks have already been dumped with first dump (full dump) for this abend dump (SNAP) invocation. These are, therefore, not dumped in the dump for this task.

DSNW035I WARNING – NO TASK RELATED CONTROL BLOCKS FOR THIS TASK

Explanation: The TCB for which the dump is being requested is not IDENTIFIED to DB2. Task-related control blocks are not dumped. The DB2 trace table and global blocks are dumped only if the 'SYSABEND' DD statement is present and only if this is the first of the dump(s) (full dump) for this abend dump (SNAP) invocation.

System Action: No DB2 formatting is done for the specified task.

DSNW036I CONTROL BLOCKS FOR TASKS ASSOCIATED WITH THE ABOVE RECOVERY COORDINATOR TASK

Explanation: The formatted blocks following this message are associated with TCBs that have IDENTIFIED to DB2 with the 'recovery coordinator = no' option. These TCBs may not have invoked SNAP, but they are associated with the TCB that did.

System Action: Related control blocks are dumped.

System Programmer Response: Examine the control blocks for relevant information.

DSNW037I TASK RELATED CONTROL BLOCKS FOR THIS TASK

Explanation: The formatted blocks following this message are associated with the TCB that is being dumped.

System Action: Relevant control blocks are dumped.

System Programmer Response: Examine the control blocks for relevant information.

DSNW038I END OF FORMATTING

Explanation: Formatting of DB2 control blocks is completed.

DSNW039I SUBSYSTEM FORMATTING COMPLETE FOR THIS DUMP

Explanation: The subsystem formatting routine has completed its processing for this dump data set.

DSNW040I 'VVV'CONTROL BLOCK FORMATTER ERROR FLAGS

:

- X'80': FIELD EXPECTED TO BE ZERO IS NONZERO
- X'40': LAST BLOCK IN CHAIN DOES NOT POINT BACK TO PARENT BLOCK
- X'20': BLOCK NOT FOUND IN DUMP
- X'10': BLOCK LENGTH INCORRECT
- X'08': VERIFICATION CODE INCORRECT
- X'04': BLOCK CHAINED FROM THIS BLOCK NOT FOUND IN DUMP
- X'02': BLOCK CHAINED FROM THIS BLOCK HAS WRONG VERIFICATION CODE
- X'01': VALIDATION CONSTANT DOES NOT MATCH EXPECTED VALUE

Explanation: The message DSNW040I appears at the beginning of a formatted dump. It defines the

hexadecimal values associated with the 'VVV=XX' keyword. This keyword is provided on the title line of each control block selected for formatting. It indicates any unusual conditions encountered during the validation and format processing of the current control block structure.

System Action: Dump formatting continues.

System Programmer Response: All nonzero 'XX' values should be examined. If an error is indicated, the printout of the dump should be used for the problem documentation.

Problem Determination: Possible errors include:

- X'80'
- X'40'
- X'20'
- X'04'

The current state of the individual control block structures at the time of error might vary with the type of error involved. Examine control block structures with one of these 'XX' values based on the specific ABEND code.

Example: A X'04' associated with the referencing control block and the X'20' associated with the referenced control block may mean the ABEND occurred between the release of the referenced control block and re-initialization of the address within the referencing one.

DB2 validation errors include:

- X'10'
- X'08'
- X'02'
- X'01'

These values indicate that a validation error occurred while formatting the associated control block.

For example, an X'08' associated with the referenced control block indicates the storage area has been overlaid or the address in the referencing control block is incorrect. Subsequent examination of the values in this control block is not reliable.

DSNW041I THE TAB CANNOT BE ACCESSED OR IT IS INVALID

Explanation: The DB2 trace table anchor block could not be located.

System Action: Formatting of the DB2 trace table is bypassed, and formatting of any other requested dump segment continues.

System Programmer Response: If 'SUMDUMP=NO' was specified on the dump control statement, omit this operand. Otherwise, specify this operand on the dump control statement. In either case, resubmit the job.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

**DSNW049I OLDEST SLOT ADDRESS INVALID,
FORMATTING TRACE TABLE FROM
FIRST ENTRY**

Explanation: The next trace table entry location is invalid.

System Action: Dump formatting continues.

System Programmer Response: The printout of the dump should be used for the problem documentation.

Problem Determination: The Trace Anchor Block has been initialized incorrectly, or overlaid during execution.

DSNW050I *ssid*,NO SDWA/LOGREC,
ABND=*comp-reason*,U=*user-id*,
M=*module*,C=XYR00.vrm.comp-function

Explanation: This message provides the default SVC dump title (SDUMP) associated with the SYS1.DUMP data set when an SDWA was unavailable during recovery processing. The variable fields are:

ssid 4-character DB2 subsystem name

comp-reason
Abend completion code, followed by the abend reason code.

user-id Authorization-ID for the individual subsystem user.

module Functional recovery routine responsible for the dump.

vrm.comp-function
Component-ID, as follows:

vrm DB2 version, release number, and modification level.

comp-function
Component-ID function.

System Action: Dump processing continues.

System Programmer Response: Since the SDWA provides important diagnostic information to assist in problem determination, examine the recovery environment at time of error to determine why an SDWA was not provided for this abend.

In a nonrecovery environment, there may be valid reasons for the lack of an SDWA.

Problem Determination: In a recovery environment, functional recovery routines (FRRs) are guaranteed an SDWA by Recovery Termination Manager (RTM). Therefore, the recovery routine is most likely an ESTAE

recovery routine. The primary reason for an SDWA not being provided to an ESTAE routine is insufficient storage available during recovery processing. Examine the region sizes allocated to the failing function to ensure that sufficient storage is available.

In a nonrecovery environment, no SDWA is provided because only RTM can create one.

DSNW051I ERROR DURING DUMP PROCESSING

Explanation: This message is generated by the 'SDUMP dump data gathering service' recovery routine when an error is encountered during dump processing.

System Programmer Response: This error is documented in a SYS1.LOGREC record. This message can be issued because of an error in the invocation of SDUMP, or because of an error in SDUMP itself, or during control block examination and access.

System Action: Processing of the 'SUMLSTA' user storage areas is terminated, an SVC dump is requested, and control is returned to RTM.

**DSNW052I ERROR ENCOUNTERED DURING
LOAD OR VALIDATION OF A CONTROL
BLOCK STRUCTURE TABLE MODULE**

Explanation: The DB2 dump formatting facility cannot be used to format control blocks. An error occurred during the DB2 startup process while attempting to LOAD one of the Control Block Structures Table (CBDS) modules from the DB2 subsystem program library.

System Action: Subsystem startup processing continues.

Operator Response: If intervention is desired, notify the system programmer.

System Programmer Response: If intervention is desired, the DB2 subsystem can be terminated by either an MVS CANCEL command or a -STOP DB2 command. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The modules must reside in a DB2 program library named on the execution procedure used to start a DB2 subsystem address space.

The named modules prohibit the use of the DB2 dump formatting facility to format SVC dumps that occur during the current execution cycle of the DB2 subsystem. The named modules are not required for DB2 execution.

**DSNW053I VRA DIAGNOSTIC INFORMATION
REPORT**

Explanation: All DB2 diagnostic information in the Variable Recording Area (VRA) at the time of the error

is extracted and displayed in this report.

The address of the SDWA, the contents of SDWARA, and SDWARA's hexadecimal offset into SDWA are also displayed. Individual diagnostic entries are identified by a hexadecimal VRA 'key', followed by the length of the subsequent data. Data fields are displayed in hexadecimal and EBCDIC formats. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

System Action: Dump format processing continues.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNW054I NO VRA DATA RECORDED IN SDWA

Explanation: The SDWA obtained from the SYS1.DUMP data set contained no diagnostic information in the VRA.

System Action: VRA report generation is bypassed, dump format processing continues.

System Programmer Response: If an error is indicated, the printout of the dump should be used for the problem documentation. If VRA data is needed, the abending DB2 subcomponent has failed to supply it. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNW055I FORMAT ROUTINE UNABLE TO LOCATE SDWA

Explanation: The MVS Summary Dump Data Access Service Routine (IEAVTFRD) was unable to locate the SDWA in the summary data portion of the SYS1.DUMP data set.

System Action: VRA report generation is terminated and dump format processing continues.

System Programmer Response: Take the appropriate action, as indicated in the next section. If an error is indicated, use the printout of the dump for problem documentation.

Problem Determination: The SDWA is placed in the summary data portion of the SYS1.DUMP data set by AMDPRDMP or IPCS. It indicates either CSA or Local Storage Residency.

If the SDWA is not in the dump data set, no error is indicated.

DSNW056I VRA DIAGNOSTIC REPORT COMPLETE

Explanation: The VRA Diagnostic Report is done.

System Action: Dump format processing continues.

DSNW060I BEGIN SAVE AREA TRACE

Explanation: This message identifies the start of the DB2 register Save Area Trace report which appears in the formatted section of a DB2 SVC Dump. The save areas for the current failing agent execution block (EB), and all associated Agent EBs, are traced from the point of error and displayed in order of invocation.

The format of this report is as follows:

Save Area Identification

The address and contents of each save area is displayed and identified by the invoking module.

Module-name Service-level-identifier

```
SA    .... WD1 .... HSA .... LSA ....
RET   .... EPA .... R0 ....
R1    .... R2 .... R3 ....
R4    .... R5 .... R6 ....
R7    .... R8 .... R9 ....
R10   .... R11 .... R12 ....
```

Module-name

Identifies the module responsible for obtaining the save area as indicated in the DB2 module entry point list (MEPL) at the time of the error.

If the MEPL does not contain an entry that corresponds to the module entry point address (EPA), this field is set to:

MODULE INFORMATION UNAVAILABLE

Service-level-identifier

The service level information associated with the module name is obtained from the corresponding module MEPL entry, and consists of the compilation-date and the PTF number of the latest maintenance applied.

If no maintenance has been applied for this module, this field defaults to the Function Modification Identifier (FMID).

SA

Identifies the address and contents of each word of the save area and is displayed using the format and register abbreviation conventions defined by MVS SNAP. All save area data references indicate the primary address space at the time of execution.

Execution Environment

Displays the current execution environment at the time of error for the save areas that follow. This information is repeated each time the current Agent execution EB changed during processing.

CURRENT EB=address JOBNAME=name
 HASID=hasid PASID=pasid
 EXECUTION MODE=mode

address

Address of the associated Agent EB.

name The 8-character MVS jobname associated with the home address space.

hasid Home address space identifier.

pasid Primary address space identifier.

mode Agent EB MVS execution mode:

TCB Task Control Mode

SRB Supervisory Request Mode

Register Save Area Contents for Agent EBs

The contents of the register save area chains for the current failing Agent EB, and all suspended Agent EBs at the time of error, are displayed using the save area (SA) format.

REGISTERS IN (CB-name) AT TIME OF execution-status

CB-name

Identifies the name of the control block from which the registers for the current Agent EB were obtained:

SDWA MVS System Diagnostic Workarea (Failure).

TCB MVS Task Control Block (Suspend).

STSV MVS SRB Status Save Area (Suspend).

execution-status

Indicates the current execution status of the Agent EB at the time of error:

Failure Failing execution EB.

Suspend Suspended execution EB.

Change of Primary Address Space

Since all register data references refer to the primary address space associated with the currently active execution EB, the following information is displayed each time the primary address changed during execution:

CHANGE OF ADDRESS SPACE, NEW PASID=pasid

pasid Indicates the new primary address space identifier associated with the save areas that follow.

System Action: save area trace format processing continues for the failing agent EB, and all associated agent EBs.

System Programmer Response: See the Problem Determination section.

Problem Determination: This report may be used to

determine the register contents, module invocation sequence, and execution environments leading up to the point of error.

DSNW061I SAVE AREA TRACE COMPLETE

Explanation: This message indicates that the DB2 formatted save area trace report (DSNW060I) is complete.

System Action: Dump format processing continues.

DSNW062I R6 (R6-contents) DOES NOT CONTAIN A VALID EB ADDRESS

Explanation: During dump format processing of the DB2 formatted Save Area Trace report (DSNW060I), register 6 (R6) did not contain the address of a valid Agent execution block (EB).

R6-contents:

The contents of register 6.

System Action: save area trace format processing is terminated for the current Agent EB, and all prior EBs.

System Programmer Response: The dump formatter expects the contents of register 6 to contain the address of a valid EB.

Problem Determination: Register 6 does not contain the current EB address or a prior EB address.

Refer to the abend reason and completion codes associated with the original error to determine the use of register 6 prior to the failure.

DSNW063I name (address) ASID (asid) NOT FOUND IN DUMP

Explanation: During dump formatter processing of the save area trace report (DSNW060I), a control block or save area was not found in the dump data set.

Since the dump formatter utilizes the DB2 and MVS control blocks defined under the 'name' field of this message to locate individual register save areas, subsequent save areas located via the 'named' control block or save area will not be displayed in the report.

name Identifies the name of the control block or save area that was not found in the dump data set:

SA Indicates a Save Area

ASCE DB2 Address Space Control Element

EB DB2 Execution Block

TCB MVS Task Control Block

RB MVS Request Block

XSB MVS Extended Status Block

PSA MVS Prefix Save Area

SDWA MVS System Diagnostic Work Area

STSV MVS SRB Status Save Area

STKE MVS Cross Memory Stack Element

address

The address of the 'named' control block or save area.

asid

The address space identifier associated with the control block or save area.

System Action: Register save area trace format processing for the current save area chains is terminated. Subsequent save area processing will vary depending on the specific control block or save area that was available, and the DB2 Agent execution environments at the time of the error.

System Programmer Response: Due to the execution structures and environmental restrictions of selected DB2 and MVS control structures, some control blocks and save areas associated with these execution environments will not be included in the dump data set.

Problem Determination: During MVS/RTM recovery processing, IFC Dump Services attempts to include all control blocks (both DB2 and MVS), and the pertinent DB2 save areas in the dump data set, regardless of the type of error. Control blocks and save areas associated with the following address spaces at time of error will be included in the dump data set:

- Primary, Secondary, and Home address spaces.
- DB2 System Services and Database Services address spaces.

DSNW108I UNABLE TO AUTOMATICALLY START type TRACE

Explanation: System parameters indicated that a DB2 trace should be started automatically during DB2 subsystem initialization, but the DB2 subsystem was unable to start the trace. A nonzero return code was received from the -START TRACE command.

System Action: Subsystem initialization continues.

Operator Response: Start the trace via the -START TRACE command after DB2 subsystem initialization is complete.

DSNW109I TRACE INITIALIZATION PARAMETERS UNAVAILABLE, DEFAULTS ASSUMED

Explanation: The trace function was unable to access the trace initialization parameters defined by the DSN6SYSP macro. Default values as defined by that macro are assumed for trace parameters.

System Action: Subsystem initialization continues.

Operator Response: Determine if the system parameters module DSNZPARM is missing or inaccessible. If not, determine if the CSECT DSN6SYSP is missing. Trace can be started with the -START TRACE command.

DSNW120I A SPECIFIED keyword VALUE IS INVALID FOR type TRACE

Explanation: A trace command has been entered, but a specified keyword value is not valid for the trace type requested.

System Action: Processing for the TRACE command is terminated.

Operator Response: If a -START TRACE command was entered, specify a valid destination for the trace. Otherwise, issue a -DISPLAY TRACE command to determine what traces are currently active. Refer to *DB2 Command Reference* for details about valid destinations.

Problem Determination: Obtain a copy of the system or terminal log to verify command entry.

DSNW121I A SPECIFIED CLASS VALUE IS INVALID FOR type TRACE

Explanation: A trace command has been entered, but a specified class value is not valid for the trace type requested.

System Action: Processing for the TRACE command is terminated.

Operator Response: If a -START TRACE command was entered, specify a valid class for the trace. Otherwise, issue a -DISPLAY TRACE command to determine what options are currently active. Refer to *DB2 Command Reference* for details about valid classes.

Problem Determination: Obtain a copy of the system or terminal log to verify command entry.

DSNW122I THE KEYWORD keyword IS NOT VALID FOR type TRACE

Explanation: A trace command has been entered, but 'keyword' is not valid for the trace type specified.

System Action: Processing for the TRACE command is terminated.

Operator Response: Either the named keyword must be omitted from the command, or a different type of trace must be specified. Refer to *DB2 Command Reference* for details about valid combinations of keywords and trace types.

Problem Determination: Obtain a copy of the system or terminal log to verify command entry.

DSNW123I csect-name TRACE RECORDING HAS BEEN RESUMED ON dest

Explanation: 'dest' destination resumes acceptance of trace data after a failure.

System Action: Data recording is resumed.

DSNW124I *csect-name type* **TRACE TERMINATED**
RC=code RMID=nn

Explanation: During processing 'type' trace, processing abended due to an error. A trace type of blank indicates all tracing has stopped. 'RMID', displayed in decimal, identifies the resource manager. 'RC', displayed in hexadecimal, specifies the return/reason/abend code associated with the action.

Further collection of the named trace is stopped. If it is necessary to resume collection of the trace, a -START TRACE command may be issued. However if another failure is experienced, the problem should be resolved before starting the trace collection again.

System Action: Processing for the named trace type is stopped. The message is not externalized by the functional recovery routine, but is outputted whenever a IFC event is driven at a later time. A trace type of blank indicates all tracing has stopped.

User Response: Investigate the reasons for the failure.

Operator Response: If necessary to collect the named trace, issue a -START TRACE command to resume processing.

Problem Determination: Obtain a copy of the system or terminal log. If a dump was produced, have it printed. Print a copy of the contents of the SYS1.LOGREC for the time period involved. Forward these items along with a copy of the system log to the system programmer.

DSNW125I **MULTIPLE ENTRIES NOT ALLOWED FOR keyword AND keyword**

Explanation: The following matrix shows keywords which can have multiple entries and the valid combinations. If the row keyword has multiple values then the column keyword can have multiple (M) entries or a maximum of one (1).

Certain keywords are not allowed with some commands. Refer to *DB2 Command Reference* for additional information.

	Class	Dest	Plan	Auth. ID	RMID	TNO	IFCID	Loca
Class		M	M	M	M	M	M	M
Dest	M		M	M	M	M	M	M
Plan	M	M		1	M	1	M	1
Auth. ID	M	M	1		M	1	M	1
RMID	M	M	M	M		M	M	M
TNO	M	M	1	1	M		M	1
IFCID	M	M	M	M	M	M		M
Loca	M	M	1	1	M	1	M	

System Action: Processing for the TRACE command is terminated.

Operator Response: Reenter the command omitting the invalid keyword.

Problem Determination: Obtain a copy of the system or terminal log to verify command entry.

DSNW126I *type* **TRACE NOT ALLOWED, ACTIVE TRACE TABLE FULL**

Explanation: The 'type' trace cannot be started because the active trace table is has reached the maximum number of active traces allowed.

This message is issued by the following CSECT: DSNWVCM1

System Action: Processing for the TRACE command is terminated.

Operator Response: Use the -DISPLAY TRACE command to see if an active trace could be stopped. An active trace must be stopped before any other start trace command will be processed.

Problem Determination: Obtain a copy of the system or terminal log to verify command entry.

DSNW127I **CURRENT TRACE ACTIVITY IS-**

Explanation: This message is the title for the -DISPLAY TRACE command output. The DSNW127I message is followed by the DSNW128I message, one or more DSNW129I messages, and the DSNW147I message.

This message is issued by the following CSECT: DSNWVCM1

DSNW128I **TNO TYPE CLASS DEST QUAL**

Explanation: This message is issued before any -DISPLAY TRACE responses. The message follows message DSNW127I. The title indicates the trace number that is active, the type of trace, the class within type, and the destination specified for the active trace entries. Whether the trace is qualified is also displayed. If QUAL=YES, the trace is qualified by authorization ID, plan, RMID, or location. If QUAL=NO, the trace is not qualified. Qualification information can be requested by specifying DETAIL(2) on -DISPLAY TRACE. Refer to messages DSNW143I, DSNW144I, DSNW145I, and DSNW148I for more information about -DISPLAY TRACE. The message number is not displayed to save space on the message line.

This message is issued by the following CSECT: DSNWVCM1

DSNW129I *tno type class dest qual*

Explanation: This message is issued for -DISPLAY TRACE responses. The message indicates the trace number that is active, the type of trace, the class within type, and the destination specified for the active trace entries. Whether the trace is qualified is also displayed. If QUAL=YES, the trace is qualified by authorization ID,

DSNW130I • DSNW137I

plan, RMID, or location. If QUAL=NO, the trace is not qualified. Qualification information may be requested by specifying DETAIL(2) on -DISPLAY TRACE. Refer to messages DSNW143I, DSNW144I, and DSNW145I for trace qualification information.

The message follows message number DSNW128I or DSNW129I. If more information is available than can be displayed on one line, subsequent lines of information are displayed. The message number is not displayed to save space on the message line.

DSNW130I *type* TRACE STARTED, ASSIGNED TRACE NUMBER *tno*

Explanation: 'type' trace has been started and assigned the decimal trace number 'tno'. Multiple messages are possible when the start request specifies multiple plans or multiple authorization ids.

This message is issued by the following CSECT:
DSNWVCM1

System Action: Processing for the -START TRACE command will continue.

DSNW131I STOP TRACE SUCCESSFUL FOR TRACE NUMBER(S) *tno*,...

Explanation: The trace number(s), 'tno,...', have been stopped. Up to five decimal trace numbers may be listed. If more than five traces have been stopped, then another DSNW131I message is sent.

System Action: Processing for the -STOP TRACE command will continue.

DSNW132I MODIFY TRACE SUCCESSFUL FOR TRACE NUMBER(S) *tno*,...

Explanation: The trace numbers, 'tno,...', have been modified. Up to five numbers may be listed. If more than five traces have been modified, then another DSNW131I message is sent.

System Action: Processing for the modify command will continue.

DSNW133I *csect-name* TRACE DATA LOST, *dest* NOT ACCESSIBLE RC=*code*

Explanation: The destination specified stopped accepting trace data during a trace. Some condition external to DB2 caused the data rejection. The reason for failure is defined by the return code (RC). The RC hexadecimal value can be:

- The hexadecimal return code from SMF. Refer to the appropriate MVS publication for the specific value.
- The hexadecimal return code from the GTF request.
04 GTF trace and/or USR tracing is not active.
- The hexadecimal return code from the OPn request.

- **04** No OPn buffer is assigned to an application to collect data.
- The hexadecimal return code from the OPX request.
04 No OPn buffer is assigned to an application to collect data.
- **08** The OPX trace destination buffer is full causing data to be lost.
- The hexadecimal return code from the SRV request.
10 The serviceability routine is absent.
xx The serviceability routine return code.

System Action: Trace processing continues although data will be lost.

This message will also be issued if a -START TRACE command is entered from the console or from the DB2I commands panel to an unassigned OPn or OPX destination. This is because the OP destination is not activated until an application program claims the buffer. DB2 will begin writing trace records to the buffer when an application program issues a -START TRACE to this same OP buffer destination.

Operator Response: Investigate the GTF or SMF facility to determine why data is not being accepted. You may want to issue a -START TRACE command to record the data at another destination. The -DISPLAY TRACE command shows what types of data were recorded at the specified destination. Message DSNW133I with RC=8 is due to exhaustion of storage in an OPx buffer.

Problem Determination: Obtain a copy of the system or terminal log to verify command. Refer to *MVS/ESA System Management Facilities (SMF)* for an explanation of the return code value. For instances of message DSNW133I with RC=8, consult Appendix E (Volume 2) of *DB2 Administration Guide*. The OPx buffer to which the records were to be written has been filled, and all subsequent records intended for the buffer will be lost until an IFI READA request is issued to read and clear the contents of the buffer. Suggested actions include increasing the size of the OPx buffer and/or issuing the IFI READA request more frequently so that the OPx buffer is read and cleared before buffer storage is exhausted.

DSNW135I *type* TRACE ALREADY ACTIVE, TRACE NUMBER *tno*

Explanation: 'type' trace was already active with trace number 'tno'.

System Action: Processing for the -START TRACE command will continue.

DSNW137I SPECIFIED TRACE NOT ACTIVE

Explanation: The specified trace could not be found in the active trace table.

System Action: Processing for the -STOP or -DISPLAY TRACE command will continue.

Operator Response: You may wish to issue an unqualified -DISPLAY TRACE command to determine all the active trace entries. If no traces are active then an unqualified -DISPLAY TRACE command response message is a DSNW137I message.

DSNW138I IFCID *ifcid-number* IS INVALID

Explanation: The specified IFCID number is outside the range of valid IFCID numbers or is an IFCID number which is not allowed on a trace command as specified in Part 5 (Volume 2) of *DB2 Administration Guide*.

System Action: Processing of the trace command is terminated before any trace functions are performed.

Operator Response: Investigate the reason for the problem.

Problem Determination: Refer to *DB2 Command Reference* for the range of valid IFCID numbers.

DSNW139I AUTHORIZATION FAILURE BECAUSE *authorization-privilege* PRIVILEGE REQUIRED

Explanation: The user of the command does not have the required authorization privilege to execute the command.

System Action: Command processing is stopped.

User Response: Notify the security administrator.

Operator Response: Notify the security administrator.

Problem Determination: Obtain a copy of the command input and verify the user's current authorization from the DB2 subsystem catalog.

DSNW140I ALL OPN DESTINATIONS ARE ASSIGNED

Explanation: The request could not be processed because destinations OP1 - OP8 were assigned.

System Action: Processing of the trace command is terminated before any trace functions are performed.

User Response: Investigate the reason for the failure.

Operator Response: Investigate the reason for the problem by doing a display trace to analyze the active traces.

Problem Determination: Analyze why all the OPn destinations are active after doing a display trace.

DSNW141I STORAGE NOT AVAILABLE FOR BUFFER SIZE *size* K BYTES

Explanation: The request could not be processed because storage cannot be obtained for the OPn destination storage buffer.

System Action: Processing of the trace command is terminated.

User Response: Investigate the reason for the failure.

Operator Response: Investigate the reason for the problem by doing a display trace to analyze the active traces.

Problem Determination: The problem is caused either because one or more prior start traces to an OPn destination used all the storage in the IFC OPn storage pool or because ECSA contiguous storage was not available. The IFC OPn storage pool limit is approximately 4 megabytes. When a trace is stopped the buffer storage is not free. If another start trace is issued to the same destination, the storage will be reused. If the requested storage is greater than the current unassigned buffer, it is free and a larger buffer is obtained. If the requested storage is less than the current unassigned buffer, the buffer is reused. Fragmentation can occur if either application programs or an operator specify numerous start commands for varying size buffers.

DSNW142I SPECIFIED BUFSIZE IS INCOMPATIBLE WITH ASSIGNED BUFFER

Explanation: The request could not be processed because the start trace command specified a BUFSIZE value for an OPn destination which has a buffer already assigned with a different BUFSIZE.

System Action: Processing of the trace command is terminated.

User Response: Investigate the reason for the failure.

Operator Response: Investigate the reason for the problem.

Problem Determination: The problem may be caused by one application program attempting to start a trace to a destination owned by another program. This is a site problem and can be solved by having application programs start traces to an OPX destination rather than a specific OPn destination. If only one application program is starting traces, then the program should either specify the same BUFSIZE for all requests or should not specify BUFSIZE.

DSNW143I CURRENT TRACE QUALIFICATIONS ARE -

Explanation: This message is issued before -DISPLAY TRACE responses when DETAIL(2) or DETAIL(*) is specified. Message DSNW143I is followed by the DSNW144I message, one or more DSNW145I messages, and the DSNW148I message.

DSNW144I TNO AUTHID PLAN RMID LOCATION

Explanation: This message is issued before -DISPLAY TRACE responses when DETAIL(2) is specified. The title indicates the trace number that is active, the authorization ID, the plan, the RMID, and the location specified for the active trace entries. The message follows message DSNW143I. The message number is not displayed to save space on the message line.

DSNW145I tno authid plan rmid location

Explanation: This message is issued for -DISPLAY TRACE responses when DETAIL(2) is specified. The message indicates the trace number that is active, the authorization ID, the plan, the RMID, and the location specified for the active trace entries.

The message follows messages DSNW143I or DSNW144I. If more information is available than can be displayed on one line, subsequent lines of information are displayed. The message number is not displayed to save space on the message line.

DSNW146I MULTIPLE ENTRIES NOT ALLOWED FOR keyword, keyword AND keyword

Explanation: The following matrix shows keywords that can have multiple entries and the valid combinations. If the row keyword has multiple values, the column keyword can have multiple (M) entries or a maximum of one (1).

	Class	Dest	Plan	Auth. ID	RMID	TNO	Loca
Class		M	M	M	M	M	M
Dest	M		M	M	M	M	M
Plan	M	M		1	M	1	1
Auth. ID	M	M	1		M	1	1
RMID	M	M	M	M		M	M
TNO	M	M	1	1	M		1
Loca	M	M	1	1	M	1	

Certain keywords are not allowed with some commands. Refer to *DB2 Command Reference* for additional information.

System Action: Processing for the TRACE command is terminated.

Operator Response: Omit the invalid keyword and reenter the command.

Problem Determination: Obtain a copy of the system or terminal log to verify command entry.

DSNW147I *END OF DISPLAY TRACE SUMMARY DATA*****

Explanation: This message is produced when all summary information for the -DISPLAY TRACE command has been written. Summary information is written when the DETAIL keyword is specified as '1', '*',

or not specified at all. Message DSNW147I follows one or more DSNW129I messages. The message number is not displayed to save space on the message line.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

DSNW148I *END OF DISPLAY TRACE QUALIFICATION DATA*****

Explanation: This message is produced when all qualification data for the -DISPLAY TRACE command has been written. Qualification data is written when the DETAIL keyword of the -DISPLAY TRACE command is specified as '2', or '*'. Message DSNW148I follows one or more DSNW145I messages. The message number is not displayed to save space on the message line.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

DSNW149I STOP TRACE COMMAND WAS UNSUCCESSFUL BECAUSE MONITOR TRACE CLASS 6 IS ACTIVE FOR QUALIFYING TRACE NUMBER(S) tno,...

Explanation: No traces were stopped by the -STOP TRACE command. Either -STOP TRACE(*) or -STOP TRACE(MON) CLASS(*) was issued when monitor trace class 6 was active. An asterisk (*) is not allowed for the TRACE and CLASS keywords when monitor trace class 6 is active. The trace numbers, 'tno,...', indicate the traces that met any other specified -STOP TRACE qualifying criteria (PLAN, AUTHID, RMID, LOCATION, TNO) and also activated monitor trace class 6, thereby preventing all qualifying traces from being stopped. This special handling of the asterisk on the -STOP TRACE command for monitor trace class 6 reduces the possibility of accidentally stopping monitor trace class 6, which enables and disables DB2 data propagation.

System Action: No traces are stopped. Processing of the -STOP TRACE command is terminated.

User Response: Reissue the -STOP TRACE command without using an asterisk for the trace type. You can use a asterisk for the CLASS keyword to stop all trace types except the monitor (MON) trace.

Operator Response: If you do not want DB2 data propagation capability, you can stop monitor trace class 6 to allow full use of the asterisk. First stop the traces

indicated by the trace numbers, 'tno,...', and then reissue the command.

If you want DB2 data propagation capability, do not stop monitor trace class 6. You must specify the trace TYPE. You can stop traces without specifying the trace CLASS as long as the trace TYPE is not (MON). If the trace TYPE is (MON), then you must specify the CLASS keyword explicitly (for example, -STOP TRACE(MON) CLASS(1,2)).

Refer to *DB2 Command Reference* for information on restrictions to the -STOP TRACE command when monitor trace class 6 is active.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

Chapter 22. DSNX... messages

DSNX100I bind-type SQL WARNING USING
authorization-id AUTHORITY
PLAN=plan-id DBRM=dbrm name
STATEMENT=statement number object
name IS NOT DEFINED

Explanation: The indicated object is not defined in the DB2 catalog.

bind-type

Type of BIND subcommand that caused the warning: BIND, REBIND

authorization-id

Authorization ID used during the BIND process: for a BIND subcommand, indicates the authorization ID of the plan owner; for a REBIND subcommand, indicates the authorization ID of the owner specified by the subcommand, or the latest owner of the plan. If this is a remote rebind, and the OWNER was not specified in the subcommand, then "REMOTE OWNER" will be output.

plan-id Name of the application plan specified in the BIND subcommand, blank if the application plan is not specified.

dbrm name

Name of the DBRM that contains the reference to the indicated object.

statement number

Statement number of the SQL statement referencing the name of the object.

object name

Name of the object that is not defined in the DB2 catalog.

System Action: A valid plan is created if no errors are detected and VALIDATE(RUN) is in effect.

System Programmer Response: Ensure that the indicated table is created before the statement is executed. Otherwise, execution of this statement results in an error.

This statement is bound dynamically on each execution of the statement. For better performance, REBIND the application program after the indicated object is created.

DSNX101I bind-type SQL WARNING USING
authorization-id AUTHORITY
PLAN=plan-id DBRM=dbrm name
STATEMENT=statement number THE
SPECIFIED AUTHORIZATION-ID DOES
NOT HAVE THE PRIVILEGE TO
PERFORM OPERATION op name ON
OBJECT object name

Explanation: The identified authorization ID does not have a privilege required for application plan execution.

bind-type

Type of BIND subcommand that caused the warning: BIND or REBIND

authorization-id

Authorization ID used during the bind process. For a BIND subcommand, it is the authorization ID of the plan owner. For a REBIND subcommand, it is the authorization ID of the owner specified by the subcommand, or the latest owner of the plan. If this is a remote operation, and the OWNER was not specified in the subcommand, then REMOTE OWNER is output.

plan-id Name of the application plan specified in the BIND subcommand. If the application plan is not specified, this field is blank.

dbrm name

Name of the DBRM that contains the unauthorized operation.

statement number

Statement number of the SQL statement containing the unauthorized operation.

System Action: A valid plan is created if no errors are detected and VALIDATE(RUN) is in effect.

System Programmer Response: You must take one of the following actions before the statement can be executed. Otherwise, the execution of the statement results in an error.

- Ensure that the appropriate authority is granted to the invoker of the latest BIND subcommand against this application plan
- Invoke the BIND subcommand again using an authorization ID with authority to perform all the operations in this application plan.

This statement is bound dynamically on each execution of the statement. For better performance, rebind the application program after the appropriate authority is granted to the invoker of the BIND subcommand against this application plan.

DSNX102I **bind-type SQL WARNING USING
authorization-id AUTHORITY
PLAN=plan-id DBRM=dbrm name
STATEMENT=statement number THE
REQUIRED INDEX HAS NOT BEEN
CREATED ON TABLE table name IN
PARTITIONED TABLESPACE table
space name**

Explanation: There was an attempt to reference the table in the table space (both specified in the message) when the required index was not yet created.

bind-type

Type of BIND subcommand that caused the warning: BIND or REBIND

authorization-id

Authorization ID used during the bind process. For a BIND subcommand, it is the authorization ID of the plan owner. For a REBIND subcommand, it is the authorization ID of the owner specified by the subcommand, or the latest owner of the plan. If this is a remote operation, and the OWNER was not specified in the subcommand, then REMOTE OWNER is output.

plan-id Name of the application plan specified in the BIND subcommand. If the application plan is not specified, this field is blank.

dbrm name

Name of the DBRM that contains the reference to the indicated table.

statement number

Statement number of the SQL statement referencing the indicated table.

System Action: A valid plan is created if no errors are detected and VALIDATE(RUN) is in effect.

System Programmer Response: Ensure that the required index on the indicated table in the partitioned table space is created before the statement is executed. Otherwise, execution of this statement results in an error. This statement is bound dynamically on each execution of the statement. For better performance, rebind the application program after the required index is created.

DSNX103I **bind-type SQL WARNING USING
authorization-id AUTHORITY
PLAN=plan-id DBRM=dbrm name
STATEMENT=statement number BIND
ISOLATION LEVEL RR CONFLICTS
WITH TABLESPACE LOCKSIZE PAGE
OR LOCKSIZE ROW**

Explanation: Because of the possible inconsistency between the isolation level of the application and the LOCKSIZE of the table space, table space locking is used to protect the integrity of the application.

bind-type

Type of BIND subcommand that caused the warning: BIND or REBIND

authorization-id

Authorization ID used during the bind process. For a BIND subcommand, it is the authorization ID of the plan owner. For a REBIND subcommand, it is the authorization ID of the owner specified by the subcommand, or the latest owner of the plan. If this is a remote operation, and the OWNER was not specified in the subcommand, then REMOTE OWNER is output.

plan-id Name of the application plan specified in the BIND subcommand. If the application plan is not specified, this field is blank.

dbrm name

Name of the DBRM that contains the reference to the indicated table.

statement number

Statement number of the SQL statement referencing the indicated table.

System Action: A valid plan is created if no errors are detected. Table space locking is used. RR isolation level is preserved.

System Programmer Response: If you do not want table space locking, use isolation level UR, CS or RS.

DSNX104I **bind-type SQL WARNING USING
authorization-id AUTHORITY
PLAN=plan-id DBRM=dbrm name
STATEMENT=statement number THE
RESULT OF DECIMAL
MULTIPLICATION MAY CAUSE
OVERFLOW**

Explanation: An arithmetic expression contains a decimal multiplication that might cause an overflow condition when the statement is executed. The problem can be corrected by restructuring the arithmetic expression so that decimal multiplication precedes decimal division or by changing the precision and scale of the operands in the arithmetic expression. Refer to Chapter 2 of *DB2 SQL Reference* for the precision and scale of the decimal multiplication and division results.

bind-type

Type of BIND subcommand that caused the warning: BIND or REBIND

authorization-id

Authorization ID used during the bind process. For a BIND subcommand, it is the authorization ID of the plan owner. For a REBIND subcommand, it is the authorization ID of the owner specified by the subcommand, or the latest owner of the plan. If this is a

remote operation, and the OWNER was not specified in the subcommand, then REMOTE OWNER is output.

plan-id Name of the application plan specified in the BIND subcommand. If the application plan is not specified, this field is blank.

dbrm name
Name of the DBRM that contains the reference to the indicated table.

statement number
Statement number of the SQL statement referencing the indicated table.

System Action: A valid plan is created if no errors are detected.

DSNX105I **bind-type SQL WARNING USING
authorization-id AUTHORITY
PLAN=plan-id DBRM=dbrm name
STATEMENT=statement number
SQLCODE=sqlcode
SQLSTATE=sqlstateTOKENS=token list**

Explanation: An SQL warning code was generated while processing an SQL statement.

bind-type
The type of subcommand that caused the warning: BIND or REBIND

authorization-id
Indicates the authorization ID used during the bind process. For a BIND subcommand, it is the authorization ID of the plan owner. For a REBIND subcommand, it is the authorization ID of the owner specified by the subcommand, or the latest owner of the plan. If this is a remote operation, and the OWNER was not specified in the subcommand, then REMOTE OWNER is output.

plan-id Name of the application plan specified in the BIND subcommand. If the application plan is not specified, this field is blank.

sqlcode
A product specific code which identifies the particular SQL warning condition. The value and semantics of the code are the same as the SQL return codes documented in Part 2, "SQL return codes," on page 11.

sqlstate
A common code which identifies the particular SQL warning condition.

dbrm name
Name of the DBRM that contains the problem.

statement number
Statement number of the SQL statement containing the problem.

token list
Sequence of one or more tokens separated by blanks. Refer to Part 2, "SQL return codes," on page 11 for an explanation of tokens.

System Action: A valid plan is created if no errors are detected.

System Programmer Response: Refer to Part 2, "SQL return codes," on page 11, for the particular SQL return code given in this message. If the reason code is negative, this statement is bound dynamically on each execution of the statement. For better performance, rebind the application program after correcting this statement or after the required object is created or altered.

DSNX106I **ATTEMPTED REBIND OF PACKAGE
pkg-id RESULTED IN A TOTAL OF
number ERRORS**

Explanation: Errors have been detected during the remote REBIND process. Only the first REBIND error will produce a specific message. Additional errors will simply be totaled, and the number will be returned to the user.

pkg-id Name of the package specified in the subcommand.

number
Total number of errors in the remote REBIND

System Action: The package was not rebound.

System Programmer Response: See previously output message to determine the initial error that caused the subcommand to be terminated unsuccessfully.

DSNX200I **bind-type SQL ERROR USING
authorization-id AUTHORITY
PLAN=plan-id DBRM=dbrm name
STATEMENT=statement number
SQLCODE=sqlcode
SQLSTATE=sqlstateTOKENS=token list
CSECT=csect name RDS
CODE=location code**

Explanation: An error has been detected while processing an SQL statement.

bind-type BIND | REBIND
indicates type of BIND subcommand that caused the error.

authorization-id
indicates the authorization ID used during the bind process. For a BIND subcommand, indicates the authorization ID of the plan owner. For a REBIND subcommand, indicates the authorization ID of the owner specified by the subcommand, or the latest owner of the plan.

plan-id Name of the application plan specified in the BIND subcommand. Blank if the application plan is not specified.

sqlcode
A product specific code which identifies the particular SQL error detected. The value and semantics of the code are the same as the SQL return codes documented in Part 2, "SQL return codes," on page 11.

sqlstate
A common code which identifies the particular SQL error detected.

dbrm name
Name of the DBRM that contains the error.

statement-number
Statement number containing the SQL error.

token list
Optional sequence of one or more tokens separated by blanks. These are the tokens that are to be substituted into the text of the error code as described at the beginning of Part 2, "SQL return codes," on page 11.

csect Name of the CSECT detecting the problem.

rds code
Unique code that identifies the location within the CSECT when the problem is detected.

System Action: No application plan is created.

System Programmer Response: Correct the SQL errors in the application program associated with the indicated DBRM. Precompile the application program, and reinvoke the BIND subcommand.

DSNX201I **bind-type SQL ERROR USING authorization-id AUTHORITY PLAN=plan-id DBRM=dbrm name STATEMENT=statement number SQL CODE=sql code TOKENS=token list; bind-type DBRM ERROR USING authorization-id AUTHORITY PLAN=plan-id DBRM dbrm name IS IN AN INCONSISTENT STATE**

Explanation: The content of a DBRM has been modified after the precompilation process.

bind-type
Type of BIND subcommand that caused the warning: BIND, REBIND

authorization-id
Authorization ID of the plan owner.

plan-id Name of the application plan specified in the BIND or REBIND subcommand (or blank if the application plan is not specified).

dbrm name
Name of the DBRM that is in error.

System Action: No application plan is created.

System Programmer Response: Precompile the application program associated with the indicated DBRM. Reinvoke the BIND subcommand.

DSNX202I **INVALID AMODE ATTRIBUTE FOUND FOR DATE OR TIME INSTALLATION REPLACEABLE EXIT ROUTINE module-name**

Explanation: During DB2 startup, the Relational Data System subcomponent loads the Date (DSNXVDTX) and Time (DSNXVTMX) exit routines. These routines must have the link-edited attributes AMODE(31) and RMODE(ANY). The module listed in the message 'module-name' did not have the correct addressing attributes. If the date and time LOCAL installation option is specified, DB2 will be unable to execute the date and time functions required by the exit routine that failed to load.

System Action: The load module is deleted. DB2 startup will continue.

Operator Response: Notify the system programmer.

System Programmer Response: When DB2 is stopped, the date and time exit routine must be link-edited again with the correct AMODE and RMODE control statements. For more information, refer to Appendix B (Volume 2) of *DB2 Administration Guide*.

DSNX203I **LOAD OF THE DATE OR TIME INSTALLATION REPLACEABLE EXIT ROUTINE module-name FAILED WITH MVS ABEND CODE = abend-code REASON CODE = reason-code DB2 STARTUP WILL CONTINUE**

Explanation: During DB2 startup, the Relational Data System subcomponent loads the date (DSNXVDTX) and time (DSNXVTMX) exit routines. During the load of EXIT ROUTINE 'module-name', MVS issued the abend code and reason code that would cause abnormal termination of the task, but the abend was suppressed. If the date and time LOCAL option is specified, DB2 will be unable to execute the date and time functions required by the exit routine that failed to load.

System Action: The load failed. DB2 startup will continue.

Operator Response: Notify the system programmer.

System Programmer Response: When DB2 is stopped, the date and time exit routine must be link-edited correctly. For more information, refer to Appendix B (Volume 2) of *DB2 Administration Guide*.

DSNX204I *csect-name* **ERROR LOADING THE DB2 CATALOG, REASON *reason*: DB2 STARTED ACCESS(MAINT)**

Explanation: The internal structure (DBD) for the catalog database (DSNDB06) was either not found or inconsistent when DB2 was started. See the appropriate reason for a more detailed description of the problem.

The *reason* is one of the following:

- 0 An error occurred reading the DBD01 table space. Check the Console for messages and SYS1.LOGREC for abends.
- 1 The expected level of the DBD for DSNDB06 is the previous release, but objects exist in the DBD for a current or later release.
- 2 The expected level of the DBD for DSNDB06 is the current release, but objects exist in the DBD for a later release.
- 3 The expected level of the DBD for DSNDB06 is a later release, but objects do not exist in the DBD for a later release.
- 4 The level of the DBD for DSNDB06 is unknown to this version of DB2.

System Action: DB2 was started ACCESS(MAINT).

System Programmer Response: Do not run any CREATES, ALTERS, DROPS, GRANTS, REVOKEs or BINDs when in this state; it might corrupt your catalog and directory. Determine the problem with the DSNDB01.DBD01 table space. An improper REPAIR or RECOVER of the table space might have been run. Fix the problem while in ACCESS(MAINT) mode and then stop and start DB2. See Section 4 (Volume 1) of Administration Guide for more information on recovering the DSNDB01.DBD01 table space.

Problem Determination: If you suspect an error in DB2 or the table space is in an inconsistent state refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2.

DSNX205I *csect-name* **THE DATA DEFINITION CONTROL OBJECT DEFINITIONS AND ATTRIBUTES ON MEMBER *member-name* ARE NOT THE SAME.**

Explanation: One or more data definition control object definitions and attributes on member *member-name* and on this member are not the same. The data definition control object definitions and attributes are defined in the initialization parameter module DSNZPARM.

System Action: Processing continues.

System Programmer Response: Use the same data definition control table object definitions and attributes for all members of the DB2 data sharing group. See Part 2 of *DB2 Installation Guide* for information about defining data definition control objects and attributes in DSNZPARM.

DSNX206I **LOAD OF THE ACCESS CONTROL AUTHORIZATION INSTALLATION REPLACEABLE EXIT ROUTINE *module-name* FAILED WITH MVS ABEND CODE = *abend-code* AND REASON CODE = *reason-code* DB2 STARTUP WILL CONTINUE**

Explanation: During DB2 startup, the Relational Data System subcomponent loads the Access Control Authorization (DSNX@XAC) exit routine. During the load of EXIT ROUTINE *module-name*, MVS issued the abend code and reason code that indicates abnormal termination of the task. However, the abend was suppressed. DB2 will not use the Access Control Authorization (DSNX@XAC) exit to perform authorization checking. DB2 authorization checking will be performed.

System Action: The load failed. DB2 startup will continue.

Operator Response: Notify the system programmer.

System Programmer Response: After DB2 has stopped, you must properly link-edit the Access Control Authorization exit routine. For more information, refer to Appendix B (Volume 2) of *DB2 Administration Guide*.

DSNX207I **INVALID AMODE ATTRIBUTE FOUND FOR ACCESS CONTROL AUTHORIZATION INSTALLATION REPLACEABLE EXIT ROUTINE *module-name***

Explanation: During DB2 startup, the Relational Data System subcomponent loads the Access Control Authorization (DSNX@XAC) exit routine. This routine must have the link-edited attributes AMODE(31) and RMODE(ANY). The module listed in the message *module-name* did not have the correct addressing attributes. DB2 will not use the Access Control Authorization (DSNX@XAC) exit to perform authorization checking. DB2 authorization checking will be performed.

System Action: The system deletes the load module. DB2 startup will continue.

Operator Response: Notify the system programmer.

System Programmer Response: After DB2 has stopped, you must properly link-edit the Access Control Authorization exit routine with the correct AMODE and RMODE control statements. For more information, refer to Appendix B (Volume 2) of *DB2 Administration Guide*.

DSNX208E *csect-name* **ATTEMPTING TO START DB2 WITH AN UNSUPPORTED CODE LEVEL. REASON CODE** *reason* **MISSING MAINTENANCE:** *maint* **CURRENT LEVEL** *current-code-level* **VALID LEVEL(S)** *valid-code-levels*

Explanation: The DB2 member that is starting has a code level that is not compatible with the catalog or with some other component of DB2.

reason indicates the problem:

- 1 DB2 is attempting to start with a level of code that is not valid. The missing maintenance, *maint*, is unknown.
- 2 The level of code that is required by the catalog, which is indicated by *current-code-level*, is not a valid code level. The missing maintenance, *maint*, is unknown.
- 3 A preconditioning or toleration APAR has not been applied. The required APAR or level of code is specified by *maint*.
- 4 The preconditioning or toleration maintenance is on the DB2 subsystem, but maintenance to the catalog that is specified by *maint*, has not been applied.

maint is an APAR number or a token that indicates a level of code. The value of *maint* is UNKNOWN if DB2 cannot determine the missing maintenance level.

current-code-level and *valid-code-levels* are for the use of your IBM service representative.

This message can occur in the following situations:

- The starting DB2 fell back from a later release and does not have the proper *maint* applied.
- The starting DB2 does not have the proper coexistence SPE, specified by *maint*, to start in a data sharing group, which is at a later release level.
- The starting DB2 is at a release in which coexistence with the data sharing group is not supported.

System Action: DB2 terminates with reason code 00E7009D.

System Programmer Response: Verify that:

- Coexistence is supported between the releases you are trying to run.
- The DB2 startup procedure points to the correct set of load libraries.
- The correct SPE has been applied.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 16.

DSNX209E *csect-name* **MEMBER** *member-name* **IS AT A CODE LEVEL WHICH IS NOT COMPATIBLE WITH THIS STARTING OR MIGRATING MEMBER. REQUIRED LEVEL:** *new-code-level* **KNOWN LEVELS:** *known-code-levels*

Explanation: The DB2 member that is starting will update the DB2 catalog, but the code level of that DB2 member is not compatible with the code level of the DB2 member that has already started. The DB2 subsystem at the earlier code level requires the correct SPE. The code level information in this message is for the use of your IBM service representative.

System Action: DB2 terminates with reason code 00E7009D after detecting the DB2 members that cannot coexist.

System Programmer Response: Check the DB2 Program Directory and Preventive Service Planning updates (PSP) for more information about the SPE that is needed.

Verify that:

- Coexistence is supported between the releases you are trying to run.
- The DB2 startup procedure points to the correct set of load libraries.
- The correct SPE has been applied to all active members in the group.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 16, 69.

DSNX900E *csect-name* **ILLEGAL VALUE DETECTED IN** *colname* **COLUMN OF SYSIBM.SYSPROCEDURES FOR PROCEDURE** *procname*

Explanation: The *colname* column of the SYSIBM.SYSPROCEDURES catalog table contains an unsupported value in a row associated with PROCEDURE=*procname*.

colname

The name of the column of the SYSIBM.SYSPROCEDURES table that contains the illegal value.

procname

The name of the stored procedure being processed when the illegal value was detected.

System Action: The invalid row in the SYSIBM.SYSPROCEDURES table cannot be processed.

Operator Response: Contact the system programmer.

System Programmer Response: Use ALTER PROCEDURE or ALTER FUNCTION to correct the unsupported column value in the

| SYSIBM.SYSROUTINES table.

DSNX905I *csect-name* **PROCEDURE OR FUNCTION** *name* **TERMINATED ABNORMALLY ASID=** *asid* **WLM_ENV=** *wlmenv*

Explanation: A stored procedure terminated abnormally while attempting to satisfy an SQL CALL statement for an SQL application.

name The name of the stored procedure or function that terminated abnormally.

asid The MVS ASID of the address space where the stored procedure executed.

wlmenv The name of the WLM application environment where the stored procedure executed. If it executed in the DB2-established stored procedures address space, this field will contain blanks.

System Action: The SQL CALL statement fails, and the SQL application is forced to roll back.

System Programmer Response: Correct the cause of the abnormal termination. If the correction requires the stored procedure to be linkedited again, then it might be necessary to cause the corrected MVS load module to be reloaded. Different commands must be used to cause this reloading depending on the environment in which the stored procedure was executed.

If it was run in a WLM-established stored procedures address space, issue the MVS VARY WLM,APPLENV=*name*,REFRESH command.

If it was run in the DB2-established stored procedures address space, issue the -START PROCEDURE command.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 4, 5.

DSNX906I *csect-name* **PROCEDURE OR FUNCTION** *name* **TERMINATED ABNORMALLY. THE PROCEDURE HAS BEEN STOPPED. ASID=** *asid* **WLM_ENV=** *wlmenv*

Explanation: A stored procedure terminated abnormally while attempting to satisfy an SQL CALL statement for an SQL application.

name The name of the stored procedure or function that terminated abnormally

asid The MVS ASID of the address space where the stored procedure executed.

wlmenv The name of the WLM application environment where the stored procedure executed. If it

executed in the DB2-established stored procedures address space, this field will contain blanks.

System Action: The SQL CALL statement fails, and the SQL application is forced to roll back.

The abnormal termination count for procedure *procname* was reached. The procedure is stopped and further requests for the procedure are rejected.

System Programmer Response: Correct the cause of the abnormal termination. If the correction requires the stored procedure to be linkedited again, then it might be necessary to cause the corrected MVS load module to be reloaded. Different commands must be used to cause this reloading depending on the environment in which the stored procedure was executed.

If it was run in a WLM-established stored procedures address space, issue the MVS VARY WLM,APPLENV=*name*,REFRESH command.

If it was run in the DB2-established stored procedures address space, issue the -START PROCEDURE command.

After the appropriate command has been issued to refresh the stored procedure load module, use the -START PROCEDURE command to activate the stored procedure.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 4, 5.

DSNX908I *csect-name* **PROCEDURE OR FUNCTION** *name* **WITH LOAD MODULE** *module* **EXCEEDED CPU RESOURCE LIMIT SSN=** *ssn* **PROC=** *jclproc* **ASID=** *asid* **WLM_ENV=** *wlmenv*

Explanation: A stored procedure or function consumed more CPU service units than allowed by the ASUTIME column of the ALTER PROCEDURES catalog table. The stored procedure might be in a loop.

name The name of the stored procedure or function being processed

module The MVS load module associated with the stored procedure

ssn The name of the DB2 subsystem that called the stored procedure.

jclproc The name of the JCL PROC used to start this stored procedures address space.

asid The MVS ASID of the address space where the stored procedure executed.

wlmenv The name of the WLM application environment where the stored procedure executed. If it executed in the DB2-established stored procedures address space, this field will contain blanks.

DSNX921I • DSNX941I

System Action: DB2 detaches the TCB associated with the stored procedure, which causes abnormal termination of the stored procedure.

Operator Response: Contact the system programmer.

System Programmer Response: If the stored procedure is looping, correct the stored procedure.

If the stored procedure is performing correctly, increase the ASUTIME value in the CREATE PROCEDURES row associated with the stored procedure.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 4, 5.

DSNX921I *csect-name* **SOME SQL CALL STATEMENTS CANNOT BE PROCESSED, BECAUSE REQUIRED RESOURCES ARE NOT AVAILABLE**
REASON=reason TYPE=type
NAME=name

Explanation: DB2 was unable to validate the attributes of the SYSIBM.SYSROUTINES catalog table and related objects because of an unavailable resource.

reason The DB2 reason code describing the unavailable resource

type The resource type

name The name of the resource

System Action: SQL CALL statements are rejected.

System Programmer Response: Resolve the unavailable resource problem. Then use the -START PROCEDURE(*) command to cause DB2 to accept SQL CALL statements.

Operator Response: Note the *reason* code, the *type* code, and the *name*. See the Problem Determination section for an explanation of the collected data.

Problem Determination: The reason code tells why the resource is unavailable. Reason codes are described in "Part 4. Reason Codes". Use the table defined for message DSNT500I to find the type of resource identified in the message.

DSNX922I *csect-name* **BEGINNING DISCONNECTION OF STORED PROCEDURE ADDRESS SPACES**

Explanation: This message is produced during -STOP DB2 processing. It indicates that DB2 SQL processing has been quiesced, and DB2 is now beginning the termination process for the stored procedures address spaces.

DSNX923I *csect-name* **ALL STORED PROCEDURE ADDRESS SPACES ARE NOW DISCONNECTED.**

Explanation: This message is produced during -STOP DB2 processing. It indicates that all of the stored procedure address spaces are now disconnected from DB2 and the stop of DB2 will continue.

WLM-established stored procedure address spaces are terminated by WLM after the disconnection from DB2.

DSNX940I *csect-name* - **DISPLAY PROCEDURE REPORT FOLLOWS-**

Explanation: This message is the title for the report output from the DISPLAY PROCEDURE command. It precedes messages DSNX941I and DSNX942I. Message DSNX943I might also be displayed. The final message for the report is DSNX945I.

System Action: The DISPLAY PROCEDURE command processing continues.

DSNX941I **PROCEDURE MODULE STATUS ACTIVE QUEUED MAXQUE TIMEOUT WLM_ENV**

Explanation: This message displays the column headings for the list of stored procedures generated by the DISPLAY PROCEDURE command. The definitions are:

PROCEDURE

The name of the stored procedure

STATUS

The status of the stored procedure

ACTIVE

The number of DB2 agents that are currently running this stored procedure

QUEUED

The number of DB2 agents that are currently waiting for this stored procedure to be scheduled

MAXQUE

The maximum number of DB2 agents that have waited for this stored procedure to be scheduled since DB2 was started

TIMEOUT

The number of times a request for this procedure timed out while waiting to be scheduled since DB2 was started

WLM_ENV

The MVS Workload Manager environment name for this stored procedure

System Action: The DISPLAY PROCEDURE command processing continues.

DSNX942I *procedure module status active maxact
queued maxque timeout*

Explanation: This message lists the DISPLAY PROCEDURE information for a given stored procedure. The definitions of the columns are:

procedure

The name of the stored procedure.

module The MVS load module associated with the stored procedure.

If the *module* column contains blanks, the request for the *procedure* is in a state in which the MVS load module name cannot yet be determined.

status The status of the stored procedure. The status can be any of the following values:

STARTED

The stored procedure is able to accept SQL CALL requests.

STOPABN

The stored procedure was stopped because of the previous abnormal termination of the stored procedure application. SQL CALL requests for the stored procedure are rejected.

The -START PROCEDURE command can be used to place the stored procedure in STARTED status.

STOPQUE

The stored procedure was stopped. SQL CALL requests for the stored procedure are queued until the stored procedure is started or the installation-defined timeout interval expires.

The -START PROCEDURE command can be used to place the stored procedure in STARTED status.

STOPREJ

The stored procedure was placed in this status by the STOP PROCEDURE ACTION(REJECT) command. SQL CALL requests for the stored procedure are rejected.

The -START PROCEDURE command can be used to place the stored procedure in STARTED status.

active The number of DB2 agents that are currently running this stored procedure.

maxact The maximum number of DB2 agents that have run this stored procedure concurrently since DB2 was started.

queued The number of DB2 agents that are currently waiting for this stored procedure to be scheduled.

maxque

The maximum number of DB2 agents that have waited for this stored procedure to be scheduled since DB2 was started.

timeout The number of times an SQL CALL statement timed out while waiting for a stored procedure to be scheduled since DB2 was started.

An SQL CALL statement can time out for several reasons:

- The procedure can be stopped by the STOP PROCEDURE ACTION(Queue) command, causing requests for the procedure to be queued until the installation-defined time interval expires.
- There might not be enough MVS TCBs in the DB2 stored procedures address space to satisfy the volume of SQL CALL statements.
- The MVS dispatching priority of the DB2 stored procedures address space might be too low to process the stored procedure requests in a timely manner.

System Action: The DISPLAY PROCEDURE command processing continues.

DSNX943I PROCEDURES *begin - end STOP (act)*

Explanation: This message indicates a STOP PROCEDURE command was issued with an invalid procedure name, causing a range of procedure names to be stopped. This message follows the DSNX940I, DSNX941I, and any DSNX942I messages.

begin The first procedure name in the range of procedure names that are currently stopped

end The last procedure name in the range of procedure names that are currently stopped

act The action provided on the STOP PROCEDURE command

System Action: The DISPLAY PROCEDURE command processing continues.

DSNX944I *csect-name* **THE STORED PROCEDURE FUNCTION IS NOT AVAILABLE**

Explanation: This message is returned by the START, STOP, and DISPLAY PROCEDURE command when the stored procedure facility is not available. It can also be produced when an MVS START command is used to start the stored procedures address space.

The following conditions cause the stored procedure facility to be unavailable:

DSNX945I • DSNX954I

- The DB2 DSNZPARM module does not include a value for the stored procedure JCL procedure name. This prevents DB2 from starting the stored procedure function.
- DB2 was unable to start the stored procedures address space. This can be caused by a JCL error in the stored procedures JCL procedure.
- DB2 is running on MVS/XA, which does not support the stored procedure function.

System Action: If a START, STOP, or DISPLAY PROCEDURE command is in progress, the command terminates.

If an MVS START command is used to start the stored procedures address space, the stored procedures address space terminates.

DSNX945I DISPLAY PROCEDURE REPORT COMPLETE

Explanation: The output from the DISPLAY PROCEDURE command is complete. This message follows the DSNX940I, DSNX941I, and any DSNX942I messages.

System Action: The DISPLAY PROCEDURE command processing continues.

DSNX946I *csect-name* START PROCEDURE SUCCESSFUL FOR *token*

Explanation: The START PROCEDURE command completed successfully.

token The procedure name supplied on the START PROCEDURE command.

System Action: The START PROCEDURE COMMAND processing continues.

DSNX947I *csect-name* STOP PROCEDURE SUCCESSFUL FOR *token*

Explanation: The STOP PROCEDURE command completed successfully.

token The procedure name supplied on the STOP PROCEDURE command

System Action: The STOP PROCEDURE command processing continues.

DSNX950I *csect-name* PROCEDURE *procname* HAS NOT BEEN ACCESSED

Explanation: The procedure name supplied on the DISPLAY PROCEDURE command has not yet been accessed by any SQL CALL statement. The specified *procname* might not be present in the SYSIBM.SYSROUTINES catalog table.

procname

The name of the stored procedure

System Action: Processing continues for any additional procedure names supplied on the command.

DSNX951I *csect-name* A STORED PROCEDURE CANNOT ISSUE START/STOP PROCEDURE COMMANDS

Explanation: A stored procedure attempted to issue the START or STOP PROCEDURE command. This is not allowed because the START and STOP PROCEDURE commands might cause the stored procedures address space tasks to terminate.

System Action: The START or STOP PROCEDURE command is rejected.

DSNX952I *csect-name* THE DB2-Established STOREDPROCEDURE ADDRESS SPACE IS ALREADY STARTED

Explanation: DB2 supports only one DB2-established stored procedure address space.

An MVS address space attempted to connect to DB2 as a DB2-established stored procedure address space, but another DB2-established stored procedure address space is already connected to DB2.

DB2 supports multiple WLM-established stored procedure address spaces.

System Action: The attempt to connect to DB2 is rejected.

DSNX953E *csect-name* STORED PROCEDURE JOBNAME OR STARTED TASK NAME DOES NOT MATCH ZPARM

Explanation: An MVS address space attempted to identify itself to DB2 as the DB2-established stored procedure address space, but the JOBNAME or started task name of the address space did not match the stored procedure's MVS procedure name recorded in the DB2 DSNZPARM module.

System Action: The attempt to connect to DB2 is rejected.

System Programmer Response: If you want to start the DB2-established stored procedure address space from the MVS console, you must use an MVS procedure name that matches the value in the DB2 DSNZPARM module.

DSNX954I *csect-name* ATTEMPT TO START DB2-Established STORED PROCEDURE ADDRESS SPACE PROC=*jclproc* FAILED

Explanation: DB2 attempted to start the DB2-established stored procedure address space using the JCL proc name specified in the DB2 DSNZPARM module. MVS failed the request.

Possible causes for the start failing include:

- JCL proc not found
- JCL error in the proc

jclproc The name of the JCL PROC used to start the stored procedures address space.

System Action: The DB2-established stored procedures address space will not be available.

System Programmer Response: Correct the error and use the -START PROCEDURE(*) command to start the DB2-established stored procedure address space.

DSNX955I

Explanation: A blank line that appears in the DISPLAY PROCEDURE or DISPLAY FUNCTION command.

System Action: The DISPLAY command processing continues.

DSNX956I ----- SCHEMA = schema

Explanation: This message reports the schema name requested on the DISPLAY PROCEDURE or DISPLAY FUNCTION command.

schema

The schema name for the stored procedure or function.

System Action: The DISPLAY command processing continues.

DSNX957I *csect-name* INSUFFICIENT AUTHORITY FOR OBJECT *object*

Explanation: This message is issued when a START, STOP, or DISPLAY command is issued for a stored procedure or user-defined function that the user is not authorized to START, STOP, or DISPLAY.

object The stored procedure or user-defined function that failed the authorization test.

System Action: The START, STOP, or DISPLAY command continues.

DSNX958I DISPLAY TERMINATED WITH MAX LINES

Explanation: This message indicates that the -DISPLAY PROCEDURE or -DISPLAY FUNCTION SPECIFIC report was truncated. The report was generated in response to a command from a MVS console, and more than 254 response messages were generated. Only 254 response messages are returned.

System Action: Command processing completes. The truncated report is written to the MVS console.

System Programmer Response: Reissue the -DISPLAY PROCEDURE or -DISPLAY FUNCTION

SPECIFIC command, specifying a smaller number of routines. This can be done by specifying a list of routines, a schema qualifier, or a partial routine name in the DISPLAY command rather than the default (*.*). Alternatively, the command can be reissued from the DB2 Commands panel or from a batch job rather than from the MVS console.

DSNX960E *csect-name* SOME SQL CALL STATEMENTS CANNOT BE PROCESSED, BECAUSE THE Language Environment ROUTINE CEEPIPI CANNOT BE LOADED SSN=*ssn* PROC=*jclproc* ASID=*asid* WLM_ENV=*wlmenv*

Explanation: To execute an SQL CALL statement, DB2 must load the Language Environment interface module (CEEPIPI). If the CEEPIPI module is not included in an accessible data set such as STEPLIB data sets, JOBLIB data sets, or the LPA library, DB2 is unable to call Language Environment to process stored procedure or function requests.

ssn The name of the DB2 subsystem to which the stored procedures address space was connected.

ssn The name of the JCL PROC used to start this stored procedures address space.

asid The MVS ASID of the address space where the load was issued.

wlmenv The name of the WLM application environment where the load was issued. If it executed in the DB2-established stored procedures address space, this field will contain blanks.

System Action: The address space attempting to process stored procedures or functions terminates.

System Programmer Response: Change the STEPLIB DD statement in the JCL used to start the stored procedure address space, or install the CEEPIPI module in one of the libraries already accessible to the address space.

After the CEEPIPI module is accessible, use one of the following techniques to restart the failing stored procedure address space:

- If the error was in a WLM-established stored procedures address space, use the MVS VARY WLM,APPLENV=name,RESUME command.
- If the error was in the DB2-established stored procedures address space, use the -START PROCEDURE(*) command.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1.

DSNX961I *csect-name* **ATTEMPT TO PERFORM JNI FUNCTION *function* FAILED FOR STORED PROCEDURE *procedure-name* SSN=*ssn* PROC=*jclproc* ASID=*asid* CLASS=*class-name* METHOD=*method-name* ERROR INFO= *error-information***

Explanation: A WLM-established stored procedures address space was unable to perform a Java Native Interface (JNI) function.

function

The JNI function that failed. Possible values are:

GET_DEFAULTS

JNI_GetDefaultJavaVMInitArgs

CREATE_VM

JNI_CreateJavaVM

CALL_METHOD

CallStaticVoidMethodA

procedure-name

The name of the stored procedure that was invoked.

ssn

The name of the DB2 subsystem to which the stored procedures address space is connected.

jclproc

The name of the JCL procedure that was used to start the stored procedures address space.

asid

The MVS ASID of the address space in which *function* was invoked.

classname

The name of the class that contains the Java method to be invoked.

method

The name of the Java method to be invoked.

error-information

The error information from the toString method for the Java error.

System Action: The CALL statement fails.

System Programmer Response: Take the appropriate action, depending on the value of *function*:

GET_DEFAULTS or CREATE_VM

Ensure that the ET/390 DLLs are in the STEPLIB concatenation for the stored procedures address space, or the z/OS UNIX System Services external link is set correctly to the PDSE that contains the DLLs.

CALL_METHOD

Fix the problem that is identified in *error-information*.

DSNX962I *csect-name* **THE Language Environment CEEPIPI SERVICE RETURNED AN UNEXPECTED RETURN CODE *rc* FOR FUNCTION *func* SSN= *ssn* PROC= *jclproc* ASID= *asid* WLM_ENV= *wlmenv***

Explanation: DB2 uses the Language Environment CEEPIPI service to load and execute user-written stored procedures. The Language Environment return code *rc* was not expected for the indicated Language Environment function call.

rc The return code received from CEEPIPI.

func The function requested by DB2. Possible values are:

add_entry

Add an entry to the Language Environment PIPI table dynamically.

call_main

Run a main program stored procedure using an existing Language Environment run time environment.

call_sub

Run a sub program stored procedure using an existing Language Environment run time environment.

delete_entry

Delete an entry from the Language Environment PIPI table dynamically.

end_seq

End a sequence of calls using CEEPIPI.

identify

Identify the language the module was written in.

init_main

Create Language Environment run time environment.

init_sub_dp

Create Language Environment sub run time environment.

term

Terminate the Language Environment run time environment.

start_seq

Start a sequence of calls using CEEPIPI.

ssn The name of the DB2 subsystem to which the stored procedures address space was connected.

jclproc The name of the JCL PROC used to start this stored procedures address space.

asid The MVS ASID of the address space where the CEEPIPI error was encountered.

wlmenv The name of the WLM application environment where the CEEPIPI error was encountered. If it executed in the DB2-established stored procedures address space, this field will contain blanks.

System Action: The attempt to run a stored procedure fails. The DB2 stored procedure address space attempts any new stored procedure requests it receives.

System Programmer Response: The Language Environment return codes from CEEPIPI are documented in *Language Environment for OS/390 & VM Programming Guide*.

If the values of *func* and *rc* are 'ADD_ENTRY' and X'0000000C', the error might be caused by using a compiler that is not Language Environment enabled to create the stored procedure. DB2 stored procedures must be compiled with a compiler that supports Language Environment.

Problem Determination: Collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 1.

DSNX964I *csect-name* **THE DB2-Established STORED PROCEDURES ADDRESS SPACE FOR SUBSYSTEM *subs* IS STARTED**

Explanation: The DB2-established stored procedures address space is now available to process SQL CALL statements.

subs The name of the DB2 subsystem to which the DB2-established stored procedures address space is connected.

System Action: Processing continues.

DSNX965I *csect-name* **THE DB2-Established STORED PROCEDURES ADDRESS SPACE FOR SUBSYSTEM *subs* IS STOPPING**

Explanation: The DB2-established stored procedures address space is terminating. Termination occurs when all active stored procedures in the DB2-established stored procedures address space return control to DB2.

subs The name of the DB2 subsystem to which the DB2-established stored procedures address space was connected.

System Action: DB2 continues to process any stored procedures that are currently running. If a new SQL CALL statement is received that is to be executed in the DB2-established stored procedures address space the request is queued.

DSNX966I *csect-name* **STORED PROCEDURE OR FUNCTION *sp* FAILED. Language Environment ENCLAVE RC = *erc*, FEEDBACK INFORMATION = *fi* SSN= *ssn* PROC= *jclproc* ASID= *asid* WLM_ENV= *wlmenv***

Explanation: DB2 uses the Language Environment CEEPIPI call_main or call_sub service to execute user-written stored procedures or user-defined function. The CEEPIPI interface returned information indicating a failure while executing the stored procedure.

sp The stored procedure or function name that was called using CEEPIPI.

erc The Language Environment enclave return code.

fi Contains one or two message identifiers. The message identifiers are constructed from the Language Environment condition token.

The message identifiers are constructed as follows:

- Single message: Facility_Id combined with Msg_No
- Two messages: Facility_Id combined with Class_Code and Facility_Id combined with Cause_Code

ssn The name of the DB2 subsystem that called the stored procedure or function.

jclproc The name of the JCL PROC used to start this stored procedures address space.

asid The MVS ASID of the address space where the stored procedure executed.

wlmenv The name of the WLM application environment where the stored procedure executed. If it executed in the DB2-established stored procedures address space, this field will contain blanks.

System Action: The attempt to run this stored procedure failed. The DB2 stored procedure address space attempts any new stored procedure requests it receives.

System Programmer Response: A description of the Language Environment enclave return code and the condition token are documented in *Language Environment for OS/390 & VM Programming Guide*. In many cases the feedback information contains a Language Environment message number. These are documented in z/OS Language Environment.

Problem Determination: Collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 1. 4.

DSNX967I *csect-name* **ATTEMPT TO PERFORM WLM FUNCTION *func* FAILED WITH WLM RC= *rc* RSN= *rsn* SSN= *ssn* PROC= *jclproc* ASID= *asid* WLM_ENV= *wlmenv***

Explanation: A WLM-established stored procedures address space was unable to perform a WLM operation required to communicate with WLM.

func The WLM function that failed. Possible values are:

- IWMCONN
- IWMSSEL
- IWMSTBGN
- IWMSTEND

ssn The name of the DB2 subsystem to which this stored procedure address space was connected.

jclproc The name of the JCL PROC used to start this stored procedures address space.

asid The MVS ASID of the address space where this function was invoked.

wlmenv The name of the WLM application environment where this function was invoked.

System Action: The stored procedures service task that encountered the error terminates. If this is the last service task in that address space, then that address space terminates.

The WLM return codes and reason codes are documented in MVS/ESA SP 5.3 Workload Management Services. In some cases the failures are caused by the WLM application environment being incorrectly defined or in a quiesced state. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 4, 5.

DSNX968I *csect-name* **STORED PROCEDURE ADDRESS SPACE IS UNABLE TO CONNECT TO WLM BECAUSE WLM_ENV = *wlmenv* IS STOPPED OR QUIESCED**

Explanation: A DB2 stored procedures address space could not connect to the Work Load Manager services of MVS because the WLM application environment was in a stopped or quiesced state.

wlmenv The name of the WLM application environment for which the stored procedure address space was being started.

System Action: The stored procedures address space terminates.

System Programmer Response: Correct the WLM application environment name that is being used by stored procedures address space JCL proc.

To change the status of the application environment use the MVS VARY WLM,APPLENV=*wlmenv*,RESUME command.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 4, 5.

DSNX969I *function status active queued maxque timeout wlm_env*

Explanation: This message lists the DISPLAY SPECIFIC FUNCTION information for a given external function. The definitions of the columns are:

function

The name of the external function.

status

The status of the function. The status can be any of the following values:

STARTED

The function is able to accept SQL statement requests.

STOPABN

The function was stopped because of the previous abnormal termination of the function application. SQL statement requests for the function are rejected. The -START SPECIFIC FUNCTION command can be used to place the function in STARTED status.

STOPQUE

The function was stopped. SQL statement requests for the function are queued until the function is started or the installation-defined timeout interval expires. The -START SPECIFIC FUNCTION command can be used to place the function in STARTED status.

STOPREJ

The function was placed in this status by the STOP SPECIFIC FUNCTION ACTION(REJECT) command. SQL statement requests for the function are rejected. The -START SPECIFIC FUNCTION command can be used to place the function in STARTED status.

active

The number of DB2 agents that are currently running this function.

queued

The number of DB2 agents that are currently waiting for this function to be scheduled.

maxque

The maximum number of DB2 agents that have waited for this function to be scheduled, since the last START SPECIFIC FUNCTION command was issued for this function.

timeout

The number of times an SQL statement timed out while waiting for a function to be scheduled since the last START SPECIFIC FUNCTION command was issued for this function. An SQL statement can time out because the function can be stopped by the STOP SPECIFIC FUNCTION ACTION(Queue) command, causing requests for the function to be queued until the installation-defined time interval expires.

wlm_env

The MVS Workload Manager environment name for this function.

System Action: The DISPLAY SPECIFIC FUNCTION command processing continues.

**DSNX970I FUNCTION STATUS ACTIVE QUEUED
MAXQUE TIMEOUT WLM_ENV**

Explanation: This message displays the column headings for the list of external functions generated by the DISPLAY SPECIFIC FUNCTION command. The definitions are:

FUNCTION

The name of the external function.

STATUS

The status of the function.

ACTIVE

The number of DB2 agents that are currently running this function.

QUEUED

The number of DB2 agents that are currently waiting for this function to be scheduled.

MAXQUE

The maximum number of DB2 agents that have waited for this function to be scheduled, since the last START SPECIFIC FUNCTION command was issued for this function.

TIMEOUT

The number of times an SQL statement timed out while waiting for a function to be scheduled since the last START SPECIFIC FUNCTION command was issued for this function.

WLM_ENV

The MVS Workload Manager environment name for this function.

System Action: The DISPLAY SPECIFIC FUNCTION command processing continues.

DSNX971I FUNCTIONS begin - end STOP (act)

Explanation: This message indicates a STOP SPECIFIC FUNCTION command was issued with an asterisk (*) in the function name, causing a range of function names to be stopped. This message follows the DSNX975I, DSNX969I, and any DSNX970I messages.

begin The first function name in the range of function names that are currently stopped

end The last function name in the range of function names that are currently stopped

act The action provided on the STOP SPECIFIC FUNCTION command

System Action: The DISPLAY SPECIFIC FUNCTION command processing continues.

**DSNX972I DISPLAY FUNCTION SPECIFIC
REPORT COMPLETE**

Explanation: The output from the DISPLAY FUNCTION SPECIFIC command is complete. This message follows DSNX975I, DSNX969I, and any DSNX970I messages.

System Action: The DISPLAY FUNCTION SPECIFIC command processing continues.

**DSNX974I csect-name STOP FUNCTION SPECIFIC
SUCCESSFUL FOR token**

Explanation: The function name supplied on the STOP FUNCTION SPECIFIC command completed successfully.

token The function name supplied on the STOP FUNCTION SPECIFIC command.

System Action: The STOP FUNCTION SPECIFIC command processing continues.

**DSNX975I csect-name - DISPLAY FUNCTION
SPECIFIC REPORT FOLLOWS-**

Explanation: This message is the title for the report output from the DISPLAY FUNCTION SPECIFIC command. It precedes messages DSNX969I and DSNX970I. Message DSNX971I might also be displayed. The final message for the report is DSNX972I.

System Action: The DISPLAY FUNCTION SPECIFIC command processing continues.

DSNX977I *csect-name* **FUNCTION *funcname* HAS NOT BEEN ACCESSED**

Explanation: The function name supplied on the DISPLAY FUNCTION SPECIFIC command has not yet been accessed by any SQL statement. The specific *funcname* might not be present in the SYSIBM.SYSROUTINES catalog table.

funcname

The name of the function.

System Action: Processing continues for any additional function names supplied on the command.

DSNX978I **DISPLAY TERMINATED DUE TO INSUFFICIENT MESSAGE SPACE**

Explanation: The DISPLAY PROCEDURE command could not obtain storage for additional messages. This should only happen for a particularly long display request, such as one requesting all stored procedures that have been accessed by DB2 applications since DB2 was started.

System Action: The display is truncated.

System Programmer Response: Reissue the -DISPLAY PROCEDURE command, and specify a smaller number of procedures. This can be done by specifying a partial procedure name in the DISPLAY PROCEDURE command rather than the default (*).

DSNX980E *csect-name* **ATTEMPT TO PERFORM CALL ATTACH FUNCTION *func* FAILED WITH DB2 SUBSYSTEM *subsys*. RETURN CODE=*rc*, REASON CODE=*reason***

Explanation: The DB2 stored procedures address space was unable to perform a DB2 call attach operation required to communicate with DB2.

func The DB2 call attach function that failed.

Possible values are:

- CONNECT
- OPEN
- CLOSE
- DISCONNECT

subsys The DB2 subsystem name involved in the call attach function

rc The DB2 call attach return code

reason The DB2 reason code

System Action: The stored procedures service task that encountered the error terminates. If this is the last service task in the address space, the the DB2 stored procedures address space terminates.

System Programmer Response: Consult the DB2 *DB2 Application Programming and SQL Guide* to

determine the cause of the DB2 call attach return code and reason code.

DSNX981E *csect-name* **THE PARAMETER *parm* CONTAINS AN INVALID VALUE "*string*" PROC=*jclproc***

Explanation: The DB2 stored procedures address space received an invalid value in the JCL parameter used to start the address space.

parm The JCL parameter is specified incorrectly. Possible values are:

SUBSYS

This parameter can be invalid for the following reasons:

- The SUBSYS parameter is null.
- The SUBSYS parameter is too long.
- The SUBSYS parameter contained an invalid character.

NUMTCB

This parameter can be invalid for the following reasons:

- A comma was not present in the parameter list to separate the NUMTCB parameter from the previous parameter.
- The NUMTCB parameter is null.
- The NUMTCB parameter contained nonnumeric characters.
- The value of the NUMTCB parameter is zero.
- The value of the NUMTCB parameter is negative.
- The value of the NUMTCB parameter is greater than the maximum number of TCBs allowed in the DB2 stored procedures address space.

APPLENV

This parameter can be invalid for the following reasons:

- A comma was not present in the parameter list to separate the APPLENV parameter from the previous parameter.
- The value of the APPLENV parameter is longer than eighteen characters.

string The value provided for the parameter in error.

jclproc The name of the JCL PROC used to start this stored procedures address space.

System Action: The DB2 stored procedures address space terminates.

If MVS WLM is used to establish the stored procedure address space, WLM will retry the start of the address space two more times. If all three attempts fail, WLM will quiesce the WLM environment associated with the stored procedure address space.

System Programmer Response: Correct the JCL parameter used to invoke the DB2 stored procedure address space.

If MVS WLM is used to establish the stored procedure address space, the MVS VARY WLM,APPLENV=*wlmenv*,RESUME command might be required to resume the WLM application environment (*wlmenv*) associated with the stored procedures address space.

DSNX982I *csect-name* **ATTEMPT TO PERFORM RRS ATTACH FUNCTION *func* FAILED WITH RRS ATTACH RC= *rc* RSN= *rsn* SSN= *ssn* PROC = *jclproc* ASID= *asid* WLM_ENV= *wlmenv***

Explanation: A WLM-established stored procedures address space was unable to perform an RRS attach operation required to communicate with DB2.

func The RRS attach function that failed. Possible values are:

- SPAS_ID
- SPAS_INIT_SP
- SPAS_TERM_SP

ssn The name of the DB2 subsystem involved with the RRS attach function.

jclproc The name of the JCL PROC used to start the stored procedures address space.

asid The MVS ASID of the address space where the function was attempted.

wlmenv The name of the WLM application environment where the function was attempted.

System Action: The stored procedures service task that encountered the error terminates. If this is the last service task in that address space, then that address space terminates.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination:

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 4, 5.

DSNX983I *csect-name* **DB2 STORED PROCEDURE SUPPORT CODE AND SUBSYSTEM CODE ARE NOT AT THE SAME LEVEL SSN= *ssn* PROC = *jclproc***

Explanation: A DB2 stored procedures address space could not connect to the DB2 subsystem. This occurred because the DB2 code in the stored procedures address space was not at the same release level as the code in the DB2 subsystem.

ssn The name of the DB2 subsystem that the stored procedure address space was attempting to connect with.

jclproc The name of the JCL PROC used to start the stored procedures address space.

System Action: The stored procedures address space terminates.

System Programmer Response: Correct the DB2 library name in the STEPLIB for the JCL proc for the stored procedures address space. Make the library name the same as the library name used for the DB2 subsystem address spaces. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 4, 5.

DSNX984I *csect-name* **ALL FUNCTIONS STARTED FOR THIS SCHEMA.**

Explanation: All functions are started for the schema listed in the preceding DSNX956I message. This message is issued only when STOP FUNCTION SPECIFIC(*.*) was in effect.

System Action: The DISPLAY SPECIFIC FUNCTION command processing continues.

DSNX985I *csect-name* **ALL PROCEDURES STARTED FOR THIS SCHEMA.**

Explanation: All procedures are started for the schema listed in the preceding DSNX956I message. This message is issued only when a STOP PROCEDURE(*.*) was in effect.

System Action: The DISPLAY PROCEDURE command processing continues.

DSNX986I **ATTEMPT TO *func* FAILED WITH RV = *rv* RC = *rc* RSN = *rsn* SSN = *ssn* PROC = *jclproc***

Explanation: A WLM-established stored procedures address space was unable to register itself to z/OS UNIX System Services. z/OS UNIX System Services

DSNX987I • DSNX992E

are not available to stored procedures running in the address space.

- func** The dub setting used by z/OS UNIX System Services BPX1SDD callable service. This can be DUBPROCESS or DUBTHREAD.
- rv** The return value given by z/OS UNIX System Services BPX1SDD callable service.
- rc** The return code given by z/OS UNIX System Services BPX1SDD callable service.
- rsn** The reason code given by z/OS UNIX System Services BPX1SDD callable service.
- ssn** The name of the DB2 subsystem to which this stored procedure address space was connected.
- proc** The name of the JCL PROC used to start this stored procedures address space.

System Action: The stored procedure address space initialization continues. z/OS UNIX System Services callable services' return values, return codes, and reason codes are documented in *z/OS UNIX System Services Messages and Codes*.

Problem Determination: Most failures are due to the user ID associated with the WLM-established stored procedures address space not being RACF defined. If you suspect an error in DB2, refer to Part 3 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

It is also possible that the number of processes was exceeded for the user ID. If the NUMBER OF TCBS is set too high during install, NUMTCB may exceed the value of the UNIX System Services MACPROCUSER setting. Refer to *z/OS UNIX System Services Messages and Codes* for more information.

DSNX987I *csect-name* **NAME** *schema-name*
INVALID, COMMAND IGNORED.

Explanation: The function name or procedure name supplied on the DISPLAY, START, or STOP, FUNCTION SPECIFIC or PROCEDURE command uses an invalid wildcard schema name. The qualified routine name must specify a full schema name, *"**"*, *"*.**"*, or blanks.

schema-name

The schema name containing invalid characters.

System Action: The START, STOP, or DISPLAY command is rejected.

DSNX988I *csect-name* **ALL OTHER FUNCTIONS IN OTHER SCHEMAS STOPPED** *act*

Explanation: A STOP FUNCTION SPECIFIC(*.*) is currently in effect. Any functions not listed in the preceding DSNX969, DSNX971, and DSNX976 messages are stopped *act*.

act The action provided on the STOP FUNCTION command

System Action: The DISPLAY SPECIFIC FUNCTION command processing continues.

DSNX989I *csect-name* **ALL OTHER PROCEDURES IN OTHER SCHEMAS STOPPED** *act*

Explanation: A STOP PROCEDURE(*.*) is currently in effect. Any functions not listed in the preceding DSNX942, DSNX943, and DSNX950 messages are stopped *act*.

act The action provided on the STOP PROCEDURE command

System Action: The DISPLAY PROCEDURE command processing continues.

DSNX990E *csect-name* **IMS ODBA INITIALIZATION FAILED BECAUSE THE CALLABLE INTERFACE CANNOT BE LOADED**

Explanation: The IMS ODBA callable interface module cannot be loaded. No IMS database DL/I calls will be supported from stored procedures. Ensure the load module named AERTDLI is located within the partitioned dataset specified in the stored procedure address space startup procedure's DFSRESLB dd card statement.

System Action: The stored procedure address space initialization continues.

DSNX991I *csect-name* **IMS ODBA INITIALIZATION COMPLETED**

Explanation: The initialization of the IMS ODBA callable interface has completed. Stored procedure applications may use DL/I calls to access IMS databases.

System Action: The stored procedure address space initialization continues.

DSNX992E *csect-name* **IMS ODBA INITIALIZATION FAILURE, AIB RC =** *rc*

Explanation: The initialization of the IMS ODBA callable interface has failed. Stored procedure applications cannot use DL/I calls to access IMS databases.

rc The AIB return code provided by IMS for the CIMS INIT call. Refer to the section on DL/I Return and Reason Codes in *IMS Application Programming: Database Manager* for more information regarding the failure.

System Action: The stored procedure address space initialization continues.

DSNX993I *csest-name* **CALL TO REXX
PROCEDURE *execname* FAILED,
FUNCTION = *function* RC = *rc* RSN = *rsn***

Explanation: An attempt to establish an environment to run a REXX stored procedure has failed. Use the following pieces of information to identify the error:

execname

The name of the REXX exec.

function

The TSO or REXX function call that failed. It can be one of three values: IKJTSOEV, IRXINIT, or IRXEXEC. For more information regarding the IKJTSOEV function, refer to *z/OS TSO/E Programming Services*. For information regarding IRXINIT and IRXEXEC, refer to *z/OS TSO/E REXX Reference*.

rc

The return code for the specific function, provided by TSO or REXX. For return code explanations, refer to *z/OS TSO/E Programming Services* and *z/OS TSO/E REXX Reference*.

reason

The reason code for the specified function, provided by TSO or REXX. For reason code explanations, refer to *z/OS TSO/E Programming Services* and *z/OS TSO/E REXX Reference*.

System Action: The stored procedure address space initialization continues.

Problem Determination: View the file associated with the SYSTSPRT DD card in the Stored Procedure Address Space start-up procedure. This file contains diagnostic messages issued by TSO regarding the failing function. Refer to *z/OS TSO/E Messages* for any messages found in the SYSTSPRT.

DSNX994I **SCOPE(GROUP) COMMAND CANNOT
BE PROCESSED DUE TO COMMAND
ALREADY IN PROGRESS**

Explanation: A -DISPLAY PROCEDURE, -START PROCEDURE, -STOP PROCEDURE, -DISPLAY FUNCTION, -START FUNCTION, or -STOP FUNCTION command with SCOPE(GROUP) was issued at the same time that another data sharing member was processing a SCOPE(GROUP) command. DB2 could not obtain the lock necessary to serialize these commands.

Severity: 8 (error)

System Action: The command is not processed on any members of the data sharing group.

User Response: Enter the command again.

Chapter 23. DSNY... messages

DSNY001I SUBSYSTEM STARTING

Explanation: The -START DB2 command is accepted. This message is issued to the MVS console that issued the -START command. The DSN9022I message is sent when the DB2 subsystem startup process has completed. Refer to the DSN9022I message for additional information.

System Action: DB2 startup processing begins.

DSNY002I SUBSYSTEM STOPPING

Explanation: The -STOP DB2 command is accepted. The DSN9022I message is issued when the DB2 subsystem shutdown process has completed. The message is issued either to the origin of the -STOP DB2 command (for MVS MCS console) or to the MVS console from which the -START DB2 command was received. Refer to the DSN9022I message for additional information.

System Action: DB2 subsystem shutdown is initiated.

DSNY003I SUBSYSTEM IS ALREADY ACTIVE

Explanation: The -START DB2 command has not been accepted, because the DB2 subsystem is active. The DSN9023I message is issued after this message. Refer to the DSN9023I message for additional information.

DSNY004I SUBSYSTEM IS ALREADY STOPPING

Explanation: The -STOP DB2 command has not been accepted either because the DB2 subsystem shutdown is in progress for the specified option (QUIESCE or FORCE), or because the QUIESCE option was specified after a FORCE option had been previously accepted. The DSN9023I message is issued after this message. Refer to the DSN9023I message for additional information.

System Action: DB2 subsystem shutdown is continued.

DSNY005I SUBSYSTEM STARTUP TERMINATED, INVALID START COMMAND

Explanation: The DB2 subsystem can be started only by a -START DB2 command.

System Action: DB2 subsystem startup is terminated.

Operator Response: Start the DB2 subsystem via the -START DB2 command, and reenter the rejected command.

DSNY006I *csect-name* INVALID AMODE OR RMODE ATTRIBUTE FOUND FOR LOAD MODULE *module name*

Explanation: The Initialization Procedures subcomponent detected that a module had an invalid AMODE or RMODE attribute when it was loaded. In the error message, 'module name' is the name of the load module with an invalid addressing or residency mode.

System Action: DB2 subsystem startup is terminated.

Operator Response: Notify the system programmer of the failure.

System Programmer Response: Verify that all installation and maintenance activities against DB2 were executed using SMP, that the JCLIN for SMP includes the correct AMODE and RMODE control statements, and that the Linkage Editor provided with the Data Facility Product (DFP) was invoked by SMP for the link edits. Correct the procedure or JCL that caused the error and rerun the necessary SMP jobs.

Problem Determination: A DB2 dump was requested to an MVS SYS1.DUMP data set. The MVS service aid AMBLIST provides Linkage Editor module attributes in the summary section of the LISTLOAD function output.

DSNY007I LOAD MODULE DSNHDECP DOES NOT HAVE RMODE(24) ATTRIBUTE

Explanation: The named load module was not link-edited with the required RMODE(24) attribute.

System Action: DB2 startup is abended with reason code 00E80160.

Operator Response: Notify the system programmer.

System Programmer Response: Verify that all installation and maintenance activities against DSNHDECP were executed using SMP. JCLIN for SMP must have included the correct AMODE and RMODE control statements. The Linkage Editor, provided with the Data Facility Product (DFP), was invoked by SMP for the link-edits. Correct the procedure or JCL that caused the error and rerun the necessary SMP jobs.

Problem Determination: The MVS service aid AMBLIST provides Linkage Editor module attributes in the summary section of the LISTLOAD function output.

DSNY008I SUBSYSTEM SHUTDOWN REQUEST NOT ACCEPTED

Explanation: The -STOP DB2 command has not been accepted because a subsystem startup has not completed to the point where shutdown can occur. The DSN9023I message is issued after this message. Refer to the DSN9023I message for additional information.

DSNY009I • DSNY020I

System Action: DB2 startup continues and the -STOP DB2 command is ignored.

User Response: Reissue the -STOP DB2 command after subsystem startup has completed.

DSNY009I SUBSYSTEM STARTING IN LIGHT MODE, NORMAL TERMINATION TO FOLLOW RELEASE OF RETAINED LOCKS

Explanation: DB2 issues this message during DB2 startup if it is restarted in light mode.

System Action: DB2 startup continues normally. The DB2 member will automatically shut itself at the end of restart after the retained locks are removed if there are no indoubt units of recovery. If indoubt units of recovery exist, then the DB2 member remains up and running in light mode so that the indoubts can be resolved.

DSNY010I LOAD MODULE *module name* IS NOT AT THE CORRECT RELEASE/VERSION LEVEL

Explanation: The named load module is not at the correct release/version level for the version of DB2 that was being started.

System Action: DB2 startup is abended with reason code 00E80161.

Operator Response: Notify the system programmer.

System Programmer Response: Verify that the correct load libraries are being used. Also verify that the application of maintenance did not result in modules being link edited into the wrong load libraries.

DSNY011I *csect-name* Z/ARCHITECTURE WITH 64-BIT ADDRESSING IS REQUIRED FOR THIS RELEASE OF DB2

Explanation: An attempt was made to start DB2 on a processor that either does not support z/Architecture, or is not enabled for 64-bit addressing.

System Action: DB2 startup abends with reason code 00E8005A.

System Programmer Response: Ensure that the processor on which DB2 is started supports z/Architecture and is enabled for 64-bit addressing.

DSNY012I *csect-name* THIS RELEASE OF DB2 REQUIRES Z/OS V1R3 OR ABOVE

Explanation: An attempt was made to start DB2 on an operating system image that was not z/OS V1R3 or above.

System Action: DB2 startup abends with reason code 00E80058.

System Programmer Response: Ensure that z/OS

V1R3 or above is enabled before starting DB2.

DSNY014I *n csect* DB2 HAS BEEN STARTED WITH ACCESS(MAINT)

Explanation: This DB2 has been started with option ACCESS(MAINT).

Severity: 0 (informational)

System Action: None.

Programmer Response: None.

DSNY015I LIGHT(YES) ON START DB2 COMMAND WAS IGNORED, SYSTEM IS NOT ENABLED FOR DATA SHARING

Explanation: DB2 issues this message during startup if DB2 is started with the LIGHT(YES) keyword and the system is not enabled for data sharing.

System Action: DB2 startup continues normally, ignoring the LIGHT(YES) keyword.

DSNY020I *csect-name* MEASURED USAGE DATA IS NOT BEING RECORDED FOR *subsystem/address-space*

Explanation: For measured usage data to be recorded, SMF type 89 records must be collected. Two PTFs must be applied: one to the early code and one to the base. Until both are active, measured usage data cannot be recorded.

System Action: Processing continues, but measured usage for either the DB2 subsystem or the specified DB2 address space is not recorded.

Programmer Response: If measured usage data is needed, be sure that SMF type 89 records are collected and that both PTFs are applied to the running system. An IPL is required for the change to early code.

If the records are being recorded, the PTFs are applied, and an address-space is in the message, then the return code for the MVS service is located in ASCEMULC for that address space.

Chapter 24. DSNZ... messages

DSNZ002I *src* DSNZINIT SUBSYSTEM *ssnm*
SYSTEM PARAMETERS LOAD
MODULE NAME IS *dsnzparm-name*

Explanation: DB2 subsystem '*ssnm*' is being started with the '*dsnzparm-name*' DSNZPARAM load module. This message is written to the MVS console which entered the -START DB2 command. The message will also appear in the JES SYSLOG and on the JES job log of *ssnm*MSTR. The message contains the name of the DSNZPARAM load module entered by the operator or the default name (DSNZPARAM) if no name was entered.

System Action: DB2 startup processing continues.

DSNZ003I *csect-name* DSNZINIT CSECT
parm-csect NOT FOUND IN SYSTEM
PARAMETERS.

Explanation: The named *parm-csect* was not found in the system parameters (ZPARM) specified when starting DB2. This CSECT is required to start DB2. The name of the system parameters load module that is missing this CSECT is identified in previously issued message DSNZ002I.

This error can occur if the system parameters load module specified is for a different release of DB2.

System Action: DB2 subsystem startup processing stops.

Operator Response: Verify that the correct system parameters name was specified. If the correct name was specified, notify the system programmer.

System Programmer Response: Verify that:

- The system parameters load module is for the release of DB2 being started.
- The correct load libraries are being used to load the system parameters load module.

If these are correct, then reassemble and relink-edit your system parameters load module.

DSNZ004I *csect-name* DSNZINIT INCORRECT
LEVEL *wrong-level* FOUND IN
parm-csect SYSTEM PARAMETERS.
LEVEL *correct-level* IS REQUIRED.

Explanation: The system parameters load module CSECT *parm-csect* contains an incorrect level identifier. The CSECT contains a level identifier of *wrong-level* and the DB2 that is starting requires a level identifier of *correct-level*.

This error can occur if the system parameters load module specified is for a different release of DB2. This error can also occur if the system parameters load module is missing some maintenance. In this case the

parm-csect is down level and must be reassembled.

System Action: DB2 subsystem startup processing stops.

Operator Response: Verify that the correct system parameters name was specified. If the correct name was specified, then notify the system programmer.

System Programmer Response: Verify that:

- The system parameters load module is for the release of DB2 being started.
- The correct load libraries are being used to load the system parameters load module.

If these are correct, then reassemble and relink-edit your system parameters load module.

DSNZ006I *src* SUBSYS *ssnm* SYSTEM
PARAMETERS LOAD MODULE NAME
module-name IS BEING LOADED

Explanation: DB2 subsystem *ssnm* is loading parameters from *module-name* subsystem parameters load module.

System Action: DB2 online refresh of subsystem parameters continues.

DSNZ007I *src* SUBSYS *ssnm* SYSTEM
PARAMETERS LOAD MODULE NAME
module-name LOAD COMPLETE

Explanation: DB2 subsystem *ssnm* has loaded subsystem parameters load module *module-name*, and has notified all resource managers.

DSNZ008I *src* CSECT *parm-csect* NOT FOUND IN
SYSTEM PARAMETERS

Explanation: The named *parm-csect* was not found in the subsystem parameters load module specified in the -SET SYSPARM command. Message DSNZ007I, which was issued prior to this message, identifies the name of the subsystem parameters load module that is missing this CSECT.

System Action: DB2 online refresh of subsystem parameters terminates.

System Programmer Response: Verify that:

- The system parameters load module matches the release level of the DB2 that was started.
- The correct load libraries are being used to load the system parameters load module.

If these are correct, then reassemble and relink-edit your system parameters load module.

DSNZ009I *src* **INCORRECT LEVEL** *wrong-level*
FOUND IN *parm-csect* **SYSTEM**
PARAMETERS. LEVEL *correct-level* **IS**
REQUIRED.

Explanation: This message, issued during -SET SYSPARM command processing, indicates the specified subsystem parameters load module CSECT *parm-csect* contains an incorrect level identifier. The CSECT contains a level identifier of *wrong-level*.

The active DB2 subsystem requires a level identifier of *correct-level*. This error can occur if the specified subsystem parameters load module does not match the release level of the DB2 system. This error can also occur if the subsystem parameters load module requires additional maintenance. In the latter case, the *parm-csect* is down-level and requires reassembly.

System Action: DB2 online refresh of subsystem parameters terminates.

DSNZ010I *src* **SUBSYS** *ssnm* **SYSTEM**
PARAMETERS LOAD MODULE NAME
module-name **NOT FOUND, BLDL**
R15=rc, R0=rsn

Explanation: During -SET SYSPARM command processing on subsystem *ssnm*, the specified subsystem parameters load module *module-name* could not be located during MVS BLDL processing. The BLDL issued a return code of *rc* and a reason code of *rsn*.

System Action: DB2 online refresh of subsystem parameters terminates.

System Programmer Response: Verify that the named load module exists, and that DB2 can access it.

DSNZ011I *src* **SUBSYS** *ssnm* **SYSTEM**
PARAMETERS SET TO STARTUP

Explanation: DB2 issues this message when the STARTUP parameter is specified on the -SET SYSPARM command. The message indicates that the subsystem parameters specified at DB2 startup are now in effect.

System Action: Processing continues.

DSNZ012I *src* **SUBSYS** *ssnm* **SYSTEM**
PARAMETERS LOAD MODULE NAME
module-name **NOT LOADED, LOAD**
R15=rc, R1=rsn

Explanation: DB2 issues this message during -SET SYSPARM command processing on subsystem *ssnm*, where the load of *module-name* failed. *rc* and *rsn* are the return and reason codes from the MVS LOAD.

System Action: Online refresh of subsystem parameters terminates.

DSNZ013I *src* **SUBSYS** *ssnm* **SYSPARM**
COMMAND REJECTED, COMMAND
ALREADY IN PROGRESS

Explanation: The current -SET SYSPARM command is rejected due to processing of a previous -SET SYSPARM command.

System Action: Online refresh of subsystem parameters for this command is rejected.

User Response: Retry the command after the previous -SET SYSPARM command completes.

DSNZ014I *src* **PARAMETER** *parm-name* **IN CSECT**
load-csect-name **CANNOT BE**
CHANGED ONLINE. PARAMETER
CHANGE IGNORED.

Explanation: Subsystem parameter *parm-name* in *load-csect-name* is different from its start-up value, but *parm-name* cannot be changed online.

System Action: DB2 uses the start-up value for parameter *parm-name*.

DSNZ015I *src* **YOU MUST HAVE INSTALL**
SYSADM AUTHORITY TO CHANGE
PARAMETER *parm-name* **ONLINE.**
PARAMETER CHANGE IS IGNORED.

Explanation: Install SYSADM authority is needed to change the *parm-name* parameter using the SET SYSPARM command. The previous value for *parm-name* is used.

System Action: The value for the *parm-name* parameter is not changed in the newly-loaded module.

Chapter 25. DSN1... messages

The messages in this section apply to DSN1LOGP, DSN1COPY, DSN1COMP, DSN1PRNT, and DSN1CHKR.

The value shown for 'severity' is the value returned as the job-stepcondition code from the job step in which the message is issued. If additional messages having higher severity values are issued during the same job step, the higher value is reflected as the job-step condition code.

Severity values have the following meanings:

- 0** An informational message. No error occurred.
- 4** A warning message. A condition was detected of which the user should be aware. The user might need to take further action.
- 8** An error message. An error situation was detected and processing could not continue.
- 12** A severe error message. A severe error situation was detected and processing could not continue.

DSN1110E LIMIT OF 50 STATEMENTS EXCEEDED

Explanation: DSN1LOGP allows a total of 50 statements for a given job.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Resubmit the job using no more than 50 statements.

DSN1111E LIMIT OF 80 TOKENS EXCEEDED

Explanation: DSN1LOGP allows a total of 80 keywords and corresponding value specifications. A keyword with its value is considered two tokens.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Resubmit the job using no more than 80 keywords.

DSN1112E TOKEN xx..xx EXCEEDS 64 HEXADECIMAL CHARACTERS

Explanation: The SYSIN input contains the character string 'xx..xx'. This string is invalid.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Resubmit the job with the specified token being no more than 64 hexadecimal characters in length.

DSN1113E VALUE FOR KEYWORD xxxxxxxx INVALID

Explanation: The SYSIN input contains the keyword 'xxxxxxx'. The value specified for that keyword is not of the form '(value)'.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Resubmit the job with the correct form of the keyword. The problem might be that the closing parenthesis ')' is missing or that an extra blank exists in the value.

DSN1114E RBASTART MULTIPLY DEFINED

Explanation: The RBASTART parameter can be specified only once for a given job.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Resubmit the job using a single RBASTART value.

DSN1115E *csect-name* KEYWORD *keyword* ALLOWS ONLY *number* HEX CHARACTERS

Explanation: The value given for *keyword* is too long.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Resubmit the job providing no more than the maximum number of characters allowed for the keyword.

DSN1116E *csect-name keyword* IS USED MORE THAN ONCE.

Explanation: The *keyword* can be used only once in a single job.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Resubmit the job providing a single keyword.

DSN1117E *csect-name keyword* SPECIFIED WITH NO VALUE OR INCORRECT VALUE

Explanation: The keyword must be followed by a correct value.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Resubmit the job providing a correct value for the keyword.

DSN1118E RBAEND > 12 HEX CHARACTERS

Explanation: The maximum size of a log RBA in DB2 is 6 bytes (hence, 12 characters).

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Resubmit the job providing an RBAEND value that is no more than 12 hexadecimal characters.

DSN1119E DBID MULTIPLY DEFINED

Explanation: The DBID keyword can be specified only once for a given job.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Resubmit the job providing a single DBID value.

DSN1120E DBID SPECIFIED WITH NO VALUE

Explanation: The DBID keyword specifies a hexadecimal database identifier and must be followed by a value.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Resubmit the job providing a DBID (value).

DSN1121E DBID > 4 HEX CHARACTERS

Explanation: A DBID is 2 bytes in length (hence, 4 characters maximum).

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Resubmit the job providing a DBID which is no longer than 4 hexadecimal characters.

DSN1122E OBID MULTIPLY DEFINED

Explanation: The OBID keyword can be specified only once for a given job.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Resubmit the job providing a single OBID value.

DSN1123E OBID SPECIFIED WITH NO VALUE

Explanation: The OBID keyword specifies a hexadecimal database object identifier. OBID must be followed by a value.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Resubmit the job providing an OBID (value).

DSN1124E OBID > 4 HEX CHARACTERS

Explanation: An OBID is 2 bytes in length (hence, 4 characters maximum).

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Resubmit the job providing an OBID which is no longer than 4 hexadecimal characters.

DSN1125E PAGE SPECIFIED WITH NO VALUE

Explanation: The PAGE keyword specifies a hexadecimal page number. PAGE must be followed by a value.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Resubmit the job providing a PAGE (value).

DSN1126E PAGE > 6 HEX CHARACTERS

Explanation: A page number is 3 bytes in length (hence, 6 characters maximum).

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Resubmit the job providing a PAGE value which is no longer than 6 hexadecimal characters.

DSN1127E KEYWORD xxxxxxxx UNKNOWN

Explanation: DSN1LOGP does not recognize the keyword 'xxxxxxx'.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Check to make sure all keywords are valid and resubmit the job.

DSN1128E *csect-name keyword* KEYWORD SPECIFIED WITHOUT *keyword*

Explanation: The identified keywords are associated with each other. You cannot specify one keyword without the other keyword.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Resubmit the job providing the corresponding correct keywords.

DSN1129E PAGE WITHOUT DBID OBID

Explanation: DB2 pages exist in objects called 'page sets'. When you specify a page, you must also identify the page set by using the appropriate DBID and OBID specifications.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Resubmit the job providing the associated DBID (value) and OBID (value) that correspond to the given page.

DSN1130E OBID WITHOUT DBID

Explanation: When you specify an OBID, you must also identify the database that contains that OBID by specifying the DBID of the database.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Resubmit the job providing both an OBID (value) and a DBID (value).

DSN1131E OFFSET/VALUE PAIR NUMBER xx CONTAINS INVALID HEX DATA

Explanation: A hexadecimal specification is required. The value for offset/value pair number 'xx' contains an invalid hexadecimal character.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Resubmit the job providing a correct hexadecimal value specification.

DSN1132E URID SPECIFIED WITH NO VALUE

Explanation: The URID keyword specifies the hexadecimal unit of recovery identifier. URID must be followed by a value.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Resubmit the job providing an associated value for the URID parameter.

DSN1133E URID > 12 HEX CHARACTERS

Explanation: The maximum size of a URID in DB2 is 6 bytes (hence, 12 characters).

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Resubmit the job providing a valid URID value of no more than 12 hexadecimal characters.

DSN1134E *csect-name* LIMIT OF *number keywords* IS EXCEEDED

Explanation: The *keyword* was specified more than the maximum number of times allowed in any given job.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Resubmit the job specifying this keyword no more than the maximum number of times.

