

**Messages and Codes
Volume 1**

**Messages and Codes
Volume 1**

Note

Before using this information and the product it supports, be sure to read the general information under "Notices" on page 1397.

First Edition (March 2004)

This edition applies to Version 8 of IBM DB2 Universal Database for z/OS (DB2 UDB for z/OS), product number 5625-DB2, and to any subsequent releases until otherwise indicated in new editions. Make sure you are using the correct edition for the level of the product.

Specific changes are indicated by a vertical bar to the left of a change. A vertical bar to the left of a figure caption indicates that the figure has changed. Editorial changes that have no technical significance are not noted.

Chapter 1. Introduction to this book and the DB2 library

This section contains specific information about this book and a general overview of the DB2 library.

Throughout this book, “DB2” means the program product DB2 Universal Database for z/OS (DB2 UDB for z/OS). Other DB2 products are given their complete names or abbreviations.

Important

In this version of DB2 UDB for z/OS, the DB2 Utilities Suite is available as an optional product. You must separately order and purchase a license to such utilities, and discussion of those utility functions in this publication is not intended to otherwise imply that you have a license to them. See Part 1 of *DB2 Utility Guide and Reference* for packaging details.

Who should read this book

This book, *DB2 Universal Database for z/OS Messages and Codes*, lists messages and codes issued by DB2, with explanations and suggested responses. This book is intended for users and system programmers who might encounter DB2 messages and codes.

How to use this material

This book consists of the following topics:

- Part 1, “Introduction,” on page 1 explains the different types of messages and codes that DB2 generates.
- Part 2, “SQL return codes,” on page 11 lists the SQL return codes.
- Part 3, “DB2 messages,” on page 157 lists the various DB2 messages.
- Part 4, “Section 4. DB2 Codes,” on page 773 lists the various DB2 codes.
- Part 5, “IRLM messages and codes,” on page 1307 lists the various IRLM messages and codes.
- Part 6, “SNA codes,” on page 1341 lists the SNA codes.
- Appendix A, “CICS Transaction Abend/Dump Code,” on page 1351 explains the CICS transaction abend/dump code (DSNC).
- Appendix B, “Problem determination,” on page 1353 lists the diagnostic items and resource types you can use to resolve problems.
- Appendix C, “SQLSTATE Values—Common Error Codes,” on page 1363 lists the error code SQLSTATE values. These values provide common return codes for common error conditions.
- Appendix D, “New, Changed, and Deleted Messages and Codes,” on page 1385 lists the new, changed, and deleted messages and codes.
- “Notices” on page 1397 lists contact information and legal notices about this product

The introduction provides general information about DB2 messages and codes. You will be referred to it from appropriate places in the documentation. However, it is recommended that you become familiar with this material ahead of time.

The SQL return codes are listed by numeric sequence. The DB2 messages are listed in order of their subcomponent identifier and further by their numeric identifier. The codes are listed by their hexadecimal ID and further by their numeric identifier. The IRLM messages and codes are listed by numeric sequence.

Message identifiers and CSECT names are used to identify messages. Unless the message is issued by a subcomponent operating outside the DB2 environment (such as the precompiler or attachment facilities), messages are preceded by a *subsystem recognition character* that is defined during system installation. The subsystem recognition character is not shown in the message texts in this book.

All DB2 message identifiers are eight to ten characters long. The first three characters are always DSN: it is the DB2 component prefix name. The fourth character is the *subcomponent identifier*: it identifies the subcomponent of DB2 that issued the message. Each subcomponent has an associated *hexadecimal identifier* (hex ID): it is the hexadecimal representation of the subcomponent identifier. The *numeric identifier* is three to five characters long and begins at the fifth character in the message. The numeric identifier is unique within the subcomponent. The last character of the message identifier is the *message type code*. For DB2 messages in general, the I type code is used. However, some older messages use other type codes. The type code does not necessarily reflect the action that you should take to remedy the situation. See the Response sections for a message to determine the required actions associated with that message. An optional field that can be found after the message number is the *subsystem identifier* or *subsystem recognition character*. An additional optional field follows the *subsystem identifier*: it is the *csect-name*. Message identifiers and CSECT names have the following format:

```
DSNB209I ! DSNB1CHK
```

where:

DSN is the DB2 subsystem prefix name.

B is the subcomponent identifier; in this example B identifies the DB2 buffer manager and the hexadecimal ID for this subcomponent is X'C2'.

209 is the numeric identifier.

I indicates that this message is for information only.

! is the subsystem recognition character; it is an optional field.

DSNB1CHK

is the csect name; it is an optional field.

The DB2 reason codes and subsystem termination reason codes are 4 bytes long. The first byte is always 00: it is the *high-order byte*. The second byte is the *hexadecimal identifier* (hex ID): it identifies the DB2 subcomponent. The last 2 bytes are the *numeric identifier*: it is unique within the subcomponent. The codes have the following format:

```
00E50041
```

where:

00 is the high-order byte.

E5 is the hexadecimal identifier; it identifies the DB2 agent services manager.

0041 is the numeric identifier.

Accompanying each message and code is the following information, when applicable:

Explanation: This section tells what the message or code means, why it occurred, and what caused it. To assist in diagnosing problems, the CSECTs that issued the message are also included. However, if the issuing CSECT is placed in the message text at run time, it is not included in the explanation.

System Action: This part tells what is happening as a result of the condition causing the message or code. If this information is not shown, no system action is taken.

User Response: If a response by the user is necessary, this section tells what the pertinent responses are and their effect. If this information is not shown, no user response is required.

Operator Response: If an operator response is necessary, this section tells what the pertinent

responses are and their effect. If this information is not shown, no operator response is required.

System Programmer Response: If a response by the system programmer is needed, this part tells what the pertinent responses are and their effect. If this information is not shown, no system programmer response is required.

Programmer Response: If a programmer response is necessary, this part tells what the pertinent responses are and their effect. If this information is not shown, no programmer response is required.

Problem Determination: This section lists the actions that can be performed to obtain adequate data for support personnel to diagnose the problem. If this information is not shown, no problem determination is required.

Message type codes

The last character of a message identifier is the *type code*. Four type codes are used, as shown in the following list:

A	Immediate action	Action is required immediately. The associated task does not continue until the requested action is taken.
D	Immediate decision	Decision or action is required immediately. The associated task does not continue until the requested decision is made or action is taken.
E	Eventual action	Action is required at some point; however, the associated task continues. All RC=8 error messages that are not host related (SOFT errors) have the E changed to a W in precompiler output when SQL(ALL) is in effect. All RC=8 errors (HARD errors) look the same as they have in the past.
I	Information only	No action is required.

DB2 message severity codes

Messages issued by the precompiler subcomponent of DB2, as well as some messages issued by the service controller and utility subcomponents of DB2, provide severity codes. The specific meanings of the severity codes differ slightly for each of the subcomponents. In general, the higher the severity level, the more significant the situation.

Severity codes for these subcomponents are described at the beginning of the individual subcomponent sections in Part 3, "DB2 messages," on page 157. They are also included in the individual messages, where appropriate.

DB2 abend completion codes (X'04E' and X'04F')

DB2 uses two system abend completion codes: X'04E' and X'04F'.

X'04E' and X'04F' identify:

- Internal errors encountered during DB2 operation
- Diagnostic information for problem determination

- Subsystem actions initiated by the DB2 subcomponent involved in the error

X'04E'

An X'04E' abend completion code indicates that DB2 detected an internal error and abended a DB2 internal task (TCB) or a user-connected task. Errors associated with an X'04E' abend completion code might be preceded by an MVS system code or by internal errors.

The diagnostic material generated by the X'04E' abend must be examined to determine the source of the error that actually resulted in a subsequent task or subsystem termination.

X'04F'

An X'04F' abend completion code indicates that DB2 detected a severe error and abended the entire DB2 subsystem. When an X'04F' is issued, DB2 determined that continued operation could result in the loss of data integrity. Errors associated with an X'04F' abend completion code might be preceded by an MVS system error or by one or more DB2 X'04E' abend completion codes.

Table 1 summarizes the diagnostic information and subsystem actions available to DB2 when these abend completion codes are issued. Some pieces of this information are not relevant to some error situations and will not help in problem diagnosis. In these cases, DB2 does not produce any diagnostic information that is unnecessary. The information that DB2 produces for a given error depends upon the specific problem. The MVS services that provide diagnostic information are discussed in “DB2 diagnostic information” on page 7

Table 1. Abend Completion Codes

	X'04E'	X'04F'
Explanation	<ul style="list-style-type: none"> • Error during DB2 normal operation 	<ul style="list-style-type: none"> • Severe error; continued operation may jeopardize data integrity
System action	<ul style="list-style-type: none"> • Internal DB2 task is abended • Connected user task is abended 	<ul style="list-style-type: none"> • The entire DB2 subsystem is abended • User task with an active DB2 connection may be abnormally terminated with an X'04F' • Possible MEMTERM (memory termination) of connected allied address space
Diagnostic information	<ul style="list-style-type: none"> • SVC dump • SYS1.LOGREC entries • VRA data entries 	<ul style="list-style-type: none"> • SYS1.LOGREC entries • VRA data entries
Associated reason codes	<ul style="list-style-type: none"> • DB2 abend reason code • Associated MVS system codes 	<ul style="list-style-type: none"> • Subsystem termination reason code • MVS system completion codes and X'04E' codes that precede the X'04F' abend
Location of accompanying codes	<ul style="list-style-type: none"> • SVC dump title • Message DSNW050I • Register 15 of SDWA section “General Purpose Registers at Time of Error” • SYS1.LOGREC entries • VRA data entries 	<ul style="list-style-type: none"> • SYS1.LOGREC entries • VRA data entries • Message DSNV086E, which is sent to MVS system operator

DB2 diagnostic information

DB2's functional recovery routines use MVS services to provide diagnostic information for assistance in problem determination.

The following MVS services provide diagnostic information:

- SVC dumps
The DB2 abend completion code X'04E' uses the MVS SDUMP service to create SVC dumps. The content and storage areas associated with these dumps vary depending on the specific error and the state of the DB2 subsystem at the time the error.
- SYS1.LOGREC entries
Entries are requested in the SYS1.LOGREC data set at the time of the error using the MVS SETRP service. The following are also recorded in SYS1.LOGREC:
 - Subsystem abnormal terminations
 - Secondary abends occurring in a recovery routine
 - Recording requests from recovery routines percolated to by the recovery termination manager.
- Variable recording area (VRA) data
Data entries are added to the VRA of the SDWA by using an MVS VRA defined key. VRA data includes a series of diagnostic data entries common to both DB2 abend completion codes. Additional information is provided by the invoking subcomponent recovery routine during initial error processing or recovery termination manager percolation.

MVS abends resulting from DB2 operation

During DB2 operation, an abend can occur with an MVS system completion code. If you receive an MVS abend during DB2 operation, refer to the appropriate MVS publication.

Using LookAt to obtain message explanations

LookAt is an online facility that displays explanations for most messages that you encounter, and for some system abends and codes.

You can use LookAt:

- From the Internet at:
www.ibm.com/eserver/zseries/zos/bkserv/lookat/
- From anywhere in z/OS where you can access a TSO/E command line (for example, a TSO/E prompt, ISPF, or z/OS UNIX System Services running OMVS). To use LookAt as a TSO/E command, LookAt must be installed on your host system. Obtain the LookAt code for TSO/E from a disk on your z/OS Collection (SK3T-4269) or from the LookAt ftp site:
[ftp.software.ibm.com/ps/products/ibmreader/tools/lookat/ZOS/](ftp://software.ibm.com/ps/products/ibmreader/tools/lookat/ZOS/)
- From your Palm VIIx personal data assistant (PDA). To use LookAt from your Palm VIIx PDA, LookAt must be installed on the PDA. Obtain the LookAt code from a disk on your z/OS Collection (SK3T-4269) or from the LookAt ftp site:
[ftp.software.ibm.com/ps/products/ibmreader/tools/lookat/PALM/](ftp://software.ibm.com/ps/products/ibmreader/tools/lookat/PALM/)

Terminology and citations

In this information, DB2 Universal Database™ for z/OS™ is referred to as "DB2 UDB for z/OS." In cases where the context makes the meaning clear, DB2 UDB for z/OS is referred to as "DB2®." When this information refers to titles of books in this library, a short title is used. (For example, "See *DB2 SQL Reference*" is a citation to *IBM® DB2 Universal Database for z/OS SQL Reference*.)

When referring to a DB2 product other than DB2 UDB for z/OS, this information uses the product's full name to avoid ambiguity.

The following terms are used as indicated:

DB2 Represents either the DB2 licensed program or a particular DB2 subsystem.

DB2 PM Refers to the DB2 Performance Monitor tool, which can be used on its own or as part of the DB2 Performance Expert for z/OS product.

C, C++, and C language Represent the C or C++ programming language.

CICS® Represents CICS Transaction Server for z/OS or CICS Transaction Server for OS/390®.

IMS™ Represents the IMS Database Manager or IMS Transaction Manager.

MVS™ Represents the MVS element of the z/OS operating system, which is equivalent to the Base Control Program (BCP) component of the z/OS operating system.

RACF® Represents the functions that are provided by the RACF component of the z/OS Security Server.

Accessibility

Accessibility features help a user who has a physical disability, such as restricted mobility or limited vision, to use software products. The major accessibility features in z/OS products, including DB2 UDB for z/OS, enable users to:

- Use assistive technologies such as screen reader and screen magnifier software
- Operate specific or equivalent features by using only a keyboard
- Customize display attributes such as color, contrast, and font size

Assistive technology products, such as screen readers, function with the DB2 UDB for z/OS user interfaces. Consult the documentation for the assistive technology products for specific information when you use assistive technology to access these interfaces.

Online documentation for Version 8 of DB2 UDB for z/OS is available in the DB2 Information Center, which is an accessible format when used with assistive technologies such as screen reader or screen magnifier software. The DB2 Information Center for z/OS solutions is available at the following Web site: <http://publib.boulder.ibm.com/infocenter/db2zhelp>.

How to send your comments

Your feedback helps IBM to provide quality information. Please send any comments that you have about this book or other DB2 UDB for z/OS documentation. You can use the following methods to provide comments:

- Send your comments by e-mail to db2pubs@vnet.ibm.com and include the name of the product, the version number of the product, and the number of the book. If you are commenting on specific text, please list the location of the text (for example, a chapter and section title, page number, or a help topic title).
- You can also send comments from the Web. Visit the library Web site at:

www.ibm.com/software/db2zos/library.html

This Web site has a feedback page that you can use to send comments.

- Print and fill out the reader comment form located at the back of this book. You can give the completed form to your local IBM branch office or IBM representative, or you can send it to the address printed on the reader comment form.

Summary of changes to this book

This edition adds and modifies messages and codes to support DB2 Version 8. It also incorporates technical corrections and changes made to previously published information. For specific information about new, changed and deleted messages and codes for Version 8, see Appendix D, “New, Changed, and Deleted Messages and Codes,” on page 1385.

Part 2. SQL return codes

Chapter 2. SQL return codes

The information in this chapter is General-use Programming Interface and Associated Guidance Information, as defined in “Notices” on page 1397.

Introduction

Structured Query Language (SQL) return codes, and the tokens referred to in the explanations, are returned in the SQL communication area (SQLCA).

The SQLCA is an area in the application program (defined by the application program) for the use of DB2. It is described in Appendix C of *DB2 SQL Reference*.

The SQL return code is returned in the SQLCODE field of the SQLCA. The tokens are returned in the SQLERRM field. If there are several tokens, they appear sequentially in SQLERRM in the order in which they appear in the message text. The tokens are separated by the character X'FF'.

A token appears in the message text in lowercase letters. When an SQL return code is returned through SPUFI, the tokens have been substituted into the message text and the text is displayed. The substitution of tokens into message text is performed by a DB2 module named DSNTIAR. This module can also be used by application programs. Refer to Part 2 of *DB2 Application Programming and SQL Guide* for more information about DSNTIAR.

Checking the execution of SQL statements

An application program containing executable SQL statements must either provide a structure named SQLCA or a stand-alone integer variable named SQLCODE (SQLCOD in FORTRAN). An SQLCA may be provided by using the INCLUDE SQLCA statement. INCLUDE SQLCA must not be used if a stand-alone SQLCODE is provided.

The SQLCA includes an integer variable named SQLCODE. The option of providing a stand-alone SQLCODE instead of an SQLCA allows for conformance with the ISO/ANSI SQL standard. The use of this option must be indicated to the precompiler.

SQLCODE

Regardless of whether the application program provides an SQLCA or a stand-alone variable, SQLCODE is set by DB2 after each SQL statement is executed. DB2 conforms to the ISO/ANSI SQL standard as follows:

- If SQLCODE = 0, execution was successful.
- If SQLCODE > 0, execution was successful with a warning.
- If SQLCODE < 0, execution was not successful.
- SQLCODE = 100, “no data” was found. For example, a FETCH statement returned no data because the cursor was positioned after the last row of the result table.

SQLSTATE

SQLSTATE is also set by DB2 after the execution of each SQL statement. Thus, application programs can check the execution of SQL statements by testing SQLSTATE instead of SQLCODE. SQLSTATE (SQLSTT in FORTRAN) is a 5-byte character string variable in the SQLCA.

SQLSTATE provides application programs with common codes for common error conditions (the values of SQLSTATE are product-specific only if the error or warning is product-specific). Furthermore, SQLSTATE is designed so that application programs can test for specific errors or classes of errors. The coding scheme is the same for all IBM relational database products. See Appendix C, “SQLSTATE Values—Common Error Codes,” on page 1363 for more information and a complete list of the possible values of SQLSTATE.

Successful execution SQL code

000 SUCCESSFUL EXECUTION

Explanation: Unqualified successful execution or successful execution with one or more warnings. If SQLWARN0 is blank, there are no warnings. If SQLWARN0 = W, at least one of the other warning indicators in the SQLCA has been set to indicate a warning condition. For example, SQLWARN1 is used to indicate that a value of a string column was truncated when assigned to a host variable. SQLWARNx fields are described in Appendix C of *DB2 SQL Reference*.

SQLSTATE: 00000 for unqualified successful execution

SQLSTATE: 01ddd for successful execution with warning 'ddd'.

+012 THE UNQUALIFIED COLUMN NAME *column-name* WAS INTERPRETED AS A CORRELATED REFERENCE

Explanation: The column name does not identify a column of a table or view in the FROM clause of the subquery. However, it does identify a column of a table or view in a FROM clause at a higher level in the statement.

System Action: The column name is interpreted as a correlated reference.

Programmer Response: If DB2's interpretation of the column name was not what you intended, rewrite the SQL statement and submit it again. If you intend the column name to refer to a table named at a higher level, we advise rewriting the statement anyway, using a table name or correlation name as a qualifier for the column name. The unqualified column name could be interpreted differently if you do a rebind after altering one of the tables to which you refer.

SQLSTATE: 01545

+098 A DYNAMIC SQL STATEMENT ENDS WITH A SEMICOLON.

Explanation: The statement string of a PREPARE or EXECUTE IMMEDIATE statement is a valid dynamic SQL statement, but it ends with a semicolon.

System Action: The semicolon and any subsequent text are ignored.

Programmer Response: Check that the semicolon is being used as a statement terminator.

SQLSTATE: 01568

+100 ROW NOT FOUND FOR FETCH, UPDATE OR DELETE, OR THE RESULT OF A QUERY IS AN EMPTY TABLE

Explanation: One of the following conditions occurred:

- No row met the search conditions specified in an UPDATE or DELETE statement.
- The result of a SELECT INTO statement was an empty table.
- A FETCH statement was executed when the cursor was positioned after the last row of the result table.
- The result of the subselect of an INSERT statement is empty.

When a SELECT statement is executed using SPUFI, this SQLCODE indicates normal completion.

System Action: No data was retrieved, updated, or deleted.

SQLSTATE: 02000

+110 SQL UPDATE TO A DATA CAPTURE TABLE NOT SIGNALLED TO ORIGINATING SUBSYSTEM

Explanation: DataPropagator (DPropNR) exit routine issued an SQL INSERT, UPDATE, or DELETE

statement to a table defined with DATA CAPTURE CHANGES. Since data capture is already in progress, notification is not sent back to the originating IMS subsystem.

System Action: DB2 changes the data and records the change in the log. DB2 does not notify DPropNR's exit routine of the change, because doing so might cause the same change to be made again.

SQLSTATE: 01561

+111 THE SUBPAGES OPTION IS NOT SUPPORTED FOR TYPE 2 INDEXES

Explanation: You cannot use the SUBPAGES option for type 2 indexes.

System Action: The option is ignored and processing continues.

Programmer Response: Remove the SUBPAGES option to get rid of the warning.

SQLSTATE: 01590

+117 THE NUMBER OF INSERT VALUES IS NOT THE SAME AS THE NUMBER OF OBJECT COLUMNS

Explanation: The number of insert values in the value list of the INSERT statement is not the same as the number of object columns specified.

System Action: A valid plan or package will be created if no errors are detected. The statement is bound dynamically on each execution of the statement.

Programmer Response: For better performance, rebind the plan or package after correcting the statement. To correct the statement, specify one and only one value for each of the specified object columns.

SQLSTATE: 01525

+162 TABLESPACE *database-name.tablespace-name* HAS BEEN PLACED IN CHECK PENDING

Explanation: The indicated table space is in check pending status because the ALTER TABLE statement was used to specify a referential constraint or a check constraint (while special register CURRENT RULES = 'DB2') on a populated table. The table space is not generally available until the check pending status is removed from the table space.

System Action: The table space was placed in check pending status.

Programmer Response: Run the CHECK DATA utility. The enforcement of the referential constraint or the check constraint is deferred until the CHECK DATA utility is run.

SQLSTATE: 01514

+203 THE QUALIFIED COLUMN NAME *column-name* WAS RESOLVED USING A NON-UNIQUE OR UNEXPOSED NAME

Explanation: The table designator selected to resolve a qualified column name is one of the following:

- An unexposed name
- An exposed name that has an exposed duplicate in the same FROM clause
- An exposed name that has an unexposed duplicate which appears before the selected name in the ordered list of names to which the qualifier is compared

Therefore, the statement does not conform to the guidelines for using only unique exposed names as qualifiers or it is possible that the column reference was not resolved to the intended instance of the table or view.

System Action: DB2 uses the selected name to resolve the reference.

Programmer Response: If DB2's resolution of the qualifier was not what you intended, rewrite the SQL statement and submit it again. The rules used to resolve column name qualifiers are given in Chapter 2 of *DB2 SQL Reference*.

SQLSTATE: 01552

+204 *name* IS AN UNDEFINED NAME

Explanation: The object identified by 'name' is not defined in the DB2 subsystem. This return code can be generated for any type of DB2 object.

System Action: A valid plan or package will be created if no errors are detected. The statement is bound dynamically on each execution of the statement.

Programmer Response: For better performance, rebind the plan or package after correcting the statement. To correct the statement, determine that the object name was correctly specified in the SQL statement (including any required qualifiers). If so, ensure that the object exists in the system before resubmitting the statement.

SQLSTATE: 01532

+206 *column-name* IS NOT A COLUMN OF AN INSERTED TABLE, UPDATED TABLE, OR ANY TABLE IDENTIFIED IN A FROM CLAUSE

Explanation: This return code is used to report one of these errors:

- In the case of an INSERT or UPDATE statement, the specified column is not a column of the table or view that was specified as the object of the insert or update.

- In the case a SELECT or DELETE statement, the specified column is not a column of any of the tables or views identified in a FROM clause in the statement.
- There is a correlated reference in GROUP BY.
- There is an unresolved qualified reference in HAVING.

System Action: A valid plan or package will be created if no errors are detected. The statement is bound dynamically on each execution of the statement.

Programmer Response: For better performance, rebind the plan or package after correcting the statement. To correct the statement, verify that the column and table names are specified correctly in the SQL statement. In the case of a SELECT statement, check to be sure that all of the required tables were named in the FROM clause.

SQLSTATE: 01533

+218 THE SQL STATEMENT REFERENCING A REMOTE OBJECT CANNOT BE EXPLAINED

Explanation: The user has used EXPLAIN(YES) on the bind subcommand to bind an application which has SQL statement referencing a remote object or the user has a static EXPLAIN SQL statement which references a remote object in the application program. EXPLAIN on a remote object is not supported by DB2.

It is issued at BIND time, and only with VALIDATE(RUN).

System Action: The plan or package will be bound successfully, but no information will be filled in the user's PLAN-TABLE for the SQL statement referencing a remote object. An SQLCODE -512 will be issued at run time if the EXPLAIN statement is found to explain a remote object.

SQLSTATE: 01537

+219 THE REQUIRED EXPLANATION TABLE *table-name* DOES NOT EXIST

Explanation: The EXPLAIN statement assumes the existence of the explanation table and it is not defined in the DB2 subsystem as a base table. Refer to Chapter 5 of *DB2 SQL Reference* for more information.

System Action: A valid plan or package will be created if no errors are detected. The statement is bound dynamically on each execution of the statement.

Programmer Response: For better performance, rebind the plan or package after correcting the statement. To correct the statement, determine whether the required explanation table does exist. If not, create the required table.

SQLSTATE: 01532

+220 THE COLUMN *column-name* IN EXPLANATION TABLE *table-name* IS NOT DEFINED PROPERLY

Explanation: An error occurred during the insertion of a row into the explanation table. The table is improperly defined for the following reasons:

- A column is missing.
- Columns are defined in the wrong order.
- The table contains an extra column.
- A column description is invalid because of its name, data type, length, or null attributes.

System Action: A valid plan or package will be created if no errors are detected. The statement is bound dynamically on each execution of the statement.

Programmer Response: For better performance, rebind the plan or package after correcting the statement. To correct the statement, correct the definition of the required explanation table. Refer to Chapter 5 of *DB2 SQL Reference* for information about defining an explanation table.

SQLSTATE: 01546

+222 HOLE DETECTED USING CURSOR *cursor-name*

Explanation: A delete hole or an update hole has been detected while processing a FETCH for cursor *cursor-name*. With a SENSITIVE STATIC cursor, a delete hole occurs when DB2 tries to refetch a row from the database for a cursor and finds that the corresponding row of the underlying table has been deleted. An update hole occurs when DB2 tries to refetch a row from the database for a cursor and finds that the corresponding row of the underlying table no longer satisfies the search condition.

cursor-name
Name of the cursor used for the FETCH statement.

System Action: The statement cannot be processed, and no data is fetched. The cursor is repositioned on the hole.

Programmer Response: Correct the application program to handle this situation, or change isolation levels so the base row cannot be deleted during the cursor operation.

SQLSTATE: 02502

+231 CURRENT POSITION OF CURSOR *cursor-name* IS NOT VALID FOR FETCH OF THE CURRENT ROW

Explanation: The cursor was not positioned on a row, and either FETCH CURRENT or FETCH RELATIVE 0 was specified. No data was fetched.

cursor-name

Name of the cursor used for the FETCH statement.

System Action: The statement cannot be processed. The cursor position is unchanged.

Programmer Response: Correct the application program to establish position before issuing this FETCH statement.

SQLSTATE: 02000

+236 SQLDA INCLUDES *integer1* SQLVAR ENTRIES, BUT *integer2* ARE REQUIRED FOR *integer3* COLUMNS

Explanation: The value of the SQLN field of the SQLDA should be at least as large as the number of columns being described. *integer3* is the number of columns being described.

In the case that USING BOTH has been specified, twice as many SQLVAR entries are needed as the number of columns being described.

The number of SQLVAR entries that are needed to return all of the information about the columns is *integer2*.

Note: in the case of DESCRIBE INPUT, each reference to *column* would actually be *parameter*.

System Action: The SQLDAID 7th byte has been set to "on" with a value of 2 indicating that 2 SQLVAR entries are needed for each column. DB2 has not set any SQLVAR entries.

Programmer Response: Increase the value of the SQLN field in the SQLDA to the value indicated in the message (making sure the SQLDA is large enough to support that amount) and resubmit the statement.

SQLSTATE: 01005

+237 SQLDA INCLUDES *integer1* SQLVAR ENTRIES, BUT *integer2* ARE REQUIRED BECAUSE AT LEAST ONE OF THE COLUMNS BEING DESCRIBED IS A DISTINCT TYPE

Explanation: Given that at least one of the columns being described is a distinct type, space should be provided for the *extended* SQLVAR entries in addition to the *base* SQLVAR entries. The value of SQLN, *integer1*, indicates that there are not enough SQLVAR entries for the base and extended SQLVAR entries.

The total number of SQLVAR entries that are required depends on whether USING BOTH was specified (*n* is the number of columns being described):

- With USING BOTH, space should be allocated for $3n$ SQLVAR entries.

- Otherwise, space should be allocated for $2n$ SQLVAR entries.

The number of SQLVAR entries that are needed to return all of the information about the columns is *integer2*.

Note: in the case of DESCRIBE INPUT, each reference to *column* would actually be *parameter*.

System Action: DB2 has set the SQLDAID 7th byte flag "on" because sufficient space was not provided for the *extended* SQLVAR entries. The value of the 7th byte flag indicates how many SQLVAR entries are needed for each column. Additionally, because there were enough SQLVAR entries for the *base* SQLVARs, DB2 has set the fields of the *base* SQLVAR entries. However, DB2 has not set any *extended* SQLVAR entries.

Programmer Response: If there is no need for the additional information about the distinct type(s), then no action is required unless USING BOTH was specified (in which case additional SQLVAR entries must be provided for the labels).

If the distinct type information is needed, the value of the SQLN field in the SQLDA should be increased to *integer2* (after making sure that the SQLDA is large enough to support that amount) and the statement should be resubmitted.

SQLSTATE: 01594

+238 SQLDA INCLUDES *integer1* SQLVAR ENTRIES, BUT *integer2* SQLVAR ENTRIES ARE NEEDED FOR *integer3* COLUMNS BECAUSE AT LEAST ONE OF THE COLUMNS BEING DESCRIBED IS A LOB

Explanation: Given that at least one the columns being described is a LOB, space must be provided for the *extended* SQLVAR entries in addition to the *base* SQLVAR entries. The value of SQLN, *integer1*, indicates that there are not enough SQLVAR entries for the base and extended SQLVAR entries. One or more of the columns being described may be a distinct type.

The total number of SQLVAR entries that are required depends on whether USING BOTH was specified or not (*n* is the number of columns being described which is *integer3*), and whether the columns include any distinct types:

- With USING BOTH, and one or more distinct types, space should be allocated for $3n$ SQLVAR entries.
- Otherwise, space should be allocated for $2n$ SQLVAR entries.

The number of SQLVAR entries that are needed to return all of the information about the columns is *integer2*.

Note: in the case of DESCRIBE INPUT, each reference to *column* would actually be *parameter*.

System Action: DB2 has set the SQLDAID 7th byte flag "on" because sufficient space was not provided for the *extended* SQLVAR entries. The value of the 7th byte flag indicates how many SQLVAR entries are needed for each column. DB2 has not set any SQLVAR entries.

Programmer Response: Increase the value of the SQLN field in the SQLDA to *integer2* (after making sure that the SQLDA is large enough to support that amount) and resubmit the statement.

SQLSTATE: 01005

+239 SQLDA INCLUDES *integer1* SQLVAR ENTRIES, BUT *integer2* ARE REQUIRED FOR *integer3* COLUMNS BECAUSE AT LEAST ONE OF THE COLUMNS BEING DESCRIBED IS A DISTINCT TYPE

Explanation: Given that at least one of the columns being described is a distinct type, space should be provided for the *extended* SQLVAR entries in addition to the *base* SQLVAR entries. The value of SQLN, *integer1*, indicates that there are not enough SQLVAR entries for the base and extended SQLVAR entries.

The total number of SQLVAR entries that are required depends on whether USING BOTH was specified or not (*n* is the number of columns being described which is *integer3*),

- With USING BOTH, space should be allocated for *3n* SQLVAR entries.
- Otherwise, space should be allocated for *2n* SQLVAR entries.

The number of SQLVAR entries that are needed to return all of the information about the columns is *integer2*.

Note: in the case of DESCRIBE INPUT, each reference to *column* would actually be *parameter*.

System Action: DB2 has set the SQLDAID 7th byte flag "on" because sufficient space was not provided for the *extended* SQLVAR entries. The value of the 7th byte flag indicates how many SQLVAR entries are needed for each column. DB2 has not set any SQLVAR entries. :elq.

Programmer Response: If the distinct type information is needed, the value of the SQLN field in the SQLDA should be increased to *integer2* (after making sure the SQLDA is large enough to support that amount) and the statement should be resubmitted.

If there is no need for the additional information about the distinct type(s) in the result set, then it is possible to resubmit the statement only providing enough SQLVAR entries to accommodate the number of columns being

described (i.e. provide the necessary number of *base* SQL entries).

SQLSTATE: 01005

+252 A NON-ATOMIC *statement* STATEMENT SUCCESSFULLY PROCESSED ALL REQUESTED ROWS, WITH ONE OR MORE WARNING CONDITIONS

Explanation: A non-atomic *statement* statement successfully processed multiple rows of data. However, one or more warning conditions occurred. Use GET DIAGNOSTICS to obtain information about the warning conditions that occurred.

System Action: The statement was processed.

Programmer Response: Analyze the warning conditions to determine whether the statement should be rolled back or not.

SQLSTATE: 01659

+304 A VALUE WITH DATA TYPE *data-type1* CANNOT BE ASSIGNED TO A HOST VARIABLE BECAUSE THE VALUE IS NOT WITHIN THE RANGE OF THE HOST VARIABLE IN POSITION *position-number* WITH DATA TYPE *data-type2*

Explanation: A FETCH or SELECT into a host variable list or structure, position number *position-number* failed because the host variable having data type *data-type2* was not large enough to hold the retrieved value having data type *data-type1*.

System Action: The FETCH or SELECT could not return the data for the indicated SELECT item, the indicator variable is set to negative two (-2) to indicate a null value returned. Processing continues.

Programmer Response: Verify that table definitions are current, and that the host variable has the proper data type. See the explanation for SQLCODE -405 for ranges of SQL data types.

SQLSTATE: 01515

+331 THE NULL VALUE HAS BEEN ASSIGNED TO A HOST VARIABLE BECAUSE THE STRING CANNOT BE TRANSLATED. REASON *reason-code*, CHARACTER *code-point*, HOST VARIABLE *position-number*

Explanation: A string assigned to a host variable had to be translated from its coded character set to the coded character set of the host variable and an error occurred during the translation. The *position-number* is the ordinality of the host variable in the SQLDA. See the description of SQLCODE -331 for further information

including the meaning of the *reason-code* and *code-point*.

System Action: The host variable is unchanged and its indicator variable is set to -2 to indicate that a null value is returned. Execution of the statement continues as if the translation error had not occurred.

SQLSTATE: 01520

+335 **DB2 CONVERTED A HOST VARIABLE, PARAMETER, OR COLUMN NUMBER**
var-num var-name-or-num **TO COLUMN NAME, HOST VARIABLE, OR EXPRESSION NUMBER**
col-name-or-num **FROM** *from-ccsid* **TO** *to-ccsid*, **AND RESULTING IN SUBSTITUTION CHARACTERS**

Explanation: A translation error occurred during the conversion of a string to a different coded character set. One or more substitution characters have been placed in the string during the conversion process.

System Action: DB2 processes the statement successfully.

Programmer Response: DB2 processes the SQL statement, but used substitution characters instead of one or more characters as a result of character conversion from *from-ccsid* to *to-ccsid*. If substitution is acceptable, then no action is necessary. If substitution is not acceptable, then issue a ROLLBACK. Ensure that data being provided to DB2 is convertible from *from-ccsid* to *to-ccsid* without data loss.

SQLSTATE: 01517

+347 **THE RECURSIVE COMMON TABLE EXPRESSION** *name* **MAY CONTAIN AN INFINITE LOOP**

Explanation: The recursive common table expression called *name* may not complete. This warning is based on not finding specific syntax as part of the iterative portion of the recursive common table expression. The expected syntax includes:

- incrementing an INTEGER column in the iterative select list by 1.
- a predicate in the where clause of the iterative portion of the form "counter_col < constant" or "counter_col < :hostvar".

The absence of this syntax in the recursive common table expression may result in an infinite loop. The data or some other characteristic of the recursive common table expression may allow the successful completion of the statement anyway.

System Action: The statement cannot be executed.

Programmer Response: To prevent an infinite loop, include the expected syntax as described.

SQLSTATE: 01605

+394 **USER SPECIFIED OPTIMIZATION HINTS USED DURING ACCESS PATH SELECTION**

Explanation: Normal access path selection was bypassed in favor of an access path specified in the PLAN_TABLE.

System Action: Processing continues normally.

Programmer Response: Ensure that the access path is correct and produces the correct results.

SQLSTATE: 01629

+395 **USER SPECIFIED OPTIMIZATION HINTS ARE INVALID (REASON CODE =**
*reason-code***). THE OPTIMIZATION HINTS ARE IGNORED.**

Explanation: The optimization hints specified for this query are invalid. *Areason-code* in the following table can help identify why the hints were invalid:

reason-code

	Description
2	TABNO is invalid.
3	TNAME is not specified.
4	TNAME is ambiguous.
5	TABNO doesn't agree with TNAME.
6	QBLOCKNO doesn't agree with TNAME.
7	PAGE_RANGE is invalid.
8	PREFETCH is invalid.
9	METHOD is invalid.
10	SORTN_JOIN is invalid.
11	SORTC_JOIN is invalid.
12	ACCESSTYPE is invalid.
13	ACCESSCREATOR or ACCESSNAME is invalid.
14	TYPE 1 index can't be used with isolation level 'UR'.
15	Specified index can't be used as requested.
16	Multi-index access can't be done.
17	Invalid ACCESSTYPE combination.
18	METHOD specified for first table accessed.
19	Nested-loop join can't be done as requested.
20	Merge join can't be done as requested.
21	Hybrid join can't be done as requested.

- 22 PARALLELISM_MODE requested can't be done.
- 23 PARALLELISM_MODE is invalid.
- 24 ACCESS_DEGREE is invalid.
- 25 JOIN_DEGREE is invalid.
- 26 A table is missing.
- 27 A table is redundant.
- 28 PRIMARY_ACCESSTYPE is invalid.
- 29 ACCESS_PGROUPE_ID is not specified.
- 30 JOIN_PGROUPE_ID is not specified.
- 31 PARALLELISM_MODE is not specified.
- 32 CREATOR or TNAME is invalid.
- 33 Join sequence is incorrect.
- 34 Full outer join requires merge join method.
- 35 WHEN_OPTIMIZE is invalid or inconsistent.
- 99 Unexpected error.

System Action: The user-specified optimization hints are ignored. The access path is determined without the use of hints and processing continues normally.

Programmer Response: Correct the problem with the optimization hints, or disable their use for this query.

SQLSTATE: 01628

+402 LOCATION *location* IS UNKNOWN

Explanation: A remote object is referenced and either the table SYSIBM.LOCATIONS is not defined or the referenced 'location' matches no entry in the SYSIBM.LOCATIONS.LOCATION column.

System Action: For the CREATE ALIAS statement, the alias is created. For binding a plan or package with the VALIDATE(RUN) option, the plan or package is created.

SQLSTATE: 01521

+403 THE LOCAL OBJECT REFERENCED BY THE CREATE ALIAS STATEMENT DOES NOT EXIST

Explanation: The local object referenced by the CREATE ALIAS statement does not exist when creating the alias.

System Action: The alias is created.

SQLSTATE: 01522

+434 OPTION *keyword* IS A DEPRECATED FEATURE

Explanation: *keyword* is a deprecated feature that will not be supported in releases following DB2 Version 8. It is accepted, but continued use of this keyword is not recommended.

For indexes, use type 2 indexes rather than type 1 indexes to avoid any incompatibilities.

System Action: Processing continues normally.

Programmer Response: No change is required for the current release. However, you should change your SQL statement and remove this feature to prepare for future releases when this feature is not supported.

SQLSTATE: 01608

+445 VALUE *value* HAS BEEN TRUNCATED

Explanation: The value *value* was truncated by a cast function, which was called to transform the value in some way. This is a warning situation. The cast function is a result of

- a CAST specification
- a built-in function such as CHAR, VARCHAR, etc.
- a CAST FROM specification on the CREATE FUNCTION statement that created the function
- a user-defined function that is sourced on another function and the result needed to be transformed.

If 'value' has the 'for bit data' subtype, then the 'value' is printed as a hexadecimal string in quotes followed by an X.

System Action: The value has been truncated.

Programmer Response: Ensure that the output is as expected and that the truncation has not caused any unexpected consequences.

SQLSTATE: 01004

+462 EXTERNAL FUNCTION OR PROCEDURE *name* (SPECIFIC NAME *specific-name*) HAS RETURNED A WARNING SQLSTATE, WITH DIAGNOSTIC TEXT *text*

Explanation: An SQLSTATE of the form 01Hxx was returned to DB2 by user-defined function or procedure *name*, along with message text *text*.

System Action: Processing continues.

Programmer Response: See your database administrator, or the author of the function or procedure to find out the meaning of the warning. The significance of the bad SQLSTATE to the invoking application can be learned from the author of the function or procedure.

SQLSTATE: 01Hxx

+464 **PROCEDURE *proc* RETURNED *num*
QUERY RESULT SETS, WHICH
EXCEEDS THE DEFINED LIMIT *integer***

Explanation: The stored procedure named by *proc* completed normally. However, the stored procedure exceeded the defined limit on the number of query result sets the procedure can return.

- *num* identifies the number of query result sets returned by the stored procedure.
- *integer* identifies the defined limit on the number of query result sets for the stored procedure.

Only the first *integer* query result sets are returned to the SQL program that issued the SQL CALL statement.

The possible causes are as follows:

- The stored procedure is unable to return *num* result sets due to the limit defined for the procedure.
- The stored procedure is unable to return *num* result sets due to the DRDA limitations imposed by the client. The DRDA client establishes this limit with the MAXRSLCNT DDM code point.

System Action: The SQL statement is successful. The SQLWARN9 field is set to 'Z'.

SQLSTATE: 0100E

+466 **PROCEDURE *proc* RETURNED *num*
QUERY RESULTS SETS**

Explanation: The stored procedure named by *proc* completed normally. The procedure returned the number of SQL query result sets specified in *num*.

System Action: The SQL statement is successful. The SQLWARN9 field is set to 'Z'.

SQLSTATE: 0100C

+494 **NUMBER OF RESULT SETS IS
GREATER THAN NUMBER OF
LOCATORS**

Explanation: The number of result set locators specified on the ASSOCIATE LOCATORS statement is less than the number of result sets returned by the stored procedure. The first "n" result set locator values are returned, where "n" is the number of result set locator variables specified on the SQL statement.

System Action: The SQL statement is successful. The SQLWARN3 field is set to 'Z'.

Programmer Response: Increase the number of result set locator variables specified on the SQL statement.

SQLSTATE: 01614

+495 **ESTIMATED PROCESSOR COST OF
estimate-amount1 PROCESSOR
SECONDS (*estimate-amount2* SERVICE
UNITS) IN COST CATEGORY
cost-category EXCEEDS A RESOURCE
LIMIT WARNING THRESHOLD OF *limit-
amount* SERVICE UNITS**

Explanation: The prepare of a dynamic INSERT, UPDATE, DELETE, or SELECT SQL statement resulted in a cost estimate that exceeded the warning threshold value specified in the resource limit specification table (RLST). This warning is also issued if DB2's cost category value was "B", and the default action specified in the RLF_CATEGORY_B column in the RLST is to issue a warning.

estimate_amount1

The cost estimate (in processor seconds) if the prepared INSERT, UPDATE, DELETE or SELECT statement were to be executed.

estimate_amount2

The cost estimate (in service units) if the prepared INSERT, UPDATE, DELETE or SELECT statement were to be executed.

cost-category

DB2's cost-category for this SQL statement. The possible values are A or B.

limit-amount

The warning threshold (in service units) specified in the RLFASUWARN column of the RLST.

System Action: The prepare of the dynamic INSERT, UPDATE, DELETE, or SELECT statement was successful. An SQLCODE -905 might be issued if the execution of the prepared statement exceeds the ASUTIME value specified in the RLST.

Programmer Response: Ensure that there is application logic to handle the warning to either allow the statement to execute or to stop the statement from being executed. If this SQLCODE was returned because the cost category value is "B", it might be that the statement is using parameter markers or that some statistics are not available for the referenced tables and columns. Make sure the administrator has run the utility RUNSTATS on the referenced tables. It might also be that UDFs will be invoked when the statement is executed, or for INSERT, UPDATE, or DELETE statements that triggers are defined on the changed table. Check the DSN_STATEMNT_TABLE or the IFCID 22 record for this statement to find the reasons this SQL statement has been put in cost category "B".

User Response: If the warning is caused by an SQL statement that is consuming too much processor resource, attempt to rewrite the statement to perform more efficiently. Another option is to ask the administrator to increase the warning threshold value in the RLST.

SQLSTATE: 01616

+535 THE RESULT OF THE POSITIONED UPDATE OR DELETE MAY DEPEND ON THE ORDER OF THE ROWS

Explanation: A positioned update of a primary key or a delete from a table with a self-referencing constraint was requested.

System Action: DB2 executes the UPDATE or DELETE statement and the contents of the table are changed.

SQLSTATE: 01591

+541 THE REFERENTIAL OR UNIQUE CONSTRAINT *name* HAS BEEN IGNORED BECAUSE IT IS A DUPLICATE

Explanation: A FOREIGN KEY clause uses the same key and parent table as another FOREIGN KEY clause, or a UNIQUE clause uses the same column list as another UNIQUE or PRIMARY KEY clause. In either case, the duplicate clause is ignored.

name is either the foreign key name or the unique constraint name.

System Action: DB2 continues processing.

Programmer Response: If the duplication is an error, correct the statement and execute it again.

SQLSTATE: 01543

+551 *auth-id* DOES NOT HAVE THE PRIVILEGE TO PERFORM OPERATION *operation* ON OBJECT *object-name*

Explanation: Authorization ID *auth-id* has attempted to perform the specified *operation* on object *object-name* without having been granted the proper authority to do so. This error might also occur if the specified object does not exist, or if the object is a read-only view (for UPDATE or INSERT). Additionally, the error may occur if *auth-id* is trying to create a table or view with an authorization ID other than its own. You may create a table or view from an *auth-id* other than your own only if your authorization ID is SYSADM, DBADM, or DBCTRL.

If this error occurs while DB2 is creating or altering a table involving referential constraints, this code reports that the user does not have the necessary ALTER privilege to perform a FOREIGN KEY, DROP FOREIGN KEY, DROP PRIMARY KEY, or DROP UNIQUE operation. The *object-name* identifies the object table of the CREATE or ALTER TABLE statement, not the table for which the user lacks the ALTER privilege.

System Action: A valid plan or package will be created if no errors are detected. The statement is bound dynamically on each execution of the statement.

Programmer Response: For better performance, rebind the plan or package after correcting the statement. To correct the statement, ensure that *auth-id* has been granted the authority to perform the desired operation, that *object-name* exists, and that *auth-id* is not trying to create a table with a different authorization ID.

SQLSTATE: 01548

+552 *auth-id* DOES NOT HAVE THE PRIVILEGE TO PERFORM OPERATION *operation*

Explanation: Authorization ID 'auth-id' has attempted to perform the specified 'operation' without having been granted the authority to do so.

System Action: A valid plan or package will be created if no errors are detected. The statement is bound dynamically on each execution of the statement.

Programmer Response: For better performance, rebind the plan or package after correcting the statement. To correct the statement, ensure that the authorization-ID has been granted the authority necessary to perform the desired operation.

SQLSTATE: 01542

+558 THE WITH GRANT OPTION IS IGNORED

Explanation: The GRANT statement contained one of the following situations:

- PUBLIC was within the list of 'grantee' authorization IDs.
- BINDAGENT privilege was being granted.
- ANY package privilege on collection-id.* was being granted.

The WITH GRANT option may not be used in the above situations.

System Action: The offending privilege(s) in the authorization specification are granted without the GRANT option. If the grantee is PUBLIC, all the privileges in the authorization specification are granted without the GRANT option.

SQLSTATE: 01516

+561 THE ALTER, INDEX, REFERENCES, AND TRIGGER PRIVILEGES CANNOT BE GRANTED PUBLIC AT ALL LOCATIONS

Explanation: You specified a GRANT statement with either an ALL or ALL PRIVILEGES keyword. ALL and ALL PRIVILEGES imply the granting of ALTER, INDEX, REFERENCES, AND TRIGGER privileges that cannot be granted to a remote user.

System Action: DB2 executes the GRANT statement.

However, it does not grant the ALTER, INDEX, REFERENCES, or TRIGGER privileges to PUBLIC*.

SQLSTATE: 01523

+562 A GRANT OF A PRIVILEGE WAS IGNORED BECAUSE THE GRANTEE ALREADY HAS THE PRIVILEGE FROM THE GRANTOR

Explanation: At least one of the privileges in the GRANT statement was ignored because the privilege was already granted to the grantee by the grantor.

System Action: The privileges previously granted are ignored; all others are granted.

SQLSTATE: 01560

+585 THE COLLECTION *collection-id* APPEARS MORE THAN ONCE WHEN SETTING THE *special-register* SPECIAL REGISTER

Explanation: The SET statement for special register *special-register* includes *collection-id* more than once.

System Action: Duplicates are removed from the list, and the first occurrence of *collection-id* is used. The statement is executed.

Programmer Response: Verify the list that contains the duplicate. If the error is only in entering a *collection-id* incorrectly that happens to duplicate another entry, enter the *collection-id* correctly and reissue the statement. If the entry is intended to be a duplicate, no action is required.

SQLSTATE: 01625

+599 COMPARISON FUNCTIONS ARE NOT CREATED FOR A DISTINCT TYPE BASED ON A LONG STRING DATA TYPE

Explanation: Comparison functions are not created for a distinct type based on a long string data type (BLOB, CLOB, DBCLOB) since the corresponding function are not available for these built-in data types.

System Action: The statement is processed successfully.

Programmer Response: No action is required.

SQLSTATE: 01596

+610 A CREATE/ALTER ON OBJECT *object-name* HAS PLACED OBJECT IN *utility* PENDING

Explanation: The identified object is in one of the following states:

- REBUILD pending for an index

The index is in REBUILD PENDING status because CREATE INDEX with DEFER was specified on a populated table. The index is not generally available until the index is removed from the REBUILD pending state.

- REORG pending for a table space partition

The table space is in REORG pending because ALTER INDEX was used to change the limit key values. The table space partition is not generally available until the REORG pending status is removed.

- REORG pending for a table space

The table space is in REORG pending because ALTER TABLE was used to add an identity column to a populated table. The table space is not generally available until the REORG pending status is removed.

System Action: The object was placed in the indicated pending status.

Programmer Response: The following actions may be taken:

- For REBUILD pending on an index, use the REBUILD INDEX utility to rebuild the index and remove the REBUILD pending status.
- For REORG pending on a table space partition, perform the following steps:
 1. Issue a DISPLAY DATABASE command for the table space to identify which partitions are in REORG pending.
 2. Run the REORG utility on the partitions that are in REORG pending.
- For REORG pending on a table space, run the REORG utility on the table space.

SQLSTATE: 01566

+645 WHERE NOT NULL IS IGNORED BECAUSE THE INDEX KEY CANNOT CONTAIN NULL VALUES

Explanation: The WHERE NOT NULL clause is ignored on the CREATE INDEX statement because the index key is defined on columns that cannot contain null values.

System Action: The option is ignored; processing continues.

Programmer Response: Remove the WHERE NOT NULL clause to get rid of the warning.

SQLSTATE: 01528

+650 THE TABLE BEING CREATED OR ALTERED CANNOT BECOME A DEPENDENT TABLE

Explanation: This table is defined with the maximum number of columns. It cannot be altered to be a dependent table later.

System Action: The table is created. Check to see if the table will become a dependent table at a later time. If yes, drop and recreate the table with fewer than 750 columns.

SQLSTATE: 01538

+653 **TABLE *table-name* IN PARTITIONED TABLESPACE *t-space-name* IS NOT AVAILABLE BECAUSE ITS PARTITIONED INDEX HAS NOT BEEN CREATED**

Explanation: An attempt has been made to insert or manipulate data in or create a view on a partitioned table (that is, a table residing in a partitioned table space) before the partitioned index for that table has been created.

A table residing in a partitioned table space cannot be referenced in any SQL manipulative statement or a CREATE VIEW statement before the partitioned index for that table has been created.

System Action: A valid plan or package will be created if no errors are detected. The statement is bound dynamically on each execution of the statement.

Programmer Response: For better performance, rebind the plan or package after correcting the statement. To correct the statement, verify that the correct table was specified in the statement. If so, ensure that the partitioned index for the table has been created successfully before attempting to execute any SQL manipulative statements that reference that table.

SQLSTATE: 01551

+655 **STOGROUP *stogroup_name* HAS BOTH SPECIFIC AND NON-SPECIFIC VOLUME IDS. IT WILL NOT BE ALLOWED IN FUTURE RELEASES**

Explanation: The CREATE/ALTER STOGROUP statement has caused the STOGROUP with 'stogroup_name' to have both specific and non-specific (*) volume ids. This warning code is used to specify that the mixing of different types of volume ids will not be allowed in future releases.

System Action: DB2 continues processing.

Programmer Response: Plan to use either specific or non-specific volume ids to avoid future release migration impact. ALTER STOGROUP may be used to drop all specific volume ids or all non-specific volume ids.

SQLSTATE: 01597

+658 **THE SUBPAGES VALUE IS IGNORED FOR THE CATALOG INDEX *index-name***

Explanation: Only SUBPAGES 1 is allowed for this catalog index.

System Action: The index was altered successfully using SUBPAGES 1. If you are also altering the TYPE option to a new value, the index is placed in recovery pending status.

SQLSTATE: 01600

+738 **DEFINITION CHANGE OF *object* *object_name* MAY REQUIRE SIMILAR CHANGE ON READ-ONLY SYSTEMS**

Explanation: A change was made to the definition of the specified object that may also require a similar change to any read-only shared systems.

System Action: The statement is successfully executed.

Programmer Response: Check the read-only shared systems that have the specified object defined, and determine if a change must be made to the object on those systems.

SQLSTATE: 01530

+799 **A SET STATEMENT REFERENCES A SPECIAL REGISTER THAT DOES NOT EXIST AT THE SERVER SITE**

Explanation: A DB2 server received a SET statement that it does not understand.

System Action: The SET SPECIAL REGISTER request is ignored.

Programmer Response: This SQLCODE can be returned to an application for any SQL statement. This SQLCODE may be masked by other negative SQLCODEs that the SQL statement receives. Processing continues at the server.

SQLSTATE: 01527

+802 **EXCEPTION ERROR *exception-type* HAS OCCURRED DURING *operation-type* OPERATION ON *data-type* DATA, POSITION *position-number***

Explanation: The exception error *exception-type* occurred while doing an ADDITION, SUBTRACTION, MULTIPLICATION, DIVISION, NEGATION, or BUILT-IN FUNCTION operation on a field whose *data-type* is DECIMAL, FLOAT, SMALLINT, or INTEGER. The error occurred while processing an arithmetic expression in the SELECT list of an outer SELECT statement, and the position in the select list is denoted by *position-number*. The possible exception types are FIXED POINT OVERFLOW, DECIMAL OVERFLOW, DIVIDE EXCEPTION, EXPONENT OVERFLOW, ZERO DIVIDE, or OUT OF RANGE. The data type displayed in the message may indicate the data type of the temporary internal copy of the data, which may differ from the actual column or literal data type due to conversions by DB2.

A fixed point overflow can occur during any arithmetic operation on either INTEGER or SMALLINT fields.

A decimal overflow exception can occur when one or more nonzero digits are lost because the destination field in any decimal operation is too short to contain the result.

A divide exception can occur on a decimal division operation when the quotient exceeds the specified data-field size. A zero divide exception occurs on any division by zero.

An exponent overflow can occur when the result characteristic of any floating-point operation exceeds 127 and the result fraction is not zero, i.e. the magnitude of the result exceeds approximately 7.2E+75.

Any of the exceptions/overflows can occur during the processing of a built-in function. If the *operation-type* is FUNCTION then the error occurred while processing either an input, intermediate, or final value. The cause could be that the value of a parameter is *out of range*.

Note: Parts of *exception-type*, *data-type*, *operation-type*, and *position-number* may or may not be returned in SQLCA, depending upon when the error was detected.

System Action: For each expression in error the indicator variable is set to negative two (-2) to indicate a null value returned. The data variable is unchanged. Execution of the statement continues with all nonerror columns and expressions of the outer SELECT list being returned. If the statement is cursor controlled then the CURSOR will remain open.

Programmer Response: Examine the expression for which the warning occurred to see if the cause (or the likely cause) of the problem can be determined. The problem may be data-dependent, in which case it will be necessary to examine the data that was being processed at the time the error occurred.

See the explanation of SQLCODE -405 for allowed ranges of numeric data types.

SQLSTATE: 01519

+806 BIND ISOLATION LEVEL RR CONFLICTS WITH TABLESPACE LOCKSIZE PAGE OR LOCKSIZE ROW AND LOCKMAX 0

Explanation: The specification of isolation level RR is incompatible with the LOCKSIZE PAGE or LOCKSIZE ROW and LOCKMAX 0 specification for a table space accessed by the application. Table space locking is used to protect the integrity of the application.

System Action: A valid package/plan is created if no errors are detected. Table space locking is used. RR isolation level is preserved.

Programmer Response: If you do not want table

space locking, use isolation level UR, CS, or RS.

SQLSTATE: 01553

+807 THE RESULT OF DECIMAL MULTIPLICATION MAY CAUSE OVERFLOW

Explanation: An arithmetic expression contains a decimal multiplication that may cause an overflow condition when the statement is executed. The problem may be corrected by restructuring the arithmetic expression so that decimal multiplication precedes decimal division or by changing the precision and scale of the operands in the arithmetic expression. Refer to Chapter 2 of *DB2 SQL Reference* for the precision and scale of the decimal multiplication and division results.

System Action: A valid package will be created if no errors are detected.

SQLSTATE: 01554

+863 THE CONNECTION WAS SUCCESSFUL BUT ONLY SBCS WILL BE SUPPORTED

Explanation: The target AS supports only the DB2 SBCS CCSID. The DB2 Mixed CCSID or GRAPHIC CCSID or both are not supported by the target AS. DB2 character data sent to the target AS must be restricted to SBCS.

System Action: The CONNECT statement is successful. The release level of the target AS has been placed into the SQLERRP field of the SQLCA (see *DB2 SQL Reference* for the CONNECT statement).

Programmer Response: Do not execute any SQL statements which pass either mixed data or graphic data as input host variables.

SQLSTATE: 01539

+883 ROLLBACK TO SAVEPOINT OCCURED WHEN THERE WERE OPERATIONS THAT CANNOT BE UNDONE, OR AN OPERATION THAT CANNOT BE UNDONE OCCURRED WHEN THERE WAS A SAVEPOINT OUTSTANDING

Explanation: The operations that are referred to are updates (inserts into or deletes from) a created global temporary table. If this SQL warning code is received as the result of a ROLLBACK TO SAVEPOINT statement, the rollback is performed; however, the changes that were made to the temporary table are not undone. If this SQL warning code is received as the result of an operation to a created global temporary table, the operation is performed; however, be advised that a savepoint is outstanding, and the update will not be backed out if a rollback to the savepoint is performed.

System Action: The SQL statement is processed.

Programmer Response: Verify that this is what you meant.

SQLSTATE: 01640

+20002 THE GBPCACHE SPECIFICATION IS IGNORED, *bpname* DOES NOT ALLOW CACHING

Explanation: This message is issued in response to a CREATE or ALTER of a table space or index in which a buffer pool is named that corresponds to a group buffer pool that is defined with GBPCACHE NO. The corresponding group buffer pool is used only for cross-invalidation. It contains no data entries. All reads and writes are from and to DASD.

System Action: The statement is processed.

User Response: If you want to use one of the GBPCACHE options other than NONE, you must alter the table space or index to use a group buffer pool that is defined with GBPCACHE YES.

SQLSTATE: 01624

+20007 USE OF OPTIMIZATION HINTS IS DISALLOWED BY A DB2 SUBSYSTEM PARAMETER. THE SPECIAL REGISTER 'OPTIMIZATION HINT' IS SET TO THE DEFAULT VALUE OF BLANKS.

Explanation: DB2 is not enabled to use optimization hints. The special register OPTIMIZATION HINT is set to the default value of BLANKS.

System Action: Processing continues normally using the default OPTIMIZATION HINT value. The user-specified optimization hints are ignored. The access path is determined without the use of hints and processing continues normally.

Programmer Response: Enable the use of OPTIMIZATION HINT by changing the value of OPTIMIZATION HINTS on the DB2 Installation panel DSNTIP4.

If, after further consideration, you do not want to use an OPTIMIZATION HINT, change or remove the SET CURRENT OPTIMIZATION HINT statement.

SQLSTATE: 01602

+20122 DEFINE NO OPTION IS NOT APPLICABLE IN THE CONTEXT SPECIFIED

Explanation: The DEFINE NO option was specified, however it is not applicable in the context specified. DEFINE NO was specified in one of the following situations:

- a CREATE INDEX statement that included the VCAT clause
- a CREATE INDEX statement for a non-empty table

- a CREATE LOB TABLESPACE statement
- a CREATE TABLESPACE statement that included the VCAT clause

System Action: DB2 ignored the DEFINE NO option and created the object with the DEFINE YES option instead.

SQLSTATE: 01644

+20237 FETCH PRIOR ROWSET FOR CURSOR *cursor-name* RETURNED A PARTIAL ROWSET

Explanation: A FETCH PRIOR ROWSET statement was issued, but there were not enough rows prior to the current cursor position to reposition the cursor on a full rowset. The cursor has been positioned on a partial rowset. If a target was specified, then data has only been returned for the number of rows that were actually fetched for the partial rowset.

System Action: The cursor is positioned on a partial rowset.

Programmer Response: Analyze the situation to determine if anything should be rolled back.

SQLSTATE: 02504

+20141 TRUNCATION OF VALUE WITH LENGTH *length* OCCURRED FOR *hv-or-parm-number*

Explanation: A value that was assigned to a host variable or parameter was truncated. However, the length of the value that was truncated is too large to be returned in the indicator variable. This situation can occur when truncation occurs on assignment of:

- a value to a parameter of a remotored stored procedure if the value being truncated is greater than 127 bytes. In this case, the indicator variable will contain a value of 127.
- a LOB value to a host variable if the value being truncated is greater than 32K bytes. In this case, the indicator variable will contain a value of 32K.

In these cases, the actual length of the truncated value cannot be returned to the application that uses the indicator variable. The actual length of the value is returned as message token *length*.

System Action: The assignment was made, but the data was truncated.

Programmer Response: Change the declaration of *hv-or-parm-number* to avoid truncation.

SQLSTATE: 01004

+20245 NOT PADDED CLAUSE IS IGNORED FOR INDEXES CREATED ON AUXILIARY TABLES

Explanation: The NOT PADDED clause is ignored on the CREATE INDEX statement because auxiliary indexes are always PADDED.

System Action: The option is ignored; processing continues.

Programmer Response: Remove the NOT PADDED clause to avoid this warning.

SQLSTATE: 01663

+20270 OPTION NOT SPECIFIED FOLLOWING ALTER PARTITION CLAUSE

Explanation: An ALTER INDEX statement, which included the ALTER PARTITION clause, did not contain an option following the ALTER PARTITION keywords.

System Action: The SQL statement is processed.

Programmer Response: Specify a partition option after the ALTER PARTITION keywords to avoid this warning in the future. For an ALTER INDEX statement, if *partition-element* is specified, specify either the ENDING clause of:

- *partition-element*
- *using-block*
- *free-block*
- *gbcaches-block*

SQLSTATE: 01664

+20272 THE LAST PARTITION'S LIMIT KEY VALUE OF *old-limit-key-value* IS SET TO THE HIGHEST OR LOWEST POSSIBLE VALUE

Explanation: After one of the following statements was completed, the last partition's limit key value *old-limit-key-value* was set to the highest possible value for ascending index key columns, or lowest possible value for descending index key columns. These are the statements:

- CREATE PARTITIONED INDEX
- DROP INDEX for a partitioning index
- ALTER INDEX with the CLUSTER NO clause

The external limit key value in SYSTABLEPART.LIMITKEY has been changed to its highest or lowest possible value.

System Action: The statement is successfully executed.

SQLSTATE: 01666

+30100 OPERATION COMPLETED SUCCESSFULLY BUT A DISTRIBUTION PROTOCOL VIOLATION HAS BEEN DETECTED. ORIGINAL SQLCODE=*original-sqlcode* AND ORIGINAL SQLSTATE=*original-sqlstate*

Explanation: The application requested operation (either COMMIT or ROLLBACK) has completed successfully but the response from the remote server and the SQLCODE that was returned from the remote server are inconsistent. For example, the reply message from the remote server indicates that a COMMIT operation completed successfully but the SQLCODE returned from the AS was negative.

System Action: An alert was generated. A DSNL0311 message may have been written to the console. Refer to the description of this message for further information.

The SQLCODE returned by the remote server is replaced with +30100 and the SQLSTATE returned by the remote server is replaced with 01558.

The SQLCODE and SQLSTATE values that were returned from the AS are stored in the SQLERRM field in a string of the following format:

```
'original-sqlcode 'FF'X original-sqlstate'
```

Programmer Response: Notify the System Programmer for assistance in analyzing the trace data that was generated.

SQLSTATE: 01558

Error SQL codes

-007 STATEMENT CONTAINS THE ILLEGAL CHARACTER *character*

Explanation: The specified 'character' is not a valid character in SQL statements.

System Action: The statement cannot be executed.

Programmer Response: Correct the syntax and resubmit the statement. Refer to Chapter 2 of *DB2 SQL Reference* for information about the valid SQL character set.

SQLSTATE: 42601

-010 THE STRING CONSTANT BEGINNING string IS NOT TERMINATED

Explanation: The statement contains a string constant, beginning with 'string', that is not terminated properly.

System Action: The statement cannot be executed.

Programmer Response: Examine the statement for missing quotation marks or apostrophes in the indicated string constant.

SQLSTATE: 42603

-029 INTO CLAUSE REQUIRED

Explanation: SELECT statements embedded in an application program must have an INTO clause to denote where the results of the SELECT are to be placed. Dynamic SELECT statements do not permit the INTO clause.

System Action: The statement cannot be executed.

Programmer Response: Add the INTO clause to the SELECT statement and precompile the application program again.

SQLSTATE: 42601

-060 INVALID type SPECIFICATION : spec

Explanation: 'type' is either LENGTH or SCALE. 'spec' is the specified length or scale. Length or scale must be specified by an unsigned integer constant and the value must be in the range allowed by the data type.

System Action: The statement cannot be executed.

Programmer Response: Correct the statement. Refer to Chapter 2 of *DB2 SQL Reference* for rules for length and scale.

SQLSTATE: 42815

-079 QUALIFIER FOR DECLARED GLOBAL TEMPORARY TABLE table-name MUST BE SESSION, NOT qualifier

Explanation: The qualifier for a declared temporary table must be SESSION. The DECLARE GLOBAL TEMPORARY TABLE statement defines a new temporary table named *table-name* with an explicit qualifier of *qualifier*. Specifying a qualifier other than SESSION is not allowed.

System Action: The statement was not executed.

Programmer Response: Change the statement in one of the following ways:

- Change the qualifier to SESSION.
- Remove the qualifier, and let DB2 default it to SESSION.

SQLSTATE: 428EK

-084 UNACCEPTABLE SQL STATEMENT

Explanation: This SQL statement is unacceptable to DB2. One of the following has occurred:

- An attempt has been made to PREPARE or EXECUTE IMMEDIATE an SQL statement that cannot be prepared; refer to the proper SQL statement in *DB2 SQL Reference*
- The embedded SQL statement is not an SQL statement supported by DB2.
- The statement referenced an undeclared cursor.
- An attempt was made to prepare an ALLOCATE CURSOR statement but the statement identifier is already associated with a declared cursor.

System Action: The statement cannot be executed.

Programmer Response: If the situation involves an SQL statement that cannot be prepared, the problem is in the source of the SQL statement, not the application program. Thus, no action is necessary unless the source of the SQL statement is the application program itself.

If the situation involves an SQL statement that is not supported by DB2, remove it from the application program and precompile again.

If the situation involves an invalid PREPARE of an ALLOCATE CURSOR statement, change the application program to use a statement identifier that is not associated with a declared cursor.

SQLSTATE: 42612

-096 VARIABLE *variable-name* DOES NOT EXIST OR IS NOT SUPPORTED BY THE SERVER AND A DEFAULT VALUE WAS NOT PROVIDED

Explanation: The GETVARIABLE function was invoked for variable *variable-name*. However, a value does not exist for a variable with that name, and a default value was not provided.

- If the qualifier is SESSION, a user-defined variable with name *variable-name* has not been set.
- If the qualifier is SYSIBM, the server does not support a built-in session variable with name *variable-name*.

System Action: The statement cannot be executed.

Programmer Response: Change the invocation of the function to specify a default variable for *variable-name*, or change the name of a variable that does exist.

SQLSTATE: 42704

-097 THE USE OF LONG VARCHAR OR LONG VARGRAPHIC IS NOT ALLOWED IN THIS CONTEXT

Explanation: The statement attempted to use the LONG VARCHAR or LONG VARGRAPHIC syntax. This syntax cannot be used for the following statements:

- CAST specification syntax
- CREATE DISTINCT TYPE
- CREATE FUNCTION
- CREATE PROCEDURE
- ALTER FUNCTION
- COMMENT ON FUNCTION
- GRANT EXECUTE ON FUNCTION
- REVOKE EXECUTE ON FUNCTION
- DROP

Use the VARCHAR or VARGRAPHIC syntax specifying an explicit length as required.

System Action: The statement cannot be executed.

Programmer Response: Correct the statement.

SQLSTATE: 42601

-101 THE STATEMENT IS TOO LONG OR TOO COMPLEX

Explanation: DB2 cannot process the statement because it exceeds the system limits for length or complexity. Enabling parallelism will increase the complexity of the statement.

System Action: DB2 cannot process the statement.

Programmer Response: Divide the statement into shorter or less complex SQL statements.

If the statement enables parallelism, try disabling

parallelism. You may do this by using the DEGREE(1) bind option for static SQL, or by setting the CURRENT DEGREE special register to '1' for dynamic SQL.

SQLSTATE: 54001

-102 LITERAL STRING IS TOO LONG. STRING BEGINS *string*

Explanation: The string constant beginning with *string* has a length greater than the maximum allowed length. Most strings have these limits:

- For a hexadecimal constant (X, GX, or UX), the number of hexadecimal digits must not exceed 32704.
- Any other character string constant must be short enough so that its UTF-8 representation requires no more than 32704 bytes.
- Any other graphic string constant must be short enough so that its UTF-8 representation requires no more than 32698 bytes.

In some contexts, however, the limit is smaller; see the *DB2 SQL Reference* for the specific cases.

For special registers, the allowable length depends on the particular special register. A string that exceeds the limit can be specified only through assignment from a host variable. If this release of DB2 increases the maximum allowed length of a string constant, then an attempt to exploit the new length before using the New Function Mode produces this SQL return code.

Two consecutive string delimiters are used to represent one string delimiter within the character string, but these count as 2 bytes when calculating the lengths of character string constants.

System Action: The statement cannot be executed.

Programmer Response: The requested function is not available interactively. If the error occurred in the context of an SQL statement embedded in an application program, the desired result can be achieved by assigning the long string to a host variable, and substituting that variable for the string literal in the SQL statement.

SQLSTATE: 54002

-103 *literal* IS AN INVALID NUMERIC LITERAL

Explanation: The indicated 'literal' begins with a digit, but is not a valid integer, decimal, or float literal.

System Action: The statement cannot be executed.

Programmer Response: Correct the invalid literal.

SQLSTATE: 42604

-104 ILLEGAL SYMBOL "token". SOME SYMBOLS THAT MIGHT BE LEGAL ARE: token-list

Explanation: A syntax error was detected where the symbol "token" occurs in the SQL statement. The list of symbols that might be legal shows some alternate symbols that could possibly be correct at that point, if the preceding part of the statement is entirely correct.

However, the preceding part of the statement might be incorrect. For example, if an important keyword is omitted, DB2 detects the error later, and not always immediately after the point where the keyword should appear. The list of alternate symbols are only suggestions. Some of those symbols might not even be legal for statements to be executed by DB2. Those symbols are possibly correct for statements sent to other database management systems.

This SQL code will also be issued if the RELEASE TO SAVEPOINT statement is specified without a savepoint name.

System Action: The statement cannot be executed.

Programmer Response: Correct the statement and execute it again.

SQLSTATE: 42601

-105 INVALID STRING

Explanation: The statement contains an invalid string. It is neither a character string nor a graphic string.

System Action: The statement cannot be executed.

Programmer Response: Specify the correct format of the string. Check for a graphic string, paired delimiters, the character G or N, and an even number of bytes within the string.

SQLSTATE: 42604

-107 THE NAME name IS TOO LONG. MAXIMUM ALLOWABLE SIZE IS size

Explanation: The name is too long. The maximum permissible length for names of that type is indicated by size. For each type of name, the DB2 SQL Reference lists the maximum allowed length. If this release of DB2 increases the maximum allowed length of a name, then an attempt to exploit the new length before using the New Function Mode produces this SQL return code.

System Action: The statement cannot be processed.

Programmer Response: Choose a shorter name for the object.

SQLSTATE: 42622

-108 THE NAME name IS QUALIFIED INCORRECTLY

Explanation: The name name is improperly qualified.

A target name on the RENAME statement may not have a qualifier.

System Action: The statement cannot be executed.

Programmer Response: Remove the qualifier and reissue the statement.

SQLSTATE: 42601

-109 clause CLAUSE IS NOT PERMITTED

Explanation: The indicated clause is not permitted in the context in which it appears in this SQL statement for the following reasons:

- A subselect cannot have an INTO clause.
- A CREATE VIEW statement cannot have INTO, ORDER BY, or FOR UPDATE clauses.
- An embedded SELECT statement cannot have ORDER BY or FOR UPDATE clauses
- SELECT statements used in cursor declarations cannot have an INTO clause.
- A RAISE_ERROR function can only be used as a select list item if it is cast to some data type using the CAST specification.
- DESCRIBE INPUT statement can not have USING clause.
- QUERYNO cannot be specified as part of an EXPLAIN statement when the EXPLAIN statement contains an 'explainable-sql-statement'.
- The table being updated in a POSITIONED UPDATE statement cannot be assigned a correlation name.
- INPUT SEQUENCE cannot be specified if the table-spec is not included in a select-statement that contains an INSERT statement.
- A SET DATA TYPE clause cannot be specified on ALTER TABLE for an identity column.

If the clause is part of a CREATE INDEX, CREATE TABLE, CREATE TABLESPACE or ALTER TABLESPACE statement, see the appropriate section of the SQL Reference for a description of the valid use of clauses for the statement.

System Action: The statement cannot be executed.

Programmer Response: Correct the SQL statement.

SQLSTATE: 42601

-110 INVALID HEXADECIMAL LITERAL BEGINNING string

Explanation: The string constant that begins with the specified string is invalid because it has at least one of the following errors:

- the string constant contains one or more characters that are not valid hexadecimal digits
- the string constant does not have an even number of digits
- for a UX or GX string constant, the number of digits is not a multiple of 4

System Action: The statement cannot be executed.

Programmer Response: Correct the invalid string constant.

SQLSTATE: 42606

-111 AN AGGREGATE FUNCTION DOES NOT INCLUDE A COLUMN NAME

Explanation: The specification of an aggregate function (for example: AVG, MAX, MIN, or SUM) was invalid because such functions must include a column name in the operand. In a trigger definition, a transition variable specification does not qualify as a column name for this purpose.

This message is still issued with Version 8 prior to New Function Mode.

System Action: The statement cannot be executed.

Programmer Response: A column name must be specified as an operand to the function. Refer to Chapter 3 of *DB2 SQL Reference* for information about the proper usage of aggregate functions.

SQLSTATE: 42901

-112 THE OPERAND OF A AGGREGATE FUNCTION INCLUDES AN AGGREGATE FUNCTION OR A SCALAR FULLSELECT

Explanation: The operand of an aggregate function can be either an expression or DISTINCT followed by an expression. The operand cannot be another aggregate function or a scalar fullselect.

System Action: The statement cannot be executed.

Programmer Response: Correct the function specification. Refer to Chapter 3 of *DB2 SQL Reference* for information about the proper usage of aggregate functions.

SQLSTATE: 42607

-113 INVALID CHARACTER FOUND IN: string, REASON CODE nnn

Explanation: The *string* contains an invalid character. It can be an SQL ordinary identifier name, a host variable name, or a DBCS comment.

For SBCS SQL ordinary identifiers, names of buffer pools, databases, plans, and storage groups must contain only uppercase alphabetic or national

characters and numerics when CHARSET is KATAKANA; the first character must be alphabetic or national.

In some cases, the name of an SQL procedure can contain an underscore character. Please see the *DB2 SQL Reference* for more information.

The following reason codes apply to SBCS identifiers:

000 An invalid character was found in the SBCS identifier (including the case in which a DBCS identifier was used where only an SBCS identifier is allowed.)

The following reason codes apply to DBCS identifiers or comments:

101 An odd number of bytes exists between the shift-out and the shift-in character.

102 Either a shift-in or shift-out character is missing.

103 DBCS blanks X'4040' are not allowed.

104 There are no characters between the shift-out and the shift-in characters.

105 Shift-out cannot be the first byte of the DBCS character between the shift-out and the shift-in characters.

System Action: Processing is terminated.

User Response: Correct the name.

SQLSTATE: 42602

-114 THE LOCATION NAME *location* DOES NOT MATCH THE CURRENT SERVER

Explanation: A 3-part SQL procedure name was provided for one of the following SQL statements:

```
ASSOCIATE LOCATORS
CALL
DESCRIBE PROCEDURE
```

The first part of the SQL procedure name, which specifies the location where the stored procedure resides, did not match the value of the SQL CURRENT SERVER special register.

System Action: The statement cannot be executed.

Programmer Response: Take one of these actions to resolve the mismatch:

- Change the location qualifier to match the CURRENT SERVER special register.
- Issue an SQL CONNECT to the location where the stored procedure resides before issuing the SQL statement. Ensure that the SQL CALL statement is issued before the ASSOCIATE LOCATORS or DESCRIBE PROCEDURE.
- Bind the package containing the 3-part SQL procedure name with the BIND option

DBPROTOCOL(DRDA). With this option, DB2 implicitly uses the DRDA protocol for remote access to the stored procedure.

- Correct the statements so that the exact syntax used to specify the procedure name on the CALL statement be the same as that on the ASSOCIATE LOCATOR and/or DESCRIBE PROCEDURE. If an unqualified name is used to CALL the procedure, the 1-part name must also be used on the other statements. If the CALL statement is made with a 3-part name, and the current server is the same as the location in the 3-part name, the ASSOCIATE LOCATOR or DESCRIBE procedure can omit the location.

SQLSTATE: 42961

-115 A PREDICATE IS INVALID BECAUSE THE COMPARISON OPERATOR *operator* IS FOLLOWED BY A PARENTHESIZED LIST OR BY ANY OR ALL WITHOUT A SUBQUERY

Explanation: A simple comparison like '>' must not be followed by a list of items. ANY and ALL comparisons must be followed by a subselect, rather than an expression or a list of items.

System Action: The statement cannot be executed.

Programmer Response: Correct the SQL statement. Refer to Chapter 5 of *DB2 SQL Reference* for information about the syntax of SQL statements.

SQLSTATE: 42601

-117 THE NUMBER OF VALUES ASSIGNED IS NOT THE SAME AS THE NUMBER OF SPECIFIED OR IMPLIED COLUMNS

Explanation: The number of insert values in the value list of the INSERT statement is not the same as the number of object columns specified. Alternatively, the number of values on the right side of an assignment in a SET assignment statement or the SET clause of an UPDATE statement does not match the number of columns on the left side.

System Action: The statement cannot be executed. No data was inserted into the object table.

Programmer Response: Correct the statement to specify one and only one value for each of the specified object columns.

SQLSTATE: 42802

-118 THE OBJECT TABLE OR VIEW OF THE DELETE OR UPDATE STATEMENT IS ALSO IDENTIFIED IN A FROM CLAUSE

Explanation: The table or view specified as the object of a DELETE or UPDATE statement also appears in the FROM clause of a subselect within the statement.

The table or view that is the object of a UPDATE or DELETE cannot also be used to supply the values to be inserted or to qualify the rows to be updated or deleted.

System Action: The statement cannot be executed. No data was updated or deleted.

Programmer Response: The implied function is not supported by DB2. It may be possible to obtain the desired result by creating a temporary copy of the object table or view and addressing the subselect to that copy. Refer to Chapter 5 of *DB2 SQL Reference* for information about the syntax of SQL statements.

SQLSTATE: 42902

-119 A COLUMN IDENTIFIED IN A HAVING CLAUSE IS NOT INCLUDED IN THE GROUP BY CLAUSE

Explanation: A column identified in a HAVING clause (possibly within a scalar function) does not appear in the GROUP BY clause. Columns specified in a HAVING clause must appear within aggregate functions or also be specified in the GROUP BY clause.

Grouping expressions can be used in a search condition in a HAVING clause. A grouping expression specifies only one value for each group. A grouping expression specified in this context must exactly match a grouping expression specified in the GROUP BY clause, except that blanks are not significant.

System Action: The statement cannot be executed.

Programmer Response: The implied function is not supported by DB2. Refer to Chapter 4 of *DB2 SQL Reference* for information about the proper usage of HAVING and GROUP BY clauses.

SQLSTATE: 42803

-120 AN AGGREGATE FUNCTION IS NOT VALID IN THE CONTEXT IN WHICH IT WAS INVOKED

Explanation: An aggregate function or a user-defined function that is sourced on an aggregate function is not permitted in a SET clause, VALUES clause, SET host-variable statement, SET transition-variable statement, assignment statement, or as the expression of a RETURN statement. An aggregate function or a user-defined function that is sourced on an aggregate function is allowed in a WHERE clause only if the WHERE clause appears within a subquery of a HAVING clause.

System Action: The statement cannot be executed.

Programmer Response: The implied function is not supported by DB2. Refer to Chapter 4 of *DB2 SQL Reference* for information about restrictions on operands that can be specified within a WHERE clause, SET clause, VALUES clause, SET host-variable statement, SET transition-variable statement, assignment

statement, or as the expression of a RETURN statement.

SQLSTATE: 42903

-121 THE COLUMN *name* IS IDENTIFIED MORE THAN ONCE IN THE INSERT OR UPDATE OR SET TRANSITION VARIABLE STATEMENT

Explanation: The same column 'name' is specified more than once, either in the list of object columns of an INSERT statement, in the SET clause of an UPDATE statement, or in a SET transition variable statement.

System Action: The statement cannot be executed. No data was inserted or updated in the object table.

Programmer Response: Correct the syntax of the statement so that each column name is specified only once.

SQLSTATE: 42701

-122 A SELECT STATEMENT WITH NO GROUP BY CLAUSE CONTAINS A COLUMN NAME AND AN AGGREGATE FUNCTION IN THE SELECT CLAUSE OR A COLUMN NAME IS CONTAINED IN THE SELECT CLAUSE BUT NOT IN THE GROUP BY CLAUSE

Explanation: The SELECT statement contains one of these errors:

- The statement contains a column name and an aggregate function in the SELECT clause, but no GROUP BY clause.
- A column name is contained in the SELECT clause (possibly within a scalar function) but not in the GROUP BY clause. Grouping expressions can be used in a SELECT list. A grouping expression specifies only one value for each group. A grouping expression that is specified in this context must exactly match a grouping expression that is specified in the GROUP BY clause, except that blanks are not significant.

Note: A HAVING clause specified without a GROUP BY clause implies a GROUP BY with no columns. Thus, no column names are allowed in the SELECT clause.

- A *sort-key-expression* was specified in the ORDER BY clause, the result table contains grouped data, but the *select-clause* and ORDER BY clause contain a mixture of grouped data and non-grouped data. Grouping expressions can be used in a *sort-key-expression* of an ORDER BY clause.. A grouping expression specifies only one value for each group. A grouping expression that is specified in this context must exactly match a grouping expression that is specified in the GROUP BY clause, except that blanks are not significant.

System Action: The statement cannot be executed.

Programmer Response: You can correct the statement by:

- including the columns in the GROUP BY clause that are in the SELECT clause, or
- removing the columns from the SELECT clause.

Refer to Chapter 4 of *DB2 SQL Reference* for information about the use of GROUP BY clauses in SQL statements.

SQLSTATE: 42803

-123 THE PARAMETER IN POSITION *n* IN THE FUNCTION *name* MUST BE A CONSTANT OR KEYWORD

Explanation: The parameter in position *n* in the function *name* is not a constant when it is required to be a constant or a keyword when it is required to be a keyword.

System Action: The statement could not be processed.

Programmer Response: Action: Ensure that each argument of the function conforms to the definition of the corresponding parameter.

SQLSTATE: 42601

-125 AN INTEGER IN THE ORDER BY CLAUSE DOES NOT IDENTIFY A COLUMN OF THE RESULT

Explanation: The ORDER BY clause in the statement contains a column number that is either less than one, or greater than the number of columns of the result table (the number of items in the SELECT clause).

System Action: The statement cannot be executed.

Programmer Response: Correct the syntax of the ORDER BY clause such that each column identifier properly denotes a column of the result table.

SQLSTATE: 42805

-126 THE SELECT STATEMENT CONTAINS BOTH AN UPDATE CLAUSE AND AN ORDER BY CLAUSE

Explanation: The SELECT statement in the declaration for a cursor contains both an UPDATE clause and an ORDER BY clause. Unless you use a scrollable cursor, an ORDER BY clause cannot be specified in the declaration for a cursor that is to be used for UPDATE.

System Action: The statement cannot be processed. The cursor remains undefined in the application program.

Programmer Response: The implied function is not

supported by DB2. A cursor that is to be used for update cannot be defined to fetch the rows of the object table in a specific order.

Refer to Chapter 4 of *DB2 SQL Reference* for information about restrictions on the declarations for cursors to be used for update.

SQLSTATE: 42829

**-127 DISTINCT IS SPECIFIED MORE THAN
ONCE IN A SUBSELECT**

Explanation: The DISTINCT qualifier can be used only once in a SELECT statement or a subselect.

Note: This message is still issued with Version 8 prior to New Function Mode.

System Action: The statement cannot be executed.

Programmer Response: The implied function is not supported by DB2. Refer to Chapter 4 of *DB2 SQL Reference* for information about restriction on the use of the DISTINCT qualifier.

SQLSTATE: 42905

**-128 INVALID USE OF NULL IN A
PREDICATE**

Explanation: The use of NULL in the search condition does not conform to the rules of SQL syntax.

System Action: The statement cannot be executed.

Programmer Response: The implied function is not supported by DB2. Refer to Chapter 2 of *DB2 SQL Reference* for information about the proper use of the NULL operand.

SQLSTATE: 42601

**-129 THE STATEMENT CONTAINS TOO
MANY TABLE NAMES**

Explanation: A subselect (including all subqueries) can have a maximum of 225 references to table names.

System Action: The statement cannot be executed.

Programmer Response: Break the SQL statement into two or more simpler statements with less than 225 table references in each. The count will include the number of base table occurrences from each table or view on the FROM list. Refer to Chapter 4 of *DB2 SQL Reference* for the definition of a subselect.

SQLSTATE: 54004

**-130 THE ESCAPE CLAUSE CONSISTS OF
MORE THAN ONE CHARACTER, OR
THE STRING PATTERN CONTAINS AN
INVALID OCCURRENCE OF THE
ESCAPE CHARACTER**

Explanation: The ESCAPE character must be a single character, either SBCS or DBCS as appropriate. For 'column-name LIKE pattern', the ESCAPE character can only appear in the character string if it is followed by itself, %, or _ (underscore). The Escape Clause cannot be specified if the column name at the left of the LIKE or NOT LIKE has the MIXED subtype.

System Action: The statement cannot be executed.

Programmer Response: Correct the string pattern, or choose a different ESCAPE character and change the pattern accordingly, or eliminate the use of the Escape Clause on the LIKE or NOT LIKE predicate where the column name to the left has the MIXED subtype.

SQLSTATE: 22019 if other than invalid ESCAPE pattern. 22025 if invalid ESCAPE pattern.

**-131 STATEMENT WITH LIKE PREDICATE
HAS INCOMPATIBLE DATA TYPES**

Explanation: If the column name at the left of LIKE or NOT LIKE is of type character, the expression at the right and the ESCAPE character must be of type character. If the column name is of type graphic, the expression at the right and the ESCAPE character must be of type graphic.

System Action: The statement cannot be executed.

Programmer Response: Check the data type of every operand.

SQLSTATE: 42818

-132 AN OPERAND OF *value* IS NOT VALID

Explanation: The operation value can be the LIKE predicate, the ESCAPE clause, the LOCATE scalar function, or the POSSTR scalar function. The operand or argument of *value* was not valid for one of the following reasons:

- The match-expression operand of a LIKE or NOT LIKE predicate must be a string expression.
- The pattern-expression operand of the LIKE or NOT LIKE predicate, or search-string argument of the LOCATE or POSSTR function must be a string expression that can be specified by any one of the following:
 - A constant
 - A special register
 - A host variable (including a LOB locator variable)
 - A scalar function whose arguments are any of the above (though nested function invocations cannot be used)

- A CAST specification whose arguments are any of the above
- An expression that concatenates (using CONCAT or ||) any of the above
- The source-string argument of the LOCATE or POSSTR function must be a string expression that can be specified by any of the following:
 - A constant
 - A special register
 - A host variable (including a LOB locator variable)
 - A scalar function whose arguments are any of the above (though nested function invocations cannot be used)
 - A CAST specification whose arguments are any of the above
 - A column name
 - An expression that concatenates (using CONCAT or ||) any of the above
- The escape-expression operand of the LIKE or NOT LIKE predicate must be a string expression that can be specified by any of the following:
 - A constant
 - A host variable (including a LOB locator variable)
 - A scalar function whose arguments are any of the above (though nested function invocations cannot be used)
 - A CAST specification whose arguments are any of the above

See the *DB2 SQL Reference* for the rules of what can be specified in each context.

A LIKE predicate, ESCAPE clause, LOCATE scalar function or POSSTR scalar function cannot be used with DATE, TIME, or TIMESTAMP.

System Action: The statement cannot be processed.

Programmer Response: Check and correct the syntax of the LIKE predicate, or LOCATE or POSSTR scalar function.

SQLSTATE: 42824

-133 AN AGGREGATE FUNCTION IN A SUBQUERY OF A HAVING CLAUSE IS INVALID BECAUSE ALL COLUMN REFERENCES IN ITS ARGUMENT ARE NOT CORRELATED TO THE GROUP BY RESULT THAT THE HAVING CLAUSE IS APPLIED TO

Explanation: If an aggregate function has a correlated column reference, it must be correlated from within a HAVING clause to the GROUP BY result that the HAVING clause is applied to. All column references in the argument must satisfy this condition.

System Action: The statement cannot be executed.

Programmer Response: Refer to Chapter 4 of *DB2 SQL Reference* for information about restrictions on the syntax of the HAVING clause.

SQLSTATE: 42906

-134 IMPROPER USE OF LONG STRING COLUMN OR AN EXPRESSION THAT RESOLVES TO A LONG STRING *name*

Explanation: The SQL statement references a long string, but DB2 does not allow the use of long strings in the context that was specified.

System Action: DB2 cannot process the statement.

Note: The *column-name* might not be returned in the SQLCA, depending on the nature of the error and the syntax in which it occurred.

Programmer Response: DB2 does not support the requested operation on a long string value. Refer to Chapter 2 of *DB2 SQL Reference* for information about restrictions on the specification and manipulation of long string values.

SQLSTATE: 42907

-136 SORT CANNOT BE EXECUTED BECAUSE THE SORT KEY LENGTH IS GREATER THAN 16000 BYTES

Explanation: A sort key is derived from the list of columns specified following a DISTINCT qualifier, or in an ORDER BY or GROUP BY clause. If both a DISTINCT qualifier and an ORDER BY or GROUP BY clause are present, the sort key is derived from the combination of both lists of columns.

The *internal* length of the sort key cannot exceed 16000 bytes. In attempting to process the SQL statement, the internal length of the sort key derived from the DISTINCT and/or ORDER BY or GROUP BY specifications was found to exceed that maximum limit.

System Action: The statement cannot be executed.

Programmer Response: The statement must be modified such that the internal length of the sort key will not exceed the maximum limit. In general, this means that one or more column names must be deleted from the ORDER BY or GROUP BY clause, or the list following the DISTINCT qualifier.

SQLSTATE: 54005

-137 THE LENGTH RESULTING FROM *operation* IS GREATER THAN *maximum-length*

Explanation: The length of the result of concatenation or a function exceeds the defined maximum. The operation that resulted in the error is *operation*.

- For concatenation, the length cannot exceed 32,764 (if character operands) or 16,382 (if graphic operands).
- For other functions, see *DB2 SQL Reference* for the maximum result length.

System Action: The statement cannot be executed.

Programmer Response: Ensure that the length of the result does not exceed the defined maximum.

SQLSTATE: 54006

-138 THE SECOND OR THIRD ARGUMENT OF THE SUBSTR FUNCTION IS OUT OF RANGE

Explanation: One of the following conditions exists:

- The second argument of the SUBSTR function is less than 1 or greater than M.
- The third argument of the SUBSTR function is an integer constant 0 or an expression whose value is less than 0 or greater than M-N+1.

M is the length of the first argument, if it is of fixed-length, or M is the maximum length of the first argument, if it is of varying-length. N is the value of the second argument.

System Action: The statement cannot be executed.

Programmer Response: Ensure that the second and third arguments of the SUBSTR function have legal values according to the above rules.

SQLSTATE: 22011

-142 THE SQL STATEMENT IS NOT SUPPORTED

Explanation: An SQL statement was detected that is not supported by the database. The statement might be valid for other IBM relational database products or it might be valid in another context. For example, statements such as VALUES and SIGNAL SQLSTATE can appear only inside a trigger. The SQLCODE is also issued if a DB2 private protocol application uses SQL statements that were added after Version 7. DB2 limits the SQL statements that a DB2 private protocol application can use to Version 7 or earlier SQL statements. See Part 4 of *DB2 Application Programming and SQL Guide* for more information.

Additionally, This SQL code will also be issued if a distributed private protocol application uses SQL statements that were implemented after Version 7. DB2 limits the SQL statements that a distributed private protocol application can use to Version 7 or lower SQL statements. Please see "MOVING FROM DB2 PRIVATE PROTOCOL ACCESS TO DRDA ACCESS" in *DB2 Application Programming and SQL Guide* for more information.

System Action: The statement cannot be executed.

Programmer Response: Change the syntax of the SQL statement or remove the statement from the program.

SQLSTATE: 42612

-144 INVALID SECTION NUMBER *number*

Explanation: One of the following:

1. The user attempted to execute an invalid section.
2. This release of DB2 does not support the SQL statement.
3. The section number in the call parameter list is one of these:
 - Negative
 - An invalid duplicate
 - Greater than the maximum section number of the DBRM or package.

System Action: The statement is not executed.

Programmer Response: For case 1: If you are executing a package that was bound with SQLERROR(CONTINUE), determine whether the statement in question was bound as a valid section. You can use the following statements to query the DB2 catalog:

```
SELECT SQLERROR
FROM SYSIBM.SYSPACKAGE
WHERE COLLID = collection-id AND
NAME = package-id AND
VERSION = version-name;
```

If that query returns 'C', the package was bound with SQLERROR(CONTINUE).

```
SELECT STMTNO, TEXT
FROM SYSIBM.SYSPACKSTMT
WHERE COLLID = collection-id AND
NAME = package-id AND
VERSION = version-name AND
SECTNO = number AND
BINDERROR = 'Y';
```

If that query returns any rows, the section is invalid. Refer to the error messages issued during the bind to determine the cause. Correct any errors and bind the package again, using the REPLACE option.

For case 2: If the DB2 system has fallen back to a previous release, determine whether there are any SQL statements with a section number of zero that are not supported by that release. You can use the following statements to query the DB2 catalog.

When executing from a DBRM, use:

```
SELECT *
FROM SYSIBM.SYSSTMT
WHERE SECTNO = 0
ORDER BY NAME, PLNAME, STMTNO, SEQNO;
```

When executing from a package, use:

```
SELECT *
FROM SYSIBM.SYSPACKSTMT
WHERE SECTNO = 0
ORDER BY COLLID, NAME, VERSION, STMTNO, SEQNO;
```

For case 3: Examine the application to determine whether the call parameter list was changed in some way. In general, you should not attempt to change the output of the precompiler.

SQLSTATE: 58003

-147 ALTER FUNCTION *function-name* FAILED BECAUSE SOURCE FUNCTIONS CANNOT BE ALTERED

Explanation: The function cannot be altered because it is a source function. Only external scalar functions, or external table functions can be altered.

To change an existing source function, you must DROP the function and recreate it.

System Action: The statement cannot be executed.

Programmer Response: Change the statement to refer to a function that can be altered, or recreate the function by dropping it and then creating a new version of it.

SQLSTATE: 42809

-148 THE SOURCE TABLE *source-name* CANNOT BE RENAMED OR ALTERED

Explanation: Possible cases:

- 1 The RENAME statement cannot be used to rename a view, an active RLST table, or a table for which a synonym is defined.
- 2 The ALTER statement cannot be used to alter the length of the column because the column is referenced in a referential integrity relation, a user exit (field procedure, edit procedure, valid procedure, stored procedure or user defined function), a global temporary table, or a table defined with data capture changes. If the table name specified in the alter is a view or if there exists a row in SYSVIEWWDEP that has *source-name* as a base table name, then this ALTER statement will fail.

System Action: The statement cannot be executed.

Programmer Response: For case:

- 1 Drop all views, inactivate the RLST table, or drop the synonym.
- 2 Avoid referential integrity relations, user exits, or global temporary tables.
- 3 Run REORG INDEX, REORG TABLESPACE, or REBUILD INDEX. If the index is partitioned, then run the utility on all the partitions. Reissue the statement.

SQLSTATE: 42809

-150 THE OBJECT OF THE INSERT, DELETE, OR UPDATE STATEMENT IS A VIEW, SYSTEM-MAINTAINED MATERIALIZED QUERY TABLE, OR TRANSITION TABLE FOR WHICH THE REQUESTED OPERATION IS NOT PERMITTED

Explanation: One of the following occurred:

- A transition table was named in an INSERT, UPDATE, or DELETE statement in a triggered action. Transition tables are read-only.

The view named in the INSERT, UPDATE, or DELETE statement is defined in such a way that the requested insert, update, or delete operation cannot be performed upon it.

Inserts into a view are prohibited if:

- The view definition contains a join, a GROUP BY, or a HAVING clause.
- The SELECT clause in the view definition contains the DISTINCT qualifier, an arithmetic expression, a string expression, a built-in function, or a constant.
- Two or more columns of the view are derived from the same column.
- A base table of the view contains a column that does not have a default value and is not included in the view.

Updates to a view are prohibited if:

- The view definition contains a join, a GROUP BY, or a HAVING clause.
- The SELECT clause in the view definition contains the DISTINCT qualifier or a function.

Also, a given column in a view cannot be updated (that is, the values in that column cannot be updated) if the column is derived from an arithmetic expression, a constant, a column that is part of the key of a partitioned index, or a column of a catalog table that cannot be updated.

Deletes against a view are prohibited if:

- The view definition contains a join, a GROUP BY, or a HAVING clause.
- The SELECT clause in the view definition contains the DISTINCT qualifier or a built-in function.

- A system-maintained materialized query table was named in an INSERT, UPDATE, or DELETE statement. System-maintained materialized query tables are refreshed using the REFRESH TABLE statement.

System Action: The statement cannot be executed. No data was inserted, updated, or deleted.

Programmer Response: The requested function cannot be performed on the view. Refer to Chapter 5 of *DB2 SQL Reference* for further information regarding inserting, deleting, and updating views.

If the error occurred on a CREATE TRIGGER statement, remove the INSERT, UPDATE, or DELETE reference to the transition table.

If the table is a system-maintained materialized query table, the requested function cannot be performed on that table. Refer to the description of the REFRESH TABLE statement in Chapter 5 of .

SQLSTATE: 42807

-151 THE UPDATE STATEMENT IS INVALID BECAUSE THE CATALOG DESCRIPTION OF COLUMN *column-name* INDICATES THAT IT CANNOT BE UPDATED

Explanation: The specified column cannot be updated for one of the following reasons:

- The values for columns occurring in the partitioning key of a partitioned table cannot be updated.
- The object table is a view and the specified column is defined (in the definition of the view) in such a way that it cannot be updated.
- The object table is a catalog table with no columns that can be updated.
- The object column is a ROWID column.
- The object column is defined with the AS IDENTITY and GENERATED ALWAYS attributes.
- The specified column of catalog tables cannot be updated because the column itself is not updatable.

Individual columns in a view cannot be updated for one of the following reasons:

- The column is derived from an SQL function, an arithmetic expression, or a constant.
- The column is defined for a column of an underlying view that cannot be updated.
- The column is defined for a read-only view.
- The column is defined for a column that is in the partitioning key of a partitioned table.

System Action: The statement cannot be executed. No data was updated in the object table or view.

Programmer Response: The requested function is not supported by DB2. Refer to the description of the UPDATE statement in Chapter 5 of *DB2 SQL Reference* for information about restrictions on the ability to update ROWID columns, identity columns, and columns in partitioned tables and views.

SQLSTATE: 42808

-152 THE DROP *clause* CLAUSE IN THE ALTER STATEMENT IS INVALID BECAUSE *constraint-name* IS A *constraint-type*

Explanation: The DROP *clause* of an ALTER TABLE statement tried to drop a constraint that does not match the *constraint-type* in the DROP clause. *clause* must identify an appropriate *constraint-type* as follows:

REFERENTIAL CONSTRAINT

The identified constraint must be a referential constraint.

CHECK CONSTRAINT

The identified constraint must be a check constraint.

PRIMARY KEY CONSTRAINT

The identified constraint must be a primary key constraint.

UNIQUE KEY CONSTRAINT

The identified constraint must be a unique key constraint.

System Action: The ALTER TABLE DROP statement cannot be executed. No object was dropped.

Programmer Response: Drop the existing object with the correct DROP clause of the ALTER TABLE statement.

SQLSTATE: 42809

-153 THE STATEMENT IS INVALID BECAUSE THE VIEW OR TABLE DEFINITION DOES NOT INCLUDE A UNIQUE NAME FOR EACH COLUMN

Explanation: You must specify a list of column names if the result table of the fullselect that is specified in the CREATE VIEW, CREATE TABLE, or DECLARE GLOBAL TEMPORARY TABLE statement has duplicate column names or an unnamed column (a column from a constant, function, or expression).

System Action: The statement cannot be executed. The specified view or table was not created, or the declared temporary table was not declared.

Programmer Response: Correct the statement by providing a list of names for the columns of the view or table. Refer to Chapter 5 of *DB2 SQL Reference* for information about the syntax of the CREATE VIEW statement, the CREATE TABLE statement, or the DECLARE GLOBAL TEMPORARY TABLE statement.

SQLSTATE: 42908

-154 THE STATEMENT FAILED BECAUSE VIEW OR TABLE DEFINITION IS NOT VALID

Explanation: The view defined in the CREATE VIEW statement, the table defined in the CREATE TABLE statement, or the table declared in the DECLARE GLOBAL TEMPORARY TABLE statement is not valid because the view or table definition references a remote object.

System Action: The statement cannot be executed. The specified object is not defined.

Programmer Response: Refer to Chapter 5 of *DB2 SQL Reference* for information about restrictions on the definitions for views, materialized query tables, or declared temporary tables.

SQLSTATE: 42909

-156 THE STATEMENT DOES NOT IDENTIFY A TABLE

Explanation: The statements ALTER TABLE, DROP TABLE, LOCK TABLE, CREATE INDEX, and CREATE TRIGGER apply only to tables. Indexes and triggers can be defined only on tables.

System Action: The statement cannot be executed. The specified view or remote object was not altered, dropped, or locked, or the index or trigger was not created.

Programmer Response: Verify that the proper name was specified in the statement.

SQLSTATE: 42809

-157 ONLY A TABLE NAME CAN BE SPECIFIED IN A FOREIGN KEY CLAUSE. *object-name* IS NOT THE NAME OF A TABLE.

Explanation: The indicated object was identified in a FOREIGN KEY clause of a CREATE or ALTER TABLE statement. A FOREIGN KEY clause must identify a table.

System Action: The statement cannot be executed.

Programmer Response: Correct the statement to specify a table name in the foreign key clause.

SQLSTATE: 42810

-158 THE NUMBER OF COLUMNS SPECIFIED FOR THE VIEW OR TABLE IS NOT THE SAME AS THE NUMBER OF COLUMNS SPECIFIED BY THE FULLSELECT, OR THE NUMBER OF COLUMNS SPECIFIED IN THE CORRELATION CLAUSE IN A FROM CLAUSE IS NOT THE SAME AS THE NUMBER OF COLUMNS IN THE CORRESPONDING TABLE, VIEW, TABLE EXPRESSION, OR TABLE FUNCTION

Explanation: There are three potential reasons for this SQL code:

- The number of column names that are specified for a view in a CREATE VIEW statement must equal the number of elements that are specified in the SELECT clauses of the following fullselect. These elements may be column names, SQL functions, and expressions, for example.
- The number of column names that are specified for a table in a CREATE TABLE statement must equal the number of columns in the result table of the following fullselect.
- The number of column names that are specified in a correlation clause must equal the number of columns in the corresponding table, view, table expression or table function.

System Action: The statement cannot be executed.

Programmer Response: Correct the syntax of the statement to specify a column name for each column in the corresponding object (table, view, etc.). Refer to Chapter 5 of *DB2 SQL Reference* for information about the syntax of the statement.

SQLSTATE: 42811

-159 THE STATEMENT REFERENCES *object-name* WHICH IDENTIFIES AN *object-type* RATHER THAN AN *expected-object-type*

Explanation: The object *object-name* was specified as part of a statement, and refers to an object of type *object-type* instead of the expected type *expected-object-type*. The type of the object that is provided with the statement must match the type that is identified by *expected-object-type*. For example, if the statement is DROP ALIAS TED.T1, then TED.T1 must be an alias name.

If *object-type* or *expected-object-type* is TABLE, and *object-type* or *expected-object-type* is a particular type of table, then the type of table was not valid for the statement that was specified.

System Action: The statement cannot be executed.

Programmer Response: Change the statement to match the type of object that is identified by

expected-object-type. For example:

- An ALTER VIEW statement must reference an existing view.
- A COMMENT ON ALIAS statement must specify the name of an alias, and not the name of a table or view.
- A COMMENT ON TABLE statement must reference an existing table or view.
- A CREATE INDEX statement with the UNIQUE keyword must specify a table that is not a materialized query table.
- A CREATE TRIGGER statement must specify a table in the ON clause that is not a materialized query table. That is, a trigger cannot be defined for a materialized query table.
- A DROP ALIAS statement must specify the name of an alias, and not the name of a table or view.
- A DROP TABLE statement must reference an existing table. If an alias is specified, then the table that the alias refers to is dropped. Use the DROP ALIAS statement to drop the alias.
- A DROP VIEW statement must reference an existing view.
- A REFRESH TABLE statement must refer to a materialized query table.

SQLSTATE: 42809

-160 THE WITH CHECK OPTION CANNOT BE USED FOR THE SPECIFIED VIEW

Explanation: The WITH CHECK OPTION does not apply to a view definition under either of the following circumstances:

- The view is read-only (for example, the view definition includes DISTINCT GROUP BY, or JOIN).
- The view definition includes a subquery.

System Action: The statement cannot be executed. The specified view was not created.

Programmer Response: Refer to Chapter 5 of *DB2 SQL Reference* for rules regarding use of the WITH CHECK OPTION in view definitions.

SQLSTATE: 42813

-161 THE INSERT OR UPDATE IS NOT ALLOWED BECAUSE A RESULTING ROW DOES NOT SATISFY THE VIEW DEFINITION

Explanation: The WITH CHECK OPTION applies to the view that is the object of the INSERT or UPDATE statement. Consequently, all attempts to insert or update rows in that view are checked to ensure that the results will conform to the view definition.

System Action: The statement cannot be executed. No inserts or updates were performed, and the contents

of the object view (and underlying base table) remain unchanged.

Programmer Response: Examine the view definition to determine why the requested INSERT or UPDATE was rejected. Note that this may be a data-dependent condition.

SQLSTATE: 44000

-164 *auth-id1* DOES NOT HAVE THE PRIVILEGE TO CREATE A VIEW WITH QUALIFICATION *authorization-ID*

Explanation: The authorization ID *auth-id1* does not have the authority necessary to create views with qualifiers other than its own authorization ID. Specifically, the attempt to create a view with qualifier *authorization-ID* is rejected.

System Action: The statement cannot be executed. The specified view was not created.

Programmer Response: Do not attempt to create views with other than your own ID as a qualifier. Only an authorization ID that holds 'SYSADM' or 'DBADM' authority can create views for other authorization IDs. The DBADM privilege should be granted on any of the databases that contain at least one of the tables on which this CREATE VIEW is based.

SQLSTATE: 42502

-170 THE NUMBER OF ARGUMENTS SPECIFIED FOR *function-name* IS INVALID

Explanation: An SQL statement includes the scalar function '*function-name*' with either too many or too few arguments.

System Action: The statement cannot be executed.

Programmer Response: Correct the statement. Refer to Chapter 3 of *DB2 SQL Reference* for information about the number of arguments required by the scalar function '*function-name*'.

SQLSTATE: 42605

-171 THE DATA TYPE, LENGTH, OR VALUE OF ARGUMENT *nn* OF *function-name* IS INVALID

Explanation: Either the data type, the length or the value of argument *nn* of scalar function *function-name* is incorrect.

If the encoding scheme is EBCDIC or ASCII, a possible reason for this error is that a character argument was specified for a built-in function that expects a graphic argument, or a graphic argument was specified for a built-in function that expects a character argument. The UNICODE encoding scheme does support the mixing of character and graphic arguments.

System Action: The statement cannot be executed.

Programmer Response: Correct the statement. Refer to Chapter 3 of *DB2 SQL Reference* for rules for each argument of the scalar function *function-name*.

SQLSTATE: 42815

-173 UR IS SPECIFIED ON THE WITH CLAUSE BUT THE CURSOR IS NOT READ-ONLY

Explanation: The cursor is not a read-only cursor. WITH UR can be specified only if DB2 can determine that the cursor is read-only.

System Action: Statement execution fails.

Programmer Response: If the cursor is intended to be read-only but is ambiguous, add the FOR FETCH ONLY clause. If the cursor is updateable, change the isolation level specified on the WITH clause.

SQLSTATE: 42801

-180 THE DATE, TIME, OR TIMESTAMP VALUE *value* IS INVALID

Explanation: The length or string representation of a DATE, TIME, or TIMESTAMP value does not conform to any valid format.

The value can contain one of the following:

- For a host variable, the position number of the input host variable. If the position number cannot be determined, a blank is displayed.
- For a character string constant, the character string constant. The maximum length that is displayed is the length of SQLERRM.
- For a character column, the column name. If the column is a VIEW column and it has a corresponding base column, the VIEW column name is displayed. If the column is a VIEW column but it does not have a corresponding base column, a string of '*N' is displayed.

Otherwise, value is a string of '*N'.

System Action: The statement cannot be executed.

Programmer Response: Correct the program to ensure the specified value conforms to the syntax of DATE, TIME, and TIMESTAMP. Refer to Chapter 2 of *DB2 SQL Reference* for a list of valid DATE and TIME formats.

SQLSTATE: 22007

-181 THE STRING REPRESENTATION OF A DATETIME VALUE IS NOT A VALID DATETIME VALUE

Explanation: The string representation of a datetime is not in the acceptable range or is not in the correct format. The proper ranges for datetime values are as

follows:

Table 2. Range of datetime values

Datetime		Numeric Range
Years		0001 to 9999
Months		1 to 12
Days	April, June, September, November (months 4, 6, 9, 11)	1 to 30
	February (month 2)	1 to 28 (Leap year 1 to 29)
	January, March, May, July, August, October, December (months 1, 3, 5, 7, 8, 10, 12)	1 to 31
Hours		0 to 24 (If hour is 24, other parts of time values are zeroes. If hour is USA, maximum hour is 12.)
Minutes		0 to 59
Seconds		0 to 59
Microseconds		0 to 999999

System Action: The statement cannot be executed.

Programmer Response: Check whether the value is within the valid range and is in the proper format. Refer to Chapter 2 of *DB2 SQL Reference* for information on string data formats.

SQLSTATE: 22007

-182 AN ARITHMETIC EXPRESSION WITH A DATETIME VALUE IS INVALID

Explanation: The specified arithmetic expression contains an improperly used datetime value or labeled duration.

System Action: The statement cannot be executed.

Programmer Response: Correct the indicated arithmetic expression.

SQLSTATE: 42816

-183 AN ARITHMETIC OPERATION ON A DATE OR TIMESTAMP HAS A RESULT THAT IS NOT WITHIN THE VALID RANGE OF DATES

Explanation: The result of an arithmetic operation is a date or timestamp that is not within the valid range of dates which are between 0001-01-01 and 9999-12-31.

System Action: The statement cannot be executed.

Programmer Response: Examine the SQL statement to see if the cause of the problem can be determined. The problem may be data-dependent, in which case it will be necessary to examine the data that was processed at the time the error occurred.

SQLSTATE: 22008

-184 AN ARITHMETIC EXPRESSION WITH A DATETIME VALUE CONTAINS A PARAMETER MARKER

Explanation: The specified arithmetic expression contains a parameter marker improperly used with a datetime value.

System Action: The statement cannot be executed.

Programmer Response: Correct the indicated arithmetic expression.

SQLSTATE: 42610

-185 THE LOCAL FORMAT OPTION HAS BEEN USED WITH A DATE OR TIME AND NO LOCAL EXIT HAS BEEN INSTALLED

Explanation: The local format option has been used with a datetime value and no datetime exit has been installed. This may occur if the LOCAL DATE LENGTH or LOCAL TIME LENGTH on the Installation Application Programming Defaults Panel indicated that an exit for datetime was supplied, but in fact the exit supplied by DB2 was not replaced. This may also occur if the datetime exit was replaced and the corresponding LOCAL DATE LENGTH or LOCAL TIME LENGTH on the Installation Application Programming Defaults Panel was not set to a nonzero value.

System Action: The statement cannot be executed.

Programmer Response: Contact the system programmer about installation of the date or time exit.

SQLSTATE: 57008

-186 THE LOCAL DATE LENGTH OR LOCAL TIME LENGTH HAS BEEN INCREASED AND EXECUTING PROGRAM RELIES ON THE OLD LENGTH

Explanation: The local format option has been used with a datetime value and DB2 has discovered that the datetime exit routine has been changed to produce a longer local format.

System Action: The statement cannot be executed.

Programmer Response: If the statement receiving this error is embedded in the application program, then a REBIND command must be issued for the application plan. If the statement was dynamic SQL, then the

statement can be reentered.

SQLSTATE: 22505

-187 A REFERENCE TO A CURRENT DATETIME SPECIAL REGISTER IS INVALID BECAUSE THE MVS TOD CLOCK IS BAD OR THE MVS PARMTZ IS OUT OF RANGE

Explanation: DB2 has encountered an invalid time-of-day (TOD) clock. The user referenced one of the special registers: CURRENT DATE, CURRENT TIME, CURRENT TIMESTAMP, or CURRENT TIMEZONE. If the user referenced CURRENT TIMEZONE, the MVS parameter PARMTZ was out of range.

System Action: The statement cannot be executed.

Programmer Response: For CURRENT TIMEZONE, check that the MVS parameter PARMTZ is between -24 and +24 hours. For the other CURRENT special registers, check that the MVS TOD clock has been set correctly.

SQLSTATE: 22506

-188 THE STRING REPRESENTATION OF A NAME IS INVALID

Explanation: The host variable referenced in the DESCRIBE statement does not contain a valid string representation of a name. One of the following error conditions has occurred.

- The first byte of the variable is a period or a blank.
- The number of identifiers is greater than 3.
- An identifier is too long.
- A period not contained in a delimited identifier is followed by a period or a blank.
- A delimited identifier is followed by a character other than a period or a blank.
- A delimited identifier is not terminated by a quotation mark.

System Action: The statement cannot be executed.

Programmer Response: Correct the value of the host variable so that it is a valid string representation of a name.

SQLSTATE: 22503

-189 CCSID *ccsid* IS INVALID

Explanation: To determine the subtype of an input host variable or result column, the SYSSTRINGS catalog table was accessed with the specified CCSID and:

- The CCSID is not a value of either INCCSID or OUTCCSID, or
- The TRANSTYPE column classifies the CCSID as GRAPHIC rather than CHARACTER, or

- A graphic CCSID has not been specified on your system.
- The CCSID is outside the acceptable range of values. The CCSID must be between 1 and 65533, inclusive, or the value 65535.
- A DBCS CCSID was specified when casting to CHAR, VARCHAR or CLOB.
- An SBCS or mixed CCSID, or 65535 was specified when casting to a graphic data type.
- CCSID 65535, which is valid only for data with the FOR BIT DATA attribute, was specified when casting to a CLOB.

This error can occur when SYSSTRINGS is accessed with a pair of CCSIDs to determine if a translation is defined for the pair. In this case, the error is the inconsistency between the data type of a string and the TRANSTYPE classification of its CCSID (one is GRAPHIC and the other is CHARACTER).

This error can also occur when a CCSID specified in DECP does not exist as a value in the INCCSID or OUTCCSID columns of SYSSTRINGS.

Another reason this error can occur is that you may be using one of the graphic built-in functions but a graphic CCSID was not specified during system installation.

System Action: The statement cannot be bound or executed.

Programmer Response: Ensure that the CCSID is valid and consistent with the data type of the string. If a valid CCSID is not listed in a built-in row of SYSSTRINGS, it can be defined by inserting a user-provided row. If a valid CCSID is misclassified in a user-provided row, that row can be updated to correct the mistake. Refer to the appendices of *DB2 Installation Guide* for more information on CCSIDs and to *DB2 SQL Reference* for more information on the SYSSTRINGS catalog table.

If a graphic CCSID had not been specified at system installation, update your DECP to include a graphic CCSID and recycle your DB2.

SQLSTATE: 22522

-190 THE ATTRIBUTES SPECIFIED FOR THE COLUMN *column-name* ARE NOT COMPATIBLE WITH THE EXISTING COLUMN DEFINITION

Explanation: The attributes that were specified in the ALTER COLUMN clause for the column *column-name* of the table *table-name* in an ALTER TABLE statement are not compatible with the attributes of the existing column. The error was returned for one of the following reasons:

- If a SET DATA TYPE clause is specified, the existing column is not compatible with the new data type that

was specified, or is of a data type that cannot be changed. The ALTER TABLE ALTER COLUMN SET DATA TYPE statement only allows changing columns of data type character or numeric.

- If a RESTART, SET GENERATED, SET INCREMENT BY, SET MINVALUE, SET NO MINVALUE, SET MAXVALUE, SET NO MAXVALUE, SET CYCLE, SET NO CYCLE, SET CACHE, SET NO CACHE, SET ORDER, or SET NO ORDER clause is specified, the existing column is not defined as an identity column. These clauses can only be specified for a column that is defined as an identity column.

System Action: The statement cannot be executed.

Programmer Response: Make the attributes that are specified in the statement compatible with the existing column definition, remove the attribute specification, or specify a different column name.

SQLSTATE: 42837

-191 A STRING CANNOT BE USED BECAUSE IT IS INVALID MIXED DATA

Explanation: The operation required the translation of a mixed data character string to a different coded character set. The string could not be translated because it does not conform to the rules for well-formed mixed data. For example, the string contains EBCDIC shift codes that are not properly paired.

System Action: The statement cannot be executed.

Programmer Response: If the string contains the intended information, the description of the column or host variable should be changed from MIXED DATA to BIT or SBCS DATA. If the description of the column or host variable is correct, the string is the problem and it must be changed to conform to the rules for well-formed mixed data. For more information about well-formed MIXED DATA refer to Chapter 2 of *DB2 SQL Reference*.

SQLSTATE: 22504

-197 QUALIFIED COLUMN NAMES IN ORDER BY CLAUSE NOT PERMITTED WHEN UNION OR UNION ALL SPECIFIED

Explanation: A SELECT statement that specifies both the union of two or more tables and the ORDER BY clause cannot use qualified column names in the ORDER BY clause.

Programmer Response: Change the statement so that qualified names are not necessary in the ORDER BY clause.

System Action: The statement is not executed.

SQLSTATE: 42877

-198 THE OPERAND OF THE PREPARE OR EXECUTE IMMEDIATE STATEMENT IS BLANK OR EMPTY

Explanation: The operand (host variable or literal string) that was the object of the PREPARE or EXECUTE IMMEDIATE statement either contained all blanks or was an empty string. A DBRM built in Version 2 Release 3 cannot be used on a Version 2 Release 2 system if the distributive functions were used. If this error appears on Version 2 Release 2 and the DBRM was built on Version 2 Release 3, the program needs to be precompiled again to correct the problem.

System Action: The statement cannot be executed.

Programmer Response: Correct the logic of the application program to ensure that a valid SQL statement is provided in the operand of the PREPARE or EXECUTE IMMEDIATE statement before that statement is executed.

SQLSTATE: 42617

-199 ILLEGAL USE OF KEYWORD *keyword*. TOKEN *token-list* WAS EXPECTED

Explanation: A syntax error was detected in the statement at the point where the keyword *keyword* appears.

As an aid to the programmer, a partial list of valid tokens is provided in SQLERRM as *token-list*. Only those tokens that will fit are listed. Some tokens in the list might not be valid in statements to be executed by DB2; those tokens are valid for sending to other database management systems.

System Action: The statement cannot be executed.

Programmer Response: Examine the statement in the area of keyword *keyword*. A colon or SQL delimiter might be missing.

Verify that the clauses are in the correct order. If the reserved word that is identified in the messages is listed as a reserved word, make the word a delimited identifier.

SQLSTATE: 42601

-203 A REFERENCE TO COLUMN *column-name* IS AMBIGUOUS

Explanation: An unqualified column name is ambiguous if more than one table or view identified in the FROM clause has a column with that name, or if more than one column of a nested table expression has that name.

A qualified column name is ambiguous only if the qualifier is the correlation name for a nested table expression and the column name is not unique.

A reference to a column of the triggering table in a

CREATE TRIGGER statement is ambiguous if it does not use the correlation name to indicate if it refers to the old or new transition variable.

System Action: The statement cannot be executed.

Programmer Response: If the problem is caused by a nonunique column name in a nested table expression, change the nested table expression so that the column name is unique. If the problem is caused by the use of an unqualified name, qualify it with a table, view, or correlation name.

SQLSTATE: 42702

-204 *name* IS AN UNDEFINED NAME

Explanation: The object identified by *name* is not defined in the DB2 subsystem. This SQLCODE can be generated for any type of DB2 object.

System Action: The statement cannot be executed.

Programmer Response: Verify that the object name was correctly specified in the SQL statement, including any required qualifiers. If it is correct, ensure that the object exists in the system before resubmitting the statement.

If the specified object is a routine, execute the CREATE PROCEDURE or CREATE FUNCTION statement to define the routine to DB2. Issue the -START PROCEDURE command to activate the new definition.

SQLSTATE: 42704

-205 *column-name* IS NOT A COLUMN OF TABLE *table-name*

Explanation: For ALTER TABLE ALTER COLUMN, column *column-name* is not a column in table *table-name*.

System Action: The statement cannot be executed.

Programmer Response: Verify that the column and table names are specified correctly (including any required qualifiers) in the SQL statement.

SQLSTATE: 42703

-206 *column-name* IS NOT A COLUMN OF AN INSERTED TABLE, UPDATED TABLE, OR ANY TABLE IDENTIFIED IN A FROM CLAUSE, OR IS NOT A COLUMN OF THE TRIGGERING TABLE OF A TRIGGER

Explanation: This return code is used to report one of the following errors:

- In the case of an INSERT or UPDATE statement, the specified column is not a column of the table or view that was specified as the object of the insert or update.

- In the case of an INSERT with VALUES clause, there is a column referenced and columns are not allowed in the VALUES clause.
- In the case of a SELECT or DELETE statement, the specified column is not a column of any of the tables or views identified in a FROM clause in the statement.
- There is a correlated reference in the GROUP BY clause in the select list of a subselect, or a correlated reference is not used in a search condition.
- There is an unresolved qualified reference in HAVING.
- For a CREATE TRIGGER statement:
 - A reference is made to a column using an OLD or NEW correlation name. The column name is not defined in the triggering table.
 - The left side of an assignment in the SET transition-variable statement in the triggered action specifies an old transition variable where only a new transition variable is supported or trigger was not created.

System Action: The statement cannot be executed. No data was retrieved, inserted, or updated or the trigger was not created.

Programmer Response: Verify that the column and table names are specified correctly in the SQL statement. In the case of a SELECT statement, check to be sure that all of the required tables were named in the FROM clause.

In the case of a CREATE TRIGGER statement, ensure that only new transition variables are specified on the left side of assignments in the SET transition-variable statement and that any reference to columns of the triggering table are qualified with a transition variable correlation name.

SQLSTATE: 42703

-208 THE ORDER BY CLAUSE IS INVALID BECAUSE COLUMN *name* IS NOT PART OF THE RESULT TABLE

Explanation: The statement is invalid because a column ('name') specified in the ORDER BY list does not appear in the result table (that is, it is not specified in the SELECT-list). Only columns in the result table can be used to order that result when the *fullselect* of the *select-statement* is not a *subselect*.

System Action: The statement cannot be executed.

Programmer Response: Correct the syntax of the statement, either by adding the specified column to the result table, or deleting it from the ORDER BY clause. Refer to Chapter 4 of *DB2 SQL Reference* for information about restrictions on the use of the ORDER BY clause to order the result of an SQL SELECT.

SQLSTATE: 42707

-212 *name* IS SPECIFIED MORE THAN ONCE IN THE REFERENCING CLAUSE OF A TRIGGER DEFINITION

Explanation: The REFERENCING clause of a CREATE TRIGGER statement specified the same name for more than one of the OLD or NEW correlation names or the OLD_TABLE or NEW_TABLE identifiers. *name* is the name that was specified multiple times.

System Action: The statement cannot be executed. The trigger was not created.

Programmer Response: Change the statement to specify unique names for all transition variables and tables in the REFERENCING clause and resubmit the CREATE TRIGGER request.

SQLSTATE: 42712

-214 AN EXPRESSION IN THE FOLLOWING POSITION, OR STARTING WITH *position-or-expression-start* IN THE *clause-type* CLAUSE IS NOT VALID. REASON CODE = *reason-code*

Explanation: The expression identified by the first part of the expression *expression-start* in the *clause-type* clause is not valid for the reason specified by the *reason-code* as follows:

1. The fullselect of the select-statement is not a subselect. Expressions are not allowed in the ORDER BY clause for this type of select-statement. This reason code occurs only when *clause-type* is ORDER BY.
2. DISTINCT is specified in the select clause, and either a column name in the ORDER BY clause cannot be matched exactly with a column name in the SELECT list, or a *sort-key-expression* is specified in the ORDER BY clause. This reason code occurs only when *clause-type* is ORDER BY.
3. The select list includes an aggregate function or the subselect includes a GROUP BY clause and the expression is not an aggregate function or does not match exactly with an expression in the select list.
4. Grouping is caused by the presence of an aggregate function in the ORDER BY clause. This reason code occurs only when *clause-type* is ORDER BY.
5. Expression in a GROUP BY clause cannot contain a scalar-fullselect. This reason code occurs only when *clause-type* is GROUP BY.
6. Invalid use of scalar-fullselect. This reason code can be issued when the RETURN statement of an SQL function contains a scalar-fullselect, or a scalar-fullselect is passed as an argument on a CALL statement for a parameter that is defined as an input parameter (IN).

System Action: The statement cannot be executed.

Programmer Response: Modify the select-statement

based on the reason specified by the *reason-code* as follows:

1. Remove the expression from the ORDER BY clause. If attempting to reference a column of the result, change the sort key to the *simple-integer* or *simple-column-name* form. See the ORDER BY syntax diagram in the DB2 SQL Reference for more information
2. Remove DISTINCT from the select clause
3. Remove DISTINCT from the SELECT clause.
4. Change the expression in the ORDER BY or GROUP BY clause to an aggregate function or change the clause to use a numeric column identifier or a column name.
5. Add a GROUP BY clause or remove the aggregate function from the ORDER BY clause.
6. Remove the scalar fullselect from the GROUP BY clause.
7. Remove the scalar fullselect from the statement.

SQLSTATE: 42822

-216 THE NUMBER OF ELEMENTS ON EACH SIDE OF A PREDICATE OPERATOR DOES NOT MATCH. PREDICATE OPERATOR IS *operator*.

Explanation: The number of expressions specified on the left-hand side of OPERATOR *operator* is unequal to either the number of values returned by the fullselect or to the number of expressions specified on the right-hand side of the operator. The number of expressions and the number of values/expressions on either side of the operator must be equal.

System Action: The statement was not executed.

Programmer Response: Change the number of expressions to match the number of values returned by the fullselect or vice versa.

SQLSTATE: 428C4

-219 THE REQUIRED EXPLANATION TABLE *table-name* DOES NOT EXIST

Explanation: The EXPLAIN statement assumes the existence of the explanation table and it is not defined in the DB2 subsystem as a base table. Refer to Chapter 5 of *DB2 SQL Reference* for more information.

System Action: The statement cannot be executed.

Programmer Response: Determine whether the required explanation table does exist. If not, create the required table.

SQLSTATE: 42704

-220 THE COLUMN *column-name* IN EXPLANATION TABLE *table-name* IS NOT DEFINED PROPERLY

Explanation: An error occurred during the insertion of a row into the explanation table. The table is improperly defined for the following reasons:

- A column is missing.
- Columns are defined in the wrong order.
- The table contains an extra column.
- A column description is invalid because of its name, data type, length, or null attributes.

System Action: The statement cannot be executed. The explanation information is not generated.

Programmer Response: Correct the definition of the required explanation table. Refer to Chapter 5 of *DB2 SQL Reference* for information on defining an explanation table.

SQLSTATE: 55002

-221 “SET OF OPTIONAL COLUMNS” IN EXPLANATION TABLE *table-name* IS INCOMPLETE. OPTIONAL COLUMN *column-name* IS MISSING

Explanation: The EXPLAIN statement assumes the required explanation table is defined properly. The optional column indicated is not defined in the indicated explanation table. PLAN_TABLEs must have one of several specific formats. The format chosen must be complete, and each column in the PLAN_TABLE definition must be correct for the chosen format. The allowed formats for the PLAN_TABLE are described in Chapter 6 of *DB2 SQL Reference*.