DSN1135E SUMMARY MULTIPLY DEFINED

Explanation: The SUMMARY option can be specified only once.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Resubmit the job using a single SUMMARY specification.

DSN1136E SUMMARY SPECIFIED WITH NO VALUE OR INCORRECT VALUE

Explanation: The permitted values for summary are YES, NO, ONLY, or FILTER.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Resubmit the job providing a valid parameter for the SUMMARY option.

DSN1137I *csect-name* **FIRST PAGE SET
CONTROL RECORD AFTER RESTART
LOG** *seq nnnnnnnnnnnn*

Explanation: This message shows the log sequence number of a record that serves as an implicit indication that a restart occurred just prior to this point.

seq RBA or LRSN

nnnnnnnnnnnn

The log sequence number

Severity: 0 (informational)

System Action: Processing continues.

DSN1138E *csect-name keyword* **AND** *keyword*
CANNOT BOTH BE SPECIFIED

Explanation: You cannot specify both keywords in one job.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Resubmit the job specifying only one of the keywords.

DSN1139E **RID SPECIFIED WITH NO VALUE**

Explanation: The RID keyword specifies a 4-byte hexadecimal number, with the first 3 bytes representing the page number and the last byte representing the record ID. A value must be associated with the RID.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Resubmit the job providing a RID (value).

DSN1140E **RID > 8 HEX CHARACTERS**

Explanation: The maximum size of a RID in DB2 is 4 bytes (hence, 8 characters).

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Resubmit the job providing a valid RID value of no more than 8 hexadecimal characters.

DSN1141E **RID WITHOUT DBID OBID**

Explanation: The DBID and OBID associated with the given RID value must be specified.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Resubmit the job providing the associated DBID (value) and OBID (value) that correspond to the given RID value.

DSN1142E **DATAONLY MULTIPLY DEFINED**

Explanation: The DATAONLY option limits the log records extracted in the detail report to those that represent data modifications. This option can be specified only once.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Resubmit the job specifying DATAONLY once.

DSN1143E **DATAONLY SPECIFIED WITH NO
VALUE OR INCORRECT VALUE**

Explanation: The DATAONLY keyword must be specified with either a YES or NO value. Any other value (including no value) is incorrect.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Resubmit the job specifying the correct value for the DATAONLY parameter.

DSN1144E **RBASTART SPECIFIED WITH NO
VALUE**

Explanation: The RBASTART keyword specifies the hexadecimal log RBA from which to begin extraction. RBASTART must be followed by a value.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Resubmit the job providing an associated value for the RBASTART parameter.

DSN1146E **CURRENT END CHECKPOINT
TIMESTAMP** **TIMESTAMP=yy.ddd**
hh.mm.ss LOG RBA=xxxxxx IS OUT
OF SEQUENCE. THE GREATEST
TIMESTAMP SEEN SO FAR IS
TIMESTAMP=yy.ddd hh.mm.ss LOG
RBA=xxxxxx **Multiple processors may**
be writing to the same log.

Explanation: This message indicates that the current log record has a timestamp that is less than the previous timestamp processed. This may be a potential problem.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Examine current log to determine whether multiple processors are writing to the same log. (Data may be being overwritten.) This may lead to data inconsistencies.

DSN1147E SYSCOPY MULTIPLY DEFINED

Explanation: The SYSCOPY option can only be specified once.

Severity: 8

System Action: Processing is terminated.

User Response: Resubmit the job using a single SYSCOPY specification.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

DSN1148E SYSCOPY SPECIFIED WITH NO VALUE OR INCORRECT VALUE

Explanation: The SYSCOPY keyword must be specified with either a YES or NO value. Any other value (including no value) is incorrect.

This message is issued by the following CSECT:
DSN1LPAR

Severity: 8

System Action: Processing is terminated.

User Response: Resubmit the job specifying the correct value for the SYSCOPY parameter.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

DSN1150I SUMMARY OF COMPLETED EVENTS

Explanation: This message heads the summary of completed units of recovery (URs) and checkpoints. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Severity: 0 (informational)

System Action: Processing continues.

DSN1151I *csect-name mbn* UR CONNID=*cc*
CORRID=*bb* AUTHID=*aa* PLAN=*pp*
START DATE=*yy.ddd* TIME=*hh:mm:ss*
DISP=*xx* INFO=*ii* STARTRBA=*ss*
ENDRBA=*ee* STARTLRSN=*rr*
ENDLRSN=*nn* NID=*nid* LUWID=*luwid*
COORDINATOR=*name* PARTICIPANTS:
(*list of participants*)

Explanation: This message describes a unit of recovery (UR) that terminated for data sharing member *mbn*.

mbn MEMBER=*membername*, where *membername* is the member of a data sharing group. This is printed only for a data sharing record.

cc Connection ID (for example, BATCH).

bb Correlation ID (for example, JOB xxx).

aa Authorization ID executing the UR.

pp Plan name used by the UR.

DSN1LOGP returns a plan name of SYSTEM in this field if the UR was generated as a result of a system event (such as the first update of a table space). In such a case, no bound plan exists for the UR described.

yy.ddd Starting date of the UR.

hh:mm:ss
Starting time of the UR.

xx Disposition of the UR. Values reported are:
Inflight
In-abort
In-commit
Indoubt
Committed
Aborted
P-Abort

If the UR was bypassed by a conditional restart, DSN1LOGP indicates this by preceding the disposition value with the word BYPASSED.

ii The status of the data is one of the following:
COMPLETE, indicating that all page sets modified by this UR were identified.
PARTIAL, indicating that the list of page sets modified by this UR is incomplete.
DSN1LOGP indicates PARTIAL status if all records associated with a UR are not available, and no checkpoint is found before the UR's completion.

ss RBA of the first log record associated with the UR (that is, the URID).

ee RBA of the last log record associated with the UR.

DSN1152I • DSN1154I

rr LRSN of the first log record associated with the UR.

nn LRSN of the last log record associated with the UR

nid The identifier assigned by IMS or CICS for this UR. This is blank if the UR is a result of TSO, batch, or remote access.

luwid The logical unit of work identifier associated with the UR

name The name of the remote coordinator associated with the UR. This is blank if the coordinator is the local DB2, IMS, or CICS.

list of participants

The names of all remote participants that might have updated data in this UR.

This message is followed by messages that identify the page sets modified by the UR. For each page set, a single message is printed in the following form:

DATABASE=*dbid*=*dbname*
PAGE SET=*obid*=*psname*

Where:

dbid Internal database identifier

dbname Database name corresponding to the *dbid*

obid Internal page set identifier

psname Page set name corresponding to the OBID

The *dbname* and *psname* fields might be absent if a full checkpoint was unavailable to DSN1LOGP or was caused by overlapped processing of DB2 during a checkpoint.

If no data was modified by the UR (for example, certain URs might be created merely to track information that is valid only for the life of the application), the phrase NO DATA MODIFIED is printed.

Severity: 0 (informational)

System Action: Processing continues.

DSN1152I *csect-name mbn UR CONNID=**
CORRID=** AUTHID=** PLAN=** START
DATE=** TIME=** DISP=xx INFO=ii
STARTRBA=ss STARTLRSN=**
ENDRBA=ee ENDLRSN=nnNID=nid
LUWID=luwid COORDINATOR=name
PARTICIPANTS: (list of participants)*

Explanation: This message describes a unit of recovery (UR) for data sharing member *mbn*. The UR identifying information (**) described in message DSN1151I is unavailable.

mbn MEMBER=*membername*, where *membername* is the member of a data sharing group. This is printed only for a data sharing record.

The remaining information (DISP, INFO, START, END, NID, LUWID, COORDINATOR and PARTICIPANTS) appears just as it does in message DSN1151I. If the UR did not complete, the END RBA or LRSN values are not printed.

This message is followed by messages that identify the page sets modified by the UR. Details of that are in the explanation of message DSN1151I.

Severity: 0 (informational)

System Action: Processing continues.

DSN1153I *csect-name CHECKPOINT mbn
STARTRBA=ss ENDRBA=ee
STARTLRSN=rr ENDLRSN=nn
DATE=yy.ddd TIME=hh:mm:ss*

Explanation: This message describes a complete checkpoint on the log starting and ending RBA or LRSN for data sharing member *mbn*. If the information is available, DSN1LOGP also returns the date and time that the checkpoint started.

When this message follows message DSN1157I RESTART SUMMARY, it identifies the checkpoint that would be used at restart. If no checkpoint is available, message DSN1158I is printed instead.

mbn MEMBER=*membername*, where *membername* is the member of a data sharing group. This is printed only for a data sharing record.

Severity: 0 (informational)

System Action: Processing continues.

DSN1154I *csect-name RESTART mbn AT RBA=xx
LRSN=ll DATE=yy.ddd TIME=hh:mm:ss*

Explanation: A normal restart occurred at log RBA *xx* or LRSN *ll*.

mbn MEMBER=*membername*, where *membername* is the member of a data sharing group. This is printed only for a data sharing record.

DSN1LOGP also returns the date and time of that restart.

Severity: 0 (informational)

System Action: Processing continues.

DSN1155I *csect-name* **CONDITIONAL RESTART**
mbn **AT RBA=xx LRSN=ll DATE=yy.ddd**
TIME=hh:mm:ss STARTRBA=ss
ENDRBA=ee FORWARD=ff
BACKOUT=bb

Explanation: A conditional restart occurred at the log RBA *xx* and LRSN *ll*. DSN1LOGP also returns the date and time of that restart.

mbn MEMBER=*membername*, where *membername* is the member of a data sharing group. This is printed only for a data sharing record.

ss Relative byte address of the beginning of the restart

ee Relative byte address of the conclusion of the restart

ff Whether forward log recovery phase was to be bypassed (YES | NO)

bb Whether backward log recovery phase was to be bypassed (YES | NO)

Severity: 0 (informational)

System Action: Processing continues.

DSN1156I ALL URS COMPLETE

Explanation: There are no URS outstanding for restart.

Severity: 0 (informational)

System Action: Processing continues.

DSN1157I RESTART SUMMARY

Explanation: This message heads the summary of the description of work to be performed at restart. Restart information that follows is based on the scope of the log scanned. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Severity: 0 (informational)

System Action: Processing continues.

**DSN1158I NO CHECKPOINT AVAILABLE —
RESTART SUMMARY INCOMPLETE**

Explanation: No checkpoint is available within the scope of the log scanned. The information following this message includes:

- URS that have not completed
- Page sets modified by these URS
- Page sets with writes pending.

The information cannot be considered complete.

Severity: 0 (informational)

System Action: Processing continues.

DSN1159I NO DATABASE WRITES PENDING

Explanation: All database I/O has been completed. If the Log Extractor can find no complete checkpoint, it will return an additional message '(BASED ON INCOMPLETE LOG INFORMATION)', to warn you that there may in fact be pending database writes.

Severity: 0 (informational)

System Action: Processing continues.

DSN1160I DATABASE WRITES PENDING:

Explanation: Database writes are pending at restart. Each page set with outstanding I/O is identified by a separate message following this one:

DATABASE=*dbid*=*dbname*
PAGESET=*obid*=*psname* START=*ss*

Where:

dbid Internal database identifier

dbname Database name corresponding to the *dbid*

obid Internal page set identifier

psname Page set name corresponding to the *obid*

Note: *dbname* and *psname* may be absent if a full checkpoint was unavailable to the Log Extractor or was caused by overlapped processing of DB2 during a checkpoint.

ss Log RBA of the earliest log record required to complete outstanding writes for this page set. If the value of *ss* is returned as **, this information is unavailable. Such will be the case if the Log Extractor is unable to locate a full checkpoint. In this event, DSN1LOGP will return an additional message (LIST MAY BE INCOMPLETE), to alert you to the possibility that the list of page sets with outstanding writes may be incomplete.

Severity: 0 (informational)

System Action: Processing continues.

DSN1162I *csect-name mbn* **UR CONNID=cc**
CORRID=bb AUTHID=aa PLAN=pp
START DATE=yy.ddd TIME=hh:mm:ss
DISP=xx INFO=ii STARTRBA=ss
STARTLRSN=ll NID=*nid*LUWID=*luwid*
COORDINATOR=*name* PARTICIPANTS:
(list of participants)

Explanation: This message describes a unit of recovery (UR) that has not terminated. The information returned is the same as for message DSN1151I, except

DSN1163E • DSN1175E

that the END field is not included in the message because the UR did not terminate.

mbn MEMBER=*membername*, where *membername* is the member of a data sharing group. This is printed only for a data sharing record.

Severity: 0 (informational)

System Action: Processing continues.

DSN1163E NO CHECKPOINT AVAILABLE DUE TO LOG ERROR -- RESTART SUMMARY INCOMPLETE

Explanation: A log error was encountered. DSN1LOGP marked any checkpoints encountered before the log error as invalid. There were no complete checkpoints following the log error in the specified log range. The information following this message includes:

- URs that have not completed
- Page set modified by these URs
- Page sets with writes pending.

This information cannot be considered complete.

Severity: 0 (informational)

System Action: Processing continues.

DSN1164E INVALID xxxx FOUND AT RBA = yyyyyyyyyyyy

Explanation: While processing the SUMMARY option, an invalid checkpoint record (either URE or RURE identified by 'xxxx') was encountered in the log.

Severity: 0 (informational)

System Action: Processing continues.

User Response: If the checkpoint record identified in the message is used to restart DB2, the restart will fail because DB2 will not be able to process the unit of recovery presented by the invalid URE or RURE. DB2 must be restarted from a previous checkpoint to correctly process all units of recovery. The print log map (DSNJU004) utility can be used to list the checkpoint records in the BSDS, and the CHPTRBA parameter of the change log inventory (DSNJU003) utility can be used to direct the DB2 restart to use a particular checkpoint.

DSN1170E SUBTYPE MULTIPLY DEFINED

Explanation: The SUBTYPE parameter can be specified only once for any given job.

Severity: 12 (severe error)

System Action: Processing terminates.

User Response: Provide a single SUBTYPE value and resubmit the job.

DSN1171E SUBTYPE SPECIFIED WITH NO VALUE

Explanation: The SUBTYPE parameter specifies a decimal set subtype. The SUBTYPE must be followed by a value, i.e. SUBTYPE(value).

Severity: 12 (severe error)

System Action: Processing terminates.

User Response: Provide a SUBTYPE value and resubmit the job.

DSN1172E SUBTYPE > 2 DECIMAL CHARACTERS

Explanation: The maximum size of a SUBTYPE is 2 decimal characters.

Severity: 12 (severe error)

System Action: Processing terminates.

User Response: Provide a SUBTYPE value with a maximum of 2 decimal characters and resubmit the job.

DSN1173E csect-name INVALID VALUE value SPECIFIED FOR KEYWORD keyword

Explanation: The specified keyword value is not valid.

Severity: 12 (severe error)

System Action: Processing terminates.

User Response: Refer to *DB2 Utility Guide and Reference* for a list of valid values. Provide a valid value and resubmit the job.

DSN1174E OFFSET SPECIFIED WITH NO SUBTYPE

Explanation: The given OFFSET has no corresponding SUBTYPE.

This message is issued by the following CSECT:
DSN1LPAR

Severity: 12 (severe error)

System Action: Processing terminates.

User Response: Provide a valid SUBTYPE for the given OFFSET and resubmit the job.

DSN1175E OFFSET SPECIFIED WITH NO VALUE OR INCORRECT VALUE

Explanation: The given OFFSET has no corresponding VALUE given or an incorrect VALUE is specified, such as specifying another keyword in place of a value.

Severity: 12 (severe error)

System Action: Processing terminates.

User Response: Provide a valid VALUE for the given OFFSET and resubmit the job.

DSN1176E OFFSET > 8 HEX CHARACTERS

Explanation: The maximum size for an OFFSET is 4 bytes (hence, 8 characters).

Severity: 12 (severe error)

System Action: Processing terminates.

User Response: Provide an OFFSET with a maximum of 8 characters and resubmit the job.

DSN1177E LIMIT OF 10 OFFSET, VALUE PAIRS EXCEEDED

Explanation: A maximum of 10 OFFSET, VALUE pairs can be specified for a given log record SUBTYPE.

Severity: 12 (severe error)

System Action: Processing terminates.

User Response: Provide a maximum of 10 OFFSET, VALUE pairs for a given SUBTYPE and resubmit the job.

DSN1178E OFFSET SPECIFIED WITH NO CORRESPONDING VALUE

Explanation: The given OFFSET has no corresponding VALUE keyword specified.

Severity: 12 (severe error)

System Action: Processing terminates.

User Response: Provide an associated VALUE (value) for the given OFFSET and resubmit the job.

DSN1179E VALUE SPECIFIED WITH NO CORRESPONDING OFFSET OR SUBTYPE PARAMETER

Explanation: The given VALUE has either no corresponding OFFSET or SUBTYPE parameter specified.

Severity: 12 (severe error)

System Action: Processing terminates.

User Response: Provide an associated OFFSET or SUBTYPE for the given VALUE and resubmit the job.

DSN1180E VALUE SPECIFIED WITH NO VALUE OR INCORRECT VALUE

Explanation: The given VALUE has no corresponding value given, an incorrect value is specified, such as specifying a keyword in place of a value, or an uneven number of characters were specified.

Severity: 12 (severe error)

System Action: Processing terminates.

User Response: Provide a valid value for the given VALUE and resubmit the job.

DSN1181E VALUE SPECIFIED WITH NO CORRESPONDING OFFSET

Explanation: The given VALUE has no corresponding OFFSET specified.

Severity: 12 (severe error)

System Action: Processing terminates.

User Response: Provide a valid OFFSET for the given VALUE and resubmit the job.

DSN1182E LIMIT OF 10 LUWIDs EXCEEDED

Explanation: A maximum of 10 LUWID keywords can be specified in any given job.

Severity: 8 (error)

System Action: DSN1LOGP processing is terminated.

User Response: Resubmit the job providing no more than 10 LUWID keywords.

DSN1183E LUWID SPECIFIED WITH INCORRECT VALUE OR NO VALUE

Explanation: The LUWID consists of an LU network name, an LUW instance number, and a commit sequence number. The LU network name consists of a 1 to 8 character network ID, a period, and a 1 to 8 character network LU name. The LUW instance number consists of a period followed by 12 hexadecimal characters. The LUW sequence number consists of a period followed by 4 hexadecimal characters.

Severity: 8 (error)

System Action: DSN1LOGP processing is terminated.

User Response: Resubmit the job providing a valid LUWID value.

DSN1184E FILTER KEYWORD MULTIPLY DEFINED

Explanation: The FILTER keyword was specified more than once.

Severity: 8 (error)

System Action: DSN1LOGP processing is terminated.

User Response: Correct the input to provide only one FILTER keyword and resubmit the job.

DSN1185E FILTER KEYWORD SPECIFIED WITHOUT SUMMARY KEYWORD

Explanation: The FILTER keyword was specified without an associated SUMMARY keyword.

Severity: 8 (error)

System Action: DSN1LOGP processing is terminated.

User Response: Correct the input to include the SUMMARY keyword and resubmit the job.

**DSN1191I DETAIL REPORT OF PAGE
 REGRESSION ERRORS**

Explanation: This message is always generated as the title for a detailed report of page regression errors. It precedes message DSN1192I.

**DSN1192I DBID OBID PAGE# CURRENT MEMBER
 PREV-LEVEL PREV-UPDATE DATE
 TIME**

Explanation: This message contains the title of the detail page regression information.

**DSN1193I dbid obid page# current member
 prev-level prev_update date time**

Explanation: This message contains the following information about a page regression error:

dbid Hexadecimal DBID of the database that has page regression.

obid Hexadecimal OBID of the pageset that has page regression.

page# Hexadecimal pageset page number that has been regressed.

CURRENT

RBA/LRSN of the current log record at which the page regression has been detected. In non-datasharing, the RBA is printed and in datasharing environment, the LRSN value is printed.

member

The two-byte member ID of the DB2 member that wrote the log record. In non- datasharing, this value is zero.

prev-level

Previous level of the page from the current log record.

prev-update

The previous update to the page found during log processing.

date

The date portion of the current log record LRSN value, in printable format.

time

The time portion of the current log record LRSN value, in printable format.

**DSN1194I SUMMARY REPORT OF PAGE
 REGRESSION ERRORS**

Explanation: This message is always generated as the title for a summary report of page regression errors. It precedes message DSN1195I.

**DSN1195I DATABASE SPACENAM DBID OBID
 #PG-REGRESSIONS**

Explanation: This message contains the summary title of the page regression information.

**DSN1196I database spacenam dbid obid
 #pg-regressions**

Explanation: This message contains the following summary information about page regression errors:

database

The name of the database that has page regression. An asterisk would be printed if the name is unknown.

spacenam

The name of the pageset that has page regression. An asterisk would be printed if the pageset name is unknown.

dbid

Hexadecimal DBID of the pageset that has page regression.

obid

Hexadecimal OBID of the database that has page regression.

pg-regressions

The total number of regressed pages for the pageset.

**DSN1197I TOTAL NUMBER OF PAGES CHECKED
 FOR REGRESSION = page-count**

Explanation: This message lists the total number of unique pages that DSN1LOGP has checked for page regression errors. *page-count* is displayed in decimal format.

DSN1198I ***NO REGRESSED PAGES
 DETECTED*******

Explanation: No page regression errors were detected within the RBA/LRSN range that was specified.

**DSN1210E DSNJSLR ERROR RETCODE=xxxxxxx
 REASON CODE =yyyyyyyy**

Explanation: The stand-alone log read function detected an error. The return code (RETCODE) is explained in Appendix C (Volume 2) of *DB2 Administration Guide*. The reason code is explained in Part 4, "Section 4. DB2 Codes," on page 773.

Severity: 8 (error)

System Action: Processing is terminated.

DSN1211E DSNJSLR RETURNED BAD LOG RBA

Explanation: One of the three problems listed below exists.

1. The recovery log data set is damaged.
2. You identified a data set that isn't a recovery log data set.
3. The stand-alone log read service has a problem.

Severity: 0 (informational)

System Action: Processing continues.

User Response: Determine if the problem is your error by dumping the data set and determining if it is a log data set.

Problem Determination: A common error is to specify the first data set on an archive tape (the 'Bxxxxxx' data set) as a log data set; it is actually a BSDS.

- An error prevents DSN1LOGP from continuing, so no log records have yet been processed. If this is the case, an error message should precede this message.
- You specified the active log data sets or archive log data sets out of RBA sequence.
- You specified a STARTRBA that is greater than any RBA in the active and/or archive data sets available.

**DSN1212I csect-name FIRST LOG seq
ENCOUNTERED nnnnnnnnnnnn**

Explanation: This message identifies the sequence number of the first log record that was read.

seq RBA or LRSN

Severity: 0 (informational)

System Action: Processing continues.

**DSN1216E csect-name DSNJSLR ERROR
RETCODE = xxxxxxxx REASON CODE =
yyyyyyyyy seq = nnnnnnnnnnnn**

Explanation: The stand-alone log read function returned an error indicating that either the log has an error in one of the control intervals (CI) or a data set containing the requested sequence number cannot be located. The sequence number shown in the message indicates where the error was detected.

seq RBA or LRSN

The sequence number points:

- To the start of the CI, if there is a problem with the log control interval definition (LCID), or with any of the general control information within a CI.
- To the log record in the CI, if there is a problem with a log record header (LRH).

If this is the first log record read during this execution of DSN1LOGP, and if there is a problem with the LCID, the sequence number is all zeros.

**DSN1213I csect-name LAST LOG seq
ENCOUNTERED nnnnnnnnnnnn**

Explanation: This message identifies the sequence number of the last log record that was read.

seq RBA or LRSN

Severity: 0 (informational)

System Action: Processing continues.

Before returning any records, DSN1LOGP checks the control information (LCID) at the end of a CI, and analyzes the LRH to ensure that all records are properly chained together within the CI. If an error is detected while performing this process, DSN1LOGP issues this message before dumping the entire CI. It will not format individual records within the CI, but will, if possible, continue processing by reading the next CI.

Severity: 0 (informational)

System Action: Processing continues.

Problem Determination: The reason code identifies the nature of the error and is explained in Part 4, "Section 4. DB2 Codes," on page 773. The return code is explained in Appendix C (Volume 2) of *DB2 Administration Guide*.

**DSN1214I NUMBER OF LOG RECORDS READ
nnnnnnnnnnnnnnnnnn**

Explanation: This identifies the number (in decimal) of 'logical' log records read during DSN1LOGP processing.

Severity: 0 (informational)

System Action: Processing continues.

**DSN1217E csect-name mbn DSNJSLR WARNING
RETCODE = xxxxxxxx REASON CODE =
yyyyyyyyy CURRENT LOG seq =
nnnnnnnnnnnn**

Explanation: A gap in the log sequence range was encountered for member *mba*. The CURRENT LOG sequence number shows the log record for the member

DSN1215I NO LOG RECORDS WERE READ

Explanation: DSN1LOGP read no log records.

Severity: 0 (informational)

System Action: Processing continues. Possible explanations:

DSN1218I • DSN1222E

following the gap, and is formatted following this message.

Previous log record can be found with same member ID.

mbn MEMBER=*membername*, where *membername* is the member of a data sharing group. This is printed only for a data sharing record.

seq RBA or LRSN

Severity: 0 (informational)

System Action: Processing continues.

Problem Determination: The reason code identifies the nature of the error and is explained in Part 4, "Section 4. DB2 Codes," on page 773. The return code is explained in Appendix C (Volume 2) of *DB2 Administration Guide*.

DSN1218I NUMBER OF LOG ERROR MESSAGES nnnnnnnnnnnnnnnnnn

Explanation: DSN1LOGP distinguishes three classes of errors:

1. Code problems existing in the DB2 or system code used for DSN1LOGP. In the event of a SYSABEND dump, a user abend code of U0153 will be issued, and DSN1LOGP will be terminated.
2. Incorrect invocation of DSN1LOGP caused, perhaps, by your having used an incorrect keyword or missed a DD statement. Under these circumstances, DSN1LOGP will issue appropriate error messages, and the program will be terminated.
3. Failure by a given log CI under the scrutiny of DSN1LOGP. Such scrutiny is performed before any of the records within the CI are processed. Failure is an indication of logical damage, and error messages are issued by the Log Extractor. The CI or failing log record is printed, and DSN1LOGP continues to the next CI or log record.

The count 'nnnnnnnnnnnnnnnn' provided summarizes the number (in decimal) of errors DSN1LOGP detected while accessing the log.

Severity: 0 (informational)

System Action: Processing continues.

DSN1219E SYSSUMRY DD STATEMENT MISSING

Explanation: You requested the SUMMARY option, but failed to include the SYSSUMRY DD statement in your JCL invocation.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Resubmit the job with a SYSSUMRY DD statement included in the JCL invocation.

DSN1220E ARCHIVE LOG TRUNCATED AT xxxxxxx - INVALID LOG RECORDS WERE READ

Explanation: At a restart of DB2, an archive log was truncated. This archive log data set could not be physically altered to reflect this truncation, and invalid log records therefore still exist. DSN1LOGP has already reported this information in the summary report, and cannot retract it. Nor can it disregard the invalid log information already read in order adequately to summarize what has occurred. Therefore, all information up to this point in the log will be summarized, and a new summary report initiated. Consequently, the same UR may be reported twice with different dispositions and different page sets modified. To avoid this condition, use the BSDS DD statement instead of the ARCHIVE DD statement.

Severity: 0 (informational)

System Action: Processing continues.

DSN1221E DSNJSLR ERROR RETCODE=xxxxxxx REASON CODE=yyyyyyy VSAM RETURN CODE=aaaa ERROR CODE=bbbb

Explanation: The stand-alone log read function resulted in a VSAM error. The DSNJSLR return code 'xxxxxxx', and reason code 'yyyyyyy', included in the message are documented in Appendixes (Volume 2) of *DB2 Administration Guide*.

The VSAM return code (aaaa), and error code (bbbb), identify the nature of the VSAM error. Refer to the appropriate VSAM publication for an explanation of these codes.

Severity: 0 (informational)

System Action: Processing continues.

DSN1222E DSNJSLR ERROR RETCODE=xxxxxxx REASON CODE=yyyyyyy DYNAMIC ALLOCATION INFORMATION CODE=aaaa ERROR CODE=bbbb

Explanation: An error occurred while dynamically allocating a log data set. DSNJSLR return code 'xxxxxxx', and reason code 'yyyyyyy', included in the message, are documented in Appendixes (Volume 2) of *DB2 Administration Guide*. Information code 'aaaa' and error code 'bbbb' were returned by the dynamic allocation SVC and identify the nature of the error. Refer to the appropriate MVS publication for an explanation of these codes.

Severity: 12 (severe error)

System Action: Processing terminates.

DSN1223E DSNJSLR ERROR RETCODE=xxxxxxx
REASON CODE=yyyyyyy RDJFCB
RETURN CODE=aaaa

Explanation: An error occurred while trying to read the job file control block. The DSNJSLR return code 'xxxxxxx', and reason code 'yyyyyyy', included in the message are documented in Appendixes (Volume 2) of *DB2 Administration Guide*.

The RDJFCB return code (aaaa), identifies the nature of the error. Refer to the appropriate MVS publication for an explanation of these codes.

Severity: 0 (informational)

System Action: Processing continues.

DSN1300E *csect-name* RBA RANGE CANNOT BE
USED TO PRINT LOG RECORDS FROM
MULTIPLE DB2 SYSTEMS

Explanation: RBASTART and RBAEND cannot be used to define the range when selecting log records from multiple DB2 systems. LRSNSTART and LRSNEND should be used instead.

System Action: Processing terminates.

User Response: Resubmit the job with either RBA values only or LRSN values only.

DSN1303E *csect-name* INCOMPATIBLE DD
STATEMENTS WERE SPECIFIED FOR
LOG PROCESSING

Explanation: Either MxxACTn or MxxARCHV was erroneously specified in conjunction with MxxBSDS to locate the log data sets of a member of a DB2 data sharing group for a DSN1LOGP job.

System Action: Processing terminates.

User Response: Correct the DD statement and resubmit the job.

DSN1309E *csect-name* SPECIFIED END RANGE IS
LESS THAN START RANGE

Explanation: The value specified for ENDLRSN or ENDRBA is less than the value of STARTLRSN or STARTRBA for a DSN1LOGP job.

System Action: Processing terminates.

User Response: Resubmit the job with correct start and end values.

DSN1700E VALUE FOR KEYWORD xxxxxxxx IS
INVALID

Explanation: The SDMPIN input contains the 'xxxxxxx'. The value specified for that keyword is invalid.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Provide a correct keyword value and resubmit the job.

DSN1701E START TRACE MISSING

Explanation: The START TRACE command is required. The first keyword record of the SDMPIN input does not contain a START TRACE command.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Resubmit the job with START TRACE as the first keyword record in the SDMPIN input.

DSN1702E KEYWORD xxxxxxxx MULTIPLY
DEFINED

Explanation: Keyword 'xxxxxxx' was specified multiple times in the SDMPIN input. All keywords are allowed only once.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Specify the keyword only once. Resubmit the job.

DSN1703E KEYWORD xxxxxxxx UNKNOWN

Explanation: DSN1SDMP does not recognize the keyword 'xxxxxxx'.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Make sure that all keywords are valid and then resubmit the job.

DSN1704E UNABLE TO OBTAIN RETURN-AREA
STORAGE

Explanation: An error resulted when DSN1SDMP attempted to obtain storage for an instrumentation facility interface (IFI) return area.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: When you resubmit the job either:

- Specify a larger region size in the job control language.
- Reduce the value of BUFSIZE on START TRACE.

DSN1705E SYNTAX ERROR, LINE = II, COLUMN = cc

Explanation: A syntax error was encountered in the SDMPIN input. The location of the error is given by:

II The line number within the input stream that is in error.

cc The column number.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Correct the syntax error and then resubmit the error.

DSN1706E INVALID ABEND CODE SPECIFIED

Explanation: An invalid abend code was specified on the ACTION keyword.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Allowable abend codes are 00E60100 through 00E60199. Specify an allowable abend code and then resubmit the job.

DSN1707E LIMIT OF 50 STATEMENTS EXCEEDED

Explanation: DSN1SDMP allows a maximum of 50 statements for a given job.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Use no more than 50 statements when you resubmit the job.

DSN1708E TOO MANY SELECT CRITERIA VALUES

Explanation: DSN1SDMP allows a maximum of eight SELECT criteria values.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Use no more than eight SELECT criteria values and then resubmit the job.

DSN1709E INPUT/OUTPUT ERROR, DDNAME=xxxxxxx

Explanation: An error resulted when DSN1SDMP attempted to do I/O. The ddname of the data set to which I/O failed is 'xxxxxxx'

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Ensure that the 'xxxxxxx' DD

statement in the job control language is valid and resubmit the job.

DSN1710E UNABLE TO OPEN SDMPTRAC

Explanation: An error resulted when DSN1SDMP attempted to open the SDMPTRAC data set.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Ensure that the SDMPTRAC DD statement in the job control language is valid and resubmit the job.

DSN1711E START TRACE ERROR, REASON=xxxxxxx

Explanation: DB2 did not process the submitted START TRACE command. The reason code 'xxxxxxx' is returned from the instrumentation facility interface (IFI).

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Check the return area that follows message DSN1712I. Possible problems are:

- The syntax of the START TRACE command is invalid. Correct the command and resubmit the job. Do not include the subsystem recognition character before the command text.
- The user does not have authority to issue trace commands. Obtain trace authority and resubmit the job.

DSN1712I START TRACE RETURN-AREA FOLLOWS:

Explanation: DSN1SDMP issued the START TRACE command and the return area resulting from the instrumentation facility interface (IFI) COMMAND call follows this message. The return area contains DB2 command response messages.

Severity: 0 (informational)

System Action: Processing continues.

DSN1713I READA ERROR, REASON=xxxxxxx

Explanation: An error resulted when DSN1SDMP issued a instrumentation facility interface (IFI) READA call in an attempt to obtain DB2 trace records. Reason code 'xxxxxxx' is the IFI reason code returned in IFCARC2.

Severity: 0 (informational)

System Action: DSN1SDMP writes any records that were returned and processing continues.

User Response: Possible reason codes are:

00E60802

The DSN1SDMP return area was not large enough to hold the returned trace records. This condition should not occur because the DSN1SDMP return area is the same size as the requested OPn monitor buffer.

00E60803

No trace data was available when the READA request was made. This condition occurs when the trace started by DSN1SDMP is stopped from the operator console or by another application program.

DSN1714I TRACE RECORDS WERE LOST

Explanation: DB2 trace records were lost and are not contained in the SDMPTRAC data set.

Severity: 0 (informational)

System Action: Processing continues.

User Response: Possible reasons for lost trace records are:

- The OP buffer is not large enough. Specify a larger BUFSIZE on the START TRACE command and then resubmit the job.
- The trace data is too voluminous and buffer is overflowing before the data can be read. Specify a more granular selectivity on the START TRACE command and then resubmit the job.

DSN1715E UNABLE TO OBTAIN WORK SPACE

Explanation: An error resulted when DSN1SDMP attempted to obtain work area storage.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Specify a larger region size in the job control language and then resubmit the job.

DSN1716E UNABLE TO OPEN SDMPIN

Explanation: An error resulted when DSN1SDMP attempted to open the SDMPIN data set.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Ensure that the SDMPIN DD statement in the job control language is valid and resubmit the job.

DSN1717I STOP TRACE RETURN-AREA FOLLOWS:

Explanation: DSN1SDMP issued the STOP TRACE command and the return area resulting from the instrumentation facility interface (IFI) COMMAND call follows this message. The return area contains DB2

command response messages.

Severity: 0 (informational)

System Action: Processing continues.

DSN1718E STOP TRACE ERROR, REASON=xxxxxxx

Explanation: DSN1SDMP attempted to submit a DB2 STOP TRACE command at the end of its processing; however, the command failed. The reason code returned from the instrumentation facility interface (IFI) is 'xxxxxxx'.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Check the return area that follows message DSN1717I. One possible problem is:

- The trace has already been stopped from the operator's console or by another application program.

DSN1719I ACTIONS ARE COMPLETE

Explanation: All requested IFC selective dump actions finished. All trace records have been written to the specified destination(s). If an abend action was requested, all abends have taken place.

Severity: 0 (informational)

System Action: DSN1SDMP stops the trace that it started and completes processing.

DSN1720I READA ERROR, REASON=xxxxxxx

Explanation: An error resulted when DSN1SDMP issued an instrumentation facility interface (IFI) READA call in an attempt to obtain DB2 trace records. Reason code 'xxxxxxx' is the IFI reason code returned in IFCARC2.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: One possible reason code is:

00E60824

The user does not have correct monitor authority. Obtain the correct monitor authority (MONITOR1 or MONITOR2) and resubmit the job.

DSN1800I START OF DSN1CHKR FOR JOB job-name step-name

Explanation: This message indicates that DSN1CHKR started processing.

Severity: 0 (informational)

System Action: DSN1CHKR starts processing.

DSN1801I ANCHOR POINT mm IN ERROR IN PAGE nnnnnn

Explanation: This message indicates that anchor point 'mm' is in error in page 'nnnnnn'. Either the backward pointer is not zero when the forward pointer is zero, or the backward pointer does not point to the last record ID in the parent chain. If this message is preceded by DSN1835I then the child pointer is pointing to a page beyond the high used RBA of the data set. Either the child pointer is invalid or the data set has been truncated.

Severity: 4 (warning)

System Action: The page is marked for output if the FORMAT/DUMP option is in effect. Processing continues.

Problem Determination: Contact your IBM Support Center for assistance.

DSN1802I RING/LINK CHAIN BROKEN - type RID = nnnnnnnn

Explanation: This message indicates that there is a broken ring or link chain beginning at 'type' (anchor or parent) with record id equal to 'nnnnnnn'. This is one of a series of messages associated with a broken ring or link. It will appear in combination with DSN1803I, DSN1804I, and DSN1805I.

Severity: 4 (warning)

System Action: The page is marked for output if the FORMAT/DUMP option is in effect. Processing continues.

Problem Determination: Contact your IBM Support Center for assistance.

DSN1803I PARENT RID = nnnnnnnn

Explanation: This message supplies the record id 'nnnnnnn' for the parent record of a detected broken ring or link. This is one of a series of messages associated with a broken ring or link. It will appear in combination with DSN1802I, DSN1804I, and DSN1805I.

Severity: 4 (warning)

System Action: Processing continues.

Problem Determination: Contact your IBM Support Center for assistance.

DSN1804I CURRENT RID = nnnnnnnn

Explanation: This message supplies the record id 'nnnnnnn' for the current record at the time the broken ring or link was detected. This is one of a series of messages associated with a broken ring or link. It will appear in combination with DSN1802I, DSN1803I, and DSN1805I.

Severity: 4 (warning)

System Action: Processing continues.

Problem Determination: Contact your IBM Support Center for assistance.

DSN1805I PREVIOUS IN CHAIN = nnnnnnnn

Explanation: This message supplies the record id 'nnnnnnn' of the record prior to when the broken ring or link was detected. This is one of a series of messages associated with a broken ring or link. It will appear in combination with DSN1802I, DSN1803I, and DSN1804I.

Severity: 4 (warning)

System Action: Processing continues.

Problem Determination: Contact Your IBM Support Center for assistance.

DSN1806I IDMAP ENTRY entry-number IN PAGE page-number IS IN ERROR

Explanation: This message indicates that the IDMAP entry 'entry-number' in page 'page-number' is not valid. Valid entries are from X'0014' to X'0Fhh' (depending on the number of IDMAP entries in the page).

Severity: 4 (warning)

System Action: The page is marked for output if the FORMAT/DUMP option is in effect. Processing continues.

Problem Determination: Contact your IBM Support Center for assistance.

DSN1807I CHILD POINTER chd-rid IN ERROR IN PARENT RECORD par-rid IN PAGE pppppp

Explanation: This message indicates that the parent record with record ID 'par-rid' in page 'pppppp' has a child pointer with an invalid record ID of 'chd-rid'. If this message is preceded by DSN1835I, then the child pointer is pointing to a page beyond the high used RBA of the data set. Either the child pointer is invalid or the data set has been truncated.

Severity: 4 (warning)

System Action: The page is marked for output if the FORMAT/DUMP option is in effect. Processing continues.

Problem Determination: Contact your IBM Support Center for assistance.

**DSN1808I OVERFLOW RECORD IN ERROR -
OVERFLOW RID = ovf-rid, POINTER
RID = ptr-rid**

Explanation: This message indicates that the record at record id 'ovf-rid', pointed to by the pointer record at record id 'ptr-rid', is not an overflow record.

Severity: 4 (warning)

System Action: The page is marked for output if the FORMAT/DUMP option is in effect. Processing continues.

Problem Determination: Contact your IBM Support Center for assistance.

**DSN1809I OVERFLOW RECORD IN ERROR -
OVERFLOW RID = ovf-rid, HAS NO
POINTER RECORD**

Explanation: This message indicates no pointer record points to the overflow record with record id 'ovf-rid'.

Severity: 4 (warning)

System Action: The page is marked for output if the FORMAT/DUMP option is in effect. Processing continues.

Problem Determination: Contact your IBM Support Center for assistance.

**DSN1810I INPUT DATA SET INVALID, NOT A
CHECKABLE SYSTEM TABLESPACE**

Explanation: This message indicates that the data set defined by SYSUT1 is not a checkable table space and therefore cannot be analyzed.

Severity: 8 (error)

System Action: Processing terminates.

System Programmer Response: Correct the SYSUT1 DD statement and rerun the job.

Problem Determination: Checkable system table spaces must be referenced by a hashed entry or contain links. Single-record table spaces referenced by an index are not checkable. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**DSN1811I ANCHOR POINT PAGE page IS OUT OF
RANGE — VALUE IS LESS THAN 2 OR
GREATER THAN 'E'X**

Explanation: The ANCHOR function has an incorrect page value for the page-slot argument. Anchor points can be found only on pages 2 through 14 (E in hexadecimal). Any anchor point page specified beyond that range is invalid.

Severity: 4 (warning)

System Action: Processing continues with the next set of parameters.

**DSN1812I ORPHAN ID = orph-id ID ENTRY =
entry-val FOUND IN PAGE
page-number**

Explanation: This message indicates that the record with id = 'orph-id' and id entry = 'entry-val' in page 'page-number' is an orphan.

Severity: 4 (warning)

System Action: Processing continues.

Problem Determination: Contact your IBM Support Center for assistance.

DSN1813I UNABLE TO DUMP PAGE page-number

Explanation: An error was encountered while retrieving the page and therefore page 'page-number' could not be dumped.

Severity: 4 (warning)

System Action: Processing continues.

Problem Determination: Examine previous diagnostic and system messages, correct problem, and rerun job.

**DSN1814I UNEXPECTED END OF DATA AT PAGE
page-number**

Explanation: The END-OF-DATA condition was reached before expected at page 'page-number'.

Severity: 8 (error)

System Action: Processing terminates.

Problem Determination: Examine previous diagnostic and system messages, correct problem and rerun job.

**DSN1815I DSN1CHKR COMPLETED
SUCCESSFULLY, pg-cnt PAGES
PROCESSED**

Explanation: This message indicates the DSN1CHKR successfully completed processing; all checks completed. The 'pg-cnt' represents the number of pages read during check processing, not the number of pages in the table space.

Severity: 0 (informational)

System Action: Processing terminates.

**DSN1816I DSN1CHKR TERMINATED WITH
ERRORS, pg-cnt PAGES PROCESSED**

Explanation: This message indicates the DSN1CHKR did not successfully complete processing. The 'pg-cnt' represents the number of pages read during check

DSN1817I • DSN1824I

processing, not the number of pages in the table space.

Severity: 4 (warning) or 8 (error)

System Action: Processing terminates.

Problem Determination: Examine previous diagnostic messages, correct problems if possible and rerun job. Otherwise contact your IBM Support Center for assistance.

DSN1817I ARGUMENT arg-val OF THE MAP COMMAND IS INVALID

Explanation: This message indicates that the argument 'arg-val' of the MAP command is invalid.

Severity: 8 (error)

System Action: Processing terminates.

Problem Determination: Refer to *DB2 Utility Guide and Reference* for the correct syntax.

Examples of invalid arguments are:

- The offset value of the ANCHOR or HASH option is neither zero (0) nor four (4).
- When the ANCHOR and RID option has been specified, the page number specified is less than two, which would be a nondata page.

DSN1818I IDMAP ENTRY entry-number IN PAGE page-number IS BEING USED BY MULTIPLE CHAINS - ONE OF WHICH IS IN ERROR

Explanation: This message indicates that a record is part of two different chains and therefore creates an invalid structure within the table space. If using the MAP option, the mapping of the chain stops since the path back to the starting record is lost.

Severity: 4 (warning)

System Action: Processing continues.

Problem Determination: Contact your IBM Support Center for assistance.

DSN1819I HASH VALUE FOR dbid CORRESPONDS TO: PAGE = page-number AND ANCHOR POINT OFFSET = offset

Explanation: This message indicates the hash values for the given 'dbid', after applying the hash function, where 'page-number' is the page and 'offset' is the anchor point.

Severity: 0 (informational)

System Action: Processing continues.

DSN1820I MAPPING OF map-opt (val1,val2) HAS STARTED

Explanation: This message indicates that mapping of the indicated option 'map-opt', which is either ANCHOR, HASH, PAGE or RID, has started. The option's arguments, 'val1' and 'val2' will also be mapped. Following this message will be the records of the chain.

Severity: 0 (informational)

System Action: Processing continues.

DSN1821I MAPPING OF 'map-opt' (val1,val2) HAS COMPLETED

Explanation: This message indicates that mapping of the indicated option 'map-opt', which is either ANCHOR, HASH, PAGE, or RID, started. The option's arguments, 'val1' and 'val2', will also be mapped. Preceding this message will be the records of the chain.

Severity: 0 (informational)

System Action: Processing continues.

DSN1822I DBID dbid HASHED TO AN EMPTY ANCHOR POINT - NO ENTRIES FOR THE GIVEN DBID ARE AVAILABLE IN THE TABLESPACE

Explanation: DBID 'dbid' hashed to an empty anchor point. An anchor point with a value of 0 (empty) means that no entries are available in the table space. Therefore, no links are checked.

Severity: 4 (warning)

System Action: Processing continues with the next set of parameters.

DSN1823I INVALID SYNTAX, c EXPECTED

Explanation: This message indicates that an unexpected character was found while parsing the parmlist and that 'c' was the expected character.

Severity: 8 (error)

System Action: Processing terminates.

Problem Determination: Refer to *DB2 Command Reference* for the correct syntax.

DSN1824I INVALID HEX DATA: hex-data

Explanation: This message indicates that the input value 'hex-data' is not a valid hexadecimal number.

Severity: 8 (error)

System Action: Processing terminates.

Problem Determination: Correct input value and rerun job.

DSN1825I INPUT VALUE EITHER TOO LONG OR OMITTED: in-val

Explanation: This message indicates that the input value 'in-val' is either greater than 8 hexadecimal digits or was totally omitted.

Severity: 8 (error)

System Action: Processing terminates.

Problem Determination: Correct input value and rerun job.

DSN1826I RECORD WITH OBID = rec-obid IS INVALID FOR THIS CHAIN

Explanation: This message indicates that the record with OBID 'rec-obid' is invalid for the chain currently being processed, assuming the OBID of the parent or first record processed was not in error.

Severity: 4 (warning)

System Action: Processing terminates.

Problem Determination: If using the MAP function, make sure the given values point to a valid record. Otherwise, contact your IBM Support Center for assistance.

DSN1827I THE SPECIFIED PAGE IS NOT A HASHED DATA PAGE - THE REQUESTED FUNCTION REQUIRES A HASHED DATA PAGE.

Explanation: This message indicates that the HASH or ANCHOR option of the MAP command was issued against a nonhashed data page (that is, a page with no anchor points).

Severity: 4 (warning)

System Action: Processing continues with the next set of parameters.

Problem Determination: If using the ANCHOR function, examine the page-slot argument to ensure that the page value is correct. If using the HASH function, ensure that the 'dbid' value is correct. Otherwise, examine the SYSUT1 DD statement to ensure that the table space is correct. If so, use the RID or PAGE function to achieve the desired mapping.

DSN1828I OBID = rec-obid IS INVALID FOR THIS DATABASE

Explanation: This message indicates that the record with OBID 'rec-obid' is invalid for the database currently being processed.

This message is issued by the following CSECTs: DSN1MAP, DSN1LNKF

Severity: 4 (warning)

System Action: Processing continues with the next set of parameters.

Problem Determination: If using the MAP command, insure that all user supplied offsets actually point to valid data. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSN1829I MAPPING MUST STOP AT PARENT RECORD WHEN USING THE BACKWARD POINTER

Explanation: This message indicates that the requested mapping stopped at the parent record rather than the starting record because of the use of backward pointers.

Severity: 4 (warning)

System Action: Processing continues.

DSN1830I INVALID NUMBERS OF VALUES SPECIFIED FOR func-name

Explanation: This message indicates that either:

- No value was specified.
- An odd number of values was specified for a function that requires an even number of values.

Severity: 8 (error)

System Action: Processing terminates.

Problem Determination: Refer to *DB2 Utility Guide and Reference* for the parameter specifications. Correct the parmlist and rerun the job.

DSN1831I END OF DATE REACHED, PAGE = page-number IS OUT OF RANGE

Explanation: This message indicates that page 'page-no', specified as a parameter of the MAP option, caused the END-OF-DATA condition to be reached. The page number is invalid for the table space being mapped.

Severity: 4 (warning)

System Action: Processing continues with the next set of parameters.

Problem Determination: Correct the page parameter of the MAP option and rerun the job.

DSN1833I ANCHOR POINT IS NOT IN USE

Explanation: The anchor point to be mapped has a value of 0, which means that it is not in use. Therefore, no links are checked.

Severity: 4 (warning)

System Action: Processing continues with the next set of parameters.

DSN1834I **GETMAIN FOR BUFFERS FAILED. NO MORE AVAILABLE STORAGE IN ADDRESS SPACE.**

Explanation: The GETMAIN for page buffers failed. There is no more virtual storage available in the address space. The table space being checked is too large to be processed with the current system configuration.

Severity: 8 (error)

System Action: Processing terminates.

Problem Determination: Make changes to the system configuration, if possible, to allow more virtual storage to be available in the address space.

DSN1835I **THE REQUESTED PAGE page-no IS BEYOND THE END OF THE TABLESPACE.**

Explanation: A request for a page number from an anchor point or a child pointer in a parent record is pointing beyond the high used RBA of the data set. Either the rid is in error or the data set has been truncated.

Severity: 4 (warning)

System Action: The page is marked for output if the FORMAT/DUMP option is in effect. Processing continues.

Problem Determination: Examine previous diagnostic and system messages, correct problem if possible and rerun the job. Otherwise, contact your IBM Support Center for assistance.

DSN1939I *csect-name* **AN INVALID CI SIZE HAS BEEN DETECTED**

Explanation: The VSAM Control Interval (CI) size for the output data set is invalid. The CI size must be 4K, or it must match the page size.

Severity: 8 (error)

System Action: Processing terminates.

System Programmer Response: Redefine the output VSAM data set so that the CI size is either 4K or equal to the page size of the object that is being processed.

DSN1940I *csect-name* **COMPRESSION REPORT**

noncmpbytes
KB WITHOUT COMPRESSION
cmpbytes
KB WITH COMPRESSION
percsave
PERCENT OF THE BYTES WOULD BE SAVED

numdictrows
ROWS SCANNED TO BUILD DICTIONARY

numscanrows
ROWS SCANNED TO PROVIDE COMPRESSION ESTIMATE

numdictents
DICTIONARY ENTRIES

auncmprowlen
BYTES FOR AVERAGE UNCOMPRESSED ROW LENGTH

avgcmprowlen
BYTES FOR AVERAGE COMPRESSED ROW LENGTH

dictpages
DICTIONARY PAGES REQUIRED

noncmppages
PAGES REQUIRED WITHOUT COMPRESSION

cmppages
PAGES REQUIRED WITH COMPRESSION

pctpgsave
PERCENT OF THE DB2 DATA PAGES WOULD BE SAVED

Explanation: DSN1COMP completed successfully. This report contains the compression savings estimate based on the input data set. For a sample of the report, see the DSN1COMP utility in *DB2 Utility Guide and Reference*.

The compression statistics follow:

noncmpbytes
The total number of uncompressed KB (where KB = 1024 bytes) for the data rows (including the row prefix). This number was rounded to the nearest KB.

cmpbytes
The total number of compressed KB for the data rows (including the row prefix). This number was rounded to the nearest KB.

percsave
The percentage of bytes that would be saved if the rows were compressed.

The values above reflect only the number of bytes for the data row and the associated row prefix (6 bytes). DB2 page and dictionary page overhead is not included.

numdictrows
The number of data rows that were used to build the dictionary.

numscanrows
The number of data rows that were processed using the dictionary to produce the compression savings estimate.

numdictents
The number of entries contained in the compression dictionary.

auncmprowlen

Average uncompressed row length.

avgcmprowlen

Average compressed row length.

dictpages

The number of DB2 pages required for the compression dictionary.

noncmppages

The estimated number of DB2 pages required by the uncompressed data rows. Space required for PCTFREE and FREEPAGE is included. This number was rounded up to the next integer.

cmppages

The estimated number of DB2 pages required by the compressed data rows. Space required for PCTFREE and FREEPAGE is included. Dictionary pages are also included. This number was rounded up to the next integer.

pctpgsave

An estimate of the percentage of DB2 pages that would be saved by compressing the data rows.

Severity: 0 (informational)

System Action: The utility completed successfully.

DSN1941I *csect-name* **COMPRESSION ESTIMATE WAS NOT CALCULATED**

Explanation: There is insufficient data to build a compression dictionary. Either the input data set is empty, or the number of rows in the input data set was insufficient to build the dictionary.

Severity: 8 (error)

System Action: Processing terminated.

User Response: Increase the number of rows in the input data set.

DSN1942I *csect-name* **ERROR WHEN BUILDING THE COMPRESSION DICTIONARY**

Explanation: An internal error was encountered while building the dictionary.

Severity: 8 (error)

System Action: Processing terminated.

System Programmer Response: Determine the failing environment. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSN1943I *csect-name* **DICTIONARY PAGE ENCOUNTERED**

Explanation: A dictionary page was encountered while processing the input data set. This indicates that the data is in compressed format.

Severity: 8 (error)

System Action: Processing terminated.

User Response: Run DSN1COMP on a data set containing data that is not in a compressed format.

DSN1944I *csect-name* **INPUT PARAMETERS**

Explanation: The input parameters used by DSN1COMP are either user-supplied or default values.

Severity: 0 (informational)

System Action: Processing continues.

DSN1945I *csect-name* **DICTIONARY TREE**

Explanation: The compression dictionary tree follows. Each node is formatted in the SYSPRINT data set.

Severity: 0 (informational)

System Action: Processing continues.

DSN1946I *csect-name* **IMAGE COPY CONTAINING MULTIPLE PARTITIONS**

Explanation: DSN1COMP will build a compression report given sufficient data in the first partition only, of an Image Copy containing multiple partitions.

Severity: 8 (error)

System Action: Processing terminated.

User Response: Run DSN1COMP on an image copy containing a single partition.

DSN1947I *csect-name* **COMPRESSION UNAVAILABLE FOR INDEX SPACES**

Explanation: Index data was provided as input to DSN1COMP. Compression is supported only for table space data.

Severity: 8 (error)

System Action: Processing terminated.

User Response: Provide DSN1COMP with data containing table space data.

DSN1950I **DSN1COPY HAS SUPPRESSED VSAM OPEN VERIFY, ACBERRFLG=acb-error-code.open-option**

Explanation: DSN1COPY suppresses the VSAM VERIFY done by the VSAM OPEN for the SYSUT1 data set. The VSAM VERIFY is not needed for the VSAM

DSN1951I • DSN1956I

data sets used by DB2. For DB2 VSAM data sets, the data set hi-used RBA in the ICF catalog is always current.

This message is issued by the following CSECT:
DSN1COPY

Severity: 0 (informational)

System Action: Processing continues.

DSN1951I ODD NUMBER OF HEX CHARACTERS SPECIFIED IN VALUE PARM.

Explanation: The VALUE parameter contained an odd number of hexadecimal characters. Only even numbers of hexadecimal characters are allowed.

This message is issued by the following CSECT:
DSN1VAL

Severity: 8 (error)

System Action: Processing terminates.

User Response: Correct the number of hexadecimal digits specified for the VALUE parameter and resubmit the job.

Problem Determination: Refer to DSN1COPY documentation for parameter requirements in *DB2 Utility Guide and Reference*.

DSN1952I UNEXPECTED END OF INPUT DATA - CHECK FOR INVALID SPECIFICATION OF THE 32K PARAMETER.

Explanation: End of data occurred for the image copy data set specified in SYSUT1 before the first page could be read. Either the wrong input data set was specified or 32KB was specified even though the input data set contains 4KB pages.

This message is issued by the following CSECT:
DSN1COPY

Severity: 8 (error)

System Action: Processing terminates.

User Response: Remove the 32KB parameter if the input data set contains 4KB pages, change the name of the input data set to specify a valid image copy, or remove the FULLCOPY or INRCOPY parameter.

Problem Determination: Refer to DSN1COPY documentation for parameter requirements.

DSN1953I STARTING PAGE NUMBER REQUIRES AN INPUT DATA SET NAME OF data-set-name

Explanation: The starting page number of the page range to be printed is inconsistent with the input data set specified.

This message is issued by the following CSECTS:
DSN1COPY, DSN1PRNT

Severity: 8 (error)

System Action: Processing terminates.

User Response: Ensure that NUMPARTS, the 32KB parameter (or its default of 4KB), and the starting page number are correct. If it is correct, change the input data set name as indicated by the message.

Problem Determination: Refer to DSN1COPY or DSN1PRNT documentation for parameter requirements.

DSN1954I csect-name PARAMETER PAGESIZE OR LOB IS MISSING OR INCORRECTLY SPECIFIED.

Explanation: This message is issued in the following situations:

- The program tried to determine the page size from the first page of the data set, but the first page is not a header page, or
- The first page is a LOB header page and the LOB parameter is missing.

This message is issued by the following CSECTS:
DSN1COPY, DSN1PRNT.

Severity: 8 (error)

System Action: Processing terminates.

User Response: If the input data set is not a LOB table space, specify the PAGESIZE parameter. If the input data set is a LOB table space, specify the LOB or PAGESIZE parameter or both, as appropriate.

DSN1955I SYSUT1 DD CARD IS MISSING

Explanation: No SYSUT1 DD statement was provided.

This message is issued by the following CSECTS:
DSN1COPY, DSN1PRNT, DSN1COMP

Severity: 8 (error)

System Action: Processing terminates.

User Response: Rerun the job with a SYSUT1 DD statement.

DSN1956I csect-name SYNTAX ERROR: parm2 IS SPECIFIED WITHOUT parm1

Explanation: The keyword *parm1* must be specified with *parm2*.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Resubmit the job specifying the correct keyword.

DSN1957I *csect-name* **COMPRESSED RECORDS CANNOT BE EXPANDED DUE TO INCORRECT INPUT DATA SET SPECIFICATION.**

Explanation: DSN1PRNT issues this message when the EXPAND option is specified. The input data set might be an incremental image copy data set.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Resubmit the job specifying the correct input data set.

DSN1958I **INVALID DATA SET NAME.**

Explanation: A DB2 table space was given an incorrect name.

This message is issued by the following CSECT:
DSN1CHDS

Severity: 8 (error)

System Action: Processing terminates.

User Response: Correct the output data set name if FULLCOPY or INRCOPY were specified. If a page range is being printed, correct the input data set name. Refer to Part 2 (Volume 1) of *DB2 Administration Guide* for a discussion of DB2 data set naming conventions.

DSN1959I **BOTH FULLCOPY AND INRCOPY PARAMETERS CANNOT BE SPECIFIED.**

Explanation: DSN1COPY cannot apply to both full images copies and incremental image copies in the same execution. The full image copies are applied first. Each incremental image copy must then be applied in separate steps, starting with the oldest incremental copy.

This message is issued by the following CSECT:
DSN1SDEF

Severity: 8 (error)

System Action: Processing will terminate.

User Response: Omit either FULLCOPY or INRCOPY.

DSN1960I *csect-name input/output* **DATA SET ALLOCATION ERROR. ERROR FIELD IS ERRFIELD *value1*. INFORMATION FIELD IS INFFIELD *value2*.**

Explanation: The allocation of an input or output data set failed. The ERRFIELD *value1* contains the error number; the INFFIELD *value2* contains the information number. See SVC99 error codes in *z/OS MVS Diagnosis: Reference* or *z/OS MVS Programming: Authorized Assembler Services Guide* for help in

determining the cause of the error.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Correct the cause of the allocation error and resubmit the job.

DSN1961I **PIECE NUMBER *value* IS INVALID.**

Explanation: A page was retrieved that has a piece number greater than Numparts for partitioned table spaces or greater than the default of 32 for linear table spaces. 'DPIECNUM *value*' is the piece number for the retrieved page. For page range printing, this message is issued if the starting page number has an invalid piece number as determined from calculations involving Numparts and the page size.

Severity: 8 (error)

System Action: Processing will terminate.

User Response: Look in SYSIBM.SYSTABLESPACE for the correct number of partitions for this page. Correct Numparts or 32KB if they were specified incorrectly, resubmit the job with a valid image copy, or correct the starting page number for page range printing.

DSN1962I **OUTPUT DATA SETS MUST BE VSAM WHEN IMAGE COPY DATA SETS ARE USED AS INPUT TO DSN1COPY.**

Explanation: If image copy data sets are used as input to DSN1COPY, the output data sets must be VSAM. QSAM data sets cannot be used for output.

Severity: 8 (error)

System Action: Processing will terminate.

User Response: Change the output data set to VSAM, or remove the FULLCOPY and Numparts parameters.

DSN1963I **ZERO PAGES ARE INVALID WHEN IMAGE COPY DATA SETS ARE USED AS INPUT TO STAND ALONE UTILITIES.**

Explanation: A page in an IMAGE COPY data set has a zero header. Pages with zero headers are illegal if image copy data sets are used as input to stand-alone utilities.

Severity: 4 (warning)

System Action: Processing continues.

User Response: If the image copy data set name was invalid, look in SYSIBM.SYSCOPY for valid names. Resubmit the valid IMAGE COPY data set to the stand-alone utility. If the IMAGE COPY data set had a valid name, use the REPAIR utility to replace the zero

DSN1964I • DSN1971I

pages with valid data pages.

DSN1964I NO VALUE HAS BEEN SPECIFIED FOR THE NUMBER OF PARTITIONS.

Explanation: No value was given for the number of partitions. This value should follow the 'NUMPARTS' parameter.

Severity: 8 (error)

System Action: Processing will terminate.

User Response: Look in SYSIBM.SYSTABLESPACE for the correct number of partitions for this page. Specify the correct number of partitions and resubmit the job. If the page is not partitioned, then either omit the NUMPARTS parameter or specify NUMPARTS as zero.

DSN1965I THE PARTITION NUMBER VALUE IS INVALID.

Explanation: The partition number value following the 'NUMPARTS' parameter is not between 1 and 64.

Severity: 8 (error)

System Action: Processing will terminate.

User Response: Look in SYSIBM.SYSTABLESPACE for the correct number of partitions for this page.

DSN1966I OUTPUT DATA SET odsname NOT FOUND

Explanation: DB2 cannot find 'odsname' because it has not yet been defined.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Use access method services to define 'odsname' and any other VSAM data sets that have not yet been defined.

DSN1967I THE OBID ARRAYS ARE FULL

Explanation: More than 500 records of OBIDs were specified in the SYSXLAT file.

Severity: 8 (error)

System Action: Processing stops.

Problem Determination: DSN1COPY cannot be used for table spaces containing more than 500 tables.

DSN1968I OBIDS SHOULD NOT BE DUPLICATED

Explanation: There should not be any repeated source OBIDs or target OBIDs within the SYSXLAT file.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Change the SYSXLAT file.

DSN1969I SYSXLAT FILE CAN NOT BE OPENED

Explanation: The QSAM OPEN for the SYSXLAT file failed because no DD statement was provided.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Notify system programmer.

System Programmer Response: Provide a SYSXLAT DD statement if OBID translate is to be done. Otherwise, remove the SYSXLAT parameter and rerun.

Problem Determination: Follow standard QSAM diagnostic procedures.

DSN1970I DATA PAGE CONTAINING OBID xxxx, HAS NO MATCHING VALUE IN THE SYSXLAT FILE

Explanation: One of the OBID records of the SYSXLAT file contains a source OBID value that does not match the OBID value of the source system.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Provide that record of the SYSXLAT file which contains an unmatched OBID value with an OBID that matches the OBID value of the source system.

This error can also be caused when an OBIDXLAT is attempted on an incremental image copy of a compressed segmented table space. For more information on how to proceed, see the OBIDXLAT option description under DSN1COPY in *DB2 Utility Guide and Reference*.

DSN1971I DBID xxxx NOT FOUND IN THE SYSXLAT FILE. REPLACE SOURCE DBID xxxx OF THE SYSXLAT FILE WITH IT.

Explanation: The first record of the SYSXLAT file has the incorrect source DBID value.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Provide the first record of the SYSXLAT file with a source DBID value which matches the DBID value of the source system.

**DSN1972I PSID xxxx NOT FOUND IN THE
SYSXLAT FILE REPLACE SOURCE
DBID xxxx OF THE SYSXLAT FILE
WITH IT**

Explanation: The second record of the SYSXLAT file has the incorrect source PSID value.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Provide the second record of the SYSXLAT file with the correct PSID value.

DSN1973I SOURCE DBID IS MISSING

Explanation: The first record of the SYSXLAT file contains no DBID value.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Provide the first record of the SYSXLAT file with a pair of source and target DBID values which match the DBID values of the source and target systems.

DSN1975I SOURCE PSID IS MISSING

Explanation: The second record of the SYSXLAT file contains no PSID value.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Provide the second record of the SYSXLAT file with a pair of source and target PSID values which match the PSID values of the source and target systems.

DSN1976I TARGET PSID IS MISSING

Explanation: The target PSID is missing from the second record of the SYSXLAT file.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Provide the second record of the SYSXLAT file with a target PSID value which matches the PSID values of the target system.

DSN1977I SOURCE OBID IS MISSING

Explanation: There is a record in the SYSXLAT file with no OBID value.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Correct the SYSXLAT file so that all the records following the first and second records will contain a pair of source and target OBID values.

DSN1978I TARGET OBID IS MISSING

Explanation: There is a record in the SYSXLAT file with no target OBID value specified.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Provide the SYSXLAT file with an OBID value that matches the OBID value of the target system.

**DSN1979I csect-name SOURCE & TARGET
VALUES MUST BE WITHIN THE
RANGE OF 1 TO 65535.**

Explanation: The SOURCE and TARGET values of the SYSXLAT file must be between 1 and 65535.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Provide the SYSXLAT file with values that are between 1 and 65535.

**DSN1980I BROKEN PAGE BIT SET, WILL RESET
AND RETRY BROKEN PAGE TEST**

Explanation: This message indicates that a broken page was detected. If message DSN1990I is issued following this message, determine the cause of the broken page. If message DSN1990I is not issued, reset the broken page bit with the REPAIR utility to correct the problem. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Severity: 4 (warning)

System Action: Processing continues.

Operator Response: Notify the system programmer.

System Programmer Response: Use either the RECOVER or REPAIR utility to correct the broken page. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem determination should have been done when the dump associated with the setting of the broken page bit was requested.

**DSN1981I INVALID PARAMETER FIELD:
bad-parameter**

Explanation: An invalid input parameter was detected on the EXEC statement. The parameter is either not a valid keyword or it has invalid subparameters associated with it.

Examples of invalid subparameters are:

- The Numparts subparameter was other than '(nn)'. 'nn' is a decimal number.

DSN1982I • DSN1985I

- The Numparts subparameter was missing either a left or right parenthesis.
- The PRINT subparameter was missing either a left or right parenthesis.
- The PRINT subparameter specified a digit in a page number which was not hexadecimal.
- The PRINT subparameter contained a starting page number that is larger than the ending page number.
- The PRINT subparameter contains a page number larger than six hexadecimal digits.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Correct the indicated parameter on the EXEC DD statement, and resubmit the job.

Problem Determination: Refer to DSN1COPY, DSN1PRNT, or DSN1COMP documentation for parameter requirements.

DSN1982I NO BLANKS ARE ALLOWED WITHIN THE PARAMETER LIST

Explanation: There is a space or spaces between one or more parameters in the utility list.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Check the parameter list and make sure that there are no spaces between any of the parameters.

DSN1983I *csect-name* DICTIONARY IS INVALID, REASON= X'nnnn'

Explanation: The dictionary found in the data set is invalid. A DB2 internal error occurred during the validation of the expansion dictionary.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Verify that the correct data set is specified. You can delete the EXPAND option and resubmit the job.

System Programmer Response: Determine the failing environment. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The REASON identifies the nature of the error. The REASON is used for diagnostic purposes by the IBM Support Center.

DSN1984I UNEXPECTED PAGE NUMBER, EXPECTING: expected-page-number

Explanation: This message indicates that an unexpected page number was encountered. This message may be received if the input data set is an image copy but the FULLCOPY or INRCOPY parameters were not specified. The 'expected page number' that is displayed (in hexadecimal) is the page number that was expected, not the one that was encountered.

Severity: 4 (warning) or 8 (error)

System Action: Processing is terminated.

User Response: Notify the system programmer.

System Programmer Response: Use DSN1PRNT to dump the table space or index space. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSN1985I ZERO PAGES ENCOUNTERED. FIRST PAGE = first-zero-page-number, LAST PAGE = last-zero-page-number

Explanation: One or more pages zero pages were encountered with valid data pages after them. A zero page is a page of all zeros or a page with only the page-synchronization bit on in the first and last byte of the page. The 'first zero page number' and the 'last zero page number' displayed in hexadecimal are the pages where zeros were first encountered and last encountered. In most cases, this is not an error condition. This is a normal condition for segmented table spaces and also for index spaces created with a FREEPAGE parameter not equal to zero. In addition, it is also normal for nonsegmented table spaces to contain zero pages after certain update scenarios terminated abnormally and data rollback was required.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Notify the system programmer.

System Programmer Response: If the zero page is the result of segmenting, no action is necessary. Similarly, if the zero page is a valid zero page that was introduced by DB2, no action is necessary as this page is free space and is used by DB2 when needed. If the zero page is a valid zero page and you want to remove it from the table space, run the REORG utility.

To help determine if the zero page was validly introduced by DB2, run the CHECK INDEX utility. This assumes that at least one index is defined on the affected table space.

If the zero page is determined to be invalid, you need to run the RECOVER utility.

DSN1986I NEITHER FULLCOPY NOR INRCOPY PARAMETERS MAY BE SPECIFIED WITH THE SEGMENT PARAMETER.

Explanation: The parameters SEGMENT, FULLCOPY, and INRCOPY describe the type of input that SYSUT1 references. SEGMENT is only relevant when a table space or index space is the input. FULLCOPY and INRCOPY are only relevant when a image copy is the input. If the input data set is a segmented table space, then the FULLCOPY or INRCOPY parameters should not be specified. If the input data set is a full or incremental image copy, then SEGMENT should not be specified.

Severity: 8 (error)

System Action: Processing will terminate.

User Response: Omit the incorrect parameter.

DSN1987I csect-name INDEX PAGE CONTAINING OBID id HAS NO MATCHING VALUE IN THE SYSXLAT FILE.

Explanation: This message is issued when the OBID on the page does not find a matching value in the input source OBID list. This message can also be issued when the input does not have enough OBID values.

Severity: 8 (error)

System Action: Processing terminates with a dump of the page on which the OBID does not find a match in the source list.

User Response: Resubmit the job with correct input OBID values.

DSN1988I csect-name EXPAND KEYWORD IS SPECIFIED BUT DICTIONARY IS NOT FOUND

Explanation: DSN1PRNT issues this message when the EXPAND option is specified. The dictionary was not found in the data set. An incorrect data set piece is specified or an incorrect data set number is specified for a multi-piece linear data set.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Resubmit the job specifying the correct keyword or the correct data set name.

DSN1989I csect-name IS PROCESSED WITH THE FOLLOWING OPTIONS:

:

- *check/32K/fullcopy/incrcopy/segment/*
- *numparts=n/format/expand/swonly/*
- *print/value/obidxlat/reset/no check/4K/*
- *no imagecopy/nonsegment/numparts=0/*

- *no print/no value/no obidxlat/*
- *no format/no reset/no expand/no swonly*

Explanation: The stand-alone utility named *csect-name* is processing with the options that are either specified or supplied by default.

Severity: 0 (informational)

System Action: Processing continues.

User Response: Make sure that the parameters are correct. Not specifying the parameters correctly can give unpredictable results.

DSN1990I csect-name BROKEN PAGE. PAGE NUMBER = broken-page-number. REASON: comment, SERVICE INFO: CODE = c1, d1 = v1 ... dn = vn

Explanation: During page checking, the page was detected as broken for the reason given in the message. The page number is displayed in hexadecimal format.

Severity: 4 (warning)

System Action: Processing continues.

Operator Response: Notify the system programmer.

System Programmer Response: Use either the RECOVER or REPAIR utility to correct the broken page.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Service information is used for diagnostic purposes by the IBM Support Center.

DSN1991I UNCLUSTERED DATA DETECTED. RID: 'xxxxxxx'X TABLE: tablename INDEX KEY: index-key

Explanation: Data is not broken. Only the arrangement of data on one of the following DB2 Catalog table spaces: SYSDBASE, SYSPLAN, and SYSVIEWS has been affected. Normally, data on these pages is arranged to minimize locking contention. DSN1COPY found that the arrangement of data no longer minimizes locking contention for the objects named by the INDEX KEY for the given TABLE. Therefore, an increase in the number of deadlocks and timeouts may be seen on SYSDBASE, SYSPLAN, and SYSVIEWS.

System Action: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Contact your IBM Support Center for assistance. Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 64.

DSN1992I VSAM PUT ERROR, RPLERREG =
return-code, RPLERRCD = *reason-code*

Explanation: VSAM PUT failed with the indicated error code.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Notify system programmer.

System Programmer Response: Follow standard VSAM diagnostic procedures. See *z/OS DFSMS: Macro Instructions for Data Sets* for more information on the standard VSAM procedures, the RPL fields, and the VSAM control blocks.

DSN1993I DSN1COPY/DSN1PRNT/DSN1COMP
TERMINATED, *page-count* PAGES
PROCESSED

Explanation: This message indicates that a stand-alone utility has not successfully completed processing. The page count is displayed in decimal format.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Examine the previous error message of the application program.

System Programmer Response: Correct the previous error and resubmit the job.

DSN1994I DSN1COPY/DSN1PRNT/DSN1COMP
COMPLETED SUCCESSFULLY,
page-count PAGES PROCESSED

Explanation: This message indicates that a stand-alone utility successfully completed processing. The page count is displayed in decimal format.

Severity: 0 (informational)

System Action: Processing terminates.

DSN1995I VSAM GET ERROR, RPLERREG =
return-code, RPLERRCD = *reason-code*

Explanation: VSAM GET failed with the indicated error code.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Notify system programmer.

System Programmer Response: Follow standard VSAM diagnostic procedures. See *z/OS DFSMS: Macro Instructions for Data Sets* for more information on the standard VSAM procedures, the RPL fields, and the VSAM control blocks.

DSN1996I VSAM OPEN ERROR, ACBERRFLG =
ACB error-code. OPEN *option*

Explanation: VSAM OPEN failed with the indicated 'ACB error-code'. The OPEN option was either 'INPUT' or 'OUTPUT'.

Severity: 8 (error) if error is greater than or equal to 128; otherwise, severity code is 4.

System Action: Processing terminates if error code is greater than or equal to 128; otherwise, processing continues normally.

User Response: Notify system programmer.

System Programmer Response: Follow standard VSAM diagnostic procedure. See *z/OS DFSMS: Macro Instructions for Data Sets* for more information on the standard VSAM procedures and the VSAM control blocks.

DSN1997I OUTPUT DSNAME = *data-set-name*,
data-set-type

Explanation: The indicated 'data set name' is used for output. 'data set type' is either VSAM or SEQ (for sequential).

Severity: 0 (informational)

DSN1998I INPUT DSNAME = *data-set-name*,
data-set-type

Explanation: The indicated 'data-set-name' is used for input. 'data-set-type' is either VSAM or SEQ (indicating sequential).

Severity: 0 (informational)

DSN1999I START OF
DSN1COPY/DSN1PRNT/DSN1COMP
FOR JOB *job-name step-name*

Explanation: This message indicates that a stand-alone utility started processing.

Severity: 0 (informational).

System Action: The stand-alone utility starts processing.

Chapter 26. DSN2... messages

There are two versions of the CICS attachment facility:

- The version shipped with DB2 requires CICS Version 3 Release 3 or an earlier release. This attachment facility issues DSN2xxx messages.
- The version shipped with CICS requires a CICS release later than Version 3 Release 3. This attachment facility issues DSN2xxx messages.

DSN2001I CICS UR INDOUBT RESOLUTION IS INCOMPLETE FOR *ssid*

Explanation: CICS cannot resolve the disposition of the units of recovery that DB2 holds indoubt from the previous connection because CICS was cold started.

System Action: The CICS attachment facility continues the startup process.

Operator Response: Notify the CICS system programmer.

System Programmer Response: You must resolve the indoubt units of recovery manually by issuing the DB2 -DISPLAY THREAD and -RECOVER INDOUBT commands.

DSN2002I *csect-name* DSN2CT_{xx} MODULE NOT FOUND

Explanation: The resource control table DSN2CT with suffix *xx* could not be loaded.

System Action: The CICS attachment facility initialization terminates.

User Response: Reenter the start command with the correct suffix. Ensure that the resource control table DSN2CT is in the correct application program library, which is concatenated in the JOBLIB or STEPLIB statement of your CICS startup JCL.

If DSN2CT is not in your application program library, ensure that you are using the correct version of the DSNCRCT macro to assemble DSN2CT. For CICS versions later than Version 3 Release 3, the correct DSNCRCT macro is in the CICS macro library rather than in the DB2 macro library.

DSN2003I THE ATTACHMENT FACILITY IS ALREADY ACTIVE

Explanation: The CICS attachment facility is already active and enabled to CICS.

System Action: The CICS attachment facility initialization is terminated.

Operator Response: Only one CICS attachment facility is permitted.

DSN2004I THE PLAN NAME IS NOT FOUND IN THE RCT

Explanation: This message is the response to a DSN2 DISPLAY or DSN2 DISCONNECT command. The plan specified in the command was not found in the resource control table (RCT).

System Action: The CICS attachment facility command is not processed.

Operator Response: Reenter the command with the correct plan name.

DSN2005I THE TRANSACTION NAME IS NOT FOUND IN THE RCT

Explanation: This message is the response to a DSN2 DISPLAY or DSN2 MODIFY command. The transaction specified in the command was not found in the resource control table (RCT).

System Action: The CICS attachment facility command is not processed.

Operator Response: Reenter the command with the correct transaction name.

DSN2006I THE *dest* DESTINATION ID IS INVALID

Explanation: This message is the response to a CICS attachment facility command. The destination ID *dest* specified in the command was not found in the CICS destination control table (DCT) or the resource control table (RCT).

System Action: The CICS attachment facility command is not processed.

Operator Response: Reenter the command with the correct destination ID.

DSN2007I THE COMMAND VERB IS MISSING OR INVALID

Explanation: The CICS attachment facility does not recognize the ACTION keyword on the entered command.

System Action: The command is not processed.

Operator Response: Reenter the command with the correct syntax.

DSN2008I KEYWORD IS MISSING OR INVALID

Explanation: A CICS attachment facility command contains an unknown positional keyword or a keyword is missing.

System Action: The command is not processed.

Operator Response: Reenter the command with the correct syntax.

DSN2009I THE VALUE IN THE COMMAND IS INVALID

Explanation: The numeric value in the DSN MODIFY command might be invalid. Otherwise, the error is caused by one of the following:

- The value in the command is greater than the value specified for the THRDM parameter in the resource control table (RCT).
- If the POOL RCT entry is being changed, the active thread count cannot be set to less than 3.

System Action: The command is not processed.

Operator Response: Reenter the command with a valid value.

System Programmer Response: If the number of threads required is more than the number allowed in the resource control table (RCT), specify a larger number of threads in the THRDM parameter and regenerate the table.

DSN2011I *tran* TRANSACTION ABENDED BECAUSE THREADS ARE UNAVAILABLE

Explanation: The transaction with CICS transaction ID *tran* was abnormally terminated because a thread connection to DB2 was not available for the transaction. This error message can occur when:

- TWAIT of the transaction entry in the resource control table is NO.
- TWAIT of the transaction entry is POOL, TWAIT in the pool entry is NO, and all threads in the POOL are active.

System Action: The indicated transaction is abended. No other action is taken by the CICS attachment facility

Operator Response: Notify the CICS system programmer.

System Programmer Response: Determine which of the following actions will correct the problem:

- If more threads are available with the current generation of the resource control table (RCT), tell the master terminal operator to make more threads active by using the DSN MODIFY command.

- Regenerate the RCT and make more threads available to the transaction that failed. Stop and then restart the CICS attachment facility to make the new RCT active.

DSN2012I THE ATTACHMENT FACILITY STOP QUIESCE IS PROCEEDING

Explanation: A DSN STOP command entered by the master terminal operator is being processed.

System Action: The CICS attachment facility releases the terminal entering the command and proceeds with the quiesce process.

Operator Response: If the quiesce is not completed within the required time period, you can enter a DB2 -STOP FORCE command.

DSN2013I DISPLAY REPORT FOLLOWS

Explanation: A CICS attachment facility display was requested and follows this message.

System Action: Processing continues.

DSN2014I STATISTICS REPORT FOR *rct-name* FOLLOWS

Explanation: A CICS attachment facility statistics display was requested and follows this message. The name of the resource control table (RCT) that is currently in use is *rct-name*.

The following information is displayed for each entry in the RCT:

TRAN CICS transaction name.

PLAN DB2 plan name.

CALLS Total number of SQL statements in this connection.

AUTHS Total number of sign-on invocations for transactions associated with this entry. A sign-on does not indicate whether a new thread is created or an existing thread is reused. If the thread is reused and TOKENE=NO, a sign-on occurs only if the authorization ID or transaction ID has changed.

W/P Number of times all available threads for this entry were busy and the transaction had to wait or the thread request was diverted to the POOL.

HIGH Maximum number of concurrent threads required by transactions associated with this entry at any time since the CICS attachment facility was started.

ABORTS Total number of units of recovery that were rolled back.

COMMITTS

One of the following two fields is incremented each time a DB2 transaction associated with this entry has an explicit or implicit (such as EOT) sync point.

1-PHASE

The total number of single phase commits for transactions associated with this entry.

2-PHASE

The total number of two phase commits for transactions associated with this entry.

For a more detailed explanation of the fields in the statistics report, refer to "Controlling CICS Connections" in Part 4 (Volume 1) of *DB2 Administration Guide*.

System Action: Processing continues normally.

DSN2015E *csect* **THE ATTACHMENT FACILITY FOR *name* IS IN STANDBY**

Explanation: The CICS attachment facility has dropped into standby mode because DB2 has stopped and STANDBY=SQLCODE was specified in the RCT.

System Action: The CICS attachment facility will issue negative SQLCODEs for all SQL requests.

Operator Response: Restart the attachment after DB2 is restarted.

DSN2016I *csect-name* **THE CONNECTION OF CICS WITH *name* FAILED, '*reason-code*'**

Explanation: The CICS attachment facility is terminating abnormally because an error occurred while connecting with DB2. The error is indicated by *reason-code*, and the specific DB2 subsystem is indicated by *name*.

System Action: The CICS attachment facility terminates with abend completion code X'04E'. If the initial identify fails because of an authorization error, DSN2042I is issued and no dump is requested.

Operator Response: Notify the system programmer.

System Programmer Response: Look up *reason-code* to determine the specific failure that caused the termination.

DSN2017I **ATTACHMENT OF A THREAD SUBTASK FAILED**

Explanation: The CICS attachment facility continues processing but is unable to start as many thread subtasks as are allowed in a resource control table (RCT) entry.

System Action: The CICS attachment facility attempted to terminate all subtasks that are currently unused, but none could be terminated. If other subtasks are not active to process the current transaction, CICS

is requested to abend the transaction.

Operator Response: Notify the system programmer.

System Programmer Response: The error might be caused by one of the following:

- There is a shortage of storage in the local storage queue area (LSQA).
- The maximum number of thread subtasks allowed was reached. The maximum is specified in the THRDMAX parameter of RCT. The DSNCL DISPLAY STATISTICS command is useful in analyzing the current thread usage.

DSN2018I *name* **IS NOT ACTIVE**

Explanation: The DSNCL STRT command cannot proceed because subsystem *name* is not active.

System Action: The DSNCL STRT command processing ends without starting the CICS attachment facility.

Operator Response: Reenter the CICS attachment facility command after DB2 is started.

DSN2019I **THE MODIFY COMMAND IS COMPLETE**

Explanation: The DSNCL MODIFY command completed successfully.

DSN2020I **THE DISPLAY COMMAND IS COMPLETE**

Explanation: The DSNCL DISPLAY command completed successfully.

DSN2021I **THE DISCONNECT COMMAND IS COMPLETE**

Explanation: The DSNCL DISCONNECT command completed successfully.

DSN2022I **THE ATTACHMENT FACILITY STOP FORCE IS PROCEEDING**

Explanation: A DSNCL STOP FORCE command entered by the master terminal operator is being processed.

System Action: The CICS attachment facility releases the terminal entering the command and proceeds with the STOP FORCE processing.

DSN2023I **THE ATTACHMENT FACILITY HAS CONNECTED TO *name* USING *rct-name***

Explanation: The DSNCL STRT command successfully completed. Subsystem *name* is now available to CICS. The name of the resource control table (RCT) that was

DSN2024I • DSN2030E

specified for this start of the CICS attachment facility is *rct-name*.

System Action: The DSNC STRT command completes processing. The CICS attachment facility is active.

DSN2024I *dest* CANNOT BE LOCATED IN THE DCT

Explanation: The destination shown in the message cannot be located in the CICS destination control table (DCT).

System Action: The CICS attachment facility startup process continues. The destination entry in the resource control table (RCT) is set to '*' for potential modification by the CICS attachment facility.

Operator Response: Notify the system programmer. Use the DSNC MODIFY command to set the error destination to the correct identification characters.

System Programmer Response: Correct either the RCT or the DCT to synchronize the error destinations.

DSN2025I THE ATTACHMENT FACILITY IS INACTIVE

Explanation: This is the final message issued by the CICS attachment facility to inform the resource control table error destinations that the CICS attachment facility completed the shutdown process.

System Action: The CICS attachment facility is terminated.

DSN2026I DSN2STOP FAILED TO DISABLE THE *name* RMI EXIT

Explanation: The CICS attachment facility failed to disable the named resource manager interface (RMI) exit. Either the exit was in use at the time DSN2STOP tried to disable it, or an abend occurred in the RMI exit code while the 'in use' flag was on. The CICS system must be stopped and restarted before the CICS attachment facility can be restarted.

System Action: The CICS attachment facility continues termination processing after dumping the CICS trace, the resource control table (RCT), and the connection control table (CCT).

Operator Response: Notify the CICS attachment facility system programmer. CICS must be stopped and restarted before restarting the CICS attachment facility.

System Programmer Response: This could be a problem in the CICS 'task-related user exit'. Analyze the trace and any dumps associated with this execution to determine the source of the error.

DSN2027I SHUTDOWN IS IN PROGRESS. *transaction* COMMANDS MAY NOT BE ENTERED

Explanation: The CICS attachment facility does not accept commands directed to DB2 during or after the termination of the CICS attachment facility.

System Action: The command is rejected.

User Response: Notify the CICS attachment facility system programmer.

DSN2028I USER IS NOT AUTHORIZED FOR *transaction* COMMANDS

Explanation: DB2 rejected the command request during the sign-on of the user. Therefore, the user is assumed to be unauthorized for the requested function in the command.

System Action: The command is rejected.

Operator Response: Notify the CICS attachment facility system programmer.

System Programmer Response: The authorization ID used is described in the generation procedures of the resource control table (RCT). If this user should be allowed access to the command, use the GRANT statement to grant authorization.

DSN2029I *transaction* COMMAND FAILED, REASON CODE *rc*

Explanation: The DB2 command, identified in the message as *transaction*, failed to return a response message indicating the action taken by the command. DB2 returned reason code *rc*.

System Action: The results of the command are unknown.

Operator Response: Notify the CICS attachment facility system programmer.

System Programmer Response: Check the master console for any messages indicating why the command failed. Refer to the explanation of the reason code returned by DB2 in Part 4, "Section 4. DB2 Codes," on page 773.

DSN2030E AN ERROR HAS OCCURRED WRITING TO THE TRANSIENT DATA OUTPUT DESTINATION *destination*

Explanation: The CICS attachment facility encountered an error while writing to the indicated destination.

System Action: The CICS attachment facility continues operation.

Operator Response: Notify the system programmer. If the destination is one of the resource control table error

destinations, use the CICS MODIFY command to change the destination code to another destination, if one is available.

System Programmer Response: Follow CICS procedures to correct the error. Refer to *CICS Transaction Server for z/OS Problem Determination Guide* for additional information.

DSN2031I THE COMMAND IS INVALID. THE ATTACHMENT FACILITY IS INACTIVE

Explanation: STRT is the only valid command when the CICS attachment facility is inactive. No other commands to the CICS attachment facility are accepted.

System Action: The command is rejected.

DSN2032I *transaction* COMMAND ALTERNATE DESTINATION OUTPUT COMPLETE

Explanation: The DB2 command identified in the message as *transaction* is complete. The resulting output should be available at the requested device.

System Action: Processing continues normally.

DSN2033I TERMINAL *termid* IS NOT SUPPORTED BY BMS OR IS INVALID

Explanation: This message is issued in response to a CICS attachment facility or DB2 command that requested an alternate destination for the response. CICS basic mapping support (BMS) encountered an error while routing to the requested terminal named *termid*.

System Action: The output from the command might be suppressed.

Operator Response: Ensure that the terminal ID was correctly entered. Otherwise, notify the system programmer.

System Programmer Response: Verify that the terminal ID is valid. This message might occur if the destination device is not supported by BMS or if it is not defined to CICS. If *termid* is CSMT, this message might also follow message DSN2030E. The attachment facility unconditionally routes output to terminal CSMT following a transient data destination error.

DSN2034I INDOUBT RESOLUTION FOR *ur-id* IS INCORRECT

Explanation: CICS indicates recovery is required for the *ur-id*, but the unit of recovery is not indoubt to DB2.

System Action: The CICS attachment facility continues the startup process.

Operator Response: Notify the CICS system programmer.

System Programmer Response: CICS tried to

recover a unit of recovery using an identifier that was not in the resolution request list from DB2. Use the DB2 -DISPLAY THREAD and -RECOVER INDOUBT commands to ensure that all indoubt units of recovery are resolved.

You must identify the reason for the inconsistency. A DB2 cold start, for example, might cause the problem.

DSN2035I INDOUBT RESOLUTION FOR *ur-id* IS INCOMPLETE

Explanation: CICS indicates recovery should not be required for the *ur-id*, but DB2 is indoubt.

System Action: The CICS attachment facility continues the startup process.

Operator Response: Notify the CICS system programmer.

System Programmer Response: CICS cannot recover a unit of recovery using an identifier that was in the resolution request list from DB2. Use the DB2 -DISPLAY THREAD and -RECOVER INDOUBT commands to ensure that all indoubt units of recovery are resolved.

You must identify the cause of the error. A CICS cold start could cause this problem.

DSN2036I INDOUBT RESOLUTION FOR *ur-id* IS INCONSISTENT

Explanation: CICS indicates recovery resolution for the *ur-id* should be ABORT (backout), but DB2 indicates the resolution should be COMMIT.

This error can be caused by a damaged CICS system journal file.

System Action: DB2 committed the unit of recovery. The CICS attachment facility continues the startup process.

Operator Response: Notify the CICS system programmer.

System Programmer Response: CICS and/or DB2 restart processes are not in synchronization. You must identify the cause of the error. Take appropriate action to return all resources to a consistent state.

DSN2037A *subsystem* IS NOT ACTIVE *transaction* IS WAITING

Explanation: The CICS attachment facility start transaction identified in the message is waiting for notification from the indicated DB2 subsystem that it is active. The start of the CICS attachment facility is complete after DB2 has started.

System Action: The CICS attachment facility waits to complete the start process.

Operator Response: Start the DB2 subsystem.

DSN2038I THE COMMAND IS INVALID WHILE WAITING FOR *subsystem name*

Explanation: The command entered cannot be processed while the CICS attachment facility is waiting for the DB2 subsystem to start. The name of the DB2 subsystem that is not yet operational is *subsystem name*.

System Action: The command is rejected.

DSN2039I THE ERROR DESTINATIONS ARE: *d1 d2 d3*

Explanation: This message is the response to the DSNM MODIFY DESTINATION command that lists the currently active message destinations known to the CICS attachment facility. Null entries that show as '*****' can be modified so they identify actual destinations.

DSN2040I MODULE *name* COULD NOT BE FOUND

Explanation: During the CICS attachment facility initialization, an attempt was made to locate and load the named module, but it was not found in any of the libraries accessible to MVS through the MVS LOAD macro.

System Action: The CICS attachment facility initialization is terminated.

Operator Response: Notify the CICS attachment facility system programmer.

System Programmer Response: Check the CICS JOBLIB/STEPLIB libraries and ensure that the CICS SDFHAUTH and the DB2 SDSNLOAD libraries are defined there.

DSN2041I NO ACTIVE THREADS

Explanation: A DSNM DISPLAY TRANSACTION or DSNM DISPLAY PLAN command was entered, but there were no active threads created. The CICS attachment facility might have identified and signed on the attached subtasks, but a create thread was not issued for any of the subtasks.

DSN2042I CONNECTION NOT AUTHORIZED TO *name*

Explanation: The attempt to connect to the named DB2 subsystem failed because the user was not authorized to access DB2. Authorization was denied by either RACF or a user-written connection exit.

System Action: The CICS attachment facility terminates.

Operator Response: Notify the system programmer.

System Programmer Response: The user specified on the CICS job was not authorized to connect to the

named DB2 subsystem. Refer to Part 3 (Volume 1) of *DB2 Administration Guide* for information on how to authorize a user to access DB2.

DSN2043I DSN2STOP ENCOUNTERED ERROR, RECOVERY ROUTINE started/completed

Explanation: A CICS abend occurred while disconnecting the CICS attachment facility from DB2 and deleting it from storage. This message might be issued twice. It is issued at the start of the abend recovery routine, which is indicated by 'started' in the message text. If the recovery routine is successful, the message is issued with 'completed' in the message text.

System Action: If the recovery routine is not successful, program DSN2STOP terminates with a CICS transaction dump. If the recovery routine is successful, the CICS attachment facility is terminated normally.

Operator Response: Notify the system programmer.

System Programmer Response: Analyze any abend dumps associated with this message to determine the cause of the failure.

DSN2044I DSNCRCT ENTRY HAS BEEN CORRUPTED OR OVERLAID

Explanation: The CICS attachment facility detected that a resource control table (RCT) entry was corrupted or overlaid since the CICS attachment facility was last started.

System Action: The CICS task is abended with reason code 00C30011. No other action is taken by the CICS attachment facility.

Operator Response: Notify the system programmer.

System Programmer Response: Analyze the abend dumps associated with this message to determine which CICS transaction and RCT entry was corrupted. Restart the CICS attachment facility to obtain a valid copy of the RCT.

DSN2045I RESOURCE MANAGER *rmi-name* IS UNKNOWN TO CICS ATTACH FACILITY

Explanation: The CICS attachment facility received a request from a resource manager interface (RMI) named *rmi-name*. This RMI is not known by the CICS attachment facility.

System Action: The CICS task is abended with a CICS transaction dump.

Operator Response: Notify the system programmer.

System Programmer Response: Analyze the CICS transaction dump to determine the source of the unknown resource manager interface (RMI) request.

Problem Determination: CICS dump information, such as the trace table and program storage, can aid in determining which module issued the request. The CICS EXEC interface block resource name field, EIBRSRCE, contains the name of the RMI.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSN2046I RCT RELEASE LEVEL *nnnn* IS INCONSISTENT WITH CICS ATTACH RELEASE LEVEL *mmmm*

Explanation: The resource control table (RCT) release level *nnnn* does not match the CICS attachment facility release level *mmmm*.

This message is issued by the following CSECT: DSN2STRT

Operator Response: Notify the system programmer.

System Programmer Response: Reassemble the RCT using the correct DB2 release level *mmmm* DSNCRCT macro.

DSN2047I TWA SIZE IS TOO SMALL FOR TRANSID *tran*

Explanation: The CICS TWASIZE defined for transaction *tran* is too small to support the CICS attachment facility command processor program (DSN2COM1).

System Action: The CICS attachment facility abends this CICS task with a CICS transaction abend.

Operator Response: Notify the system programmer.

System Programmer Response: Redefine the command processor transaction to specify the correct TWASIZE.

DSN2048I UNABLE TO INTERPRET SQL CALL WHILE FORMATTING AN EDF DISPLAY TRAN *tran* TASK *task*

Explanation: The CICS attachment facility was unable to decipher storage associated with an SQL statement for CICS transaction *tran* and task id *task*. Either the SQL communications area (SQLCA) or the RDS input parameter list (RDI) storage could not be interpreted by the CICS attachment facility.

System Action: A CICS transaction dump is taken of the storage in question.

Programmer Response: Ensure that CICS storage associated with this task was not altered or overlaid. Analyzing the storage in the CICS transaction dump might provide clues about the source of the problem.

Problem Determination: Analyze the CICS transaction dump of the storage in question. In this

situation the information supplied by the Execution Diagnostic Facility (EDF) of CICS for SQL statements consists of:

- The EDF status: ABOUT TO EXECUTE or COMMAND EXECUTION COMPLETE
- The processing status: CALL TO RESOURCE MANAGER DSNCSQL
- The ARG values associated with this call to the CICS attachment facility resource manager

No other information is provided about the SQL statement.

DSN2049E *csect-name* RECOVER INDOUBT FOR urid FAILED WITH *reason-code*

Explanation: A resolve indoubt request passed to DB2 from CICS failed.

System Action: The attachment leaves the unit of recovery indicated by 'urid' indoubt in CICS and DB2. The attachment requests a system dump of the CICS region.

System Programmer Response: Use the reason code to determine why the RECOVER INDOUBT request failed. If necessary, manually resolve the unit of recovery using the RECOVER INDOUBT command.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 82,

DSN2052I INSUFFICIENT STORAGE AVAILABLE TO START ATTACHMENT FACILITY

Explanation: During startup the CICS attachment facility was unable to allocate the required amount of storage. This message might be issued if an error occurs while the attachment facility is loading the data only load module, DSN2CTxx.

System Action: The CICS attachment facility is not initialized.

System Programmer Response: Allow a larger amount of dynamic storage on your CICS system. Alternatively, you can delete unused entries or lower THRDA and THRDM values in your RCT, which reduces the size of the storage that the attachment facility requires.

For a load error, check the MVS console log for any preceding messages to determine why the load failed. If there is not enough free REGION space to load the RCT, see the appropriate CICS documentation for information on tuning your CICS system.

**DSN2053I INSUFFICIENT TWASIZE FOR
DSN2COM1. REQUIREMENT IS *twasize***

Explanation: The CICS attachment facility requires a TWASIZE of *twasize* on all transactions that execute DSN2COM1. Either the TWASIZE that was specified is less than the requirement, or no TWASIZE was specified at all.

System Action: The attachment facility terminates.

System Programmer Response: Ensure that CSD group DFHDB2 was installed in the CSD. Any transaction that executes program DSN2COM1 should specify TWASIZE(*twasize*) on its transaction entry.

**DSN2054I DYNAMIC PLAN PROGRAM LINK
FAILED FOR TRANSACTION
'*transaction*'. EIBRESP WAS '*eibresp*'.**

Explanation: The attachment facility was unable to link to the dynamic plan exit program specified in DSNCRCT. The reason code provided by CICS in the EIBRESP field of the EIB is given in this message.

System Action: The transaction is abended with a DSNCRCT abend.

User Response: Look up the *eibresp* value in *CICS Transaction Server for z/OS Application Programming Reference*. This value was returned from CICS after the attachment facility attempted to link to the dynamic plan exit. Take appropriate action based on the *eibresp*. For example, if *eibresp* was PGMIDERR, check your RCT entry for transaction *transaction* to ensure that the dynamic plan exit program name (PLNPGME or PLNPGMI) is the name of a valid program known to CICS.

**DSN2055I SINGLE PHASE COMMIT FAILED FOR
TRANSACTION '*transaction*'. EIBTASKN
WAS '*task number*'.**

Explanation: CICS requested a single phase commit from DB2, but DB2 was unable to comply.

System Action: The transaction is abended with a DSNCRCT abend.

User Response: Contact the IBM Support Center for assistance.

**DSN2056I *csect-name* CICS RELEASE *release* IS
DOWN LEVEL FOR THIS ATTACHMENT
FACILITY**

Explanation: The attachment facility that you are using requires a CICS release later than Version 3 Release 3. You are using CICS Version 3 Release 3 or an earlier release. For this release of CICS, you must use the attachment facility shipped with DB2.

System Action: The attachment facility does not initialize.

User Response: Ensure that the CSD definition of the DSNCRCT transaction specifies program DSNCCOM1. If you are initializing the attachment facility using CICS program list table (PLT) processing, ensure that your CICS PLTPI table uses program DSNCCOM0 to initialize the attach.

**DSN2059I *csect-name* CICS ATTACHMENT
FACILITY MISMATCH WITH RESOURCE
CONTROL TABLE *rct-name***

Explanation: The wrong macro library was used to assemble DSN2CT, the resource control table.

There are two versions of the CICS attachment facility. The version shipped with DB2 requires CICS Version 3 Release 3 or an earlier release; the one shipped with CICS requires a CICS release later than Version 3 Release 3. This error message indicates CICS is using the attachment facility shipped with CICS, but the RCT was assembled using the DB2 macro libraries.

System Action: The CICS attachment facility initialization terminates.

User Response: Reassemble DSN2CT using the DSNCRCT macro shipped in the CICS macro libraries.

**DSN2060I *csect-name* INITPARM IS IGNORED
BECAUSE FORMAT IS INVALID.**

Explanation: The DSN2STRT INITPARM specified on the CICS initialization job is incorrect. The format of the INITPARM should be:

```
INITPARM=(DSN2STRT='xx,yyyy')
```

where xx is the suffix of the RCT and yyyy is the DB2 subsystem id. The RCT suffix cannot be greater than 2 characters, and the subsystem ID cannot be greater than 4 characters.

To specify an RCT suffix only, use the format:

```
INITPARM=(DSN2STRT='xx')
```

To specify a subsystem ID override only, use the format:

```
INITPARM=(DSN2STRT=' ,yyyy')
```

System Action: The attachment facility attempts to initialize with the subsystem ID specified in the DSNCRCT STRT command. If no subsystem ID is provided there, it attempts to initialize with the subsystem ID specified in the resource control table.

User Response: If you want to override the subsystem ID, restart the attachment facility using the DSNCRCT STRT command with the correct SSID. Alternatively, you can correct the DSN2STRT INITPARM and reinitialize CICS.

DSN2061I *csect-name* **INITPARM IS INVALID. ATTACHMENT FACILITY NOT STARTED.**

Explanation: No resource control table suffix was specified on the DSN2STRT command, and the format of the DSN2STRT INITPARM on the CICS initialization job is incorrect. The format of the INITPARM should be:

```
INITPARM=(DSN2STRT='xx,yyyy')
```

where xx is the suffix of the RCT and yyyy is the DB2 subsystem id. The RCT suffix cannot be greater than 2 characters, and the subsystem ID cannot be greater than 4 characters.

To specify an RCT suffix only, use the format:

```
INITPARM=(DSN2STRT='xx')
```

To specify a subsystem ID override only, use the format:

```
INITPARM=(DSN2STRT=',yyyy')
```

System Action: The attachment facility does not initialize.

User Response: To start the attachment facility, use the DSN2STRT command and specify a resource control table suffix on the command. Alternatively, you can correct the DSN2STRT INITPARM and reinitialize CICS.

DSN2063I *csect-name* **NOT AUTHORIZED TO START TRANSACTION *transaction*. ATTACHMENT FACILITY NOT STARTED**

Explanation: The user was not authorized to start transaction *transaction*.

The CICS-DB2 attachment facility starts *transaction* during initialization. Before it starts *transaction*, it checks external security (such as RACF) using CICS's QUERY SECURITY command. When CICS returns the value NOTREADABLE for *transaction*, the attachment facility produces this message.

System Action: The attachment facility does not initialize.

System Programmer Response: Identify the authorization ID of the user who started the attachment facility. Use your external security product to authorize that user to start *transaction*.

DSN2064I *csect-name transaction* **ABENDED. ATTACHMENT FACILITY IS TERMINATING.**

Explanation: The CICS-DB2 transaction *transaction* abended.

System Action: The CICS-DB2 attachment facility terminates.

System Programmer Response: Identify the cause of

the abend, correct it if necessary, and restart the attachment facility.

DSN2065I *csect-name* **INVALID LENGTH. DATA NOT DISPLAYABLE.**

Explanation: The module running under the CICS Execution Diagnostic Facility (EDF) attempted to display an input or output variable that had an incorrect length indicator.

System Action: EDF processing continues, but the value of the variable is not displayed.

DSN2070I *csect* **ROLLBACK FAILED FOR TRANSACTION *transaction* EIBRESP2 = X'eibresp2'**

Explanation: The attachment facility was unable to issue a CICS ROLLBACK. The reason code provided by CICS in the EIBRESP2 field of the EIB is shown in *eibresp2*.

System Action: The transaction is abended with a DSN2070I.

System Programmer Response: Look up the *eibresp2* value in CICS Transaction Server for z/OS Application Programming Reference. This value was returned from CICS after the attachment facility attempted a ROLLBACK requested by the ROLBE=YES option.

DSN2700I *DSN2SAMG message-id* **HAS BEEN ISSUED**

Explanation: This message is issued only if the requested message was not found in the message directory (DSN2MSGT).

System Action: The system proceeds as though the requested message was issued.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to this manual for the message text.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSN2901I **UNRECOVERABLE IOERROR IN PROGRAM DSN2COM1. THE ATTACHMENT FACILITY WILL SHUTDOWN.**

Explanation: An attempt to retrieve data stored for program DSN2COM1 failed when CICS returned an exceptional condition of IOERR (EIBRESP = X'11').

System Action: The DB2-CICS attachment facility is shutdown.

Operator Response: Notify the system programmer.

System Programmer Response: An IOERR occurs if an input or output error occurs during a RETRIEVE operation. Examine the CICS auxiliary trace records and the CICS system log to determine the cause of the IOERR.

Chapter 27. DSN3... messages

DSN3001I *csect-name* ABNORMAL DISCONNECT FROM SUBSYSTEM INTERFACE

Explanation: This message indicates that '*csect-name*' detected that an online routine was still supporting SSI calls (IEFSSREQ) even though DB2 was nearly done terminating or no longer executing. This occurs with '*csect-name*' DSN3RS0X when the service address space has reached end-of-memory and neither normal termination nor online error recovery routines have successfully completed termination of the DB2 subsystem. This occurs with '*csect-name*' DSN3SSTM when this condition is discovered during online termination.

System Action: The connection is terminated. All IEFSSREQ requests are handled by the DB2 ERLY code until DB2 is restarted.

Problem Determination: An SVC dump is requested. This SVC dump and associated SYS1.LOGREC entries provide information to determine which resource managers had not removed their support of particular SSI function codes.

For dumps requested by DSN3RS0X, all pertinent control blocks and stack storage are dumped. The primary control block of interest is the SSVT for DB2.

For DSN3SSTM, the DB2 'standard dump' facility is used to dump the information necessary for problem diagnosis. The primary control blocks of interest are the 'active' CONN blocks.

DSN3002I RECOVERY INCOMPLETE FOR *connection-name*

Explanation: At least one DB2 unit of recovery (UR), related to an identified subsystem ('*connection-name*'), is still 'indoubt' after restart synchronization has taken place. ('Indoubt' URs are those for which commit has been voted by DB2 but which have not been acknowledged by '*connection-name*'.)

This message may appear if the '*connection-name*' subsystem has begun to do new work before having resolved all indoubt URs. The '*connection-name*' subsystem may be in the process of resolving the indoubt URs.

System Action: Resources held (locked) by these 'indoubt' URs are unavailable to any other work units until their status is resolved.

System Programmer Response: The system programmer and/or system administrator must determine the correct recovery action to resolve the 'indoubt' situations. This involves either 'ensure-commit' or 'backout' decisions for all 'indoubt' URs.

The -DISPLAY THREAD command should be used to

see the URs still indoubt. It may show that all indoubt URs have already been resolved. The -RECOVER INDOUBT command should be used, either from an MVS console or through an attachment facility, to resolve the indoubt URs and to release the resources they hold.

Problem Determination: This error is probably caused by a cold start after an abnormal termination of either subsystem or by offline alterations of the logs of either subsystem.