System Action: The explanation information is not generated.

Programmer Response: Correct the definition of the required explanation table to include all of the optional columns in the chosen format, just the Version 2 Release 2 optional columns, or no optional columns. Refer to Chapter 5 of *DB2 SQL Reference* for information on defining an explanation table.

SQLSTATE: 55002

-222 AN UPDATE OR DELETE OPERATION WAS ATTEMPTED AGAINST A HOLE USING CURSOR *cursor-name*

Explanation: DB2 could not process a positioned update or delete with cursor *cursor-name* that is defined as SENSITIVE STATIC. The selected row is either a delete hole or an update hole. DB2 detects these holes when DB2 tries to delete or update the current row of the result table for cursor *cursor-name*, and cannot locate the corresponding row of the underlying table.

A *delete hole* occurs when the corresponding row of the

underlying table has been deleted.

An *update hole* occurs when the corresponding row of the underlying table has been updated, and the updated row no longer satisfies the search condition that is specified in the SELECT statement of the cursor.

System Action: The statement cannot be processed. The cursor is positioned on the hole.

Programmer Response: Issue a FETCH statement to position the cursor on a row.

SQLSTATE: 24510

-224 THE RESULT TABLE DOES NOT AGREE WITH THE BASE TABLE USING *cursor-name*

Explanation: DB2 attempted a positioned UPDATE or DELETE was attempted on a row that no longer matches its previous condition. The column values in the result table row do not match the current values in the base table row because the row was updated between the time it was inserted into the result table and the positioned update or delete was executed.

cursor-name

Name of the cursor used for the positioned update or delete.

System Action: The statement cannot be processed. The cursor is positioned on the same row.

Programmer Response: Correct the application program to handle this error condition or change isolation levels so the base row cannot be updated during the cursor operation.

SQLSTATE: 24512

-225 FETCH STATEMENT FOR *cursor-name* IS NOT VALID BECAUSE THE CURSOR IS NOT DEFINED AS SCROLL

Explanation: DB2 could not process a FETCH statement for cursor *cursor-name* because it contained a disallowed keyword. You may only specify the keyword NEXT for non-scrollable cursors. The keywords PRIOR, FIRST, LAST, ABSOLUTE, RELATIVE, CURRENT, BEFORE, and AFTER are disallowed for a cursor that was not declared with the SCROLL attribute.

cursor-name

Name of the cursor used for the FETCH statement.

System Action: The statement cannot be processed.

Programmer Response: Correct the FETCH statement to exclude the disallowed keyword, or correct the DECLARE CURSOR statement to include the appropriate SCROLL option.

SQLSTATE: 42872

-227 FETCH *fetch-orientation* IS NOT ALLOWED, BECAUSE CURSOR *cursor-name* HAS AN UNKNOWN POSITION (*sqlcode,sqlstate*)

Explanation: The cursor position for *cursor-name* is unknown. The previous multiple-row FETCH for cursor *cursor-name* resulted in an error (SQLCODE *sqlcode*, SQLSTATE *sqlstate*) in the middle of processing multiple rows that were retrieved from DB2. One or more of the requested rows could not be returned to the program following the error, leaving the position of the cursor unknown.

If an indicator structure had been provided on the previous multiple-row FETCH, a positive SQLCODE would have been returned and all of the rows that were retrieved from DB2 could have been returned to the application program.

System Action: The statement cannot be processed. The cursor position is not changed.

Programmer Response: Close and reopen the cursor to reset the position. For scrollable cursors, you can change the FETCH statement to specify one of the other fetch orientations (such as FIRST, LAST, BEFORE, AFTER, or ABSOLUTE) to establish a valid cursor position and fetch a row of data.

SQLSTATE: 24513

-228 FOR UPDATE CLAUSE SPECIFIED FOR READ-ONLY CURSOR *cursor-name*

Explanation: A cursor was declared read-only with the INSENSITIVE SCROLL option, but the SELECT statement contained a FOR UPDATE clause.

cursor-name

Name of the cursor used for the FETCH.

System Action: The statement cannot be processed.

Programmer Response: To define a scrollable cursor that is read-only, specify INSENSITIVE SCROLL, but do not specify FOR UPDATE clause. To define a scrollable cursor that can be updated, specify SENSITIVE SCROLL. Correct the application program to DECLARE CURSOR appropriately.

SQLSTATE: 42620

-229 THE LOCALE *locale* SPECIFIED IN A SET LOCALE OR OTHER STATEMENT THAT IS LOCALE SENSITIVE WAS NOT FOUND

Explanation: The statement attempted to reference a Locale that is not known or not available to DB2. *locale* is the locale that was either specified on the SET CURRENT LOCALE statement or the locale that was in effect at the time the Locale access was attempted.

System Action: The statement cannot be executed.

Programmer Response: If the statement was a SET LOCALE statement, re-specify a locale that is correct (known and available to DB2). Refer to Chapter 3 of SQL Reference for more information on Locales. If the statement was something other than SET LOCALE, then the statement contained a locale sensitive interface (the UPPER function is an example of a locale sensitive interface). Issue "SELECT CURRENT LOCALE FROM SYSIBM.SYSDUMMY1" to determine the value of the LOCALE in use by your program. Possible reasons for this message include an incorrect LOCALE bind option, or an incorrect LOCALE default value specified at installation time (The value of a Locale is not validated until it is needed in a Locale sensitive interface). Because Locales are dynamic in nature, they can be added, created, or deleted at anytime, they are not validated until they are used. Therefore, it is possible to specify a locale that is not valid at installation or bind time.

SQLSTATE: 42708

-240 THE PART CLAUSE OF A LOCK TABLE STATEMENT IS INVALID

Explanation: The LOCK TABLE statement is invalid for one of the following reasons:

- If it is partitioned, specify a PART clause that identifies the partition you want to lock.

System Action: The LOCK TABLE statement cannot be executed.

Programmer Response: Determine whether the specified table resides in a partitioned table space defined with LOCKPART YES.

- If it is partitioned and defined with LOCKPART YES, specify a PART clause that identifies the partition you want to lock.
- If it is partitioned but does not have the LOCKPART YES attribute and you want to lock a single partition, use ALTER TABLESPACE to change the LOCKPART attribute to YES.
- If it is not partitioned, do not specify the PART clause.

SQLSTATE: 428B4

-242 THE OBJECT NAMED *object-name* OF TYPE *object-type* WAS SPECIFIED MORE THAN ONCE IN THE LIST OF OBJECTS

Explanation: In a list of object names of type *object-type*, the object named *object-name* was specified more than once.

System Action: The statement cannot be processed.

Programmer Response: Correct the error by removing from the list all duplicate occurrences of the object.

SQLSTATE: 42713

-243 SENSITIVE CURSOR *cursor-name* CANNOT BE DEFINED FOR THE SPECIFIED SELECT STATEMENT

Explanation: The cursor *cursor-name* is defined as SENSITIVE, but the content of the SELECT statement requires DB2 to build a temporary table with the result table of the cursor, and DB2 cannot guarantee that changes made outside the cursor will be visible. This situation occurs when the content of the query making the result table read-only. In this case the cursor must be defined INSENSITIVE or ASENSITIVE.

System Action: The statement cannot be processed.

Programmer Response: Either change the content of the query to result in a result table that is not read-only, or change the type of cursor to be INSENSITIVE or ASENSITIVE.

SQLSTATE: 36001

-244 SENSITIVITY *sensitivity* SPECIFIED ON THE FETCH IS NOT VALID FOR CURSOR *cursor-name*

Explanation: The sensitivity option specified on FETCH conflicts with the sensitivity option in effect for cursor *cursor-name*. If a cursor is declared INSENSITIVE, the FETCH statement can only specify INSENSITIVE or nothing. If a cursor is declared SENSITIVE, the FETCH statement can specify INSENSITIVE, SENSITIVE, or nothing.

The keyword INSENSITIVE is not allowed with the FETCH statements if the associated cursor is either:

- Declared as SENSITIVE DYNAMIC SCROLL, or
- The cursor is declared ASENSITIVE, and DB2 selected the maximum allowable sensitivity of SENSITIVE DYNAMIC SCROLL for the associated SELECT statement.

In the case of a non-scrollable cursor, the sensitivity option cannot be specified.

sensitivity
Specified sensitivity for the FETCH statement.

cursor-name
Name of the cursor used for the FETCH statement.

System Action: The statement cannot be processed.

Programmer Response: Change or remove the sensitivity option that is specified on the FETCH.

SQLSTATE: 428F4

-245 THE INVOCATION OF FUNCTION *routine-name* IS AMBIGUOUS

Explanation: DB2 issues this error when an invocation of a function is ambiguous. This occurs when an untyped parameter marker is passed to a function and

there are two or more possible candidate functions to resolve to during function resolution.

System Action: The statement cannot be processed.

Programmer Response: Fix the problem and retry. This could involve a change to the SQL statement, changing the definition of a function, or a change to the user's current path. See the *DB2 Application Programming and SQL Guide* for details on function resolution.

SQLSTATE: 428F5

-246 STATEMENT USING CURSOR *cursor-name* SPECIFIED NUMBER OF ROWS *num-rows* WHICH IS NOT VALID WITH *dimension*

Explanation: A multiple-row FETCH or multiple-row INSERT statement is not valid in this context. The number of rows that were specified is not greater than 0 and not less than or equal to 32767, or is greater than the dimension of the host variable array. The number of rows that were specified is *num-rows*, and the dimension of the array is *dimension*. If this is a FETCH statement, the cursor name is *cursor-name*. Otherwise, the cursor name is not applicable.

System Action: The statement cannot be processed. The cursor position is unchanged.

Programmer Response: Change the application to either declare, or allocate a host-variable-array that is large enough to contain the number of rows specified in the statement, or update the value of *num-rows* to a value within the valid range.

SQLSTATE: 42873

-247 A HOLE WAS DETECTED ON A MULTIPLE ROW FETCH STATEMENT USING CURSOR *cursor-name*, BUT INDICATOR VARIABLES WERE NOT PROVIDED TO DETECT THE CONDITION

Explanation: A hole was detected on a FETCH statement for multiple rows of data, but no indicator variables were provided to reflect the situation to the application.

System Action: The statement cannot be processed.

Programmer Response: Change the FETCH statement to provide at least one indicator variable, and resubmit the statement.

SQLSTATE: 24519

-248 A POSITIONED DELETE OR UPDATE STATEMENT FOR CURSOR *cursor-name* SPECIFIED ROW *n* OF A ROWSET, BUT THE ROW IS NOT CONTAINED WITHIN THE CURRENT ROWSET

Explanation: The FOR ROW *n* OF ROWSET clause was specified on a positioned DELETE or UPDATE statement, but row *n* is not contained within the bound of the rowset. This situation can also occur when row *n* is within the bounds of the rowset that was requested, but the current rowset contains less than the requested number of rows. In this case, a partial rowset is returned. A partial rowset can occur for various reasons, including an end of data condition or an error that did not result in the closure of the cursor.

System Action: The statement cannot be processed.

Programmer Response: Reissue the positioned UPDATE or DELETE with a value that corresponds to a row of the current rowset. If the row that is specified is outside of the current rowset, then do the following:

- Use the FOR *n* ROWS clause on a FETCH CURRENT ROWSET statement to specify that the rowset contains a larger number of rows
- Reissue the positioned UPDATE or DELETE statement.

If this message is issued because a partial rowset was returned,

- Update the application logic to detect that the actual rowset size was less than the rowset size that was requested
- Ensure that a positioned UPDATE or DELETE statement only refers to rows of the current rowset.

SQLSTATE: 24521

-249 DEFINITION OF ROWSET ACCESS FOR CURSOR *cursor-name* IS INCONSISTENT WITH THE FETCH ORIENTATION CLAUSE *clause* SPECIFIED

Explanation: The clause that was specified as the fetch-orientation for a FETCH statement is inconsistent with the definition of the cursor. What can be specified for fetch-orientation depends on whether the cursor was defined for rowset access:

- A cursor defined WITH ROWSET POSITIONING can only use rowset positioned fetch orientation clauses: NEXT ROWSET, PRIOR ROWSET, FIRST ROWSET, LAST ROWSET, CURRENT ROWSET, or ROWSET STARTING AT.
- A cursor defined WITHOUT ROWSET POSITIONING can only use row positioned fetch orientation keywords: NEXT, PRIOR, FIRST, LAST, BEFORE, AFTER, CURRENT, or ABSOLUTE, RELATIVE.

System Action: The statement cannot be processed.

Programmer Response: Correct the fetch orientation, or redefine the cursor.

SQLSTATE: 24523

-250 THE LOCAL LOCATION NAME IS NOT DEFINED WHEN PROCESSING A THREE-PART OBJECT NAME

Explanation: A three-part object name (table, view, or alias) cannot be used until the local location name is defined.

System Action: Install or reinstall the DB2 distributed data facility (DDF) with a registered location name for local DB2.

Programmer Response: Define the local location name and then retry the function.

SQLSTATE: 42718

-251 TOKEN *name* IS NOT VALID

Explanation: A *location name* cannot contain alphabetic extenders. (The standard alphabetic extenders in the United States are #, @, \$.)

System Action: The statement cannot be executed

Programmer Response: Correct the name and reissue the statement.

SQLSTATE: 42602

-253 A NON-ATOMIC *statement* STATEMENT SUCCESSFULLY COMPLETED FOR SOME OF THE REQUESTED ROWS, POSSIBLY WITH WARNINGS, AND ONE OR MORE ERRORS

Explanation: A non-atomic *statement* statement successfully processed some of the rows of data that were requested. However, one or more error conditions occurred, and some warnings may have also occurred. Use GET DIAGNOSTICS to obtain information about the error and warning conditions that occurred.

System Action: One or more rows were successfully processed, but one or more errors or warnings also occurred.

Programmer Response: Analyse the error and warning conditions to determine if the statement should be rolled back.

SQLSTATE: 22529

-254 A NON-ATOMIC *statement* STATEMENT ATTEMPTED TO PROCESS MULTIPLE ROWS OF DATA, BUT ERRORS OCCURRED.

Explanation: A non-atomic *statement* statement specified that multiple rows of data were to be

processed, but errors occurred during the processing of those rows of data. Use GET DIAGNOSTICS to obtain information about the error and warning conditions that occurred.

System Action: One or more rows were successfully processed, but one or more errors or warnings also occurred.

Programmer Response: Analyse the error and warning conditions to determine the appropriate corrective actions.

SQLSTATE: 22530

-270 FUNCTION NOT SUPPORTED

Explanation: The statement cannot be processed because it violates one or more of the following restrictions:

- For an ALTER TABLE statement that names a materialized query table, the alterations are limited to either:
 - Changing materialized query table attributes, or turning the materialized query table to a base table, or
 - Using AUDIT, DATA CAPTURE, and ADD or DROP RESTRICT ON DROP clauses, (but not both in the same statement).
- The length of the column for a base table cannot be altered if that base table is referenced by a materialized query table definition.
- A materialized query table cannot be renamed.
- The XML data type can only be used as a transient data type, and cannot be stored in the database nor returned to an application.

System Action: The statement cannot be processed.

Programmer Response: Alter the materialized query table into a base table before performing the alteration, or drop and recreate the materialized query table.

If this error is caused by an XML data type, input the XML data to one of the functions that accept XML input. Store the output of the function in the database, or return it to the application.

SQLSTATE: 42997

-300 THE STRING CONTAINED IN HOST VARIABLE OR PARAMETER *position-number* IS NOT NUL-TERMINATED

Explanation: A host variable or parameter is invalid. Its entry in the SQLDA is indicated by *position-number*. The host variable or parameter is a C string variable that is one of the following:

- Used as an input parameter to a stored procedure or function.

- Returned as an output parameter from a stored procedure or function.
- Referenced as an input variable in an embedded SQL statement.
- Used to provide a value for a parameter marker of a dynamic SQL statement.

If the data type of the variable is character string, it is invalid because it does not include X'00'. If the data type of the variable is graphic string, it is invalid because it does not include X'0000'.

System Action: The statement cannot be executed.

Programmer Response: Append a NUL-terminator to the end of the string.

SQLSTATE: 22024

-301 THE VALUE OF INPUT HOST VARIABLE OR PARAMETER NUMBER *position-number* CANNOT BE USED AS SPECIFIED BECAUSE OF ITS DATA TYPE

Explanation: DB2 received data that could not be used as specified in the statement because its data type is incompatible with the requested operation.

The *position-number* identifies either the host variable number (if the message is issued as a result of an INSERT, UPDATE, DELETE, SELECT, VALUE INTO, or SET assignment statement), or the parameter number (if the message is issued as the result of a CALL statement, or the invocation of a function).

System Action: The statement cannot be executed.

Programmer Response: Correct the application program, function or stored procedure. Ensure that the data type of the indicated input host variable or parameter in the statement is compatible with the way it is used.

SQLSTATE: 42895

-302 THE VALUE OF INPUT VARIABLE OR PARAMETER NUMBER *position-number* IS INVALID OR TOO LARGE FOR THE TARGET COLUMN OR THE TARGET VALUE

Explanation: DB2 received data that was invalid or too large to fit in the corresponding column of the table or the corresponding target value. The *position-number* identifies either the host variable number (if the message is issued as a result of an INSERT, UPDATE, DELETE, SELECT, VALUES INTO, or SET assignment statement), or the parameter number (if the message is issued as the result of a CALL statement or the invocation of a function).

One of the following occurred:

- The column is defined as a string and the host variable or parameter contains a string that is too long for the column.
- The column is defined as numeric and the host variable or parameter contains a numeric value too large for the definition of the column.
- The host variable is defined as decimal, but contains invalid decimal data.
- The target value is a string constant and the host variable or parameter contains a string that is too long for the target value.
- The target value is a numeric constant and the host variable or parameter contains a numeric value that is too large for the target value.

System Action: The statement cannot be executed.

Programmer Response: Correct the application program, function or stored procedure. Check the column type and length of the value or the data type and contents of the input host variable or parameter *position-number*. Ensure that the value of the host variable or parameter will fit in the column or contains valid decimal data. Valid decimal data is a System/370 packed decimal number.

SQLSTATE: 22003 if *number too large for target*, 22001 otherwise.

-303 A VALUE CANNOT BE ASSIGNED TO OUTPUT HOST VARIABLE NUMBER *position-number* BECAUSE THE DATA TYPES ARE NOT COMPARABLE

Explanation: A CALL, FETCH, SELECT, VALUES INTO, or SET *host-variable* statement with an output host variable, whose entry in the output SQLDA is indicated by *position-number*, could not be performed. The data type of the variable was not compatible with the data type of the corresponding SELECT, VALUES INTO, or SET *host-variable* statement list element. The values of the output host variable and the corresponding list element must be in one of the following categories:

- Both must be numbers.
- Both must be character strings if not using Unicode.
- Both must be graphic strings if not using Unicode.
- Both must be row IDs.

In addition, for datetime, timestamp values, the host variable must be a character string variable with a correct length.

System Action: The CALL, FETCH, SELECT, VALUES INTO, or SET *host-variable* statement cannot be executed. No data was retrieved.

Programmer Response: Verify that table definitions are current and that the host variable has the correct data type.

SQLSTATE: 42806

-304 **A VALUE WITH DATA TYPE *data-type1* CANNOT BE ASSIGNED TO A HOST VARIABLE BECAUSE THE VALUE IS NOT WITHIN THE RANGE OF THE HOST VARIABLE IN POSITION *position-number* WITH DATA TYPE *data-type2***

Explanation: A CALL, FETCH, SELECT, VALUES INTO, or SET assignment statement with a host variable list or structure in position number *position-number* failed because the host variable with data type *data-type2* was not large enough to hold the retrieved value with data type *data-type1*.

System Action: The statement cannot be executed. No data was retrieved. If the statement was a FETCH, the cursor remains open.

Programmer Response: Verify that table definitions are current, and that the host variable has the correct data type. See the explanation for SQLCODE -405 for ranges of SQL data types.

SQLSTATE: 22003

-305 **THE NULL VALUE CANNOT BE ASSIGNED TO OUTPUT HOST VARIABLE NUMBER *position-number* BECAUSE NO INDICATOR VARIABLE IS SPECIFIED**

Explanation: A FETCH, SELECT, VALUES INTO, or SET assignment statement resulted in the retrieval of a null value to be inserted into the output host variable, designated by entry number 'position-number' of the output SQLDA, for which no indicator variable was provided. An indicator variable must be supplied if a column returns a null value.

System Action: The statement cannot be executed. No data was retrieved.

Programmer Response: Examine the definition of the table that is the object of the statement and correct the application program to provide indicator variables for all host variables into which null values can be retrieved. This includes host variables for columns which can contain null values and host variables which receive the results of aggregate functions whose result table could be empty.

SQLSTATE: 22002

-309 **A PREDICATE IS INVALID BECAUSE A REFERENCED HOST VARIABLE HAS THE NULL VALUE**

Explanation: The statement could not be processed because a host variable appearing in a predicate such as

column-name = host-variable

had the NULL value. Such a predicate is not permitted when the host variable contains the NULL value even though the object column might contain nulls.

System Action: The statement cannot be executed.

Programmer Response: Rebind the plan or package containing the statement. The condition described is not an error in DB2 Version 2 Release 3 and later releases.

SQLSTATE: 22512

-310 **DECIMAL HOST VARIABLE OR PARAMETER *number* CONTAINS NON-DECIMAL DATA**

Explanation: DB2 received nondecimal data from either an application (in the form of a host variable), function or a stored procedure (in the form of a parameter that was passed to or from function or a stored procedure).

number Identifies either the host variable number (if the message is issued as a result of a FETCH, INSERT, UPDATE, DELETE, SELECT, VALUES INTO, or SET assignment statement statement), or the parameter number (if the message is issued as the result of the invocation of a function, or a CALL statement).

System Action: The statement cannot be processed.

Programmer Response: Correct the application program or stored procedure. Ensure that all decimal variables or parameters contain valid System/370 packed decimal numbers.

SQLSTATE: 22023

-311 **THE LENGTH OF INPUT HOST VARIABLE NUMBER *position-number* IS NEGATIVE OR GREATER THAN THE MAXIMUM**

Explanation: When evaluated, the length specification for input host string variable, whose entry in the SQLDA is indicated by position-number, was negative or greater than the maximum.

System Action: The statement cannot be executed.

Programmer Response: Correct the program to ensure that the lengths of all host string variables are not negative or that they are not greater than the maximum allowed length.

SQLSTATE: 22501

-312 ***variable-name* IS AN UNDEFINED OR UNUSABLE HOST VARIABLE OR IS USED IN A DYNAMIC SQL STATEMENT OR A TRIGGER DEFINITION**

Explanation: The host variable *variable-name* appears in the SQL statement, but:

- The SQL statement is a prepared statement, or
- The attributes of the variable are inconsistent with its usage in the SQL statement, or
- The variable is not declared in the application program or
- The variable appeared in one of the triggered SQL statements in a CREATE TRIGGER statement.

System Action: The statement cannot be executed.

Programmer Response: Verify that

- The variable name is spelled properly in the SQL statement.
- The variable is allowed in the SQL statement.
- The application program contains a declaration for that variable.
- The attributes of the variable are compatible with its use in the statement.

SQLSTATE: 42618

-313 THE NUMBER OF HOST VARIABLES SPECIFIED IS NOT EQUAL TO THE NUMBER OF PARAMETER MARKERS

Explanation: The number of host variables specified in the EXECUTE or OPEN statement is not the same as the number of parameter markers (question marks) appearing in the prepared SQL statement.

System Action: The statement cannot be executed.

Programmer Response: Correct the application program so that the number of host variables specified in the EXECUTE or OPEN statement is the same as the number of parameter markers appearing in the prepared SQL statement. The DESCRIBE INPUT SQL statement can be used to determine the expected number of input parameter markers.

SQLSTATE: 07001

-314 THE STATEMENT CONTAINS AN AMBIGUOUS HOST VARIABLE REFERENCE

Explanation: A host variable used in the statement has been defined more than once in this application program causing confusion as to which host variable defined should be used.

System Action: The statement cannot be executed.

Programmer Response: Make the host variable unique or use qualifications to indicate which host variable definition is to be used.

SQLSTATE: 42714

-327 THE ROW CANNOT BE INSERTED BECAUSE IT IS OUTSIDE THE BOUND OF THE PARTITION RANGE FOR THE LAST PARTITION

Explanation: When a row is inserted, the calculated partition key value for the new row must be within the bounds of a partition (as specified in the VALUES clause of the CREATE INDEX statement).

System Action: The statement cannot be executed.

Programmer Response: Correct the statement to specify a value for the partition key that is within the bounds of the last partition of the partitioned table space.

SQLSTATE: 22525

-330 A STRING CANNOT BE USED BECAUSE IT CANNOT BE CONVERTED. REASON *reason-code*, CHARACTER *code-point*, HOST VARIABLE *position-number*

Explanation: A translation error occurred during the translation of a string to a different coded character set. The type of error is indicated by the *reason-code*:

- 8** Length exception (for example, expansion required for PC MIXED data exceeds the maximum length of the string).
- 12** Invalid code point (for example, use of the ERRORBYTE option of SYSSTRINGS).
- 16** Form exception (for example, invalid MIXED data).
- 20** Conversion procedure error (for example, an exit set the length control field of the string to an invalid value).
- 24** SBCS character found in string contained in a wchar_t host variable.

If the *reason-code* is 12, *code-point* is the invalid code point. Otherwise, *code-point* is either blank or an additional *reason-code* returned by an exit. If the string is the value of an input host variable, the *position-number* is the ordinality of the variable in the SQLDA. If the string is not the value of a host variable, the *position-number* is blank.

System Action: The statement cannot be executed.

Programmer Response: Take one of the following actions based on the *reason-code*

- If the *reason-code* is 8, extend the maximum length of the host variable to allow for the expansion that occurs when the string is converted.
- If the *reason-code* is 12, either change the convert table to accept the *code-point* or the data to eliminate the *code-point*.

- If the *reason-code* is 16 and the string is described as MIXED data, either change its description or the string to conform to the rules for well-formed mixed data.
- If the *reason-code* is 20, correct the conversion procedure.
- If the *reason-code* is 24, delete the SBCS character from the graphic string.

SQLSTATE: 22021

-331 A STRING CANNOT BE ASSIGNED TO A HOST VARIABLE BECAUSE IT CANNOT BE CONVERTED. REASON
reason-code, **CHARACTER** *code-point*,
POSITION *position-number*

Explanation: The operation required the conversion of a string to the coded character set of the host variable and a conversion error occurred. The type of error is indicated by the *reason-code*:

- 8 for length exception (e.g., expansion required for PC MIXED data exceeds the maximum length of the string).
- 12 for invalid *code-point* (e.g., use of the ERRORBYTE option of SYSSTRINGS).
- 16 for form exception (e.g., invalid MIXED data).
- 20 for conversion procedure error (e.g., an exit set the length control field of the string to an invalid value).

If the *reason-code* is 12, *code-point* is the invalid *code-point*. Otherwise, *code-point* is blank. The *position-number* is the ordinality of the output variable in the SQLDA.

System Action: The statement cannot be executed.

Programmer Response: Take one of the following actions based on the *reason-code*:

- If the *reason-code* is 8, the maximum length of the result column must be extended to allow for the expansion that occurs when the string is converted.
- If the *reason-code* is 12, either the conversion table must be changed to accept the *code-point* or the data must be changed to eliminate the *code-point*.
- If the *reason-code* is 16, and the string is described as MIXED data, either its description must be changed or the string must be changed to conform to the rules for well-formed MIXED data.
- If the *reason-code* is 20, the conversion procedure must be corrected.

An alternative to these corrective actions is to provide an indicator variable so that a null value and a warning can be returned rather than an error. Refer to Chapter 2 of *DB2 SQL Reference* for more information on coded character set.

SQLSTATE: 22021

-332 CHARACTER CONVERSION BETWEEN CCSID *from-ccsid* **TO** *to-ccsid*
REQUESTED BY *reason-code* **IS NOT SUPPORTED**

Explanation: The operation required a conversion between two different CCSIDs, but no conversion support was found.

This error may occur if one CCSID is 65535 (BIT data) and the other CCSID is a graphic CCSID. Conversion is not defined between 65535 and a graphic CCSID.

from-ccsid identifies the coded character set of the string to be converted.

to-ccsid identifies the coded character set to which it must be converted.

reason code describes the reason codes returned from DB2. Reason codes returned from DB2 begin with 'DSN' and identify the context in which the conversion was requested. Values other than those that start with 'DSN' are returned from other DB2 platforms and are described in the documentation for the platform.

System Action: The statement cannot be processed.

Programmer Response: If the conversion request is correct, refer to Appendix B of DB2 Installation Guide for information on how to add conversion support.

SQLSTATE: 57017

-333 THE SUBTYPE OF A STRING VARIABLE IS NOT THE SAME AS THE SUBTYPE KNOWN AT BIND TIME AND THE DIFFERENCE CANNOT BE RESOLVED BY CONVERSION CHARACTER

Explanation: The CCSID in the run time SQLDA is inconsistent with the bind time subtype of the host variable or parameter marker. Either the run time description is BIT and the bind time description was not BIT, or the run time description is not BIT and the bind time description was BIT.

System Action: The statement cannot be executed.

Programmer Response: Change the CCSID in the SQLDA so that the subtype of the host variable is consistent with the bind time subtype of the host variable or parameter marker. If the input data in error is a parameter marker, you can use the DESCRIBE INPUT SQL statement to determine the expected SQLTYPE, SQLLEN and CCSID expected. Refer to Chapter 2 of *DB2 SQL Reference* for more information on coded character set.

SQLSTATE: 56010

-336 THE SCALE OF THE DECIMAL NUMBER MUST BE ZERO

Explanation: The decimal number is used in a context where the scale must be zero. This can occur when a decimal number is specified in a CREATE or ALTER SEQUENCE statement for START WITH, INCREMENT BY, MINVALUE, MAXVALUE, or RESTART WITH.

Programmer Response: Change the decimal number so that there are no non-zero digits to the right of the decimal point.

SQLSTATE: 428FA

-338 AN ON CLAUSE IS INVALID

Explanation: This return code reports a violation of one of the following:

- One expression of the predicate must only reference columns of one of the operand tables of the associated join operator, full join, and the other expression of the predicate must only reference columns of the other operand table.
- A VALUE or COALESCE function is allowed in the ON clause only when the join operator is a FULL OUTER JOIN or FULL JOIN.
- An operator other than '=' is not allowed in a FULL OUTER JOIN or FULL JOIN.
- A subquery is not allowed in the ON clause.

System Action: The statement cannot be executed.

Programmer Response: Correct the syntax so that it doesn't violate any of the above items within the ON clause

SQLSTATE: 42972

-340 THE COMMON TABLE EXPRESSION *name* HAS THE SAME IDENTIFIER AS ANOTHER OCCURRENCE OF A COMMON TABLE EXPRESSION DEFINITION WITHIN THE SAME STATEMENT

Explanation: The common table expression name *name* is used in the definition of more than one common table expressions in the statement. The name used to describe a common table expression must be unique within the same statement.

System Action: The statement cannot be executed.

Programmer Response: Correct the error by changing the name of one of the common table expressions.

SQLSTATE: 42726

-341 A CYCLIC REFERENCE EXISTS BETWEEN THE COMMON TABLE EXPRESSIONS *name1* AND *name2*

Explanation: The common table expression *name1* refers to *name2* in a FROM clause within its fullselect and *name2* refers to *name1* in a FROM clause within its fullselects. Such forms of cyclic references are not allowed.

System Action: The statement cannot be executed.

Programmer Response: Remove the cyclic reference from one of the common table expressions.

SQLSTATE: 42835

-342 THE COMMON TABLE EXPRESSION *name* MUST NOT USE SELECT DISTINCT AND MUST USE UNION ALL BECAUSE IT IS RECURSIVE

Explanation: There are two possible explanations:

- A fullselect within the common table expression *name* cannot start with SELECT DISTINCT because the common table expression is recursive.
- A fullselect within the common table expression *name* specified UNION instead of UNION ALL as required for recursive common table expressions.

System Action: The statement cannot be executed.

Programmer Response: Remove the keyword DISTINCT from the common table expression, add the keyword ALL following UNION, or remove the recursive reference within the common table expression.

SQLSTATE: 42925

-343 THE COLUMN NAMES ARE REQUIRED FOR THE RECURSIVE COMMON TABLE EXPRESSION *name*

Explanation: The recursive common table expression name *name* must include the specification of the column names following the identifier of the common table expression.

System Action: The statement cannot be executed.

Programmer Response: Add column names following the identifier of the common table expressions.

SQLSTATE: 42908

-344 THE RECURSIVE COMMON TABLE EXPRESSION *name* HAS MISMATCHED DATA TYPES OR LENGTHS FOR COLUMN *column-name*

Explanation: The recursive common table expression name *name* has a column *column-name* that is referred to in the iterative fullselect of the common table expression. The data type and length are set based on

the initialization fullselect for this column. The result of the expression for the column *column-name* in the iterative fullselect has a different data type or length that may result in failure to assign the value for the column.

System Action: The statement cannot be executed.

Programmer Response: Correct the column used in the fullselects of the recursive common table expression so that the initialization column matches the iterative columns.

SQLSTATE: 42825

-345 THE FULLSELECT OF THE RECURSIVE COMMON TABLE EXPRESSION *name* MUST BE THE UNION OF TWO OR MORE FULLSELECTS AND MUST NOT INCLUDE COLUMN FUNCTIONS, GROUP BY CLAUSE, HAVING CLAUSE, OR AN EXPLICIT JOIN INCLUDING AN ON CLAUSE

Explanation: The common table expression *name* includes a reference to itself and therefore:

- must be the union of two or more fullselects.
- cannot include a GROUP BY clause.
- cannot have column functions.
- cannot include a HAVING clause.
- and cannot include an explicit join with an ON clause.

System Action: The statement cannot be executed.

Programmer Response: Change the common table expression by:

- making it a union of two or more fullselects.
- removing any column functions, GROUP BY clause, HAVING clause, or explicit JOIN including an ON clause.
- removing the recursive reference.

SQLSTATE: 42836

-346 AN INVALID REFERENCE TO COMMON TABLE EXPRESSION *name* OCCURS IN THE FIRST FULLSELECT, AS A SECOND OCCURRENCE IN THE SAME FROM CLAUSE, OR IN THE FROM CLAUSE OF A SUBQUERY

Explanation: The common table expression *name* includes an invalid reference to itself as described by one of the following:

- A recursive reference in the first fullselect before the UNION ALL set operator. The first fullselect must be an initialization and cannot include a recursive reference.

- More than one reference to the same common table expression in the same FROM clause. Such references are not permitted in recursive common table expression.

- A recursive reference in the FROM clause of a subquery. A recursion cycle cannot be defined using a subquery.

System Action: The statement cannot be executed.

Programmer Response: Change one of the following:

- the fullselect prior to the union operator so that it does not include a recursive reference.
- the FROM clause containing more than one reference to the same common table expression to just one reference .
- the FROM clause of the subquery so that it does not reference the common table expression.

SQLSTATE: 42836

-348 *sequence-expression* CANNOT BE SPECIFIED IN THIS CONTEXT

Explanation: The statement contains a NEXT VALUE expression or PREVIOUS VALUE expression in an invalid context.

The NEXT VALUE expression or PREVIOUS VALUE expression cannot be specified in the following contexts:

- Join condition of a full outer join
- DEFAULT value for a column in a CREATE TABLE or ALTER TABLE statement
- Column definition that is generated in a CREATE TABLE or ALTER TABLE statement
- Materialized query table definition in a CREATE TABLE or ALTER TABLE statement
- Condition of a CHECK constraint
- Input value-specification for LOAD
- CREATE VIEW statement

NEXT VALUE expressions cannot be specified in the following contexts:

- CASE expression
- Parameter list of an aggregate function
- Subquery in a context in which it is not otherwise allowed
- SELECT statement for which the outer SELECT contains a DISTINCT operator or a GROUP BY clause
- SELECT statement for which the outer SELECT is combined with another SELECT statement using the UNION set operator
- Join condition of a join
- Nested table expression
- Parameter list of a table function
- SELECT clause of the fullselect of an expression in the SET clause of an UPDATE statement

- ORDER BY clause of the outer-most SELECT statement
- IF, WHILE, DO ... UNTIL, or CASE statement in an SQL routine

Programmer Response: Remove the reference to the sequence expression and resubmit the statement.

SQLSTATE: 428F9

-350 INVALID SPECIFICATION OF A LARGE OBJECT COLUMN

Explanation: The ALTER TABLE, CREATE TABLE, or CREATE INDEX statement is invalid for one of the following reasons:

- A LOB column cannot be added to a temporary table.
- A LOB column cannot be added to a table defined with an EDITPROC.
- The *PRIMARY KEY* clause cannot specify a LOB column as a column of the primary key.
- The *UNIQUE* clause cannot specify a LOB column as a column of the unique key.
- The *referential-constraint* clause cannot specify a LOB column as a column of a foreign key.
- A LOB column cannot be specified in a *references* clause.
- The CREATE INDEX statement cannot name a LOB column as a column of the index key.
- When specifying PARTITIONING KEY, LOB columns cannot be specified when defining the partitioning key.

System Action: The statement cannot be executed.

Programmer Response: Correct the syntax and resubmit the statement.

SQLSTATE: 42962

-351 AN UNSUPPORTED SQLTYPE WAS ENCOUNTERED IN POSITION *position-number* OF THE SELECT-LIST

Explanation: *position-number* is the position of the first element in the SQLDA with an unsupported data type. Either the application requestor or the application server does not have support for this type. This error can only occur in a client/server environment.

System Action: The statement cannot be executed.

Programmer Response: Change the statement to exclude the unsupported data type. For a select statement, remove the names of any columns in the select-list with the unsupported data types.

SQLSTATE: 56084

-352 AN UNSUPPORTED SQLTYPE WAS ENCOUNTERED IN POSITION *position-number* OF THE INPUT-LIST

Explanation: The input SQLDA for an OPEN, EXECUTE, FETCH, or CALL statement contains an unsupported SQLTYPE for the parameter in position *position-number*. *position-number* is the position of the first element in the SQLDA with an unsupported data type. Either the application requestor or the application server does not have support for this data type. This error can only occur in a client/server environment.

System Action: The statement cannot be executed.

Programmer Response: Change the SQLDA to exclude the unsupported data type.

SQLSTATE: 56084

-353 FETCH IS NOT ALLOWED, BECAUSE CURSOR *cursor-name* HAS AN UNKNOWN POSITION

Explanation: The cursor position for *cursor-name* is unknown. The previous multiple-row-fetch for cursor *cursor-name* resulted in an error in the middle of processing multiple rows that were retrieved from DB2. One or more of the requested rows could not be returned to the program following the error, leaving the position of the cursor unknown. The error may have been detected at the requester. For example a row with a null value was returned to an application, but no indicator variable was provided. A subsequent FETCH statement would result in SQLCODE -353. If an indicator had been provided, a positive SQLCODE would have been returned and all of the rows retrieved from DB2 could have been returned to the application program.

System Action: The statement cannot be processed. The cursor position is not changed.

Programmer Response: Close and reopen the cursor to reset the cursor position. For scrollable cursors, you can change the FETCH statement to specify one of the other fetch orientations such as FIRST, LAST, BEFORE, AFTER, ABSOLUTE, FIRST ROWSET, LAST ROWSET, or ROWSET STARTING AT ABSOLUTE to establish a valid rowset cursor position, and fetch data. Alternately, change the application to correct the error that originally occurred. For example, if the error was issued because an indicator was not provided, change the application to provide an indicator.

SQLSTATE: 24513

-355 A LOB COLUMN IS TOO LARGE TO BE LOGGED

Explanation: One of the following has occurred:

- a CREATE TABLE statement for an auxiliary table stores a BLOB, CLOB or DBCLOB column whose

length exceeds 1 gigabyte but whose associated LOB table space was defined with the LOG YES attribute

- an ALTER TABLESPACE statement of a LOB table space specifies the LOG YES clause but the auxiliary table in the LOB table space stores a BLOB or CLOB column whose length exceeds 1 gigabyte or a DBCLOB column whose length exceeds 500 megabyte characters

System Action: The statement cannot be executed.

Programmer Response: Either change the attribute of the LOB table space to LOG NO or drop the base table, and recreate it with columns of an acceptable length for logging.

SQLSTATE: 42993

-359 THE RANGE OF VALUES FOR THE IDENTITY COLUMN OR SEQUENCE IS EXHAUSTED

Explanation: DB2 attempted to generate a value for an identity column or a sequence object. However, all allowable values have already been assigned.

System Action: The statement cannot be processed.

Programmer Response: Take one of the following actions:

- For an identity column, redefine the table with a larger range of values for the identity column. If a MAXVALUE or MINVALUE specification has been made that limits the range of values to be less than the range for the data type of the column, then the column can be altered to expand the range of valid values. Otherwise, the identity column must be recreated, which requires that the table be recreated. First, drop the existing table; then, recreate the table with a different data type for the identity column, specifying a data type that has a larger range of values than the current data type for the identity column.
- For a sequence object, redefine the sequence with a larger range of values. If a MAXVALUE or MINVALUE specification has been made that limits the range of values to be less than the range for the data type, then the sequence can be altered to expand the range of valid values. Otherwise, the sequence must be recreated using DROP SEQUENCE and CREATE SEQUENCE to cover a larger range of values.

SQLSTATE: 23522

-372 ONLY ONE ROWID OR IDENTITY COLUMN IS ALLOWED IN A TABLE

Explanation: An attempt was made to do one of the following:

- Create a table with more than one ROWID column.

- Add a ROWID column to a table that already has one.
- Create a table with more than one identity column.
- Add an identity column to a table that already has one.
- Create a table with more than one security label column.
- Add a security label column to a table that already has one.

System Action: The statement was not executed.

Programmer Response: For a CREATE TABLE statement, select only one column to have the row ID data type or the AS IDENTITY attribute. For an ALTER TABLE statement, a ROWID column or identity column already exists for the table. Do not attempt to add another column with the data type row ID or with the AS IDENTITY attribute to the table.

SQLSTATE: 428C1

-373 DEFAULT CANNOT BE SPECIFIED FOR IDENTITY COLUMN OR SECURITY LABEL *columnname-seclabel*

Explanation: A DEFAULT clause may not be specified for a column that has been identified as an IDENTITY column or a security label column

System Action: The statement cannot be executed.

Programmer Response: Remove the DEFAULT clause and resubmit the statement.

SQLSTATE: 42623

-390 THE FUNCTION *function-name*, SPECIFIC NAME *specific-name*, IS NOT VALID IN THE CONTEXT IN WHICH IT OCCURS

Explanation: A function resolved to a specific function that is not valid in the context where it is used. If *specific-name* is an empty string, then the function resolved to the built-in function identified by *function-name*. Some of the possible situations include:

- A scalar or aggregate function is referenced where only a table function is allowed (such as in the FROM clause of a query).
- A table function is referenced where only a scalar or aggregate function is allowed (such as in an expression, or in a SOURCE clause of a CREATE FUNCTION statement).

System Action: The statement cannot be executed.

Programmer Response: Ensure that the correct function name and arguments are specified and that the SQL path includes the schema where the correct function is defined. You may need to change the function name, arguments, SQL path (using SET CURRENT PATH or the PATH bind option), or change

the context in which the function is used. Refer to Chapter 5 of *DB2 SQL Reference* for information on the use of functions.

SQLSTATE: 42887

**-392 SQLDA PROVIDED FOR CURSOR
cursor HAS BEEN CHANGED FROM
THE PREVIOUS FETCH**

Explanation: The application is running with *DB2 rules*, and has requested that LOB data be returned as a LOB in one FETCH statement, and as a locator in another FETCH statement. This is not permitted.

System Action: The statement is not executed and the connection is terminated.

Programmer Response: Either do not use *DB2 rules*, or change to application to not change the data type code from LOB to locator (or the reverse) in the SQLDA between successive fetches.

SQLSTATE: 42855

**-393 THE CONDITION OR CONNECTION
NUMBER IS INVALID**

Explanation: The value of the CONDITION or CONNECTION number that was specified in the GET DIAGNOSTICS statement is either less than zero, or greater than the number of available diagnostics.

System Action: The statement cannot be processed.

Programmer Response: Correct the value of the CONDITION or CONNECTION number, while ensuring that the number is between 1 and the value of the NUMBER statement-information item or GET DIAGNOSTICS. Resubmit the GET DIAGNOSTICS CONDITION or GET DIAGNOSTICS CONNECTION statement.

SQLSTATE: 35000

**-396 *object-type object-name* ATTEMPTED TO
EXECUTE AN SQL STATEMENT
DURING FINAL CALL PROCESSING**

Explanation: A user-defined function named *object-name* was invoked and attempted to execute an SQL statement (other than CLOSE CURSOR) during final call processing, but the statement is not allowed.

System Action: The SQL statement cannot be executed.

Programmer Response: Change the definition of the function to not issue SQL statements during final call processing.

SQLSTATE: 38505

**-397 GENERATED IS SPECIFIED WITH A
COLUMN THAT IS NOT A ROW ID, A
DISTINCT TYPE BASED ON A ROW ID,
OR AN IDENTITY COLUMN**

Explanation: GENERATED was specified in a CREATE or ALTER TABLE statement for a column with a data type that is not a row ID, a distinct type that is based on a row ID, or an identity column. GENERATED can only be specified for a column with a data type of row ID, a distinct type that is based on a row ID, or an identity column.

System Action: The statement cannot be processed.

Programmer Response: Correct the statement. Either eliminate the GENERATED clause or change the data type of the column ensure that the data type of the object is row ID, or that the column is an identity column

SQLSTATE: 428D3

**-398 A LOCATOR WAS REQUESTED FOR
HOST VARIABLE NUMBER
position-number BUT THE VARIABLE IS
NOT A LOB**

Explanation: The application requested that a locator be returned from host variable number *position-number*. A locator can only be used with LOB data, and the requested data is not a LOB.

System Action: The statement cannot be executed.

Programmer Response: Change the statement to either return LOB data, or change the target host variable to not be a locator.

SQLSTATE: 428D2

**-399 ATTEMPTED TO INSERT AN INVALID
VALUE INTO A ROWID COLUMN**

Explanation: When inserting into a table, a value specified for a ROWID column was invalid. Only row ID values previously generated by DB2 are valid.

System Action: The INSERT is not performed.

Programmer Response: Do not attempt to generate any value for insertion into a ROWID column. Insertion into ROWID columns is supported for purposes of Data Propagation, where DB2 has previously generated the row ID values. Only row ID values previously generated by DB2 can be used as values for insertion into a row ID column. Alternatively, insert the row specifying DEFAULT for the ROWID column or remove the ROWID column from the insert column-list.

You may also use the OVERRIDING clause as a possible solution for this situation. See INSERT in DB2 SQL Reference for more information about the OVERRIDING USER VALUE clause.

SQLSTATE: 22511

-400 THE CATALOG HAS THE MAXIMUM NUMBER OF USER DEFINED INDEXES

Explanation: Only one hundred user-defined indexes can be created in the catalog database.

System Action: The statement cannot be executed.

Programmer Response: If this index must be created, another user-defined index on the catalog must be dropped. After that index is dropped, this statement can be executed.

SQLSTATE: 54027

-401 THE OPERANDS OF AN ARITHMETIC OR COMPARISON OPERATION ARE NOT COMPARABLE

Explanation: An arithmetic operation appearing within the SQL statement contains a mixture of numeric and non-numeric operands, or the operands of a comparison operation are not compatible.

One reason for this error is that the comparison involves both *character* and *graphic* operands. This combination of operands is not allowed for EBCDIC and ASCII data. For Unicode data, this combination of operands is not allowed if a field procedure exists on one of the columns.

System Action: The statement cannot be executed.

Programmer Response: Check the data types of all operands to ensure that their data types are comparable and compatible with their usage in the statement.

If all the operands of the SQL statement are correct, then, if a view is being accessed, check the data types of all the operands in the view definition.

SQLSTATE: 42818

-402 AN ARITHMETIC FUNCTION OR OPERATOR *arith-fop* IS APPLIED TO CHARACTER OR DATETIME DATA

Explanation: A nonnumeric operand has been specified for the arithmetic function or operator *arith-fop*.

System Action: The statement cannot be executed.

Programmer Response: Examine and correct the syntax of the SQL statement such that all operands of the specified function or operator are numeric.

SQLSTATE: 42819

-404 THE SQL STATEMENT SPECIFIES A STRING THAT IS TOO LONG

Explanation: An INSERT, UPDATE, CALL, VALUES INTO, SET, parameter, host variable, or transition variable statement specifies a value that is longer than the maximum length string that can be stored in the target column.

System Action: The statement cannot be executed.

Programmer Response: Check the length of the target column, parameter, host variable or transition variable and correct the program or SQL statement so that the length of the string does not exceed that maximum. For example, you could use the SUBSTR function to shorten the string.

SQLSTATE: 22001

-405 THE NUMERIC LITERAL *literal* CANNOT BE USED AS SPECIFIED BECAUSE IT IS OUT OF RANGE

Explanation: The numeric *literal* is not in the proper range.

The proper ranges for SQL values are as follows:

- 5.4E-79 to 7.2E+75 for FLOAT values
- $-(10^{31} - 1)$ to $+(10^{31} - 1)$ for DECIMAL values
- -2147483648 to 2147483647 for INTEGER values
- -32768 to +32767 for small integer (SMALLINT) values.

System Action: The statement cannot be executed.

Programmer Response: The value of *literal* should be reduced to the appropriate size for this data type.

SQLSTATE: 42820

-406 A CALCULATED OR DERIVED NUMERIC VALUE IS NOT WITHIN THE RANGE OF ITS OBJECT COLUMN

Explanation: A value derived or calculated during processing of the SQL statement was outside the range of the data type of its object column. This problem might have arisen because either the values occurring in the object column were out of range, or the SQL operation performed was not appropriate for the values in the object column.

System Action: The statement cannot be executed.

Programmer Response: See the explanation of SQLCODE -405 for allowed ranges for numeric data types.

SQLSTATE: 22003

-407 AN UPDATE, INSERT, OR SET VALUE IS NULL, BUT THE OBJECT COLUMN *column-name* CANNOT CONTAIN NULL VALUES

Explanation: One of the following conditions occurred:

- A null insert or update value was specified for a column defined as NOT NULL.
- No insert value was provided for a column that does not have a default value.
- A SET transition variable statement specified a NULL value for column defined as NOT NULL.

- The insert value was DEFAULT, but the object column was declared as NOT NULL without WITH DEFAULT in the table definition. Consequently, a default value of NULL cannot be inserted into that column.
- A null insert value was specified for a ROWID column.

System Action: The statement cannot be executed. The 'column-name' might be returned in the SQLCA, depending on the syntax of the SQL statement in which the error was detected.

Programmer Response: Examine the definition of the object table to determine which columns of the table have the NOT NULL attribute or have a type of ROWID, and correct the SQL statement accordingly.

SQLSTATE: 23502

-408 THE VALUE IS NOT COMPATIBLE WITH THE DATA TYPE OF ITS TARGET. TARGET NAME IS *name*

Explanation: The data type of the value to be assigned to the column, parameter, host variable or transition variable by the SQL statement is incompatible with the declared data type of the assignment target. Both must be:

- Numeric
- Character
- Graphic
- Dates or character
- Times or character
- Timestamps or character
- Row IDs
- The same distinct types

However, dates, times, or timestamps cannot be assigned to a character column that has a field procedure. Also note that character and graphic data types are compatible when using Unicode.

This SQLCODE is issued for any statement that fails required assignment rule checking.

System Action: The statement cannot be executed.

Programmer Response: Examine the current definition for the object table, procedure, user-defined function, or host variable and ensure that the host variable or literal value that is assigned to the object has the proper data type. In some cases, you can convert the value to the proper data type by using a function such as CHAR or DECIMAL.

SQLSTATE: 42821

-409 INVALID OPERAND OF A COUNT FUNCTION

Explanation: The operand of the COUNT or COUNT_BIG function in the statement violates SQL syntax. A common error is a column name or other expression without DISTINCT.

System Action: The statement cannot be executed.

Programmer Response: Correct the syntax and resubmit the statement. Refer to Chapter 3 of *DB2 SQL Reference* for information about the proper form for the operands of a COUNT or COUNT_BIG function.

SQLSTATE: 42607

-410 THE FLOATING POINT LITERAL *literal* CONTAINS MORE THAN 30 CHARACTERS

Explanation: The specified floating-point literal is more than 30 characters in length. A floating-point literal has a maximum length of 30 characters.

System Action: The statement cannot be executed.

Programmer Response: Correct the indicated literal.

SQLSTATE: 42820

-411 CURRENT SQLID CANNOT BE USED IN A STATEMENT THAT REFERENCES REMOTE OBJECTS

Explanation: A reference to the CURRENT SQLID special register is invalid in a statement that contains the three-part name or alias of an object that is remote to the remote server.

System Action: The statement cannot be executed.

Programmer Response: Either remove the reference to CURRENT SQLID or the reference to the remote object.

SQLSTATE: 56040

-412 THE SELECT CLAUSE OF A SUBQUERY SPECIFIES MULTIPLE COLUMNS

Explanation: In the context in which it was used in the SQL statement, the subquery can have only one column specified in its SELECT clause.

System Action: The statement cannot be executed.

Programmer Response: Correct the syntax of the SQL statement. Refer to Chapter 4 of *DB2 SQL Reference* for information about restrictions on the syntax for subqueries.

SQLSTATE: 42823

**-413 OVERFLOW OCCURRED DURING
NUMERIC DATA TYPE CONVERSION**

Explanation: During processing of the SQL statement, an overflow condition arose when converting from one numeric type to another. Numeric conversion is performed according to the standard rules of SQL.

System Action: The statement cannot be processed. No data was retrieved, updated, or deleted.

Programmer Response: Examine the syntax of the SQL statement to determine the cause of the error. If the problem is data-dependent, it might be necessary to examine the data processed at the time of the error.

SQLSTATE: 22003

**-414 A LIKE PREDICATE IS INVALID
BECAUSE THE FIRST OPERAND IS
NOT A STRING**

Explanation: The data type of the first operand of the LIKE predicate must be a character string or graphic string.

System Action: The statement cannot be executed.

Programmer Response: Respecify the predicate so that the data type of each operand is a character string or a graphic string.

SQLSTATE: 42824

**-415 THE CORRESPONDING COLUMNS,
column-number, OF THE OPERANDS OF
A UNION OR A UNION ALL DO NOT
HAVE COMPARABLE COLUMN
DESCRIPTIONS**

Explanation: The column descriptions of corresponding columns of the operands of a UNION or UNION ALL must be comparable. The columns of ordinality 'column-number' of the operands in this UNION or UNION ALL do not satisfy this requirement. For columns to be comparable, they must both be either numeric, character, graphic, date, time, or timestamp. They cannot be a mixture of these groups. If corresponding columns have field procedures, they must both have the same field procedure.

System Action: The statement cannot be executed.

Programmer Response: Check the data types of the specified columns and correct the UNION or UNION ALL statement so that all corresponding columns have comparable column descriptions.

SQLSTATE: 42825

**-416 AN OPERAND OF A UNION CONTAINS
A LONG STRING COLUMN**

Explanation: The UNION specified in the SQL statement could not be performed because one of the tables participating in the union contains a long string column. The operands of a UNION cannot contain long string columns.

System Action: The statement cannot be executed.

Programmer Response: The implied function is not supported by DB2. Refer to Chapter 2 of *DB2 SQL Reference* for information about restrictions on the manipulation of long string columns.

SQLSTATE: 42907

**-417 A STATEMENT STRING TO BE
PREPARED INCLUDES PARAMETER
MARKERS AS THE OPERANDS OF
THE SAME OPERATOR**

Explanation: The statement string specified as the object of a PREPARE contains a predicate or expression where parameter markers have been used as operands of the same operator—for example:

? > ?

This syntax is not permitted.

System Action: The statement cannot be executed.

Programmer Response: Correct the logic of the application program so that this syntax error does not occur. Refer to Chapter 5 of *DB2 SQL Reference* for information about the proper usage of parameter markers within SQL statements to be prepared.

SQLSTATE: 42609

**-418 A STATEMENT STRING TO BE
PREPARED CONTAINS AN INVALID
USE OF PARAMETER MARKERS**

Explanation: Parameter markers cannot be used in the SELECT list, as the sole argument of a scalar function, or in a concatenation operation. Parameter markers cannot be used in the string expression of an EXECUTE IMMEDIATE SQL statement.

System Action: The statement cannot be executed.

Programmer Response: Correct the logic of the application program so that this error does not occur. Refer to Chapter 5 of *DB2 SQL Reference* for information about the proper usage of parameter markers within SQL statements and for EXECUTE IMMEDIATE SQL statement restrictions.

SQLSTATE: 42610

-419 THE DECIMAL DIVIDE OPERATION IS INVALID BECAUSE THE RESULT WOULD HAVE A NEGATIVE SCALE

Explanation: The decimal division is invalid because it will result in a negative scale.

The formula used internally to calculate the scale of the result for decimal division is explained in Chapter 2 of *DB2 SQL Reference*.

System Action: The statement cannot be executed. No data was retrieved, updated, or deleted.

Programmer Response: Examine the precision and scale of all columns that may have participated in a decimal division. Note that an integer or small integer value may have been converted to decimal for this calculation.

SQLSTATE: 42911

-420 THE VALUE OF A STRING ARGUMENT WAS NOT ACCEPTABLE TO THE *function-name* FUNCTION

Explanation: A string argument did not conform to the requirements of the function. For example, a character string passed to the DECIMAL function did not conform to the rules for forming an SQL integer or decimal constant.

System Action: The statement cannot be processed.

Programmer Response: Change the argument value so that it conforms to the requirements of the function as specified in *DB2 SQL Reference*.

SQLSTATE: 22018

-421 THE OPERANDS OF A UNION OR UNION ALL DO NOT HAVE THE SAME NUMBER OF COLUMNS

Explanation: The operands of a UNION or UNION ALL must have the same number of columns.

System Action: The statement cannot be executed.

Programmer Response: Correct the SQL statement so that there are exactly the same number of columns in each operand.

SQLSTATE: 42826

-423 INVALID VALUE FOR LOCATOR IN POSITION *position-#*

Explanation: The value specified in a result set locator host variable, a LOB locator host variable, or a table locator that is specified at position *position-#* in the locator variable list of the SQL statement does not identify a valid result set locator, LOB locator variable, or table locator, respectively.

System Action: The statement cannot be executed.

Programmer Response: For a result set locator there are two common causes for the error:

- The host variable used as a result set locator was never assigned a valid result set locator value. Result set locator values are returned by the DESCRIBE PROCEDURE and ASSOCIATE LOCATORS statements. Make sure the value in your host variable is obtained from one of these statements.
- Result set locator values are only valid as long as the underlying SQL cursor is open. If a commit or rollback operation closes an SQL cursor, the result set locator associated with the cursor is no longer valid.

For a LOB locator, some common causes for the error are:

- The host variable used as a LOB locator was never assigned a valid LOB value.
- A commit or rollback operation or an SQL FREE LOCATOR statement freed the locator.

For a table locator, the error commonly occurs when the host variable that was used as a table locator was never assigned a valid table locator value.

SQLSTATE: 0F001

-426 DYNAMIC COMMIT NOT VALID AT AN APPLICATION SERVER WHERE UPDATES ARE NOT ALLOWED

Explanation: An application executing using DRDA protocols has attempted to issue a dynamic COMMIT statement, or a stored procedure has attempted to issue a COMMIT_ON_RETURN, while connected to a location at which updates are not allowed. A dynamic COMMIT or COMMIT_ON_RETURN can be issued only while connected to a location at which updates are allowed.

System Action: The statement cannot be executed. No COMMIT is performed.

Programmer Response: The IMS or CICS protocols should be used to commit work in these environments.

SQLSTATE: 2D528

-427 DYNAMIC ROLLBACK NOT VALID AT AN APPLICATION SERVER WHERE UPDATES ARE NOT ALLOWED

Explanation: An application executing using DRDA protocols has attempted to issue a dynamic ROLLBACK statement while connected to a location at which updates are not allowed. A dynamic ROLLBACK may be issued only while connected to a location at which updates are allowed.

System Action: The statement cannot be executed. No ROLLBACK is performed.

Programmer Response: The IMS or CICS protocols

should be used to rollback work in these environments.

SQLSTATE: 2D529

-430 *routine-type routine-name* (SPECIFIC NAME *specific-name*) HAS ABNORMALLY TERMINATED

Explanation: An abnormal termination has occurred while the routine *routine-name* (stored procedure or function) was in control.

System Action: The statement cannot be executed.

Programmer Response: The stored procedure or function needs to be fixed. Contact the author of the routine or your database administrator. Until it is fixed, the routine should not be used.

SQLSTATE: 38503

-433 VALUE *value* IS TOO LONG

Explanation: The value *value* required truncation by a system (built-in) cast or adjustment function, which was called to transform the value in some way. The truncation is not allowed where this value is used. The value being transformed is one of the following:

- an argument to a user defined function (UDF)
- an input to the SET clause of an UPDATE statement
- a value being INSERTed into a table
- an input to a cast or adjustment function in some other context.

If *value* has the 'for bit data' subtype, then the *value* is printed as a hexadecimal string in quotes followed by an X.

System Action: The statement cannot be executed.

Programmer Response: If *value* is a literal string in the SQL statement, it is too long for its intended use. If *value* is not a literal string, examine the SQL statement to determine where the transformation is taking place. Either the input to the transformation is too long, or the target is too short. Correct the problem and rerun the statement.

SQLSTATE: 22001

-435 AN INVALID SQLSTATE *sqlstate* IS SPECIFIED IN THE FUNCTION RAISE_ERROR OR IN A SIGNAL SQLSTATE STATEMENT

Explanation: The SQLSTATE specified in the RAISE_ERROR function or specified in a SIGNAL SQLSTATE statement of a trigger definition does not conform to the rules for an application defined SQLSTATE.

System Action: The statement cannot be processed.

Programmer Response: Correct the SQLSTATE

specified in the RAISE_ERROR function or SIGNAL statement. The SQLSTATE must be a character string containing exactly 5 characters. It must be of type CHAR defined with a length of 5, or a type VARCHAR defined with a length of 5 or greater. The SQLSTATE value must follow the rules for application-defined SQLSTATEs as follows:

- Each character must be from the set of digits ('0' through '9') or non-accented upper case letters ('A' through 'Z').
- The SQLSTATE class (first two characters) cannot be '00', '01' or '02' because these are not error classes.
- If the SQLSTATE class (first two characters) starts with the character '0' through '6' or 'A' through 'H', then the subclass (last three characters) must start with a letter in the range 'I' through 'Z'.
- If the SQLSTATE class (first two characters) starts with the character '7', '8', '9' or 'I' through 'Z', then the subclass (last three characters) can be any of '0' through '9' or 'A' through 'Z'.

SQLSTATE: 428B3

-438 APPLICATION RAISED ERROR WITH DIAGNOSTIC TEXT: *text*

Explanation: This error occurred as a result of execution of the RAISE_ERROR function or as a result of the SIGNAL SQLSTATE statement.

text Diagnostic text provided by the invocation of the RAISE_ERROR function or the SIGNAL SQLSTATE statement.

System Action: The statement cannot be processed.

Programmer Response: Use application-provided diagnostic text, if provided, to determine the cause of the error.

SQLSTATE: application-defined

-440 NO *routine-type* BY THE NAME *routine-name* HAVING COMPATIBLE ARGUMENTS WAS FOUND

Explanation: This occurs in a reference to routine (stored procedure or function) *routine-name*, when DB2 cannot find a function or stored procedure it can use to implement the reference. There are several reasons why this could occur.

- *routine-name* was either incorrectly specified or does not exist in the database.
- A qualified reference was made, and the qualifier was incorrectly spelled.
- A user's SQL path does not contain the schema to which the desired function belongs, and an unqualified reference was used.
- The wrong number of arguments were included.
- For functions, the data types of one or more of the arguments is incorrect.

- The routine invoker is not authorized to execute the routine.

System Action: The statement cannot be executed.

Programmer Response: Fix the problem and retry. This could involve a change to the SQL statement, the addition of new routines or a change to the user's SQL path.

SQLSTATE: 42884

-441 INVALID USE OF 'DISTINCT' OR 'ALL' WITH SCALAR FUNCTION
function-name

Explanation: The keyword 'DISTINCT' or 'ALL' was detected within parentheses in a reference to function *function-name* and the function has been resolved as a scalar function. Use of the keyword 'DISTINCT' or 'ALL' with a scalar function is invalid.

System Action: The statement cannot be executed.

Programmer Response: If a scalar function is being used, then remove the keyword 'DISTINCT' or 'ALL'.

If an aggregate function is being used, then there is a problem with function resolution. Check your SQL path to see if the desired function is in one of the schemas, and also check the SYSIBM.SYSROUTINES catalog for the spelling of the function name and the number and types of parameters.

SQLSTATE: 42601

-443 ROUTINE *routine-name* (SPECIFIC NAME *specific-name*) HAS RETURNED AN ERROR SQLSTATE WITH DIAGNOSTIC TEXT *msg-text*

Explanation: An SQLSTATE of the form 38xxx was returned by routine *routine-name*, along with message text *msg-text*.

If the third character is not 5 (for example, '385xx') then the last 3 characters of the SQLSTATE value were chosen by the function to indicate the reason of the failure. SQLSTATEs values of the form 385xx are issued by IBM with a different SQLCODE.

System Action: The actions in the external function should be rolled back.

Programmer Response: Contact the author of the function or your database administrator. Until the problem is resolved, the function should not be used.

SQLSTATE: 38xxx (the SQLSTATE that was returned by the routine).

-444 USER PROGRAM *name* COULD NOT BE FOUND

Explanation: DB2 received an SQL CALL statement for a stored procedure or an SQL statement containing an invocation of a user-defined function, and found the row in the SYSIBM.SYSROUTINES catalog table associated with the requested procedure name. However, the MVS load module identified in the EXTERNAL_NAME column of the SYSIBM.SYSROUTINES row could not be found.

name The name of the MVS load module that could not be found

System Action: The statement cannot be executed.

Programmer Response: If the EXTERNAL_NAME column value in the SYSIBM.SYSROUTINES table is incorrect, use the ALTER FUNCTION or ALTER PROCEDURE statement to correct the value.

If the EXTERNAL_NAME column value is correct, use the MVS linkage editor to create the required MVS load module in one of the MVS load libraries used by your installation for stored procedures.

This error can also occur if you are invoking a WLM-managed stored procedure that is not APF authorized, and the DB2 load libraries are not in the STEPLIB concatenation because they are being loaded from LINKLIST. In this case, if you want the stored procedure program to run APF-authorized, link-edit it with AC=1 into an MVS APF authorized library. If you do not want the stored procedure program to run APF authorized, add the DB2 load library to the STEPLIB concatenation of the JCL used to start the WLM-managed address space.

SQLSTATE: 42724

-449 CREATE OR ALTER STATEMENT FOR FUNCTION OR PROCEDURE *routine-name* CONTAINS AN INVALID FORMAT OF THE EXTERNAL NAME CLAUSE OR IS MISSING THE EXTERNAL NAME CLAUSE

Explanation: An error was found in the EXTERNAL NAME clause of the CREATE FUNCTION, CREATE PROCEDURE, ALTER FUNCTION, or ALTER PROCEDURE statement for *routine-name*, or the clause is needed but was not specified.

- For a LANGUAGE JAVA or COMPJAVA stored procedure, or LANGUAGE JAVA user-defined function, the name must be specified and it must contain a valid *external-java-routine-name* of the following form:

jar-name:package-id...class-id.method-id(method-signature)

- No blanks are permitted within the single quotes.
- For LANGUAGE COMPJAVA, do not specify a *jar-name*.

- The *method-name* consists of the list of *package-ids*, *class-id*, and *method-id*, and must not be longer than 254 bytes.
 - For LANGUAGE JAVA, zero or more *package-ids* may be specified, preceding the *class-id*. For LANGUAGE COMPJAVA, at least one *package-id* must be specified, preceding the *class-id*
 - The *method-signature* is optional, and is a list of Java data types that are separated by commas. If specified, the *method-signature* must not be longer than 1024 bytes.
 - If multiple *strings* are specified, the total length of all the *strings* concatenated together for the *external-java-routine-name* must not be greater than 1305.
- For external routines with a language other than JAVA or COMPJAVA, the external name must be a short identifier with letters or digits. The first character must be a letter. (This is the MVS naming convention for load modules). A possible cause for this error is the inclusion of a blank in the name.

If the clause is omitted, the external name defaults to *function-name*. However, for CREATE FUNCTION or CREATE PROCEDURE if the function or procedure name is longer than eight characters then the EXTERNAL NAME clause must be explicitly specified to specify a valid *short identifier* as the external name.

System Action: The statement cannot be executed.

Programmer Response: Correct the syntax of the SQL statement. Refer to the *DB2 SQL Reference* for information on the EXTERNAL NAME clause.

User Response: When LANGUAGE is JAVA or COMPJAVA, possible causes include:

- Omitting the EXTERNAL NAME clause.
- Including a blank.
- Having the '!' at the beginning or end of the name.
- Specifying an invalid *external-java-routine-name*.

SQLSTATE: 42878

-450 USER-DEFINED FUNCTION OR STORED PROCEDURE *name*, PARAMETER NUMBER *parmnum*, OVERLAYED STORAGE BEYOND ITS DECLARED LENGTH.

Explanation: Upon return from a specific function *name* or a stored procedure *name*, DB2 has detected an overlay storage beyond a parameter's declared length. The parameter number is specified for a stored procedure or function. This is not permitted.

System Action: The statement cannot be executed.

Programmer Response: Contact the author of the function or your database administrator. Until it is fixed, the function should not be used.

SQLSTATE: 39501

-451 THE *data-item* DEFINITION, IN THE CREATE FUNCTION FOR *function-name* CONTAINS DATA TYPE *type* WHICH IS NOT APPROPRIATE FOR AN EXTERNAL FUNCTION WRITTEN IN THE GIVEN LANGUAGE

Explanation: An error was made in the *data-item* part of the CREATE FUNCTION statement for *function-name*. The CREATE FUNCTION statement contained an invalid *type*, or it contained a distinct type which is based on the invalid *type*.

System Action: The statement cannot be executed.

Programmer Response: Correct the statement.

SQLSTATE: 42815

-453 THERE IS A PROBLEM WITH THE RETURNS CLAUSE IN THE CREATE FUNCTION STATEMENT FOR *function-name*

Explanation: A problem casting the result of user-defined function *function-name* has been identified. The CAST FROM data type is not castable to the RETURNS data type, and it must be. See the *SQL Reference* for details on casting between data types.

System Action: The statement cannot be executed.

Programmer Response: Change the RETURNS or CAST FROM clause so that the CAST FROM data type is castable to the RETURNS data type.

SQLSTATE: 42880

-454 THE SIGNATURE PROVIDED IN THE CREATE FUNCTION STATEMENT FOR *function-name* MATCHES THE SIGNATURE OF SOME OTHER FUNCTION ALREADY EXISTING IN THE SCHEMA

Explanation: The signature consists of the function name (*function-name*), the number of parameters defined for the function, and an ordered list of the types of the parameters (without regard to any parameters of the types). In this case there is a function already in the schema and the existing function has the same signature as the function being created. See the *SQL Reference* for the details on the uniqueness of a function.

System Action: The statement cannot be executed.

Programmer Response: Determine if the existing function already provides the functionality desired. If not, then the new function's signature will have to be changed (e.g. change the function name).

SQLSTATE: 42723

-455 **IN CREATE FUNCTION FOR *function-name*, THE SCHEMA NAME *schema-name1* PROVIDED FOR THE SPECIFIC NAME DOES NOT MATCH THE SCHEMA NAME *schema-name2* OF THE FUNCTION**

Explanation: If the SPECIFIC name is specified as a two part name, the *schema-name1* portion must be the same as the *schema-name2* portion of the *function-name*. Note that the *schema-name2* portion of *function-name* may have been specified directly or it may have defaulted to the authorization ID of the statement.

System Action: The statement cannot be executed.

Programmer Response: Correct the statement.

SQLSTATE: 42882

-456 **IN CREATE FUNCTION FOR *function-name*, THE SPECIFIC NAME *specific-name* ALREADY EXISTS IN THE SCHEMA**

Explanation: A SPECIFIC name has been explicitly specified as *specific-name* in the CREATE FUNCTION statement for *function-name*, but this name already exists as the SPECIFIC name for another function within the schema.

System Action: The statement cannot be executed.

Programmer Response: Choose a new SPECIFIC name.

SQLSTATE: 42710

-457 **A FUNCTION OR DISTINCT TYPE CANNOT BE CALLED *name* SINCE IT IS RESERVED FOR SYSTEM USE**

Explanation: The user-defined function or distinct type cannot be created or referenced because the name selected is reserved for use by the system.

A number of names used as keywords are reserved for system use. These names may not be used as user-defined functions or distinct-type-names, **even if they are delimited identifiers**. These names are:

=	<	>	>=	<=
	!=	->	->	
ALL	AND	ANY	BETWEEN	DISTINCT
EXCEPT	EXISTS	FALSE	FOR	FROM
IN	IS	LIKE	MATCH	NOT
NULL	ONLY	OR	OVERLAPS	SIMILAR
SOME	TABLE	TRUE	TYPE	UNIQUE
UNKNOWN				

The names of built-in data types cannot be used as the name of a distinct type (for example, CHAR).

System Action: The statement is not executed.

Programmer Response: Select a name for the function or distinct type that is not reserved for system use.

SQLSTATE: 42939

-458 **IN A REFERENCE TO FUNCTION *function-name* BY SIGNATURE, A MATCHING FUNCTION COULD NOT BE FOUND**

Explanation: In a reference to function *function-name* by signature, no matching function could be found. The problem could be with the data type or some other attributes of a parameter. For some data types there are attributes in addition to data type:

- Length, precision, or scale

While it is not necessary to specify a length, precision, or scale attribute for a data type, if one is specified then there must be an exact match on the corresponding specification of the parameter for the existing function as defined in SYSPARMS.

A type of FLOAT(*n*) does not need to match the defined value for *n* since 1<=*n*<=21 means REAL and 22<=*n*<=53 means DOUBLE. Matching occurs based on whether the type is REAL or DOUBLE.

However, a match on data type is sufficient.

To indicate this, an empty set of parentheses must be specified for the data types that allow a specification of length, precision, or scale. For example, assuming a function exists for which a parameter was defined as CHAR(12) on the CREATE FUNCTION statement, a reference to that function by a signature could specify this parameter as either CHAR(12), or CHAR(). The CHAR() syntax provides a way to say "don't care about length, precision and scale attributes in finding a matching function".

FLOAT() cannot be used since the parameter value indicates different data types (REAL or DOUBLE).

If, however, neither length, precision, scale, or empty parenthesis were specified, then normal default rules apply. For example, a specification of CHAR would result in CHAR(1) as on the CREATE TABLE statement. Furthermore, this implicit specification of length, precision, or scale must exactly match the corresponding specification of the parameter for the existing function as defined in SYSPARMS.

- Subtype, or encoding scheme

You do not need to specify the subtype or encoding scheme (CCSID clause) to identify an existing function in the database. However, if a subtype or encoding scheme is specified then there must be an exact match on the corresponding specification of the parameter for the existing function as defined in SYSPARMS.

Unqualified function names:

- For ALTER FUNCTION, DROP FUNCTION, COMMENT ON FUNCTION, GRANT and REVOKE

statements for EXECUTE on functions, an unqualified function name is implicitly qualified with the statement authorization ID, and this is the schema where the function with the problem can be found.

- In the SOURCE clause of a CREATE FUNCTION statement, the qualification comes from the SQL path. In this case, there is no matching function in the entire path.

Note: A function cannot be sourced on the COALESCE, NULLIF, RAISE_ERROR, or VALUE built-in functions. Additionally, there are restrictions on the way that you can source on the COUNT, COUNT_BIG, CHAR, and STRIP built-in functions because of some of the keywords that they accept.

System Action: The statement cannot be executed.

Programmer Response: Possible responses include:

- Changing the SQL path to include the correct schema.
- Changing the attributes of the parameters.
- Using a SPECIFIC name to refer to the function instead of a signature.

SQLSTATE: 42886

-461 A VALUE WITH DATA TYPE *source-data-type* CANNOT BE CAST TO TYPE *target-data-type*

Explanation: The statement contains a CAST with the first operand having a data type of *source-data-type* to be cast to the data type *target-data-type*. This is not supported.

Change the data type of either the source or target so that the cast is supported. For predefined (built-in) data types or a cast involving a user-defined distinct type, see the SQL Reference.

System Action: The statement could not be processed.

Programmer Response: Correct the CAST specification to specify a supported combination of source and target types.

SQLSTATE: 42846

-469 SQL CALL STATEMENT MUST SPECIFY AN OUTPUT HOST VARIABLE FOR PARAMETER *number*

Explanation: DB2 received an SQL CALL statement for a stored procedure. DB2 found the row in the SYSIBM.SYSROUTINES catalog table associated with the requested procedure name. However, parameter *number* was identified in the SYSIBM.SYSPARMS table as an OUT or INOUT parameter. A host variable must be supplied on the SQL CALL statement for parameters defined as OUT or INOUT.

number

The parameter number from the ORDINAL field in SYSIBM.SYSPARMS.

System Action: The statement cannot be executed.

Programmer Response: If the SQL CALL statement is coded incorrectly, modify the SQL application to provide an output host variable on the SQL CALL statement.

If the SYSIBM.SYSPARMS table contains incorrect information, the DROP PROCEDURE and CREATE PROCEDURE statements must be used to replace the catalog definition for the stored procedure.

SQLSTATE: 42886

-470 SQL CALL STATEMENT SPECIFIED A NULL VALUE FOR INPUT PARAMETER *number*, BUT THE STORED PROCEDURE DOES NOT SUPPORT NULL VALUES.

Explanation: DB2 received an SQL CALL statement for a stored procedure and found a null value in the incoming parameter list. The stored procedure was defined in the SYSIBM.SYSROUTINES catalog table with PARAMETER_STYLE of GENERAL, which specifies that the routine does not accept null values.

A call to a stored procedure with a LANGUAGE value of JAVA or COMPJAVA receives this SQLCODE if an input parameter in the compiled Java stored procedure has a Java base type that cannot be set to a null value.

number

The parameter number from the ORDINAL field in SYSIBM.SYSPARMS.

System Action: The statement cannot be executed.

Programmer Response: If the stored procedure should not accept null values, change the calling application to provide a nonnull value.

If the stored procedure should accept null values, use the ALTER PROCEDURE statement to change the PARAMETER STYLE of the stored procedure to be DB2SQL or GENERAL WITH NULLS.

SQLSTATE: 39004

-471 INVOCATION OF FUNCTION OR PROCEDURE *name* FAILED DUE TO REASON *rc*

Explanation: A routine was invoked. The routine invocation was not accepted because of DB2 reason code *rc*.

name The name of the routine that was invoked.

rc The DB2 reason code describing the cause of the failure.

System Action: The statement cannot be executed. A

DSNX9xx message describing the error might be displayed on the MVS system console.

Programmer Response: Correct the condition described by the DB2 reason code.

SQLSTATE: 55023

-472 CURSOR *cursor-name* WAS LEFT OPEN BY EXTERNAL FUNCTION *function-name* (SPECIFIC NAME *specific-name*)

Explanation: The function program did not close the specified cursor. Modify the function program so that it closes the cursor.

System Action: The statement cannot be executed.

Programmer Response: Reissue the statement when desired.

SQLSTATE: 24517

-473 A USER DEFINED DATA TYPE CANNOT BE CALLED THE SAME NAME AS A SYSTEM PREDEFINED TYPE (BUILT-IN TYPE)

Explanation: The name of a data type to be created has an unqualified name that is the same as a system-predefined data type or is BOOLEAN. This is not allowed. Adding delimiters does not make the name valid. The following names are restricted:

BLOB	CHAR			
CHARACTER	CLOB	DATE	DBCLOB	
DEC	DECIMAL	DOUBLE	FLOAT	GRAPHIC
INT	INTEGER	NUMERIC	REAL	
ROWID	SMALLINT	TIME	TIMESTAMP	VARCHAR
VARGRAPHIC				

System Action: The statement could not be processed.

Programmer Response: Correct the statement to use another identifier for the name of the new user-defined type.

SQLSTATE: 42918

-475 THE RESULT TYPE *type-1* OF THE SOURCE FUNCTION CANNOT BE CAST TO THE RETURNS TYPE *type-2* OF THE USER-DEFINED FUNCTION *function-name*

Explanation: In order for the CREATE FUNCTION for a sourced user-defined function to be valid, the result type (*type-1*) of the source function must be castable to the RETURNS type (*type-2*) of the function being created. There is no supported cast between these data types. See the *DB2 SQL Reference* for details on casting between data types.

System Action: The statement cannot be executed.

Programmer Response: Change the RETURNS data type or the SOURCE function identified so that the result type of the SOURCE function is castable to the RETURNS data type.

SQLSTATE: 42866

-476 REFERENCE TO FUNCTION *function-name* WAS NAMED WITHOUT A SIGNATURE, BUT THE FUNCTION IS NOT UNIQUE WITHIN ITS SCHEMA

Explanation: References to a function without a signature are permitted, but the named function *function-name* must be unique in its schema and it is not.

Note also that in the ALTER FUNCTION, DROP FUNCTION, COMMENT ON FUNCTION, GRANT and REVOKE statements for EXECUTE on functions, an unqualified reference is qualified with the statement authorization ID, and this is the schema where the problem can be found. In the SOURCE clause of a CREATE FUNCTION statement, the qualification comes from the SQL PATH. In this case, the first schema in the path containing a function with this name had other functions by the same name.

System Action: The statement cannot be executed.

Programmer Response: Correct the reference by one of the following:

- completing the signature
- using the SPECIFIC name of the desired function
- changing the SQL PATH

SQLSTATE: 42725

-478 DROP OR REVOKE ON OBJECT TYPE *type1* CANNOT BE PROCESSED BECAUSE OBJECT *name* OF TYPE *type2* IS DEPENDENT ON IT

Explanation: The requested action cannot be processed because a dependency exists on this *type1*. *type2* is the type of object that has the dependency on the *type1* object involved in the DROP or REVOKE. *type2* can be one of the following:

- FUNCTION
- PROCEDURE
- TABLE
- VIEW
- TRIGGER (for the trigger package)
- CHECK CONSTRAINT (*object_name* contains the table name)
- DEFAULT (*object_name* contains the table name)

DROP If *type1* is *FUNCTION*, the dependencies for DROP might be:

- Another function is sourced on this function.
- A view uses this function.

- A trigger package uses this function.
- A table uses this function in a check constraint or user-defined default.
- A materialized query table definition uses this function.

The dependency might be on one of the generated *cast functions* for a distinct type. If *type1* is *DISTINCT TYPE*, the dependencies for DROP might be:

- A parameter of a function is defined as this distinct type.
- A column of a table is defined as this distinct type.
- A parameter of a stored procedure is defined as this distinct type.

If *type1* is *PROCEDURE*, the dependencies for DROP might be:

- A trigger definition contains a CALL statement with the name of this stored procedure

REVOKE

If *type1* is *FUNCTION*, the dependencies for REVOKE might be:

- A function owned by the revokee is sourced on this function.
- A view owned by the revokee uses this function.
- A trigger package owned by the revokee uses this function.
- A table owned by the revokee uses this function in a check constraint or user-defined default.
- A materialized query table owned by the revokee uses this function in the definition.

If *type1* is *DISTINCT TYPE*, the dependencies for REVOKE might be:

- A parameter of a function owned by the revokee is defined as this distinct type.
- A column of a table owned by the revokee is defined as this distinct type.
- A parameter of a stored procedure owned by the revokee is defined as this distinct type.

If *type1* is *PROCEDURE*, the dependencies for REVOKE might be:

- A trigger definition owned by the revokee contains a CALL statement with the name of this stored procedure.

This SQLCODE may also be issued when SYSADM is being revoked. When SYSADM is revoked the cascading of the REVOKE statement may encounter dependencies that prevent the REVOKE from being successfully processed.

System Action: The statement cannot be executed.

Programmer Response: Remove the dependencies on this object and then reissue the request.

SQLSTATE: 42893

-480 THE PROCEDURE *procedure-name* HAS NOT YET BEEN CALLED

Explanation: The procedure identified in a DESCRIBE PROCEDURE or an ASSOCIATE LOCATORS statement has not yet been called within the application process or the procedure has been called, but an explicit or implicit commit occurred before the statement.

System Action: The statement cannot be executed.

Programmer Response: Correct the statements so that the exact syntax used to specify the procedure name on the CALL statement be the same as that on the ASSOCIATE LOCATOR and/or DESCRIBE PROCEDURE. If an unqualified name is used to CALL the procedure, the 1-part name must also be used on the other statements. If the CALL statement is made with a 3-part name, and the current server is the same as the location in the 3-part name, the ASSOCIATE LOCATOR or DESCRIBE procedure can omit the location. Rerun the statements.

SQLSTATE: 51030

-482 THE PROCEDURE *procedure-name* RETURNED NO LOCATORS

Explanation: The procedure identified in an ASSOCIATE LOCATORS statement returned no result set locators.

System Action: The statement cannot be executed.

Programmer Response: Determine if result set locators are returned from the identified procedure by using the DESCRIBE PROCEDURE statement.

SQLSTATE: 51030

-483 IN CREATE FUNCTION FOR *function-name* STATEMENT, THE NUMBER OF PARAMETERS DOES NOT MATCH THE NUMBER OF PARAMETERS OF THE SOURCE FUNCTION

Explanation: An attempt is being made to CREATE a user-defined function *function-name* which is sourced on another function. One of the following situations has been identified:

- The SOURCE clause uses a function-name (input parameter list) to identify the source function, and the number of types in the list is different from the number of parameters of the function being created.

- The SOURCE clause uses different syntax to identify the source function, and the number of types of that function is different from the number of parameters of the function being created.

System Action: The statement cannot be executed.

Programmer Response: The number of parameters for the SOURCE function and for the function being created must be the same. The identification of the SOURCE function needs to be changed to:

- fix the input parameter list
- correct the function name or function specific name to identify the proper function.

It is also possible that the SQL path needs to be corrected in order for correct function resolution to occur.

SQLSTATE: 42885

-487 *object-type object-name* **ATTEMPTED TO EXECUTE AN SQL STATEMENT WHEN THE DEFINITION OF THE FUNCTION OR PROCEDURE DID NOT SPECIFY THIS ACTION**

Explanation: A user-defined function or stored procedure *object-name* was invoked and attempted to execute SQL statements, but the function or procedure was created with the NO SQL option.

In an environment of nested functions and procedures, the SQL option in effect is the most restrictive one that has been specified in the nested hierarchy of functions and procedures. The SQL data access option in effect does not allow for modifying data.

System Action: The SQL statement cannot be executed.

Programmer Response: Either use an ALTER statement to change the definition of the function or procedure to allow SQL statements, or remove the failing SQL statement from the external function or procedure.

SQLSTATE: 38001

-490 **NUMBER *number* DIRECTLY SPECIFIED IN AN SQL STATEMENT IS OUTSIDE THE RANGE OF ALLOWABLE VALUES IN THIS CONTEXT (*minval*, *maxval*)**

Explanation: A number (*number*) was specified that is not valid in the context in which it was specified. The minimum allowed value in this context is *minval*. The maximum allowed value in this context is *maxval*. *n* must be within the range specified by *minval* and *maxval* ($minval \leq n \leq maxval$).

System Action: The statement was not executed.

Programmer Response: Change the value *n* to a valid value in the statement.

SQLSTATE: 428B7

-491 **CREATE STATEMENT FOR USER-DEFINED FUNCTION *function-name* MUST HAVE A RETURNS CLAUSE AND: THE EXTERNAL CLAUSE WITH OTHER REQUIRED KEYWORDS; THE RETURN STATEMENT AND PARAMETER NAMES; OR THE SOURCE CLAUSE**

Explanation: A required clause is missing in the CREATE for function *function-name*.

- For an EXTERNAL function, specify EXTERNAL and one of the following:
 - LANGUAGE
 - PARAMETER STYLE
- For an SQL FUNCTION, specify a RETURN statement, and a parameter name for each parameter.
- For a user-defined SOURCE FUNCTION, specify the SOURCE class.

System Action: The statement cannot be processed.

Programmer Response: Add the missing clauses or statement, and reissue the failing statement.

SQLSTATE: 42601

-492 **THE CREATE FUNCTION FOR *function-name* HAS A PROBLEM WITH PARAMETER NUMBER *number*. IT MAY INVOLVE A MISMATCH WITH A SOURCE FUNCTION**

Explanation: The parameter in position *number* of function *function-name* is in error. The parameter in position *number* of the source function is not castable to the corresponding parameter of the function being created.

If the parameter of the function being created is a *table parameter* then the corresponding parameter of the source function must also be a *table parameter*. Furthermore, the column numbers for both of the table parameters must be the same.

If the parameter of the function being created is not a table parameter then the corresponding parameter of the source function must also not be a table parameter.

System Action: The statement cannot be executed.

Programmer Response: Possible corrections include:

- Identify a different source function.
- Change the data type of the parameter of the function being created so that the data type of the source function can be cast to this data type.

SQLSTATE: 42879

-495 ESTIMATED PROCESSOR COST OF *estimate-amount1* PROCESSOR SECONDS (*estimate-amount2* SERVICE UNITS) IN COST CATEGORY *cost-category* EXCEEDS A RESOURCE LIMIT ERROR THRESHOLD OF *limit-amount* SERVICE UNITS

Explanation: The prepare of a dynamic INSERT, UPDATE, DELETE, or SELECT SQL statement resulted in a cost estimate that exceeded the error threshold value specified in the resource limit specification table (RLST). This error is also issued if DB2's cost category value was "B", and the default action specified in the RLF_CATEGORY_B column in the RLST is to issue an error.

estimate_amount1

The cost estimate (in processor seconds) if the prepared INSERT, UPDATE, DELETE or SELECT statement were to be executed.

estimate_amount2

The cost estimate (in service units) if the prepared INSERT, UPDATE, DELETE or SELECT statement were to be executed.

cost-category

DB2's cost-category for this SQL statement. The possible values are A or B.

limit-amount

The error threshold (in service units) specified in the RLFASUERR column of the RLST.

System Action: The prepare of the dynamic INSERT, UPDATE, DELETE, or SELECT statement was unsuccessful.

Programmer Response: If this SQLCODE was returned because the cost category value is "B", it might be that the statement is using parameter markers or that some statistics are not available for the referenced tables and columns. Make sure the administrator has run the utility RUNSTATS on the referenced tables. It might also be that UDFs will be invoked when the statement is executed, or for INSERT, UPDATE, or DELETE statements that triggers are defined on the changed table. Check the DSN_STATEMNT_TABLE or the IFCID 22 record for this statement to find the reasons this SQL statement has been put in cost category "B". If the program cannot be changed, or if statistics cannot be obtained, ask the administrator to change the value in the RLF_CATEGORY_B column in the RLST to "Y" which allows the statement to execute or "W" which returns a warning instead of an error.

User Response: If the warning is caused by an SQL statement that is consuming too much processor resource, attempt to rewrite the statement to perform more efficiently. Another option is to ask the administrator to increase the error threshold value in the RLST.

SQLSTATE: 57051

-496 THE SQL STATEMENT CANNOT BE EXECUTED BECAUSE IT REFERENCES A RESULT SET THAT WAS NOT CREATED BY THE CURRENT SERVER

Explanation: The SQL statement cannot be executed because the current server is different from the server that called a stored procedure. The SQL statement can be any of the following:

- ALLOCATE CURSOR
- DESCRIBE CURSOR
- FETCH (using an allocated cursor)
- CLOSE (using an allocated cursor)

System Action: The statement cannot be executed.

Programmer Response: Connect to the server that called the stored procedure which created the result set before running the SQL statement that failed.

SQLSTATE: 51033

-497 THE MAXIMUM LIMIT OF INTERNAL IDENTIFIERS HAS BEEN EXCEEDED FOR DATABASE *database-name*

Explanation: The SQL statement cannot be executed because an internal identifier limit has been exceeded for the database. The cause of this error is due to one of the following:

1. On a CREATE DATABASE statement, the limit of 65279 DBIDs has been exceeded.
2. For all other statements, the limit of 32767 OBIDs has been exceeded for that database.

System Action: The SQL statement cannot be executed.

Programmer Response: Take the appropriate action as described in the following cases:

1. In the case of a DBID limit being exceeded, DROP all unused databases and issue a COMMIT.
2. In the case of an OBID limit being exceeded, DROP all unused objects in the database and issue a COMMIT, specify a different database or run the MODIFY utility to reclaim unused OBIDs.

SQLSTATE: 54041

-499 CURSOR *cursor-name* HAS ALREADY BEEN ASSIGNED TO THIS OR ANOTHER RESULT SET FROM PROCEDURE *procedure-name*.

Explanation: An attempt was made to assign a cursor to a result set using the SQL statement ALLOCATE CURSOR and one of the following applies:

- The result set locator variable specified in the ALLOCATE CURSOR statement has been previously assigned to cursor *cursor-name*.

- Cursor *cursor-name* specified in the ALLOCATE CURSOR statement has been previously assigned to a result set from stored procedure *procedure-name*.

System Action: The statement cannot be executed.

Programmer Response: Determine if the target result set named in the ALLOCATE CURSOR statement has been previously assigned to a cursor.

If the result set has been previously assigned to cursor *cursor-name*, then either choose another target result set or call stored procedure *procedure-name* again and reissue the ASSOCIATE LOCATOR and ALLOCATE CURSOR statements.

If the result set has not been previously assigned to a cursor, the cursor *cursor-name* specified in the ALLOCATE CURSOR statement has been previously assigned to some result set from stored procedure *procedure-name*. You can not assign cursor *cursor-name* to another result set, so you must specify a different cursor name in the ALLOCATE CURSOR statement.

Correct the statements so that the exact syntax used to specify the procedure name on the CALL statement be the same as that on the ASSOCIATE LOCATOR and/or DESCRIBE PROCEDURE. If an unqualified name is used to CALL the procedure, the 1-part name must also be used on the other statements. If the CALL statement is made with a 3-part name, and the current server is the same as the location in the 3-part name, the ASSOCIATE LOCATOR or DESCRIBE procedure can omit the location.

SQLSTATE: 24516

-500 THE IDENTIFIED CURSOR WAS CLOSED WHEN THE CONNECTION WAS DESTROYED

Explanation: The FETCH, UPDATE, DELETE, or CLOSE statement identifies a closed cursor that was defined with the WITH HOLD option. The cursor was closed when the connection on which it was dependent was destroyed during a commit operation. The connection was destroyed because the application process placed it in the released state, or the application plan was bound with the DISCONNECT(AUTOMATIC) option.

System Action: The statement cannot be executed.

Programmer Response: The correction depends on the desired state of both the cursor and the connection, as follows:

- If you want the cursor closed, change the application program so that the cursor is not referenced in the closed state.
- If you want the cursor open and the connection was placed in the released state by the application

program, change the program so that the connection is not placed in the released state until the cursor is explicitly closed.

- If you want the cursor open and the connection was placed in the released state as a result of the DISCONNECT(AUTOMATIC) option, rebind the plan using DISCONNECT(CONDITIONAL).

Correct the error in the application, rebind the plan, and resubmit the job.

SQLSTATE: 24501

-501 THE CURSOR IDENTIFIED IN A FETCH OR CLOSE STATEMENT IS NOT OPEN

Explanation: The application program attempted to either:

1. FETCH using a cursor, or
2. CLOSE a cursor

at a time when the specified cursor was not open.

System Action: The statement cannot be executed.

Programmer Response: Check for a previous SQL return code that may have closed the cursor. Commit and rollback operations close cursors. SQLCODES -404, -652, -679, -802, -901, -904, -909, -910, -911, -913, and -952 may force the cursor to close. After the cursor is closed, any fetches or close cursor statements will receive this SQLCODE -501.

If no previous SQL return codes have been issued, correct the logic of the application program to ensure that the cursor is open at the time the FETCH or CLOSE statement is executed.

SQLSTATE: 24501

-502 THE CURSOR IDENTIFIED IN AN OPEN STATEMENT IS ALREADY OPEN

Explanation: The application program attempted to execute an OPEN statement for a cursor that was already open.

System Action: The statement cannot be executed. The cursor was unchanged (that is, it was not 'reopened').

Programmer Response: Correct the logic of the application program to ensure that it does not attempt to execute an OPEN statement for a cursor that is already open.

SQLSTATE: 24502

-503 A COLUMN CANNOT BE UPDATED BECAUSE IT IS NOT IDENTIFIED IN THE UPDATE CLAUSE OF THE SELECT STATEMENT OF THE CURSOR

Explanation: The application program attempted to update (using a cursor) a value in a column of the object table that was not identified in the FOR UPDATE clause in the cursor declaration.

Any column that is to be updated must be identified in the FOR UPDATE clause of the cursor declaration.

System Action: The statement cannot be executed. No data was updated in the object table.

Programmer Response: Correct the application program. If the column is to be updated, its name must be added to the FOR UPDATE clause of the cursor declaration.

SQLSTATE: 42912

-504 THE CURSOR NAME *cursor-name* IS NOT DEFINED

Explanation: Cursor *cursor-name* was referenced in an SQL statement, and one of the following is true:

- Cursor *cursor-name* was not declared (using the DECLARE CURSOR statement) or allocated (using the ALLOCATE CURSOR statement) in the application program before it was referenced.
- Cursor *cursor-name* was referenced in a positioned UPDATE or DELETE statement which is not a supported operation for an allocated cursor.
- Cursor *cursor-name* was allocated, but a CLOSE cursor statement naming *cursor-name* was issued and deallocated the cursor before this cursor reference.
- Cursor *cursor-name* was allocated, but a ROLLBACK operation occurred and deallocated the cursor before this cursor reference.
- Cursor *cursor-name* was allocated, but its associated cursor declared in a stored procedure was not declared WITH HOLD, and a COMMIT operation occurred and deallocated the cursor before this cursor reference. The COMMIT operation can be either explicit (the COMMIT statement) or implicit (that is, a stored procedure defined as COMMIT_ON_RETURN = 'Y' was called before this cursor reference).
- Cursor *cursor-name* was allocated, but its associated stored procedure was called again since the cursor was allocated, new result sets were returned, and cursor *cursor-name* was deallocated.

System Action: The statement cannot be executed.

Programmer Response: Check the application program for completeness and for a possible spelling error in the cursor declaration or allocation. The declaration for or allocation of a cursor must appear in

an application program before SQL statements that reference the cursor.

If the *cursor-name* was <UNKNOWN>, then the cursor was not successfully declared or allocated. This can occur if SQL(DB2) was used, and a warning message was issued during precompilation. Check the precompile output for warning messages on the DECLARE CURSOR or ALLOCATE CURSOR statement, and correct the statement.

For an allocated cursor, if an implicit or explicit COMMIT, ROLLBACK, or CLOSE occurred since the cursor was successfully allocated, modify the application program logic to do one of the following:

- After the COMMIT, ROLLBACK, or CLOSE operation, call the associated stored procedure again, and reissue the ASSOCIATE LOCATORS and ALLOCATE CURSOR statements.
- For COMMIT, declare the associated cursor in the stored procedure WITH HOLD so the COMMIT operation will not deallocate the cursor.

For an allocated cursor, if the associated stored procedure was called again and new result sets were returned since the cursor was allocated, reissue the ASSOCIATE LOCATORS and ALLOCATE CURSOR statements.

SQLSTATE: 34000

-507 THE CURSOR IDENTIFIED IN THE UPDATE OR DELETE STATEMENT IS NOT OPEN

Explanation: The application program attempted to execute an UPDATE or DELETE WHERE CURRENT OF cursor statement at a time when the specified cursor was not open.

System Action: The statement cannot be executed. No update or delete was performed.

Programmer Response: Check for a previous SQL return code that might have closed the cursor. SQLCODES -404, -652, -679,-802, -901, -904, -909, -910, -911, -913, and -952 may force the cursor to close. After the cursor is closed, any fetches or close cursor statements receive SQLCODE -501. Any updates or deletes receive this SQLCODE -507. Correct the logic of the application program to ensure that the specified cursor is open at the time the UPDATE or DELETE statement is executed.

SQLSTATE: 24501

-508 THE CURSOR IDENTIFIED IN THE UPDATE OR DELETE STATEMENT IS NOT POSITIONED ON A ROW OR ROWSET THAT CAN BE UPDATED OR DELETED

Explanation: The application program attempted to execute an UPDATE or DELETE WHERE CURRENT OF cursor statement at a time when the specified cursor was not positioned on a row of the object table. The cursor must be positioned on the row that is to be updated or deleted.

This can occur if the cursor is no longer positioned on the row because another cursor in the same application program delete the row or updates an index column. This includes deletes and index column updates that are performed as a result of rolling back to a savepoint.

This can also occur with a sensitive dynamic cursor when the FOR ROW *n* OF ROWSET clause is specified and the specified row of the current rowset has been updated or deleted.

System Action: The statement cannot be executed. No data was updated or deleted.

Programmer Response: Correct the logic of the application program to ensure that the cursor is correctly positioned on the intended row of the object table before the UPDATE or DELETE statement is executed. Note that the cursor is not positioned on a row if FETCH returned an SQLCODE = 100.

SQLSTATE: 24504

-509 THE TABLE IDENTIFIED IN THE UPDATE OR DELETE STATEMENT IS NOT THE SAME TABLE DESIGNATED BY THE CURSOR

Explanation: The application program attempted to execute an UPDATE or DELETE WHERE CURRENT OF cursor statement where the table named in that statement did not match the name of the table specified in the declaration for that cursor.

System Action: The statement cannot be executed. The update or delete was not performed.

Programmer Response: Correct the application program to ensure that the table identified in the UPDATE or DELETE statement is the same table identified in the declaration for the cursor.

SQLSTATE: 42827

-510 THE TABLE DESIGNATED BY THE CURSOR OF THE UPDATE OR DELETE STATEMENT CANNOT BE MODIFIED

Explanation: The application program attempted to execute an UPDATE or DELETE WHERE CURRENT OF cursor statement against a table or view that cannot be updated or deleted. This can occur for a delete from

a read-only view or for an update in which the cursor was not defined with the FOR UPDATE clause.

This error code is also returned when the table exists at a remote location and DB2 has employed block fetching because you explicitly declared the cursor FOR FETCH ONLY, or because the application is bound CURRENTDATA(NO) and the cursor is ambiguous.

This error code is also returned if DB2 has employed parallelism to execute the SELECT statement associated with the cursor named in a DELETE WHERE CURRENT OF cursor statement, or if a DELETE WHERE CURRENT OF is issued against a row which DB2 cannot guarantee to have not been modified by another application since the time the cursor was positioned upon it (in accordance with ISO(CS)) semantics for an ambiguous cursor in an application bound CURRENTDATA(NO)).

System Action: The statement cannot be processed. No data was updated or deleted in the object table.

Programmer Response: The requested UPDATE or DELETE cannot be performed. Refer to Chapter 5 of *DB2 SQL Reference* for information about restrictions on using UPDATE and DELETE operations against views.

For a remote table, modify the DECLARE CURSOR and then rebind the PLAN.

For a cursor that uses parallelism, disable parallelism for the query by using the DEGREE(1) BIND option for static SQL or by setting the CURRENT DEGREE special register to '1' for dynamic SQL.

For an ambiguous cursor in an application bound CURRENTDATA(NO), either make the cursor unambiguous (declare it FOR UPDATE OF), or rebind the application CURRENTDATA(YES).

SQLSTATE: 42828

-511 THE FOR UPDATE CLAUSE CANNOT BE SPECIFIED BECAUSE THE TABLE DESIGNATED BY THE CURSOR CANNOT BE MODIFIED

Explanation: The result table of the SELECT statement cannot be updated. This can occur if the SELECT specifies more than one table or view in the FROM clause, if the SELECT list contains a built-in function or DISTINCT, or if the statement contains an ORDER BY or GROUP BY or HAVING clause. This can also occur if a view is specified in the FROM clause and the view cannot be updated.

System Action: The statement cannot be executed. The specified cursor remains undefined in the application program.

Programmer Response: Updates cannot be performed on the result table as it is specified. Refer to Chapter 5 of *DB2 SQL Reference* for information about restrictions on the updating of views.

SQLSTATE: 42829

-512 STATEMENT REFERENCE TO REMOTE OBJECT IS INVALID

Explanation: One of the following conditions exists:

- The statement refers to multiple locations.
- A statement with a remote reference is being EXPLAINED either by a dynamic EXPLAIN statement or the EXPLAIN(YES) option.
- An alias is used incorrectly.
- A three-part name is implicitly or explicitly used in a statement that is not supported by the DB2 private protocols.
- A three-part name is implicitly or explicitly used in a triggered statement.
- A PREPARE statement contains an ATTRIBUTES clause. This is not supported by the BD2 private protocols.

System Action: The statement cannot be executed.

Programmer Response: If the object cannot be meaningfully eliminated from the statement, see your Database Administrator for other ways to obtain the data required. Refer to Chapter 3 of *DB2 SQL Reference* for more information about using remote objects.

If the remote object reference is in a triggered SQL statement, you can instead invoke a user-defined function or a stored procedure from the trigger and access the remote object from the function or stored procedure.

SQLSTATE: 56023

-513 THE ALIAS *alias-name* MUST NOT BE DEFINED ON ANOTHER LOCAL OR REMOTE ALIAS

Explanation: The object indicated by 'alias-name' is a local or remote alias. An alias is not allowed to be defined on a local alias, and it should not be defined on a remote alias.

System Action: The statement cannot be executed.

Programmer Response: Modify the SQL statement to ensure that all object references are to base tables or views.

SQLSTATE: 42924

-514 THE CURSOR *cursor-name* IS NOT IN A PREPARED STATE

Explanation: The application program has tried to use a cursor, 'cursor-name,' that is not in a prepared state. The cursor is associated with a statement that either (1) has never been prepared, or (2) has been invalidated by a commit or rollback operation.

System Action: The statement cannot be executed.

Programmer Response: For case (1), ensure that you prepare the statement that is named in the DECLARE CURSOR statement for 'cursor-name' before you try to open the cursor. For case (2), do one of the following:

- Use the WITH HOLD option of DECLARE CURSOR.
- Do not execute a commit or rollback operation until you are finished using the cursor.
- Prepare the statement again after the commit or rollback.

SQLSTATE: 26501

-516 THE DESCRIBE FOR STATIC STATEMENT DOES NOT IDENTIFY A PREPARED STATEMENT

Explanation: An attempt was made to execute a DESCRIBE FOR STATIC for a statement that had not been successfully prepared beforehand. This error can occur when the DESCRIBE originates on an application requester that supports extended dynamic SQL. Because the target statement is static on the DB2 for MVS/ESA subsystem, the DESCRIBE statement fails.

System Action: The statement cannot be executed.

Programmer Response: Correct the logic of the application program to ensure that a statement is properly prepared before a DESCRIBE FOR STATIC of the statement is attempted. If the DESCRIBE FOR STATIC is a distributed request that originated on a system that supports extended dynamic SQL, contact your system administrator about changing the DB2 subsystem parameter DESCSTAT to YES to tolerate these DESCRIBE FOR STATIC requests against static SQL.

SQLSTATE: 26501

-517 CURSOR *cursor-name* CANNOT BE USED BECAUSE ITS STATEMENT NAME DOES NOT IDENTIFY A PREPARED SELECT STATEMENT

Explanation: The cursor 'cursor-name' could not be used as specified because the prepared statement named in the declaration for the cursor was not a SELECT statement.

System Action: The statement cannot be executed.

Programmer Response: Verify that the statement-name is specified correctly in the PREPARE statement and the DECLARE CURSOR statement for cursor 'cursor-name'. Alternatively, correct the application program logic to ensure that only prepared SELECT statements are used in association with cursor declarations.

SQLSTATE: 07005

-518 THE EXECUTE STATEMENT DOES NOT IDENTIFY A VALID PREPARED STATEMENT

Explanation: One of the following conditions exists:

- The statement named in the EXECUTE statement has not been prepared.
- The statement named in the EXECUTE statement identifies a SELECT, VALUE INTO, or statement.
- The statement named in the EXECUTE IMMEDIATE statement identifies a SELECT, VALUE INTO, or statement.

System Action: The statement cannot be executed.

Programmer Response: Ensure that you prepare the statement prior to EXECUTE. Also, ensure that the statement you prepare is not a SELECT or VALUES INTO statement.

SQLSTATE: 07003

-519 THE PREPARE STATEMENT IDENTIFIES THE SELECT STATEMENT OF THE OPENED CURSOR *cursor-name*

Explanation: The application program has attempted to PREPARE (actually, re-PREPARE) the SELECT statement for the specified cursor at a time when that cursor was already open.

System Action: The statement cannot be executed. The cursor was not affected.

Programmer Response: Correct the logic of the application program so that it does not attempt to re-PREPARE the SELECT statement for a cursor when that cursor is open.

SQLSTATE: 24506

-525 THE SQL STATEMENT CANNOT BE EXECUTED BECAUSE IT WAS IN ERROR AT BIND TIME FOR SECTION = *sectno* PACKAGE = *pkgname* CONSISTENCY TOKEN = *contoken*

Explanation: One of the following:

- The statement was in error when the package was bound, but the error was ignored then because the option SQLERROR (CONTINUE) was used. Since the statement contains an error, it cannot be executed.
- The statement might not be an executable statement at this location, or might only be executable by a DB2 application requester (for example, DECLARE TABLE in an application running on OS/2 causes this message).

The variables are:

sectno Section number

pkgname
locid.collid.pkgid

contoken
Consistency token in hexadecimal

System Action: The statement cannot be executed.

Programmer Response: If the SQL statement is not supposed to execute at the indicated location, then correct the program so that the statement in error does not execute at that location. Precompile, compile, and bind replace the package. If the SQL statement is supposed to execute at the indicated location, correct the problem found when it was bound and bind the package over using BIND with ACTION(REPLACE). If multiple versions of the package have been bound, issue the following SELECT statement to determine which version has the error: SELECT VERSION FROM locid.SYSIBM.SYSPACKAGE WHERE LOCATION = ' ' AND COLLID = 'collid' AND NAME = 'pkgid' AND HEX(CONTOKEN) = 'contoken'

Where:

locid Location name

collid Collection id

pkgid Program name

SQLSTATE: 51015

-526 THE REQUESTED OPERATION OR USAGE DOES NOT APPLY TO *table-type* TEMPORARY TABLE *table-name*

Explanation: DB2 assumes that the SQL statement being executed refers to a *created* or *declared* temporary table named *table-name*, and the requested operation or usage in the statement is not allowed on the temporary table.

table-type
CREATED or DECLARED

CREATED is for a temporary table defined by the CREATE GLOBAL TEMPORARY TABLE statement.

DECLARED is for a temporary table defined by the DECLARE GLOBAL TEMPORARY TABLE statement.

table-name
Qualified name of the temporary table.

System Action: The statement cannot be processed.

Programmer Response: Modify the SQL statement to ensure that the object references are not to the indicated type of temporary table, or if *table-type* is DECLARED and you intended *table-name* to refer to an existing persistent base table, you must perform one of the following actions:

- Recreate the persistent base table *table-name* with a different qualifier
- In the same application process, issue a DROP TABLE for *table name* followed by a COMMIT to drop the declared temporary table and afterwards be able to reference the persistent base table with the same *table-name* in the same application process
- Remove the DECLARE GLOBAL TEMPORARY TABLE statement from the application process to use the persistent base table with the same *table-name*

SQLSTATE: 42995

-530 THE INSERT OR UPDATE VALUE OF FOREIGN KEY *constraint-name* IS INVALID

Explanation: An UPDATE or INSERT operation attempted to place a value in a foreign key of the object table; however, this value was not equal to some value of the parent key of the parent table.

When a row is inserted into a dependent table, the insert value of a foreign key must be equal to the value of the parent key of some row of the parent table in the associated relationship.

When the value of the foreign key is updated, the update value of a foreign key must be equal to the value of the parent key of some row of the parent table of the associated relationship.

System Action: The UPDATE or INSERT statement cannot be executed. The object table is unchanged.

Programmer Response: Examine the insert or update value of the foreign key first, and then compare it with each of the parent key values of the parent table to determine the cause of the problem.

SQLSTATE: 23503

-531 PARENT KEY IN A PARENT ROW CANNOT BE UPDATED BECAUSE IT HAS ONE OR MORE DEPENDENT ROWS IN RELATIONSHIP *constraint-name*

Explanation: For plans and packages bound beginning with Version 5 or dynamic SQL, a multi-row update of a parent key attempted to remove a parent key value on which a foreign key was dependent.

For plans and packages bound prior to Version 5 an UPDATE operation attempted to update a primary key in the specified row of the object table; however, the primary key in the specified row had dependent rows associated with it. The value of a primary key in a parent row cannot be updated if the parent row has any dependent rows.

System Action: The UPDATE statement cannot be executed. The object table is unchanged.

Programmer Response: Examine the parent key of the object table and the foreign key of the dependent table to determine if the value of the specified row of the parent key should be changed. If this does not expose the problem, examine the contents of the object table and the dependent table to determine the cause of the problem.

SQLSTATE: 23504

-532 THE RELATIONSHIP *constraint-name* RESTRICTS THE DELETION OF ROW WITH RID X'*rid-number*'

Explanation: A DELETE operation attempted to delete a specified parent row in the object table and all related descendent rows in the descendent tables. However, a delete rule of RESTRICT or NO ACTION was specified for one or more descendent tables.

A row of the table cannot be deleted because it has a dependent in a relationship with a delete rule of RESTRICT or NO ACTION or the deletion cascades to a row which is a dependent in a relationship with a delete rule of RESTRICT or NO ACTION.

If the statement that failed is an ALTER TABLE with ALTER PART ROTATE FIRST TO LAST, then there is a referential constraint that is defined with DELETE RESTRICT on the table, and the data in the partition that is to be reused cannot be deleted because of the referential constraint.

System Action: The DELETE statement cannot be executed. The contents of the object table are unchanged.

Programmer Response: Examine the delete rule for all descendent tables to determine the cause of the problem. The specific tables involved can be determined from the relationship '*constraint-name*'. The specific descendent row is known by RID X'*rid-number*'.

SQLSTATE: 23504

-533 INVALID MULTIPLE-ROW INSERT

Explanation: An INSERT operation with a subselect attempted to insert multiple rows into a self-referencing table.

The subselect of the INSERT operation should return no more than one row of data.

System Action: The INSERT statement cannot be executed. The contents of the object table are unchanged.

Programmer Response: Examine the search condition of the subselect to make sure that no more than one row of data is selected.

SQLSTATE: 21501

-534 THE PRIMARY KEY CANNOT BE UPDATED BECAUSE OF MULTIPLE-ROW UPDATE

Explanation: An UPDATE operation attempted to update a primary key on multiple rows of the object table.

An UPDATE statement updating the primary key cannot be used to update more than one row of the object table.

Note: This SQLCODE will only be issued for plans and packages bound prior to Version 5. SQLCODE -534 will not be issued for dynamic SQL or plans and packages bound with Version 5 or later releases.

System Action: The UPDATE statement cannot be executed. The contents of the object table are unchanged.

Programmer Response: Examine the search condition of the UPDATE statement to make sure that no more than one row of the object table is selected to be updated.

SQLSTATE: 21502

-536 THE DELETE STATEMENT IS INVALID BECAUSE TABLE *table-name* CAN BE AFFECTED BY THE OPERATION

Explanation: A DELETE operation with the indicated table referenced in a subquery was attempted.

If 'T' is the object table of the DELETE, the indicated table is one of the following:

- A dependent of 'T' in a relationship with a delete rule of CASCADE or SET NULL
- A dependent of another table in a relationship with a delete rule of CASCADE or SET NULL in which deletions from 'T' can cascade to that table.

System Action: The DELETE statement cannot be processed. The contents of the object table are unchanged.

Programmer Response: Do not attempt to reference a table in a subquery of a DELETE statement when the table can be affected by the DELETE statement.

SQLSTATE: 42914

-537 THE PRIMARY KEY, FOREIGN KEY, UNIQUE, OR PARTITIONING CLAUSE IDENTIFIES COLUMN *column-name* MORE THAN ONCE

Explanation: The primary key clause, foreign key clause, uniqueness clause and partitioning clause each contain a list of one or more column names. The statement violates the rule that no column name can appear more than once in any such list.

Programmer Response: Correct the statement to specify unique names for each column.

SQLSTATE: 42709

-538 FOREIGN KEY *name* DOES NOT CONFORM TO THE DESCRIPTION OF A PARENT KEY OF TABLE *table-name*

Explanation: The definition of the indicated foreign key does not conform to the description of parent key of the indicated table due to one of the following reasons:

- The referenced parent key has not been defined as a primary key or a unique key.
- The keys do not have the same number of columns.
- The description of the keys are not identical. The requirement for identical descriptions includes data type, length attribute, and field procedure.

name is the constraint-name specified in the foreign key clause or, if a constraint-name was not specified, the first column-name specified in the clause.

System Action: The statement cannot be processed.

Programmer Response: Correct the statement so that the description of the foreign key references a primary key or unique key, or so that the description of the foreign key conforms to that of a parent key of the indicated table.

SQLSTATE: 42830

-539 TABLE *table-name* DOES NOT HAVE A PRIMARY KEY

Explanation: DB2 cannot perform the CREATE or ALTER TABLE statement because the indicated table does not have a primary key. Thus, the primary key cannot be dropped, or the table cannot be defined as a parent in a referential constraint.

System Action: The statement cannot be processed.

Programmer Response: Correct the statement to reference a table with a primary key, or define a primary key with ALTER TABLE ADD PRIMARY KEY before referencing the table in a FOREIGN KEY clause.

SQLSTATE: 42888

-540 THE DEFINITION OF TABLE *table-name* IS INCOMPLETE BECAUSE IT LACKS A PRIMARY INDEX OR A REQUIRED UNIQUE INDEX

Explanation: The table named was defined with a PRIMARY KEY clause, a UNIQUE clause, or with a ROWID column with the GENERATED BY DEFAULT attribute. Its definition is incomplete, and it cannot be used until a unique index is defined for

- the primary key (the primary index)
- a ROWID column

- for each set of columns in any UNIQUE clause (the required unique indexes).

An attempt was made to use the table in a FOREIGN KEY clause or in an SQL manipulative statement.

System Action: The statement cannot be executed.

Programmer Response: Define a primary index or a required unique index on the table before referencing it.

SQLSTATE: 57001

-542 *column-name* **CANNOT BE A COLUMN OF A PRIMARY KEY, A UNIQUE CONSTRAINT, OR A PARENT KEY BECAUSE IT CAN CONTAIN NULL VALUES**

Explanation: The code is used to report that a column identified in a PRIMARY KEY, a UNIQUE constraint clause, or a parent key (via a REFERENCES clause) is defined to allow null values.

System Action: The statement cannot be executed.

Programmer Response: In the case of a column identified in a PRIMARY KEY or a UNIQUE constraint clause, correct the statement and rerun it.

In the case of a column identified in a REFERENCES clause, drop the parent table then recreate it with referenced columns defined as NOT NULL. Afterwards, rerun the statement.

SQLSTATE: 42831

-543 **A ROW IN A PARENT TABLE CANNOT BE DELETED BECAUSE THE CHECK CONSTRAINT *check-constraint* RESTRICTS THE DELETION**

Explanation: The delete operation cannot be executed because the target table is a parent table and is connected with a referential constraint to a dependent table with a delete rule of SET NULL. However, a check constraint defined on the dependent table restricts the column from containing a null value.

System Action: The DELETE statement was not executed. The contents of the tables are unchanged.

Programmer Response: Examine the foreign key and its delete rule in the dependent table and the conflicting check constraint. Change either the delete rule or the check constraint so that they do not conflict.

SQLSTATE: 23511

-544 **THE CHECK CONSTRAINT SPECIFIED IN THE ALTER TABLE STATEMENT CANNOT BE ADDED BECAUSE AN EXISTING ROW VIOLATES THE CHECK CONSTRAINT**

Explanation: An existing row violates the check constraint specified in the ALTER TABLE statement.

System Action: The statement cannot be executed. The check constraint definition is not added to the table. The table definition is unchanged.

Programmer Response: Examine the check constraint definition that was specified in the ALTER TABLE statement and the data in the table to determine why the ALTER TABLE statement was rejected.

You can determine which rows violated the check constraint by using the SELECT statement, negating the check constraint in the WHERE clause. For example:

```
SELECT * FROM table WHERE (NOT (check-condition));
```

SQLSTATE: 23512

-545 **THE REQUESTED OPERATION IS NOT ALLOWED BECAUSE A ROW DOES NOT SATISFY THE CHECK CONSTRAINT *check-constraint***

Explanation: Table check constraint violations occurred on an INSERT or UPDATE statement. The resulting row violated the check constraint definition on the table.

System Action: The INSERT or UPDATE statement cannot be executed. The contents of the table are unchanged.

Programmer Response: Examine the data and the check constraint definition in the SYSIBM.SYSCHECKS catalog table to determine why the INSERT or UPDATE statement was rejected. The data must be changed to satisfy the check constraint.

SQLSTATE: 23513

-546 **THE CHECK CONSTRAINT *constraint-name* IS INVALID**

Explanation: A check constraint in the CREATE TABLE or ALTER TABLE statement is invalid for one or more of the following reasons:

- The constraint definition refers to a column that has a field procedure.
- The constraint definition refers to a column with a data type that is lower in the hierarchy of numeric data types than the data type of any other operand. The hierarchy is as follows:

```
small integer < large integer < decimal  
< single precision float < double precision float
```

- The constraint definition refers to a column with a numeric data type that is not the same numeric data type as that of the other column operands.
- The constraint definition refers to a column with a length that is shorter than the other operands when the column and other operands are not character string data types.
- The constraint definition refers to a built-in or user-defined function.
- The constraint definition uses a cast function that requires conversion of the data. The only functions that are allowed in a check constraint are cast functions that do not require conversion of the data.

System Action: The statement is not executed.

For ALTER TABLE, the check constraint is not added to the object table. The definition of the table is unchanged.

For CREATE TABLE, the table is not created.

Programmer Response: Correct the check constraint definition and execute the statement again.

SQLSTATE: 42621

-548 A CHECK CONSTRAINT THAT IS DEFINED WITH *column-name* IS INVALID

Explanation: A check constraint in the CREATE TABLE or ALTER TABLE statement is invalid for one or more of the following reasons:

- The constraint definition refers to a column that has a field procedure.
- The constraint definition refers to a column with a data type that is lower in the hierarchy of numeric data types than the data type of any other operand. The hierarchy is as follows:
small integer < large integer < decimal < single precision float < double precision float
- The constraint definition refers to a column with a numeric data type that is not the same numeric data type as that of the other column operands.
- The constraint definition refers to a column with a length that is shorter than the other operands when the column and other operands are not character string data types.
- The constraint definition refers to a ROWID column.
- The constraint definition refers to a LOB column.

System Action: The statement is not executed.

For ALTER TABLE, the check constraint is not added to the object table. The definition of the table is unchanged.

For CREATE TABLE, the table is not created.

Programmer Response: Correct the check constraint definition and execute the statement again.

SQLSTATE: 42621

-549 THE *statement* STATEMENT IS NOT ALLOWED FOR *object_type1* *object_name* BECAUSE THE BIND OPTION DYNAMICRULES(RUN) IS NOT IN EFFECT FOR *object_type2*

Explanation: A program attempted to issue the indicated SQL statement that is one of several SQL statements that cannot be issued from a plan or package for which the option DYNAMICRULES(RUN) is not in effect. Those SQL statements are:

- Dynamic GRANT statement
- Dynamic REVOKE statement
- Dynamic ALTER statement
- Dynamic CREATE statement
- Dynamic DROP statement

The indicated SQL statement is bound to one of the following:

- The named plan or package that was not bound with the option DYNAMICRULES(RUN)
- The named package that was not bound with the DYNAMICRULES option, but is appended to a plan that was not bound with DYNAMICRULES(RUN)

statement

The SQL statement in error

object_type1

PACKAGE or DBRM

object_name

If *object_type1* is PACKAGE, *object_name* is the name of the package in the format 'location-id.collection-id.package-id'.

If *object_type1* is DBRM, *object_name* is the name of the DBRM in the format 'plan-name DBRM-name'.

object_type2

PLAN or PACKAGE

If *object_type1* is PACKAGE, *object_type2* can be either PACKAGE or PLAN (whichever is bound with a DYNAMICRULES value other than RUN).

If *object_type1* is DBRM, *object_type2* is PLAN.

System Action: The SQL statement cannot be executed.

Programmer Response: Do one of the following to correct the error:

- If the SQL statement is embedded, remove it, precompile and compile the application program again, and reissue the BIND command with the desired DYNAMICRULES option.

- If appropriate, use the SQL statement with a package or plan that is bound with DYNAMICRULES(RUN).
- Issue the REBIND command with the DYNAMICRULES(RUN) option for the plan or package to which the SQL statement is bound

Refer to the BIND PACKAGE(DSN), BIND PLAN(DSN), REBIND PACKAGE(DSN), or REBIND PLAN(DSN) statement in *DB2 Command Reference* for the description of the DYNAMICRULES option and the expected results. Determine if either the SQL statement should be removed from the program or the plan or package should be rebound with the DYNAMICRULES(RUN) option.

SQLSTATE: 42509

-551 *auth-id* **DOES NOT HAVE THE PRIVILEGE TO PERFORM OPERATION operation ON OBJECT object-name**

Explanation: Authorization ID *auth-id* attempted to perform *operation* on object *object-name* without having been granted the proper authority to do so. This error might also occur if the object is a read-only view (for INSERT, DELETE, or UPDATE), or if *auth-id* is trying to create a table or view with an authorization ID other than its own.

You can create a table from an *auth-id* other than your own only if your authorization ID is SYSADM, DBADM, or DBCTRL. You can create a view from an *auth-id* other than your own only if your authorization ID is SYSADM.

When *operation* is 'GRANT ***', the keyword ALL was used in the GRANT statement, but the grantor *auth-id* did not possess any privilege to grant.

If this error occurs while DB2 is creating or altering a table involving referential constraints, this code reports that the user does not have the necessary ALTER privilege to perform a FOREIGN KEY, DROP FOREIGN KEY, DROP PRIMARY KEY, or DROP UNIQUE operation. The *object-name* identifies the object table of the CREATE or ALTER TABLE statement, not the table for which the user lacks the ALTER privilege.

If this error occurs for a distributed SQL request, then:

1. If authorization ID translation is in effect for either the requesting DB2 site or the serving (responding) DB2 site, then *auth-id* is the translated authorization ID. Refer to Part 3 (Volume 1) of *DB2 Administration Guide* for information on authorization ID translation.
2. If an alias name was used in the SQL statement, then *object-name* is the resolved remote table or view name.

If the operation is a DROP PACKAGE, the object name consists of the collection ID, the package name and the consistency token. The consistency token uniquely identifies which version of the package the user does not have authorization to drop.

If this error occurs during invocation of a routine, then authorization ID *auth-id* does not have the EXECUTE privilege on any candidate routine in the SQL path. *object-name* is the name of a candidate routine in the SQL path.

Note: Beginning with Version 5, SQLCODE -551 will be returned instead of SQLCODE -204 for the runtime error where an object does not exist and the CURRENT RULES special register is set to 'STD'.

System Action: The statement cannot be executed.

Installation Action: Check for an attempted authorization violation.

Programmer Response: Ensure that *auth-id* was granted the authority to perform the desired operation, the *object-name* exists, and *auth-id* is not trying to create a table with a different authorization ID.

SQLSTATE: 42501

-552 *auth-id* **DOES NOT HAVE THE PRIVILEGE TO PERFORM OPERATION operation**

Explanation: Authorization ID 'auth-id' has attempted to perform the specified 'operation' without having been granted the authority to do so.

System Action: The statement cannot be executed.

Installation Action: Check for an attempted authorization violation.

Programmer Response: Ensure that the authorization ID has been granted the authority necessary to perform the desired operation.

SQLSTATE: 42502

-553 *auth-id* **SPECIFIED IS NOT ONE OF THE VALID AUTHORIZATION IDS**

Explanation: The authorization ID specified as the value of the 'authorization-id' or host variable in the SQL SET CURRENT SQLID statement is neither the user's primary authorization ID nor one of the associated secondary authorization IDs.

System Action: The SET CURRENT SQLID statement cannot be executed. The current SQL ID is not changed.

Programmer Response: Correct the error in the statement or contact the security administrator to have the authorization ID defined for your use.

SQLSTATE: 42503

-554 AN AUTHORIZATION ID CANNOT GRANT A PRIVILEGE TO ITSELF

Explanation: An authorization ID attempted to execute a GRANT statement in which that ID itself appears as one of the entries in the list of 'grantee' authorization IDs.

An authorization ID cannot GRANT a privilege to itself. However, if SQLRULES(STD) is in effect or CURRENT RULES contains STD, GRANT to self is allowed.

System Action: The statement cannot be executed. No privileges were granted.

Programmer Response: Refer to Chapter 4 of *DB2 SQL Reference* for information about restrictions on the use of the GRANT statement.

SQLSTATE: 42502

-555 AN AUTHORIZATION ID CANNOT REVOKE A PRIVILEGE FROM ITSELF

Explanation: An authorization ID attempted to execute a REVOKE statement in which that ID itself appears as one of the entries in the list of authorization IDs to be revoked.

An authorization ID cannot REVOKE its own privilege. However, if SQLRULES(STD) is in effect or CURRENT RULES contains STD, REVOKE to self is allowed.

System Action: The statement cannot be executed. No privileges were revoked.

Programmer Response: Refer to Chapter 5 of *DB2 SQL Reference* for information about restrictions on the use of the REVOKE statement.

SQLSTATE: 42502

-556 *authid2* CANNOT HAVE THE *privilege* PRIVILEGE *on_object* REVOKED BY *authid1* BECAUSE THE REVOKEE DOES NOT POSSESS THE PRIVILEGE OR THE REVOKER DID NOT MAKE THE GRANT

Explanation: The REVOKE statement was not successful for one of the following reasons:

- *Authid2* does not possess the *privilege*.
- The revoker, *authid1*, did not explicitly grant the privilege to *authid2*.
- *Authid2* is the owner of the specified object.
- When *privilege* is '****' the keyword ALL was used in the REVOKE statement, but *authid2* did not possess any privilege to revoke.
- When *authid1* is ALL, the BY ALL clause was used in the REVOKE statement, but *authid2* did not possess any privilege to revoke.

An authorization ID can revoke only the privileges that it has explicitly granted to other authorization IDs, unless the authorization ID has SYSADM or SYSCTRL authority and specifies the BY clause. No authorization ID, not even SYSADM, can revoke 'privileges' on an object from the object owner.

System Action: The statement cannot be executed. No privileges were revoked from any authorization ID.

Programmer Response: Check the appropriate authorization catalog tables to verify that *authid2* possesses the privilege to be revoked. Queries can be made with GRANTEE = *authid2* and the privilege column not = blanks. Correct and reissue the REVOKE statement.

If a user holding SYSADM or SYSCTRL authority receives this SQLCODE, the BY clause might have been omitted from the REVOKE statement.

SQLSTATE: 42504

-557 INCONSISTENT GRANT/REVOKE KEYWORD *keyword*. PERMITTED KEYWORDS ARE *keyword-list*

Explanation: The GRANT or REVOKE statement contains a syntax or spelling error at or before the specified 'keyword'. As an aid to the programmer, 'keyword-list' provides a list of the keywords that would be permitted in this context.

Alternatively:

- The mixture of privileges specified on the GRANT or REVOKE statement is not permitted. The privileges must all be of one type, and consistent with the form of the GRANT or REVOKE statement.
- REVOKE UPDATE (column-list) is not permitted; only REVOKE UPDATE is valid.
- The keywords DELETE, INSERT, SELECT, TRIGGER, UPDATE, REFERENCES and ALTER cannot be specified for an auxiliary table.

System Action: The statement cannot be executed.

Programmer Response: Correct the syntax of the GRANT or REVOKE statement.

SQLSTATE: 42852

-558 INVALID CLAUSE OR COMBINATION OF CLAUSES ON A GRANT OR REVOKE

Explanation: The location qualifier specified for a GRANT or REVOKE statement is invalid.

System Action: The statement cannot be executed.

Programmer Response: Refer to Chapter 5 of *DB2 SQL Reference* for valid keywords for the GRANT statement.

SQLSTATE: 56025

-559 ALL AUTHORIZATION FUNCTIONS HAVE BEEN DISABLED

Explanation: The authorization mechanism has been disabled in the DB2 subsystem. Consequently, GRANT and REVOKE statements are ignored.

System Action: The statement cannot be executed. No privileges were granted or revoked.

Programmer Response: Do not attempt to execute GRANT or REVOKE statements unless and until the authorization mechanism is enabled in the DB2 subsystem.

SQLSTATE: 57002

-567 *bind-type* AUTHORIZATION ERROR USING *auth-id* AUTHORITY PACKAGE = *package-name* PRIVILEGE = *privilege*

Explanation: The authorization ID given does not have the privilege indicated, and cannot invoke the indicated subcommand against the indicated package.

bind-type

Type of bind subcommand (BIND | REBIND | FREE).

auth-id Authorization ID of the package owner.

package-name

Name of the package (location.collection.package.version)

privilege

Name of the privilege not held:

- BINDADD—The authority to create a new package using BIND with the ADD option.
- BIND—The authority to BIND (REPLACE) or REBIND a package.
- COPY—The authority to COPY from the indicated package
- CREATE IN—The authority to create a package in the indicated collection.

System Action: The indicated package is not bound, rebound, or freed.

System Programmer Response: The indicated privilege must be granted to the authorization ID that will become the package owner.

SQLSTATE: 42501

-571 THE STATEMENT WOULD RESULT IN A MULTIPLE SITE UPDATE

Explanation:

This SQLCODE is issued in the following situations:

- When an application program operating in an IMS or CICS environment attempts to modify data at a remote location where multi-site update capabilities are not supported.

- When an application program has explicit SQL statements within a commit scope that would result in updates at multiple sites where one of the sites at which data is being updated does not support multi-site update.

This SQLCODE can be issued when an application program explicitly modifies data at a single location within a commit scope. This can occur in the following situations:

- A package or plan associated with the application program was invalidated.
- A package or plan was bound at one release of DB2 and fallback occurs to a prior release.

In the situations described above, an implicit autobind is done on behalf of the user. An autobind results in the DB2 catalog being updated. The conditions that must exist for this SQLCODE to be issued when an autobind occurs are:

- One site where data has been modified does not support multi-site update.
- The autobind occurs at a separate and distinct site from where an application program explicitly modifies data.
- At the time of the autobind, locks are being held to process an SQL statement within the application program.

System Action: The statement cannot be executed.

Programmer Response:

- Ensure that all requests for modifications to the data are confined to a single location within any given commit scope for any application that references a location that does not support multi-site update.
- For programs operating in an IMS or CICS environment where the remote database systems do not support multi-site update, all SQL statements must be read-only access.
- If an autobind is causing this SQLCODE to be issued, REBIND the plan or package.

SQLSTATE: 25000

-573 TABLE *table-name* DOES NOT HAVE A UNIQUE KEY WITH THE SPECIFIED COLUMN NAMES

Explanation: A referential constraint cannot be defined with the specified table as the parent because a unique index with the specified column names does not exist for the identified parent table.

System Action: The statement cannot be processed.

Programmer Response: Create a unique index with the specified columns for the parent table.

SQLSTATE: 42890

-574 THE SPECIFIED DEFAULT VALUE OR IDENTITY ATTRIBUTE VALUE CONFLICTS WITH THE DEFINITION OF COLUMN *column-name*

Explanation: The DEFAULT value specified for *column-name* is not valid for one of the following reasons:

- The value is not assignable to the column because the constant does not conform to the format for a constant of that data type, or the value has the incorrect length or precision.
- A floating-point constant is specified and the column is not a floating point data type
- A decimal constant is specified and non-zero digits would be truncated when assigned to the column
- The value is more than 255 bytes, including quotes for strings, introducer characters such as the X for a hex constant, fully qualified function names, and parentheses.
- Either the USER or CURRENT SQLID special register is specified and the length attribute of the character string data type is less than 8.
- A system-generated cast function was specified and the column is not defined with a user-defined distinct type
- A function was specified that is not supported. A function may only be specified when the data type is a distinct type, and in this case the specified function must be one of the system-generated cast functions associated with this distinct type.
- WITH DEFAULT is specified with a value other than NULL for a LOB column.
- A value with non-zero scale was specified for the START WITH or INCREMENT BY option of an identity column with the DECIMAL data type.

System Action: The SQL statement cannot be executed.

Programmer Response: Specify a default value that is valid for the definition of the column.

SQLSTATE: 42894

-575 VIEW *view-name* **CANNOT BE REFERENCED**

Explanation: An alteration was made to a table underlying view *view-name* which caused the view definition to become invalid. The view must be successfully regenerated with an ALTER VIEW statement before it can be referenced in a statement other than ALTER VIEW, GRANT, REVOKE, DROP, COMMENT, or LABEL.

System Action: The statement cannot be processed.

Programmer Response: Issue an ALTER VIEW statement to regenerate the view.

SQLSTATE: 51024

-577 *object-type object-name* **ATTEMPTED TO MODIFY DATA WHEN THE DEFINITION OF THE FUNCTION OR PROCEDURE DID NOT SPECIFY THIS ACTION**

Explanation: The current environment does not allow SQL statements that modify data. One of the following situations has occurred:

- A user-defined function or stored procedure *object-name* was invoked and attempted to modify data, but the function or procedure was defined without the MODIFIES SQL option.
- A user-defined function or stored procedure *object-name* was invoked and attempted to execute a data definition statement, but the function or procedure was defined without the MODIFIES SQL option.
- A function or procedure defined with READS SQL DATA, CONTAINS SQL, or NO SQL has attempted to invoke another function or procedure defined with MODIFIES SQL DATA.
- A user-defined function or stored procedure *object-name* was invoked and attempted to use a NEXTVAL expression. However, the function or procedure was defined without the MODIFIES SQL DATA option.

In an environment of nested functions and procedures, the SQL option in effect is the most restrictive one that has been specified in the nested hierarchy of functions and procedures. The SQL data access option in effect does not allow for modifying the data.

System Action: The SQL statement failed.

Programmer Response: Either use an ALTER statement to change the definition of the function or procedure to allow statements that modify data, or remove the failing SQL statement from the external function or procedure.

SQLSTATE: 38002

-579 *object-type object-name* **ATTEMPTED TO READ DATA WHEN THE DEFINITION OF THE FUNCTION OR PROCEDURE DID NOT SPECIFY THIS ACTION**

Explanation: The current environment does not allow SQL statements that read data. One of the following situations had occurred:

- A user-defined function or stored procedure *object-name* was invoked and attempted to read data, but the function or procedure was defined without the READS SQL DATA or MODIFIES SQL DATA option.
- A function or procedure defined with CONTAINS SQL or NO SQL has attempted to invoke another function or procedure defined with READS SQL DATA.

In an environment of nested functions and procedures, the SQL option in effect is the most restrictive one that has been specified in the nested hierarchy of functions and procedures. The SQL data access option in effect does not allow for reading data.

System Action: The SQL statement failed.

Programmer Response: Either use an ALTER statement to change the definition of the function or procedure to allow statements that read data, or remove the failing SQL statement from the external function or procedure.

SQLSTATE: 38004

-580 THE RESULT-EXPRESSIONS OF A CASE EXPRESSION CANNOT ALL BE NULL

Explanation: There is a CASE expression in the statement that has all the *result-expressions* (expressions following the THEN and ELSE keywords) coded with the keyword NULL.

System Action: The statement cannot be processed.

Programmer Response: Change the CASE expression to include at least one *result-expression* with a keyword other than NULL.

SQLSTATE: 42625

-581 THE DATA TYPES OF THE RESULT-EXPRESSIONS OF A CASE EXPRESSION ARE NOT COMPATIBLE

Explanation: There is a CASE expression in the statement that has *result-expressions* (expressions following THEN and ELSE keywords) that are not compatible. The data type of the *result-expressions* might be incompatible because the CASE condition result data types are not all:

- character
- graphic
- numeric
- date
- time
- timestamp

If encoded in Unicode, character and graphic data types are compatible, however. Refer to DB2 SQL Reference for more information about Unicode.

System Action: The statement cannot be processed.

Programmer Response: Correct the *result-expressions* so that they are compatible.

SQLSTATE: 42804

-582 THE SEARCH-CONDITION IN A SEARCHED-WHEN-CLAUSE CANNOT BE A QUANTIFIED PREDICATE, IN PREDICATE, OR AN EXISTS PREDICATE.

Explanation: The *search-condition* in a *searched-when-clause* specifies a quantified predicate, an IN predicate, or an EXISTS predicate, but is not allowed.

System Action: The statement cannot be processed.

Programmer Response: Correct the *search-condition*.

SQLSTATE: 42625

-583 THE USE OF FUNCTION *function-name* IS INVALID BECAUSE IT IS NOT DETERMINISTIC OR HAS AN EXTERNAL ACTION

Explanation: The function *function-name* is defined as a not deterministic function or a function with an external action. This type of function is not supported in the context in which it is used. The contexts in which these are not valid are:

- in the expression prior to the first WHEN keyword in a simple-case-expression.
- in the WHERE clause of the subselect in a CREATE VIEW statement if the WITH CHECK OPTION is specified.
- in an expression of an ORDER BY clause

System Action: The statement cannot be executed.

Programmer Response: If the use of a not deterministic or external action function was not intended, substitute a function without these characteristics. If the behavior associated with the not deterministic or external action function is intentional, use the alternate form of the statements that make that intent explicit.

- Instead of a simple-when-clause, use the corresponding searched-when-clause where the function would get specified in each search-condition.
- Remove the WITH CHECK OPTION from the CREATE VIEW statement.
- Remove the function from the ORDER BY clause. If the column is part of the result set of the query, change the expression in the ORDER BY clause to the *simple-integer* or *simple-column-name* form of the sort key. See the ORDER BY syntax diagram in the DB2 SQL Reference for more information.

SQLSTATE: 42845

-585 THE COLLECTION ID *collection-id* APPEARS MORE THAN ONCE IN THE SET *special-register* STATEMENT

Explanation: The SET statement for special register *special-register* includes *collection-id* more than once.

System Action: The statement cannot be executed.

Programmer Response: Remove duplicate occurrences of *collection-id* from the SET statement for the special register.

SQLSTATE: 42732

-586 THE TOTAL LENGTH OF THE CURRENT PATH SPECIAL REGISTER CANNOT EXCEED 2048 CHARACTERS

Explanation: The CURRENT PATH special register is defined as a VARCHAR(2048). The content of the string includes each schema name delimited with double quotes and separated from the next schema name by a comma. The total length of the string of all schema names in the CURRENT PATH cannot exceed 2048 characters. A SET PATH statement causing this message would exceed this limit.

System Action: The statement is not executed.

Programmer Response: Remove schema names to reduce the total length to fit the 2048 character maximum length. If all the schema names are required, it may be necessary to consolidate some user-defined functions so that fewer schema names are required for the CURRENT PATH.

SQLSTATE: 42907

-589 A POSITIONED DELETE OR UPDATE STATEMENT FOR CURSOR *cursor-name* SPECIFIED A ROW OF A ROWSET, BUT THE CURSOR IS NOT POSITIONED ON A ROWSET

Explanation: The FOR ROW *n* OF ROWSET clause was specified on a positioned DELETE or UPDATE statement, but the cursor is not currently positioned on a rowset.

System Action: The statement cannot be processed.

Programmer Response: Issue a FETCH statement to position the cursor on the desired rowset, and then reissue the positioned DELETE or UPDATE statement. If the cursor is not defined for rowset access, redefine the cursor first.

SQLSTATE: 24520

-590 PARAMETER NAME *parameter-name* IS NOT UNIQUE IN THE CREATE FOR ROUTINE *routine-name*

Explanation: The parameter name *parameter-name* specified on a CREATE FUNCTION or CREATE PROCEDURE statement for *routine-name* is not unique.

System Action: The statement cannot be executed.

Programmer Response: Change the name of the parameter to make all of the parameter names unique within the CREATE statement.

SQLSTATE: 42734

-592 NOT AUTHORIZED TO CREATE FUNCTIONS OR PROCEDURES IN WLM ENVIRONMENT *env-name*

Explanation: This message is issued when:

- The value of the *env-name* token is 'NO WLM ENVIRONMENT' and the check for authorization to the DB2-managed stored procedures address space failed because the NO WLM ENVIRONMENT clause was specified on the CREATE PROCEDURE or ALTER PROCEDURE statement.
- There is no DB2-managed stored procedures address space.

System Action: The statement cannot be executed.

Programmer Response: To correct the error, perform one of the following actions:

- If the value of the *env-name* token is 'NO WLM ENVIRONMENT', choose a different value for the WLM ENVIRONMENT keyword or request authorization to create objects in the specified WLM ENVIRONMENT from the system administrator.
- If there is no DB2-managed stored procedures address space, request that one be created. Also request that a RACF PERMIT be completed to allow access to this resource.

After doing one of the above, reissue the SQL statement.

SQLSTATE: 42510

-593 NOT NULL MUST BE SPECIFIED FOR ROWID OR DISTINCT TYPE COLUMN *column-name*

Explanation: ROWID columns and distinct type columns for which the source type is a ROWID do not support null values. When a ROWID column (or distinct type for which the source type is a ROWID) is defined on a CREATE TABLE, ALTER TABLE, or DECLARE TABLE statement, the NOT NULL clause must be specified for the column.

System Action: The statement cannot be executed.

Programmer Response: Change the statement to specify NOT NULL for ROWID column *column-name*.

SQLSTATE: 42831

-594 ATTEMPT TO CREATE A NULLABLE ROWID OR DISTINCT TYPE COLUMN
column-name

Explanation: A CREATE VIEW statement attempted to create a new view with a nullable ROWID column. ROWID columns (or distinct type columns for which the source type is a ROWID) do not support null values. One of the following situations has occurred:

- The subselect of a CREATE VIEW statement involves an outer join for which a column of the result table is a ROWID column that needs to allow for null values.

System Action: The statement cannot be executed.

Programmer Response: Change the content of the statement so that it does not try to create a ROWID column which must allow for null values.

SQLSTATE: 42831

-601 THE NAME OF THE OBJECT TO BE CREATED OR THE TARGET OF A RENAME STATEMENT IS IDENTICAL TO THE EXISTING NAME *name* **OF THE OBJECT TYPE** *obj-type*

Explanation: One of the following situations has been detected:

- A CREATE statement tried to create an object *name* of type *obj-type*, but an object of that type with the same name is already defined in the DB2 subsystem.
 - If *obj-type* is CONSTRAINT, the *name* was specified in the FOREIGN KEY clause, CHECK clause, PRIMARY KEY clause, or UNIQUE clause of either a CREATE or ALTER TABLE statement. All referential integrity, check constraint, primary key, and unique key constraint names defined on a table must be unique.
 - If *obj-type* is TABLE or VIEW, and a CREATE ALIAS statement failed, then the alias-name specified in the CREATE ALIAS statement is identical to the table name or view name specified. The TABLE or VIEW might not exist in the DB2 subsystem.
 - If *obj-type* is DISTINCT TYPE, and a CREATE DISTINCT TYPE statement failed, then there is already a user-defined type existing with the same name as the distinct type name specified in the CREATE DISTINCT TYPE statement.
 - If *obj-type* is FUNCTION or PROCEDURE, and a CREATE FUNCTION or CREATE PROCEDURE statement failed, then there is already a routine existing with the same name as the name

specified in the CREATE FUNCTION or CREATE PROCEDURE statement.

- If *obj-type* is PROCEDURE, and a CREATE PROCEDURE statement for an SQL procedure failed, then there may already be an SQL procedure that has the same name as the external name that was implicitly or explicitly specified.
 - If *obj-type* is FUNCTION, and a CREATE DISTINCT TYPE statement failed, then there is already a user-defined function existing with the same name as the distinct type that is specified in the CREATE DISTINCT TYPE statement.
 - If *obj-type* is SEQUENCE, and a CREATE SEQUENCE statement failed, then there is already a sequence existing with the same name as the sequence name that was specified in the CREATE SEQUENCE statement.
- A RENAME statement specified a target name *name*, but an object with the same name is already defined in the DB2 subsystem.

System Action: The CREATE, ALTER or RENAME statement cannot be executed. No new object was created, no existing object was altered, and no existing object was renamed.

Programmer Response: Either drop the existing object or choose another name. If *obj-type* is data set, do an IDCAMS DELETE of the data set before retrying the CREATE. Refer to Chapter 2 of *DB2 SQL Reference* for information about the scope of object names in DB2.

SQLSTATE: 42710

-602 TOO MANY COLUMNS SPECIFIED IN A CREATE INDEX OR ALTER INDEX STATEMENT

Explanation: The number of columns specified in the CREATE INDEX or ALTER INDEX statement exceeds 64, which is the maximum that is permitted by DB2.

System Action: The statement cannot be executed. The specified index was not created.

Programmer Response: The index definition must be modified to conform to the system-imposed column limit of 64.

SQLSTATE: 54008

-603 A UNIQUE INDEX CANNOT BE CREATED BECAUSE THE TABLE CONTAINS ROWS WHICH ARE DUPLICATES WITH RESPECT TO THE VALUES OF THE IDENTIFIED COLUMNS

Explanation: The index defined in the CREATE INDEX statement could not be created as unique because the specified table already contains rows that

are duplicates with respect to the values of the identified columns.

System Action: The statement cannot be executed.

Programmer Response: Examine the data to ascertain whether or not the duplicate data is valid. Alternatively, consider creating a nonunique index.

SQLSTATE: 23515

-604 A DATA TYPE DEFINITION SPECIFIES AN INVALID LENGTH, PRECISION, OR SCALE ATTRIBUTE

Explanation: A data type definition in a CREATE or ALTER statement contains an invalid length, precision, or scale attribute specification. In addition, the specification of data type might be incorrect or invalid. Or, the column definition in a view referenced in a CREATE TABLE LIKE *view* has an invalid length.

System Action: The statement cannot be executed. The specified object was not created or altered.

Programmer Response: Correct the syntax, and resubmit the statement. Refer to Chapter 2 of *DB2 SQL Reference* for information about valid length, precision, and scale attributes for the data type of an object.

SQLSTATE: 42611

-607 OPERATION OR OPTION *operation* IS NOT DEFINED FOR THIS OBJECT

Explanation: The operation or option cannot be performed on the object specified in the SQL statement.

System Action: The statement cannot be executed.

Programmer Response: If an option of the SQL statement is not allowed for this object, modify the SQL statement and resubmit the statement. If an operation is not defined for the object, the statement cannot be executed.

SQLSTATE: 42832

-611 ONLY LOCKMAX 0 CAN BE SPECIFIED WHEN THE LOCK SIZE OF THE TABLESPACE IS TABLESPACE OR TABLE

Explanation: This message is issued when:

- The LOCKSIZE of the table space is TABLESPACE or TABLE, and LOCKMAX is being altered to or created as a nonzero value.
- The LOCKSIZE of the table space is being altered to TABLESPACE or TABLE, and LOCKMAX is being altered to or created as a nonzero value.

If LOCKSIZE is TABLESPACE or TABLE, LOCKMAX must be 0 because lock escalation is not supported from these levels.

System Action: The statement cannot be executed.

Programmer Response: Do one of the following:

- Reissue the statement with LOCKMAX 0.
- Alter the LOCKSIZE of the table space to a value other than TABLESPACE or TABLE.

SQLSTATE: 53088

-612 *column-name* IS A DUPLICATE COLUMN NAME

Explanation: The CREATE INDEX, CREATE TABLE, CREATE VIEW or ALTER TABLE statement specifies the same *column-name* for two (or more) columns of the index, table, view, or the UPDATE OF clause of a trigger definition specifies the same column name more than once. Column names must be unique within an index, a table, a view, or in the UPDATE OF clause of a trigger definition. A column cannot be specified in more than one ALTER TABLE clause except if it is specified in an ALTER COLUMN clause and ADD CHECK CONSTRAINT clause. For ALTER TABLE ALTER COLUMN, the column name that is specified cannot be a column that is added in the same ALTER TABLE statement.

System Action: The statement cannot be executed. The specified index, table, view, or trigger was not created.

Programmer Response: Correct the CREATE statement to specify unique names for each of the columns of the index, table, view, or the columns in the UPDATE OF clause of a trigger definition. Correct the ALTER statement to specify unique names for each of the ALTER COLUMN clauses.

This error can also occur on CREATE TABLE when a column list of a PRIMARY KEY, FOREIGN KEY, or UNIQUE clause contains two or more occurrences of the same column name.

SQLSTATE: 42711

-613 THE PRIMARY KEY OR A UNIQUE CONSTRAINT IS TOO LONG OR HAS TOO MANY COLUMNS

Explanation: This error code results from a problem with the columns that are defined for a PRIMARY KEY or UNIQUE constraint. The number of columns is greater than 64, or the sum of the column length attributes is greater than the number allowed for the type of index.

If the failing statement was an ALTER TABLE statement that included the SET DATA TYPE clause to alter the definition of an existing column, a column being changed is part of a unique or primary constraint. The new sum of the lengths of the columns of the keys exceeds 255-*n*, where *n* is the number of columns allowing nulls. This sum currently exceeds the maximum number that is allowed.

If the failing statement was an ALTER TABLE statement with a PARTITIONING KEY specification, only 64 columns can be specified, and the combined lengths of all columns specified in the PARTITIONING KEY clause exceeds the maximum length of 255-*n*, where *n* is the number of columns that can contain null values.

System Action: The CREATE or ALTER statement cannot be executed. The specified table cannot be created or altered.

Programmer Response: Change the table definition to keep within the prescribed limits.

SQLSTATE: 54008

-614 THE INDEX CANNOT BE CREATED OR ALTERED, OR THE LENGTH OF A COLUMN CANNOT BE CHANGED BECAUSE THE SUM OF THE INTERNAL LENGTHS OF THE COLUMNS FOR THE INDEX IS GREATER THAN THE ALLOWABLE MAXIMUM

Explanation: The index could not be created or the length of a column cannot be changed because the sum of the internal lengths of the key columns would exceed the allowable maximum. The maximum permitted key length is as follows:

- For PADDED indexes, the sum of the length attributes of the columns must not be greater than 2000-*n*, where *n* is the number of columns that contain null values.
- For NOT PADDED indexes, the sum of the length attributes of the columns must not be greater than 2000-*n-2m*, where *n* is the number of nullable columns and *m* is the number of varying length columns.

System Action: The statement cannot be executed. The specified index was not created or the length of the column was not changed.

Programmer Response: The definition for the index must be modified (possibly by eliminating one or more key columns) to reduce the length of the key to the permitted maximum. Refer to Chapter 5 of *DB2 SQL Reference* if you require a complete explanation of other possible maximum key lengths and how they are computed.

SQLSTATE: 54008

-615 *operation-type* IS NOT ALLOWED ON A PACKAGE IN USE

Explanation: The operation '*operation-type*' cannot be performed because the package is in use by the same application process.

operation-type

Type of bind operation (BIND, REBIND or DROP).

System Action: The BIND, REBIND, or DROP operation on the package is not performed.

Programmer Response: Change the application to invoke the BIND, REBIND or DROP operation when the package is not use by the same application process.

SQLSTATE: 55006

-616 *obj-type1 obj-name1* CANNOT BE DROPPED BECAUSE IT IS REFERENCED BY *obj-type2 obj-name2*

Explanation: Some types of objects cannot be dropped if there are other objects which are dependent upon them. For example, a storage group cannot be dropped if there are one or more existing table spaces that use that storage group.

Execution of the specified DROP statement would drop object *obj-name1* of type *obj-type1* on which object *obj-name2* of type *obj-type2* is dependent.

System Action: The statement cannot be processed. The specified object was not dropped.

Programmer Response: Verify that the object specified in the DROP statement was, indeed, the object to be dropped. If so, all the existing objects that have a dependency on that object must first be dropped.

A LOB table space cannot be dropped when an association exists between it and another table space. The associated base table must be dropped first.

A populated auxiliary table and its index can only be dropped by dropping the associated base table.

A trigger package cannot be explicitly dropped. It can only be dropped by dropping the associated trigger with a DROP TRIGGER statement or by dropping the triggering table.

SQLSTATE: 42893

-618 OPERATION *operation* IS NOT ALLOWED ON SYSTEM DATABASES

Explanation: System databases cannot be the object of certain types of operations. The attempted '*operation*' cannot be performed on system databases. One possible reason for this error is that CCSID ASCII was specified when a system database was being created.

System Action: The statement cannot be executed. No changes were made to the specified system database.

Programmer Response: Do not attempt to perform the requested operation on system databases.

SQLSTATE: 42832

-619 OPERATION DISALLOWED BECAUSE THE DATABASE IS NOT STOPPED

Explanation: The statements CREATE, ALTER or DROP for a table space, table, or index in the database cannot be processed unless the database is stopped (using the STOP command).

System Action: The statement cannot be processed.

Programmer Response: Issue the -DISPLAY DATABASE command to verify that the work file database is stopped before resubmitting the statement.

SQLSTATE: 55011

-620 KEYWORD *keyword* IN *stmt type* STATEMENT IS NOT PERMITTED FOR A *space type* SPACE IN THE *database type* DATABASE

Explanation: The specified *keyword* in the SQL statement *stmt type* indicates an attribute that is not allowed for a *space type* space in the *database type* database.

keyword

Specifies the keyword that is not allowed.

stmt type

CREATE or ALTER

CREATE is for CREATE TABLESPACE or CREATE INDEX.

ALTER is for ALTER TABLESPACE or ALTER INDEX.

space type

TABLE or INDEX

TABLE is for table space, and INDEX is for index space.

database type

WORK FILE or TEMP

System Action: The statement cannot be executed.

Programmer Response: Refer to *DB2 SQL Reference* for information about attributes that are allowed or not allowed for a *space type* space in a *database type* database. Correct and resubmit the *stmt type* statement.

SQLSTATE: 53001

-621 DUPLICATE DBID *dbid* WAS DETECTED AND PREVIOUSLY ASSIGNED TO *database-name*

Explanation: The current database being created was assigned a DBID of '*dbid*', which is identical to the DBID assigned to database '*database-name*'. An inconsistency exists between the DB2 catalog and directory.

System Action: The statement cannot be executed. No new object was created, and the existing object was not altered or modified.

Programmer Response: Notify the system programmer. The inconsistency must be corrected before CREATE DATABASE will be successful.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

SQLSTATE: 58001

-622 FOR MIXED DATA IS INVALID BECAUSE THE MIXED DATA INSTALL OPTION IS NO

Explanation: FOR MIXED DATA is specified in a column description of a CREATE or ALTER TABLE, a CREATE FUNCTION, or a CREATE PROCEDURE statement, but the MIXED DATA install option is set to NO. FOR MIXED DATA is valid only when the MIXED DATA install option is set to YES.

System Action: The statement is not executed.

Programmer Response: Either change the install option or the FOR clause. If the install option is correctly set to NO, the allowable FOR clause options are BIT and SBCS.

SQLSTATE: 56031

-623 A CLUSTERING INDEX ALREADY EXISTS ON TABLE *table-name*

Explanation: A given table can have only one cluster index. This error can occur for the following reasons:

- A CREATE INDEX statement would create a second cluster index on the specified table.
- An ALTER INDEX statement specified the CLUSTER clause, but there is already a clustering index defined for the table.

System Action: The statement cannot be executed.

Programmer Response: Check to determine the identity and validity of the existing cluster index on the object table. Alternatively, consider creating the index without the CLUSTER attribute.

SQLSTATE: 55012

-624 TABLE *table-name* ALREADY HAS A PRIMARY KEY OR UNIQUE KEY CONSTRAINT WITH SPECIFIED COLUMNS

Explanation: The code is used to report that a primary key or unique key cannot be defined in an ALTER TABLE statement because the table either:

- Already has a primary key, or

- Has an existing unique constraint with the same definition (same set of columns specified) as the new key.

System Action: The statement cannot be run.

Programmer Response: Do not attempt to define a table with more than one primary key, or a unique constraint that duplicates the definition of an existing unique constraint.

SQLSTATE: 42889

-625 TABLE *table-name* DOES NOT HAVE AN INDEX TO ENFORCE THE UNIQUENESS OF THE PRIMARY OR UNIQUE KEY

Explanation: The ALTER TABLE statement is invalid for one of the following reasons:

- The table does not have a unique index with a key that is identical to the nominated primary or unique key.
- A unique index exists, but the index is already being used to enforce referential constraints. In this case, DB2 does not choose the index to enforce the primary or unique key.

System Action: The statement cannot be executed.

Programmer Response: Make sure the key list specified on the ALTER TABLE statement identifies an existing unique index of the table that is not already enforcing referential constraints.

SQLSTATE: 55014

-626 THE ALTER STATEMENT IS NOT EXECUTABLE BECAUSE THE PAGE SET IS NOT STOPPED

Explanation: An ALTER statement specifies an ADD PART, BUFFERPOOL, USING, PRIQTY, SECQTY, ERASE, or GBPCACHE clause, but the page set is not stopped.

System Action: The SQL statement cannot be executed.

Programmer Response: Stop the page set before resubmitting the statement.

SQLSTATE: 55015

-627 THE ALTER STATEMENT IS INVALID BECAUSE THE PAGESET HAS USER-MANAGED DATA SETS

Explanation: This code is used if a PRIQTY, SECQTY, or ERASE clause is specified, USING STOGROUP is not specified, and the page set has user-managed data sets.

System Action: The SQL statement cannot be executed.

Programmer Response: Verify that the correct table or partition is specified. The primary and secondary space allocation of a user-managed data set cannot be altered by means of an ALTER statement.

SQLSTATE: 55016

-628 THE CLAUSES ARE MUTUALLY EXCLUSIVE

Explanation: Mutually exclusive clauses were specified in one or more of the following ways:

- A CREATE TABLESPACE statement contains both the SEGSIZE and Numparts clauses.
- A CREATE TABLESPACE statement contains both the SEGSIZE and LARGE clauses.
- A CREATE TABLESPACE statement contains both the SEGSIZE and MEMBER CLUSTER clauses.
- A CREATE or ALTER TABLESPACE contains both the LOCKPART YES and LOCKSIZE TABLESPACE
- A 'column-definition' contains both NOT NULL and DEFAULT NULL clauses.
- A 'column-definition' contains both FIELDPROC and DEFAULT clauses.
- A select-statement contains both the update-clause and the FOR FETCH ONLY clause.
- An ALTER TABLE statement contains both a DROP CONSTRAINT clause and either a DROP FOREIGN KEY, DROP CHECK, DROP PRIMARY KEY, or DROP UNIQUE clause.
- A CREATE or ALTER TABLESPACE statement contains both LOCKPART YES and LOCKSIZE TABLESPACE.
- A CREATE TRIGGER statement specifies more than one correlation name for OLD, NEW, OLD_TABLE, or NEW_TABLE. Each of these correlation specifications can appear no more than once in the CREATE TRIGGER statement.
- A CREATE FUNCTION statement contains both a CAST FROM clause and a SOURCE clause.
- A CREATE FUNCTION statement contains both a SOURCE clause and a RETURNS TABLE clause.
- A CREATE FUNCTION statement contains both a SOURCE clause and a clause used to define an external function (For example, EXTERNAL, LANGUAGE, NO SQL).
- A CREATE or ALTER FUNCTION statement specified SCRATCHPAD. SCRATCHPAD must not be specified when LANGUAGE JAVA or PARAMETER STYLE JAVA is also specified for a function.
- A CREATE or ALTER FUNCTION statement specified FINAL CALL. FINAL CALL must not be specified when LANGUAGE JAVA or PARAMETER STYLE JAVA is also specified for a function.
- A CREATE or ALTER FUNCTION or PROCEDURE statement specified LANGUAGE JAVA, LANGUAGE

COMPJAVA, or PARAMETER STYLE JAVA, with DBINFO. DBINFO must not be specified in these cases.

- A CREATE or ALTER FUNCTION or PROCEDURE statement specified LANGUAGE JAVA, LANGUAGE COMPJAVA, or PARAMETER STYLE JAVA, with RUN OPTIONS. RUN OPTIONS must not be specified in these cases.
- A CREATE or ALTER PROCEDURE statement specified PARAMETER STYLE JAVA, but LANGUAGE COMPJAVA or LANGUAGE JAVA was not specified.
- A CREATE or ALTER PROCEDURE statement specified LANGUAGE JAVA, but did not specify PARAMETER STYLE JAVA.
- A CREATE or ALTER FUNCTION statement specified PARAMETER STYLE JAVA, but LANGUAGE JAVA was not specified.
- A CREATE or ALTER FUNCTION statement specified LANGUAGE JAVA, but did not specify PARAMETER STYLE JAVA.
- A CREATE or ALTER PROCEDURE statement specified LANGUAGE JAVA with NO WLM ENVIRONMENT. NO WLM ENVIRONMENT must not be specified when LANGUAGE JAVA or LANGUAGE COMPJAVA is also specified for a procedure.
- A CREATE or ALTER PROCEDURE statement attempts to use the NO WLM ENVIRONMENT and PROGRAM TYPE SUB options. When NO WLM ENVIRONMENT is used, then SECURITY must also be used.
- A CREATE or ALTER PROCEDURE statement attempts to use both NO WLM ENVIRONMENT and either USER or DEFINER for SECURITY. When NO WLM ENVIRONMENT is used, then SECURITY DB2 must also be used.
- A CREATE or ALTER PROCEDURE statement contains both a LANGUAGE REXX clause, and a PARAMETER STYLE DB2SQL or PARAMETER STYLE JAVA clause.
- An ALTER TABLE statement contains both an ALTER COLUMN clause and a VALIDPROC clause.
- An ALTER TABLE statement contains both an ALTER COLUMN clause and a clause other than the check constraint clause.
- An ALTER TABLE statement contains either an ADD MATERIALIZED QUERY or DROP MATERIALIZED QUERY clause, and some other clauses.
- The AS (*subselect*) clause of a DECLARE GLOBAL TEMPORARY TABLE statement contains both an INCLUDING COLUMN DEFAULTS clause and a USING TYPE DEFAULTS clause.
- A CREATE DATABASE statement contains both the AS WORKFILE clause and the AS TEMP clause.

- If INSENSITIVE or SENSITIVE is specified, then SCROLL must also be specified, either on DECLARE CURSOR or with the ATTRIBUTES clause of the PREPARE statement.
- If SCROLL is specified, then either INSENSITIVE or SENSITIVE STATIC must also be specified, either on DECLARE CURSOR or with the ATTRIBUTES clause of the PREPARE statement.
- The *attribute-string* specified in the ATTRIBUTES clause of the PREPARE statement cannot specify conflicting options.
- LANGUAGE JAVA is not allowed for table functions.
- UNIQUE and UNIQUE WHERE NOT NULL cannot be specified with PARTITIONED on CREATE INDEX.
- EXTERNAL NAME is not allowed on ALTER TABLE for an SQL procedure. You may attempt the same action by issuing a DROP for the procedure, and rebuilding it with CREATE PROCEDURE.

Programmer Response: Change the options specified in the statement, and reissue the statement.

SQLSTATE: 42613

-629 SET NULL CANNOT BE SPECIFIED BECAUSE FOREIGN KEY *name* CANNOT CONTAIN NULL VALUES

Explanation: The code SET NULL option of the indicated FOREIGN KEY clause is invalid because no column of the key allows null values. The *name* is the constraint-name specified in the FOREIGN KEY clause or, if a constraint-name was not specified, the first column-name specified in the clause.

System Action: The statement cannot be processed.

Programmer Response: Change a column of the key to allow null values or change the delete rule.

SQLSTATE: 42834

-631 FOREIGN KEY *name* IS TOO LONG OR HAS TOO MANY COLUMNS

Explanation: This code is used to report that the sum of the length attributes of the columns identified in the indicated FOREIGN KEY clause is greater than 255 bytes or the number of columns identified is greater than 64. The 'name' is the constraint-name specified in the FOREIGN KEY clause or, if a constraint-name was not specified, the first column-name specified in the clause.

System Action: The statement cannot be executed.

Programmer Response: The table definition must be modified to conform to the system-imposed limit of the sum of the length attributes of the columns identified in the PRIMARY KEY clause.

SQLSTATE: 54008

-632 THE TABLE CANNOT BE DEFINED AS A DEPENDENT OF *table-name* BECAUSE OF DELETE RULE RESTRICTIONS

Explanation: This code is used to report that the object of an ALTER TABLE statement cannot be defined as a dependent of the indicated table because either:

- The relationship would form a cycle that would cause the table to be delete-connected to itself.
- The relationship would cause the table to be delete-connected to the indicated table through multiple paths and the delete rule of the existing relationship is SET NULL.

The error is due to the delete rules of existing relationships, not the delete rule specified in the FOREIGN KEY clause of the ALTER TABLE statement.

System Action: The statement cannot be executed.

Programmer Response: Eliminate the particular FOREIGN KEY clause from the ALTER or CREATE TABLE statement.

SQLSTATE: 42915

-633 THE DELETE RULE MUST BE *delete-rule*

Explanation: The code is used to report that the 'delete-rule' specified in a FOREIGN KEY clause of the ALTER TABLE statement is invalid. The indicated 'delete-rule' is required because:

- A self-referencing constraint must have a 'delete-rule' of CASCADE or NO ACTION.
- The relationship would cause the table to be delete-connected to the same table through multiple paths and such relationships must have the same 'delete-rule'.

System Action: The statement cannot be executed.

Programmer Response: Change the 'delete rule' in the FOREIGN KEY clause.

SQLSTATE: 42915

-634 THE DELETE RULE MUST NOT BE CASCADE

Explanation: The code is used to report that the CASCADE delete rule specified in the FOREIGN KEY clause of an ALTER TABLE statement is invalid because:

- The relationship would form a cycle that would cause a table to be delete-connected to itself.
- The relationship would cause another table to be delete-connected to the same table through multiple paths with different delete rules or with a delete rule equal to SET NULL.

System Action: The statement cannot be executed.

Programmer Response: Change the delete rule.

SQLSTATE: 42915

-635 THE DELETE RULES CANNOT BE DIFFERENT OR CANNOT BE SET NULL

Explanation: The code is used to report that the delete rules specified in two FOREIGN KEY clauses of the CREATE TABLE statement are invalid because the table would be delete-connected to the same table through multiple paths involving relationships with different delete rules or with delete rules of SET NULL.

System Action: The statement cannot be executed.

Programmer Response: Change the delete rule.

SQLSTATE: 42915

-636 THE PARTITIONING KEYS FOR PARTITION *part-num* ARE NOT SPECIFIED IN ASCENDING OR DESCENDING ORDER

Explanation: In the CREATE INDEX or ALTER INDEX statement for the CLUSTER index for a partitioned table (that is, a table residing in a partitioned table space), the partitioning key values specified in the limit key value specifications were not in either ascending or descending order.

System Action: The statement cannot be executed. The specified cluster index was not created.

Programmer Response: Correct the limit key value specifications in the CREATE INDEX or ALTER INDEX statement for the identified partition so that the limit key values for successive partitions are in strictly ascending or descending order.

SQLSTATE: 56016

-637 DUPLICATE *keyword* KEYWORD

Explanation: The SQL statement contains a duplicate specification for the keyword *keyword*. For example:

- DEFAULT, UNIQUE, and PRIMARY can only be specified once in a column definition.
- UNIQUE and PRIMARY cannot both be specified for the same column definition.
- PRIMARY can only be specified once in a CREATE TABLE statement.
- The *attribute-string* specified in the ATTRIBUTES clause of the PREPARE statement cannot specify an option more than once.

System Action: The statement cannot be processed.

Programmer Response: Correct the statement by removing duplicate clauses.

SQLSTATE: 42614

-638 **TABLE *table-name* CANNOT BE
CREATED BECAUSE COLUMN
DEFINITION IS MISSING**

Explanation: The CREATE TABLE statement does not contain any column definition.

System Action: The SQL statement cannot be executed.

Programmer Response: Add column definition to the statement.

SQLSTATE: 42601

-639 **A NULLABLE COLUMN OF A FOREIGN
KEY WITH A DELETE RULE OF SET
NULL CANNOT BE A COLUMN OF THE
KEY OF A PARTITIONED INDEX**

Explanation: A partition key of the clustering index cannot be updated. Therefore, a foreign key column with a delete rule of SET NULL cannot be a column of a partition key if that column is nullable. If this error occurs for an ALTER TABLE operation, the foreign key cannot be created. If this error occurs for a CREATE INDEX operation, the index cannot be created.

System Action: The statement cannot be executed.

Programmer Response: Review the delete rule of the referential constraint and the partition keys for the index. Do one of the following:

- If the operation in error was CREATE INDEX, either change the index partition key definition or drop and redefine the referential constraint with a different delete rule.
- If the operation in error was ALTER TABLE, change the referential delete rule so that all nullable index keys are not part of the foreign keys.

SQLSTATE: 56027

-640 **LOCKSIZE ROW CANNOT BE
SPECIFIED BECAUSE TABLE IN THIS
TABLESPACE HAS TYPE 1 INDEX**

Explanation: If LOCKSIZE ROW is specified for a table space, all indexes on tables in the table space must be type 2 indexes. The following SQL statement identifies all the type 1 indexes:

```
SELECT I.CREATOR, I.NAME
FROM SYSIBM.SYSINDEXES I,
SYSIBM.SYSTABLES T
WHERE INDEXTYPE = ' '
AND T.TSNAME = 'table_space_name'
AND T.DBNAME = 'database_name'
AND T.CREATOR = I.TBCREATOR
AND T.NAME = I.TBNAME;
```

where '*table_space_name*' is the name of the table space that is to be altered; '*database_name*' is the name of the database that contains the table space.

System Action: The statement cannot be executed.

Programmer Response: Since the LOCKSIZE ROW on the table space and the type 1 indexes conflict, either use the ALTER INDEX statement to convert all type 1 indexes to type 2 indexes or use another LOCKSIZE option.

SQLSTATE: 56089

-643 **CHECK CONSTRAINT EXCEEDS
MAXIMUM ALLOWABLE LENGTH**

Explanation: The check constraint definition exceeds the maximum allowable limit of 3800 characters. The redundant blank spaces are excluded from this limit.

System Action: The CREATE TABLE or ALTER TABLE statement failed.

Programmer Response: Rewrite the check constraint definition so that it is less than 3800 characters. You might need to divide the check constraint into two or more smaller check constraints.

SQLSTATE: 54024

-644 **INVALID VALUE SPECIFIED FOR
KEYWORD OR CLAUSE**
keyword-or-clause IN STATEMENT
stmt-type

Explanation: The value specified for the *keyword-or-clause* parameter in the *stmt-type* SQL statement is not a permitted value.

System Action: The SQL statement cannot be executed.

Programmer Response: Correct the statement. Refer to Chapter 5 of *DB2 SQL Reference* for information about the permissible values for the *keyword-or-clause* keyword in *stmt-type* statements.

SQLSTATE: 42615

-646 **TABLE *table-name* CANNOT BE
CREATED IN SPECIFIED TABLE SPACE
table-space-name BECAUSE IT
ALREADY CONTAINS A TABLE**

Explanation: The table space specified in a CREATE TABLE statement is a partitioned, implicitly defined, or LOB table space in which an existing table already resides. Only one table may reside in a partitioned, implicitly defined, or LOB table space.

System Action: The statement cannot be executed. The specified table was not created.

Programmer Response: Verify that the correct table space was specified in the CREATE statement. Do not attempt to create more than one table in a partitioned, implicitly defined, or LOB table space.

SQLSTATE: 55017

-647 BUFFERPOOL *bp-name* CANNOT BE SPECIFIED BECAUSE IT HAS NOT BEEN ACTIVATED

Explanation: The buffer pool specified in a CREATE or ALTER statement for a table space or index (index space) is not activated.

Table spaces and indexes (index spaces) can only be assigned or reassigned to buffer pools that are currently activated.

System Action: The statement cannot be executed. The specified table space or index space was not created or altered.

Programmer Response: Verify that the proper buffer pool was specified in the CREATE or ALTER statement. Use the -DISPLAY BUFFERPOOL command to display the attributes of the buffer pool and determine if the buffer pool is activated. If the buffer pool is not activated, use the -ALTER BUFFERPOOL command to change the VPSIZE from 0 to the desired size.

SQLSTATE: 57003

-650 THE ALTER STATEMENT CANNOT BE EXECUTED, REASON *reason*

Explanation: The ALTER statement cannot be executed for one of the following reasons:

- 1 Alter to type 1 index is not allowed for the index whose associated table space has a LOCKSIZE specification of ROW.
- 2 Alter to type 1 index is not allowed for the index defined with UNIQUE WHERE NOT NULL.
- 3 Alter to type 1 index is not allowed for the index whose associated table space has been defined as a LARGE table space.
- 4 Alter to type 1 index is not allowed for an index on an ASCII table.
- 5 Alter PIECESIZE is not allowed for a partitioning index.
- 6 Alter PIECESIZE 4G is not allowed for non-partitioned indexes on a non-LARGE table.
- 11 Alter VALUES is not allowed for an index on a partitioned base table with LOB columns or the table itself.
- 12 ALTER INDEX is not allowed when there is a pending SQL STATEMENT.
- 13 ALTER TABLE is not allowed when there is a pending SQL STATEMENT.
- 14 ALTER INDEX VALUES is not allowed when using table-controlled partitioning.
- 15 Using ALTER to change the attributes of a

partition *values* is not allowed for an index on a partitioned basetable with LOB columns, or the table itself.

System Action: The ALTER statement is not executed.

Programmer Response: Correct the error according to the given reason and reissue the statement.

SQLSTATE: 56090

-651 TABLE DESCRIPTION EXCEEDS MAXIMUM SIZE OF OBJECT DESCRIPTOR.

Explanation: The CREATE TABLE or ALTER TABLE statement causes the table descriptor (record OBD) to exceed the object descriptor size limit of 32KB.

Programmer Response: Change the statement by reducing either the number or length (or a combination of both) of the user-defined default string constants or check constraints and execute the statement again.

System Action: The statement is not executed. For an ALTER TABLE statement, the definition of the table is unchanged. For a CREATE TABLE statement, the table is not created.

SQLSTATE: 54025

-652 VIOLATION OF INSTALLATION DEFINED EDIT OR VALIDATION PROCEDURE *proc-name*

Explanation: The result of the SQL statement has been rejected by the installation defined edit or validation procedure 'proc-name' for the object table.

System Action: The statement cannot be executed. The contents of the object table were not modified.

Programmer Response: Determine the requirements imposed by the edit or validation procedure for inserts and updates of the object table.

SQLSTATE: 23506

-653 TABLE *table-name* IN PARTITIONED TABLE SPACE *t-space-name* IS NOT AVAILABLE BECAUSE ITS PARTITIONED INDEX HAS NOT BEEN CREATED

Explanation: An attempt has been made to insert or manipulate data in or create a view on a partitioned table (that is, a table residing in a partitioned table space) before the partitioned index for that table has been created.

A table residing in a partitioned table space cannot be referenced in any SQL manipulative statement or a CREATE VIEW statement before the partitioned index for that table has been created.

System Action: The statement cannot be executed.

Programmer Response: Verify that the correct table was specified in the statement. If so, ensure that the partitioned index for the table has been created successfully before attempting to execute any SQL manipulative statements that reference that table.

SQLSTATE: 57004

-655 THE CREATE OR ALTER STOGROUP IS INVALID BECAUSE THE STORAGE GROUP WOULD HAVE BOTH SPECIFIC AND NON-SPECIFIC VOLUME IDS

Explanation: One of the following error conditions occurred:

- Both a specific and a non-specific (*) volume ID are specified in the VOLUMES clause of a CREATE STOGROUP statement.
- Both a specific and a non-specific (*) volume ID are specified in an ADD VOLUMES clause of an ALTER STOGROUP statement.
- A specific volume ID is specified in an ADD VOLUMES clause of an ALTER of a storage group that has non-specific volume IDs or mixed volume IDs.
- A non-specific volume ID (*) is specified in an ADD VOLUMES clause of an ALTER of a storage group that has specific volume IDs or mixed volume IDs.

System Action: The statement is not executed.

Programmer Response: Specify either specific or non-specific volume IDs in the VOLUMES clause of CREATE STOGROUP statement and the ADD VOLUMES clause of the ALTER STOGROUP statement. To add specific volume IDs to a storage group with non-specific volume IDs, use the REMOVE VOLUMES clause to remove the non-specific volume IDs. To add non-specific volume IDs to a storage group with specific volume IDs, use the REMOVE VOLUMES clause to remove the specific volume IDs.

SQLSTATE: 56036

-658 A *object-type* CANNOT BE DROPPED USING THE *statement* STATEMENT

Explanation: A DROP statement was issued, but the object cannot be explicitly dropped. The object must be dropped by dropping an associated object:

TRIGGER PACKAGE

A *trigger package* cannot be dropped with the DROP PACKAGE statement. A trigger package can only be dropped implicitly when the associated trigger is dropped using the DROP TRIGGER statement.

CAST FUNCTION

A *cast function* cannot be explicitly dropped with the DROP FUNCTION statement. A cast

function can only be dropped implicitly when the associated distinct type is dropped using the DROP DISTINCT TYPE statement.

System Action: The SQL statement cannot be executed.

Programmer Response: Issue the appropriate DROP statement to drop the intended objects.

SQLSTATE: 42917

-660 INDEX *index-name* CANNOT BE CREATED OR ALTERED ON PARTITIONED TABLE SPACE *tSPACE-name* BECAUSE KEY LIMITS ARE NOT SPECIFIED

Explanation: The CREATE INDEX or ALTER INDEX statement did not specify limit key values for the partitions of the table space. To create a clustering index for a table in a partitioned table space, or to modify those values using ALTER INDEX, you must include those values.

System Action: The statement cannot be executed. The specified cluster index was not created or altered.

Programmer Response: Verify that the correct table was specified in the CREATE INDEX or ALTER INDEX statement. If so, the definition for the partitioned table space must be examined so that a proper definition for the cluster index for the table may be constructed. Refer to Chapter 5 of *DB2 SQL Reference* for information about the requirements that must be satisfied by the definitions for the cluster indexes for partitioned tables.

SQLSTATE: 53035

-661 INDEX *index-name* CANNOT BE CREATED ON PARTITIONED TABLE SPACE *tSPACE-name* BECAUSE THE NUMBER OF PART SPECIFICATIONS IS NOT EQUAL TO THE NUMBER OF PARTITIONS OF THE TABLE SPACE

Explanation: The CREATE INDEX statement for the cluster index on a partitioned table (that is, a table residing in a partitioned table space) does not contain the same number of PART specifications as there are partitions in the table space. The definition for the cluster index for a partitioned table must contain exactly as many PART specifications as there are partitions in the table space in which that table resides. Also, the part numbers must be valid and unique.

System Action: The statement cannot be executed. The specified cluster index was not created.

Programmer Response: Examine the definition of the partitioned table space to determine how many partitions have been specified, and then correct the syntax of the CREATE INDEX statement to provide the proper number of PART specifications. Refer to Chapter 5 of *DB2 SQL Reference* for information about the

definitions for cluster indexes on partitioned tables.

SQLSTATE: 53036

-662 A PARTITIONED INDEX CANNOT BE CREATED ON A NON-PARTITIONED TABLE SPACE *tspace-name*

Explanation: The CREATE INDEX statement contains PART specifications, but the specified object table is not partitioned (that is, does not reside in a partitioned table space).

System Action: The statement cannot be executed. The specified index was not created.

Programmer Response: Verify that the proper object table was specified in the statement. Refer to Chapter 5 of *DB2 SQL Reference* for information about the proper usage of PART specifications in CREATE INDEX statements.

SQLSTATE: 53037

-663 THE NUMBER OF KEY LIMIT VALUES IS EITHER ZERO, OR GREATER THAN THE NUMBER OF COLUMNS IN THE KEY OF INDEX *index-name*

Explanation: The number of limit key value specifications provided in at least one of the PART specifications of the CREATE INDEX or ALTER INDEX statement is either zero or greater than the number of columns in the index key.

System Action: The statement cannot be executed. The specified index was not created.

Programmer Response: Correct the statement so that each PART specification contains exactly the same number of limit key value specifications as there are columns in the index key.

SQLSTATE: 53038

-665 THE PART CLAUSE OF AN ALTER STATEMENT IS OMITTED OR INVALID

Explanation: The ALTER statement is invalid for one of the following reasons:

- The table space or index is not partitioned and the PART clause is specified.
- The table space or index is partitioned, a partition attribute (FREEPAGE or PCTFREE) is specified, and the PART clause is not specified.
- The integer specified in the PART clause does not identify a partition of the table space or index.
- A USING, PRIQTY, SECQTY, or ERASE clause is used to alter storage attributes, but the partition is not specified.
- A GBPCACHE clause is used to alter the group buffer pool caching attributes, but the partition is not specified.

- The VALUES clause is specified without the PART clause. You must specify PART to change VALUES.
- Using ALTER to change the attributes of a partition *values* is not allowed for an index on a partitioned base table with LOB columns, or the table itself.

System Action: The SQL statement cannot be executed.

Programmer Response: Determine whether the table space or index you want to alter is partitioned. If it is partitioned, specify a PART clause that identifies the partition you want to alter. If it is not partitioned, do not specify the PART clause.

SQLSTATE: 53039

-666 *stmt-verb* object CANNOT BE EXECUTED BECAUSE *function* IS IN PROGRESS

Explanation: The SQL statement could not be executed because the named function was executing at the time.

stmt-verb

The type of data definition language (DDL) statement

object The DB2 object type

function

A utility, the governor, or the distributed data facility (DDF)

If the object is part of the communications database, it cannot be dropped while the DDF is active.

System Action: The statement was not executed.

Programmer Response: If the function is a utility, wait for the function to complete or stop. Then resubmit the statement for execution.

If the function is the governor, the statement cannot be executed until the resource limit facility is stopped or switched to a different resource limit specification table (RLST). In a DB2 data sharing environment, the resource limit facility must be stopped on all members of the DB2 data sharing group or all members must switch to an RLST that is not associated with the object.

If the function is the DDF, the facility must be stopped before the object can be dropped. In a DB2 data sharing environment, the facility must be stopped on all members of the DB2 data sharing group.

SQLSTATE: 57005

-667 THE CLUSTERING INDEX FOR A PARTITIONED TABLE SPACE CANNOT BE EXPLICITLY DROPPED

Explanation: The DROP INDEX statement attempted to drop the cluster index for a table residing in a partitioned table space. The cluster index for such a

table cannot be dropped explicitly with the DROP INDEX statement.

System Action: The statement cannot be executed. The specified index was not dropped.

Programmer Response: The cluster index for a table in a partitioned table space can only be dropped implicitly when the associated partitioned table space is dropped.

SQLSTATE: 42917

-668 THE COLUMN CANNOT BE ADDED TO THE TABLE BECAUSE THE TABLE HAS AN EDIT PROCEDURE

Explanation: The ALTER TABLE statement attempted to add a column to a table that has an edit procedure. If a table has an edit procedure, no columns can be added to it.

System Action: The statement cannot be executed. The specified table was not altered.

Programmer Response: Verify that the correct table was specified in the ALTER statement. Do not attempt to ALTER the definition of a table that has an installation-written edit procedure associated with it.

SQLSTATE: 56018

-669 THE OBJECT CANNOT BE EXPLICITLY DROPPED. REASON *reason-code*

Explanation: The DROP statement failed for the reason indicated by the *reason-code* as follows:

- 0001** The DROP TABLE statement attempted to drop a table that resides in a partitioned table space.
- 0002** The DROP INDEX statement attempted to drop an index required to enforce the primary key, unique key, or referential constraint of the table.

System Action: The statement cannot be processed. The object is not dropped.

Programmer Response: If the statement is a DROP TABLE statement, the table of a partitioned table space can only be dropped implicitly when the table space itself is dropped.

If the statement is a DROP INDEX statement and you do not want to keep the primary key, unique key, or referential constraint, use the DROP CONSTRAINT clause of the ALTER TABLE statement to remove the constraint, then drop the index.

SQLSTATE: 42917

-670 THE RECORD LENGTH OF THE TABLE EXCEEDS THE PAGE SIZE LIMIT

Explanation: The row length for a table cannot exceed the page size of the table space in which that table resides (or is to reside). The page size of the table space is determined by the buffer pool used by that table space.

One of following conditions may occur:

- As defined in a CREATE TABLE statement, the row length for the table would exceed the page size of the specified (or default) table space.
- In the case of an ALTER TABLE statement, addition of the specified column would cause the row length of the table to exceed the page size of the table space.
- In the case of an ALTER TABLE statement used to alter the length of an existing variable length column, the new length of the altered column would cause the row length of the table to exceed the page size of the table space.
- The row length in the result of a join exceeds the page size of a work file table space.
- The row length of a large sort record exceeds the page size of a work file table space. The sort record includes columns that are being sorted and columns that the user selects. The length of the columns that are being sorted is the sort key length. The length of the columns that the user selects is the sort data length.

System Action: The statement cannot be executed. The object table was not created or altered.

Programmer Response: In the case of CREATE TABLE, either (1) the row length of the table must be reduced (by eliminating or reducing the lengths of one or more of the columns), or (2) the table must be assigned to a table space that uses a larger buffer pool (assuming that the row length of the table does not exceed that page size limit).

In the case of ALTER TABLE, either (1) the length of the column to be added to the table must be reduced or, (2) if the row length of the table is already at the maximum, the table cannot be altered to add any additional columns.

In the case of a row length that exceeds the page size of a work file table space, eliminate columns from the result of the join.

In the case of a large sort record in which the row length exceeds the page size of a work file table space, eliminate columns from the SELECT list or reduce the number of columns that are being sorted.

SQLSTATE: 54010

-671 THE BUFFERPOOL ATTRIBUTE OF THE TABLE SPACE CANNOT BE ALTERED AS SPECIFIED BECAUSE IT WOULD CHANGE THE PAGE SIZE OF THE TABLE SPACE

Explanation: For example, the change to the buffer pool attribute for the table space specified in the ALTER TABLESPACE statement would change the page size of the table space—either from 4KB to 32KB, 8KB to 16KB, or vice versa.

Use of the ALTER TABLESPACE statement to change the page size of a table space is not permitted.

System Action: The statement cannot be executed. The table space definition was not altered.

Programmer Response: For example, if the table space uses one of the 4KB buffer pools (for example, BP0, BP1, or BP2), it can be reassigned to one of the other 4KB buffer pools (but not buffer pool BP32K). If, however, it is assigned to buffer pool BP32K, the buffer pool assignment cannot be subsequently altered.

SQLSTATE: 53040

-672 OPERATION DROP NOT ALLOWED ON TABLE *table_name*

Explanation: The DROP operation failed for one of the following reasons:

- The table being dropped has the RESTRICT ON DROP attribute.
- The table space or database being dropped contains the specified table, which has the RESTRICT ON DROP attribute.

System Action: The DROP statement cannot be executed.

Programmer Response: Before dropping the table, alter the table, specifying DROP RESTRICT ON DROP.

For DROP TABLESPACE or DROP DATABASE, make sure that there are no other tables within the table space or database with the RESTRICT ON DROP attribute. The following SELECT statement can identify the tables:

```
SELECT CREATOR, NAME
FROM SYSIBM.SYSTABLES
WHERE TYPE = 'T'
AND CLUSTERTYPE = 'Y'
AND DBNAME = 'database_name'
AND TSNAME = 'tablespace_name';
```

SQLSTATE: 55035

-676 ONLY A 4K PAGE BUFFERPOOL CAN BE USED FOR AN INDEX

Explanation: A buffer pool having a page size other than 4KB was specified in the CREATE INDEX statement. Only 4KB buffer pools (that is, BP0, BP1,

and BP2) can be specified for indexes.

System Action: The statement cannot be executed. The specified index was not created.

Programmer Response: Correct the statement to specify a 4KB buffer pool. Refer to Chapter 5 of *DB2 SQL Reference* for information about the syntax of SQL statements.

SQLSTATE: 53041

-677 INSUFFICIENT VIRTUAL STORAGE FOR BUFFERPOOL EXPANSION

Explanation: An attempt to either open (create) or expand a buffer pool has failed because insufficient virtual storage was available.

This error may occur under either of two circumstances:

- An attempt to create a buffer pool while opening a table space or index(space), or
- An attempt to expand a buffer pool from its current size to its maximum size.

System Action: The statement cannot be executed.

Programmer Response: If this error should occur during interactive execution of an SQL statement or execution of an application program, installation administration should be notified.

Installation Action: It may be necessary to reexamine the buffer pool storage strategy.

One of the following messages has also been sent to the MVS console: DSNB601I, DSNB603I, or DSNB605I. Refer to Part 3, "DB2 messages," on page 157 for explanations of these messages.

SQLSTATE: 57011

-678 THE LITERAL *literal* SPECIFIED FOR THE INDEX LIMIT KEY MUST CONFORM TO THE DATA TYPE *data-type* OF THE CORRESPONDING COLUMN *column-name*

Explanation: The index limit key value *literal* has been specified incorrectly in the CREATE INDEX or ALTER INDEX statement.

Limit key value specifications must conform to the data type of the corresponding index key column. In this case, *literal* must be of data type *data-type* to conform to the data type of column *&column-name*.

System Action: The statement cannot be executed. The index was not created.

Programmer Response: Correct the statement so that each limit key value *literal* is of precisely the same data type as that of the corresponding index key column.

SQLSTATE: 53045

-679 THE OBJECT *name* CANNOT BE CREATED BECAUSE A DROP IS PENDING ON THE OBJECT

Explanation: The application program has executed a DROP for the specified object, and then tried to re-create an object with the same name (and of the same type) before the DROP was completed.

System Action: The statement cannot be executed. The specified object was not created.

Programmer Response: The logic of the application program must be modified to issue a COMMIT (or the IMS or CICS equivalent) between the DROP and CREATE statements.

SQLSTATE: 57006

-680 TOO MANY COLUMNS SPECIFIED FOR A TABLE, VIEW OR TABLE FUNCTION

Explanation: The maximum number of columns permitted per table, view, or table function is 750. The statement attempted to perform one of the following actions:

- CREATE or ALTER a table to contain more than 750 columns
- CREATE a view with more than 750 columns
- CREATE a table function with more than 750 columns in the RETURNS TABLE clause

System Action: The statement cannot be executed.

Programmer Response: Change the CREATE statement to not include more than 750 columns, or do not try to alter an existing table to contain more than 750 columns.

SQLSTATE: 54011

-681 COLUMN *column-name* IN VIOLATION OF INSTALLATION DEFINED FIELD PROCEDURE. RT: *return-code*, RS: *reason-code*, MSG: *message-token*

Explanation: An installation field procedure returned an error for '*column-name*'. The '*reason-code*' and '*message-token*' are defined by the field procedure. They may give additional information to help determine the cause of the problem.

Return code

	Error
4	Invalid value on encode or decode or invalid column description on define
8	Invalid parameter value
12	Field procedure error on any function

Use '*reason-code*' and '*message-token*' for additional information.

System Action: The statement cannot be executed.

Programmer Response: If it is not a field procedure error, determine the requirements imposed by the field procedure. If it is a field procedure error, examine the field procedure.

SQLSTATE: 23507

-682 FIELD PROCEDURE *procedure-name* COULD NOT BE LOADED

Explanation: The field procedure '*procedure-name*' cannot be loaded.

System Action: The statement cannot be executed.

Programmer Response: The application should either commit or roll back to previous COMMIT. Then, in general, the application should terminate.

SQLSTATE: 57010

-683 THE SPECIFICATION FOR COLUMN, DISTINCT TYPE, FUNCTION, OR PROCEDURE *data-item* CONTAINS INCOMPATIBLE CLAUSES

Explanation: There is an error in the data item specification in a CREATE or ALTER statement. Incompatible specifications are present such as "INTEGER and FOR BIT DATA". The location of the error is given by *data-item* as follows:

- For a CREATE or ALTER TABLE statement, *data-item* gives the name of the column containing the error. The error could be an invalid specification of FOR BIT DATA, FOR SBCS DATA, FOR MIXED DATA, or FIELDPROC for column *data-item*.
- For a CREATE FUNCTION or CREATE PROCEDURE statement, *data-item* is a token that identifies the area of the problem in the statement. For example, "PARAMETER 3" or "RETURNS" or "CAST FROM".
- For a CREATE DISTINCT TYPE statement, *data-item* gives the name of the type being defined.
- *generation-alteration* cannot be specified for a column that is not defined as an identity column.

System Action: The statement cannot be executed.

Programmer Response: Correct the SQL statement by removing the incompatible specification.

SQLSTATE: 42842

-684 THE LENGTH OF LITERAL LIST BEGINNING *string* IS TOO LONG

Explanation: The length of the literal list beginning with '*string*', excluding insignificant blanks and delimiting parentheses is greater than 255.

System Action: The statement cannot be executed.

Programmer Response: Correct the SQL statement.

SQLSTATE: 54012

-685 **INVALID FIELD TYPE**, *column-name*

Explanation: The field description returned by the field procedure is invalid. The data type code denotes a long string or has an invalid value.

System Action: The statement cannot be executed.

Programmer Response: Correct the field procedure so that it returns a valid data type code.

SQLSTATE: 58002

-686 **COLUMN DEFINED WITH A FIELD PROCEDURE CAN NOT COMPARE WITH ANOTHER COLUMN WITH DIFFERENT FIELD PROCEDURE**

Explanation: The columns specified are not compatible. Different field procedures are specified, or only one field procedure is specified.

System Action: The statement cannot be executed.

Programmer Response: Correct the SQL statement. Refer to Chapter 2 of *DB2 SQL Reference* for comparison restrictions between columns defined with a field procedure.

SQLSTATE: 53043

-687 **FIELD TYPES INCOMPARABLE**

Explanation: One column cannot be compared with another column that has incompatible field types.

System Action: The statement cannot be executed.

Programmer Response: Correct the SQL statement. Refer to Chapter 2 of *DB2 SQL Reference* for comparison restrictions between columns defined with a field procedure.

SQLSTATE: 53044

-688 **INCORRECT DATA RETURNED FROM FIELD PROCEDURE**, *column-name*, *msgno*

Explanation: Unexpected data returned from field procedure for column 'column-name'. For more information see 'msgno'.

System Action: The statement cannot be executed.

Programmer Response: Correct the field procedure so that it returns values that are consistent with their descriptions.

SQLSTATE: 58002

-689 **TOO MANY COLUMNS DEFINED FOR A DEPENDENT TABLE**

Explanation: The maximum number of columns allowed for a dependent table is 749. The code is used to report that the statement is invalid because of one of the following:

- A CREATE TABLE statement is creating a dependent table with 750 columns.
- An ALTER TABLE statement is altering a dependent table with 749 columns to add a column, or altering a table with 750 columns to become a dependent table.

System Action: The statement cannot be executed.

Programmer Response: Correct the SQL statement to conform to the column limit for a dependent table.

SQLSTATE: 54011

-690 **THE STATEMENT IS REJECTED BY DATA DEFINITION CONTROL SUPPORT. REASON** *reason-code*

Explanation: The code is issued by the data definition control support to report that the statement is rejected for the reason indicated by 'reason-code' after consulting the application registration table and object registration table.

The explanation of the given reason code:

- 0001
Data definition control support is running under the controlling by application name mode. The statement is rejected because the current application is not registered in application registration table with DEFAULTAPPL on.
- 0002
Data definition control support is running under the controlling by application name with exceptions mode. The statement is rejected because the object is not registered in object registration table and the current application is not registered in application registration table with DEFAULTAPPL on.
- 0003
Data definition control support is running under the controlling by application name with exceptions mode. The statement is rejected because the object is registered in object registration table but the current application does not match.
- 0004
Data definition control support is running under the controlling by object name with exceptions mode. The statement is rejected because the object is registered in object registration table but the current application does not match.
- 0005
Data definition control support is running under the controlling by object name mode. The statement is

rejected because the object is registered in object registration table but the current application does not match.

- 0006

Data definition control support is running under the controlling by object name mode. The statement is rejected because the object is not registered in object registration table.

System Action: The statement cannot be executed.

Programmer Response: None if valid rejection. Otherwise, check to see if data definition control support is running under the desired mode. Check one or both registration table(s) to determine if the entries of the registration table(s) are correct. If they are not, then update the registration table(s).

SQLSTATE: 23508

-691 THE REQUIRED REGISTRATION TABLE *table-name* DOES NOT EXIST

Explanation: The data definition control support assumes the existence of the application registration table and object registration table. But either one or both tables is not defined.

System Action: The statement cannot be executed.

Programmer Response: Determine whether the required registration tables do exist. If not, create the required tables.

SQLSTATE: 57018

-692 THE REQUIRED UNIQUE INDEX *index-name* FOR DDL REGISTRATION TABLE *table-name* DOES NOT EXIST

Explanation: A unique index must be defined for each registration table. The code is issued when either the required index does not exist or the index defined is not a unique index.

System Action: The statement cannot be executed.

Programmer Response: Determine whether the required unique index does exist. If not, create the required index. If the index does exist, but is not unique, drop it and recreate it as a unique index.

SQLSTATE: 57018

-693 THE COLUMN *column-name* IN DDL REGISTRATION TABLE OR INDEX *table-name* (*index-name*) IS NOT DEFINED PROPERLY

Explanation: An error occurred during verification of the application or object registration table.

The table is improperly defined for the following reasons:

- A required column is missing.

- A column description is invalid because its name, column number, data type, length, or null attribute is incorrect.

or

The index is improperly defined for the following reasons:

- A required key column is missing.
- A key column description is invalid because of its key sequence or because its ordering is incorrect.
- A defined key column should not be part of the unique key.

System Action: The statement cannot be executed.

Programmer Response: Correct or alter the definition of the required registration table or index.

SQLSTATE: 55003

-694 THE DDL STATEMENT CANNOT BE EXECUTED BECAUSE A DROP IS PENDING ON THE DDL REGISTRATION TABLE *table-name*

Explanation: An error occurred while accessing the application registration table or object registration table. The application registration table or object registration table was dropped, but the DROP statement was not committed.

System Action: The statement cannot be executed.

Programmer Response: Resubmit the job. If the same error happens, check for the application that issued the DROP statement for the application registration table or the object registration table. Either commit the DROP statement which dropped the table and create a new application registration table or object registration table, or issue a ROLLBACK for the DROP statement to put the tables back.

SQLSTATE: 57023

-695 INVALID VALUE *seclabel* SPECIFIED FOR SECURITY LABEL COLUMN OF TABLE *table-name*

Explanation: For an INSERT or an UPDATE to table *table-name*, the value that was specified for the security label was invalid.

System Action: The INSERT or UPDATE cannot be performed.

Programmer Response: Ensure that the value that is specified for the security label column is a valid security label. Alternatively, insert the row that specifies DEFAULT for the security label column, or remove the security label column from the insert column list.

SQLSTATE: 23523

-696 THE DEFINITION OF TRIGGER *trigger-name* INCLUDES AN INVALID USE OF CORRELATION NAME OR TRANSITION TABLE NAME *name*. REASON CODE=*reason-code*

Explanation: The trigger definition included an invalid use of *name*

trigger-name

The trigger that encountered the error

name The transition variable correlation name or transition table name

reason-code

A reason-code indicating the specific problem as follows:

1. NEW correlation name and NEW_TABLE name are not allowed in a DELETE trigger.
2. OLD correlation name and OLD_TABLE name are not allowed in an INSERT trigger.
3. OLD_TABLE name and NEW_TABLE name are not allowed in a BEFORE trigger.

System Action: The statement cannot be executed. The trigger was not created.

Programmer Response: Remove the invalid correlation name or transition table name along with the preceding keyword.

SQLSTATE: 42898

-697 OLD OR NEW CORRELATION NAMES ARE NOT ALLOWED IN A TRIGGER DEFINED WITH THE FOR EACH STATEMENT CLAUSE. OLD_TABLE OR NEW_TABLE NAMES ARE NOT ALLOWED IN A TRIGGER WITH THE BEFORE CLAUSE.

Explanation: The trigger, as defined, includes a REFERENCING clause with one of the following invalid combinations:

- OLD or NEW correlation names specified (or both) and the FOR EACH STATEMENT clause.
- NEW_TABLE or OLD_TABLE correlation names specified (or both) and the BEFORE clause.

System Action: The statement cannot be executed. The trigger was not defined.

Programmer Response: Remove invalid correlation names or change the trigger granularity to FOR EACH ROW.

SQLSTATE: 42899

-713 THE REPLACEMENT VALUE *value* FOR *special-register* IS INVALID

Explanation: The *value* specified in the SET special-register statement is not a valid value of the indicated special register.

System Action: The statement cannot be executed.

Programmer Response: Correct the replacement value. See *DB2 SQL Reference* for an explanation of the valid values of each special register.

SQLSTATE: 42815

-715 PROGRAM *program-name* WITH MARK *release-dependency-mark* FAILED BECAUSE IT DEPENDS ON FUNCTIONS OF THE RELEASE FROM WHICH FALLBACK HAS OCCURRED

Explanation: Program '*program-name*' depends on a function of DB2 that is not supported by the current active release.

program-name

Name of the application program.

release-dependency-mark

A 1-character mark showing the oldest DB2 release supporting this program.

System Action: The BIND operation for this plan or package is not performed.

User Response: The program cannot be used until the DB2 subsystem is remigrated to the newer release.

Operator Response: Notify the system programmer.

System Programmer Response: Warn users not to use plans or packages containing this program until the DB2 subsystem has been remigrated to the newer release.

SQLSTATE: 56064

-716 PROGRAM *program-name* PRECOMPILED WITH INCORRECT LEVEL FOR THIS RELEASE

Explanation: Program '*program-name*' was precompiled under a release not supported by the current level of DB2, or the contents of the DBRM have been modified after the precompilation phase.

User Response: Precompile the named program again using the current precompiler. Reissue the BIND subcommand.

Problem Determination: If the program was precompiled at an appropriate release, and the problem persists, collect the following:

- A hexadecimal print of the first record of the failing DBRM

- The listing from the precompile job that generated the DBRM
- Output from the BIND attempt.

SQLSTATE: 56065

-717 *bind-type* **FOR** *object-type* *object-name*
WITH MARK *release-dependency-mark*
FAILED BECAUSE *object-type*
DEPENDS ON FUNCTIONS OF THE
RELEASE FROM WHICH FALLBACK
HAS OCCURRED

Explanation: The plan or package indicated depends on a function of DB2 which is not supported by the currently active release.

bind-type
 REBIND

object-type
 PLAN | PACKAGE

object-name
 Name of the application plan, or the package

release-dependency-mark
 A one-character mark showing the oldest release of DB2 can support this plan or package. The release dependency mark for the plan is kept in the IBMREQD columns in the DB2 catalog in SYSIBM.SYSPLAN (plans), SYSIBM.SYSPACKAGE(packages).

System Action: The REBIND operation for this plan or package is not performed.

User Response: The plan or package cannot be used until the DB2 subsystem is remigrated to the newer release.

Operator Response: Notify the system programmer.

System Programmer Response: Warn users not to use the plan or package until the DB2 subsystem has been remigrated to the newer release.

SQLSTATE: 56066

-718 **REBIND OF PACKAGE** *package-name*
FAILED BECAUSE IBMREQD OF
ibmreqd **IS INVALID**

Explanation: The IBMREQD column of the SYSIBM.SYSPACKAGE catalog table for the named package contains an unrecognizable character.

package-name
 Name of the package
 (location.collection.package.version)

System Action: The REBIND failed.

User Response: You must do a BIND ACTION(REPLACE) for this package.

SQLSTATE: 56067

-719 **BIND ADD ERROR USING** *auth-id*
AUTHORITY PACKAGE *package-name*
ALREADY EXISTS

Explanation: An attempt is made to add a package that already exists. The combination of 'location.collection.package.version' must be unique in the SYSIBM.SYSPACKAGE table. In addition, the combination of 'location.collection.package.consistency-token' must be unique.

auth-id Authorization ID of the invoker of the BIND subcommand.

package-name
 Name of the package
 (location.collection.package.version).

System Action: No package is created.

System Programmer Response: Check the SYSIBM.SYSPACKAGE catalog table for names of existing application packages. Re-invoke the BIND subcommand with a 'location.collection.package.version' that is not in use.

SQLSTATE: 42710

-720 **BIND ERROR, ATTEMPTING TO**
REPLACE PACKAGE = *package_name*
WITH VERSION = *version2* **BUT THIS**
VERSION ALREADY EXISTS

Explanation: An attempt is made to create a version of a package that already exists. The version specified in the REPLVER keyword is different from the version specified for the precompile. The version specified for the precompile already exists in the catalog. The combination of 'location.collection.package.version' must be unique in the SYSIBM.SYSPACKAGE catalog table. A common mistake is that the user may believe that the version he is creating is the one specified in the REPLVER keyword. This is not the case. The version specified in the REPLVER keyword is the name of the version being replaced. The version that will be created is the version that was given to the program when it was precompiled.

package_name
 Fully qualified package name

version2
 Version-id of package that is to be created

System Action: The bind will fail.

System Programmer Response: There are two approaches to solve this problem. The first is to precompile the program again with a new version name and reissue the original BIND subcommand. The other approach is not to do the precompile but reissue the BIND subcommand with REPLVER(SAME).

SQLSTATE: 42710

**-721 BIND ERROR FOR PACKAGE = *pkg-id*
CONTOKEN = *contoken*'X IS NOT
UNIQUE SO IT CANNOT BE CREATED**

Explanation: An attempt is made to add or replace a package with a consistency token that is not unique for that package. In other words, the combination of *location.collection.package.consistency-token* already exists.

pkg-id Fully qualified name of the package.

contoken

Consistency token in hexadecimal.

System Action: The BIND will fail.

System Programmer Response: Check the SYSIBM.SYSPACKAGE catalog table for names of existing application packages with the indicated consistency token. Reissue the BIND subcommand such that the *location.collection.package.consistency-token* is unique within the catalog. The following SQL statement can be used to query the catalog:

```
SELECT COLLID,NAME
FROM loc-id.SYSIBM.SYSPACKAGE
WHERE HEX(CONTOKEN) = contoken
```

SQLSTATE: 42710

**-722 *bind-type* ERROR USING *auth-id*
AUTHORITY PACKAGE *package-name*
DOES NOT EXIST**

Explanation: The indicated subcommand was issued against a package that does not exist. The individual variable fields contain:

bind-type

Type of bind subcommand (BIND | REBIND | FREE).

auth-id Authorization ID of the invoker of the BIND subcommand.

package-name

Name of the package
(*location.collection.package.version*)

System Action: Package not rebound or freed.

System Programmer Response: Check the SYSPACKAGE catalog table for the correct '*location.collection.package.version*' to use.

SQLSTATE: 42704

**-723 AN ERROR OCCURRED IN A
TRIGGERED SQL STATEMENT IN
trigger-name. INFORMATION
RETURNED: *sqlerror*,
SQLSTATE: *sqlstate*, MESSAGE
TOKENS *token-list*, SECTION NUMBER
*section-number***

Explanation: During execution of an UPDATE, INSERT, or DELETE statement, a trigger was activated. One of the triggered SQL statements received an SQL error condition.

trigger-name

The trigger that was activated when the error occurred.

section-number

The section number associated with the failing triggered SQL statement. For triggers that contain a WHEN clause, the WHEN clause is section number one. The triggered SQL statements are numbered sequentially, beginning with section number two. This is true for triggers with or without a WHEN clause.

sqlcode

The SQLCODE received by the activated trigger.

sqlstate

The corresponding SQLSTATE for the SQLCODE received by the activated trigger.

token-list

The list of tokens from the original SQL error. This list might be truncated.

System Action: The trigger and the original INSERT, UPDATE, or DELETE statement cannot be processed. The triggering table is unchanged.

Programmer Response: Contact your Database Administrator to determine why the trigger named in the message received the error.

System Programmer Response: Use the trigger name and section number to determine the failing SQL statement. If the trigger definition is available, use the section number to determine the failing statement. Alternatively, the failing statement can be retrieved from the SYSIBM.SYSPACKSTMT catalog table: SELECT TEXT, SEQNO FROM SYSIBM.SYSPACKSTMT WHERE COLLID = 'schema-name' AND NAME = 'trigger-name' AND SECTNO = section-number ORDER BY SEQNO Refer to the explanation of the reported SQLCODE. Follow the action suggested by that SQLCODE.

SQLSTATE: 09000

-724 THE ACTIVATION OF THE *object-type* OBJECT *object-name* WOULD EXCEED THE MAXIMUM LEVEL OF INDIRECT SQL CASCADING

Explanation: Cascading of indirect SQL occurs when a trigger, user-defined function or stored procedure invokes another trigger, user-defined function or stored procedure which in turn invokes another. The activation of some of the triggers in this chain might be due to the enforcement of referential constraint delete rules. The depth of this cascading is limited to 16.

Note that recursive situations where a trigger includes a triggered SQL statement that directly or indirectly causes the same trigger to be activated are very likely to cause this error. The trigger should contain logic to check for a terminating condition to prevent this error.

object-type

Names the type of object being called. Object type is TRIGGER, FUNCTION, or PROCEDURE.

object-name

Specifies the name of the trigger, user-defined function or stored procedure that would have been activated at the seventeenth level of cascading.

System Action: The original statement could not be executed. All SQL statements executed by all triggers, user-defined functions, and stored procedures in the cascade chain are rolled back. External actions performed by the indirect SQL, such as sending a network message might have already occurred.

Programmer Response: Start with the indirect SQL that is activated by the original SQL operation. Check for recursive patterns in any invoked user-defined functions or in any triggers defined on the subject of an update operation. If the chain is not recursive, the cascade chain must be simplified by altering the triggers, user-defined functions, or stored procedures involved.

SQLSTATE: 54038

-725 THE SPECIAL REGISTER *register* AT LOCATION *location* WAS SUPPLIED AN INVALID VALUE

Explanation: DB2 received a SET statement with an invalid value. Valid SETs might be allowed or retained. Further processing stops at the named site until the SET statement is corrected.

System Action: All SQL statements at the named remote site are rejected until the SET statement that was in error is corrected.

Programmer Response: The SET statement should be reissued with a valid value. This situation can be corrected with a local SET statement or with a DRDA SET statement executed at the remote site. Once the

special register has been supplied a valid value, the application can resume execution.

SQLSTATE: 42721

-726 BIND ERROR ATTEMPTING TO REPLACE PACKAGE = *package-name*. THERE ARE ENABLE OR DISABLE ENTRIES CURRENTLY ASSOCIATED WITH THE PACKAGE

Explanation: The BIND subcommand was issued to replace a package that has ENABLE or DISABLE entries currently associated with the package.

System Action: Package not bound.

System Programmer Response: FREE the package first and then BIND the package.

SQLSTATE: 55030

-728 DATA TYPE *data-type* IS NOT ALLOWED IN DB2 PRIVATE PROTOCOL PROCESSING

Explanation: An SQL statement uses a data type that cannot be used with DB2 private protocol. Data types such as LOBs (large objects), row IDs and user defined types cannot be accessed using DB2 private protocol.

System Action: The statement cannot be executed.

Programmer Response: If this is an invalid data type, correct the statement. If this is a valid (but disallowed) data type, you can:

- Remove access to the data type listed, and re-execute the statement.
- Change the application program so that DRDA is used to access the data.
- BIND the package containing the statement to the remote site with bind option DBPROTOCOL(DRDA) and rerun the program.

Refer to the *DB2 SQL Reference* for more information.

SQLSTATE: 56080

-729 A STORED PROCEDURE SPECIFYING COMMIT ON RETURN CANNOT BE THE TARGET OF A NESTED CALL STATEMENT

Explanation: A stored procedure defined with the COMMIT ON RETURN attribute was called from a stored procedure, user-defined function, or trigger. Stored procedures defined with COMMIT ON RETURN cannot be nested in this way.

System Action: The SQL statement is not executed. If the CALL statement references a remote server, the unit of work is placed in a must rollback state.

Programmer Response: Remove the CALL to the

stored procedure that was defined with the COMMIT ON RETURN attribute.

SQLSTATE: 429B1

-730 THE PARENT OF A TABLE IN A READ-ONLY SHARED DATABASE MUST ALSO BE A TABLE IN A READ-ONLY SHARED DATABASE

Explanation: An attempt was made to define a relationship between a table in a read-only shared database and a table that is not.

System Action: The statement cannot be executed.

Programmer Response: Insure that the correct tables are being used for the relationship being defined.

SQLSTATE: 56053

-731 USER-DEFINED DATASET *dsname* MUST BE DEFINED WITH SHAREOPTIONS(1,3)

Explanation: The VSAM SHAREOPTIONS must be (1,3) for all of the indexes and table spaces in the database. The user-defined data set identified did not meet this requirement.

System Action: The statement cannot be executed.

Programmer Response: Insure that the data sets used in the shared database are defined with the proper SHAREOPTIONS.

SQLSTATE: 56054

-732 THE DATABASE IS DEFINED ON THIS SUBSYSTEM WITH THE ROSHARE READ ATTRIBUTE BUT THE TABLE SPACE OR INDEX SPACE HAS NOT BEEN DEFINED ON THE OWNING SUBSYSTEM

Explanation: Prior to creating a table space or index in a database with the ROSHARE READ attribute, that object must first be defined on the owning subsystem.

System Action: The statement cannot be executed.

Programmer Response: Verify that the table space or index has been defined on the owning system in a ROSHARE OWNER database.

SQLSTATE: 56055

-733 THE DESCRIPTION OF A TABLE SPACE, INDEX SPACE, OR TABLE IN A ROSHARE READ DATABASE MUST BE CONSISTENT WITH ITS DESCRIPTION IN THE OWNER SYSTEM

Explanation: This code is issued while creating a table space, index, or table in the ROSHARE READ

database. These objects must be consistent with their descriptions in the ROSHARE OWNER database as follows:

- For a table space, the following attributes must be the same:
 - Page size
 - Segment size
 - Number of partitions
- For an index, the following attributes must be the same:
 - Number of partitions
 - Number of subpages
 - Table OBID
 - Total key length
 - Index type (Type 1 or Type 2 Index)
 - Number of key columns
- For a table, the following attributes must be the same:
 - Table OBID
 - Maximum record length
 - Number of columns
 - Whether an edit procedure exists

System Action: The statement cannot be executed.

Programmer Response: Ensure that the definition of the table space, index, or table is consistent with that in the ROSHARE OWNER database.

SQLSTATE: 56056

-734 THE ROSHARE ATTRIBUTE OF A DATABASE CANNOT BE ALTERED FROM ROSHARE READ

Explanation: An attempt was made to ALTER a database from ROSHARE READ to either ROSHARE OWNER or ROSHARE NONE.

System Action: The statement cannot be executed.

Programmer Response: Verify that the correct database was specified on the ALTER DATABASE statement. The ROSHARE attribute of a read-only shared database cannot be altered. To change this, DROP and recreate the database.

SQLSTATE: 56057

-735 DATABASE *dbid* CANNOT BE ACCESSED BECAUSE IT IS NO LONGER A SHARED DATABASE

Explanation: An attempt was made to access an object in the database identified by *dbid*, that is known to the system as having the ROSHARE READ attribute. The database, however, is no longer defined as ROSHARE OWNER on the owning subsystem.

System Action: The statement cannot be processed.

Programmer Response: Verify that the correct object is specified on the statement.

SQLSTATE: 55004

-736 INVALID OBID *obid* SPECIFIED

Explanation: An invalid OBID value was given on the CREATE statement. The OBID is invalid for one of the following reasons:

- The specified OBID does not fall within the acceptable range for OBIDs, which is 1 to 32767.
- The specified OBID is already in use for the given database.

System Action: The statement cannot be executed.

Programmer Response: Verify that the given OBID is a valid value for an OBID. If so, ensure that the OBID is correct for the object to be created, then query the catalog to find the object that is already defined as having the same OBID in the database. If an invalid OBID was given for the object to be created, correct the statement and execute it again. If the existing object is in error, then DROP and CREATE that object using the correct OBID value.

It is possible that the OBID “in use” is the OBID for an object that had been previously dropped. If that is the case, and the CREATE was issued for a table in a non-ROSHARE READ database, then select a different OBID for use in the OBID clause. If the object had been previously dropped and the CREATE was issued for a table in a ROSHARE READ database, COMMIT and re-submit the CREATE TABLE request.

SQLSTATE: 53014

-737 IMPLICIT TABLE SPACE NOT ALLOWED

Explanation: A CREATE TABLE statement was issued using an implicit table space. An implicit table space may not be used in a database that has been defined as a read-only shared database.

System Action: The statement cannot be executed.

Programmer Response: CREATE a table space for the table, using the same name as is given on the owning system. Then resubmit the CREATE TABLE statement.

SQLSTATE: 56056

-739 CREATE OR ALTER FUNCTION *function-name* FAILED BECAUSE FUNCTIONS CANNOT MODIFY DATA WHEN THEY ARE PROCESSED IN PARALLEL.

Explanation: The function cannot be created or altered because ALLOW PARALLEL and MODIFIES SQL DATA were both specified explicitly or implicitly. A function cannot be parallelized if it modifies data.

System Action: The statement cannot be processed.

Programmer Response: Specify DISALLOW PARALLEL or change the MODIFIES SQL DATA to NO SQL, CONTAINS SQL or READS SQL DATA.

SQLSTATE: 56088

-740 FUNCTION *name* IS DEFINED WITH THE OPTION MODIFIES SQL DATA WHICH IS NOT VALID IN THE CONTEXT IN WHICH IT WAS INVOKED

Explanation: A user-defined function defined with MODIFIES SQL DATA is only allowed in:

- VALUES clause of an INSERT statement
- SET clause of an UPDATE statement
- VALUES statement in a trigger
- SET Assignment statement
- CALL procedure statement

System Action: The SQL statement failed.

Programmer Response: Remove the user-defined function from the failing statement. or remove the MODIFIES SQL DATA option from the definition of the function.

SQLSTATE: 51034

-741 A *database-type* DATABASE IS ALREADY DEFINED FOR MEMBER *member-name*

Explanation: A CREATE DATABASE statement was issued for a WORK FILE or TEMP database, but the database can not be created because one is already defined for the named DB2 subsystem or data sharing group member.

database-type
WORK FILE or TEMP

member-name
Name of the DB2 subsystem or data sharing group member that already has a *database-type* database.

System Action: The statement cannot be executed.

Programmer Response: Verify the identity and validity of the existing *database-type* database for the named DB2 subsystem or data sharing member. The existing database can be altered or dropped if necessary. If the existing database is dropped, resubmit the CREATE DATABASE statement.

SQLSTATE: 55020

-742 DSNDB07 IS THE IMPLICIT WORK FILE DATABASE

Explanation: The WORKFILE clause cannot be used on a CREATE DATABASE statement to create a work file database for a DB2 subsystem that is not a member of a DB2 data sharing group. The system database,

DSNDB07, is the implicit work file database.

System Action: The statement cannot be executed.

Programmer Response: To create the work file database for a DB2 subsystem that is not a member of a DB2 data sharing group, create database DSNDB07 without the WORKFILE clause.

SQLSTATE: 53004

-746 THE SQL STATEMENT IN AN EXTERNAL FUNCTION, TRIGGER, OR IN STORED PROCEDURE *name* VIOLATES THE NESTING SQL RESTRICTION

Explanation: If a table is being modified (by INSERT, DELETE or UPDATE), the table can not be accessed by the lower level nesting SQL statement.

If any table is being accessed by a SELECT statement, no table can be modified (by INSERT, DELETE or UPDATE) in any lower level nesting SQL statement.

System Action: The SELECT, INSERT, DELETE or UPDATE SQL statement failed.

Programmer Response: Remove the failing statement from the named external function, trigger or the stored procedure.

SQLSTATE: 57053

-747 TABLE *table-name* IS NOT AVAILABLE UNTIL THE AUXILIARY TABLES AND INDEXES FOR ITS EXTERNALLY STORED COLUMNS HAVE BEEN CREATED

Explanation: An attempt was made to access or reference a table with one or more LOB columns, however either

- an auxiliary table for storing one of the LOB columns has not been created, or
- an index has not been created for an auxiliary table, or
- there is not an auxiliary table for each partition of the table space.

System Action: The statement was not executed.

Programmer Response:

1. Use CREATE TABLESPACE to create a LOB table space.
2. Use CREATE TABLE to create the auxiliary table for storing the column.
3. Use CREATE INDEX to create an index on the auxiliary table.
4. Resubmit the statement that failed.

SQLSTATE: 57054

-748 AN INDEX ALREADY EXISTS ON AUXILIARY TABLE *table-name*

Explanation: The CREATE INDEX statement would create a second index on the specified auxiliary table. An auxiliary table can have only one index.

System Action: The statement cannot be executed.

Programmer Response: An index already exists. Another index cannot be created.

SQLSTATE: 54042

-750 THE SOURCE TABLE *source-name* CANNOT BE RENAMED BECAUSE IT IS REFERENCED IN EXISTING VIEW, MATERIALIZED QUERY TABLE, OR TRIGGER DEFINITIONS

Explanation: The *source table* in a RENAME statement cannot be renamed because it is referenced in one or more existing triggers:

- It is referenced in one or more materialized query table definitions
- It is referenced as the triggering table in one or more existing triggers.

System Action: The statement cannot be executed.

Programmer Response: Change the source name to the name of an object that can be renamed and reissue the statement. Drop any triggers defined on the table before issuing the RENAME statement. These can be found by querying the system catalog: SELECT * FROM SYSIBM.SYSTRIGGERS WHERE TBNAME = 'source-name'

SQLSTATE: 42986

-751 *object-type object-name* (SPECIFIC NAME *specific name*) ATTEMPTED TO EXECUTE AN SQL STATEMENT *statement* THAT IS NOT ALLOWED

Explanation: A stored procedure or user-defined function attempted to execute an SQL statement that is not allowed.

Stored procedure

A stored procedure issued an SQL statement that forced the DB2 thread to roll back the unit of work. The SQL statement that caused the thread to be placed in the MUST_ROLLBACK state is one of the following:

COMMIT
ROLLBACK

All further SQL statements are rejected until the SQL application that issued the SQL CALL statement rolls back the unit of work. When control returns to the SQL application that issued the SQL CALL statement, the SQL application must roll back the unit of work. This

can be done by issuing an SQL ROLLBACK statement or the equivalent IMS or CICS operation.

User-defined function

External function *object-name* issued one of the following SQL statements:

- COMMIT
- ROLLBACK

System Action: The statement cannot be executed.

Programmer Response: Remove the unsupported statement from your stored procedure or user-defined function.

Remotely called stored procedures cannot execute embedded SQL Commit and/or Rollback statements unless:

- The connection with the requester system uses one phase commit protocols
- The requester system indicates that commits are allowed (via sending a DRDA RDBCMTOK=TRUE indication) when the stored procedure is called.

Note: For DB2 Connect requester systems, this requires that the client application must use Connect Type 1, or Remote Unit of Work connections. Connect Type 2 or Distributed Unit of Work connections will cause DB2 Connect to indicate that commits are not allowed, thus embedded SQL Commit and/or Rollback statements in a stored procedure will fail.

Any Commit or Rollback statements in the stored procedure must be removed, or the client application should be modified to establish an environment that allows the stored procedure to execute SQL Commit and/or Rollback statements.

SQLSTATE: 38003

-752 THE CONNECT STATEMENT IS INVALID BECAUSE THE PROCESS IS NOT IN THE CONNECTABLE STATE

Explanation: The application process attempted to execute a CONNECT statement while in the unconnectable state. See the description of the CONNECT statement in the *DB2 SQL Reference* for an explanation of connection states.

System Action: The statement cannot be executed. The connection state of the application process is unchanged.

Programmer Response: Modify the application program to execute a commit or rollback operation prior to executing the CONNECT statement.

SQLSTATE: 0A001

-763 INVALID TABLE SPACE NAME
table-space-name

Explanation: The named table space is invalid for one of the following reasons:

- It is a LOB table space and therefore cannot reside in a work file database.
- It is a LOB table space and therefore cannot contain a non-auxiliary table.
- It is not a LOB table space and therefore cannot contain an auxiliary table.

System Action: The statement cannot be executed.

Programmer Response: Either

- Create the LOB table space in a non-workfile database.
- Create the table in a non-LOB table space.
- Create the auxiliary table in a LOB table space.

SQLSTATE: 560A1

-764 A LOB TABLE SPACE AND ITS ASSOCIATED BASE TABLE SPACE MUST BE IN THE SAME DATABASE

Explanation: An attempt was made to create an auxiliary table in a LOB table space that is not in the same database as the associated base table space.

System Action: The statement cannot be executed.

Programmer Response: Correct the statement to specify a LOB table space in the same database as the associated base table space.

SQLSTATE: 560A2

-765 TABLE IS NOT COMPATIBLE WITH DATABASE

Explanation: A CREATE TABLE or ALTER TABLE statement defines a LOB column in a table whose database attribute is ROSHARE OWNER or ROSHARE READ. This is not permitted.

System Action: The statement is not executed.

Programmer Response: If CREATE TABLE, either assign the table to an ROSHARE NONE database or create the table without a LOB column. If ALTER TABLE, redefine the column as a non-LOB column or move the table to an ROSHARE NONE database.

SQLSTATE: 560A3

-766 THE OBJECT OF A STATEMENT IS AN AUXILIARY TABLE FOR WHICH THE REQUESTED OPERATION IS NOT PERMITTED

Explanation: An auxiliary table was named in one of the following statements:

- ALTER TABLE
- CREATE ALIAS

- CREATE FUNCTION
- CREATE SYNONYM
- CREATE VIEW
- DELETE
- DESCRIBE TABLE
- INSERT
- SELECT
- UPDATE

There are no attributes of an auxiliary table that can be altered.

Aliases and synonyms cannot be created on an auxiliary table.

Data in an auxiliary table cannot be accessed by specifying the auxiliary table name in the SELECT, INSERT, DELETE, UPDATE, CREATE PROCEDURE, or CREATE FUNCTION statement. Data in an auxiliary table can only be accessed through operations on the base table columns.

Additionally, do not specify CLUSTER on ALTER TABLE if the table is an auxiliary table.

System Action: The statement cannot be executed.

Programmer Response: Correct the statement to specify the corresponding base table instead of the auxiliary table and resubmit the statement.

SQLSTATE: 560A4

-767 MISSING OR INVALID COLUMN SPECIFICATION FOR INDEX
index-name

Explanation: The CREATE INDEX statement failed for one of the following reasons:

- An index on a non-auxiliary table must specify the columns on which the index is defined.
- An index on an auxiliary table must not have a column specification.

System Action: The statement cannot be executed.

Programmer Response: Correct the syntax of the CREATE INDEX statement.

- To create an index on a non-auxiliary table, specify the columns on which the index is defined.
- To create an index on an auxiliary table, do not specify the name of any column.

SQLSTATE: 42626

-768 AN AUXILIARY TABLE ALREADY EXISTS FOR THE SPECIFIED COLUMN OR PARTITION

Explanation: An attempt was made to create an auxiliary table, but an auxiliary table for the specified column or partition already exists. When the base table

belongs to a non-partitioned table space, there can be only one auxiliary table per LOB column of the table. When the base table belongs to a partitioned table space, for any given LOB column, all values of the LOB column for a given partition are stored in their own auxiliary table. There must be one auxiliary table per partition of the base table space.

System Action: The statement is not executed.

Programmer Response: Check that the correct table name, column name, and if applicable, partition number have been specified. If a different name is desired for the existing auxiliary table, the RENAME TABLE statement can be used to rename the auxiliary table.

SQLSTATE: 560A5

-769 SPECIFICATION OF CREATE AUX TABLE DOES NOT MATCH THE CHARACTERISTICS OF THE BASE TABLE

Explanation: Either an attempt was made to create an auxiliary table

- using the PART clause and the specified base table is not partitioned or
- without using the PART clause and the specified base table is partitioned

If the base table is not partitioned, then the PART keyword is not allowed on the CREATE AUXILIARY TABLE statement. If the base table is partitioned, then the PART keyword must be specified.

System Action: The auxiliary table was not created.

Programmer Response: Check whether the name of the base table specified in the CREATE AUXILIARY TABLE statement is correct. If it is correct and the table is not partitioned, remove the PART clause from the statement. If it is correct and the table is partitioned, add the PART clause to the statement. If the table name is not correct, correct the name and also check that the correct column name is specified.

SQLSTATE: 53096

-770 TABLE *table-name* CANNOT HAVE A LOB COLUMN UNLESS IT ALSO HAS A ROWID COLUMN

Explanation: An attempt was made to create a table with a LOB column or to add a LOB column to a table, but the table does not have a ROWID column. A table with a LOB column must also have a ROWID column.

System Action: The statement was not executed.

Programmer Response: If creating a table with a LOB column, define a column with type ROWID in the same table. If using ALTER to add a LOB column to a table, first use ALTER to add a column with type ROWID to the table.

SQLSTATE: 560A6

-771 **INVALID SPECIFICATION OF A ROWID COLUMN**

Explanation: For an ALTER or CREATE TABLE statement, the specification of a ROWID column might be invalid for one of the following reasons:

- A ROWID column cannot be added to a temporary table.
- The *referential-constraint* clause cannot specify a ROWID column as a column of a foreign key.
- A ROWID column cannot be a column of a primary key or unique key.
- A ROWID column cannot be a column in a table with an EDITPROC.

System Action: The statement cannot be executed.

Programmer Response: Correct the syntax and resubmit the statement.

SQLSTATE: 428C7

-797 **ATTEMPT to CREATE TRIGGER *trigger-name* WITH AN UNSUPPORTED TRIGGERED SQL STATEMENT**

Explanation: The trigger definition includes an unsupported triggered SQL statement. The SQL statements allowed as a triggered SQL statement depend on the type of trigger:

- A BEFORE trigger can include the following triggered SQL statements:
 - a fullselect or VALUES statement
 - a SET transition-variable statement (not allowed in a BEFORE DELETE trigger)
 - a SIGNAL SQLSTATE statement
 - a CALL statement
- An AFTER trigger can include the following triggered SQL statements:
 - a fullselect or VALUES statement
 - an INSERT statement
 - a searched UPDATE statement
 - a searched DELETE statement
 - a SIGNAL SQLSTATE statement
 - a CALL statement

System Action: The CREATE TRIGGER statement cannot be executed, and the trigger is not created.

Programmer Response: Check the triggered SQL statements in the trigger for any statement that is not listed above and remove it.

SQLSTATE: 42987

-798 **YOU CANNOT INSERT A VALUE INTO A COLUMN THAT IS DEFINED WITH THE OPTION GENERATED ALWAYS COLUMN *column-name***

Explanation: When inserting into a table, a value was specified for column *column-name* with the GENERATE ALWAYS attribute. GENERATED ALWAYS columns should not be specified in the column-list for an insertion unless the corresponding entry in the VALUES list is DEFAULT.

System Action: The INSERT is not performed.

Programmer Response: Remove the column from the column-list or specify DEFAULT for the GENERATED ALWAYS column in the VALUES clause.

You may also use the OVERRIDING clause as a possible solution for this situation. See INSERT in DB2 SQL Reference for more information about the OVERRIDING USER VALUE clause.

SQLSTATE: 428C9

-802 **EXCEPTION ERROR *exception-type* HAS OCCURRED DURING *operation-type* OPERATION ON *data-type* DATA, POSITION *position-number***

Explanation: An exception error has occurred in the processing of an SQL arithmetic function or arithmetic expression. This error may be indicated by *exception-type*. Possible values for *exception-type* are FIXED POINT OVERFLOW, DECIMAL OVERFLOW, ZERO DIVIDE, DIVIDE EXCEPTION, EXPONENT OVERFLOW, or OUT OF RANGE. The exception error occurred in one of the following areas:

- In the SELECT list of an SQL SELECT statement.
- In the search condition of a SELECT, UPDATE, or DELETE statement.
- In the SET clause of the UPDATE statement.
- Found during the evaluation of an aggregate function.

Data-type may indicate the data types of the items being manipulated. Possible values for *data-type* are INTEGER, SMALLINT, DECIMAL, and FLOAT. The data type displayed in the message may indicate the data type of the temporary internal copy of the data, which may differ from the actual column or literal data type due to conversions by DB2.

Operation-type may indicate the arithmetic operation that was being performed at the time of the error. The possible operation-types are ADDITION, SUBTRACTION, MULTIPLICATION, DIVISION, NEGATION, BUILT-IN FUNCTION, AGGREGATE FUNCTION, and JAVA CONVERSION.

Position-number may indicate the position of the expression in a SELECT list if the error was in the SELECT list of an outer SELECT statement

Note: Parts of *exception-type*, *data-type*, *operation-type*, and/or *position-number* may not be returned to the SQL communication area, depending on where the error was detected.

System Action: The statement cannot be executed. In the case of an INSERT or UPDATE statement, no data is updated or deleted. If the statement was a cursor-controlled FETCH, then the CURSOR will remain open unless the exception occurred while processing an aggregate function (indicated by *operation-type* of AGGREGATE FUNCTION), in which case the CURSOR will be closed. If the CURSOR is closed, subsequent attempts to use that cursor without first doing an OPEN for it receive an SQLCODE -501. If the statement was a cursor-controlled OPEN then the CURSOR will remain closed.

Programmer Response: Examine the SQL statement to see if the cause of the problem can be determined. The problem may be data-dependent, in which case it will be necessary to examine the data that was being processed at the time the error occurred.

If the arithmetic expression in error was within the SELECT list of the outer SELECT statement, then it is advisable to include an indicator variable for all expressions in the SELECT list. This allows processing to continue so that non-error column and expression values can be returned.

See the explanation of SQLCODE -405 for allowed ranges of numeric data types.

Problem Determination: A fixed point overflow can occur during any arithmetic operation on either INTEGER or SMALLINT fields.

A divide exception can occur on a decimal division operation when the quotient exceeds the specified data field size. A zero divide occurs on a division by zero.

An exponent overflow can occur when the result characteristic of any floating-point operation exceeds 127 and the result fraction is not zero, for example, the magnitude of the result exceeds approximately 7.2E+75.

A decimal overflow exception can occur under either of the following circumstances:

- One or more non-zero digits are lost because the destination field in any decimal operation is too short to contain the result.
- A Java stored procedure or user-defined function sets a decimal value in an output parameter that has a precision or scale too small for the value. *operation-type* is JAVA CONVERSION. *data-type* is DECIMAL. *position-number* indicates which parameter of the CALL statement or user-defined function invocation is in error.

Any of the exceptions/overflows can occur during the processing of a Built-In Function. If the *operation-type* is FUNCTION, then the error occurred while processing either an input, intermediate, or final value. The exception may occur because the value of a parameter is out of range.

SQLSTATE: 22012 if ZERO DIVIDE.

22003 if other than ZERO DIVIDE.

-803 AN INSERTED OR UPDATED VALUE IS INVALID BECAUSE THE INDEX IN INDEX SPACE *indexspace-name* CONSTRAINS COLUMNS OF THE TABLE SO NO TWO ROWS CAN CONTAIN DUPLICATE VALUES IN THOSE COLUMNS. RID OF EXISTING ROW IS *Xrid*

Explanation: The table that is the object of the INSERT or UPDATE operation is constrained (by UNIQUE INDEX in the INDEX SPACE *indexspace-name* to have unique values in certain columns. Completion of the requested INSERT or UPDATE would result in duplicate values occurring in row *rid*.

If a view is the object of the INSERT or UPDATE statement, the table that defines the view is constrained. The update might also be caused by a DELETE operation of a parent row that cascades to a dependent row with a delete rule of SET NULL.

System Action: The INSERT, UPDATE, or DELETE statement cannot be executed. The object table is unchanged.

Programmer Response: Examine the definitions for UNIQUE INDEX in the INDEX SPACE *indexspace-name* to determine the uniqueness constraint imposed. Please refer to SYSIBM.SYSINDEXES for the *indexspace-name* and the associated *index-name*.

For an UPDATE statement, verify that the specified operation is consistent with the uniqueness constraint. If this does not indicate the error, examine the object table to determine the cause of the problem.

For an INSERT statement, examine the object table to determine which values violate the uniqueness constraint. If the INSERT statement contains a subquery, match the contents of the table addressed by the subquery and the contents of the object table to determine the cause of the problem.

For a DELETE statement, examine the index key columns in the table that defines the index. These columns contain a foreign key, which when set NULL on a cascade delete from the object table, causes the duplicate values.

SQLSTATE: 23505

-804 AN ERROR WAS FOUND IN THE APPLICATION PROGRAM INPUT PARAMETERS FOR THE SQL STATEMENT, REASON *reason*

Explanation: The call parameter list or the SQLDA is invalid.

- The call parameter list, which is created by the precompiler, might be invalid if the application programmer has modified the output of the precompiler, used a variable name beginning with 'SQL' in the application program, or overwritten the call parameter list in some other way.
- The SQLDA, which is created by the application program, has an invalid data type or data length.
- The value of SQLDABC is not consistent with the value of SQLD.

The following is the list of reason codes:

- | | |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 01 | Open issued for non-cursor. |
| 02 | Close issued for non-cursor. |
| 03 | Prepare of EXECUTE IMMEDIATE. |
| 04 | Statement is not recognized. |
| 05 | No statement string present. |
| 06 | Bad SQLDA format in parameter list. |
| 07 | SQLDA length is invalid. |
| 08 | Unrecognized input data type. |
| 09 | Invalid length for input variable. |
| 10 | Invalid data length for output variable. |
| 11 | The value of SQLDABC is not consistent with the value of SQLD. |
| 12 | Invalid input data pointer. |
| 13 | Invalid output data pointer. |
| 14 | SQLN has too many items for SQLDABC. |
| 15 | Input RDI pointer is invalid. |
| 16 | Unrecognized output data type. |
| 17 | The value of the 7th byte of SQLDAID is not consistent with the data types contained in the SQLDA. The SQLDA contains a LOB type host variable, but the 7th byte of SQLDAID is not set to '2' or greater to indicate that the extended SQLVARs have been allocated. |

System Action: The statement cannot be executed.

System Programmer Response: Examine the application program for any of the errors noted under the explanation above. In general, the application programmer should not attempt to modify the output of the precompiler.

SQLSTATE: 07002

-805 DBRM OR PACKAGE NAME *location-name.collection-id.dbrm-name.consistency-token* NOT FOUND IN PLAN *plan-name*. REASON *reason*

Explanation: An application program attempted to use a DBRM or package 'location-name.collection-id.dbrm-name.consistency-token' that was not found.

Collection id is blank ('location-name..dbrm-name.consistency-token') if the CURRENT PACKAGESET special register was blank for the local program execution.

The REASON token is blank if the length of 'location-name' is 16, the length of 'collection-id' is 18, and the length of 'dbrm-name' is 8 due to the length of SQLERRMT.

The DBRM or package name was not found for one or more of the following reasons:

- 01
 - The DBRM name was not found in the member list of the plan and there is no package list for the plan. Refer to the first SQL statement under problem determination for assistance in determining the problem.
 - The package name was not found because there is no package list for the plan. Refer to the second SQL statement under Problem Determination for assistance in determining the problem.
- 02

The DBRM name 'dbrm-name' did not match an entry in the member list or the package list. Any of the following conditions could be the problem:

Bind conditions:

 - The 'collection-id' in the package list was not correct when the application plan 'plan-name' was bound. Refer to the second SQL statement under Problem Determination for assistance in determining the problem.
 - The 'location-name' in the package list was not correct when the application 'plan-name' was bound. Refer to the second SQL statement under Problem Determination for assistance in determining the problem.
 - The 'location-name' in the CURRENTSERVER option for the bind subcommand was not correct when the application plan 'plan-name' was bound. Refer to the third SQL statement under Problem Determination for assistance in determining the problem.

Application conditions:

- The CURRENT PACKAGESET special register was not set correctly by the application.
- The application was not connected to the proper location.
- 03

The DBRM name 'dbrm-name' matched one or more entries in the package list and the search of those entries did not find the package. The conditions listed under reason 02 or the following conditions might be the problem.

- The DBRM of the version of the application program being executed was not bound (A package with the same consistency token as that of the application program was not found.) Refer to the fourth and fifth SQL statements under the Problem Determination section.
- The incorrect version of the application program is being executed.

• 04

The package, 'collection-id.dbrm-name.consistency-token', does not exist at the remote site, 'location-name'. Refer to the fifth SQL statement under the Problem Determination section.

System Action: The statement cannot be executed.

System Programmer or Programmer response:

Based on the above reasons, the programmer can perform **one or more** of the following operations for each reason to correct the error.

• 01

- Add the DBRM name 'dbrm-name' to the MEMBER list of the BIND subcommand and bind the application plan 'plan-name', or
- Add the PKLIST option with the appropriate package list entry to the REBIND subcommand and rebind the application plan 'plan-name'.

• 02

- Correct the dbrm-name of the entry in the PKLIST option and use the REBIND subcommand to rebind the application plan 'plan-name', or
- Correct the location-name of the entry in the PKLIST option and use the REBIND subcommand to rebind the application plan 'plan-name', or
- Correct the location-name in the CURRENTSERVER option and use the REBIND subcommand to rebind the application plan 'plan-name', or
- Set the CURRENT PACKAGESET special register correctly, or
- Connect to the correct location name.

• 03

All the operations under reason 02 above might fix the problem, plus the following operations.

- Correct the collection-id of the entry in the PKLIST option and use the REBIND subcommand to rebind the application plan 'plan-name', or
- Bind the DBRM of the version of the application program to be executed into the collection 'collection-id', or

- Execute the correct version of the application program. The consistency token of the application program is the same as the package that was bound.

• 04

All the operations under reason 02 and 03 might fix the problem.

Problem Determination: The following queries aid in determining the problem. Run these queries at the local location.

1. This query displays the DBRMs in the member list for the plan. If no rows are returned, then the plan was bound without a member list.

```
SELECT PLCREATOR, PLNAME, NAME, VERSION
FROM SYSIBM.SYSDBRM
WHERE PLNAME = 'plan-name';
```

2. This query displays the entries in the package list for the plan. If no rows are returned, then the plan was bound without a package list.

```
SELECT LOCATION, COLLID, NAME
FROM SYSIBM.SYSPACKLIST
WHERE PLANNAME = 'plan-name';
```

3. This query displays the CURRENTSERVER value specified on the BIND subcommand for the plan.

```
SELECT NAME, CURRENTSERVER
FROM SYSIBM.SYSPLAN
WHERE NAME = 'plan-name';
```

4. This query displays if there is a matching package in SYSPACKAGE. If the package is remote, put the location name in the FROM clause. If no rows are returned, the correct version of the package was not bound.

```
SELECT COLLID, NAME, HEX(CONTOKEN), VERSION
FROM <location-name.>SYSIBM.SYSPACKAGE
WHERE NAME = 'dbrm-name'
AND HEX(CONTOKEN) = 'consistency-token';
```

5. This query displays if there is a matching package in SYSPACKAGE. If the package is remote, put the location name in the FROM clause. Use this query when collection-id is not blank. If no rows are returned, the correct version of the package was not bound.

```
SELECT COLLID, NAME, HEX(CONTOKEN), VERSION
FROM <location-name.>SYSIBM.SYSPACKAGE
WHERE NAME = 'dbrm-name'
AND HEX(CONTOKEN) = 'consistency-token'
AND COLLID = 'collection-id';
```

SQLSTATE: 51002

ACCESS DENIED: PACKAGE
package-name IS NOT ENABLED FOR
ACCESS FROM *connection-type*
connection-name

Explanation: Access is denied for one of the following reasons:

- It is disabled, either from the 'connection-type' or from the 'connection-type' with the specific 'connection-name'.
- The attach library that you are using is from a previous release of DB2 that does not support the ENABLE and DISABLE options of the bind operation.

The variables are:

package-name

The package name (collection.package-id).

connection-type

One of the following: BATCH, DB2CALL, REMOTE, IMSBMP, IMSMPP, CICS, DLIBATCH, or UNKNOWN.

connection-name

Name of the connection that is restricted. If all connection names from a specific connection-type are restricted, this value is not specified.

System Action: The statement is not executed and the package is not allocated.

System Programmer Response: One of the following:

- Rebind the package to enable it to execute with the required connection type and name.
- Check the SYSPLSYSTEM or SYSPKSYSTEM catalog table to find a connection from which the package can be executed.
- Correct the attach library.

SQLSTATE: 23509

-808 THE CONNECT STATEMENT IS NOT CONSISTENT WITH THE FIRST CONNECT STATEMENT

Explanation: The CONNECT semantics that apply to an application process are determined by the first CONNECT statement executed (successfully or unsuccessfully) by the application process. One of the following rules was violated:

- A type 2 CONNECT statement cannot be executed after a type 1 CONNECT statement was executed.
- A type 1 CONNECT statement cannot be executed after a type 2 CONNECT statement was executed.

System Action: The statement cannot be executed.

Programmer Response: The probable cause of this error is that different programs in the application process were precompiled with different CONNECT options.

Ensure that the application process uses either type 1 or type 2 CONNECT statements and then resubmit the job. The type of CONNECT to be used is a precompiler option. The default is type 2 CONNECT.

SQLSTATE: 08001

-811 THE RESULT OF AN EMBEDDED SELECT STATEMENT OR A SUBSELECT IN THE SET CLAUSE OF AN UPDATE STATEMENT IS A TABLE OF MORE THAN ONE ROW, OR THE RESULT OF A SUBQUERY OF A BASIC PREDICATE IS MORE THAN ONE VALUE

Explanation: Execution of an embedded SELECT statement or a subselect in the SET clause of an UPDATE statement has resulted in a result table that contains more than one row. Alternatively, a subquery contained in a basic predicate has produced more than one value.

System Action: The statement cannot be executed.

Programmer Response: Examine the syntax of the statement to ensure that it contains the proper condition specifications. If the statement syntax is correct, there might be a problem with the data that is causing more than one row or value to be returned when you do not expect it.

SQLSTATE: 21000

-812 THE SQL STATEMENT CANNOT BE PROCESSED BECAUSE A BLANK COLLECTION-ID WAS FOUND IN THE CURRENT PACKAGESET SPECIAL REGISTER WHILE TRYING TO FORM A QUALIFIED PACKAGE NAME FOR PROGRAM *program-name.consistency-token* USING PLAN *plan-name*

Explanation: A last or only entry in the package list for the plan contained asterisk (*) the 'collection-id' which requires the 'CURRENT PACKAGESET' special register to be set to a nonblank 'collection-id' in order to form a qualified package name.

System Action: The statement cannot be executed.

Programmer Response: Set the 'CURRENT PACKAGESET' special register to the desired 'collection-id' or have your system administrator check the plan's package list for correctness.

SQLSTATE: 22508

-815 A GROUP BY OR HAVING CLAUSE IS IMPLICITLY OR EXPLICITLY SPECIFIED IN A SUBSELECT OF A BASIC PREDICATE OR THE SET CLAUSE OF AN UPDATE STATEMENT

Explanation: A subselect of a basic predicate or a SET clause of an UPDATE statement either:

- directly contains a GROUP BY or HAVING clause
- specifies as its object a view having a definition that includes a GROUP BY or HAVING clause

Neither construct is permitted.

System Action: The statement cannot be executed. No data was retrieved.

Programmer Response: The implied function is not supported by DB2.

No coding workaround exists for the subselect. A GROUP BY or HAVING clause cannot be used within the subselect of a basic predicate because the subselect is allowed to return only a single value. For more information on basic predicates, refer to *DB2 SQL Reference*.

SQLSTATE: 42920

-817 THE SQL STATEMENT CANNOT BE EXECUTED BECAUSE THE STATEMENT WILL RESULT IN A PROHIBITED UPDATE OPERATION.

Explanation: The application attempted to execute an SQL statement that would result in updates to user data or to the subsystem catalog. This is prohibited for one of the following reasons:

- The application is running as an IMS inquiry-only transaction.
- The application is an IMS or CICS application that is attempting to update data at a remote DBMS that does not support two-phase commit.
- The application is attempting to update data at multiple locations and one of the locations does not support two-phase commit.
- A trigger defined with activation time BEFORE was activated and its triggered action caused updates to the database.

These SQL statements include INSERT, UPDATE, DELETE, CREATE, ALTER, DROP, GRANT, and REVOKE.

System Action: The statement cannot be executed.

Programmer Response: If the application is running as an IMS inquiry-only transaction, see your IMS system programmer about changing the inquiry-only status of the transaction under which your application is running.

If the IMS or CICS application is attempting a remote update, either the application must be changed to run as a local application on the server DBMS, or the server DBMS must be upgraded to support two-phase commit.

If the application is attempting to update data at multiple locations, either the application must be changed, or all DBMSs involved must be upgraded to support two-phase commit.

If the error is due to an invalid statement during a trigger activation, contact your system administrator to correct the trigger definition.

SQLSTATE: 25000

-818 THE PRECOMPILER-GENERATED TIMESTAMP x IN THE LOAD MODULE IS DIFFERENT FROM THE BIND TIMESTAMP y BUILT FROM THE DBRM z

Explanation: The SQL precompiler places timestamp 'y' in the DBRM, and time stamp 'x' in the parameter list in the application program for each SQL statement. At BIND time, DB2 stores the DBRM timestamp for run-time use. At run-time, timestamp 'x', for the SQL statement being processed, is compared with timestamp 'y' derived from the DBRM 'z' at BIND time. If the two timestamps do not match, the DBRM and the application program were not the result of the same precompile.

This problem can occur if you:

- Precompile, compile, and link, without doing a BIND of the application,
- Precompile and BIND, without doing the compile and link for the application program, or
- BIND the application using a DBRM that resulted from a different precompile of the application program than that which produced the object module that is linked into the application module.

The timestamps 'x' and 'y' are DB2 internal timestamps. They do not have an external interpretation.

System Action: The statement cannot be executed.

Programmer Response: BIND the application again, using the DBRM for the application program that matches the object module.

SQLSTATE: 51003

-819 THE VIEW CANNOT BE PROCESSED BECAUSE THE LENGTH OF ITS PARSE TREE IN THE CATALOG IS ZERO

Explanation: SYSIBM.SYSVTREE.VTREE is a varying-length string column that contains the parse trees of views. In processing a view, the length control field of its parse tree was found to be zero.

System Action: The statement cannot be executed.

Programmer Response: This is a system error. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

SQLSTATE: 58004

-820 THE SQL STATEMENT CANNOT BE PROCESSED BECAUSE *catalog-table* CONTAINS A VALUE THAT IS NOT VALID IN THIS RELEASE

Explanation: A column of the indicated catalog table contains a value that prevents further processing of an SQL statement. The meaning of the value is unknown to

the release of DB2. If a fall back has occurred, the value is probably the result of the use of new function prior to the fall back.

System Action: The statement cannot be executed.

Programmer Response: Verify that the statement refers to the intended tables or views and that the problem is the result of a fall back. If this is the case, the statement cannot be corrected because it depends on a function that is not supported in the current release. If the problem is not the result of a fallback, -820 is a system error. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

SQLSTATE: 58004

-822 THE SQLDA CONTAINS AN INVALID DATA ADDRESS OR INDICATOR VARIABLE ADDRESS

Explanation: The application program has placed an invalid address in the SQLDA.

System Action: The statement cannot be executed.

Programmer Response: Correct the application program such that valid addresses are placed in SQLDA.

SQLSTATE: 51004

-840 TOO MANY ITEMS RETURNED IN A SELECT OR INSERT LIST

Explanation: The number of items returned in the select list or presented in an insert list exceeds the allowable maximum of 750.

System Action: The statement cannot be executed.

Programmer Response: Determine whether all the information is actually needed. (Note that the number of items returned by the select list * in the SQL statement SELECT * FROM A, B, C is the sum of the number of columns in all three tables.) If not, rewrite the SQL statement so that only the necessary items of information are returned. If so, break the SQL statement up into two or more statements, as required.

SQLSTATE: 54004

-842 A CONNECTION TO *location-name* ALREADY EXISTS

Explanation: One of the following situations occurred:

- A CONNECT statement identifies a location with which the application process has a private connection, using system-directed access.
- SQLRULES(STD) is in effect and a CONNECT statement identifies an existing SQL connection.

- A private connection, using system-directed access, cannot be established because of an existing SQL connection to that location.
- A CONNECT (type 2) request that includes the USER/USING clause identifies an existing SQL connection.

System Action: The statement cannot be executed.

Programmer Response: The correction depends on the error, as follows:

- If the location name is not the intended name, correct it.
- If SQLRULES(STD) is in effect and the CONNECT statement identifies an existing SQL connection, replace the CONNECT with SET CONNECTION or change the option to SQLRULES(DB2).
- If the CONNECT statement identifies an existing private connection, destroy that connection (by using the RELEASE statement in a previous unit of work) before executing the CONNECT statement. If the SQL statements following the CONNECT can be executed using system-directed access, an alternative solution is to change the application to use that method.
- If system-directed access cannot be used, destroy the conflicting SQL connection (by using the RELEASE statement in a previous unit of work) before executing the SQL statement that requires system-directed access. An alternative solution is to change the application so that only application-directed access is used.
- Destroy the connection (by using the RELEASE statement in a previous unit of work) before executing the CONNECT statement which includes the USER/USING clause.

Correct the error in the application, rebind the plan or package, and resubmit the job.

SQLSTATE: 08002

-843 THE SET CONNECTION OR RELEASE STATEMENT MUST SPECIFY AN EXISTING CONNECTION

Explanation: One of the following rules was violated:

- A SET CONNECTION statement must identify an existing SQL connection of the application process.
- A RELEASE statement must identify an existing connection of the application process.

System Action: The statement cannot be executed.

Programmer Response: The correction depends on the error, as follows:

- If the location name is not the intended name, correct it.

- If the location name does not identify an existing SQL connection, replace the SET CONNECTION with a CONNECT statement.
- If RELEASE CURRENT was executed in the unconnected state or the specified location name does not identify an existing SQL or DB2 private connection, delete the RELEASE statement.

Correct the error in the application, rebind, the plan and resubmit the job.

SQLSTATE: 08003

-845 **A PREVIOUS VALUE EXPRESSION CANNOT BE USED BEFORE THE NEXT VALUE EXPRESSION GENERATES A VALUE IN THE CURRENT SESSION FOR SEQUENCE** *sequence-name*

Explanation: A PREVIOUS VALUE expression specified sequence *sequence-name*, but a value has not yet been generated for this sequence. A PREVIOUS VALUE expression for a sequence must not be used before a NEXT VALUE expression for that sequence is executed in this session, causing DB2 to generate a value for sequence.

System Action: The statement cannot be executed

Programmer Response: Make sure that the invocation of any PREVIOUS VALUE expression is preceded by at least one invocation of a NEXT VALUE expression for the same sequence in the session.

SQLSTATE: 51035

-846 **INVALID SPECIFICATION OF AN IDENTITY COLUMN OR SEQUENCE OBJECT** *object_type object_name.*
REASON CODE = *reason_code*

Explanation: For an identity column or sequence, the specification of an attribute in a CREATE or ALTER statement may be invalid for one of the following reasons:

- The underlying data type of the identity column or sequence object is not supported. Identity columns and sequence objects support the following data types: SMALLINT, INTEGER, and DECIMAL (or NUMERIC) with a scale of zero.
- The value for START WITH, INCREMENT BY, MINVALUE, MAXVALUE, or RESTART WITH is outside the range for the data type of the identity column or sequence object.
- MINVALUE must be less than or equal to MAXVALUE.
- An edit procedure was specified for the identity column.
- An identity column was specified for a global temporary table that was already defined by a CREATE GLOBAL TEMPORARY TABLE statement.

This error could occur for a CREATE GLOBAL TEMPORARY TABLE statement, or an ALTER TABLE statement for a global temporary table when there is an attempt to add an identity column to an existing global temporary table that was already defined by a CREATE GLOBAL TEMPORARY TABLE statement.

System Action: DB2 cannot process the statement.

Programmer Response: Correct the syntax and resubmit the statement.

SQLSTATE: 42815

-867 **INVALID SPECIFICATION OF A ROWID COLUMN**

Explanation: For an ALTER or CREATE TABLE statement, the specification of a ROWID column might be invalid for one of the following reasons:

- A ROWID column can not be added to a temporary table.
- The *referential-constraint* clause can not specify a ROWID column as a column of a foreign key.
- A ROWID column can not be a column of a primary key.
- A ROWID column can not be a column in a table with an EDITPROC.

System Action: The statement cannot be executed.

Programmer Response: Correct the syntax and resubmit the statement.

SQLSTATE: 428C7

-870 **THE NUMBER OF HOST VARIABLES IN THE STATEMENT IS NOT EQUAL TO THE NUMBER OF DESCRIPTORS**

Explanation: The number of host variables in the SQL statement does not match the number of host variable descriptors.

System Action: The statement cannot be executed.

Programmer Response: Correct the application program. The most likely cause of this problem is a missing colon before a host variable.

Problem Determination: If the SQL statement is bound locally, descriptors are built by the DB2 precompiler. For a remote SQL statement, descriptors are built by DDF and are passed in the array SQLSTTVRB.

SQLSTATE: 58026

-872 A VALID CCSID HAS NOT YET BEEN SPECIFIED FOR THIS SUBSYSTEM

Explanation: A valid CCSID was not specified on either the ASCII CODED CHAR SET, EBCDIC CODED CHAR SET, or UNICODE CODED CHAR SET subsystem parameter on installation panel DSNTIPF.

System Action: The statement cannot be executed.

Programmer Response: Contact your system administrator to have the necessary CCSID defined for your system.

SQLSTATE: 51032

-873 DATA ENCODED WITH DIFFERENT ENCODING SCHEMES CANNOT BE REFERENCED IN THE SAME SQL STATEMENT

Explanation: You cannot refer to a column defined in a table in one encoding scheme in the same SQL statement as a column defined in a table of another encoding scheme.