DSN3004I DESCRIPTOR GET FAILURE RC=*X* xxxxxxxx, REASON=*X* xxxxxxxx

Explanation: The parameter list required to create the DB2 agents under which IEFSSREQ calls are processed could not be obtained from the subsystem support subcomponent directory of internal parameters (DSN3DIR1). The RC indicates the return code received from the system parameter manager and REASON indicates the reason code (from register 0).

The return code is always 4 when this message is presented, indicating that the IEFSSREQ descriptor was not found in the subsystem support subcomponent directory. This is a system error and results in termination of the DB2 subsystem. The reason code is always 0.

System Action: Subsystem initialization is discontinued. Termination occurs.

System Programmer Response: Repair the master directory (DSNZPARM) and/or the DB2 program libraries, and restart the DB2 subsystem.

Problem Determination: If the problem persists, use any dumps and the console log to diagnose the problem. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSN3006I *xxxx* SSI FUNCTION WAS ALREADY ACTIVE WHEN ACTIVATE WAS ATTEMPTED

Explanation: An initialization sequence error has occurred. The subsystem support for SSI services resource manager (SSSS) has discovered during its initialization that another resource manager ('*xxxx*') has already activated the EOM or FEOT SSI call by calling DSN3AC0X. If this occurs, the error is a serious one.

System Action: Subsystem initialization is discontinued. DB2 termination occurs.

System Programmer Response: Ensure that all maintenance has been applied to the DB2 program libraries, and then restart the DB2 subsystem.

Problem Determination: If the problem persists, use any dumps and the console log to diagnose the problem. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSN3007I xxxx SSI FUNCTION WAS ALREADY INACTIVE WHEN DEACTIVATE WAS ATTEMPTED

Explanation: A termination sequence error has occurred. The subsystem support for SSI services resource manager (SSSS) has discovered during its termination that another resource manager ('xxxx') has already deactivated the EOM or FEOT SSI call by calling DSN3AC0X. If this occurs, the error is a serious one.

System Action: Termination continues.

System Programmer Response: Ensure that all maintenance has been applied to the DB2 program libraries.

Problem Determination: If the problem persists, use any dumps and the console log to diagnose the problem. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSN3008I csect-name ABNORMAL DISCONNECT FOR PROGRAM REQUEST HANDLER(S)

Explanation: This message indicates that 'csect-name' has discovered that one or more resource managers are still supporting application program calls through their program request handler, even though DB2 was almost done terminating or was no longer executing. This occurs when the system services address space has gone to end of memory and neither normal termination nor online error recovery routines have successfully completed termination of the DB2 subsystem.

System Action: The program request handler (PRH) connection is terminated. All application program support requests are rejected with an indication that DB2 is not up.

System Programmer Response: See the Problem Determination section of this message.

Problem Determination: An SVC dump is requested. This SVC dump and associated SYS1.LOGREC entries provide information to determine which resource managers were still supporting application program support calls. All pertinent control blocks and stack storage are dumped. The primary control block of interest is the program request handler block (PRHB).

DSN3010I csect-name PARTICIPANT RRS IS COLD STARTING AND HAS LOST ITS LOG. OTHER RECOVERABLE RESOURCE MANAGERS MIGHT HAVE INDOUBT UNITS OF RECOVERY.

Explanation: DB2 has coordinator responsibility for indoubt units of recovery and RRS has a participant role in the unit of recovery. RRS has cold started and has lost knowledge of indoubt units of recovery. There might be damage at RRS Recoverable Resource Managers that also participated in the unit of recovery.

System Action: Processing continues.

System Programmer Response: Contact the database administrator.

Database Administrator Action: DB2 is the coordinator for one or more indoubt units of recovery at other RRS recoverable resource managers. RRS has lost all knowledge of these units of recovery. The participant RRS Recoverable Resource Managers might still have indoubt units of recovery. DB2 has no knowledge of other RRS Recoverable Resource Manager except for the RRS unit of recover ID (URID) that identifies such a unit of recovery. Subsequent DSN3017I, DSN3018I or DSN3019I messages describe the status of each unit of recovery and contain the RRS URID for each.

DSN3011I csect-name COORDINATOR RRS IS COLD STARTING AND HAS LOST ITS LOG. INDOUBT DB2 THREADS NEED MANUAL RESOLUTION.

Explanation: DB2 has participant responsibility for indoubt threads. RRS, the commit coordinator, has informed DB2 that it lost all knowledge of DB2 indoubt threads. The indoubt threads at this DB2 must be manually resolved with the RECOVER INDOUBT command.

System Action: Processing continues.

System Programmer Response: Contact the database administrator.

Database Administrator Action: DB2 is a participant with one or more indoubt threads. The coordinator is RRS. RRS has lost knowledge of the indoubt DB2 threads. A list of indoubt threads where RRS is the coordinator can be displayed using the DISPLAY THREAD command for indoubt type threads by specifying RRSAF as the connection name. A DSNV408I message with coordinator = RRSAF identifies a thread of this type. The DSNV449I message in the DISPLAY THREAD report that follows contains the RRS unit of recovery ID (URID) that identifies the RRS unit of recovery in the NID field.

The heuristic decision (that is, to commit or abort the logical unit of work) should be coordinated with any other participant RRS Recoverable Resource Managers.

The existence of other participants might not be easy to determine. The information might be available in the MVS/RRS recovery log even though information has been lost.

At this DB2, all indoubt threads coordinated by the RRS must be resolved with the RECOVER INDOUBT command. Locked data remains unavailable until resolution. Threads that were already resolved with this command are discarded. Threads not yet resolved are discarded after resolution with the command.

The commit or abort decision provided using the RECOVER INDOUBT command for a logical unit of work are propagated to all downstream participants, if any.

DSN3012I *csect-name* **DB2 WAS RESTARTED ON THE WRONG SYSTEM AND CANNOT CONNECT TO RRS. THERE ARE UNRESOLVED UNITS OF RECOVERY WHERE DB2 IS THE COORDINATOR.**

Explanation: DB2 is the commit coordinator for one or more indoubt units of recovery. DB2 is unable to connect to RRS to resolve these indoubt units of recovery.

System Action: Processing continues.

Operator Response: Use the RRS IPCS interface to determine the correct system and restart DB2 on that system.

DSN3013I *csect-name* **DB2 WAS RESTARTED ON THE WRONG SYSTEM AND CANNOT CONNECT TO RRS. THERE ARE UNRESOLVED UNITS OF RECOVERY WHERE DB2 IS A PARTICIPANT.**

Explanation: DB2 has one or more indoubt threads and is unable to connect to RRS to resolve these indoubt units of recovery.

System Action: Processing continues.

Operator Response: Use the RRS IPCS interface to determine the correct system and restart DB2 on that system.

DSN3014I *csect-name* **DB2 HAS NO KNOWLEDGE OF RRS URID=*rrs_urid*. THE RRS UR IS INDOUBT. THE DB2 URID RECORDED BY RRS=*db2_urid*.**

Explanation: DB2 is restarting with RRS where DB2 is a participant and RRS is the coordinator. RRS has a unit of recovery that DB2 should be a participant in, but DB2 has no knowledge of the RRS unit of recovery. The RRS unit of recovery ID is '*rrs_urid*'. RRS has recorded the DB2 unit of recovery ID as '*db2_urid*'.

System Action: Restart with RRS continues.

Operator Response: Notify the database administrator.

Database Administrator Action: This message might indicate a DB2 or RRS problem, or it might be produced normally because one of the following prior actions:

- A DB2 conditional restart was performed that resulted in the loss of part or all of the DB2 log. This conditional restart might have happened at any time in the past.
- The DB2 RECOVER INDOUBT command was used to resolve the DB2 unit of recovery with URID '*db2_urid*'.

If either of these occurred, the message can be ignored. If neither occurred, there might be a DB2 or an RRS problem. If the '*db2_urid*' appears to be a valid log RBA, use the DSN1LOGP utility with the SUMMARY option and URID options using the '*db2-urid*' value. If DSN1LOGP finds the '*db2-urid*', the disposition will indicate whether the DB2 UR was committed or aborted (rolled back). If possible, use the RRS ISPF interface to commit or abort the RRS URID to avoid heuristic damage.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 6, 33, 72.

DSN3015I *csect-name* **DB2 HAS NO KNOWLEDGE OF RRS URID=*rrs_urid*. THE RRS UR IS INDOUBT. THE DB2 URID RECORDED BY RRS=*db2_urid*.**

Explanation: DB2 is restarting with RRS where DB2 is the coordinator and RRS is the participant. RRS has a unit of recovery that DB2 should be the coordinator of, but DB2 has no knowledge of the RRS unit of recovery. The RRS unit of recovery ID is '*rrs_urid*'. RRS has recorded the DB2 unit of recovery ID as '*db2_urid*'.

System Action: Restart with RRS continues.

Operator Response: Notify the database administrator.

Database Administrator Action: This message might indicate a DB2 or RRS problem, or it might be produced normally because a DB2 conditional restart was performed that resulted in the loss of part or all of the DB2 log. This conditional restart might have happened at any time in the past.

If the '*db2_urid*' appears to be a valid log RBA, use the DSN1LOGP utility with the SUMMARY option and URID options using the '*db2-urid*' value. If DSN1LOGP finds the '*db2-urid*', the disposition will indicate whether the DB2 UR was committed or aborted (rolled back). Use the RRS ISPF interface to commit or abort the RRS

DSN3016I • DSN3019I

URID to avoid heuristic damage.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 6, 33, 72.

DSN3016I *csect-name* RRS HAS LOST DATA FROM ITS LOG.

Explanation: DB2 is restarting with RRS and RRS has lost some portion of its log.

System Action: Restart with RRS continues.

Operator Response: Notify the database administrator.

Database Administrator Action: DB2 might not be able to resolve indoubt Units of Recovery successfully with RRS because of the loss of RRS log data. This message might be followed by one or more of the following messages: DSN3017I, DSN3018I, DSN3019I, DSN3020I, DSN3021I, DSN3022I and DSN3023I.

DSN3017I *csect-name* RRS HAS NO KNOWLEDGE OF DB2 URID=*db2_urid*. THE DB2 UR IS INDOUBT. THE RRS URID RECORDED BY DB2=*rrs_urid*.

Explanation: DB2 is restarting with RRS where DB2 is the coordinator and RRS is a participant. DB2 has a unit of recovery that RRS should be a participant in, but RRS has no knowledge of the DB2 unit of recovery. The DB2 unit of recovery ID is '*db2_urid*'. DB2 has recorded the RRS unit of recovery ID as '*rrs_urid*'.

System Action: Restart with RRS continues.

Operator Response: Notify the database administrator.

Database Administrator Action: This message might indicate a DB2 or RRS problem, or it might be produced normally because of one of the following:

- An RRS cold start was performed that resulted in the loss of the RRS log. In this case, message DSN3010I should have been produced.
- RRS might have had a partial loss of log data during restart. In this case, message DSN3016I should have been produced.
- The RRS ISPF interface might have been used to heuristically commit or roll back the UR.

If any of the above are true, the message can be ignored. If not, there might be a DB2 or an RRS problem.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and*

Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 6, 33, 72.

DSN3018I *csect-name* RRS HAS NO KNOWLEDGE OF DB2 URID=*db2_urid*. THE DB2 UR WAS COMMITTED. THE RRS URID RECORDED BY DB2=*rrs_urid*.

Explanation: DB2 is restarting with RRS where DB2 is the coordinator and RRS is a participant. DB2 has a unit of recovery that RRS should be a participant in, but RRS has no knowledge of the DB2 unit of recovery. The DB2 unit of recovery ID is '*db2_urid*'. DB2 has recorded the RRS unit of recovery ID as '*rrs_urid*'.

System Action: Restart with RRS continues.

Operator Response: Notify the database administrator.

Database Administrator Action: This message might indicate a DB2 or RRS problem, or it might be produced normally because of one of the following:

- An RRS cold start was performed that resulted in the loss of the RRS log. In this case, message DSN3010I should have been produced.
- RRS might have had a partial loss of log data during restart. In this case, message DSN3016I should have been produced.
- The RRS ISPF interface might have been used to heuristically commit or roll back the UR.

If any of the above are true, the message can be ignored. If not, there might be a DB2 or an RRS problem.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 6, 33, 72.

DSN3019I *csect-name* RRS HAS NO KNOWLEDGE OF DB2 URID=*db2_urid*. THE DB2 UR WAS ROLLED BACK. THE RRS URID RECORDED BY DB2=*rrs_urid*.

Explanation: DB2 is restarting with RRS where DB2 is the coordinator and RRS is a participant. DB2 has a unit of recovery that RRS should be a participant in, but RRS has no knowledge of the DB2 unit of recovery. The DB2 unit of recovery ID is '*db2_urid*'. DB2 has recorded the RRS unit of recovery ID as '*rrs_urid*'.

System Action: Restart with RRS continues.

Operator Response: Notify the database administrator.

Database Administrator Action: This message might indicate a DB2 or RRS problem, or it might be produced normally because of one of the following:

- An RRS cold start was performed that resulted in the loss of the RRS log. In this case, message DSN3010I should have been produced.
- RRS might have had a partial loss of log data during restart. In this case, message DSN3016I should have been produced.
- The RRS ISPF interface might have been used to heuristically commit or roll back the UR.

If any of the above are true, the message can be ignored. If not, there might be a DB2 or an RRS problem.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 6, 33, 72.

DSN3020I *csect-name* **POSSIBLE HEURISTIC DAMAGE. RRS HAS COMMITTED THE UR WITH RRS URID=*rrs_urid*. THE DB2 UR WITH DB2 URID=*db2_urid* IS INDOUBT.**

Explanation: DB2 is restarting with RRS and has a unit of recovery (UR) DB2 URID=*db2_urid* that is indoubt. DB2 is the commit coordinator for the UR and RRS is a participant. RRS has committed the same UR. The RRS URID=*rrs_urid*.

System Action: Restart with RRS continues.

Operator Response: Notify the database administrator.

Database Administrator Action: If possible, insure that the DB2 UR is resolved to commit. If this is done, there will be no heuristic damage. If the DB2 UR is resolved to abort, heuristic damage will have occurred since RRS committed the same UR.

DSN3021I *csect-name* **POSSIBLE HEURISTIC DAMAGE. RRS HAS ROLLED BACK THE UR WITH RRS. URID=*rrs_urid*. THE DB2 UR WITH DB2 URID=*db2_urid* IS INDOUBT.**

Explanation: DB2 is restarting with RRS and has a unit of recovery (UR) DB2 URID=*db2_urid* that is indoubt. DB2 is the commit coordinator for the UR and RRS is a participant. RRS has rolled back the same UR. The RRS URID=*rrs_urid*.

System Action: Restart with RRS continues.

Operator Response: Notify the database administrator.

Database Administrator Action: If possible, insure that the DB2 UR is resolved to abort. If this is done, there will be no heuristic damage. If the DB2 UR is resolved to commit, heuristic damage will have occurred since RRS rolled back the same UR.

DSN3022I *csect-name* **HEURISTIC DAMAGE HAS OCCURRED. RRS HAS COMMITTED THE UR WITH RRS URID=*rrs_urid*, AND DB2 HAS ROLLED BACK THE SAME UR. THE DB2 URID=*db2_urid***

Explanation: DB2 is restarting with RRS and has a unit of recovery (UR) with DB2 URID=*db2_urid* that was rolled back. DB2 is the commit coordinator for the UR and RRS is a participant. RRS has committed the same UR. The RRS URID=*rrs_urid*.

System Action: Restart with RRS continues.

Operator Response: Notify the database administrator.

Database Administrator Action: Heuristic damage has occurred since DB2 rolled back the UR and RRS has committed the same UR. Correct the damage. This is not an easy task. Knowledge of the application is required to determine which Recoverable Resource Managers are involved in the UR. Since the time of the heuristic action, the data that was updated might have been used by many applications - read and/or write. Correcting the damage might involve reversing the effects of these applications as well. Tools available are:

- The RRS ISPF functions can provide assistance in determining the set of resource managers involved and what action they took.
- The DB2 DSN1LOGP utility provides a summary report that identifies the table spaces modified by the unit of recovery.

Contact your IBM Support Center for further assistance.

DSN3023I *csect-name* **HEURISTIC DAMAGE HAS OCCURRED. RRS HAS ROLLED BACK THE UR WITH RRS URID=*rrs_urid*, AND DB2 HAS COMMITTED THE SAME UR. THE DB2 URID=*db2_urid***

Explanation: DB2 is restarting with RRS and has a unit of recovery (UR) with DB2 URID=*db2_urid* that was committed. DB2 is the commit coordinator for the UR and RRS is a participant. RRS has rolled back the same UR. The RRS URID=*rrs_urid*.

System Action: Restart with RRS continues.

Operator Response: Notify the database administrator.

Database Administrator Action: Heuristic damage has occurred since DB2 committed the UR and RRS has rolled back the same UR. Correct the damage. This is not an easy task. Knowledge of the application is required to determine which Recoverable Resource Managers are involved in the UR. Since the time of the heuristic action, the data that was updated might have been used by many applications - read and/or write. Correcting the damage might involve reversing the effects of these applications as well. Tools available are:

- The RRS ISPF functions can provide assistance in determining the set of resource managers involved and what action they took.
- The DB2 DSN1LOGP utility provides a summary report that identifies the table spaces modified by the unit of recovery.

Contact your IBM Support Center for further assistance.

DSN3024I *csect_name* **HEURISTIC DAMAGE HAS OCCURRED. COORDINATOR DB2 HAS COMMITTED THE UR WITH DB2 URID=*db2_urid*, AND RRS HAS INDICATED THAT THE OUTCOME WAS MIXED. THE RRS URID=*rrs_urid*.**

Explanation: DB2 is the commit coordinator and RRS is a participant. DB2 committed the UR with URID = *db2_urid* and RRS has indicated that one or more Recoverable Resource Managers that participated in the RRS UR with URID = *rrs_urid* has rolled back the same UR.

System Action: Processing continues.

Operator Response: Notify the database administrator.

Database Administrator Action: Heuristic damage has occurred since DB2 committed the UR and at least one RRS Recoverable Resource manager has rolled back the same UR. Correct the damage. This is not an easy task. Knowledge of the application is required to determine which Recoverable Resource Managers are involved in the UR. Since the time of the heuristic action, the data that was updated might have been used by many applications - read and/or write. Correcting the damage might involve reversing the effects of these applications as well. Tools available are:

- The RRS ISPF functions can provide assistance in determining the set of resource managers involved and what action they took.
- The DB2 DSN1LOGP utility provides a summary report that identifies the table spaces modified by the unit of recovery.

Contact your IBM Support Center for further assistance.

DSN3025I *csect_name* **HEURISTIC DAMAGE HAS OCCURRED. COORDINATOR DB2 HAS ROLLED BACK THE UR WITH DB2 URID=*db2_urid*, AND RRS HAS INDICATED THE OUTCOME WAS MIXED. THE RRS URID=*rrs_urid*.**

Explanation: DB2 is the commit coordinator and RRS is a participant. DB2 rolled back the UR with URID = *db2_urid* and RRS has indicated that one or more Recoverable Resource Managers that participated in the RRS UR with URID = *rrs_urid* has committed the same UR.

System Action: Processing continues.

Operator Response: Notify the database administrator.

Database Administrator Action: Heuristic damage has occurred since DB2 rolled back the UR and at least one RRS Recoverable Resource manager has committed the same UR. Correct the damage. This is not an easy task. Knowledge of the application is required to determine which Recoverable Resource Managers are involved in the UR. Since the time of the heuristic action, the data that was updated might have been used by many applications - read and/or write. Correcting the damage might involve reversing the effects of these applications as well. Tools available are:

- The RRS ISPF functions can provide assistance in determining the set of resource managers involved and what action they took.
- The DB2 DSN1LOGP utility provides a summary report that identifies the table spaces modified by the unit of recovery.

Contact your IBM Support Center for further assistance.

DSN3026I *csect_name* **POSSIBLE HEURISTIC DAMAGE. COORDINATOR DB2 HAS COMMITTED THE UR WITH DB2 URID=*db2_urid*, AND RRS HAS INDICATED THAT THE OUTCOME IS PENDING. THE RRS URID=*rrs_urid*.**

Explanation: DB2 is the commit coordinator for the DB2 UR with URID=*db2_urid* and RRS is a participant. RRS has also committed the UR but has indicated that at least one RRS Recoverable Resource manager has not completed commit processing for the RRS UR with URID=*rrs_urid*.

System Action: Processing continues.

Operator Response: Notify the database administrator.

Database Administrator Action: If possible, insure that the RRS Recoverable Resource Manager commits the RRS UR. If this is done, there will be no heuristic damage. If the RRS UR is rolled back by the RRS Recoverable Resource manager, heuristic damage will

have occurred since DB2 committed the same UR.

DSN3027I *csect-name* **POSSIBLE HEURISTIC DAMAGE. COORDINATOR DB2 HAS ROLLED BACK THE UR WITH DB2 URID=*db2_urid*, AND RRS HAS INDICATED THAT THE OUTCOME IS PENDING. THE RRS URID=*rrs_urid*.**

Explanation: DB2 is the commit coordinator for the DB2 UR with URID=*db2_urid* and RRS is a participant. RRS has also rolled back the UR but has indicated that at least one RRS Recoverable Resource manager has not completed roll back processing for the RRS UR with URID=*rrs_urid*

System Action: Processing continues.

Operator Response: Notify the database administrator.

Database Administrator Action: If possible, insure that the RRS Recoverable Resource Manager rolls back the RRS UR. If this is done, there will be no heuristic damage. If the RRS UR is committed by the RRS Recoverable Resource manager, heuristic damage will have occurred since DB2 rolled back the same UR.

DSN3100I *csect-name* **SUBSYSTEM *ssnm* READY FOR START COMMAND**

Explanation: This message is issued by CSECT DSN3RRSR when DB2 subsystem initialization is complete. The '*ssnm*' in the message is the name of the subsystem that issued the message. This occurs during MVS IPL processing. The message is also issued by CSECT DSN3EC0X after termination of the previous execution of DB2 is complete. Message DSN3104I is also issued during this processing.

Operator Response: Issue the -START command when DB2 execution is desired.

DSN3101I *csect-name* **INVALID EARLY PROCESSING MODULE NAME IN PARMLIB RECORD. *ssnm* IS NOT AVAILABLE**

Explanation: CSECT DSN3UR00 has discovered that a parameter passed to DB2 subsystem initialization is in error. Either the Early processing load module name is not between 1 and 8 characters long, or there are syntax errors in the parameter string. The entire parameter string must be between 3 and 10 characters long, and the next to the last character must be a ','. The parameters were obtained from the parameter fields of a record defining a DB2 subsystem in member IEFSSNxx of SYS1.PARMLIB.

The subsystem recognition character is not inserted in this message as it is not yet known. '*ssnm*' is the name of the DB2 subsystem undergoing IPL-time initialization.

System Action: The DB2 subsystem with the

indicated name is not available for this IPL of MVS.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the parameter fields in the record of SYS1.PARMLIB member IEFSSNxx, and re-IPL MVS. Refer to Part 2 of *DB2 Installation Guide* for the format of an IEFSSNxx record which defines a DB2 subsystem.

DSN3102I *csect-name* **INVALID SUBSYSTEM RECOGNITION CHARACTER IN PARMLIB RECORD. *ssnm* IS NOT AVAILABLE**

Explanation: CSECT DSN3UR00 detected that the subsystem recognition character is invalid; it must be nonblank. The subsystem recognition character is the last field of the parameter string passed to DB2 IPL initialization. It is obtained from a record for the named subsystem in member IEFSSNxx of SYS1.PARMLIB.

The subsystem recognition character is not inserted in this message as it cannot be determined. '*ssnm*' is the name of the DB2 subsystem undergoing IPL-time initialization.

System Action: The DB2 subsystem with the indicated name is not available for this IPL of MVS.

Operator Response: Notify the system programmer. Correct the parameter fields in the SYS1.PARMLIB record of member IEFSSNxx, and re-IPL MVS. Refer to Part 2 of *DB2 Installation Guide* for the format of an IEFSSNxx record which defines a DB2 subsystem.

DSN3103I *csect-name* - **UNABLE TO LOAD EARLY PROCESSING MODULE SPECIFIED IN PARMLIB RECORD. *ssnm* IS NOT AVAILABLE**

Explanation: CSECT DSN3UR00 is unable to load the early processing load module named in the first parameter passed to DB2 subsystem IPL initialization. '*ssnm*' is the name of the DB2 subsystem undergoing IPL-time initialization.

Either the load module name was specified incorrectly or the load module does not reside in a library included in the MVS linklist.

System Action: DSN3UR00 abends with code X'04E' and reason code X'00F30103'. The DB2 subsystem with the indicated name is not available for this IPL of MVS.

Operator Response: Notify the system programmer.

System Programmer Response: Identify the cause of the error. Either correct the early processing load module or take the necessary steps to include the module in a link-listed library. Re-IPL MVS. Refer to Part 2 of *DB2 Installation Guide* for the format of an IEFSSNxx record that defines a DB2 subsystem. Refer to the appropriate MVS publication for MVS linklist requirements.

Problem Determination: An entry is made to SYS1.LOGREC. No SVC dump is taken.

DSN3104I *csect-name* - **TERMINATION COMPLETE**

Explanation: This message indicates that a DB2 subsystem has terminated. The actual MVS termination of the DB2 address space(s) may have completed earlier. This message is presented for every termination, normal or abnormal.

Operator Response: Issue a DISPLAY ACTIVE command to see if MVS has completed termination processing of the address space(s).

DSN3105I *csect-name* - **UNABLE TO LOAD EARLY PROCESSING MODULE 'DSN3EPX' ssnm IS NOT AVAILABLE**

Explanation: CSECT DSN3UR00 is unable to load the early processing module DSN3EPX required for MVS. The name of the DB2 subsystem undergoing IPL-time initialization is 'ssnm'. Either the load module has been inadvertently deleted, or does not reside in a library included in the MVS linklist.

System Action: DSN3UR00 abends with code X'04E' and reason code X'00F30105'. DB2 subsystem 'ssnm' is not available for this IPL of MVS.

Operator Response: Notify the system programmer.

System Programmer Response: Identify the cause of the error. Either correct the early processing load module or take the necessary steps to include the module in a link-listed library. Re-IPL MVS.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: An entry is made in SYS1.LOGREC. No SVC dump is taken. Refer to MVS linklist requirements in *MVS/ESA JES2 Initialization and Tuning Guide*.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5.

DSN3106I *csect-name* **SUBSYSTEM STOPPED. THIS COMMAND NOT PROCESSED:**
command-text

Explanation: A command has been received which cannot be processed due to one of the following:

- The DB2 subsystem has not been started.
- The command was queued for processing while DB2 was starting, but startup terminated with an error.
- DB2 terminated before the command could be processed.

System Action: The command is not processed.

Operator Response: Start the DB2 subsystem, then reenter the command.

DSN3107I *csect-name* **COMMAND REJECTED. REQUESTER NOT AUTHORIZED**

Explanation: CSECT DSN3EC0X has discovered that the source of the command was a console that does not have 'system' authority.

System Action: The command is not processed. This message is sent to the console that entered the command.

Operator Response: Enter the command from another console that has 'system' authority.

System Programmer Response: Verify that this console should be used for entering DB2 commands. If so, authorize it for 'system' commands by using MVS services.

DSN3108I *csect-name* **COMMAND REJECTED. COMMAND FACILITY PATH UNAVAILABLE**

Explanation: CSECT DSN3EC0X has discovered that the path from MVS consoles to the DB2 command processor is unavailable. It may still be possible to enter commands through one of the attachment facilities.

System Action: The command is not processed. This message is delivered to the console that entered the command.

System Programmer Response: The console command facility is available again the next time DB2 is started. If it is necessary to regain this facility immediately, DB2 should be canceled and restarted.

DSN3109I *csect-name* - **UNABLE TO OBTAIN SUBSYSTEM AFFINITY TABLE INDEX FOR SUBSYSTEM *ssnm*. IEFSSREQ RC = *nn***

Explanation: CSECT DSN3UR00 was unable to obtain a subsystem affinity table index for the named subsystem. MVS did not recognize the named subsystem name as a known subsystem. If this message is issued, a serious error has occurred in MVS or DB2.

In the message, 'nn' is the return code from the IEFSSREQ MVS service. 'ssnm' is the name of the DB2 subsystem undergoing IPL-time initialization.

System Action: DSN3UR00 abends with completion code X'04E' and reason code X'00F30104'. The DB2 subsystem with the indicated name is not available for this IPL of MVS.

Operator Response: Notify the system programmer.

System Programmer Response: Try to re-IPL. If the

problem persists, follow standard DB2 problem reporting procedures.

Problem Determination: A record is written to SYS1.LOGREC. No SVC dump is taken. Return codes from IEFSSREQ are documented under control block SSOB in the appropriate MVS publication.

DSN3111I *csect-name* **LOAD MODULE**
module-name **DOES NOT HAVE**
AMODE(31) ATTRIBUTE. *ssnm* IS NOT
AVAILABLE

Explanation: The DB2 program which establishes DB2 as an MVS subsystem during Master Scheduler initialization has determined that either its own load module or a load module loaded by it does not have the linkage editor attributes AMODE(31) and RMODE(ANY). Most DB2 load modules must be capable of running in the 31-bit addressing mode.

In the message, 'csect-name' is the name of the program detecting the error, 'module-name' is the name of the first load module found with an invalid AMODE attribute, and 'ssnm' is the name of the DB2 subsystem undergoing IPL-time initialization.

System Action: Program DSN3UR00 abends with a code of X'04E' and a reason code of X'00F30111'. The DB2 subsystem named 'ssnm' is not initialized. The subsystem will not be available until the error is corrected and MVS is re-IPLed.

Operator Response: Notify the system programmer of the failure.

System Programmer Response: Verify that all of the following were done:

- The installation and maintenance activities against DB2 were executed using SMP.
- The JCLIN for SMP included the correct AMODE and RMODE control statements.
- The appropriate Linkage Editor provided with the Data Facility Product (DFP) for the version of MVS being used was invoked by SMP for the link-edit steps.

Correct and rerun the procedure or JCL which caused the error. If necessary, REJECT all SMP APPLY steps which were executed incorrectly and rerun the rejected steps. Request a re-IPL of MVS.

Problem Determination: A record is written to SYS1.LOGREC. No SVC dump is taken.

The MVS service aid AMBLIST provides Linkage Editor module attributes in the summary section of the LISTLOAD function output.

DSN3112I *csect-name* **UNABLE TO REGISTER**
COMMAND PREFIX, CPF RETURN
CODE = *xyyy*. *ssnm* IS NOT AVAILABLE

Explanation: DB2 is unable to register the installation-specified command prefix with MVS. The command prefix is specified in the subsystem definition parameter. *xx* is the hexadecimal return code, and *yy* is the hexadecimal reason code from the CPF MVS service. Subsystem *ssnm* is not available.

System Action: This DB2 subsystem is not available.

System Programmer Response: Refer to the MVS documentation on the CPF macro service to determine the reason for the *xx* and *yy* codes. Ensure that the specified command prefix is not already registered, or is not a substring or superstring of an already registered command prefix. Use the MVS DISPLAY OPDATA command, if necessary, to see command prefixes registered with MVS.

DSN3113I *csect-name* **INVALID SUBSYSTEM**
DEFINITION PARAMETER IN PARMLIB
RECORD. *ssnm* IS NOT AVAILABLE.

Explanation: DB2 detected an error in the subsystem definition parameter, which is obtained from the IEFSSNxx member of SYS1.PARMLIB. Some possible causes for this error are:

- The early processing load module name is not between 1 and 8 characters long.
- The command prefix is not between 1 and 8 characters long.
- The command prefix scope is not 1 character long.
- The command prefix scope is not X, S, or M.
- The group attach name is not between 1 and 4 characters long.

The command prefix is not inserted into this message because it is unknown. The name of the subsystem attempting to initialize is *ssnm*.

System Action: The DB2 subsystem is not available.

System Programmer Response: Correct the subsystem definition parameter and re-IPL MVS. Refer to *DB2 Installation Guide* for the format of the subsystem definition parameter that defines a DB2 subsystem.

DSN3114I *csect-name* **GROUP ATTACH NAME IS**
NOT ALLOWED WITH THIS RELEASE
OF MVS. *ssnm* IS NOT AVAILABLE

Explanation: DB2 found an installation-specified group attachment name specified in the subsystem definition parameter, IEFSSNxx, but DB2 group attachment is not supported with this release of MVS. DB2's group attachment feature requires MVS/ESA SP4.2.2 or a later release. The DB2 subsystem *ssnm* is not available.

System Programmer Response: Delete the group attachment name in the subsystem definition parameter and re-IPL.

DSN3115I *csect-name* **UNABLE TO REGISTER GROUP ATTACH NAME, NAME/TOKEN RC = xx. ssnm IS NOT AVAILABLE**

Explanation: DB2 is unable to register the installation-specified group attach name with MVS. The group attach name is specified in the subsystem definition parameter. *xx* is the hexadecimal return code from the MVS Name/Token service. Subsystem *ssnm* is not available.

System Action: This DB2 subsystem is not available.

System Programmer Response: Refer to MVS documentation about the Name/Token macro service to determine the reason for the *xx* return codes.

DSN3116I *csect-name* **THE VERSION OF THE DB2 EARLY CODE IS INCOMPATIBLE WITH THIS VERSION OF MVS. ssnm IS NOT AVAILABLE**

Explanation: This version of DB2 early code requires MVS/ESA 4.2.0. Subsystem *ssnm* is not available.

System Programmer Response: The version of the DB2 early code that was loaded from the LINKLIST library is not compatible with the release of MVS that you are using. Change the concatenation order of the LINKLIST library so that a compatible release of DB2 early code is used.

DSN3201I **ABNORMAL EOT IN PROGRESS FOR USER=xxxxxxx CONNECTION-ID=yyyyyyy CORRELATION-ID=zzzzzzzzzz JOBNAME=aaaaaaa ASID=9999 TCB=99999999**

Explanation: Abnormal termination started for the agent with the values shown for USER, CONNECTION-ID, CORRELATION-ID, JOBNAME, ASID and TCB address. These values are the last known set of identifiers for the terminating agent.

The abnormal termination could be the result of a failure in the allied agent's address space or the result of an operator cancel command.

The value for the USER and/or CORRELATION-ID might be blank. If the terminating agent is connected to DB2 at the IDENTIFY level and was not previously signed on, or was not previously authorized to a plan at the time of the failure, then no CORRELATION-ID is associated with the agent. Otherwise, the values for the USER, CONNECTION-ID, CORRELATION-ID, JOBNAME and ASID are the last values established to DB2 for this connection. They might represent the current activity of the agent. The TCB value is the address of the TCB that is terminating. Previous DB2

work by this agent might have completed successfully. Correlation IDs beginning with '0nn', where nn is a number from 01 to 28, identify system agents.

System Action: The agent was previously queued to a System Services service task for termination processing. This message indicates that the agent was taken from the queue for processing. Any uncommitted database changes are rolled back.

User Response: Your job or TSO session cannot be canceled. The PA1 key has no effect in this circumstance. To avoid long waits when your application program is canceled or terminates abnormally, issue frequent commits.

System Programmer Response: See the Problem Determination section for this message. The MVS CANCEL and FORCE commands have no effect and should not be issued. DB2 should not be canceled. If an extensive rollback is in progress, the subsequent DB2 restart might take a very long time because of additional log activity.

Problem Determination: You can detect a deferred termination condition for a task by examining several indicators. Some or all of the following might be present:

- The allied address space might be swapped out and appear to be in a never-ending WAIT condition.
- The MVS commands CANCEL and FORCE appear to have no effect.
- The allied task holds an MVS-shared ENQ on resource SYSZDSN3.ERLYOLRHerly-block-address.
- During abnormal termination of the agent associated with the failing task, but before this message was written, the task's connection appears on the -DISPLAY THREAD output with a QD status. See message DSNV404I for the definition of this status code.
- This message, DSN3201I, is written to the MVS console after the agent is removed from the service task work queue when termination processing begins.
- During abnormal termination of the agent associated with the failing task, the task's connection appears on the -DISPLAY THREAD output with a D status. See message DSNV404I for the definition of this status code.

DSN3458I *csect-name* **MODULE *modname* MUST HAVE THE AMODE (31) ATTRIBUTE**

Explanation: An authorization exit load module was not link-edited with the 31-bit addressing mode (AMODE) attribute. Either load module DSN3@ATH or DSN3@SGN is specified by '*modname*'.

System Action: Subsystem startup is terminated.

System Programmer Response: Relink-edit the authorization exit module specifying the attributes AMODE(31), RMODE(ANY).

Problem Determination: Check the load module attributes used for the link-edit.

DSN3580I CONNECTION FOR [EOM | FEOT | IDEN] GAVE RC=X xxxxxxxx, REASON=X xxxxxxxx

Explanation: A nonzero return code has been returned to DSN3AMI2 from the SSSS connect to subsystem interface call. The variables in the message indicate which SSI call is involved and the actual return and reason codes associated with it.

System Action: The current task (TCB) is abended with a system completion code of X'04E' and with an abend reason code of '00F30580' The DB2 subsystem terminates.

Operator Response: Notify the system programmer.

System Programmer Response: Restart the DB2 subsystem.

Problem Determination: The trace table and stack storage associated with the EB in register 6 must be examined to locate the error.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 2, 5.

DSN3581I csect-name SAF service FAILED WITH SAF RETURN CODE = saf-retc, RACF RETURN CODE = racf-retc, AND RACF REASON CODE = racf-reac. DB2 REASON CODE = db2-reac

Explanation: DB2 invoked the specified SAF (Security Authorization Facility) service which failed with the following codes:

Variable

Definition

csect The CSECT name of the DB2 module that issued the message.

service The name of the service that failed.

saf-retc The SAF return code.

racf-retc The RACF return code.

db2-reac The DB2-assigned reason code for the failure.
DB2 associates the failure with a DB2 reason code which may appear in other messages associated with this failure.

System Action: The call fails. Other messages associated with this feature may follow.

User Response: Notify the system programmer.

Operator Response: Notify the system programmer.

System Programmer Response: The action to take

depends on the service being used.

- R_ticketserv
DB2 requests this service to parse a Kerberos ticket received from a remote client. Refer to OS/390 Security Server (RACF) Callable services for an explanation of the error.

DB2 uses the SAF R_ticketserv service to parse a Kerberos ticket that was received from a remote client. Refer to OS/390 SecureWay Security Server RACF Callable Services for an explanation of the error. A SAF and RACF return code of 8 and 16 indicate a failure from the Network Authentication Privacy Service (Kerberos) when parsing the ticket in which case the RACF reason code contains a status code from the Network Authentication Privacy Service. These status codes are documented in the OS/390 SecureWaySecurity Server Network Authentication and Privacy Service Administration manual. Additional information for some of the more common status codes and how they relate to DB2 follows:

96C73A07

One possibility is that you must associate the ssnmDIST started task user ID with a principal name and the client system must use this principal name in the Kerberos target principal.

Note: DB2 Connect client systems must catalog a DB2 for OS/390 database with "AUTHENTICATION KERBEROS TARGET PRINCIPAL principal_name". Assume that SYSDSP is the user ID associated with the ssnmDIST started task. A principal, say SYSDSPp, must be associated to the SYSDSP user ID by a RACF ALTUSER command. Further, the SYSDSPp principal name must appear in the target principal name of the DB2 Connect database configuration for the DB2 for OS/390 database.

- R_ticketserv(principal name)
DB2 uses the SAF R_usermap service to determine the user ID associated with a Kerberos ticket received from a remote client. Refer to OS/390 SecureWay Security Server RACF Callable Services for an explanation of the error. The principal name obtained from the ticket is included in parenthesis to assist the user in determining the cause of the problem. Either the client system is using an invalid principal name, or a principal name to user ID association has not been defined to RACF.

Principals authenticated on the local OS/390 realm must have a mapping that associates the local principal name to a local RACF user ID. This

DSN3581I

association can be made by using the RACF ADDUSER or ALTUSER commands with the KERBNAME parameter.

Principals authenticated on a foreign realm must have a mapping that associates the foreign fully qualified principal name to a local RACF user ID. This association can be made by using the RACF RDEFINE or RALTER commands with the KERBLINK parameter.

- R_usermap

DB2 requests this service to determine the user ID associated with a Kerberos ticket received from a remote client. Refer to *OS/390 Security Server (RACF) Callable services* for an explanation of the error.

Chapter 28. DSN7... Messages

DSN7000I *csect-name* **REQUIRED CSECT DSN6GRP COULD NOT BE FOUND IN SYSTEM PARAMETERS LOAD MODULE.**

Explanation: The required CSECT DSN6GRP was not found in the system parameters load module.

System Action: The DB2 subsystem terminates with reason code 00F70001.

Operator Response: Restart DB2 with the correct system parameters load module.

System Programmer Response: Reassemble the system parameters load module and include the DSN6GRP macro.

DSN7001I *csect-name* **DATA SHARING SPECIFIED IN SYSTEM PARAMETERS, BUT NOT RUNNING ON A MVS SYSTEM LEVEL WHICH IS REQUIRED FOR DATA SHARING.**

Explanation: A DB2 subsystem was started with the data sharing option, but MVS is not at the required level. DB2 data sharing requires MVS Version 5 Release 1.0 or a later release.

System Action: The DB2 subsystem terminates with reason code 00F70002.

Operator Response: Restart DB2 on MVS Version 5 Release 1.0 or a later release.

DSN7002I **LIGHT(YES) ON START DB2 COMMAND WAS IGNORED, SYSTEM IS NOT ENABLED FOR DATA SHARING**

Explanation: DB2 issues this message during DB2 startup if DB2 is started with the LIGHT(YES) keyword and the system is not enabled for data sharing.

System Action: DB2 startup continues normally. DB2 ignores the LIGHT(YES) specification.

DSN7100I *csect-name*

Explanation: This message indicates the beginning of the output from a DISPLAY GROUP command. It is the first line of a multi-line message response.

DSN7101I ***** BEGIN DISPLAY OF GROUP(*group-name*) GROUP LEVEL (*group-level*) PROTOCOL LEVEL (*protocol-level*)**

Explanation: This message is a line of output from a DISPLAY GROUP command.

group-name is the name of the data sharing group.

group-level is a string of three numeric characters:

- Version
- Release
- Modification level

protocol-level is a value that is supplied for serviceability only.

DSN7102I -----

Explanation: This message is a line of output from a DISPLAY GROUP command.

DSN7103I **DB2 DB2 SYSTEM IRLM**

Explanation: This message is a line of output from a DISPLAY GROUP command.

DSN7104I **MEMBER ID SUBSYS CMDPREF STATUS LVL NAME SUBSYS IRLMPROC**

Explanation: This message is a line of output from a DISPLAY GROUP command.

MEMBER

Name of the DB2 data sharing member.

ID

Internally assigned ID for each data sharing member.

SUBSYS

Subsystem name of the data sharing member.

CMDPREF

Command prefix of the data sharing member.

STATUS

State of the data sharing member, which can be 'ACTIVE', 'AI', 'FAILED', 'QUIESCED', 'QI', 'QR', 'QC', 'QIC', 'QIR', or 'QICR' where:

ACTIVE

The member is currently up and running.

AI

The member is active with additional conditions. Indoubt or postponed abort units of recovery are outstanding. This means retained locks are held.

FAILED

The member has terminated abnormally.

QUIESCED

The member is down normally.

QI

The member is down with indoubt URs.

QR The member is down with resynchronization responsibility.

QC The member is down with group buffer pool castout responsibility.

QIC,QIR,QICR
A possible combination of the quiesced states that are listed above.

LVL String of three numeric characters as follows:

- DB2 Version
- DB2 Release
- DB2 Modification level

SYSTEM NAME
Name of the MVS system on which the data sharing member runs.

IRLM SUBSYS
The accompanied IRLM's subsystem name for this DB2.

IRLMPROC
The accompanied IRLM's startup procedure name.

DSN7105I -----

Explanation: This message is a line of output from a DISPLAY GROUP command.

DSN7106I *member-name subsystem-name
command-prefix member-status
mvs-system-name irlm-subsystem-name
irlm-procedure-name*

Explanation: This message is a line of output from a DISPLAY GROUP command. *member-status* can be ACTIVE, QUIESCED, or FAILED. *member-status* may also have the string '****' as output if the member has not been quiesced normally.

QUIESCED
This is a normal quiesced state, as the result of a normal STOP DB2 command.

Q The member is quiesced, but with additional conditions. Q (quiesced) can be paired with one or more of the following letters:

I Indoubt units of recovery (URs) are outstanding. This means retained locks are held.

C There was a castout error. The last updated of the page set or partition could not write from the coupling facility to DASD.

Make sure there is connectivity from the coupling facility to DASD before restarting DB2.

R There is retained information needed

for DB2 to perform resynchronization with one or more remote locations.

When DB2 is restarted, this resynchronization occurs.

ACTIVE
This is a normal active state without conditions

A The member is active, but with the additional conditions. A (active) can be paired with the following letter:

I Indoubt or postponed abort units of recovery (URs) are outstanding. This means retained locks are held.

******* Usually issued if the member has not been quiesced normally. The string '****' may also be paired with the following:

******** Information unknown. This may result if an unwanted member was previously added to the group, and continues to be named in other locations.

The *subsystem-name*, *command-prefix*, *irlm-subsystem-name*, and *irlm-procedure-name* show '****' if this information is unknown.

DSN7107I GROUP ATTACH NAME(group-attach)

Explanation: This message is a line of output from a DISPLAY GROUP command.

group-attach is the group attach name for the data sharing group.

DSN7108I NUMBER LOCK ENTRIES: nnnnnnnnnn

Explanation: This line of output from a DISPLAY GROUP command shows information about the LOCK1 coupling facility structure. The maximum number of lock table entries is displayed.

**DSN7109I SCA STRUCTURE SIZE: nnnnnnnn KB,
STATUS = xx, SCA IN USE: < nnn %**

Explanation: This message is a line of output from a DISPLAY GROUP command.

If the % value is > 0 but < 1, then a "<" character is shown before the 1 % value, e.g. "< 1 %". This can happen if the shared communications area (SCA) structure is very large or if only a small number of SCA entries are in use.

The SCA status can have following values:

IN SCA is in initialization phase.

AC SCA is active.

DS SCA loss of connectivity, delayed action started.

- DC** SCA loss of connectivity, delayed action completed.
- QS** SCA rebuild quiesce function started.
- QC** SCA rebuild quiesce function completed.
- CS** SCA rebuild connect function started.
- CC** SCA rebuild connect function completed.
- OS** SCA rebuild connect complete function started.
- RS** SCA rebuild resource manager invocation started.
- RC** SCA rebuild resource manager invocation completed.
- OC** SCA rebuild connect complete function completed.
- LS** SCA rebuild cleanup function started.
- US** SCA rebuild resource manager invocation started.
- UC** SCA rebuild resource manager invocation completed.
- LC** SCA rebuild cleanup function completed.
- PS** SCA rebuild process complete function started.
- PC** SCA rebuild process complete function completed.
- SS** SCA rebuild stop function started.
- SC** SCA rebuild stop function completed.
- ES** SCA rebuild stop complete function started.
- EC** SCA rebuild stop complete function completed.
- VS** SCA volatility change function started.
- VC** SCA volatility change function completed.
- TE** SCA is in termination phase.

DSN7110I LOCK1 STRUCTURE SIZE: *nnnnnnn* KB

Explanation: This line of output from a DISPLAY GROUP command shows the size of the LOCK1 coupling facility structure.

DSN7111I NUMBER LIST ENTRIES: *nnnnnnnnnnn*, LIST ENTRIES IN USE: < *nnnnnnnnnnn*

Explanation: This line of output from a DISPLAY GROUP command shows information about the LOCK1 coupling facility structure. The maximum number of modify lock list entries and the number of those entries currently in use are displayed. (MVS documentation refers to these list entries as "record data".)

DSN7112I * END DISPLAY OF GROUP(*group-name*)**

Explanation: This message is the last line of output from a DISPLAY GROUP command.

DSN7113I DISPLAY TERMINATED DUE TO INSUFFICIENT MESSAGE SPACE.

Explanation: There is not enough storage available to store the required information from this command.

System Action: The DB2 subsystem displays the group information, but some information is missing.

DSN7114I XCF OR STRUCTURE INFORMATION NOT AVAILABLE. MVS *nnnnnnnnn* RETURN CODE=*xxxxxxxx*, MVS *nnnnnnnnn* REASON CODE=*yyyyyyyyy*.

Explanation: An error occurred during the query of the cross-system coupling facility (XCF) or CF structure information.

nnnnnnnn could be IXCQUERY or IXLMG.

System Action: The DB2 subsystem displays the group, but some XCF or coupling facility structure information is missing. Refer to *MVS/ESA Programming: Sysplex Services Reference* for an explanation of IXCQUERY or IXLMG return and reason codes.

DSN7120I DB2 PARALLEL PARALLEL

Explanation: This message is a line of output from a DISPLAY GROUP command with the DETAIL option.

DSN7121I MEMBER COORDINATOR ASSISTANT

Explanation: This message is a line of output from a DISPLAY GROUP command with the DETAIL option.

DSN7122I -----

Explanation: This message is a line of output from a DISPLAY GROUP command with the DETAIL option.

DSN7123I *member-name parallel-coordinator parallel-assistant*

Explanation: This message is a line of output from a DISPLAY GROUP command with the DETAIL option. This message is only issued for ACTIVE DB2 members that support Sysplex query parallelism.

DSN7401I *csect-name* **INCONSISTENT DATA SHARING PARAMETER DETECTED, *parameter-name* IN DB2 SYSTEM PARAMETERS (*sysparm-parm*) IS NOT EQUAL TO PARAMETER IN THE DB2 START-UP PROCEDURE (*start-parm*).**

Explanation: At least one data sharing parameter in the member's system parameters is not equal to the data sharing parameter value passed on the DB2 start-up procedure.

System Action: The DB2 subsystem terminates with reason code 00F70003.

Operator Response: Restart DB2 with the correct system parameters load module or inform the system programmer to change the DB2 start-up procedure.

System Programmer Response: Reassemble the system parameters load module. Make sure that the group name and the member name match the values in the DB2 start-up procedure, or correct the parameters on the DB2 start-up procedure.

DSN7403I *csect-name* **MEMBER(*member-name*) IS ALREADY ACTIVE ON SYSTEM(*mvs-system-name*).**

Explanation: The started DB2 subsystem is already active on another MVS system.

System Action: The DB2 subsystem terminates with reason code 00F70003.

Operator Response: If you want the DB2 subsystem to run on this MVS system, stop the DB2 subsystem on the other MVS. After the DB2 subsystem stops, restart the DB2 on this MVS.

DSN7404I *csect-name* **INVALID MEMBER(*member-name*) WAS FOUND IN DB2 XCF GROUP(*db2-group-name*). MEMBER HAS BEEN DELETED.**

Explanation: The invalid member was found in a DB2 data sharing group, which is a particular type of cross-system coupling facility (XCF) group. The invalid name *member-name* was found in data sharing group *db2-group-name* and was deleted. *member-name* might represent an unauthorized program, other than DB2 for MVS/ESA, that attempted to join the data sharing group.

System Action: The DB2 subsystem continues.

Operator Response: Report the occurrence of this message to your system programmer.

System Programmer Response: Investigate which unauthorized program joined the DB2 group and find its owner. This could indicate a security violation.

DSN7405I *csect-name* **MEMBER(*member-name*) UNABLE TO JOIN DATA SHARING GROUP(*group-name*), MVS IXCJOIN RETURN CODE=*xxxxxxx*, MVS IXCJOIN REASON CODE=*yyyyyyyy*.**

Explanation: An unexpected error occurred when the data sharing DB2 member attempted to join the MVS cross-system coupling facility (XCF) data sharing group.

System Action: The DB2 subsystem terminates with reason code 00F70408.

Operator Response: Issue an MVS 'DISPLAY XCF,GROUP' command to ensure that XCF is functional; then try to restart the DB2 subsystem.

System Programmer Response: Refer to *MVS/ESA Programming: Sysplex Services Reference* for an explanation of the IXCJOIN return and reason codes.

DSN7406I *csect-name* **UNABLE TO QUERY DATA SHARING GROUP INFORMATION, MVS IXCQUERY RETURN CODE=*xxxxxxx*, MVS IXCQUERY REASON CODE=*yyyyyyyy*.**

Explanation: An unexpected error occurred during the execution of the MVS IXCQUERY macro.

System Action: The DB2 subsystem terminates with reason code 00F70406.

Operator Response: Issue an MVS DISPLAY XCF,GROUP command to ensure that XCF is functional. Then try to restart the DB2 subsystem again.

System Programmer Response: Refer to *MVS/ESA Programming: Sysplex Services Reference* for an explanation of the IXCQUERY return and reason codes.

DSN7407I *csect-name* **AUTOMATIC RESTART MANAGER *function* FAILED. MVS IXCARM RETURN CODE = *xxxxxxx*, MVS IXCARM REASON CODE = *yyyyyyyy*.**

Explanation: DB2 encountered an error using the specified MVS automatic restart manager (ARM) function.

System Action: DB2 continues. However, if DB2 abnormally terminates, the MVS ARM cannot automatically restart DB2.

System Programmer Response: Refer to *MVS/ESA Programming: Sysplex Services Reference* for the function, return code, and reason code from the IXCARM request.

DSN7408I *csect-name* **ARM EVENT EXIT FAILED. DB2 SUBSYSTEM *ssnm* NOT RESTARTED. MVS IEFSSI RETURN CODE = xxxxxxxx, MVS IEFSSI REASON CODE = yyyyyyyy.**

Explanation: The DB2 ARM event exit encountered an error while attempting to define the DB2 subsystem to MVS.

System Action: The automatic restart of the DB2 subsystem is stopped.

System Programmer Response: Refer to *MVS/ESA Programming: Assembler Services Reference* for return and reason codes from the IEFSSI request. If the IEFSSI return code and reason code are 0, look in the console log for previous messages that indicate why the definition of the DB2 subsystem failed. You can manually start DB2 by using the -START DB2 command on any system where the DB2 subsystem is defined.

DSN7409I *csect-name* **MEMBER(*member-name*) UNABLE TO QUIESCE FROM DATA SHARING GROUP(*group-name*), MVS IXCQUIES RETURN CODE=xxxxxxx, MVS IXCQUIES REASON CODE=yyyyyyyy.**

Explanation: An unexpected error occurred when the data sharing DB2 member attempted to place itself in an MVS cross-system coupling facility (XCF) quiesced state.

System Action: The DB2 subsystem termination continues.

Operator Response: Inform your system programmer.

System Programmer Response: Refer to *MVS/ESA Programming: Sysplex Services Reference* for an explanation of the IXCQUIES return and reason codes.

DSN7501A *csect-name* **SCA STRUCTURE *sca-structure-name* CONNECTIVITY FAILURE.**

Explanation: The specified DB2 member lost connectivity to the shared communication area (SCA) structure.

System Action: The specified DB2 disconnects from the SCA and terminates with reason code 00F70600.

Operator Response: Notify the system programmer.

System Programmer Response: Find out why the link from this central processor complex (CPC) to the SCA structure was lost. After fixing it, restart DB2.

DSN7502I *csect-name* **SCA STRUCTURE *sca-structure-name* FAILURE, ATTEMPT TO REBUILD IS IN PROGRESS.**

Explanation: The specified DB2 member detected the shared communications area (SCA) structure failure.

System Action: DB2 tries to rebuild the SCA structure on a coupling facility in the preference list for the coupling facility.

Operator Response: Wait for message DSN7503I or DSN7504A.

DSN7503I *csect-name* **SCA STRUCTURE *sca-structure-name* REBUILD SUCCESSFUL.**

Explanation: This member successfully connected to a shared communications area (SCA) structure on the same or an alternate coupling facility and completed restoration of its information in the shared communications area (SCA).

System Action: DB2 processing continues.

DSN7504I *csect-name* **SCA STRUCTURE *sca-structure-name* REBUILD UNSUCCESSFUL. REASON CODE = xx.**

Explanation: This member has not successfully connected to a shared communication area (SCA) structure on an alternate coupling facility and completed restoration of its information in the shared communications area (SCA). This message follows message DSN7502I.

- 04** An operator requested to stop the rebuild process.
- 08** A DB2 resource manager requested to stop the rebuild process.
- 12** The new SCA structure failed during the rebuild process.
- 16** A DB2 member lost connectivity to the new SCA in the rebuild process.
- 20** An MVS service used during the rebuild process failed. A message was issued from the failed MVS service.

System Action: This DB2 member terminates with reason code 00F70601. Other members can continue processing.

System Programmer Response: See the termination code for more details.

DSN7505A *csect-name* **THERE IS A SHORTAGE OF FREE STORAGE IN SCA STRUCTURE** *sca-structure-name*

Explanation: The amount of free storage in the shared communications area (SCA) coupling facility structure is low. The SCA is 75 percent full. Because SCA storage space is required by some DB2 commands and processes, the availability of those processes might be affected. Completely running out of SCA storage can cause DB2 subsystem outages.

This message stays on the MVS console and is highlighted.

System Action: DB2 processing continues.

This message might remain highlighted and might not be automatically deleted in a pre SP5.2.1-JES3 environment.

Operator Response: If the message remains highlighted after the error situation is cleared up, manually delete the message from the console.

System Programmer Response: You can monitor the amount of SCA storage in use with the DISPLAY GROUP command.

You can free SCA storage by removing exception conditions. Another thing you can do is issue START DATABASE commands with the SPACENAM option or use the RECOVER utility to remove pages from the logical page list (LPL).

If you don't do anything to reclaim space, message DSN7512A appears when the SCA is 90 percent full.

DSN7506A *csect-name* **CONNECT TO THE SCA STRUCTURE** *sca-structure-name* **FAILED. MVS IXLCONN RETURN CODE=xxxxxxx, MVS IXLCONN REASON CODE=yyyyyyyy.**

Explanation: DB2 cannot connect to the shared communications area (SCA) coupling facility structure.

System Action: DB2 startup terminates with reason code 00F70602.

System Programmer Response: DB2 uses the MVS IXLCONN service to connect to the SCA structure. Refer to *MVS/ESA Programming: Sysplex Services Reference* for return and reason codes from the IXLCONN request.

DSN7507I *csect-name* **SCA STRUCTURE** *sca-structure-name* **IS ALLOCATED IN A VOLATILE STRUCTURE.**

Explanation: The shared communications area (SCA) structure is volatile.

System Action: DB2 processing continues.

System Programmer Response: One DB2 issues

this message whenever the structure has the volatile attribute. DB2 detects this either on the first connection to the SCA or on the attribute changes later. DB2 always requests a nonvolatile SCA. If this is not what you want, change the MVS CFRM administrative policy and request a rebuild of the SCA with the MVS SETXCF START,REBUILD command.

DSN7508I *csect-name* **ACCESS TO THE SCA STRUCTURE** *sca-structure-name* **FAILED. MVS IXLLIST RETURN CODE = xxxxxxxx, MVS IXLLIST REASON CODE = yyyyyyyy.**

Explanation: DB2 encountered an error in accessing the shared communications area (SCA) structure.

System Action: DB2 terminates with reason code 00F70603.

System Programmer Response: DB2 uses the MVS IXLLIST service to access the SCA structure. Refer to *MVS/ESA Programming: Sysplex Services Reference* for return and reason codes from the IXLLIST request.

DSN7509I *csect-name* **SCA STRUCTURE** *sca-structure-name* **IS ALLOCATED IN A NONVOLATILE STRUCTURE.**

Explanation: The SCA structure is now contained in a nonvolatile coupling facility structure.

System Action: DB2 processing continues.

DSN7510I *csect-name* **SCA STRUCTURE** *sca-structure-name* **REBUILD REQUEST RECEIVED, BUT SUBSYSTEM IS NOT READY TO PARTICIPATE.**

Explanation: The DB2 subsystem received a request from MVS to rebuild the shared communications area (SCA), but DB2 is not ready to participate in this process because DB2 startup has not yet completed.

System Action: DB2 terminates with reason code 00F70604. The SCA rebuild process might continue for other DB2s in the data sharing group.

Operator Response: Wait until the SCA rebuild process is finished and then start the failed DB2 again.

DSN7511I *csect-name* **RESPONSE TO MVS REBUILD COMPLETE OF SCA STRUCTURE** *sca-structure-name* **FAILED. MVS IXLREBLD RETURN CODE = xxxxxxxx, MVS IXLREBLD REASON CODE = yyyyyyyy.**

Explanation: DB2 encountered an error during the rebuild of the shared communications area (SCA) structure.

System Action: DB2 stops.

System Programmer Response: DB2 uses the MVS IXLREBLD service during the SCA structure rebuild. Refer to *MVS/ESA Programming: Sysplex Services Reference* for return and reason codes from the IXLREBLD request.

DSN7512A *csect-name* **THERE IS A CRITICAL SHORTAGE OF FREE STORAGE IN SCA STRUCTURE** *sca-structure-name*

Explanation: The amount of free storage in the shared communications area (SCA) coupling facility structure is critically low. The SCA is 90 percent full.

This message stays on the MVS console and is highlighted.

System Action: DB2 processing continues. However, DB2 limits use of SCA to critical information. Some utilities or commands that cannot be completed can cause one or more members of the group to come down.

This message might remain highlighted and might not be automatically deleted in a pre SP5.2.1-JES3 environment.

Operator Response: If the message remains highlighted after the error situation is cleared up, manually delete the message from the console.

System Programmer Response: You can monitor the amount of SCA storage in use with the DISPLAY GROUP command.

You can free SCA storage by removing exception conditions. Another thing you can do is issue START DATABASE commands with the SPACENAM option or use the RECOVER utility to remove pages from the logical page list (LPL). Then restart any failed DB2s.

If your actions do not free up enough space, or if the problem continues to occur, you have the following options, depending on what level of MVS and the coupling facility control code you are running with:

- If all members of the group are running with MVS Version 5 Release 2 and with a coupling facility control code level greater than 0, issue the SETXCF START,ALTER command to increase the size of the SCA. The size you specify must be less than or equal to the maximum size defined in the CFRM policy for the SCA structure.

If the maximum size (SIZE in the CFRM policy) is still not big enough, take the actions described below for MVS Version 5 Release 1 systems.

- If any or all members of the group are running with MVS Version 5 Release 1 or with a coupling facility control code level of 0, increase the storage for the SCA in the CFRM policy. Then issue the MVS SETXCF START,REBUILD command to rebuild the structure.

Refer to *DB2 Data Sharing: Planning and Administration* for more detailed recovery information.

DSN7513I *csect-name* **SCA STRUCTURE**
sca-structure-name **HAS ADEQUATE FREE STORAGE.**

Explanation: The shared communications area (SCA) coupling facility structure has adequate free storage to function properly.

This message is shown in the following circumstances:

- After the SCA was rebuilt.
- After the SCA usage goes below 67%, after its usage was up to 75% or higher.

System Action: DB2 processing continues.

DSN7514I *csect-name* **RESPONSE TO AN MVS REBUILD RELATED EVENT FOR THE SCA STRUCTURE** *sca-structure-name*
FAILED. MVS IXLEERSP RETURN CODE = xxxxxxxx, MVS IXLEERSP REASON CODE = yyyyyyyy.

Explanation: DB2 encountered an error during the rebuild of the shared communications area (SCA) structure.

System Action: DB2 terminates.

System Programmer Response: DB2 uses the MVS IXLEERSP service to respond to SCA structure rebuild. Refer to *MVS/ESA Programming: Sysplex Services Reference* for return and reason codes from the IXLEERSP request.

Chapter 29. DSN8... messages

DSN8000I *REQUEST IS: request*

Explanation: The input statement is listed as received.

This message is issued by the following CSECTs:
DSN8BD3, DSN8BF3

System Action: The request is listed.

User Response: See if the input request is what you want.

DSN8001I *csect EMPLOYEE NOT FOUND*

Explanation: The 'I' or 'list' request found no employee data that match your request.

System Action: No employees are listed.

User Response: If no employee data was expected to be found, continue.

Problem Determination: If the error is unexpected, list the contents of the employee and department views VEMP and VDEPT to determine why the entry is missing.

DSN8002I *csect EMPLOYEE SUCCESSFULLY ADDED*

Explanation: Employee data was added as requested.

System Action: The request was executed successfully.

DSN8003I *csect EMPLOYEE SUCCESSFULLY ERASED*

Explanation: Data for an employee was erased as requested.

System Action: The request was executed successfully.

DSN8004I *csect EMPLOYEE SUCCESSFULLY UPDATED*

Explanation: Data for an employee was updated as requested.

System Action: The request was executed successfully.

DSN8005E *csect EMPLOYEE EXISTS ALREADY, ADD NOT DONE*

Explanation: A request was made to add data for a new employee, but the employee number already exists.

System Action: No employee data is added.

User Response: Display the existing employee data. If this is the desired employee, update the employee entry. Otherwise, choose a new employee number.

Problem Determination: List the contents of the employee view, VEMP, and the department view, VDEPT.

DSN8006E *csect EMPLOYEE DOES NOT EXIST, ERASE NOT DONE*

Explanation: The erase requested was not performed. The employee number requested was not present in the table.

System Action: No employee data is erased.

User Response: Determine if the employee data to be erased should exist. Verify that the correct search criteria and data were entered. If appropriate, correct the entries and continue processing.

Problem Determination: List the contents of the employee view, VEMP, and the department view, VDEPT.

DSN8007E *csect EMPLOYEE DOES NOT EXIST, UPDATE NOT DONE*

Explanation: The update requested was not performed. The employee number requested was not present in the table.

System Action: No employee data is updated.

User Response: Verify that the correct search criteria and data were entered.

Problem Determination: List the contents of the employee table (VPHONE, VEMPLP, or EMP) and see if the employee number to be updated is in the table. Correct the update request or the table.

DSN8008I *csect NO EMPLOYEE FOUND IN TABLE*

Explanation: No employees match the selection criteria.

System Action: No employee data is listed.

User Response: If no employee data was expected, continue processing.

Problem Determination: List the contents of the VPHONE view and the underlying tables.

DSN8011I *csect DEPARTMENT NOT FOUND*

Explanation: No departments match the selection criteria.

System Action: No departments are listed.

DSN8012I • DSN8021I

User Response: If no departments are expected to be found, continue.

Problem Determination: If the error is unexpected, list the contents of the department views VDEPT and VDEPMG1 and their underlying tables to determine why the entry is missing.

DSN8012I *csect* **DEPARTMENT SUCCESSFULLY ADDED**

Explanation: A department was added as requested.

System Action: The request was executed successfully.

DSN8013I *csect* **DEPARTMENT SUCCESSFULLY ERASED**

Explanation: Data for a department was erased as requested.

System Action: The request was executed successfully.

DSN8014I *csect* **DEPARTMENT SUCCESSFULLY UPDATED**

Explanation: Data for a department was updated as requested.

System Action: The request was executed successfully.

DSN8015E *csect* **DEPARTMENT EXISTS ALREADY, ADD NOT DONE**

Explanation: You requested that a new department be added, but the department exists already.

System Action: No departments are added.

User Response: Display data for the existing department. If it is what you want, continue. If not, you can update data for this department or choose a new department id.

Problem Determination: If the error is unexpected, list the contents of the department views VDEPT and VDEPMG1 and their underlying tables to see if the data differs from what is expected.

DSN8016E *csect* **DEPARTMENT DOES NOT EXIST, ERASE NOT DONE**

Explanation: The erase request found no departments which match your request.

System Action: No department data is erased.

User Response: See if the department data to be erased should exist. Did you enter the correct combination of search criteria and data? If not, correct the entries and continue.

Problem Determination: If the error is unexpected, list the contents of the department views VDEPT and VDEPMG1 and their underlying tables to determine why the entry is missing.

DSN8017E *csect* **DEPARTMENT DOES NOT EXIST, UPDATE NOT DONE**

Explanation: The update request found no department data which matches your request.

System Action: No department data is updated.

User Response: See if the department data to be updated should exist. If you did not enter the correct combination of search criteria and data, correct the entries and continue.

Problem Determination: If the error is unexpected, list the contents of the department views VDEPT and VDEPMG1 and their underlying tables to determine why the entry is missing.

DSN8018I *csect* **CURRENT DEPARTMENT NOT FOUND**

Explanation: A request was made by a 'current' department to reference a 'higher' department. The 'current' department was not found.

System Action: No department data is processed.

User Response: If the 'current' department was not expected to exist, continue processing.

Problem Determination: List the contents of the department views VDEPMG1, VEMP, VASTRDE1, and VASTRDE2 and their underlying tables.

DSN8019E *csect* **NO HIGHER DEPARTMENT EXISTS**

Explanation: A request was made by a 'current' department to reference a 'higher' level of the department structure. A 'higher' level does not exist for the requested 'current' department.

System Action: No department data is processed.

User Response: If a 'higher' department was not expected to be found, continue processing.

Problem Determination: List the contents of the department views VDEPMG1, VEMP, VASTRDE1, and VASTRDE2 and their underlying tables.

DSN8021I *csect* **ACTIVITY NOT FOUND**

Explanation: No activities match the selection criteria.

System Action: No activity is listed.

User Response: If no activity was expected to be found, continue processing.

Problem Determination: List the contents of the

activity views VPROJRE1, VACT, and VPROJACT and their underlying tables.

DSN8022I *csect* **ACTIVITY SUCCESSFULLY ADDED**

Explanation: An activity was added as requested.

System Action: The request was executed successfully.

DSN8023I *csect* **ACTIVITY SUCCESSFULLY ERASED**

Explanation: An activity was erased as requested.

System Action: The request was executed successfully.

DSN8024I *csect* **ACTIVITY SUCCESSFULLY UPDATED**

Explanation: An activity was updated as requested.

System Action: The request was executed successfully.

DSN8025E *csect* **ACTIVITY EXISTS ALREADY, ADD NOT DONE**

Explanation: The addition requested was not performed. The activity requested was already present.

System Action: No activity is added.

User Response: If the activity was expected to already exist, continue processing.

Problem Determination: List the contents of the activity views VPROJRE1, VACT, and VPROJACT and their underlying tables.

DSN8026E *csect* **ACTIVITY DOES NOT EXIST, ERASE NOT DONE**

Explanation: The erase requested was not performed. The activity requested was not found.

System Action: No activity is erased.

User Response: If the activity was not expected to be found, continue processing.

Problem Determination: List the contents of the activity views VPROJRE1, VACT, and VPROJACT and their underlying tables.

DSN8027E *csect* **ACTIVITY DOES NOT EXIST, UPDATE NOT DONE**

Explanation: The update requested was not performed. The activity requested was not found.

System Action: No activity is updated.

User Response: Determine if the activity to be

updated should exist. Verify that the correct search criteria and data were entered. If appropriate, correct the entries and continue processing.

Problem Determination: List the contents of the activity views VPROJRE1, VACT, and VPROJACT and their underlying tables.

DSN8028I *csect* **ACTIVITY TYPE NOT FOUND, PLEASE ADD IT INTERACTIVELY**

Explanation: The add or update was not performed. The activity type entered was not found.

System Action: No activity is listed.

User Response: If the activity type was not expected to be found, add it interactively.

Problem Determination: List the contents of the activity view, VACT, and its underlying tables.

DSN8031I *csect* **PROJECT NOT FOUND**

Explanation: No projects match the selection criteria.

System Action: No projects are listed.

User Response: If no projects are expected to be listed, continue.

Problem Determination: If the error is unexpected, list the contents of the project view VPROJ and its underlying tables to determine why the entry is missing.

DSN8032I *csect* **PROJECT SUCCESSFULLY ADDED**

Explanation: A project was added as requested.

System Action: The request was executed successfully.

DSN8033I *csect* **PROJECT SUCCESSFULLY ERASED**

Explanation: A project was erased as requested.

System Action: The request was executed successfully.

DSN8034I *csect* **PROJECT SUCCESSFULLY UPDATED**

Explanation: The update was performed as requested.

System Action: The request was executed successfully.

DSN8035E *csect* **PROJECT EXISTS ALREADY,
ADD NOT DONE**

Explanation: You requested that a new project be added, but the project exists already.

System Action: The request was not executed successfully.

User Response: Display the existing project. If it is what you want, continue. If not, you can update this project or choose a new project id.

Problem Determination: If the error was unexpected, list the contents of the project view VPROJ and its underlying tables to see if the data differs from what is expected.

DSN8036E *csect* **PROJECT DOES NOT EXIST,
ERASE NOT DONE**

Explanation: The erase request found no project which matches your request.

System Action: No projects are erased.

User Response: See if the project to be erased should exist. Did you enter the correct combination of search criteria and data? If not, correct the entries and continue.

Problem Determination: If the error was unexpected, list the contents of the project view VPROJ and its underlying tables to determine why the entry is missing.

DSN8037E *csect* **PROJECT DOES NOT EXIST,
UPDATE NOT DONE**

Explanation: The update request found no project which matches your request.

System Action: No projects are updated.

User Response: See if the project to be updated should exist. If you did not enter the correct combination of search criteria and data, correct the entries and continue.

Problem Determination: If the error is unexpected, list the contents of the project view VPROJ and its underlying tables to determine why the entry is missing.

DSN8038I *csect* **CURRENT PROJECT NOT FOUND**

Explanation: A request was made by a 'current' project to reference a 'higher' project. The 'current' project was not found.

System Action: No project data is processed.

User Response: If the 'current' project was not expected to be found, continue processing.

Problem Determination: List the contents of the project views VPROJRE1, VDEPT, VEMPPROJACT, VEMP, VSTAFAC1, VSTAFAC2, VPSTRDE1, and

VPSTRDE2 and their underlying tables.

DSN8039E *csect* **NO HIGHER PROJECT EXISTS**

Explanation: A request was made by a 'current' project to reference a 'higher' level of the project structure. A 'higher' level does not exist for the requested 'current' project.

System Action: No project data is processed.

User Response: If a 'higher' project was not expected to be found, continue processing.

Problem Determination: List the contents of the project views VPROJRE1, VDEPT, VEMPPROJACT, VEMP, VSTAFAC1, VSTAFAC2, VPSTRDE1, and VPSTRDE2 and their underlying tables.

DSN8041I *csect* **STAFFING NOT FOUND**

Explanation: No project staffing matches the selection criteria.

System Action: No project staffing is listed.

User Response: If no project staffing was expected to be found, continue processing.

Problem Determination: List the contents of the project activity views VPROJRE1, VEMPPROJACT, VACT, and VEMP and their underlying tables.

DSN8042I *csect* **STAFFING SUCCESSFULLY
ADDED**

Explanation: A project staffing was added as requested.

System Action: The request was executed successfully.

DSN8043I *csect* **STAFFING SUCCESSFULLY
ERASED**

Explanation: A project staffing was erased as requested.

System Action: The request was executed successfully.

DSN8044I *csect* **STAFFING SUCCESSFULLY
UPDATED**

Explanation: A project staffing was updated as requested.

System Action: The request was executed successfully.

DSN8045E *csect* **STAFFING EXISTS ALREADY,
ADD NOT DONE**

Explanation: A request was made to add a project staffing, but the project staffing already exists.

System Action: No project staffing is added.

User Response: Display the existing project staffing. If this is the desired project staffing, update it. Otherwise, choose a new project staffing.

Problem Determination: List the contents of the project activity views VPROJRE1, VEMPPROJACT, VACT, and VEMP and their underlying tables.

DSN8046E *csect* **STAFFING DOES NOT EXIST,
ERASE NOT DONE**

Explanation: The project staffing was not erased as requested.

System Action: No project staffing is erased.

User Response: Determine if the project staffing to be erased should exist. Verify that the correct search criteria and data were entered. If appropriate, correct the entries and continue processing.

Problem Determination: List the contents of the project activity views VPROJRE1, VEMPPROJACT, VACT, and VEMP and their underlying tables.

DSN8047E *csect* **STAFFING DOES NOT EXIST,
UPDATE NOT DONE**

Explanation: The update was not performed because the project staffing requested was not found.

System Action: No project staffing is updated.

User Response: Determine if the project staffing to be updated should exist. Verify that the correct search criteria and data were entered. If appropriate, correct the entries and continue processing.

Problem Determination: List the contents of the project activity views VPROJRE1, VEMPPROJACT, VACT, and VEMP and their underlying tables.

DSN8051I *csect* **PROGRAM ENDED**

Explanation: The application program finished.

DSN8053I *csect* **ROLLBACK SUCCESSFUL, ALL
UPDATES REMOVED**

Explanation: After any SQLWARNING or SQLERROR, all updates are removed via a ROLLBACK statement to prevent invalid updates.

System Action: The ROLLBACK was executed successfully.

User Response: Correct the prior error.

DSN8056I *csect* **NO MORE DATA TO DISPLAY**

Explanation: The last page of data has been displayed.

System Action: No more data is shown on screen.

User Response: If you expect no more data to be displayed, continue.

Problem Determination: If more displayed data is expected, list the contents of the view and the underlying tables to see if the data differs from what is expected.

DSN8057I *csect* **FURTHER ENTRIES IN TABLE -
UPDATE POSSIBLE**

Explanation: More data exists beyond that shown on the screen.

System Action: No more data is shown on screen.

User Response: Update entries as needed.

DSN8058I *csect* **PRESS PA1 FOR NEXT PAGE /
ENTER FOR SELECTION MENU**

Explanation: Press the PA1 key to see the data on the next page or press the ENTER key to return to the selection menu.

User Response: Press the PA1 key or the ENTER key depending on the function you want to perform.

DSN8060E *csect* **SQL ERROR, RETURN CODE IS:
sqlcode**

Explanation: The SQL statement did not execute correctly. The 'sqlcode' can be found elsewhere in this manual. This may be an SQL error or an SQL warning.

System Action: The request was not executed successfully.

User Response: Refer to Part 2, "SQL return codes," on page 11 for more information about the error.

Problem Determination: Determine which SQL statement in the application program caused the error and see if it is reproducible. Follow the diagnosis approach suggested for the sqlcode.

DSN8061E *csect* **ROLLBACK FAILED, RETURN
CODE IS: sqlcode**

Explanation: The SQL ROLLBACK statement was not executed correctly.

System Action: The request was not executed successfully.

User Response: Refer to Part 2, "SQL return codes," on page 11.

Problem Determination: Determine which SQL

DSN8062E • DSN8072E

statement in the application program caused the error and see if it is reproducible. Follow the diagnosis approach suggested for the sqlcode.

DSN8062E *csect* AN OBJECT WAS NOT SELECTED

Explanation: You did not specify an object code on the input line.

User Response: Select one of the object codes listed on the panel.

DSN8064E *csect* INVALID DL/I STC-CODE ON GU MSG: *status-code*

Explanation: In attempting to get a message from IMS, an unexpected status-code was received.

System Action: The application program is terminated.

Problem Determination: Refer to the messages and codes manual for IMS/VS to determine the reason for the unexpected status code.

DSN8065E *csect* INVALID DL/I STC-CODE ON ISRT MSG: *status-code*

Explanation: In attempting to insert a message for IMS, an unexpected status-code was received.

System Action: The application program is terminated.

Problem Determination: Refer to the messages and codes manual for IMS/VS to determine the reason for the unexpected status code.

DSN8066E *csect* UNSUPPORTED PFK OR LOGIC ERROR

Explanation: The sample application found an unsupported program function key or logic error while trying to execute a request.

System Action: The request was not executed successfully.

User Response: Report the error in the application program.

DSN8067E *csect* UNSUPPORTED SEARCH CRITERIA FOR OBJECT

Explanation: You entered a search criteria value and an object value that do not find any selections.

System Action: The request was not executed successfully.

User Response: Enter new search criteria values.

Problem Determination: If the values you entered are expected to provide valid selections, check the contents

of the view and the underlying tables to see if the data differs from what is expected. If after checking the view and the underlying tables, you find the search criteria values you entered should provide valid selections, the error is in the sample program. Report the error.

DSN8068E *csect* INVALID REQUEST SHOULD BE 'L' OR 'U'

Explanation: The input must begin with 'L' or 'U'.

System Action: The request is ignored.

User Response: Correct the input request.

DSN8069E *csect* NO VALID SELECTIONS QUALIFY FOR THIS REQUEST

Explanation: You entered a search criteria value and a data values that do not find any selections.

System Action: The request was not executed successfully.

User Response: Enter new search criteria values.

Problem Determination: If the criteria values you entered are expected to provide valid selections, check the contents of the view and the underlying tables to see if the data differs from what is expected. If after checking the view and the underlying tables, you find the search criteria values you entered should provide valid selections, the error is in the sample program. Report the error.

DSN8070E *csect* VITAL DATA IS MISSING IN TABLE TOPTVAL

Explanation: No valid entries exist in the table that contains possible valid entries.

System Action: The request was not executed successfully.

User Response: There is no valid entry you can enter. Report the error in the sample program.

DSN8072E *csect* INVALID SELECTION ON SECONDARY SCREEN

Explanation: You gave an invalid line number.

System Action: The request was not executed successfully.

User Response: You entered a number that is not in the list on the left under the heading NO for line number. Enter a valid number.

Problem Determination: If the line number you entered is in the list on the left under the heading NO for line number, then the error is in the sample program.

DSN8073E *csect* **SPECIFIED LINE-NUMBER NOT FOUND IN PREVIOUS SCREEN**

Explanation: You gave an invalid line number.

System Action: The request was not executed successfully.

User Response: You entered a number that is not in the list on the left under the heading NO for line number. Enter a valid number. If the line number is in the previous screen, then this is an error in the sample program. Report the error.

DSN8074E *csect* **DATA IS TOO LONG FOR SEARCH CRITERIA**

Explanation: You entered a data value that has too many characters for the type of search criterion you selected. For example, department ids have a maximum of 3 characters and most other ids have a maximum of 6 characters.

System Action: The request was not executed successfully.

User Response: Enter a data value with the correct number of characters.

DSN8075E *csect* **MESSAGE FORMAT ROUTINE ERROR, RETURN CODE IS:** *sqlcode*

Explanation: There is an error in the parameters passed to the SQLCA formatting routine, DSNTIAR.

System Action: The SQLCA could not be formatted properly.

User Response: This is an error in the program. Check the return code listing of DSNTIAR in Part 2 of *DB2 Application Programming and SQL Guide*. Report the error.

DSN8076E *csect* **VITAL DATA IS MISSING IN TABLE 'TDSPTXT'**

Explanation: No valid entries exist in the table that contains possible valid entries.

System Action: The request was not executed successfully.

User Response: There is no valid entry you can enter. Report the error in the application program.

DSN8079E **CONNECTION TO DB2 NOT ESTABLISHED**

Explanation: Sample programs DSN8SC3, DSN8SP3, and DSN8HC3 cannot be called directly from TSO. Instead, they must be called from the ISPF sample connection manager, DSN8SCM or DSN8SPM.

System Action: The program ends.

User Response: Call the desired program through the connection manager, DSN8SCM or DSN8SPM.

DSN8080E **APPLICATION TERMINATED WITH CALL ATTACH REASON CODE**
reason-code

Explanation: The call attachment facility service requested by the application program did not execute successfully.

This message is issued by the following CSECTs: DSN8SCM, DSN8SPM

System Action: The requested service is not executed.

User Response: Notify the system programmer.

System Programmer Response: Check the call attachment facility reason code.

Problem Determination: Follow the failure analysis procedures for the call attachment facility reason code.

DSN8081E **RESULTS FROM THE CALL ATTACH TRANSLATE SERVICE**

Explanation: The call attachment facility OPEN service that was requested from the application program did not execute successfully. The TRANSLATE service was requested to provide information about the OPEN failure.

System Action: The requested OPEN service was not executed.

User Response: Refer to Part 2, "SQL return codes," on page 11.

Problem Determination: Refer to Part 2, "SQL return codes," on page 11 for more information about the error.

DSN8082E **THE DISCONNECT TERMINATED WITH REASON CODE** *reason-code*

Explanation: The call attachment facility DISCONNECT service requested by the application program did not execute successfully.

System Action: The requested DISCONNECT service is not executed.

User Response: Notify the system programmer.

System Programmer Response: Check the call attachment facility reason code.

Problem Determination: Follow the failure analysis procedures for the call attachment facility reason code.

DSN8083E AN UNKNOWN SERVICE *service* WAS REQUESTED

Explanation: The user is requesting an invalid service.

This message is issued by the following CSECTs: DSN8SCM, DSN8SPM

System Action: The requested service was not executed.

User Response: Notify the system programmer.

System Programmer Response: The service request must be a valid call attachment facility service. Ensure that the request is one of the services supported by the call attachment facility.

Problem Determination: There is an error in the Sample Application Program.

DSN8200E *csect* INVALID DEPARTMENT NUMBER, EMPLOYEE NOT ADDED

Explanation: The employee number that is to be added refers to a department number that is not contained in the table DEPT.

System Action: The employee number is not added.

User Response: Ensure that the correct department number was entered.

Problem Determination: List the contents of the department table DEPT.

DSN8202E *csect* EMPLOYEE NUMBER HAS DEPENDENT ROWS, NOT ERASED

Explanation: The employee number to be erased is the same as a responsible employee number in the table PROJ or an employee number in the table EMP PROJACT. The employee number cannot be erased from the table EMP.

System Action: No employee data is erased.

User Response: Ensure that the correct employee number was entered.

Problem Determination: List the contents of the PROJ and EMP PROJACT tables.

DSN8203E *csect* INVALID WORK DEPT, EMPLOYEE NOT UPDATED

Explanation: The employee that is to be updated has a department number that is not contained in the table DEPT. The update cannot be completed.

System Action: No employee data is updated.

User Response: Ensure that the correct department number was entered.

Problem Determination: List the contents of the employee table DEPT.

DSN8210I *csect* INVALID MGRNO, DEPARTMENT NOT ADDED

Explanation: The department that is to be added has a manager number that is not contained in the table EMP. The add cannot be completed.

System Action: No department is added.

User Response: Ensure that the correct manager number was entered.

Problem Determination: List the contents of the employee table EMP.

DSN8212E *csect* DEPARTMENT NUMBER HAS DEPENDENT ROWS, NOT ERASED

Explanation: The department number that is to be erased is the same as a project department number in table PROJ. The department cannot be erased.

System Action: No department data is erased.

User Response: Ensure that the correct department number was entered.

Problem Determination: List the contents of the project table PROJ.

DSN8213E *csect* INVALID ADMIN DEPT ID, DEPARTMENT NOT ADDED

Explanation: The department that is to be added has a department number that is not contained in the table DEPT. The add cannot be completed.

System Action: No department is added.

User Response: Ensure that the correct department number was entered.

Problem Determination: List the contents of the employee table DEPT.

DSN8214E *csect* INVALID MANAGER ID, DEPARTMENT NOT UPDATED

Explanation: The department that is to be updated has a manager number that is not contained in the table EMP. The update cannot be completed.

System Action: No department data is updated.

User Response: Ensure that the correct manager number was entered.

Problem Determination: List the contents of the employee table EMP.

DSN8215E *csect* INVALID ADMIN DEPT ID, DEPARTMENT NOT UPDATED

Explanation: The department that is to be updated has a administrative department number that is not in the table DEPT. The update cannot be completed.

System Action: No department data is updated.

User Response: Ensure that the correct department number was entered.

Problem Determination: List the contents of the employee table DEPT.

DSN8216E *csect* DEPT NOT AT SPECIFIED LOCATION, EMPLOYEE NOT ADDED

Explanation: The employee number that is to be added refers to a department number whose LOCATION field in the DEPT table is different from that specified for the employee. The add cannot be completed.

System Action: No employee is added.

User Response: Ensure that the correct department number was entered.

Problem Determination: List the contents of the department table DEPT.

DSN8217E *csect* DEPT NOT AT SPECIFIED LOCATION, EMP NOT UPDATED

Explanation: The employee number that is to be updated refers to a department number whose LOCATION field in the DEPT table is different from that specified for the employee. The update cannot be completed.

System Action: No employee data is updated.

User Response: Ensure that the correct department number was entered.

Problem Determination: List the contents of the department table DEPT.

DSN8220E *csect* INVALID PROJECT NUMBER, ACTIVITY NOT ADDED

Explanation: The activity that is to be added contains a project number that is not contained in the table PROJ. The add cannot be completed.

System Action: The activity is not added.

User Response: Ensure that the correct project number was entered.

Problem Determination: List the contents of the project table PROJ.

DSN8222E *csect* ACTIVITY HAS DEPENDENT ROWS, NOT ERASED

Explanation: The activity that is to be erased from table PROJACT is the same as the corresponding activity in the table EMPPROJACT. The activity cannot be erased from the table PROJACT.

System Action: No activity data is erased.

User Response: Ensure that the correct activity was entered.

Problem Determination: List the contents of the PROJACT and EMPPROJACT tables.

DSN8223E *csect* ACTIVITY HAS DEPENDENT ROWS, NOT UPDATED

Explanation: A start date in table PROJACT is to be updated, but there is a project staffing for this activity in table EMPPROJACT. The start date in table PROJACT cannot be updated.

System Action: No activity data is updated.

User Response: Ensure that the correct start date was entered.

Problem Determination: List the contents of the project-activity-staffing table EMPPROJACT and project-activity table PROJACT.

DSN8230E *csect* INVALID DEPARTMENT NUMBER, PROJECT NOT ADDED

Explanation: The project that is to be added contains a department number that is not present in the table DEPT. The add cannot be completed.

System Action: No project is added.

User Response: Ensure that the correct department number was entered.

Problem Determination: List the contents of the department table DEPT.

DSN8231E *csect* INVALID RESPONSIBLE ID, PROJECT NOT ADDED

Explanation: The project that is to be added contains an employee number that is not contained in the table EMP. The add cannot be completed.

System Action: No project is added.

User Response: Ensure that the correct employee number was entered.

Problem Determination: List the contents of the employee table EMP.

DSN8233E *csect* PROJECT NUMBER HAS DEPENDENT ROWS, NOT ERASED

Explanation: A project number in table PROJ is to be erased, but it is the same as a project number in table PROJACT. The project cannot be erased from table PROJ.

System Action: No project is erased.

User Response: Ensure that correct project number was entered.

Problem Determination: List the contents of the

PROJ and PROJACT tables.

DSN8235E *csect* INVALID MAJOR PROJECT ID,
PROJECT NOT ADDED

Explanation: The project that is to be added contains a major project ID that is not contained in the table PROJ. The add cannot be completed.

System Action: No project is added.

User Response: Ensure that the correct major project number was entered.

Problem Determination: List the contents of the project table PROJ.

DSN8236E *csect* INVALID ASSOCIATE DEPT ID,
PROJECT NOT UPDATED

Explanation: The project that is to be updated has a department number that is not contained in the table DEPT. The update cannot be completed.

System Action: No project data is updated.

User Response: Ensure that the correct department number was entered.

Problem Determination: List the contents of the department table DEPT.

DSN8237E *csect* INVALID RESPONSIBLE ID,
PROJECT NOT UPDATED

Explanation: The project that is to be updated has an employee number that is not contained in the table EMP. The update cannot be completed.

System Action: No project data is updated.

User Response: Ensure that the correct employee number was entered.

Problem Determination: List the contents of the employee table EMP.

DSN8238E *csect* INVALID MAJOR PROJECT ID,
PROJECT NOT UPDATED

Explanation: The project that is to be updated has a major project number that is not contained in the table PROJ. The update cannot be completed.

System Action: No project data is updated.

User Response: Ensure that the correct project number was entered.

Problem Determination: List the contents of the project table PROJ.

DSN8240E *csect* INVALID EMPLOYEE NUMBER,
STAFFING NOT ADDED

Explanation: The staffing that is to be added refers to an employee number that is not present in table EMP. The add cannot be completed.

System Action: No staffing is added.

User Response: Ensure that the correct employee number was entered.

Problem Determination: List the contents of employee table EMP.

DSN8242E *csect* INVALID PROJECT ACTIVITY
DATA, STAFFING NOT ADDED

Explanation: The staffing that is to be added refers to a project number, activity number, and start date that is not present in table PROJACT. The add cannot be completed.

System Action: No staffing is added.

User Response: Ensure that the correct project number, activity number, and start date were entered.

Problem Determination: List the contents of the project table PROJACT.

DSN8243E *csect* INVALID START DATE, STAFFING
NOT UPDATED

Explanation: The start date given is not currently in the project-activity table PROJACT. The update cannot be completed.

System Action: No staffing data is updated.

User Response: Ensure that the correct start date was entered.

Problem Determination: List the contents of the project-activity table PROJACT and the project-activity-staffing table EMP PROJACT.

Chapter 30. DSN9... Messages

DSN9000I **KEYWORD** *keyword-name* **APPEARS MORE THAN ONCE**

Explanation: The same keyword (specified in the messages as 'keyword-name') appears more than once in the command. This message will be issued for each occurrence of the keyword after the first.

System Action: Processing for the command is terminated.

System Programmer Response: Correct the command by using the keyword only once, and reenter the command.

Problem Determination: Obtain a copy of the system or terminal log to verify the command entry.

DSN9001I **KEYWORD** *keyword-name* **IS INVALID**

Explanation: The keyword (specified in the message as 'keyword-name') is unknown or undefined. The keyword may be misspelled, or the keyword may not be applicable to the command being processed.

System Action: Processing for the command is terminated.

System Programmer Response: Correct the keyword, and reissue the command.

Problem Determination: Obtain a copy of the system or terminal log to verify the command entry.

DSN9002I **UNBALANCED PARENTHESES WERE FOUND FOLLOWING KEYWORD** *keyword-name*

Explanation: An invalid combination of parentheses has been encountered following the keyword (specified in the message as 'keyword-name'). Parenthesis must be paired open and close, and a close parenthesis must follow an open parenthesis before another open parenthesis is encountered.

System Action: Processing for the command is terminated.

System Programmer Response: Correct the error, and reissue the command.

Problem Determination: Obtain a copy of the system or terminal log to verify the command entry.

DSN9003I **KEYWORD** *keyword-name* **PARAMETER CONTAINS UNBALANCED APOSTROPHES**

Explanation: An odd number of apostrophes is present in a parameter. If the parameter is a quoted string, it must have one apostrophe at each end of the string. If an apostrophe is to appear within the string,

two adjacent apostrophes must be entered. If the parameter is a hexadecimal value, it must be entered as X'hex characters'.

System Action: Processing for the command is terminated.

System Programmer Response: Correct the error, and reissue the command.

Problem Determination: Obtain a copy of the system or terminal log to verify the command entry.

DSN9004I **KEYWORD** *keyword-name* **RANGE (c) INCORRECTLY SPECIFIED**

Explanation: The range for a keyword (specified in the message as 'keyword-name') was incorrectly specified using the syntax character specified in the message as 'c'. The standard syntax character used to denote a range is a colon (:). Either the ending limit of the range was omitted or a subset was specified within the range.

Examples of this error are LINE(1:) and GROUP(A*:B*).

Examples of a correctly specified range are LINE(1:3) and GROUP(A:B).

System Action: Processing for the command is terminated.

System Programmer Response: Refer to *DB2 Command Reference* to verify that the command you are using allows a range for the given keyword. Correct the error, and reissue the command.

Problem Determination: Obtain a copy of the system or terminal log to verify the command entry.

DSN9005I **KEYWORD** *keyword-name* **SUBSET (c) INCORRECTLY SPECIFIED**

Explanation: The subset for a keyword (specified in the message as 'keyword-name') was incorrectly specified for use with the syntax character 'c' in the message. The standard syntax character used to denote a subset is an asterisk (*).

For example, consider a group of objects named BLACK, BLUE, GREEN, RED, and WHITE. You may either explicitly specify BLACK and BLUE, or you may specify BL*, meaning all members of the group whose names begin with BL. The character that follows the asterisk must be a blank, comma, close parenthesis, or colon.

Examples of such an error are NAME(BL*CK) and NAME(*LUE).

Examples of correct specification are NAME(BL*) and UNIT(2*).

DSN9006I • DSN9010I

System Action: Processing for the command is terminated.

System Programmer Response: Refer to *DB2 Command Reference* to be sure that the command you are using allows a subset for the named keyword. Correct the error, and reissue the command.

Problem Determination: Obtain a copy of the system or terminal log to verify command entry.

DSN9006I **KEYWORD** *keyword-name* **ASTERISK (c) INCORRECTLY USED**

Explanation: For the keyword specified in the message (as 'keyword-name'), an asterisk (c) was used as the first character of a parameter to specify ALL. However, the asterisk appears in a list, or the characters in juxtaposition are not a blank, comma, equal sign, or parentheses.

Examples of such errors are LINE(LINE1,*,LINE7), NAME(**), and GROUP(PQR:*)

Examples of correct specification are UNIT(*) and LINE=* etc.

System Action: Processing for the command is terminated.

System Programmer Response: Refer to *DB2 Command Reference* to be sure the command you are using allows specification of ALL for the given keyword. Correct the error, and reissue the command.

Problem Determination: Obtain a copy of the system or terminal log to verify command entry.

DSN9007I **THIS COMMAND REQUIRES ONE OF THE FOLLOWING KEYWORDS BE SPECIFIED**, *keyword1 keyword2 keyword3 keyword4 keyword5 keyword6 keyword7 keyword8*

Explanation: One of the keywords identified in the list must be specified on this command, but none of these keywords was present.

System Action: Processing for the command is terminated.

System Programmer Response: Identify the appropriate keyword from the list, include that keyword, and reissue the command. Refer to *DB2 Command Reference* for descriptions of the keywords.

Problem Determination: Obtain a copy of the system or terminal log to verify command entry.

DSN9008I **KEYWORD** *keyword-name* **MAY NOT BE NEGATED**

Explanation: The negation characters (NO) appear in front of the keyword (specified in the message as 'keyword-name'), but negating this keyword is not

allowed. As an example, consider a keyword called PRINT that could indicate that you want something printed. If you did not want the material to be printed, you might specify NOPRINT. This process of prefixing a keyword with the characters NO is called negation. While negation may be meaningful on some keywords, it is not allowed on all keywords.

System Action: Processing for the command is terminated.

System Programmer Response: Reenter the command, but do not negate the named keyword. Refer to *DB2 Command Reference* for further information concerning this command.

Problem Determination: Obtain a copy of the system or terminal log to verify the command entry.

DSN9009I **KEYWORD** *keyword-name* **IS MISSING AND MUST BE SPECIFIED**

Explanation: The keyword specified in the message (as 'keyword-name') must be present, but it was not entered. This keyword must be present in order for the command to process properly.

System Action: Processing for the command is terminated.

System Programmer Response: Enter the command again, and include the specified keyword.

Problem Determination: Obtain a copy of the system or terminal log to verify the command entry.

DSN9010I **REQUIRED PARAMETER FOR KEYWORD** *keyword-name* **IS MISSING**

Explanation: A parameter must be specified for the keyword specified in the message (as 'keyword-name'), but no parameter was entered.

As an example of this error, consider a keyword called PRIORITY whose value can range from 0 to 9. Specification of PRIORITY(1) is acceptable, but, if you specify PRIORITY with no parameter value, the keyword is meaningless.

System Action: Processing for the command is terminated.

System Programmer Response: Supply appropriate parameters for the specified keyword and reissue the command. Refer to *DB2 Command Reference* for valid parameter values.

Problem Determination: Obtain a copy of the system or terminal log to verify the command entry.

DSN9011I PARAMETER(S) CANNOT BE SPECIFIED FOR KEYWORD
keyword-name

Explanation: No parameter(s) can be specified for the keyword specified in the message (as 'keyword-name'). You may have misspelled the keyword-name, causing it to be interpreted as a different keyword, or the parameter may actually belong with another keyword instead of the one on which you entered it.

System Action: Processing for the command is terminated.

System Programmer Response: Correct the error, and reissue the command. Refer to *DB2 Command Reference* for details on how to enter the command.

Problem Determination: Obtain a copy of the system or terminal log to verify the command entry.

DSN9012I KEYWORD *keyword-name* PARAMETER(S) MUST BE HEXADECIMAL

Explanation: Parameter values for the keyword specified in the message (as 'keyword-name') must be hexadecimal values. The value must be specified as X'hex characters'. Hexadecimal characters are defined as the numeric digits 0 through 9 and the letters A through F. Either uppercase or lowercase is acceptable for the letters A through F.

As an example of this error, consider the keyword OFFSET, for which you are expected to enter a hexadecimal value. If you enter OFFSET(X'2C'), it is acceptable. However, entering OFFSET(Jones) is not acceptable.

System Action: Processing for the command is terminated.

System Programmer Response: Reissue the command, but ensure that the parameters for the named keyword are hexadecimal values.

Problem Determination: Obtain a copy of the system or terminal log to verify the command entry.

DSN9013I KEYWORD *keyword-name* PARAMETER *parameter value* EXCEEDS ALLOWABLE LENGTH OF *nn*

Explanation: The parameter value (specified in the message as 'parameter value') exceeds the limit of 'nn' characters in length.

As an example of this type of error, consider a PRIORITY keyword whose value may range from zero to nine. If you specify PRIORITY(21) or PRIORITY(006), the value you have entered exceeds the limit of one character.

System Action: Processing for the command is terminated.

System Programmer Response: Refer to *DB2 Command Reference* for a list of acceptable parameters. Correct the error, and reissue the command.

Problem Determination: Obtain a copy of the system or terminal log to verify the command entry.

DSN9014I KEYWORD *keyword-name* LIMIT OF *nn* PARAMETER(S) EXCEEDED

Explanation: Too many parameters have been specified for the keyword that is specified in the message. The command processor does not accept more than the limit (specified in the message as 'nn') of parameters. This error is probably caused by entering too many parameters. It could also be caused by a missing close parenthesis that has not yet been detected.

System Action: Processing for the command is terminated.

System Programmer Response: Reissue the command, and enter no more than the specified limit of parameters for the given keyword. If necessary, issue the command more than once to process all the desired parameter values. Refer to *DB2 Command Reference* for further details.

Problem Determination: Obtain a copy of the system or terminal log to verify the command entry.

DSN9015I PARAMETER *parameter-value* IS UNACCEPTABLE FOR KEYWORD *keyword-name*

Explanation: The parameter value specified in the message is not an acceptable value for the named keyword.

As an example, consider a keyword called PRINT that can have parameters of YES or NO. Specification of PRINT(YES) or PRINT(NO) is valid. However, specification of PRINT(MAYBE) is unacceptable.

System Action: Processing for the command is terminated.

System Programmer Response: Refer to *DB2 Command Reference* for a list of acceptable parameters. Correct and reissue the command.

Problem Determination: Obtain a copy of the system or terminal log to verify the command entry.

DSN9016I *verb-name* COMMAND REJECTED, UNAUTHORIZED REQUEST

Explanation: The command specified in the message (as 'verb-name') requires that you have proper authorization in order to use the command. You do not have the required authorization.

System Action: The command is not executed. Processing is terminated.

Operator Response: If the command must be executed on behalf of the user and your installation operating procedures permit it, enter the command on request.

System Programmer Response: Contact the system programmer responsible for system security, and request that this person grant you authorization to use the command. Otherwise, you must have someone who is authorized issue the command for you. If necessary, request the system operator to enter the command for you.

Problem Determination: Obtain a copy of the system or terminal log to verify the command entry.

DSN9017I FAILURE WHILE PROCESSING
verb-name pkw-name **COMMAND,**
PROCESSING TERMINATED

Explanation: The DB2 command processor has abended while processing the command (specified in the message as 'verb-name pkw-name'). The error is been recorded in SYS1.LOGREC, and an SVC dump is requested. The command may have partially completed. Refer to any prior response messages to determine what has been done.

System Action: Processing for the command is terminated.

Operator Response: If a dump was produced, have it printed. Print a copy of the contents of the SYS1.LOGREC data set for the time period involved. Forward these items with a copy of the system log to the system programmer.

System Programmer Response: Reissue the command. If a second failure occurs, consult your supervisor.

Problem Determination: Obtain a copy of the system or terminal log to verify command entry. Contact the system operator to make sure that diagnostic information is forwarded to you.

DSN9018I csect-name ABORTING *verb-name*
PROCESSING DUE TO INSUFFICIENT
STORAGE AVAILABLE

Explanation: The command processor was unable to obtain sufficient storage to complete processing of any response messages generated by the invoked command.

System Action: Processing for the command is terminated abnormally.

Operator Response: Notify the system programmer before attempting to reissue the command.

System Programmer Response: Determine the

reason for insufficient storage available to the command. If a cursory examination of the system indicates that the region sizes for DB2 are sufficient, and the current workload does not seem excessive, then a MVS Console dump (MVS DUMP command) may be required.

Insure that any retry steps defined by the command are performed prior to reissuing the command.

Problem Determination: The invoked command had completed processing and returned to the Command Preprocessor when an attempt was made to obtain storage from the address space from which the command was entered. Since sufficient storage was unavailable, no response messages from the invoked command are available.

DSN9019I VERB *verb-name* **IS NOT A KNOWN**
COMMAND

Explanation: The command represented by the verb specified in the message is not known to the system; it is an undefined command. A possible cause for this error is that you made a spelling error while entering the command.

System Action: Processing for the command is terminated.

System Programmer Response: Refer to *DB2 Command Reference* for the correct command format.

Problem Determination: Obtain a copy of the system or terminal log to verify the command entry.

DSN9020I ONLY ONE OF THE FOLLOWING
KEYWORDS MAY BE SPECIFIED ON
THIS COMMAND, *keyword1 keyword2*
keyword3 keyword4 keyword5 keyword6
keyword7 keyword8

Explanation: Only one of the identified keywords can be specified at the same time on this command.

System Action: Processing for the command is terminated.

System Programmer Response: Identify the appropriate keyword from the list, include only that keyword, and reissue the command. Refer to *DB2 Command Reference* for descriptions of the keywords.

Problem Determination: Obtain a copy of the system or terminal log to verify the command entry.

DSN9021I VERB *verb-name* **REQUIRED**
KEYWORD IS MISSING

Explanation: The command specified in the message (as 'verb-name') was entered, but at least one required keyword is missing. The command processor was unable to determine which keyword or keywords were missing.

System Action: Processing for the command is terminated.

System Programmer Response: Refer to *DB2 Command Reference* for the proper format of the named command, and then reenter the command.

Problem Determination: Obtain a copy of the system or terminal log to verify command entry. If a failure is suspected, take a storage dump.

DSN9022I *csect-name verb-name pkw-name*
NORMAL COMPLETION

Explanation: All synchronous processing for the command specified in the message as 'verb-name pkw-name' completed successfully. Any tasks executing asynchronously for the specified command might still be executing when this message is displayed.

System Action: Synchronous processing for the specified command is complete. Subsequent system actions defined by the command are documented in *DB2 Command Reference*.

DSN9023I *csect-name verb-name pkw-name*
ABNORMAL COMPLETION

Explanation: The command specified in the message as 'verb-name pkw-name' completed unsuccessfully. The command issued one or more error messages before this message. The name of the CSECT that issued the message is shown at the beginning of the message as a diagnostic aid.

System Action: Processing for the command ended.

System Programmer Response: Proceed as indicated by previous error messages.

DSN9024I **KEYWORD** *keyword-name* **PARAMETER**
MAY NOT SPECIFY A RANGE OF
VALUES

Explanation: The parameter of the keyword specified in the message specifies a range using the colon operator, (for instance, 1:3), but a range of values is not allowed.

As an example, consider a keyword called CLASS. You might enter CLASS(1,2,3) to specify classes 1, 2, and 3, or you might enter CLASS(1:3). However, not all commands allow you to specify a range of values.

System Action: Processing for the command is terminated.

System Programmer Response: Correct the keyword parameter, and reenter the command.

Problem Determination: Obtain a copy of the system or terminal log to verify command entry.

DSN9025I *csect-name verb-name pkw-name*
NORMAL COMPLETION FOR
SYNCHRONOUS PHASE, AND IN
PROGRESS FOR ASYNCHRONOUS
PHASE.

Explanation: All synchronous processing for the command specified as 'verb-name pkw-name' in this message completed successfully. Any tasks executing asynchronously for the specified command might still be executing when this message is displayed.

System Action: Synchronous processing for the specified command is complete. Subsequent system actions defined by the command that can occur during the asynchronous phase of command processing are documented in *DB2 Command Reference*.

DSN9026I **KEYWORD** *keyword-name*
PARAMETER(S) MUST BE
ALPHABETIC

DSN9027I **KEYWORD** *keyword-name*
PARAMETER(S) MUST BE
ALPHAMERIC

DSN9028I **KEYWORD** *keyword-name*
PARAMETER(S) MUST BE NUMERIC

Explanation: Parameter values for the keyword (specified on these messages) must be of a specific type, such as all ALPHABETIC or all ALPHAMERIC / NATIONAL characters, or all NUMERIC values.

As an example of this type of error, consider the keyword NAME, where you are expected to enter a person's last name. If you enter NAME(Jones) it is acceptable, but if you enter NAME(Jon4s), it is not acceptable.

As a second example, consider a keyword WEIGHT that specifies a numeric weight. Entering WEIGHT(47) is acceptable, but entering WEIGHT(4u) is not.

System Action: Processing for the command is terminated.

System Programmer Response: Reissue the command but ensure that the parameters for the named keyword are of the required type.

Problem Determination: Obtain a copy of the system or terminal log to verify the command entry.

DSN9029I *csect-name* **FAILURE WHILE**
PROCESSING A COMMAND

Explanation: A failure has been encountered while processing a command. The command may or may not have been executed. The error has been recorded in the system error log (the SYS1.LOGREC data set), and an SVC dump was attempted.

System Action: Processing for the command is terminated.

Operator Response: If a dump was produced, have it printed. Print a copy of the contents of the SYS1.LOGREC data set for the time period involved. Forward these items with a copy of the system log to the system programmer.

System Programmer Response: Reissue the command. If a second failure occurs, consult your supervisor or the system programmer.

Problem Determination: Obtain a copy of the system or terminal log to verify command entry. Contact the system operator to make sure that diagnostic information is forwarded to the system programmer.

**DSN9030I KEYWORD *keyword-name* PARAMETER
MAY NOT SPECIFY A SUBSET OF
VALUES**

Explanation: The parameter for the keyword specified in the message identifies a subset using the asterisk operator (for instance, ABC*, *ABC, or *ABC*DEF*), but using a subset is not allowed for this command.

As an example, consider a keyword called NAME, for which you can specify people's names. You might specify NAME(ROBERT ROBERTS ROBERTSON) to enter three names, or you might specify NAME(ROB*) to indicate all names that begin with the characters ROB. NAME(*BERT*) could also be specified to indicate all names that contain the characters BERT within the name. However, not all commands allow you to specify a subset of values in this way.

System Action: Processing for the command is terminated.

System Programmer Response: Correct the keyword parameter, and reenter the command.

Problem Determination: Obtain a copy of the system or terminal log to verify command entry.

**DSN9031I SYNTAX ERROR DETECTED
FOLLOWING KEYWORD *keyword-name***

Explanation: The text that follows the named keyword contains invalid syntax.

As an example, consider specification of CLASS==A. The double equal signs do not conform to the rules of syntax and make the keyword meaningless. This is just one example of invalid syntax. It is not practical to try to illustrate every possible error here. You could, however, correctly specify CLASS=A or CLASS(A).

System Action: Processing for the command is terminated.

System Programmer Response: Examine the text following the named keyword to ensure that no errors were made as the command was entered. Ensure that

you have followed the rules for command entry, and reenter the command.

Problem Determination: Obtain a copy of the system or terminal log to verify command entry.

**DSN9032I REQUESTED FUNCTION IS NOT
AVAILABLE**

Explanation: An attempt was made to invoke a command processor that was not loaded. An example of this is invoking -START DDF or -STOP DDF when DDF is not loaded (not selected during the installation process).

System Action: The requested function is not performed.

User Response: Determine what function was requested. Do not invoke this function until DB2 is reinstalled and DDF is selected.

Problem Determination: Look at the console log to determine which command caused the error.

**DSN9033I KEYWORD *name1* REQUIRES
KEYWORD *name2***

Explanation: When keyword 'name1' is specified, keyword 'name2' must also be specified.

System Action: Processing for the command terminates.

User Response: Resubmit the command with the missing keyword.

Problem Determination: Obtain a copy of the system or terminal log to verify the command entry.

**DSN9034I THE TOTAL LENGTH OF COMMAND
RESPONSE MESSAGES EXCEEDED
ITS LIMIT. DISPLAY IS TERMINATED.**

Explanation: The total length of all response messages returned from a single DB2 command exceeded the internal limit set by the system. The message chain was truncated. This message was appended at the end of the chain to inform the user of the termination of the report.

**DSN9038I *csect-name* COMMAND REJECTED
BECAUSE DB2 WAS RESTARTED IN
LIGHT MODE**

Explanation: This command is not allowed when the DB2 member has been restarted with the LIGHT(YES) parameter.

System Action: Command processing is halted.

System Programmer Response: Refrain from issuing this command on this DB2 member until after the member has been restarted without LIGHT(YES). If the command has group scope, then you may be able to

| issue the command to a different DB2 member in the
| group.

Chapter 31. DB2 codes

This section contains DB2 abend reason codes and reason codes. In addition, this section contains DB2 instrumentation facility interface reason codes.

Conventions used in DB2 abend reason codes are described in Part 1, "Introduction," on page 1.

Chapter 32. X'C1.....' codes

00C10002

Explanation: The DB2 call attachment facility control block (the CAB) indicated that a thread was present when it should not have been present.

This abend reason code is issued by the following CSECT: DSNACA00

User Response: Notify your system programmer.

System Programmer Response: Collect a DSNTRACE trace stream and request a SYSABEND or SYSUDUMP dump.

Problem Determination: This is probably a call attachment facility error.

00C10003

Explanation: The DB2 call attachment facility received control after a nonstandard entry that did not use the call attachment facility language interface.

This abend reason code is issued by the following CSECT: DSNACA00

User Response: Modify or repair your application so that DSNACA00, the main call attachment facility code will receive control only through the language interface.

Problem Determination: This is probably a user error.

00C10004

Explanation: The call attachment facility encountered an error retrieving a trace message during processing of a call attachment facility request.

This abend reason code is issued by the following CSECT: DSNACA00

User Response: Notify your system programmer.

System Programmer Response: Collect a DSNTRACE trace stream and request a SYSABEND or SYSUDUMP dump.

Problem Determination: This is probably a call attachment facility error.

00C10005

Explanation: The application program passed an ECB address of 0 to the call attachment facility on a CONNECT call. The trace message preceding the abend indicates whether the ECB was a start-up or termination ECB.

This abend reason code is issued by the following CSECT: DSNACA00

User Response: Correct the application program that

makes the CONNECT call to DSNALI. Ensure that the CONNECT call uses a valid ECB address.

Problem Determination: See the Explanation above.

00C10201

Explanation: The application program passed two CONNECT calls to the call attachment facility (CAF) from the same TCB. The first CONNECT could have been either implicit or explicit.

This abend reason code is issued by the following CSECT: DSNACA00

User Response: You can continue processing with a corrected request.

Problem Determination: See the Explanation above.

00C10202

Explanation: The application program passed two OPEN commands to the call attachment facility (CAF) from the same TCB. The first OPEN could have been either implicit or explicit.

This abend reason code is issued by the following CSECT: DSNACA00.

User Response: You can continue processing with a corrected request.

Problem Determination: See the Explanation above.

00C10203

Explanation: A CLOSE command was issued when there was no active OPEN.

This abend reason code is issued by the following CSECT: DSNACA00

User Response: You can continue processing with a corrected request.

Problem Determination: See the Explanation above.

00C10204

Explanation: A DISCONNECT command was issued when there was no active CONNECT.

This abend reason code is issued by the following CSECT: DSNACA00

User Response: You can continue processing with a corrected request.

Problem Determination: See the Explanation above.

00C10205

Explanation: A TRANSLATE command was issued when the DB2 subsystem was not connected to the call attachment facility (CAF).

This abend reason code is issued by the following CSECT: DSNACA00

User Response: You can continue processing with a corrected request.

Problem Determination: See the Explanation above.

00C10206

Explanation: One of the following conditions exists:

- The wrong number of parameters were issued.
- The end-of-list bit was off.

This abend reason code is issued by the following CSECT: DSNACA00

User Response: You can continue processing with a corrected request.

Problem Determination: See the Explanation above.

00C10207

Explanation: The application program passed an unrecognized function parameter to the call attachment facility (CAF).

This abend reason code is issued by the following CSECT: DSNACA00

User Response: You can continue processing with a corrected request.

Problem Determination: See the Explanation above.

00C10208

Explanation: The call attachment facility (CAF) received requests from the same TCB to CONNECT to the DB2 subsystem and to another subsystem.

This abend reason code is issued by the following CSECT: DSNACA00

User Response: You can continue processing with a corrected request.

Problem Determination: See the Explanation above.

00C10209

Explanation: The call attachment facility (CAF) received an explicit call to DSNALI from a DB2 stored procedure. This is not allowed.

This abend reason code is issued by the following CSECT: DSNACA00

User Response: You can continue processing with a corrected request.

00C10824

Explanation: The CAB is reset and a new connection may be made.

This abend reason code is issued by the following CSECT: DSNACA70

User Response: You can continue processing.

Problem Determination: See the Explanation associated with message DSNA824I.

00C10831

Explanation: The call attachment facility (CAF) has detected a release level incompatibility between itself and DB2. Either the current CAF or DB2 release levels do not support coexistence, or the SPE level of the lower level release does not meet the compatibility requirements for coexistence between the two releases.

This reason code is issued by the following CSECT: DSNACA70

System Action: The connection is not successful.

User Response: If you used JCL or a TSO logon procedure to invoke CAF, check to insure the correct DB2 libraries are defined in your JOBLIB and STEPLIB allocations. See your system programmer if you invoke CAF using procedures supplied by your system programmer.

Problem Determination: If CAF trace (DSNTRACE) is active, message DSNA831E will indicate the release levels of CAF and the DB2 subsystem.

00C12001

Explanation: The DB2 RRSF attachment facility function AUTH SIGNON was invoked by a program that was not APF authorized. This condition can indicate a security violation.

System Action: The application is abended.

User Response: The AUTH SIGNON function can only be invoked from an APF authorized program. Either modify your program to use the RRSF attachment facility function SIGNON which may be invoked from a non-authorized program, or contact your security administrator to make the changes required to make your program an APF authorized program.

Problem Determination: This is a user error.

This abend reason code is issued by the following CSECT: DSNARA00

00C12002

Explanation: An abend has occurred during an attempt to access the caller-provided subsystem name parameter while executing in the PSW key of the caller.

This is probably the result of a logic error in the requesting program.

System Action: The application is abended.

User Response: A dump should be taken for problem analysis.

Problem Determination: This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

This abend reason code is issued by the following CSECT: DSNARA00

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5, 49.

00C12003

Explanation: An abend has occurred during an attempt to access the caller-provided *ribptr* parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System Action: The application is abended.

User Response: A dump should be taken for problem analysis.

Problem Determination: This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

This abend reason code is issued by the following CSECT: DSNARA00

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5, 49.

00C12004

Explanation: An abend has occurred during an attempt to access the caller-provided *eibptr* parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System Action: The application is abended.

User Response: A dump should be taken for problem analysis.

Problem Determination: This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

This abend reason code is issued by the following CSECT: DSNARA00

Collect the following diagnostic items listed in

Appendix B, "Problem determination," on page 1353: 1, 5, 49.

00C12005

Explanation: The DB2 RRSF attachment facility received control after a nonstandard entry that did not use the call attachment facility language interface.

System Action: The application is abended.

User Response: Modify or repair your application so that DSNACA00, the main call attachment facility code, will receive control only through the language interface.

Problem Determination: This is probably a user error.

This abend reason code is issued by the following CSECT: DSNARA00

00C12006

Explanation: An abend has occurred during an attempt to access the caller-provided termination ECB parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System Action: The application is abended.

User Response: A dump should be taken for problem analysis.

Problem Determination: This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

This abend reason code is issued by the following CSECT: DSNARA00

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5, 49.

00C12007

Explanation: An abend has occurred during an attempt to access the caller-provided startup ECB parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System Action: The application is abended.

User Response: A dump should be taken for problem analysis.

Problem Determination: This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

This abend reason code is issued by the following CSECT: DSNARA00

Collect the following diagnostic items listed in

Appendix B, "Problem determination," on page 1353: 1, 5, 49.

00C12008

Explanation: An abend has occurred during an attempt to access the caller-provided correlation parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System Action: The application is abended.

User Response: A dump should be taken for problem analysis.

Problem Determination: This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

This abend reason code is issued by the following CSECT: DSNARA00

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5, 49.

00C12009

Explanation: An abend has occurred during an attempt to access the caller-provided accounting token parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System Action: The application is abended.

User Response: A dump should be taken for problem analysis.

Problem Determination: This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

This abend reason code is issued by the following CSECT: DSNARA00

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5, 49.

00C12010

Explanation: An abend has occurred during an attempt to access the caller-provided accounting interval parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System Action: The application is abended.

User Response: A dump should be taken for problem analysis.

Problem Determination: This reason code is placed

in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

This abend reason code is issued by the following CSECT: DSNARA00

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5, 49.

00C12011

Explanation: An abend has occurred during an attempt to access the caller-provided authid parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System Action: The application is abended.

User Response: A dump should be taken for problem analysis.

Problem Determination: This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

This abend reason code is issued by the following CSECT: DSNARA00

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5, 49.

00C12012

Explanation: An abend has occurred during an attempt to access the caller-provided secondary authid parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System Action: The application is abended.

User Response: A dump should be taken for problem analysis.

Problem Determination: This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

This abend reason code is issued by the following CSECT: DSNARA00

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5, 49.

00C12013

Explanation: An abend has occurred during an attempt to access the caller-provided ACEE parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System Action: The application is abended.

User Response: A dump should be taken for problem analysis.

Problem Determination: This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

This abend reason code is issued by the following CSECT: DSNARA00

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5, 49.

00C12014

Explanation: An abend has occurred during an attempt to access the caller-provided plan name parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System Action: The application is abended.

User Response: A dump should be taken for problem analysis.

Problem Determination: This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

This abend reason code is issued by the following CSECT: DSNARA00

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5, 49.

00C12015

Explanation: An abend has occurred during an attempt to access the caller-provided collection parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System Action: The application is abended.

User Response: A dump should be taken for problem analysis.

Problem Determination: This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

This abend reason code is issued by the following CSECT: DSNARA00

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5, 49.

00C12016

Explanation: An abend has occurred during an attempt to access the caller-provided reuse parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System Action: The application is abended.

User Response: A dump should be taken for problem analysis.

Problem Determination: This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

This abend reason code is issued by the following CSECT: DSNARA00

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5, 49.

00C12018

Explanation: An abend has occurred during an attempt to access the caller-provided user-id parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System Action: The application is abended.

User Response: A dump should be taken for problem analysis.

Problem Determination: This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

00C12019

Explanation: An abend has occurred during an attempt to access the caller-provided applname parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System Action: The application is abended.

User Response: A dump should be taken for problem analysis.

Problem Determination: This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register

00C12020 • 00C12206

indicates which parameter caused the error.

00C12020

Explanation: An abend has occurred during an attempt to access the caller-provided ws parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System Action: The application is abended.

User Response: A dump should be taken for problem analysis.

Problem Determination: This reason code is placed in register 15 during any access to caller-provided information. When any abend occurs, this register indicates which parameter caused the error.

00C12021

Explanation: An abnormal termination has occurred during an attempt to access the caller-provided xid parameter while executing in the PSW key of the caller. This is probably the result of a logic error in the requesting program.

System Action: The application is abnormally terminated.

User Response: Correct the problem and submit your job again.

Problem Determination: This reason code is placed in register 15 during any access to caller-provided information. Register 15 indicates which parameter caused the error when any abnormal termination occurs.

00C12024

Explanation: While executing in the PSW key of the caller, an abend occurred during an attempt to access the accounting-string parameter that was provided by the caller. This is probably the result of a logic error in the requesting program.

System Action: The application is abended.

User Response: A dump should be taken for problem analysis.

Problem Determination: This reason code is placed in register 15 during any access to information that was provided by the caller. When any abend occurs, this register indicates which parameter caused the error.

00C12201

Explanation: The application program invoked IDENTIFY while it was already connected to DB2.

User Response: You can continue processing with a corrected request.

Problem Determination: This reason code is issued by the following CSECT: DSNARA00

00C12202

Explanation: The application program invoked the CREATE THREAD function request while there was already a thread created.

User Response: You can continue processing with a corrected request.

Problem Determination: This reason code is issued by the following CSECT: DSNARA00

00C12203

Explanation: A TERMINATE THREAD command was issued when there was no active thread.

User Response: You can continue processing with a corrected request.

Problem Determination: This reason code is issued by the following CSECT: DSNARA00

00C12204

Explanation: The application issued a function request other than IDENTIFY when no connection with DB2 existed. Only IDENTIFY may be issued when a connection does not exist.

User Response: You can continue processing with a corrected request.

Problem Determination: This reason code is issued by the following CSECT: DSNARA00

00C12205

Explanation: The task that invoked the DB2 RRSF attachment facility function SWITCH TO has not yet identified to the DB2 subsystem specified in the request.

System Action: The SWITCH TO function is performed.

User Response: Use IDENTIFY to connect to a DB2 subsystem before attempting to invoke any other function at the specified subsystem.

Problem Determination: This reason code is issued by the following CSECT: DSNARA00

00C12206

Explanation: One of the following conditions exists:

- The wrong number of parameters were issued.
- The end-of-list bit was off.

User Response: You can continue processing with a corrected request.

Problem Determination: This reason code is issued by the following CSECT: DSNARA00

00C12207

Explanation: The application program either omitted the function name parameter or passed an unrecognized function parameter to the RRSAF.

System Action: The application is abended.

User Response: Modify or repair your application to pass a valid function request to RRSAF.

00C12208

Explanation: The application program issued an IDENTIFY function request but omitted the *ribptr* parameter from the parameter list. An *ribptr* parameter is a required parameter on an IDENTIFY request.

System Action: The IDENTIFY request is rejected.

User Response: You can continue processing with a corrected request.

Problem Determination: This reason code is issued by the following CSECT: DSNARA00

00C12209

Explanation: The application program issued an IDENTIFY function request but omitted the *eibptr* parameter from the parameter list. An *eibptr* parameter is a required parameter on an IDENTIFY request.

System Action: The IDENTIFY request is rejected.

User Response: You can continue processing with a corrected request.

Problem Determination: This reason code is issued by the following CSECT: DSNARA00

00C12212

Explanation: The application program issued a CREATE THREAD function request and did not specify a plan name and also did not specify a collection name. If a plan name is not provided, then a collection name must be supplied.

User Response: You can continue processing with a corrected request.

Problem Determination: This reason code is issued by the following CSECT: DSNARA00

00C12214

Explanation: The application program issued a TRANSLATE function request but omitted the *sqlca* parameter from the parameter list. An *sqlca* parameter is a required parameter on a TRANSLATE request.

User Response: You can continue processing with a corrected request.

Problem Determination: This reason code is issued

by the following CSECT: DSNARA00

00C12217

Explanation: The application program issued a CREATE THREAD function request without having completed SIGNON processing. At least one successful SIGNON must be completed before a CREATE THREAD request can be issued.

User Response: You can continue processing with a corrected request.

Problem Determination: This reason code is issued by the following CSECT: DSNARA00

00C12219

Explanation: The application program issued an SQL or IFI function request without completing CREATE THREAD processing. SQL or IFI requests cannot be issued until CREATE THREAD processing is complete.

User Response: You can continue processing with a corrected request.

Problem Determination: This reason code is issued by the following CSECT: DSNARA00

00C12221

Explanation: The application program issued a CALL DSNRLI with function SET_CLIENT_ID without completing CREATE THREAD processing. SET_CLIENT_ID requests cannot be issued until CREATE THREAD processing is complete.

SET_CLIENT_ID requests are permitted after a plan is allocated, however.

User Response: You can continue processing with a corrected request.

00C12822

Explanation: The RRSAF received an explicit call to DSNRLI from a DB2 stored procedure. This is not allowed.

User Response: You can continue processing with a corrected request.

Problem Determination: This reason code is issued by the following CSECT: DSNARA00

00C12823

Explanation: An attempt was made to initiate a stored procedure for a task, but one already exists. This is not allowed.

User Response: You can continue processing with a corrected request.

Problem Determination: This reason code is issued

00C12824 • 00C12831

by the following CSECT: DSNARA00

00C12824

Explanation: The previous connection to DB2 has been terminated. Cleanup processing was performed and the RRSF is now ready to process additional IDENTIFY requests.

User Response: You can continue processing, and issue an IDENTIFY request.

Problem Determination: This reason code is issued by the following CSECT: DSNARA00

00C12825

Explanation: An attempt was made to terminate a stored procedure for a task, but no stored procedure exists. This is not allowed.

User Response: You can continue processing with a corrected request.

Problem Determination: This reason code is issued by the following CSECT: DSNARA00

00C12831

Explanation: The release of the RRSF code is not compatible with the earlier release of the DB2 program.

System Action: The connection is not made.

User Response: Ensure that the release of the RRSF library is not later than the release of DB2 to which you are attempting to connect.

Problem Determination: This problem can be caused by improper DB2 data set allocation in a LOGON procedure or CLIST.

This reason code is issued by the following CSECT: DSNARA70

Chapter 33. X'C2.....' codes

00C20021

Explanation: A member of a DB2 data sharing group was unable to perform a global drain because a physical close failure occurred in a peer DB2 due to an exceptional state or CASTOUT process failure. DSNT501I is sent to the console to report the condition.

System Action: A 'resource not available' return code, reason code, and object name are sent back to the requesting function.

This returned reason code is issued by the following CSECT: DSNB1LDA

00C20031

Explanation: An attempt to acquire a page latch in either shared mode or exclusive mode was rejected due to a time-out on the agent's wait time.

System Action: A 'resource not available' return code, reason code, and object name are sent back to the requesting function.

System Programmer Response: A diagnostic dump with reason code 00C2010F should follow 00C20031.

This reason code is issued by the following CSECTs: DSNB1LTX, DSNB1LTS

00C20069 .

Explanation: DB2 is unable to perform the drain function on an object (a table space, an index space, or a partition) because a DB2 member in the data sharing group was in the process of restarting.

System Action: If the problem was encountered by DB2 when trying to automatically recover a group buffer pool recovery pending (GRECP) object following the failure of a group buffer pool (GBP), then DB2 issues message DSNB350I or DSNB351I to the console with this reason code indicating that the object cannot be automatically recovered.

Otherwise, a 'resource not available' return code, reason code and object name are sent back to the requesting function. DSNT501I is sent to the console to report the condition.

System Programmer Response: If DSNB350I or DSNB351I messages were issued, wait for the failed DB2 member to complete its restart processing and then recover the GRECP objects as indicated in the "System Programmer Response" for DSNB350I or DSNB351I.

00C2006A

Explanation: DB2 was unable to perform the drain function on an object (table space, index space, or partition) because the object was held by one or more indoubt threads.

System Action: If the problem was encountered by DB2 when trying to automatically recover a group buffer pool recovery pending (GRECP) object following the failure of a group buffer pool (GBP), then DB2 issues message DSNB350I or DSNB351I to the console with this reason code indicating that the object cannot be automatically recovered.

System Programmer Response: Use the DB2 DISPLAY DB CLAIMERS command to find the indoubt threads. If the threads have been left indoubt because DB2 or a transaction manager was unable to automatically resolve the indoubts, you can use the DB2 RECOVER INDOUBT command to resolve the indoubt thread and remove the indoubt claimer on the object (the DB2 RECOVER INDOUBT command should only be used when automatic resolution does not work).

If DSNB350I or DSNB351I messages were issued, then after you resolve the indoubt threads, recover the GRECP objects as indicated in the "System Programmer Response" for DSNB350I or DSNB351I.

00C200A1

Explanation: This is a DB2 internal error. The caller of the buffer manager (BM) is trying to release a page latch that is not currently held.

This abend reason code is issued by the following CSECTs:

DSNB1REL	DSNB1RWI	DSNIB	DSNICLAP
DSNICUMW	DSNICUR	DSNIDILS	DSNIDLEO
DSNIFFRE	DSNIFNP	DSNIGLOK	DSNILGBW
DSNILREP	DSNILSMG	DSNIMSCU	DSNIMS1W
DSNIOSL2	DSNIOW	DSNIPOCI	DSNIRELS
DSNIRELU	DSNIREPR	DSNIRFNX	DSNISEGD
DSNISEGF	DSNISFS	DSNISFXL	DSNISGAU
DSNISGFO	DSNISGNS	DSNISGRT	DSNISGSU
DSNISMFO	DSNISMRT	DSNISMSU	DSNIUPPR
DSNIUSME	DSNI1OP		

System Action: The requesting application process is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00C200A2 • 00C200A5

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00C200A2

Explanation: This is a DB2 internal error. The caller of the buffer manager (BM) is trying to get a page latch that is currently held on the requesting page.

This abend reason code is issued by the following CSECTs:

DSNB1GET	DSNB1SWS	DSNB1GNV	DSNBLTCH
DSNIB	DSNICLAP	DSNICUMW	DSNICUR
DSNIDEFR	DSNIFFRE	DSNIFNP	DSNIGLOK
DSNILSMG	DSNILSMU	DSNIMS1W	DSNIRELS
DSNIRELU	DSNIREPR	DSNIRFNX	DSNIRNXT
DSNISEGF	DSNISFS	DSNISFXL	DSNISGAU
DSNISGFO	DSNISGNS	DSNISGRT	DSNISMRT
DSNIUSME	DSNI1OP		

System Action: The requesting application process is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00C200A3

Explanation: This is a DB2/MVS internal error. The execution unit driving a buffer manager (BM) asynchronous function, which would normally run indefinitely, has been canceled. However, work being done by the execution unit is allowed to complete before the execution unit terminates.

This abend reason code is issued by the following CSECTs:

DSNB1CMS	DSNB5COM	DSNB5RAP
----------	----------	----------

System Action: The affected asynchronous function is terminated. If the affected function is the deferred write processor (DSNB1CMS), DB2 is abended with the abend code '00C200D3'.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Start DB2 if it is abended.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem

determination," on page 1353: 1, 2, 5.

00C200A4

Explanation: This code usually indicates a problem internal to DB2; however, the problem can result from errors in other products. An unexpected reason code was returned by the media manager function when it was invoked to process a database I/O request.

System Action: The requesting execution unit is abended.

User Response: Notify the system programmer and rerun the application.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

The unexpected media manager reason code is saved in register 8.

Check the MVS console log for an IOS error message indicating the type of I/O error that occurred. If an IOS message was issued, follow the problem determination directions for that message.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 10, 12.

This abend reason code is issued by the following CSECTs:

DSNB5COM	DSNB5FOR	DSNB5RAP	DSNB5RDP
DSNB5PCO			

00C200A5

Explanation: Typically, this indicates a problem internal to DB2; however, the problem can result from errors in other products. DB2 was unable to drain a pageset in preparation for page set cleanup processing. This might be caused by one of the following:

- An IRLM out-of-storage condition
- An internal error in the lock acquisition function

This abend reason code is issued by the following CSECT: DSNB1CFC

System Action: The execution unit driving this function proceeds normally. The abend status is recorded in SYS1.LOGREC.

Operator Response: Notify the system programmer and print the SYS1.LOGREC.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and

reporting the problem. Restart DB2.

Problem Determination: The unexpected reason code returned by the drain function in register 8 might help determine the cause of the problem. If the problem is caused by an unavailable DB2 resource, message DSNT500I might also be issued.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5.

00C200A6

Explanation: This is a DB2/MVS internal error. The execution unit scheduled by the buffer manager (BM) subcomponent of DB2 to drive the page set cleanup function has been canceled.

This abend reason code is issued by the following CSECT: DSNB1CFC

System Action: DB2 is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart DB2.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Refer to similar reason code '00E50013'.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00C200A8

Explanation: An error code other than timeout, insufficient storage, or an MVS system error was returned by the IRLM LOCK request invoked by DB2 to acquire any of the following locks:

- SYSLGRNG or SYSLGRNX recording lock on a table space
- Group buffer pool-dependent conversion lock on a page set or partition
- Group buffer pool start or stop lock
- ALTER BUFFERPOOL lock

This is a DB2 or IRLM internal error.

System Action: The requesting execution unit abends.

User Response: Notify the system programmer and rerun the application.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

Problem Determination: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECTs: DSNB1SCR, DSNB1DLK

00C200A9

Explanation: A return code greater than 4 was returned by the IRLM UNLOCK request invoked by DB2 to release any of the following locks:

- SYSLGRNG or SYSLGRNX recording lock on a table space
- Group buffer pool dependent conversion lock on a page set or partition
- Group buffer pool start or stop lock
- ALTER BUFFERPOOL lock.

This is a DB2 or IRLM error.

System Action: The requesting execution unit is abended.

User Response: Notify the system programmer and rerun the application.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

Problem Determination: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

The unexpected IRLM reason code is saved in register 8. It might help determine the cause of the error.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

This abend reason code is issued by the following CSECTs: DSNB1SCR, DSNB1DLK

00C200AA

Explanation: This is a DB2 internal error. The caller of the buffer manager (BM) is trying to change a page latch type, but the requesting agent already holds this latch type on this page.

This abend reason code is issued by the following CSECT: DSNBCLTH

System Action: The requesting application process is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00C200AB

Explanation: This is a DB2 internal error. The caller of the buffer manager (BM) is trying to get another page latch, which would cause the total number of page latches held by the caller to exceed the maximum allowable number of 2.

This abend reason code is issued by the following CSECTs: DSNBLTCH DSNB2LTH

System Action: The requesting application process is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00C200AD

Explanation: This is a DB2 internal error. The caller of the buffer manager (BM) is trying to get a page latch for a page that belongs to one type of page set (index or data). However, the caller already holds a page latch on another page that belongs to a different type of page set.

This abend reason code is issued by the following CSECT: DSNB2LTH

System Action: The requesting application process is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00C200AE

Explanation: This is a DB2 internal error. The caller of the buffer manager (BM) is trying to get a page latch on a page for which there are latch waiters, but no latch holders.

This abend reason code is issued by the following CSECTs: DSNB1LTS DSNB1LTX

System Action: The requesting application process is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00C200AF

Explanation: This is a DB2 internal error. The caller of the buffer manager(BM) is attempting to update a page under the critical mode without holding an exclusive latch on the page.

This abend reason code is issued by the following CSECT: DSNB1SWS

System Action: The requesting application process is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00C200B0

Explanation: Typically, this indicates a problem internal to DB2, however the problem can result from errors in other products. The buffer address passed by the buffer manager (BM) invokers does not contain the requested page. The buffer manager detected this error by comparing the information stored in the buffer control block (BB) with the information passed with the buffer manager by its invokers. The information that is compared is the page set piece block, the page number, and the buffer address.

This abend reason code is issued by the following CSECTs:

DSNB1REL	DSNB1RWI	DSNB1SWS
DSNB1GNV	DSNB5COM	

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination:

The following general purpose registers (GPRs) contain the indicated diagnostic information:

GPR	Content
7	Address of the page buffer
8	Address of the page set block (PB)

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 10, 12.

00C200B1

Explanation: This is a DB2 internal error. Either the buffer manager (BM) subcomponent of DB2 is unable to locate the requesting page in the buffer pool or the invoker of the buffer manager is attempting to decrease the buffer use count which is already 0.

This abend reason code is issued by the following CSECTs:

DSNB1REL	DSNB1RWI	DSNB1SWS
----------	----------	----------

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00C200B2

Explanation: This is a DB2 internal error. The buffer's write intent count is already 0 and the buffer manager (BM) invoker is attempting to decrease it.

This abend reason code is issued by the following CSECT: DSNB1RWI

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00C200B3

Explanation: This is a DB2 internal error. The buffer manager (BM) subcomponent of DB2 is unable to open a page set required by the requesting function. The page size or the page set piece size passed by the

buffer manager invoker is invalid. The page set piece size is expressed by n, where 2 to the power of n is the total number of pages that can be contained within a page set piece. This error was detected during open page set processing.

This abend reason code is issued by the following CSECT: DSNB1OPS.

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00C200B4

Explanation: This is a DB2 internal error. The buffer manager (BM) subcomponent of DB2 is unable to open a page set required by the requesting function. The highest page set piece number passed by the buffer manager invoker exceeds the maximum value allowed. The maximum number of data sets that can be defined for a given page set is dependent on the page set piece size. This error was detected during open page set processing.

This abend reason code is issued by the following CSECT: DSNB1OPS

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00C200B5

Explanation: This is a DB2 internal error. The buffer manager (BM) subcomponent of DB2 is unable to open a page set required by the requesting function. During the open page set processing, the page set options passed by the buffer manager invoker were in conflict with the same page set that was opened earlier. The page set options are the writing protocol (SYSTEM or UW), the recovery option (recoverable or unrecoverable), and the page size.

This abend reason code is issued by the following CSECT: DSNB1OFA

00C200B6 • 00C200BB

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00C200B6

Explanation: Typically, this indicates a problem internal to DB2; however, the problem can result from errors in other products. The buffer manager (BM) subcomponent of DB2 is unable to reallocate a data set that is required after extending a data set to a new volume. The data set reallocation was requested and the corresponding data set was not opened. This error was detected during open page set piece processing.

This abend reason code is issued by the following CSECT: DSNB1OPP

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 10, 12.

00C200B7

Explanation: Typically, this indicates a problem internal to DB2; however, the problem can result from errors in other products. The buffer manager (BM) subcomponent of DB2 is unable to open a page set required by the requesting function. The linear page set was not formatted contiguously. This error was detected during open page set processing.

This abend reason code is issued by the following CSECT: DSNB1OPS

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 10, 12.

00C200B8

Explanation: This is a DB2 internal error. DB2 is unable to update the SYSLGRNG or SYSLGRNXpage set. The utility returned an unexpected reason code.

This abend reason code is issued by the following CSECT: DSNB1SWS

System Action: A 'resource not available' code is returned. This reason code and the table space name are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5.

00C200BA

Explanation: This is a DB2 internal error. DB2 has encountered an unexpected error while attempting to access a system page of a page set.

This abend reason code is issued by the following CSECTS: DSNB1CPP, DSNB1OPP

System Action: The requesting execution unit is abended. The SVC dump and the SYS1.LOGREC recording are requested.

Operator Response: Notify the system programmer, print the SYS1.LOGREC and the SVC dump.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for failure for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00C200BB

Explanation: This is a DB2 internal error to indicate that an invalid buffer pool ID is specified.

This abend reason code is issued by the following CSECT: DSNBRBPA

System Action: The requesting application process is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 1, 2, 5.

00C200BC

Explanation: This is a DB2 internal error. The Buffer Manager (BM) subcomponent of DB2 has discovered that the BM invoker is attempting to release the page which does not belong to the work file database.

This abend reason code is issued by the following CSECT: DSNB1REL

System Action: The requesting execution unit is abnormally terminated.

Operator Response: Notify the system programmer, and print the SYS1.LOGREC and the SVC dump.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 1, 5.

00C200BD

Explanation: This is a DB2 internal error. The caller of the buffer manager (BM) is still holding a page latch on the page which is currently being released by the application.

This abend reason code is issued by the following CSECT: DSNB1REL

System Action: The requesting application process is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 1, 2, 5.

00C200BE

Explanation: This is a DB2 internal error. The buffer manager (BM) is trying to dequeue a page latch waiter from the wait queue, but there are no waiters.

This abend reason code is issued by the following CSECTs: DSNB1CLT DSNB1ULT

System Action: The requesting application process is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 1, 2, 5.

00C200C0

Explanation: DB2 is unable to perform I/O processing for the requesting function. An error code (other than a permanent I/O error) was returned by the media manager during the I/O backend processing.

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The unexpected media manager reason code is saved in register 8. It might help determine the cause of the failure.

Check the MVS console log for an IOS error message indicating the type of I/O error that occurred. If an IOS message was issued, follow the problem determination directions for that message.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 1, 2, 5, 10, 12.

This abend reason code is issued by the following CSECTs:

DSNB5COM DSNB5FOR DSNB5RAP DSNB5PCO
DSNB5RDP

00C200C1

Explanation: The page version number in the database page header is outside the valid range of values. This can be caused by one of the following:

- Copying data sets improperly from another DB2 subsystem.
- In a CREATE TABLESPACE statement, specifying a VCAT catalog name that is the same as the name of an object in another DB2 subsystem on the same processor.
- Conditionally starting DB2 to a prior time with an invalid RBA range.
- Incorrect use of the REPAIR utility (modifying the page RBA).
- The page was damaged by a DB2 system error.

00C200C2 • 00C200C5

- TOD clock values are out of synch between systems in a Parallel Sysplex.

System Action: The requesting execution unit is abended. If DSNB1SWS issues the ABEND, then it is preceded by a DSNT500I message indicating which page is in error and a DSNI004I message indicating the page set is put in STOPE mode.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

User Response: One of the following:

- If the data set was copied from another DB2 subsystem, run DSN1COPY with the RESET option to set the log RBAs in each page to 0.
- If a table space was created with the wrong VCAT catalog name, drop the object and create it again.
- If DB2 was conditionally started with an invalid RBA range, correct the RBA range and restart DB2 with conditions again.
- If the page was damaged by the REPAIR utility, restore it with the RECOVER utility using the PAGE option.
- If you are running data sharing, check the connectivity of the systems to the sysplex timers. The TOD clock values of all systems in the sysplex should all be within one microsecond. TOD clock values will not drift more than one microsecond apart unless a sysplex timer is malfunctioning.
- Otherwise, inform your system programmer that you suspect an error.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

The following general purpose registers (GPRs) contain the indicated diagnostic information:

GPR	Content
7	Address of the page buffer
8	Address of the page set block (PB)

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 13, 33.

This abend reason code is issued by the following CSECT: DSNB1SWS.

00C200C2

Explanation: This is a DB2 internal error. The buffer manager (BM) subcomponent of DB2 has discovered that the BM invoker is attempting to decrease the page's write intent count (WIC), but the invoker has no write intent request outstanding.

This abend reason code is issued by the following CSECT: DSNB1RWI

System Action: The BM does not decrease the page's WIC as requested, and the execution unit driving this function is abended. An SVC dump is requested and the abend status is recorded in the SYS1.LOGREC.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 13, 19, 33.

00C200C3

Explanation: This is a DB2 internal error. The buffer manager (BM) subcomponent of DB2 discovered that the BM invoker is attempting to set the page's write intent count (WIC), but the invoker has no read intent request outstanding.

This abend reason code is issued by the following CSECT: DSNB1SWS

System Action: The BM does not increase the page's WIC as requested, and the execution unit driving this function is abended. An SVC dump is requested and the abend status is recorded in the SYS1.LOGREC.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 19, 33.

00C200C5

Explanation: This is a DB2 internal error. The buffer manager (BM) subcomponent of DB2 discovered that its invoker was attempting to decrease the write dependency count (WDC) for a buffer. However, the buffer contains database updates that have not yet been written back to DASD. The buffer manager makes the buffer available for reassignment.

This abend reason code is issued by the following CSECTS: DSNB1REL DSNB1RWI

System Action: The buffer manager does not decrease the WDC as requested, and the execution unit driving this function proceeds normally. An SVC dump is requested and the abend status is recorded in SYS1.LOGREC.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 13, 19, 33.

00C200C6

Explanation: This is a DB2 internal error. The buffer manager (BM) subcomponent of DB2 has discovered that the BM invoker is attempting to release a page that was not held by the invoker or the page has an unbalanced write intent (for example, reset write intent has not yet been issued prior to releasing the page).

This abend reason code is issued by the following CSECTs: DSNB1REL DSNB1RWI

System Action: The BM does not release the page as requested, and the execution unit driving this function terminates abnormally. An SVC dump is requested and the abend status is recorded in the SYS1.LOGREC.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 13, 19, 33.

00C200C7

Explanation: An error code, other than timeout, insufficient storage, or MVS system error, was returned by the IRLM LOCK request. The IRLM LOCK request was invoked to acquire an open lock to perform a physical open or close.

This abend reason code is issued by the following CSECT: DSNB1LCK

System Action: The requesting execution unit is abended.

User Response: Rerun the application.

Operator Response: Print the SYS1.LOGREC and request the SVC dump.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The unexpected IRLM reason code is saved in register 8. It may help determine the cause of the error.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00C200C8

Explanation: A return code greater than 4 was returned by the IRLM UNLOCK request invoked to release a open lock after completing a physical open or close.

This abend reason code is issued by the following CSECT: DSNB1ULK

System Action: The requesting execution unit is abended.

User Response: Rerun the application.

Operator Response: Print the SYS1.LOGREC and request the SVC dump.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The unexpected IRLM reason code is saved in register 8. It may help determine the cause of the error.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00C200C9

Explanation: The buffer manager (BM) subcomponent of DB2 discovered a damaged PBG control block while attempting to write a check point log record.

This abend reason code is issued by the following CSECT: DSNB1CHK

System Action: DB2 is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart DB2.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 33.

00C200CB

Explanation: The buffer manager (BM) subcomponent of DB2 discovered a damaged ABG or AB control block while attempting to write a checkpoint.

This abend reason code is issued by the following CSECT: DSNB1CHK

System Action: DB2 is abnormally terminated; if processing were to continue, an invalid checkpoint

00C200CC • 00C200D1

would be created which would damage data on a subsequent DB2 restart.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart DB2.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5.

00C200CC

Explanation: The buffer manager (BM) subcomponent of DB2 discovered a close task has been waiting for prefetch to complete for two checkpoints.

This abend reason code is issued by the following CSECT: DSNB1CHK

System Action: An SVC dump is produced and checkpointing continues.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00C200CE

Explanation: This is a DB2 internal error. An agent, which was suspended while awaiting completion of a database I/O, was invalidly resumed by someone other than the initiator of the I/O.

System Action: An SVC dump is taken. The affected agent re-suspends to await the completion of the I/O, and will continue executing normally.

System Programmer Response: Refer to Section 3 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 2, 5.

00C200CF

Explanation: DB2 could not acquire enough virtual storage for allocating private buffers for an internal castout process. The castout operation is queued until an existing castout process becomes available.

System Action: The requesting execution unit is abended. No dump is produced.

Problem Determination: This abend reason code is issued by the following CSECT: DSNB5PCO

00C200D0

Explanation: The buffer manager (BM) subcomponent of DB2 is unable to perform I/O processing for the requesting function. A prior abend has occurred in the buffer manager (BM) I/O termination exit routine. Retry of the prior abend is not allowed by MVS.

This abend reason code is issued by the following CSECT: DSNB5UTX

System Action: DB2 is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart DB2.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The functional recovery routine (FRR) parameter list was recorded in the SDWA variable recording area (VRA) when the original abend occurred. Examine the VRA to determine whether the media manager request block (MMRB) is properly passed by the media manager.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00C200D1

Explanation: The buffer manager (BM) subcomponent of DB2 is unable to perform I/O processing for the requesting function. A prior abend has occurred in the buffer manager I/O termination exit routine. An attempt to retry and to continue main line processing (after completion of processing of this prior abend) resulted in recursion to the I/O termination exit routine's functional recovery routine (FRR).

This abend reason code is issued by the following CSECT: DSNB5UTX

System Action: DB2 is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart DB2.

Problem Determination: The FRR parameter list was recorded in the SDWA variable recording area (VRA) when the original abend occurred. Examine the VRA to

determine whether the media manager request block (MMRB) is properly passed by the media manager.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00C200D2

Explanation: The buffer manager (BM) subcomponent of DB2 is unable to perform I/O processing for the requesting function. A prior abend has occurred in the buffer manager I/O error exit routine during processing of a database I/O error.

This abend reason code is issued by the following CSECT: DSNB5UEX

System Action: DB2 is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart DB2.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The functional recovery routine (FRR) parameter list was recorded in the SDWA variable recording area (VRA) when the original abend occurred. Examine the VRA to determine whether the media manager request block (MMRB) is properly passed by the media manager. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00C200D3

Explanation: A prior abend occurred in a 'must complete' processing window of a buffer manager (BM) function.

This abend reason code is issued by the following CSECT: DSNB1RRR

System Action: DB2 is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart DB2.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: See the Problem Determination section of the original abend code.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00C200D4

Explanation: A prior abend occurred in an I/O processing window of a buffer manager (BM) function. I/O functional recovery cannot be reliably performed because the tracking data required to do so is incomplete. The required data is probably missing because the functional recovery routine (FRR) that is protecting the abending I/O processing function was bypassed by MVS.

This abend reason code is issued by the following CSECT: DSNB1RRR

System Action: DB2 is abended.

Operator Response: Notify the system programmer, and print the SYS1.LOGREC and the SVC dump. Restart DB2.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: See the Problem Determination section of the original abend code.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00C200D5

Explanation: An abend occurred in the I/O termination exit routine while resuming the suspended execution unit. The status of resume was 'indoubt' at the time of the abend.

This abend reason code is issued by the following CSECT: DSNB5UTX

System Action: DB2 is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart DB2. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The functional recovery routine (FRR) parameter list was recorded in the SDWA variable recording area (VRA) when the original abend occurred. Examine the VRA to determine whether the media manager request block (MMRB) is properly passed by the media manager. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00C200D6 • 00C200E1

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00C200D6

Explanation: An abend occurred in the I/O termination exit routine while resuming the suspended execution unit. The status of resume was 'indoubt' at the time of the abend.

This abend reason code is issued by the following CSECT: DSNB5UTX

System Action: DB2 is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart DB2.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The functional recovery routine (FRR) parameter list is recorded in the SDWA variable recording area (VRA) when the original abend occurred. Examine the VRA to determine whether the media manager request block (MMRB) is properly passed by the media manager. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00C200D7

Explanation: A prior abend occurred while resuming a suspended execution unit. The status of resume was 'indoubt' at the time of the abend.

This abend reason code is issued by the following CSECT: DSNB1RRR

System Action: DB2 is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart DB2.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: See the Problem Determination section of the original abend code.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00C200D8

Explanation: This is a DB2 internal error. The buffer manager (BM) subcomponent of DB2 discovered that some buffer manager resources are inconsistent.

This abend reason code is issued by the following CSECTs: DSNB5COM DSNB1CMS

System Action: DB2 is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart DB2.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00C200E0

Explanation: A table space or index space cannot be accessed because DB2 is unable to create the referenced buffer pool. The referenced buffer pool size was zero, which indicates to DB2 that this buffer pool should not be activated. DB2 message DSNB602I was issued to inform the operator of the error. This reason code and the table space or index space name are recorded in the cursor table (CT) and made available to the user in the SQLCA.

This abend reason code is issued by the following CSECTs: DSNB1OPP DSNB1OPS

System Action: An SQLCODE -904 (resource not available) is returned to the user. The SVC dump and the SYS1.LOGREC recording are not requested.

System Programmer Response: Analyze the virtual storage content of the *ssnmDBM1* address space to determine further action. If appropriate, use the ALTER TABLESPACE or ALTER INDEX statement to modify the affected table space or index to indicate a usable buffer pool. To determine a usable buffer pool, use the DISPLAY BUFFERPOOL command. If necessary, use the ALTER BUFFERPOOL command to activate the failing buffer pool by setting its VPSIZE to a nonzero value.

00C200E1

Explanation: The buffer manager (BM) subcomponent of DB2 is unable to open a data set that is required to be accessed by the requesting function. An error was returned by the media manager CONNECT function, which was invoked to open a VSAM data set. DB2 message DSNB204I was issued to inform the operator of the error condition. This reason code and the data set name are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages.

This abend reason code is issued by the following CSECT: DSNB1OST

System Action: A 'resource not available' code is returned to the user. Abend status is recorded in SYS1.LOGREC.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to system message IEC161I and DB2 message DSNB204I for assistance in determining the cause of the error. Correct the situation, and notify the user to invoke the application again.

Problem Determination: The unexpected media manager return code is saved in register 8. It may help determine the cause of the failure.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5, 10, 12.

00C200E2

Explanation: The buffer manager (BM) subcomponent of DB2 is unable to open a data set that is required by the requesting function. An error was returned by the dynamic allocation function that was invoked to allocate a VSAM data set. DB2 message DSNB207I was issued to inform the operator of the error condition. This reason code and the data set name are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages.

This abend reason code is issued by the following CSECT: DSNB1OST

System Action: A 'resource not available' code is returned to the user. Abend status is recorded in SYS1.LOGREC.

User Response: Notify the system programmer. Invoke the application again after the system programmer has corrected the error.

System Programmer Response: The error code returned from the dynamic allocation function was externalized in the DSNB207I message. Refer to the appropriate MVS publication for an explanation of this error code. Correct the situation, and notify the user to invoke the application again.

Problem Determination: The unexpected dynamic allocation return code is saved in register 8. It may help determine the cause of the failure.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5, 10, 12.

00C200E5

Explanation: The buffer manager (BM) subcomponent of DB2 is unable to perform the I/O operation on a data set that is required by the requesting function. A logical I/O error was detected by the buffer manager I/O functions. The logical I/O error indicates that a requested page (read operation) resides within the error page range of the data set. This reason code and the data set name are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages.

This abend reason code is issued by the following CSECT: DSNB1GET

System Action: A 'resource not available' code is returned to the user.

User Response: Notify the system programmer. Invoke the application after the system programmer has corrected the error.

Operator Response: Use the -DISPLAY DB command to obtain the error page range. Notify the system programmer.

System Programmer Response: The error page range can be located from the console sheet or through the -DISPLAY DB command. Correct the error pages with the recovery utility, and notify the user to invoke the application again. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 10, 12.

00C200E6

Explanation: The buffer manager (BM) subcomponent of DB2 is unable to perform the I/O operation on a data set that is required by the requesting function. A permanent I/O error was detected by the media manager during preformat processing. This reason code and the data set name are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages.

This abend reason code is issued by the following CSECT: DSNB5FOR

System Action: A 'resource not available' code is returned to the user.

User Response: Notify the system programmer. Invoke the application after the system programmer has corrected the error.

System Programmer Response: Recover the entire data set with the recovery utility, and notify the user to invoke the application again. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00C200E8 • 00C200EB

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 10, 12.

Check the MVS console log for an IOS error message indicating the type of I/O error that occurred. If an IOS message was issued, follow the problem determination directions for that message.

00C200E8

Explanation: The buffer pool (indicated in the SQLCA) cannot be created because of insufficient virtual storage. Message DSNB603I or DSNB605I was issued to inform the operator of the error. This reason code and the buffer pool ID are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages.

System Action: An SQLCODE -904 (resource not available) is returned to the user. The SVC dump and the SYS1.LOGREC recording are not requested.

Operator Response: Notify the system programmer.

System Programmer Response: Analyze the virtual storage content of the *ssnm*DBM1 address space to determine further action. If appropriate, use the ALTER TABLESPACE or ALTER INDEX statement to indicate use of a different buffer pool. Otherwise, use ALTER BUFFERPOOL commands to balance virtual storage usage for all buffer pools.

00C200E9

Explanation: A buffer could not be assigned in the buffer pool (indicated in the SQLCA) because all buffers in the buffer pool are in a nondisplaceable state. (Buffers are in a nondisplaceable state when they contain actively referenced pages or updated pages for which writes are pending.)

Message DSNB601I was issued to inform the operator of the error. This reason code and the buffer pool ID are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages.

This abend reason code is issued by the following CSECTs: DSNB1GWB DSNIBMOC DSNIWKFD

System Action: An SQLCODE -904 (resource not available) is returned to the user. The SVC dump and the SYS1.LOGREC recording are not requested.

Operator Response: Notify the system programmer.

System Programmer Response: Reduce concurrent activity by reducing the number of DB2 threads, or, if necessary, increase the size of the failing buffer pool by using the ALTER BUFFERPOOL command.

00C200EA

Explanation: DB2 is unable to perform the drain function on an object (a table space, an index space, or a partition) because the object was held by other claimers and the drain request timed out waiting for the claim count to reach zero.

System Action: If the problem was encountered by DB2 when trying to automatically recover a group buffer pool recovery pending (GRECP) object following the failure of a group buffer pool (GBP), then DB2 issues message DSNB350I or DSNB351I to the console with this reason code indicating that the object cannot be automatically recovered.

Otherwise, a 'resource not available' return and reason code are sent back to the requesting function. DB2 message DSNT500I may be sent to the console. The reason code and the object name are recorded in the cursor table (CT) and made available to the user in the SQLCA or in the message.

System Programmer Response: Take one of these actions:

- Reevaluate the utility timeout factor on installation panel DSNTIPI and increase it, if necessary.
- Find the threads holding the object through the -DISPLAY DB CLAIMERS command on the object. Either terminate those threads or wait until no one holds the object. Then invoke the application again.

If DSNB350I or DSNB351I messages were issued, then after you take one of the actions above, recover the GRECP objects as indicated in the "System Programmer Response" for DSNB350I or DSNB351I.

00C200EB

Explanation: A data sharing group member is not able to perform a global drain request on an object (a table space, an index space, or a partition). One or more peer members in the group hold retained locks on the object. Message DSNT501I is sent to the console to report the condition.

System Action: A 'resource not available' return code, reason code, and object name are sent back to the requesting function.

System Programmer Response: Use the DISPLAY DATABASE command with the LOCKS option to display the member names owning the retained locks. You must restart those subsystems to remove the 'resource unavailable' condition.

Problem Determination: This reason code is issued by the following CSECT: DSNB1DRA

00C200EC

Explanation: A member of a DB2 data sharing group was unable to perform a global drain request on an object (a table space, an index space, or a partition). One or more peer DB2s in the group failed to drain the object because some error occurred. Both the DB2 running the request and the peer DB2 send DB2 message DSNT500I to the console to report the problem.

System Action: A 'resource not available' return code, reason code and object name are sent back to the requesting function.

Operator Response: Notify the system programmer.

System Programmer Response: Retrieve the DSNT501I messages from the console and analyze the corresponding reason and error codes.

Problem Determination: This reason code is issued by the following CSECT: DSNB1DRA

00C200ED

Explanation: DB2, in a data sharing environment, detected that the requested use of a type 1 index with a SUBPAGES value greater than 1 would have caused the index to become group buffer pool dependent. DB2 does not allow type 1 indexes with a SUBPAGES value greater than 1 to become group buffer pool dependent.

System Action: The use of the index is not allowed.

User Response: If the index is to be used in group buffer pool dependent mode, then either the index should be converted to a type 2 index or it should be converted to a type 1 index with SUBPAGES 1.

00C200EF

Explanation: DB2 is unable to open a necessary data set. The data set attributes stored in the DB2 catalog are not supported by the version of DFSMS that is currently running.

This reason code and the data set name are recorded in the SQLCA or in messages.

System Action: A 'resource not available' code is returned to the user.

System Programmer Response: This data set cannot be opened unless this DB2 is running with DFSMS Version 1 Release 5 or a subsequent release. The data set must also be associated with an extended addressability data class.

00C200F0

Explanation: DB2 encountered an error on an IXLCACHE request while trying to write a page to the group buffer pool during physical lock (P-lock) negotiation.

System Action: The requesting execution unit abends. The error is recorded to SYS1.LOGREC, but the dump is suppressed and the abend is retried in the functional recovery. Another group member, requesting the P-lock that caused the negotiation on this member, receives a resource not available code of 00C20252, and its P-lock request is denied.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECT: DSNB5SCM

00C200F1

Explanation: The buffer manager (BM) subcomponent of DB2 is unable to unallocate a DB2 data set. An error was returned by the dynamic unallocation function that was invoked to unallocate a data set. This reason code and the data set name are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages.

This abend reason code is issued by the following CSECT: DSNB1CST

System Action: A 'resource not available' code is returned to the user. The SVC dump and the SYS1.LOGREC recording are requested.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The unexpected dynamic unallocation reason code is saved in register 8. It may help determine the cause of the failure. Refer to the appropriate MVS publication for an explanation of the error code.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 10, 12.

00C200F2

Explanation: The buffer manager (BM) subcomponent of DB2 is unable to close a DB2 data set. An error was returned by the media manager DISCONNECT function that was invoked to close a data set. This reason code and the data set name are recorded in the cursor table (CT) and in the SQLCA or in messages.

This abend reason code is issued by the following CSECT: DSNB1CST

System Action: A 'resource not available' code is returned to the user. The SVC dump and the SYS1.LOGREC recording are requested.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The unexpected media manager disconnect reason code is saved in register 8 and may help determine the cause of the failure. Locate the corresponding IEC1611 message in the operator console sheet, and refer to the appropriate MVS publication for assistance in determining the cause of the error.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 10, 12.

00C200F3

Explanation: DB2 is unable to obtain one of the following locks:

- SYSLGRNG or SYSLGRNX recording lock on a table space
- Group buffer pool dependent conversion lock on a page set or partition
- Group buffer pool start or stop lock
- ALTER BUFFERPOOL lock

The IRLM LOCK request detected a timeout error.

System Action: A 'resource not available' code is returned to the user. This reason code and the data set name are recorded in the cursor table (CT) and are available to the user in the SQLCA or in messages.

User Response: Resubmit the failing application.

Problem Determination: This abend reason code is issued by the following CSECTs: DSNB1SCR, DSNB1DLK.

00C200F4

Explanation: DB2 is unable to obtain one of the following locks:

- SYSLGRNG or SYSLGRNX recording lock on a table space
- Group buffer pool dependent conversion lock on a page set or partition
- Group buffer pool start or stop lock
- ALTER BUFFERPOOL lock

The IRLM LOCK request detected an out-of-storage condition.

System Action: A 'resource not available' code is returned to the user. This reason code is recorded in the cursor table (CT) and is available to the user in the SQLCA or in messages.

User Response: Resubmit the failing application.

Problem Determination: This abend reason code is issued by the following CSECTs: DSNB1SCR, DSNB1DLK

00C200F6

Explanation: The buffer manager (BM) subcomponent of DB2 is unable to open a data set that is required to be accessed by the requesting function. The data set has been migrated by DFHSM and the data set must be recalled before being accessed. Since the RECALL(yes) option was selected by the installation, a recall for the migrated data set has been initiated. A recall was not complete after the amount of time specified in the RECALL option had elapsed.

This reason code and the data set name are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages. The data set name and the reason code indicated are the last migrated data set requested. Other migrated data sets within the table space may exist. For each one that exists, a DSNT500I message containing the data set name and reason code has been sent to the console.

This abend reason code is issued by the following CSECT: DSNB1RST

System Action: A 'resource not available' code is returned to the user. A DSNT500I message is sent to the console.

User Response: After the data set has been restored, rerun the application program, transaction, or query. If necessary, contact the operator to find out the status of the migrated data set.

00C200F7

Explanation: The page found in the buffer is not the page requested by the buffer manager. The buffer manager detected the error by comparing the page number of the page returned with the requested page number. This error may be caused by one of the following:

- Either the VTOC or VVDS is damaged, causing multiple data sets to occupy the same extents on DASD.
- The page was altered incorrectly by a non-DB2 facility or a DB2 service aid.
- An internal DB2 error damaged the page. The recovery log will be required for problem determination.

This abend reason code is issued by the following CSECT: DSNB1GET

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: If you suspect an

error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The following general purpose registers (GPRs) contain the indicated diagnostic information:

GPR	Content
7	Address of the page buffer
8	Address of the page set block (PB)

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 10, 12, 28, 29, 30.

00C200F8

Explanation: The buffer manager (BM) subcomponent of DB2 is unable to perform the I/O operation on a data set. A physical I/O error was detected by the buffer manager I/O functions.

This reason code and the data set name are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages.

This abend reason code is issued by the following CSECTs: DSNB1GET DSNB5COM

System Action: A 'resource not available' code is returned to the user. A DSNB224I message is issued, unless it has already been issued 10 times for the data set.

If the I/O is a write operation, or if the I/O is a read operation performed during restart or rollback, then the error page range of the data set is updated. A DSNU086E message is issued indicating the data set name and its corresponding I/O error page range, unless it has already been issued 10 times for the data set.

User Response: Notify the system programmer. Invoke the application after the system programmer has corrected the error.

Operator Response: Use the -DISPLAY DB command to obtain the error page range. Notify the system programmer.

System Programmer Response: The error page range can be located from the console sheet or with the -DISPLAY DB command. Correct the error pages with the recovery utility, and notify the user to invoke the application again. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 10, 12.

Check the MVS console log for an IOS error message indicating the type of I/O error that occurred. If an IOS

message was issued, follow the problem determination directions for that message.

00C200F9

Explanation: DB2 is unable to open a data set that the requesting function must access. The data set was migrated by HSM and must be recalled before being accessed. DB2's attempt to initiate a recall of the migrated data set was unsuccessful.

This reason code and the data set name are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages. The data set name and the reason code indicated are the last requested migrated data set. Other migrated data sets might exist. For each existing data set, message DSNT500I containing the data set name and reason code was sent to the console.

System Action: A 'resource not available' code is returned to the user. A DSNT500I message is sent to the console.

User Response: Issue the HSM command (HRECALL) to restore the migrated data set. Rerun your application program, transaction, or query after the data set is restored.

Problem Determination: This abend reason code is issued by the following CSECT: DSNB1OST

00C200FA

Explanation: The buffer manager (BM) subcomponent of DB2 is unable to obtain an open lock to perform a physical open or close of a page set. A timeout error was detected by the IRLM LOCK request. The reason code and the database and page set names are recorded in the cursor table (CT). They are made available to the user in the SQLCA or in messages.

This abend reason code is issued by the following CSECT: DSNB1LCK

System Action: A 'resource not available' code is returned to the user.

User Response: Resubmit the failing application.

00C200FB

Explanation: The buffer manager (BM) subcomponent of DB2 is unable to obtain an open lock to perform a physical open or close of a page set. An out-of-storage condition was detected by the IRLM LOCK request. The reason code and the database and page set names are recorded in the cursor table (CT). They are available to the user in the SQLCA or in messages.

This abend reason code is issued by the following CSECT: DSNB1LCK

System Action: A 'resource not available' code is returned to the user.

User Response: Resubmit the failing application.

00C200FC

Explanation: The buffer manager (BM) subcomponent of DB2 is unable to obtain an open lock to perform a physical open or close of a page set. A system error was detected by the IRLM LOCK request. The reason code and the database and page set names are recorded in the cursor table (CT). They are made available to the user in the SQLCA or in messages.

This abend reason code is issued by the following CSECT: DSNB1LCK

System Action: A 'resource not available' code is returned to the user.

User Response: Resubmit the failing application.

00C200FD

Explanation: The buffer manager is unable to perform the I/O operation on a data set due to an error on page's parity flag detected by the buffer manager's I/O function.

This abend reason code is issued by the following CSECT: DSNB1GET

System Action: A 'resource not available' return code is returned to the user. The related reason code 00C200FD, the page number, the page set name, and the data base name in question are recorded in the cursor table (CT) and made available to the user in the SQLCA.

Operator Response: Notify the system programmer.

System Programmer Response: The error page can be found via SQLCA. Correct the error pages with the recovery utility, and notify the user to invoke the application again.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for failure for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 10, 12.

00C200FE

Explanation: DB2 is unable to open a data set that the requesting function must access. The data set was migrated by DFHSM and must be recalled before being accessed. Since the RECALL(no) option was selected by the installation, recall for the migrated data set was not initiated.

This reason code and the data set name are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages. The data set name and the reason code indicated are the last migrated data set

requested. Other migrated data sets within the table space might exist. For each existing data set, message DSNT500I containing the data set name and reason code has been sent to the console.

System Action: A 'resource not available' code is returned to the user. A DSNT500I message is sent to the console.

User Response: Notify the system programmer. After the data set is restored, rerun the application program, transaction, or query.

System Programmer Response: Issue the DFHSM command (HRECALL) to restore the migrated data set.

Problem Determination: This abend reason code is issued by the following CSECT: DSNB1OST

00C200FF

Explanation: An attempted open of a page set failed because DB2 has reached the MVS limit on concurrent open data sets.

This reason code is issued by the following CSECT: DSNB1OST

System Action: A 'resource not available' (SQLCODE -904) is returned to the user and the requested open is not performed. This reason code and the data set name are recorded in the cursor table (CT) and made available to the user in the SQLCA. A DSNB207I message is displayed on the operator console. The SVC dump and the SYS1.LOGREC recording are not requested.

Operator Response: Notify the system programmer.

System Programmer Response: Reduce the number of page sets that must be kept open by DB2 by limiting the amount of concurrent activity.

Problem Determination: Collect the following diagnostic item from Appendix B, "Problem determination," on page 1353: 1.

00C20101

Explanation: The sharing attribute is inconsistent between the header page of a data set and the DBD. This reason code and the data set name are made available to the user in the SQLCA or in messages.

This reason code is issued by the following CSECT: DSNB1OPP

System Action: A "resource not available" code is returned to the user.

User Response: Notify the system programmer.

System Programmer Response: First determine whether the database is shared, and whether it is owned by this system. This can be achieved by issuing a SELECT on the SYSIBM.SYSDATABASE catalog table, where the database name is the database you

are checking, and by examining the ROSHARE column.

If the DB2 catalog indicates that it is a ROSHARE OWNER database, the problem can be corrected by the REPAIR utility or the -STOP DATABASE command. The -STOP DATABASE command will reformat the header page and make it consistent with the DBD.

If the database is ROSHARE READ on this system, then check the definition of the database on the owning system. If, on the owning system, the database is no longer defined as ROSHARE OWNER, then the table space or index should be dropped on the system on which the error was detected, since the database has been altered to nonshared by the owning system. However, if the database is defined as ROSHARE OWNER on the owning system, then issue a -STOP DATABASE with the SPACENAM parameter from the owning system, which will make the header page consistent with the owner's DBD, and force this change to DASD, making it available to other systems.

If it is a nonshared database, then the sharing attribute can only be corrected via the REPAIR utility.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1.

00C20102

Explanation: A read-only system attempted to access an inconsistent data set. This reason code and the data set name are made available to the user in the SQLCA or in messages.

This reason code is issued by the following CSECT: DSNB1OPP

System Action: A "resource not available" code is returned to the user.

User Response: Notify the system programmer.

System Programmer Response: On the system in which the database is defined as ROSHARE OWNER, perform the following tasks:

- Use the -DISPLAY DATABASE command to insure there is no exceptional state for this table space or index.
- Issue the -STOP DATABASE command with the SPACENAM parameter to stop this table space or index.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1.

00C20103

Explanation: DB2 is unable to access a data set because its system page is inaccessible. This reason code and the data set name are available to the user in the SQLCA or in messages.

This reason code is issued by the following CSECT: DSNB1OPP

System Action: A "resource not available" code is returned to the user.

User Response: Notify the system programmer.

System Programmer Response: Determine why the system page is inaccessible by examining any error messages that appeared on the console at the time of the error, or by issuing a -DISPLAY DATABASE command. Take the appropriate action to correct the situation.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1.

00C20104

Explanation: DB2 is unable to access a shared data set because it was down leveled by a DSN1COPY job, or a REPAIR utility with REPLACE RESET specified. This reason code and the data set name are made available to the user in the SQLCA or in messages.

This reason code is issued by the following CSECT: DSNB1OPP

System Action: A "resource not available" code is returned to the user.

User Response: Notify the system programmer.

System Programmer Response: On the system in which the database is defined as ROSHARE OWNER, perform the following tasks:

- Use the -DISPLAY DATABASE command to insure there is no exceptional state for this table space or index.
- Issue the -STOP DATABASE command with the SPACENAM parameter to stop this table space or index.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1.

00C20105

Explanation: The page set creation timestamp is inconsistent between the header page and the DBD. This reason code and the data set name are made available to the user in the SQLCA or in messages.

This reason code is issued by the following CSECT: DSNB1OPP

System Action: A "resource not available" is returned to the user.

User Response: Notify the system programmer.

System Programmer Response: First determine whether the database is shared, and whether it is

owned by this system. This can be achieved by issuing a SELECT on the SYSIBM.SYSDATABASE catalog table, where the database name is the database you are checking, and examining the ROSHARE column.

For a data set in a ROSHARE OWNER database, if the failure occurs on a CREATE TABLESPACE or CREATE INDEX, the timestamp mismatch indicates that the table space or index was previously dropped, but DB2 was unable to delete the data set. In this case, the data set must be deleted using AMS DELETE CLUSTER before the CREATE can take place.

For a data set in a ROSHARE OWNER database at any time other than CREATE TABLESPACE or CREATE INDEX, the inconsistent timestamp can be corrected by first stopping the table space or index via the -STOP DATABASE command with the SPACENAM parameter, and then issuing the -START DATABASE command to start it. The -STOP DATABASE command will reformat the header page using the information retrieved from the DBD.

For a data set in a ROSHARE READ database, a timestamp mismatch indicates that the table space or index has been dropped and re-created on the owning system, and must also be dropped and re-created on this system.

For a data set in a nonshared database, the timestamp value in the header page can only be corrected via the REPAIR utility.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1.

00C20106

Explanation: An update was attempted on a database defined as ROSHARE READ. This reason code and the data set name are made available to the user in the SQLCA or in messages.

This reason code is issued by the following CSECTs: DSNB1SWS DSNB5FOR.

System Action: A "resource not available" code is returned to the user.

User Response: An update operation is not allowed in this database. Check to insure that the target of the update was correct, and also that the database is defined as ROSHARE READ. If the update should occur, then it should be issued on the system in which the database was defined as ROSHARE OWNER.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1,

00C20107

Explanation: An update was attempted in a ROSHARE OWNER database, but the data set was opened in RO mode. This reason code and the data set name are made available to the user in the SQLCA or in messages.

This reason code is issued by the following CSECTs: DSNB1SWS DSNB5FOR.

System Action: A "resource not available" code is returned to the user.

User Response: Notify the system programmer.

System Programmer Response: Issue the -STOP DATABASE command with the SPACENAM parameter to explicitly stop this table space/index space and then issue the -START DATABASE ACCESS(RW) command.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1.

00C20108

Explanation: An object in a ROSHARE OWNER database cannot be accessed. At least one system with the database defined as ROSHARE READ is still accessing it. This reason code and the data set name are made available to the user in the SQLCA or in messages.

This reason code is issued by the following CSECT: DSNB1OST

System Action: A "resource not available" code is returned to the user.

User Response: Notify the system programmer.

System Programmer Response: Insure that there are no systems on which the database is defined as ROSHARE READ that are still accessing the database. Issue the -STOP DATABASE command with the SPACENAM parameter on the ROSHARE READ systems that are accessing the database.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1.

00C20109

Explanation: An object in a ROSHARE READ database cannot be accessed. The system with the database defined as ROSHARE OWNER still has RW access. This reason code and the data set name are made available to the user in the SQLCA or in messages.

This reason code is issued by the following CSECT: DSNB1OST

System Action: A “resource not available” code is returned to the user.

User Response: Notify the system programmer.

System Programmer Response: On the system in which the database is defined as ROSHARE OWNER, perform the following tasks:

- Use the -DISPLAY DATABASE command to insure there are no exceptional states for this table space or index.
- Issue the -STOP DATABASE command with the SPACENAM parameter to stop this table space or index.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 1.

00C2010A

Explanation: DB2 is attempting to open a shared data set in a ROSHARE READ database, but the system cannot locate the data set. The table space or index might already be dropped from the owning system.

System Action: A 'resource not available' code is returned to the user. This reason code and the data set name are made available to the user in the SQLCA or in messages.

User Response: Notify the system programmer.

System Programmer Response: Run IDCAMS LISTCAT to verify the existence of this data set. Verify whether the associated table space or index exists in the database defined as ROSHARE OWNER. If not, issue DROP TABLESPACE or INDEX on all systems in which the database is defined as ROSHARE READ.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 1.

This reason code is issued by the following CSECT: DSNB1OST

00C2010B

Explanation: DB2 is attempting to open a shared data set in a database defined for ROSHARE, but the data set cannot be accessed because it is not defined with SHAREOPTIONS(1,3).

System Action: A 'resource not available' code is returned to the user. This reason code and the data set name are made available to the user in the SQLCA or in messages.

User Response: Notify the system programmer.

System Programmer Response: Ensure that this data set belongs to a shared database, and check the SHAREOPTIONS using IDCAMS LISTCAT. If so, use AMS ALTER SHAREOPTIONS to alter the data set to

SHAREOPTIONS(1,3), and resubmit the failing application.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 1.

This reason code is issued by the following CSECT: DSNB1OST

00C2010C

Explanation: DB2 was unable to update the high-used RBA in the VSAM volume data set (VVDS) when it was ready to close a data set. VVDS must be updated to reflect data loaded by a RECOVER, LOAD, or REORG utility job. Message DSNB200I is issued to the console with the VSAM media manager return codes.

This reason code and the data set name are recorded in the cursor table (CT) and made available in the SQLCA or in messages.

This reason code is issued by the following CSECT: DSNB1CST

System Action: A 'resource not available' code is returned to the user. A DSNB200I message is issued to the console. DB2 continues to close the data set.

User Response: Contact the system programmer. Restart or rerun the RECOVER, LOAD, or REORG job after the system programmer corrects the error.

System Programmer Response: Refer to system messages IEC161I and DB2 message DSNB200A for assistance in determining the cause of the error. Correct the condition, and notify the user to reinvoke the application.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 1, 10, 11.

00C2010D

Explanation: DB2 was unable to open a required data set because an unexpected level ID was encountered.

The reason code and the data set name are made available in the SQLCA or in messages.

System Action: A 'resource unavailable' code is returned to the user. Message DSNB232I is issued to the console if it was not already issued for the data set. DB2 failed to open the data set.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to message DSNB232I for help in determining the cause of the error. Run the utility REPAIR LEVELID or recover the table space or index, and then tell the user to rerun the application.

Problem Determination: This reason code is issued by the following CSECT: DSNB1OPD

00C2010E

Explanation: This is a DB2 internal error. DB2 encountered a problem while trying to add a page to the logical page list (LPL).

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer, print SYS1.LOGREC, and request an SVC dump.

Problem Determination: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This reason code is issued by the following CSECT: DSNB1LPL

00C2010F

Explanation: This dump provides assistance for diagnosing the page latch time-out problem after 00C20031 is returned as the reason code for 'resource not available'.

System Action: The requesting execution unit is abended to take a diagnostic dump then recovered to return an SQLCODE -904 (resource not available) to the user with the 00C20031 reason code. The resource name is also provided.

User Response: Contact the system programmer to determine why the resource is unavailable. Print the SYS1.LOGREC and the SVC dump.

This reason code is issued by the following CSECTs: DSNB1LTX, DSNB1LTS.

00C20110

Explanation: DB2 cannot access a table space, index, or partition because the highest formatted page (as recorded by DB2 in the header page) is higher than that derived from the VSAM high-used RBA.

The reason code and the data set name for this error are available in the SQLCA or in messages.

System Action: DB2 returns a 'resource unavailable' code to the user.

System Programmer Response: To enable access to the object, take one of the following actions:

- Restore the object to a consistent state with the RECOVER or REBUILD utility, DSN1COPY, or some other means.
- Replace the data using the LOAD REPLACE utility.
- Allow access to the data in its current state. Use the REPAIR LEVELID utility to reset the high-used page number in the header page to be consistent with the VSAM high-used RBA. This may result in inconsistent data.

Problem Determination: Determine the

high-formatted page number in the header page by running DSN1PRNT with the FORMAT option, and checking the value of HPGHPREF.

You can also determine the VSAM high-used RBA by running an IDCAMS LISTCAT on the dataset.

00C20111

Explanation: An attempt was made to access a DB2 striped data set with a page size of 8K, 16K or 32K that is defined with the 4K Control Interval (CI) size. DB2 does not allow this because partial writes cannot always be detected.

System Action: A 'resource not available' code is returned to the user. This reason code and the data set name are made available to the user in the SQLCA.

User Response: Convert the data set attribute 'control interval size' of the associated tablespace from 4K CI into the one matching the page size. DB2 Utilities REORG tablespace, LOAD with REPLACE, and RECOVER can be used to convert the table space.

System Programmer Response: Ensure that the data set is defined with the CI size that matches its page size.

Problem Determination: Obtain an access method services LISTCAT for the named data set's attributes.

00C20200

Explanation: DB2 was unable to open a required index data set because the index was formatted incorrectly. For example, it may have been formatted as a Type 1 index when the DB2 catalog indicates that it should be Type 2.

The reason code and index data set name are made available in the SQL communication area or in related messages.

System Action: A 'resource unavailable' code is returned to the user.

Operator Response: Notify the system programmer.

System Programmer Response: Use the RECOVER utility to restore the index to a consistent state.

Problem Determination: This reason code is issued by the following CSECT: DSNB1OPP.

00C20203

Explanation: DB2 cannot connect to a group buffer pool. The group buffer pool is not usable by this release of DB2. This DB2 subsystem is a member of a data sharing group containing DB2 members of different release levels. A later release level of DB2 specified an option for this group buffer pool that is not supported by the previous DB2 releases. The presence of this option

makes the group buffer pool inaccessible to the previous DB2 releases.

System Action: DB2 takes the following actions:

- Unless already issued, message DSNB301E is sent to the console with this reason code to indicate that a connect failure occurred.
- SQLCODE -904 (resource not available) is returned to the user with this reason code. The resource type and resource name are also returned.

User Response: Contact the system programmer.

System Programmer Response: Do one of the following:

- Issue the -ALTER GROUPBUFFERPOOL command from a DB2 that is at the later release level to remove the new option so that previous release levels of DB2 can access the group buffer pool.
- Migrate the previous release levels to the current release.

Problem Determination: This reason code is issued by the following CSECT: DSNB1GC0

00C20204

Explanation: DB2 is unable to connect to a group buffer pool because MVS detected a problem on the IXLCONN request.

System Action: SQLCODE -904 (resource not available) and the group buffer pool name are returned to the user. Unless already issued for the IXLCONN code, message DSNB301E, which contains this reason code and the IXLCONN code, is issued to the console.

User Response: Contact the system programmer.

Problem Determination: The reason code returned by the IXLCONN request is given in message DSNB301E.

If the connection problem was caused by insufficient storage in a coupling facility, tell the MVS system administrator to alleviate the storage constraint problem by making additional storage available to the involved coupling facility, or by changing the active MVS CFRM administrative policy to redefine the coupling facility structure to a different coupling facility. Another alternative is to have the database administrator reassign those inter-DB2 sharing page sets to a different DB2 buffer pool.

Refer to *MVS/ESA Programming: Sysplex Services Reference* for the MVS IXLCONN reason code.

This abend reason code is issued by the following CSECT: DSNB1GC1

00C20205

Explanation: DB2 is unable to access a group buffer pool because of a damage assessment pending (DAP) status against the group buffer pool.

System Action: The action DB2 takes depends on the situation, as follows:

- If DB2 tries to read a page from the group buffer pool and finds that the group buffer pool is in DAP status, the following actions are taken:
 - SQLCODE -904 (resource not available) is returned to the user with this reason code. The name of the group buffer pool is also returned.
- If DB2 tries to read a page from the group buffer pool for rollback, backout, or restart and finds that the group buffer pool is in DAP status, the following actions are taken:
 - The page is added to the logical page list (LPL) for the page set.
 - Message DSNB250E is issued to the console with this reason code.
- If DB2 tries to write a page to the group buffer pool and finds that the group buffer pool is in DAP status, the following actions are taken:
 - The page is added to the logical page list (LPL) for the page set.
 - Message DSNB250E is issued to the console with this reason code.
- If DB2 detects DAP status when it tries to connect the group buffer pool, or if DB2 detects a group buffer pool version ID mismatch after a successful connection, the following actions are taken:
 - The damage assessment process is triggered for this group buffer pool.
 - SQLCODE -904 (resource not available) is returned to the user with this reason code. The name of the group buffer pool is also returned.
 - Unless already issued, message DSNB301E, which contains this reason code, is issued to the console.

User Response: Contact the system programmer.

System Programmer Response: Message DSNB304I is issued when the group buffer pool is entered into DAP state and message DSNB305I is issued when the DAP status is cleared. During the damage assessment process, DB2 must determine which page sets or partitions might have had changed pages in the failed coupling facility structure and thus need to be recovered. Each page set/partition fitting this criteria is entered into 'group buffer pool REBUILD pending (GRECP)' status. A page set/partition in GRECP status remains unavailable for read or update until it is recovered.

Problem Determination: This reason code is issued by the following CSECT: DSNB1GC0

00C20206

Explanation: An attempt was made to access a page which is currently in the logical page list (LPL). LPL pages are unavailable until recovery on the affected page set completes.

System Action: SQLCODE -904 (resource not available) is returned to the user with this reason code. The resource name is also given.

User Response: Contact the system programmer.

System Programmer Response: For those page sets in the LPL, use the RECOVER utility or the -START DATABASE command.

Problem Determination: This reason code is issued by the following CSECTs: DSNB1LPL DSNB1GET DSNB1SWS

00C20207

Explanation: DB2 is unable to connect to a group buffer pool because of a DB2 system error during connect processing. This is an internal DB2 problem.

System Action: A SYS1.LOGREC entry is produced and an SVC dump is requested for the original abend which caused this condition. After doing resource and latch recovery, DB2 retries the abend if retry is allowed. SQLCODE -904 (resource not available) is returned to the user with this reason code and the group buffer pool name. Unless already issued, message DSNB301E, which contains this reason code, is issued to the console.

Problem Determination: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This reason code is issued by the following CSECT: DSNB1GC1

00C20208

Explanation: The user attempted to access a group-buffer-pool-dependent page set or partition. However, the DB2 member was unable to connect to the group buffer pool because there was not enough hardware system area (HSA) storage in which to allocate the local cache vector (LCV).

System Action: DB2 disconnects from the group buffer pool and issues message DSNB301E with this reason code, if it has not yet been issued. DSNB301E is usually preceded by a DSNB306I message.

SQLCODE -904 is returned to the user with this reason code.

User Response: Contact the system programmer.

System Programmer Response: Refer to message DSNB306I.

Problem Determination:

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1,

This reason code is issued by the following CSECT: DSNB1GC1

00C20210

Explanation: An attempt was made to access a page set or partition which is currently in group buffer pool recovery pending (GRECP) status.

System Action: SQLCODE -904 (resource not available) is returned with this reason code. The resource name is also given. GRECP page sets or partitions remain unavailable until recovery against the affected page set or partition is complete.

User Response: Contact the system programmer to determine when the resource will be available for use.

System Programmer Response: Use the START DATABASE command with the ACCESS RW option to recover the page set or partition and remove the GRECP status. In extreme or unusual circumstances, you can also remove GRECP status as follows:

- RECOVER, either to currency, or to a prior point in time
- REPAIR SET with NORCVRPEND
- LOAD REPLACE
- START DATABASE with ACCESS FORCE (Not recommended. Specifying this option can result in inconsistent data.)

Problem Determination: This reason code is issued by the following CSECT: DSNB1OPP

00C20211

Explanation: DB2 is unable to access a group buffer pool because the group buffer pool is rebuilding, and the attempt to access the group buffer pool timed out waiting for the rebuild to complete.

System Action: 'Resource not available' return and reason codes are sent back to the requesting function.

User Response: Resubmit the request.

System Programmer Response: Use the DB2 DISPLAY GROUPBUFFERPOOL command or the MVS D XCF,STR command to monitor the status of the rebuild. Also, monitor the status messages that the DB2 members issue as the rebuild progresses (refer to messages DSNB331I, DSNB332I, and DSNB338I). If the rebuild is not progressing satisfactorily, you can use the MVS command SETXCF,STOP,REBUILD to stop the rebuild.

00C20220

Explanation: While DB2 was accessing a group buffer pool, MVS detected an environmental error during an IXLCACHE request from DB2.

System Action: The requesting execution unit abends.

Problem Determination: The IXLCACHE reason code saved in register 8 can help determine the cause of the error. Refer to *MVS/ESA Programming: Sysplex Services Reference* for the MVS IXLCACHE reason code.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECTs:

DSNB5BPL DSNB5GGP DSNB5PCO DSNB5SCM
DSNB5SCO

00C20221

Explanation: While accessing a group buffer pool, DB2 received an unexpected error from MVS, which detected an invalid parameter on an IXLCACHE request from DB2. This code usually indicates a DB2 internal problem. However, the problem can result from errors in other products.

System Action: The requesting execution unit abends.

Problem Determination: The IXLCACHE reason code saved in register 8 can help determine the cause of the error. Refer to *MVS/ESA Programming: Sysplex Services Reference* for the MVS IXLCACHE reason code.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECTs:

DSNB5BPL DSNB5GGP DSNB5PCO DSNB5SCM
DSNB5SCO

00C20222

Explanation: While accessing a page in a buffer pool, DB2 received an unexpected error from MVS, which detected an invalid parameter on an IXLVECTR request from DB2. This code usually indicates a DB2 internal problem. However, the problem can result from errors in other products.

System Action: The requesting execution unit abends.

Problem Determination: See the IXLVECTR return code in register 8 to help determine the cause of the error. Refer to *MVS/ESA Programming: Sysplex Services Reference* for the MVS IXLVECTR reason code.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECTs:

DSNB1LTS DSNB1LTX DSNB1RSS

00C20223

Explanation: DB2 encountered an error while invoking the IXLCACHE macro.

System Action: The requesting execution unit abends. DB2 terminates abnormally causing MVS to reset the castout locks.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECT: DSNB5PCO

00C20224

Explanation: DB2 received an unexpected return and reason code from the MVS IXLFCOMP macro for a group buffer pool.

System Action: DB2 abends the agent and requests a dump. If the group buffer pool is in duplex mode, then DB2 may stop duplexing for the group buffer pool in response to this error.

System Programmer Response: If the group buffer pool was duplexed and is entered back into simplex mode as a result of this error, and duplexing is not automatically reestablished, then use the MVS SETXCF command to enter the group buffer pool back into duplex mode if duplexing is desired. If DUPLEX(ENABLED) is specified in the active CFRM policy for the group buffer pool, then the system attempts to automatically reestablish duplexing for the structure.

Problem Determination: See *MVS/ESA Programming: Sysplex Services Reference* for an explanation of the MVS IXLREBLD reason code.

Refer to Section 3 of *Diagnosis Guide and Reference* for more information on identifying and reporting the problem.

00C20230

Explanation: DB2 could not establish duplexing for a group buffer pool because a coupling facility with CFLEVEL = 5 functionality was not available in which to allocate the secondary group buffer pool.

System Action: The group buffer pool is entered back into simplex mode. Message DSNB7411 is issued indicating the reason code as the reason why the process to establish duplexing failed.

System Programmer Response: Upgrade the coupling facilities to CFLEVER = 5 or above. Or change the PREFLIST for the group buffer pool to name only coupling facilities that have CFLEVER = 5 functionality.

00C20231

Explanation: DB2 could not establish duplexing for a group buffer pool because the primary structure instance of that group buffer pool is allocated in a coupling facility that does not have CFLEVEL = 5 functionality.

System Action: The group buffer pool is entered back into simplex mode. Message DSNB7411 is issued indicating the reason code as the reason why the process to establish duplexing failed.

System Programmer Response: Upgrade the coupling facilities to CFLEVER = 5 or above. Or change the PREFLIST for the group buffer pool to name only coupling facilities that have CFLEVER = 5 functionality.

00C20232

Explanation: DB2 could not establish duplexing for a group buffer pool because the group buffer pool is defined with GBPCACHE(NO). DB2 does not allow GBPCACHE(NO) group buffer pools to be duplexed.

System Action: The group buffer pool is entered back into simplex mode. Message DSNB7411 is issued indicating the reason code as the reason why the process to establish duplexing failed.

System Programmer Response: If duplexing is desired for the group buffer pool, issue the DB2 ALTER GROUPBUFFERPOOL command to specify GBPCACHE(YES) before trying to initiate duplexing.

00C20233

Explanation: DB2 detected a version id mismatch for the secondary group buffer pool when connecting to a duplexing group buffer pool. The version id mismatch indicates that the process to establish duplexing completed prematurely (for example due to a system failure), and thus the secondary group buffer pool is not in synch with the primary.

System Action: DB2 stops duplexing for the group buffer pool. The group buffer pool is entered back into

simplex mode. Message DSNB743I is issued indicating the reason code as the reason why the process to establish duplexing was stopped. If DUPLEX(AUTO) is specified for the group buffer pool in the active CFRM policy, then duplexing is automatically reinitiated.

System Programmer Response: If duplexing is desired for the group buffer pool and duplexing is not automatically reinitiated, then use the MVS SETXCF command to initiate duplexing for the group buffer pool.

00C20251

Explanation: DB2 is unable to obtain a physical lock (P-lock) because of an out-of-storage condition detected by IRLM.

System Action: SQLCODE -904 is returned to the user with this reason code. This reason code and the resource name are returned in the cursor table (CT) and made available to the user in the SQLCA.

Operator Response: Notify the system programmer.

System Programmer Response: IRLM exhausted the amount of virtual storage available to it to represent locks. Refer to code 00C90092 for methods to reduce the storage needed by IRLM.

Problem Determination: This reason code is issued by the following CSECT: DSNB1PER

00C20252

Explanation: DB2 is unable to obtain a physical lock (P-lock). Another DB2 holds the P-lock in an incompatible state, but is unable to downgrade because it does not have access to the corresponding group buffer pool.

System Action: SQLCODE -904 (resource not available) is returned to the user. The other DB2 produces additional diagnostic information in the form of messages, trace records, SYS1.LOGREC entries, and/or an SVC dump. This reason code and the resource name are returned in the cursor table (CT) and made available to the user in the SQLCA.

Problem Determination: This reason code is issued by the following CSECT: DSNB1PER

00C20254

Explanation: DB2 is unable to acquire or upgrade a physical lock (P-lock) because of an incompatible retained lock held by one or more other DB2 subsystems in the DB2 data sharing group. Retained locks are locks that persist across DB2 abnormal terminations.

System Action: SQLCODE -904 is returned to the user. This reason code and the resource name are returned in the cursor table (CT) and made available to the user in the SQLCA.

System Programmer Response: Use the -DISPLAY DATABASE command to display the DB2 member names owning the retained locks. You must restart those subsystems to remove the 'resource unavailable' condition. To show the status of the DBMS and IRLM subsystems, you can use the following command:

```
Fi rImproc,STATUS,ALLD
```

00C20255

Explanation: DB2 is unable to obtain a physical lock (P-lock). This is a DB2 internal error.

System Action: SQLCODE -904 (resource not available) is returned to the user. This reason code and the resource name are returned in the cursor table (CT) and made available to the user in the SQLCA. The other DB2 produces additional diagnostic information in the form of messages, trace records, SYS1.LOGREC entries and/or an SVC dump.

Problem Determination: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This reason code is issued by the following CSECT: DSNB1PER

00C20256

Explanation: DB2 is unable to obtain a physical lock (P-lock). This is a DB2 internal error.

System Action: SQLCODE -904 (resource not available) is returned to the user. This reason code and the resource name are returned in the cursor table (CT) and made available to the user in the SQLCA. The other DB2 produces SYS1.LOGREC entries, and, depending on the type of abend, might also produce an SVC dump.

Problem Determination: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This reason code is issued by the following CSECT: DSNB1PER

00C20257

Explanation: DB2 is unable to obtain a physical lock (P-lock) because of an 'out of record list storage' condition that IRLM detected. The record list is that part of the coupling facility lock structure that IRLM uses to record 'modify locks' (those locks that would be retained in case of a failure).

System Action: SQLCODE -904 is returned to the user with this reason code. This reason code and the resource name are returned in the cursor table (CT) and made available to the user in the SQLCA.

System Programmer Response: Allocate a larger coupling facility lock structure by using the MVS

SETXCF,REBUILD command. Make sure that the active MVS CFRM policy specifies a larger structure size for the IRLM coupling facility lock structure before you initiate the rebuild. You can use the MVS SETXCF,STOP,POLICY and SETXCF,START,POLICY commands to change the active MVS CFRM policy. If lock size is not already at the current POLICY maximum size, you can increase lock size with the SETXCF START,ALTER,STRNAME=*lock_structure*,SIZE=*new_size* command.

Problem Determination: This reason code is issued by the following CSECT: DSNB1PER

00C20258

Explanation: DB2 is not able to obtain a physical lock (P-lock) until a peer member restarts. Another DB2 holds the P-lock in an incompatible state but cannot downgrade until it completes its restart.

System Action: SQLCODE -904 (resource not available) is returned to the user. This reason code and the resource name are made available to the user in the SQLCA.

User Response: Resubmit the failing application. The P-lock becomes available after the peer member completes its restart processing.

Problem Determination: This reason code is issued by the following CSECT: DSNB1PER

00C20259

Explanation: This is a DB2 internal error. This reason code and the group buffer pool name are recorded in the cursor table (CT) and made available to the user in the SQLCA or in messages.

System Action: A 'resource not available' code is returned to the user. Abend status is recorded in SYS1.LOGREC.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: This reason code is issued by the following CSECT: DSNB1SCR

00C2025A

Explanation: DB2 encountered an unexpected error from IRLM while trying to acquire a global lock for MBA (multiple buffer pool) object.

System Action: The requesting execution unit abends. A SYS1.LOGREC entry is written and an SVC dump is requested. Collect messages DSNT376I, DSNT500I, and DSNT501I for further diagnosis.

Problem Determination: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECTs: DSNB1BSD, DSNB1GIO, DSNB1PM2, DSNB1PMT

00C2025B

Explanation: DB2 encountered an unexpected error while trying to read from the shared communications area (SCA) for MBA (multiple buffer pool) object.

System Action: The requesting execution unit abends. A SYS1.LOGREC entry is written and an SVC dump is requested.

Problem Determination: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECTs: DSNB1BSD, DSNB1GIO, DSNB1PMT

00C2025C

Explanation: DB2 encountered an unexpected error while trying to write to the shared communications area (SCA) for MBA (multiple buffer pool) object.

System Action: The requesting execution unit abends. A SYS1.LOGREC entry is written and an SVC dump is requested.

Problem Determination: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECT: DSNB1BSD, DSNB1GIO, DSNB1PM2, DSNB1PMT

00C20260

Explanation: This is a DB2 internal error. Castout was unsuccessful because DB2 lost connectivity to the group buffer pool.

System Action: A 'resource not available' code is returned to the user.

User Response: Notify the system programmer.

System Programmer Response: Establish this DB2's connectivity to the group buffer pool before allowing operations that reference this group buffer pool.

Problem Determination: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This reason code is issued by the following CSECT: DSNB5PCO

00C20261

Explanation: This is a DB2 internal error. Castout was unsuccessful due to a group buffer pool structure failure.

System Action: A 'resource not available' code is returned to the user.

User Response: Notify the system programmer.

System Programmer Response: Establish this DB2's connectivity to the group buffer pool before allowing operations that reference this group buffer pool.

Problem Determination: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This reason code is issued by the following CSECT: DSNB5PCO

00C20262

Explanation: This is a DB2 internal error. Castout was unsuccessful due to errors in writing a page to DASD.

System Action: A 'resource not available' code is returned to the user.

User Response: Notify the system programmer.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: This reason code is issued by the following CSECT: DSNB5PCO

00C20263

Explanation: This is a DB2 internal error. Castout was unsuccessful due to an unexpected error.

System Action: A 'resource not available' code is returned to the user. An SVC dump and the SYS1.LOGREC recording were requested.

User Response: Notify the system programmer.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: This reason code is issued by the following CSECT: DSNB5PCO

00C20264

Explanation: DB2 is unable to acquire or upgrade a physical lock (P-lock) because at least one other DB2 subsystem in the data sharing group is holding an incompatible retained lock. The amount of time this DB2 can wait for a locked resource was exceeded. This reason code is only issued if the RETLWAIT installation parameter in DSN6SPRM is set to 'YES'. If RETLWAIT is set to 'NO' (this is the default), then any IRLM lock

that conflicts with a retained lock will not wait, but instead will be immediately rejected (see reason code 00C20254).

System Action: An SQLCODE -904, -911, -913 or -923 is issued, and message DSNT5011 is issued. Also, message DSNT378I is issued.

System Programmer Response: Refer to the 'System Programmer Response' in message DSNT378I.

Problem Determination: This reason code is issued by the following CSECT: DSNB1PER

00C20267

Explanation: DB2 is unable to recover GRECP status for a table space or index because one or more sharing group members could not perform a global drain request on the object.

System Action: A DB2 message of DSNB350 or DSNB351 is issued.

User Response: Issue a START DB command to explicitly recover the page set from GRECP/LPL status.

System Programmer Response: Refer to the 'System Programmer Response' in message DSNB350 or DSNB351.

00C20268

Explanation: DB2 is unable to recover GRECP status for a table space or index because one or more sharing group members could not perform a global drain request on the object. One or more peer DB2s in the group failed to drain the object because some error occurred.

System Action: A DB2 message of DSNB350 or DSNB351 is issued.

User Response: Issue a START DB command to explicitly recover the page set from GRECP/LPL status.

System Programmer Response: Refer to the 'System Programmer Response' in message DSNB350 or DSNB351.

00C202A1

Explanation: DB2 encountered an unexpected error while trying to read from or write to the shared communications area (SCA).

System Action: The requesting execution unit abends. A SYS1.LOGREC entry is written and an SVC dump is requested.

Problem Determination: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECT: DSNB1GBS

00C202A2

Explanation: MVS returned an unexpected error from an IXLDISC request to disconnect a group buffer pool.

System Action: The requesting execution unit abends. A SYS1.LOGREC entry is written and an SVC dump is requested. The IXLDISC reason code is saved in register 8 for SYS1.LOGREC recording and the SVC dump.

System Programmer Response: Refer to *MVS/ESA Programming: Sysplex Services Reference* for the MVS IXLDISC reason code.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECT: DSNB1GD1

00C202A3

Explanation: MVS returned an unexpected error from an IXLFORCE request to deallocate a group buffer pool.

System Action: A SYS1.LOGREC entry is written and an SVC dump is requested. The IXLFORCE reason code is saved in register 8 for SYS1.LOGREC recording and the SVC dump.

System Programmer Response: Refer to *MVS/ESA Programming: Sysplex Services Reference* for the MVS IXLFORCE reason code.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECT: DSNB1GD1

00C202A4

Explanation: MVS detected an error on an IXLCONN request from DB2.

System Action: A SYS1.LOGREC entry is written and an SVC dump is requested. Unless already issued, message DSNB301E, which contains this reason code, is issued to the console. The IXLCONN reason code is saved in register 8 for SYS1.LOGREC recording and the SVC dump. This reason code and the group buffer pool name are returned to the user in the SQLCA.

System Programmer Response: Refer to *MVS/ESA Programming: Sysplex Services Reference* for the MVS IXLCONN reason code.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00C202A5 • 00C202AA

This abend reason code is issued by the following CSECT: DSNB1GC1

00C202A5

Explanation: The cache coupling facility structure attributes passed back by MVS on an IXLCONN request were incorrect.

System Action: A SYS1.LOGREC entry is written. The newly-connected group buffer pool is disconnected. If this is a non-rebuild connect then message DSNB301E, which contains this reason code, is issued to the console (unless it has already been issued). In the message this reason code and the group buffer pool name are returned to the user in the SQLCA. If this is a rebuild connect, then message DSNB330E, which contains this reason code, is issued to the console and this reason code is used to stop the rebuild.

Problem Determination: Check the SYS1.LOGREC variable recording area (VRA) for the following information:

- VRARRK30 - Error mask, set as follows:
 - If bit X'40' is set, DB2 specified a structure disposition of KEEP, but the structure was not allocated this way.
 - If bit X'20' is set, the data element size was not allocated as DB2 requested. VRARRK31 contains the requested data element size, and VRARRK32 contains the allocated data element size.
 - If bit X'10' is set, the allocated vector was not long enough to cover the corresponding buffer pool. VRARRK31 contains the requested vector length, and VRARRK32 contains the allocated vector length.

This abend reason code is issued by the following CSECT: DSNB1GC1

00C202A6

Explanation: This is a DB2 internal error. Unless already issued, message DSNB301E, which contains this reason code, is issued to the console.

System Action: A SYS1.LOGREC entry is written and an SVC dump is requested. The newly-connected group buffer pool is disconnected. This reason code and the group buffer pool name are returned to the user in the SQLCA.

Problem Determination: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECT: DSNB1GC1

00C202A7

Explanation: While processing an ALTER GROUPBUFFERPOOL command request, DB2 encountered an unexpected return code from the MVS IXCQUERY service.

System Action: The requesting execution unit abends. A SYS1.LOGREC entry is written. An SVC dump is requested if it appears to be a DB2 problem (return code 8 from IXCQUERY). Command processing is terminated.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECT: DSNB1AGB

00C202AA

Explanation: An error occurred in IRLM on a physical lock (P-lock) or change request from DB2. This a DB2 internal error.

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested. SQLCODE -904 is issued. This reason code and the resource name are returned in the SQLCA.

System Programmer Response: Examine SYS1.LOGREC for a previous error related to IRLM.

Problem Determination: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields in the VRA for this code are: VRARRK13, VRARRK14, VRARRK15, VRARRK30, and VRARRK33.

The information recorded with VRARRK30 is mapped as follows:

- IRLM return code (4 bytes)
- IRLM reason code (4 bytes)
- IRLM function code (1 byte)
- Lock state (1 byte)
- Flags from RLPLFLG1 (1 byte)
- Flags from RLPLFLG4 (1 byte)
- Returned cached state (1 byte)
- Unused (1 byte)
- P-lock exit reason code (2 bytes)

VRARRK33 records information from the RLPLPL (mapped by DXRRPLPL) and is mapped as follows:

- RLPHSTAT (1 byte): Current held state of the P-lock by this DB2
- RLPCSTA (1 byte): New cached state of the P-lock for this DB2

- RLPRSTAT (1 byte): Requested state of the P-lock by the other DB2 that is in conflict with the state held by this DB2
- Unused (1 byte)
- RLPWUID (8 bytes): Owing work unit

This abend reason code is issued by the following CSECT: DSNB1PER

00C202AB

Explanation: The IRLM UNLOCK request returned an error code when DB2 attempted to release a physical lock (P-lock). This is a DB2 internal error.

System Action: The requesting execution unit abends. The SVC dump and SYS1.LOGREC recording are requested.

User Response: Resubmit the failing application.

System Programmer Response: Request the SYS1.LOGREC and the SVC dump.

Problem Determination: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields in the VRA for this code are: VRARRK13, VRARRK14, VRARRK15, VRARRK30, and VRARRK33.

The information recorded with VRARRK30 is mapped as follows:

- IRLM return code (4 bytes)
- IRLM reason code (4 bytes)
- IRLM function code (1 byte)
- Lock state (1 byte)
- Flags from RLPLFLG1 (1 byte)
- Flags from RLPLFLG4 (1 byte)
- Returned cached state (1 byte)
- Unused (1 byte)
- P-lock exit reason code (2 bytes)

VRARRK33 records information from the RLPPL (mapped by DXRRLPPL) and is mapped as follows:

- RLPHSTAT (1 byte): Current held state of the P-lock by this DB2
- RLPCSTA (1 byte): New cached state of the P-lock for this DB2
- RLPRSTAT (1 byte): Requested state of the P-lock by the other DB2 that is in conflict with the state held by this DB2
- Unused (1 byte)
- RLPWUID (8 bytes): Owing work unit

This abend reason code is issued by the following CSECT: DSNB1PER

00C202AC

Explanation: There was an error during physical lock (P-lock) negotiation. This is a DB2 internal error.

System Action: An SVC dump and SYS1.LOGREC recording are requested. A 'resource unavailable' condition is returned to the P-lock requester that caused the conflict and the subsequent negotiation.

System Programmer Response: Request the SYS1.LOGREC and the SVC dump.

Problem Determination: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields in the VRA for this code are: VRARRK13, VRARRK14, VRARRK15, and VRARRK33.

VRARRK33 records information from the RLPPL (mapped by DXRRLPPL) and is mapped as follows:

- RLPHSTAT (1 byte): Current held state of the P-lock by this DB2
- RLPCSTA (1 byte): New cached state of the P-lock for this DB2
- RLPRSTAT (1 byte): Requested state of the P-lock by the other DB2 that is in conflict with the state held by this DB2
- Unused (1 byte)
- RLPWUID (8 bytes): Owing work unit

This abend reason code is issued by the following CSECT: DSNB1PPP

00C202AD

Explanation: DB2 could not start even one castout process. A probable cause is that no virtual storage is available to acquire private buffers for the castout process.

System Action: The requesting execution unit abends and DB2 terminates abnormally.

System Programmer Response: Restart DB2 after increasing the REGION parameter value on the *ssnmDBM1* startup procedure to get more virtual storage.

Problem Determination: This abend reason code is issued by the following CSECT: DSNB5PCO

00C202AE

Explanation: IRLM returned an invalid cached state on a physical lock (P-lock) request from DB2. This is an internal error.

System Action: SQLCODE -904 is issued. A record is written to SYS1.LOGREC and an SVC dump is requested.

System Programmer Response: Examine SYS1.LOGREC for a preceding error related to IRLM.

Problem Determination: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields in the VRA for this code are: VRARRK13, VRARRK14, VRARRK15, VRARRK30, and VRARRK33.

The information recorded with VRARRK30 is mapped as follows:

- IRLM return code (4 bytes)
- IRLM reason code (4 bytes)
- IRLM function code (1 byte)
- Lock state (1 byte)
- Flags from RLPLFLG1 (1 byte)
- Flags from RLPLFLG4 (1 byte)
- Returned cached state (1 byte)
- Unused (1 byte)
- P-lock exit reason code (2 bytes)

VRARRK33 records information from the RLPL (mapped by DXRRLPPL) and is mapped as follows:

- RLPHSTAT (1 byte): Current held state of the P-lock by this DB2
- RLPCCSTA (1 byte): New cached state of the P-lock for this DB2
- RLPRSTAT (1 byte): Requested state of the P-lock by the other DB2 that is in conflict with the state held by this DB2
- Unused (1 byte)
- RLPWUID (8 bytes): Owing work unit

This abend reason code is issued by the following CSECT: DSNB1PLK

00C202AF

Explanation: There was an incompatible physical lock (P-lock) held. This is a DB2 internal error.

System Action: An SVC dump and SYS1.LOGREC recording are requested. A 'resource unavailable' condition is returned to the P-lock requester that caused the conflict and the subsequent negotiation.

System Programmer Response: Request the SYS1.LOGREC and the SVC dump.

Problem Determination: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields in the VRA for this code are: VRARRK13, VRARRK14, VRARRK15, and VRARRK33.

VRARRK33 records information from the RLPL

(mapped by DXRRLPPL) and is mapped as follows:

- RLPHSTAT (1 byte): Current held state of the P-lock by this DB2
- RLPCCSTA (1 byte): New cached state of the P-lock for this DB2
- RLPRSTAT (1 byte): Requested state of the P-lock by the other DB2 that is in conflict with the state held by this DB2
- Unused (1 byte)
- RLPWUID (8 bytes): Owing work unit

This abend reason code is issued by the following CSECT: DSNB1PPP

00C202B0

Explanation: This is a DB2 internal error.

System Action: An SVC dump and SYS1.LOGREC recording are requested. A 'resource unavailable' condition is returned to the physical lock (P-lock) requester that caused the conflict and the subsequent negotiation.

User Response: Resubmit the failing application.

System Programmer Response: Request the SYS1.LOGREC and the SVC dump.

Problem Determination: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields in the VRA for this code are: VRARRK13, VRARRK14, VRARRK15, and VRARRK33.

VRARRK33 records information from the RLPL (mapped by DXRRLPPL) and is mapped as follows:

- RLPHSTAT (1 byte): Current held state of the P-lock by this DB2
- RLPCCSTA (1 byte): New cached state of the P-lock for this DB2
- RLPRSTAT (1 byte): Requested state of the P-lock by the other DB2 that is in conflict with the state held by this DB2
- Unused (1 byte)
- RLPWUID (8 bytes): Owing work unit

This abend reason code is issued by the following CSECT: DSNB1PPP

00C202B1

Explanation: An error occurred during physical (P-lock) negotiation. This is a DB2 internal error.

System Action: An SQLCODE -904 is issued. A record is written to SYS1.LOGREC and an SVC dump is requested. This reason code and the resource name are returned in the SQLCA.

System Programmer Response: Examine

SYS1.LOGREC for a previous error related to IRLM.

Problem Determination: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields in the VRA for this code are: VRARRK13, VRARRK14, VRARRK15, VRARRK30, and VRARRK33.

The information recorded with VRARRK30 is mapped as follows:

- IRLM return code (4 bytes)
- IRLM reason code (4 bytes)
- IRLM function code (1 byte)
- Lock state (1 byte)
- Flags from RLPLFLG1 (1 byte)
- Flags from RLPLFLG4 (1 byte)
- Returned cached state (1 byte)
- Unused (1 byte)
- P-lock exit reason code (2 bytes)

VRARRK33 records information from the RLPL (mapped by DXRRLPL) and is mapped as follows:

- RLPHSTAT (1 byte): Current held state of the P-lock by this DB2
- RLPCSTA (1 byte): New cached state of the P-lock for this DB2
- RLPSTAT (1 byte): Requested state of the P-lock by the other DB2 that is in conflict with the state held by this DB2
- Unused (1 byte)
- RLPWUID (8 bytes): Owning work unit

This abend reason code is issued by the following CSECT: DSNB1PER

00C202B2

Explanation: DB2 could not obtain a page set or partition physical lock (P-lock).

System Action: A 'resource unavailable' condition is returned to the user. This reason code and the resource name are returned in the cursor table (CT) and made available to the user in the SQLCA.

System Programmer Response: This problem might be caused by having multiple DB2 release levels in the DB2 data sharing group.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECTs: DSNB1PPP, DSNB1PPG.

00C202B3

Explanation: This is a DB2 internal error. The execution unit encountered an error while doing damage assessment for a group buffer pool.

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: This reason code is issued by the following CSECTs: DSNB1DAO

00C202B4

Explanation: This is a DB2 internal error. The execution unit received an error return code while doing damage assessment for a group buffer pool.

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: This reason code is issued by the following CSECTs: DSNB1CPX, DSNB1GC0, DSNB1GC1

00C202B5

Explanation: This is a DB2 internal error. The execution unit received an error return code while doing damage assessment for a group buffer pool.

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: This reason code is issued by the following CSECTs: DSNB1GC0, DSNB1GC1

00C202B6

Explanation: This is a DB2 internal error. The execution unit received an error return code while trying to translate the DB2 member name to a member ID.

System Action: The requesting execution unit is abended.

00C202B7 • 00C202C4

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: This reason code is issued by the following CSECTs: DSNB1DA2

00C202B7

Explanation: This is a DB2 internal error. An unexpected error occurred during recovery processing from a group buffer pool link failure.

System Action: The requesting execution unit abends. A SYS1.LOGREC entry is written and an SVC dump is requested.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: This abend reason code is issued by the following CSECT: DSNB1LNK

00C202C0

Explanation: DB2 timed out waiting for the use count on a group buffer pool to reach zero during rebuild quiesce processing for the group buffer pool. This is a DB2 internal problem.

System Action: The DB2 system agent that is processing the rebuild abends and takes a dump. The rebuild is stopped. Message DSNB335I is issued indicating this reason code as the reason why the rebuild stopped.

Problem Determination: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECT: DSNB1xxx

00C202C1

Explanation: DB2 encountered a problem trying to connect to the new group buffer pool coupling facility structure while trying to rebuild the group buffer pool.