This situation can occur when a table created in either the ASCII, EBCDIC, or UNICODE encoding schemes is referenced in a statement with a table that is not in the same encoding scheme.

This situation can also occur when a table is created; a DECP CCSID value is changed; another table is created, and then the two tables are referenced in a single SQL statement.

System Action: The statement cannot be executed.

Programmer Response: Correct the SQL statement.

SQLSTATE: 53090

-874 THE ENCODING SCHEME SPECIFIED FOR THE *object-type* MUST BE THE SAME AS THE CONTAINING TABLE SPACE OR OTHER PARAMETERS

Explanation: If CCSID ASCII was specified, then the containing table space is EBCDIC or UNICODE. If CCSID EBCDIC was specified, then the containing table space is ASCII or UNICODE. If CCSID UNICODE was specified, then the containing table space is ASCII or EBCDIC.

The encoding scheme of a table must be the same as the table space which contains the table.

If a table is created using a fullselect, then the following must be the same:

- The encoding scheme of the result table of the fullselect
 - The encoding scheme in the CCSID clause (if specified)
 - The encoding scheme of the target table space
-

System Action: The statement cannot be executed.

Programmer Response: Correct the SQL statement.

SQLSTATE: 53091

-875 *operand* CANNOT BE USED WITH THE ASCII DATA REFERENCED

Explanation: ASCII data was referenced in one of the following situations:

- A LIKE predicate refers to a mixed data column in an ASCII table. The LIKE predicate is not supported for mixed ASCII data.
- A VARGRAPHIC function was specified for a column in an ASCII table. The VARGRAPHIC function is not supported for ASCII data.

System Action: The statement cannot be executed.

Programmer Response: Correct the SQL statement.

SQLSTATE: 42988

-876 *object* CANNOT BE CREATED, REASON *reason*

Explanation: The object cannot be created in the SQL statement.

Possible values for '*object*':

TYPE 1 INDEX

The object being created is a type 1 index.

INDEX The object being created is an index.

Possible values for '*reason*':

TABLE DEFINED AS ASCII

The underlying table is defined as ASCII. Only type 2 indexes are supported for ASCII tables.

PIECESIZE IS NOT VALID

PIECESIZE is only valid for non-partitioned indexes.

PIECESIZE 4GB IS NOT VALID

PIECESIZE 4GB is only valid for non-partitioned indexes on LARGE tables.

System Action: The statement cannot be executed.

Programmer Response: Correct the SQL statement for the object being created.

SQLSTATE: 53092

-877 CCSID ASCII OR CCSID UNICODE IS NOT ALLOWED FOR THIS DATABASE OR TABLE SPACE

Explanation: The database or table space specified is required to be in EBCDIC.

System Action: The statement cannot be executed.

Programmer Response: Remove the CCSID ASCII or CCSID UNICODE clause from the statement.

SQLSTATE: 53093

-878 THE PLAN_TABLE USED FOR EXPLAIN CANNOT BE ASCII

Explanation: PLAN_TABLEs must be encoded in EBCDIC or Unicode for use with EXPLAIN.

System Action: The statement cannot be executed.

Programmer Response: Drop the existing PLAN_TABLE, and recreate it with the EBCDIC encoding scheme or use Unicode.

SQLSTATE: 53094

-879 CREATE or ALTER STATEMENT FOR *obj-name* CANNOT DEFINE A COLUMN, DISTINCT TYPE, FUNCTION OR STORED PROCEDURE PARAMETER AS MIXED OR GRAPHIC WITH ENCODING SCHEME *encoding-scheme*

Explanation: A CREATE or ALTER TABLE statement for *object-name* attempted to define a column, distinct type, or parameter of a user-defined function or stored procedure as mixed data or graphic when the system does not have an appropriate CCSID defined for the *encoding-scheme* encoding scheme.

- A CREATE, with CCSID UNICODE clause specified, cannot be processed because the proper level of OS/390 is not installed. Refer to the Program Directory for information on the level of OS/390 required for UNICODE support.
- A CREATE DISTINCT TYPE statement cannot define a distinct type, on EBCDIC or ASCII data, with a source type of CHAR FOR MIXED DATA, or GRAPHIC, VARGRAPHIC, or DBCLOB, when the MIXED DATA install option is set to NO.
- A CREATE FUNCTION or CREATE PROCEDURE statement cannot define a parameter or specify a RETURNS data type, for ASCII or EBCDIC data, as CHAR FOR MIXED DATA, or GRAPHIC, VARGRAPHIC, or DBCLOB, when the MIXED DATA install option is set to NO.

Note: This error only occurs when the encoding scheme in use is EBCDIC or ASCII. The MIXED DATA install option does not affect Unicode data.

Note: This error can occur when there is an attempt to define a column or parameter as character FOR MIXED DATA even though the keywords FOR MIXED DATA do not appear in the failing statement. This occurs when the MIXED value in DECP is YES, in this case the default subtype for the character types is FOR MIXED DATA.

System Action: The statement cannot be processed.

Programmer Response: Contact your system administrator to properly setup the installation options,

or change the data types of the elements in columns in your CREATE or ALTER statement.

SQLSTATE: 53095

-880 SAVEPOINT *savepoint-name* DOES NOT EXIST OR IS INVALID IN THIS CONTEXT

Explanation: The RELEASE TO SAVEPOINT or ROLLBACK TO SAVEPOINT statement does not identify a savepoint that exists.

System Action: DB2 does not process the statement.

Programmer Response: Correct the statement to use a valid savepoint name.

SQLSTATE: 3B001

-881 A SAVEPOINT WITH NAME *savepoint-name* ALREADY EXISTS, BUT THIS SAVEPOINT NAME CANNOT BE REUSED

Explanation: The SAVEPOINT statement uses the same savepoint name as another savepoint, and it cannot be created because at least one of the savepoints was defined with the UNIQUE clause to indicate that the name cannot be reused within the transaction.

System Action: The statement is not executed and a new savepoint is not set. The old savepoint still exists.

Programmer Response: Correct the statement. Either use a different savepoint name, or omit the UNIQUE clause if the other savepoint was created without the UNIQUE clause and your intention is to reuse that savepoint name.

SQLSTATE: 3B501

-882 SAVEPOINT DOES NOT EXIST

Explanation: A ROLLBACK TO SAVEPOINT statement was specified without a savepoint name to rollback to the last active savepoint, but no savepoint exists.

System Action: The statement is not executed.

Programmer Response: Correct the application logic to either set a savepoint or to not attempt to rollback to a savepoint.

SQLSTATE: 3B502

-900 THE SQL STATEMENT CANNOT BE EXECUTED BECAUSE THE APPLICATION PROCESS IS NOT CONNECTED TO AN APPLICATION SERVER

Explanation: A previous failure has placed the application process in the unconnected state. The only SQL statements that can be successfully executed from the unconnected state are CONNECT, COMMIT, ROLLBACK, and local SET statements.

System Action: The statement cannot be executed.

Programmer Response: It is possible that no response is required because checking for -900 is one way of detecting the unconnected state. If this is not the case, the logic of the application program must be changed. For additional information, see the description of the CONNECT statement in Chapter 5 of *DB2 SQL Reference*.

SQLSTATE: 08003

-901 UNSUCCESSFUL EXECUTION CAUSED BY A SYSTEM ERROR THAT DOES NOT PRECLUDE THE SUCCESSFUL EXECUTION OF SUBSEQUENT SQL STATEMENTS

Explanation: A system error occurred that prevented successful execution of the current SQL statement. However, the error does not prevent successful execution of further SQL statements.

The error might occur if the length of the SQL statement is less than 0, or is greater than the DB2 maximum length for a statement.

This SQLCODE might also occur when distributed commit processing encounters an error. In this case, all servers in the unit of work that support distributed two-phase commit backed out the unit of work. If a server that does not support distributed two-phase commit has updates in the unit of work, that server must be queried to determine if its updates were committed or backed out.

Finally, this error might occur during commit if post-processing cannot be completed because of an update that changes the partition of a row. Resource unavailable problems can prevent the post-processing from completing. The existence of held cursors can prevent the post-processing from completing. Commit is failed. The transaction is aborted.

System Action: The statement cannot be executed. A X'04E' abend might be requested for the application. The application program can have a recovery routine to recover from such an abend and can retry SQL statements.

Programmer Response: If an abend occurred, notify the system programmer for analysis of the abend that caused this return code.

Even if an abend occurred, an application program receiving this return code can retry and is not prohibited from executing further SQL statements.

SQLSTATE: 58004

-904 UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

Explanation: The SQL statement could not be executed because resource '*resource-name*' of type '*resource-type*' was not available at the time for the reason indicated by '*reason-code*'. Refer to Table 3 in Appendix B, "Problem determination," on page 1353 for an explanation of resource type codes. Refer to Part 4, "Section 4. DB2 Codes," on page 773 for an explanation of the given reason code.

If this is issued in connection with Multilevel Security authorization (resource-type 402), then the Security Server return and reason codes for the unavailable resource appear as the resource-name. In this case, refer to the *z/OS Security Server RACROUTE Macro Reference*.

System Action: The SQL statement cannot be executed. If the SQL statement being executed was a cursor FETCH, DB2 closes the cursor. Subsequent attempts to use that cursor without first doing an OPEN for it receive an SQLCODE -501.

Programmer Response: Verify the identity of the resource that was not available. To determine why the resource was unavailable, refer to the specified *reason-code*.

SQLSTATE: 57011

-905 UNSUCCESSFUL EXECUTION DUE TO RESOURCE LIMIT BEING EXCEEDED, RESOURCE NAME = *resource-name* LIMIT = *limit-amount1* CPU SECONDS (*limit-amount2* SERVICE UNITS) DERIVED FROM *limit-source*

Explanation: The execution of the SQL statement was terminated because a resource limit was exceeded.

resource-name

The name of the resource whose limit was exceeded. It is also the name of the column in the DB2 table from which the limit was derived. The *resource-name* can be ASUTIME, which is the number of CPU seconds permitted for each SQL statement.

limit-amount1

The maximum number of CPU seconds permitted

limit-amount2

The maximum number in service units permitted

limit-source

The source used to derive the limit-amount: the name of a resource limit specification table, a system parameter, or the SYSIBM.SYSROUTINES catalog table. If the source is a system parameter, the resource limit specification table did not contain an applicable entry or an error occurred while accessing the table.

System Action: If the *limit-source* was a resource limit specification table or a system parameter, the execution of this SQL statement is terminated. A record containing more detailed information about this failure is generated. If an SQL cursor is associated with the failed instruction, its position is unchanged and a CLOSE or PREPARE command can be issued. If any other operation is attempted with the cursor, it cannot be executed and SQLCODE -905 is returned. If there is no cursor, this statement was rolled back.

Programmer Response: Determine why this SQL statement or stored procedure took so long and take appropriate action. Consider simplifying the SQL statement, restructuring tables and indexes, or contacting the installation group responsible for maintaining the resource limit specification tables.

If the *limit-source* was a resource limit specification table or a system parameter, the application program that receives this return code can execute additional SQL statements.

SQLSTATE: 57014

and continue processing, it must be capable of correcting the situation that caused the create thread error to occur originally.

SQLSTATE: 51005

-908 *bind-type* **ERROR USING *auth-id* AUTHORITY. BIND, REBIND OR AUTO-REBIND OPERATION IS NOT ALLOWED**

Explanation: For BIND and REBIND, the indicated authorization ID is not allowed to perform the indicated bind-type against a plan or package. An entry in the resource limit specification table (RLST) prohibits binding and rebinding by this authorization ID, or all authorization IDs. For AUTO-REBIND, the system parameter controlling AUTO-REBIND operations is set to disallow AUTO-REBIND.

bind-type

Type of bind operation (BIND, REBIND or AUTO-REBIND).

auth-id Authorization ID of the invoker of the BIND subcommand or primary authorization ID of the invoker of the plan for AUTO-REBIND operations.

System Action: The plan or package is not bound.

System Programmer Response: If the indicated authorization id should be allowed to bind, change the entry in the active RLST table. If AUTO-REBIND operations are disabled, rebind the package before reexecuting the package.

SQLSTATE: 23510

-906 **THE SQL STATEMENT CANNOT BE EXECUTED BECAUSE THIS FUNCTION IS DISABLED DUE TO A PRIOR ERROR**

Explanation: Execution of the SQL statement failed because the requested function had been disabled by a prior error. This situation can arise if the application program has intercepted an abend (for instance, by an ON ERROR condition in a PL/I program) and continued to execute SQL statements. This situation may also arise if a DB2 CICS transaction encountered a create thread error yet continued to issue SQL requests without issuing a SYNCPOINT ROLLBACK first.

System Action: The statement cannot be executed.

Programmer Response: In general, an application program should terminate upon receipt of this return code. All subsequent attempts by the application to execute other SQL statements will also fail with the same return code. In the case of a DB2 CICS transaction, if the SQLERRP field in the SQLCA contains the module name DSNCEXT1, the transaction may issue a SYNCPOINT ROLLBACK and continue processing. If the transactions chooses to ROLLBACK

-909 **THE OBJECT HAS BEEN DELETED**

Explanation: The application program has either:
1. Dropped a table and then attempted to access it.
2. Dropped an index and then tried to access its object table using that index.

System Action: The statement cannot be executed.

System Programmer Response: The logic of the application program must be corrected such that it does not attempt to access or use an object after it has been dropped.

Dropping indexes within an application program is especially hazardous, because there is no way of determining whether or not the plan that has been generated for the application (by BIND or REBIND) actually uses a particular index for access to its object table. If the indicated authorization id should be allowed to bind, change the entry in the active RLST table. If AUTO-REBIND operations are disabled, rebind the package before reexecuting the package.

SQLSTATE: 57007

-910 THE SQL STATEMENT CANNOT ACCESS AN OBJECT ON WHICH A DROP OR ALTER IS PENDING

Explanation: The application program has issued a DROP or ALTER against an object, and then attempted to access that object before the DROP or ALTER is completed.

System Action: The statement cannot be executed.

Programmer Response: In the case of ALTER, the logic of the application program must be modified so that a COMMIT (or the IMS or CICS equivalent) is executed between the ALTER and the failing SQL statement.

For DROP, the logic of the application program should be modified such that there is no attempt to access an object after the DROP has been executed.

Note that DROP includes the case when rollback to a savepoint includes rolling back to a CREATE.

SQLSTATE: 57007

-911 THE CURRENT UNIT OF WORK HAS BEEN ROLLED BACK DUE TO DEADLOCK OR TIMEOUT. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

Explanation: The current unit of work was the victim in a deadlock, or experienced a timeout, and had to be rolled back.

The reason code indicated whether a deadlock or timeout occurred. Refer to message DSNT500I under Chapter 18, "DSNT... Messages," on page 417 for an explanation of 'resource-type' and 'resource-name'. Refer to Table 3 in Appendix B, "Problem determination," on page 1353 for an explanation of resource type codes.

Note: The changes associated with the unit of work must be entered again.

SQLERRD(3) also contains the reason-code which indicates whether a deadlock or timeout occurred. The most common reason codes are:

- 00C90088 - deadlock
- 00C9008E - timeout

The changes associated with the unit of work must be entered again.

System Action: The statement cannot be executed. The application is rolled back to the previous COMMIT.

Programmer Response: A long-running application, or an application that is likely to encounter a deadlock, should (if possible) issue frequent COMMIT commands. This can lessen the possibility of a deadlock occurring.

See message DSNT376I for other possible ways to avoid future deadlocks or timeouts. On receipt of the SQLCODE -911, the application should, in general, terminate.

For more information about how IMS, CICS, and TSO handle deadlocks, see Part 4 of *DB2 Application Programming and SQL Guide*.

SQLSTATE: 40001

-913 UNSUCCESSFUL EXECUTION CAUSED BY DEADLOCK OR TIMEOUT. REASON CODE *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

Explanation: The application was the victim in a deadlock or experienced a timeout. The reason code indicates whether a deadlock or timeout occurred.

Refer to message DSNT500I under Chapter 18, "DSNT... Messages," on page 417 for an explanation of 'resource-type' and 'resource-name'. Refer to Table 3 in Appendix B, "Problem determination," on page 1353 for an explanation of resource type codes.

System Action: The SQL statement cannot be executed. If the SQL statement being executed was a cursor FETCH, DB2 closes the cursor.

SQLERRD(3) also contains the reason-code which indicates whether a deadlock or timeout occurred. The most common reason codes are:

- 00C90088 - deadlock
- 00C9008E - timeout

Programmer Response: The application should either commit or roll back to the previous COMMIT. Then, generally, the application should terminate. See message DSNT376I for possible ways to avoid future deadlocks or timeouts.

For more information about how CICS and TSO handle deadlocks, see Part 4 of *DB2 Application Programming and SQL Guide*.

SQLSTATE: 57033

-917 BIND PACKAGE FAILED

Explanation: An error has occurred which prevents the package from being created. This SQLCODE can be issued during bind or commit processing.

System Action: The bind fails and the package is not created. If issued during commit processing, all changes to the database are rolled back. If issued during bind processing, only package creation fails. Other changes within the logical unit of work are committable.

Programmer Response: Correct the cause of the problem and try again.

Problem Determination: Inspect the SQLCODES

issued for the SQL statements of the package.

SQLSTATE: 42969

-918 THE SQL STATEMENT CANNOT BE EXECUTED BECAUSE A CONNECTION HAS BEEN LOST

Explanation: Execution of the SQL statement failed because a communications link between the local DB2 and at least one remote server no longer exists. A previous failure caused this condition.

System Action: In the IMS and CICS environments, all SQL statements are rejected until the rollback occurs. In the other environments, all SQL statements other than a static ROLLBACK are rejected until a static ROLLBACK is executed.

Programmer Response: In general, an application program should issue a static ROLLBACK. Attempts by the application to issue SQL statements other than static ROLLBACK might fail. Once the static ROLLBACK is issued, the application can resume execution.

SQLERRP contains the name of the module that detected the previous failure and placed the application in the must-abort state.

SQLSTATE: 51021

-919 A ROLLBACK OPERATION IS REQUIRED

Explanation: The unit of work was placed in a state where a rollback operation is required. This can happen for the following reasons:

- An SQL statement updated a distributed database server, but the database server can be used only for read-only operations. Either updates are currently restricted to servers that support distributed two-phase commit and this application server does not support distributed two-phase commit, or updates are restricted to a single server that does not support distributed two-phase commit and this application server is not that server.

The unit of work must be terminated by a rollback operation because the update made (but not committed) at the application server cannot be committed consistently with other current or future updates made to this distributed unit of work.

- An abend occurred during the execution of a stored procedure, or a restricted SQL statement was issued from a stored procedure.
- An abend occurred during the execution of a function, or a restricted SQL statement was issued from a function.

System Action: In the IMS and CICS environments, all SQL statements are rejected until the rollback occurs. In the other environments, all SQL statements

other than a static ROLLBACK are rejected until a static ROLLBACK is executed.

Programmer Response: Correct the application, function, or stored procedure, rebind it, and resubmit the job.

SQLERRP contains the name of the module that detected the previous failure and placed the application in the must-abort state.

SQLSTATE: 56045

-922 AUTHORIZATION FAILURE: error-type ERROR. REASON reason-code

Explanation: Authorization failed because of the error indicated by *error-type*

error-type

Types of authorization failure

- User authorization
- Plan access
- Duplicate exit requested
- Installation error
- Connect

reason-code

DB2 reason code associated with authorization failure

System Action: The statement cannot be processed. The connection to DB2 is not established.

Programmer Response: If *error-type* is *user authorization*., the authorization-ID specified to DB2 through your attachment facility is not valid for DB2. See your system programmer or your CICS, IMS, or TSO system administrator.

If *error-type* is *plan access*, then the authorization ID associated with this connection is not authorized to use the specified plan name or the specified plan name does not exist. See your system administrator.

If *error-type* is *duplicate exit*, then you requested a duplicate exit.

If *error-type* is *installation error*, a connection or sign-on exit denied your request. See your system programmer.

If *error-type* is *Connect*, an SQL CONNECT request failed to connect to the local DB2 with USER/USING specified. See the reason code for a description of the failure. The application program has been placed in the connectable and unconnected state. The only SQL statements that can be successfully completed in this state are CONNET, COMMIT, ROLLBACK, and local SET statements. Any attempt to execute other SQL statements will result in an error (SQLCODE -900).

Look up the reason code in Part 4, "Section 4. DB2 Codes," on page 773 for further information.

Any attempts to issue SQL statements following the -922 SQLCODE when *error-type* is not *Connect* causes unpredictable results.

SQLSTATE: 42505

-923 CONNECTION NOT ESTABLISHED:
DB2 *condition* **REASON** *reason-code*,
TYPE *resource-type*, **NAME**
resource-name

Explanation: The connection to DB2 failed for the reason indicated by *condition*, which can be any of the following:

- DB2 not up
- DB2 not operational
- DB2 shutdown in progress
- DB2 restricted access mode
- Allocation error
- DB2 - CICS attachment not up
- DB2 - CICS ENTRY disabled
- The object is dependent on facilities of a release of DB2 that is newer than the release that you are currently running (fall back).
- DB2 restarted in LIGHT(YES) mode

Possible causes of an allocation error are:

- The application plan does not exist.
- The application plan is inoperative. An explicit REBIND or BIND is required.
- The application plan is invalid. Underlying resources have changed.
- A required database, table space, table, or index is unavailable.
- Data set allocation failed for a required data set.
- There is insufficient virtual storage.
- The application is trying to execute the plan from a system (environment) that was restricted when the plan was bound or rebound. Check the SYSPLSYSTEM table to determine from which systems (for example, IMS or CICS) the plan can be executed.

If the *condition* is "CICS attachment not up", then NAME indicates the DB2 subsystem that is not available. The *reason code* indicates the reason the attachment is not available.

If the *condition* is "CICS entry disabled", then NAME indicates the entry that is disabled.

System Action: The statement cannot be executed. The connection to DB2 is not established.

Programmer Response: If the connection failed because either DB2 or a required database, table space, table, or index was unavailable, wait until it is available before invoking the application again.

If allocation failed for an application plan, REBIND the plan to determine the problem. Error messages are produced explaining why the plan could not be allocated.

For other types of allocation errors, installation action

might be required to correct the problem.

For CICS attachment failures, resolve the primary cause as noted by the reason code. Then restart the attachment.

Problem Determination: The *reason-code*, *resource-type*, and *resource-name* might not be available. If they are not available, nothing appears. If they are available, refer to Part 4, "Section 4. DB2 Codes" for an explanation of the *reason-code*, *resource-type*, and *resource-name*.

Refer to message DSNT500I under Chapter 18, "DSNT... Messages" for an explanation of resource type and resource name. Refer to Table 3 in Appendix B, "Problem determination," on page 1353 for an explanation of resource type codes. Any attempts to issue SQL statements after receiving SQLCODE -923 will cause unpredictable results.

SQLSTATE: 57015

-924 DB2 CONNECTION INTERNAL ERROR,
function-code, return-code, reason-code

Explanation: Connection to DB2 has failed because of an unexpected internal error, identified by the 'reason-code'.

System Action: The statement cannot be executed. The connection to DB2 is not established.

Programmer Response: Look up the abend 'reason-code' in Part 4, "Section 4. DB2 Codes" for further information. The requested 'function-code' and 'return-code' may provide additional information. Any attempts to issue SQL statements following the SQLCODE -924 will cause unpredictable results.

SQLSTATE: 58006

-925 COMMIT NOT VALID IN IMS, CICS OR RRSF ENVIRONMENT

Explanation: An application executing in either an IMS or CICS environment or an application executing in an RRSF environment when DB2 is not the only resource manager has attempted to execute a COMMIT statement. The SQL COMMIT statement cannot be executed in these environments.

System Action: The statement cannot be executed. No commit is performed.

Programmer Response: The IMS, CICS or RRSF protocols should be used to commit work in these environments.

If a stored procedure is being called from IMS or CICS, ensure that the stored procedure is not defined to perform a commit on return.

SQLSTATE: 2D521

**-926 ROLLBACK NOT VALID IN IMS, CICS
OR RRSAF ENVIRONMENT**

Explanation: An application executing in either an IMS or CICS environment or an application executing in an RRSAF environment when DB2 is not the only resource manager has attempted to execute a ROLLBACK statement. The SQL ROLLBACK statement cannot be executed in these environments.

System Action: The statement cannot be executed. No roll back is performed.

Programmer Response: The IMS, CICS or RRS protocols should be used to rollback work in these environments.

SQLSTATE: 2D521

**-927 THE LANGUAGE INTERFACE (LI) WAS
CALLED WHEN THE CONNECTING
ENVIRONMENT WAS NOT
ESTABLISHED. THE PROGRAM
SHOULD BE INVOKED UNDER THE
DSN COMMAND**

Explanation: In the TSO environment, the user has attempted to execute an application program without first establishing the correct execution environment by issuing the DSN command. In the IMS, CICS, or call attachment facility (CAF) environment, the user has attempted to execute an application program that is not using the correct language interface module.

System Action: The statement cannot be executed.

Programmer Response: In the TSO environment, DB2 application programs should be invoked under the RUN subcommand of the DSN command processor. In the IMS, CICS or CAF environment check that the application was link-edited with or is dynamically allocating the correct language interface module. The language interface modules required in each environment are as follows:

- IMS: DFSLI000
- CICS: DSNCLI
- CAF: DSNALI
- TSO: DSNELI

The DYNAM option can result in the incorrect language interface module being loaded at runtime.

SQLSTATE: 51006

**-929 FAILURE IN A DATA CAPTURE EXIT:
token**

Explanation: 'token' is an information string provided by DPROP's exit routine which captures data changes in tables defined with DATA CAPTURE CHANGES.

System Action: The information string is placed in in the SQLERRM area of the SQLCA.

System Programmer Response: For documentation of the actions associated with this SQLCODE, refer to the Data Propagator (DPROP) publications.

SQLSTATE: 58002

**-939 ROLLBACK REQUIRED DUE TO
UNREQUESTED ROLLBACK OF A
REMOTE SERVER**

Explanation: A dynamic commit was executed preceding the execution of this request. The remote server to which the application was CONNECTed during the dynamic COMMIT successfully committed. However, at least one other remote server (which was read-only) rolled back its portion of the distributed unit of work during the dynamic commit.

To ensure that an application that uses cursor-hold cursors does not incorrectly assume cursor position is being maintained at any remote server that rolled back, the application must perform a rollback operation.

Communications are still established with all remote servers.

System Action: In the IMS and CICS environments, all SQL statements are rejected until the rollback occurs. In the other environments, all SQL statements other than a static ROLLBACK are rejected until a static ROLLBACK is executed.

Programmer Response: Issue the appropriate (depending on the environment) request to cause a rollback. Re-establish any cursor positioning and continue the application with the first request that received the -939 SQLCODE.

SQLERRP contains the name of the module that detected the previous failure and placed the application in the must-abort state.

SQLSTATE: 51021

**-947 THE SQL STATEMENT FAILED
BECAUSE IT WILL CHANGE A TABLE
DEFINED WITH DATA CAPTURE
CHANGES, BUT THE DATA CANNOT
BE PROPAGATED**

Explanation: The DPROP SUPPORT option on the installation panel is set to 2 (support DPROP only). The SQL statement would have changed a table defined with DATA CAPTURE CHANGES. However, the data cannot be propagated because the SQL statement did not originate from an IMS subsystem, or monitor trace class 6 was not active at the beginning of the unit of work for that change.

System Action: The statement is not executed.

System Programmer Response: Take one of the following actions:

- Change the installation option to 1 (no propagation) or 3 (permit changes from any subsystem).

- Change the application program that receives this SQLCODE so that it can be run in an IMS subsystem, and activate monitor trace class 6.

If the installation option is changed to 3, SQL changes to tables defined with DATA CAPTURE CHANGES are permitted from any subsystem, but they are not propagated unless the environment is set up for propagation.

SQLSTATE: 56038

-948 DISTRIBUTED OPERATION IS INVALID

Explanation: The unit of work was initiated before DDF was started, and the application attempted to perform a distributed operation. The unit of work must be terminated by a rollback operation.

System Action: In the IMS and CICS environments, all SQL statements are rejected until a rollback occurs. In the other environments, all SQL statements other than a static ROLLBACK are rejected until a static ROLLBACK is executed.

Programmer Response: An application that performs local database updates before DDF is started cannot perform distributed operations within the same unit of work. The current unit of work must be terminated by a rollback operation and a new unit of work must be initiated before any SQL operations can be performed.

Restart the current unit of work.

SQLSTATE: 56062

-950 THE LOCATION NAME SPECIFIED IN THE CONNECT STATEMENT IS INVALID OR NOT LISTED IN THE COMMUNICATIONS DATABASE

Explanation: One of the following conditions applies:

- The location name is blank.
- The data type of the host variable is not character string.
- The length attribute of the host variable is greater than 16.
- The location name does not appear in the LOCATIONS column of the SYSIBM.LOCATIONS table, nor is it the name of the local DB2 subsystem.

System Action: The statement cannot be executed. The application process is placed in the unconnected state.

Programmer Response: If the location name is specified as the value of a host variable, ensure that the name is left justified in the host variable and, if necessary, padded on the right with blanks. If this is not the problem, either SYSIBM.LOCATIONS must be updated to include the specified name, or the specified name must be changed to match a name in SYSIBM.LOCATIONS.

SQLSTATE: 42705

-952 PROCESSING WAS INTERRUPTED BY A CANCEL REQUEST FROM A CLIENT PROGRAM

Explanation: A client program issued a cancel request that terminated processing of the SQL statement.

System Action: The SQL statement was terminated and any changes made by that statement have been undone. If an SQL cursor is associated with the interrupted SQL statement, that cursor is closed.

SQLSTATE: 57014

-981 THE SQL STATEMENT FAILED BECAUSE THE RRSF CONNECTION IS NOT IN A STATE THAT ALLOWS SQL OPERATIONS, REASON *reason-code*.

Explanation: The application attempted to execute an SQL operation, but the RRSF connection was not in a state that allows the processing of SQL statements.

System Action: The statement cannot be executed.

Programmer Response: See reason-code in Part 4, "Section 4. DB2 Codes," on page 773 for an explanation of the problem. Correct the error in the application, REBIND, and run the application again.

SQLSTATE: 57015

-989 AFTER TRIGGER *trigger-name* ATTEMPTED TO MODIFY A ROW IN TABLE *table-name* THAT WAS INSERTED BY AN INSERT STATEMENT WITHIN A SELECT STATEMENT

Explanation: An INSERT statement was specified in the FROM clause of a SELECT statement of a subselect or a SELECT INTO statement, but the underlying target base table of the INSERT has an AFTER trigger defined which modifies the table being inserted. This is disallowed.

System Action: The statement cannot be processed.

Programmer Response: Avoid using the INSERT statement within SELECT, or change the trigger so that it does not modify the table that is the target of the INSERT statement.

SQLSTATE: 560C3

-991 CALL ATTACH WAS UNABLE TO ESTABLISH AN IMPLICIT CONNECT OR OPEN TO DB2. RC1= *rc1* RC2= *rc2*

Explanation: Call attach attempted to perform an implicit connect and open as the result of an SQL

statement. The connect or open failed with the returned values.

- rc1* The value returned in FRBRC1 for the failed CONNECT or OPEN request.
- rc2* The value returned in FRBRC2 for the failed CONNECT or OPEN request.

System Action: The statement cannot be executed.

Programmer Response: Verify that the application intended to use the call attachment facility (CAF) as the mechanism to connect to DB2. For functions or stored procedures running in the WLM-established stored procedure address space the application must be link-edited with or dynamically allocate the RRS attachment language interface module (DSNRLI), not CAF.

SQLSTATE: 57015

-1403 THE USERNAME AND/OR PASSWORD SUPPLIED IS INCORRECT

Explanation: The username and/or password supplied is incorrect. If either a username or password is supplied, then both must be supplied and both must have a non-zero length.

System Action: The statement cannot be executed.

User Response: Supply the correct username and password combination.

SQLSTATE: 08004

-1760 CREATE PROCEDURE FOR *procedure-name* MUST HAVE VALID LANGUAGE AND EXTERNAL CLAUSES

Explanation: A LANGUAGE or EXTERNAL clause is missing in the CREATE statement for procedure *procedure-name*. This clause must be specified.

System Action: The statement cannot be executed.

Programmer Response: Change the CREATE statement to include the missing clause and reissue the statement.

SQLSTATE: 42601

-2001 THE NUMBER OF HOST VARIABLE PARAMETERS FOR A STORED PROCEDURE IS NOT EQUAL TO THE NUMBER OF EXPECTED HOST VARIABLE PARAMETERS. ACTUAL NUMBER *sqldanum*, EXPECTED NUMBER *opnum*

Explanation: DB2 received an SQL CALL statement for a stored procedure. However, the number of host variable parameters supplied on the CALL statement does not match the expected number of host variable parameters.

sqldanum

The number of host variable parameters as determined by examining the SQLDA.

opnum

The expected number of host variable parameters as determined by parsing the statement.

System Action: The statement cannot be executed.

Programmer Response: If the SQL CALL statement is coded incorrectly, modify the SQL application to provide the correct number of parameters on the SQL CALL statement.

SQLSTATE: 53089

-4302 JAVA STORED PROCEDURE OR USER-DEFINED FUNCTION *routine-name* (SPECIFIC NAME *specific-name*) HAS EXITED WITH AN EXCEPTION *exception-string*

Explanation: User-defined function or stored procedure *routine-name* exited with a Java exception that was not a java.sql.SQLException.

If present, *exception-string* contains as much as will fit of the toString() of the exception that was uncaught.

System Action: The statement cannot be executed.

Programmer Response: The user-defined function or stored procedure probably needs to be corrected. See your database administrator, or the author of the routine to find out if the exception can be avoided, or if the user-defined function or stored procedure needs to be fixed before it can be used.

SQLSTATE: 38000

-4700 ATTEMPT TO USE NEW FUNCTION BEFORE NEW FUNCTION MODE

Explanation: To use the new functions that have been introduced in this release of DB2, new-function mode must first be enabled. This error code will be given after an attempt to use a new function before new-function mode has been enabled.

Additionally, the following statements are restricted in DB2 for z/OS Version 8 until new-function mode is enabled:

- Altering a table to increase the length of a VARCHAR column
- Altering a catalog table to DATA CAPTURE CHANGES

System Action: The statement cannot be executed.

Programmer Response: Either delay running your program until new-function mode has been enabled, or restrict your program to functions that are allowed before new-function mode is enabled.

SQLSTATE: 56038

-4701 THE NUMBER OF PARTITIONS, OR THE COMBINATION OF THE NUMBER OF TABLE SPACE PARTITIONS AND THE CORRESPONDING LENGTH OF THE PARTITIONING LIMIT KEY EXCEEDS THE SYSTEM LIMIT

Explanation: When ALTER TABLE or CREATE INDEX is used to change or create limit keys, the length of the partitioning limit key exceeds the allowed maximum. The combination of the number of table space partitions and the corresponding limit key size are subject to the following limit:

$$A * (106 + B) < 65394$$

Where A = Number of partitions, and B = Limit key size (in bytes)

The intended operation would exceed this limit.

When an ALTER TABLE statement is used to add partitions, the maximum number of partitions already exist. For non-LARGE table spaces, the limit is 8, 16, 32, or 64, depending on the initial definition. For LARGE table spaces, see *DB2 SQL Reference* for more information on the limits.

System Action: The statement cannot be executed.

Programmer Response: Decrease the size of limit key or the number of table space partitions to satisfy the constraint.

SQLSTATE: 54054

-4702 THE MAXIMUM NUMBER OF ALTERS ALLOWED HAS BEEN EXCEEDED FOR object-type

Explanation: The ALTER statement cannot be processed because the maximum number of alters for the object has already been exceeded. This can occur for the following reasons:

- The SET DATA TYPE keyword was specified on an ALTER TABLE ALTER COLUMN statement, but the maximum number of ALTER statements for this table has already been reached.
- The statement attempts to alter an index, but the maximum number of ALTER statements for this index has already been reached.

System Action: The statement cannot be executed.

Programmer Response: Run MODIFY to instruct DB2 that copies of a certain age will no longer be employed in recovery, and versions only used in those copies can be reused.

SQLSTATE: 54055

-4703 THE ALTER TABLE STATEMENT CANNOT BE EXECUTED BECAUSE COLUMN *column-name* IS MIXED DATA, OR THE DATA TYPE OR LENGTH SPECIFIED DOES NOT AGREE WITH THE EXISTING DATA TYPE OR LENGTH

Explanation: The ALTER TABLE statement for column *column-name* could not be processed for one of the following reasons:

- the existing column is MIXED and the statement attempted to convert the column to SBCS. This conversion is not supported.
- the data type or length in the ALTER statement did not match the existing data type or length of the column in the table being altered.

System Action: The statement cannot be executed

Programmer Response: Correct the SQL statement to specify a conversion that is supported.

SQLSTATE: 429BQ

-5012 HOST VARIABLE *host-variable* IS NOT EXACT NUMERIC WITH SCALE ZERO

Explanation: HOST VARIABLE *host-variable* was specified, but it is not valid in the context in which it was used. HOST VARIABLE *host-variable* was specified as part of ABSOLUTE or RELATIVE in a FETCH statement, or in a ROWS clause of a FETCH or INSERT statement. The host variable was not usable for one of the following reasons:

- It is not an exact numeric type
- The scale is not zero

System Action: The statement cannot be processed.

Programmer Response: Change the host variable to be an exact numeric with a scale of zero.

SQLSTATE: 42618

-20003 GBPCACHE NONE CANNOT BE SPECIFIED FOR TABLESPACE OR INDEX IN GRECP

Explanation: GBPCACHE NONE was specified on an ALTER TABLESPACE or ALTER INDEX statement, but the table space, index, or the partition to be altered is in GRECP.

System Action: The statement cannot be processed.

User Response: Use the START DATABASE command to recover the table space or index from the GRECP then STOP the table space or index before reissuing the ALTER statement.

SQLSTATE: 560A7

**-20004 8K or 16K BUFFERPOOL PAGESIZE
INVALID FOR A WORKFILE OBJECT**

Explanation: This message is issued when:

- A CREATE or ALTER DATABASE statement for a workfile database specifies an 8K or 16K pagesize in the BUFFERPOOL clause.
- A CREATE or ALTER TABLESPACE statement for a workfile database specifies an 8K or 16K pagesize in the BUFFERPOOL clause.

System Action: The statement cannot be executed.

User Response: Correct the statement to specify a 4K or 32K bufferpool pagesize.

SQLSTATE: 560A8

**-20005 THE INTERNAL ID LIMIT OF *limit* HAS
BEEN EXCEEDED FOR OBJECT TYPE
*object-type***

Explanation: An internal ID is used to uniquely identify objects of type *object-type*. The limit for internal IDs for this type of object is *limit*, and this limit has been exceeded.

This could occur during a CREATE DISTINCT TYPE, CREATE FUNCTION, CREATE PROCEDURE, CREATE SEQUENCE, or CREATE or ALTER TABLE statement that defines an identity column.

System Action: The SQL statement cannot be executed.

Programmer Response: Drop objects of *object-type* that are not being used, and retry the statement.

SQLSTATE: 54035

**-20006 LOBS CANNOT BE SPECIFIED AS
PARAMETERS WHEN NO WLM
ENVIRONMENT IS SPECIFIED**

Explanation: On a CREATE PROCEDURE statement, one or more LOBs (or distinct types based on LOBs) were specified in the parameter list, and the NO WLM ENVIRONMENT option was also specified.

Option NO WLM ENVIRONMENT cannot be used with LOBs in the parameter list for a stored procedure.

Note: This message is still issued with Version 8 prior to New Function Mode.

System Action: The statement is not executed.

Programmer Response: Either do not specify a LOB as a parameter, or specify a WLM ENVIRONMENT name rather than NO WLM ENVIRONMENT on your CREATE PROCEDURE statement.

SQLSTATE: 53097

**-20008 UNSUPPORTED OPTION *keyword*
SPECIFIED**

Explanation: *keyword* is a deprecated feature that was supported in releases prior to DB2 Version 8, and is no longer supported.

For indexes, only one type is currently supported — type 2.

System Action: The statement cannot be executed.

Programmer Response: Correct the syntax of the SQL statement to remove reference to the unsupported keyword. Refer to the *DB2 SQL Reference* for more information.

SQLSTATE: 560A9

**-20058 THE FULLSELECT SPECIFIED FOR
MATERIALIZED QUERY TABLE
table-name IS NOT VALID.**

Explanation: The materialized query table definition has specific rules regarding the contents of the fullselect. When DISABLE QUERY OPTIMIZATION is specified, the following additional restrictions apply:

- The fullselect cannot contain a reference to a created global temporary table or a declared global temporary table.
- The fullselect cannot reference another materialized query table.

When a materialized query table is defined with ENABLE QUERY OPTIMIZATION specified, more restrictions apply:

- The fullselect must be a subselect.
- The subselect cannot reference to a user-defined scalar or table function with the EXTERNAL ACTION or NON-DETERMINISTIC attributes, or built-in function RAND.
- The subselect cannot contain any predicates which include subqueries.
- The subselect cannot contain a nested table expression or view that requires temporary materialization.
- The subselect cannot contain a join using the INNER JOIN syntax.
- The subselect cannot contain an outer join.
- The subselect cannot contain a special register.
- The subselect cannot contain a scalar fullselect.
- The subselect cannot contain a row expression predicate.
- The subselect cannot contain sideways references.
- The subselect cannot contain table objects with multiple CCSID sets.

- The subselect cannot contain more than one table with a security label column, and the security label column must be one of the select list items of the subselect.
- If the subselect references a view, the fullselect in the view definition must satisfy the above restrictions.

System Action: The statement cannot be processed.

Programmer Response: Change the fullselect in the CREATE TABLE or ALTER TABLE statement so that it conforms to the rules listed above.

SQLSTATE: 428EC

-20070 AUXILIARY TABLE *table-name* CANNOT BE CREATED BECAUSE COLUMN *column-name* IS NOT A LOB COLUMN

Explanation: An auxiliary table cannot be created for a non-LOB column. A CREATE AUXILIARY TABLE statement must refer to a LOB column in the associated base table.

System Action: The statement cannot be executed. The specified table was not created.

Programmer Response: Change the name of the column to correctly refer to a LOB column in the base table.

SQLSTATE: 53098

-20071 WLM ENVIRONMENT NAME MUST BE SPECIFIED *function-name*

Explanation: The WLM ENVIRONMENT option was not specified on CREATE FUNCTION or CREATE PROCEDURE, and there is no default WLM environment for the installation.

System Action: The statement could not be processed.

Programmer Response: Select a WLM ENVIRONMENT name and include it in the CREATE FUNCTION or CREATE PROCEDURE statement. Contact your system administrator to find out the names of the WLM environments that have been defined for your installation.

SQLSTATE: 53099

-20072 *csect-name bind-type bind-subtype* ERROR USING *auth-id* AUTHORITY OPERATION IS NOT ALLOWED ON A TRIGGER PACKAGE *package-name*

Explanation: The package specified is a trigger package. The bind-type operation cannot be performed against a trigger package using this statement or subcommand.

csect-name

Name of the CSECT that issued the message.

bind-type

Type of bind operation (BIND, REBIND, DROP, or FREE).

bind-subtype

Subtype of bind operation (COPY or blank).

auth-id Authorization ID of the invoker of the BIND, REBIND or FREE subcommand or primary authorization ID of the currently executing process for a DROP statement.

package-name

Name of the package in the following format: 'collection.package'.

System Action: The plan or package is not bound, copied, or freed.

System Programmer Response: A trigger package cannot be explicitly bound. A trigger package cannot be copied. To rebind a trigger package locally, the REBIND TRIGGER PACKAGE subcommand must be used. A trigger package cannot be rebound remotely. To drop a trigger package, the DROP TRIGGER statement must be used.

SQLSTATE: 56052

-20073 THE FUNCTION *function-name* CANNOT BE ALTERED BECAUSE IT IS REFERENCED IN EXISTING VIEW OR MATERIALIZED QUERY TABLE DEFINITIONS

Explanation: The *function-name* in an ALTER FUNCTION statement cannot be altered to NOT DETERMINISTIC or EXTERNAL ACTION. It is referenced in one or more existing view definitions or materialized query table definitions.

System Action: The statement cannot be executed.

Programmer Response: Drop the views that reference the function before issuing the ALTER FUNCTION statement. Drop the materialized query tables that reference the functions or alter the materialized query tables that reference the functions into base tables before issuing the ALTER FUNCTION statement.

SQLSTATE: 42927

-20074 THE OBJECT *object-name* CANNOT BE CREATED BECAUSE THE FIRST THREE CHARACTERS ARE RESERVED FOR SYSTEM OBJECTS

Explanation: In general, SYS is a reserved prefix for names. The only exceptions are:

- SYSADM and SYSTOOLS are valid schema names.
- SYSPROC is a valid schema name for stored procedures.

- SYSIBM is a valid schema name for a stored procedure when the current application process has the SYSADM or SYSCTRL privilege.
- SYSTOOLS is a valid schema name when the current application process has the SYSADM or SYSCTRL privilege.

This condition is similar to the condition reported in precompiler message DSNH794I.

This message is also issued if an attempt is made to grant the CREATEIN, ALTERIN or DROPIN privileges on a schema with the SYS prefix. The same exceptions apply to the grant.

System Action: The statement is not executed.

Programmer Response: Select a name that does not start with a reserved prefix.

SQLSTATE: 42939

-20091 A VIEW NAME WAS SPECIFIED AFTER LIKE IN ADDITION TO THE INCLUDING IDENTITY COLUMN ATTRIBUTES CLAUSE

Explanation: The LIKE clause specified the name of a view in combination with the INCLUDING IDENTITY COLUMN ATTRIBUTES clause. This usage is not supported.

System Action: The statement is not executed.

Programmer Response: Remove the INCLUDING IDENTITY COLUMN ATTRIBUTES clause and resubmit the statement to copy the existing view definition without the identity column attributes.

In the case of DECLARE GLOBAL TEMPORARY TABLE, it is possible to get the identity column attributes for a column of a view using the AS *subselect* clause with INCLUDING IDENTITY COLUMN ATTRIBUTES instead. For example:

```
DECLARE GLOBAL TEMPORARY TABLE ....
AS (SELECT * FROM view-name) DEFINITION ONLY
INCLUDING IDENTITY COLUMN ATTRIBUTES
```

SQLSTATE: 560AD

-20092 A VIEW WAS SPECIFIED FOR LIKE BUT IT INCLUDES A ROWID COLUMN

Explanation: The LIKE clause specified the name of a view that contains a ROWID column. This is not supported.

System Action: The statement is not executed.

Programmer Response: Specify the name of a view that does not contain a ROWID column (or distinct type column for which the source type is ROWID), or specify the name of a table and resubmit the statement.

SQLSTATE: 560AE

-20093 THE TABLE *table-name* CANNOT BE CONVERTED TO OR FROM A MATERIALIZED QUERY TABLE, OR THE MATERIALIZED QUERY TABLE PROPERTY CANNOT BE ALTERED. REASON CODE = *reason-code*.

Explanation: The ALTER TABLE statement was not able to change a table from a materialized query table to a base table, to convert a base table to a materialized query table, or to change the materialized query table properties. The ALTER TABLE statement failed because of one of the following error situations, as indicated by *reason-code*:

reason-code

	Description
2	The table is not a materialized query table, and DROP MATERIALIZED QUERY is specified.
4	The table has at least one trigger defined.
5	The table has at least one check constraint defined.
6	The table has at least one unique constraint or index defined.
7	The table has at least one referential constraint defined.
8	The table is referenced in the definition of an existing materialized query table, or it is referenced in the definition of a view when altering to a system-maintained materialized query table.
9	The table is referenced directly or indirectly (through a view, for example) in the fullselect.
10	The table is already a materialized query table.
11	The number of columns of the existing table does not match the number of columns that are defined in the select list of the fullselect.
12	The data types of the columns of the existing table do not exactly match the corresponding columns in the select list of the fullselect.
13	The column names of the columns of the existing table do not exactly match the corresponding column names in the select list of the fullselect.
14	The nullability, default, or other characteristics of the columns of the existing table do not exactly match the characteristics of the corresponding columns in the select list of the fullselect.
15	The conversion cannot be performed if there are any other table alterations in the same ALTER TABLE statement.

16 The table is not a materialized query table, and alteration of materialized query table properties was specified.

System Action: The statement cannot be processed.

Programmer Response: Depending on *reason-code*, take the following action:

reason-code

Action

2 There is no need to convert this table. No action is required.

4 Drop any triggers, and try the ALTER TABLE statement again.

5 Drop any check constraints, and try the ALTER TABLE statement again.

6 Drop any unique constraint and unique indexes. Try the ALTER TABLE statement again.

7 Drop the referential constraints, and try the ALTER TABLE statement again.

8 Drop the materialized query table that references the table, and try ALTER TABLE statement again.

9 A materialized query table cannot reference itself. Modify the fullselect to remove the direct or indirect reference to the table being altered.

10 The operation is not allowed since the table is already a materialized query table.

11 Modify the fullselect to include the correct number of columns in the select list.

12 Modify the fullselect so that the result column data types exactly match the data types of the corresponding existing columns.

13 Modify the fullselect so that the result column names exactly match the column names of the corresponding existing columns.

14 The table cannot be converted to a materialized query table unless the the nullability characteristics can be matched. Create a new materialized query table instead.

15 Perform the other table alterations in an ALTER TABLE statement that do not include the ADD MATERIALIZED QUERY clause.

16 Either correct the table name to specify a materialized query table, or use the ALTER TABLE statement to convert the table to a materialized query table with the required properties.

SQLSTATE: 428EW

-20100 AN ERROR OCCURRED WHEN BINDING A TRIGGERED SQL STATEMENT. INFORMATION RETURNED: SECTION NUMBER : *section-number* **SQLCODE** *sqlerror*, **SQLSTATE** *sqlstate*, **AND MESSAGE TOKENS** *token-list*

Explanation: During execution of a CREATE TRIGGER statement, the SQL statements specified in the triggered action are bound into a trigger package. During that processing, an error was discovered in one of those statements.

section-number

The section number associated with the failing triggered SQL statement. For triggers that contain a WHEN clause, the WHEN clause is section number one. The triggered SQL statements are numbered sequentially, beginning with section number two. This is true for triggers with or without a WHEN clause.

sqlcode

The SQLCODE received when binding the statement.

sqlstate

The corresponding SQLSTATE for the SQLCODE received when binding the statement.

token-list

The list of tokens from the original SQL error. This list might be truncated.

System Action: The CREATE TRIGGER statement was not processed. The trigger and the trigger package were not created.

Programmer Response: Use the section number determine the failing triggered SQL statement. Refer to the explanation of the reported SQLCODE. Follow the action suggested by that message.

SQLSTATE: 56059

-20101 THE FUNCTION *function* FAILED WITH REASON *rc*

Explanation: The statement attempted to execute a function *function*. The statement failed, Reason Code *rc*

Possible values for *rc* are: 00E73001, 00E73002, 00E73003, and 00E73004.

System Action: The statement cannot be executed.

Programmer Response: Correct the condition described by the DB2 reason code.

SQLSTATE: 56060

-20102 CREATE OR ALTER STATEMENT FOR ROUTINE *routine-name* SPECIFIED THE *option* OPTION WHICH IS NOT ALLOWED FOR THE TYPE OF ROUTINE

Explanation: An option was specified that is not allowed for the type of routine being created or altered.

- MODIFIES SQL DATA is not allowed for table functions.
- ALLOW PARALLEL is not allowed for table functions.
- CARDINALITY is not allowed for non-table functions.
- LANGUAGE SQL is not allowed for non-SQL functions or procedures.
- LANGUAGE specifying something other than SQL is not allowed for SQL functions or procedures.
- LANGUAGE JAVA is not allowed for table functions.
- PARAMETER STYLE JAVA is not allowed for table functions.

System Action: The statement cannot be processed.

Programmer Response: Remove the option from the statement and reissue the failing statement.

SQLSTATE: 42849

-20104 AN ATTEMPT TO ALTER A CCSID FROM *from-ccsid* TO *to-ccsid* FAILED

Explanation: The statement attempted to alter the CCSID for a database or table space and the statement failed.

from-ccsid represents the CCSID that is currently in use for the database or table space.

to-ccsid is the CCSID that specified on the alter statement.

System Action: The statement cannot be executed.

Programmer Response: The SQL REFERENCE contains a list of CCSIDs that may be specified on this statement. Only CCSIDs specified in this appendix may be altered, and then, only to the corresponding value listed in the table. Altering the CCSID of a database or table space to a value not listed in the table is not permitted.

SQLSTATE: 42856

-20106 THE CCSID FOR TABLE SPACE OR DATABASE CANNOT BE CHANGED BECAUSE THE TABLE SPACE OR DATABASE ALREADY CONTAINS A TABLE THAT IS REFERENCED IN EXISTING VIEW OR MATERIALIZED QUERY TABLE DEFINITIONS

Explanation: An ALTER statement cannot be used to alter the CCSID for a table space or database that contains a table that is referenced in existing view definitions.

System Action: The statement cannot be executed.

Programmer Response: To alter the CCSID for the specified space, first drop any existing view definitions that refer to tables contained in the identified space and then reissue the ALTER statement.

SQLSTATE: 42945

-20107 HOST VARIABLE OR PARAMETER NUMBER *position-number* CANNOT BE USED AS SPECIFIED BECAUSE REASON *reason*

Explanation: DB2 received data that could not be used as specified in the statement because it is not convertible to an acceptable format in this machine environment.

position-number identifies either the host variable number (if the message is issued as a result of an INSERT, UPDATE, DELETE, SELECT, SET, or VALUES statement), or the parameter number (if the message is issued as the result of a CALL statement, or the invocation of a function).

reason

- 01** IEEE (BFP) floating point instructions or instruction emulation is not available. This support is called the basic-floating-point-extensions facility, and is discussed in detail in *z/Architecture Principles of Operation*.

System Action: The statement cannot be executed.

Programmer Response: This host variable or parameter requires machine instructions that are not available on this machine. These instructions must be available to DB2 to perform the requested operation. Run this statement on a machine that is capable of supporting the required operations. Contact your system administrator.

SQLSTATE: 53022

-20108 A RESULT SET CONTAINS AN UNSUPPORTED DATA TYPE IN POSITION NUMBER *position-number* FOR CURSOR *cursor-name* OPENED BY STORED PROCEDURE *procedure-name*

Explanation: Stored procedure *procedure-name* cannot return one or more query result sets. *cursor-name* indicates the first query result set that the stored procedure cannot return. The column at *position-number* in the query result set contains a data type that is not supported by the requester or the server.

System Action: The CALL statement cannot be executed.

Programmer Response: Modify the stored procedure at the server to return result sets that include only data

types that are supported by the requester. You may also upgrade the level of code at the requester to one that supports the data type(s) that were returned by the server.

SQLSTATE: 56084

-20110 CANNOT IMPLICITLY CONNECT TO A REMOTE SITE WITH A SAVEPOINT OUTSTANDING

Explanation: The statement referenced an object at a remote DBMS with an alias or a three-part name when an active savepoint exists. Such a reference requires an implicit connection to the remote DBMS, which is not allowed when there is an outstanding savepoint.

System Action: The statement is not executed.

Programmer Response: Either release the savepoint, or move the data.

SQLSTATE: 51036

-20111 CANNOT ISSUE SAVEPOINT, RELEASE SAVEPOINT, ROLLBACK TO SAVEPOINT FROM A TRIGGER, FROM A USER-DEFINED FUNCTION, OR FROM A GLOBAL TRANSACTION

Explanation: SAVEPOINT, RELEASE SAVEPOINT, and ROLLBACK TO SAVEPOINT statements can not be used in the body of a trigger or a global transaction.

System Action: The statement is not executed.

Programmer Response: Correct the logic of the application program so that this error does not occur.

SQLSTATE: 3B503

-20123 CALL TO STORED PROCEDURE *procedure* FAILED BECAUSE THE RESULT SET RETURNED FOR CURSOR *cursor* IS SCROLLABLE, BUT THE CURSOR IS NOT POSITIONED BEFORE THE FIRST ROW

Explanation: A scrollable result set for cursor *cursor* has been returned by a CALL to stored procedure *procedure*, and one or more of these cursors is not positioned before the first row.

System Action: The Call to the stored procedure was unsuccessful. All result set cursors defined in the stored procedure were closed before returning to the caller. The scrollable cursor can not be used to FETCH from the result set. Actions completed by the stored procedure are not rolled back, and any external actions initiated by the stored procedure have completed because the error was detected upon completion of the stored procedure.

Programmer Response: Modify the content of the stored procedure to ensure that the result set cursors

are positioned before the first row before returning to the caller.

SQLSTATE: 560B1

-20124 OPEN CURSOR *cursor* FAILED BECAUSE THE CURSOR IS SCROLLABLE BUT THE CLIENT DOES NOT SUPPORT THIS

Explanation: The cursor *cursor* has been defined as scrollable, but the client is downlevel and does not support scrollable cursors. The DRDA Application Requestor is not able to process scrollable result sets.

System Action: The statement cannot be processed.

Programmer Response: Modify the definition of the cursor to not be scrollable.

SQLSTATE: 560B2

-20125 CALL TO STORED PROCEDURE *procedure* FAILED BECAUSE THE RESULT SET FOR CURSOR *cursor* IS SCROLLABLE, BUT THE CLIENT DOES NOT SUPPORT THIS

Explanation: A scrollable result set for cursor *cursor* has been returned by a CALL for stored procedure *procedure*, but the client is downlevel and does not support scrollable cursors. The DRDA Application Requestor is not able to process scrollable result sets.

System Action: The statement cannot be processed. All result set cursors that are defined in the stored procedure were closed before returning to the caller. The scrollable cursor cannot be used to FETCH from the result set. Actions that were completed by the stored procedure are not rolled back, and any actions that were initiated by the stored procedure have completed because the error was detected at the end of the execution of the stored procedure.

Programmer Response: Modify the content of stored procedure *procedure* to not define result set cursors as scrollable.

SQLSTATE: 560B3

-20127 VALUE SPECIFIED ON FETCH STATEMENT FOR ABSOLUTE OR RELATIVE IS TOO LARGE FOR DRDA

Explanation: The value that was specified after ABSOLUTE or RELATIVE on a FETCH statement is larger than 64 bits. DRDA limits this specification to 64 bits.

System Action: The statement cannot be processed.

Programmer Response: Modify the scroll specification on the FETCH statement.

SQLSTATE: 56051

-20129 LOCAL SPECIAL REGISTER IS NOT VALID AS USED

Explanation: Local special registers cannot be referenced in an assignment statement (SET or VALUES INTO) that assigns multiple values. For example, the following special registers are local: CURRENT SERVER and CURRENT PACKAGESET.

Additionally, the local special registers cannot be referenced in a SET host-variable statement that has parenthesis around the special register.

The following statements are not valid:

```
SET (:hv1) = (CURRENT SERVER);
SET (:hv1,:hv2) = (CURRENT SERVER,CURRENT
PATH);
VALUES CURRENT SERVER, CURRENT DATE
INTO :c1, :c2;
```

Severity: 8 (error)

System Action: The statement cannot be executed.

Programmer Response: Split the statement into multiple statements so that the local special registers are not referenced in a statement that assigns multiple values. Also be sure that a SET statement for a local special register does not use parenthesis on either side of the equal sign.

SQLSTATE: 560B5

-20142 SEQUENCE *sequence-name* CANNOT BE USED AS SPECIFIED

Explanation: *sequence-name* was referenced in a context in which it cannot be used. It was an invalid reference to a system-generated sequence object. *sequence-name* is a sequence that was generated by the system for an identity column. These sequences cannot be referenced in:

- An ALTER SEQUENCE statement
- A DROP SEQUENCE, COMMENT ON SEQUENCE, GRANT, or REVOKE statement
- A NEXTVAL or PREVVAl expression

System Action: The statement cannot be executed.

Programmer Response: Specify the name of a user-defined sequence object in this context.

SQLSTATE: 428FB

-20143 THE ENCRYPTION OR DECRYPTION FUNCTION FAILED, BECAUSE THE ENCRYPTION PASSWORD VALUE IS NOT SET

Explanation: The ENCRYPTION PASSWORD value is not set.

System Action: The statement cannot be executed

Programmer Response: Issue the SET

ENCRYPTION PASSWORD statement to set the ENCRYPTION PASSWORD value. The length of the PASSWORD must be a minimum of 6 bytes and a maximum of 127 bytes.

SQLSTATE: 51039

-20144 THE ENCRYPTION IS INVALID BECAUSE THE LENGTH OF THE PASSWORD WAS LESS THAN 6 BYTES OR GREATER THAN 127 BYTES

Explanation: The data must be encrypted with a password length between 6 and 127 bytes.

System Action: The statement cannot be executed

Programmer Response: Ensure that your password length is between 6 and 127 bytes in length.

SQLSTATE: 428FC

-20146 THE DECRYPTION FAILED. THE DATA IS NOT ENCRYPTED

Explanation: The data must be encrypted before it is decrypted.

System Action: The statement cannot be executed

Programmer Response: Ensure that the data being decrypted has been encrypted using the ENCRYPT_TDES built-in-function.

SQLSTATE: 428FE

-20147 THE ENCRYPTION FUNCTION FAILED. MULTIPLE PASS ENCRYPTION IS NOT SUPPORTED

Explanation: Data that has already been encrypted, cannot be encrypted again.

System Action: The statement cannot be executed

Programmer Response: Ensure that the data that is being encrypted has not already been encrypted.

SQLSTATE: 55048

-20163 HEXADECIMAL CONSTANT GX IS NOT ALLOWED

Explanation: A hexadecimal graphic string constant, GX, was used in a statement when one of the following two conditions was true:

- The MIXED DATA install option is set to NO.
- The application encoding scheme is UNICODE.
- The GX constant was specified as a column default value in a WITH DEFAULT clause.
- The GX constant was specified as a limit key value in a VALUES clause.

System Action: The statement cannot be executed.

Programmer Response: If your data is not graphic, use an X hexadecimal constant instead of a GX constant. If your MIXED DATA install option is set to NO, contact your system administrator to set up the installation options properly for use with the GX constant. If your application encoding scheme is UNICODE, use a UX hexadecimal constant instead of GX.

SQLSTATE: 560B9

**-20165 INSERT STATEMENT WITHIN A
SELECT IS NOT ALLOWED IN THE
CONTEXT IN WHICH IT WAS
SPECIFIED**

Explanation: An INSERT statement can be specified in the FROM clause of a SELECT in specific contexts. It is only allowed as the only table-spec in the FROM clause of a SELECT statement (excluding the common table expressions) that is a subselect or a SELECT INTO statement.

System Action: The statement cannot be processed.

Programmer Response: Change the statement so that the INSERT statement is used only in a SELECT statement that is a subselect or a SELECT INTO statement. Ensure that the INSERT statement in the FROM clause is the only table-spec in the FROM clause.

SQLSTATE: 428FL

**-20166 INSERT STATEMENT WITHIN A
SELECT SPECIFIED A VIEW *view-name*
WHICH IS NOT A SYMMETRIC VIEW**

Explanation: The target view of the INSERT statement within a SELECT statement must be defined WITH CASCADED CHECK OPTION or the fullselect in the view definition must not have a WHERE clause.

A symmetric view is a view defined implicitly or explicitly with the WITH CASCADED CHECK OPTION.

System Action: The statement cannot be executed

Programmer Response: Do not use the INSERT statement within a SELECT with the specified view.

SQLSTATE: 428FM

**-20177 SET DATA TYPE CLAUSE ON ALTER
TABLE SPECIFIED FLOATING POINT,
BUT THIS CHANGE IS DISALLOWED**

Explanation: The SET DATA TYPE clause of an ALTER TABLE statement specified floating point as the new data type. However, there is an existing unique index or constraint that is defined on the column. This type of change is not allowed when unique indexes or constraints are defined on the column to be changed.

Programmer Response: Change the statement to

specify a different compatible data type, and resubmit the statement.

SQLSTATE: 530A1

**-20180 COLUMN *column-name* IN TABLE
table-name CANNOT BE ALTERED AS
SPECIFIED**

Explanation: Column *column-name* cannot be altered for one of the following reasons:

- ALTER COLUMN cannot be specified on ALTER TABLE if:
 - The table is defined with DATA CAPTURE CHANGES
 - The column is involved in a referential integrity constraint (either as part of the parent key or foreign key)
 - The column has a field procedure defined
 - or the column is an identity column
- Additionally, SET DATA TYPE cannot be specified on ALTER TABLE if:
 - The table is a materialized query table
 - The table has an edit procedure or valid procedure

System Action: The statement cannot be executed.

Programmer Response: Change the name of the column to a column that can be altered, or drop and recreate the table with the necessary attributes.

SQLSTATE: 428FR

**-20181 COLUMN CANNOT BE ADDED TO
INDEX *index-name***

Explanation: An ALTER INDEX ADD COLUMN statement attempted to add a column to an index that is an auxiliary index, enforces a primary key, unique key, referential constraint, or ROWID column; or, the index is a partitioning index, and index-based partitioning is being used.

System Action: The statement cannot be executed.

Programmer Response: Change the statement to refer to an index that can have a column added to it.

SQLSTATE: 428FS

**-20182 *values* PARTITIONING CLAUSE ON
stmt-type STATEMENT FOR *index-name*
IS NOT VALID**

Explanation: The *values* PARTITIONING clause was not accepted on CREATE or ALTER INDEX statement for one of the following reasons:

- On ALTER INDEX, if the table uses *table-based* CONTROLLED partitioning, or if the index is a partitioning index created in Version 8 or later releases.

- On CREATE INDEX, *values* partitioning attributes were specified on a previous CREATE or ALTER TABLE statement for the table.
- On CREATE INDEX, if the partitioning scheme of the index is predetermined by that of the underlying data.
- When altering partition limit key values, if there are any large object (LOB) columns in the table.

System Action: The statement cannot be executed.

Programmer Response: Change the name of the index to an index for which the *values* partitioning clause would be valid, and resubmit the statement.

SQLSTATE: 530A2

-20183 THE PARTITIONED, ADD PART, ADD PARTITIONING KEY, OR ALTER PART CLAUSE SPECIFIED ON CREATE OR ALTER FOR *name* IS NOT VALID

Explanation: The PARTITIONED, ADD PART, ADD PARTITIONING KEY, and ALTER PART clauses cannot be specified on ALTER TABLE, CREATE INDEX, or CREATE TABLE if:

- The table is a non-partitioned table
- The table is a materialized query table
- A materialized query table is defined on this table

Additionally, the ADD PARTITIONING KEY clause cannot be specified if the table is already complete by having established either table-based partitioning or index-based partitioning.

System Action: The statement cannot be executed.

SQLSTATE: 428FT

-20185 CURSOR *cursor-name* IS NOT DEFINED TO ACCESS ROWSETS, BUT A CLAUSE WAS SPECIFIED THAT IS VALID ONLY WITH ROWSET ACCESS

Explanation: The FOR ROW *n* OF ROWSET clause was specified on a FETCH statement, but the cursor is not defined for rowset access.

System Action: The statement cannot be processed.

Programmer Response: Remove the FOR *n* ROWS clause from the FETCH statement, or redefine the cursor for multiple row access with the WITH ROWSET POSITIONING clause on DECLARE CURSOR or PREPARE.

SQLSTATE: 24518

-20186 A CLAUSE SPECIFIED FOR THE DYNAMIC SQL STATEMENT BEING PROCESSED IS NOT VALID

Explanation: A clause was not valid for one of the following reasons:

- On a PREPARE statement, a FOR SINGLE ROW or FOR MULTIPLE ROWS clause was specified. However, the statement that was being prepared was not an INSERT statement.
- On a PREPARE statement, an ATOMIC or NOT ATOMIC clause was specified. However, the statement that was being prepared was not an INSERT statement.
- On an EXECUTE statement, a multiple-row-insert clause was specified. However, the statement that was being executed was not an INSERT statement.
- On a PREPARE statement, a SENSITIVE DYNAMIC clause and SCROLL clause were specified. However, the content of the query requires the use of a temporary table for processing.
- On an EXECUTE statement, a multiple-row-insert clause was specified. However, the statement that was being executed was not an INSERT statement that was prepared with FOR MULTIPLE ROWS specified as part of the ATTRIBUTES clause on the PREPARE statement.
- On an EXECUTE statement, a multiple-row-insert clause was not specified. However, the statement that was being executed was an INSERT statement, and FOR MULTIPLE ROWS was specified as part of the ATTRIBUTES clause on the PREPARE statement.
- On an EXECUTE statement, a FOR *n* ROWS clause was specified. However, the INSERT statement that was being executed also contained a FOR *n* ROWS clause.
- On an EXECUTE statement, host variable arrays were provided. However, the FOR *n* ROWS clause was not specified (on either the EXECUTE or INSERT statement).

System Action: The statement cannot be processed.

Programmer Response: Remove the clause that was not valid in the context in which it was used.

SQLSTATE: 07501

-20200 THE INSTALL OR REPLACE OF *jar-id* WITH URL *url* FAILED DUE TO REASON *reason-code* (*reason-string*).

Explanation: The URL that was specified on the install or replace jar procedure did not identify a valid jar file.

jar-id Name of the JAR that was specified for INSTALL_JAR or REPLACE_JAR

url Up to 80 characters of the URL are displayed.

The possible values for reason-code and reason-string appear below:

1 (FILE NOT FOUND)

No HFS file was found with the name specified.

2 (URL FORMAT)

The URL must begin with 'file:/' or 'file://'.

3 (FILE SIZE)

The file must not be larger than 100MB.

System Action: The statement cannot be processed.

SQLSTATE: 46001

User Response: Reissue the install or replace jar procedure with a URL that identifies a valid jar file.

-20201 THE INSTALL, REPLACE, OR REMOVE OF *jar-name* FAILED DUE TO REASON *reason-code* (*reason-string*)

Explanation: The jar name *jar-name* that was specified on the install, replace, or remove jar procedure was invalid. For example, the jar may be of the improper format, may not exist to be replaced or removed, or cannot be installed as it already exists.

The possible values for reason-code and reason-string appear below:

1 (UNDEFINED JAR)

A JAR with the name specified on REPLACE_JAR or REMOVE_JAR does not exist in DB2.

2 (SCHEMA LENGTH)

In the jar-name parameter, the schema delimiter '.' was found after more than 128 bytes, but the schema has a maximum of 128 bytes.

3 (NAME LENGTH)

In the jar-name parameter, more than bytes were found after the schema delimiter or the default schema was used, and the Jar name exceeds the maximum of 128 bytes.

4 (PARSER ERROR)

During INSTALL_JAR or REMOVE_JAR processing, the DB2 parser was invoked and returned an error. This may be due to invalid characters or invalid length of the jar name parameter.

5 (DUPLICATE JAR)

A JAR with the name specified on INSTALL_JAR already exists in DB2.

System Action: The statement cannot be processed.

SQLSTATE: 46002

User Response: Correct the jar identifier parameter and re-issue the request.

-20202 THE REPLACE OR REMOVE OF *jar-name* FAILED AS *class* IS IN USE

Explanation: The specified class in the jar file is currently in use by a defined routine, or the replacement

jar file does not contain the specified class for which a routine is defined.

System Action: The statement cannot be processed.

User Response: Ensure all routines referencing the classes being removed are dropped, and resubmit the replace or remove procedure.

SQLSTATE: 46003

-20203 USER-DEFINED FUNCTION OR PROCEDURE *name* HAS A JAVA METHOD WITH AN INVALID SIGNATURE. THE ERROR IS AT OR NEAR PARAMETER *number*. THE SIGNATURE IS *signature*.

Explanation: The signature of the java method that was used to implement the function or procedure was invalid. For example, the method may have parameters that are not mappable to the parameters on the corresponding CREATE PROCEDURE statement.

name identifies the specific name of the external Java function or procedure whose signature caused the error

number indicates the position of the parameter within the signature closest to the error

signature provides at most the first 100 characters of the invalid signature

System Action: The statement is not executed.

Programmer Response: Reissue the corresponding CREATE statement specifying parameters that match the Java method, or correct the specified procedure or function signature.

SQLSTATE: 46007

-20204 THE USER-DEFINED FUNCTION OR PROCEDURE *routine-name* WAS UNABLE TO MAP TO A SINGLE JAVA METHOD

Explanation: A CREATE or ALTER FUNCTION or PROCEDURE statement for *routine-name* specified a Java method in the EXTERNAL NAME clause that cannot be used. The EXTERNAL NAME clause did not contain a matching Java method, or contained more than one matching Java method.

System Action: The statement cannot be processed.

Programmer Response: The EXTERNAL NAME clause of the identified function or procedure must be altered to uniquely identify a valid Java method for the routine, or the Java class must be changed to have a single method with the specified or implicit signature.

SQLSTATE: 46008

-20207 THE INSTALL OR REMOVE OF *jar-name* SPECIFIED THE USE OF A DEPLOYMENT DESCRIPTOR.

Explanation: The DEPLOY or UNDEPLOY parameter of the install or remove jar procedure for *jar-name* was non-zero. Use of deployment descriptors is not supported, and this parameter must be zero.

System Action: The JAR is not installed, or removed.

User Response: Reissue the INSTALL_JAR or REMOVE_JAR procedure call with the DEPLOY or UNDEPLOY parameter set to zero.

SQLSTATE: 46501

-20210 THE SQL STATEMENT CANNOT BE EXECUTED BECAUSE IT WAS AT A LEVEL THAT IS INCOMPATIBLE WITH THE CURRENT VALUE OF THE ENCODING BIND OPTION OR SPECIAL REGISTER

Explanation: The SQL statement was precompiled at a level prior to Version 7, but the current value of the ENCODING bind option or special register does not represent the system EBCDIC CCSIDs. The information that is necessary to execute the SQL statement is unavailable for processing, and the SQL statement cannot be successfully completed. Additional processing of the SQL statement is terminated.

An application that was precompiled prior to DB2 Version 7 may not be bound, either implicitly or explicitly, with an ENCODING bind option of anything other than ENCODING(EBCDIC) or ENCODING(*ccsid*) where *ccsid* represents the system EBCDIC CCSID. If the value of MIXED DATA for the system is YES, then *ccsid* must be the default EBCDIC mixed CCSID. Otherwise, *ccsid* must be the default EBCDIC single byte CCSID.

System Action: The statement cannot be executed.

Programmer Response: To correct the situation, you may:

- Precompile the program again using the current precompiler and reissue the BIND command
- Reissue the BIND command using ENCODING(EBCDIC) or ENCODING(*ccsid*) where *ccsid* represents the system EBCDIC CCSID.

SQLSTATE: 560B8

-20212 USER-DEFINED ROUTINE *name* ENCOUNTERED AN EXCEPTION ATTEMPTING TO LOAD JAVA CLASS *class-name* FROM JAR *jar-name*. ORIGINAL EXCEPTION: *exception-string*.

Explanation: A Java exception occurred while DB2 was trying to load a Java class. The error can occur when loading the class that is identified in the

EXTERNAL NAME clause, or a referenced class. This message could indicate more than that a class was not found. Some examples would be an I/O error occurring when reading the JAR file, or an SQL error occurring when reading the BLOB containing the JAR from the DB2 catalog.

name the specific name of the external Java function or procedure that caused the ClassNotFoundException

class-name the Java class DB2 was trying to load when the error occurred

jar-name the jar that the class was being loaded from, if any

exception-string contains as much of the toString() of the underlying exception that resulted in this ClassNotFoundException as fits, if any

System Action: The statement cannot be executed. A DSNX961 message describing the error will be displayed on the MVS system console.

Programmer Response: Correct the condition reported by the *exception-string*.

SQLSTATE: 46103

-20213 STORED PROCEDURE *procedure-name* HAS RETURNED A DYNAMIC RESULT SET OF AN INVALID CLASS. PARAMETER *number* IS NOT A DB2 RESULT SET

Explanation: A Java Stored Procedure has returned a DYNAMIC RESULT SET parameter that is not an instance of the Java class that was used by the JDBC driver to represent result sets.

procedure-name identifies the external Java procedure whose returned parameter caused the error.

number indicates the position of the parameter whose returned class was not an instance of the Java class that is used by the JDBC driver to represent result sets.

System Action: The CALL statement fails.

Programmer Response: Recreate the Java method to make returned DYNAMIC RESULT SET parameters be instances of the class produced by the DB2 for OS/390 JDBC driver (COM/ibm/db2os390/sqlj/jdbc/DB2SQLJResultSet).

SQLSTATE: 46502

-20223 THE ENCRYPT_TDES OR DECRYPT FUNCTION FAILED. ENCRYPTION FACILITY NOT AVAILABLE *return-code, reason-code*

Explanation: The encryption facility is not available, or not able to service the encryption or decryption request.

System Action: The statement cannot be executed

Programmer Response: If the encryption facility is not installed, then install it before using the ENCRYPT_TDES or DECRYPT functions. If the encryption facility is installed, then verify that it is working correctly. *returncode* and *reason-code* may give further information on the regarding why this message was issued. If the encryption facility is not installed, then install it before using the ENCRYPT_TDES or DECRYPT functions. If the encryption facility is installed, then verify that it is working correctly. *returncode* and *reason-code* may give further information on the regarding why this message was issued. Consult *ICSF Application Programmers Guide*, Appendix A, for the ICSF Return Code and ICSF Reason Codes for further information.

SQLSTATE: 560BF

-20227 REQUIRED CLAUSE IS MISSING FOR ARGUMENT *number OF expression*

Explanation: The *expression* expression requires that a clause be specified for argument *number*.

- If *expression* is XMLATTRIBUTES, then an AS clause is required for the XML attribute name.
- If *expression* is XMLFOREST, then an AS clause is required for the XML element name.

System Action: The statement cannot be processed.

Programmer Response: Correct the statement by providing the required clause for the argument.

SQLSTATE: 42633

-20232 CHARACTER CONVERSION FROM CCSID *from-ccsid* TO *to-ccsid* FAILED WITH ERROR CODE *error-code* FOR TABLE *dbid.obid* COLUMN *column-number* REQUESTED BY *csect-name*

Explanation: A conversion error occurred during the conversion of a string to a different coded character set.

from-ccsid

identifies the coded character set of the string to be converted.

to-ccsid

identifies the coded character set to which it must be converted.

error-code

indicates the type of error as defined as follows:

- 8 - Length exception (for example, expansion required for PC MIXED data exceeds the maximum length of the string).
- 20 - Translate procedure error (for example, an error during Unicode/390 stage 2 conversions or an exit set the length control field of the string to an invalid value).
- 24 - The conversion services have not been setup correctly or the conversion is not supported.

dbid.obid

gives the database id and the table obid of the object with the conversion error. This could be either the target or the source of the conversion.

column-number

gives the column number of the failing object. This could be either the target or the source of the conversion.

csect-name

describes the reason codes returned from DB2. Reason codes returned from DB2 begin with 'DSN' and identify the context in which the conversion was requested. Values other than those that start DSN' are returned from other DB2 platforms and are described in the documentation for the platform.

System Action: The statement cannot be processed.

Programmer Response: If the error-code is 24 and the conversion request is correct, refer to Appendix B of *DB2 Installation Guide* for information on how to add conversion support. For all the other error-codes, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

SQLSTATE: 57017

-20235 THE COLUMN *column-name* CANNOT BE ADDED OR ALTERED BECAUSE *table-name* IS A MATERIALIZED QUERY TABLE

Explanation: The alter table statement attempted to add or alter column *column-name* of materialized query table *table-name*. This is not allowed.

System Action: The statement could not be processed.

Programmer Response: Columns of materialized query tables cannot be added, altered, or dropped. Alter the materialized query table to become a regular table before adding, altering, or dropping a column.

SQLSTATE: 428FY

-20240 **INVALID SPECIFICATION OF A SECURITY LABEL COLUMN**
column-name **REASON CODE**
reason-code

Explanation: For a security label column the specification of an attribute in a CREATE TABLE, or ALTER TABLE, DECLARE GLOBAL TEMPORARY TABLE, or CREATE GLOBAL TEMPORARY TABLE statement may be invalid for one of the following reasons:

- The underlying data type of the security label column is not supported. A security label column must be defined as CHAR(8) for single-byte data.
- An edit procedure was specified for the table with a security label column.
- A security label column must be defined as NOT NULL WITH DEFAULT.
- A security label column cannot be defined for a created global temporary table.
- The data type of a security label column cannot be altered.
- A security label column cannot be defined for a table that is the source for a materialized query table.
- A check constraint cannot specify a security label column.

System Action: The statement cannot be executed.

Programmer Response: Correct the syntax and resubmit the statement.

SQLSTATE: 42963

-20248 **ATTEMPTED TO EXPLAIN A CACHED STATEMENT WITH STMTID OR STMTOKEN *ID-token* BUT THE REQUIRED EXPLAIN INFORMATION IS NOT ACCESSIBLE.**

Explanation: The EXPLAIN statement cannot be executed because the required explain information is not accessible due to one of the following reasons:

1. The SQL statement with specified ID or token has never been cached because dynamic statement caching was not on when the statement was executed.
2. The statement with specified ID or token was cached before but is not in cache anymore (it was either invalidated or removed from cache by LRU algorithm).
3. The current user is not authorized to explain the statement with specified ID or token.

System Action: The statement cannot be executed.

Programmer Response: Perform the following steps:

1. Check if dynamic statement caching is on and if the statement ID or token is correct. The EXPLAIN

statement cannot be executed if dynamic statement caching has never been turned on.

2. Re-execute (or re-prepare) the statement to be explained, find the updated statement ID or token, and explain it again.
3. Correct the authorization problem and re-execute the EXPLAIN statement.

SQLSTATE: 26501

-20249 **THE PACKAGE *package-name* NEEDS TO BE REBOUND IN ORDER TO BE SUCCESSFULLY EXECUTED (*token*)**

Explanation: The package needs to be rebound for one of the following reasons:

- Package *package-name* was bound on a system with an older maintenance level that is no longer supported. The package needs to be rebound on a system with a maintenance level that is supported.
- Package *package-name* was bound on a newer maintenance level, but it was sent to execute on a system with an older maintenance level. In this case, the APAR *token* needs to be applied to the server before executing this package.

System Action: The statement cannot be executed.

Programmer Response: Take the appropriate action as explained in the explanation.

SQLSTATE: 560C5

-20252 **DIAGNOSTICS AREA FULL. NO MORE ERRORS CAN BE RECORDED FOR THE NOT ATOMIC STATEMENT**

Explanation: A statement with the NOT ATOMIC CONTINUE ON SQLEXCEPTION clause encountered more errors than could be recorded in the diagnostics area. NOT ATOMIC processing with CONTINUE ON SQLEXCEPTION allows DB2 to continue processing a statement after one or more errors is encountered. DB2 will continue processing until it is no longer able to record errors in the diagnostic area (See the GET DIAGNOSTICS statement for information on how to retrieve error information). When DB2 is no longer able to record error diagnostics, processing of the statement is terminated, and this error is returned.

System Action: The statement is terminated.

Programmer Response: Analyze the warning and error conditions using the GET DIAGNOSTICS statement. Determine how to change the statement to eliminate or reduce the number of warnings and errors. It is up to the programmer to determine if a ROLLBACK or COMMIT should be issued for this message. Either is appropriate depending on the application logic.

SQLSTATE: 429BI

-20264 FOR TABLE *table-name*, *primary-auth-id* WITH SECURITY LABEL *primary-auth-id-seclabel*, IS NOT AUTHORIZED TO PERFORM *operation* ON A ROW WITH SECURITY LABEL *row-seclabel*. THE RECORD IDENTIFIER (RID) OF THIS ROW IS *rid-number*.

Explanation: *primary-auth-id* attempted an MLS READWRITE operation on a row without having the proper Multilevel Security (MLS) authorization. The RID identifies this row.

The RID may be *N when a RID identifier is not available for the row.

System Action: The operation that was attempted could not be performed.

Programmer Response: If this user is authorized to perform this operation, ensure that this user has been properly defined to MLS. If the row data needs to be viewed, use DSN1PRINT.

In the case of a view or cursor, where the primary authorization ID is able to access more rows than it can update or delete, you can add the WHERE clause to limit the rows accessed, based on the security label of the primary authorization ID. The security label can be retrieved using GETVARIABLE(SYSIBM.SECLABEL).

SQLSTATE: 42512

-20265 SECURITY LABEL IS *reason* FOR *primary-auth-id*

Explanation: User *primary-auth-id* has a blank security label, or the security label is not accessible. *reason* is BLANK or INACCESSIBLE.

System Action: The operation that was attempted could not be performed.

Programmer Response: Ensure the value that was specified for the security label of this user is a valid security label. If it is valid, then this error may be caused if the SECLABEL class in the Security Server has not been activated.

SQLSTATE: 42501

-20266 ALTER VIEW FOR *view-name* FAILED INFORMATION RETURNED: **SQLCODE:** *sqlcode*, **SQLSTATE:** *sqlstate*, **MESSAGE TOKENS** *token-list*

Explanation: An ALTER VIEW statement was issued for *view-name*, but the view cannot be successfully regenerated.

System Action: The statement cannot be processed.

SQLSTATE: 560C7

-20281 *primary-auth-id* DOES NOT HAVE THE MLS WRITE-DOWN PRIVILEGE

Explanation: This operation requires the Multilevel Security write-down privilege.

System Action: This operation cannot be performed.

Programmer Response: Ensure that the user has the MLS write-down privilege when write-down is in effect.

SQLSTATE: 42513

-20286 DB2 CONVERTED STRING *token-type* *token* FROM *from-ccsid* TO *to-ccsid*, AND RESULTED IN SUBSTITUTION CHARACTERS

Explanation: A conversion error occurred during the conversion of a string for *token-type* *token* to a different coded character set. One or more substitution characters have been placed in the string during the conversion process.

System Action: The statement cannot be processed.

Programmer Response: Ensure that the data that is provided to DB2 can be converted from *from-ccsid* to *to-ccsid* without data loss.

SQLSTATE: 428GB

-20289 INVALID STRING LENGTH UNIT *unit* SPECIFIED FOR FUNCTION *function-name*

Explanation: The statement invoked a built-in function using a string length unit that is not valid with the type of data that is provided to the function. This can occur for the following reasons:

- non-string data that is specified with an explicit length unit *unit* for the LENGTH function. A string length unit cannot be specified for non-string data.
- bit data or binary data was specified with *unit*. CODEUNITS16, or CODEUNITS32 are not valid with bit data or binary string data.
- graphic data was specified with OCTETS as the string length unit. OCTETS is not valid with graphic data.

System Action: The statement cannot be executed.

Programmer Response: Change the invocation of the function to remove the invalid string length unit or change it to a valid unit for the data type being processed.

SQLSTATE: 428GC

-30000 EXECUTION FAILED DUE TO A DISTRIBUTION PROTOCOL ERROR THAT WILL NOT AFFECT THE SUCCESSFUL EXECUTION OF SUBSEQUENT COMMANDS OR SQL STATEMENTS: REASON *reason-code* (*sub-code*)

Explanation: A DRDA protocol error has resulted which prevented successful execution of the current SQL statement. The error was such that it will not preclude the successful execution of further SQL statements.

System Action: The statement cannot be executed. The SQLCA is formatted. Message DSNL0311 or DSNL0321, which might contain additional diagnostic information, might be issued to the MVS console.

Programmer Response: Notify the DBA for assistance in analysis of the SQL statement which yielded this SQLCODE.

Problem Determination: The 'reason-code' identifies the DDM code point which represents the DDM reply message received from the remote server in response to the attempt to execute the SQL statement. These represent internal errors detected at the remote server or possibly, by the local DB2 functions.

The 'reason-code' value is the two-byte hexadecimal code point for the DDM reply message that represents the error and is one of the following:

- X'1254' - CMDCHKRM
- X'220A' - DSCINVRM
- X'220E' - DTAMCHRM
- X'1245' - PRCCNVRM
- X'2202' - QRYNOPRM
- X'220F' - QRYPOPRM
- X'2207' - RDBACCRM
- X'2204' - RDBNACRM
- X'124C' - SYNTAXRM

A two-byte 'sub-code' accompanies 'reason-codes' X'220A' (DSCINVRM), X'1245' (PRCCNVRM), and X'124C' (SYNTAXRM). In all other cases, the 'sub-code' is zero.

The 'sub-code' when nonzero, consists of two bytes such that the high-order byte indicates the site at which the error was detected. This is X'01' if the error was detected by the local DB2; it is X'02' if the error was detected by the remote server. The low-order byte is dependent on the 'reason-code' as follows:

1. Description Error Code (DSCERRCD) if 'reason-code' = X'220A' (DSCINVRM).
2. Syntax Error Code (SYNERRCD) if 'reason-code' = X'124C' SYNTAXRM).
3. Conversational Protocol Error Code (PRCCVNCD) if 'reason-code' = X'1245' (PRCCNVRM).

Refer to the *IBM Distributed Data Management (DDM) Reference Guide* for a detailed discussion of the semantics of the DDM terms DSCERRCD, SYNERRCD, and PRCCNVCD.

SQLSTATE: 58008

-30002 THE SQL STATEMENT CANNOT BE EXECUTED DUE TO A PRIOR CONDITION IN A CHAIN OF STATEMENTS

Explanation: An SQL statement was chained to PREPARE, but the PREPARE statement has received a warning SQLCODE that requires the program or end user to either re-issue the chained statement or issue a different SQL request. This error can occur only in a client/server environment.

- A distributed client using DRDA has chained an OPEN statement to a PREPARE, but the PREPARE statement received SQLCODE +495.

System Action: The statement cannot be executed as chained.

Programmer Response: The statement must be sent again as a separate request.

SQLSTATE: 57057

-30005 EXECUTION FAILED BECAUSE FUNCTION NOT SUPPORTED BY THE SERVER: LOCATION *location* PRODUCT ID *pppvrr* REASON *reason-code* (*sub-code*)

Explanation: The current SQL statement failed because the SQL statement was routed to a server that does not support the requested function. The error was such that it will not preclude the successful processing of further SQL statements.

System Action: The statement cannot be executed. The SQLCA is formatted.

Programmer Response: Notify the DBA for assistance in analyzing the SQL statement that prompted this SQL code.

Problem Determination: *location* identifies the name of the server that could not support the required database protocols to perform the requested function. The product identifier is in the form *pppvrrm*. It is an eight-byte field with alphanumeric characters, and identifies the product that could not support the function. *ppp* identifies the specific database product. *vv* identifies the product version. *rr* identifies the product release level. *m* identifies the product modification level.

Possible values for *pppvrrm*:

ppp DSN for z/OS, ARI for VM/VSE, SQL for Unix/Windows/NT, QSQ for iSeries, and JCC for Java

| **vv** Version number
 | **rr** Release level
 | **m** Modification level

| To correct the problem, first identify the function that is not supported. To determine what function was not supported, and why, refer to the *reason-code* that was specified. Here are the possible values for *reason-code*, and the functions that they correspond to:

- | **0010** LONG_STMTS
- | **0010** LONG255_IDS
- | **0030** EXTENDED_DESCRIBE
- | **0040** EXTENDED_DIAGNOSTICS
- | **0050** KEEP_DYNAMIC
- | **0060** MULTI_ROW_FETCH
- | **0070** MULTI_ROW_INSERT
- | **0080** SQL_CANCEL
- | **0090** SCROLLABLE_CURSORS
- | **0100** CURSOR_ATTRIBUTES
- | **0110** MONITORING
- | **0120** SELECT_WITH_INSERT
- | **0130** DATA_ENCRYPTION
- | **0140** PACKAGE_PATH

| Lastly, you may use the *sub-code* value to further identify the problem. When non-zero, the *sub-code* consists of a one-byte code to indicate how the error was detected in the network:

- | • If '01'x, then the local DB2 that is acting as the requester detected the error. The LOCATION and PRDID identify the server in error.
- | • If '02'x, then the server detected the error. The LOCATION and PRDID identify the location and level of the local DB2 server.
- | • If '03'x, then an intermediate server (hop site) detected the error. The error, the LOCATION, and PRDID identify the server in error.
- | • If '04'x, then an intermediate server (hop site) detected the error. The error, the LOCATION, and PRDID identify the server in error.

| **SQLSTATE:** 56072

-30020 EXECUTION FAILED DUE TO A DISTRIBUTION PROTOCOL ERROR THAT CAUSED DEALLOCATION OF THE CONVERSATION: REASON
<reason-code (sub-code)>

Explanation: A DRDA protocol error has occurred that prevented the successful execution of the current SQL

statement or command, as well as any subsequent SQL statements.

The 'reason-code' identifies the DDM code point which represents the DDM reply message received from the remote server in response to the attempt to execute the SQL statement. These represent internal errors detected at the remote server site or possibly, by the local DB2 functions.

The 'reason-code' value is the two-byte hexadecimal code point for the DDM reply message that represents the error and is one of the following:

- X'1232' - AGNPRMRM
- X'1254' - CMDCHKRM
- X'220A' - DSCINVRM
- X'220E' - DTAMCHRM
- X'0010' - FDODSC
- X'1218' - MGRDEPRM
- X'1245' - PRCCNVRM
- X'241A' - QRYDSC
- X'2202' - QRYNOPRM
- X'220F' - QRYPOPRM
- X'2207' - RDBACCRM
- X'2204' - RDBNACRM
- X'124C' - SYNTAXRM

A two byte sub-code accompanies 'reason codes'. The sub-code, when nonzero, consists of two bytes such that the high-order byte indicates the site at which the error was detected. This is X'01' if the error was detected by the local DB2; It is X'02' if the error was detected by the remote server. The low-order byte is dependent upon the 'reason code' as follows:

- Description Error Code (DSCERRCD) if reason code= X'220A' (DSCINVRM).
- Syntax Error Code (SYNERRCD) if reason code = X'124C' (SYNTAXRM).
- Conversational Protocol Error Code (PRCCVNCD) if reason code = X'1245' (PRCCNVRM).
- Manager Dependency Error Code (DEPERRC) if reason code = X'1218' (MGRDEPRM).

Refer to *IBM Distributed Data Management (DDM) Reference Guide* for a detailed discussion of the semantics of the DDM terms DSCERRCD, SYNERRCD, PRCCVNCD, and DEPERRC.

System Action: The statement cannot be executed. The SQLCA is formatted and the conversation on which the error was detected is deallocated. Message DSNL0311 or DSNL0321, which might contain additional diagnostic information, might be issued to the MVS console.

Programmer Response: The connection to the server has been broken, and the server has, therefore, rolled back the unit of work. In this case, the only SQL statement that may be successfully executed is ROLLBACK. However, if the requester detects this error on a COMMIT, then it is unknown whether the unit of work was committed or rolled back at the server.

SQLSTATE: 58009

-30021 EXECUTION FAILED DUE TO A DISTRIBUTION PROTOCOL ERROR THAT WILL AFFECT THE SUCCESSFUL EXECUTION OF SUBSEQUENT COMMANDS OR SQL STATEMENTS: MANAGER *manager* AT LEVEL *level* NOT SUPPORTED ERROR

Explanation: A DRDA error occurred that prevented the successful execution of the current SQL statement or command and any subsequent SQL statements.

A manager-level conflict was detected during the processing of the DDM EXCSAT command. Refer to the *IBM Distributed Data Management (DDM) Reference Guide* for a detailed description of EXCSAT processing and errors.

The *manager* value is the 2-byte hexadecimal code point of the DDM manager class identified as not supported in the EXCSATRD that reported the error. Refer to the DDM term MGRLVL in the *IBM Distributed Data Management (DDM) Reference Guide* for the 2-byte hexadecimal values.

The *level* value is the 2-byte hexadecimal value of the manager level identified as not supported in the EXCSATRD that reported the error. Refer to the DDM term MGRLVL in the *IBM Distributed Data Management (DDM) Reference Guide* for the 2-byte hexadecimal values.

System Action: The statement cannot be executed.

Programmer Response: Notify the system programmer for analysis of the condition that caused this SQLCODE.

SQLSTATE: 58010

-30025 EXECUTION FAILED BECAUSE FUNCTION IS NOT SUPPORTED BY THE SERVER WHICH CAUSED TERMINATION OF THE CONNECTION: LOCATION *location* PRODUCT ID *pppvrr* REASON *reason-code* (*sub-code*)

Explanation: The current SQL statement failed because the SQL statement was routed to a server that does not support the requested function. A new connection is required to allow the successful execution of further SQL statements.

System Action: The statement cannot be executed. The current unit of work is rolled back. The SQLCA is formatted.

Programmer Response: Notify the DBA for assistance in analyzing the SQL statement that prompted this SQL code.

Problem Determination: *location* identifies the name of the server that could not support the required

database protocols to perform the requested function. The product identifier is in the form *pppvrrm*. It is an eight-byte field with alphanumeric characters, and identifies the product that could not support the function. *ppp* identifies the specific database product. *vv* identifies the product version. *rr* identifies the product release level. *m* identifies the product modification level.

Possible values for *pppvrrm*:

- ppp** DSN for z/OS, ARI for VM/VSE, SQL for Unix/Windows/NT, QSQ for iSeries, and JCC for Java
- vv** Version number
- rr** Release level
- m** Modification level

To correct the problem, first identify the function that is not supported. To determine what function was not supported, and why, refer to the *reason-code* that was specified. Here are the possible values for *reason-code*, and the functions that they correspond to:

- 0010** LONG_STMTS
- 0010** LONG255_IDS
- 0030** EXTENDED_DESCRIBE
- 0040** EXTENDED_DIAGNOSTICS
- 0050** KEEP_DYNAMIC
- 0060** MULTI_ROW_FETCH
- 0070** MULTI_ROW_INSERT
- 0080** SQL_CANCEL
- 0090** SCROLLABLE_CURSORS
- 0100** CURSOR_ATTRIBUTES
- 0110** MONITORING
- 0120** SELECT_WITH_INSERT
- 0130** DATA_ENCRYPTION
- 0140** PACKAGE_PATH

Lastly, you may use the *sub-code* value to further identify the problem. When non-zero, the *sub-code* consists of a one-byte code to indicate how the error was detected in the network:

- If '01'x, then the local DB2 that is acting as the requester detected the error. The LOCATION and PRDID identify the server in error.
- If '02'x, then the server detected the error. The LOCATION and PRDID identify the location and level of the local DB2 server.
- If '03'x, then an intermediate server (hop site) detected the error. The error, the LOCATION, and PRDID identify the server in error.

- If '04'x, then an intermediate server (hop site) detected the error. The error, the LOCATION, and PRDID identify the server in error.

SQLSTATE: 56073

-30030 COMMIT REQUEST WAS UNSUCCESSFUL, A DISTRIBUTION PROTOCOL VIOLATION HAS BEEN DETECTED, THE CONVERSATION HAS BEEN DEALLOCATED. ORIGINAL SQLCODE=*original-sqlcode* AND ORIGINAL SQLSTATE=*original-sqlstate*

Explanation: The application requested COMMIT operation was unsuccessful and the response from the remote server and the SQLCODE that was returned from the remote server are inconsistent. For example, the reply message from the remote server indicates that a COMMIT operation did not complete successfully but the SQLCODE returned from the remote server was greater than or equal to zero. The unit of work has been rolled back and the connection with the remote server has been deallocated.

System Action: An alert was generated. A DSNL0311 message may have been written to the console. Refer to the description of this message for further information.

The SQLCODE returned by the remote server is replaced with -30030 and the SQLSTATE returned by the AS is replaced with '158013' and the connection with the remote server has been deallocated.

The SQLCODE and SQLSTATE values that were returned from the remote server are stored in the SQLERRM field in a string of the following format: 'original-sqlcode 'FF'X original-sqlstate'

Programmer Response: Notify the system programmer for assistance in analyzing the trace data that was generated.

SQLSTATE: 58013

-30040 EXECUTION FAILED DUE TO UNAVAILABLE RESOURCES THAT WILL NOT AFFECT THE SUCCESSFUL EXECUTION OF SUBSEQUENT COMMANDS OR SQL STATEMENTS. REASON *reason-code* TYPE OF RESOURCE *resource-type* RESOURCE NAME *resource-name* PRODUCT ID *pppvrrm* RDBNAME *rdbname*

Explanation: The SQL statement or command requires a non RDB resource that is currently unavailable. The *reason-code* identifies why the resource identified by the *resource-type* and *resource-name* is unavailable. The product, product level, and RDB are identified.

Values for *reason-code*

This is product specific and can be found in the remote server documentation.

Values for *resource-type*

Two byte hexadecimal number defined as follows:

This is product specific and can be found in the remote server documentation.

Values for *resource-name*

Variable length field with alphanumeric characters and a maximum length of 35 bytes.

Values for *pppvrrm*

Eight-byte field with alphanumeric characters defined as follows:

ppp..... DSN for OS/390, ARI for SQL/DS SQL and QSQ for AS/400 (3 bytes)

vv..... version number (2 bytes)

rr..... release level (2 bytes)

m..... modification level (1 byte)

Values for *rdbname*

Sixteen-byte field with the RDBNAME.

System Action: The statement cannot be processed. The local DB2 is disconnected from the remote server.

Programmer Response: Verify the identify of the resource that was not available. The reason the resource is unavailable is identified by the *reason-code*.

Collect the following diagnostic items to help determine the cause of the unavailable resource.

- Console output from the system identified by RDBNAME, and a listing of SYSLOG data set for the period of time spanning the failure.
- Information described for the reason code received.

SQLSTATE: 57012

-30041 EXECUTION FAILED DUE TO UNAVAILABLE RESOURCES THAT WILL AFFECT THE SUCCESSFUL EXECUTION OF SUBSEQUENT COMMANDS AND SQL STATEMENTS. REASON *<reason-code>* TYPE OF RESOURCE *<resource-type>* RESOURCE NAME *<resource-name>* PRODUCT ID *<pppvrrm>* RDBNAME *<rdbname>*

Explanation: The SQL statement or command requires a non RDB resource that is currently unavailable. The *<reason-code>* identifies why the resource identified by the *<resource-type>* and *<resource-name>* is unavailable. The product, product level, and RDB are identified.

Values for *<reason-code>*

-30050 • -30060

Four byte binary number that is product specific. This can be found in the remote server documentation.

Values for <resource-type>

Two byte hexadecimal number that is product specific. This can be found in the remote server documentation.

Values for <resource-name>

Variable length field with alphanumeric characters and a maximum length of 35 bytes.

Values for <pppvvrrm>

Eight byte field with alphanumeric characters defined as follows:

ppp..... DSN for DB2, ARI for SQL/DS, SQL for OS/2 and QSQ for AS/400 (3 bytes)

vv..... version number (2 bytes)

rr..... release level (2 bytes)

m..... modification level (1 byte)

Values for <rdbname>

Sixteen byte field with the RDBNAME.

System Action: The statement cannot be executed. The local DB2 is disconnected from the remote server.

Programmer Response: Verify the identity of the resource that was not available. The reason the resource is unavailable is identified by the reason-code.

Collect the following diagnostic items to help determine the cause of the unavailable resource.

- Console output from the system identified by RDBNAME, and a listing of SYSLOG data set for the period of time spanning the failure.
- Information described for the <reason-code> received.

SQLSTATE: 57013

-30050 *<command-or-SQL-statement-type>*
**COMMAND OR SQL STATEMENT
INVALID WHILE BIND PROCESS IN
PROGRESS**

Explanation: A remote command or remote SQL execution was attempted while a remote bind was in progress. The only commands allowed during bind are, BIND STATEMENT, END BIND, ROLLBACK, or COMMIT.

System Action: The request is rejected. The local DB2 is disconnected from remote server.

Programmer Response: Ensure the remote bind has completed before attempting to execute an SQL statement or process a remote command. COMMIT and ROLLBACK will terminate the bind processing.

SQLSTATE: 58011

-30051 **BIND PROCESS WITH SPECIFIED
PACKAGE NAME AND CONSISTENCY
TOKEN NOT ACTIVE**

Explanation: Binding of a statement or end bind was attempted while the package was not undergoing bind processing.

System Action: The bind statement request or end bind request is rejected. The local DB2 is disconnected from the remote server.

Programmer Response: Ensure that the server processing the bind request was not abending when this request was being processed, or that the package name hasn't changed before terminating the remote bind package request.

SQLSTATE: 58012

-30052 **PROGRAM PREPARATION
ASSUMPTIONS ARE INCORRECT**

Explanation: The program preparation assumptions in effect for binding a statement (i.e. BINDSQLSTT command) are incorrect.

System Action: The statement is rejected.

Programmer Response: The creation of the package following this error is dependent on the package creation options specified at begin bind time.

SQLSTATE: 42932

-30053 **OWNER AUTHORIZATION FAILURE**

Explanation: An authorization error associated with the package owner is detected. The AS, for example, has determined that the binder has specified a package owner that the binder has no authorization to specify.

System Action: The begin bind request is rejected.

Programmer Response: Correct the authorization problem and reissue the request.

SQLSTATE: 42506

-30060 **RDB AUTHORIZATION FAILURE**

Explanation: The user is not authorized to access an RDB.

System Action: The request is rejected.

Programmer Response: Correct the authorization problem and resubmit the job.

SQLSTATE: 08004

-30061 RDB NOT FOUND

Explanation: An attempt was made to access an RDB which cannot be found. This usually means that a requester specified the server location name incorrectly. The server responded by indicating that the requester's specification of the server location name is incorrect. Requester or server changes are needed to make the location names consistent. Location names for DB2 systems are defined in the BSDS DDF record and are also in the DSNL004I console message when DDF is started. For more information about defining location names, see Part 3 of *DB2 Installation Guide*.

System Action: The request is not processed.

Programmer Response: Ensure the RDB name was correctly specified and resubmit the job.

SQLSTATE: 08004

-30070 command COMMAND NOT SUPPORTED ERROR

Explanation: The target does not support a particular command. The error causes termination of the connection between the local DB2 and the remote server.

Values for *command*

Two byte hexadecimal DDM code point.

System Action: The command is rejected. The local DB2 is disconnected from the remote server.

Programmer Response: Ensure the proper command was issued.

SQLSTATE: 58014

-30071 object-type OBJECT NOT SUPPORTED ERROR

Explanation: The target does not support a particular object. The error causes the termination of the connection between the local DB2 and the remote server.

Values for *object-type*

Two byte hexadecimal DDM code point.

System Action: The command/SQL statement is rejected. The local DB2 is disconnected from the remote server.

Programmer Response: Ensure the object has been correctly specified and resubmit the job or reissue the command.

SQLSTATE: 58015

-30072 parameter subcode PARAMETER NOT SUPPORTED ERROR

Explanation: A particular parameter is not supported by either the application requester or the remote server.

Values for *parameter*

Two byte hexadecimal DDM code point.

Values for *subcode*

Two byte hexadecimal number defined as follows: This subcode is composed of two distinct parts, but may optionally be zero. The high-order byte (when not zero) indicates the site at which the error was detected. This is X'01' if the error was detected by the local DB2; it is X'02' if the error was detected by the remote server. The low order byte is always zero.

Common parameters that are not supported include:

X'2450'

Usually this means that the server does not support the attribute clause on prepare.

System Action: The command/SQL statement is rejected. A disconnect has occurred.

Programmer Response: The connection to the server has been broken, and the server has therefore rolled back the unit of work. In this case, the only SQL statement that may be successfully executed is ROLLBACK. However, if the requester detects this error on a COMMIT, then it is unknown whether the unit of work was committed or rolled back at the server.

SQLSTATE: 58016

-30073 parameter subcode PARAMETER VALUE NOT SUPPORTED ERROR

Explanation: The specified parameter value is not supported by either the local DB2 or the remote server.

The *parameter*, is a 2-byte hexadecimal DDM code point. See *IBM Distributed Data Management (DDM) Reference Guide* for a definition of the valid code points. Common values for *parameter* include:

X'0035' Usually means that a DB2 server does not support the single-byte coded character set identifier (CCSID) sent by the requester, or a DB2 requester does not support the single-byte CCSID received from a server. See X'119C' for more information.

X'1144' DRDA servers return this code point when a DB2 client specifies a version for a package and the DRDA server does not support versions.

X'119C'

If the subcode information contains X'01', the requester does not support the single-byte

CCSID that the server wants to use. If the subcode information contains X'02', the server does not support the single-byte CCSID that the requester wants to use.

Determine the single-byte CCSIDs for the requester and server systems. The single-byte CCSID for DB2 subsystems is defined in DSNHDECP. One or both partners might be using an incorrect CCSID, or support might need to be added. See *DB2 Installation Guide* for more information on CCSIDs.

X'147A'

DB2 servers can return this code point when a numeric input host variable is not within the range that DB2 supports. See the explanation of SQLCODE -406 for more information.

X'14AC'

DB2 servers return this code point when a DRDA client requests an authentication mechanism that is not supported by the DB2 server. See the explanation of DB2 reason code 00D3010E for more information.

X'2110'

Usually means that a requester specified the server location name incorrectly. The server responded by indicating that the requester's specification of the server location name is incorrect, and the length of the location name is longer than that supported by the server. Requester or server changes are needed so the location names are consistent. Location names for DB2 systems are defined in the BSDS DDF record and can also be seen in the DSNL004I console message when DDF is started. See Part 3 of *DB2 Installation Guide* for more information about defining location names.

X'2120' Usually means that the server does not support the use of double quote string delimiters in SQL statements. DB2 COBOL applications can use double quote string delimiters in SQL statements. This requires that the program be precompiled with the SQLDELIM(QUOTESQL) option. If the server product does not support double quote SQL statement string delimiters, then the program must be modified to use single quote SQL string delimiters and be precompiled with the SQLDELIM(APOSTSQL) option.

X'2121' Usually means that there is a semantic error with the string that specifies the character used as a decimal delimiter in SQL statements.

X'213F'

Means that the server was processing a bind or rebind command that specified an unsupported value for the DYNAMICRULES bind parameter. If the server is a DB2 Version

3 system, specify DYNAMICRULES(RUN) or omit the DYNAMICRULES parameter.

The 'subcode', which is a 2-byte hexadecimal number, consists of two distinct parts and can optionally be zero. The high-order byte (when not zero) indicates the site at which the error was detected. If the error was detected by the local DB2, it is X'01'. If the error was detected by the remote server, it is X'02'. The low-order byte is always zero.

System Action: The command or SQL statement is rejected. A disconnect occurred.

Programmer Response: The connection to the server was broken, and the server rolled back the unit of work. The only SQL statement that can be successfully executed is ROLLBACK. However, if the requester detects this error on a COMMIT, then it is unknown whether the unit of work was committed or rolled back at the server.

SQLSTATE: 58017

-30074 REPLY MESSAGE WITH *codepoint* (svrcod) NOT SUPPORTED ERROR

Explanation: A reply message *codepoint* is not recognized or the reply message *SVRCOD* is not recognized. The error does not affect the processing of subsequent DRDA commands and SQL statements issued by the application program.

Values for *codepoint*

- The *codepoint* is a two-byte hexadecimal value that represents a DDM reply message. *IBM Distributed Data Management (DDM) Reference Guide* defines the valid *codepoints* for reply messages.

Values for *SVRCOD*

- The *SVRCOD* is a one-byte hexadecimal value which represents the reply messages severity code. *IBM Distributed Data Management (DDM) Reference Guide* defines the valid *SVRCOD* for reply messages.

System Action: Processing continues.

Programmer Response: The cause of this error may be a mismatch in source and target manager levels or might be an internal error.

SQLSTATE: 58018

-30080 COMMUNICATION ERROR *code* (*subcode*)

Explanation: A SNA communications error was detected. *VTAM for MVS/ESA Programming for LU 6.2* contains the valid *code* and *subcode* values that can appear in this message.

- *code* is VTAM's primary LU6.2 return code (RCPRI).
- *subcode* takes one of the following forms:
 - rcsec-sense

– rcsec

The *rcsec* portion of *subcode* is VTAM's secondary LU6.2 return code (RCSEC).

The *sense* portion of *subcode* is VTAM's sense code. See Part 6, "SNA codes," on page 1341 for descriptions of sense codes that are often associated with SNA network definition errors.

System Action: The statement is not executed. The application was disconnected from the server because of a communication failure. A DSNL500I message containing additional diagnostic information might be issued to the MVS console.

Programmer Response: Review the diagnostic information described in *VTAM for MVS/ESA Programming for LU 6.2* for the particular LU6.2 return codes. Consult with a communications expert to determine the cause of the communication failure.

SQLSTATE: 08001

-30081 *prot* **COMMUNICATION ERROR DETECTED. API=*api*, LOCATION=*loc*, FUNCTION=*func*, ERROR CODES=*rc1 rc2 rc3***

Explanation: A communications error was detected while communicating with a remote client or server.

prot Identifies the communication protocol that encountered the error. Currently, 'TCP/IP' is the only possible value.

api Identifies the communication application programming interface (API) used by DB2. Currently, 'SOCKETS' is the only possible value.

loc The network location of the partner system.
For TCP/IP partners, this field contains the dotted decimal IP address of the partner.

func The communication function that failed.
For TCP/IP partners, this field identifies name of the socket call that failed.

rc1 The first return code indicator.
For TCP/IP partners, this field contains the TCP/IP *return code* in decimal format. The *return code* values are documented in *z/OS UNIX System Services Programming: Assembler Callable Services Reference*.

rc2 The second return code indicator.
For TCP/IP partners, this field contains the TCP/IP *reason code* in decimal format. The *reason code* values are documented in *z/OS UNIX System Services Programming: Assembler Callable Services Reference*.

rc3 The third return code indicator.

For TCP/IP partners, this field contains zero.

System Action: The statement is not executed. The application is disconnected from the server.

Programmer Response: Consult with a communications expert to determine the cause of the communication failure.

SQLSTATE: 08001

-30082 **CONNECTION FAILED FOR SECURITY REASON** *reason-code (reason-string)*

Explanation: The attempt to connect to a remote database server was rejected due to invalid or incorrect security information. The cause of the security error is described by the *reason-code* and *reason-string* values.

The possible values for *reason-code* and *reason-string* appear below:

- 1 (PASSWORD EXPIRED) -- the password used to connect to the remote server has expired.
- 2 (PASSWORD INVALID) -- the password used to connect to the remote server does not match the password stored at the remote server.
- 3 (PASSWORD MISSING) -- the remote server rejected the connection request because the request did not include a password.
- 4 (PROTOCOL VIOLATION) -- the remote server rejected the connection request because the request did not contain the proper security information. Error messages or trace records should be produced by the server system to explain the nature of the security violation.
- 5 (USER-ID MISSING) -- the remote server rejected the connection request because the request did not specify a user-id.
- 6 (USER-ID INVALID) -- the user-id specified in the connection request is not defined at the remote server system.
- 7 (USER-ID REVOKED) -- the user-id specified in the connection request has been revoked.
- 15 (SECURITY FAILURE:*secchkcd:svcerrno*)—Authentication failed at the remote server system. Refer to the *IBM Distributed Data Management (DDM) Reference Guide* for a detailed discussion of the semantics of the DDM terms SECCHKCD and SVCERRNO.
- 16 (NEW PASSWORD INVALID) -- the password specified on a change password request did not meet the server's requirements.
- 17 (UNSUPPORTED FUNCTION) -- the security mechanism specified by the client is invalid for this server. Some typical examples:
 - The client is configured to send an Already Verified userid but the server does not support

Already Verified userids. Client or server changes must be made to correct the inconsistency.

- DB2 for z/OS server acceptance of Already Verified userids over TCP/IP connections is controlled by the TCPALVER value of the DSNTIP5 installation panel (DSN6FAC TCPALVER).
 - DB2 for z/OS client usage of Already Verified userids is controlled by the SECURITY_OUT column of the SYSIBM.LUNAMES or SYSIBM.IPNAMES table.
- The client is configured to use one of the following security mechanisms but the server does not support the mechanism:
- Encrypted userid and encrypted security-sensitive data.
 - Encrypted userid, encrypted password, and encrypted security-sensitive data.

Client changes must be made to correct the inconsistency.

- DB2 for z/OS server acceptance of Already Verified userids over TCP/IP connections is controlled by the TCPALVER value of the DSNTIP5 installation panel (DSN6FAC TCPALVER).
 - DB2 for z/OS client usage of Already Verified userids is controlled by the SECURITY_OUT column of the SYSIBM.LUNAMES or SYSIBM.IPNAMES table.
- The client is configured to use one of the following security mechanisms but the server does not support the mechanism:
- Encrypted userid and encrypted security-sensitive data.
 - Encrypted userid, encrypted password, and encrypted security-sensitive data.

Client changes must be made to correct the inconsistency.

- DB2 for z/OS client usage of encryption security mechanism is controlled by the SECURITY_OUT column of the SYSIBM.IPNAMES table.
- The client sent a new password value to a server that does not support the DRDA change password function.
 - The client sent DCE authentication information to a server that does not support DCE.
 - The client is configured to send an Already Verified userid but the server does not support Already Verified userids. Client or server changes must be made to correct the inconsistency.
- DB2 for z/OS server acceptance of Already Verified userids over TCP/IP connections is controlled by the TCPALVER value of the DSNTIP5 installation panel (DSN6FAC TCPALVER).

- DB2 for z/OS client usage of Already Verified userids is controlled by the SECURITY_OUT column of the SYSIBM.LUNAMES or SYSIBM.IPNAMES tables.

System Action: The attempt to connect to the remote database server fails. If the server system is a DB2 UDB for z/OS server, a DSNL030I message at the server system describes the cause.

Programmer Response: DB2 uses the communications database (CDB) to control network security functions. Make the appropriate changes to the CDB to correct the security failure.

SQLSTATE: 08001

-30090 REMOTE OPERATION INVALID FOR APPLICATION EXECUTION ENVIRONMENT

Explanation: An update operation or a dynamic commit or rollback was attempted at a server that was supporting an application that was in a read-only execution environment (IMS or CICS).

System Action: The request is rejected.

Programmer Response: Do not attempt to update data or issue dynamic commits or rollbacks from IMS or CICS applications that are accessing remote data.

SQLSTATE: 25000

-30104 ERROR IN BIND OPTION *option* AND BIND VALUE *value*.

Explanation: While processing the bind parameters that were passed from the requester site, either the bind option or the bind value is not acceptable to the server database, or the option/value pair is not appropriate.

Programmer Response: The BIND or REBIND command failed. Examine the command options and values, determine the error, and resubmit the command.

SQLSTATE: 56095

-30105 BIND OPTION *option1* IS NOT ALLOWED WITH BIND OPTION *option2*

Explanation: While processing the bind parameters that were passed from the requester site, it was found that there is a conflict in bind options that are mutually exclusive.

Programmer Response: The BIND or REBIND command failed. Examine the command options, determine the cause of the conflict, and resubmit the command.

SQLSTATE: 56096

**-30106 INVALID INPUT DATA DETECTED FOR
A MULTIPLE ROW INSERT
OPERATION. INSERT PROCESSING IS
TERMINATED**

Explanation: An error was detected with the input data for one row of a multiple row INSERT operation. No further rows will be inserted. For an atomic operation, all inserted rows are rolled back. For a non-atomic operation, rows inserted successfully before the row containing the invalid input data was encountered are not rolled back.

System Action: The statement cannot be processed.

Programmer Response: Correct the row containing the invalid input data and submit the multiple-row INSERT statement again for the rows that did not get inserted.

SQLSTATE: 22527

Chapter 3. DB2 Messages

Refer to Part 1, "Introduction," on page 1 for a description of message types and message numbering conventions.

Unless the message is issued by a subcomponent operating outside the DB2 environment, messages are preceded by a *command prefix* that is defined during system installation. The command prefix is not shown in the message text.

In the TSO attachment facility, the user can control whether message IDs are displayed. To see them, type 'PROFILE MSGID'. To suppress them, type 'PROFILE NOMSGID'.

Chapter 4. DSN... Messages

There are two types of messages in this chapter:

1. Messages that are written to a trace file. These are seen only if the trace is turned on (that is, ddname DSNTRACE was allocated to SYSOUT or the TSO terminal).
2. Messages that are returned by a DB2 stored procedure. These are seen only as a parameter that is returned by the stored procedure.

DSNA... messages share a basic structure. Here are the message elements, listed in order:

1. Message number (DSNAnna).
2. The name of the CSECT responsible for writing the message.
3. TCB address of the task currently executing.
4. A series of tokens and token-explanations unique to each message.

Note: The intent of these messages is to aid IBM development and the IBM Support Center. They contain information that might not be meaningful except to IBM.

DSNA002E DSNACA00 TCB=address SYSTEM ERROR - FOUND UNEXPECTED THREAD

Explanation: The DB2 call attachment facility control block, the CAB, indicated that a thread was present when none should have been present. This is a CAF system error.

This message is issued by the following CSECT:
DSNACA00

System Action: This message immediately precedes an 04E abend, with reason code 00C10002.

System Programmer Response: Collect a SYSUDUMP and DSNTRACE trace stream.

Programmer Response: Refer the problem to your system programmer.

Problem Determination: Contact your IBM Support Center.

DSNA201E DSNACA00 TCB=address CANNOT USE 'CONNECT', ALREADY CONNECTED TO DB2

Explanation: A CONNECT request was received but a connection to DB2 already existed for the TCB identified by 'address' in the message. This is a CAF error (application program error). The message is accompanied by return code (R15) 200 and code (R0) 00C10201.

System Action: No new connection is made to DB2 and an error return and reason code are issued. The DB2 call attachment facility is ready for more input.

System Programmer Response: Refer the problem to the programmer using the DB2 call attachment facility.

Programmer Response: You must DISCONNECT the previous connection before you can re-CONNECT. Correct the logic in your code.

Problem Determination: See a DSNTRACE trace stream to understand the context of this message.

DSNA202E DSNACA00 TCB=address CANNOT USE 'OPEN', PRIOR OPEN OR SQL ALREADY CONNECTED APPLICATION TO DB2

Explanation: An OPEN request was received but a DB2 thread had already been created for the specified TCB. This is a user error. The message is accompanied by return code (R15) 200 and code (R0) 00C10202.

System Action: No new DB2 thread is created and an error return and reason code are issued. The DB2 call attachment facility is ready for more input.

System Programmer Response: Refer the problem to the programmer using the DB2 call attachment facility.

Programmer Response: Your application program had already (explicitly or implicitly) established an OPEN level connection to DB2. You cannot do this again until the original OPEN is terminated. 'Explicit' OPENS occur when an application issues the call attachment facility OPEN request. 'Implicit' OPENS occur when an application issues SQL statements before a DB2 connection was established. Correct the logic in your application program.

Problem Determination: See a DSNTRACE trace stream to understand the context of this message.

DSNA203E DSNACA00 TCB=address CANNOT USE 'CLOSE', THERE WAS NO 'OPEN' IN EFFECT

Explanation: A CLOSE request was received but no OPEN level connection (implicit or explicit) existed for this task. This is a user error. The message is accompanied by return code (R15) 200 and code (R0) 00C10203.

System Action: No CLOSE is performed. The DB2 call attachment facility is ready for more input.

System Programmer Response: Refer the problem to the programmer using the DB2 call attachment facility.

Programmer Response: Correct the logic in your application. Do not issue CLOSE unless an explicit OPEN has been performed. 'Explicit' OPENS occur when an application issues the call attachment facility OPEN request.

Problem Determination: See a DSNTRACE trace stream to understand the context of this message.

DSNA204E DSNACA00 TCB=address CANNOT USE 'DISCONNECT', THERE WAS NO 'CONNECT' IN EFFECT

Explanation: A DISCONNECT request was received but no DB2 connection had been established. This is a user error. The message is accompanied by return code (R15) 200 and code (R0) 00C10204.

System Action: No DISCONNECT has been performed. The DB2 call attachment facility is ready for more input.

System Programmer Response: Refer the problem to the programmer using the DB2 call attachment facility.

Programmer Response: Correct the logic in your application. Do not issue DISCONNECT unless a CONNECT has been performed.

Problem Determination: See a DSNTRACE trace stream to understand the context of this message.

DSNA205E DSNACA00 TCB=address CANNOT USE 'TRANSLATE', THERE WAS NO CONNECTION TO DB2 OR NOTHING TO TRANSLATE

Explanation: A TRANSLATE request was received but no data was available for translation. You must have valid DB2 call attachment facility control structures before you can make a TRANSLATE request. Control structures are built when you issue explicit or implicit connection requests. This is a user error. The message

is accompanied by return code (R15) 200 and code (R0) 00C10205.

System Action: No TRANSLATE is performed. The DB2 call attachment facility is ready for more input.

System Programmer Response: Refer the problem to the programmer using the DB2 call attachment facility.

Programmer Response: Correct the logic in your application. Do not issue TRANSLATE unless a DB2 connection has been attempted.

Problem Determination: See a DSNTRACE trace stream to understand the context of this message.

DSNA206E DSNACA00 TCB=address WRONG NUMBER OF PARMS OR VL BIT OFF

Explanation: An erroneous DB2 call attachment facility request was received. The request had too many or too few parameters and could not be processed. The message is accompanied by return code (R15) 200 and code (R0) 00C10206.

System Action: The previous request was not processed. The DB2 call attachment facility is ready for more input.

System Programmer Response: Refer the problem to the programmer using the DB2 call attachment facility.

Programmer Response: Correct the logic in your application. Be sure that any parameter list passed to the DB2 call attachment facility has the correct number of parameters for the individual call, and that the high order (VL) bit is turned on to end the parameter list.

Problem Determination: See a DSNTRACE trace stream to understand the context of this message.

DSNA207E DSNACA00 TCB=address DID NOT RECOGNIZE ACTION PARAMETER - parm

Explanation: An unrecognized action request type or parameter was received by the DB2 call attachment facility and could not be processed. The allowable action request types are CONNECT, OPEN, CLOSE, DISCONNECT, and TRANSLATE. For allowable parameters, refer to the CAF section in *DB2 Application Programming and SQL Guide*. This message is accompanied by return code (R15) 200 and code (R0) 00C10207.

System Action: Control returns to the caller. Your request was not processed. The DB2 call attachment facility is ready for more input.

System Programmer Response: Refer the problem to the programmer using the DB2 call attachment facility.

Programmer Response: Correct the logic in your

application. Check the spelling of the action parameter type or keyword on the previous request passed to the DB2 call attachment facility. The action parameter type you passed is listed in the parm field of the DSNA800I trace message. If the error is not the action parameter, the parameter in error is listed in the parm field of this message.

Problem Determination: See a DSNTRACE trace stream to understand the context of this message.

DSNA208E DSNACA00 TCB=address CANNOT HAVE 2 SSIDS (ssid1 AND ssid2) FROM 1 TCB

Explanation: An OPEN request was received specifying a different subsystem identifier (ssid2) than the previous CONNECT request (ssid1). Your task can only be connected to a single DB2 subsystem. The message is accompanied by return code (R15) 200 and code (R0) 00C10208.

System Action: Control returns to the caller. Your request was not processed. The DB2 call attachment facility is ready for more input.

System Programmer Response: Refer the problem to the programmer using the DB2 call attachment facility.

Programmer Response: Specify the correct DB2 subsystem identifier on both the OPEN and CONNECT requests.

Problem Determination: See a DSNTRACE trace stream to understand the context of this message.

DSNA209E DSNACA00 A STORED PROCEDURE ISSUED AN EXPLICIT CALL TO DSNALI

Explanation: A stored procedure issued an explicit call to DSNALI. This is not allowed. Return code 200 in register 15 and code 00C10209 in register 0 accompany this message.

System Action: Control returns to the caller. The request was not processed. The DB2 call attachment facility is ready for more input.

System Programmer Response: Refer the problem to the programmer using the DB2 call attachment facility.

Programmer Response: Remove explicit calls to DSNALI from the application program.

Problem Determination: See a DSNTRACE trace job stream to understand the context of this message.

DSNA301I THE VALUE *parm-value* FOR PARAMETER *parm-name* IS NOT VALID

Explanation: The stored procedure DSNACICS could not run because one of the input parameters contains an incorrect value.

Severity: 12

System Action: The stored procedure DSNACICS terminates without calling the CICS transaction.

Programmer Response: Correct the input parameter value specified on the SQL CALL statement.

System Programmer Response: Ensure that the user exit DSNACICX sets the parameter to a valid value.

DSNA302I THE REQUIRED INPUT PARAMETER *parm-name* CONTAINS NULLS

Explanation: The stored procedure DSNACICS could not run because one or more of the required input parameters contains a null value.

Severity: 12

System Action: The stored procedure DSNACICS terminates without calling the CICS transaction.

Programmer Response: Correct the input parameter value in the SQL CALL statement, or ensure that the user exit DSNACICX sets the parameter to a non-null value.

System Programmer Response: Ensure that the user exit DSNACICX sets the parameter to a non-null value.

DSNA303I THE PARAMETER NETNAME WAS NOT SPECIFIED WHEN THE CONNECT TYPE OF SPECIFIC WAS SPECIFIED

Explanation: The input parameter NETNAME must contain a non-null value when the CONNECT TYPE parameter is set to SPECIFIC.

Severity: 12

System Action: The stored procedure DSNACICS terminates without calling the CICS transaction.

Programmer Response: Correct the input parameter value in the SQL CALL statement, or ensure the the user exit DSNACICX sets the parameter to a non-null value.

System Programmer Response: Ensure that the user exit DSNACICX sets the parameter to a non-null value.

DSNA304I THE USER EXIT DSNACICX RETURNED RETURN CODE = X'hhhhhhh' AND THE FOLLOWING ERROR MESSAGE:

Explanation: The user exit DSNACICX returned a non-zero return code and a message to stored

DSNA305I • DSNA307I

procedure DSNACICS. The message that DSNACICX returns immediately follows message DSNA304I.

Severity: 12

System Action: The stored procedure DSNACICS terminates without calling the CICS transaction.

Programmer Response: Contact the system programmer.

System Programmer Response: Correct the cause of the error message that the user exit generated.

DSNA305I THE CICS EXCI *func* REQUEST FAILED. CICS RESPONSE CODE = X'hhhh' CICS REASON CODE = X'hhhhhhh'

Explanation: DSNACICS uses the CICS EXCI Call interface to request the execution of a CICS server program. CICS EXCI interface call *func* resulted in an unexpected CICS response code and reason code. Possible values of *func* are:

Initialize_User Initializes the EXCI user environment.

Allocate_Pipe Allocates a session to a CICS region.

Open_Pipe Connects an allocated pipe to a receive session of the CICS region.

DPL_Request Issues a request to execute the CICS server program.

Close_Pipe Disconnects an open pipe from a CICS region.

Deallocate_Pipe
Deallocates a pipe from a CICS region.

The failure can occur because the EXCI interface is not properly enabled for the CICS subsystem. For explanations of the CICS response code and reason code, see *CICS Transaction Server for z/OS External Interfaces Guide*.

Severity: 12

System Action: The stored procedure DSNACICS terminates without calling the CICS transaction.

Programmer Response: Contact the system programmer.

System Programmer Response: Ensure that the EXCI interface is enabled to the CICS region that the stored procedure calls. If you suspect an error in the DB2 stored procedure, refer to Part 3 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Add a DSNADUMP DD statement to the JCL startup procedure for the stored procedure address space in which DSNACICS runs. Then rerun the application that calls DSNACICS. This causes DB2 to generate an SVC dump whenever it issues an error message for DSNACICS.