System Action: A dump may or may not be taken depending on the nature of the error. The rebuild is stopped. Message DSNB335I is issued indicating this reason code as the reason why the rebuild stopped.

Problem Determination: Check the console log for previous error messages (for example, DSNB330E or DSNB306I) to determine why DB2 could not connect to the new group buffer pool structure.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECT: DSNB1RBC

00C202C2

Explanation: DB2 received an unexpected return and reason code from the MVS IXLREBLD macro during rebuild processing for a group buffer pool.

System Action: The DB2 system agent that is processing the rebuild abends and takes a dump. The rebuild is stopped. Message DSNB340I will be issued indicating that the IXLREBLD request failed and message DSNB335I is issued indicating this reason code as the reason why the rebuild stopped.

Problem Determination: See *MVS/ESA Programming: Sysplex Services Reference* for an explanation of the MVS IXLREBLD reason code.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECT: DSNB1xxx

00C202C3

Explanation: DB2 received an unexpected return and reason code from the MVS IXLEERSP macro during rebuild processing for a group buffer pool.

System Action: The DB2 system agent that is processing the rebuild abends and takes a dump. The rebuild is stopped. Message DSNB340I is issued indicating that the IXLEERSP request failed and message DSNB335I is issued indicating this reason code as the reason why the rebuild stopped.

Problem Determination: See *MVS/ESA Programming: Sysplex Services Reference* for an explanation of the MVS IXLEERSP reason code.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECT: DSNB1xxx

00C202C4

Explanation: DB2 detected that the number of changed pages in the new structure is greater than the number of changed pages in the original structure at the time that the rebuild of the group buffer pool was about to be completed.

System Action: DB2 abends and takes a dump. The rebuild is stopped. Message DSNB335I is issued indicating this reason code as the reason why the rebuild stopped.

Problem Determination: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECT: DSNB1xxx

00C202D0

Explanation: DB2 is unable to respond to an event that was reported by MVS. This is a DB2 internal error.

System Action: DB2 terminates abnormally.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump. Restart DB2.

Problem Determination: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECT: DSNB5REE

00C202D1

Explanation: This is a DB2 internal error. DB2 encountered an unrecoverable error while trying to add a page to the logical page list (LPL).

System Action: The DB2 subsystem is abnormally terminated.

Operator Response: Notify the system programmer, print SYS1.LOGREC, and request an SVC dump.

Problem Determination: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This reason code is issued by the following CSECT: DSNB1LPL

00C20300

Explanation: This is a DB2 internal error. The execution unit attempted to access, claim, or drain a page set or partition, but the page set was not logically opened.

This reason code is issued by the following CSECTs: DSNB1CLM DSNIOPNP DSNISGSC DSNITFFS DSNIWPSC DSNUQUIA

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00C20301

Explanation: This is a DB2 internal error. The execution unit attempted to access, claim, or drain a logical partition, but the page set is not a type 2 nonpartitioned page set.

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

Problem Determination: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This reason code is issued by the following CSECTs:

DSNB1LCM DSNB1LDN DSNB1CPP DSNBWFOR
DSNBLCM DSNBDRN DSNBDDRN

00C20302

Explanation: This is a DB2 internal error. A page set was not logically opened by the execution unit that was attempting to do one of the following:

- Logical close a page set
- Physical close a page set or partition

This reason code is issued by the following CSECT: DSNB1DDN

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00C20303

Explanation: This is a DB2 internal error. A page set is not in-use, but an execution unit was attempting to do one of the following:

- Logical close a page set
- Physical close a page set or partition

This reason code is issued by the following CSECT: DSNB1CPS

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00C20304

Explanation: This is a DB2 internal error. During force write processing, the buffer manager detected that the write claim class count is not zero or there are pending updates on the page set or partition.

This reason code is issued by the following CSECT:
DSNB1WFO

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00C20305

Explanation: This is a DB2 internal error. The execution unit attempted to access, claim, drain, open, or close a partition or piece, but the partition or piece number is invalid.

This reason code is issued by the following CSECTs:
DSNB1ABP, DSNB1CLM, DSNB1CPP, DSNB1DCM,
DSNB1DDN, DSNB1DRA, DSNB1GET, DSNB1SWS,
DSNICLDR, DSNICLOS, DSNICLTO, DSNICMTC,
DSNICMT2, DSNIDALC, DSNIERST, DSNIWPSC,
DSNIOPNP, DSNIRCLS, DSNISGSC, DSNITFFS,
DSNPXTN0, DSNUQUIA, DSNXISB2

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer, print the SYS1.LOGREC, and request the SVC dump.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00C20306

Explanation: This is a DB2 internal error.

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer, print SYS1.LOGREC, and request an SVC dump.

Problem Determination: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This reason code is issued by the following CSECTs:
DSNB1GET, DSNB1LTS, DSNB1LTX, DSNB1SWS

00C20307

Explanation: This is a DB2 internal error.

System Action: The requesting execution unit is abended.

Operator Response: Notify the system programmer, print SYS1.LOGREC, and request an SVC dump.

Problem Determination: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This reason code is issued by the following CSECT:
DSNBLTCH

Chapter 34. X'C3.....' codes

For information about the CICS transaction abend/dump code DSNB, refer to Appendix A, "CICS Transaction Abend/Dump Code," on page 1351.

00C30001

Explanation: The CICS attachment facility terminated because of errors that cannot be corrected. The attachment facility task-related user exit detected one of the following conditions:

- The life of task block (LOT) is invalid.
- The LOT and connection control table (CCT) element were disconnected before the end of a unit of recovery
- The previous application program support (APS) call failed and a commit call is being attempted

These symptoms might be caused by an overlay of the LOT and/or the CCT.

This abend reason code is issued by the following CSECTs: DSNBMSUB DSN2MSUB

System Action: The CICS attachment facility terminates.

Operator Response: Notify the system programmer.

System Programmer Response: Analyze the dumps and system console messages for storage violations.

Problem Determination: One or more control blocks do not pass validity checks. The most probable cause is that they were overlaid by some user application. A CICS dump (DSNB) and a subtask dump (system abend X'04E' with abend reason code 00C30001) were requested. Register 9 in the CICS transaction dump contains the address of the LOT.

If the LOT is valid, CLOTCTE contains the CCT element address, and CCCTLOT contains the LOT address. Use these pointers (CLOTCTE and CCCTLOT) to verify the validity of the LOT and the CCT element. Both control blocks should contain seven character eye catchers (DSNBLOT and DSNBCCCT or DSN2LOT and DSN2CCT). If they are in error, check the application program for possible storage violations.

00C30002

Explanation: The CICS attachment facility was not able to start.

This abend reason code is issued by the following CSECTs: DSNBMSUB DSN2MSUB

System Action: The CICS attachment facility terminates.

Operator Response: Notify the system programmer.

Problem Determination: A subtask dump (system

abend X'04E' with abend reason code 00C30002) is requested unless FRBRC2 equals 00F30013 or 00F30058. Within the dump, register 7 contains the address of the resource control table load module. In this load module, location CRCTCCTA contains the address of the connection control table (CCT) in subpool 99. The CCT contains the FRB control block for the IDENTIFY to DB2. The FRB control block begins at CCCTFRB within the CCT. You can also locate the FRB with the CCT control block by scanning the CCT for the FRB character string eye catcher. The FRB contains two fields, FRBRC1 and FRBRC2, which contain the return code and reason code from the IDENTIFY to the DB2 subsystem.

00C30003

Explanation: The CICS attachment facility could not complete a recover indoubt call because of the return and reason codes from DB2.

This abend reason code is issued by the following CSECTs: DSNBMSUB DSN2MSUB

System Action: The CICS attachment facility terminates. The unit of recovery (UR) is not resolved and remains indoubt.

Operator Response: Notify the system programmer.

Problem Determination: The return code from the recover indoubt process does not allow the CICS attachment facility to complete the unit of recovery (UR). If the UR included in the error is valid, an attempt should be made to resolve the UR manually, using the DB2 -RECOVER command.

A subtask dump (system abend X'04E' with abend reason code 00C30003) is requested. Register 7 contains the address of the resource control table. Location CRCTCCTA in load module DSNCRCTx or DSN2CTxx contains the address of the connection control table (CCT) in subpool 99.

The CCT contains the FRB control block, which can be located by scanning the CCT for the FRB character string eye catcher. FRBRC1 and FRBRC2 contain the return code and reason code from DB2.

A nonzero return code indicates problems specified by the reason code. Higher return codes (4, 8, and 12) indicate higher severity.

Examine the MVS console for DB2 messages that might indicate any related errors. If an SVC dump was also taken, print it as well as the SYS1.LOGREC to obtain further diagnostic information. The CICS SYSTEM LOG

00C30004 • 00C30007

might help to determine the final disposition of the indoubt unit of work.

Register 6 in the subtask abend dump plus X'20' contains the address of a 16-byte area that contains the network id (NID). The last 8 bytes of the NID contain the store clock value that was passed to DB2 by CICS to identify the logical unit of work (LUW). This value can be used to correlate the DB2 unit of recovery with the CICS logical unit of work.

00C30004

Explanation: A thread subtask failed because of a validity check failure of a transaction-related life of task block (LOT).

This abend reason code is issued by the following CSECTs: DSNCEXT3 DSN2EXT3

System Action: The CICS attachment facility continues operation; however, the one subtask is abended and a subtask dump (system abend X'04E' with abend reason code 00C30004) is requested.

Because the LOT contains an ECB on which the CICS application is waiting and this error indicates the LOT was overlaid, the effect on the CICS application is unpredictable.

Operator Response: Notify the system programmer.

Problem Determination: The most probable cause is that the LOT was overlaid by some user application. In the subtask abend dump, register 7 contains the address of the resource control table (RCT).

CRCTCCTA in the RCT contains the address of the CCT, and CCCTLN in the CCT contains its length. Register 9 contains the CCT element that was assigned to the application in error.

This CCT element address can be validated by ensuring that it lies within the CCT. If the CCT address is valid, CCCTLOT contains the address of the LOT in error. To determine the source of the error, analyze the subtask dump and check the CICS master terminal for any storage violation messages.

00C30005

Explanation: The CICS attachment facility could not complete a commit or abort call for a transaction because of return codes from the application program support call.

This abend reason code is issued by the following CSECTs: DSNCEXT3 DSN2EXT3

System Action: The CICS attachment facility continues operation, but the one subtask abends with a subtask dump (system abend X'04E' with abend reason code 00C30005). The CICS transaction that is associated with the abend is also abended with a CICS transaction dump

Operator Response: Notify the system programmer.

Problem Determination: The return code from the commit or abort does not allow the CICS attachment facility to complete the transaction's unit of recovery. Register 7 in the subtask dump contains the address of the resource control table (RCT).

Location CRCTCCTA in the RCT load module contains the address of the connection control table (CCT) in subpool 99. CCCTCSUB in the CCT contains the address of the subtask work area (CSUB or C2UB).

The subtask work area contains the FRB control block, which you can locate by scanning DSNCSUB or DSN2SUB for the FRB character string eye catcher. FRBRC1 and FRBRC2 contain the return code and reason code from DB2.

A nonzero return code indicates trouble specified by the reason code. Higher return codes (4, 8, and 12) indicate higher severity.

Refer to the reason code in Part 4, "Section 4. DB2 Codes," on page 773 and prepare a search argument, using the reason code as the appropriate keyword. If the reason code is not listed, it is an internal code that is useful only as a keyword.

If an SVC dump was also taken, print it and the SYS1.LOGREC to obtain further diagnostic information.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00C30006

Explanation: The CICS attachment facility failed because of return codes from the MVS ATTACH macro while attempting to start a thread subtask.

This abend reason code is issued by the following CSECTs: DSNCMSUB DSN2MSUB

System Action: The CICS attachment facility terminates.

Operator Response: Notify the system programmer.

Problem Determination: A subtask dump (system abend X'04E' with abend reason code 00C30006) is requested. To determine why the ATTACH failed, use the MVS dump, MVS system trace, SYS1.LOGREC, and MVS console listing. Refer to the appropriate MVS publication to interpret the meaning of return codes from the MVS ATTACH macro.

00C30007

Explanation: The start of the CICS attachment facility failed because of return codes while attempting to establish a shutdown listen exit with DB2.

This abend reason code is issued by the following CSECTs: DSNCMSUB DSN2MSUB

System Action: The CICS attachment facility terminates.

Operator Response: Notify the system programmer.

Problem Determination: The return code from the establish exit process does not allow the CICS attachment facility to start. A subtask dump (system abend X'04E' with abend reason code 00C30007) is requested. Register 7 contains the address of the resource control table (RCT).

Location CRCTCCTA in the RCT load module (DSNCRCTx or DSN2CTxx) contains the address of the connection control table (CCT) in subpool 99. The CCT contains the FRB control block, which can be located by scanning the CCT for the FRB character string eye catcher. FRBRC1 and FRBRC2 contain the return code and reason code from DB2.

A nonzero return code indicates trouble specified by the reason code. Higher return codes (4, 8, and 12) indicate higher severity.

Refer to the reason code in Part 4, "Section 4. DB2 Codes," on page 773. If the reason code is not listed, it is an internal code that is useful only as a keyword.

If an SVC dump was also taken, print it as well as the SYS1.LOGREC to obtain further diagnostic information.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00C30008

Explanation: The start of the CICS attachment facility failed while attempting to establish an ESTAE recovery exit. because of reasons indicated by the return codes.

This abend reason code is issued by the following CSECTs: DSNCMSUB DSN2MSUB

System Action: An X'04E' abend subtask dump is taken, and the CICS attachment facility remains partially initialized.

Operator Response: Notify the system programmer, and issue the DSNCR STOP FORCE command.

Problem Determination: The return code from the ESTAE macro does not allow the CICS attachment facility to start. A subtask dump (system abend X'04E' with abend reason code 00C30008) is requested. To determine why the ESTAE failed, use the MVS dump, MVS system trace, SYS1.LOGREC, and MVS console listing. The MVS trace contains the return code from the ESTAE macro. Refer to the appropriate MVS publication for the meaning of return codes from the MVS ESTAE macro.

00C30009

Explanation: The CICS attachment facility failed because of the return code and reason code from DB2 for the SHOW INDOUBT units of recovery process.

This abend reason code is issued by the following CSECTs: DSNCMSUB DSN2MSUB

System Action: The CICS attachment facility terminates, and a subtask dump is requested.

Operator Response: Notify the system programmer.

Problem Determination: The return code from the SHOW INDOUBT process does not allow the CICS attachment facility to continue. A subtask dump (system abend X'04E' with abend reason code 00C30009) is requested. Register 7 contains the address of the resource control table (RCT).

Location CRCTCCTA in the RCT load module (DSNCRCTx or DSN2CTxx) contains the address of the connection control table (CCT) in subpool 99. The CCT contains the FRB control block, which can be located by scanning the CCT for the FRB character string eye catcher. FRBRC1 and FRBRC2 contain the return code and reason code from DB2.

A nonzero return code indicates trouble specified by the reason code. Higher return codes (4, 8, and 12) indicate higher severity. Analyze the subtask dump.

Refer to the reason code in Part 4, "Section 4. DB2 Codes," on page 773. If the reason code is not listed, it is an internal code that is useful only as a keyword.

If an SVC dump was also taken, print it and the SYS1.LOGREC to obtain further diagnostic information.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00C30010

Explanation: An IDENTIFY call to DB2 from a CICS attachment facility connection subtask failed, indicating that DB2 is no longer active.

This abend reason code is issued by the following CSECTs: DSNCEXT3 DSN2EXT3

System Action: A subtask dump is requested for the failing task thread, and the automatic STOP of the CICS attachment facility is initiated.

Operator Response: Notify the system programmer.

Problem Determination: Some other error, which is the source of the failure, probably occurred prior to this action. Use the subtask dump, SYS1.LOGREC, MVS console listing, and any SVC dumps that might have been requested if DB2 failed.

00C30011

Explanation: The CICS attachment facility detected that a resource control table (RCT) entry was corrupted or overlaid since the CICS attachment facility was last started.

This abend reason code is issued by the following CSECTs: DSNCEXT3 DSN2EXT3

System Action: The CICS attachment facility abends CICS task with a CICS transaction abend.

Operator Response: Notify the system programmer.

System Programmer Response: Stop and then restart the CICS attachment facility to refresh the RCT.

Problem Determination: Analyze the CICS dumps to determine which CICS trans-id and corresponding RCT entries were affected. The CICS transaction dump contains the RCT storage at the time of the failure. Location CRCTAUWD in the affected RCT entry was altered since the CICS attachment facility was last started. This might be caused by an application program modifying storage it does not own (a CICS storage violation).

00C30020

Explanation: A previous error occurred during create thread processing which put the transaction in a must-abort state. The only request allowed in this state is a SYNCPOINT ROLLBACK.

This abend reason code is issued by the following CSECTs: DSNCEXT1 DSN2EXT1

System Action: The transaction is placed in a must-abort state and remains in that state until the transaction terminates or issues a SYNCPOINT ROLLBACK. Any SQL statement issued by a transaction while in a must-abort state receive an SQLCODE -906. SYNCPOINT requests without the ROLLBACK option cause an ASP7 abend.

User Response: If the create thread error was anticipated, and the transaction can correct the situation that caused the create thread error, the transaction might issue a SYNCPOINT ROLLBACK and continue processing.

System Programmer Response: If it is undesirable for a transactions to continue after create thread errors, reassemble the resource control table (RCT) and change the PCTEROP parameter to AEY9, or remove it completely and take the default.

Problem Determination: Unless PCTEROP=N906, this error reason code is preceded by a DSNCEXT3 transaction dump, which provides diagnostic information about the create thread failure. The SQLCA also contains the SQL return code identifying the create thread error.

00C30021

Explanation: The CICS attachment facility detected an application which is using the instrumentation facility interface (IFI) and is link-edited with a back level version of the CICS attachment facility language interface module DSNCLI.

This abend reason code is issued by the following CSECTs: DSNCEXT1 DSN2EXT1

System Action: The transaction is abended with a DSNCEXT1 abend. The life of task block (LOT) contains reason code 00C30021.

User Response: Relink-edit the application with the appropriate version of the CICS attachment facility language interface module DSNCLI which corresponds to the current CICS attachment facility maintenance level.

System Programmer Response: Ensure the appropriate level of the CICS attachment facility language interface module DSNCLI is available to all users. Discard any back level version of DSNCLI.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: If the problem continues to occur after link-editing the application again with the proper level of the CICS attachment facility language interface module, validate that the correct DSNCLI is being used.

The eye catcher in DSNCLI should have the proper maintenance level identified. Look at the DSNCLI, which is actually link-edited with the application to ensure the proper level.

00C30100

Explanation: An application attempted to issue an SQL request when the CICS attachment was not operational. This reason code results when the attachment is in STANDBY mode and the RCT STANDBY option is "SQLCODE".

System Action: The SQL request is not executed.

User Response: Wait until the CICS attachment facility is started. Then resubmit the transactions that failed.

Operator Response: Restart the CICS attachment facility after ensuring that DB2 is active.

System Programmer Response: Collect any dumps produced by the CICS attachment facility or DB2, the MVS system console log, and any record of -STOP DB2 commands that might have been issued. Determine if the termination of the CICS attachment facility was the result of a DB2 stop command or abnormal termination of DB2.

Problem Determination: The CICS attachment facility was in standby mode. This occurs if DB2 stops and the RCT STANDBY option is "SQLCODE". Locate all the CICS attachment facility dumps and all DB2 termination dumps. Follow the problem determination procedures documented for the error conditions that caused the dumps to be produced.

attachment facility detected an unexpected condition, if the DB2 STOP MODE(FORCE) command was issued, or if DB2 abnormally terminated. If the stop command with the force option was not issued, locate all the CICS attachment facility abnormal termination dumps and all DB2 abnormal termination dumps. Follow the problem determination procedures documented for the error conditions that caused the dumps to be produced.

00C30200

Explanation: An application attempted to issue an SQL request but no thread resource was available for that request. This reason code results when the CICS-DB2 attachment DB2ENTRY definition for the transaction is disabled.

System Action: The SQL request is not executed.

User Response: Retry the transaction after the DB2ENTRY has been reenabled.

System Programmer Response: Enable the transaction's DB2ENTRY or set the DISABLEDACT to POOL to allow transactions in that entry to run.

00C30805

Explanation: The caller's connection with DB2 terminated because the CICS attachment facility is terminating in stop force mode. This reason code indicates that the CICS attachment facility is terminating because stop force was initiated. Stop force was probably initiated by the DSNB STOP FORCE command, the STOP DB2 MODE(FORCE) command, DB2 abnormally terminating, or the CICS attachment facility abnormally terminating. If a command was not used to cause stop force processing, abnormal termination dumps are produced by either DB2 if it is abnormally terminating, or by the CICS attachment facility if it is abnormally terminating.

This abend reason code is issued by the following CSECTs: DSNCEXT1 DSN2CEXT1

System Action: All current requests are returned with an indication that the CICS attachment facility is terminating.

User Response: Wait until the CICS attachment facility is restarted; then resubmit the transactions that failed.

Operator Response: Restart the CICS attachment facility after ensuring that DB2 is active.

System Programmer Response: Collect any dumps produced by the CICS attachment facility or DB2, the MVS system console log, and any record of DSNB STOP commands that might have been issued. Determine if the termination of the CICS attachment facility was the result of a STOP command or abend.

Problem Determination: The CICS attachment facility was forced into termination. This occurs if the DSNB STOP FORCE command is issued, if the CICS

Chapter 35. X'C5.....' codes

For these codes, the standard documentation to be collected is a SYSUDUMP and a printout of the DSNTRACE data set. The standard SPUFI documentation is a SYSUDUMP and a printout of the ISPF log for this session. A SYSUDUMP data set must be allocated in advance to collect your dump. A DSNTRACE data set must be allocated in advance to collect your DSN trace stream unless you are running in the background, in which case the SYSTSPRT data set contains the DSNTRACE output. ISPF normally runs with an active log data set. ISPF suppresses dumps unless it is invoked with the TEST parameter. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

In the TSO attachment facility, the user can control whether or not message IDs are displayed. To see them, type PROFILE MSGID. To suppress them, type PROFILE NOMSGID.

The following abends can occur in the TSO attachment facility.

00C50001

Explanation: This is probably a DB2 subsystem error. DSNESM30 has detected an illegal value in the YTYPE portion of the SQLTYPE field of the SQLDA.

This abend reason code is issued by the following CSECT: DSNESM30

User Response: If the problem persists, notify the system programmer.

System Programmer Response: The standard SPUFI documentation should be collected. Refer to Chapter 35, "X'C5.....' codes" for information about obtaining dumps and displaying message IDs.

Problem Determination: An illegal value was detected in the SQLTYPE field of the SQLDA. This may have been caused by this field being overlaid in error. To determine the source of the error, analyze the SQLDA in the storage dump.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 4, 21.

00C50002

Explanation: This is probably a DB2 subsystem error. DSNESM32 has detected an illegal value in the YTYPE portion of the SQLTYPE field of the SQLDA. This suggests that an illegal value was in the SQLTYPE field of the SQLDA.

This abend reason code is issued by the following CSECT: DSNESM32

User Response: If the problem persists, notify the system programmer.

System Programmer Response: The standard

SPUFI documentation should be collected. Refer to Chapter 35, "X'C5.....' codes" for information about obtaining dumps and displaying message IDs.

Problem Determination: An illegal value was detected in the YTYPE of the SQLDA. This may have been caused by this field being overlaid in error. Analyze the SQLDA in the storage dump to determine the source of the error.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 4, 21.

00C50003

Explanation: This could be either a user or a system error. SPUFI was unable to obtain the required storage via GETMAIN.

This abend reason code is issued by the following CSECTS: DSNESM10, DSNESM20

System Action: SPUFI task abends. User returns to ISPF main menu.

User Response: If the problem persists, notify the system programmer. You may have to specify a larger machine size at logon time.

System Programmer Response: If the problem persists, the standard SPUFI documentation should be collected. Refer to Chapter 35, "X'C5.....' codes" for information about obtaining dumps and displaying message IDs.

Problem Determination: Register 2 contains the amount of storage that was requested. Message DSNE392E, in the ISPF log data set, gives the name of the module that issued this abend.

Collect the following diagnostic items listed in

Appendix B, "Problem determination," on page 1353: 4, 21.

00C50005

Explanation: This could be either a user or a system error. The DYNALLOC SVC returned an unexpected return code when attempting to allocate a data set.

This abend reason code is issued by the following CSECT: DSNESM55

System Action: The contents of the field are written to the ISPF log.

User Response: If the problem persists, notify the system programmer.

System Programmer Response: The standard SPUFI documentation should be collected. Refer to Chapter 35, "X'C5.....' codes," on page 827 for information about obtaining dumps and displaying message IDs.

Problem Determination: Message DSNE381E, in the ISPF log data set, gives the return code and reason code values returned from the dynamic allocation request. Refer to the appropriate MVS publication to determine the source of the error and analyze these values.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 4, 21.

00C50007

Explanation: This is probably an error in the SPUFI code. The field describing the record format of the output data set is not valid.

This abend reason code is issued by the following CSECT: DSNESM55

System Action: The contents of the field are written to the ISPF log.

User Response: If the problem persists, notify the system programmer.

System Programmer Response: The standard SPUFI documentation should be collected. Refer to Chapter 35, "X'C5.....' codes," on page 827 for information about obtaining dumps and displaying message IDs.

Problem Determination: Message DSNE383A, in the ISPF log data set, gives the record format of the output data set that was determined to be in error. The output data set record format must be one of the following: F, FB, FBA, V, VB, or VBA.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 4, 21.

00C50008

Explanation: This could be either a user or a system error. The DYNALLOC SVC returned an unexpected return code when attempting to deallocate a data set.

This abend reason code is issued by the following CSECT: DSNESM55

System Action: The contents of the field are written to the ISPF log

User Response: If the problem persists, notify the system programmer.

System Programmer Response: The standard SPUFI documentation should be collected. Refer to Chapter 35, "X'C5.....' codes," on page 827 for information about obtaining dumps and displaying message IDs.

Problem Determination: Message DSNE384E, in the ISPF log data set, gives the return code and reason code values returned from the dynamic allocation request. Analyze these values to determine the source of the error.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 4, 21.

00C50009

Explanation: This is probably caused by an error in the SPUFI code. The SQLCODE translation service (module DSNTIAR) has returned an unexpected return code.

This abend reason code is issued by the following CSECT: DSNESM40

System Action: The contents of the field have been written to the ISPF log.

User Response: If the problem persists, notify the system programmer.

System Programmer Response: The standard SPUFI documentation should be collected. Refer to Chapter 35, "X'C5.....' codes," on page 827 for information about obtaining dumps and displaying message IDs.

Problem Determination: Message DSNE387A, in the ISPF log data set, gives the return code value returned from DSNTIAR. The meanings of these return codes are:

- 4** More data was available than could fit into the message area provided.
- 8** The LRECL was not within the limits: $72 \geq LRECL \leq 240$
- 12** The message area was not large enough. Message length ≥ 240
- 16** Error in message routine (IKJEFF02).

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 4, 21.

00C50100

Explanation: This is probably caused by an error in the DSN command processor code. Module DSNECP66 (in the DSN command processor) called module DSNTIAR to format an error message to explain an unexpected SQL return code received by DCLGEN. DSNTIAR failed.

This abend reason code is issued by the following CSECT: DSNECP66

User Response: If the problem persists, notify the system programmer.

System Programmer Response: The standard documentation should be collected, including a DSN trace stream. Refer to Chapter 35, "X'C5.....' codes," on page 827 for information about obtaining dumps and displaying message IDs.

Problem Determination: Message DSNE004E in the output gives the return code value returned from DSNTIAR. For an explanation of these return codes, see abend reason code '00C50009'.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 4, 20.

00C50101

Explanation: The user has entered the ABEND subcommand of the DSN command processor. This causes a X'04E' abend and a dump to be requested. In order to retain the dump, you must have previously allocated a SYSUDUMP or SYSADUMP data set. The ABEND subcommand can be useful for debugging.

This abend reason code is issued by the following CSECT: DSNECP19

System Action: A X'04E' abend results, and a dump is requested.

System Programmer Response: The standard documentation may be needed. Refer to Chapter 35, "X'C5.....' codes," on page 827 for information about obtaining dumps and displaying message IDs.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 4, 20.

00C50102

Explanation: An error probably occurred in DB2 while it attempted to process an IDENTIFY request from the DSN command processor. DSN received an unexpected return code (FRBRC1 or FRBRC2) from DB2.

This abend reason code is issued by the following CSECT: DSNECP12

System Action: Immediately after writing this message, DSN abends with an abend code of X'04E' and an abend reason code of '00C50102'.

User Response: If the problem persists, notify the system programmer.

System Programmer Response: See the Problem Determination section of this message.

Problem Determination: Rerun the job with DSN tracing turned on. You may need a SYSUDUMP from the TSO address space. You probably need a DB2 dump. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 4, 20.

00C50103

Explanation: An error probably occurred in DB2 while it attempted to process an ESTABLISH EXIT request from the DSN command processor. DSN received an unexpected return code (FRBRC1 or FRBRC2) from DB2.

This abend reason code is issued by the following CSECT: DSNECP12

System Action: Immediately after writing this message, DSN abends with an abend code of X'04E' and an abend reason code of '00C50103'.

User Response: If the problem persists, notify the system programmer.

System Programmer Response: See the Problem Determination section of this message.

Problem Determination: Rerun the job with DSN tracing turned on. You may need a SYSUDUMP from the TSO address space. You probably need a DB2 dump. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 4, 20.

00C50104

Explanation: An error probably occurred in DB2 while it attempted to process a CREATE THREAD request from the DSN command processor. DSN received an unexpected return code (FRBRC1 or FRBRC2) from DB2.

This abend reason code is issued by the following CSECT: DSNECP13

00C50108 • 00C50111

System Action: Immediately after writing this message, DSN abends with an abend code of X'04E' and an abend reason code of '00C50104'.

User Response: If the problem persists, notify the system programmer.

System Programmer Response: See the Problem Determination section of this message.

Problem Determination: Rerun the job with DSN tracing turned on. You may need a SYSUDUMP from the TSO address space. You probably need a DB2 dump. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 4, 20.

00C50108

Explanation: An error probably occurred in DB2 while it attempted to process a BIND, REBIND, or FREE request from the DSN command processor. DSN received an unexpected return code (FRBRC1 or FRBRC2) from DB2.

This abend reason code is issued by the following CSECT: DSNECP30

System Action: Immediately after writing this message, DSN abends with an abend code of X'04E' and an abend reason code of '00C50108'.

User Response: If the problem persists, notify the system programmer.

System Programmer Response: See the Problem Determination section of this message.

Problem Determination: Rerun the job with DSN tracing turned on. You may need a SYSUDUMP from the TSO address space. You probably need a DB2 dump. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 4, 20.

00C50109

Explanation: An error probably occurred in DB2 while it attempted to process a TERMINATE request from the DSN command processor. DSN received an unexpected return code (FRBRC1 or FRBRC2) from DB2.

This abend reason code is issued by the following CSECT: DSNECP18

System Action: Immediately after writing this message, DSN abends with an abend code of X'04E' and an abend reason code of '00C50109'.

User Response: If the problem persists, notify the system programmer.

System Programmer Response: See the Problem Determination section of this message.

Problem Determination: Rerun the job with DSN tracing turned on. You may need a SYSUDUMP from the TSO address space. You probably need a DB2 dump. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 4, 20.

00C50110

Explanation: This is a DSN command processor error. It occurs when the DSN STAX routine (DSNEBP01) is entered and the DSN control blocks cannot be located; the AEPLUSR field did not contain the CIB address.

This code is issued by the following CSECT: DSNECP01

Severity: 4

System Action: The DSN command processor abended.

User Response: If you allocated a SYSUDUMP or SYSABEND dump data set, collect the dump. Otherwise, allocate SYSUDUMP and DSNTRACE data sets, turn on DSN tracing, and try to recreate the error. Save these data sets.

00C50111

Explanation: Your application program made an instrumentation facility component application program interface (instrumentation facility interface) call to DB2 language interface module DSNELI, but your application program was not running under the DSN command processor. You must run all application programs using DSNELI under DSN. To do this, first issue the DSN command, then start your application using the RUN subcommand of the DSN command processor, and finally, when the application completes, stop DSN with an END subcommand.

This reason code is issued by the following CSECT: DSNELI

System Action: Control returns to the application. Your application can continue processing. Further attempts at instrumentation facility interface (IFI) calls will continue to produce this return and reason code.

User Response: Rerun your application under the DSN command processor.

Operator Response: Notify your system programmer.

System Programmer Response: Modify the job to

invoke DSN. Initiate the application program using the RUN subcommand of the DSN command processor.

Chapter 36. X'C6.....' code

00C60001

Explanation: DB2 received return code X'20' when issuing a WTO request to display a DB2 console message. MVS sets this return code when there are no message buffers for either Multiple Console Support (MCS) or JES3, or when there is a JES3 WTO staging area excess. The WTO request is terminated. The current DB2 console message and all subsequent DB2 informational console messages are ignored until the MVS problem is corrected.

At the time of the abend, general register zero contains the return code from WTO request.

This abend reason code is issued by the following CSECT: DSNFWTO

System Action: A record is written to SYS1.LOGREC. A retry is requested and execution continues. DB2 resumes issuing console messages when the condition is corrected.

Chapter 37. X'C8.....' codes

Abends in the precompiler are not intercepted via ESTAE, so standard system abends might occur. The SYNAD exit is not used, so I/O errors cause S001 or S002 abends. S04E abends are generated for precompiler internal errors. Following is a list of reason codes.

00C8901x

Explanation: An internal precompiler/parser consistency check failed. An S04E abend is generated. The error type and reason code are found in register 15 of the dump.

In the reason code, x is one of the following:

- 1 Parser received a token code of 0 from a lexical scan. A lexical scan refers to a scan of words rather than syntax.
- 2 Error in storage suballocation control blocks. The error might occur when a DB2 SQL statement limitation is exceeded. The SQL statement might be referencing, creating, or declaring more columns than the DB2 defined maximum number allowed for an SQL statement. Another possibility is that too many host variables are being referenced in the SQL statement.
- 3 Error in storage suballocation request. This error might occur because of storage constraints when building the DBRM entry for the SQL statement or because the SQL statement exceeds the DB2 maximum statement length.
- 4 Error in pointer structures.
- 5 Host variable information in the precompiler/parser dictionary or in the DBRM is not consistent with host variable information for an SQL statement. The error might occur when the precompiler misinterprets an illegal host variable declaration.
- 6 Unexpected value for parser option.
- 7 Internal limit exceeded. A fully qualified name exceeds the maximum length of 255 characters.
- 8 Internal conversion error. An error occurred when converting a timestamp version-id.
- 9 Internal stack storage exhausted.
- A Language Environment required, but not available.

System Programmer Response: Obtain the SVC dump and a copy of the application program source. If

the abend reason code is 00C89015, obtain a copy of the DBRM being bound (IEBCOPY).

00C89041

Explanation: More storage is needed, but could not be obtained during the precompiler execution. An S04E abend occurs. The error type and reason code are found in register 15 of the dump.

This reason code is issued by the following CSECT: DSNHCORE

System Programmer Response: The storage required for the current statement could not be acquired or exceeds the maximum (64KB) for a single request. If the region is full, determine if the region can be expanded. If it cannot be expanded, the SQL statement is too large to be processed.

Chapter 38. X'C9.....' codes

00C9007D

Explanation: The compression dictionary for the table space or partition cannot be stored in the table space or partition. Therefore, the LOAD or REORG utility cannot complete successfully.

This abend reason code is issued by the following CSECTs: DSNIZLDL, DSNIDL0D

System Action: The table space or partition is implicitly stopped by DB2. Messages DSNT501I and DSNIO04I are displayed to inform the operator that the dictionary and the object for which the dictionary is defined are unavailable. An SQLCODE -904 is returned to the SQL end user.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the problem and resubmit the LOAD or REORG job. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00C9007E

Explanation: The compression dictionary for the table space or partition was not successfully retrieved. Therefore, the data request failed.

This abend reason code is issued by the following CSECTs: DSNIRFNX, DSNIRLPG, DSNICUMR, DSNIMSMS, DSNINXPT, DSNIRIDC, DSNIRNXT, DSNIRSET, DSNISRID, DSNISFS, DSNISFX, DSNISRTI, DSNICUMW, DSNILREP, DSNIMS1W, DSNIRELF, DSNIRELS, DSNIREDR, DSNIENSR

System Action: The table space or partition is implicitly stopped by DB2. Messages DSNT501I and DSNIO04I are displayed to inform the operator that the dictionary and the object for which the dictionary is defined are unavailable. An SQLCODE -904 is returned to the SQL end user.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the problem and inform the user to resubmit the request. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00C9007F

Explanation: The compression dictionary for the table space or partition is invalid. Therefore, the table space or partition cannot be opened.

This abend reason code is issued by the following CSECT: DSNIZLDR

System Action: The table space or partition is implicitly stopped by DB2. Messages DSNT501I and DSNIO04I are displayed to inform the operator that the dictionary and the object for which the dictionary is defined are unavailable. An SQLCODE -904 is returned to the SQL end user.

Operator Response: Notify the system programmer.

System Programmer Response: Recover and start the table space or partition and tell the user to resubmit the request.

00C90080

Explanation: An attempt was made to allocate a resource for update operations. However, the resource was already started for read-only access.

This reason code is issued by the following CSECTs:

DSNIDBCA DSNIDBCI DSNIDBCN DSNIDBCP
DSNIDBET

System Action: The allocation process is not allowed.

User Response: Determine when the resource is started for read/write access, and rerun the job.

Operator Response: If this reason code appears in message DSNT501I, determine whether the named resource should be started for read-only access.

Problem Determination: The requested operation is not performed. An SQLCODE -904 is issued, and/or message DSNT501I is issued. For more information, refer to the SQL return code in Part 2, "SQL return codes," on page 11 or to the description of the DSNT501I message in Chapter 18, "DSNT... Messages," on page 417.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5, 32.

00C90081

Explanation: An attempt was made to allocate a resource that is stopped for all access.

This reason code is issued by the following CSECTs:

00C90082 • 00C90083

DSNIDBCA DSNIDBCI DSNIDBCJ DSNIDBCN
DSNIDBCO DSNIDBCP DSNIDBCQ DSNISTDB
DSNISTPS

System Action: The allocation process is not allowed.

User Response: Determine when the resource is no longer stopped, and rerun the job.

Operator Response: If this reason code appears in message DSNT500I or DSNT501I, determine whether the resource should be stopped.

Problem Determination: The requested operation is not performed. An SQLCODE -904 or -923 is issued, and/or message DSNT500I or message DSNT501I is issued. For more information, refer to the SQL return code in Part 2, "SQL return codes," or to the description of the DSNT500I or DSNT501I message in Chapter 18, "DSNT... Messages."

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5, 32.

00C90082

Explanation: An attempt was made to allocate a resource that is already allocated to a DB2 utility function.

This reason code is issued by the following CSECTs:

DSNIDBCJ DSNIDBCO DSNIDBCQ

System Action: The allocation process is not allowed.

User Response: Determine when the resource is available and rerun the job.

Problem Determination: The requested operation is not performed. An SQLCODE -904 or -923 is issued, and/or message DSNT501I is issued. The resource allocated to the DB2 utility function might be either in use by a utility or reserved for a utility. If the resource is reserved for a utility, but not currently in use, the -DISPLAY UTILITY command will indicate that no utilities are operating on that object. To access a resource that is reserved for a utility, use the -TERM UTILITY command. For more information, refer to the SQL return code in Part 2, "SQL return codes," on page 11, or to the description of the DSNT501I message in Chapter 18, "DSNT... Messages," on page 417.

SYS1.LOGREC contains information in the variable

recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5, 32, 72.

00C90083

Explanation: An attempt was made to allocate a resource for update operations. However, the resource is already allocated to a DB2 utility function that allows other users to have read-only access.

This reason code is issued by the following CSECTs:

DSNIDBCJ DSNIDBCO DSNIDBCQ

System Action: DB2 determines whether there is a utility function that would prohibit allocation of the resource. If it finds an indication of a such a utility, the allocation of the resource is not allowed.

User Response: Determine when the resource is no longer restricted by a utility and is started for read/write access, and rerun the job.

Problem Determination: The requested operation is not performed. An SQLCODE -904 or -923 is issued, and/or message DSNT501I is issued.

The resource allocated to the DB2 utility function might be either in use by a utility or reserved for a utility. If the resource is reserved for a utility, but not currently in use, the -DISPLAY UTILITY command will indicate that no utilities are operating on that object. The -DISPLAY DATABASE command shows which restrictive states DB2 assigned to the resource in question. Utilities set a restrictive state (for example, UTRO) on the resource that they are processing, and then remove this state when the utility successfully completes. Therefore, if the -DISPLAY DATABASE command is issued after the successful completion of the utility, the restrictive state set by the utility is not displayed. To access a resource that is reserved for a utility, use the -TERM UTILITY command. For more information, refer to the SQL return code in Part 2, "SQL return codes," on page 11, or to the description of the DSNT501I message in Chapter 18, "DSNT... Messages," on page 417.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in

Appendix B, “Problem determination,” on page 1353: 1, 3, 5, 32, 72.

00C90084

Explanation: The temporary file with the page size shown in NAME is not available. An error was detected either during the opening of the page set or during the formatting of the header and the space map pages of the page set.

This reason code is issued by the following CSECTs: DSNIWKFL, DSNITFFS

System Action: DB2 startup/restart continues if this reason code appears in a DSNT500I message issued during the startup process.

If the reason code appears in a DSNT500I message issued during the -START DATABASE command, the request fails. In either case, the temporary file function does not allocate any temporary file on the page set.

User Response: Delete and redefine the temporary data set(s) in question, and then issue the -START DATABASE command to start the temporary file.

Problem Determination: The requested operation is not performed. An SQLCODE -904 is issued, and/or message DSNT500I is issued. For more information, refer to the SQL return code in Part 2, “SQL return codes,” on page 11, or to the description of the DSNT500I message in Chapter 18, “DSNT... Messages,” on page 417.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 1, 3, 4, 5, 10, 32.

00C90085

Explanation: The limit of 253 extends for a temporary file has been reached.

One of the following could be the reason.

- Large number of concurrent transactions requiring use of temporary files.
- Small primary/secondary quantity defined for table space(s) in temporary file database.
- Inadequate space allocated to temporary file database.

This reason code is issued by the following CSECT: DSNIWCUB

System Action: The request to extend temporary file is not allowed.

User Response: To resolve the above situation, do one of the following:

- Reduce the number of concurrent transactions.
- Increase primary/secondary quantity defined for the table space(s) in the temporary file database.
- Increase space allocated to temporary file database.

Problem Determination: The requested operation is not performed. An SQLCODE -904 is issued, and/or message DSNT500I is issued. For more information, refer to the SQL return code in Part 2, “SQL return codes,” on page 11, or to the description of the DSNT500I message in Chapter 18, “DSNT... Messages,” on page 417.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 1, 3, 5, 17, 32, 52.

00C90086

Explanation: An attempt was made to allocate a resource that is started for DB2 utility access only.

This reason code is issued by the following CSECTs:

DSNIDBCA DSNIDBCI DSNIDBCN DSNIDBCP

System Action: The allocation process is not allowed.

User Response: Determine when the resource is available for use, and rerun the job.

Operator Response: If this reason code appears in message DSNT501I, determine whether the resource should be started for utility access only.

Problem Determination: The requested operation is not performed. An SQLCODE -904 or -923 is issued, and/or message DSNT501I is issued. For more information, refer to the SQL code in Part 2, “SQL return codes,” on page 11, or to the description of the DSNT500I message in Chapter 18, “DSNT... Messages,” on page 417.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 1, 3, 5, 32.

00C90087

Explanation: A page that is marked as 'broken' has been read. The database, table space or index space, and the page number are identified in NAME.

This reason code is issued by the following CSECT: DSNIADBR

System Action: The data manager function that detected this condition returns a 'resource not available' condition to its invoker. Access to the page is not permitted until it is repaired.

User Response: If the TYPE is '00000300', examine the name to determine if the page is in an index space or a table space. Use the REPAIR utility to fix the broken page.

Problem Determination: The requested operation is not performed. An SQLCODE -904 or -923 is issued, and/or message DSNT500I is issued. For more information, refer to the SQL return code in Part 2, "SQL return codes," on page 11, or to the description of the DSNT500I message in Chapter 18, "DSNT... Messages," on page 417.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5, 32.

00C90088

Explanation: The resource identified by NAME in message DSNT501I is involved in a deadlock condition.

This reason code is issued by the following CSECT: DSNILMCL

System Action: The requested operation is not performed.

User Response: Rerun the application.

System Programmer Response: If the deadlock condition becomes chronic, examine the mix of applications running to determine why the deadlock is occurring.

Problem Determination: The requested operation is not performed. An SQLCODE -911, -913, or -923 is issued, and/or message DSNT501I is issued. For more information, refer to the SQL return code in Part 2, "SQL return codes," on page 11, or to the description of the DSNT501I message in Chapter 18, "DSNT... Messages," on page 417.

If statistics trace class 3 is active, IFCID 172 contains

diagnostic information. For a discussion of the effects of locking, see Part 5 (Volume 2) of *DB2 Administration Guide*. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5, 18, 32, 36, 38.

00C90089

Explanation: The environmental descriptor manager (EDM) function of the data manager subcomponent did not have enough storage in its pool or data space to support the retrieval of object with ID 'object id' (DBD ID, SKCT plan name or SKPT package name). The object can be either a database descriptor (DBD), a skeleton cursor table (SKCT) or a skeleton package table (SKPT).

This reason code is issued by the following CSECTS:

DSNGEDLC DSNGEDST DSNGEELC DSNGEFSP
DSNGESLC DSNGEPLC

System Action: The requested operation is not performed.

User Response: Invoke the application again. If, after several attempts, there is still not enough space, the following actions can be taken to reduce EDM storage requirements:

- Reduce the number of concurrent users using DB2.
- Try reducing the number of SQL statements in the plan or package and rebind.
- Try to simplify the database design—for example, reduce the number of partitions in the database.

To increase the EDM pool size definition, on the UPDATE install panels:

- If EDM storage shortage is a recurring problem, change the installation parameters that affect the size of the EDM pool—that is, increase the number of concurrent users and the number of currently active databases, then restart DB2.

Problem Determination: The requested operation is not performed. An SQLCODE -904 or -923 is issued, and/or message DSNT500I is issued. For more information, refer to the SQL return code in Part 2, "SQL return codes," on page 11, or to the description of the DSNT500I message in Chapter 18, "DSNT... Messages," on page 417.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on the identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5, 32.

00C9008A

Explanation: The database procedure installation exit identified by NAME could not be loaded for execution.

This reason code is issued by the following CSECTS: DSNIREDR, DSNIENSR

System Action: The requested operation is not performed.

User Response: Determine the reason the installation exit could not be loaded, correct the problem, and rerun the job.

Problem Determination: The requested operation is not performed. An SQLCODE -904 is issued, and/or message DSNT500I is issued. For more information, refer to the SQL return code in Part 2, "SQL return codes," on page 11, or to the description of the DSNT500I message in Chapter 18, "DSNT... Messages," on page 417.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on the identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5, 32.

00C9008B

Explanation: An attempt was made to create a database, but no DBIDs are available; that is, the system limit has been reached.

This reason code is issued by the following CSECT: DSNNGDCID

System Action: The create is not allowed.

User Response: DROP all unused databases, and rerun the job.

Problem Determination: The requested operation is not performed. An SQLCODE -904 is issued, and/or message DSNT500I is issued. For more information, refer to the SQL return code in Part 2, "SQL return codes," on page 11, or to the description of the DSNT500I message in Chapter 18, "DSNT... Messages," on page 417.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of *DB2*

Diagnosis Guide and Reference for information on the identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5, 32.

00C9008C

Explanation: An attempt was made to allocate or bind to a partitioned table space for which no partitioning key was defined.

System Action: The bind or allocation process is not allowed.

User Response: Define the partitioning key or partitioning index for the partitioned table space, and rerun the job.

Problem Determination: The requested operation is not performed. An SQLCODE -904 is issued, and/or message DSNT501I is issued. For more information, refer to the SQL return code in Part 2, "SQL return codes," on page 11, or to the description of the DSNT501I message in Chapter 18, "DSNT... Messages," on page 417.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5, 15, 17, 32, 33, 35.

00C9008D

Explanation: An attempt was made to bind to a table space that had an incomplete clustering definition.

This reason code is issued by the following CSECTS: DSNISPSC, DSNIPSEFI

System Action: The bind process is not allowed.

User Response: Complete the clustering definition for the table space, and rerun the job.

Problem Determination: The requested operation is not performed. An SQLCODE -904 is issued, and/or message DSNT501I is issued. For more information, refer to the SQL return code in Part 2, "SQL return codes," on page 11, or to the description of the DSNT501I message in Chapter 18, "DSNT... Messages," on page 417.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of *DB2*

00C9008E • 00C90090

Diagnosis Guide and Reference for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5, 15, 17, 32, 33, 35.

00C9008E

Explanation: A lock request for the resource identified by NAME could not be granted, and the request waited for a period longer than the maximum specified by the installation.

This reason code is issued by the following CSECT: DSNILMCL

System Action: The data manager function that detected this condition returns 'resource not available' to its invoker.

Message DSNT378I might also be issued.

Problem Determination: The requested operation is not performed. An SQLCODE -904, -911, -913, or -923 is issued, and/or message DSNT501I is issued. For more information, refer to the SQL return code in Part 2, "SQL return codes," on page 11, or to the description of the DSNT501I message in Chapter 18, "DSNT... Messages," on page 417. If a time-out occurs, see also the "System Programmer Response" in message DSNT376I for problem determination.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5, 18, 32, 36, 38.

00C9008F

Explanation: The database descriptor's size (DBD) has reached the limit of 25% of the EDM Pool size.

This reason code is issued by the following CSECT: DSNNGDCPD

System Action: The request to create/alter a database object is not allowed.

User Response: Create the database object in a different database or drop unused database objects from the database. If you drop an object that is an index or a table space, the space becomes available in the DBD as soon as the drop is committed. If you drop an object that is a table, the space in the DBD is made available only after all of the following:

- The DROP is committed.

- The DB2 REORG is run on the table space and there is no point in time recover after the REORG.
- MODIFY is run to delete all image copies of data that contains rows of the dropped table, that is, copies that were taken before the REORG. Note that MODIFY will reclaim space in the DBD only if there are SYSCOPY rows to delete.

Problem Determination: The requested operation is not performed. An SQLCODE -904 is issued, and/or message DSNT500I is issued. For more information, refer to the SQL return code in Part 2, "SQL return codes," on page 11, or to the description of the DSNT500I message in Chapter 18, "DSNT... Messages," on page 417.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5, 32.

00C90090

Explanation: An attempt to lock a required resource failed.

System Action: The operation is not performed.

User Response: Wait for all jobs which hold a lock on the resource in an incompatible lock state to complete before reissuing the failing statement.

Problem Determination: The requested operation is not performed.

If the resource type is table space, table, or index, then issue the -DISPLAY DATABASE command with the LOCKS option to get a list of jobs which currently hold locks on the required resource.

If the resource type is a package, then wait for BIND activity on that package to complete before reissuing the failing request.

If the problem persists after jobs which hold incompatible locks complete, gather diagnostic information to pursue the problem.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5, 32, 33.

00C90091

Explanation: The table space or index space could not be started, because there is an outstanding indoubt UR that must be resolved before the start is allowed.

This reason code is issued by the following CSECT: DSNILSTS

System Action: The START operation is not performed.

Problem Determination: Message DSNI002I is issued. See the description of that message for additional information.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5, 32, 33.

00C90092

Explanation: DB2 received an out-of-storage indication from IRLM resulting from a lock, unlock, or lock change request.

This reason code is issued by the following CSECT: DSNILMCL

System Action: A record is written to SYS1.LOGREC only when an abend is issued. No dump is requested.

Operator Response: Notify the system programmer.

System Programmer Response: IRLM has exhausted the amount of virtual storage available to it to represent locks. Insufficient virtual storage remains to satisfy this request. Refer to Part 5 (Volume 2) of *DB2 Administration Guide* for the IRLM procedure to determine the amount of storage space available.

The current mix of transactions caused all available storage to be used. You can find the number of locks held by a particular transaction by either using the DB2 performance trace facility or by performing IRLM tracing. Refer to Part 5 (Volume 2) of *DB2 Administration Guide* for information about the DB2 performance trace facility.

Determine what transactions were running and the number of locks they held. You might want to schedule some of these transactions at a different time.

You can reduce the total number of page or row locks that applications concurrently hold by changing the locking protocol on one or more table spaces. Use one of the following:

- ALTER TABLESPACE...LOCKSIZE ANY
- ALTER TABLESPACE...LOCKSIZE TABLESPACE

- LOCK TABLE statements

If application logic permits, reduce the number of page or row locks concurrently held for SELECT statements by re-binding application plans with isolation level of cursor stability instead of repeatable read or read stability. Refer to Chapter 4 of *DB2 SQL Reference* for further information on SELECT.

You can reduce the total number of LOB locks that applications concurrently hold by changing the locking protocol on one or more LOB table space. Use one of the following:

- ALTER TABLESPACE...LOCKSIZE TABLESPACE
- LOCK TABLE statement

Problem Determination: One or more of the following might be issued:

- An SQLCODE -904 or -923
- Message DSNT501I
- An abend

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5, 18, 32, 35, 36.

00C90093

Explanation: An error occurred in IRLM.

This reason code is issued by the following CSECT: DSNILMCL

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

Operator Response: Notify the system programmer.

System Programmer Response: Examine SYS1.LOGREC for a preceding error related to IRLM.

Problem Determination: One or more of the following might be issued:

- An SQLCODE -904 or -923
- Message DSNT501I
- An abend

SYS1.LOGREC contains the same diagnostic information in the variable recording area (VRA) as shown for abend reason code '00C90101'. The first four bytes of CTSIWHY contain the return code from the IRLM function. The fifth byte of CTSIWHY contains the request code, as follows:

X'02'	Lock
X'03'	Unlock

X'04' Change

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5, 18, 32, 35, 36.

00C90094

Explanation: A data set is in a state that is different from what DB2 expects. Possible causes are:

- A data set was deleted and redefined without DB2's knowledge.
- A previous DB2 failure involving the data set might have occurred.

This reason code is issued by the following CSECT: DSNIBMCL

System Action: The requested action is not performed. If the invoker of this module (DSNIBMCL) abends, a record is written to SYS1.LOGREC, and the invoker probably initiates a dump. If the invoker does not abend, no record is written to SYS1.LOGREC, and no dump is requested. If this occurs, an SQL return code is issued, and/or message DSNT500I is issued. If the invoker of DSNIBMCL is not a utility, the data set is placed in a stopped status.

User Response: If the code was received while processing a user table, DB2 determined that the data set is empty. A DROP TABLESPACE statement followed by a CREATE TABLESPACE statement and a CREATE TABLE statement defines the dropped table to DB2. Use the IDCAMS LISTCAT for the failing DB2 dataset. Check the HI-USED-RBA for this dataset; if HI-USED-RBA = 0, the dataset is empty. If it was received while processing a DB2 catalog or directory, then recover the object as specified in *DB2 Administration Guide* in the section "Recovering Catalog and Directory Objects".

Operator Response: Notify the system programmer.

System Programmer Response: If you do not have the current level of the data set, you must perform DB2 recovery to return the data set to its expected state. See the Problem Determination section of this message for procedures to determine the name of the data set to be corrected. Use the DISPLAY command to check the status of the data set. If the data set is stopped, use the START command before performing recovery.

Problem Determination: For more information, refer to the SQL return code in Part 2, "SQL return codes," on

page 11, or to the description of the DSNT500I message in Chapter 18, "DSNT... Messages," on page 417.

This error is detected at a time when the specific name of the data set involved cannot be determined by DB2. However, the SQL return code or message DSNT500I provides the name of the table space or index space in which the data set resides. When the table or index space consists of a single data set, this is specific. Otherwise, the system programmer must find the particular data set within the table or index space.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5, 10, 32, 33, 35.

00C90095

Explanation: An attempt was made during DB2 restart to access a page in order to apply a log record but DB2 was unable to access the page. This abend reason code appears as the reason code in message DSNIO01I.

This abend reason code is issued by the following CSECTS: DSNIBMOC, DSNIIIMP

System Action: The restart of the named table space, index space, or partition is deferred by the subsystem.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the problem, and then use either the -START DATABASE command or the RECOVER utility to make the table space, index space, or partition available.

Problem Determination: Examine previous messages on the console to determine why DB2 could not access the page. One possible reason is that a back-level pack was mounted. That is, the page to which the log record applies was not yet formatted by VSAM. DB2 does not extend data sets during restart.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5, 13, 32, 33.

00C90096

Explanation: The page, row or LOB lock on the page or subpage identified by NAME in message DSNT500I or DSNT501I caused the total number of page, row or LOB locks concurrently held to reach the installation maximum number of page, row or LOB locks (NUMLKUS) allowed for a single agent in the system.

This reason code is issued by the following CSECT: DSNILMCL

System Action: The operation that encountered this condition is not executed. If a utility job encountered this condition, the utility is stopped. Otherwise, any database updates for the statement that was executing are backed out. Any database reads for the statement that was executing are not executed. The position of the cursor is unpredictable.

User Response: Rerun the application after correcting the cause of this resource unavailable condition.

Programmer Response: Reduce the total number of page, row or LOB locks that the application concurrently holds by changing the locking protocol on one or more of the table spaces to table space level locking. To do this, use the ALTER ... LOCKSIZE TABLESPACE or LOCK TABLE statements.

Review the application to see if a different choice of SQL statements can be used to perform the same operation with less concurrent access to multiple tables with page, row or LOB locking.

If application logic permits, reduce the number of page, row or LOB locks concurrently held for SELECT statements by rebinding the application plan with isolation level of cursor stability instead of repeatable read or read stability, or add more frequent commits.

System Programmer Response: If the application should be able to run with the current page, row or LOB locking protocol and SQL statements, increase the NUMLKUS value for the installation to allow a higher limit of page, row or LOB locks to be concurrently held by a single application. If a utility job encountered this resource unavailable condition, the NUMLKUS value must be increased to accommodate the utility, because utilities are programmed to use the minimum number of page, row or LOB locks possible. Refer to Part 5 (Volume 2) of *DB2 Administration Guide* for further information about choosing the value for NUMLKUS.

Operator Response: If a utility job encountered this resource unavailable condition, terminate the utility and restart it after the cause of the resource unavailable condition has been corrected.

Problem Determination: An SQLCODE -904 and message DSNT500I or DSNT501I are issued. For more information refer to the SQL return code in Part 2, "SQL return codes," on page 11, or message DSNT500I or DSNT501I in Chapter 18, "DSNT... Messages," on page 417.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5, 32.

00C90097

Explanation: An attempt was made to allocate to a table space for update operations. However, the table space was marked as 'image copy' required, and updates are not allowed. This condition occurs as a result of any of the following:

- Running a REORG LOG NO or LOAD LOG NO utility on the table space without running a copy that specifies FULL YES.
- Execution of a RECOVER utility which specifies the TORBA or TOCOPY options, without following it with the required COPY utility.
- Execution of a -TERM UTILITY command on a COPY utility that failed during the copy phase or was active in the copy phase. Until the COPY utility completes, SQL updates are not allowed because the integrity of the data would be compromised.
- Execution of a MODIFY utility after all back up copies of the table space or data set were deleted from the SYSCOPY catalog table.

This reason code is issued by the following CSECTs:

DSNIDBCJ DSNIDBCO DSNIDBCQ

System Action: The allocation process is not allowed.

User Response: Run the COPY utility. However, if the table space is to be used for read-only access, or if recoverability of the data is not required, instead of taking a full image copy you can run the REPAIR utility and request that the image copy required condition be removed.

Problem Determination: The requested operation is not performed. An SQLCODE -904 and/or message DSNT501I is issued. For more information, refer to the SQL return code in Part 2, "SQL return codes," on page 11 or to the description of the DSNT501I message in Chapter 18, "DSNT... Messages," on page 417.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on

identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5, 32.

00C90098

Explanation: An attempt was made to increase read-only or write-access counts of the utility in process beyond the maximum (255) allowed.

This abend reason code is issued by the following CSECT: DSNIDBMF.

User Response: Use the -DISPLAY UTILITY command to determine how many utility jobs are currently active. If a number of utility jobs are active but not in the stopped state, notify the system programmer. If the utility jobs are running, resubmit your job after they complete.

System Programmer Response: Determine why active utilities are in the stopped state. Use the -TERM UTILITY command to terminate utilities and reduce the UIP (utility in process) counts. If no active utilities are indicated, then use the -DISPLAY DATABASE command to show which table spaces or partitions are in a UTRW or UTRW state.

Problem Determination: Message DSNT500I is issued. For more information, refer to the explanation of message DSNT500I.

00C90099

Explanation: An attempt was made to load data into a partition, but the partition is full. Based on the High Key value specified in the Index for each partition, utilities instructed Data Manager to load a record into the proper partition. This required Data Manager to build a new page with a page number one higher than the last page in the partition. However, this new page is in the next partition.

This abend reason code is issued by the following CSECT: DSNILPG

System Action: The requested action is not performed.

User Response: Redefine the High Key values in the Index and retry the load.

If you receive this code during a reorganization, query the catalog to check the PCTFREE and FREEPAGE values. You might be able to decrease the amount of free space to allow the REORG utility to complete successfully.

Operator Response: Notify the system programmer.

System Programmer Response: Use the -TERM UTILITY command to terminate the load utility and reduce the UIP (utility in process) counts.

Problem Determination: For more information, refer to the explanation of message DSNT500I in the Service Controller Messages section of this book.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 32, 37.

00C9009A

Explanation: An attempt was made to create a system database which, according to the DBID space map, has already been created. However, the catalog shows the database was not created. This discrepancy between the catalog and the space map for DBIDs may be due to an unsuccessful migration.

This abend reason code is issued by the following CSECT: DSNGDCID

System Action: Database is not created.

Operator Response: Notify the system programmer.

System Programmer Response: Drop the database, then create it (using DROP and CREATE commands). If this fails to resolve the error, follow the steps in problem determination.

Problem Determination: The requested operation is not performed. An SQLCODE -904 is issued, and/or message DSNT500I is issued. For more information, refer to the SQL return code in Part 2, "SQL return codes," on page 11, or to the description of the DSNT500I message in Chapter 18, "DSNT... Messages," on page 417.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5, 32, 38, 39.

00C9009B

Explanation: An attempt was made to load data into a linear table space, but the table space is full. A linear table space can contain a maximum of 64GB of data.

This abend reason code is issued by the following CSECT: DSNILPG

System Action: The requested action is not performed.

User Response: Use the -TERM UTILITY command to terminate the LOAD utility. Use ALTER TABLE SPACE to reduce the amount of free space within a page (PCTFREE) and the number of free pages within the table space (FREEPAGE). Then retry the load. If it

is a resume load job, reorganize the table space before rerunning the load.

Problem Determination: For more information, refer to the explanation of message DSNT500I in Chapter 18, "DSNT... Messages," on page 417.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 32, 37.

00C9009C

Explanation: An attempt was made to insert data into a partitioned table space or index space, but the partition is full. For table space partition, the data to be inserted is based on the high-key value specified in the cluster index. If it is an index space partition, the index entry to be inserted is also based on the high-key value associated with the index.

This abend reason code is issued by the following CSECTs: DSNISMPI, DSNISMPX

System Action: A 'resource not available' code is returned to the end user and the requested action is not performed. The SVC dump and the SYS1.LOGREC recording are not requested.

User Response: Notify the system programmer to redefine the partitions and rerun the job.

System Programmer Response: Refer to Part 2 (Volume 1) of *DB2 Administration Guide* to redefine a partition. The partition that must be redefined is identified in the DSNT501I message.

If you suspect an error in DB2 refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: For more information, refer to the explanation of message DSNT501I in Chapter 18, "DSNT... Messages," on page 417.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 37.

00C9009D

Explanation: An attempt was made to insert data into a linear table space or index space, but the table space or index space is full. A linear table space or index space can contain a maximum of 64GB of data.

This abend reason code is issued by the following CSECTs:

DSNISGPI DSNISMPI DSNISMPX

System Action: A 'resource not available' code is returned to the end user and the requested action is not performed. The SVC dump and the SYS1.LOGREC recording are not requested.

User Response: Notify the system programmer to reclaim some free space in the associated table space or index space and rerun the job.

System Programmer Response: The table space or index space name is identified in the DSNT501I message. If it is a table space, run the DB2 REORG utility to attempt to reclaim additional free space. If it is an index space, drop and recreate the index with a fewer number of SUBPAGES. If free space cannot be reclaimed, notify the database administrator to redistribute the data into different table spaces or index spaces.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: For more information, refer to the explanation of message DSNT501I in Chapter 18, "DSNT... Messages," on page 417.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 37.

00C9009E

Explanation: The object depends on new facilities of the release and is therefore unavailable for processing. For data-sharing systems, the object will be available on a new release in a data-sharing group. For non-data-sharing systems, the object will be available after re-migration if release fall back has occurred.

This abend reason code is issued by the following CSECTs: DSNICUBC, DSNIPSF1

System Action: The operation is not allowed. The data manager function that detected this condition returns 'resource not available' to its invoker.

Operator Response: Notify the system programmer.

System Programmer Response: In order to perform the operation on the object:

- For non-data sharing systems a re-migration is required.
- For data sharing systems, insure that the operation is performed on a member at the correct level of DB2.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The requested operation is not performed. An SQLCODE -904 is issued. Message DSNT500I or message DSNT501I may also be issued. For more information, refer to the Part 2, "SQL return codes," on page 11 or to the description of the DSNT500I and DSNT501I messages in Chapter 18, "DSNT... Messages," on page 417.

Collect the following diagnostic items listed in

Appendix B, "Problem determination," on page 1353: 1, 3, 5.

00C9009F

Explanation: A table has been referenced that has a primary key or unique key but no index exists to enforce its uniqueness. The reference is usually to a parent table when attempting to verify the referential constraint of an insert or update operation to a dependent table.

This abend reason code is issued by the following CSECTS:

DSNIALLC DSNICUBC DSNIKESR DSNIRELI

System Action: The use of the table is not allowed.

User Response: Create a unique index on the referenced table to enforce the primary key or unique key.

Problem Determination: The requested operation is not performed. An SQLCODE -904 or -923 is issued. For more information, refer to Part 2, "SQL return codes," on page 11, or to the description of the DSNT501I message in Chapter 18, "DSNT... Messages," on page 417.

00C900A0

Explanation: An attempt was made to allocate or access a table space or index that is in the rebuild pending status (PSRBD) or an index in pageset rebuild pending status (PSRBD).

System Action: The use of the object is not allowed.

User Response: Determine when the resource is available for use and rerun the job.

Operator Response: Determine whether the RECOVER utility should be run to complete recovering the object.

Problem Determination: The requested operation is not performed because the table space or index might be in an inconsistent state. An SQLCODE -904 and/or message DSNT501I and/or message DSN1005I is issued. For more information, refer to Part 2, "SQL return codes," on page 11, or to the description of the DSNT501I message in Chapter 18, "DSNT... Messages," on page 417.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5.

00C900A1

Explanation: An attempt was made to allocate a table space or index that is in group recovery pending state.

System Action: The use of the object is not allowed.

User Response: Run the RECOVER utility, LOAD utility or START DATABASE command to recover the object.

Operator Response: Determine whether the RECOVER utility or START DATABASE command should be run to complete recovery of the object.

Problem Determination: The requested operation is not performed because the table space or index might be in an inconsistent state. An SQLCODE -904 and/or message DSNT501I is issued. For more information, refer to Part 2, "SQL return codes," on page 11, or to the description of the DSNT501I message in Chapter 18, "DSNT... Messages," on page 417.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5.

00C900A3

Explanation: An attempt was made to allocate a table space, index space, or a related index space while the table space or index space was in check pending status.

This abend reason code is issued by the following CSECTS:

DSNIDBCI DSNIDBCJ DSNIDBCN DSNIDBCO
DSNIDBCP DSNIDBCQ DSNIDBET DSNIRCCA

System Action: The operation is not allowed.

Operator Response: Notify the system programmer.

System Programmer Response: The check pending status needs to be resolved before the operation will be allowed.

If the object is a table space with referential relationships, then run the CHECK DATA utility to check for referential integrity violations.

If the object is a base table space with LOB columns, then run the CHECK DATA utility to validate the auxiliary columns.

If the object is a LOB table space, then run the CHECK LOB utility to validate the structure of the LOB table space.

If the object is an index space, then run the CHECK INDEX utility to verify that the index keys are consistent with the data in the table space or table space partition.

For more information, see Part 2 (Volume 1) of *DB2 Administration Guide*.

Problem Determination: The requested operation is not performed. An SQLCODE -904 or -923 is issued. For more information, refer to Part 2, "SQL return codes," on page 11, or to the description of the DSNT501I message in Chapter 18, "DSNT... Messages," on page 417.

00C900A4

Explanation: An attempt was made to allocate a segment for a table in a segmented table space, but there are no free segments. A segmented table space can contain a maximum of 64GB of data. A segment will be allocated under one of the following conditions:

- When a table is ready to be created in a segmented table space with the CREATE TABLE statement.
- When a record is inserted/loaded into a segmented table and free space is not available from existing segments.

This abend reason code is issued by the following CSECTs: DSNISEGF, DSNISGNS

System Action: A 'resource not available' code is returned to the end user and the requested action is not performed.

User Response: Notify the system programmer to reclaim some free space in the associated segmented table space and rerun the job.

System Programmer Response: An SQLCODE -904 is issued, and/or message DSNT501I is issued. The segmented table space name is identified in SQLCA and/or in the DSNT501I message. If the requested function is the CREATE TABLE statement, create the table in a different segmented table space. Otherwise, run the DB2 REORG utility to attempt to reclaim additional free space. If no free space can be reclaimed, then notify the database administrator to redistribute the data into different table spaces.

Problem Determination: For more information, refer to the explanation of message DSNT501I in Chapter 18, "DSNT... Messages," on page 417.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 37.

00C900A5

Explanation: The temporary file(s) is full or the maximum number of extensions for a VSAM data set(s) has been exceeded for all temporary files or the volume(s) has no space available in which to extend.

This reason code is issued by the following CSECT: DSNIXWKF

System Action: The reason code appears in a DSNT501I message, and the requested operation is not performed.

User Response: If the reason code appears in a DSNT501I message, issue -DISPLAY THREAD to determine the total number of concurrent users. If there were a large number of users using temporary file(s), resubmit the job when concurrent users are low. IDCAMS LISTCAT may be used to determine the VSAM data set(s) space allocations.

- If there was no space available on a volume(s), then clear space from the volume(s) or add more volumes to the STOGROUP or redefine the VSAM data set to concatenate more volumes.
- If the maximum number of extensions has been exceeded for the VSAM data set(s), then ALTER or delete and redefine the temporary data set(s) with a larger size.
- If all the temporary files are full, then create or define more temporary files.

Issue the -START DATABASE command to start the temporary file.

Problem Determination: The requested operation is not performed. An SQLCODE -904 or message DSNT501I is issued, and/or message DSNT501I is issued. For more information, refer to SQLCODE -904 in SQL Return Codes, Part 2, "SQL return codes," on page 11, or to the description of the DSNT501I message in Part 3, "DB2 messages," on page 157.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 32, 10, and definitions of temporary file(s) involved in the error.

00C900A6

Explanation: Access to the catalog was requested but denied because the catalog was not migrated to the current release level. The object in the catalog is available after the catalog is migrated.

This abend reason code is issued by the following CSECT: DSNICUBC

System Action: The operation is not allowed. The data manager function that detected this condition returns 'resource not available' to its invoker.

Operator Response: Notify the system programmer.

System Programmer Response: To perform the operation on the object, you must migrate the catalog to the current release. To do this, run DSNTIJTC. Refer to Part 2 of *DB2 Installation Guide* for information about this job.

Problem Determination: The requested operation is not performed. SQLCODE -904 and message DSNT501I are issued. For more information refer to the SQL Return Code section or to the description of the DSNT501I message in Chapter 18, "DSNT... Messages," on page 417.

00C900A7

Explanation: At allocation of a bound plan or a bound package, a lock inconsistency is detected. A DB2 internal bind error is probably responsible for this condition. The plan or the package cannot be allocated.

00C900A8 • 00C900AB

This reason code is issued by the following CSECT:
DSNIALLC

System Action: The plan or the package is not allocated. A DSNT5011 message is issued and an SQLCODE -923 is returned to the application.

System Programmer Response: Re-bind the plan or the package.

Problem Determination: If the problem persists after the plan or the package is rebound, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5, 32, 33.

00C900A8

Explanation: The table space, index, or partition could not be started because of a failure to acquire the lock. Activity on the table space, index, or partition must quiesce before the START DB ACCESS(FORCE) command can acquire the necessary lock.

The abend reason code is issued by the following CSECT: DSNISTFO

System Action: The START operation is not performed.

User Response: Wait for all activity on the table space, index, or partition to complete before reissuing the START command.

Problem Determination: The requested operation is not performed. Message DSNI002I is issued. For more information, refer to the description of this message in Chapter 10, "DSNI... Messages," on page 285. If the problem persists after all activity on the table space, index, or partition completes, gather diagnostic information to pursue the problem.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5, 32, 33

00C900A9

Explanation: An attempt was made to allocate a resource that is deferred.

The abend reason code is issued by the following CSECT: DSNIDBCN

System Action: The allocation process is not allowed.

User Response: Determine the reason for which the resource was deferred and take the appropriate action to correct the problem. Such actions include issuing the

START DATABASE command or running the RECOVER TABLESPACE, RECOVER INDEX, RECOVER, or LOAD REPLACE utility.

Problem Determination: The requested operation is not performed. An SQLCODE -904 is issued, and/or message DSNT500I or DSNT501I is issued. For more information, refer to the SQL return code or to the description of the DSNT500I or DSNT501I message. SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5, 32, 33

00C900AA

Explanation: The table space or index space could not be stopped because it is indoubt.

The abend reason code is issued by the following CSECTS: DSNILSTS DSNIPDBA

System Action: The STOP operation is not performed.

User Response: Resolve the indoubt unit of recovery (UR) using the RECOVER INDOUBT command.

Problem Determination: Message DSNI003I is issued. For more information, refer to the description of this message. If the problem persists after all indoubts with locks on the table space/index space are resolved, gather diagnostic information to pursue the problem.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5, 32,

00C900AB

Explanation: An attempt was made to access a resource that is in the restart pending state.

System Action: The use of the resource is not allowed.

System Programmer Response: Use the DISPLAY THREAD TYPE(POSTPONED) to determine the status of the resource.

Use the RECOVER POSTPONED command if recover has not already been started.

Problem Determination: The requested operation is not performed because the table space might be in an inconsistent state. An SQLCODE -904 is issued. For more information, refer to the "Section 2. SQL Return Codes" in topic A.2 or to the description of the DSNT5011 messages in "Section 3. DSNT Messages" in topic A.3.

00C900AC

Explanation: The DB2 subsystem currently serves as a remote site tracker system. Users cannot have write access for tracker systems, and a tracker DB2 will not allow the use of any SQL statement that requires write access.

System Action: DB2 cannot process the operation.

System Programmer Response: None.

Problem Determination: A tracker DB2 does not allow the use of any SQL statement that requires write access, such as DDL, GRANT/REVOKE, INSERT, DELETE, or UPDATE. DB2 issues SQL code -904 in conjunction with this message. You can also find more information in the description for message DSNT5011, which DB2 issues along with this reason code.

Additionally, a tracker DB2 does not allow the START DATABASE command to perform LPL/GRECP recovery. If you attempt a START DATABASE command on a tracker DB2, DB2 will issue message DNSI0051 with this reason code.

00C900AD

Explanation: An attempt was made to access a resource that is in the REORG pending state.

This reason code is issued by the following CSECT:

System Action: The use of the resource is not allowed.

System Programmer Response: Use the REORG utility with SHRLEVEL(NONE) PART n1:n2 to resolve the REORG pending state. The following methods may be used to resolve the REORD pending state:

- REORG SHRLEVEL(NONE) PART (m:n)
- LOAD REPLACE tablespace
- DROP tablespace

Problem Determination: The requested operation is not performed because the table space might be in an inconsistent state. A SQLCODE -904 is issued.

00C900AE

Explanation: An attempt was made to allocate or access an index that is in the rebuild pending status.

This abend reason code is issued by the following CSECTS:

DSNIDBCJ DSNIDBCO DSNIDBCQ

System Action: The use of the object is not allowed.

User Response: Determine when the resource is available for use and rerun the job.

Operator Response: Determine whether the REBUILD utility should be run to complete recovering the object.

Problem Determination: The requested operation is not performed because the index may be in an inconsistent state. An SQLCODE -904 and/or message DSNT5011 and/or message DSNI0051 is issued. For more information, refer to Part 2, "SQL return codes," on page 11, or to the description of the DSNT5011 message in Chapter 18, "DSNT... Messages," on page 417.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5.

00C900BA

Explanation: A request for a drain lock for the resource identified by NAME in messages DSNT5001 and DSNT5011 could not be granted. The request waited for a period longer than the maximum specified by the installation.

This reason code is issued by the following CSECT: DSNILMCL

System Action: The requested action is not performed. The Data Manager function that detected this condition returns 'resource not available' to its caller.

User Response: Wait for all jobs that hold a drain lock on the resource in an incompatible state to complete before reissuing the failing statement. To display drain locks, issue a DISPLAY DB LOCKS command. In order to avoid a potential deadlock, the application should either commit or roll back to the previous COMMIT.

System Programmer Response: See SQLCODE -913 or -911 and/or message DSNT5011, which accompany this abend reason code.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5, 32, 35.

00C900BC

Explanation: The statement depleted the record identifier (RID) storage available.

This abend reason code is issued by the following CSECT: DSNIREFS

System Action: The requested action is not performed.

Operator Response: Notify the system programmer.

System Programmer Response: Restructure the SQL statement so that fewer RIDs are needed. The best way to do this is to split the statement into two or more SQL statements equivalent to the original statement. Also, in some cases, increasing the virtual storage might eliminate the times when storage is depleted.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: SQL return code -904 and/or message DSNT500I is issued. For more information, refer to the explanation of message DSNT500I.

00C900BE

Explanation: DB2 is unable to acquire a lock on a resource because another DB2 subsystem in the DB2 data sharing group holds an incompatible retained lock on that resource. Retained locks are locks that persist across DB2 abnormal terminations.

System Action: The requested action is not performed. SQLCODE -904 is issued. A 'resource not available' code is returned to the user. This reason code and the resource name are returned in the cursor table (CT) and made available to the user in the SQLCA.

Problem Determination: SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK13, VRARRK14, and VRARRK15.

This reason code is issued by the following CSECT: DSNILMCL

00C900BF

Explanation: DB2 is unable to obtain a lock because IRLM detected an 'out of record list' storage condition. The record list is that part of the coupling facility lock structure that contains the 'modify locks' (those locks that would be retained in case of a failure).

This reason code is issued by the following CSECT: DSNILMCL

System Action: SQLCODE -904 is returned to the user with this reason code. This reason code and the resource name are returned in the cursor table (CT) and

made available to the user in the SQLCA. If it is active, an IFCID 0021 trace record is written and might contain additional diagnostic information.

System Programmer Response: If this becomes a prevalent problem, you will need to redistribute the coupling facility lock structure storage resource to make more room for the record list. You can do this in one of two ways:

- issue a rebuild, or
- dynamically change the lock structure size

See Chapter 6 of *DB2 Data Sharing: Planning and Administration* for more details about these options.

00C900C0

Explanation: A request for an internal lock could not be granted. The request waited for a longer period than is allowed.

This reason code is issued by the following CSECT: DSNILMCL

System Action: The request action is not performed. A 'resource not available' reason code is returned to the caller.

User Response: If the user is a DB2 utility, rerun or restart the utility. If it is a DB2 command, reissue the command. DB2 applications should either commit or roll back to the previous commit, then retry from the commit point.

System Programmer Response: See SQLCODE -911 or -913 and/or message DSNT500I, which accompany this reason code. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00C900C1

Explanation: An attempt was made to allocate an index that has one or more logical partitions in a rebuild pending state.

System Action: Use of the object is not allowed.

User Response: Determine when the resource is available for use and rerun the job.

Operator Response: Determine when the REBUILD utility should be run to complete recovering the object. Only the logical partitions marked as rebuild pending need to be recovered.

Problem Determination: The requested operation is not performed because the index might be in an inconsistent state. An SQLCODE -904 or message DSNT501I is issued. For more information, refer to the SQL return code in Part 2, "SQL return codes," or to the description of the DSNT501I.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on

identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5, 32, 72.

00C900C4

Explanation: An attempt was made to insert values into a table that has a ROWID column with the *generated by default* attribute but no index exists to enforce its uniqueness.

System Action: The use of the table is not allowed.

System Programmer Response: Create a unique single column index for the ROWID column.

Problem Determination: The requested operation is not performed. An SQLCODE -904 is issued. For more information, refer to the Part 2, "SQL return codes," on page 11 or to the description of the DSNT5011 messages in Chapter 18, "DSNT... Messages," on page 417.

00C900C5

Explanation: An attempt was made to access a table space that is in the auxiliary check pending state (ACHKP).

System Action: The operation is not allowed. DB2 returns 'resource not available' to its invoker.

System Programmer Response: Use the CHECK DATA utility to identify the invalid LOBs. Use the SQL UPDATE statement to replace the invalid LOBs or the SQL DELETE statement to remove the rows with the invalid LOBs. After rectifying all invalid LOBs, run CHECK DATA again to clear the ACHKP state from the table space.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

An SQLCODE -904 is issued. Message DSNT500I or message DSNT501I may also be issued. For more information, refer to the Part 2, "SQL return codes," on page 11 or to the description of the DSNT500I and DSNT501I messages in Chapter 18, "DSNT... Messages," on page 417.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5.

00C900C6

Explanation: DB2 detected an uncommitted write on an index being altered to change the type during the same commit scope. This is not allowed. Commit or rollback all changes to an index before alter index convert type is used to change the index type.

System Action: The alter index convert type of the index is not allowed.

System Programmer Response: The requested operation is not performed and SQLCODE -904 is issued. For more information, refer to the SQL code in "Section 2. SQL Return Codes". Commit or rollback changes to the index and retry the Alter Index convert type.

Problem Determination: The requested operation is not performed and SQLCODE -904 is issued. For more information, refer to the SQL return code in "Section 2. SQL Return Codes."

00C900C7

Explanation: The requested function was either:

- not supported by the current release or maintenance level of DB2, or
- deactivated by a modified the system parameters.

In the former case, the NAME field of the accompanying message indicates the required level of maintenance. In the latter case, the NAME field indicates the deactivating system parameter.

System Action: The requested action is not performed.

User Response: Inform the system administrator.

System Programmer Response: To permit the use of the function, take the appropriate actions according to the situation. Apply the indicated maintenance, migrate to the indicated release of DB2, or use an alternate setting for the indicated system parameter.

00C900C8

Explanation: Access to the index is disallowed within the same commit scope as an ALTER TABLE statement that alters the key column in the index. If the ALTER TABLE statement failed, then commit the changes to the index and retry the ALTER TABLE statement. If an INSERT, DELETE, UPDATE, or SELECT statement failed, then commit the ALTER and retry the statement.

System Action: The operation is not allowed.

User Response: Commit and then retry the operation.

00C900C9

Explanation: After being expanded to process triggers, a row has grown too large to fit into a 32K page of a workfile.

System Action: DB2 does not perform the requested operation.

Programmer Response: Drop and recreate triggers to use less LOB columns as transition variables, or eliminate the use of the ROWID column as a transition variable. For a table with LOB columns or a ROWID

00C900CB • 00C900D0

column whose row size is very close to 32K, it may not be possible to use transition tables with triggers.

Problem Determination: DB2 does not perform the requested operation. DB2 issues SQL code -904, and may also issue message DSNT500I or DSNT501I. For more information, refer to Part 2, "SQL return codes," on page 11, or to the description of the DSNT500I and DSNT501I messages in Chapter 18, "DSNT... Messages," on page 417.

Collect the following terms listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5, 37.

00C900CB

Explanation: Resource is unavailable because the resource is in a refresh pending state.

System Action: The use of the resource is not allowed.

Problem Determination: DB2 does not perform the requested operation because the table space or index space might be in an inconsistent state. DB2 issues SQL code -904. For more information, refer to the SQL return code, or to the description of the DSNT501I message.

00C900CC

Explanation: DB2 does not accept the NOBACKOUT request during the rollback of a non-global transaction while the backout of catalog changes is in progress.

System Action: DB2 rejects the NOBACKOUT request.

Problem Determination: DB2 does not perform the requested operation because the backout in progress must be complete before the NOBACKOUT request can succeed. Wait for the backout to complete, then reissue the request.

00C900CD

Explanation: DB2 does not accept the NOBACKOUT request during the rollback of a non-global transaction. At least one of the objects of the transaction is shared by another transaction.

This reason code is issued by the following CSECT: DSNILABR

System Action: DB2 rejects the NOBACKOUT request.

Problem Determination: DB2 does not perform the requested operation because at least one object involved in the operation is also updated by other active transactions in DB2. Wait for the other transactions to finish, then reissue the request.

00C900CE

Explanation: Resource is unavailable because the resource is in a state that is incompatible with this version of DB2.

System Action: DB2 does not allow the use of the resource.

Problem Determination: DB2 does not perform the requested operation because the table space or index space might be in an inconsistent state. DB2 issues SQL code -904. For more information, refer to the SQL return code or to the description of the DSNT501I message.

00C900CF

Explanation: DB2 was unable to open the specified object because it is one of the following types:

1. A Type 1 index
2. An index with a data set password
3. A table space with a data set password
4. An ROSHARE database

The reason code and object name are in the SQL communication area or in related messages.

System Action: Use of the object is not allowed.

User Response: Use the ALTER INDEX, ALTER TABLESPACE, or ALTER DATABASE command to put the object into a supported state. DROP can also be used if the object is no longer needed.

Problem Determination: The requested operation is not performed. A resource unavailable code is returned to the user.

00C900D0

Explanation: An attempt was made to access a value in a column with one of the LOB data types (BLOB, CLOB, DBCLOB), but the value of the column is no longer valid.

System Action: The operation is not allowed. DB2 returns 'resource not available' to its invoker.

System Programmer Response: Use the CHECK LOB utility to identify the invalid LOBs. Use update to replace or delete the invalid LOBs.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The requested operation is not performed. An SQLCODE -904 is issued. Message DSNT500I or message DSNT501I may also be issued. For more information, refer to the Part 2, "SQL return codes," on page 11 or to the description of the DSNT500I and DSNT501I messages in Chapter 18, "DSNT... Messages," on page 417.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5.

00C900D1

Explanation: The amount of space allowed for processing LOB values by a user has been exceeded. The amount of space allowed per user is indicated by panel DSNTIP7.

This reason code is issued by the following CSECTs: DSNOTCSO

System Action: The operation is not allowed. DB2 returns 'resource not available' to its invoker.

System Programmer Response:

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The requested operation is not performed. An SQLCODE -904 is issued. Message DSNT500I or message DSNT501I may also be issued. For more information, refer to the Part 2, "SQL return codes," on page 11 or to the description of the DSNT500I and DSNT501I messages in Chapter 18, "DSNT... Messages," on page 417.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5.

00C900D2

Explanation: The amount of space allowed for processing LOB locators for a system has been exceeded. The amount of space allowed for a system is indicated by panel DSNTIP7.

This reason code is issued by the following CSECTs: DSNOTCSO

System Action: The operation is not allowed. DB2 returns 'resource not available' to its invoker.

System Programmer Response:

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The requested operation is not performed. An SQLCODE -904 is issued. Message DSNT500I or message DSNT501I may also be issued. For more information, refer to the Part 2, "SQL return codes," on page 11 or to the description of the DSNT500I and DSNT501I messages in Chapter 18, "DSNT... Messages," on page 417.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5.

00C900D3

Explanation: No more space in the data space is available for processing LOB values.

This reason code is issued by the following CSECTs: DSNOTCSO

System Action: The operation is not allowed. DB2 returns 'resource not available' to its invoker.

System Programmer Response:

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The requested operation is not performed. An SQLCODE -904 is issued. Message DSNT500I or message DSNT501I may also be issued. For more information, refer to the Part 2, "SQL return codes," on page 11 or to the description of the DSNT500I and DSNT501I messages in Chapter 18, "DSNT... Messages," on page 417.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5.

00C90101

Explanation: The data manager detected an internal error within DB2. This error may indicate inconsistent data or an error in internal DB2 control structures or code.

This abend reason code is issued by the following CSECT: DSNnnnnn

'nnnnn' is the CSECT name identifier given in VRARRK5 of the VRA in the SDWA (see the Problem Determination section of this message). 'DSNnnnnn' is the full CSECT name given in the dump title.

Possible causes of this error include:

- Improper migration or fall back procedures,
- DB2 directory and DB2 Catalog restored to different points in time,
- Table space restored improperly,
- An internal DB2 failure.

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

User Response: Notify the system programmer.

Operator Response: Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: If this abend occurred while

00C90102 • 00C90105

processing data in one or more pages, message DSNIO14I is issued to identify each page involved. In general, the data in these pages is fine. However, if problems are reported that repeatedly involve the same pages or if the same pages are reported by other abends, you may want to analyze the set of pages specified.

Run the CHECK utility to determine the extent of index inconsistency if:

- The page type indicated in message DSNIO14I is index.
- The page type indicated in message DSNIO14I is data.
- There is an index defined on a table in the indicated page set.

The LOC keyword in the dump title gives the Load-module.CSECT:qualifier of the location where the abend occurred. 'Qualifier' is a unique, 4-digit hexadecimal number that identifies the place within the source module (CSECT) where the abend was issued.

Refer also to Table 4 in Appendix B, "Problem determination," on page 1353 for further information on DSN1COPY misuse.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 31, 32, 33, 40, 41.

If the abend reason code was issued by a CSECT with name DSNNGxxxx, where 'xxxx' is any value, make a copy of DSNDB01.DBD01, DSNDB01.SCT02, and DSNDB01.DSNSCT02 on tape with DSN1COPY. This might be a large copy.

00C90102

Explanation: An inconsistent page was detected. This has been caused by a DB2 internal error.

This abend reason code is issued by the following CSECT: DSNIBROK

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields

for this code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

In addition, the following general purpose registers (GPRs) contain the indicated diagnostic information:

GPR	Content
2	Address of the page set block (PB)
3	Address of the log record, if any
8	Address of the buffer block (BB)
9	Address of the page buffer

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 6, 13, 32.

00C90103

Explanation: Bad data was returned from either the edit or the validation exit.

This abend reason code is issued by the following CSECTS: DSNIREDR, DSNIENSR

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: SYS1.LOGREC contains the same diagnostic information in the variable recording area (VRA) as in abend reason code '00C90101'. Refer to the table accompanying that abend reason code for details.

The '00C90103' abend reason code was issued because one of the checks described in the following list failed:

- Save first and last byte of the input record. On return from exit, see if either group has been modified. If so, abend.
- Check length of edited data. If greater than maximum allowed for this row, or less than one, abend.
- Store a special character in the first byte past the end of the output area (place for edit procedure to put edited or (original unedited) row), to make sure the exit doesn't overrun this area. On return, check if it is still the same special character. If not, abend.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

00C90105

Explanation: An inconsistent page was detected. This has been caused by a DB2 internal error.

This abend reason code is issued by the following CSECT: DSNIBROK

System Action: A record is written to SYS1.LOGREC, an SVC dump is requested, and the page will be scheduled for automatic recovery. If automatic recovery is successful, message DSNB215I is issued. If automatic recovery fails, message DSN1012I is issued, and an abend '04E' with reason code 00C90102 will occur.

Note: If the resource required for automatic recovery is in use, automatic recovery will be delayed until the resource is available.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9. Exceptions to the table definitions of the VRA fields are:

- VRARRK5 is the name of the module that called the check page routine that detected the error in the page.
- VRARRK6 identifies the error in the page.

The following general purpose registers (GPRs) contain the indicated diagnostic information:

GPR	Content
2	Address of the page set block (PB)
3	Address of the log record, if any
8	Address of the buffer block (BB)
9	Address of the page buffer

Refer also to Table 4 in Appendix B, "Problem determination," on page 1353 for further information on DSN1COPY misuse.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 6, 13, 32.

00C90106

Explanation: The entry is not found for a table space that is being set for deferred restart. An error in DB2 logic is probably responsible for this condition.

This abend reason code is issued by the following CSECT: DSNIIIMP

System Action: A record is written to SYS1.LOGREC, an SVC dump is requested, and the DB2 restart is terminated.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 32, 33.

00C90107

Explanation: At commit phase 1, a nonzero write intent count was detected. An error in DB2 logic is probably responsible for this condition.

This abend reason code is issued by the following CSECT: DSNICMT2

System Action: A record is written to SYS1.LOGREC, an SVC dump is requested. The thread is aborted.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 31, 32, 33.

00C90108

Explanation: At commit phase 2, a nonzero read intent count or write intent count was detected. An error in DB2 logic is probably responsible for this condition.

This abend reason code is issued by the following CSECT: DSNICMT2

System Action: A record is written to SYS1.LOGREC, and a SVC dump is requested. The thread is committed and the application is allowed to continue without notification of the error.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 31, 32, 33.

00C90109

Explanation: At deallocate, a nonzero read intent count or write intent count was detected. An error in DB2 logic is probably responsible for this condition.

This abend reason code is issued by the following CSECT: DSNIDALC

System Action: A record is written to SYS1.LOGREC, and a SVC dump is requested. The thread is deallocated normally.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 31, 32, 33.

00C90110

Explanation: The data manager detected an inconsistent data condition. This may be caused by an inconsistency in either the DB2 catalog or the DB2 directory. In this case, the OBD for the requested OBID cannot be located in the database descriptor (DBD). The DBD in storage may be inconsistent. Specifically, the OBDDMAP(OBID) array element should contain an offset into the DBD where the OBD should be located. However, in this case the OBD expected was not at the indicated offset.

To prevent further damage and possible loss of data, the inconsistency must be corrected before any further SQL access is attempted to this database.

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which databases were being used when the error occurred. Prevent further SQL access to the databases. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The DBD in use at the time of the abend is inconsistent in storage and may be inconsistent on DASD. Since the nature and extent of the damage done to the DBD is not immediately known, an analysis of the entire DBD must be done.

The inconsistency may be due to:

- Incomplete recovery of DB2 catalog and/or DB2 directory.
- Invalid restore of DB2 catalog and/or DB2 directory to a prior point in time.
- A conditional restart which bypassed recovery of either the DSNDB01.DBD01 page set or the DSNDB06.SYSDBASE page set.
- A DB2 internal error.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5, 69, 70, 71, 72.

00C90111

Explanation: The data manager detected an inconsistent data condition. In this case, the OBD for the requested OBID does not exist. This may be caused by an inconsistency in either the DB2 catalog or the DB2 directory. Specifically, the OBDDMAP(OBID) entry is zero rather than an offset to an OBD within the DBD.

To prevent further damage and possible loss of data, the inconsistency must be corrected before any further

SQL access is attempted to this database.

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which databases were being used when the error occurred. Prevent further SQL access to the databases. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Since the DB2 directory does not agree with the DB2 catalog, either of these may be inconsistent. Since the nature and extent of the inconsistency between the DB2 catalog the DBD is not immediately known, an analysis of the entire DBD must be done.

The inconsistency may be due to:

- Incomplete recovery of DB2 catalog and/or DB2 directory.
- Invalid restore of DB2 catalog and/or DB2 directory to a prior point in time.
- A conditional restart which bypassed recovery of DSNDB01.DBD01 or DSNDB06.SYSDBASE page sets.
- A DB2 internal error.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5, 69, 70, 71, 72.

00C90112

Explanation: The data manager detected an inconsistent data condition. There may be more than one object with the same OBID in the DB2 Catalog. To prevent further damage and possible loss of data, the inconsistency must be corrected before any further SQL access is attempted to this database.

This abend reason code is issued by the following CSECT: DSNNGDCOB

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which databases were being used when the error occurred. Prevent further SQL access to the databases. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Since the extent of this inconsistency is not immediately known, an analysis of the entire DBD must be done.

The inconsistency may be due to:

- Incomplete recovery of the DB2 Catalog and/or the DB2 Directory.

- Invalid restore of the DB2 Catalog and/or the DB2 Directory to a prior point in time.
- A conditional restart which bypassed recovery of DSND01.DBD01 or DSND06.SYSDBASE page sets.
- A DB2 internal error.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5, 69, 70, 71, 72.

00C90124

Explanation: An attempt was made to apply prior-version/release DB2 log records other than checkpoint records.

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

User Response: Notify the system programmer.

Operator Response: Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting problems.

Problem Determination: This abend can occur in migration/remigration when some necessary migration/remigration steps are skipped. It indicates that some DB2 activity occurred or was pending after the last complete checkpoint on the prior system. See Part 2 of *DB2 Installation Guide* for a complete list of migration/remigration steps. If this was the cause of the problem, it can be corrected by falling back to the prior version/release long enough to bring DB2 up, then bring it down while conforming to all migration/remigration steps. Pay specific attention to resolving all indoubts and to performing a stop mode quiesce.

00C90202

Explanation: The data manager detected an inconsistent data condition. In this case, one of the pointers in a link does not point to a valid child or parent row (that is, the link is 'broken'). The pointer, the target row, or the page that contains the pointer or target row is in error.

This abend reason code is issued by the following CSECT: DSNnnnnn

'nnnnn' is the CSECT name identifier given in VRARRK5 of the VRA in the SDWA (see the Problem Determination section of this message). 'DSNnnnnn' is the full CSECT name given in the dump title.

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

User Response: Notify the system programmer.

Operator Response: Collect the console output from the system on which the job was run for the period of time spanning the failure. Save the output for use in problem determination.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Message DSN1013I is issued to identify the data pages. It identifies the database name and table space name. This message is issued for all pages in use at the time of the abend. Within this group of pages, at least one page is involved in the inconsistency. The other pages were present at the time of the abend.

The LOC keyword in the dump title gives the Load-module.CSECT:qualifier of the location where the abend occurred. 'Qualifier' is a unique, 4-digit hexadecimal number that identifies the place within the source module (CSECT) where the abend was issued.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 31, 32, 33, 42.

00C90203

Explanation: The data manager detected an inconsistent data condition. In this case, one of the pointers in a hash chain does not point to a valid row or anchor (that is, the hash chain is 'broken'). The pointer, the target row/anchor, or the page that contains the pointer or target row/anchor is in error.

This abend reason code is issued by the following CSECT: DSNnnnnn

'nnnnn' is the CSECT name identifier given in the dump header and appearing in VRARRK5 of the VRA in the SDWA (see the Problem Determination section of this message). 'DSNnnnnn' is the full CSECT name given in the dump title.

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

User Response: Notify the system programmer.

Operator Response: Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide*

and *Reference* for information on identifying and reporting the problem.

Problem Determination: Message DSNI013I is issued to identify the data pages. It identifies the database name and the table space name. This message is issued for all pages in use at the time of the abend. Within this group of pages, at least one page is involved in the inconsistency. The other pages were present at the time of the abend.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

The LOC keyword in the dump title gives the Load-module.CSECT:qualifier of the location where the abend occurred. 'Qualifier' is a unique, 4-digit hexadecimal number that identifies the place within the source module (CSECT) where the abend was issued.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 31, 32, 33, 42.

00C90205

Explanation: The data manager detected an inconsistent data condition. In this case, a row obtained from an index entry does not point to a valid row in a data page. The error is probably caused by an extra index entry, but it could also result from a table update not being redone when it should have been.

This abend reason code is issued by the following CSECT: DSNnnnnn

'nnnnn' is the CSECT name identifier given in the dump header and appearing in VRARRK5 of the VRA in the SDWA (see the Problem Determination section of this message). 'DSNnnnnn' is the full CSECT name given in the dump title.

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

User Response: Notify the system programmer.

Operator Response: Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Message DSNI013I is issued to identify the index page. It identifies the database name, table space name, and index space name. This message is issued for all pages in use at the time of the abend. Within this group of pages, at least one page is involved in the inconsistency. The other pages were

present at the time of the abend.

Run the CHECK utility to determine the extent of index inconsistency if:

- The page type indicated in message DSNI014I is index
- The page type indicated in message DSNI014I is data
- There is an index defined on a table in the indicated page set.

The LOC keyword in the dump title gives the Load-module.CSECT:qualifier of the location where the abend occurred. 'Qualifier' is a unique, 4-digit hexadecimal number that identifies the place within the source module (CSECT) where the abend was issued.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 31, 32, 33, 41, 42.

00C90206

Explanation: The data manager detected an inconsistent data condition. In this case, a row that should be pointed to by an index does not have an index entry. The error is probably caused by a missing index entry, but it could also be caused by a table update that was not backed out when it should have been.

This abend reason code is issued by the following CSECT: DSNnnnnn

'nnnnn' is the CSECT name identifier given in the dump header and appearing in VRARRK5 of the VRA in the SDWA (see the Problem Determination section of this message). 'DSNnnnnn' is the full CSECT name given in the dump title.

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

User Response: Notify the system programmer.

Operator Response: Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Message DSNI013I is issued to identify the data pages. It identifies the database name, table space name, and index space name. This

message is issued for all pages in use at the time of the abend. Within this group of pages, at least one page is involved in the inconsistency. The other pages were present at the time of the abend.

Run the CHECK utility to determine the extent of index inconsistency if:

- The page type indicated in message DSN1014I is index
- The page type indicated in message DSN1014I is data
- There is an index defined on a table in the indicated page set.

The LOC keyword in the dump title gives the Load-module.CSECT:qualifier of the location where the abend occurred. 'Qualifier' is a unique, 4-digit hexadecimal number that identifies the place within the source module (CSECT) where the abend was issued.

Refer also to Appendix B, "Problem determination," on page 1353 Table 4 for further information on DSN1COPY misuse.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 31, 32, 33, 41, 42.

00C90207

Explanation: The data manager detected an inconsistent data condition. In this case, a pointer record does not point to a valid overflow record. The pointer record, the overflow record, or the page that contains the pointer or overflow record is in error.

This abend reason code is issued by the following CSECT: DSNnnnnn

'nnnnn' is the CSECT name identifier given in the dump header and appearing in VRARRK5 of the VRA in the SDWA (see the Problem Determination section of this message). 'DSNnnnnn' is the full CSECT name given in the dump title.

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

User Response: Notify the system programmer.

Operator Response: Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

System Programmer Response: If you suspect an error in DB2, for information on identifying and reporting the problem.

Problem Determination: Message DSN1013I is issued to identify the data pages. It also identifies the database name and the table space name. This message is issued for all pages in use at the time of the abend. Within this group of pages, at least one page is involved in the inconsistency. The other pages were present at the time of the abend.

The LOC keyword in the dump title gives the Load-module.CSECT:qualifier of the location where the abend occurred. 'Qualifier' is a unique, 4-digit hexadecimal number that identifies the place within the source module (CSECT) where the abend was issued.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 31, 32, 33, 42.

00C90210

Explanation: The data manager detected an inconsistent data condition. In this case, the subpage directory of an index leaf page indicates that a given search key doesn't belong to any of the subpages. Either this leaf page is the index tree or the nonleaf portion of the index tree lead to this leaf page as the one that should contain the given key.

This abend reason code is issued by the following CSECT: DSNnnnnn

'nnnnn' is the CSECT name identifier given in the dump header and appearing in VRARRK5 of the VRA in the SDWA (see the Problem Determination section of this message). 'DSNnnnnn' is the full CSECT name given in the dump title.

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

User Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Message DSN1013I is issued to identify the index page. It also identifies the database name and index space name. This message is issued for all pages in use at the time of the abend. Within this group of pages, at least one page is involved in the inconsistency. The other pages were present at the time of the abend.

The LOC keyword in the dump title gives the Load module.CSECT:qualifier of the location where the abend occurred. 'Qualifier' is a unique, 4-digit hexadecimal number that identifies the place within the source module (CSECT) where the abend was issued.

Refer also to Appendix B, "Problem determination," on page 1353 Table 4 for further information on DSN1COPY misuse.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 31, 32, 33, 43.

00C90211

Explanation: The data manager detected an inconsistent data condition. In this case, a row is missing a column that is not nullable and does not allow default values.

This abend reason code is issued by the following CSECT: DSNnnnnn

'nnnnn' is the CSECT name identifier given in the dump header and appearing in VRARRK5 of the VRA in the SDWA (see the Problem Determination section of this message). 'DSNnnnnn' is the full CSECT name given in the dump title.

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

User Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Message DSNI013I is issued to identify the data page. It also identifies the database name and table space name. This message is issued for all pages in use at the time of the abend. Within this group of pages, at least one page is involved in the inconsistency. The other pages were present at the time of the abend.

The LOC keyword in the dump title gives the Load module.CSECT:qualifier of the location where the abend occurred. 'Qualifier' is a unique, 4-digit hexadecimal number that identifies the place within the source module (CSECT) where the abend was issued.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 31, 32, 33, 42, 62.

00C90212

Explanation: The data manager detected an inconsistent data condition. In this case, there is an empty index leaf page other than the root. (DB2 removes empty pages from the index tree.)

This abend reason code is issued by the following CSECT: DSNnnnnn

'nnnnn' is the CSECT name identifier given in the dump header and appearing in VRARRK5 of the VRA in the SDWA (see the Problem Determination section of this message). 'DSNnnnnn' is the full CSECT name given in the dump title.

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

User Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Message DSNI013I is issued to identify the index leaf page. It also identifies the database name and index space name. This message is issued for all pages in use at the time of the abend. Within this group of pages, at least one page is involved in the inconsistency. The other pages were present at the time of the abend.

Run the CHECK utility to determine the extent of index inconsistency if:

- The page type indicated in message DSNI014I is index.
- The page type indicated in message DSNI014I is data.
- There is an index defined on a table in the indicated page set.

The LOC keyword in the dump title gives the Load module.CSECT:qualifier of the location where the abend occurred. 'Qualifier' is a unique, 4-digit hexadecimal number that identifies the place within the source module (CSECT) where the abend was issued.

Refer also to Appendix B, "Problem determination," on page 1353 Table 4 for further information on DSN1COPY misuse.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 31, 32, 33, 41, 43.

00C90213

Explanation: The data manager detected an inconsistent data condition. In this case, a row has an unexpected OBID stored in its prefix. A possible cause is that the table space was restored (via DSN1COPY or similar tool) improperly. For example, the wrong data set was copied for the given table space.

This abend reason code is issued by the following CSECT: DSNnnnnn

'nnnnn' is the CSECT name identifier given in the dump header and appearing in VRARRK5 of the VRA in the SDWA (see the Problem Determination section of this message). 'DSNnnnnn' is the full CSECT name given in the dump title.

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

User Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Message DSN1013I is issued to identify the data page. It also identifies the database name and table space name. This message is issued for all pages in use at the time of the abend. Within this group of pages, at least one page is involved in the inconsistency. The other pages were present at the time of the abend.

The LOC keyword in the dump title gives the Load module.CSECT: qualifier of the location where the abend occurred. 'Qualifier' is a unique, 4-digit hexadecimal number that identifies the place within the source module (CSECT) where the abend was issued.

Refer also to Table 4 in Appendix B, "Problem determination," on page 1353 for further information on DSN1COPY misuse.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 31, 32, 33, 42, 62.

00C90214

Explanation: The data manager detected a condition of inconsistent data. The description of the index in the index OBD does not match the attributes of an index page. The problems consists of one of the following conditions:

- IPPNUNI does not equal OBDKNUNI,
- IPPTLTH does not equal OBDKLEN,
- IPPOLTH does not equal OBDLENO, or

- If the page is a leaf page, the segmentation flag or number of subpages conflict (IPPNLPG does not equal OBDINLPG or IPPSEGM conflicts with OBDINLPG).

The index space may have been improperly restored by using DSN1COPY or the wrong data set may have been copied for the given index.

This abend reason code is issued by the following CSECT: DSNnnnnn

'nnnnn' is the CSECT name identifier given in VRARRK5 of the VRA in the SDWA. 'DSNnnnnn' is the full CSECT name given in the dump title.

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

User Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Message DSN1013I will be issued for each index page. It identifies the database, and the index name. This message is issued for all pages in use at the time of the abend. Within this group of pages, at least one page is involved in the inconsistency. The other pages were present at the time of the abend.

The LOC keyword in the dump title gives the Load-module.CSECT:qualifier of the location where the abend occurred. 'Qualifier' is a unique, 4-digit hexadecimal number that identifies the place within the source module (CSECT) where the abend was issued.

Refer also to Table 4 in Appendix B, "Problem determination," on page 1353 for further information on DSN1COPY misuse.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 31, 32, 33, 42, 44, 62.

00C90215

Explanation: The data manager detected a condition of inconsistent data. The index manager subcomponent has been passed a key with a key length not equal to the key length in pages of the index. The index space may have been improperly restored by using DSN1COPY or the wrong data set may have been copied for the given index.

00C90216 • 00C90218

This abend reason code is issued by the following CSECT: DSNnnnnn

'nnnnn' is the CSECT name identifier given in VRARRK5 of the VRA in the SDWA. 'DSNnnnnn' is the full CSECT name given in the dump title.

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

User Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

A rebuild index or recover index will restore the index to a correct condition.

Problem Determination: Message DSNI013I will be issued for each index page. It identifies the database, the index name. This message is issued for all pages in use at the time of the abend. Within this group of pages, at least one page is involved in the inconsistency. The other pages were present at the time of the abend.

The LOC keyword in the dump title gives the Load-module.CSECT:qualifier of the location where the abend occurred. 'Qualifier' is a unique, 4-digit hexadecimal number that identifies the place within the source module (CSECT) where the abend was issued.

Refer also to Table 4 in Appendix B, "Problem determination," on page 1353 for further information on DSN1COPY misuse.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 31, 32, 33, 42, 44, 62, 63, 64.

00C90216

Explanation: The data manager has detected an inconsistent data condition. Either the length of a record in a table space is longer than the maximum-defined record length as defined in the DB2 directory or a variable-length column has a longer length than the length defined in the DB2 directory.

This abend reason code is issued by the following CSECTs:

DSNIOSET	DSNIRNXT	DSNIRSET	DSNISFWL
DSNISFX	DSNISRID		

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

User Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Message DSNI013I is issued to identify the data page that contains the record that is longer than allowed by its corresponding record definition. This could occur if the DB2 directory was recovered to a previous point, allowing new object creations (with a shorter record length) to be created having record identifiers identical to objects previously created in the table space. Also the table space may have been improperly restored by using DSN1COPY or the wrong data set may have been copied for the given table space.

Refer also to Table 4 in Appendix B, "Problem determination," on page 1353 for further information on DSN1COPY misuse.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 32, 33, 42, 62, 65, 66.

00C90218

Explanation: The data manager detected an inconsistent data condition in a segmented table space. In this case, an unallocated segment was found on a segment chain.

This abend reason code is issued by the following CSECT: DSNnnnnn

The CSECT name identifier given in the dump header and appearing in VRARRK5 of the VRA in the SDWA is 'nnnnn' (see the Problem Determination section of this message). The full CSECT name given in the dump title is 'DSNnnnnn'.

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested.

User Response: Notify the system programmer.

Operator Response: Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Message DSNI013I is issued to identify the space map page that contains the bad segment entry. The database name and table space name will also be identified.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are:

VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

Refer also to Table 4 in Appendix B, “Problem determination,” on page 1353 for further information on DSN1COPY misuse.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 1, 3, 32, 37.

00C90219

Explanation: The data manager detected an inconsistent data condition in a segmented table space. In this case, an allocated segment was found on a wrong segment chain (that is, a segment chain contains a segment that belongs to a different table).

This abend reason code is issued by the following CSECT: DSNnnnnn

The CSECT name identifier given in the dump header and appearing in VRARRK5 of the VRA in the SDWA is 'nnnnn' (see the Problem Determination section of this message). The full CSECT name given in the dump title is 'DSNnnnnn'.

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested.

User Response: Notify the system programmer.

Operator Response: Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Message DSN1013I is issued to identify the space map page that contains the bad segment entry. The database name and table space name will also be identified.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

Refer also to Table 4 in Appendix B, “Problem determination,” on page 1353 for further information on DSN1COPY misuse.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 1, 3, 32, 37.

00C9021A

Explanation: The data manager detected an inconsistent data condition in a segmented table space. In this case, a data page contains a record which belongs to a table that has not been allocated for the page.

This abend reason code is issued by the following CSECT: DSNnnnnn

The CSECT name identifier given in the dump header and appearing in VRARRK5 of the VRA in the SDWA is 'nnnnn' (see the Problem Determination section of this message). The full CSECT name given in the dump title is 'DSNnnnnn'.

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

User Response: Notify the system programmer.

Operator Response: Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Message DSN1013I is issued to identify the data page that contains the bad data record. The database name and table space name will also be identified.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

Refer also to Table 4 in Appendix B, “Problem determination,” on page 1353 for further information on DSN1COPY misuse.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 1, 3, 32, 37.

00C9021B

Explanation: The data manager detected an inconsistent data condition in a segmented table space. In this case, the space map page indicates a data page that is not empty exists. However, the data page is either not formatted by the data manager or it is beyond the highest VSAM formatted area.

This abend reason code is issued by the following CSECT: DSNnnnnn

The CSECT name identifier given in the dump header and appearing in VRARRK5 of the VRA in the SDWA is 'nnnnn' (see the Problem Determination section of this

00C9021C • 00C9021E

message). The full CSECT name given in the dump title is 'DSNnnnnn'.

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested.

User Response: Notify the system programmer.

Operator Response: Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Message DSN1013I is issued to identify the inconsistent data page and its covering space map page. The database name and table space name will also be identified.

SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 32, 37.

00C9021C

Explanation: While running a utility, the data manager detected an inconsistent data condition. A row was encountered that is not represented by a record OBD in the database descriptor (DBD). This abend may indicate an internal DB2 error, but most likely occurs due to a user error. Possible user errors may include:

- Data from a DB2 subsystem was copied to another DB2 subsystem incorrectly. This is the most common error.
- DSNDB01.DBD01 was regressed to a time prior to a table being created.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This abend reason code is issued by the following CSECTs: DSNIRFNX, DSNISNPG

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested. The dump is required in the event that the problem is determined to be a DB2 internal error.

User Response: Notify the system programmer.

System Programmer Response: Determine if improper procedures were used to restore the table space or DBD that would lead to the inconsistency.

Problem Determination: Message DSN1013I will be issued.

If a DB2 internal error is indicated, collect the following diagnostic items:

- DSN1COPY of the user table space.
- DSN1COPY of DSNDB01.DBD01.

Also collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 31, 32, 33, 37.

00C9021D

Explanation: During a LOAD/REORG utility or termination of a utility, the data manager detected an inconsistent data condition. A space map page was missing from the table space. This abend may indicate an internal DB2 error (caused by the utilities subcomponent passing a bad start position to the data manager), but most likely occurs due to a user error. Possible causes are that the table space data set has been deleted and redefined without DB2's knowledge, or that the table space was incorrectly restored from an improper DSN1COPY of the table space.

This abend reason code is issued by the following CSECT: DSNIDL0D

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested. The dump is required in the event that the problem is determined to be a DB2 internal error.

User Response: Notify the system programmer.

System Programmer Response: Determine if the data set was improperly restored or deleted and redefined by the user. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Message DSN1013I will be issued. If the message information describes page 'xx0001'X of the table space, this indicates that the data set was deleted and redefined without DB2's knowledge.

If a DB2 internal error is indicated, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 10, 12, 31, 32, 33, 37, 43.

00C9021E

Explanation: The data manager detected an inconsistent data condition in a segmented table space. An invalid page was requested. The page number is outside the highest formatted RBA for the page set. Either the segment chain is broken, or the table space has been truncated. A truncated table space could be a possible user error.

This abend reason code is issued by the following CSECTs: DSNISGSC, DSNISNPG

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

User Response: Notify the system programmer.

Operator Response: Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5, 3, 32, 37.

00C9021F

Explanation: The data manager detected an inconsistent data condition in a segmented table space. A duplicate first segment block for a table is found during the rebuilding of the first segment block in a segmented table space. The segment chain may be broken.

This abend reason code is issued by the following CSECT: DSNISEGR

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

User Response: Notify the system programmer.

Operator Response: Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items:

- Console output from the system on which the job was run and a listing of SYSLOG data set for the period of time spanning the failure.
- Listing of SYS1.LOGREC data set, obtained by executing IFCEREP1.
- SVC dump (or system dump), taken to SYS1.DUMPxx data set, as a result of operator initiated dump command or SLIP trap exit.
- SYSPRINT output, including JCL, for the batch job and system messages that were issued
- Definitions of table spaces, tables, and indexes involved in the error
- Listing of the entire table space
- Listing of the DBD, obtained by executing UTILITY DIAGNOSE OBD.

00C90220

Explanation: The data manager detected an inconsistent data condition. In this case, free index page cannot be found in the index space. The problem could be caused by a problem detected by IRLM, such as out-of-storage, or some other problem.

This abend reason code is issued by the following CSECT: DSNISMXF.

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

User Response: Notify the system programmer.

Operator Response: Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Message DSNI013I is issued to identify the data pages. It identifies the database name, table space name, and index space name. This message is issued for all pages in use at the time of the abend. Within this group of pages, at least one page is involved in the inconsistency. The other pages were present at the time of the abend.

From the console output, determine if resource unavailable message DSNT500I/DSNT501I was given prior to the abend. If there is and the reason code given is 00C90092, 00C90093, or 00C90096, then refer to the description of the appropriate message in this book for more information. Otherwise, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 31, 32, 33. Also collect a DSN1COPY output of the tables and indexes before any recover is performed.

00C90221

Explanation: The data manager detected an inconsistent data condition. In this case, a nonsegmented space map page was read for a table space that had been defined as segmented. This problem could be caused by incorrect use of the DSN1COPY service aid or a DB2 internal problem reading the space map page.

This abend reason code is issued by the following CSECT: DSNISGAU

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested.

User Response: Notify the system programmer.

Operator Response: Collect the console output from the system on which the job was run for the period of

00C90222 • 00C90304

time spanning the failure. Save this output for use in problem determination.

System Programmer Response: If you suspect an error in DB2, Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: SYS1.LOGREC contains information in the variable recording area (VRA) of the system diagnostic work area (SDWA). Significant fields for this abend code are: VRARRK5, VRARRK6, VRARRK7, VRARRK8, and VRARRK9.

Refer also to Table 4 in Appendix B, "Problem determination," on page 1353 for further information on DSN1COPY misuse. Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 32, 37.

00C90222

Explanation: While starting DB2, the data manager detected a utility in process (UTUT, UTRO or UTRW) state on an object that originated from Version 2 Release 3. This abend might indicate an internal DB2 error, but most likely occurs because of a user error. A possible user error is a result of not terminating all utilities before migrating to this release.

This abend reason code is issued by the following CSECT: DSNIERST

System Action: The -START DB2 command fails. A record is written to SYS1.LOGREC and an SVC dump is requested. The dump is required if the problem is determined to be a DB2 internal error.

User Response: Notify the system programmer.

System Programmer Response: Determine if an improper procedure was used to migrate to this release. If the utilities were not terminated before migrating, fall back to Version 2 Release 3 and restart DB2. Use the -TERM UTILITY command to terminate utilities, use the -DISPLAY UTILITY command to make sure no utility job is currently active, stop DB2, and remigrate to this release.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 31, 33.

00C90301

Explanation: The data manager detected an internal error with DB2 during RID LIST processing. The requested RIDMAP pointer can not be found in the specified CUB control block.

This abend reason code is issued by the following CSECTS:

DSNICMT2 DSNIRIDR DSNITCUS DSNXRFCH
DSNXRRID DSNXRFSN DSNXRSGB DSNXRT1J
DSNXSMIN DSNXSMRL DSNXSMUN DSNXSRID

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested.

User Response: Notify the system programmer.

Operator Response: Collect the console output from the system on which the job was run from the period of time spanning the failure. Save this output for use in problem determination.

System Programmer Response: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 32, 37.

00C90303

Explanation: An attempt to make the database exception table (DBET) consistent failed after an agent failure.

System Action: The DB2 subsystem abends, a record is written to SYS1.LOGREC, and an SVC dump is requested.

Problem Determination: This reason code is issued by the following CSECT: DSNIDBPX

Restarting the member rebuilds the local DBET. Analyze SYS1.LOGREC and the dump to determine why the agent failed and why the attempt to make the DBET consistent failed.

00C90304

Explanation: START DATABASE recovery of GRECP cannot proceed because the recover base RBA value in the header page for the object is invalid. The following might have occurred:

- The data set was restored from an earlier release backup that does not have a starting RBA or LRSN in the header page.
- DSN1COPY RESET utility command.

System Action: The GRECP recovery for this object is terminated; all other objects being recovered by this START DATABASE command are not affected.

System Programmer Response: Use the RECOVER utility without the LOGONLY option.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in

Appendix B, "Problem determination," on page 1353: 1, 2, 5.

This abend reason code is issued by the following CSECT: DSNISREC

00C90611

Explanation: The Security Server was unable to process this row-level, Multilevel Security (MLS) request.

System Action: The operation that was requested is not performed.

System Programmer Response: Refer to the Security Server documentation for advice regarding corrective action, and an explanation of the SAF/RACF return/reason codes that were placed in resource-name.

00C90614

Explanation: DB2 attempted to load a DBD during DB2 startup in deferred mode.

System Action: Startup continues, and the DBD is not loaded.

User Response: After DB2 startup is complete, the DBD can be loaded or recovered.

00C90D01

Explanation: DB2 detected an inconsistent condition. An entry in the auxiliary index was not found. The error is probably caused by not recovering all table spaces in a table space set to the same point-in-time.

This abend reason code is issued by the following CSECTs: DSNONLLE and DSNOTCSO

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Message DSNI013I is issued to identify the index page. Run CHECK INDEX on the auxiliary index followed by CHECK DATA on the base table space in order to identify the inconsistencies. See DB2 Utility Guide and Reference for information about CHECK INDEX and CHECK DATA.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5.

Chapter 39. X'D1.....' codes

For X'D1' codes, DB2 provides the following diagnostic information in the SYS1.LOGREC variable recording area (VRA) of the SDWA for many of the reason codes:

MODID

Name of module issuing the abend

LEVEL

Change level

COMPONENT

Subcomponent ID

REGISTERS

General purpose registers (GPRs) 0 through 15 at time of abend

00D10010

Explanation: The DB2 stand-alone log services OPEN processing macro (DSNJSLR) issues this reason code. The RANGE parameter on the OPEN request specifies the address of a 12-byte area containing the log relative byte address (RBA) range to be processed by subsequent GET requests. However, the RBA specified in the second six bytes of the RANGE parameter (which indicates the end of the log RBA) is less than or equal to the RBA specified in the first six bytes of the RANGE parameter (which indicates the start of the log RBA).

This reason code is issued by the following CSECT: DSNJRS01

System Action: In response to the DSNJSLR FUNC=OPEN call, DB2 places a return code of 8 in register 15 and a reason code of 00D10010 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user application program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

System Programmer Response: Correct the RANGE RBA parameter input, and resubmit the request.

00D10011

Explanation: The DB2 stand-alone log services OPEN and GET processing macro (DSNJSLR) issued this reason code. During the initial processing of a FUNC=OPEN or FUNC=GET request, storage is obtained to contain the control blocks and other

information required to process this request. An MVS GETMAIN failed when attempting to obtain the required storage.

This reason code is issued by the following CSECTs:

DSNJRS01 DSNJRS03 DSNJRS04

System Action: In response to the DSNJSLR FUNC=OPEN or FUNC=GET call, DB2 places a return code of 8 in register 15 and a reason code of 00D10011 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

System Programmer Response: In all likelihood, the REGION parameter on the EXEC statement for the user program is too small. Increase the REGION size, and resubmit the user program.

00D10012

Explanation: The DB2 stand-alone log services OPEN processing macro (DSNJSLR) issued this reason code. The Job Control Language (JCL) for the user program that uses the DSNJSLR macro must specify either the use of the bootstrap data set (BSDS) or, in the absence of the BSDS, the active or archive data set(s) which is used in the processing. The FUNC=OPEN request failed because neither BSDS nor any log data set is allocated for the job.

00D10013 • 00D10015

This reason code is issued by the following CSECT:
DSNJRS01

System Action: In response to the DSNJSLR FUNC=OPEN call, DB2 places a return code of 8 in register 15 and a reason code of 00D10012 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

System Programmer Response: Correct the JCL and resubmit the user program.

00D10013

Explanation: The DB2 stand-alone log services OPEN processing macro (DSNJSLR) issued this reason code. A VSAM OPEN error occurred while opening the bootstrap data set (BSDS).

This reason code is issued by the following CSECT:
DSNJRS04

System Action: In response to the DSNJSLR FUNC=OPEN call, DB2 places a return code of 12 in register 15 and a reason code of 00D10013 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the OPEN request is also returned in the stand-alone log GET Feedback Area (SLRF). The VSAM OPEN error return code is placed in SLRFRG15. The ACB error code (ACBERFLG) is placed in SLRFERCD.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

System Programmer Response: Refer to the *z/OS DFSMS: Macro Instructions for Data Sets* to determine the meaning of the VSAM OPEN error returned in SLRFRG15, and the ACB error code returned in

SLRFERCD. Take appropriate action, and resubmit the FUNC=OPEN request.

00D10014

Explanation: The DB2 stand-alone log services OPEN processing macro (DSNJSLR) issued this reason code. The Job Control Language (JCL) associated with the user-written application determines how access to the DB2 log data is achieved. Access can either be through the bootstrap data set (BSDS), or through the explicit inclusion of ddnames in the JCL for the active or archive log data set(s) which are to be examined. If the BSDS method is used, the user must specify a RANGE parameter on the FUNC=OPEN call. This reason code indicates that the user used the BSDS method, but did not specify the range of RBAs to be examined.

This reason code is issued by the following CSECT:
DSNJRS01

System Action: In response to the DSNJSLR FUNC=OPEN call, DB2 places a return code of 8 in register 15 and a reason code of 00D10014 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

System Programmer Response: Two choices are available:

1. Continue to use the BSDS method of access. If this choice is made, then the FUNC=OPEN invocation must specify a range of RBAs to be examined by use of the RANGE parameter.
2. Replace the use of the BSDS method of access. This can be done by using explicit archive data set ddnames and/or active log data set ddnames in the JCL used to invoke the user-written application program.

00D10015

Explanation: The DB2 stand-alone log services OPEN processing macro (DSNJSLR) issued this reason code. The VSAM OPEN of the bootstrap data set was successful but the record format of the BSDS is invalid. An invalid BSDS is the result of a failure during a prior attempt to run conversion program DSNJCNVB.

System Action: In response to DSNJSLR

FUNC=OPEN call, DB2 places a return code of 12 in register 15 and a reason code of 00D10015 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must, therefore, anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to the nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

System Programmer Response: The procedure for running program DSNJCNVB includes making a copy of the BSDS prior to conversion. Restore the BSDS to the original pre-conversion copy, and retry the conversion. When the BSDS data set has been successfully converted, rerun the original application program.

00D10016

Explanation: The DB2 stand-alone log services OPEN processing macro (DSNJSLR) issued this reason code. In the job control language (JCL) associated with the user-written application, MxxARCHV and/or MxxACTn DD statements were specified for a DB2 member while MxxBSDS was also specified for the same member. However, the specification of MxxARCHV and MxxACTn DD statements is mutually exclusive with the specification of MxxBSDS DD statement for the same member.

This reason code is issued by the following CSECT: DSNJRS06

System Action: In response to DSNJSLR FUNC=OPEN call, DB2 places a return code of 12 in register 15 and a reason code of 00D10016 in register 0. No abend is issued by the stand-alone log services, and no information is written to SYS1.LOGREC data set.

User Response:

Correct the JCL and rerun the job. Specify either the DD statements for the log data sets (MxxARCHV and MxxACTN) or the DD statement for the BSDS (MxxBSDS) for a given member; do not specify both.

For additional details about the stand-alone log services, including a sample of an application program that reacts to the nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

00D10017

Explanation: The DB2 stand-alone log services OPEN processing macro (DSNJSLR) issued this reason code. The job control language (JCL) associated with the user-written application indicated that the logs from more than one DB2 member were to be read in CI mode. However, CI mode is allowed only when reading the log of a single DB2 system.

This reason code is issued by the following CSECT: DSNJRS06

System Action: In response to DSNJSLR FUNC=OPEN call, DB2 places a return code of 12 in register 15 and a reason code of 00D10017 in register 0. No abend is issued by the stand-alone log services, and no information is written to SYS1.LOGREC data set.

User Response:

Either remove the CI mode from the OPEN request to read log records of more than one member or change the JCL to specify only one system's log to read its log in CI mode.

For additional details about the stand-alone log services, including a sample of an application program that reacts to the nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

00D10018

Explanation: The DB2 stand-alone log services OPEN processing macro (DSNJSLR) issued this reason code. In the job control language (JCL) associated with the user-written application, more than one DB2 system's logs were identified. However, on the OPEN request an RBA range was specified. When reading logs from more than one DB2 system, you cannot specify an RBA range; you must specify an LRSN range.

This reason code is issued by the following CSECT: DSNJRS06

System Action: In response to DSNJSLR FUNC=OPEN call, DB2 places a return code of 12 in register 15 and a reason code of 00D10018 in register 0. No abend is issued by the stand-alone log services, and no information is written to SYS1.LOGREC data set.

User Response: Correct the range specification on the OPEN request, and rerun the job. If range is specified when reading log records from multiple members, LRSN=YES must also be specified. Also range must be specified if GROUP DD or a MxxBSDS (BSDS) DD is specified in the JCL.

For additional details about the stand-alone log services, including a sample of an application program which reacts to the nonzero return codes and nonzero

reason codes, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

00D10019

Explanation: The DB2 stand-alone log services OPEN processing macro (DSNJSLR) issued this reason code. A VSAM OPEN error occurred while opening the bootstrap data set (BSDS). The error was determined to be one which could be corrected by use of an AMS VERIFY, but the VERIFY also failed.

This reason code is issued by the following CSECT: DSNJRS04

System Action: In response to the DSNJSLR FUNC=OPEN call, DB2 places a return code of 12 in register 15 and a reason code of 00D10019 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the OPEN request is also returned in the stand-alone log GET Feedback Area (SLRF). The VSAM return code from the original VSAM OPEN error is placed in SLRFRG15. The ACB error code (ACBERFLG) from the ACB used in the original VSAM OPEN operation is placed in SLRFERCD.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

System Programmer Response: Refer to the *z/OS DFSMS: Macro Instructions for Data Sets* to determine the meaning of the VSAM OPEN error returned in SLRFRG15, and the ACB error code returned in SLRFERCD. take appropriate action, and resubmit the FUNC=OPEN request.

00D10020

Explanation: The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. The end of data has been reached (end of the log, end of the user-specified log data set(s), or end of the log RBA range specified by the RANGE parameter).

This reason code is issued by the following CSECTS: DSNJRS02, DSNJRS03

System Action: In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 4 in register 15 and a reason code of 00D10020 in register 0. No abend is issued by the stand-alone log services

CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

System Programmer Response: This is not an error; rather, this reason code denotes a normal end of data condition. No action is necessary.

00D10021

Explanation: The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. A gap in the log RBA range has been encountered when switching log data sets, indicating missing log records.

This condition may or may not be intentional on the part of the user. Normally, a continuous set of log records are supplied as input by the ACTIVE_n and ARCHIVE ddnames in the user's JCL. If a log data set was intentionally (or unintentionally) removed, this condition will arise.

This reason code is issued by the following CSECT: DSNJRS02

System Action: In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 4 in register 15 and a reason code of 00D10021 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). A pointer to the next log record following the gap is placed in SLRFFRAD.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

System Programmer Response: As mentioned above, this may or may not be an intentional error. Check the user's JCL to ensure that a continuous string of log records has been supplied. If the BSDS method is being used, use the print log map (DSNJU004) utility

to examine the RBA ranges as recorded in the BSDS, and note any RBA gaps which may have resulted from the deletion of an active log data set or an archive log data set.

If it appears that a log error may have occurred, execute the log print utility (DSN1LOGP) to attempt to obtain a detailed report of the log record(s) associated with the failure. If the DSN1LOGP utility fails, refer to Part 4 (Volume 1) of *DB2 Administration Guide* for information about recovery from log failures.

00D10022

Explanation: The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. A gap in the log RBA range has been encountered when switching log data sets, indicating missing log records, and the log RBA of the next record following the gap is greater than the end RBA of the RBA range specified by the RANGE parameter.

This condition may or may not be intentional on the part of the user. Normally, a continuous set of log records are supplied as input by the ACTIVE_n and ARCHIVE_n ddnames in the user's JCL. If a log data set was intentionally (or unintentionally) removed, this condition will arise.

This reason code is issued by the following CSECTs: DSNJRS03, DSNJRS04

System Action: In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 8 in register 15 and a reason code of 00D10022 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). A pointer to the next log record following the gap is placed in SLRFFRAD.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

System Programmer Response: As mentioned above, this may or may not be an intentional error. Check the RBA range specified on the RANGE parameter to determine if the end RBA value was in error. Check the user's JCL to ensure that a continuous string of log records has been supplied. If the BSDS method is being used, use the print log map (DSNJU004) utility to examine the RBA ranges as

recorded in the BSDS, and note any RBA gaps which may have resulted from the deletion of an active log data set or an archive log data set.

If it appears that a log error may have occurred, execute the log print utility (DSN1LOGP) to attempt to obtain a detailed report of the log record(s) associated with the failure. If the DSN1LOGP utility fails, refer to Part 4 (Volume 1) of *DB2 Administration Guide* for information about recovery from log failures.

00D10023

Explanation: The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. A gap in the log RBA range has been encountered, and a conditional restart record has been found beyond a conditional restart truncation point. This condition exists when a log RBA gap was intentionally forced by the user as part of log truncation during conditional restart.

This reason code is issued by the following CSECT: DSNJRS02

System Action: In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 4 in register 15 and a reason code of 00D10023 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The length, address, and RBA of the conditional restart record are placed in fields SLRFRCLL, SLRFFRAD and SLRFRBA, respectively.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

System Programmer Response: Use the print log map (DSNJU004) utility to examine the conditional restart control records and the RBA ranges of log data sets. Note any RBA gaps which may have resulted from the truncation of the log during a conditional restart.

If it appears that a log error may have occurred, execute the log print utility (DSN1LOGP) to attempt to obtain a detailed report of the log record(s) associated with the failure. If the DSN1LOGP utility fails, refer to Part 4 (Volume 1) of *DB2 Administration Guide* for information about recovery from log failures.

00D10024

Explanation: The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. A log RBA sequence error has occurred. The RBA of the previous log record is greater than the RBA of the current log record.

This reason code is issued by the following CSECT: DSNJRS03

System Action: In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 8 in register 15 and a reason code of 00D10024 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). A pointer to the next log record following the gap is placed in SLRFFRAD.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

System Programmer Response: The DD statements in the user's Job Control Language (JCL) must specify the log data sets in ascending log RBA range order. If both ARCHIVE and ACTIVE_n DD statements are included, the first archive data set must contain the lowest log RBA value.

Use the print log map (DSNJU004) utility to obtain a listing of the RBA ranges associated with each archive log data set and active log data set. If necessary:

- Adjust the concatenation sequence of the archive data sets in the user's JCL to ensure that the log records are read in ascending RBA sequence.
- Adjust the order of the active log data sets such that the RBA range is arranged in ascending order, starting with the ACTIVE₁ ddname, and progressing through the ACTIVE_n ddname.

Following the above adjustments, resubmit the user's JCL.

00D10025

Explanation: The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. A VSAM error occurred while reading an active log data set.

This reason code is issued by the following CSECT: DSNJRS03

System Action: In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 12 in register 15 and a reason code of 00D10025 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The VSAM GET error return code is placed in SLRFRG15. The RPL error code (RPLERRCD) is placed in SLRFRERCD. The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

System Programmer Response: Refer to the z/OS *DFSMS: Macro Instructions for Data Sets* to determine the meaning of the VSAM GET error returned in SLRFRG15, and the RPL error code returned in SLRFRERCD. Take appropriate action to correct the error.

00D10026

Explanation: The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. The GET processing was unable to locate a log data set containing the requested RBA.

This reason code is issued by the following CSECT: DSNJRS04

System Action: In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 8 in register 15 and a reason code of 00D10026 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The RBA for which the GET request failed is placed in SLRFRBA.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

System Programmer Response: There could be several reasons for this error:

- The RBA range supplied in the RANGE parameter may have exceeded the upper or lower bound of RBAs available on all active log data sets and all archive log data sets. This will normally occur when the user has specified the bootstrap data set (BSDS) method in the JCL.
- The RBA range supplied in the RANGE parameter may have exceeded the upper or lower bound of RBAs available on the active log data sets and/or archive log data sets supplied in the user's JCL. This will occur when the user has supplied log data sets using the ACTIVE and ARCHIVE ddnames.

To resolve the problem, use the print log map (DSNJU004) utility to obtain a listing of the archive and active log data sets, and their corresponding RBA ranges. Check the user's JCL and the user's RANGE parameter to ensure that they are in harmony with one another. Correct the JCL and RANGE parameters as necessary, and rerun the application.

00D10027

Explanation: The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. A VSAM error occurred while reading the bootstrap data set (BSDS).

This reason code is issued by the following CSECT: DSNJRS03

System Action: In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 12 in register 15 and a reason code of 00D10027 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The VSAM GET error return code is placed in SLRFRG15. The RPL error code (RPLERRCD) is placed in SLRFRERCD.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero

reason codes, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

System Programmer Response: Refer to the z/OS *DFSMS: Macro Instructions for Data Sets* to determine the meaning of the VSAM GET error returned in SLRFRG15, and the RPL error code returned in SLRFRERCD. Take appropriate action to correct the error.

00D10028

Explanation: The DB2 stand-alone log services OPEN processing macro (DSNJSLR) issued this reason code. Both LRSN range and CI mode read were specified on the OPEN request when reading the log of a DB2 system. However, when reading the log in CI mode, range can be specified only in RBA.

This reason code is issued by the following CSECT: DSNJRS06

System Action: In response to DSNJSLR FUNC=OPEN call, DB2 places a return code of 12 in register 15 and a reason code of 00D10028 in register 0. No abend is issued by the stand-alone log services, and no information is written to SYS1.LOGREC data set.

User Response: Correct the range specification on the OPEN request, and rerun the job.

For additional details about the stand-alone log services, including a sample of an application program which reacts to the nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

00D10029

Explanation: The DB2 stand-alone log services OPEN processing macro (DSNJSLR) issued this reason code. The BSDS data set of a member named in the BSDS data set pointed to by the GROUP DD statement cannot be allocated.

This reason code is issued by the following CSECT: DSNJRS06

System Action: In response to DSNJSLR FUNC=OPEN call, DB2 places a return code of 12 in register 15 and a reason code of 00D10029 in register 0. No abend is issued by the stand-alone log services, and no information is written to SYS1.LOGREC data set.

User Response: Make sure the BSDS data set of every member named in the BSDS data set pointed to by the GROUP DD statement is available for allocation. If the missing BSDS data set belongs to a member that is no longer active and its BSDS data set does not exist any more, then do not use GROUP DD to allocate required BSDS and log data sets. To read log records of other active members, specify a MxxBSDS DD statements for each active member. The print log map

00D1002A • 00D1002C

(DSNJU004) utility can be used to find the name of every member's BSDS data set.

For additional details about the stand-alone log services, including a sample of an application program which reacts to the nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

00D1002A

Explanation: The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. The GET processing has requested an RBA in an active log data set which was previously not opened. A VSAM OPEN error occurred while opening the active log data set.

This reason code is issued by the following CSECT: DSNJRS03

System Action: In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 12 in register 15 and a reason code of 00D1002A in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The VSAM OPEN error return code is placed in SLRFRG15. The ACB error code (ACBERFLG) is placed in SLRFERCD. The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

System Programmer Response: Refer to the *z/OS DFSMS: Macro Instructions for Data Sets* to determine the meaning of the VSAM OPEN error returned in SLRFRG15, and the ACB error code returned in SLRFERCD. Take appropriate action, and then resubmit the application job.

00D1002B

Explanation: The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. The GET processing has requested an RBA in an active log data set which was previously not opened. A VSAM OPEN error occurred while opening the active log data set. The error was determined to be one which could be corrected; however, a system error occurred while

executing an MVS TESTCB macro to determine whether the active log data set which had just been opened was a VSAM ESDS data set or a VSAM LDS data set.

This reason code is issued by the following CSECT: DSNJRS03

System Action: In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 12 in register 15 and a reason code of 00D1002B in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The VSAM return code from the original VSAM OPEN error is placed in SLRFRG15. The ACB error code (ACBERFLG) from the ACB used in the original VSAM OPEN operation is placed in SLRFERCD. The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

System Programmer Response: Refer to the *z/OS DFSMS: Macro Instructions for Data Sets* to determine the meaning of the VSAM OPEN error returned in SLRFRG15, and the ACB error code returned in SLRFERCD. Take appropriate action, and resubmit the application job.

If the SLRFERCD field contains X'1001' (decimal 4097), then the error is the result of an inconsistency between the TESTCB parmlist generated in DSNJRS03 and the level of MVS under which the application program was executed. Contact IBM for assistance if SLRFERCD reflects this value.

00D1002C

Explanation: The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. The GET processing has requested an RBA in an active log data set which was previously not opened. A VSAM OPEN error occurred while opening the active log data set. The error was determined to be one which could be corrected by use of an access method services VERIFY, but the access method services VERIFY failed.

This reason code is issued by the following CSECT: DSNJRS03

System Action: In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 12 in register 15 and a reason code of 00D1002C in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The VSAM return code from the original VSAM OPEN error is placed in SLRFRG15. The ACB error code (ACBERFLG) from the ACB used in the original VSAM OPEN operation is placed in SLRFERCD. The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

System Programmer Response: Refer to the *z/OS DFSMS: Macro Instructions for Data Sets* to determine the meaning of the VSAM OPEN error returned in SLRFRG15, and the ACB error code returned in SLRFERCD. Take appropriate action, and resubmit the application job.

00D1002D

Explanation: The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. The GET processing has requested an RBA in an active log data set which was previously not opened. A VSAM OPEN error occurred while opening the active log data set. The open error was corrected by use of an access method services VERIFY, but a subsequent attempt to reposition the VSAM pointer back to the beginning of the active log data set (via access method services POINT) failed.

This reason code is issued by the following CSECT: DSNJRS03

System Action: In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 12 in register 15 and a reason code of 00D1002D in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The VSAM return code from the original VSAM OPEN error is placed in SLRFRG15. The ACB error code (ACBERFLG) from the ACB used in the original

VSAM OPEN operation is placed in SLRFERCD. The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

System Programmer Response: Refer to the *z/OS DFSMS: Macro Instructions for Data Sets* to determine the meaning of the VSAM OPEN error returned in SLRFRG15, and the ACB error code returned in SLRFERCD. Take appropriate action (in most cases, the problem can be solved by use of an AMS VERIFY against the active log data set named in the SLRFDDNM field of the SLRF). Once the problem is solved, resubmit the application job.

00D10030

Explanation: The DB2 stand-alone log services GET and CLOSE processing macro (DSNJSLR) issued this reason code. The stand-alone log services uses a request block to establish communication between itself and the invoking application program. The address to the request block is returned to the application program on a FUNC=OPEN call, and is required for all subsequent stand-alone FUNC=GET and FUNC=CLOSE calls in the RBR parameter. This reason code is returned to the invoking application when the RBR does not address a valid stand-alone request block. Subsequently, the application program's request cannot be processed.

This reason code is issued by the following CSECT: DSNJRS01

System Action: In response to the DSNJSLR FUNC=GET or FUNC=CLOSE call, DB2 places a return code of 8 in register 15 and a reason code of 00D10030 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero

reason codes, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

System Programmer Response: On a FUNC=OPEN call, the RBR value is returned in register 1. The application program must preserve this value for all subsequent stand-alone FUNC=GET and FUNC=CLOSE calls. Due to an application program logic error in the program which invokes the stand-alone log services, the RBR value has been compromised. Repair the application program, and resubmit the application job.

00D10031

Explanation: The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. The GET processing has requested an RBA in a log data set which was previously not opened. The user's Job Control Language (JCL) has specified that the bootstrap data set (BSDS) be used as the guide to determining which log data sets are required. An attempt to dynamically allocate the appropriate log data set (via MVS SVC 99) failed.

This reason code is issued by the following CSECT: DSNJRS05

System Action: In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 12 in register 15 and a reason code of 00D10031 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The SVC 99 error code (S99ERROR) and information code (S99INFO) are placed in the SLRFRFC and SLRFINFO fields, respectively. The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

System Programmer Response: Refer to the appropriate MVS publication to determine the meaning of the SVC 99 error code (S99ERROR) returned in SLRFRG15, and SVC 99 information code (S99INFO) returned in SLRFINFO. Take the appropriate action to correct the error, and resubmit the application job.

00D10040

Explanation: The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. The GET processing has requested an RBA in an archive log data set which was previously not opened. An attempt is made to open the second file on the archive log tape (the first file normally contains the bootstrap data set, while the second is normally the archive log data set). If this first attempt failed because the archive log data set was not the second file on an archive tape, then the RDJFCB macro is used to change the data set sequence number from the default value of 2 to a value of 1, before the OPEN is attempted again. This reason code is generated when an error was returned from the RDJFCB macro.

This reason code is issued by the following CSECT: DSNJRS03

System Action: In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 12 in register 15 and a reason code of 00D10040 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The RDJFCB error code is placed in SLRFRG15. The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

System Programmer Response: Refer to the *DFSMS/MVS: Using Advanced Services* to determine the meaning of the RDJFCB error code returned in SLRFRG15. Take the appropriate action to correct the error, and resubmit the application job.

00D10044

Explanation: The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. The GET processing has requested an RBA in an archive log data set which was previously not opened. The attempt to open the archive log data set failed.

This reason code is issued by the following CSECT: DSNJRS03

System Action: In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 12 in

register 15 and a reason code of 00D10044 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The dname of the data set on which the activity occurred is placed in SLRFDDNM.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, if you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

System Programmer Response: Determine the cause of the QSAM OPEN error, take the appropriate action to correct the error, and resubmit the application job.

00D10048

Explanation: The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. A QSAM GET error occurred while reading an archive log data set.

This reason code is issued by the following CSECT: DSNJRS03

System Action: In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 12 in register 15 and a reason code of 00D10048 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The dname of the data set on which the activity occurred is placed in SLRFDDNM.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

System Programmer Response: Determine the cause of the QSAM GET error, take the appropriate

action to correct the error, and resubmit the application job.

00D10050

Explanation: The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. The bootstrap data set (BSDS) was erroneously specified as one of the ARCHIVE data sets in the user's Job Control Language (JCL). Consequently, the GET request failed.

This reason code is issued by the following CSECT: DSNJRS03

System Action: In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 8 in register 15 and a reason code of 00D10050 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The RBA of the requested log record control interval is placed in SLRFRBA.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

System Programmer Response: Examine the user's JCL, and remove the occurrence of the BSDS data set as one of the concatenated ARCHIVE data sets. Resubmit the application job.

00D10061

Explanation: The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. The log record control interval (CI) requested by the application program was read successfully from an active log data set or an archive log data set. However, the physical record length returned from reading the CI is not the expected length. The GET function will complete, but will issue this reason code as a warning.

The length of a log CI in an active log data set is expected to be 4089 bytes. The length of a log CI in an archive log data set is expected to be 4096 bytes.

This reason code is issued by the following CSECT: DSNJRS03

System Action: In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 4 in

00D10062 • 00D10063

register 15 and a reason code of 00D10061 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set. The GET function will complete, but will issue this reason code as a warning.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The length and address of the CI are placed in fields SLRFRCLL and SLRFFRAD, respectively. The RBA associated with the CI is placed in SLRFRBA. The 'ddname' of the data set on which the activity occurred is placed in SLRFDDNM.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

System Programmer Response: The RDF/CIDF control information in the CI has been compromised. If the SLRFRCLL field indicates a value greater than expected, then the data within the CI can still be used by the application program. If the SLRFRCLL field indicates a value less than expected, then the data within the CI in all likelihood can still be used, but with caution (additional error checking routines may be required by the user program).

00D10062

Explanation: The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. The requested record was found to be a middle spanned record segment, but a preceding first record segment does not exist. The GET function will complete, but will issue this reason code as a warning.

This reason code is issued by the following CSECT: DSNJRS02

System Action: In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 4 in register 15 and a reason code of 00D10062 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set. The GET function will complete, but will issue this reason code as a warning.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The length and address of the requested record are placed in fields SLRFRCLL and SLRFFRAD, respectively. The RBA associated with the log record segment is placed in SLRFRBA. The ddname of the

data set on which the activity occurred is placed in SLRFDDNM.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

System Programmer Response: Several possibilities exist for the cause of this condition:

- The Recovery Log Manager component of DB2 did not originally construct the LRH properly.
- The log record header (LRH) for the log record segment was damaged after it was written by the DB2 subsystem.
- The application program continued to process after receipt of a 00D10021 reason code (gap in the log).

If the error was caused by the application program, modifications to the application program may be required.

If the error is a suspected DB2 problem, run the log print (DSN1LOGP) utility, specifying a range of RBAs which would encompass the problem RBA. Determine if the LRH of the log record segment is truly in error by looking at the record segments directly preceding and after the record segment in question.

00D10063

Explanation: The DB2 stand-alone log services GET processing macro (DSNJSLR) issued this reason code. The requested record was found to be a last spanned record segment, but a preceding first record segment does not exist. The GET function will complete, but will issue this reason code as a warning.

This reason code is issued by the following CSECT: DSNJRS02

System Action: In response to the DSNJSLR FUNC=GET call, DB2 places a return code of 4 in register 15 and a reason code of 00D10063 in register 0. No abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set. The GET function will complete, but will issue this reason code as a warning.

Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The length and address of the requested record are placed in fields SLRFRCLL and SLRFFRAD, respectively. The RBA associated with the log record segment is placed in SLRFRBA. The ddname of the

data set on which the activity occurred is placed in SLRFDDNM.

The stand-alone log services program is under the control of a user-written program that uses the DSNJSLR macro. The user program must therefore anticipate and react to a nonzero return code and a nonzero reason code, possibly by terminating the execution of the user program.

For additional details about the stand-alone log services, including a sample of an application program which reacts to nonzero return codes and nonzero reason codes, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

System Programmer Response: Several possibilities exist for the cause of this condition:

- The Recovery Log Manager component of DB2 did not originally construct the log record header (LRH) properly.
- The LRH for the log record segment was damaged after it was written by the DB2 subsystem.
- The application program continued to process after receipt of a 00D10021 reason code (gap in the log).

If the error was caused by the application program, modifications to the application program may be required.

If the error is a suspected DB2 problem, run the log print (DSN1LOGP) utility, specifying a range of RBAs which would encompass the problem RBA. Determine if the LRH of the log record segment is truly in error by looking at the record segments directly preceding and after the record segment in question.

00D10101

Explanation: The ENDRBA value specified in the control statement was either greater or less than any known RBA, but cold start was not specified for the conditional restart.

This abend reason code is issued by the following CSECT: DSNJW306

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: Run the change log inventory (DSNJU003) utility with a CRESTART control statement that has an RBA value known to the system in the BSDS, or that has the ENDRBA and STARTRBA specifying the same RBA (cold start).

Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for more information.

00D10102

Explanation: A request to disable data sharing failed.

This abend reason code is issued by the following CSECT: DSNJS001

System Action: DB2 startup terminates.

Operator Response: Collect an SVC dump, and contact the system programmer.

System Programmer Response: Obtain the SVC dump for the return code. To disable data sharing, you must run the disable data sharing job (DSNTIJGF) and then restart DB2. For more information, see Chapter 2 of *DB2 Data Sharing: Planning and Administration*.

Problem Determination: General register 2 contains a return code. Explanation of the return code is as follows:

- | | |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2 | A request to disable data sharing is in the BSDS, but a conditional restart record is not present. You must use job DSNTIJGF for the correct conditional restart control record. |
| 4 | A request to disable data sharing is recorded in the BSDS, but the conditional restart record is not correct. You cannot request a normal conditional restart with a disable request. You must use job DSNTIJGF. |
| 8 | Update of the BSDS failed. Data sharing was not disabled. See DB2 code 00D10411 for problem determination. After the BSDS problem is fixed, run DSNTIJGF to disable data sharing, and then restart DB2. |
| 10 | A delete in the BSDS failed. Data sharing was not disabled. See DB2 code 00D10413 for problem determination. After the BSDS problem is fixed, run DSNTIJGF to disable data sharing, and then restart DB2. |

00D10103

Explanation: DB2 failed to open the shared communications area (SCA) structure.

This abend reason code is issued by the following CSECT: DSNJS001

System Action: DB2 startup terminates.

Operator Response: Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem Determination: Review the DB2 system console for possible DSN7xxxx messages that could relate to this problem.

00D10104

Explanation: DB2 failed to find the data sharing member record in the BSDS during DB2 startup.

This abend reason code is issued by the following CSECT: DSNJS001

System Action: DB2 startup terminates.

Operator Response: Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem Determination: If this is the first startup of a new member joining the data sharing group, run the DSNTIJUZ job created to enable data sharing for this DB2 subsystem, and then restart this DB2 subsystem. Also, check whether the correct BSDS is specified in the DB2 master startup procedure. See message DSN7501A for additional problem determination.

00D10105

Explanation: DB2 found a mismatch in the shared communications area (SCA) while a new member was attempting to join a data sharing group.

This abend reason code is issued by the following CSECT: DSNJS001

System Action: DB2 startup terminates.

Operator Response: Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem Determination: This indicates that a new member is attempting to join the data sharing group. If this a migration from DB2 3.1, then catalog migration must be completed before a new member can join this data sharing group. Wait until catalog migration completes, then restart this DB2 to join the group. Otherwise, group restart is required. Wait until group restart completes, then restart this DB2 to join the group. For more information, see Chapter 2 of *DB2 Data Sharing: Planning and Administration*.

00D10106

Explanation: DB2 failed to update an internal control record in the BSDS for data sharing.

This abend reason code is issued by the following CSECT: DSNJS001

System Action: DB2 startup terminates.

Operator Response: Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem Determination: See DB2 code 00D10411 for problem determination.

00D10107

Explanation: DB2 failed to insert an internal control record in the BSDS for data sharing re-enable.

This abend reason code is issued by the following CSECT: DSNJS001

System Action: DB2 startup terminates.

Operator Response: Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem Determination: See DB2 code 00D10412 for problem determination.

00D10108

Explanation: DB2 failed to write an internal control record for re-enable in the shared communications area (SCA) structure.

This abend reason code is issued by the following CSECT: DSNJS001

System Action: DB2 startup terminates.

Operator Response: Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem Determination: See message DSN7501A for problem determination.

00D10109

Explanation: DB2 found a shared communications area (SCA) structure during the data sharing re-enable process. This structure should not be built at this time.

This abend reason code is issued by the following CSECT: DSNJS001

System Action: DB2 startup terminates.

Operator Response: Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System Programmer Response: Display the existing SCA structures on this MVS system.

Problem Determination: If an SCA structure already exists for this DB2 data sharing group, use the MVS command SETXCF to delete this structure, then restart DB2 to complete the re-enable process.

00D1010A

Explanation: DB2 failed to write a record for re-enable in the shared communications area (SCA) structure.

This abend reason code is issued by the following CSECT: DSNJS001

System Action: DB2 startup terminates.

Operator Response: Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem Determination: Review the DB2 system console for possible DSN7xxxx messages that could relate to this problem.

00D1010B

Explanation: DB2 failed to update an internal control record in the BSDS to enable data sharing.

This abend reason code is issued by the following CSECT: DSNJS001

System Action: DB2 startup terminates.

Operator Response: Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem Determination: See DB2 Code 00D10411 for problem determination.

00D1010C

Explanation: DB2 failed to write an internal control record in the shared communications area (SCA) to enable data sharing.

This abend reason code is issued by the following CSECT: DSNJS001

System Action: DB2 startup terminates.

Operator Response: Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem Determination: Review the DB2 system console for possible DSN7xxxx messages that could relate to this problem.

00D1010D

Explanation: DB2 could not find an internal control record for data sharing in the BSDS or the shared communications area (SCA).

This abend reason code is issued by the following CSECT: DSNJS001

System Action: DB2 startup terminates.

Operator Response: Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem Determination: Check to be sure that this DB2 system is supposed to be part of a data sharing group. If this DB2 is in a group, you can restart another DB2 subsystem that is in the same DB2 data sharing group first, and then restart. If no other DB2 subsystems exist in this group, you must recover the BSDS before restarting.

00D1010E

Explanation: DB2 failed to write an internal control record for a data sharing restart in the shared communications area (SCA) structure.

This abend reason code is issued by the following CSECT: DSNJS001

System Action: DB2 startup terminates.

Operator Response: Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem Determination: Review the DB2 system console for possible DSN7xxxx messages that could relate to this problem.

00D1010F

Explanation: DB2 failed an attempt to change the generic LU or location name in the shared communications area (SCA) structure for the data sharing group.

This abend reason code is issued by the following CSECT: DSNJS001

System Action: DB2 startup terminates.

Operator Response: Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump for analysis. All members in the data sharing group must first be stopped, then this DB2 subsystem can be restarted to make this change.

Problem Determination:

00D10110

Explanation: DB2 failed to write an internal control record for a generic LU or location name change in the shared communications area (SCA) structure.

00D10111 • 00D10116

This abend reason code is issued by the following CSECT: DSNJS001

System Action: DB2 startup terminates.

Operator Response: Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem Determination: DB2 failed in a write to the SCA structure for a data sharing restart change. Review the DB2 system console for possible DSN7xxxx messages that could relate to this problem.

00D10111

Explanation: DB2 failed to find an internal record in the shared communications area (SCA) that is needed to re-enable data sharing.

This abend reason code is issued by the following CSECT: DSNJS001

System Action: DB2 startup terminates.

Operator Response: Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump for analysis. To re-enable data sharing, you must start the surviving DB2 member first before other members can be started. If this is meant to be a re-enable attempt, check whether the surviving member was started first. If this re-enable is already complete, check that this is the correct data sharing group.

Another possibility is that the SCA is damaged. Use the MVS command SETXCF to rebuild the SCA.

00D10112

Explanation: DB2 failed to update an internal control record in the BSDS for a generic LU or location name change.

This abend reason code is issued by the following CSECT: DSNJS001

System Action: DB2 startup terminates.

Operator Response: Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem Determination: DB2 failed in an update to the BSDS for a data sharing generic LU or location name change. See DB2 Code 00D10411 for problem determination.

00D10113

Explanation: DB2 failed to update a data sharing member's information record in the BSDS to enable data sharing.

This abend reason code is issued by the following CSECT: DSNJS001

System Action: DB2 startup terminates.

Operator Response: Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem Determination: See DB2 Code 00D10411 for problem determination.

00D10114

Explanation: DB2 failed to write a data sharing member information record in the shared communications area (SCA) for a restart of data sharing.

This abend reason code is issued by the following CSECT: DSNJS001

System Action: DB2 startup terminates.

Operator Response: Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem Determination: Review the DB2 system console for possible DSN7xxxx messages that could relate to this problem.

00D10115

Explanation: DB2 failed to update the data sharing record in the BSDS to reset the enable flag.

This abend reason code is issued by the following CSECT: DSNJS001

System Action: DB2 startup terminates.

Operator Response: Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem Determination: See DB2 code 00D10411 for problem determination.

00D10116

Explanation: DB2 failed to update an internal control record in the BSDS for non-data sharing migration or fallback with DB2.

This abend reason code is issued by the following CSECT: DSNJS001

System Action: DB2 startup terminates.

Operator Response: Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem Determination: See DB2 Code 00D10411 for problem determination.

00D10117

Explanation: DB2 failed to truncate and switch to a new log for data sharing re-enable.

This abend reason code is issued by the following CSECT: DSNJS001

System Action: DB2 startup terminates.

Operator Response: Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem Determination: Determine why DB2 failed to truncate and switch to a new log. DB2 might be using the last log. If so, determine why off-load has not occurred. See DB2 messages DSNJ319I and DSNJ320I for problem determination.

00D10210

Explanation: An internal logic error occurred during processing.

System Action: The error is recorded in SYS1.LOGREC and an SVC dump is requested. DB2 then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the System Programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump. This is likely an error in DB2.

Problem Determination: Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 16.

00D10219

Explanation: DB2 found that the current LRSN is less than the prior LRSN after calculating a delta for the current LRSN.

System Action: DB2 terminates.

Operator Response: Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem Determination: This indicates that the system time is now less than the time recorded earlier in the DB2 log data set. Check that this DB2 subsystem is using the correct BSDS and log data sets. Also check that the correct system time is being used.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00D10220

Explanation: An unsuccessful completion of a LOG WRITE has occurred. An invalid write cursor ID was supplied.

This abend reason code is issued by the following CSECT: DSNJW001

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 2, 5, 16.

00D10221

Explanation: An unsuccessful completion of a LOG WRITE has occurred. An invalid number of areas was specified.

This abend reason code is issued by the following CSECT: DSNJW001

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00D10222 • 00D10240

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 2, 5, 16.

00D10222

Explanation: An unsuccessful completion of a LOG WRITE has occurred. The record length specified was greater than 32767.

This abend reason code is issued by the following CSECT: DSNJW001

System Action: An execution unit writes a record SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 2, 5, 16.

00D10223

Explanation: There was an attempt to modify a log data set while doing a conditional restart with CSRONLY specified.

This abend reason code is issued by the following CSECTS: DSNJB001, DSNJW001

System Action: DB2 startup terminates.

Operator Response: Notify the system programmer.

System Programmer Response: If a complete DB2 startup is desired, remove CSRONLY from the control statement. Restart DB2.

00D10230

Explanation: A CHECK LOG was issued and the log RBA specified in the macro had not been written to DASD at the time.

This abend reason code is issued by the following CSECT: DSNJW004

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 2, 5, 16.

00D10231

Explanation: An unsuccessful completion of a CHECK LOG has occurred. The specified RBA is beyond the end of the log.

This abend reason code is issued by the following CSECT: DSNJW004

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 2, 5, 16.

00D10232

Explanation: A request was made to force an LRSN in non-data sharing mode.

System Action: DB2 issues an SVC dump and returns an error to the requesting function.

Operator Response: Collect the SYS1.LOGREC and SVC dump and contact the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump for analysis.

Problem Determination: The requesting function can be determined from the SVC dump. It has requested a data sharing log manager function in non-data sharing.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00D10240

Explanation: An unsuccessful completion of a CLOSE LOG FOR WRITE has occurred. An invalid write cursor ID was supplied.

This abend reason code is issued by the following CSECT: DSNJW002

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 2, 5, 16.

00D10250

Explanation: An unrecoverable error occurred while updating either the BSDS or the MVS catalog to reflect changes in active log data sets.

This abend reason code is issued by the following CSECT: DSNJW307

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. DB2 then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump. Correct the error, and restart DB2.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871. In addition, see abend reason code '00D10252' for a description of the information recorded in the variable recording area (VRA) of the SDWA. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Examine the console log for a DSNJxxxx message preceding this abend to determine whether the error was a BSDS error or an MVS catalog update error.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 16.

00D10251

Explanation: An unrecoverable error occurred in the log buffer writer.

This abend reason code is issued by the following CSECT: DSNJW008

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. DB2 then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump.

This error is usually caused by a previous error that was recorded on SYS1.LOGREC and produced an SVC dump. The SYS1.LOGREC entries and SVC dump should be examined to determine the primary error that occurred.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871. In addition, see abend reason code '00D10252' for a description of the information recorded in the variable recording area (VRA) of the SDWA. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 16.

00D10252

Explanation: This abend reason code is used to define the format of the information recorded in the variable recording area (VRA) of the SDWA.

This abend reason code is issued by the following CSECT: DSNJW008

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871. In addition, the following information is contained in the variable recording area (VRA) of the SDWA:

- Reason code '00D10252' stored with key=VRARC.
- The log buffer writer recovery tracking area is stored with key=VRARRP. These fields in the VRA are described by the system mapping macro IHAVRA.

00D10253 • 00D10256

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 2, 5.

00D10253

Explanation: An application program check occurred in an MVCP instruction that attempted to move a parameter list or other data from the caller's address space to the recovery log manager address space.

This abend reason code is issued by the following CSECTs:

DSNJR001 DSNJW001 DSNJW002

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump. Examine the area from which data was to be moved. It may be in the wrong key, or the address may be the cause of the problem. The failing instruction has a DA opcode and indicates the registers showing address and length to be moved.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 5, 16.

00D10254

Explanation: An application program check occurred in an MVCS instruction that attempted to move data from the recovery log manager address space to the caller's address space.

This abend reason code is issued by the following CSECT: DSNJR103

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump. Examine the area to which data was to be moved. It may be in the wrong key, or the address may be the cause of the problem. The failing instruction has a DB opcode and indicates the registers showing address and length to be moved.

Problem Determination: RLM standard diagnostic

information is provided in Chapter 39, "X'D1.....' codes," on page 871.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 5, 16.

00D10255

Explanation: DSNJR008 attempted to resume the waiting execution unit, and a failure occurred leaving the state of the resume indoubt.

This abend reason code is issued by the following CSECTs: DSNJRE08, DSNJW206

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The DB2 subsystem then terminates to avoid leaving the execution unit in a state of indefinite suspension.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871. In addition, register 6 has the address of the execution block (EB).

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 5, 16.

00D10256

Explanation: Recursive abends were detected while trying to reinitialize an archive log read service task.

This abend reason code is issued by the following CSECTs: DSNJR008 DSNJR206 DSNJR208

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The DB2 subsystem then terminates to avoid leaving an execution unit in a state of indefinite suspension.

Operator Response: Collect the SYS1.LOGREC, SVC dump, and console output. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC, the SVC dump, and a listing of the BSDS by running the print log map (DSNJU004) utility. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871.

Collect the following diagnostic items listed in

Appendix B, "Problem determination," on page 1353: 1, 2, 5, 16, 32.

00D10261

Explanation: While scanning the records and record segments in a log control interval (CI), it was discovered that the forward record chain was broken. This condition is the result of an incorrect record length in the log record header of some record in the log CI.

This reason code is issued by the following CSECTs:

DSNJOFF1 DSNJRS01 DSNJR005 DSNJW009
DSNJW107

System Action: This reason code can be issued by an active DB2 subsystem as the log buffers are scanned before they are written to the active log, or by the DB2 stand-alone log services GET processing macro (DSNJSLR) as a CI is retrieved from a user-specified active or archive log data set.

If the reason code is issued by an active DB2 subsystem, then an abend is issued. A diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested.

- If the error was detected by DSNJOFF1, then the archiving of the active log data set is terminated and the faulty active log data set is marked 'stopped'.
- If the error was detected by DSNJR005, then message DSNJ012I is issued and the calling agent is terminated.
- If the error was detected by DSNJW009, then message DSNJ012I is issued and the DB2 subsystem is terminated.
- If the error was detected by DSNJW107, then the DB2 subsystem is terminated.

If this reason code is issued as the result of DB2 stand-alone log services GET processing, no abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set. Rather, in response to the DSNJSLR FUNC=GET call, DB2 places a return code of 4 in register 15 and a reason code of 00D10261 in register 0. Information about the results of the GET request is also returned in the stand-alone log GET feedback area (SLRF). The RBA of the record in error is placed in SLRFRBA. The address and length of the CI which contains the errant log record header are placed in SLRFFRAD and SLRFRCLL, respectively. The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

For additional details about the stand-alone log services, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

Operator Response: If the reason code is issued by an active DB2 subsystem, collect the SYS1.LOGREC

and SVC dump, and notify the system programmer.

System Programmer Response: If the reason code is issued by an active DB2 subsystem, obtain the SYS1.LOGREC and the SVC dump from the operator.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 2, 5, 16.

Problem Determination: If the reason code is issued by an active DB2 subsystem:

- RLM standard diagnostic information is provided under Chapter 39, "X'D1.....' codes," on page 871.
- Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for information about recovery from log failures.
- Refer to Appendix C (Volume 2) of *DB2 Administration Guide* for failure analysis procedures, with particular emphasis on the use of the DB2 stand-alone log services.
- Obtain a DSN1LOGP detail report containing the log record(s) associated with the failure.

If the reason code is issued upon return of an invocation of the DB2 stand-alone log services macro (DSNJSLR), then an additional user-written exit or diagnostic routine may have to be written.

00D10262

Explanation: While scanning a log control interval (CI), the offset to the last record or record segment in the CI was found to be incorrect.

This reason code is issued by the following CSECTs:

DSNJOFF1 DSNJRS01 DSNJR005 DSNJW009
DSNJW107

System Action: This reason code can be issued by an active DB2 subsystem as the log buffers are scanned before they are written to the active log, or by the DB2 stand-alone log services GET processing macro (DSNJSLR) as a CI is retrieved from a user-specified active or archive log data set.

If the reason code is issued by an active DB2 subsystem, then an abend is issued. A diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested.

- If the error was detected by DSNJOFF1, then the archiving of the active log data set is terminated and the faulty active log data set is marked 'stopped'.
- If the error was detected by DSNJR005, then message DSNJ012I is issued and the calling agent is terminated.
- If the error was detected by DSNJW009, then message DSNJ012I is issued and the DB2 subsystem is terminated.

00D10263

- If the error was detected by DSNJW107, then the DB2 subsystem is terminated.

If this reason code is issued as the result of DB2 stand-alone log services GET processing, no abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set. Rather, in response to the DSNJSLR FUNC=GET call, DB2 places a return code of 4 in register 15 and a reason code of 00D10262 in register 0. Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The RBA of the beginning of the CI is placed in SLRFRBA. The address and length of the CI are placed in SLRFFRAD and SLRFRCLL, respectively. The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

For additional details about the stand-alone log services, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

Operator Response: If the reason code is issued by an active DB2 subsystem, collect the SYS1.LOGREC and SVC dump, and notify the system programmer.

System Programmer Response: If the reason code is issued by an active DB2 subsystem, obtain the SYS1.LOGREC and the SVC dump from the operator.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 2, 5, 16.

Problem Determination: If the reason code is issued by an active DB2 subsystem:

- RLM standard diagnostic information is provided under Chapter 39, "X'D1.....' codes," on page 871.
- Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for information about recovery from log failures.
- Refer to Appendix C (Volume 2) of *DB2 Administration Guide* for failure analysis procedures, with particular emphasis on the use of the DB2 stand-alone log Services.
- Obtain a DSN1LOGP detail report containing the log record(s) associated with the failure.

If the reason code is issued upon return of an invocation of the DB2 stand-alone log services macro (DSNJSLR), then an additional user-written exit or diagnostic routine may have to be written.

00D10263

Explanation: While scanning a log control interval (CI), the VSAM RDF/CIDF control information was found to be incorrect.

This reason code is issued by the following CSECTs:

DSNJOFF1 DSNJRS01 DSNJR005 DSNJW009
DSNJW107

System Action: This reason code can be issued by an active DB2 subsystem as the log buffers are scanned before they are written to the active log, or by the DB2 stand-alone log services GET processing macro (DSNJSLR) as a CI is retrieved from a user-specified active or archive log data set.

If the reason code is issued by an active DB2 subsystem, then an abend is issued. A diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested.

- If the error was detected by DSNJOFF1, then the archiving of the active log data set is terminated and the faulty active log data set is marked 'stopped'.
- If the error was detected by DSNJR005, then message DSNJ012I is issued and the calling agent is terminated.
- If the error was detected by DSNJW009, then message DSNJ012I is issued and the DB2 subsystem is terminated.
- If the error was detected by DSNJW107, then the DB2 subsystem is terminated.

If this reason code is issued as the result of DB2 stand-alone log services GET processing, no abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set. Rather, in response to the DSNJSLR FUNC=GET call, DB2 places a return code of 4 in register 15 and a reason code of 00D10263 in register 0. Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The RBA of the beginning of the CI is placed in SLRFRBA. The address and length of the CI are placed in SLRFFRAD and SLRFRCLL, respectively. The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

For additional details about the stand-alone log services, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

Operator Response: If the reason code is issued by an active DB2 subsystem, collect the SYS1.LOGREC and SVC dump, and notify the system programmer.

System Programmer Response: If the reason code is issued by an active DB2 subsystem, obtain the SYS1.LOGREC and the SVC dump from the operator.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 2, 5, 16.

Problem Determination: If the reason code is issued by an active DB2 subsystem:

- RLM standard diagnostic information is provided under Chapter 39, "X'D1.....' codes," on page 871.

- Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for information about recovery from log failures.
- Refer to Appendix C (Volume 2) of *DB2 Administration Guide* for failure analysis procedures, with particular emphasis on the use of the DB2 stand-alone log Services.
- Obtain a DSN1LOGP detail report containing the log record(s) associated with the failure.

If the reason code is issued upon return of an invocation of the DB2 stand-alone log services macro (DSNJSLR), then an additional user-written exit or diagnostic routine may have to be written.

00D10264

Explanation: While scanning a log control interval (CI), the beginning log RBA of the CI was not the expected RBA.

This reason code is issued by the following CSECTs:

DSNJOFF1 DSNJRS01 DSNJR005 DSNJW009
DSNJW107

System Action: This reason code can be issued by an active DB2 subsystem as the log buffers are scanned before they are written to the active log, or by the DB2 stand-alone log services GET processing macro (DSNJSLR) as a CI is retrieved from a user-specified active or archive log data set.

If the reason code is issued by an active DB2 subsystem, then an abend is issued. A diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested.

- If the error was detected by DSNJOFF1, then the archiving of the active log data set is terminated and the faulty active log data set is marked 'stopped'.
- If the error was detected by DSNJR005, then message DSNJ012I is issued and the calling agent is terminated.
- If the error was detected by DSNJW009, then message DSNJ012I is issued and the DB2 subsystem is terminated.
- If the error was detected by DSNJW107, then the DB2 subsystem is terminated.

If this reason code is issued as the result of DB2 stand-alone log services GET processing, no abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set. Rather, in response to the DSNJSLR FUNC=GET call, DB2 places a return code of 4 in register 15 and a reason code of 00D10264 in register 0. Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The expected RBA of the beginning of the CI is placed in SLRFRBA. The address

and length of the CI are placed in SLRFFRAD and SLRFRCLL, respectively. The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

For additional details about the stand-alone log services, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

Operator Response: If the reason code is issued by an active DB2 subsystem, collect the SYS1.LOGREC and SVC dump, and notify the system programmer.

System Programmer Response: If the reason code is issued by an active DB2 subsystem, obtain the SYS1.LOGREC and the SVC dump from the operator.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 2, 5, 16.

Problem Determination: If the reason code is issued by an active DB2 subsystem:

- RLM standard diagnostic information is provided under Chapter 39, "X'D1.....' codes," on page 871.
- Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for information about recovery from log failures.
- Refer to Appendix C (Volume 2) of *DB2 Administration Guide* for failure analysis procedures, with particular emphasis on the use of the DB2 stand-alone log Services.
- Obtain a DSN1LOGP detail report containing the log record(s) associated with the failure.

If the reason code is issued upon return of an invocation of the DB2 stand-alone log services macro (DSNJSLR), then an additional user-written exit or diagnostic routine may have to be written.

00D10265

Explanation: While scanning the records and record segments in a log control interval (CI), it was discovered the backward record chain was broken. This condition is the result of an incorrect record length in the log record header of some record in the log CI.

This reason code is issued by the following CSECTs:

DSNJOFF1 DSNJRS01 DSNJR005 DSNJW009
DSNJW107

System Action: This reason code can be issued by an active DB2 subsystem as the log buffers are scanned before they are written to the active log, or by the DB2 stand-alone log services GET processing macro (DSNJSLR) as a CI is retrieved from a user-specified active or archive log data set.

If the reason code is issued by an active DB2 subsystem, then an abend is issued. A diagnostic

00D10266

record is written to SYS1.LOGREC, and an SVC dump is requested.

- If the error was detected by DSNJOFF1, then the archiving of the active log data set is terminated.
- If the error was detected by DSNJR005, then message DSNJ012I is issued and the calling agent is terminated.
- If the error was detected by DSNJW009, then message DSNJ012I is issued and the DB2 subsystem is terminated.
- If the error was detected by DSNJW107, then the DB2 subsystem is terminated.

If this reason code is issued as the result of DB2 stand-alone log services GET processing, no abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set. Rather, in response to the DSNJSLR FUNC=GET call, DB2 places a return code of 4 in register 15 and a reason code of 00D10265 in register 0. Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The RBA of the record in error is placed in SLRFRBA. The address and length of the CI are placed in SLRFFRAD and SLRFRCLL, respectively. The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Operator Response: If the reason code is issued by an active DB2 subsystem, collect the SYS1.LOGREC and SVC dump, and notify the system programmer.

System Programmer Response: If the reason code is issued by an active DB2 subsystem, obtain the SYS1.LOGREC and the SVC dump from the operator.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 2, 5, 16.

Problem Determination: If the reason code is issued by an active DB2 subsystem:

- RLM standard diagnostic information is provided under Chapter 39, "X'D1.....' codes," on page 871.
- Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for information about recovery from log failures.
- If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.
- Obtain a DSN1LOGP detail report containing the log record(s) associated with the failure.

If the reason code is issued upon return of an invocation of the DB2 stand-alone log services macro

(DSNJSLR), then an additional user-written exit or diagnostic routine may have to be written.

00D10266

Explanation: While scanning a log control interval (CI), a unit of recovery ID or LINK RBA in some record was found to be inconsistent with the beginning log RBA of the CI.

This reason code is issued by the following CSECTs:

DSNJOFF1 DSNJRS01 DSNJR005 DSNJW009
DSNJW107

System Action: This reason code can be issued by an active DB2 subsystem as the log buffers are scanned before they are written to the active log, or by the DB2 stand-alone log services GET processing macro (DSNJSLR) as a CI is retrieved from a user-specified active or archive log data set.

If the reason code is issued by an active DB2 subsystem, then an abend is issued. A diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested.

- If the error was detected by DSNJOFF1, then the archiving of the active log data set is terminated and the faulty active log data set is marked 'stopped'.
- If the error was detected by DSNJR005, then message DSNJ012I is issued and the calling agent is terminated.
- If the error was detected by DSNJW009, then message DSNJ012I is issued and the DB2 subsystem is terminated.
- If the error was detected by DSNJW107, then the DB2 subsystem is terminated.

If this reason code is issued as the result of DB2 stand-alone log services GET processing, no abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set. Rather, in response to the DSNJSLR FUNC=GET call, DB2 places a return code of 4 in register 15 and a reason code of 00D10266 in register 0. Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The RBA of the log record with the invalid RBA is placed in SLRFRBA. The address and length of the CI are placed in SLRFFRAD and SLRFRCLL, respectively. The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

For additional details about the stand-alone log services, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

Operator Response: If the reason code is issued by an active DB2 subsystem, collect the SYS1.LOGREC and SVC dump, and notify the system programmer.

System Programmer Response: If the reason code is issued by an active DB2 subsystem, obtain the SYS1.LOGREC and the SVC dump from the operator.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 2, 5, 16.

Problem Determination: If the reason code is issued by an active DB2 subsystem:

- RLM standard diagnostic information is provided under Chapter 39, "X'D1.....' codes," on page 871.
- Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for information about recovery from log failures.
- Refer to Appendix C (Volume 2) of *DB2 Administration Guide* for failure analysis procedures, with particular emphasis on the use of the DB2 stand-alone log Services.
- Obtain a DSN1LOGP detail report containing the log record(s) associated with the failure.

If the reason code is issued upon return of an invocation of the DB2 stand-alone log services macro (DSNJSLR), then an additional user-written exit or diagnostic routine may have to be written.

00D10267

Explanation: While scanning a log control interval (CI), a middle or last spanned record segment was not the first segment contained in the log CI.

This reason code is issued by the following CSECTs:

DSNJOFF1 DSNJRS01 DSNJ005 DSNJW009
DSNJW107

System Action: This reason code can be issued by an active DB2 subsystem as the log buffers are scanned before they are written to the active log, or by the DB2 stand-alone log services GET processing macro (DSNJSLR) as a CI is retrieved from a user-specified active or archive log data set.

If the reason code is issued by an active DB2 subsystem, then an abend is issued. A diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested.

- If the error was detected by DSNJOFF1, then the archiving of the active log data set is terminated and the faulty active log data set is marked 'stopped'.
- If the error was detected by DSNJR005, then message DSNJ012I is issued and the calling agent is terminated.
- If the error was detected by DSNJW009, then message DSNJ012I is issued and the DB2 subsystem is terminated.
- If the error was detected by DSNJW107, then the DB2 subsystem is terminated.

If this reason code is issued as the result of DB2 stand-alone log services GET processing, no abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set. Rather, in response to the DSNJSLR FUNC=GET call, DB2 places a return code of 4 in register 15 and a reason code of 00D10267 in register 0. Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The RBA of the record segment in error is placed in SLRFRBA. The address and length of the CI are placed in SLRFFRAD and SLRFRCLL, respectively. The ddname of the data set on which the activity occurred is placed in SLRFDNM.

For additional details about the stand-alone log services, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

Operator Response: If the reason code is issued by an active DB2 subsystem, collect the SYS1.LOGREC and SVC dump, and notify the system programmer.

System Programmer Response: If the reason code is issued by an active DB2 subsystem, obtain the SYS1.LOGREC and the SVC dump from the operator.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 2, 5, 16.

Problem Determination: If the reason code is issued by an active DB2 subsystem:

- RLM standard diagnostic information is provided under Chapter 39, "X'D1.....' codes," on page 871.
- Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for information about recovery from log failures.
- Refer to Appendix C (Volume 2) of *DB2 Administration Guide* for failure analysis procedures, with particular emphasis on the use of the DB2 stand-alone log Services.
- Obtain a DSN1LOGP detail report containing the log record(s) associated with the failure.

If the reason code is issued upon return of an invocation of the DB2 stand-alone log services macro (DSNJSLR), then an additional user-written exit or diagnostic routine may have to be written.

00D10268

Explanation: While scanning a log control interval (CI), a first or middle spanned record segment was not the last segment contained in the log CI.

This reason code is issued by the following CSECTs:

DSNJOFF1 DSNJRS01 DSNJR005 DSNJW009
DSNJW107

System Action: This reason code can be issued by

00D10269 • 00D10301

an active DB2 subsystem as the log buffers are scanned before they are written to the active log, or by the DB2 stand-alone log services GET processing macro (DSNJSLR) as a CI is retrieved from a user-specified active or archive log data set.

If the reason code is issued by an active DB2 subsystem, then an abend is issued. A diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested.

- If the error was detected by DSNJOFF1, then the archiving of the active log data set is terminated and the faulty active log data set is marked 'stopped'.
- If the error was detected by DSNJR005, then message DSNJ012I is issued and the calling agent is terminated.
- If the error was detected by DSNJW009, then message DSNJ012I is issued and the DB2 subsystem is terminated.
- If the error was detected by DSNJW107, then the DB2 subsystem is terminated.

If this reason code is issued as the result of DB2 stand-alone log services GET processing, no abend is issued by the stand-alone log services CSECT (DSNJRS01), and no information is written to SYS1.LOGREC data set. Rather, in response to the DSNJSLR FUNC=GET call, DB2 places a return code of 4 in register 15 and a reason code of 00D10268 in register 0. Information about the results of the GET request is also returned in the stand-alone log GET Feedback Area (SLRF). The RBA of the record segment in error is placed in SLRFRBA. The address and length of the CI are placed in SLRFFRAD and SLRFRCLL, respectively. The ddname of the data set on which the activity occurred is placed in SLRFDDNM.

For additional details about the stand-alone log services, refer to Appendix C (Volume 2) of *DB2 Administration Guide*.

Operator Response: If the reason code is issued by an active DB2 subsystem, collect the SYS1.LOGREC and SVC dump, and notify the system programmer.

System Programmer Response: If the reason code is issued by an active DB2 subsystem, obtain the SYS1.LOGREC and the SVC dump from the operator.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 2, 5, 16.

Problem Determination: If the reason code is issued by an active DB2 subsystem:

- RLM standard diagnostic information is provided under Chapter 39, "X'D1.....' codes," on page 871.
- Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for information about recovery from log failures.

- Refer to Appendix C (Volume 2) of *DB2 Administration Guide* for failure analysis procedures, with particular emphasis on the use of the DB2 stand-alone log Services.
- Obtain a DSN1LOGP detail report containing the log record(s) associated with the failure.

If the reason code is issued upon return of an invocation of the DB2 stand-alone log services macro (DSNJSLR), then an additional user-written exit or diagnostic routine may have to be written.

00D10269

Explanation: An unrecoverable error was found in one of the buffers, while moving the current log buffer to the static write buffer ('shadow buffer') in preparation for the physical write to the active log. Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for information about recovery from log failures.

This abend reason code is issued by the following CSECT: DSNJW107

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The subsystem then terminates.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided under Chapter 39, "X'D1.....' codes," on page 871.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 2, 5, 16.

00D10301

Explanation: An unsuccessful completion of an OPEN LOG FOR READ has occurred. An open log read cursor already exists for this execution block (EB). Only one log read cursor per EB is permitted.

This abend reason code is issued by the following CSECT: DSNJR001

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump. Scan the read cursor pool for a cursor with the same EB, or examine through

the DB2 trace for the problem. Trace IDs 040301 and 040302 identify OPEN entries while 040303 and 040304 are for CLOSE.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, “X'D1.....’ codes,” on page 871. All log read cursors reside in a recovery log manager storage pool whose header address is in the log manager block (LMB) at LMBRCPHB. The LMB is pointed to by register 5. Register 6 contains the address of the EB.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 5, 16.

00D10302

Explanation: An unsuccessful completion of an OPEN LOG FOR READ has occurred. A valid scope was not specified.

This abend reason code is issued by the following CSECT: DSNJR001

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, “X'D1.....’ codes,” on page 871.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 5, 16.

00D10303

Explanation: An unsuccessful completion of an OPEN LOG FOR READ has occurred. An invalid log RBA range was specified. HIGHRBA is less than LOWRBA.

This abend reason code is issued by the following CSECT: DSNJR001

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide*

and *Reference* for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, “X'D1.....’ codes,” on page 871.

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 2, 5, 16.

00D10304

Explanation: An unknown function was requested in an open of a log read cursor.

System Action: DB2 issues a return code of 4 and reason code of 00D10304 to the requesting function.

System Programmer Response: Review the DB2 console for related errors.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00D10305

Explanation: A peer log read request was made without a peer log read cursor.

System Action: DB2 issues a return code of 4 and reason code of 00D10305 to the requesting function.

System Programmer Response: Review the DB2 console for related errors.

Problem Determination:

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00D10306

Explanation: A request to read merged log records failed.

System Action: DB2 issues a return code of 4 and reason code of 00D10306 to the requesting function.

System Programmer Response: Review the DB2 console for related errors.

Problem Determination: The requesting function has put this error code out. Check on this function.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00D10307

Explanation: A log read open in data sharing failed because the RBA values were not increasing or were overlapping.

System Action: DB2 issues a return code of 4 and reason code of 00D10307 to the requesting function.

System Programmer Response: Review the DB2 console for related errors.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00D10308

Explanation: A log read open in data sharing failed.

System Action: DB2 issues a return code of 4 and reason code of 00D10308 to the requesting function.

System Programmer Response: Review the DB2 console for related errors.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00D10309

Explanation: A peer BSDS open request failed.

System Action: DB2 issues a return code of 4 and reason code of 00D10309 to the requesting function.

System Programmer Response: Review the DB2 console for related errors.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00D1030A

Explanation: A peer log read request was made in non-data sharing.

System Action: DB2 issues a return code of 4 and reason code of 00D1030A to the requesting function.

System Programmer Response: Review the DB2 console for related errors.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00D10310

Explanation: An unsuccessful completion of a SET READ CURSOR RANGE has occurred. The specified log read cursor was not opened by the execution block submitting this request. All input requests must be submitted under the execution block that opened the cursor.

This abend reason code is issued by the following CSECT: DSNJR001

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871. In addition, register 6 contains the address of the execution block (EB). All log read cursors reside in a recovery log manager storage pool whose header address is in the log manager block (LMB) at LMBRCPHB. The LMB is pointed to by register 5.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 5, 16.

00D10311

Explanation: An unsuccessful completion of a SET READ CURSOR RANGE has occurred. An invalid write cursor ID was specified.

This abend reason code is issued by the following CSECT: DSNJR001

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871. In addition, all log write cursors reside in a recovery log manager storage pool whose header address is in the log manager block (LMB) at LMBWCPHB. The LMB is pointed to by register 5. Read cursors are in a similar pool at LMBRCPHB.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 2, 5, 16.

00D10312

Explanation: An unsuccessful completion of a SET READ CURSOR RANGE has occurred. An invalid log RBA range was specified. HIGHRBA is lower than LOWRBA.

This abend reason code is issued by the following CSECT: DSNJR001

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 2, 5, 16.

00D10322

Explanation: An unsuccessful completion of a LOG READ has occurred. MODE=DIRECT with a record matching the specified TYPE was not found.

This abend reason code is issued by the following CSECT: DSNJR003

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 5, 16.

00D10323

Explanation: An unsuccessful completion of a LOG READ has occurred. MODE=DIRECT with record matching the specified SCOPE is not found.

This abend reason code is issued by the following CSECT: DSNJR003

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 5, 16.

00D10324

Explanation: An unsuccessful completion of a LOG READ has occurred. MODE=DIRECT with record matching the specified CDATA is not found.

This abend reason code is issued by the following CSECT: DSNJR003

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 5, 16.

00D10325

Explanation: An unsuccessful completion of a LOG READ has occurred. The sum of CDATA length value and CDATA offset value is greater than 256.

00D10326 • 00D10329

This abend reason code is issued by the following CSECT: DSNJR003

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 5, 16.

00D10326

Explanation: An unsuccessful completion of a LOG READ has occurred. The macro invocation specified that no wait was to occur because of a busy archive log data set (ADSWAIT(NO)). The macro invocation also specified that, rather than returning with a condition code (COND(NO)), an abend should be issued by the recovery log manager (RLM) subcomponent. The RLM determined that the record requested was on an archive log data set that was in use.

This abend reason code is issued by the following CSECT: DSNJR008

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 5, 16.

00D10327

Explanation: An unsuccessful completion of a LOG READ has occurred because of an invalid LOGRBA value. MODE=DIRECT with requested RBA does not match the start of a log record.

This abend reason code is issued by the following CSECT: DSNJR003

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and

SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871.

00D10328

Explanation: A LOG READ completed unsuccessfully, because a MODE request sequence was invalid. A read request specifying a sequential MODE (any MODE except DIRECT) must be preceded by an open log for read, a set read cursor range, or a read with the same MODE parameter value. It is invalid to intermix read requests with different sequential mode values.

This abend reason code is issued by the following CSECT: DSNJR003

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 5, 16.

00D10329

Explanation: A LOG READ completed unsuccessfully, because an I/O error occurred while reading the log data set.

Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for information about recovery from log failures.

This abend reason code is issued by the following CSECT: DSNJR003

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Examine SYS1.LOGREC and SVC dump information. Also,

examine any prior messages with a DSNJ prefix from the log buffer reader.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 5, 16.

00D1032A

Explanation: An unsuccessful completion of a LOG READ has occurred. BSDS does not map the specified RBA into a log data set. Either the BSDS is in error, or the log data set has been deleted.

Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for information about recovery from BSDS or log failures.

This abend reason code is issued by the following CSECT: DSNJR003

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. Also, obtain a listing of the BSDS by running the print log map (DSNJU004) utility. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 2, 5, 16.

00D1032B

Explanation: A LOG READ completed unsuccessfully because an error occurred while trying to allocate a log data set.

Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for information about recovery from log failures.

System Action: An execution unit writes a record to SYS1.LOGREC and might request an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump, if a dump was produced. Notify the system programmer.

System Programmer Response: Examine LOGREC and SVC dump information, if a dump was produced. Also, examine any prior messages with a DSNJ prefix

from recovery log manager allocation processing.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 5, 16.

This abend reason code is issued by the following CSECT: DSNJR003

00D1032C

Explanation: A LOG READ completed unsuccessfully, because an error occurred while opening or closing a log data set.

Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for information about recovery from log failures.

This abend reason code is issued by the following CSECT: DSNJR003

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Examine LOGREC and SVC dump information. Also, examine prior messages from recovery log manager open/close processing. These messages have a prefix of DSNJ.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 5, 16.

00D1032D

Explanation: An unsuccessful completion of a LOG READ has occurred. The specified log read cursor was not opened by the execution block submitting this request. All input requests must be submitted under the execution block that opened the cursor.

This abend reason code is issued by the following CSECT: DSNJR003

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to the Part 2 of *DB2 Diagnosis Guide*

00D1032E • 00D10331

and Reference for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871. In addition, all log read cursors reside in a recovery log manager storage pool whose header address is in the log manager block (LMB) at LMBRCPHB. The LMB is pointed to by register 5.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 5, 16.

00D1032E

Explanation: A LOG READ completed unsuccessfully due to an internal error.

This abend reason code is issued by the following CSECT: DSNJR103

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Examine LOGREC and SVC dump information. LOG READ was passed a bad parameter list. The field which was detected to be in error (RDPLOPT1) is the third byte of the second word traced in the log manager 311 trace entry. The RET field of this trace entry along with the MEPL may be used to determine which module issued the Log Read request. Both pieces of information are useful in isolating the failure.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871.

Collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 5.

00D1032F

Explanation: A LOG READ completed unsuccessfully because the high range RBA provided was not the RBA of a valid log record. This is an internal error.

This abend reason code is issued by the following CSECT: DSNJR103

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871. In addition, register 6 contains the address of the execution block (EB). All log read cursors reside in a recovery log manager storage pool whose header address is in the log manager block (LMB) at LMBRCPHB. The LMB is pointed to by register 5 and described by DSNDLMB.

00D10330

Explanation: An unsuccessful completion of a Close Log for read has occurred. The specified log read cursor was not opened by the execution block submitting this request. All input requests must be submitted under the execution block that opened the cursor.

This abend reason code is issued by the following CSECT: DSNJR001

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871. In addition, register 6 contains the address of the execution block (EB). All log read cursors reside in a recovery log manager storage pool whose header address is in the log manager block (LMB) at LMBRCPHB. The LMB is pointed to by register 5 and described by DSNDLMB.

00D10331

Explanation: A LOG READ completed unsuccessfully because a LINK RBA did not point to the beginning of a LOG record. This is an internal error.

This abend reason code is issued by the following CSECT: DSNJR103

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic

information is provided in Chapter 39, “X'D1.....’ codes,” on page 871. In addition, register 6 contains the address of the execution block (EB). All log read cursors reside in a recovery log manager storage pool whose header address is in the log manager block (LMB) at LMBRCPHB. The LMB is pointed to by register 5 and described by DSNDLMB.

00D10332

Explanation: A log read completed unsuccessfully because a link RBA pointed to a log record with a different URID. This is an internal error.

This abend reason code is issued by the following CSECT: DSNJR103

System Action: A record is written to SYS1.LOGREC and an SVC DUMP is requested. The requesting execution unit is abnormally terminated.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: While reading the log backwards using the LRHLINK RBAs, a log record was found that contained a different URID. A link read is normally done when processing a rollback or an abort. This abend is issued to prevent a rollback of the wrong transaction. If this occurs during abort processing, the subsystem is brought down. If the abend reoccurs on the subsequent restart of DB2, a conditional restart is necessary to bypass the invalid log record. Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for information on recovering from a log failure during restart and resolving inconsistencies resulting from conditional restart.

Problem Determination: RLM standard diagnostic information is provided in “Recovery Log Manager Reason Codes (X'D1’)”. In addition, register 6 contains the address of the execution block (EB). All log read cursors reside in a recovery log manager storage pool whose header address is in the log manager block (LMB) at LMBRCPHB. The LMB is pointed to by register 5 and described in the DSNDLMB macro.

00D10333

Explanation: A log read failed because an internal error was detected by the Data Manager while examining the log record during recover and deferred restart.

This abend reason code is issued by the following CSECT: DSNJR103

System Action: The execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

User Response: Notify the system programmer.

Operator Response: Collect the SYS1.LOGREC and the SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, “X'D1.....’ codes,” on page 871 (X'D1’). In addition, the following diagnostic information is provided in registers:

Register 0: the Data Mgr ERQUAL that identifies the place within CSECT DSNILGRX where the error was detected

Register 2, 3: the RBA of the log record that was being read at the time of the error

Register 7: the address of DSCF selection bLock

Register 8: the address of *ssnmDBM1*'s selection block.

00D10334

Explanation: An unsuccessful completion of a LOG READ occurred because of an invalid LOGRBA value. MODE=SEQUENTIAL DIRECT with the requested RBA does not match the start of a log record.

This abend reason code is issued by the following CSECT: DSNJR003

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in “Recovery Log Manager Reason Codes (X'D1’)”.

00D10335

Explanation: An unsuccessful completion of a LOG READ occurred because the log was not being read in ascending order for MODE=SEQUENTIAL DIRECT.

This abend reason code is issued by the following CSECT: DSNJR003

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide*

and *Reference* for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in "Recovery Log Manager Reason Codes (X'D1)".

00D10340

Explanation: An unsuccessful completion of a LOG READ has occurred. This reflects a logic failure internal to the recovery log manager (RLM) subcomponent and is probably caused by a passed parameter list being lost or a previous abend processing a LOG READ request.

This abend reason code is issued by the following CSECT: DSNJR008

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect all relevant diagnostic materials, including SYS1.LOGREC, SVC dump, and console output. Notify the system programmer.

System Programmer Response: Examine LOGREC and SVC dump information for prior abends during LOG READ processing. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 5, 16.

00D10341

Explanation: A LOG READ completed unsuccessfully because an error was detected during a Forward READ of the log record. This is an internal error.

This abend reason code is issued by the following CSECT: DSNJR103

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871. In addition, register 6 contains the address of the execution block (EB). All log read cursors reside in a recovery log manager storage pool whose header address is in the log manager block (LMB) at LMBRCPHB. The LMB is pointed to by register 5 and described by DSNDLMB.

00D10342

Explanation: A LOG READ completed unsuccessfully because an error was detected during a backward READ of a log record. This is an internal error.

This abend reason code is issued by the following CSECT: DSNJR103

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871. In addition, register 6 contains the address of the execution block (EB). All log read cursors reside in a recovery log manager storage pool whose header address is in the log manager block (LMB) at LMBRCPHB. The LMB is pointed to by register 5 and described by DSNDLMB.

00D10343

Explanation: A LOG READ completed unsuccessfully because an error was detected during a READ of a log record due to an invalid CI offset. This is an internal error.

This abend reason code is issued by the following CSECT: DSNJR103

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871. In addition, register 6 contains the address of the execution block (EB). All log read cursors reside in a recovery log manager storage pool whose header address is in the log manager block (LMB) at LMBRCPHB. The LMB is pointed to by register 5 and described by DSNDLMB.

00D10345

Explanation: A LOG READ completed unsuccessfully because an error was received from a CATALOG LOCATE request for an archive log data set. The requested archive log data set might have been uncataloged or deleted.

System Action: An execution unit might write a record to SYS1.LOGREC and request an SVC dump.

Operator Response: Collect the SYS1.LOGREC and SVC dump, if requested. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump, if requested. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871.

This abend reason code is issued by the following CSECT: DSNJR106

00D10347

Explanation: An attempt to notify a peer to force write the log buffer failed.

System Action: DB2 issues a return code of 4 and reason code of 00D10347 to the requesting function.

System Programmer Response: Review the DB2 console for related errors.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00D10348

Explanation: The maximum retry count was exceeded while attempting to read a log RBA.

System Action: The execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

System Programmer Response: Review the DB2 console for related errors.

Problem Determination: This problem might occur if the user has added an archive log to the BSDS with an incorrect RBA range using Change Log Inventory (DSNJU003) or if an active log dataset has been regressed such that the log dataset does not contain the RBA range that is listed in the BSDS.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00D10349

Explanation: A deadlock occurred attempting to allocate an archive log tape.

System Action: DB2 issues a return code of 8 and reason code of 00D10349 to the requesting function.

System Programmer Response: Review the DB2 console for the terminated function.

Problem Determination: The requesting function was terminated. There was another function allocating the same archive log tapes. Rerun the terminated function after the present function no longer has the archive log tapes allocated.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00D10350

Explanation: A lock or unlock failed in an attempt to allocate an archive log tape.

System Action: An execution unit writes a record to SYS1.LOGREC, requests an SVC dump, and then terminates.

Operator Response: Collect all relevant diagnostic materials, including SYS1.LOGREC, an SVC dump, and console output. Notify the system programmer.

System Programmer Response: This is an internal DB2 error, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00D10401

Explanation: A BSDS read was requested and the record was not found.

System Action: DB2 returns a return code of 4 and reason code of 00D10401 to the requesting function.

System Programmer Response: Review the DB2 console for related errors.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00D10402

Explanation: A BSDS read was requested and the input area was too small.

System Action: DB2 returns a return code of 8 and reason code of 00D10402 to the requesting function.

System Programmer Response: Review the DB2 console for related errors.

Problem Determination: If you suspect an error in

00D10403 • 00D10411

DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00D10403

Explanation: A BSDS update was requested and the record was not found.

System Action: DB2 returns a return code of 4 and reason code of 00D10403 to the requesting function.

System Programmer Response: Review the DB2 console for related errors.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00D10404

Explanation: A BSDS insert was requested and the record already exists.

System Action: DB2 returns a return code of 4 and reason code of 00D10404 to the requesting function.

System Programmer Response: Review the DB2 console for related errors.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00D10405

Explanation: A BSDS delete was requested and the record does not exist.

System Action: DB2 returns a return code of 4 and reason code of 00D10405 to the requesting function.

System Programmer Response: Review the DB2 console for related errors.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00D10406

Explanation: The bootstrap data set access service received a request with an invalid function code.

This abend reason code is issued by the following CSECT: DSNJB001

System Action: If this was an unconditional request, an execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect all relevant diagnostic

materials, including SYS1.LOGREC, SVC dump, and console output. Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 5, 16.

00D10410

Explanation: An unsuccessful completion of a READ BSDS RECORD has occurred. An error has been returned from VSAM.

This abend reason code is issued by the following CSECT: DSNJB002

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Use the SYS1.LOGREC and SVC dump to determine the cause of the problem.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871. In addition, the VSAM RPL fields RPLERRCD and RPLERREG are stored in the BSDS request parameter list. The address of the BSDS request parameter list is stored in the BSDS request element (BSDSRQEL) field (located at offset X'8' in the bootstrap data set block).

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 16.

00D10411

Explanation: An unsuccessful completion of a WRITE UPDATE BSDS RECORD has occurred. An error has been returned from VSAM.

This abend reason code is issued by the following CSECT: DSNJB002

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump. Determine the cause of the problem from the diagnostic information in the Problem Determination section of this message.

Problem Determination: RLM standard diagnostic

information is provided in Chapter 39, “X'D1.....’ codes,” on page 871. In addition, the VSAM RPL fields RPLERRCD and RPLERREG are stored in the BSDS request parameter list. The address of the BSDS request parameter list is stored in the BSDS request element (BSDSRQEL) field (located at offset 8 in the bootstrap data set block).

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 1, 2, 5, 16.

00D10412

Explanation: An unsuccessful completion of a WRITE INSERT BSDS RECORD has occurred. An error has been returned from VSAM.

This abend reason code is issued by the following CSECT: DSNJB002

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Collect the SYS1.LOGREC and SVC dump. Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump. Determine the cause of the problem from the diagnostic information in the Problem Determination section of this message.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, “X'D1.....’ codes,” on page 871. In addition, the VSAM RPL fields RPLERRCD and RPLERREG are stored in the BSDS request parameter list. The address of the BSDS request parameter list is stored in the BSDS request element (BSDSRQEL) field (located at offset 8 in the bootstrap data set block).

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 1, 2, 5, 16.

00D10413

Explanation: An unsuccessful completion of a DELETE BSDS RECORD has occurred. An error has been returned from VSAM.

This abend reason code is issued by the following CSECT: DSNJB002

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump. Determine the cause of the problem from the diagnostic information in the Problem Determination section of this message.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, “X'D1.....’ codes,” on page 871. In addition, the VSAM RPL fields RPLERRCD and RPLERREG are stored in the BSDS request parameter list. The address of the BSDS request parameter list is stored in the BSDS request element (BSDSRQEL) field (located at offset 8 in the bootstrap data set block).

Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 1, 2, 5, 16.

00D10414

Explanation: DB2 cannot dynamically allocate a copy of the requested bootstrap data set (BSDS).

System Action: The system places the BSDS in disabled mode.

User Response: Notify the system programmer.

System Programmer Response: Restore the BSDS data set (or data sets) and restart the DB2 subsystem associated with the BSDS.

Problem Determination: This reason code is issued by the following CSECT: DSNJB002

00D10415

Explanation: The bootstrap data set (BSDS) is not a valid BSDS for the data sharing group.

System Action: The system places the BSDS in disabled mode.

User Response: Notify the system programmer.

System Programmer Response: Restore the BSDS data set (or data sets) and restart the DB2 subsystem associated with the BSDS.

Problem Determination: This abend reason code is issued by the following CSECT: DSNJB002

00D10416

Explanation: A peer BSDS process was requested in non-data sharing.

System Action: DB2 issues a return code of 8 and reason code of 00D10416 to the requesting function.

System Programmer Response: Review the DB2 console for related errors.

Problem Determination: Peer BSDS requests cannot occur in non-data sharing.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00D10417

Explanation: A peer BSDS process was requested for a host BSDS.

System Action: DB2 issues a return code of 8 and reason code of 00D10417 to the requesting function.

System Programmer Response: Review the DB2 console for related errors.

Problem Determination: Peer BSDS requests cannot be processed for the host BSDS.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00D10500

Explanation: The recovery log manager's dynamic allocation function has been passed a bad function code (LRB4FUNC in control block LRB4).

This abend reason code is issued by the following CSECT: DSNJDS01

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump. Determine the cause of the problem from the diagnostic information in the Problem Determination section of this message.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871. In addition, trace entry 501 provides the return address to the module that passed the LRB4 with the undefined function code. It also provides the address of the LRB4. This address is also in register 7 at the time of the abend.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 2, 5.

00D10501

Explanation: The recovery log manager's common access method services has been passed a bad function code (DSPLFUNC in control block DSPL).

This abend reason code is issued by the following CSECT: DSNJDS05

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump. Determine the cause

of the problem from the diagnostic information in the Problem Determination section of this message.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871. The address of the DSPL is provided in register 3, and the invalid function in register 4.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 2, 5.

00D10700

Explanation: An error completion code was returned by SETLOCK OBTAIN.

This abend reason code is issued by the following CSECT: DSNJM002

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump. Determine the cause of the problem from the diagnostic information in the Problem Determination section of this message.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871. In addition, register 0 contains the return code from SETLOCK OBTAIN.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 2, 5.

00D10701

Explanation: An error completion code was returned by SETLOCK RELEASE.

This abend reason code is issued by the following CSECT: DSNJM002

System Action: An execution unit writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates abnormally.

Operator Response: Notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and SVC dump. Determine the cause of the problem from the diagnostic information in the Problem Determination section of this message.

Problem Determination: RLM standard diagnostic information is provided in Chapter 39, "X'D1.....' codes," on page 871. In addition, register 0 contains the return code from SETLOCK RELEASE.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 2, 5.

00D10800

Explanation: The log manager command processor (DSNJC001) was entered with an invalid Tokenized Command Segment (TCS).

This reason code is issued by the following CSECT: DSNJC001

System Action: A diagnostic record is written to SYS1.LOGREC, and an SVC dump is requested. The requesting execution unit is abended.

Operator Response: Collect the SYS1.LOGREC and SVC dump, and notify the system programmer.

System Programmer Response: Obtain the SYS1.LOGREC and the SVC dump from the operator. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: RLM standard diagnostic information is provided under Chapter 39, "XD1....." codes," on page 871.

General register 1 contains the address of the TCS as passed to log manager. The character string 'TCS' should appear at the address provided in R1, plus 4. The address of the GPC Pool Header Block (PHB) is provided in general register 2. The value X'0036' should appear at the address provided in R2. If these two items are not present, then the DSNJC001 CSECT was invoked in error by an execution unit.

00D10901

Explanation: DB2 failed to locate a data sharing member in the SCA.

System Action: If this was an unconditional request, an execution unit writes a record to SYS1.LOGREC, requests an SVC dump, and terminates.

Operator Response: Collect all relevant diagnostic materials, including SYS1.LOGREC, an SVC dump, and console output.

Problem Determination: Review the DB2 system console for possible DSN7xxxx messages that could relate to this problem.

See the DB2 system console for message DSNJ700I that is issued with this DB2 condition code.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00D10902

Explanation: A dynamic allocation of a peer's BSDS failed.

System Action: If this was an unconditional request, an execution unit writes a record to SYS1.LOGREC,

requests an SVC dump, and terminates.

Operator Response: Collect all relevant diagnostic materials, including SYS1.LOGREC, an SVC dump, and console output of peer and host.

Problem Determination: Review the DB2 system console for possible errors relating the peer's BSDS on both the host and peer DB2 system.

See the DB2 system console for messages DSNJ103I and DSNJ700I that are issued with this DB2 condition code.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00D10903

Explanation: An open of a peer BSDS failed.

System Action: If this was an unconditional request, an execution unit writes a record to SYS1.LOGREC, requests an SVC dump, and terminates.

Operator Response: Collect all relevant diagnostic materials, including SYS1.LOGREC, an SVC dump, and console output. Notify the system programmer.

Problem Determination: Review the DB2 system console for messages DSNJ100I and DSNJ700I that are issued with this DB2 condition code.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00D10904

Explanation: There was a VSAM MRKBFR error for a peer BSDS.

System Action: If this was an unconditional request, an execution unit writes a record to SYS1.LOGREC, requests an SVC dump, and terminates.

Operator Response: Collect all relevant diagnostic materials, including SYS1.LOGREC, an SVC dump, and console output.

Problem Determination: The VSAM MRKBFR error is placed in LRB1XRC.

See the DB2 system console for message DSNJ700I that is issued with this DB2 condition code.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00D10905

Explanation: There is a mismatch between the two BSDS timestamps of a peer.

System Action: If this was an unconditional request,

an execution unit writes a record to SYS1.LOGREC, requests an SVC dump, and terminates.

Problem Determination: There is a mismatch between the two BSDS system timestamps of a peer, the BSDS change log inventory (DSNJU003) timestamps of a peer, or both. The peer log environment might have changed. This must be resolved at the peer DB2 subsystem by determining which BSDS is in error and recovering that BSDS.

See the DB2 system console for message DSNJ7001 that is issued with this DB2 condition code.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00D10906

Explanation: The change log inventory (DSNJU003) timestamp does not match the system timestamp in the peer BSDS.

System Action: If this was an unconditional request, an execution unit writes a record to SYS1.LOGREC, requests an SVC dump, and terminates.

Problem Determination: A change log inventory (DSNJU003) job was executed against the peer BSDS after the last peer DB2 subsystem restart. The peer log environment might have changed. Restart the peer DB2 subsystem to reset this condition.

See the DB2 system console for message DSNJ7001 that is issued with this DB2 condition code.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00D10907

Explanation: DB2 could not locate a peer's active log data set in the peer's BSDS.

System Action: If this was an unconditional request, an execution unit writes a record to SYS1.LOGREC, requests an SVC dump, and terminates.

Operator Response: Collect all relevant diagnostic materials including SYS1.LOGREC, an SVC dump, and console output.

Problem Determination: Run a print log map (DSNJU004) job against the peer's BSDS to compare BSDS active log entries with the existing peer's log data sets. There is probably a mismatch between them.

See the DB2 system console for message DSNJ7001 that is issued with this DB2 condition code.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00D10908

Explanation: An open of a peer's active log failed.

System Action: If this was an unconditional request, an execution unit writes a record to SYS1.LOGREC, requests an SVC dump, and terminates.

Operator Response: Collect all relevant diagnostic materials, including SYS1.LOGREC, an SVC dump, and console output of peer and host.

Problem Determination: Review the DB2 system console for possible errors relating the peer's active log on both the host and peer DB2 system.

The VSAM CONNECT return code is in LRB1XRC if an SVC dump was taken.

See the DB2 system console for message DSNJ7001 that is issued with this DB2 condition code.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00D10909

Explanation: There was no active BSDS found for the peer DB2 subsystem.

System Action: If this was an unconditional request, an execution unit writes a record to SYS1.LOGREC, requests an SVC dump, and terminates.

Operator Response: Collect all relevant diagnostic materials, including SYS1.LOGREC, SVC dump, and console output of peer and host.

Problem Determination: Review the DB2 system console for possible errors relating the peer's BSDSs on both the host and peer DB2 system.

See the DB2 system console for message DSNJ7001 that is issued with this DB2 condition code.

The peer BSDSs have been placed in inactive mode. There might have been an error against this peer's BSDSs and a recovery is needed.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00D10910

Explanation: A BLDVRP/DLVRP macro failed for the BSDS buffer.

System Action: An execution unit writes a record to SYS1.LOGREC, requests an SVC dump, and then terminates.

Operator Response: Collect all relevant diagnostic materials, including SYS1.LOGREC, SVC dump, and console output.

Problem Determination: Review the DB2 system

console for possible errors relating to the BSDS.

A BLDVRP/DLVRP macro for a VSAM shared resource pool failed for the BSDS. General register 2 will contain a value of 1 for a BLDVRP macro or a value of 2 for a DLVRP macro. The macro return code is contained in general register 3. See the appropriate VSAM publication for advanced VSAM applications.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00D10916

Explanation: DB2 received an error while attempting to read shared communications area (SCA) information from the coupling facility.

System Action: Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested. The subsystem will be terminated with the same reason code.

System Programmer Response: Correct the problem with the coupling facility, and restart DB2.

Problem Determination: Review the DB2 system console for possible DSN7xxxx and DSNJxxxx messages that might relate to this problem. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00D10917

Explanation: DB2 received an error while attempting to write shared communications area (SCA) information to the coupling facility.

System Action: Standard DB2 diagnostic information is recorded in SYS1.LOGREC, and an SVC dump is requested. The subsystem will be terminated with the same reason code.

System Programmer Response: Correct the problem with the coupling facility, and restart DB2.

Problem Determination: Review the DB2 system console for possible DSN7xxxx and DSNJxxxx messages that might relate to this problem. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

Chapter 40. X'D3.....' codes

00D30000

Explanation: The operator canceled the allied agent at the requesting location and a dump was requested, or the agent abended with a reason code that indicated a possible communication problem. In either case, the database access agent at this location abended to take a dump to assist in problem determination.

This abend reason code is issued by the following CSECT: DSNLABRT

System Action: The agent terminates.

Operator Response: Notify the system programmer.

System Programmer Response: The information collected as a result of this abend is related to information collected at the requesting location. Obtain a copy of the SYS1.LOGREC listing and the SVC dump. Contact the system programmer at the requesting location (the location name can be determined from the dump header) to coordinate further action.

Problem Determination: This abend was initiated in order to save diagnostic information that might be useful in problem determination.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00D30001

Explanation: The DPS RALE was not initialized. The DSNLSPRR was invoked with the DPSB defined as the functional recovery routine (FRR) anchor. The DPSB is created after the DPS RALE is initialized.

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D30002

Explanation: The distributed data facility (DDF) standard ESTAE and FRR recovery routines detected a bad recovery element. This is a DB2 internal error.

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D30003

Explanation: While establishing an ESTAE functional recovery, DB2 detected a failure.

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D30004

Explanation: A database access agent received an invalid message. This is a DB2 internal error.

This abend reason code is issued by the following CSECTs:

00D30005 • 00D3000A

DSNLABRT DSNLPREP DSNLRUSE DSNLTMR

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D30005

Explanation: DB2 detected a failure while retrying DB2 recovery.

This abend reason code is issued by the following CSECT: DSNLFRCV

System Action: DB2 abends after it writes a SYS1.LOGREC record and requests a SVC dump.

Operator Response: Notify the system programmer.

System Programmer Response: This is a DB2 internal error. Obtain a copy of the SYS1.LOGREC listing and the SVC dump. Determine the failing environment (DB2, IMS, CICS, or TSO). Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: A distributed data facility (DDF) module retried recovery after an abend, but invalidly returned control to the DDF functional recovery routine (DSNLFRCV) that issued the abend.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00D30008

Explanation: The distributed transaction manager (DTM) could not allocate a RALE for the distributed data facility (DDF). This is a DB2 internal error.

This abend reason code is issued by the following CSECTs: DSNLARALDSNLTACCDNSLTMRA

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D30009

Explanation: During allocation of a database access agent, simultaneous use of an APLE was attempted. An APLE can be used once during allocation of a database access agent. This is a DB2 internal error.

This abend reason code is issued by the following CSECT: DSNLTMRA

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D3000A

Explanation: DB2 invoked the DSNLTDSC macro or a function of the distributed transaction manager (DTM). The required function could not be performed because the DPSB control block does not exist. This is a DB2 internal error.

This abend reason code is issued by the following CSECTs:

DSNLBABR DSNLCMT1 DSNLDALB DSNLTGBK
DSNLTMIG DSNLTRNA

System Action: DB2 writes a SYS1.LOGREC record and requests a SVC dump. The execution unit abnormally terminates.

Operator Response: Notify the system programmer.

System Programmer Response: Obtain a copy of the SYS1.LOGREC listing and the SVC dump. Determine the failing environment (DB2, IMS, CICS, or TSO). Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: DB2 detects this error when the module that abnormally terminated is invoked and determines that the existence of the DDF agent local anchor block (DPSB) is not indicated by the DDF RALE or is not indicated by the ACE.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5

00D3000B

Explanation: A function of the distributed transaction manager (DTM) was invoked and attempted to establish a functional recovery environment. The functional recovery element (FRE) that was created was not the first one on the chain of FREs anchored in the DPSB. This is a DB2 internal error.

This abend reason code is issued by the following CSECTs: DSNLAGNT, DSNLCMT1.

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D3000C

Explanation: The location name received in a response message from a responding site disagrees with the location name to which the request message was sent. This is a DB2 internal error.

This abend reason code is issued by the following CSECT: DSNLCMT1

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D3000D

Explanation: A request using application-directed access starting at site 'A' referenced an object at site 'B' that is stored at site 'A'.

This abend reason code is issued by the following CSECT: DSNLTMIG

System Action: The application statement was not processed.

User Response: Recode the application to remove the alias reference at the remote server that resolves to an object stored at the local DB2. Objects stored at the local site must be referenced using a local name.