If you suspect an error in the DB2 stored procedure, refer to Part 3 of *DB2 Diagnosis Guide and Reference*. Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 22.

DSNA306I THE CICS SERVER PROGRAM *program* ABENDED. CICS ABEND CODE=C'cccc'

Explanation: The CICS server program that DSNACICS called abnormally terminated. CICS returns a four-character abend code to indicate the error. These error codes are described in *CICS Transaction Server for z/OS Problem Determination Guide*.

Severity: 12

System Action: Stored procedure DSNACICS processes the next request. CICS does a backout to the last syncpoint and forces the SYNCONRETURN option.

Programmer Response: Correct the error in the server program.

System Programmer Response: Correct the cause of the error in the server program. Ensure that the mirror transaction is still enabled after this error. The mirror transaction must be enabled so that subsequent requests to run a server program are accepted.

DSNA307I OS/390 *token-service* REQUEST FAILED. SYSTEM RETURN CODE=X'hhhh'

Explanation: DSNACICS uses the OS/390 token services to save task-level information. The OS/390 service returned an unexpected return code.

token-service is the token service function that DSNACICS requested. Possible values are:

Create_token Create a token using the IEANTCR service.

Retrieve_token Retrieve a token using the IEANTRT service.

See the description of IEANTCR or IEANTRT in *z/OS MVS Programming: Assembler Services Reference, Volumes 1 and 2* for a full description of the return code.

Severity: 12

System Action: Stored procedure DSNACICS processes the next request.

Programmer Response: Contact the system programmer.

System Programmer Response: Add a DSNADUMP DD statement to the JCL startup procedure for the stored procedure address space in which DSNACICS runs. Then rerun the application that calls DSNACICS. This causes DB2 to generate an SVC dump whenever it issues an error message for DSNACICS.

If you suspect an error in the DB2 stored procedure, refer to Part 3 of *DB2 Diagnosis Guide and Reference*. Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 22.

DSNA308I THE CICS EXCI DPL_REQUEST REQUEST FAILED. CICS RESPONSE CODE=0. DPL RETAREA CONTAINS FIELD1=X'hhhhhhh', FIELD2=X'hhhhhhh', FIELD3=C'cccc'

Explanation: DSNACICS uses the CICS EXCI Call interface to request the execution of a CICS server program. The DPL_REQUEST command returned an unexpected value in the DPL_RETAREA. See *CICS Transaction Server for z/OS External Interfaces Guide* and *CICS Application Programming Guide* for a full description of the meanings of FIELD1, FIELD2, and FIELD3.

Severity: 12

System Action: Stored procedure DSNACICS processes the next request.

Programmer Response: Correct any errors in the server program. Contact the system programmer.

System Programmer Response: Add a DSNADUMP DD statement to the JCL startup procedure for the stored procedure address space in which DSNACICS runs. Then rerun the application that calls DSNACICS. This causes DB2 to generate an SVC dump whenever it issues an error message for DSNACICS.

If you suspect an error in the DB2 stored procedure, refer to Part 3 of *DB2 Diagnosis Guide and Reference*. Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 22.

DSNA309I UNABLE TO LOAD USER EXIT DSNACICX. SYSTEM REASON CODE=X'hhhh' SYSTEM COMPLETION CODE=X'hhhh'

Explanation: DSNACICS was unable to load the user exit routine DSNACICX.

Severity: 12

System Action: The stored procedure DSNACICS does not call the CICS transaction. DSNACICS processes the next request.

Programmer Response: Contact the system programmer.

System Programmer Response: Ensure that the STEPLIB statement in the startup procedure for the stored procedure address space specifies the library that contains DSNACICX. A default user exit is shipped in the SDSNLOAD DB2 library.

Add a DSNADUMP DD statement to the JCL startup procedure for the stored procedure address space in which DSNACICS runs. Then rerun the application that calls DSNACICS. This causes DB2 to generate an SVC dump whenever it issues an error message for DSNACICS.

If you suspect an error in the DB2 stored procedure, refer to Part 3 of *DB2 Diagnosis Guide and Reference*. Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 22.

DSNA310I STORED PROCEDURE TASK CANCELLED BY OPERATOR

Explanation: The task that called the DSNACICS stored procedure was cancelled by the operator.

Severity: 12

System Action: DSNACICS terminates immediately. The CICS server program might have been called.

Programmer Response: Contact the system programmer.

System Programmer Response: Determine why the operator cancelled the stored procedure task.

DSNA311I DSNACICS ABNORMALLY TERMINATED

Explanation: The task that called the DSNACICS stored procedure abnormally terminated.

Severity: 12

System Action: DSNACICS terminates immediately. The CICS server program might have been called. An SVC dump or a SYSMDUMP is generated for this error. If a CICS service encountered an error, a SYSMDUMP might be generated. For an abend in the stored procedure, an SVC dump is generated.

Programmer Response: Contact the system programmer.

System Programmer Response: Review the JES messages for the stored procedure address space in which DSNACICS runs. Look for CICS or system messages that describe the source of the problem.

If you suspect an error in the DB2 stored procedure, refer to Part 3 of *DB2 Diagnosis Guide and Reference*. Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 22.

DSNA312I USER EXIT DSNACICX ABNORMALLY TERMINATED

Explanation: User exit program DSNACICX abnormally terminated.

Severity: 12

DSNA313I • DSNA319I

System Action: DSNACICS terminates immediately. The CICS server program is not called. An SVC dump is generated for this error.

Programmer Response: Contact the system programmer.

System Programmer Response: Determine why the user exit abended. If you suspect an error in the DB2 stored procedure, refer to Part 3 of *DB2 Diagnosis Guide and Reference*. Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 22.

DSNA313I DSNACICS TERMINATED BY DB2 CANCEL THREAD COMMAND

Explanation: The stored procedure DSNACICS terminated because the operator issued the DB2 CANCEL THREAD command.

Severity: 12

System Action: DSNACICS terminates immediately. The CICS server program might have been called.

Programmer Response: Contact the system programmer.

System Programmer Response: Determine why the operator issued the DB2 CANCEL THREAD command.

DSNA314I UNABLE TO LOAD CICS STUB ROUTINE DFHXCSTB. SYSTEM REASON CODE=X'hhhh' SYSTEM COMPLETION CODE=X'hhhh'

Explanation: DSNACICS was unable to load the CICS stub routine DFHXCSTB.

Severity: 12

System Action: The stored procedure DSNACICS does not call the CICS transaction. DSNACICS processes the next request.

Programmer Response: Contact the system programmer.

System Programmer Response: Ensure that the STEPLIB statement in the startup procedure for the stored procedure address space specifies the CICS library that contains DFHXCSTB. DFHXCSTB is in the CICS EXCI library (SDFHEXCI). This library must be APF authorized.

Add a DSNADUMP DD statement to the JCL startup procedure for the stored procedure address space in which DSNACICS runs. Then rerun the application that calls DSNACICS. This causes DB2 to generate an SVC dump whenever it issues an error message for DSNACICS.

If you suspect an error in the DB2 stored procedure, refer to Part 3 of *DB2 Diagnosis Guide and Reference*. Collect the following diagnostic items listed in

Appendix B, "Problem determination," on page 1353: 1, 2, 22.

DSNA315I DSNAIMS FUNCTION *func-name* HAS COMPLETED SUCCESSFULLY.

Explanation: The stored procedure, DSNAIMS, executed successfully.

System Action: None.

Programmer Response: None.

DSNA316I DSNAIMS INPUT PARAMETER ERROR. CALLER MUST PROVIDE INPUT FOR PARAMETER *parm-name* WITH FUNCTION *func-name*.

Explanation: A value for parameter *parm-name* is required for function *func-name*.

System Action: DSNAIMS execution terminated before invoking IMS.

Programmer Response: Provide an appropriate value for the parameter, and re-run the function.

DSNA317I DSNAIMS ERROR IN *otmaci-api* API. RC=*return-code*, RSN1=*reason-code1*, RSN2=*reason-code2*, RSN3=*reason-code3*, RSN4=*reason-code4*.

Explanation: OTMA Callable Interface API *otmaci-api* encountered an error.

System Action: The DSNAIMS execution terminated after executing the specified API call.

Programmer Response: Refer to the *IMS OTMA Guide and Reference* for explanations of the return and reason codes.

DSNA318I DSNAIMS ERROR IN RRS CTXRCC API. RC=*return-code*

Explanation: An error was encountered in RRS when processing the two-phase commit.

System Action: DSNAIMS execution terminated before invoking IMS.

Programmer Response: Refer to the *MVS Programming Resource Recovery* manual for an explanation of the return code.

DSNA319I DSNAIMS RECEIVED UNKNOWN FUNCTION *func-name*

Explanation: DSNAIMS received an unknown function name in parameter 1 of the stored procedure call.

System Action: DSNAIMS terminated before invoking IMS.

| **Programmer Response:** Specify a function name
| known to DSNAIMS in parameter 1.

DSNA8xx

Explanation: Messages in the DSNA800 series are intended for diagnosis and are documented in Part 8 of *DB2 Diagnosis Guide and Reference*.

Chapter 5. DSNB... Messages

DSNB200I UPDATE VVDS FAILED. DSNNAME =
dsn, **MMRC=cccccccc**
CONNECTION-ID=xxxxxxxxx,
CORRELATION-ID=yyyyyyyyyyyyy,
LUW-ID=logical-unit-of-work-id =token

Explanation: DB2 was unable to update the data set high-used RBA in the VSAM volume data set (VVDS) when it was ready to close a data set that was used by a RECOVER, LOAD, or REORG utility job. The error was detected by the media manager catalog update function that issues system message IEC161I. The *dsn* indicates the DSNNAME of the data set. MMRC is the return code that DB2 received from the media manager catalog update service. Refer to *z/OS DFSMSdfp Diagnosis Reference* for a description of these codes.

The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem.

An LUW-ID of '*' indicates that the thread does not have an LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

System Action: DB2 continues closing this data set. However, the utility job is informed with a 00C2010C 'resource unavailable' reason code. The utility job is left in a failed state.

Operator Response: Notify the system programmer.

System Programmer Response: To determine the cause of the error, refer to system message IEC161I in the appropriate MVS publication. Correct the error, and then notify the user to reinvoke the application.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 10, 11.

DSNB204I OPEN OF DATA SET FAILED. DSNNAME
= dsn

Explanation: A required data set of a DB2 table or index space could not be opened. The error was detected by the media manager CONNECT function that issues system message IEC161I. The *dsn* indicates the DSNNAME of the data set.

After being issued for a given data set, this message is disabled for that data set.

System Action: Buffer manager functions that detect this condition terminate.

Operator Response: Notify the system programmer.

System Programmer Response: To determine the

cause of the error, refer to system message IEC161I in the appropriate MVS publication. Correct the error, and reinvoke the application.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5, 10, 12.

DSNB207I DYNAMIC ALLOCATION OF DATA SET
FAILED. REASON = rrrr DSNNAME = dsn

Explanation: A required data set of a DB2 table or index space could not be allocated. Reason code *rrrr*, which is returned by dynamic allocation, indicates the reason for the failure. Refer to the appropriate MVS publications for a description of this reason code. The *dsn* indicates the data set's DSNNAME.

After being issued for a given data set, this message is disabled for that data set.

This message is issued by the following CSECT:
DSNB1OST

System Action: Buffer manager functions that detect this condition terminate and pass a unique error return code.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the situation, and then reinvoke the application.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5, 10, 12.

DSNB209I csect-name-BUFFER MANAGER
TABLESPACE/INDEXSPACE
CLEAN-UP ROUTINE (DSNB1CFC)
HAS BEEN SCHEDULED FOR DBNAME
= dbn, SPACENAME = spn, PSID =
X'psid'

Explanation: DB2 detected an abnormal condition for one of the following reasons:

- The associated table space or index space contains modified pages that cannot be written to DASD for a period of time that is longer than expected. This can be caused by either an unusually long period of contiguous update or by an internal logic error.
- This message follows an abnormal termination due to inconsistent data or an incomplete update to the page.

DB2 scheduled the table space or index space cleanup routine (DSNB1CFC) for the associated table space or index space. DSNB1CFC acquires a drain lock to ensure that no updates are in progress. Data is inaccessible to users during the cleanup process.

For recoverable inconsistent pages with unbalanced write intents, DB2 initiates the recovery process and reconstructs the pages using the DB2 log. For other modified pages with unbalanced write intents, the buffer manager forces the pages to be written back to DASD and then makes the buffer space available for reassignment.

The *dbn* indicates the database name with which the table space or index space is associated. The *spn* is the name of the table space or index space that must be cleaned up. The *psid* is the internal identifier for the table space or index space; it is used to associate this message with follow-on message DSNB221I, which might be issued.

System Action: DB2 is ready to clean up the associated table space or index space. However, before any cleanup is initiated, DB2 requests a drain on the table space or index space. DB2 waits indefinitely for this lock. Therefore, all activities against the table space and/or index space must be quiesced before the cleanup process can proceed. If the associated object is an index space, all activities against the table space for which the index space is defined must also be quiesced. After the cleanup process completes, the table space or index space is automatically made accessible to users.

User Response: If the clean up activity does not appear to be completed, DB2 might still be waiting for a drain lock on the table space. Issue a -DISPLAY DATABASE CLAIMERS command for the table space in question (for index spaces, this would be the associated table space) to determine whether the clean up routine is still waiting for a lock and if so, to determine the holders of the table space lock. If the jobs are holding the table space lock for a very long duration (for instance, wait-for-input), it might be necessary to cancel those jobs in order to allow the clean up process to proceed.

DSNB212I *csect-name*—RECOVER PAGE
STARTING DBNAME = *dbn* ,
SPACENAME = *spn* , PAGE NUMBER =
X'*pno*'

Explanation: The buffer manager (BM) subcomponent of DB2 discovered an inconsistent page with unbalanced write intents. DB2 is ready to do online recovery on the page using the DB2 log. The *dbn* indicates the associated database name. The *spn* indicates the table space name or index space name. The *pno* is the page number (in hexadecimal) within the table space or index space that is logically inconsistent.

System Action: Processing continues.

DSNB215I *csect-name*—ONLINE RECOVERY FOR AN INCONSISTENT PAGE HAS BEEN COMPLETED FOR DBNAME = *dbn* ,
SPACENAME = *spn* , PAGE NUMBER =
X'*pno*'

Explanation: The recovery process for an inconsistent page completed. The *dbn* indicates the associated database name. The *spn* indicates the table space name or index space name. The *pno* is the page number (in hexadecimal) within the table space or index space that was logically inconsistent.

System Action: Processing continues.

DSNB217I *csect-name*—ONLINE RECOVERY FOR AN INCONSISTENT PAGE WAS UNSUCCESSFUL FOR DBNAME = *dbn* ,
SPACENAME = *spn* , PAGE NUMBER =
X'*pno*'

Explanation: The recovery process for an inconsistent page failed. The page is written to DASD as logically inconsistent. This message is issued in response to message DSNB212I, which was issued to indicate the start of the recovery process. The *dbn* indicates the associated database name. The *spn* indicates the table space name or index space name. The *pno* is the page number (in hexadecimal) within the table space or index space that was logically inconsistent.

System Action: The page is marked as logically inconsistent and is unavailable until it is repaired. The execution unit driving this function proceeds normally.

Problem Determination: A DSNB012I message might be issued before this message to indicate the same failure. If it is, a 00C90102 abend dump might help determine the cause of this failure. Otherwise, see SYS1.LOGREC for any abend that occurred between the associated DSNB212I message and this message. Use the time stamp on the log records to find this abend.

DSNB219I *csect-name*—BUFFER MANAGER TABLESPACE/INDEXSPACE CLEAN-UP PROCESS HAS BEEN COMPLETED FOR DBNAME = *dbn* ,
SPACENAME = *spn*

Explanation: This message indicates that the buffer manager (BM) table space or index space cleanup process completed for the associated table space or index space. Refer to message DSNB209I for the reasons why the buffer manager schedules the table space or index space cleanup process. The *dbn* indicates the associated database name. The *spn* indicates the table space name or index space name.

System Action: Processing continues.

DSNB221I *csect-name*–BUFFER MANAGER
TABLESPACE/INDEXSPACE
CLEAN-UP PROCESS WAS NOT
REQUIRED FOR PSID = X'*psid*'

Explanation: This message indicates that the buffer manager (BM) table space or index space cleanup process was bypassed for the associated table space or index space. After quiescing all other activities against the table space or index space, the buffer manager discovered that the table space or index space is no longer in active mode; that is, it was closed.

The abnormal condition detected earlier was resolved by buffer manager close page set processing. Refer to the corresponding message, DSNB209I, using *psid* as the matching field, for the reasons the buffer manager schedules the table space or index space cleanup process. The *psid* is the internal identifier for the associated table space or index space.

System Action: Processing continues.

DSNB223I *csect-name*–BUFFER MANAGER
TABLESPACE/INDEXSPACE CLEANUP
PROCESS WAS SKIPPED FOR PSID =
X'*psid*'

Explanation: This message indicates that the table space or index space cleanup process was bypassed for the associated table space or index space. During the process of quiescing all other activities against the table space or index space, an error that is not recoverable was detected. The error might be caused by any of the following conditions:

- An out-of-storage condition was detected by IRLM.
- The table space or index space was dropped because of a backout.

It is assumed that the abnormal condition detected earlier can later be resolved by the close page set processing. Refer to the corresponding message DSNB209I (use *psid* as the matching field) for the reasons for scheduling the table space or index space cleanup process. The *psid* specifies the internal identifier for the associated table space or index space.

System Action: Processing continues.

System Programmer Response: The associated table space or index space might contain inconsistent data. Issue the DB2 STOP TABLESPACE or INDEXSPACE command to allow close page set processing to perform cleanup for the associated table space or index space.

DSNB224I *csect-name*– BUFFER MANAGER I/O
ERROR DURING *function*,
DBNAME=*dbn*,SPACENAME=*snm*, DATA
SET NUMBER=*dsno*, PAGE
NUMBER=X'*pno*', MM ERROR
FLAG=X'*aa*', CSW STATUS=X'*bbbb*',
SENSE BYTES=X'*cccc*', SEEK
ADDRESS=X'*dddddddddddddd*'

Explanation: An I/O error was encountered by the buffer manager (BM) subcomponent of DB2. The function specified in the message is READ, WRITE, or FORMAT. The message gives the database name, table space name or index space name, data set number, and page number (in hexadecimal) of the page for which the I/O operation was being performed. The remaining information is error information returned by the media manager and is used for error analysis by IBM support personnel.

System Action: The system action depends on the function being performed. If the function is WRITE, or if the function is READ and the operation was performed during restart or rollback, the I/O error page range of the data set is updated and message DSNU086I is issued. In most cases (READ, synchronous WRITE, FORMAT), a 'resource not available' is returned to the user with a reason code that identifies the nature of the problem.

After being issued 10 times for a given data set, this message is disabled for that data set until it is closed and reopened.

Operator Response: Notify the system programmer.

System Programmer Response: See documentation in Part 4, "Section 4. DB2 Codes," on page 773 for the reason code returned to the user in the SQLCA or in utility messages. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: See the Problem Determination section of the reason code returned to user.

Check the MVS console log for an IOS error message indicating the type of I/O error that occurred. If an IOS message was issued, follow the problem determination directions for that message.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5.

DSNB225I *csect-name* - BUFFER MANAGER I/O
 ERROR DURING *function*
 DBNAME=*dbn*, SPACENAME=*snm*, DATA
 SET NUMBER=*dsno*, MM ERROR
 CODES=*X'aaaaaaaa'* DB2 REASON
 CODE=*X'bbbbbbb'*

Explanation: DB2 encountered an I/O error. The function specified in the message is READ, WRITE, CASTOUT, or FORMAT. The message contains the database name, table space name or index space name, data set number, media manager error information returned at the time of the failure, and the DB2 reason code associated with this failure.

System Action: Except for a castout error, the application terminates with abend X'04E' and reason code 00C200A4 or 00C200C0. If an error occurs during castout, processing continues.

Operator Response: Notify the system programmer and follow the directions given for the reason code described in Part 4, "Section 4. DB2 Codes," on page 773.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: This message is issued before the occurrence of abend X'04E' and reason code 00C200A4 or 00C200C0 to provide information related to the media manager failure.

Check the MVS console log for an IOS error message indicating the type of I/O error that occurred. If an IOS message was issued, follow the problem determination directions for that message.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 10, 12.

DSNB226I *csect-name* - BUFFER MANAGER PAGE
 GET ROUTINE DETECTED AN INVALID
 PAGE IN DBNAME=*dbn*
 SPACENAME=*snm* DATA SET
 NUMBER= *dsno* PAGE
 EXPECTED=*X'aaaaaa'* PAGE NUMBER
 FOUND=*X'bbbbbb'*

Explanation: An unexpected page was received during buffer manager (BM) get page processing. The page set involved is identified by the database name, space name, and data set number. The page in error is identified by page expected *aaaaaa*. Page number *bbbbbb* was found in the buffer that should contain the expected page.

System Action: The application is terminated with abend X'04E' and reason code 00C200F7.

Operator Response: Notify the system programmer and follow the directions given for reason code

00C200F7 in Part 4, "Section 4. DB2 Codes," on page 773

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: This message is issued before the occurrence of abend X'04E' and reason code 00C200F7 to provide information about the page set involved.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 10, 12, 64.

DSNB227I *csect-name* - DFHSM RECALL FAILED
 FOR DSNAME=*dsn* HSMRC=*aaaaaaaa*
 HSMRSN=*bbbbbbb'*

Explanation: The attempt to recall a migrated data set failed. DSNAME identifies the data set. HSMRC and HSMRSN are the return code and reason code given by DFHSM.

System Action: A 'resource not available' code is returned to the user.

Operator Response: Notify the system programmer.

System Programmer Response: Use the information provided in the message to determine the reason for the DFHSM recall failure.

Problem Determination: Refer to Part 4, "Section 4. DB2 Codes," on page 773 for an explanation of the return and reason codes contained in this message. Refer to the DFHSM message ARC11nnI, where nn is the value of HSMRC.

DSNB228I *csect-name* GROUP BUFFER POOL
gbpname CANNOT BE ACCESSED FOR
function MVS IXLCACHE REASON
 CODE=*reason*

Explanation: While accessing group buffer pool *gbpname* for function *function* DB2 received an error from the MVS IXLCACHE request.

function

READ or WRITE

reason Reason code from the MVS IXLCACHE request

System Action: The system action depends on the function being performed. If the function is a WRITE, or a READ performed during rollback or DB2 restart, the page is added to the logical page list (LPL) for the data set and message DSNB250E is issued. Otherwise, 'resource unavailable' is returned to the user with a reason code that identifies the specific problem.

System Programmer Response: See *MVS/ESA Programming: Sysplex Services Reference* for an

explanation of the MVS IXLCACHE reason code.

DSNB229I *csect-name* **UNEXPECTED ERROR WHEN CHECKING FOR REQUEST COMPLETION FOR GROUP BUFFER POOL** *gpb-name* **MVS IXLFCOMP REASON CODE=reason**

Explanation: DB2 received an unexpected error from MVS when checking for the completion of a write request to the secondary group buffer pool for duplexing. *gpb-name* indicates the name of the group buffer pool. If the group buffer pool is duplexed and the error was encountered on a request to the secondary group buffer pool, then *gpb-name* indicates the name of the group buffer pool suffixed with '-SEC'.

reason is the reason code from the MVS IXLFCOMP service.

System Action: DB2 returns the group buffer pool back to simplex mode. The secondary group buffer pool is deallocated.

System Programmer Response: See *MVS/ESA Programming: Sysplex Services Reference* for an explanation of the MVS IXLFCOMP reason code.

DSNB232I *csect-name* - **UNEXPECTED DATA SET LEVEL ID ENCOUNTERED - LEVEL ID =lvlid EXPECTED LEVEL ID=xlvlid DSN=dsn**

Explanation: A required data set of a DB2 table space could not be opened. DB2 encountered an unexpected data set level ID.

lvlid The unexpected level ID from the data set. If DB2 was unable to retrieve the level ID from the data set (for example, if the data set had been deleted and redefined), the level ID is shown as "X".

xlvlid The level ID recorded by DB2 previously and is the expected level ID for opening the data set

dsn The DSNAME of the data set.

This problem could be the result of data sets that were restored to a level that is inconsistent with other data sets, inconsistent with the DB2 log, or both.

System Action: DB2 sends back a 'resource unavailable' SQL code to the application and a reason code explaining the error.

Operator Response: Notify the system programmer.

System Programmer Response: To enable access to a data set reported as down level, take one of the following actions:

- Restore the page set or partition to the proper level (use DSN1COPY, DFHSM, or another tool).

Identify the level ID of a copy of the page set or partition by running the DSN1PRNT(FORMAT) utility. The level ID is found in the header page of the page set or partition.

- Recover the down level page set or partition to currency by running the RECOVER or RECOVER LOGONLY utility.
- Accept the down levelling by running the REPAIR utility with the LEVELID option.

This option is only valid if DB2 is able to access the level ID (*lvlid* is not "X").

Inconsistent data problems might result from this action and are the user's responsibility.

- Replace the contents of the page set or partition using the LOAD REPLACE utility.
- Explicitly restore the page set to a prior point in time with the RECOVER utility.

If the expected level ID is less than the encountered level ID, it is possible that the object identified in the message was ported from another system improperly or it might indicate that DSNDB01.SYSLGRNX is down level. If the problem is in the object identified in the message, the actions listed above can be used to allow access to the data. If the problem is in SYSLGRNX, this is a serious situation that compromises the recoverability of all objects managed by DB2. Investigate whether SYSLGRNX might have inadvertently been restored to a point in time inconsistent with the rest of the DB2 system.

DSNB250E *csect-name* **A PAGE RANGE WAS ADDED TO THE LOGICAL PAGE LIST DATABASE NAME = dbn SPACE NAME = spn DATA SET NUMBER = dsno PAGE RANGE = lowpg TO highpg START LRSN = startlrsn END LRSN = endlrsn START RBA = startrba LPL TRACE ID = traceid LPL REASON TYPE = reasontype**

Explanation: DB2 added a page range to the logical page list (LPL) for the specified data set because of a problem with the pages in the page range. The *startlrsn* and *endlrsn* give the log range needed to recover the pages in the page range. These values are RBA values unless DB2 is in the data sharing environment, in which case these values are LRSN values. In the data sharing environment, *startrba* indicates the starting RBA value of the recovery log range if the value is not zero. The *startrba* only applies to log records for the DB2 member that issued the message. The zero value for *endlrsn* in this message refers to the current end of the recovery log. The *traceid* is for IBM serviceability. The *reasontype* explains why the pages were added into LPL; the following are the reason types:

DASD DB2 encountered a DASD I/O error when trying to read or write pages on DASD.

LOGAPPLY

DB2 cannot apply log records to the pages.

GBP

DB2 cannot successfully read nor externalize the pages from or to the group buffer pool because of link or structure failure, the GBP is in rebuild status, or the GBP was disconnected.

LOCK

DB2 cannot get the required page latch or page P-lock on the pages.

CASTOUT

The DB2 Castout processor cannot successfully cast-out the pages.

System Action: The pages are added to the LPL, and DB2 initiates the Automatic LPL Recovery. The pages remain inaccessible until they are recovered with either the START DATABASE command with the SPACNAM option, the RECOVER utility, the LOAD utility, or the Automatic LPL Recovery. Users attempting to access a page in the LPL receive SQLCODE -904 with reason code 00C20206. If MVS detects a problem during group buffer pool access processing, DB2 writes a SYS1.LOGREC entry describing the error.

System Programmer Response: Check the reason and follow the appropriate actions, based on the console message. To recover pages from the LPL, perform one of the following actions:

- Issue the -START DATABASE command with the SPACENAM option
- Run the RECOVER or LOAD utility

DSNB260I *csect-name* **WARNING - A READER HAS BEEN RUNNING FOR *nnnn* MINUTES - CORRELATION NAME = xxxxxxxxxxxx, CONNECTION ID = yyyyyyyy, LUWID = LOGICAL-UNIT-OF-WORK-ID=*token*, PLAN NAME = xxxxxxxx, AUTHID = xxxxxxxx, END USER ID = xxxxxxxx, TRANSACTION NAME = xxxxxxxx, WORKSTATION NAME = xxxxxxxx**

Explanation: This message indicates that a long running reader has reached the time limit threshold without a COMMIT or ROLLBACK. This threshold was defined during installation.

The value *nnnn* is cumulative, and indicates the time in minutes that has elapsed since the beginning of this Unit of Work (UW).

CORRELATION name, CONNECTION ID, and Logical Unit of Work ID (LUWID) together identify a thread associated with the UW. *token* is a unique token number associated with the LUWID. If the LUWID is an '*', it indicates that the thread originated at this site.

PLAN NAME and AUTHID further identify the thread associated with the UW.

If the thread's creator included End User information, then DB2 displays the End User's ID, TRANSACTION

NAME, and WORKSTATION NAME. Otherwise, these fields will contain an '*'.
System Action: DB2 continues processing. If statistics class 3 is active, IFCID 0313 is written. This message will be repeated each additional time the threshold is reached.

System Programmer Response: Consult with the application programmer to determine if this is a problem UW. See Part 4 (Volume 1) of *DB2 Administration Guide* for more information about problems caused by uncommitted UR's.

If an application program caused the UW to reach its time limit threshold, you can use CANCEL THREAD to cancel the UR.

Programmer Response: Ensure that the application commits frequently enough, or consult with your DB2 administrator about decreasing the frequency of the check.

DSNB301E *csect-name* **GROUP BUFFER POOL *gbpname* CANNOT BE CONNECTED DB2 REASON CODE = *reason1* MVS IXLCONN REASON CODE = *reason2***

Explanation: DB2 was not able to connect to the named group buffer pool. This message is generally issued once for each DB2 subsystem for each DB2 reason code, except 00C20204, until the failure condition is corrected.

reason1

DB2 reason code

reason2

MVS IXLCONN reason code

For DB2 reason code 00C20204, which indicates a problem during MVS IXLCONN processing, this message is issued once for each DB2 subsystem for each IXLCONN reason code until the failure condition is corrected. If the DB2 reason code is not 00C20204, then *reason2* contains zeros. See *MVS/ESA Programming: Sysplex Services Reference* for an explanation of MVS IXLxxx reason codes

System Action: If the connection was requested on behalf of an access request by an SQL user on this DB2, SQLCODE -904 (resource unavailable) is returned to the SQL user with the DB2 reason code shown in this message.

If the connection was requested on behalf of an SQL user on another DB2 in the data sharing group, SQLCODE -904 (resource unavailable) is returned to the SQL user with DB2 reason code 00C20252. This indicates that the requested table space or index space is unavailable because another DB2 cannot connect to the group buffer pool.

If the MVS IXLCONN reason code is xxx0C08 (structure allocation failed because there was no

suitable facility to allocate based on the preference list in the MVS CFRM administrative policy), or if the MVS IXLCONN reason code is xxxx084C (user does not have proper Security Access Facility (SAF) authorization), then IFCID 0250, if active, contains additional diagnostic information.

DSNB302I *csect-name* **GROUP BUFFER POOL**
gbpname **IS ALLOCATED IN A**
VOLATILE STRUCTURE

Explanation: The DB2 group buffer pool structure is volatile.

One DB2 member issues this message whenever the structure has the volatile attribute. DB2 detects this either on the first connection to the group buffer pool or when the attribute changes later. DB2 always requests nonvolatile group buffer pools but allows allocation in a volatile structure if that is all that is available.

System Action: DB2 processing continues.

System Programmer Response: To cause the group buffer pools to be allocated in nonvolatile coupling facilities, ensure that:

- At least a subset of your coupling facilities are configured correctly for nonvolatility.
- The MVS CFRM policy correctly specifies the nonvolatile coupling facilities in the preference list for the group buffer pool coupling facility structures.

Even when these things are correctly done, there might be instances when a suitable coupling facility in the preference list cannot be found (for example, not enough free space), and therefore allocation occurs in a different coupling facility. MVS tries to allocate the structure in the facility that best meets the structure allocation request as follows:

1st choice:

Coupling facility that meets the volatility requirement, the space requirement, and the exclusion list requirement.

2nd choice:

Coupling facility that meets the volatility requirement and the storage requirement.

3rd choice:

Coupling facility that has the best fit (most available free space) even though this might be less than the amount requested.

4th choice:

Structure cannot be allocated.

IFCID 0250, if activated, contains a list of the coupling facilities on which allocation was attempted.

DSNB303E *csect-name* **A LOSS OF CONNECTIVITY**
WAS DETECTED TO GROUP BUFFER
POOL *gbpname*

Explanation: Connectivity to group buffer pool *gbpname* was lost.

System Action: DB2 disconnects from the coupling facility structure with REASON=FAILURE.

The action taken in response to this problem depends on the attempted function, as follows:

- For a coupling facility read: SQLCODE -904 (resource unavailable) is returned to the SQL user with a reason code indicating the specific error.
- For a coupling facility read during rollback, backout, or restart: The inaccessible page is added to the logical page list (LPL) for the page set. Message DSNB250E is issued for the first page of each data set added to the LPL.
- For a coupling facility read during castout: The castout operation cannot complete.
- For a coupling facility write: The changed page is added to the LPL for the page set.

DSNB304I *csect-name* **GROUP BUFFER POOL**
gbpname **WAS SET TO 'DAMAGE**
ASSESSMENT PENDING' STATUS

Explanation: A coupling facility structure for a group buffer pool was damaged.

System Action:

- DB2 puts the group buffer pool into 'damage assessment pending' (DAP) status. Message DSNB304I indicates the DAP status. The group buffer pool cannot be accessed until DAP status is cleared.
- The DB2 damage assessment process determines which table spaces and index spaces are using the failed group buffer pool and puts those spaces into 'group buffer pool recovery pending' (GRECP) status.
- After DB2 sets all the necessary spaces to GRECP status, the DAP status for the group buffer pool is cleared. Message DSNB305I indicates that DAP status is cleared.

DSNB305I *csect-name* **'DAMAGE ASSESSMENT**
PENDING' STATUS WAS CLEARED
FOR GROUP BUFFER POOL *gbpname*

Explanation: Damage assessment completed and the 'damage assessment pending' (DAP) status is cleared for the group buffer pool (GBP). At this point, the group buffer pool status is no longer restricted and DB2 attempts to reconnect to the group buffer pool on the next reference to a GBP-dependent page set within the associated buffer pool.

Message DSNB304I precedes this message.

DSNB306I *csect-name* **THE REQUESTED LENGTH OF THE LOCAL CACHE VECTOR COULD NOT BE ALLOCATED FOR GROUP BUFFER POOL** *gbpname*
REQUESTED LENGTH = length1
ALLOCATED LENGTH = length2

Explanation: DB2 connected to the group buffer pool indicated by *gbpname*, but the MVS Cross-system Extended Services (XES) component could not allocate the requested size of the local cache vector (LCV) in the hardware system area (HSA). DB2 requires an LCV size that is large enough to handle all pages in the member's buffer pool.

length1 indicates the LCV size (in number of bits) that DB2 requested. *length2* indicates the LCV size (in number of bits) that XES was able to allocate.

To prevent flooding the operator console, this message is only issued once per DB2 member per group buffer pool until the condition is corrected.

System Action: DB2 disconnects from the GBP and issues message DSNB301E with reason code 00C20208, if it has not yet been issued.

SQLCODE -904 is returned to the user with a reason code of 00C20208.

System Programmer Response: There is not enough HSA storage on the processor to support the size of the local cache vector. The details of HSA allocation are machine-dependent and are defined by the hardware. To correct this problem, take one or both of the following actions:

- Consult the documentation for your processor hardware to determine if the HSA storage allocation can be increased, and if so, how to do it.
- Modify the software configuration in your parallel sysplex to reduce the number or size of the vectors that are in use by other coupling facility structure users. Consider the following possible solutions:
 - Use the DB2 ALTER BUFFERPOOL command to reduce the size of this local buffer pool. This means that you might have to reduce the size of the virtual pool.
 - Use the DB2 ALTER BUFFERPOOL command to reduce the size of another local buffer pool that is already connected to a group buffer pool. This means that you might have to reduce the size of the virtual pool. If you make a connected buffer pool smaller, DB2 can usually contract the size of the corresponding LCV dynamically, making HSA storage available. However, DB2 cannot always do the dynamic LCV contraction. In cases where DB2 cannot dynamically contract the LCV size, you can use the DB2 ALTER BUFFERPOOL command to either force a deallocation of the LCV or to force a contraction of the LCV as follows:
 1. Redefine the virtual pool to be smaller than the original size.

2. Take one of the following actions:
 - a. Make the virtual pool very small (perhaps 50 pages or less). Making the virtual pool sufficiently small should let DB2 dynamically contract the LCV, or
 - b. Delete the virtual pool to let DB2 disconnect from the group buffer pool. This frees the entire LCV associated with that member's connection to that group buffer pool.
- Consolidate your group buffer pool-dependent page sets into fewer buffer pools to reduce the number of group buffer pool connections.
 - Consult the documentation for the other software components that might be using a coupling facility cache or list structure with an associated LCV to determine whether it is possible to either delete the connection or to reduce the size of the LCV associated with the connection.

DSNB307I *csect-name* **GROUP BUFFER POOL** *gbpname* **WAS SUCCESSFULLY ALLOCATED BUT THE EXCLUSION LIST WAS NOT HONORED**

Explanation: DB2 successfully connected to the group buffer pool and allocated the group buffer pool in a coupling facility. However, the group buffer pool was allocated in a coupling facility containing a structure in the exclusion list.

System Programmer Response: If you require that the exclusion list be honored, you must ensure that there is sufficient space in the coupling facilities that are not in the exclusion list. IFCID 0250 provides information about which facilities were attempted.

DSNB308I *csect-name* **GROUP BUFFER POOL** *gbpname* **WAS SUCCESSFULLY ALLOCATED BUT THE ALLOCATED SIZE OF *alloc_size* IS LESS THAN THE REQUESTED SIZE OF *req_size***

Explanation: DB2 successfully connected to the group buffer pool and allocated the group buffer pool in a coupling facility. However, the allocated size of the group buffer pool was less than the requested size in the MVS CFRM administrative policy because there is not enough space in the preference list facilities. Both *alloc_size* and *req_size* are in 4KB blocks.

System Programmer Response: IFCID 0250 provides information about which coupling facilities were used for attempted allocation.

DSNB309I *csect-name* **GROUP BUFFER POOL** *gbpname* **HAS BEEN DISCONNECTED WITH A REASON OF '*reason*'**

Explanation: DB2 disconnected from the named group buffer pool.

reason indicates one of the following values:

NORMAL

DB2 disconnected the group buffer pool normally. MVS deletes the connection.

FAILURE

DB2 disconnected the group buffer pool abnormally. MVS puts the connection into a 'failed-persistent' state. DB2 disconnects the GBP with a reason of FAILURE when some type of error has been detected, and castout processing cannot proceed. Usually the error involves a connectivity failure to either the coupling facility or DASD. This message is preceded by message DSNB303E, and probably a series of DSNB311I and DSNB312I messages.

If this message is issued because connectivity was lost to the group buffer pool, this message signifies that this DB2 member has completed its processing of the error.

System Programmer Response: See the system programmer response for message DSNB311I or DSNB312I.

DSNB310I *csect-name* **GROUP BUFFER POOL**
gpbname **IS ALLOCATED IN A**
NONVOLATILE STRUCTURE

Explanation: The coupling facility storage in which the group buffer pool is allocated was previously volatile, but is now nonvolatile. For availability reasons, we recommend that DB2 group buffer pools be allocated in nonvolatile coupling facility storage. When DB2 connects a group buffer pool, it requests that the backing coupling facility structure be allocated in nonvolatile storage. If the request for nonvolatile storage is not honored, DB2 issues message DSNB302I.

System Action: DB2 processing continues.

DSNB311I *csect-name* **DBNAME database SPACE**
NAME spacename HAS PAGES IN THE
LOGICAL PAGE LIST

Explanation: This message is issued after a loss of connectivity to a group buffer pool was detected. The message indicates that the named table space or index space has one or more pages in the logical page list (LPL) that need to be recovered. This message is issued after DB2 has completed its processing for the table space or index space; this is the earliest point at which you can recover LPL pages for that table space or index.

System Action: The pages in the LPL are not accessible until they have been recovered.

System Programmer Response: Issue the START DATABASE command with the named table space or index to recover the LPL pages. The START DATABASE command must be issued from a DB2

member that can connect to the group buffer pool. Alternatively, the RECOVER utility or the LOAD utility can be used to recover the LPL pages.

DSNB312I *csect-name* **DBNAME database SPACE**
NAME spacename PARTITION
part-number **HAS PAGES IN THE**
LOGICAL PAGE LIST

Explanation: This message is issued after a loss of connectivity to a group buffer pool was detected. The message indicates that a partition of the named table space or index has one or more pages in the logical page list (LPL) that need to be recovered. This message is issued after DB2 has completed its processing for the partition; this is the earliest point at which you can recover the LPL pages for that partition.

System Action: The pages in the LPL are not accessible until they have been recovered.

System Programmer Response: Issue the START DATABASE command on the table space or index space partition to recover the LPL pages. The START DATABASE command must be issued from a DB2 member that can connect to the group buffer pool. Alternatively, the RECOVER utility or the LOAD utility can be used to recover the LPL pages.

DSNB313I *csect-name* **GROUP BUFFER POOL**
gpbname **TO BE DISCONNECTED**
REASON=reason LOSSCONN
PERCENTAGE=percentage

Explanation: This DB2 member is disconnecting from group buffer pool *gpbname* because it has lost connectivity to the coupling facility in which the group buffer pool is allocated.

reason is one of the following:

NOSFMPOL

MVS cannot determine the scope of the loss of connectivity because there is no active SFM policy with CONNFIL(YES).

LOSSCONN

MVS determined that the scope of the loss of connectivity was less than 100%.

NOXESEVL

MVS started to try to determine the scope of the loss of connectivity, but some condition occurred which prevented MVS from being able to complete the evaluation. One example of such a condition would be that the SFM policy became inactive while MVS was trying to do the evaluation.

If *reason* is LOSSCONN, then *percentage* indicates the percentage of lost connectivity that was calculated by MVS. MVS evaluates the scope of the loss of connectivity in terms of SFM weights associated with the systems which have lost connectivity and which

DSNB314I • DSNB315I

have active connectors to the coupling facility structure (if there are systems that do not have an active connector to the coupling facility structure, then those systems are not factored into the "percentage loss of connectivity" calculation).

If *reason* is not LOSSCONN, then *percentage* is not applicable (it should appear as zero).

System Action: The DB2 member disconnects the group buffer pool, putting its connection into a "failed-persistent" state.

If there are transactions that are in progress at the time of the connectivity failure, DB2 might need to add pages to the logical page list (LPL).

System Programmer Response: Use the START DATABASE command to recover the LPL pages. If DSNDB01 or DSNDB06 objects have LPL pages, you might need to recover these first, before proceeding with LPL recovery for other objects.

DSNB314I *csect-name* **DAMAGE ASSESSMENT TO BE TRIGGERED FOR GROUP BUFFER POOL** *gpbname* **REASON=reason**

Explanation: DB2 is about to initiate the damage assessment function for group buffer pool *gpbname* because of a detected error in either the coupling facility in which the group buffer pool was allocated, or in the connectivity from the MVS systems to the coupling facility.

reason is one of the following:

100%LCON

An error has occurred in a coupling facility or in the attachments of MVS systems to a coupling facility which has caused all DB2 members to lose connectivity to the named group buffer pool.

STRFAIL

There was an error in the coupling facility in which the group buffer pool was allocated which caused a failure of the coupling facility structure.

CONERROR

The named group buffer pool is currently allocated in a coupling facility, but DB2 cannot connect to the group buffer pool because the system on which it is running does not currently have connectivity, and MVS has indicated that currently no other member is actively connected and has connectivity.

DAP The named group buffer pool is in damage assessment pending (DAP) state.

System Action: DB2 triggers the damage assessment function to ensure that any changed pages that might have been cached in the affected group buffer pool get marked as "needing recovery" (the objects to which the

pages belong are marked in GRECP state). This message should be immediately followed by a DSNB304I message indicating that the group buffer pool has been entered into damage assessment pending (DAP) state.

If there are transactions that are in progress at the time of the connectivity failure, DB2 might need to add pages to the logical page list (LPL).

There is one case where DB2 triggers damage assessment for a group buffer pool, but no DSNB314I message is issued. This case is where the group buffer pool was manually deleted (via MVS SETXCF FORCE commands) while all connections to the group buffer pool were failed-persistent (e.g. all DB2 members were down). In this case, the next DB2 member to connect to the group buffer pool will cause MVS to try to reallocate a new instance of the group buffer pool in some coupling facility in the CFRM policy preference list. If the allocation succeeds, then DB2, by doing a coupling facility structure version id comparison, will detect that the previous instance of the group buffer pool had been lost, and will trigger damage assessment. But you will not receive the DSNB314I message in this case, nor will you receive the DSNB304I or DSNB305I messages indicating that the group buffer pool has been put into damage assessment pending (DAP) state. You will only receive a series of DSNB322I and/or DSNB323I messages indicating those pagesets or partitions that have been put into GRECP state by the damage assessment process.

System Programmer Response: Use the START DATABASE command to recover the LPL pages and GRECP objects. If DSNDB01 or DSNDB06 objects are in GRECP state or have LPL pages, you might need to recover these first, before proceeding with GRECP or LPL recovery for other objects.

DSNB315I *csect-name* **GROUP BUFFER POOL** *gpbname* **IS ALLOCATED AS** **GBPCACHE** *cacheatt*

Explanation:

YES The group buffer pool will be used for data caching.

NO The group buffer pool will not be used for data caching. It will be used for cross invalidation only.

One DB2 member issues this message whenever the structure is allocated. DB2 detects this on the first connection to the group buffer pool either in the mainline processing or during group buffer pool rebuild.

System Action: DB2 processing continues.

DSNB319A *csect-name* **THERE IS A SHORTAGE OF SPACE IN GROUP BUFFER POOL**
gbp-name

Explanation: The amount of storage in the group buffer pool (GBP) coupling facility structure available for writing new pages is low. The GBP is 75 percent full with changed data. As the GBP fills with changed data, the castout thresholds are continuously reached, and the castout engines must continuously work to attempt to keep the number of changed pages in the GBP below the castout thresholds. Also, the more changed data the GBP contains, the less efficiently it operates. Completely running out of GBP storage can result in transaction delays and in pages being added to the logical page list (LPL).

This message stays on the MVS console and is highlighted.

System Action: DB2 processing continues.

This message might remain highlighted and might not be automatically deleted in a pre SP5.2.1-JES3 environment.

Operator Response: Contact the system programmer to fix the storage problem.

System Programmer Response:

You can relieve the GBP storage shortage by taking one or more of the following actions:

- Use the ALTER GROUPBUFFERPOOL command to lower the CLASST and GBPOOLT castout thresholds.
- Use the ALTER GROUPBUFFERPOOL command to lower the GBPCHKPT GBP checkpoint frequency.
- Use the MVS SETXCF START,REBUILD command to expand the GBP coupling facility structure. If you rebuild, you can use the ALTER GROUPBUFFERPOOL command to lower the RATIO so that a higher percentage of the GBP storage is given to data entries over directory entries.
- If you are running on MVS 5.2 or a subsequent release, you can use the MVS SETXCF START,ALTER command to expand the size of the GBP (the maximum size to which you can expand is determined by the SIZE parameter in the CFRM policy that was used to allocate the GBP).

If you don't do anything to relieve the storage shortage, message DSNB325A appears if the GBP reaches 90 percent full.

Message DSNB327I appears when the GBP storage shortage is relieved.

You can monitor the amount of GBP storage in use with the DISPLAY GBPOOL command and with the DB2 statistics trace. Monitor the castout activity to ensure that castouts are keeping up with the rate of GBP-write activity. You can use Performance trace classes 20 and

21 (specifically, IFCIDs 0261, 0262 and 0263) to do more detailed monitoring of the DB2 castout processing.

DSNB320I *csect-name - DBNAME database* **SPACE NAME** *spacename* **PARTITION**
part-number **IN GROUP BUFFERPOOL**
gbpname **IS IN GROUP BUFFERPOOL**
RECOVERY PENDING STATE

Explanation: This message reports the group buffer pool recovery pending (GRECP) status of the named table space or index space partition.

Severity: 4 (warning)

System Action: The data in the named partition is not accessible.

User Response: Issue the -START DATABASE command on the partition to remove the GRECP status and make the data accessible again. You can also use the RECOVER or LOAD utility with the REPLACE option to clear the GRECP status.

DSNB321I *csect-name - DBNAME database* **SPACE NAME** *spacename* **IN GROUP**
BUFFERPOOL *gbpname* **IS IN GROUP**
BUFFERPOOL RECOVERY PENDING
STATE

Explanation: This message reports the group buffer pool recovery pending (GRECP) status of the named table space or index space.

Severity: 4 (warning)

System Action: The table space or index space is not accessible.

User Response: Issue the -START DATABASE command on the table space or index space to remove the GRECP status and make the data accessible. You can also use the RECOVER or LOAD utility with the REPLACE option to clear the GRECP status.

DSNB322I *csect-name - TABLE SPACE OR INDEX*
SPACE WITH DBID X' dbid' PSID X'psid'
part-number **IN GROUP**
BUFFERPOOL *gbpname* **IS IN GROUP**
BUFFERPOOL RECOVERY PENDING
STATE AND CANNOT BE
AUTOMATICALLY RECOVERED

Explanation: This message reports the group buffer pool recovery pending (GRECP) status of the table space or index space partition identified by the internal identifiers DBID and PSID. This message is issued instead of message DSNB320I when the name of the table space or index space is not available. The partition cannot be automatically recovered because there are retained physical locks (P-locks) on the partition.

Severity: 4 (warning)

DSNB323I • DSNB327I

System Action: The data in the identified partition is not accessible.

User Response: Issue the -DISPLAY DATABASE(*) SPACENAM(*) RESTRICT command to determine the table spaces or index spaces partition in GRECP status. First, start the failed DB2 members that hold retained P-locks on the partition. Issue the -START DATABASE command on the partition to remove the GRECP status and make the data accessible again. You can also use the RECOVER or LOAD utility with the REPLACE option to clear the GRECP status.

DSNB323I *csect-name* - **TABLE SPACE OR INDEX SPACE WITH DBID X' dbid' PSID X' psid' IN GROUP BUFFERPOOL gbpname IS IN GROUP BUFFERPOOL RECOVERY PENDING STATE AND CANNOT BE AUTOMATICALLY RECOVERED**

Explanation: This message reports the group buffer pool recovery pending (GRECP) status of the table space or index space identified by the internal identifiers DBID and PSID. This message is issued instead of message DSNB321I when the name of the table space or index space is not available. The table space or index space cannot be automatically recovered because there are retained physical locks (P-locks) on the space.

Severity: 4 (warning)

System Action: The table space or index space is not accessible.

User Response: Issue the -DISPLAY DATABASE(*) SPACENAM(*) RESTRICT command to determine the table spaces or index spaces in GRECP status. First, start the failed DB2 members that hold retained P-locks on the table space or index space. Issue the -START DATABASE command on the table space or index space to remove the GRECP status and make the data accessible again. You can also use the RECOVER or LOAD utility with the REPLACE option to clear the GRECP status.

DSNB325A *csect-name* **THERE IS A CRITICAL SHORTAGE OF SPACE IN GROUP BUFFER POOL gbp-name**

Explanation: The amount of storage in the group buffer pool (GBP) coupling facility structure available for writing new pages is critically low. The GBP is 90 percent full with changed data. As the GBP fills with changed data, the castout thresholds are continuously reached, and the castout engines must continuously work to attempt to keep the number of changed pages in the GBP below the castout thresholds. In addition, the more the GBP is filled with changed data, the less efficient are the coupling facility storage management algorithms. Completely running out of GBP storage can result in transaction delays and in pages being added to the logical page list (LPL).

This message stays on the MVS console and is highlighted.

System Action: DB2 processing continues.

This message might remain highlighted and might not be automatically deleted in a pre-SP5.2.1-JES3 environment.

Operator Response: Contact the system programmer to fix the storage problem.

System Programmer Response: You can relieve the GBP storage shortage by taking one or more of the following actions:

- Use the ALTER GROUPBUFFERPOOL command to lower the CLASST and GBPOOLT castout thresholds.
- Use the ALTER GROUPBUFFERPOOL command to lower the GBPCHKPT GBP checkpoint frequency.
- Use the MVS SETXCF START,REBUILD command to expand the GBP coupling facility structure. If you rebuild, you can use the ALTER GROUPBUFFERPOOL command to lower the RATIO so that a higher percentage of the GBP storage is given to data entries over directory entries.
- If you are running on MVS 5.2 or a subsequent release, you can use the MVS SETXCF START,ALTER command to expand the size of the GBP (the maximum size to which you can expand is determined by the SIZE parameter in the CFRM policy that was used to allocate the GBP).

If you don't do anything to relieve the storage shortage, message DSNB228I appears if a write to the GBP fails due to a 'GBP full' condition. If DB2 detects a 'full' condition, it will suspend the transaction, initiate castout activity, and then retry the write to the GBP. If the GBP write still fails after several retry attempts, then DB2 adds the page to LPL.

Message DSNB327I appears when the GBP storage shortage is relieved.

You can monitor the amount of GBP storage in use with the DISPLAY GBPOOL command and with the DB2 statistics trace. Monitor the castout activity to ensure that castouts are keeping up with the rate of GBP-write activity. You can use Performance trace classes 20 and 21 (specifically, IFCIDs 0261, 0262 and 0263) to do more detailed monitoring of the DB2 castout processing.

DSNB327I *csect-name* **GROUP BUFFER POOL gbp-name HAS ADEQUATE FREE SPACE**

Explanation: The group buffer pool (GBP) coupling facility structure has adequate space available for the writing of new pages to the GBP.

This message may be issued when either of the following occurs:

- Rebuilding of GBP reduces changed page count to 60% or less of GBP capacity.
- 'changed data.' entries decrease to 60% or lower when they were previously 75% GBP capacity or higher.

System Action: DB2 processing continues.

DSNB330I *csect-name* **GROUP BUFFER POOL**
gbpname **CANNOT BE CONNECTED**
FOR REBUILD DB2 REASON CODE =
reason1 **MVS IXLCONN REASON CODE**
= *reason2*

Explanation: DB2 was not able to connect to the named group buffer pool for rebuild. *reason1* is the DB2 reason code. *reason2* is the MVS IXLCONN reason code. See *MVS/ESA Programming: Sysplex Services Reference* for an explanation of MVS IXLxxxx reason codes.

System Action: DB2 stops the rebuild.

Problem Determination: If the MVS IXLCONN reason code is xxxx0C08 (structure allocation failed because there was no suitable facility to allocate based on the preference list in the MVS CFRM administrative policy), or if the MVS IXLCONN reason code is xxxx084C (user does not have proper Security Access Facility (SAF) authorization), then IFCID 0250, if active, contains additional diagnostic information.

DSNB331I *csect-name* **REBUILD STARTED FOR**
GROUP BUFFER POOL *gbpname*
REASON = *reason*

Explanation: A rebuild has been initiated for the named group buffer pool. *reason* indicates the reason why the rebuild was initiated. *reason* can be one of the following:

OPERATOR

The operator initiated a SETXCF command to initiate the rebuild.

LOSSCONN

MVS detected a loss of connectivity to the group buffer pool.

This message is issued by each DB2 member participating in the rebuild.

System Action: The DB2 members that are actively connected to the named group buffer pool participate in the rebuild. DB2 accomplishes the group buffer pool rebuild processing in two phases:

1. Quiesce phase. Each member quiesces all local access to the group buffer pool.
2. Connect phase. Each member connects to the new structure. Each page set or partition castout owner that has connectivity to original structure is responsible for writing pages from the original structure to the new one. If there are not enough

data entries in the new structure, the page set and partition owners cast those pages out to DASD instead. Each member issues message DSNB332I after it completes this activity. After all members have completed their castout owner rebuild work, the group buffer pool structure owner does the final sweep and checks to see if there are any changed pages still remaining in the original structure. If so, the structure owner reads the changed pages from the original structure and writes them to the new one. The structure owner issues message DSNB333I after it has completed the final sweep.

After all members have responded to MVS indicating that its connect phase processing is complete, MVS then notifies each member that the rebuild is complete. Each DB2 member issues message DSNB338I indicating that the rebuild has completed successfully.

If an error occurs during the rebuild, the rebuild is stopped. Each DB2 member issues message DSNB335I indicating the reason why the rebuild is stopping, followed by message DSNB339I indicating that the rebuild has not completed successfully. The operator can also stop rebuilds using the MVS SETXCF command.

DSNB332I *csect-name* **THIS MEMBER HAS**
COMPLETED CASTOUT OWNER
WORK FOR GROUP BUFFER POOL
gbpname **PAGES CAST OUT FROM**
ORIGINAL STRUCTURE = *value1*
PAGES WRITTEN TO NEW
STRUCTURE = *value2*

Explanation: This DB2 member has completed its part of the rebuild processing for the named group buffer pool for the page sets and partitions for which it is the castout owner.

value1 indicates the number of pages that this member has castout to DASD for the rebuild. If the new structure has a sufficient number of data entries, then *value1* should normally be zero because DB2 writes the changed pages from the original structure to the new structure. However, if the new structure does not have sufficient space, then *value1* may be greater than zero because DB2 responds to insufficient space in the new structure by casting the changed pages in the original structure to DASD instead of writing them to the new structure.

value2 indicates how many changed pages this member wrote to the new structure from the original as part of the rebuild process. If the new structure has sufficient space, then each DB2 that has connectivity to the original structure writes the changed pages for page sets and partitions for which it is the castout owner from the original structure to the new structure, and *value2* indicates the number of pages that the DB2 member wrote.

value1 and *value2* would be zero if this member has no page set or partition castout ownership responsibility.

This message is issued by each DB2 member that has connectivity to the original group buffer pool, and it is always be preceded by message DSNB331I.

System Action: If this DB2 member is not the group buffer pool structure owner, then its rebuild work is done, and it notifies MVS that it has completed its part of the rebuild and awaits later notification that all members have completed. If this member is the structure owner, then it proceeds to its final sweep processing (see DSNB333I).

Refer to "System Action" for message DSNB331I for an explanation of the group buffer pool rebuild processing.

DSNB333I *csect-name* **FINAL SWEEP COMPLETED FOR GROUP BUFFER POOL** *gbpname* **PAGES WRITTEN TO NEW STRUCTURE = *value1***

Explanation: DB2 has completed the final sweep for the rebuild of the named group buffer pool. A final sweep means that the DB2 member that is the group buffer pool structure owner ensures that all changed pages have either been cast out to DASD or have been written to the new structure after all the page set and partition owners have finished their work. If any changed pages are found in the original structure during the final sweep, then the structure owner writes them out to the new structure. *value1* should be zero in most cases for a manual rebuild. *value1* will probably be greater than zero in most cases where the rebuild was initiated because a DB2 lost connectivity to the group buffer pool.

This message is issued by the structure owner and is always preceded by message DSNB332I.

System Action: Immediately after issuing this message, the structure owner notifies MVS that the rebuild has completed, and MVS should soon begin notifying each participating member that the rebuild is complete.

Refer to "System Action" for message DSNB331I for an explanation of the group buffer pool rebuild processing.

DSNB335I *csect-name* **REBUILD STOPPED FOR GROUP BUFFER POOL** *gbpname* **REASON = *reason1* DB2 REASON CODE = *reason2***

Explanation: A rebuild has been stopped for the named group buffer pool.

reason1 indicates why the rebuild was stopped:

OPERATOR

The operator initiated an MVS SETXCF command to stop the rebuild.

LOSSCONNNEW

One or more of the DB2 members lost connectivity to the new group buffer pool structure while the rebuild was in progress.

LOSSCONNOLD

One or more of the DB2 members lost connectivity to the original group buffer pool structure while the rebuild was in progress.

STRFAILNEW

The new group buffer pool structure failed while the rebuild was in progress.

STRFAILOLD

The original group buffer pool structure failed while the rebuild was in progress.

DB2REASON

DB2 decided to stop the rebuild. The reason code given in *reason2* indicates why DB2 stopped the rebuild.

INSUFFCONN

New structure does not provide connectivity that is better than or equivalent to the current structure.

NOBETRCNN

New structure does not provide better connectivity than the current structure for a *LossConn* rebuild

If *reason1* indicates 'DB2REASON', then *reason2* specifies a DB2 reason code that indicates why DB2 stopped the rebuild. If *reason1* is not 'DB2REASON', then *reason2* is zero.

This message is normally preceded by message DSNB331I, which indicates that the rebuild was started and the reason why the rebuild was started. This message is issued by each DB2 member participating in the rebuild. This message is followed by message DSNB339I.

System Action: The new structure is discarded. If the original structure is still usable, then all members that still have connectivity to the original structure resume using it. Members that do not have connectivity to the original structure disconnect, and their connections become failed-persistent.

If the original structure is not usable, then DB2 initiates damage assessment processing for the group buffer pool.

System Programmer Response: If the rebuild stopped because of "DB2REASON", see the explanation for the reason code given.

DSNB338I *csect-name* **THE REBUILD FOR GROUP BUFFER POOL *gbpname* HAS COMPLETED SUCCESSFULLY**

Explanation: The rebuild for the named group buffer pool has successfully completed.

This message is preceded by message DSNB331I which indicates the reason why the rebuild was started. This message is issued by each DB2 member participating in the rebuild.

System Action: The original structure is discarded and all DB2s that are connected to the group buffer pool begin using the new structure.

DSNB339I *csect-name* **THE STOP OF THE REBUILD FOR GROUP BUFFER POOL *gbpname* HAS COMPLETED**

Explanation: The stop of the rebuild for the named group buffer pool has completed.

This message is preceded by message DSNB335I which indicates the reason why the rebuild was stopped. This message is issued by each DB2 member participating in the rebuild.

System Action: The new structure is discarded. If the original structure is still usable, then all members that still have connectivity to the original structure resume using it, and members that do not have connectivity to the original structure disconnect and their connection goes into a failed-persistent state.

If the original structure is not usable, then DB2 initiates damage assessment processing for the group buffer pool.

DSNB340I *csect-name* **UNEXPECTED ERROR DURING REBUILD FOR GROUP BUFFER POOL *gbpname* MVS *service-name* RETURN CODE = *rc* MVS *service-name* REASON CODE = *reason***

Explanation: DB2 received an unexpected error from MVS during rebuild processing for the named group buffer pool.

service-name is one of the following:

IXLREBLD
IXLEERSP

rc is the return code from the MVS service and *reason* is the reason code.

System Action: DB2 stops the rebuild.

System Programmer Response: See *MVS/ESA Programming: Sysplex Services Reference* for an explanation of the return and reason code for the named MVS service.

DSNB350I *csect-name* **DBNAME *database* SPACE NAME *spacename* CANNOT BE AUTOMATICALLY RECOVERED. DB2 REASON CODE = *reason***

Explanation: Following a group buffer pool failure, DB2 cannot automatically recover the named table space or index space. *reason* specifies a DB2 reason code that indicates why DB2 could not initiate the recovery.

Severity: 4 (warning)

System Action: The table space or index space remains in group buffer pool recovery pending (GRECP) status and is inaccessible.

User Response: Use the DB2 -START DATABASE command on the table space or index space to remove the GRECP status and make the data accessible. You can also use the RECOVER or LOAD utility with the REPLACE option to clear the GRECP status.

DSNB351I *csect-name* **DBNAME *database* SPACE NAME *spacename* PARTITION *part#* CANNOT BE AUTOMATICALLY RECOVERED. DB2 REASON CODE = *reason***

Explanation: Following a group buffer pool failure, DB2 cannot automatically recover the named table space or index space partition. *reason* specifies a DB2 reason code that indicates why DB2 could not initiate the recovery.

Severity: 4 (warning)

System Action: The partition remains in group buffer pool recovery pending (GRECP) status and is inaccessible.

User Response: Use the DB2 -START DATABASE command on the partition to remove the GRECP status and make the data accessible. You can also use the RECOVER or LOAD utility with the REPLACE option to clear the GRECP status.

DSNB352I *csect-name* **AUTOMATIC RECOVERY CANNOT BE INITIATED FOR GROUP BUFFER POOL *gbp-name* REASON = *reason***

Explanation: Following a failure of the named group buffer pool, DB2 is not able to initiate automatic recovery.

reason indicates the reason why automatic recovery was not initiated:

AUTORECNO

The AUTOREC option is set to NO for the group buffer pool.

CONNRELEASE

At least one actively connected DB2 member is not at the proper release to support automatic recovery.

Severity: 4 (warning)

System Action: The page sets and partitions that are in group buffer pool recovery pending (GRECP) status remain inaccessible.

User Response: Use the DB2 -START DATABASE command on the page sets and partitions to remove the GRECP status and make the data accessible. You can also use the RECOVER or LOAD utility with the REPLACE option to clear the GRECP status.

If *reason* is AUTORECNO and you want to enable automatic recovery for the group buffer pool, use the ALTER GROUPBUFFERPOOL command to set AUTOREC to YES for the group buffer pool.

If *reason* is CONNRELEASE, then you must ensure that all DB2 members in the group are running at the appropriate release. Automatic recovery is not supported unless all members are running Version 5 or a later release.

DSNB353I *csect-name* **ASYNCHRONOUS GRECP RECOVERY IN PROGRESS FOR GROUP BUFFER POOL** *bpoolname*

Explanation: Following a group buffer pool failure, DB2 triggers an automatic recovery process to attempt to recover GRECP page sets for the specified group buffer pool. This message is issued once by any DB2 member who is the page set castout owner on one of the objects being recovered.

System Action: Check for the DSNB354I message to verify the completion of the automatic recovery process.

DSNB354I *csect-name* **ASYNCHRONOUS GRECP RECOVERY HAS COMPLETED FOR GROUP BUFFER POOL** *bpoolname*.

Explanation: DB2 has completed the GRECP recovery process for those GRECP page sets in the group buffer pool specified in the message. This message is issued once by any DB2 member who previously issued a DSNB353I message, who is the page set castout owner on one of the objects being recovered.

DSNB357I *csect-name* **AUTOMATIC LPL RECOVERY SUPPRESSED FOR OBJECT TYPE** *object-type* **OBJECT NAME** *object-name* **REASON** *reasoncode*

Explanation: One or more pages in the object that is identified in the message have been added to the logical page list (LPL). However, DB2 cannot initiate automatic LPL recovery due to an environmental condition that prevents automatic LPL recovery.

The object could be a table space, an index space, or a partition within within a table space or an index space that is identified by the *object-type*. *object-name* identifies the name.

If the object is a table space or an index space, the format of the name is *dbname.spacename*. If the object is a partition within a table space or an index space, the format of the name is *dbname.spacename.partitionnumber*. *dbname* is the database name. *spacename* is the table space or the index space name. *partitionnumber* is the partition number.

reason indicates the condition that prevents DB2 from being able to initiate automatic LPL recovery. Here is a list of the potential values for *reason*:

DASD DB2 encountered a DASD I/O error.

RESTART

DB2 is in Restart or End_Restart mode.

GBP DB2 Group Buffer Pool structure failure or 100% loss of connectivity.

System Action: The Automatic LPL Recovery is not initiated.

Programmer Response: Check the reason that is specified to solve the system condition. To recover the LPL page, perform one of the following actions:

- Issue the START DATABASE command with the SPACENAM option
- Run the RECOVER or LOAD utility with REPLACE keyword.

DSNB401I **BUFFERPOOL NAME** *bpname*, **BUFFERPOOL ID** *bpid*, **USE COUNT** *ucount*

Explanation: This message contains the display information that results from a DISPLAY BUFFERPOOL command. For each buffer pool, this message is the first of a set of messages that display information from the DISPLAY BUFFERPOOL command.

The statistics are:

bpname

The buffer pool external name (BP0, BP1, ..., BP49, BP8KB, BP16KB BP32K, BP32K1, ..., BP32K9).

bpid

The buffer pool internal identifier (0-49, 80-89).

ucount

The number of open table spaces or index spaces that refer to this buffer pool. A zero use count means that the buffer pool is inactive.

System Action: Processing continues.

DSNB402I **BUFFERPOOL SIZE = *vpsize* BUFFERS
ALLOCATED = *vpalc* TO BE DELETED
= *vptbd* IN-USE/UPDATED = *vpcba***

Explanation: This message, displayed by the DISPLAY BUFFERPOOL command, describes the allocation status of a buffer pool. This message is always preceded by message DSNB401I identifying the associated buffer pool.

The statistics are:

vpsize The user-specified buffer pool size

vpalc Number of allocated buffers in an active buffer pool

vptbd Number of buffers to be deleted in an active buffer pool because of pool contraction

vpcba Number of currently active (that is, not stealable) buffers in the buffer pool

System Action: Processing continues.

DSNB404I **THRESHOLDS — VP SEQUENTIAL =
vpseq DEFERRED WRITE = *dwt*
VERTICAL DEFERRED WRT =
dvv1,dvv2 PARALLEL SEQUENTIAL =
vppseqt ASSISTING PARALLEL SEQT =
*vpxpseqt***

Explanation: This message is displayed by the DISPLAY BUFFERPOOL command to describe the user-modifiable thresholds for the buffer pool. This message is always preceded by message DSNB401I identifying the associated buffer pool.

The input threshold variables are:

vpseq Sequential steal threshold for the virtual pool, expressed as a percentage of the total buffer pool size.

dwt Free buffer deferred write threshold for the buffer pool, expressed as a percentage of the total buffer pool size.

dvv1 Vertical deferred write threshold for the buffer pool, expressed as a percentage of the total buffer pool size.

dvv2 Vertical deferred write threshold for the buffer pool, expressed as an absolute number of buffers. *dvv2* is used to determine the threshold only if *dvv1* is zero and *dvv2* is non-zero; otherwise *dvv1* is used to determine the threshold.

vppseqt Sequential threshold for parallel query processing, expressed as a percentage of the virtual sequential steal threshold. When the threshold is set to 0, there is no parallel query processing support.

vpxpseqt

Assisting parallel sequential threshold, expressed as a percentage of the sequential threshold for parallel query processing. *vpxpseqt* allows you to control how much buffer resource is used when this DB2 is assisting another member of the group in parallel processing. When the threshold is set to 0, this buffer pool will not be used to assist other data sharing members in processing a query. In a non-data-sharing environment, this value is ignored.

System Action: Processing continues.

DSNB406I **PAGE STEALING METHOD = *pgsteal***

Explanation: This message, displayed by the DISPLAY BUFFERPOOL command, describes the current and pending PGSTEAL attributes. This message is always preceded by message DSNB401I identifying the associated buffer pool.

pgsteal is the page stealing method (PGSTEAL) that is in use for the buffer pool.

LRU Specifies the buffer pool buffers are managed using the least recently used (LRU) algorithm. This is the default.

FIFO Specifies the buffer pool buffers are managed using the first in first out (FIFO) algorithm.

System Action: Processing continues.

DSNB408I **NO DETAIL STATISTICS AVAILABLE
FOR BUFFER POOL *bpname***

Explanation: This message is displayed by the DISPLAY BUFFERPOOL command with the DETAIL option specified. It indicates that no detail statistics are available for the requested buffer pool because the pool was not activated since DB2 startup.

System Action: Processing continues.

DSNB409I **INCREMENTAL STATISTICS SINCE
*basetime***

Explanation: This message is displayed by the DISPLAY BUFFERPOOL command with the DETAIL(INTERVAL) option specified. It indicates the start time of the interval for which the statistics were accumulated (that is, either the time of the previous incremental display or the time the buffer pool was first activated, if there was no previous incremental display).

System Action: Processing continues.

DSNB410I CUMULATIVE STATISTICS SINCE
basetime

Explanation: This message is displayed by the DISPLAY BUFFERPOOL command with the DETAIL(*) option specified. It indicates the start time of the interval for which the statistics were accumulated (that is, the time the buffer pool was first activated).

System Action: Processing continues.

DSNB411I RANDOM GETPAGE = *rgp* SYNC READ I/O (R) = *srr* SEQ. GETPAGE = *sgp* SYNC READ I/O (S) = *srs* DMTH HIT = *dmt* PAGE-INS REQ = *pir*

Explanation: This message is displayed by the DISPLAY BUFFERPOOL command with the DETAIL option specified. It lists the page read statistics for the buffer pool. This message is always preceded by message DSNB401I identifying the associated buffer pool.

The statistics are:

- rgp** Number of nonsequential GETPAGE requests
- srr** Number of synchronous read I/O operations for nonsequential GETPAGE requests
- sgp** Number of sequential GETPAGE requests
- srs** Number of synchronous read I/O operations for sequential GETPAGE requests
- dmt** Number of times data management threshold was hit
- pir** Number of page-ins required for read I/O

System Action: Processing continues.

DSNB412I SEQUENTIAL PREFETCH - REQUESTS = *pft* PREFETCH I/O = *pio* PAGES READ = *pfp*

Explanation: This message is displayed by the DISPLAY BUFFERPOOL command with the DETAIL option specified. It lists the sequential prefetch statistics for the buffer pool. This message is always preceded by message DSNB401I identifying the associated buffer pool.

The statistics are:

- pft** Number of times sequential prefetch was requested
- pio** Number of sequential prefetch read I/O operations
- pfp** Number of pages read because of sequential prefetch

System Action: Processing continues.

DSNB413I LIST PREFETCH - REQUESTS = *pft* PREFETCH I/O = *pio* PAGES READ = *pfp*

Explanation: This message is displayed by the DISPLAY BUFFERPOOL command with the DETAIL option specified. It shows the list prefetch statistics for the buffer pool. This message is always preceded by message DSNB401I identifying the associated buffer pool.

The statistics are:

- pft** Number of times list prefetch was requested
- pio** Number of list prefetch read I/O operations
- pfp** Number of pages read because of list prefetch

System Action: Processing continues.

DSNB414I DYNAMIC PREFETCH - REQUESTS = *pft* PREFETCH I/O = *pio* PAGES READ = *pfp*

Explanation: This message is displayed by the DISPLAY BUFFERPOOL command with the DETAIL option specified. It lists the dynamic prefetch statistics for the buffer pool. This message is always preceded by message DSNB401I identifying the associated buffer pool.

The statistics are:

- pft** Number of times dynamic prefetch was requested
- pio** Number of dynamic prefetch read I/O operations
- pfp** Number of pages read because of dynamic prefetch

System Action: Processing continues.

DSNB415I PREFETCH DISABLED - NO BUFFER = *pfd* NO READ ENGINE = *ree*

Explanation: This message is displayed by the DISPLAY BUFFERPOOL command with the DETAIL option specified. It lists prefetch statistics for the buffer pool. This message is always preceded by message DSNB401I identifying the associated buffer pool.

The statistics are:

- pfd** Number of times prefetch was disabled (no buffer)
- ree** Number of times prefetch was disabled (no asynchronous read processor available)

System Action: Processing continues.

DSNB420I **SYS PAGE UPDATES = *sws* SYS
PAGES WRITTEN = *pws* ASYNC WRITE
I/O = *wio* SYNC WRITE I/O = *imw*
PAGE-INS REQ = *pir***

Explanation: This message is displayed by the DISPLAY BUFFERPOOL command with the DETAIL option specified. It lists page write statistics for the buffer pool. This message is always preceded by message DSNB401I identifying the associated buffer pool.

The statistics are:

sws Number of system page updates
pws Number of system pages written
wio Number of asynchronous write I/O operations
imw Number of synchronous write I/O operations
pir Number of page-ins required for write I/O

System Action: Processing continues.

DSNB421I **DWT HIT= *dwt* VERTICAL DWT HIT=*vdw*
NO WRITE ENGINE=*wee***

Explanation: This message is displayed by the DISPLAY BUFFERPOOL command with the DETAIL option specified. It lists page-write statistics for the buffer pool. This message is always preceded by message DSNB401I identifying the associated buffer pool.

The statistics are:

dwt Number of times deferred write threshold was hit
vdw Number of times vertical deferred write threshold was hit
wee Number of times write engine (asynchronous write processor) was not available for I/O operations

System Action: Processing continues.

DSNB440I **PARALLEL ACTIVITY — PARALLEL
REQUEST = *tpa* DEGRADED
PARALLEL = *dpa***

Explanation: This message is issued in response to the DISPLAY BUFFERPOOL command with DETAIL specified. It lists statistics about parallel activities. This message is always preceded by message DSNB401I identifying the associated buffer pool.

The variables are:

tpa Total number of negotiations with the buffer pool for getting the requested number of sequential prefetch streams
dpa Total number of times the negotiation resulted in the degraded mode of parallel operations

DSNB453I **VP CACHED PAGES - CURRENT =
vcount MAX = *mvcount* CHANGED =
ccount MAX = *mccount***

Explanation: This message might be displayed for an active buffer pool by the DISPLAY BUFFERPOOL command with LSTATS specified. It lists the number of cached pages and the number of changed pages in the buffer pool for a data set. The message is only issued if there are nonzero values to display. This message is always preceded by message DSNB401I identifying the associated buffer pool, DSNB464I or DSNB465I identifying the table space or index space, and DSNB466I identifying the data set.

The statistics are:

vcount Number of cached pages in VP for the data set (that is, the number of buffers that contain pages for the data set in the buffer pool).

mvcount

Maximum number of cached pages in VP for the data set since the last DISPLAY BUFFERPOOL command with the LSTATS option was issued.

ccount Number of changed pages in VP for the data set (that is, the number of buffers that were changed in the buffer pool for the data set).

mccount

Maximum number of changed pages in VP for the data set since the last DISPLAY BUFFERPOOL command with the LSTATS option was issued.

This message is issued by the following CSECT:
DSNB1DBP

System Action: Processing continues.

DSNB455I **SYNCHRONOUS I/O DELAYS —
AVERAGE DELAY = *avd* MAXIMUM
DELAY = *mxd* TOTAL PAGES = *tpg***

Explanation: This message might be displayed for an active buffer pool by the DISPLAY BUFFERPOOL command with the LSTATS option specified. It lists synchronous I/O delay statistics for a data set belonging to an open table space or index space associated with the buffer pool. The values listed are incremental since the last display for the data set. The message is only issued if there are nonzero values to display. This message is always preceded by message DSNB401I identifying the associated buffer pool, DSNB464I or DSNB465I identifying the table space or index space, and DSNB466I identifying the relative data set within the table space or index space.

The statistics are:

avd Average I/O delay in milliseconds for pages in the data set

DSNB456I • DSNB462I

mxd Maximum I/O delay in milliseconds for pages in the data set

tpg Total number of pages read or written for the data set

System Action: Processing continues.

DSNB456I ASYNCHRONOUS I/O DELAYS — AVERAGE DELAY = *avd* MAXIMUM DELAY = *mxd* TOTAL PAGES = *tpg* TOTAL I/O COUNT = *tio*

Explanation: This message might be displayed for an active buffer pool by the DISPLAY BUFFERPOOL command with the LSTATS option specified. It lists asynchronous I/O delay statistics for a data set belonging to an open table space or index space associated with the buffer pool. The values listed are incremental since the last display for the data set. The message is only issued if there are nonzero values to display. This message is always preceded by message DSNB401I identifying the associated buffer pool, DSNB464I or DSNB465I identifying the table space or index space, and DSNB466I identifying the relative data set within the table space or index space.

The statistics are:

avd Average I/O delay in milliseconds for pages in the data set

mxd Maximum I/O delay in milliseconds for pages in the data set

tpg Total number of pages read or written for the data set

tio Total number of I/Os issued for the data set

System Action: Processing continues.

DSNB459I *csect-name* OPEN FAILURE HAS OCCURRED FOR DATA SET *dsn*

Explanation: This message might be displayed for an active buffer pool by the DISPLAY BUFFERPOOL command with the LIST option specified. It indicates that a previous attempt to access a data set (identified by its relative data set number within a table space or index space) failed due to an allocation or open error.

This message is always preceded by a DSNB401I message identifying the associated buffer pool and a DSNB464I or DSNB465I message identifying the table space or index space.

System Action: Processing continues.

DSNB460I --PAGE SET/PARTITION LIST INFORMATION---DATA SHARING INFO-- TS GBP MEMBER CASTOUT USE P-LOCK DATABASE SPACE NAME PART IX DEP NAME OWNER COUNT STATE

Explanation: This message displays the column headings that indicate the beginning of a multiple line display generated by a DISPLAY BUFFERPOOL command. The format of the multiple line display has three parts:

- The column headers (DSNB460I), which are underlined
- Detailed space information for all spaces and partitions requested by the command (DSNB462I)
- An ending message (DSNB463I) that might be displayed if no spaces matched the command criteria

The text of message DSNB462I provides the detail lines that follow the headings generated by this message. If the DISPLAY BUFFERPOOL LIST command finds more than 255 lines of output to display, the report will be broken up and new headings (DSNB460I) will be displayed with '(CONTINUED)' showing in the heading text. This is needed due to the MVS limitation of 255 messages for multi-line WTO messages.

System Action: Processing continues.

DSNB461I

Explanation: This message appears within a multiple line display generated by a DISPLAY BUFFERPOOL command. It follows message DSNB460I and is used to underline the column headings that are displayed by DSNB460I.

System Action: Processing continues.

DSNB462I *database spacenam part ty gbp mbr castout use p-lock*

Explanation: This message displays the detail lines generated by a DISPLAY BUFFERPOOL command. It follows DSNB460I.

The detail lines contain the following information (for report readability, the fields for DBNAME and SPACE NAME might be blank. When either field is blank, one of the prior detail lines contains the suppressed value).

database

Name of the database that is associated with the page set/partition.

spacenam

Name of the table space or index space.

part

The partition number. It is blank for a simple table space or simple index space. For non partitioned indexes on a partitioned table

space, it is the logical partition number preceded by the character L (for example, L01).

- ty* Whether the object is a table space (TS) or an index space (IX).
- gbp* Whether the page set/partition is GBP-dependent ('Y' for yes; 'N' for no).
- mbr* Name of the member that the detail line pertains to.
- castout* Whether the member identified in this line is the castout owner ('Y' for yes; blank for no).
- use* Number of active claimers or drainers for the page set/partition for the member displayed on this detail line.
- p-lock* P-lock state that the member identified in this line currently holds. Values are:

- IS** R/O interest. There are other members who have interest in this page set/partition. The page set/partition is GBP-dependent.
- IX** R/W interest. There are other members who have interest in this page set/partition. The page set/partition is GBP-dependent.
- S** R/O interest. There may be other members reading the page set/partition. The page set/partition is not GBP-dependent.
- SIX** R/W interest. There may be other members who are reading the page set/partition. The page set/partition is GBP-dependent.
- NSU** R/W interest. The page set/partition is GBP-dependent.
- X** R/W interest. There are no other members accessing the page set/partition. The page set/partition is not GBP-dependent.
- US** A temporary state that can be held by a restarting DB2 when 'waiting for retained locks' is enabled.
- ###** A number that is to be used as a diagnostic aid. A number is displayed only when a DISPLAY BUFFERPOOL command encounters a lock state other than any of those defined above.

System Action: Processing continues.

DSNB463I * NO OBJECTS MATCHED LIST/LSTATS SELECTION CRITERIA**

Explanation: This message appears as part of the DISPLAY BUFFERPOOL output if the command did not find any page sets/partitions that matched the selection criterion. For example, the message would be displayed for DIS BPOOL(BP0) GBPDEP(Y) if the command did not find any page sets/partitions that were GBP-dependent.

User Response: If you expected to see a list of page sets/partitions, ensure that the syntax of the command was coded correctly. Consider adding or changing the filter keywords to obtain a list of page sets/partitions.

System Action: The command terminates normally.

DSNB464I TS USE DATABASE SPACE NAME PART IX COUNT =====
===== =====

Explanation: This message displays underlined column headings that indicate the beginning of a multiple line display generated by a DISPLAY BUFFERPOOL command. The format of the multiple line display has three parts:

- Underlined column headings (DSNB464I).
- Detailed space information for the spaces and partitions that are requested by the command (DSNB465I).
- An ending message (DSNB463I) that may be displayed if no spaces matched the command criteria.

The text of message DSNB465I provides the detail lines that follow the headings generated by this message. If the DISPLAY BUFFERPOOL LIST command finds more than 255 lines of output to display, the report will be broken up and new headings (DSNB464I) will be displayed with '(CONTINUED)' showing in the heading text. This is needed due to the MVS limitation of 255 messages for multi-line WTO messages.

System Action: Processing continues.

DSNB465I database spacenam part ty use

Explanation: This message displays the detail lines generated by the DISPLAY BUFFERPOOL command. It follows DSNB464I.

The detail lines contain the following information (for report readability, the fields for DBNAME and SPACE NAME might be blank. When either field is blank, one of the prior detail lines will contain the suppressed value).

database

Name of the database that is associated with the page set/partition.

spacenam

Name of the table space or index space.

DSNB466I • DSNB502I

- part** The partition number. It is blank for a simple table space or simple index space. For non-partitioned indexes on a partitioned table space, it is the logical partition number preceded by the character L
- ty** Whether the object is a table space (TS) or an index space (IX).

System Action: Processing continues.

DSNB466I -----PAGE SET/PARTITION STATISTICS-----

Explanation: This message appears as part of the DISPLAY BUFFERPOOL output if the command was specified with the LSTATS option. It shows statistics for data sets.

System Action: Processing continues.

DSNB467I STATISTICS FOR *type* *dbname.spacenam* DATA SET #: *dsn#* USE COUNT:*ucount*

Explanation: This message might be displayed for an active buffer pool by the DISPLAY BUFFERPOOL command with the LSTATS option specified. It identifies the page set/partition type (table space/index space), database name, space name, number of claimers/drainers and the relative data set number within a table space or index space for the statistics displayed in one or more of the messages that follow this one.

type Whether the page set/partition is a table space (TABLE SPACE) or an index space (INDEX SPACE).

dbname
Database name

spacenam
Name of the table space or index space.

dsn# The relative data set number within a table space or index space for the statistics displayed in one or more of the messages that follow this one.

ucount Number of applications with a claim or drain on the page set/partition.

System Action: Processing continues.

DSNB468I *keyword* KEYWORD IS IGNORED FOR NON-DATA SHARING SYSTEMS

Explanation: The identified keyword is valid only in a data-sharing environment. Keywords GBPDEP and CASTOWNR can cause this message to be displayed.

User Response: Re-enter the command without the keyword since the DB2 is a non-data-sharing DB2.

System Action: The command ignores the keyword and terminates normally.

DSNB469I *keyword1* KEYWORD IS IGNORED WHEN *keyword2* KEYWORD IS SPECIFIED

Explanation: Keyword1 is incompatible with keyword2. For example, in command DIS BPOOL(BP0) GBPDEP(Y) LSTATS(*), keyword GBPDEP indicates that a list of page sets or partitions are desired (as in LIST keyword); however, keyword GBPDEP is ignored because LIST and LSTATS are two different reports.

User Response: Omit keyword1 if keyword2 is used on the next entry of the command.

System Action: The command ignores keyword1 and terminates normally.

DSNB499I DISPLAY TERMINATED DUE TO INSUFFICIENT MESSAGE SPACE

Explanation: The DISPLAY BUFFERPOOL or the DISPLAY GROUPBUFFERPOOL command was unable to obtain storage for additional messages. This should only happen for a particularly long display request, such as a detail display for a large number of buffer pools or group buffer pools.

System Action: The display is truncated.

System Programmer Response: Reissue the -DISPLAY BUFFERPOOL or the -DISPLAY GROUPBUFFERPOOL command, specifying a smaller number of buffer pools or group buffer pools.

DSNB501I *bpname* IS NOT A VALID BUFFER POOL NAME

Explanation: An invalid buffer pool name was specified on an ALTER BUFFERPOOL or DISPLAY BUFFERPOOL command. THE VALID NAMES ARE BP0, BP1,..., BP49, BP32K, BP32K1,...BP32K9.

System Action: The request is rejected.

System Programmer Response: Reissue the ALTER BUFFERPOOL or DISPLAY BUFFERPOOL command, specifying a valid buffer pool name.

DSNB502I *csect-name* VPSIZE FOR *bpname* MUST BE BETWEEN *llimit* AND *ulimit*

Explanation: An attempt was made to change a buffer pool's VPSIZE to an invalid value using the ALTER BUFFERPOOL command. VPSIZE is the number of buffers in the buffer pool.

bpname
Buffer pool name.

llimit Lower limit for buffer pool's VPSIZE. For BP0, the lower limit is 2000. For BP8K0, the lower

limit is 1000. For BP16K0, the lower limit is 500. For all other buffer pools, the lower limit is 0.

- ulimit** Upper limits for buffer pool's VPSIZE. The upper limit is as follows:
- 250000000 for 4KB page-size buffer pools
 - 125000000 for 8KB page-size buffer pools
 - 62500000 for 16KB page-size buffer pools
 - 31250000 for 32KB page-size buffer pools

System Action: The request is rejected.

System Programmer Response: Reissue the ALTER BUFFERPOOL command, specifying a legitimate VPSIZE value.

DSNB504I VPSEQT FOR *bpname* MUST BE BETWEEN 0 AND 100

Explanation: An ALTER BUFFERPOOL command was issued to try to alter a buffer pool's VPSEQT attribute to an invalid value. VPSEQT is the buffer pool sequential steal threshold. Valid values range from 0 to 100.

System Action: The request is rejected.

System Programmer Response: Reissue the ALTER BUFFERPOOL command, specifying a legitimate VPSEQT value.

DSNB506I DWQT FOR *bpname* MUST BE BETWEEN 0 AND 90

Explanation: An attempt was made to change a buffer pool's DWQT attribute value using the ALTER BUFFERPOOL command. DWQT is the free buffer deferred write threshold. Valid values range from 0 to 90.

System Action: The request is rejected.

System Programmer Response: Reissue the ALTER BUFFERPOOL command, specifying a legitimate DWQT value.

DSNB507I VDWQT FOR *bpname* MUST BE BETWEEN 0 AND 90

Explanation: An attempt was made to change a buffer pool's VDWQT attribute to an invalid value using the ALTER BUFFERPOOL command. VDWQT is the vertical deferred write threshold. Valid values range from 0 to 90.

System Action: The request is rejected.

System Programmer Response: Reissue the ALTER BUFFERPOOL command, specifying a legitimate VDWQT value.

DSNB508I *csect-name* THE TOTAL VPSIZE IS BEYOND THE MAXIMUM LIMIT

Explanation: An ALTER BUFFERPOOL command specified a VPSIZE or VPTYPE value that would cause the sum of the *ssnm*DBM1 address space storage requirements for all buffer pools to exceed 1TB. When calculating the storage requirements for the buffer pools, DB2 uses the page size (4K, 8K, 16K, or 32K) for each pool buffer.

System Action: The buffer pool's VPSIZE or VPTYPE is not changed. Processing for other parameters, if requested, proceeds normally.

System Programmer Response: Rebalance VPSIZE for all buffer pools.

DSNB510I NO ACTION REQUESTED

Explanation: An ALTER BUFFERPOOL command was issued, but no buffer pool attributes were specified.

System Action: The buffer pool's attributes are not changed.

System Programmer Response: Reissue the ALTER BUFFERPOOL command specifying one or more buffer pool attributes.

DSNB511I VDWQT CANNOT BE GREATER THAN DWQT

Explanation: An ALTER BUFFERPOOL command specified a DWQT and/or VDWQT value that would result in the buffer pool's VDWQT parameter being greater than its DWQT parameter.

System Action: The buffer pool's VDWQT or DWQT is not changed. Processing for other parameters, if requested, proceeds normally.

System Programmer Response: Rebalance DWQT and VDWQT for the buffer pool.

DSNB512I *integer* IS THE CURRENT VPSIZE FOR BUFFER POOL *bpname*

Explanation: An ALTER BUFFERPOOL command specified a VPSIZE equal to the buffer pool's current buffer pool size.

System Action: The buffer pool size is not changed. Processing for other parameters, if requested, proceeds normally.

DSNB514I *integer* IS THE CURRENT VPSEQT FOR BUFFER POOL *bpname*

Explanation: An ALTER BUFFERPOOL command specified an VPSEQT equal to the current sequential steal threshold of the buffer pool.

System Action: The buffer pool sequential threshold

is not changed. Processing for other parameters, if requested, proceeds normally.

DSNB516I *integer* IS THE CURRENT DWQT FOR BUFFER POOL *bpname*

Explanation: An ALTER BUFFERPOOL command specified a DWQT equal to the current deferred write threshold of the buffer pool.

System Action: The deferred write threshold of the buffer pool is not changed. Processing for other parameters, if requested, proceeds normally.

DSNB517I *int1,int2* IS THE CURRENT VDWQT FOR BUFFER POOL *bpname*

Explanation: An ALTER BUFFERPOOL command specified a VDWQT equal to the current vertical deferred write threshold of the buffer pool.

System Action: The vertical deferred write threshold of the buffer pool is not changed. Processing for other parameters, if requested, proceeds normally.

DSNB519I *csect-name* PGSTEAL FOR *bpname* HAS BEEN SET TO *value*.

Explanation: This message is issued in response to an ALTER BUFFERPOOL command to indicate that the requested change to the PGSTEAL parameter was accepted.

bpname is the name of the buffer pool.

value is one of the following:

LRU The buffer pool buffers are managed using the least recently used (LRU) algorithm. This is the default.

FIFO The buffer pool buffers are managed using the first in first out (FIFO) algorithm.

System Action: Processing continues.

DSNB520I READY TO EXPLICITLY DELETE BUFFER POOL *bpname*

Explanation: This message is issued before draining an active buffer pool in response to an ALTER BUFFERPOOL command, which specified VPSIZE=0 against an active buffer pool.

System Action: After this message is issued, DB2 quiesces all current activities against this buffer pool. DB2 locks the table space exclusively and performs physical close for all open table spaces or index spaces that reference this pool. DB2 also prevents subsequent database access that references this pool. SQL applications get an SQLCODE -904 (resource not available) with reason code 00C200E0 to indicate that the requested buffer pool size is not initialized. After the

requested buffer pool is deleted, message DSNB521I is issued.

DSNB521I BUFFER POOL *bpname* HAS BEEN EXPLICITLY DELETED

Explanation: This message is issued after an active buffer pool is explicitly deleted with an ALTER BUFFERPOOL command. This message is always preceded by a corresponding DSNB520I message.

System Action: The virtual storage and hiperspaces associated with this buffer pool are released.

DSNB522I VPSIZE FOR *bpname* HAS BEEN SET TO *integer*

Explanation: This message is issued in response to an ALTER BUFFERPOOL command to indicate that the requested change to the VPSIZE parameter was accepted. For an active pool, the actual expansion, contraction, or deletion does not take place until after this message is issued.

System Action: Processing continues.

System Programmer Response: Issue the DISPLAY BUFFERPOOL command to determine the actual virtual storage usage for this pool.

DSNB524I VPSEQT FOR *bpname* HAS BEEN SET TO *integer*

Explanation: This message is issued in response to an ALTER BUFFERPOOL command. It indicates the successful modification of the sequential steal threshold of the buffer pool.

DSNB526I DWQT FOR *bpname* HAS BEEN SET TO *integer*

Explanation: This message is issued in response to an ALTER BUFFERPOOL command. It indicates the successful modification of the deferred write threshold of the buffer pool.

DSNB527I VDWQT FOR *bpname* HAS BEEN SET TO *int1,int2*

Explanation: This message is issued in response to an ALTER BUFFERPOOL command. It indicates the successful modification of the vertical deferred write threshold of the buffer pool.

DSNB529I VPPSEQT FOR *bpname* HAS BEEN SET TO *integer*

Explanation: This message is issued in response to the ALTER BUFFERPOOL command. It indicates the successful modification of the parallel sequential steal threshold of the buffer pool.

DSNB530I *integer* IS THE CURRENT VPPSEQT FOR BUFFER POOL *bpname*

Explanation: An ALTER BUFFERPOOL command specified a VPPSEQT equal to the current parallel sequential steal threshold of the buffer pool.

System Action: The parallel sequential steal threshold of the buffer pool is not changed. Processing for other parameters, if requested, proceeds normally.

DSNB531I VPPSEQT FOR *bpname* MUST BE BETWEEN 0 AND 100

Explanation: An ALTER BUFFERPOOL command was issued to alter a buffer pool's VPPSEQT attribute to an invalid value. VPPSEQT is the parallel sequential steal threshold of the buffer pool. Valid values range from 0 to 100.

System Action: The VPPSEQT value is not changed.

System Programmer Response: Change the VPPSEQT attribute to a valid value and reenter the command.

DSNB532I VPXPSEQT FOR *bpname* HAS BEEN SET TO *integer*

Explanation: This message is issued from DSNB1ABP csect in response to the ALTER BUFFERPOOL command. It indicates the successful modification of the assisting parallel sequential threshold of the buffer pool.

DSNB533I *integer* IS THE CURRENT VPXPSEQT FOR BUFFER POOL *bpname*

Explanation: An ALTER BUFFERPOOL command specified a VPXPSEQT equal to the current assisting parallel sequential threshold of the buffer pool.

System Action: The assisting parallel sequential threshold of the buffer pool is not changed. Processing for other parameters, if requested, proceeds normally.

DSNB534I VPXPSEQT FOR *bpname* MUST BE BETWEEN 0 AND 100

Explanation: An ALTER BUFFERPOOL command was issued to change a buffer pool's VPXPSEQT attribute to an invalid value. VPXPSEQT is the assisting parallel sequential threshold of the virtual buffer pool. Valid values range from 0 to 100. This message is issued from DSNB1ABP csect.

System Action: The VPXPSEQT value is not changed.

System Programmer Response: Change the VPXPSEQT attribute to a valid value and reenter the command.

DSNB536I *csect-name* THE TOTAL VIRTUAL BUFFER POOL STORAGE EXCEEDS THE REAL STORAGE CAPACITY

Explanation: This message is issued as a warning that the total amount of allocated virtual buffer pool storage for this DB2 subsystem has exceeded the real storage capacity of the z/OS image. The amount of real storage should be at least as much as the total amount of virtual buffer pool storage, and should also be enough to accommodate the EDM pool and DB2 working storage in addition to the virtual buffer pool storage. Paging activity in the buffers is an indication of a performance problem.

System Action: Processing continues.

System Programmer Response: Allocate more real storage to the z/OS image. If there is not enough real storage to hold the buffers, then the number of buffers needs to be reduced. This might mean fewer concurrent users. If the number of buffers is reduced, then DB2 will issue the DSNB538I message when the total amount of virtual buffer pool storage no longer exceeds the real storage capacity.

DSNB538I *csect-name* THE TOTAL BUFFER POOL STORAGE NO LONGER EXCEEDS THE REAL STORAGE CAPACITY

Explanation: This message is issued following a previous DSNB536I message to indicate that the total amount of allocated buffer pool storage for this DB2 subsystem no longer exceeds the real storage capacity of the z/OS image.

System Action: Processing continues.

DSNB539I KEYWORD *keyw-oid* IS NO LONGER SUPPORTED. THE SPECIFIED VALUE IS IGNORED.

Explanation: An ALTER BUFFERPOOL command specified a keyword that is no longer supported.

System Action: The keyword and its specified value are ignored. Processing for other parameters, if requested, proceeds normally.

DSNB540I *csect-name* INSUFFICIENT LOCAL CACHE VECTOR STORAGE TO EXPAND BUFFER POOL *bpname* TO SPECIFIED SIZE *size1*. BUFFER POOL SIZE IS NOW *size2*.

Explanation: The specified buffer pool could not be expanded to the requested size (*size1*). The associated group buffer pool is connected, and the local cache vector could not be expanded to cover the requested buffer pool size.

The local cache vector is a bit array which tracks whether the page in a given buffer was modified by

DSNB551I • DSNB602I

another system (cross-invalidated). There must be one bit in the vector for each buffer in the buffer pool. For more information on the local cache vector, see *MVS/ESA Programming: Sysplex Services Reference*.

System Action: DB2 downgrades the expansion request to the size that can be supported by the available local cache vector storage (*size2*).

System Programmer Response: Free local cache vector storage by contracting or deleting other buffer pools that are connected to a group buffer pool. Then reattempt the pool expansion by reissuing the ALTER BUFFERPOOL command.

DSNB551I **BSDS READ ERROR, RC= *integer*, RSN=*integer***

Explanation: This message is issued in response to a failure of a READ function on the bootstrap data set (BSDS). Users should check any previous error messages issued by MVS and DB2 against the corresponding BSDS. RC and RSN indicate an error return code and reason code from the BSDS function.

System Action: Processing continues.

Operator Response: Notify the system programmer.

System Programmer Response: Analyze the return and reason codes to determine what type of error occurred. Refer to message DSNJ1071 for more information.

DSNB552I **BSDS WRITE ERROR, RC= *integer*, RSN= *integer***

Explanation: This message is issued in response to a failure of a WRITE function on the bootstrap data set (BSDS). Check any previous error messages issued by MVS and DB2 against the corresponding BSDS. RC and RSN indicate an error return code and reason code from the BSDS function.

System Action: Processing continues.

Operator Response: Notify the system programmer.

System Programmer Response: Analyze the return and reason codes to determine what type of error occurred. Refer to message DSNJ1081 for more information.

DSNB553I **BSDS INSERT ERROR, RC= *integer*, RSN= *integer***

Explanation: This message is issued in response to a failure of an INSERT function on the bootstrap data set (BSDS). Check any previous error messages issued by MVS and DB2 against the corresponding BSDS. RC and RSN indicate an error return code and reason code from the BSDS function.

System Action: Processing continues.

Operator Response: Notify the system programmer.

System Programmer Response: Analyze the return and reason codes to determine what type of error occurred. For more information, refer to message DSNJ109I or other DSNJ messages related to BSDS.

DSNB601I **BUFFER POOL *bpname* FULL**

Explanation: A buffer is required to access a database page that is not currently contained within the buffer pool. A buffer cannot be assigned because all buffers in the buffer pool are in a nondisplaceable state. (Buffers are in a nondisplaceable state when they contain actively referenced pages or updated pages for which writes are pending.)

This message can occur if there is an overload of concurrent activity for the buffer pool size. The variable *bpname* is the buffer pool external name.

System Action: Reason code 00C200E9 and the buffer pool external name are recorded in the cursor table (CT), which is available in the SQL communication area (SQLCA) or messages. An SQLCODE -904 (resource not available) is returned to the user.

Operator Response: Notify the system programmer.

System Programmer Response: Do one of the following:

- Reduce concurrent activity by reducing the number of DB2 threads.
- Use the ALTER BUFFERPOOL command to increase the size of the buffer pool.

DSNB602I **UNABLE TO CREATE BUFFER POOL *bpname*. BUFFER POOL SIZE IS ZERO**

Explanation: An attempt to create the buffer pool failed while opening a DB2 table space or index that specified its use. The buffer pool size for *bpname* was zero. This indicates that the use of the pool is invalid.

System Action: Reason code 00C200E0 and the buffer pool external name are recorded in the cursor table (CT), which is available in the SQL communication area (SQLCA) or messages. An SQLCODE -904 (resource not available) is returned to the user.

Operator Response: Notify the system programmer.

System Programmer Response: Use the ALTER TABLESPACE or ALTER INDEX statement to modify affected table spaces or indexes to indicate a usable buffer pool. Use the DISPLAY BUFFERPOOL command to determine a usable buffer pool. If necessary, use the ALTER BUFFERPOOL command to activate the failing buffer pool by setting its VPSIZE to a nonzero value.

DSNB603I **INSUFFICIENT STORAGE TO
CREATE/EXPAND BUFFER POOL
bpname TO SPECIFIED SIZE integer.
BUFFER POOL SIZE IS NOW integer.**

Explanation: A buffer pool could not be created or expanded to the requested size. Insufficient storage exists within the *ssnmDBM1* address space to build the buffer pool. The buffer pool size is set by the ALTER BUFFERPOOL command and can be queried by using the DISPLAY BUFFERPOOL command.

System Action: The buffer pool is created or expanded to the size allowed by the available storage. If the buffer pool cannot be created at all, and the creation request was triggered by a page set open by an application, then an SQLCODE -904 (resource not available) is returned to the user. Reason code 00C200E8 and the buffer pool external name are recorded in the cursor table (CT), which is available in the SQL communication area (SQLCA) or messages.

Operator Response: Notify the system programmer.

System Programmer Response: Analyze the storage content of the *ssnmDBM1* address space to determine further action. If appropriate, use the ALTER TABLESPACE or ALTER INDEX statement to use a different buffer pool. Otherwise, use ALTER BUFFERPOOL commands to balance storage use for all buffer pools.

DSNB605I **UNABLE TO CREATE BUFFER POOL
bpname TO SPECIFIED SIZE DURING
STARTUP/RESTART. INSUFFICIENT
VIRTUAL STORAGE**

Explanation: An attempt to create the buffer pool failed at the time that DB2 was performing its startup or restart processing. Insufficient virtual storage exists within the *ssnmDBM1* address space for building the buffer pool. The name of the buffer pool is *bpname*.

System Action: The buffer pool is not created. The table space or index open request, which triggered the attempt to create the buffer pool, fails. An SQLCODE -904 (resource not available) is returned to the user. Reason code 00C200E8 and the buffer pool external name are recorded in the cursor table (CT), which is available in the SQL communication area (SQLCA) or messages.

Operator Response: Notify the system programmer. This message remains on the console until the operator deletes it.

System Programmer Response: Analyze the virtual storage content of the DSNDBM1 *ssnmDBM1* address space to determine further action. If appropriate, use ALTER BUFFERPOOL commands to balance virtual storage use for all buffer pools.

DSNB609I **BUFFER POOL bpname CREATED
USING DEFAULT SIZE integer DURING
STARTUP/RESTART. BUFFER POOL
SIZE IS ZERO**

Explanation: While activating a buffer pool during DB2 startup or restart processing, the buffer pool size was zero. A zero value might be caused by an unusable bootstrap data set (BSDS) or by a DB2 abnormal termination after buffer pool size was altered to zero. The name of the buffer pool is *bpname* and the default buffer pool size is *integer*.

System Action: DB2 creates the buffer pool using the startup restart default value. For 4KB/32KB page-type buffer pools, the default values are 1000 and 12, respectively.

Operator Response: Notify the system programmer. This message remains on the console until deleted by the operator.

System Programmer Response: Use the ALTER TABLESPACE or ALTER INDEX statement to modify the affected table spaces or indexes to indicate a usable buffer pool. To determine a usable buffer pool, use the DISPLAY BUFFERPOOL command. If necessary, use the ALTER BUFFERPOOL command to activate the failing buffer pool by setting the VPSIZE to a nonzero value.

DSNB610I **csect-name MAXIMUM ALLOCATABLE
BUFFER POOL STORAGE OF int1MB
HAS BEEN REACHED. UNABLE TO
CREATE/EXPAND BUFFER POOL
bp-name TO SPECIFIED SIZE int2.
BUFFER POOL IS NOW int3**

Explanation: A buffer pool could not be created or expanded to the requested size. The maximum amount of allowable buffer pool storage, indicated by *int1*, has been reached. The maximum allowable buffer pool storage is calculated to be twice the amount of real storage that is available on the z/OS image, or 1TB, whichever is less.

bpname

Indicates the name of the buffer pool that was affected.

int2

Indicates the size of the buffer pool that was requested.

int3

Indicates the actual size of the buffer pool that was created/expanded.

System Action: The buffer pool is created or expanded to the size allowed by the available storage within the maximum. If the maximum has already been reached, then the buffer pool is allocated at a minimum size as follows:

- 2,000 pages for 4K page size
- 1,000 pages for 8K page size

DSNB740I • DSNB743I

- 500 pages for 16K page size
- 250 pages for 32K page size

Once the maximum has been reached, buffer pool sizes are not allowed to be increased.

System Programmer Response: Analyze the buffer pool sizes and determine if any can be decreased, or consider adding more memory.

DSNB740I *csect-name* **ATTEMPTING TO ESTABLISH DUPLEXING FOR GROUP BUFFER POOL** *gbpname* **REASON =** *reason*

Explanation: DB2 has been requested to establish duplexing for the named group buffer pool. *reason* indicates the reason why duplexing was initiated. *reason* can be one of the following:

OPERATOR

The operator initiated a SETXCF command to initiate duplexing.

POLICY

The currently active CFRM policy indicated that duplexing should be automatically established for the group buffer pool.

This message is issued by each DB2 member participating in establishing duplexing.

System Action: The DB2 members that are actively connected to the named group buffer pool participate in establishing duplexing for the group buffer pool. Access to the group buffer pool is quiesced while duplexing is being established.

DSNB741I *csect-name* **DUPLEXING COULD NOT BE ESTABLISHED FOR GROUP BUFFER POOL** *gbpname* **REASON =** *reason*

Explanation: DB2 was unable to establish duplexing for the named group buffer pool. *reason* indicates the DB2 reason code indicating why duplexing could not be established.

System Action: The group buffer pool goes back to simplex mode.

System Programmer Response: See the explanation for the reason code given.

DSNB742I *csect-name* **DUPLEXING HAS BEEN SUCCESSFULLY ESTABLISHED FOR GROUP BUFFER POOL** *gbpname*

Explanation: The process to establish duplexing for the named group buffer pool has successfully completed.

This message is preceded by message DSNB740I which indicates the reason why duplexing was initiated.

This message is issued by each DB2 member participating in establishing duplexing.

System Action: Processing of mainline requests is resumed for the group buffer pool. Writes of changed pages to the group buffer pool will be duplexed writes from this point forward.

DSNB743I *csect-name* **DUPLEXING IS BEING STOPPED FOR GROUP BUFFER POOL** *gbpname* **FALLING BACK TO PRIMARY REASON =** *reason1* **DB2 REASON CODE =** *reason2*

Explanation: Duplexing is being stopped for the named group buffer pool. To stop the duplexing, the secondary group buffer pool will be deallocated, and DB2 will go back to simplex mode on the primary group buffer pool.

reason1 indicates why duplexing was stopped:

OPERATOR

The operator initiated an MVS command to stop duplexing.

POLICY

A new CFRM policy has been activated which specifies DUPLEX(DISABLED) for the group buffer pool.

LOSSCONNSEC

One or more of the DB2 members lost connectivity to the secondary group buffer pool structure.

STRFAILSEC

The secondary group buffer pool structure failed.

DB2REASON

DB2 decided to stop duplexing. The reason code given in *reason2* indicates why DB2 stopped duplexing.

DUPCONNCHG

Duplexing rebuild stopped because of insufficient connectivity due to a change in the set of connectors.

If *reason1* indicates 'DB2REASON', then *reason2* specifies a DB2 reason code that indicates why DB2 stopped duplexing. If *reason1* is not 'DB2REASON', then *reason2* is zero.

This message is issued by each DB2 member connected to the duplexed group buffer pool.

System Action: The secondary group buffer pool structure is discarded, and DB2 enters back into simplex mode on the primary group buffer pool structure. If DUPLEX(AUTO) is specified in the active CFRM policy for the group buffer pool, then duplexing will be automatically reinitiated, if duplexing is still possible.

System Programmer Response: If the rebuild stopped because of "DB2REASON", see the explanation for the reason code given. If duplexing is not automatically reinitiated and duplexing is desired for the group buffer pool, then use the MVS SETXCF command to reestablish duplexing.

DSNB744I *csect-name* **DUPLEXING IS BEING STOPPED FOR GROUP BUFFER POOL *gbpname*, SWITCHING TO SECONDARY REASON = *reason1* DB2 REASON CODE = *reason2***

Explanation: Duplexing is being stopped for the named group buffer pool. To stop the duplexing, the primary group buffer pool will be deallocated, and DB2 will switch to the the secondary group buffer pool to go back to simplex mode.

reason1 indicates why duplexing was stopped:

OPERATOR

The operator initiated an MVS command to stop duplexing.

POLICY

A new CFRM policy has been activated which specifies DUPLEX(DISABLED) for the group buffer pool.

LOSSCONNPRI

One or more of the DB2 members lost connectivity to the primary group buffer pool structure.

STRFAILPRI

The primary group buffer pool structure failed.

DB2REASON

DB2 decided to stop duplexing. The reason code given in *reason2* indicates why DB2 stopped duplexing.

If *reason1* indicates 'DB2REASON', then *reason2* specifies a DB2 reason code that indicates why DB2 stopped duplexing. If *reason1* is not 'DB2REASON', then *reason2* is zero.

This message is issued by each DB2 member connected to the duplexed group buffer pool.

System Action: The primary group buffer pool structure is discarded, and DB2 enters back into simplex mode on the secondary group buffer pool structure. If DUPLEX(ENABLED) is specified in the active CFRM policy for the group buffer pool, then duplexing will be automatically reinitiated, if duplexing is still possible.

System Programmer Response: If the rebuild stopped because of "DB2REASON", see the explanation for the reason code given. If duplexing is not automatically reinitiated and duplexing is desired for the group buffer pool, then use the MVS SETXCF

command to reestablish duplexing.

DSNB745I *csect-name* **THE TRANSITION BACK TO SIMPLEX MODE HAS COMPLETED FOR GROUP BUFFER POOL *gbpname***

Explanation: The named group buffer pool has completed the transition from duplex mode back to simplex mode.

This message is preceded either by message DSNB743I or by message DSNB744I which indicates the reason why duplexing was stopped. This message is issued by each DB2 member connected to the group buffer pool.

System Action: The group buffer pool is now back in simplex mode which means that writes of changed pages to the group buffer pool are now simplexed. If DUPLEX(ENABLED) is specified in the active CFRM policy for the group buffer pool, then duplexing will be automatically reinitiated, if duplexing is still possible. This would mean that the group buffer pool is only temporarily back into simplex mode (it is soon to be entered back into duplex mode).

DSNB749I **GBPCACHE NO IS NOT ALLOWED FOR GROUP BUFFER POOL *gbpname* BECAUSE IT IS DUPLEXED**

Explanation: This message is issued in response to an ALTER GROUPBUFFERPOOL command that requests a change of the GBPCACHE attribute from YES to NO, but because the group buffer pool is duplexed, the change from YES to NO is not allowed.

System Action: The request to change from GBPCACHE(YES) to GBPCACHE(NO) is rejected.

System Programmer Response: GBPCACHE(NO) and duplexing are mutually exclusive. If you want GBPCACHE(NO), then you must put the group buffer in simplex mode before specifying GBPCACHE(NO). To put a duplexed group buffer pool in simplex mode, do any of the following procedures:

- Activate a new CFRM policy that specifies DUPLEX(DISABLED) for the group buffer pool. This is the preferred method if you do not intend to duplex the group buffer pool again for awhile.
- Ensure that DUPLEX(AUTO) is not specified in the active CFRM policy for the group buffer pool, and then issue the MVS command SETXCF STOP,REBUILD,DUPLEX.

DSNB750I **DISPLAY FOR GROUP BUFFER POOL *gbpname* FOLLOWS**

Explanation: This message is issued in response to a DISPLAY GROUPBUFFERPOOL command. It signals the beginning of a display for group buffer pool *gbpname* if the following are true:

- It meets the selection criteria on the command.

DSNB751I • DSNB755I

- The MVS CFRM administrative policy information for the group buffer pool is accessible.

If the CFRM policy information is unavailable, message DSNB751I signals the partial display of group buffer pool information.

The series of messages DSNB755I through DSNB759I provide information on the group buffer pool's allocation characteristics. Messages DSNB765I through DSNB769I provide information on DB2 connections to the group buffer pool, while DSNB770I through DSNB788I provide statistics on group buffer pool usage. Note that all message numbers in the range might not be used. Message DSNB790I ends the display.

DSNB751I MVS CFRM POLICY INFORMATION NOT AVAILABLE FOR GROUP BUFFER POOL *gbpname* MVS IXCQUERY RETURN CODE = *retcode* MVS IXCQUERY REASON CODE = *reason* A PARTIAL DISPLAY FOLLOWS

Explanation: DB2 could not retrieve group buffer pool policy information in response to a DISPLAY GROUPBUFFERPOOL command. Either the MVS query request (IXCQUERY) did not successfully complete, or the backing structure for the group buffer pool is not defined in the MVS CFRM administrative policy. To determine the exact reason, examine return code *retcode* and reason code *reason* returned by MVS on the query request. For an explanation of the IXCQUERY codes, see *MVS/ESA Programming: Sysplex Services Reference*. If the IXCQUERY request did not complete successfully, no CONNLIST information, even if requested, is provided.

System Action: Processing continues, but the information displayed is incomplete.

DSNB752I GROUP DETAIL STATISTICS ARE NOT AVAILABLE FOR THE GROUP BUFFER POOL BECAUSE A REBUILD IS IN PROGRESS

Explanation: Because a rebuild is in progress for the group buffer pool, DB2 cannot retrieve group buffer pool group (GDETAIL) statistics in response to a DISPLAY GROUPBUFFERPOOL command. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool.

System Action: Processing continues.

DSNB753I GROUP BUFFER POOL STRUCTURE OWNER INFORMATION NOT AVAILABLE IRLM NOTIFY RETURN CODE = *retcode* IRLM NOTIFY REASON CODE = *reason*

Explanation: DB2 could not retrieve group buffer pool structure owner information for message DSNB798I

because the IRLM Notify request did not successfully complete. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool.

retcode Return code from IRLM on the Notify request

reason Reason code from IRLM on the Notify request

For an explanation of IRLM return and reason codes, see Chapter 60, "IRLM error return and reason codes," on page 1327.

System Action: Processing continues.

DSNB755I DB2 GROUP BUFFER POOL STATUS CONNECTED = *status1* CURRENT DIRECTORY TO DATA RATIO = *ratio1* PENDING DIRECTORY TO DATA RATIO = *ratio2* CURRENT GBPCACHE ATTRIBUTE = *gcache1* PENDING GBPCACHE ATTRIBUTE = *gcache2*

Explanation: In response to a DISPLAY GROUPBUFFERPOOL command, this is the first of two messages displaying information about the status of the group buffer pool as it is known to DB2. This message is followed by DSNB756I. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool.

status1 Whether this DB2 is connected to the group buffer pool:

YES This DB2 is actively connected to the group buffer pool.

NO This DB2 is not actively connected to the group buffer pool.

ratio1 The ratio of directory entries to data pages, as specified for the current allocation of this group buffer pool. If the group buffer pool is not currently allocated, this field contains blanks.

ratio2 The desired ratio of directory entries to data pages to take effect at the next reallocation of the group buffer pool.

gcache1 The GBPCACHE attribute as specified for the current allocation of this group buffer pool.

gcache2 The value for GBPCACHE attribute that will take effect at the next reallocation of the group buffer pool.

DSNB756I CLASS CASTOUT THRESHOLD =
threshold1 % **GROUP BUFFER POOL**
CASTOUT THRESHOLD = *threshold2* %
GROUP BUFFER POOL CHECKPOINT
INTERVAL = *interval* **MINUTES**
RECOVERY STATUS = *status1*
AUTOMATIC RECOVERY =
auto-rec-parm

Explanation: This is the second of two messages displaying information about the status of the group buffer pool as it is known to DB2. If DB2 was successful in getting MVS CFRM policy information for the group buffer pool, messages DSNB757I through DSNB759I immediately follow this message. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool.

threshold1

The threshold at which class castouts are to be initiated. It is expressed as a percentage of the group buffer pool size.

threshold2

The threshold at which castout is to be initiated at the group buffer pool level. It is expressed as a percentage of the group buffer pool size.

interval The time, in minutes, between successive initiations of group buffer pool checkpoint.

status1 The recovery status for the group buffer pool:

DAP Damage assessment pending. DB2 is in the process of doing damage assessment for the group buffer pool in response to a coupling facility structure failure. The group buffer pool is temporarily stopped internally by DB2 and is unavailable for use until the damage assessment process completes.

NORMAL

There is no pending recovery action for this group buffer pool.

auto-rec-parm

Automatic recovery parameter specification:

YES DB2 should automatically initiate recovery for the objects using this group buffer pool following a failure of the group buffer pool. This is the default.

NO DB2 should not initiate automatic group buffer pool recovery. If the group buffer pool fails, you must manually issue DB2 -START DATABASE commands to do the recovery.

DSNB757I MVS CFRM POLICY STATUS FOR
structure-name = *status2* **MAX SIZE**
INDICATED IN POLICY = *psize* **KB**
DUPLEX INDICATOR IN POLICY =
dupstat **CURRENT DUPLEXING MODE =**
dupmode **ALLOCATED =** *status1*

Explanation: For a DISPLAY GROUPBUFFERPOOL command, this message gives the status for the structure associated with the group buffer pool. It is displayed only if DB2 was successful in querying the MVS CFRM administrative policy. It is immediately preceded by message DSNB756I, and if the structure is allocated, followed by messages DSNB758I and DSNB759I. A preceding DSNB750I message identifies the associated group buffer pool.

structure-name

The coupling facility structure name for this group buffer pool, such as DSNCAT_GBP0.

status2 MVS global status of the backing coupling facility structure:

NORMAL

Structure is defined in the current CFRM policy and has no current MVS restrictions.

CHNGP

Change pending in the structure policy.

dupstat The duplexing attribute for the coupling facility structure, as indicated by the DUPLEX parameter in the CFRM policy definition.

DISABLED

DUPLEX(DISABLED) is specified for the coupling facility structure. The DUPLEX parameter is not specified.

ENABLED

DUPLEX(ENABLED) is specified for the coupling facility structure.

ALLOWED

DUPLEX(ALLOWED) is specified for the coupling facility structure.

dupmode

Indication of current status of the group buffer pool in relation to duplexing.

SIMPLEX

Group buffer pool is currently in simplex mode.

DUPLEX

Group buffer pool is currently in duplex mode.

INTRAN

Group buffer pool is currently in a transition state. Either from simplex mode to duplex mode, or from duplex mode to simplex mode. The rebuild

status indicator in message DSNB758I gives information about the transition state.

psize The size (in kilobytes) of the coupling facility structure as indicated in the CFRM policy definition.

status1 Whether the backing coupling facility structure is currently allocated:

YES The coupling facility structure is allocated in a coupling facility.

NO The coupling facility structure is not allocated in any coupling facility.

DSNB758I **ALLOCATED SIZE = *asize* KB**
VOLATILITY STATUS = *volstat* REBUILD STATUS = *rblstat* CFNAME = *cfname*
CFLEVEL - OPERATIONAL = *cflevel1*
CFLEVEL - ACTUAL = *cflevel2*

Explanation: This message is the first of two messages giving the allocation details for the group buffer pool on a DISPLAY GROUPBUFFERPOOL command. It is issued only if DB2 determines, by successfully querying the MVS CFRM policy, that the group buffer pool is allocated. It is immediately preceded by message DSNB757I. A preceding DSNB750I message identifies the associated group buffer pool.

asize The actual allocated group bufferpool structure size (in kilobytes).

volstat The volatility status of the backing group buffer pool structure for this group buffer pool:

VOLATILE

The backing coupling facility structure is volatile.

NON-VOLATILE

The backing coupling facility structure is non-volatile.

rblstat Indication of whether or not rebuild is in progress for the group buffer pool structure, and if so, which part of the rebuild process is happening:

NONE Rebuild is not in progress.

QUIESCE

Rebuild is in progress and the rebuild is currently in the rebuild quiesce phase.

CONNECT

Rebuild is in progress and the rebuild is currently in the rebuild connect phase.

CLEANUP

The rebuild has completed, and the connected DB2 members are making

final preparations to use the new group buffer pool structure. If the duplexing status in message DSNB757I indicates 'INTRAN', then the 'CLEANUP' indication means that DB2 is in the final stages of transitioning from duplex mode back to simplex mode, switching to the secondary group buffer pool.

STOPPING

The rebuild is stopping, and the connected DB2 members are making preparations to fall back to the original group buffer pool structure. If the duplexing status in message DSNB757I indicates 'INTRAN', then the 'STOPPING' indication means that DB2 is transitioning from duplex mode back to simplex mode, reverting back to the primary group buffer pool.

DUPLEXED

The group buffer pool is in steady-state duplexing mode.

SWITCHING

DB2 is in the initial phase of transitioning from duplex mode back to simplex mode, switching to the secondary group buffer pool. The group buffer pool is transitioning from duplex mode back to simplex mode, switching to the secondary group buffer pool.

cfname

The name of the coupling facility in which the group buffer pool is allocated. If the group buffer pool is duplexed, this is the coupling facility name associated with the primary group buffer pool.

cflevel1

The coupling facility level from a DB2 functionality perspective for the coupling facility in which this group buffer pool is allocated. If the group buffer pool is duplexed, *cflevel1* is the coupling facility level associated with the primary group buffer pool.

cflevel2

The coupling facility level for the coupling facility in which this group buffer pool is allocated. If the group buffer pool is duplexed, *cflevel2* is the coupling facility level associated with the primary group buffer pool."

DSNB759I **NUMBER OF DIRECTORY ENTRIES = *dir#***
NUMBER OF DATA PAGES = *data#*
NUMBER OF CONNECTIONS = *conn#*

Explanation: This message is the second of two messages giving the allocation details for the group

buffer pool for a DISPLAY GROUPBUFFERPOOL command. It is issued only if DB2 determines, by successfully querying the MVS CFRM administrative policy, that the group buffer pool is allocated. It is immediately preceded by message DSNB758I. A preceding DSNB750I message identifies the associated group buffer pool.

- dir#* Actual number of directory entries allocated for the coupling facility structure.
- data#* Actual number of data pages allocated for the coupling facility structure.
- conn#* The number of DB2 subsystems that are connected to the coupling facility structure. This includes both active connections and failed-persistent connections. The CONNLIST option of the DISPLAY GROUPBUFFERPOOL command gives details of the connection status.

DSNB760I GBPCACHE OPTION SET TO *value* FOR *gbpname*. IT WILL TAKE EFFECT ON THE NEXT REALLOCATION

Explanation: This message is issued in response to an ALTER GROUPBUFFERPOOL command that requests a change in the GBPCACHE attribute. It is also issued for the first ALTER GROUPBUFFERPOOL command for a group buffer pool, even when the GBPCACHE option is not specified on the command. (In this case, the message shows YES for the GBPCACHE option.) The new setting takes effect the next time the coupling facility cache structure is allocated.

System Programmer Response: Use the MVS command SETXCF START, REBUILD command when you are ready for the change to take effect.

System Action: Processing continues.

DSNB761I THE NEW SETTING WILL TAKE EFFECT AFTER THE GBPCACHE ATTRIBUTE HAS BEEN CHANGED TO YES

Explanation: This message is issued in response to an ALTER GROUPBUFFERPOOL command that requests a change to RATIO, CLASST, GBPOOLT or GBPCHKPT when GBPCACHE NO is also specified on the command or when the current GBPCACHE attribute is NO. The new setting takes effect the next time the coupling facility cache structure is allocated after the GBPCACHE attribute has been changed to YES.

System Programmer Response: Use the ALTER GROUPBUFFERPOOL command to change the GBPCACHE attribute to YES and the MVS command SETXCF START, REBUILD when you are ready for the change to take effect.

System Action: Processing continues.

DSNB762I DUPLEXING STATISTICS FOR *secondary-gbpname* WRITES FAILED DUE TO LACK OF STORAGE = *s2* CHANGED

Explanation: This message is displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the GDETAIL option if the group buffer pool is duplexed. It lists the statistics on writes to the secondary group buffer pool and the total number of changed pages for the secondary group buffer pool. *secondary-gbpname* is the normal group buffer pool name (such as GBP0) suffixed with '-SEC'.

- s2* **Write miss cache full** counter. Number of times a coupling facility write request was not completed because of a lack of storage in the secondary group buffer pool.

For information about the Group Detail Report, see *DB2 Data Sharing: Planning and Administration* .

DSNB763I *gbpname* IS NOT DEFINED WITH GBPCACHE NO

Explanation: This message is issued in response to a DISPLAY GROUPBUFFERPOOL command with TYPE(NOCACHE) and either one name or a list of names specified in the selection list. The specified group buffer pool is not defined with GBPCACHE NO, and therefore does not meet the qualification to be displayed. This message is issued once for each group buffer pool that does not match the "GBPCACHE NO" criterion.

System Action: The display is terminated for this group buffer pool. Command processing continues, if there are other group buffer pool names to process.

DSNB764I DUPLEXING STATISTICS FOR *secondary-gbpname* WRITES FAILED DUE TO LACK OF STORAGE = *s2* ASYNCHRONOUS COMPLETION CHECKS = *s3*

Explanation: This message is displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the MDETAIL option if the group buffer pool is duplexed. It lists the statistics on writes to the secondary group buffer pool. *secondary-gbpname* is the normal group buffer pool name (e.g. GBP0) suffixed with '-SEC'.

- s2* Coupling facility write requests that were not completed because of a lack of storage in the secondary group buffer pool.
- s3* The number of times DB2 checked for the completion of the write of a changed page to the secondary group buffer pool, but the write had not yet completed and thus the transaction had to wait until the write to the secondary group buffer pool completed.

DSNB765I • DSNB772I

For information about the Member Detail Report, see *DB2 Data Sharing: Planning and Administration*.

DSNB765I NO CONNLIST REPORT IS GENERATED. THERE ARE NO CONNECTIONS TO THIS GROUP BUFFER POOL.

Explanation: DB2 displays this message in response to a DISPLAY GROUPBUFFERPOOL command with the CONNLIST option when there are currently no connection names to report for the group buffer pool. A preceding DSNB750I message identifies the associated group buffer pool.

DSNB766I THE CONNLIST REPORT FOLLOWS

Explanation: DB2 displays this message in response to a DISPLAY GROUPBUFFERPOOL command with the CONNLIST option to indicate the beginning of the CONNLIST display for this group buffer pool. A preceding DSNB750I message identifies the associated group buffer pool.

**DSNB767I CONNECTION NAME = *conname*,
CONNECTION STATUS = *status*
CONNECTOR'S RELEASE = *DB2 release***

Explanation: This message contains the display information that results from a DISPLAY GROUPBUFFERPOOL command with the CONNLIST option. One DSNB767I message is issued for each defined connection to the group buffer pool. The associated group buffer pool is identified on a preceding DSNB750I message.

conname

Name of the connection. DB2 subsystems use the DB2 member name as the connection name.

status Status of the connection.

A Active.

F Failed-Persistent.

D Dually connected to both the original structure and the new structure during a rebuild.

DB2 release

The release of the connected DB2.

DSNB768I THERE ARE NO GROUP BUFFER POOLS DEFINED WITH GBPCACHE NO

Explanation: This message is issued in response to a DISPLAY GROUPBUFFERPOOL command with the TYPE(NOCACHE) option and an asterisk (*) specified as the selection list when DB2 determines that there are

no group buffer pools defined with the GBPCACHE(NO) attribute.

System Action: Command processing is terminated.

DSNB769I THE CONNLIST REPORT IS COMPLETE

Explanation: DB2 displays this message in response to a DISPLAY GROUPBUFFERPOOL command with the CONNLIST option to indicate the end of the CONNLIST display for this group buffer pool. A preceding DSNB750I message identifies the associated group buffer pool.

DSNB770I MEMBER DETAIL STATISTICS ARE NOT AVAILABLE FOR THE GROUP BUFFER POOL. THIS DB2 HAS NEVER BEEN CONNECTED TO THE GROUP BUFFER POOL.