Problem Determination: If necessary, consult with the data base administrators at the local site and the remote server location. Inspect the remote SYSIBM.SYSTABLES catalog table to determine the object at this location being referenced in a circular manner.

00D3000E

Explanation: The DSNLFTMB macro was invoked to determine whether an update request was sent to a specified location, but the transaction has not yet been migrated to that location. This is a DB2 internal error.

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem

determination," on page 1353: 56, 57.

00D3000F

Explanation: A DB2 resource manager attempted to add a duplicate entry to the list of resource managers. This list contains the names of resource managers that can participate in the allocation of a database access agent at a remote site. This is a DB2 error.

This abend reason code is issued by the following CSECT: DSNLADRA

System Action: DB2 writes a SYS1.LOGREC record and requests a SVC dump. The execution unit abends.

Operator Response: Notify the system programmer.

System Programmer Response: Obtain a copy of the SYS1.LOGREC listing and the SVC dump. Determine the failing environment (DB2, IMS, CICS, or TSO). If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The module that incorrectly invoked this function also invoked DSNLADRA.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00D30010

Explanation: A DB2 resource manager attempted to delete a resource manager that is not given in the list of resource managers that participate in the allocation of a database access agent at a remote site. This is a DB2 internal error.

This abend reason code is issued by the following CSECT: DSNLADRA

System Action: DB2 writes a SYS1.LOGREC record and requests a SVC dump. The execution unit abends.

Operator Response: Notify the system programmer.

System Programmer Response: Obtain a copy of the SYS1.LOGREC listing and the SVC dump. Determine the failing environment (DB2, IMS, CICS, or TSO). Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: This module which incorrectly invoked this function also invoked DSNLADRA.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00D30011

Explanation: Only a certain number of resource managers can participate in the allocation of a database access agent at a remote site. The maximum has been attained and cannot be extended. This is a DB2 internal error.

This abend reason code is issued by the following CSECT: DSNLADRA

System Action: DB2 writes a SYS1.LOGREC record and requests a SVC dump. The execution unit abends.

Operator Response: Notify the system programmer.

System Programmer Response: Obtain a copy of the SYS1.LOGREC listing and the SVC dump. Determine the failing environment (DB2, IMS, CICS, or TSO). Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00D30012

Explanation: More than one resource manager attempted to reserve the same RALE for use in the allocation of a database access agent at a remote site. This is a DB2 internal error.

This abend reason code is issued by the following CSECT: DSNLTMIG

System Action: DB2 writes a SYS1.LOGREC record and requests a SVC dump. The execution unit abends.

Operator Response: Notify the system programmer.

System Programmer Response: Obtain a copy of the SYS1.LOGREC listing and the SVC dump. Determine the failing environment (DB2, IMS, CICS, or TSO). Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The RALE was previously reserved by another resource manager and is not available.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00D30013

Explanation: The facility section (DSN6FAC) in the DB2 initialization parameter module does not exist.

This abend reason code is issued by the following CSECT: DSNLSSRW

System Action: DB2 writes a SYS1.LOGREC record and requests a SVC dump. The distributed data facility is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: This is probably an installation error. Obtain a listing of the DSNZPARM module used.

Problem Determination: Ensure that DSN6FAC was installed correctly.

00D30014

Explanation: The distributed transaction manager (DTM) detected an internal error. This is a DB2 internal error.

This abend reason code is issued by the following CSECTs:

DSNLATR	DSNLB	DSNLC	DSNLE
DSNLDP	DSNLE	DSNLI	DSNLP
DSNLS	DSNLS	DSNLS	DSNLT
DSNLT	DSNL	DSNLT	DSNLT
DSNLT	DSNLT	DSNLT	DSNLT

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D30015

Explanation: The facility section (DSN6FAC) in the DB2 initialization parameter module is invalid.

This abend reason code is issued by the following CSECT: DSNLSSRW

System Action: DB2 writes a SYS1.LOGREC record and requests a SVC dump. The distributed data facility (DDF) is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: This is probably an installation error. Obtain a listing of the DSNZPARM module used.

Problem Determination: Ensure that DSN6FAC was installed correctly.

00D30016

Explanation: An allied agent received an invalid response. This is a DB2 internal error.

This abend reason code is issued by the following CSECT: DSNLCMT1

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D30018

Explanation: An agent exists at the site at which the abend occurred, but an agent that should exist at another site does not exist at that site. This is probably a DB2 internal error.

System Action: DB2 writes a SYS1.LOGREC record and requests a SVC dump. The execution unit abends.

Operator Response: Notify the system programmer.

System Programmer Response: Obtain a copy of the SYS1.LOGREC listing and the SVC dump. Determine the failing environment (DB2, IMS, CICS, or TSO). Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The distributed data facility (DDF) error monitor, which terminates the agent that is waiting for some action to be taken by the nonexistent agent, detects this error. The module that was waiting for the action of the nonexistent agent is the module that issued the abend.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00D30019

Explanation: The distributed data facility (DDF) error monitor detected an error at another site which caused the agent at this site to be canceled. This is probably a DB2 internal error.

System Action: DB2 writes a SYS1.LOGREC record

00D3001A • 00D3001C

and requests a SVC dump. The execution unit abends.

Operator Response: Notify the system programmer.

System Programmer Response: Obtain a copy of the SYS1.LOGREC listing and the SVC dump. Determine the failing environment (DB2, IMS, CICS, or TSO). Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The DDF error monitor, which terminates the agent because of an error detected at another site to which the agent is connected and for which the agent is waiting, detected this error. The module that was suspended to wait for the action to be taken at the other site is the module that issued the abend.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00D3001A

Explanation: A CANCEL THREAD or CANCEL DDF THREAD command naming a distributed thread caused the thread to be terminated. A dump is provided for diagnostic purposes as a result of the CANCEL command DUMP keyword.

System Action: DB2 writes a SYS1.LOGREC record and requests an SVC dump. The execution unit abends. If the canceled distributed thread is an allied thread, DB2 requests the cancelation of each associated database access thread at each of the server sites (refer to the explanation for 00D30000).

Operator Response: Notify the system programmer.

System Programmer Response: The command might have been used to terminate a thread that was in a state where no processing was occurring and the thread could not continue.

If you suspect an internal DB2 error, obtain a copy of the SYS1.LOGREC listing and the SVC dump. Determine the failing environment (DB2, IMS, CICS, or TSO). Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353 1, 2, 5.

The module that was suspended while waiting for some action to be taken is the module that issued the abend.

00D3001B

Explanation: The database access request from a remote site failed because the SYSIBM.USERNAMES table did not contain an inbound row, the TYPE column specified as an 'I' describing what DB2 authorization ID to be used for the remote primary authorization ID.

When the USERNAMES column in SYSIBM.LUNAMES specifies 'I' or 'B', requiring inbound name translation, the SYSIBM.USERNAMES table must contain entries describing which DB2 authorization IDs are to be used for each remote authorization ID from the LU.

This abend reason code is issued by the following CSECTs: DSNLTACC, DSNLTMRA.

System Action: The DSNL030I message is issued at the server. The database access agent is not allocated.

Operator Response: Notify the communications database administrator

System Programmer Response: Make sure the USERNAMES column in SYSIBM.LUNAMES has been specified correctly for the indicated LUNAME. If you intend to use remote authorization IDs that differ from DB2 authorization IDs, verify that the SYSIBM.USERNAMES table has rows that correctly specify the DB2 authorization IDs to be used for each possible remote authorization ID.

Problem Determination: Analyze the SYSIBM.USERNAMES table for an incorrect or missing entry.

00D3001C

Explanation: The database access request from a remote site failed because the SYSIBM.USERNAMES table did not contain an inbound row, the TYPE column specified as an 'I' describing what DB2 authorization ID to be used for the remote new user primary authorization ID. When the USERNAMES column in SYSIBM.LUNAMES specifies 'I' or 'B' requiring inbound name translation, the SYSIBM.USERNAMES table must contain entries describing which DB2 authorization IDs are to be used for each remote authorization ID from the LU.

This abend reason code is issued by the following CSECTs: DSNLRUSE, DSNLTEXC.

System Action: The DSNL030I message is issued at the server. The database access agent is not allocated.

Operator Response: Notify the communications database administrator.

System Programmer Response: Make sure the USERNAMES column in SYSIBM.LUNAMES has been specified correctly for the indicated LUNAME. If you intend to use remote authorization IDs that differ from the DB2 authorization IDs, verify that the SYSIBM.USERNAMES table has rows that correctly specify the DB2 authorization IDs to be used for each possible remote authorization ID.

Problem Determination: Analyze the SYSIBM.USERNAMES table for an incorrect or missing entry.

00D3001D

Explanation: The database access request from a remote site failed because the SYSIBM.USERNAMES table did not contain an inbound row, the TYPE column specified as an 'I' describing what DB2 authorization ID to be used for the remote plan owner authorization ID. When the USERNAMES column in SYSIBM.LUNAMES specifies 'I' or 'B', requiring inbound name translation, the SYSIBM.USERNAMES table must contain entries describing which DB2 authorization IDs are to be used for each remote authorization ID from the LU.

This reason code is issued by the following CSECT: DSNLTMRA

System Action: The DSNL030I message is issued at the server. The database access agent is not allocated.

Operator Response: Notify the communications database administrator.

System Programmer Response: Make sure the USERNAMES column in SYSIBM.LUNAMES has been specified correctly for the indicated LUNAME. If you intend to use remote authorization IDs that differ from the DB2 authorization IDs, verify that the SYSIBM.USERNAMES table has rows that correctly specify the DB2 authorization IDs to be used for each possible remote authorization ID.

Problem Determination: Analyze the SYSIBM.USERNAMES table for an incorrect or missing entry.

00D3001E

Explanation: The SYSTEM PARAMETER section (DSN6SYSP) in the DB2 installation parameter module does not exist.

This abend reason code is issued by the following CSECT: DSNLTMIN

System Action: A record is written to SYS1.LOGREC, and an SVC dump is requested. DDF is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: This is probably an installation error. Obtain a listing of the DSNZPARM module used.

Problem Determination: Ensure that DSN6SYSP was installed correctly.

00D3001F

Explanation: ACCRDBRM received from the remote server indicates incompatible server.

This abend reason code is issued by the following CSECT: DSNLTAC1

System Action: The TYPDEFNAM or TYPDEFOVR values returned from the remote server in the DDM

ACCRDBRM reply require data type and/or code page translations that cannot be supported by the local DB2. The local DB2 has disconnected the conversation with the remote server. DB2 requests neither a SVC dump nor a SYS1.LOGREC record.

User Response: Notify the system programmer. Invoke the application after the problem has been corrected.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem. Notify the system programmer at the remote location that the remote server may not be usable.

Problem Determination: Determine the server being accessed by examining the SQLCODE -30041 message text. Refer also to the DDM documentation of the ACCRDB command and the ACCRDBRM reply message.

00D30020

Explanation: The processing of the CONNECT statement at a remote server has failed. This is because acceptable CONNECT information was not conveyed in the distributed relational database architecture (DRDA) EXCSAT command sent by the local DB2 to the remote server.

This reason code is issued by the following CSECT: DSNLTEXC

System Action: The remote server database access agent (DBAA) sends a DRDA reply message (for example, MGRLVLRM) to the local DB2 which indicates the specific nature of the problem. The above reason code is sent in the server diagnosis area of the reply message. The DBAA awaits further DRDA commands from the local DB2.

User Response: The SQLCA returned in response to the CONNECT statement indicates what DRDA reply message was sent by the remote server. The user should contact the local DB2 system administrator with this information.

Operator Response: Operator will not detect this problem.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: This represents a DRDA configuration mismatch between the local DB2 and the remote server. The precise mismatch is determined from the reply message sent from the remote server to the local DB2. The reply message may be determined by examining the SQLCODE and the SQLCA tokens returned for the CONNECT statement.

The remote server and local DB2 system administrators

00D30021 • 00D30022

should consult together to determine if this is a system configuration error, or if an internal error exists at either the local DB2 or remote server.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5.

Collect the following local DB2 diagnostic items:

- Application source code and runtime listing.
- Relevant error and system logs spanning the time of the failure.

00D30021

Explanation: The processing of the CONNECT statement at a DB2 remote server has failed. This is because acceptable CONNECT information was not conveyed in the distributed relational database architecture (DRDA) ACCRDB command sent by the local DB2 to the remote server.

This reason code is issued by the following CSECT: DSNLTACC

System Action: The remote server database access agent (DBAA) sends a DRDA reply message (for example, VALNSPRM) to the local DB2 which indicates the specific nature of the problem. The above reason code is sent in the server diagnosis area of the reply message. The DBAA awaits further DRDA commands from the local DB2.

User Response: The SQLCA returned in response to the CONNECT statement indicates what DRDA reply message was sent by the remote server. The user should contact the local DB2 system administrator with this information.

Operator Response: Operator will not detect this problem.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: This represents a DRDA configuration mismatch between the local DB2 and the remote server. The precise mismatch is determined from the reply message sent from the DB2 remote server to the local DB2. The reply message may be determined by examining the SQLCODE and the SQLCA tokens returned for the CONNECT statement. It could indicate any one of the following problems (but is not limited to these):

- The EXCSAT command was not successfully processed prior to receipt of the ACCRDB command.
- The TYPDEFNAM parameter (specifies local DB2 data types) in the ACCRDB command is not supported.
- The TYPDEFOVR parameter (specifies local DB2 CCSIDs) in the ACCRDB command is not supported.

- The local DB2 product is not recognized/supported by the remote server.

The system administrators for the two locations should consult together to determine if this is a system configuration error or if an internal error exists at either location.

Collect the following diagnostic items at the remote server:

- Console output from the system on which the job was run and a listing of SYSLOG data set for the period of time spanning the failure.
- Listing of SYS1.LOGREC data set obtained by executing IFCEREP1.
- The system CCSIDs.

Collect the following diagnostic items at the local DB2:

- Application source code and runtime listing.
- Relevant error and system logs spanning the time of the failure.
- The system CCSIDs.

00D30022

Explanation: The processing of the CONNECT statement at the remote server has failed and the local DB2 Data Base Access Agent (DBAA) has been abended. This is because authorization checking has failed at the remote server.

This abend reason code is issued by the following CSECTS: DSNLTACC DSNLTTEXC

System Action: The conversation with the local DB2 is terminated by the remote server with an LU6.2 SNA sense code. The DBAA is abended. A DSNL030I message is written to the MVS console at the remote server, and an alert is generated.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Either the user does not have the proper authority to execute at the remote server, or there is a security configuration mismatch between the local DB2 and the remote server. Examine the DSNL030I message or the alert for a more specific reason code describing the failure. Consult with the two system administrators if necessary to fix the problem. No dump is generated for this abend.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5.

00D3002D

Explanation: The remote server was not successfully connected. The SYSIBM.USERNAMES table did not contain an outbound row, the TYPE column specified as an 'O' describing the remote authorization identifier to be used for the plan owner DB2 authorization ID. When the USERNAMES column in SYSIBM.LUNAMES specifies 'O' or 'B' requiring outbound name translation, the SYSIBM.USERNAMES table must contain entries describing the remote authorization IDs to be used for each DB2 authorization ID communicating with the LU.

This abend reason code is issued by the following CSECTs: DSNLTXAC DSNLTMIG

System Action: A resource unavailable is returned to the application. The request is not sent to the remote site.

Operator Response: Notify the communications database administrator.

System Programmer Response: Make sure the USERNAMES column in SYSIBM.LUNAMES has been specified correctly for the indicated LUNAME. If you intend to use remote authorization IDs that differ from DB2 authorization IDs, verify that the SYSIBM.USERNAMES table has rows that correctly specify the remote authorization ID to be used for each possible DB2 authorization ID.

Problem Determination: Analyze the SYSIBM.USERNAMES table for an incorrect or missing entry.

00D3002E

Explanation: No resync list entry exists during resynchronization when one is expected to exist. This is an internal error.

This abend reason code is issued by the following CSECTs:

DSNLTRLA DSNLTRLO DSNLTRPA DSNLTRPN
DSNLTRRH

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the sites to which the abending agent was connected by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D3002F

Explanation: An unrecognized function request was detected during resynchronization. This is an internal error.

This abend reason code is issued by the following CSECTs:

DSNLTRD DSNLTRE DSNLTRLS DSNLTRTR

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the sites to which the abending agent was connected by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D30030

Explanation: This site is not considered a coordinator or participant during resynchronization. This is an internal error.

This abend reason code is issued by the following CSECTs:

DSNLTRE DSNLTRLO DSNLTRPV DSNLTRVS

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the sites to which the abending agent was connected by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference*

for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D30031

Explanation: An unknown 2-phase COMMIT protocol is being used during resynchronization. This is an internal error.

This abend reason code is issued by the following CSECTs: DSNLTRLO DSNLTRVS

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the sites to which the abending agent was connected by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D30032

Explanation: This site is not considered either an initiator or recipient of resynchronization. This is an internal error.

This abend reason code is issued by the following CSECTs:

DSNLTRCN DSNLTRLA DSNLTRLN DSNLTRPA
DSNLTRPN

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the sites to which the abending agent was connected by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D30033

Explanation: This site is invalidly an initiator of resynchronization. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLTRPN

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the sites to which the abending agent was connected by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D30034

Explanation: An INDOUBT resync list entry does not have the correct associated structures during resynchronization. This is an internal error.

This abend reason code is issued by the following CSECTs: DSNLTRPA DSNLTRPN

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the sites to which the abending agent was connected by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D30035

Explanation: A resolved unit of work still has internal structures associated with it during resynchronization. This is an internal error.

This abend reason code is issued by the following CSECTs: DSNLTRPA DSNLTRPN

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the sites to which the abending agent was connected by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D30036

Explanation: Either the coordinator or participant has an invalid status during resynchronization. This is an internal error.

This abend reason code is issued by the following CSECTs:

DSNLTRCA DSNLTRCN DSNLTRLA DSNLTRLN
DSNLTRLO DSNLTRPA DSNLTRPN DSNLTRRA

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the sites to which the abending agent was connected by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D30037

Explanation: The resync list latch is erroneously still being held during resynchronization. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLTRTR

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the sites to which the abending agent was connected by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D30038

Explanation: The storage calculation for the amount of storage needed for -DISPLAY THREAD is invalid. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLTDTI

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the sites to which the abending agent was connected by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D30039

Explanation: A resync conversation is invalid. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLTRVR

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the sites to which the abending agent was connected by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D3003A

Explanation: An error occurred during resynchronization. This is an internal error.

This abend reason code is issued by the following CSECTs:

DSNLTRCA DSNLTRCN DSNLTRE DSNLTRLA
DSNLTRLN DSNLTRPA DSNLTRPN DSNLTRPV
DSNLTRRA

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the sites to which the abending agent was connected by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D3003B

Explanation: A distributed thread was canceled because the timeout value in the DB2 startup parameters module (usually DSNZPARM) was exceeded. This value is specified by the IDLE THREAD TIMEOUT value in the DSNTIPR installation panel or the IDTHTOIN value in the DSN6FAC macro, which is used to build the DB2 start up parameters module.

System Action: The execution unit abends.

Operator Response: Notify the system programmer.

System Programmer Response: The server thread was holding DB2 resources and the requester application did not make a request to the DB2 server thread for an extended period of time. The server thread is terminated in order to releases resources that might affect other threads.

This usually occurs for one of these reasons:

- The ACTIVE thread option was specified in the DDF THREADS field of the DSNTIPR installation panel, and a requester application or its user did not make a request to the DB2 server for an extended period. This can happen, for example, during a lengthy end user absence. As a result, the server thread becomes susceptible to being canceled because of the timeout value.

Determine why the requester application has not made a request to the DB2 server in the specified time. If the design or use of the application requires additional time, increase the IDLE THREAD TIMEOUT value or set it to zero to deactivate the function.
- The INACTIVE thread option was specified in the DDF THREADS field of the DSNTIPR installation panel, and a requester application or its user:
 - Failed to commit before an extended dormant period (such as end user absence), or
 - Committed before an extended dormant period (such as end user absence), but database resources are still held because of other existing conditions.

As a result, the server thread cannot be moved to the inactive state and becomes susceptible to being canceled because of the timeout value.

Determine why the server thread was not moved to the inactive state. For information about active and inactive threads, see the description of the DDF THREADS option of the DSNTIPR installation panel in "Planning and Installing DB2" in Part 2 of *DB2 Installation Guide*. If the design or use of the application requires additional time, increase the IDLE THREAD TIMEOUT value or set it to zero to deactivate the function.

Problem Determination: This abend reason code is issued by the following CSECT: DSNLBABR

00D300F1

Explanation: The DSNLTOKS macro was invoked to extract error information from the DTMF block using the CHECK_SQLCODE keyword and the DTMF block was either uninitialized or contained an SQL return code that was not negative. This is a DB2 internal error.

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested. The execution unit is abnormally terminated.

Operator Response: Notify the system programmer.

System Programmer Response: This is a DB2 internal error. Obtain a copy of SYS1.LOGREC and the SVC dump. Determine the failing environment (DB2, IMS, CICS, or TSO). Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: This name of the module that invoked the function given as the abending module name. This is not the module in error. An earlier failing module neglected to report error information in the DTMF block.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00D300F2

Explanation: EXCSATRD reply received from a remote server indicates an incompatible server.

This abend reason code is issued by the following CSECT: DSNLTEX1

System Action: The manager levels returned from the local DB2 in the DDM EXCSATRD reply were too low for the local DB2 to support. The local DB2 has disconnected the conversation with the remote server. DB2 requests neither an SVC dump nor a SYS1.LOGREC record written.

User Response: Notify the system programmer. Invoke the application after the problem has been corrected.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem. Notify the system programmer at the remote location that the remote server is not usable.

Problem Determination: Determine the server being accessed by inspecting the SQLCODE -30041 message text. Refer to the DDM documentation of the EXCSAT command.

00D300F3

Explanation: The remote server was not successfully connected. The SYSIBM.USERNAMES table did not contain an outbound row, the TYPE column specified as an 'O' describing the remote authorization identifier to be used for the new user primary DB2 authorization ID. When the USERNAMES column in SYSIBM.LUNAMES specifies 'O' or 'B' requiring outbound name translation, the SYSIBM.USERNAMES table must contain entries describing the remote authorization IDs to be used for each DB2 authorization ID communicating with the LU.

This abend reason code is issued by the following CSECTs: DSNLTMIG DSNLTXAC

System Action: A resource unavailable is returned to the application. The request is not sent to the remote site.

Operator Response: Notify the communications database administrator.

System Programmer Response: Make sure the USERNAMES column in SYSIBM.LUNAMES has been specified correctly for the indicated LUNAME. If you intend to use remote authorization IDs that differ from DB2 authorization IDs, verify that the SYSIBM.USERNAMES table has rows that correctly specify the remote authorization ID to be used for each possible DB2 authorization ID.

Problem Determination: Analyze the SYSIBM.USERNAMES table for an incorrect or missing entry.

00D300F4

Explanation: A DRDA protocol error occurred. Either a reply chain is broken but there is no DDM reply with a high enough severity to break the chain, or a message chain is unbroken in spite of a high severity code, or a conversation expected to be available has been terminated. The problem, though detected by DB2, is believed to have originated at the remote server. The server might not be a DB2 subsystem.

This abend reason code is issued by the following CSECTs:

DSNLBABR DSNLCMT1 DSNLTAC1 DSNLTEX1
DSNLTXAC

System Action: This reason code is returned to the application. A request message has likely been sent to the remote site but the outcome is uncertain. A DSNL0311 message may have been written to the console. Refer to the description of this message for more information. If this reason code is returned for an SQL 'COMMIT' statement, determine if manual recovery of the unit of work is necessary.

Operator Response: Notify the operator or systems programmer for the remote server.

00D300F5 • 00D300F9

System Programmer Response: Determine the product type of the server. The DISPLAY THREAD command may be used. Refer to the server products' diagnostic recommendations. If the server DBMS is DB2, contact your IBM representative to report the problem and open an APAR.

Problem Determination: The problem originated with the remote server. Follow the diagnostic recommendations published for the server DBMS product, which might not be DB2.

00D300F5

Explanation: DDM command chaining is in use.

This reason code is issued by the following CSECT: DSNLTXAC

System Action: The DTM module returns to its invoker with a return code = 4.

00D300F6

Explanation: A valid but unexpected DDM reply was received from a remote server during a connect, commit, or abort operation. For a connect, the expected DDM reply is EXCSATRD (for EXCSAT command) or ACCRDBRM (for ACCRDB command). For a commit or abort, the expected DDM reply is ENDUOWRM. (The DDM command for a commit is RDBCMM. For a rollback, it is RDBRLLBCK).

This reason code is issued by the following CSECTS:

DSNLBABR DSNLCMT1 DSNLTAC1 DSNLTEX1

System Action: The local DB2 tried to access a remote server and the server replied with an unexpected DDM answer. The remote server may have suffered permanent damage. The local DB2 may or may not subsequently disconnect the conversation to the server. This is an internal-only DDF reason code. The local DB2 requests neither a SVC dump nor a SYS1.LOGREC record.

User Response: Contact the system programmer

System Programmer Response: If the SQLCA is available, examine all fields in the SQLCA. Using this information, try to determine what DDM reply was received. Contact the system programmer at the server site with this information. This is probably a programming error at the server database system, although it may be a DB2 error. The server database system may have recorded diagnostic information for the problem. If this is a DB2 error, write an APAR.

Problem Determination: Examine the SQL return code in the SQLCA. It should give further indication of the real cause.

00D300F7

Explanation: A DDM reply message was too big to fit in the DTM reply buffer.

This abend reason code is issued by the following CSECTS:

DSNLBABR DSNLCMT1 DSNLTAC1 DSNLTEX1
DSNLTXAC

System Action: The requesting allied agent is terminated. A SYS1.LOGREC record is written and an SVC dump is requested at the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: This error should never occur. Write an APAR.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5.

00D300F8

Explanation: An attempt was made to access data at a remote location that has been started in restricted access mode. When a DB2 system is started in restricted access mode, no remote inbound or outbound access is allowed.

System Action: Remote access is not allowed.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the remote location where the remote data access was attempted. Retry the request when the remote location and/or the local DB2 has been restarted in full access mode.

00D300F9

Explanation: The DB2 server was unable to allocate a database access agent since the maximum number allowed was zero (ZPARM MAXDBAT value was zero).

This abend reason code is issued by the following CSECT: DSNLAGNT

System Action: The DB2 server terminates the conversation with a 084B6031 SNA sense code for application-directed access and a 00D300F9 DB2 code for system-directed access. A DSNL030I message containing this reason code is written to the MVS operator console at the DB2 server site.

System Programmer Response: At the server, currently no data base access agents are allowed because the MAXDBAT value in the ZPARM is zero. If

access to this site from a remote site is desirable, change the MAXDBAT parameter in ZPARM to the maximum number of database access agents desired. Restart DB2 at the server. Notify the user to rerun the application.

00D300FA

Explanation: You attempted a COMMIT statement for a plan that specified ISOLATION (RR) and update operations were performed either at the local site or at a remote site. The COMMIT operation could not be performed because the COMMIT request could not be transmitted to a remote site where Repeatable Read operations had been performed.

This abend reason code is issued by the following CSECT: DSNLCMT1

System Action: All update operations were backed out.

System Programmer Response: Determine why the COMMIT failed and retry the application.

00D300FB

Explanation: A resource was not available during database access agent allocation at a remote site.

This abend reason code is issued by the following CSECTs: DSNLTACC DSNLTMRA

System Action: The allocation of the database access agent was unsuccessful. A 'resource not available' code is returned to the user. DB2 requests neither a SVC dump nor a SYS1.LOGREC record.

User Response: Notify the system programmer. Invoke the application after the problem has been corrected.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of the *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Determine the name of the resource being allocated and correct the problem.

00D300FC

Explanation: You attempted to allocate a resource at a remote site using an invalid name.

This abend reason code is issued by the following CSECTs: DSNLTACC DSNLTMRA

System Action: The allocation of the database access agent was unsuccessful. A 'resource not available' code is returned to the user. DB2 requests neither a SVC dump nor a SYS1.LOGREC record. This reason code is returned only for system-directed access (DSNLTMRA).

User Response: Notify the system programmer.

Invoke the application after the problem has been corrected.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of the *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Determine the resource being allocated and correct the problem.

00D300FD

Explanation: An attempt was made to disconnect a connection with a specified location, but the transaction has not yet been connected to that location. This is a DB2 internal error.

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested. The execution unit is abnormally terminated.

Problem Determination: Obtain a copy of SYS1.LOGREC and the SVC dump. Determine the failing environment (DB2, IMS, CICS, or TSO). Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

The name of the module that invoked the function incorrectly is given as the abending module name.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00D300FE

Explanation: You executed a COMMIT statement and update operations were performed at a remote site. The success of the COMMIT operation could not be determined because a failure occurred at the remote site or in the communication link with the remote site after the request to commit the operation had been transmitted.

This abend reason code is issued by the following CSECT: DSNLCMT1

System Action: The remote updates have been committed or backed out, depending on when the error occurred.

User Response: After communication has been reestablished with the remote site, use SQL to query the updated data to determine whether the updates were committed. If the updates were not committed, rerun the application and perform the updates again.

00D300FF

Explanation: You attempted a COMMIT statement and update operations were performed at a remote site. The attempt failed.

00D30100 • 00D30103

Thisabend reason code is issued by the following CSECT: DSNLCMT1

System Action: The updates at the remote site have been backed out.

User Response: Rerun the application.

Problem Determination: Determine why the COMMIT failed and retry the application.

00D30100

Explanation: A COMMIT statement was chained to a set of commands sent to an remote server. The remote server stopped processing the chained commands before it reached the COMMIT. COMMIT was NOT performed.

This reason code is issued by the following CSECT: DSNLCMT1

System Action: Any updates performed within the current unit of Work have been backed out.

User Response: Notify the system programmer of the failure.

After the problem causing the chain to be broken at the remote server is fixed, rerun the application and perform the updates again.

Operator Response: Operator will not detect this problem.

System Programmer Response: See "Problem Determination" section below.

Problem Determination: Collect the following diagnostic items from the local DB2 system.

- Listing of application program and output from application program.
- Console output and a listing of SYSLOG data set for the period of time spanning the failure.
- Listing of SYS1.LOGREC data set, obtained by executing IFCEREP1.

Consult with the remote server system programmer to determine the cause of the error.

The remote server system programmer may need to collect the following remote server diagnostic items:

- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server dumps.

00D30101

Explanation: A COMMIT was attempted but failed due to a prior error. Communications to a remote site have been lost. The COMMIT operation cannot be performed because the COMMIT request could not be transmitted to a remote site. If the program has performed updates,

the updates have been backed out to the prior COMMIT point.

This reason code is issued by the following CSECT: DSNLCMT1

System Action: All update operations were backed out.

Operator Response: Notify the system programmer.

System Programmer Response: Restart DDF at the affected sites and rerun the application.

00D30103

Explanation: This reason code may be returned for a failed distributed commit using DRDA protocols. It indicates that commit has failed because an ABNUOWRM reply message was received from the server for a prior SQL statement, but an abort had not been driven at the DB2 requester prior to this commit and after the receipt of the ABNUOWRM.

An ABNUOWRM reply message is sent by the server when it has rolled back its unit-of-work in response to an unusual situation at the server (for example, deadlock or operator intervention). When an ABNUOWRM reply message is received by the requester, an abort must be driven at the requester to synchronize the distributed systems. Until an abort is driven, all subsequent SQL statements will receive an SQLCODE -906. After an abort is driven, further SQL statements will be accepted.

This reason code is issued by the following CSECT: DSNLCMT1

System Action: The commit at the DB2 requester fails.

User Response: Scan backwards in your application for the first non -906 SQLCODE prior to the commit. This SQLCODE was returned with the ABNUOWRM from the server system. Use the server product reference manuals to determine and correct whatever problem this SQLCODE represents on the server and rerun your application. This may involve contacting your system programmer if the situation at the Server cannot be corrected or improved by changes to the application program.

Operator Response: The operator will not detect this problem.

System Programmer Response: Determine the cause of the problem represented by the SQLCODE returned with the ABNUOWRM and if necessary, work with the system programmer at the server to resolve it. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items:

- User's application output, including SQLCAs returned for each SQL statement.

00D30104

Explanation: The unit-of-work disposition (commit or rollback) received from a DRDA server is inconsistent with the command sent (commit or rollback), and the SQL code returned from the server. For example, if a commit is sent to the server, and the reply message indicates the unit of work (UOW) was committed, but the SQL code returned is negative, then this reason code will be contained in the alert sent to NetView.

This reason code is issued by the following CSECTs: DSNLCMT1 DSNLBABR.

System Action: An alert is generated and sent to NetView. Two trace records, IFCID 0191 and IFCID 0193, may be written to the Statistics Class 4 trace, and two DSNL0311 messages may be written to the console. The trace records and messages will not be written if this error was previously detected within the last 5 minutes. The Statistics Class 4 trace must be active for the trace records to be written.

An SQLCODE +30100, -30020, or -30030 is returned to the application. An SQLCODE -30020 indicates a rollback was sent to the DRDA server, but a commit unit-of-work disposition was received. An SQLCODE +30100 or -30030 conveys the unit-of-work disposition reported by the server, and replaces the original SQL return code sent by the server, which was not consistent with the UOW disposition. The original SQL return code and SQLSTATE returned by the server are saved as tokens in the SQLCA.

Operator Response: Notify the system programmer.

System Programmer Response: This is a DRDA distributed protocol problem. Once the nature of the inconsistency is known, the server system programmer may have to be contacted to help resolve the problem. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items:

- Listing of the user's application program output, including printouts of the SQLCAs received for all SQL statements.
- Console output from the system on which the job was run, and a listing of SYSLOG data set for the period of time spanning the failure.
- Listing of the Statistics Class 4 trace records for the LUWID associated with the failing request.

If no DSNL0311 messages were written at the same time as the alert, then scan the log backwards for previous DSNL0311 messages. A DB2 filter function prohibits multiple occurrences of the same problem detected within a 5 minute period from flooding the

console and trace data set with diagnostic information. You will have to find an earlier occurrence of the same problem to start diagnosing it.

Once you have found the two DSNL0311 messages, locate the IFCID 0191 and 0193 trace records written for the problem by using the IFCID sequence numbers from the DSNL0311 messages.

The IFCID 0193 trace record will document the nature of the inconsistency (command sent, UOW disposition received, SQL return code received).

The IFCID 0191 trace record will document the exact data stream returned from the Server. Use this information to determine if the reply message from the server was correctly converted into the UOW disposition and the SQL return code reported in the IFCID 0193 record. If the data stream was correctly converted, then the problem lies at the server and you should contact the system programmer at the server and have him or her analyze the data stream produced by the server.

00D30105

Explanation: A distributed commit has failed because the allied agent was cancelled as a result of a STOP DDF MODE(FORCE) command during a previous execution of DDF which has terminated. When an allied agent does not issue database requests for more than 2 minutes after a STOP DDF MODE(FORCE) command is issued, DDF will come down without terminating the allied agent. The agent is cancelled when it makes its next request to DB2.

This reason code is issued by the following CSECT: DSNLCMT1

System Action: The commit operation is failed and the agent is cancelled. The last unit of work was rolled back at all server systems when the STOP DDF MODE(FORCE) command was processed.

User Response: Contact the operator to re-start DDF. After DDF is re-started, continue your application's work starting with the last unit of work that was rolled back.

Operator Response: Re-start DDF.

00D30106

Explanation: The result of a DRDA distributed commit could not be determined because the reply message from the server either was invalid or could not be deciphered.

This reason code is issued by the following CSECT: DSNLCMT1

System Action: An alert is generated and sent to NetView. An IFCID 0191 trace record may be written to the statistics class 4 trace, and a DSNL0311 message may be written to the console. The trace record and

message will not be written if this error was previously detected within the last 5 minutes. The statistics class 4 trace must be active for the trace records to be written.

The requester disconnects from the server system. The state of the unit of work at the server is unknown. It may have been committed, or it may have been rolled back. An SQLCA indicating the nature of the DRDA reply message distortion is given to the application.

User Response: Notify the system programmer. After the problem has been resolved, re-connect to the server site to determine whether the last unit of work was committed or rolled back. Continue your application after correcting the server database (if necessary).

Operator Response: Notify the system programmer whenever a DSNL0311 message is written to the MVS console.

System Programmer Response: This is a DRDA distributed protocol problem. Once the nature of the problem is known, the server system programmer may have to be contacted to help resolve the problem.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items:

- Listing of the user's application program output, including printouts of the SQLCAs received for all SQL statements.
- Console output from the system on which the job was run, and a listing of SYSLOG data set for the period of time spanning the failure.
- Listing of the statistics class 4 trace records.

If no DSNL0311 message was written at the same time as the alert, then scan the log backwards for a previous DSNL0311 message. A DB2 filter function prohibits multiple occurrences of the same problem detected within a 5 minute period from flooding the console and trace data set with diagnostic information. You will have to find an earlier occurrence of the same problem to start diagnosing it.

Once you have found the DSNL0311 message, locate the IFCID 0191 trace record written for the problem by using the IFCID sequence number from the DSNL0311 message.

The IFCID 0191 trace record will document the exact data stream returned from the server. Use this information to determine if the reply message from the Server was correct, and if so, the error resides with the DB2 AR.

If the data stream is incorrect, then the problem lies at the server and you should contact the system programmer at the server and have he or she analyze the data stream produced by the server.

00D30109

Explanation: Phase 1 of a distributed commit failed. One or more remote servers did one of the following:

- Voted NO
- Voted heuristic mixed
- Experienced a communications error
- Made an error in their use of commit protocol

This reason code is issued by the following CSECT: DSNLCMT1

System Action: The commit fails. The unit of work is backed out.

For communication errors, message DSNL406I is written to the system console, alert A006 is generated, and trace record IFCID 0209 is produced to record the server affected (LUWID of the unit of work, and other information).

For protocol errors, message DSNL413I is written to the system console, alert A005 is generated, and trace record IFCID 0208 is produced to describe the nature of each server's protocol violation.

User Response: Contact the DB2 systems programmer. If the commit failed for other than a commit protocol violation by a remote server, resubmit your application. Otherwise, wait for resolution of the protocol error.

System Programmer Response: For protocol errors, contact the system programmer for the remote site. The invalid sync point message is recorded in the IFCID 0208 trace record. The system logic error that causes the invalid sync point message must be corrected at the remote site.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1.

00D3010A

Explanation: This might occur when a version of IMS that does not support the COMMIT VERIFY exit is running an IMS MODE=MULTI application with one or more non-DB2 servers. This is probably a user error, since this scenario is not supported by DB2 and IMS unless the IMS version is 4 or later.

IMS requested a new user SIGNON without an immediately preceding commit or abort, and your application was connected to one or more remote non-DB2 servers. In order to preserve the consistency of database updates made at several different servers, when at least one server is a non-DB2 server, a commit or abort must precede any new user SIGNON.

This reason code is issued by the following CSECT: DSNLXNEW

System Action: The execution unit writes a record to SYS1.LOGREC. No dump is requested. The IMS

application terminates as a result of the abend.

Operator Response: Collect the SYS1.LOGREC. Notify the system programmer.

System Programmer Response: Determine if the IMS version and release being used invokes the DB2 COMMIT VERIFY exit, which is available in DB2 Version 3 and later. Obtain the SYS1.LOGREC.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1.

00D3010B

Explanation: Cached information was used to determine whether updates are allowed at the server. From the time of the execution of the CONNECT statement to the time that the first SQL statement was sent to the server, the conversation SYNC_LEVEL supported by the partner changed from a cached value of SYNC to the current of value NONE.

SYNC_LEVEL NONE servers are not allowed to update in the current unit of work. Since an update might have been performed by the partner during execution of the first statement at the server, the application must roll back (abort).

This reason code is returned as a token in the SQLCODE -904.

This reason code is issued by the following CSECT: DSNLTAC1

System Action: The connection to the server is deallocated. The server's portion of the current unit of work is rolled back at the server. The application is placed in a must-abort state. All subsequent operations except rollback or abort fail with an SQLCODE -918. The remainder of the current unit of work is backed out when rollback or abort is performed or when the application terminates.

User Response: If your application does not do any work at a server for a long time after issuing a CONNECT, consider rewriting it to perform the CONNECT immediately before performing any work at the server. This minimizes the possibility of the server system going down and coming back up at a different SYNC_LEVEL.

Rerun your application starting with the unit of work containing the SQL statement that received an SQLCODE -904.

00D3010C

Explanation: Cached information was used to determine whether updates are allowed at the server. From the time of the execution of the CONNECT statement to the time that the first SQL statement was sent to the server, the partner was started with a program that does not support two-phase commit.

Such servers are not allowed to update in the current unit of work. Since an update might have been performed by the partner during execution of the first statement at the server, the application must roll back.

This reason code is returned as a token in the SQLCODE -904.

This reason code is issued by the following CSECT: DSNLTAC1

System Action: The connection to the server is deallocated. The server's portion of the current unit of work is rolled back at the server. The application is placed in a must-abort state. All subsequent operations except rollback or abort fail with an SQLCODE -918. The remainder of the current unit of work is backed out when rollback or abort is performed or when the application terminates.

User Response: If your application does not do any work at a server for a long time after issuing a CONNECT, consider rewriting it to perform the CONNECT immediately before performing any work at the server. This minimizes the possibility of the server system going down and coming back up at a different level.

Rerun your application starting with the unit of work containing the SQL statement that received the SQLCODE -904.

00D3010D

Explanation: DB2 requested updates at multiple servers, but at least one server does not support distributed two-phase commit.

This reason code is issued by the following CSECT: DSNLCMT1

System Action: The commit fails for this unit of work (UOW). If the application is using TSO or BATCH attach, then DB2 rolls back the UOW. If the application is using CICS or IMS attach, then CICS or IMS rolls back the UOW after receiving the NO commit vote from DB2.

User Response: Change the application so that updates to multiple servers (including the local server) are not performed within a single UOW unless all the update servers in the UOW support distributed two-phase commit.

Problem Determination: In the UOW that was not committed, the first SQL statement that performed an update that was not allowed received an SQLCODE

00D3010E • 00D31011

-919. All subsequent SQL statements also received an SQLCODE -919 until a ROLLBACK or a static ROLLBACK SQL statement was executed (if either occurred).

00D3010E

Explanation: The DRDA server system does not support the authentication mechanism specified in the communications database. For example, the communications database specified that RACF passtickets were supposed to be used, but the server does not support it.

System Action: The attempt to access the remote server fails. An SQLCODE -30073 is returned to the application.

User Response: Notify the system programmer.

System Programmer Response: Modify the row in SYSIBM.LUNAMES or SYSIBM.IPNAMES to specify a security mechanism in the SECURITY_OUT column that the remote server supports.

00D3010F

Explanation: DB2 was unable to authenticate the DRDA end user, due to an error detected by RACF or DCE.

System Action: The end user's attempt to connect is rejected. An SQLCODE -30082 is returned to the application.

User Response: Notify the system programmer.

System Programmer Response: Correct the error detected by DCE or RACF. Both products write messages to the MVS console describing the error.

00D30110

Explanation: A DRDA error occurred. The DB2 crypto security component detected an error and could not process the encryption security tokens used to authenticate the end user.

System Action: The attempt to connect to DB2 fails, the failure is reported to the SQL application with an SQLCODE of -30082, and the connection is terminated.

System Programmer Response: Determine the reason for the failure by verifying the DRDA data stream and by reviewing the server diagnostic work area returned in the DRDA security check reply message.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00D31010

Explanation: An internal logic error occurred while a DCRM functional service was being invoked.

This abend reason code is issued by the following CSECT: DSNLCnnn

DSNLCnnn identifies that a DCRM Conversation manager CSECT detected a logic error. Refer to the dump title for the specific CSECT name.

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D31011

Explanation: An internal logic error occurred while invoking a VTAM functional service.

This abend reason code is issued by the following CSECT: DSNLVnnn

DSNLVnnn identifies that a DCRM VTAM manager CSECT detected a logic error. Refer to the dump title for the specific CSECT name.

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

User Response: Notify the system programmer.

Operator Response: Collect the SYS1.LOGREC listing and the SVC dump.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D31012

Explanation: A VTAM functional service request failed because the state of the conversation was invalid for the request.

This abend reason code is issued by the following CSECTs: DSNLVDDC DSNLVFSM

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

User Response: Notify the system programmer.

Operator Response: Collect the SYS1.LOGREC listing and the SVC dump.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the DB2 failure.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D31013

Explanation: A DB2 message was received with an invalid message block header (MBH). The MBH is a header that precedes all messages exchanged between two DB2 subsystems.

This abend reason code is issued by the following CSECTs:

DSNLVASY DSNLVRCA DSNLVRQP

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

User Response: Notify the system programmer.

Operator Response: Collect the SYS1.LOGREC listing and the SVC dump.

System Programmer Response: Determine which connected sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the DB2 failure. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following

diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D31014

Explanation: One or more invalid parameters were supplied while invoking a VTAM functional service.

This abend reason code is issued by the following CSECTs:

DSNLVASY DSNLVDDC DSNLVFSM DSNLVINF
DSNLVRCA DSNLVREQ DSNLVRQP DSNLVSCA
DSNLVSDA DSNLVSEA

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

User Response: Notify the system programmer.

Operator Response: Collect the SYS1.LOGREC listing and the SVC dump.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the DB2 failure.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D31018

Explanation: A syntax error was detected in a DDM reply received from a remote distributed database remote server.

This abend reason code is issued by the following CSECTs: DSNLCSRR DSNLCMSR

System Action: The attempt to access the remote database resource fails, and the failure is reported to the application.

A DSNL0311 message might have been written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem

determination,” on page 1353: 1, 83.

00D31019

Explanation: A DDM protocol error was detected in a DDM reply received from a remote distributed database remote server.

This abend reason code is issued by the following CSECTs: DSNLCMSR DSNLCSRR

System Action: The attempt to access the distributed resource fails, and the failure is reported to the local DB2.

A DSNL031I message might have been written to the console. Refer to the description of this message in this book for further information.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 1, 83.

00D3101A

Explanation: A syntax error was detected in a DDM request received from a remote distributed database local DB2.

This abend reason code is issued by the following CSECT: DSNLCRTD

System Action: The attempt to access the DB2 server fails, and the failure is reported to the local DB2.

A DSNL032I message might have been written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 1, 83.

00D3101B

Explanation: A DDM protocol error was detected in a DDM request received from a remote distributed database local DB2.

This abend reason code is issued by the following CSECT: DSNLCRTD

System Action: The attempt to access the DB2 server

fails, and the failure is reported to the local DB2.

A DSNL032I message may have been written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 1, 83.

00D3101C

Explanation: DB2 has detected an error while processing a connection request from DDCS. A DB2RA connection request was received from DDCS.

This reason code is issued by the following CSECTs: DSNLCRTD and DSNLIRTR.

System Action: A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator Response: Notify the DDCS system administrator.

System Programmer Response: This is probably not a DB2 problem. This error is most likely caused by an incorrect entry in the DCS directory on DDCS. Refer to *IBM Distributed Database Connection Services Installation and Configuration Guide* for information on configuring your DDCS system.

00D31022

Explanation: The requested VTAM function for allocating a conversation was not performed because the data manager returned an unavailable resource when attempting to read the SYSIBM.LOCATIONS table in the communication database (CDB). The LOCATION cannot be resolved to the remote DB2 subsystem LUNAME.

This abend reason code is issued by the following CSECT: DSNLVCLM

System Action: Notification of the failure is returned to the application. The conversation is not allocated.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: For more information, refer to the explanation of message DSNL700I. Collect the following diagnostic items:

- Definitions of the communication database (CDB) table space, tables, and indexes involved in the error.

- Items 1 and 5 listed in Appendix B, "Problem determination," on page 1353.

00D31023

Explanation: A request for a protected SNA conversation was rejected by a DB2 server because the SNA exchange log names (XLN) process has not yet completed with the requesting system.

This abend reason code is issued by the following CSECT: DSNLVPFV

System Action: Message DSNL030I is displayed on the system console with reason code 00D31023. The SNA conversation is rejected with SNA sense code 08640001, indicating the SNA protocol for protected conversations was violated.

User Response: Notify the DB2 system programmer.

System Programmer Response: The requesting system should have sent a valid SNA XLN request before starting a protected conversation. Contact the system programmer for the requesting system to determine why the SNA XLN process was not completed successfully.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1.

00D31024

Explanation: The requested VTAM function for allocating a conversation was not performed because the location name is not defined in the SYSIBM.LOCATIONS table in the communication database (CDB).

This abend reason code is issued by the following CSECTs:

DSNLVAAC DSNLVCLM DSNLVPF5

System Action: Notification of the failure is returned to the application. The conversation is not allocated to the specified location.

Operator Response: Notify the system programmer.

System Programmer Response: Add the location to the SYSIBM.LOCATIONS table.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 73, 74.

00D31025

Explanation: The requested VTAM function for allocating a conversation was not performed because a mode name could not be found in the SYSIBM.MODESELECT table in the communication database (CDB) for the requesting thread.

This abend reason code is issued by the following CSECT: DSNLVCLM

System Action: Notification of the failure is returned to the application. The conversation is not allocated.

Operator Response: Notify the system programmer.

System Programmer Response: Add the mode name to be selected in the SYSIBM.MODESELECT table for the authorization ID, PLANNAME, and LUNAME of the service request that failed.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 75, 76.

00D31026

Explanation: The requested VTAM function was not performed because VTAM returned a nonzero return code while attempting to communicate on a conversation.

This abend reason code is issued by the following CSECT: DSNLVRPL

System Action: Notification of the failure is returned to the application. The conversation is abnormally deallocated.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: For more information, refer to the explanation of message DSNL500I or message DSNL502I, depending on the type of conversation that failed.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5,

00D31027

Explanation: The requested VTAM function cannot be performed because VTAM is abending or because the operator has issued a HALT NET command to terminate VTAM.

This abend reason code is issued by the following CSECTs:

DSNLVAAC DSNLVASY DSNLVCNS DSNLVDDC
DSNLVRCA DSNLVREQ DSNLVSCA DSNLVSDA
DSNLVSEA DSNLVPCS DSNLVPF5 DSNLVRQP

System Action: Notification of DDF termination is reported to the application. No remote communications are allowed. The distributed data facility is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: Determine why VTAM was terminated.

00D31029

Explanation: The requested VTAM function to allocate a conversation failed. VTAM returned a nonzero return code while attempting to negotiate limits with a remote location for a mode.

This abend reason code is issued by the following CSECT: DSNLVCNS

System Action: Notification of the failure is returned to the application. All communications to the remote location on the mode fail until the CNOS is successfully negotiated.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: For more information, refer to the explanation of message DSNL501I.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5.

00D3102A

Explanation: A conversation was not allocated because a VTAM LU name contained in the LUNAME column of the SYSIBM.LULIST table was also present in the LUNAME column of the SYSIBM.LUNAMES table. A given VTAM LU name can appear in only one of these two tables.

System Action: The conversation is not allocated.

Operator Response: Notify the system programmer.

System Programmer Response: Make sure each remote VTAM LU is defined in the SYSIBM.LULIST table or the SYSIBM.LUNAMES table, but not both tables.

Problem Determination: Collect the following diagnostic items:

- Print the contents of the SYSIBM.LUNAMES table.
- Print the contents of the SYSIBM.LULIST table.

This abend reason code is issued by the following CSECT: DSNLVCLM

00D3102B

Explanation: A conversation was not allocated because the partner LU attempted to allocate a conversation using a blank mode name. Although DB2 tolerates CNOS requests with a blank mode name, DB2 does not accept conversations with a blank mode name.

System Action: Message DSNL030I is displayed on the system console with reason code 00D3102B. The conversation is not allocated.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the definitions at the partner LU to prevent conversations from being allocated with a blank mode name.

00D31031

Explanation: The local distributed data facility (DDF) is terminating.

This reason code is issued by the following CSECTs:

DSNLCCCN	DSNLVAAC	DSNLVCNS	DSNLVDDC
DSNLVINP	DSNLVRCA	DSNLVREQ	DSNLVSCA
DSNLVSDA	DSNLVSEA		

System Action: Notification of the failure is returned to the application. DB2 does not allow any new distributed threads while DDF is in termination or is terminated.

User Response: Contact your system programmer to determine why DDF was terminated.

Operator Response: Contact the system to determine the cause of DDF termination.

System Programmer Response: To determine why DDF was terminated and then start DDF.

00D31032

Explanation: The requested VTAM function failed because the distributed data facility (DDF) at the remote location is terminating.

This abend reason code is issued by the following CSECTs:

DSNLCRTR	DSNLCTRM	DSNLVRPL
----------	----------	----------

System Action: DB2 writes a SYS1.LOGREC record. No communication on the conversation is allowed.

Operator Response: Notify the system programmer.

System Programmer Response: To determine the cause of the DDF termination, contact the communication administrator at the location.

00D31033

Explanation: The VTAM function request to allocate a conversation failed because the thread timed-out while waiting for a session.

This abend reason code is issued by the following CSECT: DSNLVALM

System Action: Notification of the failure is returned to the application.

Operator Response: Notify the system programmer.

System Programmer Response: The defined session limit for the mode used by the thread might be too small. The CONVLIMIT specified for the mode might have to be negotiated with the communication administrator at the remote subsystem.

Problem Determination: Refer to message DSNL510I for the limit negotiated by VTAM for the location and mode used by the thread. Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5, 77.

00D31034

Explanation: The MAX REMOTE CONNECTED limit was reached and the conversation was abnormally deallocated. The thread was not allowed to connect to DB2.

This abend reason code is issued by the following CSECT: DSNLVPFV

System Action: The requester is not connected to DB2.

Operator Response: Notify the system programmer.

System Programmer Response: The maximum number of database access threads that can concurrently exist is defined by the installation option MAX REMOTE CONNECTED. When the MAX REMOTE CONNECTED limit is equal to the number of active database access threads plus the number of inactive database access threads, additional threads are not allowed to connect to DB2. Use the DDF global statistics to determine if the limit should be increased.

Problem Determination: Collect the following diagnostic items:

- DDF global statistics to determine the number of requests that failed because of the MAX REMOTE CONNECTED limit.

00D31035

Explanation: The requested VTAM function failed. The database access agent was aborted at the remote location. Notification of the failure is returned to the application. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLCTRC

System Action: DB2 writes a SYS1.LOGREC record and requests an SVC dump at the failed DB2 site.

Operator Response: Notify the system programmer.

System Programmer Response: Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of

the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D31036

Explanation: The LINKNAME column of the SYSIBM.LOCATIONS table was invalid. Since LINKNAME is a foreign key of the SYSIBM.LUNAMES table, the LINKNAME column must specify one of the values provided in the LUNAME column of the SYSIBM.LUNAMES table. This error should not occur.

This abend reason code is issued by the following CSECT: DSNLVCLM

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

User Response: Notify the system programmer.

Operator Response: Collect the SYS1.LOGREC, and the SVC dump.

System Programmer Response: Obtain copies of the SYS1.LOGREC and SYSLOG data sets from the DB2 site with the inconsistently defined communications database (CDB).

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D31037

Explanation: The remote server was not successfully connected. The SYSIBM.USERNAMES table did not contain an outbound row, the TYPE column specified as an 'O' describing the remote authorization identifier to be used for the primary DB2 authorization ID. When the USERNAMES column in SYSIBM.LUNAMES specifies 'O' or 'B' requiring outbound name translation, the SYSIBM.USERNAMES table must contain entries describing the remote authorization IDs to be used for each DB2 authorization ID communicating with the LU.

This reason code is issued by the following CSECTs:

DSNLCCCN DSNLCSRR DSNLTMIG

System Action: A resource unavailable is returned to the application. The request is not sent to the remote site.

00D31038

Operator Response: Notify the communications database administrator.

System Programmer Response: Make sure the USER NAMES column in SYSIBM.LUNAMES has been specified correctly for the indicated LUNAME. If you intend to use remote authorization IDs that differ from the DB2 authorization IDs, verify that the SYSIBM.USER NAMES table has rows that correctly specify the remote authorization ID to be used for each possible DB2 authorization ID.

Problem Determination: Analyze the SYSIBM.USER NAMES table for an incorrect or missing entry.

00D31038

Explanation: A conversation was not allocated for one of these reasons:

- The requesting LU is part of a DB2 sysplex. When one or more LU names within a DB2 sysplex appear in the SYSIBM.LULIST table at the remote site, all LU names within the sysplex must be identified in the SYSIBM.LULIST table at the remote site.
 - You might have intended to list all the sysplex's LU names in the SYSIBM.LULIST table, but you did not include one or more LU names.
 - You listed a subset of the LU names in SYSIBM.LULIST but none of the LU names you listed are currently available. Please note that it can take up to 3 minutes for LU availability information to be updated following START DDF at the remote site.
- The location name sent to a remote site does not match the location name recorded in the BSDS at that remote site.
- The local SYSIBM.LULIST table is incorrectly defined for the remote location.

A DSNL030I message might have been written to the console.

System Action: A record is written to SYS1.LOGREC and the conversation is not allocated.

Operator Response: Notify the system programmer.

System Programmer Response: The CDB tables and DB2 BSDS parameters must correctly associate the LOCATION names with their corresponding LUNAME names.

The cause of this error is usually one of the following:

- The BSDS at the remote site does not have the correct LOCATION or LUNAME value, which causes the remote DBMS to respond to the wrong LOCATION name when receiving distributed database requests.
- The SYSIBM.LOCATIONS table at the local DB2 system has an incorrect value in the LINKNAME or

LOCATION column for the failing LOCATION, which causes the request to be sent to the wrong remote DBMS.

- The SYSIBM.LULIST table at the local DB2 system has an incorrect value in the LUNAME column for the failing LOCATION, which causes the request to be sent to the wrong remote DBMS.
- Not all LU names in the requesting DB2 sysplex are defined in the SYSIBM.LULIST table at the remote site.
- Not all LU names in the requesting DB2 sysplex are defined in the SYSIBM.LULIST table at the server DB2 subsystem. The remote LU is not allowed access to the server subsystem.

In general, when the requester is a member of a sysplex, each member of the requesting sysplex should be defined in SYSIBM.LULIST of the server subsystem. However, there may be causes where an LU of a remote sysplex is not defined in SYSIBM.LULIST of the local subsystem to prevent the remote LU from being a candidate member when accessing the remote sysplex. This is known as "member specific routing". If the remote sysplex LU attempts to access the local subsystem, this reason code will be returned if the remote LU is not defined in the local SYSIBM.LULIST table and is also not defined in SYSIBM.LUNAMES. Remote requesting sysplex members can be defined in SYSIBM.LULIST, or, when member specific routing requirements to the remote sysplex member are desired, the remote sysplex LU can be defined in SYSIBM.LUNAMES for inbound purposes from the remote sysplex LU that contain the appropriate inbound security characteristics.

- The local DB2 system contains a SYSIBM.LULIST row for a remote system that is not a member of a Data Sharing group. SYSIBM.LULIST rows CANNOT be defined for remote non Data Sharing server systems. Remove the SYSIBM.LULIST row for the remote systems.

Problem Determination:

- Determine the LUNAME and LOCATION name of the DB2 system that attempted to start a VTAM conversation.
- Print the contents of the SYSIBM.LOCATIONS table at that site.
- Print the contents of the SYSIBM.LULIST table at both the local site and the remote site.
- Determine the LUNAME and LOCATION name of the remote DBMS involved in the failure from the BSDS at the remote site.
- Issue the -DISPLAY LOCATION command to determine which LUNAMES and LOCATIONS were active at the time of failure.

This abend reason code is issued by the following CSECTS:

DSNLCSIM DSNLVCLM DSNLVPF5

00D31039

Explanation: The requested VTAM function to allocate a conversation was not performed because the SYSIBM.USERNAMES table at the requesting site did not contain a row describing the remote authorization ID to be used for this DB2 authorization ID. When the USERNAMES column in SYSIBM.LUNAMES specifies 'O' or 'B', outbound name translation is in effect. The SYSIBM.USERNAMES table must contain entries describing the remote authorization ID to be used for each DB2 authorization ID communicating with that LUNAME.

This abend reason code is issued by the following CSECT: DSNLVCLM

System Action: A record is written to SYS1.LOGREC, and the conversation is not allocated.

Operator Response: Notify the system programmer.

System Programmer Response: Make sure the USERNAMES column in SYSIBM.LUNAMES has been specified correctly for the indicated LUNAME. If you intend to use remote authorization IDs that differ from the DB2 authorization ID, verify that the SYSIBM.USERNAMES table has rows that correctly specify the remote authorization ID to be used for each possible DB2 authorization ID. These rows must specify 'O' in the TYPE column of the SYSIBM.USERNAMES table.

Problem Determination: Determine the LUNAME and authorization ID for the failing VTAM conversation. Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 58, 59.

00D3103A

Explanation: Database access agent allocation failed because the RACROUTE REQUEST=EXTRACT macro failed to locate a user profile for the DB2 primary authorization ID obtained from the SYSIBM.USERNAMES table. When the ENCRYPTPSWDS column in SYSIBM.LUNAMES specifies 'Y', the requesting DB2 system must be able to extract the encrypted password (via RACROUTE REQUEST=EXTRACT) and send this encrypted password to the responding DB2 system for validation.

This reason code is issued by the following CSECT: DSNLVINF

System Action: The reason code is returned to the application.

Operator Response: Notify the communications database administrator.

System Programmer Response: Make sure the new

authorization ID column in SYSIBM.USERNAMES has been specified correctly for the indicated LUNAME. If you intend to use encrypted passwords, the new authorization ID must be defined to your MVS security subsystem.

Problem Determination:

- Analyze the SYSIBM.USERNAMES table for an incorrect or missing entry.
- Verify that the names given in the NEWAUTHID column are defined to your MVS security subsystem properly.

00D3103B

Explanation: An attempt to allocate an LU6.2 conversation failed because the conversation limits for the desired partner LU and VTAM MODE have been reached.

This abend reason code is issued by the following CSECT: DSNLVALM

System Action: This reason code is generated internally when an attempt is made to allocate an LU6.2 conversation and conversation limits have been reached for the desired partner LU and VTAM MODE. In this situation, the requesting DB2 system will attempt to reuse one of the existing LU6.2 conversations that have already been allocated to the agent in question.

The allocate process will be retried using the existing conversation.

System Programmer Response: If you increase the LU6.2 conversation limits for the indicated partner LU and VTAM MODE, it will not be necessary for DB2 to reclaim conversations in order to allocate additional LU6.2 conversations. The reclaiming process will reduce system throughput, since the reclaimed conversation will have to service multiple SQL statements.

00D3103C

Explanation: An attempt to allocate an LU6.2 conversation failed because the specified partner LU cannot support the LU6.2 SECURITY=SAME capability (that is, the LU6.2 Already-Verified security function).

This abend reason code is issued by the following CSECT: DSNLVAAC

System Action: The attempt to allocate an LU6.2 conversation fails, and the error is reported to the DB2 application that requested access to the distributed resource.

User Response: Notify your DB2 system programmer.

System Programmer Response: DB2 will attempt to use SECURITY=SAME when connecting to remote database systems whose USERSECURITY column in the SYSIBM.LUNAMES table contains a value other than 'C'. In order to support the LU6.2 SECURITY=SAME function, the target DBMS must

00D3103D • 00D3103E

declare support for the SECURITY=SAME function.

If the target DBMS is DB2, support for the SECURITY=SAME function is declared by specifying the following:

1. The DB2 VTAM APPL definition must specify SECACPT=ALREADYV at the remote DB2 subsystem.
2. The value in the USERSECURITY column of the SYSIBM.LUNAMES table at the remote DB2 subsystem must specify a value other than 'C' in the row associated with the requesting DB2 subsystem.

Problem Determination: Collect the following diagnostic items:

- The VTAM APPL definition for the remote DB2 system.
- The contents of the SYSIBM.LUNAMES table.

00D3103D

Explanation: An attempt to allocate a VTAM LU6.2 conversation with a remote site failed because the request did not contain the proper security information.

This abend reason code is issued by the following CSECT: DSNLVRPL

System Action: The attempt to access the remote database resource failed and the failure is reported to the application.

User Response: Notify the communications database administrator.

System Programmer Response: This error is usually caused by transmitting an invalid authorization ID or password in a request to the remote site. However, this is not always the case, so it is important to review the diagnostic information at the remote site to determine the cause of the failure.

- If the remote site is a DB2 subsystem, refer to the DSNL030I message at the remote site for the cause of the security failure. Additionally, an ALERT will be recorded in NetView (if the NetView product is available) to describe the security failure.

If the remote site is not a DB2 subsystem, obtain any diagnostic information about the security failure at the remote site.

If you suspect the authorization ID or password is not correct, the DB2 CDB on the local DB2 system should be examined to validate the following items:

- If the remote site requires both an authorization ID and a password on LU6.ALLOCATE requests (i.e., the remote site does not accept already-verified ALLOCATE requests), the USERNAMES column of the SYSIBM.LUNAMES table at the local DB2 system must specify either 'O' or 'B'.
- If the USERNAMES column of the SYSIBM.LUNAMES table at the local DB2 system

specifies 'O' or 'B', the SYSIBM.USERNAMES table will be used to determine the authorization ID and password sent on the LU6.ALLOCATE request.

If you intend to translate the authorization IDs, ensure that the NEWAUTHID column of the SYSIBM.USERNAMES table contains the correct authorization ID to be used at the remote site.

- If the remote site is a DB2 system, the ENCRYPTPSWDS value in the SYSIBM.LUNAMES table must exactly match the ENCRYPTPSWDS column of the SYSIBM.LUNAMES table at the remote site.
- If the remote site is not a DB2 system, the ENCRYPTPSWDS value in the SYSIBM.LUNAMES table must be set to 'N'.
- If you are transmitting passwords to the remote site, the password transmitted by the local DB2 system must exactly match the value expected by the remote site.

1. For encrypted passwords, the password sent to the remote DB2 subsystem is obtained by extracting the RACF password of the user identified by the NEWAUTHID column in the SYSIBM.USERNAMES table. This user's RACF password must exactly match the password at the remote site.

2. If password encryption is not used, the password will be taken from the PASSWORD column of the SYSIBM.USERNAMES table. This value must exactly match the password at the remote site.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 58, 59, 1.

00D3103E

Explanation: The requested VTAM function to allocate a conversation was not performed because the VTAM MODE specified a conversation limit of zero. The conversation limits must be set to a value greater than zero before a conversation can be allocated.

This abend reason code is issued by the following CSECT: DSNLVALM

System Action: The conversation is not allocated.

Operator Response: Notify the system programmer.

System Programmer Response: If you have placed entries in the SYSIBM.LUMODES table, make sure CONVLIMIT column has a nonzero value. If you are allowing the session limits to be chosen by VTAM, make sure the DSESLIM values on the VTAM APPL and mode entries are nonzero.

Problem Determination: Collect the following diagnostic items:

- Determine the LUNAME and MODE name of the DB2 system that attempted to start a VTAM conversation.
- Print the contents of the SYSIBM.LUMODES table.

- Determine the session limits defined on the VTAM APPL statement and the VTAM MODE entry.

00D3103F

Explanation: An attempt to allocate a VTAM LU6.2 conversation with a remote site failed because the server at the remote LU does not support the SNA two-phase commit process.

This abend reason code is issued by the following CSECT: DSNLVRPL

System Action: DB2 starts a new conversation to the remote site that does not use two-phase commit. DB2 does not attempt to use two-phase commit with this remote site until DDF is restarted.

System Programmer Response: This reason code is produced when the LU at the remote site supports two-phase commit, but the TPN at the remote LU does not support two-phase commit. This is a normal situation, so no system programmer action is required.

00D31040

Explanation: The requested VTAM function failed before the database access agent has failed. This is an internal error.

This abend reason code is issued by the following CSECTs:

DSNLCTRC DSNLCRTR DSNLCRTD

System Action: DB2 writes a SYS1.LOGREC record and requests an SVC dump at the failed DB2 site.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 failure. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the DB2 failure.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D31041

Explanation: The requested VTAM function to allocate a conversation was not performed because the SYSIBM.USERNAMES table at the responding site did not contain a row whose authorization ID column matches the DB2 authorization ID received from the

requesting DB2 system. When the USERNAMES column in SYSIBM.LUNAMES specifies 'I' or 'B', inbound name translation is in effect. The SYSIBM.USERNAMES table must contain entries describing the local DB2 authorization ID to be used for each DB2 authorization ID sent by the requesting DB2 system.

This abend reason code is issued by the following CSECT: DSNLVCLM

System Action: A record is written to SYS1.LOGREC and the conversation is not allocated.

Operator Response: Notify the system programmer.

System Programmer Response: Make sure the USERNAMES column in SYSIBM.LUNAMES has been specified correctly for the indicated LUNAME. If you intend to use local authorization IDs that differ from the remote DB2 authorization ID, verify that the SYSIBM.USERNAMES table has rows that correctly specify the local authorization ID to be used for each possible remote authorization ID. These rows must specify 'I' in the TYPE column of the SYSIBM.USERNAMES table.

Problem Determination: Determine the LUNAME and authorization ID for the failing VTAM conversation. Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 58.

00D31042

Explanation: The requested VTAM function failed. The connection to the remote location was interrupted. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLCSIM

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the failed DB2 site.

Operator Response: Notify the system programmer.

System Programmer Response: Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D31043

Explanation: The requested VTAM function failed. The connection from the remote location was interrupted. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLCSIM

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the failed DB2 site.

Operator Response: Notify the system programmer.

System Programmer Response: Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D31044

Explanation: A remote subsystem has attempted to allocate a VTAM LU6.2 conversation, but the request was rejected because the request did not contain the proper security information. The FMH5 received from the remote subsystem did not contain any security subfields. This represents SECURITY=NONE in the LU6.2 architecture, which is not supported by DB2.

This abend reason code is issued by the following CSECT: DSNLVPF5

System Action: The attempt to access the remote database resource fails and the failure is reported to the application.

A DSNL030I message may have been written to the console.

User Response: Notify the communications database administrator.

Operator Response: Notify the system programmer.

System Programmer Response: Verify that the remote subsystem is configured to send valid security subfields.

If the remote subsystem is DB2, make sure the VTAM APPL definition does not specify SECACPT=NONE, which is the default for the VTAM APPL definition. SECACPT=NONE will cause VTAM to remove the security subfields from the FMH5.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following

diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 58, 59.

00D31045

Explanation: A remote subsystem has attempted to allocate a VTAM LU6.2 conversation, but the request was rejected because the request did not contain the proper security information. The FMH5 received from the remote subsystem did not contain the security subfield that supplies the USERID, or the USERID was not 1 to 8 bytes in length.

This abend reason code is issued by the following CSECT: DSNLVPF5

System Action: The attempt to access the remote database resource fails and the failure is reported to the application.

A DSNL032I message may have been written to the console. Refer to the description of this message for further information.

User Response: Notify the communications database administrator.

Operator Response: Notify the system programmer.

System Programmer Response: Verify that the remote subsystem is configured to send valid security subfields.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 58, 83, 59.

00D31046

Explanation: A remote subsystem has attempted to allocate a VTAM LU6.2 conversation, but the request was rejected because the request did not contain the proper security information. The FMH5 received from the remote subsystem indicated SECURITY=SAME (also known as Already-Verified) and the subsystem in question was not authorized to send requests with SECURITY=SAME.

This abend reason code is issued by the following CSECT: DSNLVPF5

System Action: The attempt to access the remote database resource fails and the failure is reported to the application.

A DSNL030I message may have been written to the console.

User Response: Notify the communications database administrator.

Operator Response: Notify the system programmer.

System Programmer Response: The request was rejected because the SECURITY_IN column of the SYSIBM.LUNAMES table contained a 'V' in the row associated with the remote system. The value 'V' indicates that the remote system must send both a USERID and a PASSWORD, which corresponds to SECURITY_PGM in the SNA LU6.2 architecture. Users should also be aware that in the absence of a SYSIBM.LUNAMES row that specifically identifies the remote LU, a "default" SYSIBM.LUNAMES row (blank LUNAME) may be utilized, if defined, if the inbound connection is via DRDA protocols. This "default" row may not reflect the desired inbound security characteristics in which case a SYSIBM.LUNAMES row can be defined that explicitly identifies the remote LU.

If the remote LU is a member of a remote sysplex and the local system requires access to the remote sysplex, then members of the remote sysplex to be accessed must be defined in the local SYSIBM.LULIST table. In this case, the remote sysplex LU can be defined in the local SYSIBM.LULIST table although a SYSIBM.LUNAMES definition, default row or explicit definition, is appropriate in cases where it is undesirable to define the remote LU in SYSIBM.LULIST (for example when you don't want the remote LU to be a candidate member when outbound accessing the remote SYSPLEX location).

This problem can be corrected in two ways:

1. If you would like DB2 to accept requests that are marked with SECURITY=SAME, change the SECURITY_IN value in the SYSIBM.LUNAMES table to 'A' for the remote LU in question. Also the DB2 VTAM APPL definition should specify SECACPT=ALREADYV.
2. If you would like DB2 to continue to reject requests of this kind, the remote LU must be configured to send requests that contain both a USERID and PASSWORD (SECURITY=PGM in SNA LU6.2 terms).

If the remote LU is DB2, the SECURITY_OUT column in the SYSIBM.LUNAMES table must specify either 'R' or 'P' in the row associated with the local DB2 subsystem.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 58, 59.

00D31047

Explanation: A remote subsystem has attempted to allocate a VTAM LU6.2 conversation, but the request was rejected because the request did not contain the proper security information. The FMH5 received from the remote subsystem did not contain the security

subfield that supplies the PASSWORD, or the PASSWORD was not 1 to 8 bytes in length.

This abend reason code is issued by the following CSECT: DSNLVPF5

System Action: The attempt to access the remote database resource fails and the failure is reported to the application.

A DSNL032I message may have been written to the console. Refer to the description of this message for further information.

User Response: Notify the communications database administrator.

Operator Response: Notify the system programmer.

System Programmer Response: Verify that the remote subsystem is configured to send valid security subfields.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 58, 59, 83.

00D31048

Explanation: The requested VTAM function for allocating a conversation at the DB2 server was not performed because the requester's LUNAME is not defined in the SYSIBM.LUNAMES table of the communication database (CDB) at the server.

This abend reason code is issued by the following CSECT: DSNLVPF5

System Action: Notification of the failure is returned to the application. The conversation is not allocated to the specified location.

Operator Response: Notify the system programmer.

System Programmer Response: Add the requester's LUNAME to the SYSIBM.LUNAMES table at the server. If the remote LU is DB2, the requester's LUNAME is the label name, as opposed to the ACBNAME keyword, on the DB2 VTAM APPL statement for the requester site. A server's SYSIBM.LUNAMES table should contain an entry for the requester's LUNAME.

Users should also be aware that in the absence of a SYSIBM.LUNAMES row that specifically identifies the remote LU, a "default" SYSIBM.LUNAMES row (blank LUNAME) may be utilized, if defined, if the inbound connection is via DRDA protocols. This "default" row may not reflect the desired inbound security characteristics in which case a SYSIBM.LUNAMES row can be defined that explicitly identifies the remote LU.

If the remote LU is a member of a remote sysplex and the local system requires access to the remote sysplex,

00D31049 • 00D3104C

then members of the remote sysplex to be accessed must be defined in the local SYSIBM.LULIST table. In this case, the remote sysplex LU can be defined in the local SYSIBM.LULIST table although a SYSIBM.LUNAMES definition, default row or explicit definition, is appropriate in cases where it is undesirable to define the remote LU in SYSIBM.LULIST (for example when you don't want the remote LU to be a candidate member when outbound accessing the remote SYSPLEX location).

A DSNL030I message may have been written to the console at the server.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 58.

00D31049

Explanation: A request using application-directed access starting at site 'A' referenced an object at site 'B' that is stored at site 'A'

This abend reason code is issued by the following CSECT: DSNLCCCN

System Action: The application statement was not processed.

User Response: Recode the application to remove the alias reference at the remote server that resolves to an object stored at the local DB2. Objects stored at the local site must be referenced using a local name.

Problem Determination: If necessary, consult with the database administrators at the local site and the remote server location. Inspect the remote SYSIBM.SYSTABLES catalog table to determine the object at this location being referenced in a circular manner.

00D3104A

Explanation: A remote server issued an SNA BACKOUT, which was not sent as a reply to an SNA PREPARE or REQUEST_COMMIT. This indicates the server backed out the current unit of work without waiting for the SQL application to either commit or roll back.

This abend reason code is issued by the following CSECT: DSNLVRPL

System Action: The attempt to access the remote database resource fails and the failure is reported to the application. DB2 terminates the SNA conversation to the remote server and forces the application to roll back.

User Response: Notify the DB2 systems programmer.

System Programmer Response: DB2 never issues an unsolicited SNA BACKOUT. Non-DB2 servers can send an SNA BACKOUT indication when resources required to complete the unit of work are not available.

For example, a deadlock might cause the non-DB2 server to send an SNA BACKOUT. Contact the system programmer for the remote system to determine why the unit of work had to be aborted.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1.

00D3104B

Explanation: An SNA conversation was rejected by a DB2 server because the SNA FMH5 specified SNA persistent verification. DB2 does not support the SNA persistent verification option.

This abend reason code is issued by the following CSECT: DSNLVPF5

System Action: Message DSNL030I is displayed on the system console with reason code 00D3104B. The SNA conversation is rejected with SNA sense code X'080F6051', indicating the SNA security parameters in the FMH5 were not acceptable.

User Response: Notify the DB2 system programmer.

System Programmer Response: The SECACPT keyword on the VTAM APPL statement tells VTAM whether DB2 supports persistent verification. Because DB2 does not support persistent verification, the SECACPT=PERSISTV and SECACPT=AVPV options cannot be used on DB2's VTAM APPL statement.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1.

00D3104C

Explanation: The SNA Exchange Log Names (XLN) process failed because of a log name mismatch between DB2 and a remote LU in the network.

This abend reason code is issued by the following CSECT: DSNLCXLI

System Action: The attempt to allocate an SNA two-phase commit conversation fails with reason code 00D3104C. Message DSNL410 is displayed on the system console to describe the error.

User Response: Contact the DB2 systems programmer.

System Programmer Response: The log name recorded in the DB2 log does not match the log name currently in use at the remote LU. There are indoubt units of work that need to be resolved at this DB2 system. The log name required to resolve the indoubt units of work is displayed in the DSNL410 message.

If a non-DB2 partner was started with the wrong log, it might be possible to restart the non-DB2 partner with the desired log name. This should cause the indoubt units of work to be resolved automatically.

If the partner cannot be restarted with the desired log name, the -RECOVER INDOUBT command can be used to resolve the indoubt units of work. Once the indoubt units of work are resolved, DB2 will accept an SNA XLN with a new partner log name.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1.

00D3104D

Explanation: The local DB2 system does not support connectivity to the DB2 release currently running at the remote DB2 site.

This abend reason code is issued by the following CSECT: DSNLCSIM

System Action: The attempt to allocate an SNA conversation is rejected with reason code 00D3104D.

User Response: Contact the DB2 systems programmer.

System Programmer Response: DB2 distributed database connections can only be established between compatible DB2 releases. For example, DB2 Version 3 can connect to DB2 2.3, but not to DB2 2.2.

In order to establish connectivity, the down-level DB2 system must be migrated to a supported release of DB2.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1.

00D3104E

Explanation: An SNA Exchange Log Names (XLN) protocol violation was detected when attempting to establish a connection to a remote site.

This abend reason code is issued by the following CSECT: DSNLCXLI

System Action: The attempt to allocate an SNA conversation is rejected with reason code 00D3104E. Message DSNL421E is written to the system console and IFCID 0213 is produced to describe the protocol violation.

User Response: Contact the DB2 systems programmer.

System Programmer Response: Contact the system programmer for the remote site. The invalid XLN message is recorded in the IFCID 0213 trace record. The system logic error that causes the invalid XLN message must be corrected at the remote site.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1.

00D3104F

Explanation: A connection to a remote location was lost during a previous communication operation.

This abend reason code is issued by the following CSECTS:

DSNLCBCS DSNLCSRM DSNLCSRR DSNLCMSR

System Action: If the communication failure occurred during a commit or abort operation, the SQL application might not be aware that a failure occurred. Messages associated with the failure were written to the system console at the time of failure. Additionally, alerts were reported to NetView at the time of failure.

User Response: Reestablish the connection to the remote site and reissue the SQL statement.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1.

00D31050

Explanation: DB2 expected to receive security information for the remote client but a valid DRDA SECCHK command was not received for a connection request from a DRDA application requester (AR). The DRDA SECCHK command is only valid with a DRDA security manager level greater than or equal to 5.

This can be the case if one of the following occurs:

- The DRDA AR requested a DRDA security manager less than level 5 for an SNA connection where the APPL command for DB2 was specified with the SECACPT=NONE option.
- The DRDA SECCHK command did not contain the required security information.
- The DRDA AR requested a DRDA security manager less than level 5 for a TCP/IP connection.

This abend reason code is issued by the following CSECTS: DSNLTEXC, DSNLTSEC.

System Action: The attempt to access the local database resource fails, the failure is reported to the SQL application, and the conversation is terminated.

System Programmer Response: For SNA connections, if SECACPT=NONE and the DRDA AR does not support DRDA security manager level 5, contact the DB2 security administrator to change the SECACPT option to ALREADYV or CONV to allow for security information in the VTAM FMH-5 in the form of userid or userid/password fields. If SECACPT=NONE is not changed, then DB2 cannot accept connection requests from this remote client.

For SNA connections, If SECACPT=ALREADYV or CONV, then even though userid or userid/password fields in the FMH-5 are received and validated, DB2

must evaluate a DRDA SECCHK command if it is sent. If the DRDA AR requests this level of security but does not provide the correct information in the form of a SECCHK command, this is a DRDA protocol error committed by the DRDA AR implementation at the remote client.

For TCP/IP connections, this is a DRDA protocol error committed by the DRDA AR implementation at the remote client.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem. Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

00D31052

Explanation: An application caused recursive access to a remote location, followed by access to another remote location, which is not permitted.

For example, an application at location LOC1 might have connected to location LOC2 and accessed a table using an alias that resolves back to LOC1. There was a subsequent remote access from LOC1 to LOC n , which caused the error.

System Action: The attempt to access the remote location fails. The SQL application receives a -904 SQLCODE.

System Programmer Response: Correct the application program so that it does not cause recursive access to a location followed by remote access from that location. The application might have used table aliases, three-part table names, stored procedures, user-defined functions, or triggers to cause the condition.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 35, 73, 74.

00D31055

Explanation: The remote location defined in the SYSIBM.LOCATIONS table could not be accessed because the TCP/IP interface to DDF is not available.

System Action: The request to connect to a remote site fails. The SQL application receives a -904 SQLCODE.

User Response: Notify the system programmer.

Operator Response: Notify the system programmer.

System Programmer Response: One of the following actions should be taken:

- If the remote site is not supposed to be using TCP/IP, add a row to SYSIBM.LUNAMES defining the LUNAME used by the remote location.

- If the remote site is correctly defined in the CDB, examine the messages written to the console during -START DDF processing. Those messages describe any errors that would prevent DDF from using TCP/IP.
- Determine if DB2 is started in restricted access mode. If so, retry the request when DB2 has been started in full access mode.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1.

00D31056

Explanation: The PORT column of the SYSIBM.LOCATIONS table could not be converted to a TCP/IP port number by the getservbyname TCP/IP socket call.

This abend reason code is issued by the following CSECT: DSNLxxxx

System Action: The request to connect to a remote site fails. The SQL application receives a -904 SQLCODE, and message DSNL514, DSNL517, or DSNL518 is written to the console describing the error.

User Response: Notify the system programmer.

Operator Response: Notify the system programmer.

System Programmer Response: Use the information in the DSNL514, DSNL517, or DSNL518 message to resolve the error.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1.

00D31057

Explanation: DB2 was able to find the row in SYSIBM.LOCATIONS for the LOCATION specified in the SQL request. However, the LINKNAME column value specified in LOCATIONS did not match any row in SYSIBM.LUNAMES or SYSIBM.IPNAMES.

This abend reason code is issued by the following CSECT: DSNLxxxx

System Action: The request to connect to a remote site fails. The SQL application receives a -904 SQLCODE.

User Response: Notify the system programmer.

Operator Response: Notify the system programmer.

System Programmer Response: Insert a row in SYSIBM.LUNAMES or SYSIBM.IPNAMES that matches the LINKNAME specified in SYSIBM.LOCATIONS.

00D31058

Explanation: The IPADDR column of the SYSIBM.IPNAMES table could not be converted to an IP address by the gethostbyname TCP/IP socket call.

This abend reason code is issued by the following CSECT: DSNLxxxx

System Action: The request to connect to a remote site fails. The SQL application receives a -904 SQLCODE, and message DSNL513, DSNL517, or DSNL518 is written to the console describing the error.

User Response: Notify the system programmer.

Operator Response: Notify the system programmer.

System Programmer Response: Use the information in the DSNL513, DSNL517, or DSNL518 message to resolve the error.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1.

00D31059

Explanation: An attempt to allocate a conversation to the remote site failed because DB2 was unable to obtain a RACF PassTicket. The user specified an 'R' in the SECURITY_OUT column of the SYSIBM.IPNAMES and/or SYSIBM.LUNAMES communications database (CDB) tables for the partner site. As a result, DB2 invokes RACF to extract a PassTicket for the partner site. However, RACF could not provide a PassTicket, and the attempt failed.

System Action: The attempt to access the remote database resource failed, and the failure is reported to the application.

User Response: Notify the system programmer.

System Programmer Response: The error usually occurs due to incorrect or missing RACF definitions. To avoid this error, specify the proper RACF definitions to provide for the PassTicket. Alternatively, you may avoid the use of PassTickets by changing the SECURITY_OUT column of the SYSIBM.IPNAMES and/or SYSIBM.LUNAMES CDB table for the partner site. For information regarding PassTickets, refer to Part 3 (Volume 1) of *DB2 Administration Guide*.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 14, 58, 74.

00D3105A

Explanation: Userid, password is not valid for the location specified. An SQL CONNECT with userid/password was issued to connect to a location that requires RACF PassTicket authorization. The entry in SYSIBM.SYSLUNAMES or SYSIBM.IPNAMES for the

location specified on the SQL CONNECT specifies that a connection request must contain a user ID and RACF PassTicket.

System Action: The connect request is not processed. The application is placed in the unconnected and connectable state.

00D31100

Explanation: The data communications function service was invoked with a parameter list that contained one or more invalid parameters. This is an internal error.

This abend reason code is issued by the following CSECTs:

DSNLCBCS	DSNLCBUF	DSNLCCCN	DSNLCCDR
DSNLCCNR	DSNLCSIM	DSNLCMSR	DSNLCSRM
DSNLCTCN	DSNLCTDR	DSNLCTRC	

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain any related diagnostic information from each connected site and the SVC dump and STS1.LOGREC at the site of a DB2 abend.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D31101

Explanation: A data communications functional service was invoked with the cursor table marked invalid. This is an internal error.

This abend reason code is issued by the following CSECTs:

DSNLCCCN	DSNLCCDR	DSNLCSRM
----------	----------	----------

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain any related diagnostic information from each connected

00D31102 • 00D31105

site and the SVC dump and SYS1.LOGREC at the site of the DB2 failure.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D31102

Explanation: A data communications functional service encountered an inconsistency in the requesting thread control block structure. This is an internal error.

This abend reason code is issued by the following CSECTs:

DSNLCCCN DSNLCSRM DSNLCTCN

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D31103

Explanation: A data communications functional service received an invalid logical-unit-of-work ID (LUWID) or no LUWID. This is an internal error.

This abend reason code is issued by the following CSECTs: DSNLCCCN, DSNLCCDR

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC as the site of the DB2 failure.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D31104

Explanation: A data communications functional service cannot find a distributed processing block for the primary thread. This is an internal error.

This abend reason code is issued by the following CSECTs:

DSNLCSRM DSNLCTCN DSNLCBCS DSNLCCNR
DSNLPCPR DSNLCTDR

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the DB2 failure.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D31105

Explanation: A data communications functional service detected an invalid or incorrect buffer size on a send message operation. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLCSRM

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference*

for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D31106

Explanation: A data communications functional service detected an invalid message sequence. One or more rows of data might have been lost. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLCSRMR

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D31107

Explanation: A data communications functional service was invoked incorrectly (protocol violation) to wait for a message. This is an internal error.

This abend reason code is issued by the following CSECTs: DSNLCSRMR, DSNLCCNR

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the DB2 failure.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D31108

Explanation: A data communications functional service was invoked incorrectly (protocol violation) to receive a message. This is an internal error.

This abend reason code is issued by the following CSECTs: DSNLCSRMR, DSNLCCNR

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the DB2 failure.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D31109

Explanation: A data communications functional service was invoked incorrectly (protocol violation) to send a message. This is an internal error.

This abend reason code is issued by the following CSECTs: DSNLCSRMR, DSNLCCNR

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the DB2 failure.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D3110A

Explanation: A data communications functional service detected an invalid message sequence. One or more rows of data might have been lost. This is an internal error.

00D3110B • 00D31111

This abend reason code is issued by the following CSECTs: DSNLCSRM, DSNLCBCS

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D3110B

Explanation: While a message was being sent or received by the data communications resource manager, an internal error was detected in DB2. Register 4 contains a reason code that provides additional information about this error. This is an internal error.

This abend reason code is issued by the following CSECTs:

DSNLCSRM DSNLCBCS DSNLCSIM DSNLCRR

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the DB2 failure.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D31110

Explanation: Instrumentation facility component (IFC) has passed a nonzero return code to the data communications resource manager. This is an internal error.

This abend reason code is issued by the following CSECTs: DSNLCRTR, DSNLCRTD

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the DB2 failure.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D31111

Explanation: The instrumentation facility component (IFC) passed a nonzero return code to the data communications resource manager. This is an internal error.

This abend reason code is issued by the following CSECTs: DSNLCRTR, DSNLCRTD

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the DB2 failure.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D31112

Explanation: The data communications resource manager cannot find the LUWID for the remote thread in the database thread control blocks. This is an internal error.

This abend reason code is issued by the following CSECTs: DSNLCRTR, DSNLCRTD

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain any related diagnostic information from each connected site and the SVC dump and SYS1.LOGREC at the site of the DB2 failure.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D31113

Explanation: The data communications resource manager received an invalid set of control block pointers. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLCRTR

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D31114

Explanation: A data communications resource manager(DCCM) block for a deallocated conversation which belongs to a database access thread cannot be found. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLCRTR

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D31115

Explanation: The data communications resource manager attempt to enqueue a request for a database access thread failed. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLCRTR

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D31116

Explanation: The data communications resource manager received an invalid DC message number. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLCRTR

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D31117

Explanation: The data communications resource manager received a request with an invalid response type. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLCRTR

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D31118

Explanation: A message-processing routine returned to the data communications resource manager without the requested response. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLCRTR

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D31119

Explanation: The data communications resource manager processed a request with an unassigned or disconnected message class. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLCRTR

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D3111A

Explanation: The data communications resource manager received an unexpected communications error when processing a request. This can occur for any of the following reasons:

- A VTAM session failure caused the premature termination of a DB2 conversation.
- A VTAM VARY NET, INACTIVE or HALT NET command was issued which interrupted a DB2 conversation.
- A DB2 internal logic error occurred.

This abend reason code is issued by the following CSECTS:

DSNLCRTR DSNLCSIM DSNLCSND

System Action: A record is written to SYS1.LOGREC and an SVC dump may be requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: If the abend appears to have been caused by a DB2 logic error, determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site as well as any related dumps from each connected site.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D3111B

Explanation: The data communications resource manager cannot find the remote location for the requesting thread in the control blocks. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLCSIM

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or

similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D3111C

Explanation: An internal logic error occurred while invoking a TCP/IP functional service.

This abend reason code is issued by the following CSECT: DSNLInnn

DSNLInnn identifies that a DCRM TCP/IP manager CSECT detected a logic error. Refer to the dump title for the specific CSECT name.

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

User Response: Notify the system programmer.

Operator Response: Collect the SYS1.LOGREC listing and the SVC dump.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D3111F

Explanation: The maximum amount of buffered query data has been exceeded. Rather than return one block of query data, the DRDA server system elected to return multiple extra blocks. Instead of fetching all rows in all the extra blocks, the requesting application executed an SQL statement not related to the query or executed a commit while a held cursor was still open. DB2 buffers the extra in-transit blocks, however DB2 was not able to buffer the entire set of extra blocks and thus truncated the result set. The application then resumed fetching and attempted to fetch data beyond the point of truncation.

System Action: The SQL statement fails.

User Response: Notify the system programmer.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the failing application program and consider the following resolutions:

- The cursor definition may cause the server to return extra blocks. In this case, the cursor definition can be changed to reduce the number of rows, thus extra blocks, being returned by the server.

DB2 UDB for z/OS systems return extra blocks for cursors defined with the Optimize For *n* Rows clause and will return only enough extra blocks in order to return *n* rows. When a cursor is defined with Optimize For *n* Rows, either in the application or in a stored procedure, this indicates an application intent to fetch all *n* rows before attempting to execute other SQL statements. The application is not abiding by its intent and is executing other SQL, or committing, prior to fetching all *n* rows. In this case, the cursor definition can be changed to reduce the value of *n*, or the application logic can be modified to fetch all *n* rows or to close the cursor before executing the statement that caused the in-transit data to be buffered.

- The number of extra blocks returned can be controlled by DB2 installation parameters. The maximum number of extra blocks requested by a DB2 requester system is determined by the "Extra Blocks Req" option of the DSNTIP5 DB2 installation panel. This value can be reduced which prevents the server system from returning more blocks than the DB2 requester system can buffer.

Similarly, the server system may also provide a method to regulate the maximum number of extra blocks that it will return to a requester in which case this number can also be reduced. For DB2 UDB for z/OS systems, this is determined by the "Extra Blocks Srv" option of the DSNTIP5 DB2 installation panel.

For information about block fetching result sets, see Part 5 (Volume 2) of *DB2 Administration Guide*.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 14, 17.

00D31201

Explanation: DB2 has detected an inconsistency in the TCP/IP PORT configuration parameter between the DRDA and RSYNC ports. A BIND ipaddr was specified on the DRDA PORT statement in the PROFILE.TCPIP data set but the BIND ipaddr was not specified on the RSYNC PORT statement in the PROFILE.TCPIP data set. When using dynamic virtual IP addresses (VIPA), DB2 requires both the DRDA PORT and RSYNC PORT to be configured to use a VIPA.

System Action: DDF is abnormally terminated.

System Programmer Response: If using dynamic

VIPA to bind to a DB2 PORT number, verify that a VIPA is defined for both the DRDA PORT number and RSYNC PORT number by specifying the BIND ipaddr on the PORT statement in the PROFILE.TCPIP data set used to reserve the PORTs for DB2. If not using dynamic VIPA to bind to DB2 PORT, remove the BIND ipaddr option on the PORT statement in the PROFILE.TCPIP data set used to reserve the PORT numbers for DB2. After fixing the TCP/IP PORT configuration statements, start DDF.

00D31202

Explanation: DB2 has detected an inconsistent change in the TCP/IP PORT configuration parameter for the RSYNC PORT. A BIND ipaddr specified on the RSYNC PORT statement was changed in the PROFILE.TCPIP data set since DDF was started.

System Action: DDF is abnormally terminated. This change may cause outages because of invalid sysplex routing information or commit resynchronization failures due to invalid IP addresses being returned to requesters.

System Programmer Response: Verify the BIND ipaddr specified on the RSYNC PORT number in the TCP/IP PORT statement and start DDF.

00D31203

Explanation: A conversation was not allocated for one of these reasons:

- The LINKNAME was present in the SYSIBM.IPLIST table, but not in SYSIBM.IPNAMES table.
- The IP address that is contained in the IPADDR column of SYSIBM.IPLIST table was also present in the IPADDR column of SYSIBM.IPNAMES table. An IP address can only appear in one of these two tables.

System Action: A record is written to SYS1.LOGREC, and the conversation is not allocated.

Operator Response: Notify the system programmer.

System Programmer Response: Make sure the LINKNAME in SYSIBM.IPLIST table is also defined in SYSIBM.IPNAMES table. Make sure the IP address is specified in the IPADDR column of SYSIBM.IPLIST table and a blank value is specified in the IPADDR column of SYSIBM.IPNAMES table.

Problem Determination: collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 86, 87.

00D34401

Explanation: The relational data system (RDS) passed an invalid function code to the distributed RDS (DRDS). This is an internal error.

This abend reason code is issued by the following CSECT: DSNLXRDS

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D34404

Explanation: The relational data system (RDS) passed the distributed RDS (DRDS) an invalid distributed interface block (DIB). This is an internal RDS error.

This abend reason code is issued by the following CSECT: DSNLXRDS

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D34405

Explanation: The data communications resource manager (DCRM) passed an invalid LMPP message number to the distributed relational data system (DRDS). This is either an internal DCRM error or an internal DRDS error.

This abend reason code is issued by the following CSECT: DSNLXRTR

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D34406

Explanation: The distributed relational data system (DRDS) detected a message of invalid length from the data communications resource manager (DCRM). The message is longer than the buffer size. This is either an internal DRDS error or an internal DCRM error.

This abend reason code is issued by the following CSECTs: DSNLXQPR, DSNLXSQD

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D34407

Explanation: The distributed relational data system (DRDS) received an invalid return code from the data communications resource manager (DCRM) on a SEND request. This is a DCRM internal error.

This abend reason code is issued by the following CSECTs:

DSNLXQEX DSNLXQFH DSNLXQOP DSNLXQPR

00D34408 • 00D3440B

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D34408

Explanation: The distributed relational data system (DRDS) received an invalid LMPP from the data communications resource manager (DCRM). This is either a DCRM internal error or a DRDS internal error.

This abend reason code is issued by the following CSECTs:

DSNLXOPF DSNLXPCL DSNLXPEX DSNLXPPR
DSNLXPXI DSNLXRTR

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D34409

Explanation: The distributed relational data system (DRDS) detected an internal inconsistency. An invalid state transition occurred. This is a DRDS internal error.

This abend reason code is issued by the following CSECTs:

956 Messages and Codes

DSNLXOPF DSNLXQFH DSNLXRTR

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D3440B

Explanation: The distributed relational data system (DRDS) detected an inconsistency. This is an internal error.

This abend reason code is issued by the following CSECTs:

DSNLXCMT DSNLXCNV DSNLXCQS DSNLXD5A
DSNLXGET DSNLXIVB DSNLXOPF DSNLXOQS
DSNLXPEX DSNLXPPR DSNLXPRS DSNLXPXI
DSNLXQAL DSNLXQCL DSNLXQEX DSNLXQFH
DSNLXQOP DSNLXQPR DSNLXQR DSNLXQRO
DSNLXQUR DSNLXQXI DSNLXRAP DSNLXRAX
DSNLXRBF DSNLXRCL DSNLXRCM DSNLXRCS
DSNLXRCX DSNLXRCX DSNLXRDS DSNLXRDT
DSNLXRFT DSNLXROP DSNLXRSL DSNLXRSQ
DSNLXRSS DSNLXRTR DSNLXR5W DSNLX5SS

System Action: DB2 writes a SYS1.LOGREC record and requests an SVC dump at the failed DB2 site.

Operator Response: Notify the system programmer.

System Programmer Response: Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D3440C

Explanation: The distributed relational data system (DRDS) requesting site control block must exist at this time but does not. This is an internal DRDS error.

This abend reason code is issued by the following CSECT: DXNLXRDS

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D3440D

Explanation: The distributed statistics and accounting control block does not exist. This is an internal distributed data facility (DDF) error.

This abend reason code is issued by the following CSECT: DSNLXDSA

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D3440E

Explanation: A distributed request was received, but the distributed data facility (DDF) is inactive.

This reason code is issued by the following CSECTs: DSNLXRDS, DSNLXR UW

System Action: The request is not processed.

User Response: Notify the system operator.

Operator Response: Ensure that the DDF has been started.

00D3440F

Explanation: The distributed relational data system (DRDS) detected a message of invalid length from the data communications resource manager (DCRM). The message is smaller than the buffer size, but the return code from the DCRM indicates that the message is greater than one buffer. This is either an internal DRDS error or an internal DCRM error.

This abend reason code is issued by the following CSECTs: DSNLXQPR, DSNLXSQD

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D34410

Explanation: The distributed relational data system (DRDS) received an invalid return code from the data communications resource manager (DCRM) on a RECEIVE request. This is an internal DCRM error.

This abend reason code is issued by the following CSECTs: DSNLXQPR, DSNLXQFH

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at

00D34411 • 00D34414

the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D34411

Explanation: The distributed relational data system (DRDS) detected an internal inconsistency. An invalid state is specified. This is an internal DRDS error.

This abend reason code is issued by the following CSECTS:

DSNLXOPF DSNLXQFH DSNLXRTR

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D34412

Explanation: The distributed relational data system (DRDS) detected an internal inconsistency. An internal buffer offset variable contains an invalid value. This is an internal DRDS error.

This abend reason code is issued by the following CSECT: DSNLXQGT

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis*

Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D34413

Explanation: The data header on the message received from the responding site contains invalid information. This is an internal error.

This abend reason code is issued by the following CSECTS: DSNLXQGT, DSNLXQFH

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D34414

Explanation: The relational data system (RDS) did not specify an area for the null indicator of the data. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLXQGT

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D34415

Explanation: The input host variable SQLDA format specified in the RDI is not valid. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLXIVB

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D34416

Explanation: An incomplete response was received on a conversation when a complete response was expected.

This abend reason code is issued by the following CSECT: DSNLXQFH

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D34417

Explanation: DRDS detected an illegal attempt to enter Continuous Block Fetch mode.

This abend reason code is issued by the following CSECT: DSNLXQFH

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D34418

Explanation: The remote server was not successfully connected. The SYSIBM.USERNAMES table did not contain an outbound row, the TYPE column specified as an 'O' describing the remote authorization identifier to be used for the plan owner DB2 authorization ID. When the USERNAMES column in SYSIBM.LUNAMES specifies 'O' or 'B' requiring outbound name translation, the SYSIBM.USERNAMES table must contain entries describing the remote authorization IDs to be used for each DB2 authorization ID communicating with the LU.

This reason code is issued by the following CSECT: DSNLXQAL

System Action: A resource unavailable is returned to the application. The request is not sent to the remote site.

Operator Response: Notify the communications database administrator.

System Programmer Response: Make sure the USERNAMES column in SYSIBM.LUNAMES has been specified correctly for the indicated LUNAME. If you intend to use remote authorization IDs that differ from DB2 authorization IDs, verify that the SYSIBM.USERNAMES table has rows that correctly specify the remote authorization ID to be used for each possible DB2 authorization ID.

Problem Determination: Analyze the SYSIBM.USERNAMES table for an incorrect or missing entry.

00D34419

Explanation: RDS has passed an invalid DESCRIBE request to DRDS. This is an internal error.

This abend reason code is issued by the following CSECT: DSNLXRDS

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D3441B

Explanation: DRDS detected an invalid use of a conversation.

This abend reason code is issued by the following CSECT: DSNLXCNV

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D3441C

Explanation: Allocation of the distributed processing services block (DPSB) failed.

This abend reason code is issued by the following

CSECTs:

DSNLXCNV DSNLXQCL DSNLXQEX DSNLXQFH
DSNLXQOP DSNLXQPR DSNLXSQD DSNLXQXI

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D3441D

Explanation: The distributed relational data system (DRDS) subcomponent has determined that control structures necessary for processing do not exist. This is a DB2 internal error.

This abend reason code is issued by the following CSECT: DSNLXR UW

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 ABEND.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the ABENDING agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D3441E

Explanation: The distributed relational data system (DRDS) subcomponent has determined that the function to be executed is not a valid function. This is a DB2 internal error.

This abend reason code is issued by the following CSECTs:

DSNLXRCM DSNLXRCN DSNLXRCX DSNLXRQX
DSNLXRUW

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 ABEND.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the ABENDING agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected left 20he SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D3441F

Explanation: The distributed relational data system (DRDS) subcomponent is in an invalid state and cannot process the function requested. This is a DB2 internal error.

This abend reason code is issued by the following CSECT: DSNLXRUW

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 ABEND.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the ABENDING agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D34420

Explanation: The application executed a dynamic COMMIT or ROLLBACK operation while executing in an environment in which DB2 is not coordinating the COMMIT/ROLLBACK process (for example, IMS or CICS). This is an application error.

This abend reason code is issued by the following CSECT: DSNLXRUW

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D34422

Explanation: The distributed relational data system (DRDS) subcomponent has received an unexpected return code from the Distributed Transaction Manager (DTM) subcomponent during CONNECT processing. This is a DB2 internal error.

This abend reason code is issued by the following CSECT: DSNLXRCN

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 ABEND.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the ABENDING agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D34423

Explanation: The distributed relational data system (DRDS) subcomponent has received an unexpected return code from the Distributed Data Interchange Service (DDIS) subcomponent on an invocation to generate a request. This is a DB2 internal error.

This abend reason code is issued by the following CSECTs:

DSNLXPRS DSNLXRAX DSNLXRBF DSNLXRCL
DSNLXRDM DSNLXRDT DSNLXRFT DSNLXRDP
DSNLXRSL DSNLXRSQ

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 ABEND.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the ABENDING agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D34424

Explanation: The distributed relational data system (DRDS) subcomponent has received an unexpected return code from the Distributed Data Interchange Service (DDIS) subcomponent on an invocation to parse a reply. This is a DB2 internal error.

This abend reason code is issued by the following CSECTs:

DSNLXRAX DSNLXRBF DSNLXRCL DSNLXRDM
DSNLXRDT DSNLXRFT DSNLXRDP DSNLXRQX
DSNLXRSL DSNLXRSQ

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 ABEND.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the ABENDING agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC

dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D34425

Explanation: The distributed relational data system (DRDS) subcomponent has received an unexpected return code from the Data Communications Resource Manager (DC) subcomponent. This is a DB2 internal error.

This abend reason code is issued by the following CSECTs:

DSNLXRAX DSNLXRBF DSNLXRCL DSNLXRDM
DSNLXRDX DSNLXRFX DSNLXRFT DSNLXRDP
DSNLXRQX DSNLXRQX DSNLXRSQ

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 ABEND.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the ABENDING agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D34426

Explanation: The distributed relational data system (DRDS) subcomponent has detected an invalid date format in DSNHDECP. This is a DB2 internal error.

This abend reason code is issued by the following CSECT: DSNLXRDM

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 ABEND.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the ABENDING agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data

sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D34427

Explanation: The distributed relational data system (DRDS) subcomponent has detected an invalid time format in DSNHDECP. This is a DB2 internal error.

This abend reason code is issued by the following CSECT: DSNLXRCM

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 ABEND.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the ABENDING agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D34429

Explanation: The distributed relational data system (DRDS) subcomponent has detected that the call type in the RDI is invalid. This is a DB2 internal error.

This abend reason code is issued by the following CSECT: DSNLXRSQ

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 ABEND.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the ABENDING agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D3442A

Explanation: The distributed relational data system (DRDS) subcomponent has received a return code from the Data Communications Resource Manager (DCRM) indicating that an exit was chained; however, no exit should have been chained. This is a DB2 internal error.

This abend reason code is issued by the following CSECTS:

DSNLXRBF DSNLXRCL DSNLXRFT

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 ABEND.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the ABENDING agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D3442B

Explanation: The distributed relational data system (DRDS) subcomponent has received a nonzero SQL return code from an invocation of the parser. This is a DB2 internal error.

This abend reason code is issued by the following CSECT: DSNLXRCM

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 ABEND.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the ABENDING agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data sets or similar data from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00D3442E • 00D34431

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D3442E

Explanation: The distributed relational data system (DRDS) subcomponent has detected an inconsistency processing a request using advanced SQL protocols (ASP) of distributed relational database architecture at the local DB2.

The local DB2 has received an ENDUOWRM that indicates that the remote server processed a dynamic COMMIT request successfully; however, the SQLCARD that accompanies the ENDUOWRM contains a negative SQL return code.

This reason code is issued by the following CSECT: DSNLXRAX

System Action: An alert is generated. If this error has not been previously detected, then message DSNL0311 is written to the MVS console and trace record containing the reply from the remote server are written in statistics class 4. If the error was already detected, information from the previous occurrence can be used to diagnose the problem.

During execution the application will receive an SQLCODE +30100 for this operation.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Examine the trace record associated with the failing request's LUWID to determine the reply message and data that was received by the local DB2. Consult with the remote server system programmer to diagnose the problem.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5, 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D3442F

Explanation: The distributed relational data system (DRDS) subcomponent has detected an inconsistency processing a request using advanced SQL protocols (ASP) of distributed relational database architecture at the local DB2.

The inconsistency may manifest itself as follows:

- In the processing of an embedded SELECT SQL statement, a prior execution of this embedded SELECT SQL statement resulted in a SQLDTARD

that is NOT the same as the SQLDTARD received on the current execution of this SQL statement.

- In the processing of an OPEN cursor SQL statement, a prior description of the resultant data, obtained either as a result of a PREPARE or a prior execution of this SQL statement is NOT the same as the description of the resultant data that was received on the current execution of this SQL statement.

The data length, the data type and CCSID of each column of resultant data is checked for consistency.

This reason code is issued by the following CSECTS: DSNLXROP, DSNLXRSL

System Action: An alert is generated. If this error has not been previously detected, then message DSNL0311 is written to the MVS console and trace record containing the reply from the remote server written in statistics class 4. If the error was already detected, information from the previous occurrence can be used to diagnose the problem.