Explanation: This message is issued in response to a DISPLAY GROUPBUFFERPOOL command with MDETAIL specified. MDETAIL statistics are not available for the requested group buffer pool because this DB2 has not connected to the group buffer pool since startup. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool.

System Action: Processing continues.

DSNB771I INCREMENTAL MEMBER DETAIL STATISTICS SINCE *basetime*

Explanation: This message is displayed in response to the DISPLAY GROUPBUFFERPOOL command with MDETAIL(INTERVAL) specified. It indicates the start time of the interval for which the statistics were accumulated. This is the time of the previous MDETAIL incremental display on this DB2 or the time DB2 first connected to the group buffer pool if there was no previous MDETAIL incremental display. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool.

System Action: Processing continues.

DSNB772I CUMULATIVE MEMBER DETAIL STATISTICS SINCE *basetime*

Explanation: This message is displayed in response to the DISPLAY GROUPBUFFERPOOL command with MDETAIL(*) specified. It indicates the start time of the interval for which the statistics were accumulated. This is the time this DB2 first connected to the group buffer pool. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool.

System Action: Processing continues.

**DSNB773I MEMBER DETAIL STATISTICS
SYNCHRONOUS READS DUE TO
BUFFER INVALIDATION DATA
RETURNED = r1 DATA NOT RETURNED
= r2**

Explanation: This is the first of eight messages containing local statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the MDETAIL option. It lists some synchronous read statistics for the group buffer pool. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool. Messages DSNB774I, DSNB775I, DSNB789I, and DSNB776I through DSNB779I always follow this one.

The counter descriptions are listed below. In the descriptions, the term "synchronous" means that the coupling facility interaction is done under the DB2 user's execution unit.

- r1 Synchronous coupling facility read requests issued because the virtual buffer was marked "invalid". Data is successfully returned from the group buffer pool.
- r2 Synchronous coupling facility read requests issued because the virtual buffer was marked "invalid". Data is *not* returned from the group buffer pool.

**DSNB774I DUE TO DATA PAGE NOT IN BUFFER
POOL DATA RETURNED = r3 DATA
NOT RETURNED = r4**

Explanation: This is the second of eight messages containing local statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the MDETAIL option. It lists more local synchronous read statistics for the group buffer pool. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool. This message is always preceded by message DSNB773I and followed by messages DSNB775I, DSNB789I, and DSNB776I through DSNB779I.

The counter descriptions are listed below. In the descriptions, the term "synchronous" means that the coupling facility interaction is done under the DB2 user's execution unit.

- r3 Synchronous coupling facility read requests issued because the required data was not in the buffer pool buffer. Data is successfully returned from the group buffer pool.
- r4 Synchronous coupling facility read requests issued because the required data was not in the buffer pool buffer. Data is *not* returned from the group buffer pool.

**DSNB775I PREFETCH READS DATA NOT
RETURNED = r5**

Explanation: This is the third of eight messages containing local statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the MDETAIL option. It lists some prefetch read statistics for the group buffer pool. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool.

- r5 This is the number of pages that were not retrieved from the GBP following RPL request. These pages were retrieved from DASD. Note that there are not any CF interactions associated with this number; this number is incremented when the RPL feedback indicates that the page is not cached in the GBP so that DB2 can avoid a CF read request for the page and go directly to DASD.

**DSNB776I SYNCHRONOUS WRITES CHANGED
PAGES = w1 CLEAN PAGES = w2**

Explanation: This is the fifth of eight messages containing local statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the MDETAIL option. It lists some local write statistics for the group buffer pool. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool. This message is always preceded by messages DSNB773I through DSNB775I and DSNB789I and followed by messages DSNB777I through DSNB779I.

The counter descriptions are listed below. In the descriptions, the term "synchronous" means that the coupling facility interaction is done under the DB2 user's execution unit.

- w1 Number of changed pages that were written synchronously, under a user's execution unit, to the coupling facility.
- w2 Number of clean pages that were written synchronously, under a user's execution unit, to the coupling facility.

**DSNB777I ASYNCHRONOUS WRITES CHANGED
PAGES = w3 CLEAN PAGES = w4
FAILED WRITES DUE TO LACK OF
STORAGE = w5**

Explanation: This is the sixth of eight messages containing local statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the MDETAIL option. It lists local write and cross-invalidation statistics for the group buffer pool. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool. This message is always preceded by messages DSNB773I through DSNB775I, DSNB789I, and DSNB776I and followed by messages DSNB778I and DSNB779I.

DSNB778I • DSNB784I

The counter descriptions are listed below. In the descriptions, the term "asynchronous" means that the coupling facility interaction is done under a DB2 system execution unit, such as with a prefetch.

- w3 Number of changed pages that were written asynchronously, under a system execution unit, to the coupling facility
- w4 Number of clean pages that were written asynchronously, under a system execution unit, to the coupling facility.
- w5 Coupling facility write requests that were not completed because of a lack of storage in the group buffer pool.

DSNB778I CASTOUT THRESHOLDS DETECTED FOR CLASSES = *t1* FOR GROUP BUFFER POOL = *t2* GBP CHECKPOINTS TRIGGERED = *k1* PARTICIPATION IN REBUILD = *k2*

Explanation: This is the seventh of ten messages containing local statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the MDETAIL option. It lists local castout threshold statistics for the group buffer pool and also group buffer pool checkpoint and rebuild statistics. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool. This message is always preceded by messages DSNB773I through DSNB775I, DSNB789I, DSNB776I, and DSNB777I and followed by messages DSNB796I, DSNB779I, and DSNB797I.

Counters:

- t1* Number of times the class castout threshold was detected
- t2* Number of times the group buffer pool castout threshold was detected
- k1* Number of group buffer pool checkpoints that were triggered.
- k2* Number of times that this member participated in a rebuild of the group buffer pool structure.

DSNB780I GROUP DETAIL STATISTICS ARE NOT AVAILABLE FOR THE GROUP BUFFER POOL. THIS DB2 IS NOT CURRENTLY CONNECTED TO THE GROUP BUFFER POOL.

Explanation: DB2 could not retrieve group buffer pool group (GDETAIL) statistics in response to a DISPLAY GROUPBUFFERPOOL command because this DB2 subsystem is not currently connected to the group buffer pool. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool.

System Action: Processing continues.

DSNB781I GROUP DETAIL STATISTICS ARE NOT AVAILABLE FOR THE GROUP BUFFER POOL. MVS IXLCACHE RETURN CODE = *retcode* MVS IXLCACHE REASON CODE = *reason*

Explanation: DB2 could not retrieve group buffer pool group (GDETAIL) statistics in response to a DISPLAY GROUPBUFFERPOOL command because the statistics request (IXLCACHE macro) did not successfully complete. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool.

retcode Return code from MVS on the statistics request

reason Reason code from MVS on the statistics request

For an explanation of IXLCACHE return and reason codes, see *MVS/ESA Programming: Sysplex Services Reference*.

System Action: Processing continues.

DSNB782I INCREMENTAL GROUP DETAIL STATISTICS SINCE *basetime*

Explanation: This message is displayed by the DISPLAY GROUPBUFFERPOOL command with GDETAIL(INTERVAL) specified. It indicates the start time of the interval for which the statistics were accumulated. This is the time of the previous GDETAIL incremental display from this DB2 or the time the group buffer pool was allocated or reallocated, if there was no previous GDETAIL incremental display.

System Action: Processing continues.

DSNB783I CUMULATIVE GROUP DETAIL STATISTICS SINCE *basetime*

Explanation: This message is displayed in response to the DISPLAY GROUPBUFFERPOOL command with GDETAIL(*) specified. It indicates the start time of the interval for which the statistics were accumulated. This is the time the group buffer pool was first allocated or reallocated.

System Action: Processing continues.

DSNB784I GROUP DETAIL STATISTICS READS DATA RETURNED = *r1*

Explanation: This is the first of five messages containing group statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the GDETAIL option. It lists the successful reads for the group buffer pool. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool. This message is always followed by messages DSNB785I through DSNB788I.

r1 "Read hit" counter. Number of times that a page was returned on a coupling facility read request.

For information about the Group Detail Report, see *DB2 Data Sharing: Planning and Administration* .

DSNB785I DATA NOT RETURNED DIRECTORY ENTRY EXISTED = *r2* DIRECTORY ENTRY CREATED = *r3* DIRECTORY ENTRY NOT CREATED = *r4*, *r5*

Explanation: This is the second of five messages containing group statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the GDETAIL option. It continues the read statistics for the group buffer pool. The associated group buffer pool is identified in a preceding DSNB750I or DSNB751I message. This message is always preceded by message DSNB784I and followed by messages DSNB786I through DSNB788I.

All the "read counters" in this message represent cases where data was not returned on the coupling facility read request.

- r2* "Read miss directory hit" counter. Number of times that a coupling facility read request specified a page for which a directory entry exists, but no data was cached for that page.
- r3* "Read miss name assigned" counter. Number of times that a coupling facility read request specified a page for which a directory entry was created.
- r4* "Read miss assignment suppressed" counter. Number of times that a coupling facility read request specified a page for which no directory entry exists and no directory entry is created.
- r5* "Read miss cache full" counter. Number of times that a coupling facility read request specified a page for which no directory entry exists and no directory entry is created because of a lack of storage in the group buffer pool.

For information about the Group Detail Report, see *DB2 Data Sharing: Planning and Administration* .

DSNB786I WRITES CHANGED PAGES= *w1* CLEAN PAGES = *w2* FAILED DUE TO LACK OF STORAGE = *w3* CHANGED PAGES SNAPSHOT VALUE = *p1*

Explanation: This is the third of five messages containing group statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the GDETAIL option. It is followed by messages DSNB787I and DSNB788I. It lists the statistics on writes to the group buffer pool and the total number of changed pages for the group buffer pool. The associated group

buffer pool is identified in a preceding DSNB750I or DSNB751I message. This message is always preceded by messages DSNB784I and DSNB785I.

- w1* "Changed page write hit" counter. Number of changed pages that were successfully written.
- w2* "Clean page write hit" counter. Number of clean pages that were successfully written.
- w3* "Write miss cache full" counter. Number of times a coupling facility write request was not completed because of a lack of storage in the group buffer pool.
- p1* "Total changed" counter. Snapshot value of the current number of changed pages. The displayed value of this counter is not affected by whether this is an incremental or cumulative display.

For information about the Group Detail Report, see *DB2 Data Sharing: Planning and Administration* .

DSNB787I RECLAIMS FOR DIRECTORY ENTRIES = *d1* FOR DATA ENTRIES = *d2* CASTOUTS= *c1*

Explanation: This is the fourth of five messages containing group statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the GDETAIL option. It is always preceded by messages DSNB784I through DSNB786I and followed by message DSNB788I. It lists the statistics on reclaims and castouts for the group buffer pool. The associated group buffer pool is identified in a preceding DSNB750I or DSNB751I message.

- d1* "Castout" counter. Number of pages that were castout.
- d2* "Data entry reclaim" counter. Number of times a name assignment required that a data page be reclaimed by the coupling facility.
- c1* "Castout" counter. Number of castout operations performed.

For information about the Group Detail Report, see *DB2 Data Sharing: Planning and Administration* .

DSNB788I CROSS INVALIDATIONS DUE TO DIRECTORY RECLAIMS = *x1* DUE TO WRITES = *x2* EXPLICIT = *x3*

Explanation: This is the last of five messages containing group statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the GDETAIL option. It lists the cross-invalidation (XI) statistics for the group buffer pool. The associated group buffer pool is identified in a preceding DSNB750I or DSNB751I message. This message is always preceded by messages DSNB784I through DSNB787I.

DSNB789I • DSNB793I

- x1* "XI for directory reclaim" counter. Number of times a directory entry was reclaimed (stolen) and XI signals had to be sent (that is, the stolen directory entry had registered DB2 interest).
- x2* "XI for write" counter. Number of times a coupling facility write request caused XI to one or more registered DB2s.
- x3* "XI for explicit invalidation" counter. Number of times an explicit coupling facility XI request caused XI to one or more registered DB2s.

For more information about these counters, see *DB2 Data Sharing: Planning and Administration*.

DSNB789I REGISTER PAGE LIST = *r7* PAGES RETRIEVED = *r8*

Explanation: This is the fourth of eight messages containing local statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the MDETAIL option. It lists more local read statistics for the group buffer pool. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool.

The counter descriptions are listed below.

- r7* The number of requests to the coupling facility to register interest in a list of pages. DB2 does this when prefetch (sequential or list) is used when the following conditions are met:
- The DB2 member is running on a particular service level of MVS 5.2 or above
 - The GBP is allocated in a coupling facility with CFLEVEL=2 or above.
- r8* Coupling facility read requests that were done for prefetch to retrieve a page in the group buffer pool as a result of feedback from the request to register a list of pages.

DSNB790I DISPLAY FOR GROUP BUFFER POOL *gbpname* IS COMPLETE

Explanation: For a DISPLAY GROUPBUFFERPOOL command, this message signals the end of the display for group buffer pool *gbpname*.

DSNB791I THIS DB2 IS NOT CONNECTED TO *gbpname*

Explanation: This message is issued in response to a DISPLAY GROUPBUFFERPOOL command with TYPE(MCONN) and either one name or a list of names specified in the selection list. The DB2 on which the DISPLAY GROUPBUFFERPOOL command was issued is not currently connected to the specified group buffer pool. This message is issued once for each group buffer pool that does not match the "member connectivity" criterion.

System Action: The display is terminated for this group buffer pool. Command processing continues, if there are other group buffer pool names to process.

DSNB792I NO DB2 IN THE GROUP IS CONNECTED TO *gbpname*

Explanation: This message is issued in response to a DISPLAY GROUPBUFFERPOOL command with TYPE(GCONN) and either one name or a list of names specified in the selection list. No DB2 in the group is currently connected to the specified group buffer pool. This message is issued once for each group buffer pool that does not match the "group connectivity" criterion.

System Action: The display is terminated for this group buffer pool. Command processing continues, if there are other group buffer pool names to process.

DSNB793I DELETE NAME LIST = *s5* READ CASTOUT STATISTICS = *s6* DELETE NAME = *s7* OTHER ASYNCHRONOUS GBP REQUESTS = *s8*

Explanation: This message is displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the MDETAIL option if the group buffer pool is duplexed. It lists the statistics on requests to the secondary group buffer pool that are related to castout processing and to garbage collection processing.

- s5* The number of Delete Name List requests to delete a set of pages from the secondary group buffer pool that have just been cast out from the primary. If the group buffer pool has been duplexed for the entire reporting interval, then this number should be roughly equal to the number of Unlock Castout requests to the primary (indicated in message DSNB796I).
- s6* The number of Read Castout Statistics requests to check for "orphaned data entries" in the secondary group buffer pool. The DB2 member that is the group buffer pool structure owner periodically issues these requests to determine whether garbage collection is necessary to clean up orphaned data entries from the secondary. Orphaned data entries are "changed" data entries in the secondary group buffer pool without a corresponding "changed" data entry in the primary. Orphaned data entries are to be expected from time to time and do not represent any kind of data inconsistency problem (because the page has already been cast out from the primary and such that the version of the page in the secondary is the same as the version of the page on DASD). Orphaned data entries can be introduced by certain transaction or system failures, or by new group buffer pool write

activity that encounters very unlikely timing windows when castout is concurrently processing.

- s7 The number of Delete Name requests to delete "orphaned data entries" from the secondary group buffer pool. The DB2 member that is the group buffer pool structure owner issues these requests if it determines that garbage collection is necessary. See the description above under s6 for a description of "orphaned data entries".
- s8 The number of asynchronous CF requests sent to the secondary group buffer pool. This excludes ASYNCHRONOUS COMPLETION CHECKS as reported on the DSNB764I message.

For information about the Member Detail Report, see *DB2 Data Sharing: Planning and Administration*.

DSNB794I THIS DB2 IS NOT CONNECTED TO ANY GROUP BUFFER POOL

Explanation: This message is issued in response to a DISPLAY GROUPBUFFERPOOL command with the TYPE(MCONN) option and an asterisk (*) specified as the selection list. This message is issued when DB2 determines that there are no group buffer pools having "member connectivity" from the DB2 on which the DISPLAY GROUPBUFFERPOOL command was issued.

System Action: Command processing is terminated.

DSNB795I NO DB2 IN THE GROUP IS CONNECTED TO ANY GROUP BUFFER POOL

Explanation: This message is issued in response to a DISPLAY GROUPBUFFERPOOL command with the TYPE(GCONN) option and an asterisk (*) specified as the selection list. When DB2 successfully determines (that is, no error is encountered during command processing) that there are no group buffer pools connected to any DB2 in the data sharing group.

System Action: Command processing is terminated.

**DSNB796I CASTOUTS PAGES CASTOUT = c1
UNLOCK CASTOUT = c2 READ
CASTOUT CLASS = c3 READ
CASTOUT STATISTICS = c4 READ
DIRECTORY INFO = c5**

Explanation: This is the eighth of ten messages containing local statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the MDETAIL option. It lists local castout statistics for the group buffer pool. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool. This message is always preceded by messages DSNB773I through DSNB775I, DSNB789I, DSNB776I

through DSNB778I, and followed by messages DSNB779I and DSNB797I.

Counters:

- c1 Number of pages cast out.
- c2 Number of requests to unlock for castout.
- c3 Number of read castout class requests.
- c4 Number of read castout statistics requests.
- c5 Number of read directory info requests. These requests are made during group buffer pool checkpoint.

**DSNB797I OTHER INTERACTIONS REGISTER
PAGE = o1 UNREGISTER PAGE = o2
DELETE NAME = o3 READ STORAGE
STATISTICS = o4 EXPLICIT CROSS
INVALIDATIONS = o5 ASYNCHRONOUS
GBP REQUESTS = o6**

Explanation: This is the last of ten messages containing local statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the MDETAIL option. It lists local castout statistics for the group buffer pool. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool. This message is always preceded by messages DSNB773I through DSNB775I, DSNB789I, DSNB776I through DSNB779I, and DSNB796I.

Counters:

- o1 Number of requests to the coupling facility to register interest in a single page.
- o2 Number of requests to the coupling facility to remove the registered interest in a single page.
- o3 Number of requests to the coupling facility to delete the directory entries associated with a set of pages.
- o4 Number of requests to the coupling facility to read the statistics counters associated with the structure. DB2 generally issues this request once per group buffer pool checkpoint, and once per GDETAIL request on the DB2 DISPLAY GROUPBUFFERPOOL command.
- o5 Number of explicit cross-invalidations for pages in the group buffer pool.
- o6 Number of coupling facility requests to the primary group buffer pool that were converted from synchronous to asynchronous.

**DSNB798I LAST GROUP BUFFER POOL
CHECKPOINT *timestamp* GSP
CHECKPOINT RECOVERY LRSN = *lrsn*
STRUCTURE OWNER = *member-name***

Explanation: This message is displayed in response to the DISPLAY GROUPBUFFERPOOL command. It is

issued only if DB2 determines, by successfully querying the MVS CFRM policy, that the group buffer pool is allocated. It is immediately preceded by message DSNB759I. A preceding DSNB750I message identifies the associated group buffer pool.

timestamp

The date and time of the last group buffer pool checkpoint.

lrsn

The recovery log record sequence number (LRSN) that was recorded by the last group buffer pool checkpoint that reflects the oldest changed page clean-to-dirty LRSN value at the time of the checkpoint. If the group buffer pool were to fail, *lrsn1* is used by DB2 as input to determine the starting points for the merged log scan to recover the page sets and partitions that are entered into group buffer pool recovery pending (GRECP) status. You can do more detailed monitoring of the group buffer pool checkpoint processing with IFCID 0261.

member-name

The member name of the group buffer pool structure owner. The structure owner's responsibilities include the following:

- Issue the group buffer pool checkpoint.
- Detect the GBPOOLT castout threshold and initiate castout if this threshold has been reached (by notifying the pageset or partition castout owners).
- Coordinate the damage assessment process in case the group buffer pool fails.
- Coordinate the rebuild process for the group buffer pool.

'UNKNOWN' is displayed if DB2 is not able to determine which member is the structure owner for the group buffer pool. This should only happen in an unexpected error situation. See the message accompanying that error.

System Action: Processing continues.

DSNB799I SECONDARY GBP ATTRIBUTES
ALLOCATED SIZE = *ssize* KB
VOLATILITY STATUS = *svolstat*
CFLEVEL - OPERATIONAL =
cflevel1/mv > **CFLEVEL - ACTUAL =**
cflevel2 **NUMBER OF DIRECTORY**
ENTRIES = *sdir#* NUMBER OF DATA
PAGES = *sdata#*

Explanation: For a DISPLAY GROUPBUFFERPOOL command, this message gives the attributes of the secondary group buffer pool if the group buffer pool is duplexed. It is displayed only if the group buffer pool is duplexed and if DB2 was successful in querying the MVS CFRM administrative policy. This message is not displayed if the group buffer pool is in a transition state between simplexing and duplexing.

ssize The actual allocated size (in kilobytes) of the secondary group buffer pool coupling facility structure.

svolstat

The volatility status of the secondary group buffer pool:

VOLATILE

The structure is volatile.

NON-VOLATILE

The structure is non-volatile.

sdir#

Actual number of directory entries allocated for the secondary group buffer pool.

sdata#

Actual number of data pages allocated for the secondary group buffer pool.

cflevel1

The coupling facility level from a DB2 functionality perspective for the coupling facility in which the secondary group buffer pool is allocated.

cflevel2

The coupling facility level for the coupling facility in which the secondary group buffer pool is allocated.

DSNB800I DIRECTORY ENTRY TO DATA PAGE RATIO SET TO *value* FOR *gbpname*. IT WILL TAKE EFFECT ON THE NEXT REALLOCATION

Explanation: This message is issued in response to an ALTER GROUPBUFFERPOOL command that requests a change to the directory entry to the data page ratio for a group buffer pool. It is also issued for the first ALTER GROUPBUFFERPOOL command for a group buffer pool, even when no ratio value is specified on the command (in this case, the default ratio value is being used). The new ratio takes effect the next time the coupling facility cache structure is allocated.

The directory entry to data page ratio determines the number of directory entries and the number of data pages that are allocated in the coupling facility cache structure for the group buffer pool. If the coupling facility structure is not allocated, the first connect from any DB2 causes allocation of the structure and the new directory entry to data page ratio to take effect.

If the structure size can be determined from the MVS CFRM administrative policy, message DSNB801I is issued to indicate an estimate of the number of directory and data entries that are allocated based on the new ratio and the current size of the coupling facility structure. Otherwise, message DSNB812I is issued.

System Action: Processing continues.

System Programmer Response: Use the -DISPLAY GROUPBUFFERPOOL command to display the number of allocated directory and data entries.

**DSNB801I MAX STRUCTURE SIZE INDICATED IN
MVS CFRM POLICY = *size* KB
ESTIMATED NUMBER OF DIRECTORY
ENTRIES = *dir#* ESTIMATED NUMBER
OF DATA PAGES = *data#***

Explanation: This message is issued in response to an ALTER GROUPBUFFERPOOL command after the directory entry to data page ratio is successfully updated. It is also issued for the first ALTER GROUPBUFFERPOOL command for a group buffer pool, even when no ratio value is specified on the command (in this case, the default ratio value is used). The group buffer pool is identified in message DSNB800I, which immediately precedes this message.

Because the actual ratio change does not take affect until the group buffer pool is reallocated, this message shows the estimated number of directory entries and data pages that are allocated based on the new ratio and the maximum size of the coupling facility structure, as indicated in the active CFRM policy definition. The actual number of entries that are allocated varies based on the amount of coupling facility storage that is available at the time the allocation is attempted, and on the amount of storage overhead necessary for the coupling facility control structures. Because DB2 cannot determine these variables, the estimated number of directory and data entries displayed in this message assumes that the entire storage allocation for the coupling facility cache structure will be used for directory and data entries, which is not the case.

To determine the actual number of directory and data entries that are allocated for this group buffer pool, you must cause the buffer pool to be reallocated or rebuilt, as described in *DB2 Data Sharing: Planning and Administration*, then issue a DISPLAY GROUPBUFFERPOOL command.

System Action: Processing continues.

**DSNB802I "*value*" IS NOT A VALID PARAMETER
FOR 'RATIO'**

Explanation: An illegal value for the RATIO parameter was specified for an ALTER GROUPBUFFERPOOL command. The RATIO value can be up to 6 characters, and must be a decimal number from 1.0 to 255 (inclusive). For values less than 25, any digits after the first decimal place are ignored. If the value for the RATIO parameter is greater than or equal to 25, any digits after the decimal point are ignored. Informational message DSNB803I is displayed if the system ignores any precision that exceeds the limits of the RATIO parameter.

System Action: The request is rejected.

System Programmer Response: Reissue the ALTER GROUPBUFFERPOOL command, and specify an acceptable value for RATIO.

DSNB803I RATIO IS TRUNCATED TO *value*

Explanation: The precision specified on the RATIO parameter on an ALTER GROUPBUFFERPOOL command was greater than allowed. For decimal numbers less than 25, any digits after the first decimal place are ignored: for example, 5.67 is treated as 5.6. For decimal numbers greater than or equal to 25, any digits after the decimal point are ignored: for example, 25.3 is treated as 25.

System Action: Processing continues.

**DSNB804I CLASS CASTOUT THRESHOLD SET
TO *value%* FOR *gbpname***

Explanation: This message is issued in response to an ALTER GROUPBUFFERPOOL command that requests a change to the class castout threshold value for a group buffer pool. It is also issued for the first ALTER GROUPBUFFERPOOL command for a group buffer pool, even when no threshold value is specified on the command (in this case, the default class castout threshold value is being used).

System Action: Processing continues.

**DSNB805I *value* IS NOT A VALID PARAMETER
FOR 'CLASST'**

Explanation: An illegal value was specified on the CLASST (class castout threshold) keyword on an ALTER GROUPBUFFERPOOL command. The CLASST value must be an integer between 0 and 90, inclusive.

System Action: The request is rejected.

System Programmer Response: Reissue the -ALTER GROUPBUFFERPOOL command, specifying an acceptable value for CLASST.

**DSNB806I GROUP BUFFER POOL CASTOUT
THRESHOLD SET TO *value%* FOR
*gbpname***

Explanation: This message is issued in response to an ALTER GROUPBUFFERPOOL command that successfully changes the group buffer pool castout threshold value for a group buffer pool. It is also issued for the first successful ALTER GROUPBUFFERPOOL command for a group buffer pool, even when no threshold value is specified on the command (in this case, the default group buffer pool castout threshold value is being used).

System Action: Processing continues.

**DSNB807I *value* IS NOT A VALID PARAMETER
FOR 'GBPOOLT'**

Explanation: An ALTER GROUPBUFFERPOOL command was issued with an illegal value specified on the GBPOOLT (group buffer pool castout threshold)

DSNB808I • DSNB815I

keyword. The GBPOOLT value must be an integer between 0 and 90, inclusive.

System Action: The request is rejected.

System Programmer Response: Reissue the -ALTER GROUPBUFFERPOOL command, specifying an acceptable value for GBPOOLT.

DSNB808I GROUP BUFFER POOL CHECKPOINT INTERVAL SET TO *value* MINUTES FOR *gbpname*

Explanation: This message is issued in response to an ALTER GROUPBUFFERPOOL command that successfully changes the group buffer pool checkpoint interval value for a group buffer pool. It is also issued for the first successful ALTER GROUPBUFFERPOOL command for a group buffer pool, even when no interval value is specified on the command (in this case, the default group buffer pool checkpoint interval value is being used).

System Action: Processing continues.

DSNB809I *value* IS NOT A VALID PARAMETER FOR 'GBPCHKPT'

Explanation: An ALTER GROUPBUFFERPOOL command was issued with an illegal value specified on the GBPCHKPT (group buffer pool checkpoint) keyword. The GBPCHKPT value must be an integer between 1 and 999999, inclusive.

System Action: The request is rejected.

System Programmer Response: Reissue the -ALTER GROUPBUFFERPOOL command, specifying an acceptable value for GBPCHKPT.

DSNB812I SIZE ESTIMATES ARE NOT AVAILABLE FOR THE GROUP BUFFER POOL MVS IXCQUERY RETURN CODE = *return code* MVS IXCQUERY REASON CODE = *reason code*

Explanation: The directory entries and data pages estimates for the group buffer pool, identified on the preceding DSNB800I message, could not be computed because IXCQUERY was unable to obtain the backing structure's size information from the MVS CFRM administrative policy definition. This can happen if an IXCQUERY processing error occurred, or if the structure was not defined in the CFRM policy. The backing structure for the group buffer pool must be defined in the CFRM policy before the group buffer pool can be allocated. The exact reason can be determined from the *return code* and the *reason code*. For an explanation of the IXCQUERY codes, see *MVS/ESA Programming: Sysplex Services Reference*.

System Action: The command completes successfully, but without giving the estimates.

DSNB813I *csect-name* ALTER NOTIFICATION FAILED

Explanation: An ALTER GROUPBUFFERPOOL command failed to propagate the request for castout threshold or checkpoint interval change to other DB2s in the data sharing group. This error is triggered by an error encountered by the IRLM notification process. As a result, different DB2s in the group might have different values for the castout threshold or checkpoint interval. The RATIO change does not use the notification process and is, therefore, not affected by such a failure.

System Action: Processing continues.

System Programmer Response: Reissue the -ALTER GROUPBUFFERPOOL command with the same parameters. If the problem persists, it indicates a deeper problem, such as inadequate space for the locking structures.

DSNB814I *csect-name* NO CHANGES REQUESTED ON COMMAND

Explanation: An ALTER GROUPBUFFERPOOL command without any parameters was issued for an existing group buffer pool. If an ALTER GROUPBUFFERPOOL command without any parameters is issued for a group buffer pool that does not yet exist, a group buffer pool definition with default parameters values is created.

System Action: The command is successful and processing continues.

DSNB815I PAGE P-LOCK LOCK/UNLOCK, P-LOCK REQUESTS FOR SPACE MAP PAGES = *nn* P-LOCK REQUESTS FOR DATA PAGES = *nn* P-LOCK REQUESTS FOR INDEX LEAF PAGES = *nn* P-LOCK UNLOCK REQUESTS = *nn*

Explanation: This message is issued in response to a DISPLAY GROUPBUFFERPOOL command. This message reports the physical lock (P-lock) status at the Group Buffer Pool level. The accounting of these P-locks is intended for use in monitoring and tuning database performance, especially in a data-sharing environment. For more information about the DISPLAY GROUPBUFFERPOOL command, please see the DB2 Command Reference.

System Action: Processing Continues.

DSNB816I PAGE P-LOCK
SUSPENSIONS/NEGOTIATIONS,
P-LOCK SUSPENSIONS FOR SPACE
MAP PAGES = *nn* P-LOCK
SUSPENSIONS FOR DATA PAGES = *nn*
P-LOCK SUSPENSIONS FOR INDEX
LEAF PAGES = *nn* P-LOCK
NEGOTIATIONS FOR SPACE MAP
PAGES = *nn* P-LOCK NEGOTIATIONS
FOR DATA PAGES = *nn* P-LOCK
NEGOTIATIONS FOR INDEX LEAF
PAGES = *nn*

Explanation: This message is issued in response to a DISPLAY GROUPBUFFERPOOL command. This message reports the physical lock (P-lock) status at the Group Buffer Pool level. These P-lock statistics are intended for use in monitoring and tuning database performance, especially in a data-sharing environment. For more information about the DISPLAY GROUPBUFFERPOOL command, please see the DB2 Command Reference.

System Action: Processing Continues.

DSNB890I *command-verb* *gbp-kwd* **COMMAND IS ONLY VALID FOR DATA SHARING**

Explanation: An attempt was made to issue a GROUPBUFFERPOOL command on a DB2 that was not initialized to participate in data sharing.

command-verb

The name of the command attempted: ALTER, or DISPLAY

gbp-kwd

The keyword GROUPBUFFERPOOL or GBPOOL

System Action: The command request is rejected.

DSNB891I *name* **IS NOT A VALID GROUP BUFFER POOL OR COUPLING FACILITY STRUCTURE NAME**

Explanation: An invalid name was specified on an ALTER GROUPBUFFERPOOL or DISPLAY GROUPBUFFERPOOL command.

name Either the DB2 group buffer pool name or the backing coupling structure name

You must either specify the DB2 group buffer pool name (*gbpname*) or the backing coupling facility structure name (*strname*). Acceptable values for *gbpname* are GBP0, GBP1, ... , GBP49, GBP32K, GBP32K1, ... , GBP32K9. The *strname* has the following format:

groupname_gbpname

The *groupname* is the DB2 data sharing group name. The underscore (`_`) is used as a delimiter between the *groupname* and the *gbpname*.

System Action: The request is rejected.

System Programmer Response: Reissue the command specifying a valid group buffer pool name.

DSNB892I *grpname* **IS NOT A VALID GROUP NAME FOR THIS DB2**

Explanation: The group name specified as part of the full coupling facility cache structure name on an ALTER GROUPBUFFERPOOL or DISPLAY GROUPBUFFERPOOL command is incorrect. On the commands, you can specify either the correct 16-byte coupling facility cache structure name or the DB2 group buffer pool name. The coupling facility cache structure name is a 16-character name specified as follows:

groupname_gbpname

The *gbpname* can be GBP0, GBP1, ..., GBP49 GBP32K, GBP32K1, ..., GBP32K9. The *groupname* is the DB2 data sharing group name. The underscore (`_`) is used as a delimiter between the *groupname* and the *gbpname*. The coupling facility cache structure names are left-justified with a blank as the rightmost padding character. DB2 adds the padding blanks if they are not specified on the command.

System Action: The request is rejected.

System Programmer Response: Reissue the command, specifying a valid group buffer pool name.

Chapter 6. DSNE... messages

In the TSO attachment facility, the user can control whether message IDs are displayed. To see them, type PROFILE MSGID. To suppress them, type PROFILE NOMSGID.

Trace messages associated with the TSO attachment facility (including DSN and DB2) are not listed in this documentation. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

All DSN command processor trace messages have the same message number: DSNET20I.

DSNET20I

Explanation: This is one of many possible trace messages bearing this message number. Complete documentation of all of the TSO attachment facility trace messages bearing this message number is found in Part 8 of *DB2 Diagnosis Guide and Reference*.

DSNE004E PROBABLE SUBSYSTEM ERROR DETECTED IN CSECT csect-name, SUBSYSTEM FUNCTION service, RETCODE retcode, REASON CODE reason-code

Explanation: A subsystem error has occurred. The function identified in the message as 'service' is either an MVS or a DB2 service routine. The error was discovered in the 'csect-name' indicated in the message. Refer to the appropriate MVS publications for a description of the return and reason codes.

System Action: This message is sometimes followed by an intentional system abend. In other instances, the DSN command processor will terminate the current subcommand and attempt to continue by issuing another DSN prompt.

User Response: Run the job again with a SYSUDUMP dump data set allocated and DSN tracing set to 123. Collect the DSN trace stream. If an abend occurs, collect the dump.

DSNE005A EXECUTION IS INTERRUPTED. ENTER C TO CANCEL, OR ANY OTHER REPLY TO RESUME THE subcmd SUBCOMMAND

Explanation: The Attention key was pressed. Entering a 'C' will cancel the DSN subcommand that is currently executing. If the user enters a question mark, message DSNE006A will appear. Any other reply will cause execution of the subcommand that was in progress to continue.

If the DSN prompt was issued just before the Attention

key was pressed, 'subcmd' may be either 'DSN' or the previously invoked subcommand.

User Response: Enter a 'C' to cancel the DB2 subcommand currently executing. The DSN prompt will appear on the terminal. Enter anything else (except another attention) to resume execution.

DSNE006A C WILL TERMINATE THE SUBCOMMAND WITH UNCOMMITTED CHANGES BACKED OUT

Explanation: Enter a 'C' to terminate the subcommand. No uncommitted changes are made to the database. Any other reply causes subcommand execution to continue.

User Response: Enter a 'C' to terminate the subcommand. Control returns to DSN, and the DSN prompt appears on the terminal. This is a second-level help message associated with message DSNE005A.

DSNE008I REPLY WAS xxxxx, EXECUTION RESUMED

Explanation: Execution was suspended by a user ATTENTION and then was resumed, because the string specified in the message as 'xxxxx' was entered.

System Action: Control returns to the interrupted session.

DSNE009I REPLY WAS C, EXECUTION TERMINATED

Explanation: The response to message DSNE005A was a C. This caused the current subcommand to terminate.

System Action: The current subcommand is terminated. The DSN prompt appears on the terminal.

User Response: You can now enter another DSN subcommand.

**DSNE010I SUBCOMMAND subcmd CANCELED
BY ATTENTION**

Explanation: The subcommand specified in the messages was canceled because the user pressed the attention key and then entered a 'C'.

System Action: The current subcommand is terminated. The DSN prompt appears on the terminal.

User Response: A new subcommand can be entered.

**DSNE011I DSN COMMAND CANCELED BY
ATTENTION**

Explanation: The user of the DSN command processor has pressed attention. Since this occurred before DSN was fully initialized, DSN terminates. If DSN had been fully initialized, it would have prompted the user to continue or cancel.

System Action: The DSN command processor terminates. Control returns to TSO or the calling CLIST.

User Response: Restart DSN.

**DSNE100I ssid NOT OPERATIONAL, RETRY
COUNT IS ZERO**

Explanation: The subsystem (specified in the message as 'ssid') was not active, and no retries remain to be executed. No more connection attempts are made. The operator should be notified to start this specific subsystem, and the DSN command should be resubmitted. Issue the DSN command with the RETRY parameter set greater than zero.

System Action: Control returns to TSO.

User Response: Notify the operator to start the subsystem.

Operator Response: Start the subsystem with the 'ssid' specified in the message.

**DSNE101I ssid NOT OPERATIONAL, WILL RETRY
nnn MORE TIMES**

Explanation: The requested DB2 subsystem 'ssid' was not started or is not available. Connection to it will be attempted 'nnn' more times. This message is issued every 30 seconds (and each time 'nnn' is decreased by 1) until the connection is made or 'nnn' is zero.

System Action: DSN repeats the connection attempt until the connection is made or until the retry count is decreased to zero.

User Response: Notify the operator start DB2.

**DSNE102I YOU ARE NOT AUTHORIZED TO USE
DB2 SUBSYSTEM ssid**

Explanation: The authorization ID is not authorized to use subsystem 'ssid'.

System Action: Control returns to TSO.

User Response: Contact the system programmer, or system administrator to arrange for the required RACF or equivalent security system authorization.

**DSNE103E MAIN STORAGE REQUEST FROM
csect-id FAILED**

Explanation: A request for main storage failed.

System Action: The TSO attachment facility is ready for more input.

User Response: Increase the address space size. This can be done as part of the logging on process.

**DSNE104E RETRY COUNT OF number NOT VALID,
SET TO 120**

Explanation: An invalid 'RETRY' parameter was entered on the DSN command. It has been set to 120. Valid retry counts are integer numbers from 0 to 120.

System Action: Retry count is modified, and DSN execution continues.

User Response: The next time you invoke DSN, use a RETRY count of 0 to 120.

**DSNE105E SUBSYSTEM ssid NO LONGER
OPERATIONAL**

Explanation: The DB2 subsystem is down. It must be restarted before the user can continue.

System Action: Control returns to TSO attachment facility.

User Response: Before you can continue, DB2 must be restarted. You must also reissue the DSN command. ISPF users should restart their jobs.

**DSNE106E PLAN plan-id NOT AUTHORIZED FOR
SUBSYSTEM ssid AND AUTH-ID
auth-id**

Explanation: The requested combination of plan-id, subsystem-id, and user-id is not currently authorized.

System Action: The TSO attachment facility is ready for more input.

User Response: Notify the system programmer or system administrator to obtain proper authorization.

System Programmer Response: The system administrator for the DB2 subsystem can arrange the necessary authorization.

DSNE107E SUBSYSTEM RESOURCE NEEDED FOR PLAN plan-name, AUTH ID auth-id, AND SUBSYSTEM subsys IS NOT AVAILABLE

Explanation: The DB2 subsystem was unable to allocate a necessary resource for the requested combination of plan-id, user-id, and subsystem-id. This message is accompanied by DSNE108E. An attempt to establish connection with the DB2 subsystem has failed.

System Action: The TSO attachment facility is ready for more input.

User Response: Arrange to obtain the needed resource, and resubmit the subcommand. See the explanation for message DSNE108E, which accompanies this message.

DSNE108E FEEDBACK - REASON CODE reason-code TYPE= type RESOURCE NAME - 44 characters

Explanation: This message accompanies message DSNE107E or DSNE114E to explain the problem more clearly. RESOURCE NAME is the name of the unavailable resource. The reason code is in hexadecimal format.

System Action: The TSO attachment facility is ready for more input.

User Response: Arrange for the missing resource to be available, and resubmit your job.

Problem Determination: The reason the resource is unavailable is identified by a reason code. The reason codes that appear in this message are described in Part 4, "Section 4. DB2 Codes," on page 773.

TYPE and RESOURCE NAME identify the resource that is currently unavailable. The TYPE code identifies the type, as well as the format and content, of the RESOURCE NAME. Refer to Table 3 in Appendix B, "Problem determination," on page 1353 for an explanation of resource type codes.

DSNE109E NO INPUT TO BIND, SUBCOMMAND TERMINATED

Explanation: No LIBRARY parameter was specified on the BIND subcommand. No DBRMLIB was allocated.

System Action: The TSO attachment facility is ready for more input.

User Response: Specify the LIBRARY parameter, and resubmit the BIND subcommand. Alternatively, you could issue an ALLOCATE command for the DDNAME DBRMLIB and then resubmit the BIND subcommand as originally written.

DSNE110E ssid NOT VALID SUBSYSTEM ID, COMMAND TERMINATED

Explanation: There is no subsystem id with the name identified in the message as 'ssid'. The subsystem identifier you specify (or default to) on the DSN command must exist. This message is the result of specifying (or defaulting to) a nonexistent subsystem identifier. For information on the SYSTEM parameter of the DSN command, refer to *DB2 Command Reference*.

System Action: The DSN processor ends, and control returns to TSO.

User Response: Reissue the command with a valid SYSTEM parameter.

DSNE111E INSTALLATION EXIT REJECTED DSNNAME data-set-name

Explanation: A local installation-supplied exit has rejected the data set name identified in the message as 'data-set-name'.

System Action: The TSO attachment facility is ready for more input.

User Response: Either correct the data set name specified, or arrange to authorize the original data set name. Resubmit the request.

DSNE112E userid STILL SIGNED ON TO SUBSYSTEM ssid

Explanation: An attempt was made to sign on to DB2 when the user was already signed on.

System Action: Control returns to TSO.

User Response: Log off and log on again.

DSNE113E NOT ABLE TO LINK TO MODULE modname IN DSNNAME data-set-name

Explanation: A DB2 subsystem error occurred during an attempt to link to module 'modname' in data set 'data-set-name'.

System Action: The TSO attachment facility is ready for more input.

User Response: Check that the module exists and that its name is spelled correctly. Enter the correct module name.

DSNE114E THE COMBINATION OF PLAN planid, AUTH ID auth-id, AND SUBSYSTEM ssid IS NOT VALID

Explanation: The resource in message DSNE108E, which will follow this message, is not a valid resource name.

System Action: The TSO attachment facility is ready for more input.

DSNE117E • DSNE124E

User Response: Correct the invalid combination, and resubmit the subcommand. The problem is probably caused by a user spelling error. If it is not, check with the system administrator to determine the availability of the needed resource. Your program may need to be bound. See the explanation for message DSNE108 (which accompanies this one) for more information.

DSNE117E NOT ABLE TO LOCATE membername IN DSNNAME data-set-name

Explanation: The 'data-set-name' specified does not contain the member the user wanted to run.

System Action: Control remains with the DSN command processor, and the DSN prompt appears on the terminal. The DSN command processor is ready for another command.

User Response: Correct the PROGRAM or LIBRARY parameter, and resubmit the subcommand.

DSNE118E invalid-command NOT VALID COMMAND

Explanation: The user entered an invalid command. A typing error may be responsible. You may be trying to run a command processor that is either not available on your system or that is not part of your current LNKST or STEPLIB concatenation.

System Action: The TSO attachment facility is ready for more input.

User Response: Either correct the spelling error, or rearrange your library concatenation so that you can access the required command processor. Resubmit the command.

DSNE119E data-set-name NOT PARTITIONED DATA SET

Explanation: The user tried to allocate a sequential data set when a partitioned data set was required.

System Action: The TSO attachment facility is ready for more input.

User Response: Check the data-set-name. The data set you specified is sequential, but you specified a member name. Remove the member name, and resubmit the job.

DSNE120E data-set-name NOT SEQUENTIAL DATA SET

Explanation: The user tried to allocate a partitioned data set when a sequential data set was required.

This message is issued by the following CSECT:
DSNECP69

System Action: The TSO attachment facility is ready for more input.

User Response: Check the data-set-name. The data set you specified is partitioned, but you did not specify a member name. Add a member name, and resubmit the job.

DSNE121E csect-id NOT ABLE TO OPEN DATA SET

Explanation: The DB2 subsystem was unable to open the requested data set.

This message is issued by the following CSECTs:
DSNECP23, DSNECP69

System Action: The TSO attachment facility is ready for more input.

User Response: For information about why the data set could not be opened, read the explanations of the messages that accompany this message. Correct the condition, and resubmit the job.

DSNE122E DATA SET ORGANIZATION MUST BE EITHER SEQUENTIAL OR PARTITIONED. data-set-name IS NOT

Explanation: The DB2 subsystem was unable to open data set 'data-set-name', because it is not a sequential or partitioned data set.

This message is issued by the following CSECT:
DSNECP69

System Action: The TSO attachment facility is ready for more input.

User Response: Correct the data-set-name, or change the data set organization. Resubmit the job.

DSNE123I data-set-name NOT PARTITIONED DATA SET, IT IS IGNORED

Explanation: The data-set-named in the message is required to be partitioned. It is not and, consequently, was ignored.

System Action: DSN will attempt to continue BIND processing.

User Response: Correct the subcommand, and resubmit it.

DSNE124E DATA SET data-set-name, MEMBER member-name IN USE, TRY LATER

Explanation: The member contained in 'data-set-name' is currently in use. This message is normally issued when another user is updating the specified member.

This message is issued by the following CSECT:
DSNECP69

System Action: The TSO attachment facility is ready for more input.

User Response: Wait until the member is available

and reissue your DCLGEN request.

DSNE125E DATA SET *data-set-name* IN USE, TRY LATER

Explanation: The sequential data set 'data-set-name' is currently in use. This message is normally issued when another user is updating the specified data set.

This message is issued by the following CSECT:
DSNECP69

System Action: The TSO attachment facility is ready for more input.

User Response: Wait until the data set is available and reissue your DCLGEN request.

DSNE126E THE DB2 OPERATOR IS STOPPING THE SUBSYSTEM. PLEASE END YOUR DSN SESSION

Explanation: The operator has requested that DB2 quiesce. The user should promptly finish the current task and terminate the DSN session so that this can take place. This message may be followed by message DSNE127I.

This message is issued by the following CSECT:
DSNECP00

System Action: No new users will be permitted to initiate DB2 sessions. Current users will be permitted to work until they terminate their connections to DB2.

User Response: End your DSN session as soon as possible.

DSNE127I THE DB2 OPERATOR IS STOPPING THE SUBSYSTEM. DSN IS TERMINATING

Explanation: The operator has requested that DB2 terminate.

System Action: DB2 will shut down, interrupting user activities as necessary. DSN will terminate immediately and return the user to TSO.

User Response: Reinitiate your session when DB2 returns.

DSNE128I DB2 IS ABNORMALLY ENDING. DSN IS TERMINATING

Explanation: DB2 has encountered a problem from which it cannot recover.

System Action: DB2 is abending. DSN terminates immediately and returns the user to TSO.

User Response: Reinitiate your session when DB2 returns.

DSNE130I MAXIMUM NUMBER OF DB2 USERS REACHED. YOUR RETRY COUNT IS ZERO

Explanation: The number of concurrent connections to DB2 is restricted. The number is specified in the installation parameters in member DSN6SYSP. For TSO foreground, see parameter IDFORE. For background jobs, see parameter IDBACK. The DSN request has been denied, because the current number of DB2 connections in the system has reached the installation-specified limit.

System Action: Control returns to TSO.

User Response: Resubmit the DSN command when activity using DB2 has diminished. If still unsuccessful, see the system programmer about the installation parameters.

DSNE131I MAXIMUM NUMBER OF DB2 USERS REACHED. WILL RETRY *nnn* MORE TIMES

Explanation: The number of concurrent connections to DB2 is restricted. The number is specified in the installation parameters in member DSN6SYSP. For TSO foreground, see parameter IDFORE. For background jobs, see parameter IDBACK. The DSN request was denied because the current number of DB2 connections in the system reached the installation specified limit.

The DSN connection to DB2 is attempted '*nnn*' more times. The number of retries is determined by the RETRY parameter on the DSN command. For more information, refer to *DB2 Command Reference*.

This message is issued every 30 seconds (and each time '*nnn*' is decreased by 1) until the connection is made or until '*nnn*' is decreased to zero.

System Action: DSN repeats the connection attempt until the connection is made or the retry count is decreased to 0.

User Response: If all retry attempts fail, resubmit the DSN command when DB2 activity diminishes. If still unsuccessful, see the system programmer about the installation parameters.

DSNE132I DB2 IS OPERATING IN RESTRICTED ACCESS MODE. MAINTENANCE PERSONNEL ONLY

Explanation: DB2 is not available for normal operation. It is only available to service personnel.

System Action: Control returns to the caller. Your request was not processed. The DSN command processor was unable to connect to DB2.

User Response: Wait until DB2 is available for general use, then resubmit your request.

DSNE133E *csect-name* **RELEASE LEVELS NOT COMPATIBLE. DSN=*release_level*, DB2=*release_level***

Explanation: The DSN command processor, perhaps running under the control of DB2I, has detected a release level incompatibility between itself and DB2. The current *release_level* of the DSN command processor code and the DB2 subsystem load modules is indicated as a string of three numeric characters as follows:

- Version
- Release
- Modification level

System Action: The DSN command processor terminates.

User Response: Check that your method of invoking DSN or DB2I allocates the correct libraries for DSN. If you used JCL or a TSO logon procedure to execute DSN code, check your JOBLIB and STEPLIB allocations. If you used a CLIST to execute DSN, insure that you obtained the correct version of the DSN code. See your system programmer if you invoke DSN using procedures supplied by your system programmer.

Operator Response: Notify the system programmer.

System Programmer Response: If you are unable to determine the problem, you can trace DSN execution through DB2I or the DSN command processor.

Problem Determination: Insure that coexistence is supported on both release levels (DSN and DB2). If coexistence is supported, insure that the lower level release has the correct SPE level code support that is required to coexist with the current higher level release.

For more information about coexistence and SPEs, refer to the program directory or preventative service planning (PSP) updates.

DSNE136I **DB2 IS OPERATING IN RESTART LIGHT MODE. INDOUBT RESOLUTION ONLY**

Explanation: The DB2 member is not available for normal operation. It is only available to commit coordinators that have indoubt units of recovery that need to be resolved with this member.

System Action: Control returns to the caller. Your request was not processed. The DSN command processor was unable to connect to DB2.

User Response: Wait until this DB2 is available for general use, then resubmit your request. Or, request connection to a different DB2 member in the data sharing group (for example, by using the DB2 group attach name).

DSNE231A **ONE NAME IS REQUIRED TO FREE A PLAN OR A PACKAGE**

Explanation: The user has attempted to use the FREE PLAN or PACKAGE panel without specifying a plan or package name.

System Action: The TSO attachment facility is ready for more input.

User Response: Enter the name of a plan or package, or (*) to indicate 'all'.

DSNE232A **CONNECTION NAME REQUIRES ENABLE/DISABLE OF CONNECTION TYPE**

Explanation: The user indicated that specific connection names were to be specified for ENABLE or DISABLE, but the associated connection type field was not updated. The ENABLE or DISABLE of connection names requires the corresponding connection type to also be specified for ENABLE or DISABLE.

System Action: The TSO attachment facility is ready for more input.

User Response: Enter Y (Yes) on the connection type for the associated connection names.

DSNE233A **MEMBER NAME MUST NOT BE SPECIFIED MORE THAN ONCE**

Explanation: The LIBRARY field containing the data set name, also contains a member name.

System Action: The TSO attachment facility is ready for more input.

User Response: The member name must be specified only once, and must be specified on the MEMBER field.

DSNE234A **EITHER DBRM MEMBER OR INCLUDE PACKAGE LIST MUST BE SPECIFIED**

Explanation: The BIND PLAN subcommand requires either a DBRM member name or a package list as input, neither was specified.

System Action: The TSO attachment facility is ready for more input.

User Response: Enter a DBRM member name(s), or specify that a package list is to be included. Both options are also allowed.

DSNE235A *plan/package* **NAME IS A DUPLICATE OF PRIMARY *plan/package* NAME**

Explanation: In addition to the primary 'plan' or 'package' name specified on the REBIND or FREE subcommand panel, the user also specified that additional plans or packages were to be included in the list. The primary 'plan' or 'package' name was again

specified to be included in the list.

System Action: The duplicate of the primary 'plan' or 'package' name is automatically deleted from the list to avoid errors during subcommand processing. The TSO attachment facility is ready for more input.

User Response: Complete the list of additional plans or packages.

DSNE236A SPECIFY A CONNECTION TYPE TO ENABLE OR DISABLE

Explanation: The user indicated that individual connection types were to be ENABLED or DISABLED, but no specific connection types were specified.

System Action: The TSO attachment facility is ready for more input.

User Response: Enter Y (YES) for each individual connection type to ENABLE, or DISABLE.

DSNE237A SPECIFY ENABLE ALL OR SPECIFIC CONNECTION TYPES

Explanation: In addition to requesting that all connection types be enabled, the user also requested that specific connection types be enabled. The enable of all connection types includes the enable of specific connection types.

System Action: The TSO attachment facility is ready for more input.

User Response: Specify specific connection types to be enabled, or specify that all connection types are to be enabled.

DSNE240A ISPF RETURNED AN UNEXPECTED CODE WHILE CLOSING A TABLE

Explanation: An ISPF error return code was encountered when attempting to perform a TBCLOSE for an ISPF table while processing the current subcommand panel.

System Action: TSO processing for the current subcommand is terminated.

User Response: Notify the system programmer.

System Programmer Response: Verify that the ISPF table library allocated to the DSNETBLS DD statement has sufficient space or directory entries available. Also refer to the ISPF error log for additional diagnostic information.

DSNE241A INTERNAL PROCEDURE WAS PASSED AN INVALID NUMBER OF ARGUMENTS

Explanation: A TSO Interpreter error was encountered while executing a subroutine during the processing of the current subcommand.

System Action: TSO processing for the current subcommand is terminated.

User Response: Notify the system programmer.

System Programmer Response: Notify the IBM support center that an error was encountered in the TSO SYSCALL instruction.

Problem Determination: The TSO SYSCALL instruction is not passing all the parameters to a subroutine defined within the CLIST.

DSNE242A ISPF RETURNED AN UNEXPECTED CODE WHILE SETTING SEARCH ARGUMENTS

Explanation: An ISPF table for the current function does not contain the expected column or table format.

System Action: TSO processing for the current subcommand is terminated.

User Response: Notify the system programmer.

System Programmer Response: Delete the ISPF table in error. The table is recreated automatically during the next invocation of the DB2I function.

Problem Determination: The format of the ISPF table was changed since the last successful use of the table. Refer to the DB2I ISPF table library allocated to the DSNETBLS DD statement, and examine the ISPF error log for additional diagnostic information.

DSNE243A ISPF RETURNED AN UNEXPECTED CODE DURING A TABLE DISPLAY

Explanation: An ISPF error was encountered when attempting to display a DB2I table panel.

System Action: TSO processing for the current subcommand is terminated.

User Response: Notify the system programmer.

System Programmer Response: Insure that the DB2I panel and panel library are established correctly. If the format of both is correct, then use ISPF option 7.2 to test the panel for additional errors.

Examine the ISPF error log for additional error information and determine the name of the panel to be displayed.

DSNE244A CANNOT SAVE CREATED TABLE, VERIFY SPACE IN TABLE LIBRARY

Explanation: An ISPF TBSAVE function returned with a condition code greater than zero.

System Action: TSO processing for the current subcommand is terminated.

User Response: Notify the system programmer.

System Programmer Response: Verify that the ISPF

DSNE245A • DSNE288A

table library allocated to the DSNETBLS DD statement has sufficient space and directory entries available. Also refer to the ISPF error log for additional diagnostic information.

DSNE245A ISPF RETURNED AN UNEXPECTED CODE WHILE ADDING A ROW TO A TABLE

Explanation: An ISPF TBADD function returned with a condition code greater than four.

System Action: The TSO attachment facility is ready for more input.

User Response: Enter the DB2I CANCEL command, and notify the system programmer.

System Programmer Response: Verify that the user has enough memory to perform ISPF functions. Also refer to the ISPF error log for additional diagnostic information.

DSNE246A ISPF RETURNED AN UNEXPECTED CODE WHILE DELETING A ROW

Explanation: An ISPF TBDELETE function returned with a condition code greater than zero.

System Action: TSO processing for the current subcommand is terminated.

User Response: Enter the DB2I CANCEL command, and notify the system programmer.

System Programmer Response: Verify that the user has enough memory to perform ISPF functions. Also refer to the ISPF error log for additional diagnostic information.

DSNE247A ISPF RETURNED AN UNEXPECTED CODE WHILE UPDATING A ROW

Explanation: An ISPF TBPUT function returned with a condition code greater than four.

System Action: TSO processing for the current subcommand is terminated.

User Response: Enter the DB2I CANCEL command, and notify the system programmer.

System Programmer Response: Verify that the user has enough memory to perform ISPF functions. Recreate the user actions that lead to the failure. Also refer to the ISPF error log for additional diagnostic information.

DSNE248A COMMAND ENTERED CONTAINS INVALID CHARACTERS, RESPECIFY

Explanation: The command entered at the command line contains an invalid character, the command must be reentered.

System Action: The TSO attachment facility is ready for more input.

User Response: Correct the invalid command entry.

DSNE250A PLEASE ENTER THE COMMAND AT THE LINE WITH THE PLAN/PACKAGE NAME

Explanation: SELECT or RESET commands must be entered on the line where the PLAN/PACKAGE name is shown. This line contains the name of the PLAN/PACKAGE, while the secondary line(s) do not.

System Action: The line command is rejected. The TSO attachment facility is ready for more input.

User Response: Reenter the line command on the primary PLAN/PACKAGE line(s).

DSNE252A JCL WAS NOT CREATED, ERROR *errcode* WHILE DOING *function_name* FUNCTION

Explanation: Error code '*errcode*' was received while doing a function '*function_name*', the JCL was not created.

Severity: 20

System Action: Refer to *z/OS ISPF Dialog Developer's Guide* for the cause of this error.

User Response: Contact your systems programmer.

Problem Determination: Use the return code/function combination to find the causes for the problem in *z/OS ISPF Dialog Developer's Guide* and correct the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 21.

DSNE283A THE , (COMMA) OPTION IS INCOMPATIBLE WITH THE *hostlang* LANGUAGE

Explanation: The user tried to select the '*hostlang*' APPLICATION LANGUAGE and the comma option of the DECIMAL POINT field on the DB2I defaults panel. This combination is not supported.

System Action: The defaults panel is displayed again.

User Response: Either change the APPLICATION LANGUAGE field or the DECIMAL POINT field. If you need the C (C/370 Compiler), then the DECIMAL POINT field must contain a decimal point (.).

DSNE288A YOU CANNOT SPECIFY (RUN)=YES WITH CICS OR IMS

Explanation: Application programs that make CICS or IMS calls cannot be run from the TSO environment. They can, however, be precompiled, bound, compiled,

and linked under TSO. The user should specify N on the RUN panel when preparing a CICS or IMS application.

System Action: The system is waiting for new input to the panel.

User Response: Change the RUN option to N.

DSNE291A ALL DB2 COMMANDS BEGIN WITH A DASH

Explanation: The user omitted the DB2 command recognition character that must precede all DB2 commands.

System Action: The DB2 commands panel is displayed again so the user can resubmit the command.

User Response: Add the DB2 command recognition character, and reenter the command.

DSNE292I DATA SET *data-set-name* NOW CONTAINS YOUR JCL

Explanation: DB2I has just created some JCL for you. The JCL now resides in data set '*data-set-name*'. You can now edit this data, if desired. The TSO SUBMIT command will start the job running in background.

System Action: The system is waiting for your next request.

User Response: You can start another DB2I job or leave the panel.

DSNE293A MEMBER NAME IS REQUIRED. YOUR PROGRAM MUST BE IN A PDS

Explanation: The user either has attempted to run a program that is not in a partitioned data set or has forgotten to specify a member name.

System Action: The RUN panel will be displayed so that the user can specify a member name and try the run again.

User Response: Specify a member name, and rerun the program.

DSNE294I SYSTEM RETCODE=*hex-code* USER OR DSN RETCODE=*decimal-code*

Explanation: A DB2I function has just completed. The return codes for that function are returned in this message. The variable '*hex-code*' is a 3-digit hexadecimal number; the variable '*decimal-code*' is a 3-digit decimal number. Refer to the appropriate MVS publication for explanations of the return codes.

System Action: DB2I is ready for another execution cycle unless other messages appeared indicating that DB2 is unavailable.

User Response: You may have to change input

parameters to correct unsatisfactory completion codes.

DSNE295A YOU CANNOT DISPLAY AND RESTART A UTILITY AT THE SAME TIME

Explanation: You have set options on the DB2I Utilities panel that call for conflicting actions. You can either DISPLAY the status of a utility, or you can RESTART a utility, but you cannot do both.

System Action: The system is waiting for new input to the panel.

User Response: Either change the RESTART option to NO, or select a different FUNCTION.

DSNE296A YOU CANNOT TERMINATE AND RESTART A UTILITY AT THE SAME TIME

Explanation: You have set conflicting options on the DB2I Utilities panel. You can either TERMINATE a utility, or you can RESTART a utility, but you cannot do both.

System Action: The system is waiting for new input to the panel.

User Response: Either change the RESTART option to NO, or select a different FUNCTION.

DSNE297A ENTER DATA SET NAME: COPYDSN OR RCPYDSN1

Explanation: You have not specified a data set name for the COPY utility. A data set name for the local/current site (COPYDSN), and/or the recovery site (RCPYDSN1) is required.

System Action: The system is waiting for new input to the panel.

User Response: Enter a data set name for COPYDSN, and/or RCPYDSN1.

DSNE298A ERROR DURING EDIT: CLIST *data set name*

Explanation: Errors were encountered while attempting to change the online book data set names in the DB2 CLIST member DSNEMC01. No data set names were changed.

System Action: The system is waiting for new input to the panel.

User Response: Ensure that the CLIST data set name is correct and contains the DSNEMC01 CLIST member to be changed. This CLIST data set must also be available to the TSO user ID in WRITE mode. This error will continue to be displayed on the panel until the error is resolved or the user exits the panel (END).

System Programmer Response: If you are unable to determine the problem, you can trace the DB2 CLIST execution while displaying this panel.

Problem Determination: Examine the CLIST trace output for any TSO/ISPF nonzero return codes encountered during CLIST execution.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNE340I INTERNAL ERROR – ILLEGAL TYPE IN MODULE *module-name*

Explanation: An internal DB2 problem has occurred. The named module has detected a nonexistent SQLTYPE.

User Response: Collect the SPUFI trace and ISPF log, and notify either the system programmer or the database administrator.

You may have to rerun the failing job after you have turned on trace. This will enable you to send trace messages to the ISPF log.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNE351A EDIT PROCESSING OPTION MUST BE Y (YES) OR N (NO)

Explanation: The user specified an edit option other than 'YES', 'NO', or the abbreviation 'Y' or 'N'. A valid user response determines whether SPUFI invokes the ISPF editor to allow the user to edit the input data set.

System Action: SPUFI will wait until the user enters a valid response.

User Response: Type in a 'Y' or an 'N', and press 'ENTER'.

DSNE352A EXECUTE PROCESSING OPTION MUST BE Y (YES) OR N (NO)

Explanation: The user specified an execute option other than 'YES', 'NO', or the abbreviation 'Y' or 'N'. A valid user response determines whether SPUFI executes the SQL statements in the user input data set.

System Action: SPUFI waits until the user enters a valid response.

User Response: Type in a 'Y' or an 'N', and press 'ENTER'.

DSNE353A BROWSE PROCESSING OPTION MUST BE Y (YES) OR N (NO)

Explanation: The user specified a browse option other than 'YES', 'NO', or the abbreviation 'Y' or 'N'. A valid user response determines whether SPUFI invokes ISPF BROWSE to allow the user to browse the output data set.

System Action: SPUFI will wait until the user enters a valid response.

User Response: Type in a 'Y' or an 'N', and press 'ENTER'.

DSNE354A AUTOCOMMIT PROCESSING OPTION MUST BE Y (YES) OR N (NO)

Explanation: The user specified an AUTOCOMMIT option other than 'YES', 'NO', or the abbreviation 'Y' or 'N'. A valid user response determines whether SPUFI automatically commits all the changes to the database subsystem. This was encountered as a result of executing the user's SQL statement(s). The commit is done at the end of the processing of an input data set, if it is requested and if there has been no SQL execution error.

System Action: SPUFI waits until the user enters a valid response.

User Response: Type in a 'Y' or an 'N', and press 'ENTER'.

DSNE355A CHANGE DEFAULTS PROCESSING OPTION MUST BE Y (YES) OR N (NO)

Explanation: The user specified a change-default option other than 'YES', 'NO', or the abbreviation 'Y' or 'N'. A valid user response determines whether SPUFI displays the current-session SPUFI defaults and allows the user to change the defaults.

System Action: SPUFI waits until the user enters a valid response.

User Response: Type in a 'Y' or an 'N', and press 'ENTER'.

DSNE359A OUTPUT DATA SET NAME REQUIRED FOR EXECUTE OR BROWSE

Explanation: The user did not specify the name of the output data set.

System Action: SPUFI waits until the user specifies an output data set.

User Response: Type in the correct entry, and press 'ENTER'.

DSNE360A THE OUTPUT DATA SET MUST RESIDE ON DASD

Explanation: The user has attempted to send the output of SPUFI to a SYSOUT data set. He must enter a generic device class that contains only DASD devices.

System Action: SPUFI waits until the user specifies a valid output device class.

User Response: Type in the correct entry, and press 'ENTER'.

DSNE361I SPUFI PROCESSING COMPLETE

Explanation: This informational message is displayed after SPUFI successfully created the output data set. If errors are encountered before the completion of output data set processing, or during the subsequent BROUSE OUTPUT option for this data set, this message is replaced by either SPUFI or TSO/ISPF error messages.

System Action: The system waits for the next user input.

User Response: At this point you can change the SPUFI panel variable settings to initiate a new SPUFI request, or you can exit SPUFI.

DSNE363A ONLY RR (REPEATABLE READ) OR CS (CURSOR STABILITY) ALLOWED

Explanation: The user has entered an invalid isolation level. This value must be either RR or CS. 'Isolation level' here refers to the degree to which the SPUFI user wants to isolate SQL execution from the effects of other concurrently executing DB2 applications.

If the repeatable read (RR) level is specified and the AUTOCOMMIT option is 'YES', other applications can modify the selected database values as soon as the SPUFI EXECUTE phase is completed and as soon as the automatic COMMIT (or ROLLBACK, if an error was encountered,) operation is performed. Therefore, it is possible that the retrieved data being browsed by the user has already been modified by another application.

If the RR level is specified and the AUTOCOMMIT option is 'NO', no other DB2 application executing concurrently can change any of the selected database values until the SPUFI user issues either a COMMIT or a ROLLBACK. Therefore, other applications might be in a normal wait state while the SPUFI user is browsing the output data set.

If the cursor stability (CS) level is specified, it does not make any difference whether the AUTOCOMMIT option is 'YES' or 'NO'. Other concurrently executing DB2 applications can change the selected database values as soon as the SELECT has completed.

System Action: SPUFI waits until the user specifies either 'RR' or 'CS'.

User Response: Type in the correct entry, and press 'ENTER'.

DSNE364A *token* IS INVALID AS AN SQL STATEMENT TERMINATOR

Explanation: The user has entered an SQL statement terminator (token) that is not supported. The following values are not valid for use as a SQL statement terminator:

- blank
- comma

- single and double quotes
- underscore
- left and right parenthesis

System Action: The statement cannot be executed.

User Response: Specify a valid SQL statement terminator.

DSNE365A SQL STATEMENT TERMINATOR HAS BEEN CHANGED TO *token*

Explanation: The SPUFI input data set contains a #SET statement that changes the SQL statement terminator to *token*.

System Action: *token* is the SQL statement terminator until another #SET statement changes it or the end of the input data is reached.

DSNE366A ONLY THE LISTED RECFM TYPES ARE ALLOWED

Explanation: The user has entered an invalid record format for the output data set.

System Action: The system waits until the user enters one of the allowed RECFM types.

User Response: Enter a RECFM of V, VB, VBA, F, FB, or FBA.

DSNE367A ACTION MUST BE C (COMMIT) OR R (ROLLBACK) OR D (DEFER)

Explanation: This message requests the user to make a commit action decision.

User Response: To commit all the changes made since the last commit point, enter a 'C'. To undo all the changes that have been made since the last commit point, enter an 'R'. To defer the decision, enter a blank.

DSNE368A YES OR NO MUST BE ENTERED FOR EACH PROCESSING OPTION

Explanation: One of the processing options was left blank or set to blank by the user.

User Response: Enter 'YES' or 'NO' for each processing option.

DSNE370A INPUT DATA SET COULD NOT BE OPENED

Explanation: The input data set could not be opened because of invalid data set attributes. The logical record length (LRECL) of the input data set must be 80K. The record format (RECFM) must be either F or FB. The input data set may be either sequential or partitioned.

User Response: Specify an input data set having valid attributes.

DSNE371A OUTPUT DATA SET COULD NOT BE OPENED

Explanation: The output data set could not be opened because of invalid data set attributes. The logical record length (LRECL) must be at least 80KB and less than 32KB. The record format (RECFM) must be F, FB, FBA, V, VB, or VBA. The output data set must be sequential.

User Response: Either specify an output data set having valid attributes, or enter correct attributes for this data set.

DSNE372A OUTPUT DATA SET MUST BE SEQUENTIAL

Explanation: The user has requested that a nonsequential output data set contain the output from execution of SQL statements.

User Response: Enter the data-set-name of a sequential data set for the output data set.

DSNE374A OUTPUT DATA SET MUST BE SEQUENTIAL

Explanation: The output data set is of unrecognized organization. It must be sequential.

System Action: Processing does not begin until the panel entries are correct and the user presses 'ENTER'.

User Response: The output data set must be sequential. Enter a sequential data-set-name (no member) in the output data set field.

DSNE375A ACCESS TO INPUT DATA SET NOT AUTHORIZED

Explanation: A local installation-supplied exit has rejected access to the input data set specified by the user.

User Response: Either specify the name of a data set for which authorization will be allowed, or arrange to authorize the original data-set-name. Resubmit the request.

DSNE376A ACCESS TO OUTPUT DATA SET NOT AUTHORIZED

Explanation: A local installation-supplied exit has rejected access to the output data set.

User Response: Either specify the name of a data set for which authorization will be allowed, or arrange to authorize the original data-set-name. Resubmit the request.

DSNE377A INPUT DATA SET RECFM MUST BE F OR FB WITH LRECL 79 OR 80

Explanation: The user specified an input data set that does not have the required attributes (F or FB with LRECL 79 or 80).

Note: If the input data set has an LRECL of 79, SPUFI assumes the data set was exported by QMF. Therefore, it is recommended that you should not use an LRECL of 79 for a data set that is not exported from QMF.

User Response: Correct the input data set attributes, and try again.

DSNE378A ASA CONTROL CHARACTER NOT ALLOWED ON INPUT DATA SET RECFM

Explanation: The user attempted to use an input data set containing forms control characters or machine control characters. These characters are not allowed on the input data set.

User Response: Remove the forms control characters or machine control characters from the input data set, and try again.

DSNE379A text from DYNALLOC

Explanation: An attempt to allocate a data set has failed. This message contains the secondary explanation for the failure.

User Response: Correct the condition, and resubmit the subcommand.

DSNE381A UNEXPECTED ALLOCATION RETURN CODE return-code, reason-code

Explanation: An unexpected return code from SVC 99 was received. The return code received is the DYNALLOC (SVC 99) return code. Refer to the appropriate MVS publication for explanations of the return and reason codes.

User Response: Correct the condition, and resubmit the subcommand.

DSNE383A INVALID OUTPUT DATA SET RECORD FORMAT. OPEN RETURN CODE rcode

Explanation: The data set format was invalid. Acceptable record formats are: F, FB, FBA, V, VB, or VBA.

User Response: Enter a valid value in the record format field.

DSNE384A UNEXPECTED DEALLOCATION
RETURN CODE return-code,
reason-code

Explanation: A deallocation request has returned an unexpected return and reason code.

User Response: Refer to the appropriate MVS publication for explanations of the return and reason codes.

DSNE385A ENTER MEMBER NAME. INPUT DATA
SET IS PARTITIONED

Explanation: The input data set is partitioned, and the user did not enter the member name on the SPUFI main menu.

System Action: Processing does not begin until the panel entries are correct. If any of the processing options are changed, this message is ignored, and processing will proceed according to the new settings.

User Response: Enter the member name.

DSNE386A MEMBER member-name NOT
PRESENT IN SPECIFIED INPUT DATA
SET

Explanation: The named member is not in the input data set.

System Action: Processing does not begin until the panel entries are correct.

User Response: Enter a correct member name or a correct data-set-name.

DSNE387I DSNTIAR ERROR. RETURN CODE =
return-code

Explanation: An internal DB2 error has occurred. DSNTIAR attempted to format a message to explain a nonzero SQL code, but the attempt failed.

User Response: Notify the system programmer.

System Programmer Response: Print the ISPF log, and collect a dump of the TSO address space. Refer to Part 2 of *DB2 Application Programming and SQL Guide* for failure analysis procedures.

DSNE388A INPUT DATA SET MUST BE
SEQUENTIAL OR PARTITIONED

Explanation: The input data set organization is not recognized.

System Action: Processing does not begin until the panel entries are correct.

User Response: Enter a data-set-name with sequential or partitioned organization. It may be necessary to allocate a sequential or partitioned data set.

DSNE389A A MEMBER HAS BEEN SPECIFIED
FOR A SEQUENTIAL DATA SET

Explanation: The user has specified a member as input to SPUFI. However, the input data set specified is sequential.

System Action: Processing does not begin until the panel entries are correct.

User Response: Enter the data-set-name without attempting to specify a member.

DSNE390A THE OUTPUT DATA SET ATTRIBUTES
ARE INCONSISTENT

Explanation: This message indicates that the user made one of three possible errors in specifying block size and logical record length (LRECL):

- The user specified a record format (RECFM) of F, but the block size is not equal to the logical record length (LRECL)
- The user specified a record format (RECFM) of F, FB, or FBA, but block size is not evenly divisible by logical record length (LRECL).
- The user specified a record format (RECFM) of VB, but the block size is less than logical record length (LRECL) + 4. The user must allow 4 bytes for the block header.

User Response: Specify logical record length (LRECL) and block size appropriately on the DSNE3902 panel.

DSNE391I FREEMAIN ERROR IN MODULE
module-name

Explanation: SPUFI encountered a FREEMAIN error in the specified module.

System Action: This message is logged in the ISPF log data set. No abend occurs.

User Response: Notify the system programmer or system administrator.

System Programmer Response: Print the ISPF log, and collect a dump of the TSO address space. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNE392I GETMAIN ERROR IN MODULE
module-name

Explanation: SPUFI encountered a GETMAIN error in the specified module.

System Action: This message is logged in the ISPF log data set. User abend X'00C50003' is issued.

User Response: Notify the system programmer or system administrator.

System Programmer Response: Ensure that enough

storage is allocated to the TSO user.

**DSNE393I SPF VDELETE ERROR IN MODULE
 DSNESM90. ERROR CODE = flag**

Explanation: An internal SPUFI error has occurred. CSECT DSNESM90 tried to delete an ISPF dialog variable that was not previously defined.

System Action: This message is logged in the ISPF log data set. No abend is issued. However, if the problem persists, notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Record the error code 'flag'. It has no user significance, but it can assist the IBM Support Center in resolving the problem.

**DSNE395I UNEXPECTED RETURN CODE FROM
 SPF SERVICE**

Explanation: A return code of 4 from ISPF DISPLAY or a return code of 8 from the ISPF editor was encountered.

System Action: The message is displayed on the SPUFI panel and logged in the ISPF log data set. No user abend is issued.

User Response: Notify the system programmer.

System Programmer Response: If a new release of ISPF is used, determine whether the above return codes are now assigned meaning by ISPF.

Problem Determination: This message may be issued if a previously unassigned (by ISPF) return code from the ISPF DISPLAY or EDIT function is encountered. If a new release of ISPF is used, determine whether the above return codes are now assigned meaning by ISPF.

**DSNE396A YOU CANNOT SPECIFY DEFER WHEN
 LEAVING SPUFI**

Explanation: You have attempted to leave SPUFI with outstanding database changes not yet committed or rolled back. You can't leave SPUFI unless a decision has been made to commit or rollback.

System Action: The system is waiting for new input to the panel.

User Response: Specify COMMIT or ROLLBACK.

DSNE415A csect-name TYPE IS DATE

Explanation: This is a SPUFI trace message. SPUFI has looked in the SQLTYPE field of the SQLDA and detected a data type of DATE.

DSNE416A csect-name TYPE IS TIME

Explanation: This is a SPUFI trace message. SPUFI has looked in the SQLTYPE field of the SQLDA and detected a data type of TIME.

DSNE417A csect-name TYPE IS TIMESTAMP

Explanation: This is a SPUFI trace message. SPUFI has looked in the SQLTYPE field of the SQLDA and detected a data type of TIMESTAMP.

**DSNE457I csect-name ARITHMETIC ERROR IN
 THE CURRENT ROW AND COLUMN**

Explanation: This is a SPUFI trace message. SPUFI has looked in the SQLDA and detected an arithmetic error. The indicator variable associated with this value contains -2.

**DSNE601I SQL STATEMENTS ASSUMED TO BE
 BETWEEN COLUMNS nn AND nn**

Explanation: This message indicates which record columns in the input data set are scanned for SQL statements. For data sets of type COBOL, columns 8 through 72 are scanned. For STANDARD data set types, if the LRECL is 79 then columns 1 through 71 are scanned, and if the LRECL is 80 then columns 1 through 72 are scanned.

System Action: This message is written to the SPUFI output data set along with other summary messages.

**DSNE603E INPUT STATEMENT HAS
 UNBALANCED APOSTROPHES**

Explanation: An opening apostrophe was detected in an input record, but the end of data set was reached before a closing apostrophe was encountered.

System Action: SPUFI processing stops. Correct the error, and start again.

User Response: A closing apostrophe was probably omitted from a literal value. Add the missing apostrophe, and execute the input file again.

**DSNE604E THE SQL STATEMENT EXCEEDS THE
 MAXIMUM ALLOWED LENGTH**

Explanation: This message indicates that the preceding SQL statement in the output data set exceeds the maximum length allowed. An SQL statement may span up to a maximum of 455 input records.

System Action: SPUFI processing stops. Correct the error, and start again.

User Response: Edit the SQL statement in question so that it resides on fewer input records.

DSNE605E THE INPUT DATA SET IS EMPTY

Explanation: The user has specified an input data set that does not contain any valid SQL statements.

System Action: SPUFI processing stops. Correct the error, and start again.

User Response: Edit SQL statements into the specified data set, or specify another input data set that contains valid SQL statements.

DSNE606E INVALID USE OF AN SQL STATEMENT TERMINATOR

Explanation: An SQL statement terminator has been used improperly in an SQL input statement. Either two successive statement terminators were encountered, or a series of blanks followed by a terminator was detected. The proper use of the SQL statement terminator is to delimit the end of a valid SQL statement.

System Action: SPUFI processing stops. Correct the error, and start again.

User Response: Remove the extraneous terminator from the input data set.

DSNE607E PREVIOUS INPUT RECORD HAS UNBALANCED SO/SI CHARACTERS

Explanation: A shift out (SO) character was detected in the previous input record with no corresponding shift in (SI) character in the record. The SO/SI characters delimit a DBCS string in the SPUFI input data set. SPUFI requires that SO/SI characters be paired within an input record.

System Action: SPUFI processing stops.

User Response: A closing SI character was probably omitted from a literal value. Add the missing SI character, and re-execute the input file.

DSNE609E INPUT STATEMENT HAS UNBALANCED QUOTES

Explanation: An opening quote (") was detected in an input record, but a corresponding quote was not found at the end. Two sets of quotes are used to delimit a statement.

System Action: SPUFI processing stops.

User Response: A closing quote was probably omitted from a literal value. Add the missing quote, and execute the input file again.

DSNE610I NUMBER OF ROWS DISPLAYED IS nn

Explanation: Execution of an SQL SELECT statement causes one or more rows of data to be displayed. This message appears in the output data set following the returned data for a SELECT. It gives a count, 'nn', of the number of rows displayed.

System Action: Input data set processing is completed, and this message is included in the SPUFI output.

DSNE611I COLUMN HEADER FOR COLUMN NUMBER nn WAS TRUNCATED

Explanation: An SQL SELECT statement was executed, but the specified column name, identified by 'nn' in the message, was truncated. This truncation occurred either because the column name was longer than the remaining record width or because the name was longer than the user-specified maximum field length.

System Action: Input data set processing is completed, and this message is included in the SPUFI output.

User Response: If the truncation is caused by insufficient record width, use a larger LRECL for the output data set or specify fewer data columns to be returned on the SELECT statement.

If the truncation is caused by the user-specified maximum field length setting, use a larger value for this setting.

DSNE612I DATA FOR COLUMN HEADER name COLUMN NUMBER nn WAS TRUNCATED

Explanation: An SQL SELECT statement was executed, but data for the specified column name, identified by 'nn' in the message, was truncated. This truncation occurred either because the data was longer than the remaining record width or because the data was longer than the user-specified maximum field length.

System Action: Input data set processing is completed, and this message is included in the SPUFI output.

User Response: If the truncation is because of insufficient record width, use a larger LRECL for the output data set or specify fewer data columns be returned on the SELECT statement.

If the truncation is because of the user-specified maximum field length setting, use a larger value for this setting.

**DSNE613I OUTPUT LRECL IS TOO SMALL TO
DISPLAY THE FOLLOWING COLUMNS:**

Explanation: An SQL SELECT statement was executed, but the logical record length of the output data set was not large enough to display the column names and data values of all returned columns. The columns specified following this message were not displayed because of insufficient remaining record width.

System Action: Input data set processing is completed, and this message is included in the SPUFI output.

User Response: This condition can be avoided by using a larger LRECL for the output data set or by specifying that fewer data columns be returned on the SELECT statement.

**DSNE614I AUTOCOMMIT IS NO, NO CHANGES
COMMITTED**

Explanation: The user delayed committing or rolling back changes made during execution of the input file until later in the session. This is done by specifying an AUTOCOMMIT option of 'NO'.

System Action: Input data set processing is completed, and this message is included in the SPUFI output.

User Response: Commit or roll back these changes before ending the session.

DSNE615I NUMBER OF ROWS AFFECTED IS nn

Explanation: This message is written to the output data set following execution of an SQL UPDATE, INSERT, or DELETE statement. 'nn' in the message is a count of the number of rows that were modified as a result of executing the UPDATE, INSERT, or DELETE statement.

Note: In the case of a mass delete of a table in a segmented table space where DB2 does not access nor count the individual rows, this message will not be displayed.

System Action: Input data set processing is completed, and this message is included in the SPUFI output.

**DSNE616I STATEMENT EXECUTION WAS
SUCCESSFUL, SQLCODE IS number**

Explanation: This message is written to the output data set following the successful execution of an SQL statement from the input data set. 'number' specifies the SQL return code for the statement. These return codes are listed in Part 2, "SQL return codes."

System Action: Input data set processing is

completed, and this message is included in the SPUFI output.

**DSNE617I COMMIT PERFORMED, SQLCODE IS
number**

Explanation: When an input file is executed successfully and the user specified an AUTOCOMMIT option of 'YES', this message is written to the output data set to indicate the status of the COMMIT that was performed. 'number' specifies the SQL return code for the COMMIT. These return codes are listed in Part 2, "SQL return codes," on page 11.

System Action: Input data set processing is completed, and this message is included in the SPUFI output.

**DSNE618I ROLLBACK PERFORMED, SQLCODE
IS number**

Explanation: When an error is encountered while executing a SPUFI input file, and the user specified an AUTOCOMMIT option of 'YES', this message will be written to the output data set to indicate the status of the ROLLBACK that was performed. 'number' specifies the SQL return code for the statement. These return codes are listed in Part 2, "SQL return codes," on page 11.

System Action: Input data set processing is completed, and this message is included in the SPUFI output.

**DSNE620I NUMBER OF SQL STATEMENTS
PROCESSED IS nn**

Explanation: This message is written to the output data set after processing all SQL statements in the current input data set. The term 'nn' is a count of the number of SQL statements processed.

System Action: Input data set processing is completed, and this message is included in the SPUFI output.

**DSNE621I NUMBER OF INPUT RECORDS READ
IS nn**

Explanation: This message is written to the output data set after processing all SQL statements in the current input data set. The term 'nn' is a count of the total number of records read from the input data set.

System Action: Input data set processing is completed, and this message is included in the SPUFI output.

**DSNE622I NUMBER OF OUTPUT RECORDS
WRITTEN IS nn**

Explanation: This message is written to the output data set after processing all SQL statements in the current input data set. The term 'nn' is a count of the total number of records written to the output data set.

System Action: Input data set processing is completed, and this message is included in the SPUFI output.

**DSNE623I SYNTAX ERROR AT RECORD xx,
OFFSET xx**

Explanation: A syntax error was detected in the SQL statement preceding this message in the output data set. 'xx' identifies the erroneous line number in the SQL statement, and 'yy' identifies the offset (in characters) of the error within that record.

System Action: Input data set processing is completed, and this message is included in the SPUFI output.

User Response: Correct the specified syntax error in the input data set, and execute the job again.

**DSNE624I UNABLE TO LOAD ISPLINK MODULE.
SPUFI PROCESSING TERMINATED**

Explanation: During SPUFI initialization processing, an error was encountered attempting to LOAD the ISPF interface module, ISPLINK. This module could not be located in the LNKLST or STEPLIB library concatenation.

System Action: SPUFI processing is terminated.

User Response: Rearrange your library concatenation so that the ISPLINK module can be located. This module resides in the ISPF load library.

**DSNE625I CONNECT TO LOCATION (location
name) PERFORMED, SQLCODE IS
number**

Explanation: The SPUFI user has indicated that the SQL statements defined in the input file are to be processed by the server at the remote location specified in the CONNECT LOCATION field of the SPUFI panel.

This message appears in the output file and indicates that an SQL CONNECT request was issued by SPUFI to the specified location name. The 'number' specifies the SQL return code associated with the CONNECT request. These return codes are listed in Part 2, "SQL return codes," on page 11.

System Action: Subsequent processing of the SQL statements in the input file is based upon the successful completion of the CONNECT request. If the request is unsuccessful, the SQL error number and all associated error messages are placed in the output file.

User Response: Respond as indicated by the SQL code returned.

**DSNE626I MAXIMUM OUTPUT LINES FOR
SELECT STATEMENT REACHED
(number), PROCESSING FOR
CURRENT SELECT STATEMENT
TERMINATED**

Explanation: The maximum number of output lines to be displayed for a SELECT statement was reached. Processing of the current SELECT statement is terminated. The maximum number to display is specified by the SPUFI user on the CURRENT SPUFI DEFAULTS panel.

This message appears in the SPUFI output file.

System Action: Processing of subsequent SQL statements in the input file continues.

User Response: If the number of lines displayed is insufficient, you can increase the maximum number of lines to be displayed for SELECT statements on the CURRENT SPUFI DEFAULTS panel and re-execute the SELECT statement.

**DSNE627I csect-id FOR SQLCODE = number,
USER REQUESTED: action**

Explanation: During PREPARE processing of the SQL statement, SPUFI received an SQLCODE (+495) and requested you to respond with the desired action to be taken by SPUFI (CONTINUE or BYPASS).

SPUFI does not consider this to be an SQL statement error and places this message in the SPUFI output file to document the SQLCODE received and the action you requested. *number* specifies the SQL return code associated with the PREPARE request. These return codes are listed in Part 2, "SQL return codes," on page 11.

System Action: SPUFI processing for this statement is based on *action* documented in the message:

- CONTINUE
 - Processing for the current SQL statement continues normally.
- BYPASS
 - Processing for the current SQL statement is terminated without error.

User Response: Respond as indicated by the SQL code returned.

**DSNE800A NO DEFAULT VALUES WERE
CHANGED. PRESS ENTER TO
CONTINUE**

Explanation: The user left panel DSNE800A without changing it. This panel contains all the defaults that can be modified by the user.

System Action: This message is presented on the SPUFI panel DSNE803A. SPUFI waits for the next user input.

User Response: Press 'ENTER' if you want to continue.

**DSNE803A INPUT FILE WAS NOT CHANGED.
PRESS ENTER TO CONTINUE**

Explanation: The user has exited from the ISPF editor without modifying the input data set.

System Action: The system waits for the next user input.

User Response: Press 'ENTER' if you want to continue. The SPUFI panel variable settings can be changed at this point.

**DSNE804A TO CONTINUE, C (COMMIT) OR R
(ROLLBACK) MUST BE SPECIFIED**

Explanation: The user has specified the AUTOCOMMIT=NO option and now wants either to exit or to switch to another DB2 subsystem with outstanding work uncommitted on the current DB2 subsystem.

System Action: DB2 waits for the user to specify either the COMMIT (C) or the ROLLBACK (R) option.

User Response: Enter 'C' or 'R' to continue.

**DSNE808A EDIT SESSION HAS COMPLETED.
PRESS ENTER TO CONTINUE.**

Explanation: The user has exited from the ISPF editor.

System Action: SPUFI waits form the next user input.

User Response: Press 'Enter' if you want to continue. Press 'END' if you want to terminate your SPUFI session. The SPUFI panel variable settings can be changed at this point.

DSNE901I EXECUTION COMPLETE

Explanation: Execution of a subcommand has successfully completed.

System Action: The TSO attachment facility is ready for more input.

**DSNE903I WARNING, DECLARATION HAS SAME
NAME AS TABLE table-name**

Explanation: A DCLGEN subcommand has a 'STRUCTURE' parameter that is the same as the 'table name' specified in the message. The requested declaration has been created, but this could cause conflicts with internal names.

System Action: DCLGEN execution continues.

User Response: Choose a different 'STRUCTURE' parameter.

**DSNE904I EXECUTION COMPLETE, MEMBER
member-name REPLACED**

Explanation: A DCLGEN subcommand executed successfully, replacing the 'member-name' specified in the message.

System Action: The TSO attachment facility is ready for more input.

**DSNE905I EXECUTION COMPLETE, MEMBER
member-name ADDED**

Explanation: A DCLGEN subcommand executed successfully, adding the 'member-name' specified in the message to the data set specified in the DCLGEN subcommand.

System Action: The TSO attachment facility is ready for more input.

**DSNE908E csect-name INVALID USE OF parameter
IN PARAMETER LIST OF KEYWORD
keyword.**

Explanation: An invalid parameter was specified in the parameter list of the specified keyword.

Severity: 8

System Action: Subcommand processing is terminated. The TSO attachment facility is ready for more input.

User Response: Correct the parameter list in error, and resubmit the job.

**DSNE909E csectname WARNING, DBCSSYMBOL
KEYWORD IS INVALID WITH
LANGUAGE language KEYWORD
IGNORED**

Explanation: You specified the DBCSSYMBOL keyword in your DCLGEN invocation, but your LANGUAGE keyword value was not COB2. DBCSSYMBOL only applies to COB2 PICTURE clauses. DCLGEN will ignore this keyword.

System Action: DCLGEN processing continues.

User Response: In the future, do not specify the DBCSSYMBOL keyword unless the LANGUAGE keyword value is COB2.

**DSNE910E csectname WARNING, THE OWNER
KEYWORD WAS SPECIFIED WITH A
QUALIFIED TABLE NAME. OWNER
KEYWORD IGNORED**

Explanation: You specified both the OWNER keyword and a qualified table name for the TABLE keyword in

your DCLGEN invocation. The table qualifier will be used as the table owner, and the OWNER keyword will be ignored.

System Action: DCLGEN processing continues.

User Response: In the future, specify either a qualified table name for the TABLE keyword, or an unqualified table name for the TABLE keyword along with the OWNER keyword.

DSNE920E member-name ALREADY EXISTS, SPECIFY ACTION(REPLACE) TO REPLACE

Explanation: The DCLGEN user tried to overwrite an old declaration with a new one without specifying REPLACE on the 'ACTION' parameter.

System Action: The TSO attachment facility is ready for more input.

User Response: Change the 'ACTION' parameter to REPLACE (if that's actually what you want to do), and resubmit the command.

DSNE921E REQUIRED PARAMETER table-parameter IS MISSING

Explanation: Your DCLGEN subcommand was missing the required TABLE parameter.

System Action: Your DCLGEN subcommand was not processed. The DSN command processor issued a return code of 8. DSN is ready for more input.

User Response: Resubmit the DCLGEN subcommand with a TABLE parameter.

DSNE922E TABLE NAME QUALIFIER OF qualifier IS TOO LONG. CANNOT EXCEED 8 CHARACTERS IN LENGTH

Explanation: DCLGEN detected an invalid TABLE parameter. The table name qualifier (the left portion of the table name) was too long.

System Action: Your DCLGEN subcommand was not processed. The DSN command processor issued a return code of 8. DSN is ready for more input.

User Response: Resubmit the DCLGEN subcommand with a shorter table name qualifier.

DSNE923E CSECT csect-name FOUND AN UNRECOGNIZED LANGUAGE unknown

Explanation: This is a DCLGEN subsystem error, not a user error. The language parameter 'unknown' is not known to the subsystem.

System Action: The TSO attachment facility is ready for more input.

User Response: Report the problem to the system programmer.

System Programmer Response: Re-create the problem with DSN tracing turned on. Collect the trace stream in the DSNTRACE data set. Use the ABEND subcommand of the DSN command processor to collect a dump. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNE924E PARSE FAILED IN CSECT csect-name PARAMETER parm, FLAG flag

Explanation: This is a DB2 subsystem error, not a user error. The 'PARM' parameter was not correctly parsed. The flag specified was detected as an inappropriate value in a parse results field.

System Action: The TSO attachment facility is ready for more input.

User Response: Report the problem to the system programmer.

System Programmer Response: Re-create the problem with DSN tracing turned on. Collect the trace stream in the DSNTRACE data set. Use the ABEND subcommand of the DSN command processor to collect a dump. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNE925E BUFFER OVERFLOW IN CSECT csect-name WHILE WRITING string

Explanation: This is a DCLGEN subsystem error. CSECT 'csect-name' detected a buffer overflow condition while attempting to write 'string'.

System Action: The TSO attachment facility is ready for more input.

User Response: Notify the system programmer.

System Programmer Response: Re-create the problem with DSN tracing turned on. Collect the trace stream in the DSNTRACE data set. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNE926E COMMAND REJECTED - command NOT SUPPORTED UNDER command_processor

Explanation: The user entered a TSO TIME or TEST command. These are not supported by DSN or DB2I.

System Action: The user should leave DSN or DB2I, return to TSO, and retry the command. DSN can be run under TSO TEST. The TSO attachment facility is ready for more input.

User Response: Enter the DSN subcommand, or

leave DSN to execute the requested command.

**DSNE927E RUN SUBCOMMANDS REQUIRE
(1)PROGRAM PARM OR (2)PLAN AND
CP PARMS**

Explanation: RUN subcommands may contain (1) the 'PROGRAM' parameter and, optionally, the 'PLAN' parameter or (2) the 'PLAN' and command processor ('CP') parameters. Combinations of (1) and (2) are not allowed.

System Action: The TSO attachment facility is ready for more input.

User Response: Correct the subcommand, and resubmit the job.

**DSNE928E RUN SUBCOMMANDS CANNOT HAVE
A PROGRAM PARM AND A CP PARM**

Explanation: A RUN subcommand cannot contain both the 'PROGRAM' and command processor ('CP') parameters. The subcommand should be resubmitted with only one of the parameters.

System Action: The TSO attachment facility is ready for more input.

User Response: Correct the subcommand, and resubmit the job.

**DSNE929E TABLE NAME LOCATION OF
(location-name) IS TOO LONG.
CANNOT EXCEED 16 CHARACTERS IN
LENGTH.**

Explanation: DCLGEN detected an invalid AT(location) keyword parameter. The specified location name is too long.

System Action: Your DCLGEN subcommand was not processed. The DSN command processor issues a return code of 8. The DSN is ready for more input.

User Response: Resubmit the DCLGEN subcommand specifying a location name that does not exceed 16 characters.

**DSNE930E TABLE NAME OF table-name MUST BE
QUALIFIED WHEN SPECIFIED WITH
LOCATION OF location-name**

Explanation: DCLGEN detected an invalid TABLE keyword parameter. You must specify a qualified table name with the AT (location) keyword.

System Action: Your DCLGEN subcommand was not processed. The DSN command processor issues a return code of 8. DSN is ready for more input.

User Response: Specify a qualified table name and resubmit the DCLGEN command.

**DSNE931E csect-name keyword-name
(parameter_value) CONTAINS AN
INVALID SYMBOL (symbol)**

Explanation: An invalid 'symbol' (symbol) was specified in the 'parameter_value' associated with the specified 'keyword-name'.

Severity: 8

System Action: Subcommand processing is terminated. The TSO attachment facility is ready for more input.

User Response: Correct the keyword 'parameter_value' in error, and resubmit the job.

**DSNE932I WARNING, ONLY IBM SUPPLIED
names SHOULD BEGIN WITH DSN**

Explanation: The user has issued a BIND, REBIND, or FREE subcommand, using a name or id that begins with DSN.

System Action: Processing continues.

User Response: In the future, do not use plan-names, collection-ids, or package -ids that begin with DSN. It would be a good idea to FREE the plan or package you just created and to BIND again with a new plan-name, collection-id, or package-id.

**DSNE935I ... IS THE DCLGEN COMMAND THAT
MADE THE FOLLOWING STATEMENTS**

Explanation: This message is a part of normal DCLGEN output. It identifies the DCLGEN command that produced the declaration of which it is a part.

System Action: This message is included in the DCLGEN output.

**DSNE936I THE NUMBER OF COLUMNS
DESCRIBED BY THIS DECLARATION
IS nnn**

Explanation: This message is a part of normal DCLGEN output. It tells how many columns were in the table that was named in the DCLGEN command.

System Action: This message is included in the DCLGEN output.

**DSNE937I COBOL DECLARATION FOR TABLE
table-name**

Explanation: This message is a part of normal DCLGEN output. It tells the name of the table for which the declaration was created.

System Action: This message is included in the DCLGEN output.

DSNE938I **PLI DECLARATION FOR TABLE**
table-name

Explanation: This message is a part of normal DCLGEN output. It tells the name of the table for which the declaration was created.

System Action: This message is included in the DCLGEN output.

DSNE939E *csect-name* **THE COMBINATION**
ACQUIRE(ALLOCATE) AND
RELEASE(COMMIT) IS NOT ALLOWED

Explanation: The BIND or REBIND subcommand was submitted with conflicting parameters. You cannot specify ACQUIRE(ALLOCATE) and RELEASE(COMMIT) on the same subcommand.

System Action: The subcommand is terminated and the DSN command processor reissues the DSN prompt to allow another subcommand to be entered.

User Response: Enter the corrected subcommand. Refer to *DB2 Command Reference* for additional information about the BIND and REBIND subcommands.

DSNE940E **DEFER(PREPARE) INVALID WITH**
NODEFER(PREPARE)

Explanation: The BIND or REBIND subcommand was submitted with conflicting parameters. You cannot specify DEFER(PREPARE) and NODEFER(PREPARE) on the same subcommand because these actions conflict.

System Action: The subcommand is terminated and the DSN command processor reissues the DSN prompt to allow another subcommand to be entered.

User Response: Enter the corrected subcommand. Refer to *DB2 Command Reference* for additional information regarding the BIND and REBIND subcommands.

DSNE941I **DSNBIND IS A RESERVED PLAN NAME**

Explanation: This message is generated when the plan name is 'DSNBIND' in a BIND statement.

System Action: Subcommand processing is terminated. The TSO attachment facility is ready for more input.

User Response: Change the plan-name and resubmit the job.

DSNE942E *csect-name* **REMOTE CONNECTION**
NAME (parameter_value) HAS INVALID
FORMAT

Explanation: The REMOTE connection name 'parameter_value' contains a < or > character in the

starting or ending position of the parameter, but the parameter value is not bracketed by both characters. This message is also generated if the first character of the connection name is not an alphabetic character.

If the LU name format of the REMOTE keyword is to be used, the name must be specified as <LU_name>.

Severity: 8

System Action: Subcommand processing is terminated. DSN command processor reissues the DSN prompt to allow another subcommand to be entered.

User Response: Correct the keyword 'parameter_value' in error, and resubmit the job. Refer to *DB2 Command Reference* for additional information about the specification of connection names for the REMOTE keyword.

DSNE943E *csect-name* **REMOTE CONNECTION**
NAME (parameter_value) CANNOT
EXCEED (length_value) CHARACTERS
IN LENGTH

Explanation: The REMOTE connection name 'parameter_value' specified is greater than the length 'length_value' permitted for the REMOTE keyword.

This message is issued if the REMOTE location name format exceeds 16 characters, or the LU name format (<LU name>) exceeds 10 characters in length.

Severity: 8

System Action: Subcommand processing is terminated. DSN command processor reissues the DSN prompt to allow another subcommand to be entered.

User Response: Correct the keyword 'parameter_value' in error and resubmit the job. Refer to *DB2 Command Reference* for additional information about the specification of connection names for the REMOTE keyword.

DSNE944I **WARNING, BECAUSE YOUR TABLE OR**
COLUMN NAMES CONTAIN LOWER
CASE OR NON-ALPHABETIC
CHARACTERS, YOU WILL NEED TO
USE THE SQL (NOT PL/I) INCLUDE
STATEMENT TO INCLUDE DCLGEN
OUTPUT INTO YOUR PROGRAM

Explanation: DCLGEN had to wrap your table or column name(s) in quotes so DB2 could process them. Quotes are not recognized by the PL/I compiler. To avoid compilation errors, use the SQL INCLUDE statement ('EXEC SQL INCLUDE membername') to merge the DCLGEN output with your source program.

Refer to Chapter 5 of *DB2 SQL Reference* for more information about the SQL INCLUDE statement.

System Action: DCLGEN processing continues.

User Response: If you have not coded the SQL

INCLUDE, do so before the next compile.

DSNE947I QUOTE PARAMETER IS ONLY VALID WITH COBOL. IT HAS BEEN CHANGED TO APOST

Explanation: You specified the DCLGEN QUOTE parameter and a non-COBOL language parameter. This combination is not valid. The QUOTE parameter was specified as either a parameter on the DCLGEN subcommand or a default set for your site at DB2 installation time.

The DCLGEN processor changed the QUOTE setting (for this run) to APOST.

System Action: DCLGEN processing continues and should produce valid output.

User Response: If you used QUOTE on the DCLGEN command, you may want to change it to APOST before submitting it again.

DSNE948I *csect-id* FURTHER *subcommand* PROCESSING WILL NOT BE ATTEMPTED

Explanation: A DSN command processor subcommand (indicated in the message) has encountered an error which stopped DSN from processing this subcommand. The subcommand will not complete normally. This message is accompanied by other messages explaining the exact nature of the problem.

System Action: Subcommand processing terminates. The DSN prompt is reissued, indicating DSN is ready for another subcommand.

User Response: Read the accompanying messages for help in deciding what to do next.

DSNE949E COMMIT PROCESSING ABNORMAL TERMINATION, REASON CODE *reason_code*

Explanation: The DSN command processor has initiated a 'prepare to commit' request in DB2. The request is rejected when DB2 cannot commit the work performed

System Action: Commit processing is terminated.

User Response: Examine the reason code associated with this message, and respond as indicated before resubmitting the job.

Problem Determination: Reference the associated reason code to determine why the 'prepare to commit' was not successful.

DSNE950E DCLGEN DOES NOT SUPPORT THE *lang* LANGUAGE

Explanation: A DCLGEN user attempted to specify a LANGUAGE parameter, '*lang*', that DCLGEN does not support.

System Action: DCLGEN processing terminates.

User Response: Correct the LANGUAGE parameter and resubmit the DCLGEN subcommand.

DSNE952I C DECLARATION FOR TABLE *table-name*

Explanation: This message is a part of normal DCLGEN output. It tells the name of the table for which the declaration was created.

System Action: This message is included in the DCLGEN output.

DSNE953I *csect-name* PRECISION OF DECIMAL COLUMN *colname* EXCEEDS THE MAXIMUM PRECISION FOR THE *lang* LANGUAGE.

Explanation: DCLGEN was building a COBOL or PL/I language declaration for a table when it encountered a decimal column with a precision greater than the precision supported by the language.

System Action: DCLGEN set the return code to 4 and processed the rest of the table.

User Response: This is a warning. Be aware that the declaration for column '*colname*' causes a compiler error. You must edit the declaration before including it in an application program.

DSNE954I *csect-name* USE OF THE DCLGEN COLSUFFIX(YES) OPTION WILL RESULT IN A MIXED FIELD NAME FOR COLUMN *colname*. THE *lang* LANGUAGE DOES NOT SUPPORT MIXED FIELD NAMES.

Explanation: The COLSUFFIX(YES) option and a double-byte NAMES prefix were specified in a DCLGEN invocation, but column '*colname*' contains single-byte characters. This combination would result in a generated field name with a mixture of double-byte and single-byte characters, but the '*lang*' language does not support mixed field names.

System Action: DCLGEN set the return code to 4 and generated the field name as requested.

User Response: This is a warning. Be aware that the declaration for column '*colname*' causes a compiler error. You must edit the declaration before including it in an application program.

DSNE955I *csect-name* COLSUFFIX(YES) WAS SPECIFIED WITHOUT A NAMES PREFIX. COLUMN NAMES WILL BE USED FOR FIELD NAMES

Explanation: When COLSUFFIX(YES) is specified in a DCLGEN invocation, DCLGEN generates field names by concatenating the NAMES prefix with the column names. However, no NAMES prefix was specified.

System Action: DCLGEN set the return code to 4 and used the column names as field names.

User Response: This is a warning. Specify a NAMES prefix when you specify COLSUFFIX(YES).

DSNE956A A FIELD NAME PREFIX MUST BE SPECIFIED WHEN COLUMN SUFFIX VALUE IS YES.

Explanation: When YES is specified for the COLUMN SUFFIX field on the DCLGEN panel, DCLGEN generates field names by concatenating the value in the FIELD NAME PREFIX field with the column names. However, no value was specified for FIELD NAME PREFIX.

System Action: The DCLGEN panel generated this error message.

User Response: Specify a FIELD NAME PREFIX value, or change the COLUMN SUFFIX value to NO.

DSNE960E PARAMETER STRING EXCEEDS ALLOWABLE LIMIT OF 100 (DECIMAL) CHARACTERS

Explanation: The PARMs option parameter-string of the RUN subcommand cannot exceed 100 (decimal) characters in length.

System Action: The TSO attachment facility is ready for more input.

User Response: Correct the PARMs option and resubmit the job.

DSNE964E *csect-name* INVALID SYNTAX FOR *keyword* KEYWORD PARAMETER *parameter*

Explanation: A parameter that does not follow DB2 naming conventions was specified for *keyword*.

System Action: Subcommand processing is terminated. The DSN command processor reissues the DSN prompt to allow you to enter another subcommand.

User Response: Correct the keyword parameter value in error, and resubmit the command. Refer to *DB2 Command Reference* for additional information about the specification of a package name and the

REBIND/BIND PACKAGE/PLAN or FREE PACKAGE subcommand.

DSNE965E *parameter_value* IS NOT A VALID *keyword* KEYWORD PARAMETER

Explanation: The *parameter_value* is not a valid parameter value for the keyword.

System Action: Subcommand processing terminates. The DSN command processor reissues the DSN prompt to allow you to enter another subcommand.

User Response: Enter the corrected subcommand. Refer to *DB2 Command Reference* for additional information about the parameter values supported on the keyword.

DSNE966E *connection_type* KEYWORD OMITTED FROM THE ENABLE|DISABLE DECLARATION

Explanation: The 'connection_type' keyword was not specified in either the ENABLE or DISABLE keywords and is required if connection-names are specified for the 'connection_type'.

Severity: 8

System Action: Subcommand processing is terminated. DSN command processor reissues the DSN prompt to allow you to enter another subcommand.

User Response: Enter the corrected subcommand. Refer to *DB2 Command Reference* for additional information about the connection type parameter values supported on the ENABLE and DISABLE keywords.

DSNE967E *keyword_name* KEYWORD CANNOT BE SPECIFIED MORE THAN ONCE PER RUN

Explanation: Either the BIND PACKAGE MEMBER or LIBRARY keywords specified more than one parameter value. Only one member or library name is permitted.

Severity: 8

System Action: Subcommand processing is terminated. DSN command processor will reissue the DSN prompt to allow another subcommand to be entered.

User Response: Enter the corrected subcommand. Refer to *DB2 Command Reference* for additional information regarding the BIND PACKAGE and BIND PLAN subcommands.

DSNE969E *csect-name* *keyword1* IS MUTUALLY EXCLUSIVE WITH *keyword2*

Explanation: Both the PKLIST and NOPKLIST keywords, cannot be specified on one invocation of the REBIND PLAN subcommand. Both the ENABLE and

DISABLE keywords cannot be specified on one invocation of the BIND/REBIND PLAN/PACKAGE subcommand.

Severity: 8

System Action: Subcommand processing is terminated. DSN command processor will reissue the DSN prompt to allow another subcommand to be entered.

User Response: Enter the corrected subcommand. Refer to *DB2 Command Reference* for additional information regarding the REBIND PLAN subcommand.

DSNE970E EITHER MEMBER OR PKLIST MUST BE SPECIFIED, BOTH ARE ALSO ALLOWED

Explanation: The BIND PLAN subcommand requires either the MEMBER or PKLIST keyword, and neither was specified. Either keyword or both may be specified.

Severity: 8

System Action: Subcommand processing is terminated. DSN command processor will reissue the DSN prompt to allow another subcommand to be entered.

User Response: Enter the corrected subcommand. Refer to *DB2 Command Reference* for additional information regarding the BIND PLAN subcommand.

DSNE971E EITHER MEMBER OR COPY BUT NOT BOTH MUST BE SPECIFIED

Explanation: The BIND PACKAGE subcommand requires either the MEMBER or COPY keyword; both are not allowed on the same subcommand invocation.

Severity: 8

System Action: Subcommand processing is terminated and the DSN command processor will reissue the DSN prompt to allow another subcommand to be entered.

User Response: Enter the corrected subcommand. Refer to *DB2 Command Reference* for additional information regarding the BIND PACKAGE subcommand.

DSNE974E csect-name keyword1 KEYWORD IS INVALID WITH keyword2 KEYWORD.

Explanation: The keyword2 should not be specified with keyword1.

System Action: Subcommand processing is terminated. The DSN command processor reissues the DSN prompt to allow another subcommand to be entered.

User Response: Modify one of the keywords on the command and resubmit the job. Refer to *DB2*

Command Reference for additional information about the BIND PACKAGE/PLAN subcommands.

DSNE975E csect-name keyword KEYWORD IS ONLY VALID WHEN COPY KEYWORD IS PRESENT

Explanation: A keyword was issued that may only be specified in conjunction with the COPY keyword.

keyword
COPYVER or OPTIONS

Severity: 8

System Action: Subcommand processing is terminated. The DSN command processor will reissue the DSN prompt to allow another subcommand to be entered.

User Response: Enter the corrected subcommand. Refer to *DB2 Command Reference* for additional information regarding the BIND PACKAGE subcommand.

DSNE976E LIBRARY KEYWORD IS ONLY VALID WHEN MEMBER KEYWORD IS PRESENT

Explanation: The LIBRARY keyword may only be specified in conjunction with the MEMBER keyword.

Severity: 8

System Action: Subcommand processing is terminated. The DSN command processor will reissue the DSN prompt to allow another subcommand to be entered.

User Response: Enter the corrected subcommand. Refer to *DB2 Command Reference* for additional information regarding the BIND PACKAGE subcommand.

DSNE999 INVALID SQL RETURN CODE

Explanation: The number you selected is not a valid SQL return code.

This message is issued by panel: DSN4SRC

User Response: Check the number and enter it again.

Chapter 7. DSNF... messages

**DSNF001I MESSAGE GENERATOR
INITIALIZATION PARAMETERS NOT
FOUND. DEFAULTS ASSUMED**

Explanation: The message generator was unable to access the routing code initialization parameter defined by the DSN6SYSP macro. Default values defined by that macro are assumed.

System Action: Subsystem initialization continues.

Operator Response: Notify the system programmer.

System Programmer Response: It might be necessary to change the DSN6SYSP macro and replace the DSN6SYSP member of the DSNIPARM directory. Refer to Part 2 of *DB2 Installation Guide* for details of this process.

**DSNF700I csect-name message-id HAS BEEN
ISSUED**

Explanation: An unsuccessful attempt has been made to issue the message 'message-id'. This message is issued only if the requested message could not be found in the DB2 message directory.

System Action: The system proceeds as though the requested message had been issued.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to this manual for actual message text. You need the message number ('message-id'). If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Chapter 8. DSNQ... messages

DSNG001I EDM *stype* CAN NOT BE DECREASED BELOW THE VALUE *isize* SPECIFIED AT DB2 STARTUP

Explanation: The EDM *stype* storage cannot be decreased below the size that was specified at DB2 startup.

System Action: Processing continues.

DSNG002I EDM *stype* HAS AN INITIAL SIZE *isize*, REQUESTED SIZE *rsize*, AND AN ALLOCATED SIZE *asize*

Explanation: This message is issued in response to a request to increase or decrease the EDM *stype* storage.

isize The EDM *stype* storage size prior to the request for a change.

rsize The requested EDM *stype* storage size.

asize The EDM *stype* storage size immediately available.

- When increasing the EDM Pool, the *asize* is the storage available to satisfy the request.
- When decreasing the EDM Pool, the *asize* is the INITIAL size reduced by the amount that could be released immediately.

When the *asize* is larger than the *rsize*, the difference is marked to be released when it is no longer referenced.

System Action: Processing continues.

DSNG003I INSUFFICIENT VIRTUAL STORAGE TO EXPAND EDM *stype* STORAGE

Explanation: Insufficient virtual storage exists to expand the EDM *stype* storage as specified.

System Action: The EDM *stype* storage is expanded only to the size allowed by the available virtual storage.

DSNG005I DBD IS INCONSISTENT WITH THE CATALOG. UNABLE TO FIND A ROW IN SYSTABLES WITH DBID *dbid* AND OBID *obid*.

Explanation: This message is issued in response to a request to load a database with DBID *dbid*. This message is issued when the row is not found in SYSTABLES.

DBID DBID of the database that is being loaded.

OBID OBID of a table in the database.

Severity: 8 (Error)

System Action: DBD could not be loaded.

Operator Response: Based on *dbid* and *obid* from the message, verify that the row does not exist in the Catalog. REPAIR DBD TEST or DIAGNOSE can be run to gather more diagnostic information. Once you have determined that the Catalog contains the correct information, REPAIR DBD REBUILD can be run to rebuild the DBD.

DSNG006I DBD IS INCONSISTENT WITH THE CATALOG. UNABLE TO FIND A ROW IN SYSCOLUMNS WITH DBID *dbid*, OBID *obid*, AND COLUMN NUMBER *colno*.

Explanation: This message is issued in response to a request to load a database with DBID *dbid*. This message is issued when the row is not found in SYSCOLUMNS.

DBID DBID of the database that is being loaded.

OBID OBID of a table in the database.

COLNO

Column number in the table.

Severity: 8 (Error)

System Action: DBD could not be loaded.

Operator Response: Based on *dbid/obid/colno* from the message, verify that the row does not exist in the Catalog. REPAIR DBD TEST or DIAGNOSE can be run to gather more diagnostic information. Once you have determined that the Catalog contains the correct information, REPAIR DBD REBUILD can be run to rebuild the DBD.

Chapter 9. DSNH... Messages

Message line numbers

The line number *nnnn* in the following compiler messages is generated by assigning sequential numbers to the original source. The numbers are printed on the SQL precompiler source listing (if the SOURCE option is specified to the precompiler).

'COL *cc*' in the messages identifies the source column in which the condition was detected. This is usually the location of the column containing the first character of the associated source token. However, if the precompiler cannot determine this location, it is the beginning of the statement. Because the detected error might be similar to a valid, but different, construction, the SQL parsing might indicate the wrong location for the error.

Message severity codes

One of the characters I, W, E, S, or U is shown at the beginning of each precompiler message as an aid to the programmer. These characters indicate the severity level as follows:

I	0	Informational
W	4	Warning
E	8	Error
S	12	Severe error
U	16	Unrecoverable error

When unsupported non-DB2 statements are detected during SQL(ALL) precompilation, the return code will be forced to 4 if the return code was 8, and no host-related errors were detected. This is done so that the application can proceed with the compilation and link-edit steps. This allows the syntax checking to be delayed until bind. If a severity 8 precompiler error message is not a host-related error, the precompiler treats the error as a warning and place a W instead of an E in the precompiler output listing. In this instance, the precompiler also issues DSNH049I to indicate that the actual return code 8 from the precompiler was changed to 4.

The following precompiler messages with severity levels of 8 are not changed from errors to warnings when SQL(ALL) is in effect:

DSNH051I
DSNH080I
DSNH290I
DSNH291I
DSNH292I
DSNH312I
DSNH313I
DSNH314I
DSNH504I

Source tokens in messages

Tokens from your source program do not always appear in messages exactly as they appear in your program. For example, leading zeros are removed from integer tokens.

DSNH003I **S** *csectname* **FILE** *ddname*
PARAMETERS INCORRECT

Explanation: The file *ddname* has invalid or incorrect parameters, such as logical record length.

Severity: 12 (severe error)

System Action: The precompiler is terminated.

User Response: Correct the data set or library parameters.

DSNH004I **S** *csectname type* **COULD NOT BE FOUND**

Explanation: The precompiler could not find the indicated type of statement in the application program source. This message is only issued for HOST(COBOL) and HOST(COB2). The *type* is DATA DIVISION, WORKING-STORAGE SECTION, or PROCEDURE DIVISION. This error can cause other errors.

Severity: 12 (severe error)

System Action: Processing continues. Additional errors might result.

User Response: Ensure that the host language statement in your application program is correct and that the statement is present within the proper margins.

DSNH005I **U** *csectname* **FILE** *ddname* **NO MEMBER NAME SPECIFIED**

Explanation: The *ddname* must refer to a partitioned data set, and the member name must be specified in the allocation. This helps to prevent accidental erasure of the DBRM library.

Severity: 16 (unrecoverable error)

System Action: The precompiler is terminated.

User Response: Correct the JCL or TSO allocate command to specify a member name.

DSNH006I **U** *csectname* **FILE** *ddname* **COULD NOT BE OPENED**

Explanation: The file identified in the message is required, but it could not be opened.

Severity: 16 (unrecoverable error)

System Action: The precompiler is terminated.

User Response: Ensure that the file is present in your JCL.

System Programmer Response: Ensure that the SYSIN data is provided. Also ensure that SYSLIB is defined if the application program contains SQL INCLUDE statements.

DSNH007I **E** *csectname* **LINE** *nnnn* **COL** *cc*
ILLEGAL CHARACTER IGNORED: 'c'
('hh'X)

Explanation: The character identified in the message as *c* is not permitted. The hexadecimal representation for the character is *hh*.

Severity: 8 (error)

System Action: The character is ignored.

User Response: Correct the character. It might need to be within quotation marks or apostrophes.

DSNH008I **S** *csectname* **LINE** *nnnn* **COL** *cc*
NESTED INCLUDE NOT SUPPORTED

Explanation: While processing an INCLUDE, another nested INCLUDE statement was encountered.

Severity: 12 (severe error)

System Action: The nested INCLUDE statement is ignored.

User Response: Remove the nested INCLUDE statements; they are not allowed in an included file. The DB2 precompiler permits only one level of INCLUDE statements.

DSNH009I **S** *csectname* **LINE** *nnnn* **COL** *cc*
MEMBER *name* **COULD NOT BE INCLUDED**

Explanation: The identified member name was not found or could not be read.

Severity: 12 (severe error)

System Action: Processing continues without the data from that member.

User Response: Ensure that the member is in the library and that its name is spelled correctly. Check and correct any JCL errors. They are likely to cause other errors. Ensure that the data set and library parameters are correct.

DSNH010I S *csectname* LINE *nnnn* COL *cc*
**UNTERMINATED STRING CONSTANT
BEGINNING** *text*

Explanation: The constant identified in the message as *text* is not terminated properly.

Severity: 12 (severe error)

System Action: The string is treated as if it were terminated by the end of file.

User Response: Terminate the string constant. Check for and correct any missing or extra quotation marks and apostrophes. These errors are likely to cause others. Some statements were probably missed because of missing or extra string delimiters.

DSNH011I S *csectname* LINE *nnnn* COL *cc*
UNTERMINATED COMMENT

Explanation: A comment is not terminated properly. This message is only issued for HOST(PLI) and HOST(C).

Severity: 12 (severe error)

System Action: The string is treated as if it were terminated by the end of file.

User Response: Ensure that the comment terminator is typed properly and that it is within the specified margins. This error is likely to cause others. Some statements were probably missed because of the missing comment terminator.

DSNH012I W *csectname* LINE *nnnn* COL *cc*
INVALID CONTINUATION

Explanation: The continuation does not follow the host language rules.

Severity: 4 (warning)

System Action: Processing continues. Additional errors might result.

User Response: Follow the host language continuation rules and embedded SQL continuation rules. Check the margin option. This error is most common in assembler language in cases where a continuation begins before the continuation column (the continuation column is column 16 by default).

DSNH013I E *csectname* LINE *nnnn* COL *cc* SQL
**STATEMENT FOUND OTHER THAN IN
THE FIRST PROGRAM (OR MAIN
PROGRAM)**

Explanation: This message is for VS COBOL II only. If any SQL statement is found in the source after the first program in a BATCH COMPILE or the end of the main program of a nested program, this message is issued.

Severity: 8 (error)

System Action: The precompiler is terminated.

User Response: Move up the SQL statement and corresponding host variable declaration to the main program or to the first program and resubmit the job.

DSNH014I S *csectname* LINE *nnnn* COL *cc* SQL
**STATEMENT IS FOUND IN AN
INAPPROPRIATE PLACE**

Explanation: If any SQL statement is found in the COBOL DECLARATIVES section, this message is issued.

Severity: 12 (severe error)

System Action: Processing continues. Additional errors might result.

User Response: Move the SQL statement out of the COBOL DECLARATIVES section and resubmit the job.

DSNH016I E *csectname* LINE *nnnn* COL *cc* *token*
REQUIRED

Explanation: The required character or keyword identified as *token* is missing.

Severity: 8 (error)

System Action: The token is assumed to be present in order to continue checking the statement syntax.

User Response: Correct the SQL statement. Determine if you skipped either this keyword or another keyword earlier in the SQL statement. The assumed token is printed in the SYSTEM error message. This token might not be what you intended, even though it is the only symbol allowed in the clause at this point.

DSNH019I W *csectname* **OPTION: INVALID
OPTION** *option*

Explanation: The identified option was requested, but it is not a precompiler option.

Severity: 4 (warning)

System Action: The option is ignored.

User Response: Check the valid precompiler options to determine if your spelling is correct for this option. This problem might cause additional errors if the APOST, APOSTSQL, COMMA, HOST, MARGINS, QUOTESQL, or TWOPASS option is needed but not specified. The other options are either defaults or affect only the listing. Correct the problem and run the precompile again.

DSNH021I W *csectname* **OPTION: SUBOPTION
NOT PERMITTED WITH OPTION** *option*

Explanation: The identified option cannot have suboptions, but one or more were specified.

Severity: 4 (warning)

DSNH022I • DSNH029I

System Action: The suboptions are ignored.

User Response: None is required. However, you should remove the suboption.

DSNH022I W *csectname* **OPTION: UNMATCHED ')' TAKEN AS ','**

Explanation: An unmatched ending parenthesis was found before the end of the option string.

Severity: 4 (warning)

System Action: The parenthesis is assumed to be a comma.

User Response: Balance the parentheses.

DSNH023I W *csectname* **OPTION: SUBOPTION MISSING FOR OPTION** *option*

Explanation: The specified option requires a suboption, but one was not provided.

Severity: 4 (warning)

System Action: The option is ignored.

User Response: Provide a suboption or remove the option. This problem might cause additional errors if the HOST or MARGINS option is needed but not specified. The other options are either defaults or affect only the listing. Correct the problem and run the precompile again.

DSNH024I W *csectname* **OPTION: SUBOPTION** *suboption* **INVALID FOR OPTION** *option*

Explanation: The identified suboption is not allowed for the option specified.

Severity: 4 (warning)

System Action: The entire option is usually ignored.

User Response: Refer to the 'options used' list in the precompiler output listing to see if the option was used. Remove the suboption.

DSNH025I W *csectname* **OPTION: EXCESSIVE SUBOPTIONS FOR OPTION** *option*

Explanation: Too many suboptions were given for the identified option.

Severity: 4 (warning)

System Action: The excess suboptions are ignored.

User Response: Remove excess suboptions.

DSNH026I W *csectname* **OPTION: INVALID MARGINS FOR HOST LANGUAGE**

Explanation: The host language does not permit the specified margins.

Severity: 4 (warning)

System Action: The MARGINS option is ignored.

User Response: Ensure that the source statements are within the proper margins and that the margins are specified correctly. The margins for COBOL must be 8, 72. The margins for FORTRAN must be 1, 72.

DSNH027I W *csectname* **SUBOPTION** *suboption* **TOO LONG, TRUNCATED AFTER** *numofchar* **CHARS**

Explanation: The version ID is greater than *numofchar* bytes long. The maximum length for the version ID is 64 bytes.

Severity: 4 (warning)

System Action: The option is honored, but the version ID is truncated after 64 bytes.

User Response: Refer to the 'options used' list in the precompiler output to see what version ID was used.

DSNH028I W *csectname* **ATTACH SUBOPTION** *suboption* **NOT PERMITTED WITH HOST (FORTRAN) SPECIFIED.**

Explanation: The identified suboption for precompiler option ATTACH cannot take effect when the application is a FORTRAN application because the interface code for FORTRAN is always DSNHFT.

Severity: 4 (warning)

System Action: The option is ignored.

User Response: None is required. However, you can either code ATTACH(TSO) or specify no ATTACH precompiler option

DSNH029I E *csectname* **LINE** *nnnn* **COL** *cc* **INTO CLAUSE REQUIRED**

Explanation: SELECT statements embedded in an application program must have an INTO clause to denote where the results of the SELECT are to be placed. Dynamic SELECT statements do not permit the INTO clause.

Severity: 8 (error)

System Action: The statement is replaced by host language statements that, if executed, set an error code in the SQLCA.

User Response: Add the INTO clause to the SELECT statement, and precompile the application program again.

DSNH030I **W** *csectname* **LINE** *nnnn* **COL** *cc*
**STATEMENT CONTAINS WRONG
NUMBER OF 'INTO' VARIABLES**

Explanation: The number of variables specified in an INTO clause is not the same as the number of select-list elements (taking into account expansion of host structures and '*' or 'table.*' select entries according to the declarations supplied).

Severity: 4 (warning)

System Action: Processing continues.

User Response: Ensure the included table declarations are correct. If the declarations are correct, this statement causes an error when the application program is bound. If the declarations are incorrect, you can proceed, but the declarations should be corrected. Otherwise, you need to correct the SQL statement and precompile again.

DSNH031I **W** *csectname* **LINE** *nnnn* **COL** *cc*
**STATEMENT CREATES A COLUMN
WITH NAME** *name1* **WHICH DOES NOT
MATCH DECLARED NAME** *name2*

Explanation: The column name specified in a CREATE statement (*name1*) is not the same as the name of the corresponding column in the DECLARE TABLE statement (*name2*).

Severity: 4 (warning)

System Action: Processing continues.

User Response: Ensure that the DECLARE TABLE matches the CREATE TABLE. You can use the cross-reference and source listings to help find the two statements.

DSNH032I **W** *csectname* **LINE** *nnnn* **COL** *cc*
**STATEMENT CREATES A COLUMN
name WHOSE ATTRIBUTES DO NOT
MATCH THE DECLARATION**

Explanation: The column *name* is specified in a CREATE statement with a different data type or length than was specified for the corresponding column in the DECLARE TABLE statement.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Correct the DECLARE TABLE or CREATE TABLE statement. If the DECLARE TABLE statement is incorrect, some warnings might also be incorrect or might not be generated when needed. If the CREATE TABLE statement is incorrect, you must correct it.

DSNH033I **W** *csectname* **LINE** *nnnn* **COL** *cc*
**STATEMENT CREATES MORE OR
LESS COLUMNS THAN WERE
DECLARED**

Explanation: The number of columns specified in a CREATE statement is different from the number of columns specified in the DECLARE TABLE statement.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Ensure that the DECLARE TABLE matches the CREATE TABLE. If the DECLARE TABLE statement is incorrect, some warnings might also be incorrect or might not be generated when needed. If the CREATE TABLE statement is incorrect, you must correct it.

DSNH034I **W** *csectname* **LINE** *nnnn* **COL** *cc*
**STATEMENT INSERTS MORE OR LESS
VALUES THAN THE NUMBER OF
COLUMNS DECLARED**

Explanation: The number of values specified in an INSERT statement is different from the number of columns specified in the DECLARE TABLE statement for the receiving table.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Insert the correct number of values. If the DECLARE TABLE statement is incorrect, this warning might also be incorrect. If the INSERT statement is incorrect, you must correct it.

DSNH038I **S** *csectname* **LINE** *nnnn* **COL** *cc*
**PROGRAM OR SUBPROGRAM
CONTAINS MORE THAN 32767 SQL
STATEMENTS**

Explanation: The number of SQL statements in an application program or a FORTRAN subprogram is greater than 32767.

Severity: 12 (severe error)

System Action: The precompiler terminates.

User Response: Divide the application program or subprogram into smaller programs or reduce the SQL statements in each program unit so that the maximum number of SQL statements is not exceeded.

DSNH041I **W** *csectname* **OPTION: MISSING HOST
OPTION**

Explanation: The host language was not specified in the OPTION field.

Severity: 4 (warning)

System Action: HOST(COBOL) is assumed.

User Response: Specify the host language if it is not COBOL. It is probably best to specify the host language and remove all warnings.

DSNH042I W csectname OPTION: option OPTION INVALID FOR HOST LANGUAGE

Explanation: The option identified in the message is not valid. The QUOTE and COMMA options are not permitted with HOST(ASM), HOST(PLI), or HOST(C). The TWOPASS option is not permitted with HOST(COBOL).

Severity: 4 (warning)

System Action: The specified option is ignored.

User Response: Remove the invalid option, or correct the host specification.

DSNH049I W csectname RETURN CODE IS FORCED TO 4 BECAUSE OPTION SQL(ALL) IS IN EFFECT, ORIGINAL RETURN CODE WAS nnn

Explanation: One or more SQL-related error messages were detected by the precompiler, but because of option SQL(ALL), the return code is forced to 4 in order to let the application proceed with compilation.

The SQL syntax checking is deferred until bind time because the source might contain non-DB2 SQL syntax that the DB2 precompiler does not recognize and flags as an error. The DBRM produced by this precompilation cannot be bound successfully by DB2 if there are SQL syntax errors or non-DB2 SQL syntax.

The return code remains untouched if there are host-related syntax or semantic errors in the source.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Ensure that the intention of this precompilation is for executing it in a non-DB2 system.

DSNH050I I csectname WARNINGS HAVE BEEN SUPPRESSED DUE TO LACK OF TABLE DECLARATIONS

Explanation: One or more warning messages were suppressed because no table declarations were found before the first SQL statement that referenced a table or column.

Severity: 0

System Action: Processing continues. Suppression is discontinued if a table declaration is found.

User Response: Insert (or INCLUDE) table declarations before they are referenced in order to permit table and column checking.

DSNH051I E csectname LINE nnnn COL cc sqltype name PREVIOUSLY DECLARED OR REFERENCED

Explanation: The variable *sqltype* is TABLE, CURSOR, or STATEMENT. The identifier *name* was already defined with the given *sqltype*. The definition might have occurred implicitly. For example, *name* might have been found in the FROM clause of a SELECT, causing it to be defined as a table.

Severity: 8 (error)

System Action: The name is installed in the symbol table as a duplicate.

User Response: Remove duplicate definitions, or correct the references. Avoid implicit definitions by inserting (or including) table declarations before they are referenced. Check the number of passes used. Use the cross-reference and source listings to help resolve this type of error.

DSNH052I E csectname LINE nnnn COL cc COLUMN name IS ALREADY DEFINED IN TABLE table-name

Explanation: The identified name is already defined as a column in the table named *table-name*. The definition might have occurred implicitly. For example, *table-name* might have been found in a select-list, causing *name* to be defined as a column within *table-name* if *table-name* was not declared as a host variable.

Severity: 8 (error)

System Action: The name is installed in the symbol table as a duplicate.

User Response: Remove duplicate definitions, or correct the references. Avoid implicit definitions by inserting (or including) table declarations before they are referenced.

DSNH053I W csectname NO SQL STATEMENTS WERE FOUND

Explanation: No SQL statements were found in the precompiler input file. An empty DBRM member was written.

Severity: 4 (warning)

System Action: Processing continues.

User Response: If you embedded SQL statements in your application program and none were found, make sure your column margins are properly defined for your application program.

DSNH060I E *csectname* LINE *nnnn* COL *cc*
INVALID *type* SPECIFICATION: *spec*

Explanation: The *type* is either SCALE or LENGTH. The *spec* is the given SCALE or LENGTH specification in an SQL declaration. Length and scale specifications must be unsigned integers. The scale specification, where permitted, cannot exceed the length. The length specification cannot be 0.

Severity: 8 (error)

System Action: Processing continues.

User Response: Correct the length or scaling.

DSNH080I E *csectname* LINE *nnnn* COL *cc* *usage*
VARIABLE *name* IS NOT *type* TYPE

Explanation: The *usage* is INDICATOR or STRING. The *type* is SMALLINT, VARCHAR, or CHARACTER. The data type of the variable *name* is not acceptable. All indicator variables must be small integers. PREPARE and EXECUTE strings must be variable character strings, except for FORTRAN, which requires character type.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Specify a host variable of the proper type.

DSNH081I W *csectname* LINE *nnnn* COL *cc*
STATEMENT DOES NOT CONFORM TO
ANS SYNTAX STANDARD - REASON
CODE *ccc*

Explanation: When the precompiler option STDSQL(YES) is in effect, the SQL syntax is checked to see if it conforms to the ANSI/ISO SQL standard of 1992. Reason codes are:

- 000** Aggregate function with DISTINCT as an arithmetic-operation operand does not conform to the ANSI/ISO SQL standard of 1992.
- 001** FOR UPDATE OF as part of a DECLARE CURSOR statement does not conform to the ANSI/ISO SQL standard of 1992.

Severity: 4 (warning)

System Action: Processing continues.

User Response: You have the option of changing or not changing the syntax to conform to the ANS syntax standard.

System Programmer Response: Check the SQL statement.

DSNH082I I *csectname* LINE *nnnn* COL *cc*
STATEMENT DOES NOT CONFORM TO
IBM SQL SYNTAX OR SEMANTIC
STANDARD - REASON CODE *ccc*

Explanation: When the precompiler option SQL(ALL) is in effect, statements that do not conform to certain IBM SQL rules are flagged.

Severity: 0 (informational)

System Action: Processing continues.

User Response: Change the syntax of the statement to conform to the IBM SQL standard if portability is required. Not changing the syntax means that the program is less portable within the IBM SQL environment.

DSNH083I I *csectname* LINE *nnnn* COL *cc* IBM SQL
RESERVED WORD *ibmkeywd*
SPECIFIED AS AN IDENTIFIER NAME

Explanation: When the precompiler option SQL(ALL) is in effect, IBM SQL reserved words should not be used as identifier names. Using IBM SQL reserved words limits the portability of the statement.

Severity: 0 (informational)

System Action: Processing continues.

User Response: If possible, change the identifier name to a non-IBM SQL reserved word so that the statement conforms to the IBM SQL standard. Not changing the identifier name means that the program is less portable within the IBM SQL environment.

DSNH084I W *csectname* LINE *nnnn* COL *cc*
UNACCEPTABLE SQL STATEMENT

Explanation: The referenced SQL statement is not allowed in this situation, but it will not cause an error. Depending on the option specified at precompile time, one of the following occurred.

- The BEGIN DECLARE SECTION(*), END DECLARE SECTION(*), and UPDATE STATISTICS statements are flagged as not compatible.
 - * For C applications, BEGIN and END DECLARE SECTION are not flagged.
 - * For other languages, the statement is only allowed with precompiler option STDSQL(YES).
- Using the STDSQL(YES) precompiler option, the INCLUDE SQLCA statement is flagged as a warning.

Severity: 4 (warning)

System Action: The BEGIN DECLARE SECTION, END DECLARE SECTION, and INCLUDE SQLCA statements are ignored. The other statements are replaced by host language statements that will, if executed, set a warning code or SQLCODE -84 in the SQLCA.

DSNH085I • DSNH102I

User Response: Unless this application program is used in a portable manner, remove the statement.

DSNH085I W *csectname* LINE *nnnn* COL *cc*
UNACCEPTABLE SQL KEYWORD
IGNORED: *keyword*

Explanation: The SQL *keyword* is not allowed by DB2, but it does not cause an error. This message is printed as a warning to the programmer.

Severity: 4 (warning)

System Action: The keyword and its parameters are ignored.

User Response: Unless this application program is used with both SQL/DS and DB2, remove the keyword.

DSNH088I W *csectname* LINE *nnnn* COL *cc* THIS
STATEMENT WILL *action* AN ENTIRE
TABLE

Explanation: The *action* is either DELETE or UPDATE. The referenced SQL statement has no WHERE clause and will delete or update all rows of the specified table. This message is printed as a warning to the programmer.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Be sure that you intend to delete or update all rows, or add a suitable WHERE clause.

DSNH090I S *csectname* LINE *nnnn* COL *cc* HOST
VARIABLE NOT PERMITTED HERE:
name

Explanation: Host variable references are not permitted in this type of SQL statement. The *name* is invalid.

Severity: 12 (severe error)

System Action: The statement is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Specify a literal or a column name rather than a host variable. The colon (:) indicates that the name that follows is a host variable. Remove it to specify a column name.

DSNH091I I *csectname* LINE *nnnn* COL *cc* EBCDIC
CCSID used for string-expression.

Explanation: In a PL/1 application program, a string-expression was specified for a PREPARE or EXECUTE IMMEDIATE statement, and the precompiler-generated structures for this string-expression specify an EBCDIC CCSID.

Severity: 0 (informational)

System Action: Processing continues.

User Response: If you intended that the string-expression should be treated as a string expression, then no action is required.

If the string-expression consists of just one host variable, and you intended that the string-expression should be treated as a host variable, then the host variable must be preceded by a colon, and at least one DECLARE VARIABLE statement must be contained in your program source.

If you add a DECLARE VARIABLE for any host variable in your program source, and re-compile your application, the variable previously treated as a string-expression by the precompiler will be treated as a host variable and this message will not be issued.

DSNH097I E *csectname* LINE *nnnn* COL *cc*. THE
USE OF LONG VARCHAR OR LONG
VARGRAPHIC IS NOT ALLOWED IN
THIS CONTEXT.

Explanation: The statement attempted to use the LONG VARCHAR or LONG VARGRAPHIC syntax. This syntax cannot be used for the following statements:

- CAST syntax
- CREATE DISTINCT TYPE
- CREATE FUNCTION
- CREATE PROCEDURE
- ALTER FUNCTION
- COMMENT ON FUNCTION
- GRANT EXECUTE ON FUNCTION
- REVOKE EXECUTE ON FUNCTION

Severity: 8 (error)

System Action: The statement cannot be executed.

User Response: Correct and reissue the failing statement.

DSNH101I S *csectname* THE STATEMENT IS TOO
LONG OR TOO COMPLEX.

Explanation: The statement cannot be executed because it exceeds the system limits for either length or complexity.

Severity: 16

System Action: The statement cannot be executed.

User Response: Break the statement into shorter or less complex SQL statements.

DSNH102I E *csectname* LINE *nnnn* COL *cc*
LITERAL STRING IS TOO LONG.
STRING BEGINS *string*

Explanation: The character string constant that was referenced in this message is too long. The erroneous string begins with *string*. Most strings have these limits:

- For a hexadecimal constant (X, GX, or UX), the number of hexadecimal digits must not exceed 32704.
- Any other character string constant must be short enough so that its UTF-8 representation requires no more than 32704 bytes.
- Any other graphic string constant must be short enough so that its UTF-8 representation requires no more than 32698 bytes.

In some contexts, however, the limit is smaller; see the *DB2 SQL Reference* for the specific cases.

If this release of DB2 increases the maximum allowed length of a string constant, then an attempt to exploit the new length when the value of the NEWFUN option is NO (New Function Mode is NO) will produce this message.

For special registers, the allowable length depends on the particular special register. A string that exceeds the limit can be specified only through assignment from a host variable. If this release of DB2 increases the maximum allowed length of a string constant, then an attempt to exploit the new length before using the New Function Mode produces this SQL return code.

Two consecutive string delimiters are used to represent one string delimiter within the character string, but these count as 2 bytes when calculating the lengths of character string constants.

Severity: 8 (error)

System Action: If the SQL statement containing the string is a declaration, it is discarded. If the SQL statement containing the string is executable, it is replaced by host language statements that, if executed, set an error code in the SQLCA.

User Response: Correct the string. If a shorter string is acceptable, reduce the length of the string constant. If a long string is required, a host variable is required.

DSNH103I E *csectname* LINE *nnnn* COL *cc*
INVALID NUMERIC LITERAL *token*

Explanation: The *token* was found. It begins with a digit, but it is not a valid integer, decimal, or float literal. Identifiers cannot begin with a digit except for the WHENEVER statement with HOST(FORTRAN), and the identifiers in COBOL.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Check the indicated token for validity. Use apostrophes or quotation marks if a character literal

is desired. Remove the invalid characters if a number is desired.

DSNH104I E *csectname* LINE *nnnn* COL *cc*
ILLEGAL SYMBOL "*token*". SOME
SYMBOLS THAT MIGHT BE LEGAL
ARE: *token-list*

Explanation: A syntax error was detected where the symbol "*token*" occurs in the SQL statement. The list of symbols that might be legal shows some alternate symbols that could possibly be correct at that point, if the preceding part of the statement is entirely correct.

However, the preceding part of the statement might be incorrect. For example, if an important keyword is omitted, DB2 detects the error later, and not always immediately after the point where the keyword should appear. The list of alternate symbols are only suggestions.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the statement and precompile the program again.

DSNH105I E *csectname* LINE *nnnn* COL *cc*,
INVALID STRING CONSTANTS

Explanation: Incorrect graphic or mixed data literals were found on line *nnnn*, column *cc*.

Severity: 8 (error)

System Action: The literal is ignored and the SQL statement containing the problem is discarded.

User Response: Specify the correct format of literals.

System Programmer Response: Check for a quote, an apostrophe, shift-out (so) or shift-in (si) characters, G or N characters, or the number of characters within the literal.

DSNH107I E *csectname* LINE *nnnn* COL *cc* NAME
name IS TOO LONG; MAXIMUM IS *size*
CHARACTERS

Explanation: For each type of *name*, the *DB2 SQL Reference* lists the maximum allowed length.

If this release of DB2 increases the maximum allowed length of a name, then an attempt to exploit the new length when the value of the NEWFUN option is NO will produce this message.

Severity: 8 (error)

System Action: If the SQL statement containing the problem is a declaration, it is discarded. If the SQL

DSNH109I • DSNH113I

statement containing the problem is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the name length.

DSNH109I E *csectname* LINE *nnnn* COL *cc* *type* CLAUSE NOT PERMITTED

Explanation: The *type* is INTO, ORDER BY, FOR UPDATE, , USING, LARGE, or CORRELATION NAME.

- Embedded SELECT statements cannot include ORDER BY, because the result cannot be more than a single row.
- Embedded SELECT statements cannot include FOR UPDATE OF, because position is not retained.
- SELECT clauses used in cursor declarations or subselects cannot have an INTO clause because the INTO is on the FETCH statement.
- CREATE VIEW statements cannot include any of the above clauses.
- The UNION operator is not allowed in an embedded SELECT.
- A CREATE TABLESPACE statement cannot specify LOCKPART without the Numparts option.
- An ALTER TABLESPACE statement cannot specify LOCKPART for a non-partitioned table space.
- A table space with LOCKPART YES cannot be altered to LOCKSIZE TABLESPACE.
- A table space with LOCKSIZE TABLESPACE cannot be altered to LOCKPART YES.
- The LARGE clause without the Numparts option is not allowed in a CREATE TABLESPACE statement.
- DESCRIBE INPUT statement can not have USING clause.
- The table being updated in a POSITIONED UPDATE statement can not be assigned a correlation name.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Remove the clause. You might need to use a cursor to perform the processing. The ORDER and FOR UPDATE clauses are accepted on the DECLARE CURSOR statement. The INTO clause is accepted on the FETCH statement. The LARGE clause is accepted on a CREATE TABLESPACE statement with the Numparts option.

DSNH110I E *csectname* LINE *nnnn* COL *cc* INVALID HEX LITERAL BEGINNING *string*

Explanation: The hexadecimal string constant that was referenced contains one or more of the following errors:

- one or more characters are not valid hexadecimal digits
- the number of digits is not even
- for a UX or GX string constant, the number of digits is not a multiple of 4

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the string constant.

DSNH111W W *csectname* LINE *nnnn* COL *cc* THE SUBPAGES OPTION IS NOT SUPPORTED FOR TYPE 2 INDEXES

Explanation: You cannot use the SUBPAGES option for type 2 indexes.

Severity: 4 (warning)

System Action: The option is ignored; processing continues.

Programmer Response: Remove the SUBPAGES option to get rid of the warning.

DSNH113I E *csectname* LINE *nnnn* COL *cc* INVALID CHARACTER FOUND IN *string*, REASON CODE - *nnn*

Explanation: The string contains an invalid character. It can be an SQL ordinary identifier name, a host variable name, or a DBCS comment.

For SBCS SQL ordinary identifiers, names of buffer pools, databases, plans and storage groups must contain only uppercase alphabetic or national characters and numerics when CHARSET is KATAKANA; the first character must be alphabetic or national.

The following reason codes apply to SBCS identifiers:

- 000** An invalid character was found in the SBCS identifier (including the case in which a DBCS identifier was used where only an SBCS identifier is allowed). In some cases, the name of an SQL procedure may contain an underscore character. For more information, see the *DB2 SQL Reference*.

The following reason codes apply to DBCS identifiers or comments:

- 101** An odd number of bytes exists between the shift-out and the shift-in character.
- 102** Either a shift-in or shift-out character is missing.
- 103** DBCS blanks X'4040' are not allowed.
- 104** There are no characters between the shift-out and the shift-in characters.
- 105** Shift-out cannot be the first byte of the DBCS character between the shift-out and the shift-in characters.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Correct the name.

DSNH115I E *csectname* **LINE** *nnnn* **COL** *cc*
**ILLEGAL USE OF COMPARISON
 OPERATOR** *operator*

Explanation: The syntax is not correct for this type of comparison. A simple comparison such as '>' must not be followed by a list of items. The ANY and ALL comparisons must precede a subselect, rather than an expression or a list of items.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the syntax. If necessary, refer to Chapter 2 of *DB2 SQL Reference* for the correct syntax.

DSNH117I E *csectname* **LINE** *nnnn* **COL** *cc*
**STATEMENT INSERTS THE WRONG
 NUMBER OF VALUES**

Explanation: The number of entries in a value-list is not the same as the number of columns specified in an INSERT statement.

Severity: 8 (error)

System Action: Processing continues.

User Response: Correct the syntax. If necessary, refer to Chapter 5 of *DB2 SQL Reference* for the correct syntax.

DSNH120I E *csectname* **LINE** *nnnn* **COL** *cc*
FUNCTION USAGE NOT PERMITTED:
fname

Explanation: A WHERE clause or SET clause contains an aggregate function, possibly as a result of a reference to a column that is derived from an aggregate function in a view definition. An aggregate function is allowed in a WHERE clause only if that clause appears within a subquery of a HAVING clause.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the syntax. A subselect clause might be needed to produce the function result. If necessary, refer to Chapter 4 of *DB2 SQL Reference* for the correct syntax.

DSNH125I E *csectname* **LINE** *nnnn* **COL** *cc*
**INVALID ORDER BY COLUMN
 NUMBER:** *number*

Explanation: The identified column number is either less than 1 or greater than the number of items in the select-list.

Severity: 8 (error)

System Action: The cursor declaration is discarded.

User Response: Correct the column number. If necessary, refer to Chapter 4 of *DB2 SQL Reference* for the correct syntax.

DSNH126I E *csectname* **LINE** *nnnn* **COL** *cc* **ORDER
 BY CANNOT BE USED WITH A FOR
 UPDATE OF CLAUSE**

Explanation: The ORDER BY clause makes the cursor incapable of being updated.

Severity: 8 (error)

System Action: The cursor declaration is discarded.

User Response: This is a DB2 restriction. You can have either an ordered cursor or a cursor that can be updated. You cannot specify both attributes for the same cursor. You might need to change your application logic.

DSNH129I E *csectname* **LINE** *nnnn* **COL** *cc* **TOO
 MANY TABLES SPECIFIED IN SQL
 STATEMENT**

Explanation: In a subselect, (including all subqueries), there can be no more than 225 references to table names.

DSNH130I • DSNH171I

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Reduce the number of table references in each subselect. Each reference to a single table counts separately. The count only applies to table/view references in the FROM list. Each view is only counted one time. Refer to Chapter 4 of *DB2 SQL Reference* for the definition of a subselect.

DSNH130I E *csectname* LINE *nnnn* COL *cc* THE
ESCAPE CLAUSE 'x' CONSISTS OF
MORE THAN ONE CHARACTER

Explanation: The literal x used in the ESCAPE clause is too long. Only one SBCS or one DBCS character is allowed.

Severity: 8 (error)

System Action: The corresponding SQL statement is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the string. The literal string for the ESCAPE clause can only be one SBCS or DBCS character.

DSNH131I E *csectname* LINE *nnnn* STATEMENT
WITH LIKE PREDICATE HAS
INCOMPATIBLE DATA TYPES

Explanation: If the column name at the left of LIKE or NOT LIKE is a character type, the expression at the right must be a character type. If the column name is a graphic type, the expression at the right must be a graphic type.

Severity: 8 (error)

System Action: The statement is ignored.

User Response: Check the data type of every operand.

DSNH132I E *csectname* LINE *nnnn* COL *cc*
INVALID LIKE PREDICATE

Explanation: The value following LIKE must be an alphanumeric host variable or literal, graphic host variable or literal, or special character literal.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the syntax. If necessary,

refer to Chapter 2 of *DB2 SQL Reference* for the correct syntax.

DSNH142I E *csectname* LINE *nnnn* COL *cc* THE
SQL STATEMENT IS NOT SUPPORTED

Explanation: The *token* was found. An SQL statement was detected that is not supported by the database. The statement might be valid for other IBM relational database products or it might be valid in another context. For example, statements such as VALUES and SIGNAL SQLSTATE can appear only inside a trigger.

Severity: 8 (error)

System Action: The SQL statement is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Change the syntax of the SQL statement or remove the statement from the program.

DSNH170I E *csectname* LINE *nnnn* COL *cc*
NUMBER OF ARGUMENTS SPECIFIED
FOR *function-name* IS INVALID

Explanation: An SQL statement specified the scalar function *function-name* with either too many or too few arguments.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the function call. Refer to Chapter 3 of *DB2 SQL Reference* for information about the number of arguments required by the scalar function *function-name*.

DSNH171I E *csectname* LINE *nnnn* COL *cc* THE
DATA TYPE, LENGTH, OR VALUE OF
ARGUMENT *nn* OF *function-name* IS
INVALID

Explanation: Either the data type, the length or the value of argument *nn* of scalar function *function-name* is incorrect.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the argument. Refer to Chapter 3 of *DB2 SQL Reference* for rules for each argument of the scalar function *function-name*.

DSNH182I E *csectname* LINE *nnnn* COL *cc* AN
ARITHMETIC EXPRESSION WITH A
DATETIME VALUE IS INVALID

Explanation: The specified arithmetic expression contains an improperly used date/time value or labeled duration.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the indicated expression. Refer to Chapter 2 of *DB2 SQL Reference* for the rules for date/time arithmetic.

DSNH184I E *csectname* LINE *nnnn* COL *cc* AN
ARITHMETIC EXPRESSION WITH A
DATETIME VALUE CONTAINS A
PARAMETER MARKER

Explanation: The specified expression contains a parameter marker improperly used with a date/time value.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the indicated expression. Refer to Chapter 2 of *DB2 SQL Reference* for information about date/time arithmetic.

DSNH198I E *csectname* LINE *nnnn* COL *cc* EMPTY
SQL STATEMENT IGNORED

Explanation: The referenced SQL statement has no text between the EXEC SQL and the statement terminator.

Severity: 8 (error)

System Action: The statement is ignored.

User Response: Correct the statement, or remove it.

DSNH199I E *csectname* LINE *nnnn* COL *cc*
INVALID KEYWORD *keyword*; VALID
SYMBOLS ARE: *token list*

Explanation: A syntax error was detected at the keyword specified in the message. As an aid to the programmer, a partial list of valid tokens is provided in the message. Only those tokens that fit are listed. The error might be earlier in the statement, but the syntax of the statement appears to be valid up to this point.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Check the SQL statement in the area of the indicated keyword. A colon or SQL delimiters might be missing. Correct the SQL statement.

DSNH203I W *csectname* LINE *nnnn* COL *cc*
STATEMENT REFERENCES COLUMN
column name, WHICH IS DECLARED IN
MORE THAN ONE OF THE SPECIFIED
TABLES

Explanation: The column *column name* was referenced without sufficient qualification. Type checking cannot be done.

Severity: 4 (warning)

System Action: Processing continues.

User Response: If the table declares are correct and the column name is not unique, this creates an error in the BIND step. Correct the DECLARE TABLE statement, or use the correct table name to qualify the column name.

DSNH204I W *csectname* LINE *nnnn* COL *cc*
STATEMENT REFERENCES
UNDECLARED TABLE *table-name*

Explanation: The table definition was not provided. It is optional, but checking cannot be done without the table information. (BIND checks against the actual table during later processing.)

Severity: 4 (warning)

System Action: Processing continues.

DSNH205I W *csectname* LINE *nnnn* COL *cc*
COLUMN *column-name* WAS NOT
DECLARED IN TABLE *table-name*

Explanation: The column name *column-name* is not contained in the table declarations. The name specified in a DISTINCT function must reference a column of the table. The value expression of an ALL function must reference a column of the table.

Severity: 4 (warning)

System Action: Processing continues.

User Response: If the table declares are correct and the column name is not in the table, this creates an error in the BIND step. Correct the DECLARE TABLE statement or the column name.

DSNH206I **W** *csectname* **LINE** *nnnn* **COL** *cc*
STATEMENT REFERENCES COLUMN
column name **WHICH IS NOT**
DECLARED IN THE SPECIFIED
TABLE(S)

Explanation: The column *column name* is not contained in any TABLE declaration for the tables specified in the statement.

Severity: 4 (warning)

System Action: Processing continues.

User Response: If the table declares are correct and the column name is not in the tables, this creates an error in the BIND step. Correct the DECLARE TABLE statements or the column name.

System Programmer Response: Check the spelling of the column name. Ensure that all the tables needed were specified in the statement.

DSNH207I **E** *csectname* **LINE** *nnnn* **COL** *cc*
ILLEGAL ORDER BY SPECIFICATION

Explanation: If the select expression involves a UNION operator, the ORDER BY list must use numeric constants rather than variables.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the syntax. If necessary, refer to Chapter 4 of *DB2 SQL Reference* for the correct syntax.

DSNH251I **E** *csectname* **LINE** *nnnn* **COL** *cc* **TOKEN**
name **IS NOT VALID**

Explanation: The location name cannot contain alphabetic extenders for national languages (that is, #, @, and \$ in the United States).

Severity: 8 (error)

System Action: Processing continues.

User Response: Correct the content of the location name.

DSNH290I **E** *csectname* **LINE** *nnnn* **COL** *cc* **NO**
VALID 'END DECLARE SECTION'
FOUND

Explanation: The user's source program contains a BEGIN DECLARE SECTION, but no corresponding END DECLARE SECTION was found.

Severity: 8 (error)

System Action: Processing continues.

User Response: Check the application program and ensure that a valid END DECLARE SECTION statement is present.

DSNH291I **E** *csectname* **LINE** *nnnn* **COL** *cc* **NO**
VALID 'BEGIN DECLARE SECTION'
FOUND

Explanation: The user's source program contains an END DECLARE SECTION, but no corresponding BEGIN DECLARE SECTION was found.

Severity: 8 (error)

System Action: Processing continues.

User Response: Check the application program and ensure that a valid BEGIN DECLARE SECTION is present.

DSNH292I **E** *csectname* **LINE** *nnnn* **COL** *cc* **HOST**
NAME *name* **IS TOO LONG; MAXIMUM**
IS *size* **CHARACTERS**

Explanation: Fully qualified C host variable names cannot contain more than 256 characters.

Severity: 8 (error)

System Action: If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Reduce the length of names or the level of qualification of the host variable name in error.

DSNH303I **W** *csectname* **LINE** *nnnn* **COL** *cc*
STATEMENT SELECTS INCOMPATIBLE
DATA TYPE INTO *hostvar*

Explanation: The data type of host variable *hostvar* is not compatible with the apparent type of the corresponding select expression. One of them is numeric and the other is character, or one of them is character and the other is graphic. If the select expression is a column reference, the data type is obtained from its declaration.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Ensure that the table definitions are current and that the host variable has the proper data type.

System Programmer Response: Ensure that the table definitions are current, and that the host variable has the proper data type.

DSNH307I E *csectname* **HOST VARIABLE
ALREADY DECLARED**

Explanation: The host variable being registered with SQLGALHV has already been registered.

Severity: 8 (error)

System Action: The host variable is ignored.

User Response: Continue the compilation or precompilation process.

DSNH308I U *csectname* **MAXIMUM NUMBER OF
HOST VARIABLES EXCEEDED**

Explanation: The registration of host variables exceeded the internal symbol table storage capacity.

Severity: 16 (unrecoverable error)

System Action: Further processing halts.

User Response: Terminate compilation or precompilation.

DSNH310I W *csectname* **LINE nnnn COL cc
language HOST VARIABLE name WAS
DECLARED IN location**

Explanation: Host variable *name* should not be declared in this *location* of the source program. This message is issued only at reference time.

Severity: 4 (warning)

System Action: Processing continues.

User Response: If this host variable is used, the user assumes responsibility for possible exposure of incorrect output. Refer to Part 2 of *DB2 Application Programming and SQL Guide* to determine where host variables can be validly declared.

Declaring a COBOL host variable in the File Section might lead to incorrect output from SQL statements or abend 04E with RC=00E7000C.

DSNH312I E *csectname* **LINE nnnn COL cc
UNDEFINED OR UNUSABLE HOST
VARIABLE name**

Explanation: The *name* in the message is used in an SQL statement, but either no declaration was found in the application program so far, or the attributes are improper for this use. Declarations for host variables used in a DECLARE CURSOR statement must precede the SQL statement, regardless of the ONEPASS or TWOPASS option for the precompiler, or a parameter marker was expected in an EXECUTE IMMEDIATE statement. This message is issued only at reference time.

Severity: 8 (error)

System Action: If the containing SQL statement is a

declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Check the declaration and the attributes of the named host variable. If you intended the name to refer to a column, the colon (:) should not be present. If you intended a literal, you need to enclose the value in string delimiters (apostrophes or quotation marks).

If you intended to use a host variable, only a subset of the possible variable declarations are valid for use as a DB2 host variable. The rules for host variables are listed in the application programming guides. Use the cross-reference listing and precompiler source listing to determine the source of the problem.

- If you use the STDSQL(YES) option for the precompilation, make sure that all of the host variable declarations are declared within BEGIN/END DECLARE SECTIONS.
- If the cross-reference listing does not contain the host variable name, the declaration is missing. If the source for a declaration is present, a missing terminator from a comment or from a string might cause this type of error. The margins could also cause this type of error.
- If the name is present, but the data type is not listed, the host variable is not usable; it does not follow the rules outlined for valid host variable definitions.
- If several definitions exist for the name, the first reference might occur before the definition. The use of the TWOPASS option helps by processing DECLARE statements before the other types of statements. However, host variable declarations and cursor declarations are processed in the same pass. The host variables referenced in cursor declarations must be defined before the cursor is defined in the application program.
- A parameter marker is expected rather than a host variable in an EXECUTE IMMEDIATE statement.
- The data type of a host variable passed in a CALL statement is not character or varying character.
- The length attribute of a character or varying character host variable passed in a CALL statement exceeds 255 characters.

DSNH313I E *csectname* **LINE nnnn COL cc
INVALID TYPE OR LENGTH OF HOST
VARIABLE 'name'**

Explanation: The host variable *name* is used in an SQL statement, but either the type or the length is improper for this use.

Severity: 8 (error)

System Action: The corresponding SQL statement is replaced by host language statements that will, if executed, set an error code in the SQLCA.

DSNH314I • DSNH350I

User Response: Check the declaration and the attributes of the named host variable. Refer to Part 2 of *DB2 Application Programming and SQL Guide* for the allowable host variable type and length.

DSNH314I E *csectname* LINE *nnnn* COL *cc*
REFERENCE TO HOST VARIABLE
name IS AMBIGUOUS

Explanation: The host variable *name* was defined more than once in this application program. The precompiler cannot distinguish which host variable definition should be used here. The following table indicates some possible combinations. DB2 supports only a single adjacent qualifier for a host variable name.

Case	Ref	Definition	Result	Suggested Change
1	a	x.a	Valid	None
2	x.a	x.a, y.a	Valid	None
3	a	x.a, y.a	DSNH314I	Reference x.a or y.a
4	a	x.a, a	Valid	None
5	x.a	q.x.a, v.x.a	DSNH314I	Variable name changes
6	a	a, a	DSNH314I	Variable name changes

Severity: 8 (error)

System Action: If the SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Make the host variable name unique or use qualification to indicate which host variable definition is to be used, as suggested in the above table.

DSNH330I E *csectname* LINE *nnnn* COL *cc* TEXT
COULD NOT BE CONVERTED TO
CCSID 1208, REASON *reason-code*,
CHARACTER *code-point*

Explanation: DB2 parses SQL statements in Unicode UTF-8, which is also known as CCSID 1208. DB2 will convert the application program internally (not externally) to UTF-8 for processing if an application program uses a different CCSID (for example, an EBCDIC CCSID).

Text from the application program could not be converted from the source CCSID to CCSID 1208. The reason code indicates the context of this error:

012 Invalid code point. An invalid character was sent to be converted as indicated by the code-point

016 Other invalid input character. For example, this could be a mismatch between shift-in and shift-out, or the absence of half of a DBCS character. The code-point is blank.

Severity: 8 (error)

System Action: The statement is discarded.

Programmer Response: If the reason code is 012, change the text in the application program to a valid code point. If the reason code is 016, change the text in the application program to conform to the rules for well-formed mixed data.

DSNH332I S *csectname* CHARACTER
CONVERSION FROM CCSID *from-ccsid*
TO CCSID 1208 IS NOT SUPPORTED,
REASON *reason-code*

Explanation: DB2 parses SQL statements in Unicode UTF-8, which is also known as CCSID 1208. DB2 will convert the application program internally (not externally) to UTF-8 for processing if an application program uses a different CCSID (for example, an EBCDIC CCSID). The source CCSID can be specified by the CCSID option.

This message indicates that conversion could not take place from the source CCSID to CCSID 1208. The reason code indicates the context of this error:

000 The value of the CCSID option is neither 65535, nor in the range 1 through 65533.

001 No conversion is defined from the source CCSID to CCSID 1208.

002 No conversion is defined from CCSID 1208 to the source CCSID.

Severity: 12 (severe error)

System Action: The precompiler is terminated.

User Response: Check that the value of the CCSID option is valid. Run the precompilation again with a valid CCSID if you do not want to use the EBCDIC system CCSID.

System Programmer Response: Make sure that the Unicode System Services conversion image includes the required conversions. See the V2R8.0-V2R10.0 *z/OS Support for Unicode: Using Conversion Services*.

DSNH350I E *csectname* LINE *nnnn* COL *cc*.
INVALID SPECIFICATION OF A LARGE
OBJECT COLUMN

Explanation: The ALTER TABLE, CREATE TABLE, or CREATE INDEX statement is invalid for one of the following reasons:

- A LOB column cannot be added to a temporary table.
- A LOB column cannot be added to a table defined with an EDITPROC.

- The *PRIMARY KEY* clause cannot specify a LOB column as a column of the primary key.
- The *UNIQUE* clause cannot specify a LOB column as a column of the unique key.
- The *referential-constraint* clause cannot specify a LOB column as a column of a foreign key.
- The CREATE INDEX statement cannot name a LOB column as a column of the index key.
- A LOB column cannot be specified in a *references* clause.
- A *table check constraint* cannot be specified in the definition of a LOB column.

Severity: 8 (error)

System Action: The statement cannot be executed.

User Response: Correct and reissue the failing statement.

DSNH372I E *csectname* LINE *nnnn* COL *cc*. **ONLY ONE COLUMN DEFINED AS ROWID IS ALLOWED IN A TABLE**

Explanation: An attempt was made to create a table with more than one ROWID column or to add a ROWID column to a table which already has one.

Severity: 8 (error)

System Action: The statement cannot be executed.

User Response: For a CREATE TABLE statement, select only one column to have the row ID data type. For an ALTER TABLE statement, a ROWID column already exists for the table. Do not attempt to add another column with data type row ID to the table.

DSNH385I W *csectname* LINE *nnnn* COL *cc* **ASSIGNMENT TO AN SQLSTATE OR SQLCODE VARIABLE IN AN SQL PROCEDURE MAY BE OVER-WRITTEN AND DOES NOT ACTIVATE ANY HANDLER**

Explanation: The SQL procedure includes at least one statement that assigns a value to the SQLSTATE or SQLCODE special variables. Since DB2 assigns values to those variables to indicate the results of SQL statement execution, DB2 overwrites the values assigned by the SQL assignment statement.

An SQL procedure cannot activate a handler by assigning a value to SQLSTATE.

Severity: 4 (warning)

System Action: Processing continues.

User Response: To prevent this warning, do not assign values to the SQLCODE or SQLSTATE special variables.

DSNH401I W *csectname* LINE *nnnn* COL *cc* **STATEMENT SPECIFIES INCOMPATIBLE OPERANDS FOR COMPARISON OPERATOR** *name*

Explanation: The comparison operation *name* is used with a mixture of incompatible data type operands.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Make both operands compatible character data types. Ensure that the table declaration is correct.

DSNH402I W *csectname* LINE *nnnn* COL *cc* **STATEMENT APPLIES** *name* **TO CHARACTER DATA**

Explanation: The numeric operation or function *name* is used with a non-numeric operand.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Make the operand numeric or use a character function. Ensure that the table declaration is correct.

DSNH404I W *csectname* LINE *nnnn* COL *cc* **STATEMENT INSERTS OR UPDATES COLUMN** *name* **WITH VALUE THAT IS TOO LONG**

Explanation: An INSERT or UPDATE statement specifies a value that is longer than the maximum length string that can be stored in that column, according to the DECLARE TABLE statement.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Ensure that the length is allowed and that the table declaration is correct.

DSNH405I E *csectname* LINE *nnnn* COL *cc* **LITERAL** *number* **IS OUT OF RANGE**

Explanation: The number is not in the proper range:

- +5.4E-79 to 7.2E+75 for floating-point
- $-(10^{31} - 1)$ to $+(10^{31} - 1)$ for packed decimal
- -2147483648 to 2147483647 for integers

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the number.

DSNH408I W *csectname* LINE *nnnn* COL *cc*
**STATEMENT INSERTS OR UPDATES
 COLUMN *name* WITH INCOMPATIBLE
 DATA TYPE**

Explanation: The data type of the value to be inserted into column *name* by an INSERT or UPDATE statement is incompatible with the declared data type of the column. Both must be numeric or both must be character.

Severity: 4 (warning)

System Action: Processing continues.

Programmer Response: Be sure that the table definitions are current, and that host variables and literals have the proper data types and are matched.

DSNH414I E *csectname* LINE *nnnn* COL *cc* **THE
 NUMERIC OR DATETIME COLUMN
column-name IS SPECIFIED IN A LIKE
 PREDICATE**

Explanation: Column *column-name* with a numeric data type was specified in a LIKE predicate. Columns specified in a LIKE predicate must be character or graphic string columns.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the statement.

DSNH434I OPTION *keyword* IS A DEPRECATED
 FEATURE

Explanation: *keyword* is a deprecated feature that will not be supported in releases following DB2 Version 8. It is accepted, but we recommend that you discontinue the use of this keyword.

For indexes, we recommend that you use type 2 indexes rather than type 1 indexes.

Severity: 4 (warning)

System Action: Processing continues normally.

User Response: No change is required for the current release. However, we recommend that you change your SQL statement to remove this feature to prepare for future releases when this feature is not supported.

DSNH449I W *csectname* LINE *nnnn* COL *cc*
**CREATE FUNCTION OR PROCEDURE
 FOR *routine-name* CONTAINS AN
 INVALID FORMAT OF THE EXTERNAL
 NAME CLAUSE OR IS MISSING THE
 EXTERNAL NAME CLAUSE**

Explanation: An error was found in the EXTERNAL NAME clause of the CREATE FUNCTION or CREATE PROCEDURE statement for *name*, or the clause is needed but was not specified.

If LANGUAGE is not COMPJAVA, the external name must follow these conventions:

- The external name must be a short identifier with letters or digits. The first character must be a letter. (This is the MVS naming convention for load modules). A possible cause for this error is the inclusion of a blank in the name.
- If the external name is omitted, the external name defaults to *function-name*. However, if the function or procedure name is longer than eight characters then the EXTERNAL NAME clause must be explicitly specified to specify a valid *short identifier* as the external name.

If LANGUAGE is COMPJAVA, the length of the EXTERNAL NAME parameter value must be less than or equal to 254 bytes.

Severity: 8 (error)

System Action: The corresponding SQL statement is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the syntax of the SQL statement. Refer to the *DB2 SQL Reference* for information on the EXTERNAL NAME clause.

DSNH457I E *csectname* LINE *nnnn* COL *cc*. A
**FUNCTION OR DISTINCT TYPE
 CANNOT BE CALLED *name* SINCE IT
 IS RESERVED FOR SYSTEM USE.**

Explanation: The user-defined function or distinct type cannot be created or referenced because the name selected is reserved for use by the system.

A number of names used as keywords are reserved for system use. These names may not be used as user-defined functions or distinct-type-names, **even if they are delimited identifiers**. These names are:

=	<	>	>=	<=
<>	!=	->		
ALL	AND	ANY	BETWEEN	DISTINCT
EXCEPT	EXISTS	FALSE	FOR	FROM
IN	IS	LIKE	MATCH	NOT
NULL	ONLY	OR	OVERLAPS	SIMILAR
SOME	TABLE	TRUE	TYPE	UNIQUE
UNKNOWN				

Severity: 8 (error)

System Action: The statement cannot be executed.

User Response: Select a name for the function or distinct type that is not reserved for system use.

DSNH473I E *csectname* LINE *nnnn* COL *cc*. A
**USER DEFINED DATA TYPE CANNOT
 BE CALLED THE SAME NAME AS A
 SYSTEM PREDEFINED TYPE (BUILT-IN
 TYPE).**

Explanation: The name of a data type to be created has an unqualified name that is the same as a system-predefined data type or is BOOLEAN. This is not allowed. Adding delimiters does not make the name valid. The following names are restricted:

BIGINT	BINARY	BLOB	BOOLEAN	CHAR
CHARACTER	CLOB	DATALINK	DATE	DBCLOB
DEC	DECIMAL	DOUBLE	FLOAT	GRAPHIC
INT	INTEGER	NUMERIC	REAL	REF
ROWID	SMALLINT	TIME	TIMESTAMP	VARCHAR
VARGRAPHIC				

Severity: 8 (error)

System Action: The statement cannot be executed.

User Response: Correct the statement to use another identifier for the name of the new user-defined type.

DSNH487I E *csectname* LINE *nnnn* COL *cc*
object-type object-name **ATTEMPTED TO
 EXECUTE AN SQL STATEMENT WHEN
 THE DEFINITION OF THE FUNCTION
 OR PROCEDURE DID NOT SPECIFY
 THIS ACTION**

Explanation: SQL procedure *object-name* contains SQL statements, but the SQL procedure definition specifies the NO SQL option.

System Action: The SQL statement cannot be executed.

Programmer Response: Change the definition of the SQL procedure to allow SQL statements, or remove the failing SQL statement from the SQL procedure.

DSNH490I E *csectname* LINE: MV.NNNN COL *cc*
**NUMBER *number* DIRECTLY SPECIFIED
 IN A SQL STATEMENT IS OUTSIDE
 THE RANGE OF ALLOWABLE VALUES
 IN THIS CONTEXT (*minval*, *maxval*)**

Explanation: A number (*number*) was specified that is not valid in the context in which it was specified. The minimum allowed value in this context is *minval*. The maximum allowed value in this context is *maxval*. *n* must be within the range specified by *minval* and *maxval* ($minval \leq n \leq maxval$).

Severity: 8 (error)

System Action: The statement was not executed.

User Response: Change the value *n* to a valid value in the statement.

DSNH491I E *csectname* LINE *nnnn* COL *cc*.
**CREATE STATEMENT FOR
 USER-DEFINED FUNCTION
function-name MUST HAVE A RETURNS
 CLAUSE, AND EITHER THE EXTERNAL
 CLAUSE (WITH OTHER REQUIRED
 KEYWORDS) OR THE SOURCE
 CLAUSE.**

Explanation: A required clause is missing in the CREATE for function *function-name*. If EXTERNAL was specified, the following must also be specified:

- LANGUAGE
- PARAMETER STYLE

Severity: 8 (error)

System Action: The statement cannot be executed.

User Response: Correct and reissue the failing statement.

DSNH504I E *csectname* LINE *nnnn* COL *cc*
CURSOR *name* WAS NOT DECLARED

Explanation: Identifier *name* is used as a cursor, but was not declared. The declaration might have been discarded because of errors.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct or add the required cursor declaration.

DSNH506I E *csectname* LINE *nnnn* COL *cc*
**DECLARE CURSOR FOR STATEMENT
 NAME MUST PRECEDE THE PREPARE
 STATEMENT FOR THAT STATEMENT
 NAME**

Explanation: This DECLARE *name* CURSOR statement is preceded by a PREPARE *name* statement. In DB2, declarations must precede action statements. This is not the same as in SQL/DS.

Severity: 8 (error)

System Action: The declaration is noted as being in error and discarded.

User Response: Move the DECLARE or PREPARE statement so that they are in the proper order, or specify the TWOPASS option if the host language is PLI, ASM, or C. The TWOPASS option has the precompiler check for declarations on the first pass and avoids this problem.

DSNH520I E *csectname* **THE OPEN STATEMENT FOR CURSOR cursor-name IS INVALID BECAUSE THE CURSOR WAS DEFINED BY AN ALLOCATE CURSOR STATEMENT**

Explanation: The cursor was not successfully declared, so it was assumed to be defined by an ALLOCATE CURSOR statement. A cursor defined by an ALLOCATE CURSOR statement is open after successful completion of the statement. Attempting to OPEN an allocated cursor is an error.

Severity: 8 (error)

System Action: The statement cannot be executed.

User Response: Add or fix the declaration of the cursor. If the cursor is supposed to be defined by an ALLOCATE CURSOR statement then remove the OPEN statement.

DSNH521I W *csectname* **THE statement FOR CURSOR cursor-name IS ASSUMED TO APPLY TO A DYNAMIC ALLOCATE CURSOR STATEMENT.**

Explanation: A FETCH, CLOSE, or DESCRIBE for an undeclared cursor was issued. The cursor is assumed to be defined using a dynamic ALLOCATE CURSOR statement.

Severity: 4 (warning).

System Action: The cursor is assumed to be allocated dynamically.

User Response: Ensure that the cursor in the FETCH, CLOSE, or DESCRIBE statement is dynamically allocated.

DSNH522I E *csectname* **DESCRIBE CURSOR cursor-name IS INVALID BECAUSE THE CURSOR WAS DEFINED BY A DECLARE CURSOR STATEMENT.**

Explanation: DESCRIBE CURSOR is allowed for cursors defined using the ALLOCATE CURSOR statement.

Severity: 8 (error).

System Action: The statement cannot be executed.

User Response: Remove the DESCRIBE CURSOR statement. Issue a DESCRIBE of the statement used to define the declared cursor.

DSNH527I **ERROR: THE PRECOMPILER ATTEMPTED TO USE THE DB2-SUPPLIED DSNHDECP MODULE.**

Explanation: The DSNHDECP module that is supplied by DB2 is being used to run the DB2 precompiler. The precompiler requires site-dependent settings that are

specified in the DSNHDECP module that was created when DB2 was installed. The installation-generated DSNHDECP module typically resides in the SDSNEXIT library.

System Action: Processing halts.

User Response: Check the STEPLIB, JOBLIB, or system linklist concatenation used in the DB2 address spaces. To ensure that the proper DSNHDECP module is used, verify that the library that contains the DSNHDECP module that is generated during installation precedes the SDSNLOAD library that contains the DSNHDECP module that was supplied by DB2.

System Programmer Response: The following actions are required to enable the DSNH CLIST to load your user-supplied DSNHDECP module rather than the DB2 DSNHDECP module that was supplied by DB2:

1. The JOBLIB or STEPLIB concatenation of any job or TSO userid that calls DSNH needs to allocate the library where the user-supplied DSNHDECP module resides (usually prefix.SDSNEXIT) ahead of the library where the DB2-supplied DSNHDECP module resides (prefix.SDSNLOAD).
2. The DSNH call should include the PLOAD parameter, and it should be coded as shown here: PLOAD('*(DSNHPC)').

DSNH557I E *csectname* **LINE nnnn COL cc INCONSISTENT GRANT/REVOKE KEYWORD keyword; PERMITTED KEYWORDS ARE keyword list**

Explanation: The identified *keyword* is not permitted. The *keyword list* is a list of the keywords that are permitted in this context. The combination of privileges requested on a GRANT or REVOKE statement is not allowed. The authorities must all be of one type and consistent with the form of GRANT or REVOKE. REVOKE UPDATE(column list) is not allowed; only REVOKE UPDATE is permitted.

Severity: 8 (error)

System Action: The containing SQL statement is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the syntax. If necessary, refer to Chapter 5 of *DB2 SQL Reference* for the correct syntax.

DSNH558I E *csectname* **LINE nnnn COL ccc INVALID CLAUSE OR COMBINATION OF CLAUSES ON A GRANT OR REVOKE**

Explanation: "PUBLIC AT ALL LOCATIONS" is invalid for non-table privilege GRANT or REVOKE statements. It is also invalid for table privilege GRANT or REVOKE statements that specify the ALTER or INDEX privilege.

Severity: 8 (error)

System Action: The statement cannot be executed.

User Response: Refer to Chapter 5 of *DB2 SQL Reference* for valid keywords for the GRANT or REVOKE statement.

DSNH577I E *csectname* LINE *nnnn* COL *cc* *object-type object-name* **ATTEMPTED TO MODIFY DATA WHEN THE DEFINITION OF THE FUNCTION OR PROCEDURE DID NOT SPECIFY THIS ACTION**

Explanation: An SQL procedure contains SQL statements that modify data, but the SQL procedure is defined with the NO SQL, READS SQL DATA, or CONTAINS SQL option.

Severity: 8 (error)

System Action: The SQL statement cannot be executed.

User Response: Change the definition of the SQL procedure to allow SQL statements that modify data, or remove the failing SQL statement from the SQL procedure.

DSNH580I E *csectname* LINE *nnnn* COL *cc* **THE RESULT-EXPRESSIONS OF A CASE EXPRESSION CANNOT ALL BE NULL**

Explanation: There is a CASE expression in the statement that has all the *result-expressions* (expressions following the THEN and ELSE keywords) coded with the keyword NULL.

Severity: 8 (error)

System Action: The statement was not processed.

Programmer Response: Change the CASE expression to include at least one *result-expression* with a keyword other than NULL.

DSNH581I E *csectname* LINE *nnnn* COL *cc* **THE DATA TYPES OF THE RESULT-EXPRESSIONS OF A CASE EXPRESSION ARE NOT COMPATIBLE**

Explanation: A CASE expression in the statement has at least one *result-expression* (expressions following the THEN and ELSE keywords) whose data type does not match that of one of the other result-expressions.

Severity: 8 (error)

System Action: The statement was not processed.

Programmer Response: Change the CASE expression so that the data types of all of the *result-expressions* are compatible.

DSNH582I E *csectname* LINE *nnnn* COL *cc* **THE SEARCH-CONDITION IN A SEARCHED-WHEN-CLAUSE CANNOT BE A QUANTIFIED PREDICATE, IN PREDICATE, OR AN EXISTS PREDICATE**

Explanation: The *search-condition* in a *searched-when-clause* specifies a quantified predicate, an IN predicate or an EXISTS predicate, but is not allowed.

Severity: 8 (error)

System Action: The statement was not processed.

Programmer Response: Correct the *search-condition*.

DSNH585I W *csectname* LINE *nnnn* COL *cc* **DUPLICATE *schema name* SCHEMA NAME**

Explanation: The identified schema name was specified twice in the statement.

Severity: 4 (error)

System Action: The duplicated schema name is ignore.

User Response: Remove/correct the duplicate specification.

DSNH586I E *csectname* LINE *nnnn* COL *cc*. **THE TOTAL LENGTH OF THE CURRENT PATH SPECIAL REGISTER CANNOT EXCEED 254 CHARACTERS.**

Explanation: The CURRENT PATH special register is defined as a VARCHAR(254). The content of the string includes each schema name delimited with double quotes and separated from the next schema name by a comma. The total length of the string of all schema names in the CURRENT PATH cannot exceed 254 characters. A SET CURRENT PATH statement causing this message would exceed this limit.

Severity: 8 (error)

System Action: The statement cannot be executed.

User Response: Remove schema names to reduce the total length to fit the 254 character maximum length. If all the schema names are required, it may be necessary to consolidate some user-defined functions so that fewer schema names are required for the CURRENT PATH.

DSNH587I **A list of item-references are not in the same family.**

Explanation: Each item-reference in the SET assignment statement is either a host-variable or a transition-variable. The list of item-references must be of the same family, meaning if one of the item-references

DSNH590I • DSNH628I

is a transition-variable, then all of the item-references in the list must be a transition-variable. If the statement is used in the triggered action of a CREATE TRIGGER statement, each item-reference must identify a transition variable. If the statement is used in any other context, each item-reference must identify a host variable.

Severity: 8 (error)

System Action: The corresponding SQL statement is replaced by host language statements that will, if executed, set an error code in the SQLCA.

Programmer Response: Correct the statement and execute it again.

User Response: Correct the syntax of the SQL statement and precompile the program again. Refer to the DB2 SQL Reference to information on the SET assignment statement.

DSNH590I E *csectname* LINE *nnnn* COL *cc* NAME *name* IS NOT UNIQUE IN ROUTINE *routine-name*

Explanation: Name *name* is a parameter, SQL variable, condition name, or label in SQL procedure *routine-name*. *name* is not unique.

System Action: The statement cannot be processed.

Severity: 8 (error)

User Response: Change the name to make it unique within the routine.

DSNH599I W *csectname* LINE *nnnn* COL *cc*.
COMPARISON FUNCTIONS ARE NOT
CREATED FOR A DISTINCT TYPE
BASED ON A LONG STRING DATA
TYPE.

Explanation: Comparison functions are not created for a distinct type based on a long string data type (BLOB, CLOB, DBCLOB, LONG VARCHAR, LONG VARGRAPHIC) since the corresponding function are not available for these built-in data types.

Severity: 4 (warning)

System Action: Processing continues.

User Response: No action is required.

DSNH612I E *csectname* LINE *nnnn* COL *cc*
column-name IS A DUPLICATE
COLUMN NAME

Explanation: The CREATE INDEX, CREATE TABLE, CREATE VIEW or ALTER TABLE statement specifies the same 'column-name' for two (or more) columns of the index, table, view, or the UPDATE OF clause of a trigger definition specifies the same column name more than once. Column names must be unique within an index, a table, a view, or in the UPDATE OF clause of a

trigger definition. A column cannot be specified in more than one ALTER TABLE clause except if it is specified in an ALTER COLUMN clause and ADD CHECK CONSTRAINT clause.

Severity: 8 (error)

System Action: The statement cannot be executed.

User Response: Correct the CREATE statement to specify unique names for each of the columns of the index, table, view, or the columns in the UPDATE OF clause of a trigger definition. Correct the ALTER statement to specify unique names for each of the ALTER COLUMN clauses.

This error can also occur on CREATE TABLE when a column list of a PRIMARY KEY, FOREIGN KEY, or UNIQUE clause contains two or more occurrences of the same column name.

DSNH628I E *csectname* LINE *nnnn* COL *cc*
MUTUALLY EXCLUSIVE CLAUSES
HAVE BEEN SPECIFIED.

Explanation: Mutually exclusive clauses were specified in one or more of the following ways:

- A CREATE TABLESPACE statement contains both the SEGSIZE and Numparts clauses
- A CREATE TABLESPACE statement contains both the SEGSIZE and LARGE clauses.
- A CREATE TABLESPACE statement contains both the SEGSIZE and MEMBER CLUSTER clauses.
- A CREATE or ALTER TABLESPACE contains both the LOCKPART YES and LOCKSIZE TABLESPACE
- A 'column-definition' contains both NOT NULL and DEFAULT NULL clauses.
- A 'column-definition' contains both FIELDPROC and DEFAULT clauses.
- A select-statement contains both the update-clause and the FOR FETCH ONLY clause.
- An ALTER TABLE statement contains both a DROP CONSTRAINT clause and either a DROP FOREIGN KEY clause or a DROP CHECK clause.
- A CREATE or ALTER TABLESPACE contains both the LOCKPART YES and LOCKSIZE TABLESPACE
- A CREATE TRIGGER statement specifies more than one correlation name for OLD, NEW, OLD_TABLE, or NEW_TABLE. Each of these correlation specific can appear no more than once in the CREATE TRIGGER statement.
- A CREATE FUNCTION statement contains both a CAST FROM clause and a SOURCE clause.
- A CREATE FUNCTION statement contains both a SOURCE clause and a RETURNS TABLE clause.
- A CREATE FUNCTION statement contains both a SOURCE clause and a clause used to define an external function (EXTERNAL, LANGUAGE, NO SQL).

- A CREATE or ALTER PROCEDURE statement attempts to use the NO WLM ENVIRONMENT and PROGRAM TYPE SUB options. When NO WLM ENVIRONMENT is used, then PROGRAM TYPE MAIN must also be used.
- A CREATE or ALTER PROCEDURE statement attempts to use both NO WLM ENVIRONMENT and either USER or DEFINER for EXTERNAL SECURITY. When NO WLM ENVIRONMENT is used, then PARAMETER STYLE must be either GENERAL or SIMPLE CALL WITH NULLS.
- A CREATE or ALTER PROCEDURE statement contains both a LANGUAGE REXX clause, and a PARAMETER STYLE DB2SQL or PARAMETER STYLE JAVA clause.
- An ALTER TABLE statement contains both an ALTER COLUMN clause and a VALIDPROC clause.
- An ALTER TABLE statement contains both an ALTER COLUMN clause and a clause other than the check constraint clause.

Severity: 8 (error)

System Action: The statement was not executed.

Programmer Response: Change the options specified in the statement and reissue the statement.

DSNH630E E *csectname* **LINE *nnnn* COL *cc* THE WHERE NOT NULL SPECIFICATION IS INVALID FOR TYPE 1 INDEXES**

Explanation: Type 1 indexes cannot be created with the WHERE NOT NULL specification.

Severity: 8 (error)

System Action: The statement cannot be executed.

Programmer Response: Either the index must be created as a type 2 index, or the WHERE NOT NULL specification must not be used.

DSNH637I E *csectname* **LINE *nnnn* COL *cc* DUPLICATE *keyword* KEYWORD**

Explanation: The identified keyword was specified twice in the statement.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Remove the duplicate specification.

DSNH644I E *csectname* **INVALID VALUE SPECIFIED FOR KEYWORD *keyword* IN *stmt-type* STATEMENT**

Explanation: The value specified for the *keyword* parameter in the *stmt-type* SQL statement is not a permitted value.

Severity: 8 (error)

System Action: If the SQL statement containing the problem is a declaration, it is discarded. If the SQL statement containing the problem is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the statement. Refer to Chapter 5 of *DB2 SQL Reference* for information about the allowable values for the *keyword* in the *stmt-type* statement.

DSNH683I E *csectname* **LINE *nnnn* COL *cc*. THE SPECIFICATION FOR COLUMN, DISTINCT TYPE, FUNCTION, OR PROCEDURE *data-item* CONTAINS INCOMPATIBLE CLAUSES**

Explanation: There is an error in the data item specification in a statement. Incompatible specifications are present such as "INTEGER and FOR BIT DATA", or "INTEGER AS LOCATOR". The location of the error is given by *data-item* as follows:

- For a CREATE or ALTER TABLE statement, *data-item* gives the name of the column containing the error. The error could be an invalid specification of FOR BIT DATA, FOR SBCS DATA, FOR MIXED DATA, or FIELDPROC for column *data-item*.
- For a CREATE FUNCTION or CREATE PROCEDURE statement, *data-item* is a token that identifies the area of the problem in the statement. For example, "PARAMETER 3", "RETURNS", or "CAST FROM".
- For a CREATE DISTINCT TYPE statement, *data-item* gives the name of the type being defined
- Otherwise, *data-item* is a token that identifies the area of the problem in a parameter list for a function. For example, "PARAMETER 5".

Severity: 8 (error)

System Action: The statement cannot be processed.

User Response: Correct and reissue the failing statement.

DSNH684I E *csectname* **LINE *nnnn* COL *cc* LENGTH OF LITERAL LIST BEGINNING *string* IS TOO LONG**

Explanation: The length of the literal list beginning with *string*, excluding insignificant blanks and delimiting parenthesis, is greater than 255.

DSNH700I • DSNH708I

Severity: 8 (error)

System Action: The SQL statement cannot be executed.

System Programmer Response: Correct the SQL statement. Refer to Chapter 2 of *DB2 SQL Reference* for information about writing literal lists.

DSNH700I I *csectname* THE FIPS STANDARD IS USED FOR FLAGGING

Explanation: This message identifies the standard used for flagging during execution.

Severity: 0 (informational)

System Action: Processing continues.

DSNH701I I *csectname* THE IBM SQL STANDARD IS USED FOR FLAGGING

Explanation: This message identifies the standard used for flagging during execution.

Severity: 0 (informational)

System Action: Processing continues.

DSNH702I W *csectname* LINE *nnnn* COL *cc* THE STATEMENT DEVIATES FROM THE SQL STANDARD AT THE TOKEN COMMENCING WITH THE TEXT *text*

Explanation: A syntax deviation from the standard named in the earlier message (FIPS or IBM SQL) was found in the SQL statement.

Severity: 4

User Response: Check and correct the SQL statement.

DSNH703I W *csectname* LINE *nnnn* COL *cc*. A DATA DEFINITION STATEMENT IS NOT WITHIN A CREATE SCHEMA STATEMENT

Explanation: The FIPS standard requires all data definition statements to be contained within a CREATE SCHEMA statement.

Severity: 4

User Response: Check and correct the SQL statement.

DSNH704I W *csectname* LINE *nnnn* COL *cc*. THERE IS A NONSTANDARD EMBEDDED COMMENT

Explanation: A comment embedded within an SQL statement does not meet the requirements of the standard being flagged: The FIPS standard is being

checked and the comment does not begin with at least two consecutive hyphens.

Severity: 4

User Response: Check and correct the SQL statement.

DSNH705I W *csectname* LINE *nnnn* COL *cc*. AN SQL SYNTAX DEVIATION OCCURRED. THE STATEMENT IS NOT COMPLETE

Explanation: The SQL statement terminated before all required elements were found.

Severity: 4

User Response: Check and correct the SQL statement.

DSNH706I W *csectname* LINE *nnnn* COL *cc*. THE IDENTIFIER *token* IS GREATER THAN 18 CHARACTERS

Explanation: Authorization identifier, table identifier, column name, correlation name, module name, cursor name, procedure name, or parameter name has a length of more than 18 characters.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH707I W *csectname* LINE *nnnn* COL *cc*. THE COLUMN *column* HAS AN INVALID LENGTH, PRECISION, OR SCALE ATTRIBUTE

Explanation: One of the following conditions was not met:

- The length value should be greater than zero.
- The precision value should be greater than zero.
- The scale value should not be greater than precision.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH708I W *csectname* LINE *nnnn* COL *cc*. THE DATA TYPE OF *token* SHOULD BE EXACT NUMERIC WITH A SCALE OF ZERO

Explanation: The data type of INDICATOR PARAMETER or INDICATOR VARIABLE should be exact numeric with a scale of zero.

Severity: 4

User Response: Note the deviation from the

applicable standard. Check and correct the SQL statement.

DSNH709I W *csectname* LINE *nnnn* COL *cc*. THE SET FUNCTION REFERENCES COLUMN *column*

Explanation: One of the following conditions was not met:

- A column specification of a DISTINCT set function cannot reference a column derived from a set function specification.
- A column specification of an ALL set function cannot reference a column derived from a set function specification.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH710I W *csectname* LINE *nnnn* COL *cc*. A VALUE EXPRESSION CONTAINING *column* CANNOT INCLUDE OPERATORS

Explanation: A value expression cannot include operators in an outer reference column specification.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH711I W *csectname* LINE *nnnn* COL *cc*. THE COLUMN SPECIFICATION IS MISSING OR INVALID FOR THE ALL SET FUNCTION *function*

Explanation: The value expression of an ALL set function specification should include a column specification.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH712I W *csectname* LINE *nnnn* COL *cc* THE COLUMN *column* IS NOT UNIQUE AND REQUIRES QUALIFICATION.

Explanation: The identified column is duplicated within the current scope. Qualification must be given to uniquely identify the required column.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH713I W *csectname* LINE *nnnn* COL *cc*. A VALUE EXPRESSION MAY NOT CONTAIN A SET FUNCTION SPECIFICATION

Explanation: The value expression of an ALL set function might not contain a set function specification.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH714I W *csectname* LINE *nnnn* COL *cc*. THE COLUMN *column* DOES NOT IDENTIFY A COLUMN OF A TABLE WITHIN THE CURRENT SCOPE

Explanation: One of the following conditions was found:

- The table or correlation name used as a qualifier does not exist.
- The column name does not exist within the current scope or the scope of the qualifier.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH715I W *csectname* LINE *nnnn* COL *cc*. A SET FUNCTION THAT CONTAINS THE OUTER REFERENCED COLUMN *column* IS NOT IN THE SUBQUERY OF A HAVING CLAUSE

Explanation: A set function specification must be contained in a subquery of a HAVING clause if it contains an outer referenced column specification.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH716I W *csectname* LINE *nnnn* COL *cc* THE RESULT OF A SUM OR AVG FUNCTION CANNOT BE A CHARACTER STRING

Explanation: The character string is not valid for the result of a SUM or AVG set function specification.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH717I W *csectname* LINE *nnnn* COL *cc*. THE OPERATOR *operator* IS INVALID IN THIS CONTEXT

Explanation: One of the following conditions was not met:

- A value expression containing a distinct set function cannot include dyadic operators.
- The first character following a monadic operator cannot be a plus or minus sign.
- The value expression should not contain operators if primary is a character string.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH718I W *csectname* LINE *nnnn* COL *cc*. THE *exptype* EXPRESSION IS COMPARING INCOMPATIBLE DATA TYPES

Explanation: The data types of one of the following (identified by *exptype*) do not match:

exptype	Meaning
----------------	----------------

COMPARISON

Comparison operators must match.

BETWEEN

The three value expressions must match.

IN

Value expression, subquery, and all value specifications must match.

QUANTIFIED

Value expression and subquery must match.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH719I W *csectname* LINE *nnnn* COL *cc*. THE OPERAND IN THE LIKE PREDICATE IS NOT A CHARACTER STRING

Explanation: One of the following conditions was found:

- The data type of the column in a LIKE predicate is not a character string.
- The data type of the pattern in a LIKE predicate is not a character string.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH720I W *csectname* LINE *nnnn* COL *cc*. THE ESCAPE CHARACTER MUST BE A ONE-BYTE CHARACTER STRING

Explanation: The escape character in a LIKE predicate must have the data type of character string with a length of 1.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH721I W *csectname* LINE *nnnn* COL *cc*. THE WHERE CLAUSE, GROUP BY CLAUSE, OR HAVING CLAUSE IS INVALID FOR THE GROUPED VIEW *table*.

Explanation: If the table identified in the FROM clause is a grouped view, then the table expression must not contain a WHERE clause, GROUP BY clause, or HAVING clause.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH722I W *csectname* LINE *nnnn* COL *cc*. *name* OCCURS MORE THAN ONCE IN A FROM CLAUSE

Explanation: One of the following conditions was found:

- The table name occurs more than once in a FROM clause.
- The correlation name is identical to a table name or to another correlation name in a FROM clause.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH723I W *csectname* LINE *nnnn* COL *cc*. ONLY ONE TABLE REFERENCE IS ALLOWED IN THE FROM CLAUSE FOR A GROUPED VIEW

Explanation: If the table identified by table name is a grouped view, then the FROM clause must contain exactly one table reference.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH724I W *csectname* LINE *nnnn* COL *cc*. A REFERENCE TO THE COLUMN *column* WHICH IS DERIVED FROM A SET FUNCTION IS INVALID IN A WHERE CLAUSE

Explanation: A value expression directly contained in the search condition of a WHERE clause must not include a reference to a column derived from a set function specification.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH725I W *csectname* LINE *nnnn* COL *cc*. A WHERE CLAUSE MUST BE CONTAINED IN A HAVING CLAUSE WHEN A FUNCTION IS USED

Explanation: If a value expression directly contained in the search condition is a set function specification, then the WHERE clause must be contained in a HAVING clause.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH726I W *csectname* LINE *nnnn* COL *cc*. THE COLUMN SPECIFICATION FOR *column* MUST BE AN OUTER REFERENCE

Explanation: If a value expression directly contained in the search condition is a function, then the column specification in the function must be an outer reference.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH727I W *csectname* LINE *nnnn* COL *cc*. THE COLUMN *column* IS DUPLICATED WITHIN THE CURRENT SCOPE

Explanation: The specified column is duplicated within the current scope.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH728I W *csectname* LINE *nnnn* COL *cc*. THE COLUMN SPECIFICATION FOR *table* SHOULD BE A GROUPING COLUMN OR SHOULD BE SPECIFIED WITHIN A SET FUNCTION

Explanation: Each column specification contained in a subquery in the search condition of a HAVING clause must reference a grouping column or be specified within a set function specification.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH729I W *csectname* LINE *nnnn* COL *cc*. THE DEGREE OF TABLE *table* SHOULD BE 1 WHEN USING A RESULT SPECIFICATION OF *

Explanation: The degree of the table expression must be 1 if the result specification '*' is specified in a subquery of any predicate other than an EXISTS predicate.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH730I W *csectname* LINE *nnnn* COL *cc*. THE SET FUNCTION IS NOT VALID FOR THE TABLE EXPRESSION BEGINNING WITH *table*

Explanation: One of the following conditions was not met:

- If the table expression is a grouped view, the result specification of a subquery cannot contain a set function specification.
- If the table expression is a grouped view, the select list of a query specification cannot contain a function.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH731I W *csectname* LINE *nnnn* COL *cc*. THE COLUMN SPECIFICATION FOR *column* IS INVALID

Explanation: One of the following conditions was not met:

- For a grouped table, the column specification must reference a grouping column or be specified within a set function specification.

DSNH732I • DSNH739I

- If it is not a grouped table, and the value expression includes a set function specification, then each column specification must be specified within a set function.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH732I W *csectname* LINE *nnnn* COL *cc*.
DISTINCT IS SPECIFIED MORE THAN ONCE.

Explanation: One of the following conditions has not been met:

- DISTINCT must not be specified more than once in a query specification, excluding any subquery of that query specification.
- DISTINCT must not be specified more than once in a subquery, excluding any subquery contained in that subquery.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH733I W *csectname* LINE *nnnn* COL *cc*. **THE COMPARISON PREDICATE SUBQUERY CANNOT CONTAIN A GROUP BY OR HAVING CLAUSE**

Explanation: If a subquery is specified in a comparison predicate, then the table expression whose FROM clause identifies the named table must not contain a GROUP BY clause or a HAVING clause.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH734I W *csectname* LINE *nnnn* COL *cc*. **THE COMPARISON PREDICATE SUBQUERY CANNOT IDENTIFY A GROUPED VIEW**

Explanation: If a subquery is specified in a comparison predicate, then the table expression whose FROM clause identifies the named table must not identify a grouped view.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH735I W *csectname* LINE *nnnn* COL *cc*.
INVALID AUTHORIZATION IDENTIFIER
authid

Explanation: The authorization identifier prefixed to the table name is invalid.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH736I W *csectname* LINE *nnnn* COL *cc*. **THE TABLE OR VIEW *name* ALREADY EXISTS**

Explanation: The table name or view name specified already exists in the catalog.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH737I W *csectname* LINE *nnnn* COL *cc*. **THE COLUMN DEFINITION IS MISSING**

Explanation: At least one column definition should be specified for a CREATE TABLE.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH738I W *csectname* LINE *nnnn* COL *cc*. **THE DATA TYPE *type1* OF THE TARGET IS NOT COMPATIBLE WITH THE DATA TYPE *type2* OF THE SOURCE**

Explanation: Data types should match between source and target in a FETCH and SELECT statement.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH739I E *csectname* LINE *nnnn* COL *cc*.
CREATE FUNCTION *function-name*
FAILED BECAUSE FUNCTIONS
CANNOT MODIFY DATA WHEN THEY
ARE PROCESSED IN PARALLEL.

Explanation: The function cannot be created because ALLOW PARALLEL and MODIFIES SQL DATA were both specified explicitly or implicitly. A function cannot be parallelized if it modifies data.

Severity: 8 (error)

System Action: The statement cannot be executed.

User Response: Specify DISALLOW PARALLEL or change the MODIFIES SQL DATA to NO SQL, CONTAINS SQL or READS SQL DATA.

DSNH740I *xxxxxx phase FINISHED, RC = retcode, LISTING IN data-set*

Explanation: The DSNH INST phase completed with return code *retcode*. The *phase* is one of the following:

- PLI Macro Pass
- Precompiler
- CICS Command Translator
- Bind Package
- Bind Plan
- Compile/assembly
- PLI
- Prelink (unique to C/370 Compiler)
- Link
- Run

If the CLIST puts the listing into a data set, the name of the data set is shown as *data-set*. If the PRINT parameter is LEAVE, NONE, or TERM, the 'LISTING IN *data-set*' part of this message is omitted.

Refer to message DSNH756I for an explanation of the print data set names assigned during processing.

This message is issued by the following CLIST: DSNH

Severity: *retcode*

System Action: Processing continues as requested.

User Response: This phase is complete. If there are errors, other messages are produced. The next phase requested begins. The order of the phases is:

1. PLI Macro Pass
2. Precompiler
3. CICS Command Translator
4. Bind Package
5. Bind Plan
6. ASM, ASMH, C (C/370 Compiler), COBOL, COBOL2, FORTRAN, PLI
7. Prelink
8. Link
9. Run

DSNH741I *process1(NO) IMPLIES THAT process2 CANNOT BE RUN*

Explanation: An inconsistent processing set was specified. An earlier phase and a later phase were requested, but not the intermediate step needed to process data between them. For example, requesting the precompile and the link edit without the compile produces this error. Values for *process1* are PRECOMP, CICSXLAT, COMPILE, LINK, or BIND. Values for *process2* are COMPILE, LINK, or RUN.

This message is issued by the following CLIST: DSNH

Severity: 4 (warning)

System Action: *process2* is not performed, but other processing is done.

User Response: Specify a consistent combination of processing. Application program preparation needs to run all the steps to provide a correct application program. The process does allow beginning or ending steps to be run at a different time. See message DSNH740I for the required step order.

DSNH750I **INVALID DATA SET:** *clist-keyword clist-keyword-parameter*

Explanation: The data set name specified on the *clist-keyword-parameter* contains unbalanced parenthesis.

This message is issued by the following CLIST: DSNH

Severity: 8 (error)

System Action: The CLIST is terminated.

User Response: If a member name is to be associated with the specified data set, the member name must be enclosed in parentheses.

DSNH751I *clist ERROR IN parameter VALUE value*

Explanation: The specified CLIST keyword *parameter* does not have an acceptable value.

Severity: 8 (error)

System Action: The CLIST processing is terminated.

User Response: Refer to the DSNH (TSO clist) section in *DB2 Command Reference* for a complete list of the supported CLIST parameters and their associated values. Correct the invalid parameter, and resubmit the job.

DSNH752I **INPUT DATA SET NAME IS MISSING OR NONE**

Explanation: The DSNH CLIST requires a value for the input data set name (INPUT). You cannot use an input data set name of NONE.

This message is issued by the following CLIST: DSNH

Severity: 0 (successful)

System Action: The CLIST prompts for a name, if prompting is allowed. If prompting is not allowed, for example in batch or when PROFILE NOPROMPT was entered, the CLIST terminates.

User Response: Specify an INPUT name. See message DSNH753I.

DSNH753I ENTER INPUT DATA SET NAME

Explanation: The CLIST is requesting the name of the input data set.

This message is issued by the following CLIST: DSNH

Severity: 0 (successful)

System Action: The system waits for user to enter data set name or for the CLIST to be terminated.

User Response: Enter the name of the data set. Do not specify the parameter or command, but just enter the name of the data set. The standard TSO prefixing will be done if the data set name is not entered within apostrophes.

DSNH754I *clist* OUTNAME PARAMETER *name* MUST NOT CONTAIN SPECIAL CHARACTERS

Explanation: The DSNH and DSNHC CLISTs, *clist*, use the OUTNAME parameter to build names for a number of data sets that are passed from phase to phase. These names are prefixed by an authorization ID or TSO prefix value and have a number of suffixes. For this reason, OUTNAME parameter *name* must not contain special characters. It can contain a period or national characters. It cannot have apostrophes to specify a single data set name.

Severity: 8 (error)

System Action: The CLIST is terminated.

User Response: Correct the input request. The default for this parameter is TEMP, which should be adequate for most usage.

DSNH755I OUTNAME PARAMETER *name* MUST NOT BEGIN THE SAME AS INPUT *input*

Explanation: The DSNH CLIST uses the OUTNAME parameter *name* to build a number of data sets that are passed from phase to phase. These data sets could conflict with the INPUT data set (*input*) if the names are the same, causing the INPUT data set to be overwritten. To avoid this problem, the names are not allowed to have the same initial characters.

This message is issued by the following CLIST: DSNH

Severity: 8 (error)

System Action: The CLIST is terminated.

User Response: Correct the input request. Specify a different OUTNAME. The default for OUTNAME is TEMP.

DSNH756I *clist* PRINT PARAMETER *name* MUST NOT CONTAIN SPECIAL CHARACTERS

Explanation: The DSNH and DSNHC CLISTs (*clist*) use the PRINT parameter to build names for data sets used for the print listings from various phases. These names are prefixed by an authorization ID or a TSO prefix value and have a number of suffixes. The PRINT parameter *name* can contain a period or national characters, but it cannot contain special characters. It cannot have apostrophes to specify a single data set name.

The data set names built using the PRINT(print) qualifier are the following:

- print.CXLIST**
CICS Command Translator
- print.LINKLIST**
Linkage Editor
- print.LIST**
Compiler or Assembler
- print.PCLIST**
DB2 Precompiler
- print.SYSCPRT.LIST**
C/370 Compiler
- print.SYSOUT.PRELLIST**
C/370 Prelink Utility

Severity: 8 (error)

System Action: The CLIST terminates.

User Response: Correct the *name* specified with the PRINT parameter.

DSNH757I ERROR IN PLAN NAME LENGTH *value*

Explanation: The *value* is too long for a plan name. A plan name has a maximum of 8 characters.

This message is issued by the following CLIST: DSNH

Severity: 8 (error)

System Action: The CLIST is terminated.

User Response: Specify a plan name with 8 or fewer characters.

DSNH758I HOST(*host-language*) IS NOT PERMITTED WITH RUN(IMS) OR RUN(CICS)

Explanation: There is no facility for connecting a FORTRAN program to either IMS or CICS.

This message is issued by the following CLIST: DSNH

Severity: 8 (error)

System Action: The CLIST terminates.

User Response: Use the specified language in the TSO or batch environment.

DSNH759I *clist* **TERMINATING**, *phase RC = retcode*

Explanation: The DSNH or DSNHC *clist* terminated at *phase* because the return code *retcode* was greater than or equal to the RCTERM parameter value.

The *phase* is one of the following:

ASM	ASMH
BIND Package	BIND Plan
	CICS Command Translator
COBOL	COB2
CLIST CHECKING	FORTRAN
PLI	C (C/370 Compiler)
Prelink	Link
PLI Macro Pass	Precompiler
Run	

Severity: *retcode*

System Action: The CLIST terminates.

User Response: Determine the cause for the high return code. If the parameters include TERM(NONE) and direct the PRINT to a data set, you might need to search the print data sets for the listing of the error. Refer to message DSNH756I for an explanation of the print data set names assigned during processing.

Problem Determination: The location of the messages describing the prior errors depends upon the values of the TERM and PRINT parameters. The messages can be directed to the terminal, to preallocated data sets, or to data sets dynamically allocated during CLIST processing.

If TERM(NONE) PRINT(NONE) was specified, the messages are not available. Execute the CLIST again and specify a location for the error messages.

To find the documentation, note the immediately preceding DSNH740I message for the location of the listings. If the 'LISTING IN data-set' portion of the message is missing, specify a PRINT data set, SOURCE(YES) and XREF(YES), and execute the CLIST again. Use TERM(TERM) to direct error messages to your terminal. These listings and execution of the DSNH CLIST are required for problem diagnosis.

If the error is in the CLIST or the error location is CLIST CHECKING, use CONTROL(SYMLIST) to produce a detailed trace of the CLIST execution and provide the trace listing.

Check for DSNH751I messages that describe the error.

DSNH760I **PRELINK OPTION INVALID WITH HOST LANGUAGE** (*host-language*)

Explanation: Invocation of the PRELINK step is not supported by *host-language*. This option is only valid for the following DSNH HOST language compilers: C, CPP, and IBMCOB.

This message is issued by the following CLIST: DSNH

Severity: 4 (error)

System Action: The DSNH PRELINK parameter is ignored and prelink utility processing is bypassed. Clist processing continues normally with a return code of 4.

User Response: Refer to the description of the DSNH PRELINK keyword option in *DB2 Command Reference*.

DSNH770I **W csectname LINE nnnn COL cc. YOU MUST DECLARE COLUMN column AS NOT NULL**

Explanation: All columns identified as UNIQUE must be defined with the NOT NULL option.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH771I **W csectname LINE nnnn COL cc. THE VIEWED TABLE table MUST BE UPDATEABLE**

Explanation: When the WITH CHECK OPTION is specified, then the viewed table must be updateable.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH772I **W csectname LINE nnnn COL cc. INVALID NUMBER OF COLUMN NAMES**

Explanation: The number of column names in the view column list should be the same as the degree of the table specified by the query specification.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH773I **W csectname LINE nnnn COL cc. YOU MUST DECLARE THE CURSOR cursor BEFORE USE**

Explanation: The cursor specified was not declared in a DECLARE CURSOR statement.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH774I W *csectname* LINE *nnnn* COL *cc*. THE CURSOR *cursor* IS ALREADY DECLARED

Explanation: The cursor specified was already declared in a DECLARE CURSOR statement.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH775I W *csectname* LINE *nnnn* COL *cc*. ONLY '**' OR COLUMN NAMES ARE VALID IN THIS CONTEXT

Explanation: When UNION is specified, the select list for the specification of the two table expressions identified by the query expression and query term should consist of '**' or column specifications.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH776I W *csectname* LINE *nnnn* COL *cc*. THE DESCRIPTIONS OF TABLES IDENTIFIED BY THE QUERY EXPRESSION BEGINNING WITH TABLE: *table1* AND THE QUERY TERM BEGINNING WITH TABLE: *table2* SHOULD BE IDENTICAL

Explanation: When UNION is specified, the descriptions of the two tables should be identical, except for the column names.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH777I W *csectname* LINE *nnnn* COL *cc*. THE SORT SPECIFICATION *number* IS OUTSIDE THE DEGREE OF TABLE *table*

Explanation: If the sort specification contains an unsigned integer, it should be greater than zero and not greater than the number of columns in the table.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH778I W *csectname* LINE *nnnn* COL *cc*. THE TABLE *table* IS A READ-ONLY TABLE

Explanation: A DELETE, an INSERT, or an UPDATE statement was specified on a read-only table.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH779I W *csectname* LINE *nnnn* COL *cc*. THE TABLE *table* MUST NOT BE IDENTIFIED IN A FROM CLAUSE OF ANY SUBQUERY CONTAINED IN A SEARCH CONDITION

Explanation: A table specified in a DELETE or an UPDATE statement cannot be used in a FROM clause of any subquery contained in its search condition.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH780I W *csectname* LINE *nnnn* COL *cc*. THE TABLE *table1* IS NOT THE FIRST TABLE *table2* SPECIFIED IN THE DECLARE CURSOR STATEMENT

Explanation: The table specified in a DELETE or an UPDATE statement should be the first table specified in the FROM clause of the DECLARE CURSOR statement.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH781I W *csectname* LINE *nnnn* COL *cc*. THE NUMBER OF TARGET SPECIFICATIONS DO NOT MATCH THE DEGREE OF TABLE *table*

Explanation: The number of target specifications in the FETCH statement do not match the degree of the table specified.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH782I W *csectname* LINE *nnnn* COL *cc*. THE TARGET TABLE *table* OF THE INSERT STATEMENT IS ALSO IN THE FROM CLAUSE OR IN A CONTAINED SUBQUERY

Explanation: The named table must not be identified in a FROM clause of a query specification or of any subquery contained in the query specification.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH783I W *csectname* LINE *nnnn* COL *cc*. THE NUMBER OF COLUMNS SPECIFIED DOES NOT MATCH THE NUMBER OF VALUES SPECIFIED

Explanation: In an INSERT statement, the number of columns specified does not match the number of values specified.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH784I W *csectname* LINE *nnnn* COL *cc*. THE NUMBER OF COLUMNS SPECIFIED DOES NOT MATCH THE DEGREE OF TABLE *table* IN THE QUERY SPECIFICATION

Explanation: The number of columns specified in an INSERT statement does not match the degree of the table specified in the query specification.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH785I W *csectname* LINE *nnnn* COL *cc*. THERE IS A DATA TYPE OR LENGTH MISMATCH BETWEEN COLUMN *column* AND ITS INSERT OR UPDATE ITEM

Explanation: One of the following conditions was not met:

- If the data type of the column name is character string, then the corresponding item in the INSERT or UPDATE statement should be character string with a length equal to or less than the length of the column name.
- If the data type of the column name is exact numeric, then the corresponding item in the INSERT or UPDATE statement should be exact numeric.

- If the data type of the column name is approximate numeric, then the corresponding item in the INSERT or UPDATE statement should be approximate numeric or exact numeric.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH786I W *csectname* LINE *nnnn* COL *cc*. YOU CANNOT USE A GROUP BY OR HAVING CLAUSE OR IDENTIFY A GROUPED VIEW IN THIS CONTEXT

Explanation: The table identified in the FROM clause of the table expression in a SELECT statement should not include a GROUP BY or HAVING clause and should not identify a grouped view.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH787I W *csectname* LINE *nnnn* COL *cc*. THE NUMBER OF ELEMENTS SPECIFIED IN THE SELECT LIST SHOULD MATCH THE NUMBER IN THE TARGET LIST

Explanation: In the SELECT statement, the number of elements specified in the select list should match the number of elements in the target list.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH788I W *csectname* LINE *nnnn* COL *cc*. THE SET FUNCTION *function* IS NOT ALLOWED IN AN UPDATE STATEMENT

Explanation: A value expression in a SET clause of an UPDATE statement should not include a set function specification.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH789I W *csectname* LINE *nnnn* COL *cc*. YOU CANNOT SPECIFY NULL FOR NOT NULL COLUMN *column*

Explanation: If NULL is specified in the SET clause of the UPDATE statement, then the corresponding column should allow nulls.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH790I W *csectname* LINE *nnnn* COL *cc*.
THERE IS AN INVALID SQL TERMINATOR FOR THE HOST LANGUAGE

Explanation: The SQL statement was not terminated by the correct construct for the host language being processed.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH791I W *csectname* LINE *nnnn* COL *cc*. YOU
MUST DEFINE THE HOST VARIABLE identifier

Explanation: The host variable named was either not defined within the program or defined outside the SQL declaration section.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH792I W *csectname* LINE *nnnn* COL *cc*. THE
TABLE *table* WAS NOT FOUND IN THE CATALOG

Explanation: The named table does not exist in the catalog.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH793I W *csectname* LINE *nnnn* COL *cc*.
THERE IS AN INVALID IDENTIFIER FORMAT *identifier* FOR HOST LANGUAGE *language*

Explanation: The format of the identifier name displayed does not meet the requirements of the host language.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH794I W *csectname* LINE *nnnn* COL *cc*. THE
OBJECT *object-name* CANNOT BE CREATED BECAUSE THE FIRST THREE CHARACTERS ARE RESERVED FOR SYSTEM OBJECTS

Explanation: In general, SYS is a reserved prefix for names. The only exceptions are:

- SYSPROC is a valid schema name for stored procedures.
- SYSADM is a valid schema name.

This condition is similar to the condition reported in SQLCODE -707.

Severity: 4

User Response: Select a name that does not start with a reserved prefix.

DSNH795I E *csectname* LINE *nnnn* COL *cc*.
INVALID SPECIFICATION OF A ROWID COLUMN

Explanation: For a CREATE TABLE statement, the specification of a ROWID column may be invalid for one of the following reasons:

- A ROWID column cannot be a column of a temporary table
- A ROWID column cannot be a column of a table with an EDITPROC
- A ROWID column cannot be a column of a foreign key
- A ROWID column cannot be a column of a primary key
- A ROWID column cannot be referenced in the check-condition of a table check constraint.

Severity: 8

System Action: The statement was not executed.

User Response: Correct the syntax.

DSNH867I E *csectname* LINE *nnnn* COL *cc*.
INVALID SPECIFICATION OF A ROWID COLUMN

Explanation: For a CREATE TABLE statement, the specification of a ROWID column might be invalid for one of the following reasons:

- A ROWID column cannot be a column of a temporary table.
- A ROWID column cannot be a column of a table with an EDITPROC.
- A ROWID column cannot be a column of a foreign key.
- A ROWID column cannot be a column of a primary key.

- A ROWID column cannot be referenced in the check-condition of a table check constraint.

Severity: 8

System Action: The statement was not executed.

User Response: Correct the syntax.

DSNH870I W *csectname* THERE IS NOT ENOUGH MEMORY FOR THE FLAGGER; FLAGGING IS DISCONTINUED

Explanation: The flagger could not allocate enough storage to load all required modules.

Severity: 4

System Action: Precompiling continues but flagger operation is discontinued.

User Response: Increase the region size in the JCL for the application. Allocate more storage for flagger operation.

DSNH871I W *csectname* AN ERROR OCCURRED WHEN ATTEMPTING TO LOAD THE FLAGGER MODULE *module*. FLAGGING IS DISCONTINUED

Explanation: A flagger module was not found during flagger initialization.

Severity: 4

System Action: Precompiling continues but flagger operation is discontinued.

User Response: Refer to the message produced by the operating system for details of causes and proceed as instructed for that message.

DSNH872I W *csectname* AN ERROR OCCURRED WHEN INITIALIZING THE FLAGGER. FLAGGING IS DISCONTINUED

Explanation: An internal error occurred during flagger initialization.

Severity: 4

System Action: Precompiling continues but flagger operation is discontinued.

User Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNH873I W *csectname* THE FLAGGER COULD NOT PROCESS THE SQL STATEMENT. FLAGGING IS DISCONTINUED

Explanation: An SQL statement passed to the flagger caused an internal error within the flagger.

Severity: 4

System Action: Precompiling continues but flagger operation is discontinued.

User Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNH874I W *csectname* AN ERROR OCCURRED WHEN TERMINATING THE FLAGGER

Explanation: An internal error occurred during flagger termination.

Severity: 4

System Action: Precompiling continues but flagger operation is discontinued.

User Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNH875I W *csectname* AN ERROR OCCURRED WHEN ATTACHING TO DB2, REASON CODE: X'*reason*'; FLAGGING CONTINUED AS SYNTAX ONLY

Explanation: An error occurred while trying to connect or disconnect from the DB2 subsystem.

Severity: 4

System Action: Processing continues without semantics flagging.

User Response: Refer to the reason code returned in this message and perform corrective actions.

DSNH876I W *csectname* AN ERROR SQLCODE *sqlcode* WAS RETURNED DURING FLAGGER ACCESS TO THE CATALOG OBJECT *authid.table*. MODULE NAME: *module* ERROR REASON CODE: X'*reason*'; FLAGGING CONTINUES WITH SYNTAX CHECK ONLY

Explanation: An error occurred during the execution of a flagger access to the DB2 catalog.

Severity: 4

System Action: Processing continues without semantics flagging.

User Response: Use the provided SQL return code, object type, and name to identify the problem. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNH877I **W** *csectname* **NOT ENOUGH MEMORY FOR FLAGGER OPERATION: RETURN CODE: return**

Explanation: Insufficient storage is available for flagger operation.

Severity: 4

System Action: Processing continues without flagging.

User Response: Check whether the storage allocation for the precompiler can be increased. Allocate more storage for flagger operation.

DSNH878I **W** *csectname* **ERROR RELEASING FLAGGER MEMORY; FLAGGING IS DISCONTINUED**

Explanation: An error occurred when a flagger module attempted to release storage back to the flagger pool.

Severity: 4

System Action: Processing continues without flagging.

User Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNH879I **W** *csectname* **ERROR RELEASING FLAGGER MEMORY; RETURN CODE return**

Explanation: An error occurred when a flagger module attempted to release storage back to the operating system.

Severity: 4

System Action: Processing continues without flagging.

User Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNH880I **W** *csectname* **AN ERROR WAS RETURNED DURING FLAGGER ACCESS TO THE DB2 CATALOG; REASON CODE: X'reason' RETURN CODE X'return'**

Explanation: An error occurred when a flagger module attempted to access the system catalog.

Severity: 4

System Action: Processing continues without flagging.

User Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for

information on identifying and reporting the problem.

DSNH901I **S** *csectname* **U LINE nnnn COL cc INTERNAL PRECOMPILER ERROR – REASON CODE ccc**

Explanation: An internal compiler consistency check failed. Reason codes are:

- 000** The message formatter was called with an unlisted internal message number.
- 001** The parser received a token code of 0 from the lexical scan. Lexical scan refers to a scan of words rather than syntax.
- 002** Error in storage suballocation control blocks.
 - The error might have occurred because a DB2 SQL statement limitation was exceeded. The SQL statement might be referencing, creating, or declaring more columns than the DB2 defined maximum number allowed for an SQL statement. Another possibility is that too many host variables are being referenced in the SQL statement.
- 003** Error in a storage suballocation request.
 - This error might have occurred because of storage constraints when building the DBRM entry for the SQL statement or because the SQL statement exceeds the DB2 maximum statement length.
- 004** Error in pointer structures.
- 005** On BIND or REBIND, a host variable was not found.
- 006** Unexpected value for parser option.
- 007** The internal limit was exceeded.
 - A fully qualified name exceeds the maximum length of 255 characters.
 - The size of a DBRM record exceeds 65536 bytes of storage.
- 008** Internal conversion error.
 - An error occurred when converting a timestamp version-id.

Severity: 16 (unrecoverable error)

System Action: The precompiler is terminated immediately.

User Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: A copy of the application program source and the printout is useful (specify SOURCE and XREF).

DSNH902I S *csectname* LINE *nnnn* COL *cc*
**SEVERE INTERNAL PRECOMPILER
 ERROR IN CONVERSION, REASON**
reason-code

Explanation: DB2 parses SQL statements in Unicode UTF-8, which is also known as CCSID 1208. DB2 will convert the application program internally (not externally) to UTF-8 for processing if an application program uses a different CCSID (for example, an EBCDIC CCSID). After processing, DB2 converts the output back to the original CCSID.

This message indicates that a severe error has occurred in DB2's internal conversion. The reason code indicates the context of this error:

- 000** Substitution occurred on conversion from the source CCSID to CCSID 1208.
- 001** The internal buffer is too small for conversion from the source CCSID to CCSID 1208.
- 002** A miscellaneous error occurred on conversion from the source CCSID to CCSID 1208.
- 003** No conversion is defined from the source CCSID to CCSID 1208.
- 004** A miscellaneous error occurred on conversion from the source CCSID to CCSID 1208.
- 005** Substitution occurred on conversion from CCSID 1208 to the source CCSID.
- 006** The internal buffer is too small for conversion from CCSID 1208 to the source CCSID.
- 007** An invalid code point was found during conversion from CCSID 1208 to the source CCSID.
- 008** Another type of invalid input character was found during conversion from CCSID 1208 to the source CCSID.
- 009** A miscellaneous error occurred during conversion from CCSID 1208 to the source CCSID.
- 010** No conversion is defined from CCSID 1208 to the source CCSID.
- 011** A miscellaneous error occurred during conversion from CCSID 1208 to the source CCSID.

Severity: 16 (unrecoverable error)

System Action: The precompiler is terminated immediately.

User Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: A copy of the application program source and the print-out is useful (specify SOURCE and XREF).

DSNH904I *csectname* U **STORAGE OVERFLOW**

Explanation: More storage is needed, but could not be obtained during precompiler/parser execution.

Severity: 16 (unrecoverable error)

System Action: The precompiler/parser is terminated immediately.

System Programmer Response: The storage required for the current statement could not be acquired or exceeds the maximum for a single request. If the region size is being used completely, check whether the region can be expanded. If it cannot be expanded, the SQL statement is too large to be processed.

DSNH1760I E *csectname* LINE *nnnn* COL *cc*.
**CREATE STATEMENT FOR STORED
 PROCEDURE *procedure-name* MUST
 HAVE A VALID LANGUAGE CLAUSE
 AND EXTERNAL CLAUSE.**

Explanation: The CREATE statement for procedure *procedure-name* must have both a valid LANGUAGE clause and a valid EXTERNAL clause.

Severity: 8 (error)

System Action: The statement cannot be executed.

User Response: Correct and reissue the failing statement.

DSNH4001I **HOST LANGUAGE STATEMENT
 EXCEEDS MAXIMUM OF 1000 LINES**

Explanation: A user put more than 1000 lines in a single PL/I DCL statement.

Severity: 8

System Action: Processing continues.

User Response: Split the DCL statement into two parts.

DSNH4408I E *csectname* LINE *nnnn* COL *cc* **THE
 VALUE IS NOT COMPATIBLE WITH
 THE DATA TYPE OF ITS TARGET**

Explanation: The data type of the value to be assigned to the parameter or SQL variable is incompatible with the declared data type of the assignment target. Both must be:

- Numerals
- Characters
- Graphics
- Dates or character
- Times or character
- Timestamps or character

DSNH4700I • DSNH4779I

- Row ID's
- The same distinct types

Severity: 8 (error)

System Action: The statement cannot be processed.

User Response: Examine the current definition for the parameter or SQL variable and ensure that it has the proper data type.

DSNH4700I E *csectname* LINE *nnnn* COL *cc*
**ATTEMPT TO USE NEW FUNCTION
WITH NEWFUN NO**

Explanation: When the SQL processing option NEWFUN has a value of NO, you cannot use syntax for functions that this release of DB2 introduces. An attempt was made to use one of these functions.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

Programmer Response: Do one of these things:

- Restrict your program to functions that earlier releases of DB2 introduced. These functions are allowed regardless of the value of NEWFUN.
- Process your program with a value of YES for the NEWFUN option. However, you cannot BIND the DBRM until New Function Mode has been enabled.

DSNH4701I S *csectname* **OPTION: *option* OPTION
NOT PERMITTED WITH NEWFUN NO**

Explanation: You cannot use the indicated SQL processing option when the SQL processing option NEWFUN has a value of NO.

Severity: 12 (severe error)

System Action: The precompiler is terminated.

Programmer Response: To prevent this error in the future, do one of the following:

- Restrict your precompilation to options that were introduced in earlier releases of DB2. These options are valid regardless of the value of NEWFUN.
- Process your program with a value of YES for the NEWFUN option.

DSNH4702I *column* **IS NOT VALID IN THE CONTEXT
WHERE IT IS USED**

Explanation: The specified column is not a column of the table or view that was specified as the object of the UPDATE or INSERT statement.

System Action: The statement cannot be executed. No data was updated.

Programmer Response: Verify that the column and

table names are specified correctly in the SQL statement. If a correlation name is specified for a table or view, verify that subsequent table references of the table or view in qualified column names use the correlation name and not the table or view name.

SQLSTATE: 42703

DSNH4777I E *csectname* LINE *nnnn* COL *cc*
**NESTED COMPOUND STATEMENTS
NOT ALLOWED**

Explanation: An SQL procedure contains nested compound statements, which are not allowed.

Severity: 8 (error)

System Action: The statement cannot be executed.

User Response: Rewrite the SQL procedure body so that it does not contain nested compound statements.

DSNH4778I E *csectname* LINE *nnnn* COL *cc* END
**LABEL *label-name* NOT SAME AS
BEGIN LABEL**

Explanation: An SQL procedure statement contains an ending label and a beginning label that do not match.

Severity: 8 (error)

System Action: The statement cannot be executed.

User Response: Change the ending label in the statement to match the beginning label.

DSNH4779I *csectname* LINE *nnnn* COL *cc* LABEL
label **SPECIFIED *statement* IS NOT
VALID**

Explanation: In an SQL procedure, *label* is specified on a GOTO or LEAVE statement. *label* is not defined or is not a valid label for the statement.

The label on a LEAVE statement must be the label for a LOOP, REPEAT, WHILE, or compound statement.

The label in a GOTO statement must be defined within a scope that the GOTO statement can reach.

- If the GOTO statement is defined in a compound statement, *label* must be defined inside the same compound statement.
- If the GOTO statement is defined in a handler, *label* must be defined in the same handler and must follow the other scope rules.
- If the GOTO statement is defined outside a handler, *label* must not be defined within a handler.

Severity: 8 (error)

System Action: The statement cannot be processed.

User Response: Change the label in the LEAVE statement to match the label on the LOOP, REPEAT,

WHILE, or COMPOUND statement that contains the LEAVE statement.

Ensure that the label in the GOTO statement is defined within a scope that the GOTO statement can reach.

DSNH4780I E csectname LINE nnnn COL cc UNDO SPECIFIED FOR A HANDLER AND ATOMIC NOT SPECIFIED

Explanation: In an SQL procedure, a compound statement is defined as NOT ATOMIC, but the compound statement contains an UNDO handler. An UNDO handler can be used only for a compound statement that is defined as ATOMIC.

Severity: 8 (error)

System Action: The statement cannot be executed.

User Response: Define the compound statement as ATOMIC, or change the UNDO handler to a CONTINUE or EXIT handler.

DSNH4781I E csectname LINE nnnn COL cc CONDITION condition-name SPECIFIED IN HANDLER NOT DEFINED

Explanation: In an SQL procedure, a handler is declared for condition *condition-name*, but the SQL procedure does not contain a condition declaration statement that defines *condition-name*.

Severity: 8 (error)

System Action: The statement cannot be executed.

User Response: Include a condition declaration statement in the SQL procedure that relates *condition-name* to an SQLSTATE value.

DSNH4782I E csectname LINE nnnn COL cc CONDITION VALUE value SPECIFIED IN HANDLER NOT VALID

Explanation: In an SQL procedure, a condition handler is not valid for one of the following reasons:

- The handler specifies an SQLSTATE value that is not valid.
- The handler specifies duplicate conditions.
- The handler specifies SQLWARNING, SQLEXCEPTION, or NOT FOUND with other conditions.

Severity: 8 (error)

System Action: The statement cannot be executed.

User Response: Specify a valid condition in the handler. Ensure that a handler specifies a condition only once.

DSNH4783I E csectname LINE nnnn COL cc SELECT LIST FOR CURSOR cursor-name IN FOR STATEMENT NOT VALID

Explanation: An SQL procedure contains a FOR statement in which the select list in the cursor declaration has a column that is not valid. That column is a duplicate of another column in the select list, or the column is not named.

Severity: 8 (error)

System Action: The statement cannot be executed.

User Response: Ensure that all columns in the select list for a cursor declaration in a FOR statement are unique and are named. If a column of the select list is the result of a column function, specify an AS clause to name the column.

DSNH4785I E csectname LINE nnnn COL cc THE DECLARATION OR USE OF THE SQLSTATE OR SQLCODE VARIABLE IS NOT VALID

Explanation: The declaration or use of an SQLCODE or SQLSTATE special variable is not valid for one of the following reasons:

- SQLSTATE is declared with a data type other than CHAR(5).
- SQLCODE is declared with a data type other than INTEGER.
- NULL is assigned to SQLCODE or SQLSTATE.

Severity: 8 (error)

System Action: The statement cannot be processed.

User Response: Declare SQLSTATE only as CHAR(5) and SQLCODE only as INTEGER. Do not assign the null value to SQLCODE or SQLSTATE.

DSNH4911I E csectname SQL TYPE OF HOST VARIABLE IS INVALID

Explanation: SQLGALHV received a host variable with an invalid SQL data type code.

Severity: 8 (error)

System Action: The invalid host variable is ignored.

User Response: Correct the SQL data type code and register the host variable again.

DSNH4912I E csectname LENGTH OF HOST VARIABLE IS OUT OF RANGE

Explanation: SQLGALHV received a host variable with an invalid data area. The length of the data area in parameter SQL_LENGTH is either too large or too negative.

Severity: 8 (error)

DSNH4913I • DSNH5011I

System Action: The host variable is ignored.

User Response: Correct the data area length parameter and register the host variable again.

DSNH4913I E *csectname* TOKEN IDENTIFIER HAS ALREADY BEEN USED

Explanation: The token identifier passed to SQLGALHV already exists for another host variable.

Severity: 8 (error)

System Action: The host variable is ignored.

User Response: Assign a different token identifier and register the host variable again.

DSNH4914I E *csectname* INVALID TOKEN IDENTIFIER

Explanation: The token identifier passed to SQLGALHV is invalid.

Severity: 8 (error)

System Action: The host variable is ignored.

User Response: Assign a token identifier that is a valid 4-byte integer, and register the host variable again.

DSNH4915I E *csectname* SQLGINIT HAS ALREADY BEEN INVOKED

Explanation: A call to SQLGINIT has already been made.

Severity: 8 (error)

System Action: Control is returned to caller with no other action taken.

User Response: Change the compiler or precompiler code so that SQLGINIT is only called once. The compilation or precompilation currently in progress may continue.

DSNH4916I E *csectname* SQLGINIT HAS NOT BEEN INVOKED

Explanation: A call to SQLGINIT has not been made.

Severity: 8 (error)

System Action: Control is returned to caller with no other action taken.

User Response: Change the compiler or precompiler code so that SQLGINIT is called before any of the other API entry points.

DSNH4919I E *csectname* TASK ARRAY TOO SMALL

Explanation: Precompiler Services need more task array entries than the precompiler allocated.

Severity: 8 (error)

System Action: Control is returned to caller with no other action taken.

User Response: Allocate a larger task array and make the call to SQLGCMPL again.

DSNH4920I E *csectname* TOKEN ID ARRAY TOO SMALL

Explanation: Precompiler Services needs more token identifier array entries than the precompiler allocated.

Severity: 8 (error)

System Action: Control is returned to caller with no other action taken.

User Response: Allocate a larger token identifier array and make the call to SQLGCMPL again.

DSNH4941I U *csectname* BLANK OR EMPTY SQL STATEMENT TEXT

Explanation: The SQL statement passed to SQLGCMPL was blank.

Severity: 8 (error)

System Action: Control is returned to caller with no other action taken.

User Response: Assign the SQL statement buffer to the correct parameter and call SQLGCMPL again.

DSNH4999I U *csectname* PRECOMPILER SERVICES INTERNAL ERROR

Explanation: Precompiler Services encountered an unrecoverable internal error.

Severity: 16 (unrecoverable error)

System Action: Control is returned to caller with no other action taken.

User Response: Terminate compilation or precompilation.

DSNH5011I HOST VARIABLE ARRAY *host-variable-array* IS EITHER NOT DEFINED OR IS NOT USABLE

Explanation: Host-variable-array *host-variable-array* was specified in a multiple-row FETCH or multiple-row INSERT statement. The host-variable-array is not defined or is not usable for one of the following reasons:

- The host variable is not a valid host-variable-array.
- The host variable is not a dimensioned array.
- The host-variable-array has more than 1 dimension.
- The host-variable-array defines a structure that does not conform to the rules for defining a host-variable-array.

- The dimension of the host-variable-array used for indicators is not equal to the dimension of the main host-variable-array.

System Action: The statement cannot be processed.

Programmer Response: Correct any of the following and recompile the program again. Ensure that:

- the dimension of the indicator variable array is equal to the dimension of the main host-variable-array.
- the host-variable-array is a single-dimensional array.
- the host-variable-array or host indicator variable array do not contain structures that are not permissible. The only structures that may be defined in a host-variable-array are those that are used to define variable length string host variables.

See the *DB2 Application Programming and SQL Guide* for more language-specific information on how to define the host-variable-arrays in a program.

SQLSTATE: \

DSNH5033I DECLARE VARIABLE NOT VALID FOR *variable*

Explanation: Host variable *variable* specified in a DECLARE VARIABLE statement is not valid. The DECLARE VARIABLE statement occurs after any SQL statement (in a COBOL or FORTRAN application program) or after a DECLARE CURSOR statement (in an application program in any other host language), where the SQL statement and the DECLARE VARIABLE refer to the same variable.

Severity: 8 (error)

System Action: The statement cannot be processed.

User Response: Ensure that the DECLARE VARIABLE occurs before the use of the host variable in an SQL statement in the application.

DSNH5034I DECLARE VARIABLE NOT VALID FOR *variable*

Explanation: Host variable *variable* specified in a DECLARE VARIABLE statement is not valid for one of the following reasons:

- A reference is made to a variable that does not exist.
- A reference is made to a variable that is a structure.
- A reference is made to a variable that is a component of two more structures.
- The host variable is not defined as character, varying-length character, graphic, varying-length graphic, CLOB, or DBCLOB. In this case, CLOB AS LOCATOR or DBCLOB AS LOCATOR is not considered a CLOB or DBCLOB.
- FOR BIT DATA, CCSID 65535, FOR MIXED DATA, FOR SBCS DATA is specified and the variable is defined as graphic, varying-length graphic, or DBCLOB.

- FOR BIT DATA, or CCSID 65535 is specified and the variable is defined as CLOB.

Severity: 8 (error)

System Action: The statement cannot be precompiled.

User Response: Correct the definition of the host variable. Precompile the program again.

DSNH5035I HOST VARIABLE *variable* IS SPECIFIED TWICE IN A DECLARE VARIABLE STATEMENT

Explanation: The host variable *variable* was specified in two or more DECLARE VARIABLE statements, or was specified two or more times in one DECLARE VARIABLE statement. A host variable can be specified once at most in a DECLARE VARIABLE statement.

Severity: 8 (error)

System Action: The statement cannot be processed.

User Response: Specify the host variable at most once in a DECLARE VARIABLE statement.

DSNH5036I CCSID VALUE OUT OF RANGE

Explanation: The CCSID for a DECLARE VARIABLE or CAST statement is outside the range of 1 to 65533, or the the value 65535. The value must be within the range of 1 to 65533, or the value must be 65535.

Severity: 8 (error)

System Action: The statement cannot be processed.

User Response: If this message is issued for a "DECLARE VARIABLE CCSID integer" or "CAST CCSID integer" statement, change the value to be within the range of 1 to 65533 or the value 65535. If this message is issued for a DECLARE VARIABLE statement with the "FOR SBCS DATA" or "FOR MIXED DATA" clause, then the CCSIDs specified on panel DSNTIPF at installation time need to be updated with valid values.

DSNH5037I DECLARE VARIABLE STATEMENT FOUND WITH ONE-PASS PRECOMPILE

Explanation: A DECLARE VARIABLE statement was found, but the source program is being precompiled with only one pass. If a DECLARE VARIABLE is used in an assembler source program, the ONEPASS precompiler option must not be used. If a DECLARE VARIABLE is used in a C, C++, or PL/I source program, the TWOPASS precompiler option must be used.

Severity: 8 (error)

System Action: The source program cannot be precompiled.

User Response: Specify the TWOPASS precompiler

option or, for assembler, do not specify the ONEPASS precompiler option.

DSNH20008I UNSUPPORTED OPTION *keyword*
SPECIFIED

Explanation: *keyword* is a deprecated feature that was supported in releases prior to DB2 Version 8, and is no longer supported.

For indexes, only one type is currently supported — type 2.

Severity: 8 (error)

System Action: The statement cannot be executed.

User Response: Correct the syntax of the SQL statement to remove reference to the unsupported keyword. Refer to the *DB2 SQL Reference* for more information.

SQLSTATE: 560A9

DSNH20060I E csectname LINE nnnn COL cc
UNSUPPORTED DATA TYPE *data-type*
ENCOUNTERED IN SQL *object-type*
object-name

Explanation: *data-type* was specified in the definition of *object-name*. *object-type* is an SQL procedure parameter or variable. *data-type* is not supported for SQL procedure parameters or variables.

You can use the same built-in data types for SQL procedure parameters or variables that you can use for the CREATE TABLE statement, except these:

- LONG VARCHAR
- LONG VARGRAPHIC
- CLOB
- DBCLOB
- BLOB
- ROWID
- distinct type

Severity: 8 (error)

System Action: The statement cannot be executed.

User Response: Change the syntax to specify one of the supported data types. Instead of a LONG VARCHAR or CLOB data type, use a VARCHAR data type with an explicit length. Instead of a LONG VARGRAPHIC or DBCLOB data type, use a VARGRAPHIC data type with an explicit length.

DSNH20061I E csectname LINE nnnn COL cc
UNEXPECTED ERROR RETURNED
FROM LANGUAGE ENVIRONMENT:
REASON CODE *reason-code*, **RETURN**
CODE *return-code module-name*

Explanation: An Language Environment error occurred while the DB2 precompiler was processing an SQL procedure. The reason codes and associated return codes are:

Reason code	Meaning and associated return code
1	No PIPI token. <i>return-code</i> is the return code from the CEEPIPI(init_sub) call.
2	CEE could not be loaded. <i>return-code</i> is the return code from the CEEPIPI(add_entry) call.
3	PIPI would not terminate. <i>return-code</i> is the return code from the CEEPIPI(term) call.
4	Call to <i>module-name</i> failed. <i>return-code</i> is the return code from the CEEPIPI(call_sub) call.
5	Bad response from PIPI. <i>return-code</i> is the return code from <i>module-name</i> .

See the explanation of return codes for the appropriate CEEPIPI call in *z/OS Language Environment Programming Guide* for explanations of the Language Environment return codes.

Severity: 8 (error)

System Action: The statement cannot be executed.

User Response: Correct the condition that is described by *reason-code*.

DSNH20129I E csectname LINE nnnn COL cc
LOCAL SPECIAL REGISTER IS NOT
VALID AS USED

Explanation: Local special registers cannot be referenced in an assignment statement (SET or VALUES INTO) that assigns multiple values. For example, the following special registers are local: CURRENT SERVER and CURRENT PACKAGESET.

Additionally, the local special registers cannot be referenced in a SET host-variable statement that has parenthesis around the special register.

The following statements are not valid:

```
SET (:hv1) = (CURRENT SERVER);
SET (:hv1,:hv2) = (CURRENT SERVER,CURRENT
PATH);
VALUES CURRENT SERVER, CURRENT DATE
INTO :c1, :c2;
```

Severity: 8 (error)

System Action: The statement cannot be executed.

User Response: Split the statement into multiple statements so that the local special registers are not referenced in a statement that assigns multiple values. Also be sure that a SET statement for a local special register does not use parenthesis on either side of the equal sign.

Chapter 10. DSNi... Messages

DSNI001I **RESTART HAS BEEN DEFERRED**
REASON reason **TYPE** type **NAME**
name

Explanation: Restart could not be performed for one or more pages of the resource identified by *type* and *name*. Those pages are placed in the logical page list (LPL) and restart for those pages is deferred. The reason code explains why restart was not performed.

Refer to Table 3 on page 1355 for an explanation of resource type codes.

System Action: DB2 restart continues. Pages for which restart activity was not performed are put into the LPL.

User Response: Correct the problem indicated by the reason code. Then use the START DATABASE command or the RECOVER utility to remove the pages from the LPL.

DSNI002I *csect-name* **UNABLE TO START**
OBJECT TYPE *object-type* **OBJECT**
NAME *object-name* **REASON** reason
TYPE type **NAME** name

Explanation: The resource identified could not be started because it was unavailable. The resource could be a database, a table space, an index space, or a partition within a table space or an index space. The 'object-type' identifies the type. The 'object-name' identifies the name. If the DB2 catalog is unavailable, 'object-type' contains binary zeros and 'object-name' contains blanks.

The resource that was unavailable is identified by 'type' and 'name'. The 'type' code identifies the type of the resource as well as the format and content of the 'name'. For an explanation of resource type codes, see "Resource types" on page 1355. The 'reason' contains the reason code explaining why the resource was unavailable.

System Action: The specified database, space, or partition is not started and remains in its current state. If there are other databases, spaces, or partitions to be started, they are processed normally.

User Response: Correct the resource unavailable problem and reissue the -START command.

DSNI003I *csect-name* **UNABLE TO STOP OBJECT**
TYPE *object-type* **OBJECT NAME**
object-name **REASON** reason **TYPE** type
NAME name

Explanation: The identified object could not be stopped because a resource required to perform the stop was unavailable. The object could be a database,

a table space, an index space, or a partition within a table space or an index space.

The 'object-type' identifies the type and 'object-name' identifies the name. If the DB2 catalog is unavailable, 'object-type' contains binary zeros and 'object-name' contains blanks.

The resource that was unavailable is identified by 'type' and 'name'. The 'type' code identifies the type of the resource as well as the format and content of the resource, 'name'. For an explanation of resource type codes, see "Resource types" on page 1355. The 'reason' contains the reason code explaining why the resource was unavailable.

System Action: The specified database, space, or partition is not stopped and remains in the current state. If there are other databases, spaces, or partitions to be stopped, they are processed normally.

User Response: Correct the resource unavailable problem and reissue the -STOP command.

DSNI004I **RESOURCE HAS BEEN STOPPED**
TYPE type **NAME** name

Explanation: The resource identified by TYPE and NAME could not be opened/closed, initialized, or was found to be in an inconsistent state. The resource has been 'stopped' by DB2. If an open error occurred during DB2 startup, restart processing for the resource was deferred.

TYPE and NAME identify the resource that has been stopped. The TYPE code identifies the type of the resource as well as the format and content of the resource, NAME.

For an explanation of resource type codes, see "Resource types" on page 1355.

System Action: The database, table space or index space is stopped by DB2.

User Response: Previous messages provide information to allow you to determine the cause of the problem and the method of correcting it. Refer to them, and correct the problem. Then restart the database, table space, or index space using the -START command; and invoke the application again.

DSNI005I *csect-name* **LPL OR GRECP RECOVERY**
CANNOT BE DONE FOR *function - ID =*
id **OBJECT TYPE** *object-type* **OBJECT**
NAME *object-name* **REASON** reason
TYPE type **NAME** name

Explanation: The resource that is identified could not be recovered during a recovery function that is identified by *function_id* because of problems during LPL or

DSNI006I • DSNI007I

GRECP recovery. The resource could be a table space, an index space, or a partition within a table space or index space. *object-type* identifies the type of resource. *object-name* identifies the name of the resource.

The resource that could not be recovered is identified by *type* and *name*. The *type* code identifies the type of the resource, as well as the format and content of *name*. *reason* contains the reason code explaining why the resource could not be recovered. For an explanation of resource type codes, see "Resource types" on page 1355. *reason* contains the reason code explaining why the resource could not be recovered.

The potential values for *function* are START DATABASE COMMAND, AUTOMATIC GRECP RECOVERY, or AUTOMATIC LPL RECOVERY.

id is a decimal number that represents the recovery function that is indicated by *function*.

This message, in combination with message DSNI006I or DSNI022I, provides the LPL or GRECP recovery information for a recovery function that is identified by the *recovery-id*.

System Action: The specified space, or partition is started but remains in a LPL/GRECP state. If there are other spaces or partitions to be recovered, they are processed normally.

User Response: Correct the problem that is specified by the reason code, and reissue the -START command.

DSNI006I *csect-name* **ASYNCHRONOUS GRECP OR LPL RECOVERY IN PROGRESS FOR function - ID id TYPE type NAME name**

Explanation: This message is issued in response to a START DATABASE command, AUTOMATIC GRECP RECOVERY, or AUTOMATIC LPL RECOVERY function under the following conditions:

- When the object (table space or index space), which is identified by *type* and *name*, had group buffer pool recovery pending (GRECP) or logical page list (LPL) status, and
- Recovery was triggered.

The values for *function* could be START DATABASE COMMAND, AUTOMATIC GRECP RECOVERY, or AUTOMATIC LPL RECOVERY.

id is a decimal number that represents the recovery function.

For an explanation of resource type codes, refer to "Resource types" on page 1355 for an explanation of resource type codes.

System Action: The object is started. Also, GRECP or LPL recovery is initiated. During LPL or GRECP recovery process, message DSNI022I might be issued

periodically to indicate the recovery status. If the recovery completes successfully, message DSNI021I will appear at the end of recovery. Otherwise, message DSNI005I will indicate the error.

User Response: Wait for the DSNI021I or the DSNI005I message to be issued to the console. You can periodically issue a DISPLAY DATABASE RESTRICT command for the specified table space or index space to determine whether the GRECP or LPL exception state has been cleared.

DSNI007I *csect-name* **UNABLE TO START/RECOVER BECAUSE UNABLE TO DIRECT READ A LOG RECORD LOGRBA logrba**

Explanation: Unable to START (or RECOVER) because the necessary log records could not be accessed. Either an error occurred while attempting to allocate or open the log data set or an expected log record was not found on the log.

If the message is in response to a START command, issue the -DISPLAY command to determine which resource(s) was not started. If the message is in response to a RECOVER utility, the resource is the table space or index space that is the object of the RECOVER.

LOGRBA gives the log RBA of the log record that is unavailable.

System Action: The resource is not started (or recovered) and remains in the current state. If this is a START command, the resources are processed normally if there are other databases or spaces to be started and they do not involve reading the log.

User Response: Resubmit the utility, or reissue the START command, when the problem with the log has been resolved.

System Programmer Response: Run the print log map (DSNJU004) utility. This may be run with DB2 up or down. Find the data set that contains the requested RBA in the output of DSNJU004. If the required RBA is not in a listed data set, one of the following may have occurred:

- The data set was deleted from the bootstrap data set by a run of the change log inventory (DSNJU003) utility. In this case, rerun the utility to insert the missing data set name. DB2 must be down to run this utility.
- The bootstrap data set has been damaged. In this case, the BSDS must be restored from the dump that occurred with the most recent archive log data set. DSNJU003 must be run to supply changes that occurred during and after the last off-load operation. Changes may be determined from the operator's console listing.

If a listed log data set contains the required RBA, this message will be preceded by one or more error messages from the log manager (DSNJ). See these messages for appropriate action.

Problem Determination: Issue the -DISPLAY command to verify what got started.

**DSNI008I DATABASE VALIDATION PROCEDURE
name COULD NOT BE LOADED**

Explanation: The database validation procedure identified by 'name' could not be loaded.

User Response: Correct the name, and rerun the application.

**DSNI009I csect-name DATABASE EDIT
PROCEDURE name COULD NOT BE
LOADED**

Explanation: The database edit procedure identified by 'name' could not be loaded.

User Response: Correct the name, and rerun the application.

**DSNI010I BROKEN PAGE ACCESSED TYPE type
NAME name MODNAME csect-name
CONN-ID id CORR-ID id LUW-ID id**

Explanation: The page identified by TYPE and NAME could not be accessed, because it is marked as logically broken.

The TYPE and NAME identify the resource that is currently unavailable. The TYPE code identifies the type of the resource as well as the format and content of the resource NAME.

Type codes '00000301', '00000302', and '00000303' apply to this message. Refer to Appendix B, "Problem determination," on page 1353 for a table showing all types and names.

'csect-name' has encountered the logically broken page. CONN-ID, CORR-ID, and LUW-ID identify the thread involved in the problem. If the LUW-ID is an '*', the thread originated at this site. Correlation IDs beginning with 'Onn', where 'nn' is a number from 01 to 28, identify system agents.

User Response: If the TYPE is '00000300', use NAME to determine if the page is in an index space or a table space. Use the REPAIR utility to fix the broken page. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

**DSNI011I PAGE TEMPORARILY UNAVAILABLE
TYPE type NAME name MODNAME
modname ERQUAL erqual**

Explanation: The page identified by TYPE and NAME has been temporarily marked as logically broken to prevent access until it can be recovered.

The TYPE and NAME identify the resource that is currently unavailable. The TYPE code identifies the type of the resource as well as the format and content of the resource NAME. Refer to Table 3 on page 1355 for an explanation of resource type codes.

The module named modname has called a page checking routine, which discovered an error in the page.

The ERQUAL gives the trace id for the error in the page. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

System Action: Automatic recovery for the page has been scheduled. The current agent will abend with reason code '00C90105', and a dump will be taken. The page will be unavailable to this and other agents until the online recovery has completed successfully. Message DSNIO10I will be issued, and a 'resource unavailable' condition will be returned to any agents that attempt to access the page. If the online recovery fails, the page will be marked as broken until it is repaired or recovered (see message DSNIO12I).

User Response: Save the dump. Watch for message DSNB215I (indicating successful recovery of the page), or DSNIO12I (indicating failure of recovery of the page).

**DSNI012I PAGE LOGICALLY BROKEN TYPE type
NAME name MODNAME modname
ERQUAL erqual**

Explanation: The page identified by TYPE and NAME is logically incorrect. Additional attempts to access the page will be denied.

The TYPE and NAME identify the resource that is currently unavailable. The TYPE code identifies the type of the resource as well as the format and content of the resource NAME. Refer to Table 3 on page 1355 for an explanation of resource type codes.

The module named 'modname' has called a page checking routine, which discovered an error in the page.

The ERQUAL gives the trace id for the error in the page. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem. An ERQUAL of X'0000' indicates that an abend occurred during online recovery or recover utility. The page has been marked as broken, and the recovery has failed.

System Action: The page is marked as logically broken, an 04E abend with reason code '00C90102' is issued, and a dump is taken. The page will be

unavailable to this and other agents until it is repaired.

User Response: Save the dump for analysis by IBM Support Center. Copy the table space or index space to another data set for later analysis by IBM Support Center. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Operator Response: Notify the system programmer.

System Programmer Response: See the Explanation section of this message.

DSNI013I *csect-name* **POTENTIALLY INCONSISTENT DATA REASON** *reason*
ERQUAL *erqual* **TYPE** *type* **NAME** *name*
CONN-ID *id* **CORR-ID** *id* **LUW-ID** *id*

Explanation: This message identifies a page with potentially inconsistent data. This message is issued for each page involved in the current data manager operation. The 'csect-name' in the message identifies the CSECT that issued the message.

The 'erqual' in the message identifies the specific abend in the CSECT that caused this message to be issued. This information and the reason code are used by IBM Support Center to identify the cause of the problem.

'name' and 'type' identify the page and its type. The TYPE code identifies the type, as well as the format and content, of the NAME. Refer to Appendix B, "Problem determination," on page 1353 for a table showing all types and names.

CONN-ID, CORR-ID, and LUW-ID together identify the thread involved in the problem. If the LUW-ID is an '*', the thread originated at this site. Correlation IDs beginning with '0nn' where 'nn' is a number from 01 to 28, identify system agents.

For further information, see the Explanation section for the abend reason code specified in this message.

System Action: The job is abended shortly after this message appears.

User Response: Notify the system programmer.

Operator Response: Collect the console output from the system on which the job was run. Save this output for use in problem determination.

System Programmer Response: See the Problem Determination section for the specific abend reason code.

Problem Determination: See the System Programmer Response section of the abend reason code specified in this message.

DSNI014I *csect-name* **DATA IN USE DURING ABEND REASON 00C90101 ERQUAL**
erqual **TYPE** *type* **NAME** *name* **CONN-ID**
id **CORR-ID** *id* **LUW-ID** *id*

Explanation: This message identifies a page that was in use at the time an abend condition occurred with reason code 00C90101. This message is issued for each page involved in the current operation.

ERQUAL identifies the specific abend in the CSECT that caused this message to be issued. This information and the reason code are used by IBM Support Center to identify the cause of the problem.

NAME and TYPE identify the page and its type. The TYPE code identifies the type, as well as the format and content, of the NAME. Refer to Table 3 in Appendix B, "Problem determination," on page 1353 for an explanation of resource type codes.

CONN-ID, CORR-ID, and LUW-ID together identify the agent involved in the problem. If the LUW-ID is an '*', the thread originated at this site. Correlation IDs beginning with '0nn' where 'nn' is a number from 01 to 28, identify system agents.

System Action: The job abends with reason code 00C90101 after this message appears.

User Response: Notify the system programmer.

Operator Response: Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

System Programmer Response: See abend reason code 00C90101 for more information.

Problem Determination: In general, the data in these pages is fine. However, if problems are reported that repeatedly involve the same pages or if the same pages are reported by other abends, you might want to analyze the set of pages involved.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNI015I **OBJECT name IS ALREADY STARTED FOR RW ACCESS. THE OBJECT WILL REMAIN STARTED FOR RW ACCESS**

Explanation: The -START DATABASE command with the ACCESS(FORCE) keyword was entered, but the object specified was already started for read/write access.

**DSNI016I RESOURCE TYPE type NAME name
MUST FIRST BE STOPPED BEFORE IT
CAN BE STARTED IN A DIFFERENT
ACCESS MODE**

Explanation: When issuing the -START DATABASE command on the ROSHARE OWNER system, the object to be started must first be stopped before changing access modes. For example, if a table space in a database defined as ROSHARE OWNER is started for RW access, before it can be started for RO access it must be stopped via the -STOP DATABASE command. It can then be started for RO access via the -START DATABASE command.

Severity: 8 (error)

System Action: The -START DATABASE command is not allowed to proceed.

User Response: Issue a -STOP DATABASE command to stop the object before attempting to start it.

**DSNI017I RESOURCE TYPE type NAME name IS
INCONSISTENT DUE TO ONE OR
MORE PENDING STATES**

Explanation: There are two possible reasons for this message:

- The header page of a table space, index, or partition belonging to a database defined as ROSHARE OWNER could not be marked as consistent during the processing of the STOP DATABASE command because one or more of the following was true:
 - The table space, index, or partition is in recovery pending status.
 - The table space, index, or partition is in check pending status.
 - The table space, index, or partition has pages in the logical page list (LPL).
 - The table space, index, or partition status has a utility in progress (UTUT status on the output from a DISPLAY DATABASE command).
 - The table space, index, or partition has a utility in progress that allows read-only access (UTRO on the output from a DISPLAY DATABASE command).
 - An I/O error range exists.
- A retained lock is held on the table space, index, or partition. The retained lock could be signifying a pending status.

If the STOP DATABASE command was issued without specifying the SPACENAM parameter, then one or more of the conditions stated above is true for one or more table spaces, indexes, or partitions in the specified database.

Severity: 4 (warning)

System Action: For case 1, if the STOP DATABASE

command was specified with the SPACENAM parameter, the table space, index, or partition is stopped. DB2 does not allow access to an inconsistent table space, index, or partition by any ROSHARE READ system.

For case 2, no access to an inconsistent table space, index, or partition is allowed until the retained lock is released by the failed system at completion of its restart.

User Response: Issue a DISPLAY DATABASE command to display the status of the object in question. Resolve the pending states and then reissue the STOP DATABASE command to ensure that the consistency indicator is reset.