During execution the application will receive an SQLCODE -30020 for this operation. Subsequent requests within this unit of work will receive an SQLCODE -900 or -906.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Examine the trace record associated with the failing request's LUWID to determine the reply message and data that was received by the local DB2. Consult with the remote server system programmer to diagnose the problem.

At the local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5, 83.

At the remote server, collect the following items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D34431

Explanation: The distributed relational data system (DRDS) subcomponent encountered an error while processing a FREE package request. This is a DB2 internal error.

This abend reason code is issued by the following CSECT: DSNLXR UW

System Action: The request was not processed successfully.

00D34432

Explanation: The Distributed Relational Data System (DRDS) subcomponent encountered a positive SQL return code during remote program BIND processing. This is a DB2 internal error.

This abend reason code is issued by the following CSECT: DSNLXR UW

System Action: The request was successfully processed.

00D34433

Explanation: The distributed relational data system (DRDS) subcomponent encountered a negative SQL return code during remote program BIND processing. This is a DB2 internal error.

This abend reason code is issued by the following CSECT: DSNLXR UW

System Action: The request was not successfully processed.

00D34434

Explanation: The distributed relational data system (DRDS) subcomponent was forced to deallocate the conversation. This is a DB2 internal error.

System Action: The request was not processed successfully.

00D34436

Explanation: The distributed relational data system (DRDS) subcomponent detected that a remote program BIND request specified the local site. This is a DB2 internal error.

This abend reason code is issued by the following CSECT: DSNLXR CN

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the BB2 ABEND.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the ABENDING agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D34438

Explanation: The distributed relational data system (DRDS) subcomponent received an invalid SQLD value from the Relational Data System (RDS) component as a result of a DESCRIBE request. This is a DB2 internal error.

This abend reason code is issued by the following CSECT: DSNLXXSS

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 ABEND.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the ABENDING agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 ABEND. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D3443A

Explanation: The database access request from a remote site failed because the SYSIBM.USERNAMES table did not contain an inbound row, the TYPE column specified as an 'I' describing the DB2 authorization ID to be used for the remote plan owner authorization ID. When the USERNAMES column in SYSIBM.LUNAMES specifies 'I' or 'B', requiring inbound name translation, the SYSIBM.USERNAMES table must contain entries describing which DB2 authorization IDs are to be used for each remote authorization ID from the LU.

This abend reason code is issued by the following CSECT: DSNLXALC

System Action: The DSNL030I message is issued at the server. The database access agent is not allocated.

Operator Response: Notify the system programmer.

System Programmer Response: Make sure the USERNAMES column in SYSIBM.LUNAMES has been specified correctly for the indicated LUNAME. If you intend to use remote authorization IDs that differ from the DB2 authorization IDs, verify that the SYSIBM.USERNAMES table has rows that correctly specify the DB2 authorization IDs to be used for every possible remote authorization ID.

Problem Determination: Analyze the SYSIBM.USERNAMES table for an incorrect or missing entry.

00D3443B

Explanation: The distributed relational data system (DRDS) subcomponent has detected an inconsistency processing a chained request using advanced SQL protocols (ASP) of distributed relational database architecture at the local DB2.

Examples of inconsistencies follow:

- The local DB2 believes that the chain is intact but the remote server believes that the chain has been severed.
- The local DB2 believes that the chain has been severed but the remote server believes that the chain is intact.
- The local DB2 has received a negative SQL return code while processing a response to BEGIN BIND yet the remote server has not severed the chain.

This reason code is issued by the following CSECTs: DSNLXRCX, DSNLXRQX

System Action: An alert is generated. If this error has not been previously detected, then message DSNL0311 is written to the MVS console and trace record containing the reply from the remote server are written in statistics class 4. If the error was already detected, information from the previous occurrence can be used to diagnose the problem.

During BIND, the application will receive a DSNT5001 message. During execution the application will receive an SQLCODE -904 for this operation. Subsequent requests within this unit of work will receive an SQLCODE -900 or -906.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Examine the trace record associated with the failing request's LUWID to determine the reply message and data that was received by the local DB2. Consult with the remote server system programmer to diagnose the problem.

At the local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5, 83.

At the remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D3443C

Explanation: The distributed relational data system (DRDS) received an invalid return code from the relational data system (RDS) on a string translation request. This is a DRDS internal error.

This reason code is issued by the following CSECT: DSNLXQTD

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 abend.

Operator Response: Notify the system programmer.

System Programmer Response: Determine which sites the abending agent was connected to by examining the DSNL027 and DSNL028 SYSLOG console messages at the site of the DB2 abend. Obtain copies of the SYS1.LOGREC and SYSLOG data sets from each connected site, the SVC dump at the site of the DB2 failure, and any related dumps from each connected site. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D3443D

Explanation: The database access request from a remote site failed because the SYSIBM.USERNAMES table did not contain an inbound row, the TYPE column specified as an 'I' describing the DB2 authorization ID to be used for the remote primary authorization ID. When the USERNAMES column in SYSIBM.LUNAMES specifies 'I' or 'B' requiring inbound name translation, the SYSIBM.USERNAMES table must contain entries describing which DB2 authorization IDs are to be used for each remote authorization ID from the LU.

This reason code is issued by the following CSECT: DSNLXALC

System Action: The DSNL030I message is issued at the server. The database access agent is not allocated.

Operator Response: Notify the communications database administrator.

System Programmer Response: Make sure the USERNAMES column in SYSIBM.LUNAMES has been specified correctly for the indicated LUNAME. If you intend to use remote authorization IDs that differ from DB2 authorization IDs, verify that the SYSIBM.USERNAMES table has rows that correctly specify the DB2 authorization IDs to be used for every possible remote authorization ID.

Problem Determination: Analyze the SYSIBM.USERNAMES table for an incorrect or missing entry.

00D3443E

Explanation: The database access request from a remote site failed because the SYSIBM.USERNAMES table did not contain an inbound row, the TYPE column specified as an 'I' describing the DB2 authorization ID to be used for the remote package owner authorization ID. When the USERNAMES column in SYSIBM.LUNAMES specifies 'I' or 'B' requiring inbound name translation, the SYSIBM.USERNAMES table must contain entries describing which DB2 authorization IDs are to be used for each remote authorization ID from the LU.

This reason code is issued by the following CSECT: DSNLXRCS

System Action: The database access agent is not allocated.

Operator Response: Notify the communications database administrator.

System Programmer Response: Make sure the USERNAMES column in SYSIBM.LUNAMES has been specified correctly for the indicated LUNAME. If you intend to use remote authorization IDs that differ from DB2 authorization IDs, verify that the SYSIBM.USERNAMES table has rows that correctly specify the DB2 authorization IDs to be used for every possible remote authorization ID.

Problem Determination: Analyze the SYSIBM.USERNAMES table for an incorrect or missing entry.

00D3443F

Explanation: The remote server was not successfully connected. The SYSIBM.USERNAMES table did not contain an outbound row, the TYPE column specified as an 'O' describing the remote authorization identifier to be used for the package owner DB2 authorization ID. When the USERNAMES column in SYSIBM.LUNAMES specifies 'O' or 'B' requiring outbound name translation, the SYSIBM.USERNAMES table must contain entries describing the remote authorization IDs to be used for each DB2 authorization ID communicating with the LU.

This reason code is issued by the following CSECT: DSNLXRCS

System Action: A resource unavailable is returned to the application. The request is not sent to the remote site.

Operator Response: Notify the communications database administrator.

System Programmer Response: Make sure the USERNAMES column in SYSIBM.LUNAMES has been specified correctly for the indicated LUNAME. If you intend to use remote authorization IDs that differ from DB2 authorization IDs, verify that the SYSIBM.USERNAMES table has rows that correctly specify the remote authorization ID to be used for each

possible DB2 authorization ID.

Problem Determination: Analyze the SYSIBM.USERNAMES table for an incorrect or missing entry.

00D34440

Explanation: A timeout or deadlock was detected during remote bind processing. This can occur during BIND, REBIND, or FREE.

This reason code is issued by the following CSECT: DSNLXRUC

System Action: The BIND is not successful.

User Response: Reissue the BIND subcommand.

System Programmer Response: None is required.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1 on page 1353

00D34443

Explanation: Userid, password not valid in an IMS or CICS environment. An IMS or CICS application issued an SQL CONNECT with userid password.

System Action: The connect request is not processed. The application is placed in the unconnected and connectable state.

00D34444

Explanation: The Userid or Password submitted on a request to CONNECT to the local DB2 exceeded the maximum length supported. The maximum length for each is 8 characters.

System Action: The connect request is not processed. The application is placed in the unconnected and connectable state.

00D34445

Explanation: The distributed relational data system (DRDS) subcomponent detected an error while processing a DDM CNTQRY command received from a remote requester. A previous CNTQRY command specified a QRYROWSET parameter, indicating the number of rows to be returned as a rowset. Because of the blocking limits in effect with the requester, only a partial rowset was returned to the requester and a number of rows in the requested rowset are still unfetched, and thus pending. The DRDA rules require that this subsequent CNTQRY command must specify a QRYROWSET value equal to the pending rows in the rowset or must reset the query blocks from the pending rowset. The CNTQRY command did not specify the QRYRSTBLK parameter to reset the query blocks, and thus this command is assumed to one that completes

00D34446 • 00D34448

the pending rowset. Since the requested QRYROWSET value does not equal the number of pending rows in the rowset requested by the previous CNTQRY, a DRDA exception is generated.

System Action: A message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) is returned to the requester system.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the requester system is a DB2 for OS/390 system, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 83, 49.

At the DB2 server system generating the DSNL032I message, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 83, 49.

00D34446

Explanation: The distributed relational data system (DRDS) subcomponent detected an error while processing a DDM CNTQRY command received from a remote requester. A previous CNTQRY command specified a QRYROWSET parameter, indicating the number of rows to be returned as a rowset. Because of the blocking limits in effect with the requester, only a partial rowset was returned to the requester and a number of rows in the requested rowset are still unfetched, and thus pending. The CNTQRY command being processed specified a QRYRTNDDTA value of FALSE, but the DRDA rules require that this subsequent CNTQRY command must either explicitly or implicitly specify a QRYRTNDDTA value of TRUE. A DRDA exception is detected.

System Action: A message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) is returned to the requester system.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the requester system is a DB2 for OS/390 system, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 83, 49.

At the DB2 server system generating the DSNL032I message, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 83, 49.

00D34447

Explanation: The distributed relational data system (DRDS) subcomponent detected an error while processing a DDM CNTQRY command received from a remote requester. If either or both the OPNQRY command and the first CNTQRY command specified QRYROWSET parameter, then all subsequent CNTQRY commands must specify the QRYROWSET parameter explicitly. The CNTQRY command did not specify a QRYROWSET parameter as required by the DRDA rules and a DRDA exception is generated.

System Action: A message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) is returned to the requester system.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the requester system is a DB2 for OS/390 system, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 83, 49.

At the DB2 server system generating the DSNL032I message, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 83, 49.

00D34448

Explanation: The distributed relational data system (DRDS) subcomponent detected an error while processing a DDM CNTQRY command received from a remote requester. If both the OPNQRY command and the first CNTQRY command did not specify the QRYROWSET parameter, then all subsequent CNTQRY

commands may not specify the QRYROWSET parameter. The CNTQRY command specified a QRYROWSET parameter which is prohibited by the DRDA rules and a DRDA exception is generated.

System Action: A message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) is returned to the requester system.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the requester system is a DB2 for OS/390 system, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 83, 49.

At the DB2 server system generating the DSNL032I message, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 83, 49.

00D34449

Explanation: The distributed relational data system (DRDS) subcomponent detected an error while processing a DDM CNTQRY command received from a remote requester. Scrolling parameters were specified on the CNTQRY command (such as QRYSCRORN, QRYROWNBR, QRYROWSNS, QRYBLKRST, QRYRTNDTA) but either the cursor is not scrollable or the cursor is scrollable but is being accessed by the requester in a non-scrollable manner (both the OPNQRY command and the first CNTQRY command did not specify the QRYROWSET parameter). A DRDA exception is generated.

System Action: A message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) is returned to the requester system.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number

enumerated in the DSNL032I message should be analyzed.

If the requester system is a DB2 for OS/390 system, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 83, 49.

At the DB2 server system generating the DSNL032I message, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 83, 49.

00D3444A

Explanation: The distributed relational data system (DRDS) subcomponent detected an error while processing a DDM CNTQRY command received from a remote requester. The CNTQRY is fetching data from a scrollable cursor which is being accessed in a scrollable manner by the requester. The CNTQRY command will return one or more LOB columns as LOB data, but the RTNEXTDTA parameter on the CNTQRY command (indicating how LOB values are to be returned) did not specify RTNEXTALL as required by the DRDA rules. A DRDA exception is generated.

System Action: A message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) is returned to the requester system.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the requester system is a DB2 for OS/390 system, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 83, 49.

At the DB2 server system generating the DSNL032I message, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 83, 49.

00D3444D

Explanation: The distributed relational data system (DRDS) subcomponent detected an error. This is a DB2 internal error.

System Action: A record is written to SYS1.LOGREC and an SVC dump is requested at the site of the DB2 ABEND.

Operator Response: Notify the system programmer.

System Programmer Response: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 56, 57.

00D3444E

Explanation: The stored procedure result set contains an unsupported data type.

System Action: The stored procedure call fails.

Programmer Response: Modify the stored procedure to return result sets that include only data types that are supported by the requester. You may also upgrade the level of the code at the requester to one that supports the data types that were returned by the server.

00D35000

Explanation: DB2 has detected a DRDA exception condition. This is a generic reason code that describes a situation not covered by any other reason codes.

This reason code is issued by the following CSECT: DSNLZxxx

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at the local DB2.

- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server.

- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server trace information or dumps.

00D35030

Explanation: DB2, acting as a DRDA server, detected an error while processing an SQL request from a remote DRDA client. DB2 was building a DDM query descriptor (QRYDSC or FDODSC) to return to the DRDA client, but could not do so because the descriptor

required more late environment descriptors (LEDs) than DB2 can support.

System Action: The DBAA is abended. The conversation with the remote site is terminated. At the server console, the DSNL027I message is issued, accompanied by one or more DSNL028I messages identifying all remote sites where the distributed agent also exists and where diagnostic information might also be collected.

User Response: The SQL request issued by the client cannot be processed by DB2. As a circumvention, the SQL request can be simplified to reduce the number of LEDs required to describe the data using DRDA. LEDs may be required, for example, if columns being fetched are in a different code page (CCSID) than the default CCSID for the DB2 for MVS system.

Operator Response: Notify the application programmer or user creating the SQL statement.

If the remote DRDA client is a DB2 for MVS system, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83. For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At DB2 DRDA server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

This abend reason code is issued by the following CSECT: DSNLZSRD.

00D35101

Explanation: DB2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The DDM level 6b object, other than a Reply DSS or an Object DSS, is invalid.

This reason code is issued by the following CSECT: DSNLZRPA

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items

listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35102

Explanation: DB2 has detected an error in the DDM reply data object received from the remote server in response to a DDM command. The object, carried in a level 6b OBJDSS, is not defined as valid for DDM level 3.

This reason code is issued by the following CSECT:
DSNLZRPA

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30072 and SQLSTATE 58016.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35103

Explanation: DB2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. Multiple instances of a DDM reply data object, defined within DDM level 3 as nonrepeatable, have been returned.

This reason code is issued by the following CSECT:
DSNLZRPA

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an

error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35104

Explanation: DB2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The reply data object is not defined by DRDA.

This reason code is issued by the following CSECT:
DSNLZRPA

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30071 and SQLSTATE 58015.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

Collect the following diagnostic items at this local DB2.

- Statistics Class 4 trace record identified by the IFCID sequence number specified in message DSNL0311.

Collect the following diagnostic items at the remote server.

- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server trace information or dumps.

00D35105

Explanation: DB2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. While defined by DDM Level 3 as a valid reply object for this command, DB2 does not support the object.

00D35106 • 00D35108

This reason code is issued by the following CSECT:
DSNLZRPA

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35106

Explanation: DB2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The object must be contained within a single OBJDSS, but was received in an OBJDSS which contained other objects. The object must be contained within a single DSS but was received in a DSS which contained other DDM objects.

This reason code is issued by the following CSECT:
DSNLZRPA

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic

items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35107

Explanation: DB2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. One or more DDM reply data objects, defined by DDM Level-3 as required for the DDM command, were not received.

This reason code is issued by the following CSECT:
DSNLZRPA

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35108

Explanation: DB2 has detected an error in the DDM SQLDTARD reply data object received in response to a DDM EXCSQLSTT command. The SQL operation is a SELECT and the size of the FDODSC scalar, contained within the SQLDTARD, exceeds 32KB. The DDM extended length field required to support this is invalid. The SQL operation is a SELECT and the size of the FDODSC object, contained within the SQLDTARD collection, exceeds 32KB. The DDM extended length field required to support this is invalid.

This reason code is issued by the following CSECT:
DSNLZRPA

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35109

Explanation: DB2 has detected an error in the DDM SQLDTARD reply data object received in response to a DDM EXCSQLSTT command. The DDM SQLDTARD object is a collection consisting of the FDODSC and FDOTA scalars. The FDODSC scalar, describing a single row returned on SELECT, is not contained with the SQLDTARD reply data object. The DDM SQLDTARD object is a collection which contains the FDODSC and FDOTA DDM objects. The FDODSC element, describing the single row, is not contained within the SQLDTARD reply data object.

This reason code is issued by the following CSECT: DSNLZRPA

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D3510A

Explanation: DB2 has detected an error in the DDM SQLDTARD reply data object received in response to a DDM EXCSQLSTT command. The DDM SQLDTARD object is a collection consisting of the FDODSC and FDOTA scalars. The FDOTA scalar, containing the single row described by the FDODSC, is not contained within the SQLDTARD reply data object. The DDM SQLDTARD object is a collection which contains the FDODSC and FDOTA DDM objects. The FDOTA element, containing the single row, is not contained within the SQLDTARD reply data object.

This reason code is issued by the following CSECT: DSNLZRPA

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D3510B

Explanation: DB2 has detected an error in the DDM SQLDTARD reply data object received in response to a DDM EXCSQLSTT command. The SQL operation is a SELECT and the size of the resultant row, contained with the FDOTA scalar, exceeds 32KB. The FDOTA DDM extended length field required to support this is invalid. The SQL operation is a SELECT and the size of the resultant row exceeds 32KB. The DDM extended length field required to support this is invalid.

This reason code is issued by the following CSECT: DSNLZRPA

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D3510C

Explanation: DB2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The SQL operation is a SELECT and the size of the SQLDTARD, a DDM collection consisting of the FDODSC and FDOTA scalars, SQLDTARD is greater than the sum of the lengths of the constituent FDODSC and FDOTA scalars. The object is invalid.

This reason code is issued by the following CSECT: DSNLZRPA

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D3510D

Explanation: DB2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The DDM object is a TYPDEFNAM signaling a change in machine representation. The length of the DDM object is incorrect.

This reason code is issued by the following CSECT: DSNLZRPA

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D3510E

Explanation: DB2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The DDM object is a TYPDEFNAM signaling a change in machine representation. The value of the DDM object specifies a machine environment which is not supported by DRDA.

This reason code is issued by the following CSECT: DSNLZRPA

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace

record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D3510F

Explanation: DB2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The DDM object is a TYPDEFOVR collection signaling a remote server change in CCSIDs. The length of one of the constituent scalars, CCSIDSBC, CCSIDMBC or CCSIDDBC is incorrect.

This reason code is issued by the following CSECT: DSNLZRPA

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35110

Explanation: DB2 has detected an error in the DDM TYPEDEFOVR reply data object received from the remote server in response to a DDM command, signaling a change in the remote server CCSIDs. The TYPEDEFOVR contains multiple occurrences of the CCSIDSBC scalar (SBCS CCSID). This is an error. The DDM object is a TYPDEFOVR collection signaling a remote server change in CCSIDs. The CCSIDSBC (SBCS CCSID) code point is invalid.

This reason code is issued by the following CSECT: DSNLZRPA

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35111

Explanation: DB2 has detected an error in the DDM TYPEDEFOVR reply data object received from the remote server response to a DDM command, signaling a change in the remote server CCSIDs. The TYPEDEFOVR contains multiple occurrences of the CCSIDSBC scalar (MIXED CCSID). This is an error. The DDM object is a TYPDEFOVR collection signaling a remote server change in CCSIDs. The CCSIDMBC (MIXED CCSID) code point is invalid.

This reason code is issued by the following CSECT: DSNLZRPA

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic

items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35112

Explanation: DB2 has detected an error in the DDM TYPEDEFOVR reply data object received from the remote server in response to a DDM command, signaling a change in the remote server CCSIDs. The TYPEDEFOVR contains multiple occurrences of the CCSIDSBC scalar (GRAPHIC CCSID). This is an error. The DDM object is a TYPDEFOVR collection signaling a remote server change in CCSIDs. The CCSIDDBC (GRAPHIC CCSID) code point is invalid.

This reason code is issued by the following CSECT: DSNLZRPA

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35113

Explanation: DB2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The DDM object is a TYPDEFOVR collection signaling a remote server change in CCSIDs. The DDM object length is invalid.

This reason code is issued by the following CSECT: DSNLZRPA

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an

error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35114

Explanation: DB2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The length of the DDM reply message is inconsistent with the length of its DSS carrier.

This reason code is issued by the following CSECT: DSNLZRPA

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at this local DB2.

- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server.

- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server trace information or dumps.

00D35115

Explanation: DB2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The sum of the lengths of the constituent DDM objects

within an OBJDSS is inconsistent with the length of the DSS carrier.

This reason code is issued by the following CSECT:
DSNLZRPA

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

Collect the following diagnostic items at this local DB2.

- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL0311.

Collect the following diagnostic items at the remote server.

- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server trace information or dumps.

00D35116

Explanation: DB2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The DDM reply message is not valid for the current command.

This reason code is issued by the following CSECT:
DSNLZRPA

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

Collect the following diagnostic items at this local DB2.

- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL0311.

Collect the following diagnostic items at the remote server.

- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server trace information or dumps.

00D35117

Explanation: DB2 has detected an error in the SQLDTARD reply data object received in response to an EXCSQLSTT DDM command. The FDOTA element of the SQLDTARD collection contains a null SQLDTAGRP containing no data and a null SQLCAGRP, indicating that the SQL SELECT operation was successful. This is an inconsistency.

This reason code is issued by the following CSECT:
DSNLZRPA

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

Collect the following diagnostic items at this local DB2.

- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL0311.

Collect the following diagnostic items at the remote server.

- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server trace information or dumps.

00D35118

Explanation: DB2 detected an error in the DDM reply data object received from the application server (AS) in response to a DDM command. The DDM minimum level attribute of the reply data object (that is, the level of DDM required to support the object) exceeds the DDM level of the AS specified during CONNECT processing.

This reason code is issued by the following CSECT:
DSNLZRPA

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application receives SQLCODE -30020 and SQLSTATE 58009.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Analyze the statistics class 4 trace record identified by the IFCID sequence number included in the DSNL0311 message.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353:

00D35119

Explanation: DB2 detected an error in the DDM reply message received from the application server (AS) in response to a DDM command. The DDM minimum level attribute of the reply message (that is, the level of DDM required to support the reply message) exceeds the DDM level of the AS specified during CONNECT processing.

This reason code is issued by the following CSECT:
DSNLZRPA

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application received SQLCODE -30020 and SQLSTATE 58009.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Analyze the statistics class 4 trace record identified by the IFCID sequence number included in the DSNL0311 message.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D3511A

Explanation: DB2 has detected an error in the DRDA summary component received from the remote server in response to a DDM EXCSQLSTT command that generated query result sets. The DRDA summary component should consist of the DDM RSLSETRM reply message, a DDM SQLCARD or SQLDTARD reply data object, and a DDM SQLRSLRD reply data object. Neither the SQLCARD nor the SQLDTARD is contained in the summary component.

This reason code is issued by the following CSECT:
DSNLZRPA.

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30020 and SQLSTATE 58009.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Analyze the statistics class 4 trace record identified by the IFCID sequence number given in message DSNL0311.

At the DB2 requester, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 83.

If the DRDA server is DB2 UDB for z/OS, then DB2 diagnostic information is available. In this case, at the DB2 server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1.

00D3511B

Explanation: DB2 has detected an error in the DRDA summary component received from the remote server in response to a DDM EXCSQLSTT command that generated query result sets. The DRDA summary component should consist of the DDM RSLSETRM reply message, a DDM SQLCARD or SQLDTARD reply data object, and a DDM SQLRSLRD reply data object. The SQLRSLRD object is not contained in the summary component.

This reason code is issued by the following CSECT:
DSNLZRPA.

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30020 and SQLSTATE 58009.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Analyze the statistics class 4 trace record identified by the IFCID sequence number given in message DSNL0311.

At the DB2 requester, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 83.

If the DRDA server is DB2 UDB for z/OS, then DB2 diagnostic information is available. In this case, at the DB2 server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1

00D3511C

Explanation: DB2 has detected an error in the DRDA summary component received from the remote server in response to a DDM EXCSQLSTT command that generated query result sets. The DRDA summary component should consist of the DDM RSLSETRM reply message, a DDM SQLCARD or SQLDTARD reply data object, and a DDM SQLRSLRD reply data object. The SQLRSLRD reply data object was not preceded by the RSLSETRM reply message.

This reason code is issued by the following CSECT: DSNLZRPA.

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30020 and SQLSTATE 58009.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Analyze the statistics class 4 trace record identified by the IFCID sequence number given in message DSNL0311.

At the DB2 requester, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 83.

If the DRDA server is DB2 UDB for z/OS, then DB2 diagnostic information is available. In this case, at the DB2 server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1.

00D3511D

Explanation: DB2 has detected an error in the DRDA summary component or the DRDA result set component received from the remote server in response to a DDM EXCSQLSTT command that generated query result sets. The DRDA summary component should consist of the DDM RSLSETRM reply message, a DDM SQLCARD or SQLDTARD reply data object, and a DDM SQLRSLRD reply data object. The DRDA result set component should consist of at least the DDM OPNQRYRM reply message and the DDM QRYDSC reply data object. The OPNQRYRM message is not present following the SQLRSLRD object.

This reason code is issued by the following CSECT: DSNLZRPA.

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30020 and SQLSTATE 58009.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Analyze the statistics class 4 trace record identified by the IFCID sequence number given in message DSNL0311.

At the DB2 requester, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 83.

If the DRDA server is DB2 UDB for z/OS, then DB2 diagnostic information is available. In this case, at the DB2 server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1.

00D351FF

Explanation: DB2 received a DDM reply message from the remote server in response to a DDM command. The reply message, while valid for the DDM command, indicates that the DDM command and hence the SQL statement was not successfully processed. The application is notified of the failure through the architected SQLCODE (-300xx) and associated SQLSTATE.

This reason code is issued by the following CSECT: DSNLZRPA

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

00D35201 • 00D35203

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number included in the DSNL0311 message should be analyzed.

Collect the following diagnostic items at this local DB2.

- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL0311.

Collect the following diagnostic items at the remote server.

- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server trace information or dumps.

00D35201

Explanation: DB2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The DDM object is the FDODSC element of an SQLDTARD. The size of the FDODSC is greater than 32KB and the DDM level 6b extended length field is invalid.

This reason code is issued by the following CSECT: DSNLZRDS

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35202

Explanation: DB2 has detected an error in the QRYDSC or SQLDTARD reply data object received in response to an OPNQRY or EXCSQLSTT DDM command. The DDM object is either a QRYDSC or the

FDODSC scalar of the SQLDTARD collection. The FDOCA geometry is incorrect. The SQLCADTA row (RLO) MDD is either invalid or has not been included within the SQLDTARD descriptor. The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZRDS

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35203

Explanation: DB2 has detected an error in the QRYDSC or SQLDTARD reply data object received in response to an OPNQRY or EXCSQLSTT DDM command. The DDM object is either a QRYDSC or the FDODSC scalar of the SQLDTARD collection. The FDOCA geometry is incorrect. The SQLCADTA row triplet (RLO) is either invalid or has not been included with the SQLDTARD descriptor.

This reason code is issued by the following CSECT: DSNLZRDS

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35204

Explanation: DB2 has detected an error in the QRYDSC or SQLDTARD reply data object received in response to an OPNQRY or EXCSQLSTT DDM command. The DDM object is either a QRYDSC or the FDOFSC scalar of the SQLDTARD collection. The FDOCA geometry is incorrect. Either the first component of the SQLCADTA row is other than an SQLCAGRP (early) group or the number of elements taken from the SQLCAGRP or SQLCAGRP replication factor (or both) are incorrect. The descriptor is invalid. The DDM object is either a QRYDSC or the FDOFSC element of the SQLDTARD collection. The FDOCA geometry is incorrect. The first elements of the row are other than the elements of the early SQLCAGRP. The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZRDS

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35205

Explanation: DB2 has detected an error in the QRYDSC or SQLDTARD reply data object received in response to an OPNQRY or EXCSQLSTT DDM command. The DDM object is either a QRYDSC or the FDOFSC scalar of the SQLDTARD collection. The FDOCA geometry is incorrect. The first component of the SQLCADTA row correctly enumerates the elements of the SQLCAGRP; however, the second component, identifying the SQLDTAGRP (late) group is incorrect. Either the SQLTAGRP local identifier (LID) is different than the LID of the SQLDTAGRP previously specified or

the number of elements taken from the SQLDTAGRP replication factor (or both) are incorrect. The descriptor is invalid. The DDM object is either a QRYDSC or the FDOFSC element of the SQLDTARD collection. The FDOCA geometry is incorrect. The first elements of the row correctly enumerate the elements of the early SQLCAGRP, however, the local identifier (LID) following the SQLCAGRP LID is different than the LID of the SQLDTAGRP group previously specified. The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZRDS

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35206

Explanation: DB2 has detected an error in the QRYDSC or SQLDTARD reply data object received in response to an OPNQRY or EXCSQLSTT DDM command. The DDM object is either a QRYDSC or the FDOFSC scalar of the SQLDTARD collection. The FDOCA geometry is incorrect. One or more late environmental descriptors is included within the previously specified SQLDTAGRP late group descriptor. However, SQLDTARD row (RLO) Meta Data Definition (MDD) is either incorrect or has not been included within the SQLDTARD descriptor. The descriptor is invalid. The DDM object is either a QRYDSC or the FDOFSC scalar of the SQLDTARD collection. The FDOCA geometry is incorrect. One or more late environmental descriptors have been included within the previously processed SQLDTAGRP group. However, the Meta Data Definition (MDD) of the SQLDTARD row (RLO) has not been included within the descriptor. The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZRDS

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35207

Explanation: DB2 has detected an error in the QRYDSC or SQLDTARD reply data object received in response to an OPNQRY or EXCSQLSTT DDM command. The DDM object is either a QRYDSC or the FDODSC scalar of the SQLDTARD collection. The FDOCA geometry is incorrect. Either the SQLDTARD is specified as other than a row triplet (RLO) or the SQLDTARD RLO triplet length is invalid. The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZRDS

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic

items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35208

Explanation: DB2 has detected an error in the QRYDSC or SQLDTARD reply data object received in response to an OPNQRY or EXCSQLSTT DDM command. The DDM object is either a QRYDSC or the FDODSC scalar of the SQLDTARD collection. The FDOCA geometry is incorrect. Either the SQLCADTA LID referenced within the SQLDTARD RLO did not match the LID defined within the SQLCADTA RLO or the number of elements or replication factor (or both) within the SQLDTARD RLO was non zero. The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZRDS

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

If this DB2 is the AR for the thread, the DDM object received is an SQLDTA or QRYDSC. The application will receive SQLCODE -30000 and SQLSTATE 58008. If this DB2 is a remote server for the thread, the DDM object received is SQLDTA. DSCINVRM will be returned to the AR.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at the local DB2.

- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server.

- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server trace information or dumps.

00D35209

Explanation: DB2 has detected an error in the QRYDSC or SQLDTARD reply data object received in response to an OPNQRY or EXCSQLSTT DDM command. The DDM object is either a QRYDSC or the FDODSC scalar of the SQLDTARD collection. The FDOCA geometry is incorrect. Either the length is specified in the LL preceding the QRYDSC or FDODSC

is greater than the length of the OBJDSS carrier or the length of one of the constituent geometries (triplet lengths) is inconsistent with the length of the QRYDSC or FDODSC. The descriptor is invalid.

This reason code is issued by the following CSECT:
DSNLZRDS

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D3520A

Explanation: DB2 has detected an error in the SQLDTARD reply data object received in response to an EXCSQLSTT DDM command. The DDM object is the FDODSC scalar of the SQLDTARD collection and is contained within multiple DDM Level 6b OBJDSS carriers. The descriptor is invalid. The DDM object is the FDODSC scalar of the SQLDTARD collection. The SQLDTARD is contained in multiple level 6b object DSSs. The descriptor is invalid.

This reason code is issued by the following CSECT:
DSNLZRDS

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number

enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D3520B

Explanation: DB2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The DDM object is a QRYDSC returned from an OPNQRY command which spans multiple DDM level 6b DSSs. One or more of the containing level 6b DSSs is (are) other than an object (OBJ) DSS. The descriptor is invalid.

This reason code is issued by the following CSECT:
DSNLZRDS

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D3520C

Explanation: DB2 has detected an error in the DDM reply message or DDM reply data object received from the remote server in response to a DDM command. The DDM object is a QRYDSC returned from an OPNQRY command which spans multiple DDM level 6b object DSSs. One or more of the DDM code points within the containing object DSSs is (are) other than QRYDSC (X'241A'). The descriptor is invalid.

This reason code is issued by the following CSECT:
DSNLZRDS

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D3520D

Explanation: DB2 has detected an error in the QRYDSC reply data object received in response to an OPNQRY DDM command. The QRYDSC contained in one or more query blocks is incomplete, i.e., the entire QRYDSC has not been returned in response to the OPNQRY command.

This reason code is issued by the following CSECT: DSNLZRDS

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D3520E

Explanation: DB2 has detected an error in the DDM QRYDSC or the DDM SQLCINRD reply data object received from the remote server in response to a DDM EXCSQLSTT command that generated query result sets. The number of columns described by the QRYDSC object is inconsistent with the number of columns described by the DDM SQLCINRD object.

This reason code is issued by the following CSECT: DSNLZRDS.

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30020 and SQLSTATE 58009.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Analyze the statistics class 4 trace record identified by the IFCID sequence number given in message DSNL031I.

At the DB2 requester, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 83.

If the DRDA server is DB2 UDB for z/OS, then DB2 diagnostic information is available. In this case, at the DB2 server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1.

00D35301

Explanation: DB2 has detected an error in the DDM reply message received from the remote server in response to a DDM command. The reply message code point is not supported by DDM Level 3.

This reason code is issued by the following CSECT: DSNLZRPY

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number

enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35302

Explanation: DB2 has detected an error in the DDM reply message received from the remote server in response to a DDM command. The reply message contains one or more constituent instance variables whose code point is not supported by DDM Level 3.

This reason code is issued by the following CSECT: DSNLZRPY

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35303

Explanation: DB2 has detected an error in the DDM reply message received from the remote server in response to a DDM command. The length of the reply message is greater than the sum of the lengths of the constituent instance variables.

This reason code is issued by the following CSECT: DSNLZRPY

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35304

Explanation: DB2 has detected an error in the DDM reply message received from the remote server in response to a DDM command. One or more instance variables, specified by DDM Level 3 as required for this reply message, is (are) not contained within the reply message.

This reason code is issued by the following CSECT: DSNLZRPY

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35305

Explanation: DB2 has detected an error in the DDM reply message received from the remote server in response to a DDM command. The length of the reply message exceeds the sum of the lengths of all the constituent instance variables.

00D35306 • 00D35308

This reason code is issued by the following CSECT:
DSNLZRPY

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35306

Explanation: DB2 has detected an error in the DDM reply message received from the remote server in response to a DDM command. The length of the RDBNAM instance variable is 18 bytes as specified by DDM Level 3, however, bytes 17 and 18 are non blank. DB2 supports only a 16 byte RDBNAM.

This reason code is issued by the following CSECT:
DSNLZRPY

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35307

Explanation: DB2 has detected an error in the DDM reply message received from the remote server in response to a DDM command. The value of the DDM enumerated value instance variable, DTALCKST is other than TRUE (X'F1') or FALSE (X'F0').

This reason code is issued by the following CSECT:
DSNLZRPY

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35308

Explanation: DB2 has detected an error in the MGRLVLRM reply message received from the remote server in response to the EXCSAT DDM command. The MGRLVL specified is not supported by DB2. DB2 supports the following DDM Level 3 managers: CMNAPPC, SUPERVISOR, SECMGR, AGENT, DIRECTORY, SQLAM, and RDB.

This reason code is issued by the following CSECT:
DSNLZRPY

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number

enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35309

Explanation: DB2 has detected an error in the ACCRDBRM reply message received from the remote server as in response to the ACCRDB command. The length of the PRDID instance variable is invalid.

This reason code is issued by the following CSECT: DSNLZRPY

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D3530A

Explanation: DB2 has detected an error in the ACCRDBRM reply message received from the remote server in response to ACCRDB DDM command. DB2 is currently disabled to connect to the server specified by the value of the PRDID instance variable.

This reason code is issued by the following CSECT: DSNLZRPY

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D3530B

Explanation: DB2 has detected an error in the DDM reply message received from the remote server in response to a DDM OPNQRS command. The value of the enumerated instance variable, QRYPRCTYP, is other than SNGROWPRC or LMTBLKPRC.

This reason code is issued by the following CSECT: DSNLZRPY

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58017.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D3530C

Explanation: DB2 has detected an error in the DDM reply message received from the remote server in response to a DDM command. The value of the severity code (SVRCOD) instance variable, as specified by DRDA, is not valid for this reply message.

This reason code is issued by the following CSECT: DSNLZRPY

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D3530D

Explanation: DB2 has detected an error in the ACCRDBRM reply message received from the remote server in response to ACCRDB DDM command. The DDM TYPDEFOVR instance variable, a collection, contains a scalar instance variable other than CCSIDSBC, CCSIDMBC or CCSIDDBC.

This reason code is issued by the following CSECT: DSNLZRPY

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D3530E

Explanation: DB2 has detected an error in the ACCRDBRM reply message received from the remote server in response to the ACCRDB DDM command. The length of the TYPDEFOVR instance variable, a collection, is different than the sum of the lengths of the constituent scalar instance variables.

This reason code is issued by the following CSECT: DSNLZRPY

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D3530F

Explanation: DB2 has detected an error in the DDM reply message received from the remote server in response to a DDM command. The length of a DDM fixed length collection or scalar is different than that specified by DDM Level 3.

This reason code is issued by the following CSECT: DSNLZRPY

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number

enumerated in the DSNL0311 message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35310

Explanation: DB2 has detected an error in the DDM reply message received from the remote server in response to a DDM command. The length of a DDM variable length collection or scalar is different than that specified by DDM Level 3.

This reason code is issued by the following CSECT: DSNLZRPY

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35311

Explanation: DB2 detected an error in the DDM reply message received from the application server (AS) in response to a DDM EXCSQLIMM or EXCSQLSTT command. The AS DDM level specified during CONNECT is 4 and an ENDUOWRM was returned signaling that a dynamic COMMIT or ROLLBACK was performed. The correct response from an AS supporting DDM Level 4 is the CMMRQSRM reply message.

This reason code is issued by the following CSECT: DSNLZRPY

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application receives SQLCODE -30020 and SQLSTATE 58009.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Analyze the statistics class 4 trace record identified by the IFCID sequence number included in the DSNL0311 message.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35401

Explanation: DB2 detected an error in the DDM SQLCARD reply data object received from the remote server in response to a DDM command. The object contains nonzero lengths for both the SQLERRMSG_m and SQLERRMSG_s elements as described by the SQLCAXGRP early group descriptor. This is invalid as specified by DRDA.

This reason code is issued by the following CSECT: DSNLZRCA

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Analyze the statistics class 4 trace record identified by the IFCID sequence number identified in the DSNL0311 message.

00D35501

Explanation: DB2 has detected an error in the DDM SQLDARD reply data object received from the remote server in response to a DDM PRPSQLSTT command. The value of the single element of the SQLNUMGRP, SQLNUM, defining the total number of SQLDAROW occurrences within the SQLDARD array, is either negative or is inconsistent with the size of the SQLDARD array.

This reason code is issued by the following CSECT: DSNLZRDA

00D35502 • 00D35602

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35502

Explanation: DB2 has detected an error in the DDM SQLDARD reply data object received from the remote server in response to a DDM PRPSQLSTT command. Within one or more SQLDAROW occurrences, either (a) the lengths of SQLNAME_m and SQLNAME_s are both non-0, or (b) the lengths of SQLLABEL_m and SQLLABEL_s are both non-0, or (c) the lengths of SQLCOMMENTS_m and SQLCOMMENTS_s are both non-0. The data is invalid with regard to the Early SQLDAGRP group descriptor as defined by DRDA.

This reason code is issued by the following CSECT: DSNLZRDA

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic

items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35601

Explanation: DB2 has detected an error in command data received from a local DB2, or reply data received from the remote server in response to a DDM command. The command or reply data is described by either an FDOCA early or late descriptor. Any Late descriptors have been previously validated. The data currently being retrieved from the data stream is described by a simple data Array (SDA) defining variable length data whose length is given by a 2 byte length field. The value of the length field is either negative or greater than the maximum length specified by the SDA. The data is inconsistent with the descriptor.

This reason code is issued by the following CSECT: DSNLZFDT

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

If the error occurs within reply data, then the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within command data, a DDM DTAMCHRM reply message will be returned to the AR.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35602

Explanation: DB2 has detected an error in a SQLSTT, SQLSTTVRB, SQLOBJNAM or SQLDTA data object received from a local DB2. The length of the data to be retrieved from the data stream is defined by an SDA which is part of an early or late descriptor. The length exceeds the length of remainder of the OBJDSS carrier of the command data object. The data is inconsistent with the descriptor.

This reason code is issued by the following CSECT: DSNLZFDT

System Action: An alert is generated and message

DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM DTAMCHRM reply message will be returned to the AR.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35603

Explanation: DB2 has detected an error in SQLCARD, SQLDARD, or SQLDTARD reply data object received from an remote server in response to a DDM command. The reply data is described by either the SQLCAGRP or SQLDAGRP early descriptors or the SQLDTAGRP (contained within a SQLDTARD) late descriptor. The length of the data to be retrieved is specified by the default length of a constituent SDA within the SQLCAGRP or SQLDAGRP early groups or the SDA length specification within the SQLDTAGRP late group. All OBJDSSs received in response to the DDM command have been processed but the SQLCARD, SQLDARD, or SQLDTARD is incomplete. These must be returned in their entirety. The data is inconsistent with the descriptor.

This reason code is issued by the following CSECT: DSNLZFDT

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items

listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35604

Explanation: DB2 has detected an error in SQLCARD, SQLDARD, or SQLDTARD reply data object received from an remote server in response to a DDM command. The reply data is described by either the SQLCAGRP or SQLDAGRP early descriptors or the SQLDTAGRP (contained within a SQLDTARD) late descriptor. The length of the data to be retrieved is specified by the default length of a constituent SDA within the SQLCAGRP or SQLDAGRP early groups or the SDA length specification within the SQLDTAGRP late group. The carrier OBJDSS has been exhausted but the complete object has not been assembled. The object must be contained in exactly one OBJDSS carrier. This is not the case and the data is inconsistent with the descriptor.

This reason code is issued by the following CSECT: DSNLZFDT

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35605

Explanation: DB2 has detected an error in a QRYDTA reply data object received from the remote server in response to a DDM OPNQRY or CNTQRY command. The reply data, described by an SQLDTARD late descriptor carried in a DDM QRYDSC reply data object, has been previously validated. The reply data spans multiple query blocks, each of which are contained in a level 6b DSS. One or more of the containing level 6b

00D35606 • 00D35608

DSSs is other than a DDM level 6b object DSS. This is invalid.

This reason code is issued by the following CSECT:
DSNLZFDT

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35606

Explanation: DB2 has detected an error in a QRYDTA reply data object received from the remote server in response to a DDM OPNQRY or CNTQRY command. The reply data, described by an SQLDTARD late descriptor carried in a DDM QRYDSC reply data object, has been previously validated. The reply data spans multiple query blocks, each of which are contained in a level 6b Object DSS (OBJDSS). The code points of one or more of the DDM reply data objects is other than QRYDTA (X'241B'). This is invalid.

This reason code is issued by the following CSECT:
DSNLZFDT

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35607

Explanation: DB2 has detected an error in a QRYDTA reply data object received from a remote server in response to a DDM OPNQRY or CNTQRY. The cursor is being processed with single row protocols (SNGROWPRC). The QRYDTA may span multiple query blocks but must be returned in its entirety. This is not the case.

This reason code is issued by the following CSECT:
DSNLZFDT

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at this local DB2.

- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server.

- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server trace information or dumps.

00D35608

Explanation: DB2 has detected an error in a QRYDTA reply data object received from the remote server in response to a DDM OPNQRY or CNTQRY command. The reply data, described by an SQLDTARD late descriptor carried in a DDM QRYDSC reply data object, has been previously validated. The current data to be retrieved from the QRYDTA is described by an SDA defining Null-Terminated data (DRDA types X'2C', X'2D', X'2E', X'2F', X'42' or X'43'). The null terminator cannot be located within the reply data. The data is inconsistent with the descriptor defined by the QRYDSC.

This reason code is issued by the following CSECT:
DSNLZFDT

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35609

Explanation: DB2 detected an error in conversion of numeric data. Possible scenarios are: floating point conversion overflow, or digits of numeric character out of range.

This reason code is issued by the following CSECT:
DSNLZFDT

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

The application receives SQLCODE -30073 and SQLSTATE 58017.

User Response: Check your numeric data. If you are connecting to DB2 via a non-S/370 type machine, overflow can occur when the floating point value is out of the System/370 floating point range. Refer to Appendix A of *DB2 SQL Reference* for details of floating point range.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Analyze the statistics class 4 trace record identified by the IFCID sequence number given in message DSNL0311.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35701

Explanation: DB2 has detected an error while processing the SQLDTAGRP late group descriptor, contained within either the DRDA SQLDTARD or SQLDTA late descriptors. The DDM object is either a QRYDSC, SQLDTARD or SQLDTA. The FDOCA geometry is incorrect. The late descriptor includes late environmental descriptors and the SQLDTAGRP meta data definition (MDD) is either invalid or has not been included within the descriptor. The descriptor is invalid.

This reason code is issued by the following CSECT:
DSNLZGDT

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

If the error occurs within the QRYDSC or SQLDTARD DDM objects, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DSCINVRM reply message will be returned to the AR.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35702

Explanation: DB2 has detected an error while processing the SQLDTAGRP late group descriptor, contained within either the DRDA SQLDTARD or SQLDTA late descriptors. The DDM object is either a QRYDSC, SQLDTARD or SQLDTA. The FDOCA geometry is incorrect. The SQLDTAGRP triplet is not defined as an FDOCA nullable group. The descriptor is invalid.

This reason code is issued by the following CSECT:
DSNLZGDT

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

If the error occurs within the QRYDSC or SQLDTARD DDM objects, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within

00D35703 • 00D35705

the DDM SQLDTA object, a DSCINVRM reply message will be returned to the AR.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35703

Explanation: DB2 has detected an error while processing the SQLDTAGRP late group descriptor, contained within either the DRDA SQLDTARD or SQLDTA late descriptors. The DDM object is either a QRYDSC, SQLDTARD or SQLDTA. The FDOCA geometry is incorrect. The local identifier (LID) of one of the SQLDTAGRP constituent triplets has not been previously defined by a late environmental descriptor and the LID is outside of the bounds of the default environmental descriptor LIDs (LID > X'49'). Note that the default LIDs are identical to the DRDA types. The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZGDT

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

If the error occurs within the QRYDSC or SQLDTARD DDM objects, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DSCINVRM reply message will be returned to the AR.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35704

Explanation: DB2 has detected an error while processing the SQLDTAGRP late group descriptor, contained within either the DRDA SQLDTARD or SQLDTA late descriptors. The DDM object is either a QRYDSC, SQLDTARD or SQLDTA. The FDOCA geometry is incorrect. The local identifier (LID) of one of the constituent SQLDTAGRP SDAs has either not been previously defined by a late environmental descriptor, or is not a valid default LID. Note that the default LIDs are identical to the DRDA types. The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZGDT

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

If the error occurs within the QRYDSC or SQLDTARD DDM objects, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DSCINVRM reply message will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35705

Explanation: DB2 has detected an error while processing the SQLDTAGRP late group descriptor contained within either the DRDA SQLDTARD or SQLDTA late descriptors. The DDM object is either a QRYDSC, SQLDTARD reply data object, or the SQLDTA command data object. The FDOCA geometry is incorrect. All the OBJDSS carriers have been processed and the SQLDTAGRP has not been assembled. The SQLDTAGRP is incomplete and the descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZGDT

System Action: If the error occurs within the QRYDSC or SQLDTARD reply data object, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DSCINVRM reply message will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at this local DB2.

- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server.

- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server trace information or dumps.

00D35706

Explanation: DB2 has detected an error while processing the SQLDTAGRP late group descriptor, contained within the DRDA SQLDTARD or SQLDTA late descriptors. The DDM object is either an SQLDTARD or SQLDTA and must be contained within a single OBJDSS. The descriptor, as defined by the length of the SQLDTARD or SQLDTA DDM objects, is incomplete and is therefore invalid.

This reason code is issued by the following CSECT: DSNLZGDT

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

If the error occurs within the SQLDTARD DDM object, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DSCINVRM reply message will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35707

Explanation: DB2 has detected an error while processing the SQLDTAGRP late group descriptor, contained within the DRDA SQLDTARD late descriptor. The DDM object is a QRYDSC spanning multiple query blocks and DDM Level 6b DSSs. One or more of the containing level 6b DSSs is other than an object (OBJ) DSS. The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZGDT

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

the application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35708

Explanation: DB2 has detected an error while processing the SQLDTAGRP late group descriptor, contained within the DRDA SQLDTARD late descriptor. The DDM object is a QRYDSC spanning multiple query blocks and DDM level object 6b DSSs. The code point of one or more of the containing DDM objects is other than QRYDSC (X'241B'). The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZGDT

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

00D35709 • 00D3570B

the application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35709

Explanation: DB2 has detected an error while processing the SQLDTAGRP late group descriptor contained within a QRYDSC DDM object. The FDOCA geometry is incorrect. The SQLDTAGRP length specification exceeds the size of the QRYDSC level 6b DSS carrier. The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZGDT

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at this local DB2.

- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server.

- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server trace information or dumps.

00D3570A

Explanation: DB2 has detected an error while processing the SQLDTAGRP late group descriptor, contained within either the DRDA SQLDTARD or SQLDTA late descriptors. The DDM object is one of the following: QRYDSC, SQLDTARD or SQLDTA. The length override value in one of the constituent SQLDTAGRP SDAs is a placeholder length value, but an allowable placeholder length was not received. This is invalid.

This reason code is issued by the following CSECT: DSNLZGDT

System Action: An alert is generated and message DSNL032I is written to the console if the error is detected while parsing a command or message DSNL031I is written to the console if the error is detected while parsing a command reply. Refer to the description of this message for further information.

If the error occurs within a QRYDSC or SQLDTARD DDM object, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DCINVRM reply message will be returned to the remote DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a DB2 for MVS system, at the DB2 DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83. For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D3570B

Explanation: DB2 has detected an error while processing the SQLDTAGRP late group descriptor, contained within the DRDA SQLDTA late descriptor. The DDM object is the OUTOVR object. A non-zero local identifier (LID) was received as an output override descriptor, but the LID value was not one of the values allowed for the current DRDA level (DRDA Level 4). This is invalid.

This reason code is issued by the following CSECT:
DSNLZGDT

System Action: An alert is generated and message DSNL032I is written to the console if the error is detected while parsing a command. Refer to the description of this message for further information.

A DSCINVRM reply message will be returned to the remote DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a DB2 for MVS system, at the DB2 DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83. For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35801

Explanation: DB2 has detected an error while processing late environmental descriptors which precede the SQLDTAGRP late group descriptor, contained within either the SQLDTARD or SQLDTA late descriptors. The DDM object is a QRYDSC, SQLDTARD or SQLDTA. The FDOCA geometry is incorrect. The late environmental descriptor meta data definition does not specify a valid DRDA type. The SDA and the entire descriptor are invalid.

This reason code is issued by the following CSECT:
DSNLZLEP

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

If the error occurs within the QRYDSC or SQLDTARD DDM objects, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DSCINVRM reply message will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace

record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35802

Explanation: DB2 has detected an error while processing late environmental descriptors which precede the SQLDTAGRP late group descriptor contained within either the SQLDTARD or SQLDTA late descriptors. The DDM object is either a QRYDSC, SQLDTARD reply data object, or an SQLDTA command data object. The FDOCA geometry is incorrect. The late environmental descriptor meta data definition (MDD) either specifies a local identifier (LID) of 0 or defines a nonrelational database application class (other than X'05') or the meta data reference type is other than X'01'. The MDD and the entire descriptor are invalid.

This reason code is issued by the following CSECT:
DSNLZLEP

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

If the error occurs within the QRYDSC or SQLDTARD DDM objects, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DSCINVRM reply message will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35803

Explanation: DB2 has detected an error while processing late environmental descriptors which precede the SQLDTAGRP late group descriptor,

00D35804 • 00D35805

contained within either the SQLDTARD or SQLDTA late descriptors. The DDM object is either a QRYDSC, SQLDTARD or SQLDTA. The FDOCA geometry is incorrect. The late environmental descriptor meta data definition (MDD) is valid, however, the descriptor following the MDD is either not an SDA or is an SDA with a length other than 12 (X'0C'). The SDA and the entire descriptor are invalid.

This reason code is issued by the following CSECT: DSNLZLEP

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

If the error occurs within the QRYDSC or SQLDTARD DDM objects, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DSCINVRM reply message will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35804

Explanation: DB2 has detected an error while processing late environmental descriptors which precede the SQLDTAGRP late group descriptor, contained within either the SQLDTARD or SQLDTA late descriptors. The DDM object is either a QRYDSC, SQLDTARD or SQLDTA. The FDOCA geometry is incorrect. The late environmental descriptor meta data definition (MDD) is valid, however, the SDA immediately following the MDD is overriding a DRDA type not supported by DRDA. The SDA and the entire descriptor are invalid.

This reason code is issued by the following CSECT: DSNLZLEP

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

If the error occurs within the QRYDSC or SQLDTARD DDM objects, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within

the DDM SQLDTA object, a DSCINVRM reply message will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35805

Explanation: DB2 has detected an error while processing late environmental descriptors which precede the SQLDTAGRP late group descriptor contained within either the SQLDTARD or SQLDTA late descriptors. The DDM object is a QRYDSC, SQLDTARD, or an SQLDTA data object. The FDOCA geometry is incorrect. The size of the late environmental descriptors exceeds the size of the DDM level 6b DSS carrier. The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZLEP

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If the error occurs within a QRYDSC or SQLDTARD replay data object (SQLDTARD late descriptor), the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within an SQLDTA command data object (SQLDTA late descriptor), a DSCINVRM reply message will be returned to the local DB2.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at this local DB2.

- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server.

- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server trace information or dumps.

00D35806

Explanation: DB2 has detected an error while processing late environmental descriptors which precede the SQLDTAGRP late group descriptor, contained within either the SQLDTARD or SQLDTA late descriptors. The DDM object is either an SQLDTARD or SQLDTA, each of which may not span DDM level 6b object (OBJ) DSSs. The containing level 6b OBJDSS contains only late environmental descriptors and neither groups or rows are defined. The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZLEP

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

If the error occurs within the QRYDSC or SQLDTARD DDM objects, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DSCINVRM reply message will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35807

Explanation: DB2 has detected an error while processing late environmental descriptors which precede the SQLDTAGRP late group descriptor, contained within the SQLDTARD late descriptor. The DDM object is a QRYDSC which spans multiple query blocks. One or more of the containing level 6b DSSs is (are) other than an object (OBJ) DSS. The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZLEP

System Action: An alert is generated and message

DSNL0311 is written to the console. Refer to the description of this message for further information.

If the error occurs within the QRYDSC or SQLDTARD DDM objects, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DSCINVRM reply message will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35808

Explanation: DB2 has detected an error while processing late environmental descriptors which precede the SQLDTAGRP late group descriptor, contained within the SQLDTARD late descriptor. The DDM object is a QRYDSC which spans multiple query blocks. One or more of the code points of the DDM objects carrying the descriptor is (are) other than QRYDSC (X'241B'). The descriptor is invalid.

This reason code is issued by the following CSECT: DSNLZLEP

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

If the error occurs within the QRYDSC or SQLDTARD DDM objects, the application will receive SQLCODE -30000 and SQLSTATE 58008. If the error occurs within the DDM SQLDTA object, a DSCINVRM reply message will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At this local DB2, collect the following diagnostic items

00D35809 • 00D35902

listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35809

Explanation: DB2 has detected an error while processing late environmental descriptors which precede the SQLDTAGRP late group descriptor contained within the SQLDTARD late descriptor. This late descriptor is within a QRYDSC which spans one or more query blocks. The QRYDSC contains only late environmental descriptors and is, therefore, incomplete.

This reason code is issued by the following CSECT: DSNLZLEP

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at this local DB2.

- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server.

- Relevant error and system logs spanning the time of the failure.
- Any relevant remote server trace information or dumps.

00D35901

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data received from a local DB2. A reply DSS (RPYDSS) has been received from the local DB2. This is invalid.

This reason code is issued by the following CSECT: DSNLZSPA

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35902

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data received from a local DB2. The first level 6b DSS received is an object DSS. The DDM command carried in a level 6b request DSS (RQSDSS) must be the first level 6b DSS received.

This reason code is issued by the following CSECT: DSNLZSPA

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35903

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data received from a local DB2. The first level 6b DSS received is neither a request (RQS) DSS, Object (OBJ) DSS nor Reply (RPY) DSS and is invalid.

This reason code is issued by the following CSECT:
DSNLZSPA

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35904

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data received from a local DB2. The DDM command, specified by the code point contained within the level 6b RQSDSS, is invalid or not supported by DDM Level 3.

This reason code is issued by the following CSECT:
DSNLZSPA

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (CMDNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35905

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data received from a local DB2. The first DDM command received on this conversation, while a valid DDM Level 3 command, is other than EXCSAT. The first command must be EXCSAT.

This reason code is issued by the following CSECT:
DSNLZSPA

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35906

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data received from a local DB2. The EXCSAT command has been successfully processed but the current DDM command, while supported by DDM Level 3 and DB2, has been sent prior to ACCRDB. The only valid command prior to ACCRDB is another EXCSAT command.

This reason code is issued by the following CSECT:
DSNLZSPA

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (RDBNACRM) will be returned to the local DB2.

00D35907 • 00D35909

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35907

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data received from an local DB2. the ACCRDB command has been successfully processed and the current command is another ACCRDB instance. This is invalid.

This reason code is issued by the following CSECT: DSNLZSPA

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (RDBACCRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35908

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data received from an local DB2. The state of the DB2 remote server is in 'BIND processing' and the current DDM command is other than BNDSQLSTT, ENDBND, RDBCMM or RDBRLLBCK.

This reason code is issued by the following CSECT: DSNLZSPA

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PKGBPARM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35909

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data received from an local DB2. The DDM command has been successfully processed, however, one or more of the level 6b DSSs are other than object (OBJ) DSSs. The only valid level 6b DSS chain is a single RQS DSS, followed by one or more OBJ DSSs.

This reason code is issued by the following CSECT: DSNLZSPA

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic

items listed in Appendix B, “Problem determination,” on page 1353: 1, 49.

00D3590A

Explanation: DB2 has detected an error while parsing DDM command data received from a local DB2. The DDM command data object, as defined by the DDM code point, is either invalid or not valid for this command, as specified by DDM level 3.

This reason code is issued by the following CSECT:
DSNLZSPA

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (OBJNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this DB2 local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 1, 49.

00D3590B

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data received from a local DB2. One or more DDM command data objects, defined as required by DDM Level 3, were not received with the DDM command.

This reason code is issued by the following CSECT:
DSNLZSPA

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace

record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 1, 49.

00D3590C

Explanation: DB2 has detected an error while parsing DDM command data received from a local DB2. The DDM object is a TYPDEFNAM, signaling a change in machine representation from the local DB2, however, the length, as specified by DDM level 3, is incorrect.

This reason code is issued by the following CSECT:
DSNLZSPA

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 1, 49.

00D3590D

Explanation: DB2 has detected an error while parsing a DDM command data object received from a local DB2. The DDM object is a TYPDEFNAM, signaling a change in machine representation from the local DB2, however, the value of this DDM scalar is other than QTDSQL370, QTDSQLX86 or QTDSQL400. These are the only valid machine representations supported by DRDA.

This reason code is issued by the following CSECT:
DSNLZSPA

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the

00D3590E • 00D35910

description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D3590E

Explanation: DB2 has detected an error while parsing a DDM command data object received from a local DB2. The DDM object is a TYPDEFOVR, signaling a change in CCSIDs from the local DB2. This is a DDM collection consisting of three DDM scalars: CCSIDSBC, CCSIDMBC, and CCSIDDBC. The length of one of the constituent scalars is incorrect.

This reason code is issued by the following CSECT: DSNLZSPA

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D3590F

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data received from a local DB2. The DDM object is a TYPDEFOVR, signaling a change in CCSIDs from the local DB2. This is a DDM collection consisting of three DDM scalars: CCSIDSBC, CCSIDMBC, and CCSIDDBC. The TYPDEFOVR contains multiple instances of the CCSIDSBC scalar. This is invalid.

This reason code is issued by the following CSECT: DSNLZSPA

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35910

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data received from a local DB2. The DDM object is a TYPDEFOVR, signaling a change in CCSIDs from the local DB2. This is a DDM collection consisting of three DDM scalars: CCSIDSBC, CCSIDMBC, and CCSIDDBC. The TYPDEFOVR contains multiple instances of the CCSIDMBC scalar. This is invalid.

This reason code is issued by the following CSECT: DSNLZSPA

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide*

and Reference for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35911

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data received from a local DB2. The DDM object is a TYPDEFOVR, signaling a change in CCSIDs from the local DB2. This is a DDM collection consisting of three DDM scalars: CCSIDSBC, CCSIDMBC, and CCSIDDBC. The TYPDEFOVR contains multiple instances of the CCSIDDBC scalar. This is invalid.

This reason code is issued by the following CSECT: DSNLZSPA

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35912

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data received from a local DB2. The DDM object is a TYPDEFOVR, signaling a change in CCSIDs from the local DB2. This is a DDM collection consisting of three DDM scalars: CCSIDSBC, CCSIDMBC, and CCSIDDBC. The TYPDEFOVR length exceeds the sums of the lengths of

the constituent scalars. This is invalid.

This reason code is issued by the following CSECT: DSNLZSPA

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35913

Explanation: DB2 has detected an error while parsing a DDM command data object received from a local DB2. The DDM object is TYPDEFOVR, signaling a CCSID change from the local DB2. This is a collection consisting of CCSIDSBC, CCSIDMBC, and CCSIDDBC. The TYPDEFOVR contains an object other than CCSIDSBC, CCSIDDBC, or CCSIDDBC. This is invalid.

This reason code is issued by the following CSECT: DSNLZSPA

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at this local DB2.

- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

00D35914 • 00D35919

Collect the following diagnostic items at the remote server.

- Relevant error and system logs spanning the time of the failure.
- Any relevant AS trace information or dumps.

00D35914

Explanation: DB2 detected an error while parsing a DDM command received from the application requester (AR). The minimum level attribute of the DDM command received from the AR, (that is, the level of DDM required to support the command) exceeds the DDM level specified by the AR during CONNECT processing.

This reason code is issued by the following CSECT: DSNLZSPA

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) is returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Analyze the statistics class 4 trace record identified by the IFCID sequence number included in the DSNL032I message.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35915

Explanation: DB2 detected an error while parsing a DDM command data object received from the application requester (AR). The minimum level attribute of the DDM command data object received from the AR (that is, the level of DDM required to support the object) exceeds the DDM level specified by the AR during CONNECT processing.

This reason code is issued by the following CSECT: DSNLZSPA

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) is returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Analyze the statistics class 4 trace record identified by the IFCID sequence number included in the DSNL032I message.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35918

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. The DDM command, specified by the code point contained within the level 6b RQSDSS, is invalid or not supported by DDM Level 3.

This reason code is issued by the following CSECT: DSNLZSPA.

System Action: A DDM reply message (CMDNSPRM) is returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35919

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. The negotiated security manager level is greater than or equal to 5, and the required ACCSEC and SECCHK commands were not received before the ACCRDB command.

This reason code is issued by the following CSECT: DSNLZSPA.

System Action: The conversation is terminated, and message DSNL030I is issued. Refer to the description of this message for further information.

A DDM reply message (MGRDEPRM) is returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D3591A

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. The negotiated security manager level is less than 5, and an ACCSEC command was received.

This reason code is issued by the following CSECT: DSNLZSPA.

System Action: A DDM reply message (CMDNSPRM) is returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D3591B

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. An ACCSEC command was received when an ACCSEC command had already been executed successfully.

This reason code is issued by the following CSECT: DSNLZSPA.

System Action: The conversation is terminated, and

message DSNL030I is issued. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) is returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D3591C

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. The negotiated security manager level is less than 5, and a SECCHK command was received.

This reason code is issued by the following CSECT: DSNLZSPA.

System Action: A DDM reply message (CMDNSPRM) is returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D3591D

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. A SECCHK command was received out of order, which means either an ACCSEC command has not executed successfully, or a SECCHK command has already been processed.

00D3591E • 00D35A02

This reason code is issued by the following CSECT:
DSNLZSPA.

System Action: The conversation is terminated, and message DSNL030I is issued. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) is returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D3591E

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. An ACCSEC or SECCHK command was sent after an ACCRDB was successfully processed.

This reason code is issued by the following CSECT:
DSNLZSPA.

System Action: The conversation is terminated, and message DSNL030I is issued. Refer to the description of this message for further information.

A DDM reply message (PRCCNVRM) is returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35A01

Explanation: DB2 has detected an error while parsing a DDM command data object received from a local DB2. The DDM object is either an SQLSTT, SQLOBJNAM or SQLSTTVRB. These objects are described by early group descriptors, each of which contains both SBCS and mixed SDAs describing character data. In all cases, the instantiation of the SBCS and mixed elements are mutually exclusive, i.e. if the SBCS element is sent, then the mixed must not be sent and conversely. The instantiation of both the SBCS and mixed data SDAs has been sent. This is invalid.

This reason code is issued by the following CSECT:
DSNLZSMT

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (DTAMCHRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35A02

Explanation: DB2 has detected an error while parsing a DDM command data object received from a local DB2. The DDM object is either an SQLSTT, SQLOBJNAM, or SQLSTTVRB. These objects are described by early group descriptors, each of which contains both SBCS and mixed SDAs describing character data. In all cases, the instantiation of the SBCS and mixed elements are mutually exclusive, i.e. if the SBCS element is sent, then the mixed must not be sent and conversely. Further, either the SBCS or mixed (not both) must be instantiated. The data retrieved from the object instantiates neither the SBCS nor the mixed SDA. This is invalid.

This reason code is issued by the following CSECT:
DSNLZSMT

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35B01

Explanation: DB2 has detected an error while parsing an SQLDTA command data object received from a local DB2. The length of the SQLDTA exceeds 32KB, however, the DDM extended length field is invalid.

This reason code is issued by the following CSECT: DSNLZSDT

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35B02

Explanation: DB2 has detected an error while parsing an SQLDTA command data object received from a local DB2. The SQLDTA is a DDM collection consisting of the FDODSC and FODOTA scalars. The first scalar within

the SQLDTA is other than the FDODSC scalar. This is invalid.

This reason code is issued by the following CSECT: DSNLZSDT

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35B03

Explanation: DB2 has detected an error while parsing an SQLDTA command data object received from a local DB2. The SQLDTA is a DDM collection consisting of the FDODSC and FODOTA scalars. The length of the FDODSC scalar exceeds 32KB, however, the format of the DDM extended length is invalid.

This reason code is issued by the following CSECT: DSNLZSDT

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

00D35B04 • 00D35B07

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35B04

Explanation: DB2 has detected an error while parsing an SQLDTA command data object received from a local DB2. The SQLDTA FDOCA descriptor, contained in the FDODSC scalar, includes late environmental descriptors, however, the SQLDTA meta data definition (MDD) is either invalid or has not been included within the SQLDTA descriptor. The descriptor is invalid.

This reason code is issued by the following CSECT:
DSNLZSDT

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (DSCINVRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35B05

Explanation: DB2 has detected an error while parsing an SQLDTA command data object received from a local DB2. The SQLDTA FDOCA descriptor geometry is incorrect. Either the SQLDTA triplet length is incorrect or the SQLDTA triplet type is other than an row layout (RLO). The descriptor is invalid.

This reason code is issued by the following CSECT:
DSNLZSDT

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (DSCINVRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide*

and *Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35B06

Explanation: DB2 has detected an error while parsing an SQLDTA command data object received from a local DB2. The SQLDTA FDOCA descriptor geometry is incorrect. The SQLDTA RLO triplet either specifies a local identifier (LID) which is different than that defined in the previously processed SQLDTAGRP late group descriptor, or specifies a nonzero number of elements or a repetition factor other than 1. The descriptor is invalid.

This reason code is issued by the following CSECT:
DSNLZSDT

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (DSCINVRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35B07

Explanation: DB2 has detected an error while parsing an SQLDTA command data object received from a local DB2. The SQLDTA FDOCA descriptor, contained within the FDODSC scalar, has been validated, however, the FDOTA scalar, containing the host variable data, is not included within the SQLDTA DDM object. This is invalid.

This reason code is issued by the following CSECT:
DSNLZSDT

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35B08

Explanation: DB2 has detected an error while parsing an SQLDTA command data object received from a local DB2. The SQLDTA FDOCA descriptor, contained within the FDODSC scalar, has been validated. The length of the FDOTA scalar, containing the host variable data, exceeds 32KB, however, the format of the DDM extended length field is invalid.

This reason code is issued by the following CSECT:
DSNLZSDT

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem

determination," on page 1353: 1, 49.

00D35C01

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. An invalid instance has been received as a parameter on a BGNBND command.

This reason code is issued by the following CSECT:
DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35C02

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. An invalid instance has been received as a parameter on a BNDSQLSTT command.

This reason code is issued by the following CSECT:
DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number

00D35C03 • 00D35C06

enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35C03

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. An invalid instance has been received as a parameter on a DRPPKG command.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35C04

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. An invalid instance has been received as a parameter on an ENDBND command.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35C05

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. An invalid instance has been received as a parameter on a REBIND command.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35C06

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. One or more instance variables, defined by DDM Level 3 as required parameters for this DDM command, were not received.

This reason code is issued by the following CSECT:
DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35C07

Explanation: DB2 has detected an error while parsing a DDM command or DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command data received from a local DB2. The DDM command contains an instance variable which is not defined within DDM level 3.0. The instance variable (parameter) is invalid.

This reason code is issued by the following CSECT:
DSNLZSBD

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at this DB2 remote server.

- Statistics Class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server.

- Relevant error and system logs spanning the time of the failure.
- Any relevant AS trace information or dumps.

00D35C08

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. Multiple occurrences of a DDM instance variable, defined by DDM Level 3 as nonrepeatable, have been processed as parameters on this DDM command.

This reason code is issued by the following CSECT:
DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35C09

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The value of the DDM enumerated scalar, BNDCHKEXS, is invalid.

This reason code is issued by the following CSECT:
DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an

00D35C0A • 00D35C0C

error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35C0A

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The value of the DDM enumerated scalar, BNDCRTCTL, is invalid.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35C0B

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The value of the DDM enumerated scalar, BNDEXPOPT, is invalid.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message

DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35C0C

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The value of the DDM enumerated scalar, BNDSTTASM, is invalid.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35C0D

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The value of the DDM enumerated scalar, DECPRC, is invalid.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35C0E

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. Bytes 9 through 18 of the DDM scalar, DFTRDBCOL are other than blank. While DDM defines the length of DFTRDBCOL to be 18 bytes, DB2 supports only 8-byte collection identifiers.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number

enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35C0F

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The value of the DDM enumerated scalar, PKGATHOPT, is invalid.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35C10

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The length of the DDM scalar PKGDFTCC is invalid.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

00D35C11 • 00D35C13

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35C11

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The DDM PKGDFTCC collection consists of three DDM scalars: CCSIDSBC, CCSIDMBC, and CCSIDDBC. The PKGDFTCC collection contains multiple instances of the CCSIDSBC scalar. This is invalid.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35C12

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The DDM PKGDFTCC collection consists of three DDM scalars: CCSIDSBC, CCSIDMBC, and CCSIDDBC. The PKGDFTCC collection contains multiple instances of the

CCSIDDBC scalar. This is invalid.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35C13

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The DDM PKGDFTCC collection consists of three DDM scalars: CCSIDSBC, CCSIDMBC, and CCSIDDBC. The PKGDFTCC collection contains multiple instances of the CCSIDMBC scalar. This is invalid.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 1, 49.

00D35C14

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The DDM PKGDFTCC collection consists of three DDM scalars: CCSIDSBC, CCSIDMBC, and CCSIDDBC. The PKGDFTCC collection contains an invalid DDM object.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 1, 49.

00D35C15

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The value of the DDM enumerated scalar, PKGDFTCST, is invalid.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 1, 49.

00D35C16

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The value of the DDM enumerated scalar, PKGISOLVL, is invalid.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 1, 49.

00D35C17

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The DDM object PKGNAM is a mapped scalar containing RDBNAM, RDBCOLID and PKGID. Bytes 17 and 18 of the DDM scalar, RDBNAM, are other than blank. While DDM defines the length of RDBNAM to be 18 bytes, DB2 supports only a 16 byte RDBNAM.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message

00D35C18 • 00D35C1A

DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35C18

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The DDM object PKGNAM is a mapped scalar containing RDBNAM, RDBCOLID and PKGID. Bytes 9 through 18 of the DDM scalar, PKGID, are other than blank. While DDM defines the length of PKGID to be 18 bytes, DB2 supports only 8 byte package identifiers.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35C19

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The DDM object PKGNAMCT is a mapped scalar containing RDBNAM, RDBCOLID, PKGID and PKGCNSTKN. Bytes 17 and 18 of the DDM scalar, RDBNAM, are other than blank. While DDM defines the length of RDBNAM to be 18 bytes, DB2 supports only a 16 byte RDBNAM.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35C1A

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The DDM object PKGNAMCT is a mapped scalar containing RDBNAM, RDBCOLID, PKGID and PKGCNSTKN. Bytes 9 through 18 of the DDM scalar, PKGID, are other than blank. While DDM defines the length of PKGID to be 18 bytes, DB2 supports only 8 byte package identifiers.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an

error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 1, 49.

00D35C1B

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The value of the DDM enumerated scalar, PKGRPLOPT, is invalid.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 1, 49.

00D35C1C

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The value of the DDM enumerated scalar, QRYBLKCTL, is invalid.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message

DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 1, 49.

00D35C1D

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. Bytes 17 and 18 of the DDM scalar, RDBNAM, are other than blank. While DDM defines the length of RDBNAM to be 18 bytes, DB2 supports only a 16 byte RDBNAM.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, “Problem determination,” on page 1353: 1, 49.

00D35C1E

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The value of the RDBNAM scalar is other than the local DB2 RDBNAM.

This reason code is issued by the following CSECT:
DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (RDBNACRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35C1F

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The value of the DDM enumerated scalar, RDBLSOPT, is invalid.

This reason code is issued by the following CSECT:
DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35C20

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The value of the DDM enumerated scalar, STTDATFMT, is invalid.

This reason code is issued by the following CSECT:
DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35C21

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The value of the DDM enumerated scalar, STTDECDEL, is invalid.

This reason code is issued by the following CSECT:
DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an

error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35C22

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The value of the DDM enumerated scalar, STTSTRDEL, is invalid.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35C23

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from the local DB2. The value of the DDM enumerated scalar, STTTIMFMT, is invalid.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message

DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35C24

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The DDM TIMESTAMP scalar has been received as a command parameter from a database other than DB2. The TIMESTAMP scalar is private to DB2.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35C25

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The length of a DDM object is less than 4, the minimum length of any DDM object. This is invalid.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35C26

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The length of the DDM command is less than the sum of the lengths of the constituent instance variables appearing as parameters.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number

enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35C27

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The length of a DDM object exceeds the length defined by DDM Level 3. This is invalid.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35C28

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. The length of a DDM object is less than the length defined by DDM Level 3. This is invalid.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35C29

Explanation: DB2 has detected an error while parsing a DDM command or DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from a local DB2. A package related identifier or collection identifier is in violation of the SAA syntax. This is either the collection identifier (DFTRDBCOL) received on a BGNBND or REBIND command or the package identifier or collection identifier within the PKGNAM, PDGNAMCT, or PKGNAMCSN mapped scalars received on a BGNBND, BNDSQLSTT, ENDBND, or DRPPKG command.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at this local DB2.

- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server.

- Relevant error and system logs spanning the time of the failure.
- Any relevant AS trace information or dumps.

00D35C2A

Explanation: DB2 has detected an error while parsing a DDM BGNBND, BNDSQLSTT, ENDBND, DRPPKG, or REBIND command received from the local DB2. The value of MAXSCTNBR received on the ENDBND command is invalid. The value must be within the range 1 to 32767 inclusive.

This reason code is issued by the following CSECT: DSNLZSBD

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

Collect the following diagnostic items at this local DB2.

- Statistics class 4 trace record identified by the IFCID sequence number specified in message DSNL031I.

Collect the following diagnostic items at the remote server.

- Relevant error and system logs spanning the time of the failure.
- Any relevant AS trace information or dumps.

00D35C2B

Explanation: DB2 detected an error in a DDM BGNBND or REBIND command received from a DRDA requester. The value of the enumerated scalar, PKGATHRUL, is invalid.

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for more information.

A DDM reply message (VALNSPRM) is returned to the DRDA requester.

Operator Response: Notify the system programmer.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Analyze the statistics class 4 trace record identified by the IFCID sequence number given in message DSNL032I.

00D35D01 • 00D35D04

If the DRDA requester is a DB2, then DB2 diagnostic information is available. In that case, at the DB2 requester, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At the DB2 server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

This reason code is issued by the following CSECT:
DSNLZSBD

00D35D01

Explanation: DB2 has detected an error while parsing a DDM command received from a local DB2. An instance variable, defined as valid by DDM Level 3, but not supported by DB2, has been detected on one of the following DDM commands: CLSQRY, DSCRDBTBL, DSCSQLSTT, or EXCSQLIMM.

This reason code is issued by the following CSECT:
DSNLZSQL

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35D02

Explanation: DB2 has detected an error while parsing a DDM command received from a local DB2. An instance variable, defined as valid by DDM Level 3, but not supported by DB2, has been detected on a DDM CNTQRY command.

This reason code is issued by the following CSECT:
DSNLZSQL

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35D03

Explanation: DB2 has detected an error while parsing a DDM command received from a local DB2. The value of the DDM OUTEXP enumerated value instance variable, contained within a DDM EXCSQLSTT command, is other than FALSE (X'F0') or TRUE (X'F1').

This reason code is issued by the following CSECT:
DSNLZSQL

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35D04

Explanation: DB2 has detected an error while parsing a DDM command received from a local DB2. An instance variable, defined as valid by DDM Level 3, but not supported by DB2, has been detected on a DDM EXCSQLSTT command.

This reason code is issued by the following CSECT:
DSNLZSQL

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35D05

Explanation: DB2 has detected an error while parsing a DDM command received from a local DB2. The value of DDM QRYBLKCTL instance variable, received as a parameter on OPNQRY, is other than FRCSNGROW. The local DB2 may not specify LMTBLKPRC or SNGROWPRC as values of QRYBLKCTL as an OPNQRY parameter.

This reason code is issued by the following CSECT: DSNLZSQL

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35D07

Explanation: DB2 has detected an error while parsing a DDM command received from a local DB2. The value of the DDM RTNSQLDA enumerated value instance variable, contained within a DDM EXCSQLSTT command, is other than FALSE (X'F0') or TRUE (X'F1').

This reason code is issued by the following CSECT: DSNLZSQL

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35D08

Explanation: DB2 has detected an error while parsing a DDM command received from a local DB2. An instance variable, defined as valid by DDM Level 3, but not supported by DB2, has been detected on a DDM PRPSQLSTT command.

This reason code is issued by the following CSECT: DSNLZSQL

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

00D35D09 • 00D35D0C

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35D09

Explanation: DB2 has detected an error while parsing a DDM command received from a local DB2. An instance variable, defined as valid by DDM Level 3, but not supported by DB2, has been detected on a DDM RDBCMM or RDBRLBCK command.

This reason code is issued by the following CSECT:
DSNLZSQL

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35D0A

Explanation: DB2 has detected an error while parsing a DDM command received from a local DB2. The length of the DDM command is not equal to the sum of the lengths of the constituent instance variables.

This reason code is issued by the following CSECT:
DSNLZSQL

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide*

and *Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35D0B

Explanation: DB2 has detected an error while parsing a DDM command received from a local DB2. One or more instance variables, defined by DDM Level 3 as required for this command, were not received as command parameters.

This reason code is issued by the following CSECT:
DSNLZSQL

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35D0C

Explanation: DB2 has detected an error while parsing a DDM command received from a local DB2. An instance variable, defined by DDM Level 3 as not valid for this command, has been received as a command parameter.

This reason code is issued by the following CSECT:
DSNLZSQL

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the

description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35D0D

Explanation: DB2 has detected an error while parsing a DDM command received from a local DB2. Multiple occurrences of one or more instance variables, defined by DDM level 3 as nonrepeatable, have been received as parameters of this DDM command.

This reason code is issued by the following CSECT: DSNLZSQL

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35D0E

Explanation: DB2 has detected an error while parsing a DDM command received from a local DB2. Bytes 17 and 18 of the DDM scalar, RDBNAM, are other than blank. While DDM Level 3 defines the length of this scalar to be 18 bytes, DB2 supports only a 16 byte RDBNAM.

This reason code is issued by the following CSECT: DSNLZSQL

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35D0F

Explanation: DB2 has detected an error while parsing a DDM command received from a local DB2. The value of the RDBNAM instance variable is different than that received on the ACCRDB command.

This reason code is issued by the following CSECT: DSNLZSQL

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (RDBNACRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

00D35D10 • 00D35D12

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35D10

Explanation: DB2 has detected an error while parsing a DDM command received from a local DB2. The mapped scalar, PKGNAMCSN, is invalid. Bytes 17 and 18 of the DDM scalar RDBNAM, contained within PKGNAMCSN, are other than blank. While DDM Level 3 defines the length of this scalar to be 18 bytes, DB2 supports only a 16 byte RDBNAM.

This reason code is issued by the following CSECT: DSNLZSQL

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35D11

Explanation: DB2 has detected an error while parsing a DDM command received from a local DB2. The mapped scalar, PKGNAMCSN, is invalid. Either bytes 9 through 18 of the package name are other than blank or the section number is nonpositive. While the DDM scalar, PKGID, is defined by DDM level 3 to be 18 bytes in length, DB2 supports only 8 byte package names.

This reason code is issued by the following CSECT: DSNLZSQL

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35D12

Explanation: DB2 has detected an error while parsing a DDM command received from a local DB2. The value of the DDM scalar, QRYBLKSZ, contained as a parameter on a DDM OPNQRY, CNTQRY, or EXCSQLSTT command, is invalid. The value of QRYBLKSZ must be between 512 and 32767, inclusive.

This reason code is issued by the following CSECT: DSNLZSQL

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35D13

Explanation: DB2 has detected an error while parsing a DDM command received from a local DB2. a TIMESTAMP instance variable has been included as a command parameter received from a database other than DB2. This DDM scalar is private to DB2.

This reason code is issued by the following CSECT:
DSNLZSQL

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35D14

Explanation: DB2 has detected an error while parsing a DDM command received from a local DB2. The length of one or more instance variables received as command parameters is less than 4. This is the minimum length to support a DDM length and code point (llcp).

This reason code is issued by the following CSECT:
DSNLZSQL

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35D15

Explanation: DB2 has detected an error while parsing a DDM command received from a local DB2. The length of the DDM command is less than the sum of the lengths of all constituent instance variables.

This reason code is issued by the following CSECT:
DSNLZSQL

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35D16

Explanation: DB2 has detected an error while parsing a DDM command received from a local DB2. The length of an instance variable received as a command parameter exceeds the length of the instance variable, as specified by DDM Level 3.

This reason code is issued by the following CSECT:
DSNLZSQL

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide*

00D35D17 • 00D35D19

and *Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35D17

Explanation: DB2 has detected an error while parsing a DDM command received from a local DB2. The length of an instance variable received as a command parameter is less than the length of the instance variable, as specified by DDM Level 3.

This reason code is issued by the following CSECT:
DSNLZSQL

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this DB2 remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35D18

Explanation: DB2 has detected an error while parsing a DDM command received from a DRDA requester. The value of the DDM scalar, MAXRSLCNT, contained as a parameter on a DDM EXCSQLSTT command, is invalid. The value of MAXRSLCNT must be greater than or equal to -1.

This reason code is issued by the following CSECT:
DSNLZSQL

System Action: An alert is generated and message

DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the DRDA requester.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Analyze the statistics class 4 trace record identified by the IFCID sequence number given in message DSNL032I.

If the DRDA requester is DB2 UDB for z/OS, then DB2 diagnostic information is available. In this case, at the DB2 requester, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1.

At the DB2 server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 83.

00D35D19

Explanation: DB2, acting as a DRDA server, has detected an error while parsing a DDM DSCSQLSTT command received from a remote DRDA client. The value of the DDM enumerated scalar TYPSQLDA is invalid.

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the remote DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a DB2 UDB for OS/390, at the DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83. For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35D1A

Explanation: DB2, acting as a DRDA server, has detected an error while parsing a DDM DSCSQLSTT command received from a remote DRDA client. An instance variable, defined as valid by DDM Level 5, but not supported by DB2, has been detected on a DDM DSCSQLSTT command.

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the remote DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a DB2 UDB for OS/390 system, at the DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83. For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35D1B

Explanation: DB2, acting as a DRDA server, has detected an error while parsing a DDM OPNQRY or EXCSQLSTT command received from a remote DRDA client. The value of the DDM enumerated scalar OUTOVROPT is invalid.

This reason code is issued by the following CSECT: DSNLZSQL

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the remote DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number

enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a DB2 for MVS system, at the DB2 DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83. For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35D1C

Explanation: DB2, acting as a DRDA server, has detected an error while parsing a DDM CNTQRY command received from a remote DRDA client. The value of the DDM enumerated scalar RTNEXTDTA is invalid.

This reason code is issued by the following CSECT: DSNLZSQL

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (VALNSPRM) will be returned to the remote DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a DB2 for MVS system, at the DB2 DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83. For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E00

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. An invalid RDBNAM length was sent on an ACCSEC command.

This reason code is issued by the following CSECT: DSNLZSAS

System Action: If the length of the RDBNAM is greater than 18, then A DDM reply message

00D35E01 • 00D35E04

(SYNTAXRM) is returned to the DRDA client. If the data in characters 17-18 of the RDBNAME is non-blank, then a DDM reply message (VALNSPRM) is returned to the DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E01

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. An ACCSEC or SECCHK command was sent without one or more of its required DDM instance variables.

This reason code is issued by the following CSECT: DSNLZSAS.

System Action: A DDM reply message (SYNTAXRM) is returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E02

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. An ACCSEC or SECCHK command was sent with the RQSDSS length fields set improperly.

This reason code is issued by the following CSECT: DSNLZSAS.

System Action: A DDM reply message (SYNTAXRM) is returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E03

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. An invalid instance variable was sent on an ACCSEC command.

This reason code is issued by the following CSECT: DSNLZSAS.

System Action: A DDM reply message (SYNTAXRM) is returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E04

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. A duplicate instance variable was sent on an ACCSEC command.

This reason code is issued by the following CSECT: DSNLZSAS.

System Action: A DDM reply message (SYNTAXRM) is returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E05

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. An invalid SECMGRNM length was sent on an ACCSEC command. The SECMGRNM must be null.

This reason code is issued by the following CSECT: DSNLZSAS.

System Action: A DDM reply message (SYNTAXRM) is returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E06

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. An invalid SECMEC length was sent on an ACCSEC command. Only one SECMEC can be specified.

This reason code is issued by the following CSECT: DSNLZSAS.

System Action: A DDM reply message (SYNTAXRM) is returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an

error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E07

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. An invalid instance variable was sent on a SECCHK command.

This reason code is issued by the following CSECT: DSNLZSAS.

System Action: A DDM reply message (SYNTAXRM) is returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E08

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. A duplicate instance variable was sent on a SECCHK command.

This reason code is issued by the following CSECT: DSNLZSAS.

System Action: A DDM reply message (SYNTAXRM) is returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

00D35E09 • 00D35E0C

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E09

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. An invalid SECMGRNM length was sent on a SECCHK command. The SECMGRNM must be null.

This reason code is issued by the following CSECT: DSNLZSAS.

System Action: A DDM reply message (SYNTAXRM) is returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E0A

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. An invalid SECMEC length was sent on a SECCHK command. Only one SECMEC can be specified.

This reason code is issued by the following CSECT: DSNLZSAS.

System Action: A DDM reply message (SYNTAXRM) is returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace

record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E0B

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. An invalid RDBNAM length was sent on a SECCHK command.

This reason code is issued by the following CSECT: DSNLZSAS

System Action: A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E0C

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. An invalid USRID length was sent on a SECCHK command. DB2 userids cannot exceed 8 bytes.

This reason code is issued by the following CSECT: DSNLZSAS.

System Action: A DDM reply message (SYNTAXRM) is returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number

enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E0D

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. An invalid PASSWRD length was sent on a SECCHK command. DB2 passwords cannot exceed 8 bytes.

This reason code is issued by the following CSECT: DSNLZSAS.

System Action: A DDM reply message (SYNTAXRM) is returned to the local DB2.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E0E

Explanation: DB2 has detected an error in the DDM command data object or DDM reply data object received from the remote server as part of a DDM command or reply. The sum of the lengths of the constituent DDM objects within an OBJDSS is inconsistent with the length of the DSS carrier.

This reason code is issued by the following CSECT: DSNLZODM

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide*

and *Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E0F

Explanation: DB2 has detected an error in the DDM command data object or DDM reply data object received from the remote server as part of a DDM command or reply. The size of the object is greater than 32KB and the DDM level 6b extended length field is invalid.

This reason code is issued by the following CSECT: DSNLZODM

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E10

Explanation: DB2, acting as a DRDA client, has detected a floating point conversion error when converting a 4-byte or 8-byte floating point number in IEEE format to System/370 format.

This reason code is issued by the following CSECT: DSNLZFEX

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the

00D35E11 • 00D35E13

description of this message for further information.

Operator Response: Notify the system programmer.

User Response: Check the floating point value. Overflow can occur when the floating value is out of the System/370 floating point range. Refer to Appendix A of *DB2 Diagnosis Guide and Reference* for details of floating point range.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

00D35E11

Explanation: DB2, acting as a DRDA client, has detected a floating point conversion error when converting a nullable 4-byte or 8-byte floating point number in IEEE format to System/370 format.

This reason code is issued by the following CSECT: DSNLZFEX

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

User Response: Check the floating point value. Overflow can occur when the floating value is out of the System/370 floating point range. Refer to Appendix A of *DB2 SQL Reference* for details of floating point range.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

00D35E12

Explanation: DB2, acting as a DRDA client, has detected a floating point conversion error when converting a 4-byte floating point number in VAX format to System/370 format.

This reason code is issued by the following CSECT: DSNLZFEX

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

User Response: Check the floating point value. Overflow can occur when the floating value is out of the System/370 floating point range. Refer to Appendix A of *DB2 SQL Reference* for details of floating point range.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

00D35E13

Explanation: DB2, acting as a DRDA client, has detected a floating point conversion error when converting a nullable 4-byte floating point number in VAX format to System/370 format.

This reason code is issued by the following CSECT: DSNLZFEX

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

User Response: Check the floating point value. Overflow can occur when the floating value is out of the System/370 floating point range. Refer to Appendix A of *DB2 SQL Reference* for details of floating point range.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

00D35E14

Explanation: DB2, acting as a DRDA client, has detected a floating point conversion error when converting a 8-byte floating point number in VAX format to System/370 format.

This reason code is issued by the following CSECT: DSNLZFEX

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

User Response: Check the floating point value. Overflow can occur when the floating value is out of the System/370 floating point range. Refer to Appendix A of *DB2 SQL Reference* for details of floating point range.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

00D35E15

Explanation: DB2, acting as a DRDA client, has detected a floating point conversion error when converting a nullable 8-byte floating point number in VAX format to System/370 format.

This reason code is issued by the following CSECT: DSNLZFEX

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

User Response: Check the floating point value. Overflow can occur when the floating value is out of the System/370 floating point range. Refer to Appendix A of *DB2 SQL Reference* for details of floating point range.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At the DB2 for MVS DRDA client, collect the following

diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

00D35E16

Explanation: DB2, acting as a DRDA client, has detected a floating point conversion error when converting a 4-byte floating point number in 80x86 format to System/370 format.

This reason code is issued by the following CSECT: DSNLZFEX

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

User Response: Check the floating point value. Overflow can occur when the floating value is out of the System/370 floating point range. Refer to Appendix A of *DB2 SQL Reference* for details of floating point range.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

00D35E17

Explanation: DB2, acting as a DRDA client, has detected a floating point conversion error when converting a nullable 4-byte floating point number in 80x86 format to System/370 format.

This reason code is issued by the following CSECT: DSNLZFEX

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

User Response: Check the floating point value. Overflow can occur when the floating value is out of the System/370 floating point range. Refer to Appendix A of *DB2 SQL Reference* for details of floating point range.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number

00D35E18 • 00D35E1B

enumerated in the DSNL0311 message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

00D35E18

Explanation: DB2, acting as a DRDA client, has detected a floating point conversion error when converting a 8-byte floating point number in 80x86 format to System/370 format.

This reason code is issued by the following CSECT: DSNLZFEX

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

User Response: Check the floating point value. Overflow can occur when the floating value is out of the System/370 floating point range. Refer to Appendix A of *DB2 SQL Reference* for details of floating point range.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

00D35E19

Explanation: DB2, acting as a DRDA client, has detected a floating point conversion error when converting a nullable 8-byte floating point number in 80x86 format to System/370 format.

This reason code is issued by the following CSECT: DSNLZFEX

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

User Response: Check the floating point value. Overflow can occur when the floating value is out of the System/370 floating point range. Refer to Appendix A of *DB2 SQL Reference* for details of floating point range.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

00D35E1A

Explanation: DB2, acting as a DRDA client, has detected an error in a NUL-terminated string of length less than 257 bytes. The NUL-terminator cannot be located within the data field as defined by the DDM descriptor received.

This reason code is issued by the following CSECT: DSNLZFEX

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

00D35E1B

Explanation: DB2, acting as a DRDA client, has detected an error in a nullable NUL-terminated string of length less than 257 bytes. The NUL-terminator cannot be located within the data field as defined by the DDM descriptor received.

This reason code is issued by the following CSECT: DSNLZFEX

System Action: An alert is generated and message DSNL0311 is written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL0311 message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

00D35E1C

Explanation: DB2, acting as a DRDA client, has detected an error in a NUL-terminated string of length greater than 256 bytes. The NUL-terminator cannot be located within the data field as defined by the DDM descriptor received.

This reason code is issued by the following CSECT: DSNLZFEX

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

00D35E1D

Explanation: DB2, acting as a DRDA client, has detected an error in a nullable NUL-terminated string of length greater than 256 bytes. The NUL-terminator cannot be located within the data field as defined by the DDM descriptor received.

This reason code is issued by the following CSECT: DSNLZFEX

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

00D35E1E

Explanation: DB2, acting as a DRDA client, has detected an error in a numeric character data field (nullable or non-nullable). DB2 has detected a numeric conversion error, preventing the data from being converted to packed decimal format.

This reason code is issued by the following CSECT: DSNLZFEX

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

User Response: Check the numeric data.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

00D35E1F

Explanation: DB2, acting as a DRDA client, has detected an error in a variable length DBCS character data field whose length is given by a 2-byte length field and whose maximum length is less than 257 bytes. The value of the length field is either negative or greater than the maximum length specified by the DDM descriptor for the field.

This reason code is issued by the following CSECT: DSNLZFEX

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

00D35E20

Explanation: DB2, acting as a DRDA client, has detected an error in a nullable variable length DBCS character data field whose length is given by a 2-byte length field and whose maximum length is less than 257 bytes. The value of the length field is either negative or greater than the maximum length specified by the DDM descriptor for the field.

This reason code is issued by the following CSECT:
DSNLZFEX

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

00D35E21

Explanation: DB2, acting as a DRDA client, has detected an error in a variable length DBCS character data field whose length is given by a 2-byte length field and whose maximum length is greater than 256 bytes. The value of the length field is either negative or greater than the maximum length specified by the DDM descriptor for the field.

This reason code is issued by the following CSECT:
DSNLZFEX

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

00D35E22

Explanation: DB2, acting as a DRDA client, has detected an error in a nullable variable length DBCS character data field whose length is given by a 2-byte length field and whose maximum length is greater than 256 bytes. The value of the length field is either negative or greater than the maximum length specified by the DDM descriptor for the field.

This reason code is issued by the following CSECT:
DSNLZFEX

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

00D35E23

Explanation: DB2, acting as a DRDA client, has detected an error in a variable length DBCS character data field whose length is given by a 1-byte length field. The value of the length field is greater than the maximum length specified by the DDM descriptor for the field.

This reason code is issued by the following CSECT:
DSNLZFEX

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

00D35E24

Explanation: DB2, acting as a DRDA client, has detected an error in a nullable variable length DBCS character data field whose length is given by a 1-byte length field. The value of the length field is greater than the maximum length specified by the DDM descriptor for the field.

This reason code is issued by the following CSECT:
DSNLZFEX

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

00D35E25

Explanation: DB2, acting as a DRDA client, has detected an error in a variable length SBCS character data field whose length is given by a 2-byte length field and whose maximum length is less than 257 bytes. The value of the length field is either negative or greater than the maximum length specified by the DDM descriptor for the field.

This reason code is issued by the following CSECT:
DSNLZFEX

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

00D35E26

Explanation: DB2, acting as a DRDA client, has detected an error in a nullable variable length SBCS character data field whose length is given by a 2-byte length field and whose maximum length is less than 257 bytes. The value of the length field is either negative or greater than the maximum length specified by the DDM descriptor for the field.

This reason code is issued by the following CSECT:
DSNLZFEX

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

00D35E27

Explanation: DB2, acting as a DRDA client, has detected an error in a variable length SBCS character data field whose length is given by a 2-byte length field and whose maximum length is greater than 256 bytes. The value of the length field is either negative or greater than the maximum length specified by the DDM descriptor for the field.

This reason code is issued by the following CSECT:
DSNLZFEX

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

00D35E28

Explanation: DB2, acting as a DRDA client, has detected an error in a nullable variable length SBCS character data field whose length is given by a 2-byte length field and whose maximum length is greater than 256 bytes. The value of the length field is either negative or greater than the maximum length specified by the DDM descriptor for the field.

This reason code is issued by the following CSECT: DSNLZFEX

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

00D35E29

Explanation: DB2, acting as a DRDA client, has detected an error in a zoned decimal data field (nullable or non-nullable). DB2 has detected a numeric conversion error, preventing the data from being converted to packed decimal format.

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

Operator Response: Notify the system programmer.

User Response: Check the numeric data.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At the DB2 for MVS DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

00D35E2A

Explanation: DB2, acting as a DRDA server, has detected an error while parsing a DDM BNDOPT command data object received from a remote DRDA client. The BNDOPT collection contains multiple instances of the BNDOPTNM scalar. This is invalid.

This reason code is issued by the following CSECT: DSNLZOBO

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the remote DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a DB2 for MVS system, at the DB2 DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83. For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E2B

Explanation: DB2, acting as a DRDA server, has detected an error while parsing a DDM BNDOPT command data object received from a remote DRDA client. The BNDOPT collection contains multiple instances of the BNDOPTVL scalar. This is invalid.

This reason code is issued by the following CSECT: DSNLZOBO

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the remote DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace

record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a DB2 for MVS system, at the DB2 DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83. For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E2C

Explanation: DB2, acting as a DRDA server, has detected an error while parsing a DDM BNDOPT command data object received from a remote DRDA client. The BNDOPT collection contains an invalid instance.

This reason code is issued by the following CSECT: DSNLZOBO

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (PRMNSPRM) will be returned to the remote DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed

If the remote DRDA client is a DB2 for MVS system, at the DB2 DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83. For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E2D

Explanation: DB2, acting as a DRDA server, has detected an error while parsing a DDM BNDOPT command data object received from a remote DRDA client. A BNDOPTNM instance variable is required for this DDM collection but was not received.

This reason code is issued by the following CSECT: DSNLZOBO

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the remote DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a DB2 for MVS system, at the DB2 DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83. For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E2E

Explanation: DB2, acting as a DRDA server, has detected an error while parsing a DDM BNDOPT command data object received from a remote DRDA client. A BNDOPTVL instance variable is required for this DDM collection but was not received.

This reason code is issued by the following CSECT: DSNLZOBO

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the remote DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a DB2 for MVS system, at the DB2 DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83. For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

00D35E2F • 00D35E31

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E2F

Explanation: DB2, acting as a DRDA server, has detected an error while parsing a DDM BNDOPT command data object received from a remote DRDA client. The length of the DDM object is less than 4, the minimum length of any DDM object. This is invalid.

This reason code is issued by the following CSECT: DSNLZOBO

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the remote DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a DB2 for MVS system, at the DB2 DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83. For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E30

Explanation: DB2, acting as a DRDA server, has detected an error while parsing a DDM BNDOPT command data object received from a remote DRDA client. The length of the DDM command is less than the sum of the lengths of the constituent instance variables appearing as parameters.

This reason code is issued by the following CSECT: DSNLZOBO

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the remote DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an

error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed

If the remote DRDA client is a DB2 for MVS system, at the DB2 DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83. For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E31

Explanation: DB2, acting as a DRDA server, has detected an error while parsing a DDM BNDOPT command data object received from a remote DRDA client. The length of a DDM instance variable is less than the minimum length defined by DDM Level 3. This is invalid.

This reason code is issued by the following CSECT: DSNLZOBO

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the remote DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a DB2 for MVS system, at the DB2 DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83. For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E32

Explanation: DB2, acting as a DRDA server, has detected an error while parsing a DDM BNDOPT command data object received from a remote DRDA client. The length of a DDM instance variable is greater than the maximum length defined by DDM Level 3. This is invalid.

This reason code is issued by the following CSECT: DSNLZOBO

System Action: An alert is generated and message DSNL032I is written to the console. Refer to the description of this message for further information.

A DDM reply message (SYNTAXRM) will be returned to the remote DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

If the remote DRDA client is a DB2 for MVS system, at the DB2 DRDA client, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83. For other remote DRDA clients, refer to the client product documentation for diagnostic recommendations.

At the DB2 DRDA server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E33

Explanation: DB2 has detected an error in the DDM SQLRSLRD reply data object received from the remote server in response to a DDM EXCSQLSTT command that generated query result sets. The value of the single element of the SQLNUMGRP, SQLNUM, defining the total number of SQLRSROW occurrences within the SQLRSLRD array, is inconsistent with the number of result sets indicated in the RSLSETRM.

This reason code is issued by the following CSECT: DSNLZRRS.

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30020 and SQLSTATE 58009.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide*

and *Reference* for information on identifying and reporting the problem.

Problem Determination: Analyze the statistics class 4 trace record identified by the IFCID sequence number given in message DSNL031I.

At the DB2 requester, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 83.

If the DRDA server is DB2 UDB for z/OS, then DB2 diagnostic information is available. In this case, at the DB2 server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1.

00D35E34

Explanation: DB2 has detected an error in the DDM SQLRSLRD reply data object received from the remote server in response to a DDM EXCSQLSTT command that generated query result sets. Within one or more SQLRSROW occurrences, the lengths of SQLRSNAME_m and SQLRSNAME_s are both non-0, but only one of these lengths should be non-0. The data is invalid with regard to the Early SQLRSGRP group descriptor as defined by DRDA.

This reason code is issued by the following CSECT: DSNLZRRS.

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30020 and SQLSTATE 58009.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Analyze the statistics class 4 trace record identified by the IFCID sequence number given in message DSNL031I.

At the DB2 requester, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 83.

If the DRDA server is DB2 UDB for z/OS, then DB2 diagnostic information is available. In this case, at the DB2 server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1.

00D35E35

Explanation: DB2 has detected an error in the DDM SQLCINRD reply data object received from the remote server in response to a DDM EXCSQLSTT command that generated query result sets. The value of the single

00D35E36 • 00D35E38

element of the SQLNUMGRP, SQLNUM, defining the total number of SQLCIROW occurrences within the SQLCINRD array, is either negative or is inconsistent with the size of the SQLCINRD array.

This reason code is issued by the following CSECT: DSNLZRCL.

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30020 and SQLSTATE 58009.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Analyze the statistics class 4 trace record identified by the IFCID sequence number given in message DSNL031I.

At the DB2 requester, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 83.

If the DRDA server is DB2 UDB for z/OS, then DB2 diagnostic information is available. In this case, at the DB2 server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1.

00D35E36

Explanation: DB2 has detected an error in the DDM SQLCINRD reply data object received from the remote server in response to a DDM EXCSQLSTT command that generated query result sets. Within one or more SQLCIROW occurrences, the lengths of SQLCNAME_m and SQLCNAME_s are both non-0, but only one of these lengths should be non-0. The data is invalid with regard to the Early SQLCIGRP group descriptor as defined by DRDA.

This reason code is issued by the following CSECT: DSNLZRCL.

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30020 and SQLSTATE 58009.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Analyze the statistics class 4 trace record identified by the IFCID sequence number

given in message DSNL031I.

At the DB2 requester, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 83.

If the DRDA server is DB2 UDB for z/OS, then DB2 diagnostic information is available. In this case, at the DB2 server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1.

00D35E37

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. An invalid IPADDR length was sent on a SYNCLOG object.

This reason code is issued by the following CSECT: DSNLZPSL

System Action: A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E38

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. An invalid SNAADDR length was sent on a SYNCLOG object.

This reason code is issued by the following CSECT: DSNLZPSL

System Action: A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E39

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. An invalid RDBNAM length was sent on a SYNCLOG object.

This reason code is issued by the following CSECT: DSNLZPSL

System Action: A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E3A

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. An invalid LOGNAME length was sent on a SYNCLOG object.

This reason code is issued by the following CSECT: DSNLZPSL

System Action: A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E3B

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. An invalid LOGTSTMP length was sent on a SYNCLOG object.

This reason code is issued by the following CSECT: DSNLZPSL

System Action: A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E3C

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. An invalid instance variable was sent on a SYNCLOG object.

This reason code is issued by the following CSECT: DSNLZPSL

System Action: A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E3D

Explanation: DB2 has detected an error in the DDM command data object or DDM reply data object received from the remote server as part of a DDM command or reply. The DDM level 6b length field is invalid.

This reason code is issued by the following CSECT:
DSNLZPSL

System Action: An alert is generated and message DSNL031I is written to the console. Refer to the description of this message for further information.

The application will receive SQLCODE -30000 and SQLSTATE 58008.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL031I message should be analyzed.

At this local DB2, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E3E

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. An invalid instance variable was sent on a SYNCCTL command.

This reason code is issued by the following CSECT:
DSNLZSAS

System Action: A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic

items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E3F

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. A duplicate instance variable was sent on a SYNCCTL command.

This reason code is issued by the following CSECT:
DSNLZSAS

System Action: A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E40

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. An invalid SYNCTYPE length was sent on a SYNCCTL command.

This reason code is issued by the following CSECT:
DSNLZSAS

System Action: A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E41

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. An invalid RLSCONV length was sent on a SYNCCTL command.

This reason code is issued by the following CSECT:
DSNLZSAS

System Action: A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E42

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. An invalid UOWID length was sent on a SYNCCTL command.

This reason code is issued by the following CSECT:
DSNLZSAS

System Action: A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E43

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. An invalid instance variable was sent on a SYNCRSY command.

This reason code is issued by the following CSECT:
DSNLZSAS

System Action: A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E44

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. A duplicate instance variable was sent on a SYNCRSY command.

This reason code is issued by the following CSECT:
DSNLZSAS

System Action: A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E45

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. An invalid RSYNCTYP length was sent on a SYNCRSY command.

This reason code is issued by the following CSECT:
DSNLZSAS

System Action: A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E46

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. An invalid UOWID length was sent on a SYNCRSY command.

This reason code is issued by the following CSECT:
DSNLZSAS

System Action: A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E47

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. An invalid UOWSTATE length was sent on a SYNCRSY command.

This reason code is issued by the following CSECT:
DSNLZSAS

System Action: A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: The statistics class 4 trace record identified by the IFCID sequence number enumerated in the DSNL032I message should be analyzed.

At this local DB2, collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 83.

At this remote server, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 49.

00D35E48

Explanation: DB2 has detected an error while parsing a DDM command or DDM command data. An invalid FORGET length was sent on a SYNCCTL command.

This reason code is issued by the following CSECT:
DSNLZSAS

System Action: A DDM reply message (SYNTAXRM) is returned to the DRDA client.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.