**DSNI018I UNABLE TO GET LOCK FOR
RESOURCE TYPE type NAME name.
WILL RETRY TO GET LOCK.**

Explanation: The resource identified by 'type' and 'name' could not be locked because of lock contention. The lock request is made again for this resource.

The 'type' and 'name' identify the resource trying to get a lock. The 'type' code identifies the type of resource as well as the format and content of the resource 'name'.

Refer to Table 3 in Appendix B, "Problem determination," on page 1353 for an explanation of resource type codes.

Severity: 0 (informational)

System Action: The lock request is made again for the specified resource.

**DSNI019I THE STOP COMMAND FOR OBJECT
name WAS OVERRIDDEN BY A START
FORCE. THE STOP COMMAND IS
IGNORED.**

Explanation: The object identified by 'name' was not stopped because a START FORCE command on this object was subsequently issued and processed.

This message is informational only.

Severity: 0 (informational)

System Action: The object is not stopped.

**DSNI020I csect-name UNABLE TO DRAIN
RESOURCE TYPE type NAME name.
WILL RETRY DRAINING THE
RESOURCE.**

Explanation: The resource identified by 'type' and 'name' could not be drained. The 'type' code identifies the type of resource as well as the format and content of the resource 'name'. The drain request is made again for this resource.

Refer to Table 3 in Appendix B, "Problem determination," on page 1353

DSNI021I • DSNI026I

on page 1351 for an explanation of resource type codes.

System Action: The drain request is made again for the specified resource.

DSNI021I *csect-name* **GRECP OR LPL RECOVERY FOR *function* - ID = *id* TYPE *type* NAME *name* HAS COMPLETED SUCCESSFULLY.**

Explanation: The group buffer pool recovery pending (GRECP) or logical page list (LPL) exception state of the table space or index space has been cleared. The table space or index space can be identified by *type* and *name*.

The potential values for *function* are START DATABASE COMMAND, AUTOMATIC GRECP RECOVERY, or AUTOMATIC LPL RECOVERY.

id is a decimal number that represents a recovery function.

Refer to "Resource types" on page 1355 for an explanation of resource type codes.

This message is always preceded by the DSNI006I message, which indicates the beginning of the LPL or GRECP recovery for the object.

System Action: The identified table space or index space is started normally.

DSNI022I *csect-name* **LPL or GRECP RECOVERY LOG APPLY FOR *function* - ID = *id* AT LOGPOINT *xxx* TO LOGPOINT *yyy***

Explanation: This message periodically shows the progress of the LPL or GRECP recovery of a START DATABASE command, AUTOMATIC GRECP RECOVERY, or AUTOMATIC LPL RECOVERY.

The potential values for *function* are START DATABASE COMMAND, AUTOMATIC GRECP RECOVERY, or AUTOMATIC LPL RECOVERY.

id is a decimal number that represents a recovery function.

xxx is the LOGPOINT of the log record currently being processed. *yyy* is the LOGPOINT of the last log record that will be applied in this recovery. The value of logpoint is RBA in a non-data sharing environment and LRSN in a data sharing environment.

This message, in combination with message DSNI006I, DSNI005I, or DSNI021I, provides the LPL or GRECP recovery information for the recovery function that is identified by *function*.

System Action: The LOGAPPLY phase continues normally.

DSNI023I *csect-name* **PAGE SET *dbnam.psnam* PART *part* IS RESTP ON BEHALF OF UR *urid*. BACKOUT TO RBA *rba* IS REQUIRED.**

Explanation: 'Status' is either RESTP (Restart Pending) or AREST (Advisory Restart Pending). This message indicates that the named UR has backout work pending against the named page set or partition. The backout work for this UR against this page set or partition will be complete once backward processing of the log reaches the identified RBA.

For non-partitioned page sets, the partition given in the message is the string *n/a*.

DSNI024I *csect-name* **BACKOUT PROCESSING IS COMPLETE FOR PAGE SET *dbnam.psnam* PART *part*.**

Explanation: This message indicates that backout processing is complete for the named table space, index space, or partition. If the object was in restrictive *restart pending* state, that state is lifted. If the object was in an *advisory restart pending* state, locks held on the object on behalf of postponed abort URs by the DB2 member issuing the message are released. The advisory restart pending state is lifted if the DB2 member issuing the message is the only member still contributing to the state.

For non-partitioned page sets, the partition given in the message is the string "n/a".

DSNI025I *csect-name* **THE FAST LOG APPLY PROCESS REQUIRES *aaaaaaaa* BYTES OF STORAGE, BUT GOT ONLY *bbbbbbbb* BYTES**

Explanation: The Fast Log Apply process could not obtain all the required storage. However, the storage acquired is enough for the Fast Log Apply process to continue.

Severity: 0 (informational)

System Action: The Fast Log Apply process continues with the smaller amount of storage for the log buffers.

DSNI026I *csect-name* **THE FAST LOG APPLY PROCESS IS DISABLED BECAUSE ALL OF THE ALLOWABLE STORAGE IS EXHAUSTED**

Explanation: There is no *ssnmDBM1* storage available for the Fast Log Apply process to use. There are too many jobs (RECOVER or -START DB command) running in parallel.

Severity: 0 (informational)

System Action: The recovery of the requested objects continues without the Fast Log Apply process.

DSNI027I *csect-name* **THE FAST LOG APPLY PROCESS IS DISABLED BECAUSE IT IS UNABLE TO ACQUIRE THE MINIMUM REQUIRED STORAGE**

Explanation: There is not enough ssnmDBM1 storage available or reserved for the Fast Log Apply process to use.

Severity: 0 (informational)

System Action: The recovery of the requested objects continues without the Fast Log Apply process.

DSNI028I *csect-name* **THE NUMBER OF QUALIFIED LOG RECORDS READ DURING THE FAST LOG APPLY PROCESS IS *log-records* AND THE NUMBER OF FAST LOG APPLY BUFFERS PROCESSED ARE *fla-buffers***

Explanation: This informational message is issued during the Fast Log Apply process. *log-records* indicates the number of log records that have been applied during the Fast Log Apply process. *fla-buffers* indicates the number of buffers used by the Fast Log Apply process.

Severity: 0 (informational)

DSNI029I *csect-name* **THE FAST LOG APPLY PROCESS IS ACTIVE AND THE AVAILABLE *ssnmDBM1* STORAGE IS *bytes* BYTES**

Explanation: This informational message is issued during the Fast Log Apply process for member *ssnm*. There is sufficient storage for the Fast Log Apply process to continue, and the remaining amount of available storage is displayed in hexadecimal as *bytes*.

Severity: 0 (informational)

DSNI030I *csect-name* **BACKOUT PROCESSING IS CONTINUING BEYOND THE REQUESTED LIMIT DUE TO CATALOG OR DIRECTORY ACTIVITY OF UR *urid*.**

Explanation: The number of log records requested to be processed during restart's backward phase have been processed. Under other circumstances further backout processing would be postponed. However, because the indicated UR has catalog or directory updates that are not backed out yet (and because backout against catalog or directory page sets cannot be postponed), backout processing is continuing. It will continue until this UR's backout is complete.

System Action: Backout processing continues.

DSNI031I *csect-name* - **LOCK ESCALATION HAS OCCURRED FOR RESOURCE NAME = *name*, LOCK STATE = *state*, PLAN NAME : PACKAGE NAME = *id1:id2*, COLLECTION-ID = *id11*, STATEMENT NUMBER = *id3*, CORRELATION-ID = *id4*, CONNECTION-ID = *id5*, LUW-ID = *id6*, THREAD-INFO = *id7:id8:id9:id10***

Explanation: Lock escalation balances concurrence with performance by using page locks while a process accesses relatively few pages, then changing to table space or table locks when the process accesses a number of pages that exceeds a defined threshold (LOCKMAX) for the tablespace.

name The name of the escalated resource. The format of *name* depends on the type of table space. For simple or partitioned table spaces, the format is *database-name.tablespace-name*. For a segmented table space, the format is *creator-name.table-name* (or DBID.OBID of the table).

state The lock state (after escalation) of the escalated resource.

id1 The name of the executing plan associated with this thread.

id2 The name of the executing package (if any) associated with this thread.

id3 The statement number of the executing SQL statement associated with this plan.

id4 The correlation identifier of the thread associated with the escalated resource.

id5 The connection identifier of the thread associated with the escalated resource.

id6 The logical-unit-of-work identifier of the thread associated with the escalated resource.

id7 Thread Info - the primary authorization_id associated with the thread.

id8 Thread Info - Work station name of the end user's work station. An asterisk (*) indicates that it is not relevant to the thread or was not provided by the client.

id9 Thread Info - User-Id of the end user. An asterisk (*) indicates that it is not relevant to the thread or was not provided by the client.

id10 Thread Info - Application name of the end user's application. An asterisk (*) indicates that it is not relevant to the thread or was not provided by the client.

id11 The collection-id of the package (if any). resource.

System Action: Escalation has occurred for the specified object

DSNI032I *csect-name* **CANCEL THREAD NOBACKOUT COMMAND FAILED FOR THE THREAD = *token* REASON = *reason***

Explanation: DB2 displays this message when it cannot grant a request to cancel a thread without backing out data changes. The reason code explains why the request was rejected.

token Identifies a thread whose processing you requested to cancel. The token is a 1- to 15-digit decimal number.

reason Indicates the reason why the command failed.

System Action: Processing terminates normally.

User Response: The reason code specifies the action to be taken.

DSNI033I *csect-name* **PAGE SET *dbname.psname* PART *part* IS MARKED REFP AND *status* ON BEHALF OF UR *ur-id*. RECOVERY TO *logout* IS REQUIRED.**

Explanation: No further backout processing will be attempted on the specified page set or partition because backout for unit of recovery *ur-id* has been cancelled. The specified page set or partition is marked Refresh pending (REFP).

Severity: 0 (informational)

User Response: If the object in Refresh pending status is a table space, you can resolve the REFP,LPL state of the specified page set or partition in more than one way. You can run the RECOVER utility to perform point-in-time recovery, or run the LOAD utility with the REPLACE option to resolve the REFP,LPL state.

If page set is an index space, run the REBUILD utility to perform point-in-time recovery and resolve the REFP,RBDP or REFP,LPL status. You can use the RBA;LRSN value indicated in this message for point-in-time recovery.

DSNI034I *csect-name* **TABLE SPACE *table-space-name* IS IN AUX WARNING STATE**

Explanation: DB2 attempted to recover table space *table-space-name*, but no log records exist because the table space was created with the LOG NO option. The table space is placed in an auxiliary warning state. You can use SQL statements to update the LOB values that are in error or to delete the row that contains the LOB values. In addition, you can use SQL statements to access valid LOBs. However, you cannot use SQL statements to retrieve a LOB value that is not valid.

Severity: 0 (informational)

System Action: DB2 marks the LOB values that are in error as not valid. Processing continues.

Programmer Response: Use SQL statements to update or delete the LOB values in error. Use the CHECK LOB utility to verify that all errors were corrected and to reset the auxiliary warning state. The auxiliary warning state can also be reset using the REPAIR utility with SET NOAUXWARN.

DSNI035I *csect-name* **THE REAL-TIME STATISTICS COLLECTION PROCESS IS STOPPED**

Explanation: The statistics database stopped successfully, and the real-time statistics process is halted.

Severity: 0 (informational)

System Action: DB2 will not externalize in-memory statistics.

DSNI036I *csect-name* **THE REAL-TIME STATISTICS COLLECTION PROCESS IS DISABLED**

Explanation: An error prevents DB2 from externalizing the in-memory statistics. The error is generally a persistent error and must be remedied before the process can be enabled. Look for prior messages to identify the nature of the problem.

System Action: The statistics database is implicitly stopped and no further attempt will be made to externalize the in-memory statistics.

Operator Response: Notify the system programmer.

System Programmer Response: Inspect the console for prior messages and refer to those messages for problem determination.

DSNI037I *csect-name* **THE REAL-TIME STATISTICS COLLECTION PROCESS COULD NOT ACCESS AN OBJECT IN THE REAL-TIME STATISTICS DATABASE**

Explanation: An error prevents DB2 from externalizing the in-memory statistics. An attempt failed to insert, update, or delete a row in the statistics database. The error is generally transient (lock time-out or resource unavailable). If the operation is retried, it is likely to succeed.

System Action: The statistics are kept in-memory until the next opportunity to externalize them.

DSNI038I *csect-name* **THE REAL-TIME STATISTICS COLLECTION PROCESS IS ENABLED**

Explanation: The statistics database started successfully. The required object descriptors in the statistics database exist and have the correct attributes.

DB2 proceeds to externalize in-memory statistics for all modified objects.

Severity: 0 (informational)

System Action: The database is started R/w.

DSNI041I *csect-name* **START ACCESS(FORCE)
CANNOT BE ISSUED AGAINST
TARGET** *obj-type obj-qual.obj-name part*
**DUE TO STOPPED UTILITIES ON
VERSION** *version-number*. **REQUEST IS
REJECTED.**

Explanation: The object cannot be started due to outstanding utilities on a different version. The status of the object is unchanged.

version-number is the version on which the utility was running.

obj-type is table space or index space.

obj-qual is the database name.

obj_name is the table space or index space name.

part represents the partition number for a partitioned table space.

System Action: The request is rejected.

User Response: Use the DISPLAY UTILITY command to see what utilities are outstanding. Issue the -START DATABASE ACCESS(FORCE) command on the same version as the version on which the stopped utility was running. If there is more than one utility outstanding on the object and the utilities were submitted on a different release of DB2, start the correct version of DB2 and use the -TERM UTILITY command to terminate each utility.

Chapter 11. DSNJ... Messages

DSNJ001I *csect-name* **CURRENT COPY *n* ACTIVE LOG DATA SET IS DSNNAME=..., STARTRBA=..., ENDRBA=...**

Explanation: This message is generated for one of two reasons:

1. When the log manager is initialized, it sends this informational message to identify the current active log data sets (copy-1 and, if dual logging is used, copy-2).
2. When the current active log data set is full, DB2 will switch to the next available active log data set. This message identifies the next available active log data set which will be used for logging.

The value specified by the STARTRBA=value keyword is the RBA of the first byte of log data in the named data set. The value specified by the ENDRBA=value keyword is the RBA of the last possible byte in the data set. These values may later be needed for a conditional restart.

System Programmer Response: None required. However, if recovery is required, information from this message may be required as input to the change log inventory (DSNJU003) utility.

DSNJ002I **FULL ACTIVE LOG DATA SET DSNNAME=..., STARTRBA=..., ENDRBA=...**

Explanation: This message is sent at the time the log manager fills an active log data set and switches to a new empty data set. The message shows the name and log RBA range of the full data set.

System Programmer Response: None required. However, if recovery is required information from this message may be required as input to the change log inventory (DSNJU003) utility.

DSNJ003I *csect-name* **FULL ARCHIVE LOG VOLUME DSNNAME=..., STARTRBA=..., ENDRBA=..., STARTxxx=..., ENDxxx=..., UNIT=..., COPYnVOL=..., VOLSPAN=..., CATLG=...**

Explanation: Offloading for the specified archive log data set was successfully completed for the given volume. If the data set spans multiple tape volumes, this message is generated for each tape volume. If the data set spans multiple dasd volumes, only one message will be generated displaying the first VOLSER appended with a '+' to indicate the data set spans multiple volumes. 'xxx' is replaced by either TIME or LRSN.

System Action: An archive log data set has been created, and the archive log data set inventory in the

bootstrap data set (BSDS) has been updated with the information in the message:

DSNAME

The name of the archive log data set.

STARTRBA

The starting RBA contained in the volume.

ENDRBA

The ending RBA contained in the volume.

STARTLRSN

The starting LRSN contained in the volume for data sharing systems.

ENDLRSN

The ending LRSN contained in the volume for data sharing systems.

STARTTIME

The starting store-clock value of the log records in the volume for non-data sharing systems.

ENDTIME

The ending store-clock value of the log records in the volume for non-data sharing systems.

UNIT

The device unit to which the data set was allocated.

COPYnVOL

The name of the volume. This message keyword is displayed as COPY1VOL if this is the copy-1 archive log data set, and as COPY2VOL if this is the copy-2 archive log data set.

VOLSPAN

An indicator to denote one of four conditions:

- If '00', the data set is entirely contained on the volume specified by 'COPYnVOL'.
- If '01', this is the first entry of a multivolume data set.
- If '11', this is the middle entry of a multivolume data set.
- If '10', this is the last entry of a multivolume data set.

CATLG An indicator to denote one of two conditions:

- If 'NO', the archive log data set is uncataloged.
- If 'YES', the archive log data set is cataloged.

The BSDS is automatically updated with the information contained in this message; however, if recovery is required, information from this message may be required as input to the change log inventory (DSNJU003) utility.

DSNJ004I **ACTIVE LOG COPY *n* INACTIVE, LOG IN SINGLE MODE, ENDRBA=...**

Explanation: This message is sent when the dual active logging option is selected and copy 'n' becomes inactive. A log copy becomes inactive when the next active log data set is not ready when required. ENDRBA

is the last byte of log data written on copy 'n'. This is usually caused by a delay in off-load.

System Action: The log is switched to single mode until the next data set for copy 'n' is ready for logging.

If DB2 is shut down or abends while in single mode with the ZPARM option still set for dual active data sets, the previous state of the active log data sets determines what happens when DB2 is started, as follows:

- If fewer than two data sets are available (not flagged as STOPPED) for each set of active logs, DB2 startup terminates and message DSNJ112E is issued.
- If an active log data set is in NOTREUSABLE state, DB2 can be started in single logging mode, but dual mode takes effect when the other active log data set becomes available after offloading.

Operator Response: Execute an MVS *Display System Requests* command (D R,L for example) to ensure that there are no outstanding requests that are related to the log off-load process. Take the necessary action to satisfy any requests, and permit off-load to continue.

System Programmer Response: If the switch to single mode was caused by the lack of a resource required for off-load, the necessary resource should be made available to allow off-load to complete and thus permit dual logging to proceed. If recovery is required, information from this message might be required as input to the change log inventory (DSNJU003) utility.

DSNJ005I ACTIVE LOG COPY n IS ACTIVE, LOG IN DUAL MODE, STARTRBA=...

Explanation: This message is sent when copy 'n' of the log becomes active after previously being flagged as inactive. STARTRBA is the RBA of the first byte of log data written on copy 'n' after it was activated.

System Programmer Response: None required. However, if recovery is required, information from this message may be required as input to the change log inventory (DSNJU003) utility.

DSNJ006I ALLOCATION FOR NEW ARCHIVE LOG DATA SET HAS BEEN CANCELLED BY OPERATOR.

Explanation: This message is sent if the operator answers 'N' to the WTOR message DSNJ008E.

System Action: If the allocation is for copy 1 archive log data set, off-load terminates processing until the next time it is activated. If copy 1 has already been allocated and this request is for copy 2, off-load switches to single off-load mode for this data set only.

DSNJ007I csect-name OPERATOR CANCELED MOUNT OF ARCHIVE VOL SER= volser

Explanation: If the operator answers 'N' to the WTOR message DSNJ009I, this message is issued. The variable 'volser' is the volume serial of an archive log volume required for the read request.

System Action: The read request for the archive log volume fails. If the request was issued with the COND=YES parameter, return code 12 and reason code 00D1032B are returned to the requester. Otherwise, DB2 abends with reason code 00D1032B.

DSNJ008E nn OF mm ACTIVE LOGS ARE FULL. ssname NEEDS ARCHIVE SCRATCH. REPLY Y WHEN DEVICE READY OR N TO CANCEL.

Explanation: The installation has requested a WTOR before archive log data set allocation. DB2 needs a scratch volume for offloading an active log data set. 'ssname' is the name of the DB2 subsystem. 'nn' is the number of full active log data sets. 'mm' is the total number of active log data sets.

System Action: The off-load task waits for the operator's reply.

Operator Response: The operator has three options:

- Get a scratch volume ready, make sure there is an available unit for the volume, and reply 'Y'. DB2 then continues with the off-load.
- Determine from the number of active log data sets available whether the off-load can be delayed until the next time an active log data set becomes full. If the process can be delayed, then reply 'N'. This response has two possible effects.
 - If dual archive logging is in effect and this allocation is for a copy 1 archive data set, the 'N' response delays the off-load process until the next active log data set becomes full.
 - However, if the copy 1 archive data set has already been allocated and this request is for copy 2, the 'N' response causes the off-load to switch to single archive mode (the switch is for this data set only).
- Defer giving a response. This causes off-load to wait before processing. However, because off-load is a separate service task, the wait does not affect DB2 performance.

If offloading to DASD, an error has occurred attempting to allocate an archive log data set. Reply 'Y' to receive the error messages.

DSNJ009E **ssname NEEDS VOL SER=nnnnnn.**
REPLY Y TO CONTINUE OR N TO
CANCEL

Explanation: The installation requested WTOR before archive log data set allocation. DB2 needs the specified archive volume for a read operation. The subsystem name is 'ssname'.

System Action: The archive log read service task waits for the operator's reply. This wait affects the agent for which the log read was issued and any other agents that might be waiting on the log read service task queue.

Operator Response: Locate the requested volume, ensure that a device is available, and reply 'Y'. DB2 continues with dynamic allocation and then begins reading the log.

If dual archiving is in effect, a response of 'N' causes archive read to reissue the message for the copy 'Z' copy 2 archive VOLSER with the same RBA range. A response of 'N' to this second WTOR, or to the initial WTOR for single archiving, causes the archive read service task to fail with unpredictable results.

DSNJ010I *csect-name* **INVALID RESPONSE. WTOR**
WILL BE REPEATED.

Explanation: A WTOR was issued during archive data set allocation. The user did not respond correctly to the message. Either 'Y' or 'N' must be entered.

System Action: The original WTOR is repeated.

Operator Response: Reply as indicated in the repeated message.

DSNJ011I **CONDITIONAL RESTART RECORD rrr**
CREATED AT WAS FOUND. REPLY
Y TO USE, N TO CANCEL

Explanation: When the log manager was initialized, a conditional restart control record was found in the bootstrap data set. Both the record identifier (a 4 byte hexadecimal number) and the creation time stamp (yy.ddd hh:mm) are displayed to help identify the conditional restart record which will be used. If you want a conditional restart using that record, reply 'Y' to the message. Otherwise, reply 'N' and notify the system programmer.

System Action: If 'Y' is the response, DB2 is started conditionally, using the record found. If 'N' is the response, DB2 startup is terminated.

Operator Response: If a DB2 conditional restart is to be done and if the date and time displayed are correct, then reply 'Y' to the outstanding message. If you are not sure, then contact the system programmer.

System Programmer Response: If a normal restart of DB2 has failed and you have created a conditional restart control record with the change log inventory

(DSNJU003) utility, check whether the time and date in the message agree with when you created that record. If they do, reply 'Y' to the outstanding WTOR. If they do not, reply 'N' and investigate the discrepancy.

DSNJ012I **ERROR ccc READING RBA rrr IN DATA**
SET ddd CONNECTION-ID=xxxxxxx,
CORRELATION-ID=yyyyyyyyyyy

Explanation: While scanning log records read into a buffer, the log manager detected a logical error with reason code 'ccc'. 'rrr' is the log RBA of the segment in the buffer at which the error was detected. 'ddd' is the name of the active or archive log data set from which the record was read. If 'ddd' is blank, the data was read from an active log output buffer.

The connection and correlation IDs identify the user or application that encountered the problem. Messages that have the same connection ID and correlation ID relate to the same user. Correlation IDs beginning with '0nn' where 'nn' is a number from 01 to 28, identify system agents.

Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for information about recovery from log failures.

System Action: The application program that invoked the log manager is terminated with reason code 'ccc'. However, information in this message may be useful in diagnosing the abend that will follow.

DSNJ013I **TERMINAL ERROR ccc IN BUFFER rrr**
BEFORE ACTIVE LOG WRITE

Explanation: A scan of the log output buffer just prior to writing the buffer detected an inconsistency in the log data. 'ccc' is the abend reason code associated with the SDUMP that is produced. 'rrr' is the log RBA at which the error was detected.

System Action: DB2 will terminate with a dump, and will not write the damaged buffer to either COPY 1 or COPY 2 active log data set.

Operator Response: Notify the system programmer. Start DB2 after it terminates.

System Programmer Response: Because the damaged buffer has not been written to a log data set, DB2 may be restarted. No corrective action is required.

Problem Determination: In the DB2 formatted block section of the dump, locate the chain of LBCE blocks. Those are log buffer control elements, and each LBCE controls one 4KB log output buffer. LBCEBUFF, at offset X'20' in the LBCE, points to the buffer, which is always on a 4KB boundary. The log RBA of the first byte of the buffer is in a 6-byte field at offset X'FF2' in the buffer itself. The layout of the buffer is described by the DSNDLCID mapping macro. The header of each record within the buffer is described by the DSNDLRH mapping macro. Locate the buffer that contains the log RBA from the message and find the damage by referring to the

description of the reason code later in this book.

**DSNJ014I TERMINAL ERROR ccc IN BUFFER rrr
AFTER ACTIVE LOG WRITE.**

Explanation: A scan of the log output buffer, after writing to the COPY 1 active log data set and before writing to COPY 2, detected an inconsistency in the log data. 'ccc' is the abend reason code associated with the SDUMP that is produced. 'rrr' is the log RBA at which the error was detected.

System Action: DB2 will terminate with a dump, and will not write the damaged buffer to the COPY 2 data set.

Operator Response: Notify the system programmer.

System Programmer Response: The block containing the indicated log RBA may be damaged. The buffer was found to be in error at the completion of the write to the COPY 1 data set of the active log.

If dual active logs are being used, use print log map (DSNJU004) to list the active log data sets for both copies of the active log. Find the COPY 2 data set with the corresponding RBA, and copy that data set (using access method services REPRO) to the COPY 1 data set. Start DB2.

If only a single active log is used, contact the IBM support center for assistance. An attempt to start DB2 may succeed if the damage to the buffer occurred after completion of the write to DASD.

Problem Determination: In the DB2 formatted block section of the dump, locate the chain of LBCE blocks. Those are log buffer control elements, and each LBCE controls one 4KB log output buffer. LBCEBUFF, at offset X'20' in the LBCE points to the buffer, which is always on a 4KB boundary. The log RBA of the first byte of the buffer is in a 6-byte field at offset X'FF2' in the buffer itself. The layout of the buffer is described by the DSNLDCID mapping macro. The header of each record within the buffer is described by the DSNDLRH mapping macro. Locate the buffer that contains the log RBA from the message and find the damage by referring to the description of the reason code later in this book.

**DSNJ015I CSRONLY PROHIBITS LOG
ALTERATIONS. RECORD rrr CREATED
.... REPLY Y TO USE, N TO CANCEL.**

Explanation: During DB2 startup, the log manager found an inactive conditional restart control record in the bootstrap data set. Because this control record indicates CSRONLY, no log data sets will be modified. If log truncation was specified, it will be simulated. Only the first phase of restart (current status rebuild) will be performed. The hexadecimal identifier (rrr) and creation timestamp (yy.ddd hh:mm) identify the record found.

System Action: A 'Y' reply will continue the conditional restart. A 'N' reply will terminate DB2 startup.

Operator Response: To continue this CSRONLY processing, reply 'Y' to this message. If you are not sure, contact the system programmer.

System Programmer Response: The conditional restart control record will not be deactivated at the end of the CSRONLY processing. To deactivate this record, either cancel this record or create a new record. Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for more information.

**DSNJ016E csect-name WARNING - SYSTEM
CHECKPOINT PROCESSOR MAY HAVE
STALLED. LAST CHECKPOINT WAS
TAKEN date-time.**

Explanation: While switching active log data sets, DB2 found that there has not been a system checkpoint taken since the last time DB2 switched active log data sets. *date-time* is the date and time of the last system checkpoint. There should be at least one system checkpoint on each log data set.

System Action: DB2 continues processing. If statistics class 3 is active, IFCID 0335 is written. This message will be deleted when a system checkpoint is taken.

System Programmer Response: This may be an indication that the system checkpoint processor may no longer be functioning. This situation can result in a very long restart if logging continues without a system checkpoint. You should monitor system checkpoint activity very closely. You can use the -DISPLAY LOG command or run the Print Log Map utility (DSNJU004) to display the most recent checkpoint. If DB2 continues logging beyond the defined checkpoint frequency, you should quiesce activity and terminate DB2 to minimize the restart time.

Prior to terminating DB2, obtain a dump of the DB2 address spaces for problem determination.

**DSNJ017E csect-name WARNING - OFFLOAD
TASK HAS BEEN ACTIVE SINCE
date-time AND MAY HAVE STALLED.**

Explanation: While switching active log data sets, DB2 found that the offload task has been active since the last time DB2 switched active log data sets. The offload task began archiving an active log data set at *date-time*.

System Action: DB2 continues processing. If statistics class 3 is active, IFCID 0335 is written. This message will be deleted when the offload task completes the archive process.

System Programmer Response: This may be an indication that there may be an outstanding tape mount request or that the offload task may no longer be functioning. This situation can result in a log-full situation if DB2 can not archive log data sets when they fill. You should reply to any tape mount requests and monitor offload activity very closely. You can issue the

-DISPLAY LOG command to display the status of the offload task, and the -ARCHIVE LOG CANCEL OFFLOAD command can be used to terminate and restart the offload process.

Prior to terminating the offload task, obtain a dump of the DB2 MSTR address space for problem determination.

DSNJ020I *csect-name* **RECEIVED REPLY OF N TO msg-num. SUBSYSTEM STARTUP IS TERMINATED.**

Explanation: The operator chose to terminate DB2 startup by answering 'N' to 'msg-num'.

System Action: DB2 will not restart.

Operator Response: To restart DB2, follow the 'operator response' of 'msg-num'.

DSNJ030I **RBA RANGE startdba TO enddba NOT AVAILABLE IN ACTIVE LOG DATA SETS**

Explanation: Previous errors have made the active log data set(s) that contain the relative byte address (RBA) range reported in the message unavailable to DB2. The status of these log(s) is STOPPED in the bootstrap data set (BSDS).

System Action: DB2 terminates with a dump.

Operator Response: Notify the system programmer.

System Programmer Response: The log RBA range must be available for DB2 to be recoverable. Correct previous errors and restore the active log data set(s) that contain the RBA range reported in the message.

- If the log data set(s) are recoverable, the active log data set inventory in the BSDS must be modified to reset the STOPPED status. Use the print log map (DSNJU004) utility to obtain a copy of the BSDS log inventory. Next, use the change log inventory (DSNJU003) utility to delete the active log data sets marked STOPPED (use the DELETE statement), and then add them again (use the NEWLOG statement). The starting and ending RBA for each active log data set must be specified on the NEWLOG statement when the log(s) are added back to the BSDS using the DSNJU003 utility.
- If the log data set(s) are not recoverable, it is necessary to conditionally restart DB2. See Part 4 (Volume 1) of *DB2 Administration Guide* for additional information on conditional restart and recovering from log failures.

Problem Determination: Examine previous messages to determine the reason the active log data set(s) are unavailable to DB2.

DSNJ031I *csect-name* **WARNING - UNCOMMITTED UR HAS WRITTEN nn LOG RECORDS - CORRELATION NAME = xxxxxxxxxxxx CONNECTION ID = yyyyyyyy LUWID = LOGICAL-UNIT-OF-WORK-ID=token PLAN NAME = xxxxxxxx AUTHID = xxxxxxxx END USER ID = xxxxxxxx TRANSACTION NAME = xxxxxxxx WORKSTATION NAME = xxxxxxxx**

Explanation: This message indicates that a unit of recovery (UR) reached the threshold number of log records written without a COMMIT or ROLLBACK. This threshold was defined during installation.

The value *nn* is cumulative, and indicates the number of log records that were written since the beginning of the UR.

CORRELATION name, CONNECTION ID, and LUWID together identify a thread associated with the UR. *token* is a unique token number associated with the LUWID. If the LUWID is an '*', it indicates that the thread originated at this site.

PLAN NAME and AUTHID further identify the thread associated with the UR.

If the thread's creator included End User information, then DB2 displays the End User's ID, TRANSACTION NAME, and WORKSTATION NAME. Otherwise, these fields will contain an '*'.

System Action: DB2 continues processing. If statistics class 3 is active, IFCID 0313 is written. This message will be repeated each additional time the threshold is reached.

System Programmer Response: Consult with the application programmer to determine if this is a problem UR. See Part 4 (Volume 1) of *DB2 Administration Guide* for more information about problems caused by uncommitted UR's.

If an application program caused the UR to reach its threshold number of log records, you can use CANCEL THREAD to cancel the UR. If you cancel an uncommitted UR, DB2 will undo the changes. The amount of time required for this process depends on the amount of work done by the UR. The amount of time required for this process depends on the amount of work done by the UR.

Programmer Response: Ensure that the application commits frequently enough, or consult with your DB2 administrator about decreasing the frequency of the check.

DSNJ050I **LOAD MODULE DSNJL003 DOES NOT HAVE RMODE(24) ATTRIBUTE**

Explanation: The named load module was not link edited with the required RMODE(24) attribute.

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer of the failure.

System Programmer Response: Verify that all installation and maintenance activities against this module were executed using SMP. Verify that the JCLIN for SMP includes the correct RMODE control statement, and that the Linkage Editor provided with the Data Facility Product (DFP) for the version of MVS being used was invoked by SMP for the link edits. Correct the procedure or JCL which caused the error and rerun the necessary SMP jobs.

Problem Determination: The MVS service aid AMBLIST provides Linkage Editor module attributes in the summary section of the LISTLOAD function output.

DSNJ070I *csect-name* **ARCHIVE LOG DSN PREFIX NOT IN PROPER FORMAT TO RECEIVE TIMESTAMP DATA. TIMESTAMPING OF *dsname* BYPASSED**

Explanation: By way of a ZPARM parameter, the user has specified that the date and time of creation of an archive log data set be included as part of the archive log data set name (DSN). To accomplish this, the DB2 subsystem requires that the length of the archive log data set name prefix not exceed 19 characters if using the standard DATE format (YYDDD), or 17 characters if using the extended DATE format (YYYYDDD). If the prefix requirement is not met, this message is issued just prior to the allocation of the archive log data set specified in the message.

System Action: The archive log data set will be allocated using the archive log prefix. However, the archive log DSN will not contain the date and time as the user requested.

Operator Response: Notify the system programmer.

System Programmer Response: The ZPARM parameters for the log archive function must be changed. Specifically, the TSTAMP and ARCPFXn fields are not consistent with one another. For details concerning the course of action required to eliminate this problem, refer to Part 2 of *DB2 Installation Guide*, under the DSNTIPH panel and DSN6ARVP macro subtopics.

DSNJ071I *csect-name* **TIMER FAILURE CAUSED TIMESTAMPING OF ARCHIVE *dsname* TO BE BYPASSED**

Explanation: By way of a ZPARM parameter, the user has specified that the date and time of creation of an archive log data set be included as part of the archive log data set name (DSN). However an attempt to get the current date and time from the system failed. This message is issued just prior to the allocation of the archive log data set specified in the message.

System Action: The archive log data set will be allocated using the archive log prefix. However, the

archive log DSN will not contain the date and time as the user requested.

DSNJ072E **ARCHIVE LOG DATA SET *dsname* HAS BEEN ALLOCATED TO NON-TAPE DEVICE AND CATALOGED. ZPARM CATALOG OPTION OF 'NO' HAS BEEN OVERRIDDEN.**

Explanation: By way of an archive log DSNZPARM parameter, the user specified that all archive log data sets should be uncataloged (CATLG=NO). However, DB2 requires that all archive log data sets allocated to nontape devices must be cataloged. The archive log data set specified by '*dsname*' has been allocated to a nontape device, and has thus been cataloged. The user's DSNZPARM CATLG setting of 'NO' has been overridden.

System Action: The archive log data set has been allocated to a nontape device, and has been cataloged. The DSNZPARM CATLG=NO setting has been overridden. The BSDS reflects that the data set has been cataloged.

Operator Response: Notify the system programmer.

System Programmer Response: The DSNZPARM parameters for the log archive function must be changed. Specifically, the ARCHCTLG and ARCHDEV fields are not consistent with one another. For details concerning the course of action required to eliminate this problem, refer to Part 2 of *DB2 Installation Guide* under the DSNTIPA panel and DSN6ARVP macro subtopics.

DSNJ073I **LOG ARCHIVE UNIT ALLOCATION FAILURE DETECTED, RETURN CODE=*nnnn*. ALLOCATION OR OFF-LOAD OF ARCHIVE LOG DATA SET MAY FAIL.**

Explanation: While building the SVC99 text entries to dynamically allocate a new archive log data set, a unit allocation failure was detected. This message is only generated when a trace for IFCID 320 is active. The reason code, indicated by '*nnnn*' in the message, further clarifies the problem as follows:

4 (X'04')

The device type (unit name) on which the archive log data set is to be allocated is specified by the user in the DB2 system parameters. No UCBs could be found for the device type (unit name).

8 (X'08')

The device type (unit name) on which the archive log data set is to be allocated is specified by the user in the DB2 system parameters. This device type (unit name) could not be found in the MVS eligible device table (EDT).

32 (X'20')

DB2 was able to obtain a list of devices corresponding to the device type (unit name) specified in ZPARMs. However, it was determined by DB2 that this list contained a mixture of tape and nontape devices.

40 (X'28')

The device type (unit name) specified by the user in ZPARMs is valid. However, no devices are currently associated with the given device type (unit name).

44 (X'2C')

The device type (unit name) specified by the user in ZPARMs is valid. However, no DASD volumes are available with a volume use attribute of 'storage'.

48 (X'30')

The CVT indicates that UCB services are not available.

System Action: This message is issued by DB2 after the SVC99 text entries are built, but prior to the allocation of the new archive log data set. As a result of the error, the dynamic allocation of the archive log data set will be attempted using standard default values. The standard default values are generally acceptable; however, the allocation may fail or the subsequent off-load may produce undesirable processing results. For example:

- A return code of 4 or 44 (X'2C') will foretell an allocation error (DSNJ103I) when the SVC99 is issued for the archive data set.
- Off-load processing to tape may fail. DB2 uses a volume count of 20 when allocating to tape, and uses the standard MVS volume count default of 5 volumes when writing to nontape devices. In the case of most of the above errors, it would be impossible for the DB2 subsystem to determine the device type on which the data set is to be allocated. Therefore, the standard MVS default is assumed for the volume count. If the data set is successfully allocated to a tape device, and the volume of data is such that more than five volumes will be used for the archive data set, the off-load processing will receive an MVS ABEND 837-08 with message IEC028I when attempting to write to the sixth tape volume.
- Off-load processing to a direct access device may fail. When allocating a new archive log data set on a direct access device, the DB2 subsystem will use a unit count to facilitate multivolume archive data sets. With most of the above errors, it may be impossible for the DB2 subsystem to correctly determine the type of device on which the data set is to be allocated. Therefore, the standard default (1) is assumed for the unit count. If the data set is successfully allocated to a direct access device, and during the off-load processing it becomes necessary to extend the data set to another device, the off-load

processing will receive an MVS B37 (out of space) ABEND, and the archive log data set will be deallocated.

Operator Response: Notify the system programmer.

System Programmer Response: The required action is based on the return code indicated in the message.

4 (X'04') or 8 (X'08')

The most likely cause is an incorrect specification in the archive log ZPARMs (DSNTIPA panel). Correct the DEVICE TYPE field. If the DEVICE TYPE field from the archive log ZPARMs appears to be correct, check the EDT to ensure that the esoteric or generic unit name specified in the ZPARMs is actually in the EDT. Subsequent off-load processing will archive the log data which could not be previously archived due to the allocation failure (DSNJ103I).

32 (X'20') or 40 (X'28')

To correct this situation, change the archive log DEVICE TYPE ZPARM to use a device type (unit name) which contains homogenous devices, or modify the device list associated with the device type (unit name) via a system generation to supply a list of homogenous devices.

44 (X'2C')

To correct this situation, issue an MVS mount command to change the volume use attribute of a mounted 'private' volume to 'storage'. If this is a recurring problem, a system generation may be required to add permanently resident volumes with a volume use attribute of 'storage' to the esoteric or generic unit, or ZPARMs may have to be changed to use a different esoteric or generic unit name for the DEVICE TYPE (on the DSNTIPA installation panel).

48 (X'30')

UCB services became available in MVS/ESA Version 4.1 (HBB4410).

DSNJ096E *csect-name* **CRCR ENDLRSN RBA VALUE OF *rrr* IS INVALID, NO TRUNCATION WILL OCCUR**

Explanation: Truncation cannot take place because the RBA value specified on the active CRCR record is not equal to the RBA of a log record. *rrr* is the ENDLRSN specified in the active record. The ENDLRSN RBA value must match the start of a log record in a non-data sharing environment.

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: Confirm that the ENDLRSN value specified in the Conditional Restart

control record is correct. Run the Change Log Inventory (DSNJU003) utility with the CRESTART CANCEL parameters to cancel the conditional restart. If log truncation is desired, run the DSNJU003 utility with the correct ENDLRSN value. Restart DB2.

DSNJ098E *csect-name* **CRCR ENDLRSN OF *rrr* IS *xxx* THAN ANY KNOWN *yyyy*, NO TRUNCATION WILL OCCUR**

Explanation: Truncation cannot take place because the CRCR ENDLRSN is not in the range of LRSN or RBA values known to either the active or archive logs. *rrr* is the end LRSN specified in the active record. *xxx* is replaced by either HIGHER or LOWER. In a data sharing environment, if *xxx* is HIGHER, the CRCR ENDLRSN is higher than the LRSN of the last record written to the log data sets. If *xxx* is LOWER, the CRCR ENDLRSN is lower than the starting LRSN of the oldest archive data set. *yyyy* is replaced by LRSN. In a non-data sharing environment, if *xxx* is HIGHER, the CRCR ENDLRSN is higher than the RBA of the last record written to the log data sets. If *xxx* is LOWER, the CRCR ENDLRSN value is an RBA value that is lower than the starting LRSN of the oldest archive data set. *yyyy* is replaced by RBA.

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: Confirm that the ENDLRSN value specified in the Conditional Restart control record is correct. If it is not correct, run the Change Log Inventory (DSNJU003) utility with the CRESTART CANCEL parameters to cancel the conditional restart. If log truncation is desired, run the the DSNJU003 utility with the correct ENDLRSN. Restart DB2.

DSNJ099I **LOG RECORDING TO COMMENCE WITH STARTRBA=...**

Explanation: This message is generated when the log manager is initialized during DB2 startup. The value specified by the STARTRBA=value keyword is the RBA of the next byte of log data to be recorded in the DB2 active log data set(s). This information may later be needed for a conditional restart.

This message is preceded by one DSNJ001I message (if single logging) or two DSNJ001I messages (if dual logging).

System Programmer Response: None required. However, if recovery is required, information from this message may be required as input to the change log inventory (DSNJU003) utility.

DSNJ100I *csect-name* **ERROR OPENING BSDSn DSNNAME=..., ERROR STATUS=eeii**

Explanation: Log manager initialization or the -RECOVER BSDS command could not open the specified bootstrap data set (BSDS). BSDSn matches the ddname in the log startup JCL of the data set that cannot be opened. The value of 'n' is 1 or 2. Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for information about recovery from BSDS or log failures.

System Action: When this error occurs at initialization time, DB2 startup must be terminated, because the log data sets cannot be determined and allocated without the BSDS. When this error occurs during -RECOVER BSDS processing, the command is terminated, and the system continues in single BSDS mode.

Operator Response: Notify the system programmer.

System Programmer Response: Recover the BSDS that cannot be opened. Normally, if dual BSDSs are being used, recovery consists of making a copy of the remaining good BSDS.

Problem Determination: The 'error status' contains the VSAM open return code in 'ee', and the VSAM open reason code in 'ii'. Refer to *z/OS DFSMS: Macro Instructions for Data Sets* for a list of the VSAM open return codes and reason codes, and the steps required to take corrective action.

DSNJ101E *csect-name* **CRCRERBA OF *rrr* IS *xxx* THAN ANY KNOWN RBA, BUT COLD START WAS NOT SPECIFIED**

Explanation: Truncation cannot take place because the CRCR end RBA is not in the range of RBA values known to either the active or archive logs. '*rrr*' is the end RBA specified in the active record. '*xxx*' is replaced by either HIGHER or LOWER. If HIGHER is the case, the CRCRERBA is higher than the end RBA of the most recent active log data set. LOWER means the CRCRERBA is lower than the starting RBA of the oldest archive data set.

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: Most likely, the archive log data set that contained the requested RBA has been deleted from the bootstrap data set (BSDS) by the change log inventory (DSNJU003) utility. Locate the output from an old Print Map run, and identify the data set that contains the missing RBA. If the data set has not been reused, run the DSNJU003 utility to add this data set back into the inventory of log data sets. Restart DB2.

DSNJ102I LOG RBA CONTENT OF LOG DATA SET DSNAME=..., STARTRBA=..., ENDRBA=..., DOES NOT AGREE WITH BSDS INFORMATION

Explanation: The log RBA range shown in the BSDS for the specified data set does not agree with the content of the data set. This message indicates that the change log inventory (DSNJU003) utility was used incorrectly or that a down-level volume is being used.

System Action: DB2 startup processing is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: Use the print log map (DSNJU004) and change log inventory (DSNJU003) utilities to make the BSDS consistent with the log data sets.

- Using AMS, providing another copy of the active log data set
- Updating the BSDS with the change log inventory (DSNJU003) utility
- Restarting DB2.

For archive log data sets:

- If the problem occurred during allocation with the intent to write the data set, no immediate action is required. However, failure to resolve the SVC99 error (indicated by the STATUS value in the message) might eventually cause the available space in the active log to be exhausted (DSNJ111E), since all future off-loads might fail due to the same error.
- If the problem occurred during allocation with the intent to read the data set, determine the problem, and use the DSNJU003 utility DELETE function to delete the archive log data set from the BSDS archive log inventory. Then use the NEWLOG function to add the data set back into the archive log inventory, pointing to the correct volume and device.

DSNJ103I csect-name LOG ALLOCATION ERROR DSNAME=dsname, ERROR STATUS=eeeeiiii, SMS REASON CODE=ssssssss

Explanation: The log manager encountered an error while attempting to allocate the active or archive log data set indicated by the DSNAME=keyword. The STATUS=keyword indicates the error reason code returned by MVS dynamic allocation (SVC99).

This message might be preceded by message DSNJ073I.

System Action: Subsequent log manager actions are based upon the type of data set involved.

For active log data sets, if the error is encountered during log manager initialization, DB2 startup is terminated. If two copies of the active log data sets are defined, this message appears only once.

For archive log data sets, if two copies of the archive log data sets are defined, processing continues on the remaining archive log data set.

Operator Response: Notify the system programmer.

System Programmer Response: The error status portion of this message contains a 2-byte error code (S99ERROR) followed by the 2-byte information code (S99INFO) from the SVC99 request block. If the S99ERROR code indicates an SMS allocation error (97XX), then 'ssssssss' contains additional SMS reason code information obtained from S99ERSN. Refer to *z/OS MVS Programming: Authorized Assembler Services Guide* for a description of the SVC99 codes. Additional SMS reason codes can be found in *z/OS DFSMSdfp Diagnosis Reference*.

For active log data sets, if the problem occurred during DB2 initialization, you can resolve the problem by either:

- Resolving the error associated with the active log data set as indicated by STATUS=keyword

If additional information is required about recovery from log failures, refer to Part 4 (Volume 1) of *DB2 Administration Guide*.

This message can also be issued as the result of a possible user error. If the STATUS=keyword displays a value of '17080000', then the site might have one or more active log data sets defined in the BSDS, but not allocated on DASD. To correct the situation, print the contents of the current active log data set inventory using the print log map (DSNJU004) utility, and then do *one* of the following:

- For each active log data set listed in the BSDS, but not actually allocated on DASD, allocate the active log data set using access method services. The access method services command syntax for active log data sets can be found in the DSNTIJIN installation job stream.
- Use the DSNJU003 utility DELETE statement to delete the errant active log data set name, and the NEWLOG statement to add the correct name to the active log data set inventory. The name specified on the NEWLOG statement must be the same as the name of the actual DB2 active log data set allocated on DASD.

DSNJ104I csect-name RECEIVED ERROR STATUS nnn FROM macro-name FOR DSNAME dsname

Explanation: DB2 encountered an error while issuing macro 'macro-name'. Error status is the return code from the specified macro.

- For an OPEN of a VSAM data set, the return code in the error field of the access method services control block is included in this message as the error status

value. Refer to the appropriate VSAM publication for a definition of these values.

- If the OPEN was for a non-VSAM data set, the error status is zero.
- For MMSRV errors, error status contains the error information returned by media manager services. If an MMSRV CATUPDT failure occurs attempting to truncate an active log data set, the log data set will be unavailable to DB2 and the status of the log data set will be flagged as 'STOPPED' in the BSDS.
- For VSAM OPEN and MMSRV errors, this message is preceded by an IEC161I message that defines the error that occurred.
- For a PROTECT of an archive log data set, the return code is from DADSM PROTECT. Refer to the appropriate MVS publication for a description of the MMSRV return codes.
- For a CLOSE of an archive log data set, the return code is the TCB completion code for an abend received during CLOSE processing. This abend is normally preceded by an IEC210I or IEC212I message that defines the error.
- For EDTINFO and UCBLLOOK errors, the first 2 bytes contain the return code and the second 2 bytes contain the reason code.

Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for information about recovery from log failures.

System Action: If this condition is encountered during log manager initialization, DB2 startup is terminated. If the error occurs later and the data set is needed either for offload or for input operations, DB2 processing continues. If a second copy of the data is available, DB2 attempts to allocate and open the second data set.

If the data set is needed as an active log data set, the log manager attempts to retry the failing request. If the retry fails, the DB2 subsystem is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: If the error occurred during initialization, the installation must either correct the problem so that the data set is available or provide another copy of the data set and change the BSDSs to point to the new data set.

If the error occurred during DB2 processing, the return code should be reviewed and the appropriate action taken to correct the problem so that the data set can be used at a later time or the data set entry can be removed from the BSDS via the change log inventory (DSNJU003) utility.

If the error was received from PROTECT, there may be a problem with the PASSWORD data set. You should refer to the appropriate DADSM publication to determine the cause of the problem. When the problem has been corrected, you should ensure the archive log data sets receiving the error are added to the PASSWORD data set. If these archive log data sets are not added to the

PASSWORD data set, archive read will fail when attempting to OPEN these data sets.

If the error was received from EDTINFO or UCBLLOOK and the allocation for the archive log data set fails, verify that the archive UNIT names are correct in ZPARMS.

DSNJ105I *csect-name* LOG WRITE ERROR
DSNAME=..., LOGRBA=..., ERROR
STATUS=ccccffss

Explanation: The log manager encountered a write error in the specified active log data set. If 'csect-name' is DSNJW107, the error occurred writing the log buffers to an active log data set. If 'csect-name' is DSNJW207, the error occurred while preformatting the next control area before writing log data into it.

Error status contains the error information returned by media manager in the form 'ccccffss', where 'cccc' is a 2-byte return code that describes the error, 'ff' is a 1-byte code that defines the functional routine that detected the error, and 'ss' is the 1-byte status code that defines a general category of error. Refer to the appropriate MVS publication for a description of the MMCALL return codes.

If the dual active logging option is selected, the log manager switches to the next data set for this copy. If the next data set is not ready, the log manager temporarily enters single logging mode and allocates a replacement data set for the one that encountered the error. Dual logging is resumed as soon as possible.

If single active logging option is selected and the next data set is not ready, the log manager waits for that data set to be available. In this case, log writing is inhibited until the replacement is ready for output.

System Action: See the Explanation section of this message.

Operator Response: Notify the system programmer.

System Programmer Response: See the Explanation section of this message.

DSNJ106I LOG READ ERROR DSNAME=...,
LOGRBA=..., ERROR STATUS=ccccffss

Explanation: The log manager encountered an error while reading an active log data set. The 'error status' contains the error information returned by the media manager in the form 'ccccffss', where 'cccc' is a 2-byte return code that describes the error, 'ff' is a 1-byte code that defines the functional routine that detected the error, and 'ss' is the 1-byte status code that defines a general category of error.

System Action: If another log data set contains the data, the log manager attempts to read the data from the alternate source. If an alternate source is not available, the log manager returns a read error return code to the program requesting the log data.

Operator Response: Notify the system programmer.

System Programmer Response: If the site is using dual logging, the requested RBA was probably retrieved from the corresponding dual active log data set, and no immediate response is necessary. However, if this error occurs frequently, or if the site is using single logging, immediate attention may be required.

Since this condition might indicate an error detected by the media manager, refer to *z/OS DFSMSdfp Diagnosis Reference* for a description of media manager return codes. Take corrective action based on these codes.

It might be necessary to replace the bad data set with a new data set containing the log data, and to update the BSDSs to reflect the new data set using the change log inventory (DSNJU003) NEWLOG operation.

For additional information about recovery from log failures, refer to Part 4 (Volume 1) of *DB2 Administration Guide*

This message can also be issued as the result of a possible user error. If the data set name associated with the DSNAME=keyword is missing, and the STATUS=keyword displays a value of '00180408' or '00100408', then the site is using dual logging, but only one set of active log data sets are defined in the BSDS. To resolve this condition, do *one* of the following:

- Define a second set of active log data sets using access method services (if they are not defined already), and update the BSDS log inventory using the DSNJU003 NEWLOG operation.
- Reset the log parameters ZPARM to indicate single logging. To do this, set the TWOACTV parameter in the DSN6LOGP ZPARMs to NO.

DSNJ107I READ ERROR ON BSDS
DSNAME=*name* ERROR STATUS=*status*

Explanation: The log manager encountered an error while reading the specified bootstrap data set. Error Status contains the VSAM return and feedback codes. It is a 2-byte field with the first byte containing the hexadecimal return code and the second containing the hexadecimal feedback code. Refer to the appropriate MVS publication for a description of VSAM return and reason codes.

Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for information about recovery from BSDS or log failures.

System Action: If dual BSDSs are available, the log manager attempts to read from the other BSDS. If read from the second BSDS fails or if there is only one BSDS, an error code is returned to the log request that caused access to the BSDS.

If read error is detected during start-up, DB2 initialization process is terminated to prevent users from operating in a cripple mode. User should take action to correct the problem.

Operator Response: Notify the system programmer.

System Programmer Response: It may be necessary to replace or repair the BSDS, depending on what conditions resulted from the read error. To replace a BSDS, first delete the bad BSDS, and then define the new BSDS with the same name and attributes. If a new name is used for the new BSDS, change the log startup JCL to specify the new BSDS name.

DSNJ108I WRITE ERROR ON BSDS DSNAME=...
ERROR STATUS=...

Explanation: The log manager encountered an error while writing to the specified bootstrap data set. Error Status contains the VSAM return and feedback codes. It is a 2-byte field with the first containing the hexadecimal return code and the second containing the hexadecimal feedback code. Refer to the appropriate VSAM publication for a description of VSAM return and reason codes.

System Action: If dual BSDSs are available, the log manager enters single BSDS mode using the remaining good BSDS. Otherwise, an error code is returned to the log request that caused access to the BSDS.

Operator Response: Notify the system programmer.

System Programmer Response: If dual BSDS mode is being used, execute an offline access method services job to rename the error BSDS and define a new BSDS with the same name. Then enter the log manager -RECOVER BSDS command to reestablish dual BSDS mode.

If dual BSDS mode is not being used, the DB2 subsystem must be shut down, and the BSDS must be recovered from a backup copy. To recover the BSDS, use the change log inventory (DSNJU003) utility.

DSNJ109I OUT OF SPACE IN BSDS DSNAME=...

Explanation: There is no more space in the specified bootstrap data set. The operation that encountered the out-of-space condition did not complete properly.

System Action: If dual BSDSs are available, the log manager enters single BSDS mode using the remaining good BSDS. Otherwise, an error code is returned to the log request that caused access to the BSDS.

Operator Response: Notify the system programmer.

System Programmer Response: If dual BSDS mode is being used, execute an offline access method services job to rename the full BSDS and define a new, larger BSDS with the same name. Enter the DB2 -RECOVER BSDS command to reestablish dual BSDS mode.

If dual BSDS mode is not being used, the DB2 subsystem must be shut down and the BSDS recovered offline. In this case, execute the same access method services job mentioned above to rename the full data

set and define a larger data set. Next, execute an access method services REPRO job to copy the full BSDS into the new BSDS.

DSNJ110E LAST COPYn ACTIVE LOG DATA SET IS nnn PERCENT FULL

Explanation: This message is issued when the last available active log data set is 5% full, and is reissued after each additional 5% of the data set space is filled.

System Action: Each time the message is issued, the off-load processing is retried. If the situation is not corrected, the active log data space fills to capacity, message DSNJ111E is issued, and the DB2 online processing halts.

Operator Response: To clear this condition, steps must be taken to complete other waiting off-load tasks. Once an active log data set is made available (reusable) by completing the off-load process for it, the DB2 logging activity can continue.

Execute an MVS *Display System Requests* command (D R,L for example) to determine the outstanding requests related to the log off-load process. Take the necessary action to satisfy any requests, and permit off-load to continue. If off-load fails to complete normally or cannot be initiated, notify the system programmer.

System Programmer Response: Either correct the problem that is causing the off-load process to fail, or add more active log data sets. Note that the latter action requires DB2 to be down and the change log inventory (DSNJU003) utility to be run.

Possible causes for the shortage of active log data space are:

- Excessive logging. For example, too many users have requested logs at the same time or too many utilities have specified LOG(YES).
- Delayed or slow off-loading. For example, failure to mount archive volumes, incorrect replies to off-load messages, or slow device speeds.
- Excessive use of the -ARCHIVE LOG command. Each invocation of the -ARCHIVE LOG command causes the DB2 subsystem to switch to a new active log data set and to initiate an off-load of the active log. Although the -ARCHIVE LOG command will not be processed when only one active log data set remains in a copy of the active log (see DSNJ319I), excessive use of the command could have consumed all space in the active log except the current active log data sets.
- Off-loads failed. See Operator Response.
- Insufficient active log space. See Operator Response.
- Offload task no longer functioning. Issue the -ARCHIVE LOG CANCEL OFFLOAD command to abnormally terminate and restart the offload process.

DSNJ111E OUT OF SPACE IN ACTIVE LOG DATA SETS

Explanation: Due to delays in off-load processing, all available space in all active log data sets has been exhausted. DB2 recovery logging cannot continue.

System Action: The DB2 log manager waits for an available data set.

Operator Response: Execute an MVS *Display System Requests* command (D R,L for example) to ensure that there are no outstanding requests that are related to the log off-load process. Take the necessary action to satisfy any requests, and permit off-load to continue.

System Programmer Response: If the delay was caused by the lack of a resource required for off-load, the necessary resource must be made available to allow off-load to complete and thus permit logging to proceed. For additional information on recovery from this condition, refer to the discussion on DB2 system resource failures and active log failures in Part 4 (Volume 1) of *DB2 Administration Guide*.

DSNJ112E csect-name INSUFFICIENT ACTIVE LOG DATA SETS DEFINED IN BSDS

Explanation: There are not enough active log data sets defined in the BSDS to start DB2. This condition usually exists for one of the following reasons.

- Fewer than two data sets are defined for one of the active log copy sets.
- DSN6LOGP specified TWOACTV=YES in DB2 initialization parameters, but data sets for two copies of active log are not defined in BSDS.
- Fewer than two data sets are available (not flagged as STOPPED) for one of the active log copy sets.

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: Use the change log inventory (DSNJU003) utility to make the number of active log data sets defined in the BSDS consistent with the parameters specified on DSN6LOGP. Log data sets that are flagged as 'STOPPED' will not be reused by DB2. These data sets must be recovered (either redefined or recovered from the other copy of the log) and the log data sets must be deleted and re-added to the BSDS (using DSNJU003) with the appropriate RBA's, to clear the STOPPED status. Restart DB2.

DSNJ113E csect-name log-type log-value NOT IN ANY ACTIVE OR ARCHIVE LOG DATA SET. CONNECTION-ID=aaaaaaaa, CORRELATION-ID=aaaaaaaa, MEMBER-ID=member-id

Explanation: A request was made to read the log starting at this log-value and log-type (RBA or LRSN).

However, the log value cannot be found in any active or archive log data set for the indicated member. The member-id contains the ID of the data sharing member whose logs were being requested at the time of the failure or zero if data sharing is not active. The connection and correlation IDs identify the user or application that encountered the problem. Correlation IDs beginning with '0nn' where 'nn' is a number from 01 to 28, identify system agents. Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for information about recovery from log failures.

System Action: Depending upon what log record is being read and why, this may result in an abend with a reason code of '00D1032A'.

Operator Response: Notify the system programmer.

System Programmer Response: Probable user error. Most likely, the archive log data set that contained the requested log value has been deleted from the bootstrap data set (BSDS) by the change log inventory (DSNJU003) utility. Locate the output from an old print log map run of the BSDS for the DB2 member identified by member-id, and identify the data set that contains the missing log-value. If the data set has not been reused, run the DSNJU003 utility to add this data set back into the inventory of log data sets. Restart DB2.

**DSNJ114I ERROR ON ARCHIVE DATA SET,
OFFLOAD CONTINUING WITH ONLY
ONE ARCHIVE DATA SET BEING
GENERATED**

Explanation: An error occurred while accessing one of the archive data sets being created by off-load. Because the dual archive option is specified, off-load is continuing with the other archive data set. For the RBA range being off-loaded, there is only one copy of archive instead of the usual two copies.

System Action: Off-load produces a single archive data set.

System Programmer Response: A second copy of this archive log data set can be made, and the BSDS(s) can be updated with the change log inventory (DSNJU003) utility.

**DSNJ115I OFFLOAD FAILED, COULD NOT
ALLOCATE AN ARCHIVE DATA SET**

Explanation: Off-load could not allocate an archive log data set. The off-load was not performed. This message is usually preceded by message DSNJ103I.

System Action: Off-load will be tried at a later time.

Operator Response: Notify the system programmer.

System Programmer Response: Review the error status information of message DSNJ103I. Correct the condition that caused the data set allocation to fail so that, on retry, the off-load can take place.

**DSNJ116I ERROR ATTEMPTING TO ADD
ARCHIVE ENTRY TO BSDS**

Explanation: Off-load could not add an archive entry to the BSDS. The off-load is considered incomplete. The active log data set is not marked as reusable for new log data. This message is preceded by message DSNJ107I, DSNJ108I, or DSNJ109I.

System Action: Off-load will be retried at a later time.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to the specific preceding message for action.

**DSNJ117I INITIALIZATION ERROR READING
BSDS DSNAME=....., ERROR
STATUS=...**

Explanation: The log manager encountered an error during initialization reading from the specified bootstrap data set. Error status contains the VSAM return and feedback codes. It is a two byte field with the first containing the hexadecimal return code and the second byte containing the hexadecimal feedback code. Refer to the appropriate VSAM publication for a description of VSAM return and reason codes.

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the cause of the read error using the VSAM error status information provided. Restart DB2.

**DSNJ118I LOG INITIALIZATION RECEIVED
RETURN CODE nnn FROM xxxxxxxx
MACRO**

Explanation: Log manager initialization received a bad return code from the named macro.

System Action: DB2 initialization is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the problem from the documentation on the named macro and return code. Then take appropriate steps, and restart the DB2 subsystem.

**DSNJ119I BOOTSTRAP ACCESS INITIALIZATION
PROCESSING FAILED**

Explanation: During log manager initialization, the bootstrap data set access function was unable to complete its initialization process. Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for information about recovery from BSDS or log failures.

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer.

DSNJ120I • DSNJ125I

System Programmer Response: One or more error messages describing the specific error have preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

DSNJ120I DUAL BSDS DATA SETS HAVE UNEQUAL TIMESTAMPS, BSDS1 SYSTEM=..., UTILITY=..., BSDS2 SYSTEM=..., UTILITY=...

Explanation: When the log manager was initialized, the time stamps of the dual bootstrap data sets (BSDS) did not agree. The time stamps from the system and from the change log inventory (DSNJU003) utility are shown for each BSDS. The time stamps have the format yy.ddd hh:mm:ss.th.

System Action: DB2 attempts to re-synchronize the BSDS data sets to restore dual BSDS mode. If re-synchronization is successful, DB2 restart continues.

Operator Response: If restart fails, notify the system programmer.

System Programmer Response: If restart fails, run the print log map (DSNJU004) utility against each BSDS. From the output, determine which data set is obsolete, delete it, define a replacement for it, and copy the remaining BSDS to the replacement.

If output from the print log map (DSNJU004) utility for both data sets is similar, delete the data set with the oldest time stamp, and copy the data set with the most recent time stamp.

DSNJ121I LOG MANAGER ENCOUNTERED AN ERROR READING THE JFCB. DDNAME=nnnnnnnn

Explanation: During log manager initialization (if dual BSDS data sets are specified), the job file control block (JFCB) in MVS is read to obtain the data set names associated with DDNAME BSDS1 and BSDS2. This error is caused by a missing DD statement.

System Action: DB2 is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: Ensure that a DD statement exists in the DB2 startup procedure for DDNAME BSDS1. If dual BSDS data sets are used, ensure that a DD statement also exists in the DB2 startup procedure for DDNAME BSDS2.

DSNJ122I DUAL BSDS DATA SETS ARE OUT OF SYNCHRONIZATION

Explanation: During log manager initialization, the dual BSDS data sets were found to differ in content.

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: Run the print log map (DSNJU004) utility against each BSDS to determine which data set was last used as copy 1. Delete the copy 2 data set, define a replacement for the deleted data set, and copy the remaining BSDS to the replacement.

DSNJ123I CHANGE LOG INVENTORY FAILURE DETECTED

Explanation: During log manager initialization, the BSDS data set was found to have been incompletely processed by the change log inventory (DSNJU003) utility.

System Action: DB2 startup is terminated.

System Programmer Response: Run the print log map (DSNJU004) utility to determine what operation against the BSDS did not complete. Run the change log inventory (DSNJU003) utility against the BSDS(s) to allow any unfinished processing to be completed.

DSNJ124I OFFLOAD OF ACTIVE LOG SUSPENDED FROM RBA xxxxxx TO RBA xxxxxx DUE TO I/O ERROR

Explanation: During off-load, an unrecoverable I/O error was encountered on an active log data set. The data set experiencing the error is marked unusable, and no further logging is done to that data set.

System Action: Active log data sets continue to be off-loaded as they become full.

Operator Response: Notify the system programmer to allow recovery actions to be initiated.

System Programmer Response: Recover the data manually from the data set, copy it to an archive data set, run the change log inventory (DSNJU003) utility to make the new archive data set available to the DB2, and remove the error-prone active log data set from DB2 by using the change log inventory utility.

DSNJ125I ERROR DUMPING BSDS, OFFLOAD CONTINUING WITHOUT PRODUCING THE BSDS DUMP

Explanation: An error occurred while dumping the BSDS data set during the off-load process. The data set is not produced, but the off-load process continues. The volume containing the off-loaded data set does not contain a BSDS for recovery use.

System Action: The system continues the off-load process without producing a dump of the bootstrap data set.

DSNJ126I BSDS ERROR FORCED SINGLE BSDS MODE

Explanation: The log manager encountered an I/O error or a VSAM logical error on a bootstrap data set. This message is preceded by message DSNJ107I or DSNJ108I.

System Action: The log manager enters single BSDS mode using the remaining BSDS.

Operator Response: Notify the system programmer.

System Programmer Response: Execute an offline access method services job to rename the error BSDS and define a new BSDS with the same name. Then enter the log manager -RECOVER BSDS command to reestablish dual BSDS mode.

DSNJ127I SYSTEM TIMESTAMP FOR BSDS=...

Explanation: When the log manager is initialized, the system time stamp for the bootstrap data sets (BSDS) is displayed. The time stamp is of the format yy.ddd hh:mm:ss.th. This time stamp should be close to the last time at which this subsystem was stopped. If not, then it may indicate a restart is being attempted with the wrong BSDS.

System Action: DB2 startup continues.

Operator Response: If the time displayed does not appear to be close to the time this subsystem was last stopped, contact the system programmer.

System Programmer Response: If you cannot explain the apparent time discrepancy, cancel the subsystem. From the startup procedure for the subsystem services address space, determine the data set names of the bootstrap data sets and run the print log map (DSNJU004) utility. Check whether the active and archive log data sets all belong to this subsystem. If not, then change the startup procedure for the subsystem services address space to use the correct bootstrap data sets.

DSNJ128I LOG OFFLOAD TASK FAILED FOR ACTIVE LOG nnnnn

Explanation: The off-load task abended while attempting to offload the relative byte address (RBA) range in active log data set 'nnnnn'.

System Action: The off-load task terminates and the archive data sets allocated to the off-load task are deallocated and deleted. The status of the active log data sets involved in the failed off-load processing remains set to 'not reusable'.

The log off-load task will be reinitiated by one of several events. The most common are:

- All the available space in the current active log data set has been used (normal case).
- A DSNJ110E message is issued.

- The master address space is started, but data in the active log has not been archived.
- An I/O error occurs on the active log, which will force the system to truncate and off-load the active log data set, and switch to a new active log data set.

Operator Response: This message is the result of an off-load failure, and will be preceded by one or more DB2 messages (for example, DSNJ073I) and/or MVS ABEND messages (for example, IEC030I, IEC031I, IEC032I). If DB2 is operating with restricted active log resources (see message DSNJ110E), quiesce the system to restrict logging activity until the ABEND or the DSNJ110E condition can be resolved. Notify the system programmer.

System Programmer Response: This message is the result of an off-load failure, and will be preceded by one or more DB2 messages (for example, DSNJ073I) and/or MVS ABEND messages (for example, IEC030I, IEC031I, IEC032I). Investigate and correct the cause of the ABEND before the off-load is attempted again by DB2.

Problem Determination: This message is the result of an off-load ABEND and will be preceded by one or more DB2 messages and/or MVS ABEND messages. See the documentation for the associated DB2 and/or MVS messages to formulate a course of corrective action. Use the print log map (DSNJU004) utility to print the BSDS (both copies if running in dual mode), and then use the DSNJU004 output to determine the current status of the active and archive log data sets.

This message can be generated for a variety of reasons. However, the most likely are:

- Archive log data set allocation errors. Refer to the text for message DSNJ103I for corrective action.
- The size of the archive log data set is too small to contain the active log data set(s) during off-load processing. All secondary space allocations have been used. This condition is normally accompanied by MVS ABEND message IEC030I.
- All available space on the DASD volume(s) to which the archive data set is being written has been exhausted. This condition is normally accompanied by MVS ABEND message IEC032I.
- The primary space allocation for the archive log data set (as specified in ZPARMS) is too large to allocate to any available online DASD device. This condition is normally accompanied by MVS ABEND message IEC032I.

DSNJ129I END OF log-rba eol-rba X COULD NOT BE FOUND IN ANY ACTIVE LOG DATA SET HIGHEST RBA FOUND WAS hi-rba X

Explanation: The log manager has been requested to find 'eol-rba', the log record which has been recorded in the bootstrap data set (BSDS) as the highest RBA written. This RBA cannot be found in any active log data

set. The highest RBA which could be found in any active data set was 'hi-rba'.

System Action: DB2 startup processing is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: Most likely, the active log data set containing the requested RBA has been deleted from the BSDS by the change log inventory (DSNJU003) utility. If the data set has not been reused, run DSNJU003 to add this data set back into the BSDS. Restart DB2.

If the data set is not available, a conditional restart must be performed to either truncate the log prior to the RBA value of the missing data set, or to cold start at a higher RBA value. Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for more information.

DSNJ130I ICF CATALOG NAME IN BSDS DOES NOT AGREE WITH DSNZPARM. BSDS CATALOG NAME=*name*, DSNZPARM CATALOG NAME=*name*

Explanation: The ICF catalog name defined in DSNZPARM does not agree with the name contained in the bootstrap data set (BSDS).

System Action: DB2 startup is abended.

User Response: Notify the system programmer.

Operator Response: If you attempt to start the DB2 subsystem, you will receive this same message and abnormal termination will result until the problem is resolved.

System Programmer Response: Change the ICF catalog name in the BSDS to agree with the name defined in DSNZPARM during DB2 initialization. To change the ICF catalog name in the BSDS, use the BSDS change log inventory (DSNJU003) utility with the NEWCAT control statement.

Problem Determination: During log manager initialization, the ICF catalog name defined in DSNZPARM is compared to the catalog name in the BSDS to ensure that the catalog name used by the log manager during DB2 processing is correct. These names were found not to be the same.

DSNJ131I *csect-name* DUAL BSDS MODE RESTORED FROM BSDS*n*

Explanation: Dual BSDS mode has been restored using BSDS copy *n*. This copy is the BSDS data set with the most recent system timestamp.

System Action: DB2 startup continues.

DSNJ138I *csect-name* OFFLOAD COMPLETE FOR LOG TRUNCATION FROM AN ARCHIVE LOG COMMAND, ENDRBA=xxxxxxxxxxxx

Explanation: This message indicates that the offload of the truncated active logs, resulting from an -ARCHIVE LOG command, has completed successfully. xxxxxxxxxxxx is the ENDRBA of the truncated active logs and the newly created archive log data sets.

DSNJ139I LOG OFFLOAD TASK ENDED

Explanation: Processing of the active log off-load ended.

System Action: This message is written to the MVS console.

Operator Response: This message does not guarantee that the off-load completed without errors. Check the console log and task messages to review the execution of the off-load task to determine whether any abnormal events occurred during the off-load.

DSNJ140I *csect-name* INVALID BSDS RELEASE LEVEL ACTIVE=xxxxxx ARCHIVE=yyyyyy DSN=zzzzzz

Explanation: At initialization time DB2 detected that the BSDS log records are not at the proper release level for this release of DB2. 'xxxxxx' contains the release level for the ACTIVE log records and 'yyyyyy' contains the release level for the ARCHIVE log records. 'zzzzzz' contains the data set name for the BSDS encountering the error.

System Action: DB2 startup will be terminated.

Operator Response: Notify the system programmer so operating procedures can be changed.

System Programmer Response: Run the appropriate conversion program (DSNJMIG0 or DSNJFAL0) to convert the BSDS data set to a compatible release level.

DSNJ150E LOG CAPTURE EXIT ABEND, EXIT DEACTIVATED

Explanation: An abnormal program interrupt was detected while executing in the installation-supplied log capture exit code (i.e. entry point DSNJW117 in load module DSNJL004). As a result of the abend, the log capture exit will no longer be active; log data will no longer be available for Exit capture/processing.

This message can only occur when an installation-supplied log capture exit (entry DSNJW117) is active for this instance of DB2.

System Action: The log capture exit (entry point DSNJW117) is terminated. No further calls will be

attempted for this DB2 instance. A full dump is provided for diagnostic purposes.

User Response: See “System Programmer Response” below.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the cause of the DSNJL004 load module (DSNJW117 entry point) abend and take corrective action.

Note: A correctly-functioning copy of load module DSNJL004/entry DSNJW117 must be available in order to start DB2. If the problem which caused the above abend cannot be corrected, ensure that the default DSNJW117 entry (load module DSNJL004 - supplied with the DB2 release) is available during the next DB2 subsystem start.

DSNJ151I *csect-name* **IN READING** *log-type*
log-value, **A NONZERO REASON CODE**
WAS RETURNED. CONNECTION-
ID=xxxx, CORRELATION-ID=yyyyyy,
REASON-CODE=ccc,
MEMBER-ID=member-id

Explanation: DB2 could not successfully complete the read of this 'log-value' and 'log-type' (RBA or LRSN) due to reason code 'ccc'. The member-id contains the ID of the data sharing member whose logs were being requested at the time of the failure or zero if data sharing is not active. The user or application that encountered the error is identified by the connection and correlation ID. Messages that have the same connection ID and correlation ID relate to the same application. Correlation IDs beginning with '0nn', where 'nn' is a number from 01 to 28, identify system agents.

System Action: DB2 attempts to recover from the error.

System Programmer Response: If DB2 was able to recover from the error and successfully complete the application, no further action is required. If the application abnormally terminated or DB2 could not recover successfully, this message is followed by one or more messages. Refer to the information in this message and the subsequent messages to determine the appropriate corrective action. For information about recovery from log failures, refer to Part 4 (Volume 1) of *DB2 Administration Guide*.

DSNJ152I *csect-name* **ERROR ENCOUNTERED**
WHEN ATTEMPTING TO BUILD
ARCHIVE LOG VOLUME LIST.
CONNECTION-ID=xxxx,
CORRELATION-ID=yyyyyy,
REASON-CODE=ccc

Explanation: An error occurred while attempting to create the Archive Log Volumes report. An RBA range could not be successfully mapped into one or more

archive data sets due to reason code 'ccc'. The user or application that encountered the error is identified by the connection and correlation ID. This message might be preceded by one or more related error messages. Messages that have the same connection ID and correlation ID relate to the same user. Correlation IDs beginning with '0nn', where 'nn' is a number from 01 to 28, identify system agents.

This failure could be caused by one or more missing archive log data sets, or a system error (for example, an I/O error reading BSDS).

The Archive Log Volumes report (see message DSNJ330) is not produced. In addition, no premounting of tapes is possible.

System Action: The user or application continues execution. The physical read process for the user or application continues until the job completes normally or terminates abnormally. The job can terminate abnormally if the error is encountered again when the data set is physically required for the read process.

System Programmer Response: If the user or application completes successfully, no further action is necessary. If the user or application does not complete successfully, refer to the messages related to the actual failure to determine the appropriate corrective actions. For information about recovery from log failures, refer to Part 4 (Volume 1) of *DB2 Administration Guide*.

DSNJ153E

csect-name **CRITICAL LOG READ ERROR**
CONNECTION-ID = connection-id
CORRELATION-ID = correlation-id
LUWID = logical-unit-of-work-id=token
REASON-CODE = reason-code

Explanation: While processing a DB2 must-complete function, DB2 encountered an error during an attempt to access the required log data sets.

CONNECTION-ID, CORRELATION-ID, and LUWID together identify the thread associated with the request. *token* is a unique token number associated with the LUWID. *reason-code* identifies the most recent log-read failure.

System Action: The DSNJ154I message requests to retry the log-read request, and immediately follows this error message. DB2 will wait for a reply to message DSNJ154I before retrying the failed log-read request, or before abending.

System Programmer Response: Review the description of the reason-code associated with the log-read failure. Examine the system console log for additional messages regarding the log-read error. Correct the cause of the error, if possible, and reply 'Y' to the DSNJ154I message in order to retry the log-read request. If it is not possible to correct the problem causing the log-read errors, quiesce the work on the

DSNJ154I • DSNJ204I

DB2 system before replying 'N' to the DSNJ154I message in preparation for DB2 termination.

DSNJ154I *csect-name* REPLY Y TO RETRY LOG READ REQUEST, N TO ABEND

Explanation: While processing a DB2 must-complete function, DB2 encountered an error during an attempt to access the required log data sets.

System Action: The DSNJ153E message identifies the critical log-read error, and immediately precedes this message. DB2 will wait for the operator's reply to proceed with the log-read request.

Operator Response: Notify the system programmer. Once actions have been taken to correct the cause of the log-read errors, reply 'Y' to request a retry of the failing log-read request. A reply of 'N' will fail the log-read request and DB2 will abend.

System Programmer Response: Review the description of the reason-code associated with the log-read failure, and examine the system console log for additional messages regarding the log-read error. Correct the cause of the error, if possible, and reply 'Y' to the DSNJ154I message to retry the log-read request. If it is not possible to correct the problem causing the log-read errors, quiesce the work on the DB2 system before replying 'N' to the DSNJ154I message in preparation for DB2 termination.

DSNJ155I MAXARCH SUBSYSTEM PARAMETER VALUE OF nnnn IS TOO LARGE

Explanation: The MAXARCH subsystem parameter that was specified is too large for the current BSDS format. MAXARCH, which is specified as RECORDING MAX on panel DSNTIPA, indicates the maximum number of archive log volumes per log copy to record in the BSDS. The maximum value depends on whether or not you have performed a BSDS conversion. The limit for archive volumes recorded in the BSDS is 1,000 per copy if no conversion has occurred, or 10,000 per copy if the BSDS has been converted.

System Action: The MAXARCH subsystem parameter is set to 1,000 archive log volumes, and restart continues.

Operator Response: Notify the system programmer.

DSNJ156I INVALID BSDS CONVERSION, DSN=xxxxxx

Explanation: During initialization time, DB2 detected an invalid BSDS. An invalid BSDS can result from a failure during a prior attempt to run conversion program DSNJCNVB. xxxxxx is the data set name for the BSDS encountering the error.

System Action: DB2 startup will be terminated.

System Programmer Response: The procedure for

running program DSNJCNVB includes making a copy of the BSDS prior to conversion. Restore the BSDS to the original pre-conversion copy, and retry the conversion. Once the conversion is successful, restart DB2.

DSNJ200I *csect-name* xxxxxxxx UTILITY PROCESSING COMPLETED SUCCESSFULLY

Explanation: The control section 'csect-name' successfully completed the 'xxxxxxx' utility.

System Action: DB2 writes this message to the SYSPRINT data set, not to a console.

DSNJ201I *csect-name* xxxxxxxx UTILITY PROCESSING WAS UNSUCCESSFUL

Explanation: The control section 'csect-name' was unable to successfully complete processing of 'xxxxxxx' utility.

System Action: The current utility is terminated. DB2 writes this message to the SYSPRINT data set, not to a console.

User Response: Review other messages produced by the utility to determine the appropriate action to be taken.

DSNJ202I *csect-name* INSUFFICIENT VIRTUAL STORAGE AVAILABLE TO CONTINUE WITH UTILITY

Explanation: A GETMAIN macro instruction has failed, because virtual storage is unavailable for the job-step.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Rerun the utility after providing a larger virtual storage allocation for the job-step.

DSNJ203I xxxxxxxx OPERATION IS INVALID

Explanation: The user entered a utility control statement operation of 'xxxxxxx' that is invalid.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the control statement, and rerun the utility.

DSNJ204I xxxxxxxx PARAMETER IS INVALID

Explanation: The user specified a utility control statement parameter of 'xxxxxxx' that is invalid.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the control statement, and rerun the utility.

DSNJ205I xxxxxxxx PARAMETER HAS NO ARGUMENT

Explanation: 'xxxxxxx' contains the name of a parameter that requires an argument.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Specify an argument for the identified parameter and then rerun the utility.

DSNJ206I xxxxxxxx PARAMETER REQUIRES NO ARGUMENT

Explanation: 'xxxxxxx' contains the name of the parameter that has been incorrectly followed by an = symbol.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the control statement, and rerun the utility.

DSNJ207I csect-name PARAMETERS INCONSISTENT WITH SPECIFIED OPERATION

Explanation: The user has specified utility control statement parameters that are inconsistent with the specified utility operation.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the control statement, and rerun the utility.

DSNJ208E csect name MEMBER member name WAS NOT FOUND IN THE BSDS SPECIFIED IN THE GROUP DD STATEMENT.

Explanation: You are running the print log map (DSNJU004) utility. No member record exists for this member in the bootstrap data set (BSDS) specified in the GROUP DD statement.

System Action: The log map for this member is not printed. If the records for other members are requested and are found in the BSDS specified in the GROUP DD statement, they are printed.

User Response: Use the DISPLAY GROUP command to verify that the member name is a valid name and that the member has successfully joined the group. Also verify that the BSDS specified in the GROUP DD

statement is correct. If the member name and the BSDS name are correct, then the most likely causes of this message are:

- The 'missing member' never joined the group because it was never started.
- The member whose BSDS you specified in the GROUP DD statement was down when the missing member joined the group and has not been restarted.

To gather the information from the missing member, you can rerun the utility, using the BSDS DDNAME option to point to the missing member's BSDS. To avoid this problem in the future, make sure the BSDS named in the GROUP statement is from a recently started member.

DSNJ209I ENDRBA VALUE MUST BE GREATER THAN STARTRBA VALUE

Explanation: The 'STARTRBA' and 'ENDRBA' parameters specify an RBA range. Hence, the ENDRBA value must be greater than the STARTRBA value.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the control statement, and rerun the utility.

DSNJ210I OLD ICF CATALOG NAME=oldname, NEW CATALOG NAME=newname

Explanation: Change log inventory (DSNJU003) utility processing for the NEWCAT control statement has completed successfully.

oldname

Either:

- The name of the prior ICF catalog or
- 'NULL' if no prior name existed.

newname

The name of the ICF catalog defined by the VSAMCAT keyword.

DSNJ211I UNEXPECTED END OF DATA ON SYSIN DATA SET

Explanation: Additional control statements were expected but could not be found.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the control statement(s), and rerun the utility.

DSNJ212I *csect-name* **ERROR RETURNED FROM
BSDS READ, RPLERRCD=yy,
DDNAME=xxxxxxx**

Explanation: A VSAM GET was issued that resulted in a nonzero return code. 'yy' contains the error code returned by VSAM. 'xxxxxxx' contains the ddname of the BSDS encountering the error.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: The action taken is dictated by the return code. The BSDS may have to be recovered by use of a backup copy.

DSNJ213I *csect-name* **ERROR RETURNED FROM
BSDS WRITE, RPLERRCD=yy,
DDNAME=xxxxxxx**

Explanation: A VSAM PUT was issued that resulted in a nonzero return code. 'yy' contains the error code returned by VSAM. 'xxxxxxx' contains the ddname of the BSDS encountering the error.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: The action to be taken is dictated by the return code. The BSDS may have to be recovered by use of a backup copy.

DSNJ214I **SPECIFIED DSNAME ALREADY EXISTS
IN BSDS, DDNAME=xxxxxxx**

Explanation: The user attempted a NEWLOG operation with a data set name that already exists in the BSDS. An entry is never made in a BSDS if the specified DSNAME currently exists in either the active or archive records of that BSDS. 'xxxxxxx' contains the ddname of the subject BSDS.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Either correct the control statement and rerun the utility, or delete the existing DSNAME from the BSDS and rerun the utility.

DSNJ215I *csect-name* **SVC 99 INFORMATION
REQUEST FOR DD NAME 'ddname'
FAILED. RC= rc, RSN= rsncl, AND INFO
CODE infocode.**

Explanation: The Print Log Map utility requested information from the MVS Dynamic Allocation facility about the DD name shown in the message, but the system was unable to provide the information. The return code, reason code, and information code were returned by the system's SVC 99 facility. See *MVS/ESA Programming: Authorized Assembler Services Guide* for

an explanation of these codes.

System Action: If the information request was for the SYSIN DD statement, the Print Log Map utility assumes the control statement was not provided and attempts to continue the request using the SYSUT1 DD statement to locate the BSDS to be mapped.

If the information request was for the DD name of a BSDS, attempts to get information about BSDS data sets is terminated. If information about any BSDS data sets was previously acquired, the maps of those BSDS data sets are printed. Otherwise, the utility terminates.

System Programmer Response: Use the MVS manual (or the equivalent manual for the level of MVS on your system) to help you in problem determination.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353 : 4, 32.

DSNJ216I **NO SPACE IN BSDS FOR ADDITIONAL
ACTIVE LOG ENTRIES,
DDNAME=xxxxxxx**

Explanation: The maximum number of active log data sets is fixed. No further entries can be inserted after the maximum has been reached. xxxxxxxx contains the ddname of the subject BSDS.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Run the print log map utility to determine the current status of the BSDS. Subsequent actions can then be formulated, depending upon the status of the BSDS.

DSNJ217I **SPECIFIED DSNAME DOES NOT EXIST
IN BSDS, DDNAME=xxxxxxx**

Explanation: The DELETE operation specifies a DSNAME that cannot be found in the BSDS. 'xxxxxxx' contains the ddname of the subject BSDS.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the control statement, and rerun the utility.

DSNJ218I **SPECIFIED VOLUME DOES NOT EXIST
IN BSDS, DDNAME=xxxxxxx**

Explanation: The DELETE operation specifies a COPY1VOL or COPY2VOL argument that cannot be

found in the BSDS. 'xxxxxxx' contains the ddname of the subject BSDS.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the control statement, and rerun the utility.

DSNJ219I *csect-name* **OPEN ERROR,**
DDNAME=xxxxxxx

Explanation: An error occurred when the CSECT 'csect-name' tried to open a data set named 'xxxxxxx'.

This error can be caused by a number of different conditions. The most probable conditions are:

1. The ddname of the SYSPRINT, SYSIN, or SYSUT1 data set was not specified in the user's job control language (JCL).
2. The DB2 subsystem is currently executing.
3. The bootstrap data set (BSDS) was allocated by another job with a disposition (DISP) that conflicts with the DISP specified in the user's JCL.
4. The data set associated with 'xxxxxxx' is already open, possibly due to an earlier system abend.
5. The user is not authorized to access the data set associated with 'xxxxxxx'
6. Insufficient virtual storage is available to perform the OPEN command.
7. The catalog indicates that the data set associated with 'xxxxxxx' has an invalid physical record size.

System Action: The current utility is terminated.

DB2 writes this message to the SYSPRINT data set, not to a console.

User Response: The user's action depends on the condition that caused the OPEN error. The following is a list of appropriate actions corresponding to the conditions listed in the explanation:

1. Provide the missing DD statements, and then rerun the utility. Refer to *DB2 Utility Guide and Reference* for details about the required DD statements.
2. Wait until the DB2 subsystem is inactive before running the utility again because the log utility cannot execute while the DB2 subsystem is active.
3. Correct the disposition conflict and then rerun the utility.
4. Submit an access method services (IDCAMS) VERIFY job against the data set associated with 'xxxxxxx'. Rerun the log utility job.
5. In the case of an authorization failure, a separate message is usually generated from the authorization facility (RACF, for example). Investigate the authorization messages and obtain the proper authorization before running the utility again.

6. Insufficient virtual storage is usually accompanied by a separate error from the MVS operating system. Increase the REGION size on the JCL job step and rerun the utility.
7. Contact the system programmer.

DSNJ220I **BSDS IN CREATE MODE. NO DATA TO**
MAP, DDNAME=nnnnnnnn

Explanation: A utility found the BSDS to be in create mode, meaning it contains no data. *nnnnnnnn* contains the ddname of the BSDS data set.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Ensure that the BSDS data set name specified as input to the utility is correct.

DSNJ221I **PREVIOUS ERROR CAUSED xxxxxxxx**
OPERATION TO BE BYPASSED

Explanation: DB2 encountered errors while processing a utility. These errors subsequently caused 'xxxxxxx' to be bypassed.

This message is a warning only and is displayed after messages that specify the error or errors that caused the utility operation to abend. Note that the error or errors may not be associated with the current 'xxxxxxx' operation; rather, under log utility processing, a significant error in any operation causes the control statements for this and any subsequent operations to be checked for syntax only. BSDS updates do not occur for any operation specified in this message.

System Action: The log utility continues to process. However, for this and all subsequent operations, the bootstrap data set (BSDS) is not updated and the utility only checks the syntax of the control statements.

DB2 writes this message to the SYSPRINT data set, not to a console.

User Response: Consult the previous messages and correct any errors that caused this message to be generated. Resubmit the log utility job for all operations that have been bypassed.

DSNJ222I **INVALID SPECIFICATION OF xxxx**
PARAMETER ARGUMENT

Explanation: You specified the parameter 'xxxx'. This parameter is not valid for the argument.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the parameter argument on the control statement, and rerun the utility.

**DSNJ223I xxxx PARAMETER ARGUMENT
EXCEEDS MAXIMUM ALLOWABLE
LENGTH**

Explanation: The argument value of the parameter named 'xxxx' exceeds the maximum length allowed.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the parameter argument on the control statement, and rerun the utility.

**DSNJ224I xxxx PARAMETER APPEARS TOO
OFTEN**

Explanation: The parameter named 'xxxx' was specified more than once on the same control statement.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Remove the redundant parameter, and rerun the utility.

**DSNJ225I xxxx OPERATION COMPLETED
SUCCESSFULLY**

Explanation: The change log inventory (DSNJU003) utility operation named 'xxxx' completed successfully.

System Action: This message is written to the SYSPRINT data set, not to a console.

**DSNJ226I SPECIFIED VOLUME ALREADY EXISTS
IN BSDS, DDNAME=xxxxxxx**

Explanation: The specified volume currently exists in the archive log records of the BSDS. 'xxxxxxx' specifies the ddname of the subject BSDS.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Either correct the parameter argument on the control statement, or delete the specified volume and rerun the utility.

**DSNJ227I NO SPACE AVAILABLE IN BSDS FOR
ADDITIONAL ARCHIVE VOLUME
ENTRIES, DDNAME=xxxxxxx**

Explanation: The maximum number of archive volumes has been exceeded, and no more space is available for volume entries in the copy specified.

System Action: The current utility is terminated.

User Response: Delete some of the archive entries in the specified copy number, and rerun the utility.

**DSNJ228I csect-name LOG DEALLOCATION
ERROR DSNAME=dsname, ERROR
STATUS=eeeeiiii, SMS REASON
CODE=ssssssss**

Explanation: The log manager encountered an error while trying to dynamically deallocate the data set. Error status is the error reason code returned by MVS dynamic allocation.

System Action: Log manager processing continues.

Operator Response: Notify the system programmer.

System Programmer Response: The error status portion of this message contains the 2-byte error code (S99ERROR) followed by the 2-byte information code (S99INFO) from the SVC request block. If the S99ERROR code indicates an SMS deallocation error (97XX), then 'ssssssss' contains additional SMS reason code information obtained from S99ERSN. Refer to the *MVS/ESA SPL: Application Development Guide* for a description of these codes.

DSNJ229I csect-name OPEN FAILED FOR SYSIN

Explanation: An error occurred when the DB2 Print Log Map utility tried to open the SYSIN data set.

Possible causes are:

1. The DD name of the SYSIN data set was not specified in the user's job control language (JCL).
2. Insufficient virtual storage is available to perform the OPEN command.
3. The characteristics of the SYSIN data set are different from those expected by the print log map (DSNJU004) utility.

System Action: DSNJU004 attempts to continue processing without an input control statement. DB2 writes this message to the SYSPRINT data set, not to the system console.

User Response: Take one of the following actions based on the cause of the error.

1. Provide the missing DD statement and rerun the utility. Refer to *DB2 Utility Guide and Reference* for details about the required DD statements.
 2. Insufficient virtual storage is usually accompanied by a separate error message from the MVS operating system. Increase the REGION size on the JCL job step and rerun the utility.
 3. Check that the SYSIN data set is a fixed record format (blocked or unblocked) with an LRECL of 80. You might need to contact the system programmer for help if this is a JES data set.
-

**DSNJ230I LOG OFFLOAD SUBCOMPONENT
INITIALIZATION PROCESSING FAILED**

Explanation: During log manager initialization, the off-load function was unable to complete its initialization process.

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate actions to take.

**DSNJ231I LOG COMMAND INITIALIZATION
PROCESSING FAILED**

Explanation: During log manager initialization, the log command function was unable to complete its initialization process.

System Action: DB2 startup is terminated.

Operator Response: The rest of subsystem termination will direct the actions you should take.

System Programmer Response: One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

This message will be of interest to the IBM support center when the problem is described.

**DSNJ232I OUTPUT DATA SET CONTROL
INITIALIZATION PROCESSING FAILED**

Explanation: During log manager initialization, the output data set control function was unable to complete its initialization process.

System Action: DB2 startup is terminated.

System Programmer Response: One or more error messages describing the specific error preceded this message. Refer to the specific message for error analysis and the appropriate action to take.

This message will be of interest to the IBM support center when the problem is described.

**DSNJ233I ARCHIVE LOG READ INITIALIZATION
PROCESSING FAILED**

Explanation: During log manager initialization, the archive log read function was unable to complete its initialization process.

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error

analysis and the appropriate action to take.

**DSNJ234I ARCHIVE LOG COMMAND QUIESCE
INITIALIZATION PROCESSING FAILED**

Explanation: During log manager initialization, the quiesce function which supports the -ARCHIVE LOG MODE(QUIESCE) command processing was unable to complete its initialization process.

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

**DSNJ235I OUTPUT BUFFER WRITER
INITIALIZATION PROCESSING FAILED**

Explanation: During log manager initialization, the output buffer writer function was unable to complete its initialization process.

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

**DSNJ236I BOOTSTRAP ACCESS TERMINATION
PROCESSING FAILED**

Explanation: During log manager termination, the bootstrap data set access function was unable to complete its termination process.

System Action: Log manager shutdown continues to the next step.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

**DSNJ237I *csect-name* INVALID CONTROL
STATEMENT. THE FIRST WORD MUST
BE 'MEMBER'.**

Explanation: The print log map (DSNJU004) utility read an invalid control statement from the SYSIN data set.

System Action: DSNJU004 ignores the control statement and attempts to continue processing by looking for a SYSUT1 DD statement to describe the BSDS that is to be printed.

User Response: Refer to *DB2 Utility Guide and*

Reference for information on creating a print log map (DSNJU004) utility control statement. Correct or remove the control statement and rerun the job.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353 : 32.

DSNJ238I LOG OFFLOAD TERMINATION PROCESSING FAILED

Explanation: During log manager termination, the off-load function was unable to complete its termination process.

System Action: Log manager shutdown continues to the next step.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

DSNJ239I LOG COMMAND TERMINATION PROCESSING FAILED

Explanation: During log manager termination, the log command function was unable to complete its termination process.

System Action: Log manager shutdown continues to the next step.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

DSNJ240I OUTPUT DATA SET CONTROL TERMINATION PROCESSING FAILED

Explanation: During log manager termination, the output data set control function was unable to complete its termination process.

System Action: The log manager shutdown continues to the next step.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

DSNJ241I ARCHIVE LOG READ TERMINATION PROCESSING FAILED

Explanation: During log manager termination, the archive log read function was unable to complete its termination process.

System Action: Log manager shutdown continues to the next step.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

DSNJ242I ARCHIVE LOG COMMAND QUIESCE TERMINATION PROCESSING FAILED

Explanation: During log manager termination, the quiesce function which supports the -ARCHIVE LOG MODE(QUIESCE) command processing was unable to complete its termination process.

System Action: Log manager shutdown continues to the next step.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

DSNJ243I OUTPUT BUFFER WRITER TERMINATION PROCESSING FAILED

Explanation: During log manager termination, the output buffer writer function was unable to complete its termination process.

System Action: Log manager shutdown continues to the next step.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

DSNJ244I LOG TERMINATION RECEIVED RETURN CODE nnn FROM xxxxxxxx MACRO

Explanation: Log manager termination was passed a bad return code from the named macro.

System Action: Log manager termination processing continues.

Operator Response: Record the return code and macro-name, and notify the system programmer.

System Programmer Response: This message is

associated with a failure in the named macro. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNJ245I **CONDITIONAL RESTART RECORD INDICATES TRUNCATION AT *xxx rrr*.
REPLY Y TO CONTINUE, N TO CANCEL**

Explanation: The conditional restart control record in use indicates that the DB2 log should be truncated at the specified RBA or LRSN.*xxx* is replaced by either RBA or LRSN, and *rrr* is the value specified in the current record.

System Action: If Y, DB2 startup continues. If N, DB2 startup is terminated.

Operator Response: Reply N if the truncation is going to occur at an undesirable point. Notify system programmer. Reply Y to continue the restart.

System Programmer Response: Rerun the change log inventory (DSNJU003) utility to modify the conditional restart record.

DSNJ246I **CONDITIONAL RESTART RECORD INDICATES COLD START AT RBA *rrr*.
REPLY Y TO CONTINUE, N TO CANCEL**

Explanation: The conditional restart control record in use indicates that DB2 is to be cold started and that logging is to be begin at the specified RBA.

System Action: If 'Y', DB2 startup continues. If 'N', DB2 startup is terminated.

Operator Response: Reply 'N' if the truncation is going to occur at an undesirable point. Notify the system programmer. Reply 'Y' to continue the cold start.

System Programmer Response: Rerun the change log inventory (DSNJU003) utility to modify the conditional restart record.

DSNJ247E *csect-name* **I/O ERROR DURING PROCESSING OF *rrr* RC = *rc*, REASON = *reason***

Explanation: The I/O error occurred at record '*rrr*'. '*rc*' indicates the return code received from the I/O operation. '*reason*' indicates the reason code received from the I/O operation.

If a return code '4' was received, this indicates that the log manager detected a problem. If a return code '8' was received, this indicates a VSAM error.

System Action: DB2 startup terminates.

Operator Response: Notify the system programmer.

System Programmer Response: For a return code of '4', if you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on

identifying and reporting the problem. For a return code of '8', execute an offline access method services job to determine the cause of the VSAM error.

DSNJ248I **ARCHIVE LOG READ DEALLOCATION INITIALIZATION PROCESSING FAILED**

Explanation: During log initialization, the archive log read deallocation process was unable to complete its initialization.

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error precede this message. Refer to these messages for error analysis and the appropriate action to take.

DSNJ249I **ARCHIVE LOG READ SCHEDULER INITIALIZATION PROCESSING FAILED**

Explanation: During log initialization, the archive log read scheduling process was unable to complete its initialization.

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error precede this message. Refer to these messages for error analysis and the appropriate action to take.

DSNJ250E *csect-name* **DATA SHARING REQUIRES ALL ACTIVE LOG DATA SETS TO BE DEFINED WITH SHAREOPTIONS(2 3) OR HIGHER.**

Explanation: DB2 detected an active log data set defined with share options that do not permit recovery operations in a data sharing environment. This message is followed by message DSNJ251E, which identifies the specific active log data set.

All active log data sets for a DB2 data sharing member must be defined with a minimum of SHAREOPTIONS(2 3) for successful DB2 initialization. See the description of message DSNJ251E for more details.

System Action: The DB2 subsystem detecting this condition is terminated.

DSNJ251E *csect-name* **DATA SET *dsname* FAILS TO MEET THE MINIMUM REQUIRED SHAREOPTIONS FOR DATA SHARING.**

Explanation: The share options defined for the data set named in the message are too low to permit the data set to participate in a DB2 data sharing group. All active log data sets must be defined with

DSNJ252I • DSNJ301I

SHAREOPTIONS(2 3) or higher in order to participate in a data sharing group.

System Action: The DB2 subsystem detecting this error is terminated.

System Programmer Response: Using IDCAMS LISTCAT or TSO LISTCAT, display the share options of all of the active log data sets of all of the members in the data sharing group. For any active log data set that is defined with less than SHAREOPTIONS(2 3), use IDCAMS ALTER or TSO ALTER to alter the data set definitions to SHAREOPTIONS(2 3) or higher.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 11.

DSNJ252I xxxx NUMBER OF PARAMETER ARGUMENTS EXCEED MAXIMUM VALUE

Explanation: The number of arguments for the parameter named xxxx exceed the maximum value allowed.

System Action: The current operation is terminated. This message is written to the SYSPRINT data set, but not written to a console.

User Response: Change the number of parameter arguments on the control statement, and rerun the utility.

DSNJ253I csect-name alias-port USE IS INVALID

Explanation: The *alias-port* value has been used in an invalid manner. The error could be due to one of the following conditions:

- *alias-port* was specified after more than one alias-name parameter
- *alias-port* duplicates the port value for the PORT or RESPORT parameters which have been specified with this update, or are already stored in the BSDS

System Action: The update of the BSDS will not be performed.

User Response: Retry the BSDS update with unique *alias-port* values, which also do not match the values for the PORT or RESPORT parameters.

DSNJ260I csect_name BSDS CONVERSION FOR DDNAME=nnnnnnnn COMPLETED SUCCESSFULLY

Explanation: The BSDS conversion utility issues this message to indicate a successful conversion for the BSDS data set specified by the *nnnnnnnn* DDNAME.

System Action: Processing continues.

DSNJ261I csect_name BSDS CONVERSION FOR DDNAME=nnnnnnnn WAS NOT SUCCESSFUL

Explanation: The BSDS conversion utility issues this message to indicate conversion was not successful for the BSDS data set specified by the *nnnnnnnn* DDNAME.

System Action: The action taken depends on whether dual BSDS data sets are specified, and if so, which conversion failed. The DDNAME in the message indicates the failing BSDS data set.

If dual BSDS data sets are specified, the SYSUT1 data set is converted first. If that conversion is successful, the SYSUT2 data set is then converted. A failure at this point does not affect the successful SYSUT1 conversion.

If conversion fails for the SYSUT1 data set, processing is terminated at that point. In this case, any SYSUT2 data set that was specified will not be converted.

User Response: Review other messages produced by the utility to determine the cause of the failure and the resulting action to take.

DSNJ266I WARNING - BSDS UTILITY TIMESTAMP MISMATCH DETECTED. PROCESSING TERMINATED.

Explanation: DB2 detected a mismatch in the timestamps for the SYSUT1 and SYSUT2 BSDS copies during execution of BSDS conversion utility DSNJCNVB. This indicates the possibility that the dual BSDSs are out of sync.

System Action: The program will terminate with no action taken.

System Programmer Response: Run the print log map utility (DSNJU004) against each BSDS. From the output, determine which data set is obsolete, delete it, and define a replacement for it. Then copy the remaining data set into the replacement and retry the utility.

If output from the print log map utility for both data sets is similar, delete the data set with the oldest time stamp, and copy the data set with the most recent time stamp into the replacement.

DSNJ301I csect-name ERROR action ONLINE BOOTSTRAP DATA SET

Explanation: During command processing for the -RECOVER BSDS command or the -ARCHIVE LOG command, an error occurred while performing an operation on the Bootstrap Data Set. The type of operation is specified in the 'action' keyword in the message text:

- **ACCESSING** Unable to OPEN the BSDS.
- **READING** Unable to read a required record from the BSDS.
- **UPDATING** Unable to write a required record to the BSDS.
- **RESTORING DUAL** The contents of the stable BSDS was successfully copied to the replacement BSDS; however, the DB2 subsystem was unable to successfully restore dual BSDS operation.

System Action: If this message was received during processing of the -RECOVER BSDS command, then the DB2 subsystem will continue in single BSDS mode. If this message was received during processing of the -ARCHIVE LOG command, the archive log history record in the BSDS will not be updated to reflect the occurrence of an -ARCHIVE LOG command; logging and the off-load processing will continue.

Operator Response: Inform the system programmer of the type of error that occurred, and whether the error occurred while processing a -RECOVER BSDS command or an -ARCHIVE LOG command.

System Programmer Response: If this message was received during processing of the -RECOVER BSDS command, then recovery action must be performed on the bootstrap data set before reentering the command. If this message was received during processing of the -ARCHIVE LOG command, no action is necessary.

**DSNJ302I ALLOCATION ERROR ON
REPLACEMENT BSDS DSNAME=...
ERROR STATUS=...**

Explanation: The RECOVER BSDS command encountered an error while trying to dynamically allocate the specified data set. DSNAME is the data set name. Error Status is the error code and information code returned by MVS dynamic allocation.

System Action: Processing of the command is terminated. The system continues in single BSDS mode.

Operator Response: Determine the cause of the error from the error status contained in the message, and correct the condition. Then reenter the -RECOVER BSDS command.

System Programmer Response: The error status portion of this message contains the 2-byte error code (S99ERROR) followed by the 2-byte information code (S99INFO) from the SVC request block. Refer to the appropriate MVS publication for a description of these codes.

**DSNJ303I WRITE ERROR ON REPLACEMENT
BSDS DSNAME=... ERROR STATUS=...**

Explanation: The -RECOVER BSDS command encountered an error while attempting to write to the specified bootstrap data set. Error Status contains the

VSAM return and feedback codes. It is a 2-byte field with the first containing the hexadecimal return code and the second containing the hexadecimal feedback code.

System Action: Processing of the command is terminated. The system continues in single BSDS mode.

Operator Response: Notify the system programmer.

System Programmer Response: Execute an offline access method services job to delete or rename the replacement BSDS and define a new BSDS with the same name. Reenter the log manager -RECOVER BSDS command to reestablish dual BSDS mode.

**DSNJ304I ERROR CLOSING REPLACEMENT
BSDS DSNAME=... ERROR STATUS=...**

Explanation: The -RECOVER BSDS command encountered an error while attempting to close the specified bootstrap data set. Error Status contains the VSAM return and feedback codes. It is a 2-byte field with the first containing the hexadecimal return code and the second containing the hexadecimal feedback code.

System Action: Processing of the command is terminated. The system continues in single BSDS mode.

Operator Response: Notify the system programmer.

System Programmer Response: Execute an offline access method services job to delete or rename the replacement BSDS and define a new BSDS with the same name. Reenter the log manager -RECOVER BSDS command to reestablish dual BSDS mode.

**DSNJ305I REPLACEMENT BSDS NOT EMPTY
DSNAME=...**

Explanation: The -RECOVER BSDS command was issued, but the replacement bootstrap data set was not empty; that is, it contained data.

System Action: Processing of the command is terminated. DB2 continues in single BSDS mode.

Operator Response: Notify the system programmer.

System Programmer Response: Execute an offline access method services job to delete or rename the error BSDS and define a new BSDS with the same name. Reenter the log manager -RECOVER BSDS command to reestablish dual BSDS mode.

**DSNJ306I DUAL BSDS MODE ALREADY
ESTABLISHED**

Explanation: The -RECOVER BSDS command was issued, but DB2 was already in dual BSDS mode.

System Action: The command is ignored.

DSNJ307I LOG INITIALIZED IN SINGLE BSDS MODE

Explanation: The -RECOVER BSDS command was issued, but the system was initialized in single BSDS mode.

System Action: Processing of the command is terminated. The system continues in single BSDS mode.

DSNJ310I (A)SYNCHRONOUS ARCHIVE LOG COMMAND QUIESCE PROCESSING STARTED FOR MAXIMUM OF xxx SECONDS

Explanation: An -ARCHIVE LOG command with the MODE(QUIESCE) option has been accepted by the DB2 subsystem. The quiesce processing has commenced.

System Action: The DB2 subsystem will attempt to stop all updates to DB2 resources within the time period specified in the message. Users/jobs operating on the DB2 subsystem will be allowed to reach a point of consistency (commit point) before being blocked from further update activity. Jobs and users will be suspended until they are released by DB2 following the initiation of the off-load processing. If the DB2 subsystem can effectively block all users from performing updates before the maximum specified time, then the off-load will be initiated immediately, and normal processing will be resumed.

The message will display either the word SYNCHRONOUS or ASYNCHRONOUS, to inform the user of the type of quiesce processing which has been used.

- If the word SYNCHRONOUS is displayed, then the invoker used the WAIT(YES) option. This means that quiesce processing will be synchronous to the user; that is, the user can enter additional DB2 commands, but the commands will not be processed by the DB2 command processor until the quiesce processing has ended.
- If the word ASYNCHRONOUS is displayed, then the invoker used the WAIT(NO) option, or did not specify the WAIT option. This means that quiesce processing will be asynchronous to the user; that is, control will be returned to the invoker as soon as the quiesce task has been started. Thus, the DB2 command processor will accept - and process - any new DB2 commands while the quiesce task is running.

This message will be followed by message DSNJ311I or DSNJ317I.

Operator Response: No operator response is necessary. However, it can be expected that users and jobs using DB2 resources will be suspended (queued) by DB2 through the duration of the specified time interval, or until the DB2 subsystem can be certain that

all update activity has been effectively blocked. At some point, this message will be followed by the DSNJ311I message or DSNJ317I message.

DSNJ311I csect-name ASYNCHRONOUS LOG ARCHIVE (OFFLOAD) TASK INITIATED

Explanation: A user-initiated -ARCHIVE LOG command has been accepted by the DB2 subsystem. An asynchronous task to archive (off-load) the active log data set has been started.

System Action: The current active log data set(s) will be truncated and switched to the next available active log data set(s), and an asynchronous off-load task will be initiated to archive the Active log data set(s).

The term ASYNCHRONOUS is used to indicate that control will be returned to the invoker as soon as the off-load task has been started. Thus, the DB2 command processor will accept — and process — any DB2 commands while the off-load task is running.

This message is followed by message DSNJ312I if the MODE(QUIESCE) option was used with the -ARCHIVE LOG command.

Operator Response: The operator should respond per normal operational procedures when the off-load task begins.

DSNJ312I ARCHIVE LOG QUIESCE ENDED. UPDATE ACTIVITY AGAINST DB2 RESOURCES IS NOW RESUMED.

Explanation: An -ARCHIVE LOG command with the MODE(QUIESCE) option was processed by the DB2 subsystem. As part of the MODE(QUIESCE) processing, an attempt was made to stop all new update activity against DB2 resources. This message signals the end of the quiesce processing, and the resumption of normal DB2 activity for all users and jobs which were blocked during the quiesce period.

This message follows message DSNJ311I or DSNJ317I.

System Action: The DB2 subsystem has now resumed all normal DB2 activity for all users and jobs that were blocked during the quiesce period.

DSNJ313I PARAMETER SPECIFIED ON THE keyword KEYWORD (value) IS NOT IN THE RANGE OF ALLOWABLE VALUES

Explanation: This message was generated by an error occurring in one of the following commands:

- ARCHIVE LOG command with MODE(QUIESCE)
- SET ARCHIVE
- SET LOG

You specified a value for one of the command options that was outside of the range of allowed values.

System Action: Processing for the ARCHIVE LOG, SET ARCHIVE, or SET LOG command is terminated. This message is followed by message DSN9023I.

Operator Response: Refer to *DB2 Command Reference* for the correct syntax of the command. Correct the command syntax and reenter the command.

**DSNJ314I xxxx KEYWORD REQUIRES yyyy
KEYWORD TO ALSO BE SPECIFIED
ON THE COMMAND**

Explanation: A command was entered which specified the 'xxxx' keyword. However, use of the 'xxxx' keyword requires that the 'yyyy' keyword also be used.

System Action: Command processing terminates for the -ARCHIVE LOG or -RECOVER BSDS command. This message is followed by message DSN9023I.

Operator Response: Refer to the *DB2 Command Reference* for the correct syntax of the command. Correct the command syntax, and reenter the command.

**DSNJ315I -STOP DB2 MODE(FORCE) IN
PROGRESS**

Explanation: An attempt was made to issue an -ARCHIVE LOG command when a -STOP DB2 MODE(FORCE) command was already in progress.

System Action: Command processing terminates for the -ARCHIVE LOG command. The -STOP DB2 MODE(FORCE) processing continues.

**DSNJ316I SYSTEM QUIESCE ALREADY IN
PROGRESS**

Explanation: An attempt was made to issue an -ARCHIVE LOG command with the MODE(QUIESCE) option when a system quiesce was already in progress. The system quiesce could be the result of processing by another -ARCHIVE LOG MODE(QUIESCE) command, or by a -STOP DB2 MODE(QUIESCE) command.

System Action: Command processing will terminate. The system quiesce currently in progress will continue.

**DSNJ317I ARCHIVE LOG QUIESCE PERIOD
EXPIRED. NUMBER OF OUTSTANDING
UR'S = xxxx. ARCHIVE LOG
PROCESSING WILL BE TERMINATED,
AND UPDATE ACTIVITY AGAINST DB2
RESOURCES WILL BE RESUMED.
HH:MM:SS**

Explanation: An -ARCHIVE LOG MODE(QUIESCE) command was processed by the DB2 subsystem; however, the DB2 subsystem was not able to quiesce all update activity in the user-specified quiesce time interval.

System Action: This message is informational only. The DB2 subsystem determined that 'xxxx' units of recovery (URs) did not reach a point of consistency during the quiesce period, and therefore could not be stopped from continuing their associated update processing.

Consequently, the -ARCHIVE LOG processing will be terminated. The current active log data set(s) will not be truncated, and will not be switched to the next available active log data set(s). The log archive (off-load) task will not be created. All jobs and users suspended during the quiesce will be resumed, and normal update activity against DB2 resources will be commenced.

This message will be followed by the DSNJ312I message.

Operator Response: Contact the system programmer.

System Programmer Response: A determination must be made whether the outstanding (nonquiesced) URs represent significant work.

Each user on the system has a unit of recovery if they are modifying DB2 resources. URs are also created by the DB2 subsystem itself for internal processing. Since the purpose of the MODE(QUIESCE) option is to have all URs reach a point of consistency (commit point) before the active log data set is truncated and off-loaded, determine all outstanding nonqueued jobs and users by using -DISPLAY THREAD and the MVS 'D A,L' operator command.

It should be noted that URs may be outstanding due to lock contention between a user or job which holds a resource (and has reached a point of consistency), and a user or job which wants a lock (and therefore cannot reach a point of consistency).

Before resubmitting the -ARCHIVE LOG command with the MODE(QUIESCE) option, either:

- Wait until the threads have been deallocated.
- Wait until the DB2 subsystem is less busy.
- Force the offending thread(s) to terminate.
- Use the TIME option to dynamically override and extend the maximum quiesce time period specified in ZPARMS.
- Or, if having all URs reach a point of consistency in the active log is no longer critical, issue the -ARCHIVE LOG command without the MODE(QUIESCE) option.

Important: If the decision is made to use the -ARCHIVE LOG command without the MODE(QUIESCE) option, the active log data set(s) will be truncated without regard to quiescing activity on the DB2 subsystem. If the resulting archive log data set is used for recovery, it is possible that some URs may be found to be In-flight, In-Abort, In-Commit, or In-doubt during DB2 initialization.

DSNJ318I • DSNJ321I

If expiration of the quiesce period before all URs reach a consistent point are a chronic problem, an adjustment to ZPARMs may have to be made. The quiesce period is controlled by the 'Maximum Quiesce Period' ZPARM. Refer to the discussion about the Archive Log Parameters (DSNTIPA) panel in Part 2 of *DB2 Installation Guide*.

DSNJ318I ARCHIVE LOG COMMAND ALREADY IN PROGRESS

Explanation: An attempt was made to issue an ARCHIVE LOG command when an ARCHIVE LOG command was already in progress. In data sharing, the ARCHIVE LOG command currently in progress could be initiated by another member.

Operator Response: If the conflicting command satisfies your archival request, do not reissue the command. Otherwise, wait for the conflicting command to complete and then reissue the -ARCHIVE LOG command.

DSNJ319I *csect name* CURRENT ACTIVE LOG DATA SET IS THE LAST AVAILABLE ACTIVE LOG DATA SET. ARCHIVE LOG PROCESSING WILL BE TERMINATED.

Explanation: The -ARCHIVE LOG command was rejected because the current active log is the last available active log data set. To process the command when these conditions exist would cause the DB2 subsystem to exhaust its available active log resources and immediately halt processing.

System Action: Processing for the command is terminated. If the situation is not corrected, the DB2 subsystem will issue the DSNJ110E message (if it has not already done so) as the available active log data space reaches critically low levels. Ultimately, message DSNJ111E will be issued when the available active log data space is exhausted, and the DB2 online processing will halt until active log space is made available.

User Response: Notify the operator or system programmer.

Operator Response: To clear this condition, steps must be taken to complete other waiting off-load tasks. Once another active log is made available (re-usable) by completing the off-load process for it, the command processing for the current active log can proceed.

Execute an MVS *Display System Requests* command (D R,L for example) to determine the outstanding requests related to the log off-load process. Take the necessary action to satisfy any requests, and permit off-load to continue. If off-load fails to complete normally, or cannot be initiated, notify the systems programmer.

System Programmer Response: Either correct the problem that is causing the off-load process to fail, or

add more active log data sets. Note that the latter action requires DB2 to be down and the change log inventory (DSNJU003) utility to be run.

Possible causes for the shortage of active log data space are:

- Excessive logging. For example, too many users requesting logs at the same time, or too many utilities specifying LOG (YES).
- Delayed or slow off-loading. For example, failure to mount archive volumes, incorrect replies to off-load messages, or slow device speeds.
- Excessive use of the -ARCHIVE LOG command. Each invocation of the command causes the DB2 subsystem to switch to a new active log data set. Excessive use could consume the available active log data space if the resulting off-loads were not processed in a timely manner.
- Off-loads(s) failed (see Operator Response).
- Insufficient active log space (see Operator Response).

DSNJ320I *csect-name* UNABLE TO PROCESS LOG TRUNCATION REQUEST DUE TO SUBSYSTEM COMPONENT *action* FAILURE

Explanation: While processing an -ARCHIVE LOG command, an internal request was made of the log buffer output routine to force-write the log buffers and to truncate and switch the active log to the next available active log data set(s). The request failed during the processing of the 'action' specified in the message.

System Action: Processing for the command is terminated.

User Response: Notify the system programmer.

Operator Response: Notify the system programmer.

System Programmer Response: This error is an internal error detected by the DB2 subsystem. The error may be caused by an unrelated ABEND in the Log Buffer Writer component (DSNJWxxx), by a -STOP DB2 MODE(FORCE) command, or by abnormal subsystem termination. Refer to messages and ABENDS which precede this message.

DSNJ321I UNABLE TO CONTINUE ARCHIVE LOG QUIESCE DUE TO INTERNAL SUBSYSTEM ERROR. ARCHIVE LOG PROCESSING WILL BE TERMINATED, AND UPDATE ACTIVITY AGAINST DB2 RESOURCES WILL BE RESUMED.

Explanation: An -ARCHIVE LOG command with the MODE(QUIESCE) option was processed by the DB2 subsystem. As part of the MODE(QUIESCE) processing, an attempt was made to stop all new update activity against DB2 resources. During the internal subsystem interaction between the log manager

and the recovery manager, an internal interface error was detected by the recovery manager.

System Action: The -ARCHIVE LOG MODE(QUIESCE) processing is terminated. This message will be followed by message DSNJ312I after all users and jobs quiesced by the MODE(QUIESCE) processing are resumed.

User Response: Notify the system programmer.

Operator Response: Notify the system programmer.

System Programmer Response: This error is an internal error detected by the DB2 subsystem. Retry the -ARCHIVE LOG MODE(QUIESCE) command. If the error persists, the active log data sets may be switched using the -ARCHIVE LOG command without the MODE(QUIESCE) option.

DSNJ322I DISPLAY ARCHIVE REPORT FOLLOWS—

Explanation: This message is always generated as the title for the -DISPLAY ARCHIVE command report output. It precedes the other messages generated by this command.

The series of messages DSNJ323I through DSNJ329I provide the formatted report for -DISPLAY ARCHIVE.

DSNJ323I COUNT TIME

Explanation: The column headings for the list of parameter specifications generated by the -DISPLAY ARCHIVE command are displayed. The message number is not included in this message.

DSNJ324I (TAPE UNITS) (MIN,SEC)

Explanation: The format of the COUNT and TIME parameter specifications displayed by the -DISPLAY ARCHIVE command are shown. The message number is not included in this message.

DSNJ325I name count time

Explanation: This message, in combination with messages DSNJ323I and DSNJ324I, provides the parameter information that is a part of the -DISPLAY ARCHIVE report.

name Identifies the count and time values in the message line.

DSNZPARM

Values specified during DB2 installation.

CURRENT

Current values in the DB2 system.

count The value for COUNT as specified in name.

time The value for TIME as specified in name.

The message number is not included in this message.

DSNJ326I

Explanation: This message separates messages DSNJ325I and DSNJ327I that are generated by the -DISPLAY ARCHIVE command. The message number is not included in this message.

DSNJ327I ADDR STATUS CORR-ID VOLSER DATASET_NAME

Explanation: This message displays the column headings for the DISPLAY ARCHIVE report.

The message number is not included in this message.

DSNJ328I tapeaddr status corr-id vname dsname

Explanation: This message, in combination with message DSNJ327I, provides the tape unit information that is part of the -DISPLAY ARCHIVE report.

tapeaddr

The physical tape address of the tape unit allocated to read archive log.

status Status of tape address:

BUSY Tape address is actively processing an archive log data set.

PREM Tape address is active and allocated for premount.

AVAIL Tape unit is inactive and waiting for work.

corr-id The correlation id associated with the user of the tape being processed. If the status is PREM or AVAIL, this column might contain '*****', indicating no current user is associated with this tape.

vname The name of the tape volume that is mounted on the tape address.

dsname

The data set on the tape volume that is being processed (BUSY and PREM) or was last processed (AVAIL).

The message number is not included in this message.

DSNJ329I END OF DISPLAY ARCHIVE REPORT.

Explanation: This message follows messages DSNJ322I through DSNJ328I and indicates that the -DISPLAY ARCHIVE report was generated successfully. The message number is not included in this message.

DSNJ330I ARCHIVE LOG VOLUMES REQUIRED FOR CONNECTION ID conn-id CORRELATION ID corr-id

Explanation: This message is the title for the ARCHIVE LOG VOLUMES report output. The ARCHIVE LOG VOLUMES report lists the archive log volumes needed by the correlation ID for that connection ID. This message is generated automatically by the archive read process at the first archive log tape mount for corr-id. This message precedes the other messages generated by this action.

This message, in combination with messages DSNJ331I and DSNJ332I, provides the formatted report for the ARCHIVE LOG VOLUMES requested.

conn-id

An identifier representing the 'connection name' used to establish the thread.

corr-id

An identifier associated with a specified thread. In TSO, it is either the authorization ID or the job name.

DSNJ331I avolume, avolume, avolume, avolume ...

Explanation: This message provides the tape volume information for the Archive Log Volumes report output.

avolume

The name of the archive log volume required for this correlation ID. An 'avolume' prefixed with an '*' signifies that the data on the archive log volume is also mapped by an active log data set. As such, the 'avolume' **might not** be required for the read process, since the data is read from the active log, if possible.

DSNJ332I END OF ARCHIVE LOG VOLUMES REPORT

Explanation: This message follows messages DSNJ330I and DSNJ331I and indicates that the ARCHIVE LOG VOLUMES report was generated successfully. The message number is not included in this message.

DSNJ333I csect-name SYSTEM CHECKPOINT INITIATED

Explanation: This message indicates that the SET LOG command processed successfully and that a system checkpoint has been initiated.

DSNJ334I PARAMETER SPECIFIED ON THE keyword KEYWORD (VALUE) CONTAINS INVALID CHARACTERS

Explanation: A -SET ARCHIVE command was processed by the DB2 subsystem. One of the command

keywords specified a value that contains an invalid character.

System Action: Processing for the -SET ARCHIVE command is terminated. This message is followed by the DSN9023I message.

Operator Response: Refer to *DB2 Command Reference* for the syntax of the command. Correct the syntax and reenter the command.

DSNJ335I INVALID KEYWORDS COMBINATION IN SET ARCHIVE COMMAND

Explanation: This command requires that keyword COUNT or keyword TIME be specified. If both are omitted, the keyword DEFAULT must be specified. It is invalid to specify keyword DEFAULT when either the COUNT keyword or TIME keyword is specified.

System Action: Processing for the -SET ARCHIVE command is terminated. This message is followed by the DSN9023I message.

Operator Response: Refer to *DB2 Command Reference* for the syntax of the command. Correct the syntax and reenter the command.

DSNJ336I UNABLE TO ALLOCATE TAPE UNIT FOR conn-id corr-id, x ALLOCATED, y ALLOWED.

Explanation: An attempt to allocate a tape unit for connection ID 'conn-id' failed. The current maximum tape unit specified is 'y', but only 'x' are physically available.

System Action: The 'conn-id corr-id' process is queued until either an allocated tape unit becomes free or more tape units are varied online and made available to the DB2 archive read task.

Operator Response: This situation rectifies itself over time as currently allocated tape units become available. To improve throughput, vary additional tape units online and make them available to DB2. Note that a queue rescan is not attempted until the -SET ARC READ COUNT command is issued or when an allocated tape dismounts.

DSNJ337I SET ARCHIVE COMMAND COMPLETED COUNT(count) TIME(minute,second)

Explanation: This message indicates that the -SET ARCHIVE command processed successfully and displays the current values for COUNT and TIME.

count The value for the COUNT parameter

minute The 'minute' value for the TIME parameter

second The 'second' value for the TIME parameter

DSNJ338I NO TAPE ARCHIVE READING ACTIVITY

Explanation: This message indicates that there is no current archive tape reading activity to report.

The message number is not included in this message.

DSNJ339I *csect-name* SET LOG COMMAND COMPLETED, *type(quantity)*

Explanation: This message indicates that the SET LOG command processed successfully, and displays the current checkpoint frequency. The checkpoint frequency remains in effect until DB2 is restarted or until the value is modified by a SET LOG or SET SYSPARM command.

type Along with *quantity*, determines the current system checkpoint frequency. It indicates MINUTES for a time-based checkpoint frequency, or LOGRECORDS if the checkpoint frequency is determined by the number of log records that are written.

quantity The number of minutes, or the number of log records that determine the current checkpoint frequency.

DSNJ340I *csect-name* COMMAND KEYWORD *xxx* IS ONLY VALID FOR DATA SHARING

Explanation: An attempt was made to issue a DB2 command with KEYWORD *xxx* on a DB2 that was not initialized to participate in data sharing.

System Action: The command request is rejected.

DSNJ341I *csect-name* -ARCHIVE LOG COMMAND NOT ALLOWED, LOGGING IS SUSPENDED

Explanation: An attempt to issue an -ARCHIVE LOG command failed because a -SET LOG SUSPEND command has suspended logging.

System Action: Command processing terminates for the -ARCHIVE LOG command. You may reissue the command when logging has been resumed by the -SET LOG RESUME command.

DSNJ350I *csect-name* (A)SYNCHRONOUS ARCHIVE LOG COMMAND QUIESCE PROCESSING STARTED IN DATA SHARING

Explanation: The DB2 subsystem of a data sharing group accepted an ARCHIVE LOG command with the MODE(QUIESCE) option.

Each active DB2 member in the data sharing group performs the quiesce operation. The member originating

the quiesce issues message DSNJ350I; all other members issue DSNJ310I as they start quiescing.

DSNJ351I *csect-name* MEMBER *member name* STATUS=*member status*

Explanation: This message appears in response to MODE(QUIESCE) being specified with the ARCHIVE LOG command. It is one of a list of elements that display archive related status of the indicated member of the data sharing group. These member status messages are preceded by the message DSNJ359I and are followed by DSNJ361I.

member name identifies the member of the data sharing group.

member status indicates archive related status of the named member. It appears as one of the following:

ABNORMALLY TERMINATING

The named member was undergoing abnormal subsystem termination at the time ARCHIVE LOG processing was active for the data sharing group. ARCHIVE LOG command processing for the remainder of the data sharing group terminates unsuccessfully.

ARCHIVE ALREADY ACTIVE

ARCHIVE LOG command processing was running at the named member at the time a succeeding ARCHIVE LOG command was issued. The succeeding ARCHIVE LOG command terminates unsuccessfully for the remaining members of the data sharing group.

CANCELED

ARCHIVE LOG command processing for the named member was canceled due to a problem encountered elsewhere in the data sharing group. The quiesce operation is interrupted and terminated and update activity against DB2 resources is resumed before command processing is terminated for the member.

COMMUNICATIONS FAILURE

A communications failure occurred between the named member and one or more other members in the data sharing group. The quiesce operation is interrupted and update activity against DB2 resources is resumed before command processing is terminated for the member. ARCHIVE LOG command processing for the remainder of the data sharing group terminates unsuccessfully.

FAILED

The named member was inactive at the time the ARCHIVE LOG command was issued. Termination of the DB2 subsystem for this member was abnormal. This status, if displayed for any member, will cause ARCHIVE

LOG command processing for the entire data sharing group to terminate unsuccessfully.

NOT AVAILABLE

Archive command status for the named member could not be determined. This condition typically occurs when the named member fails to respond during ARCHIVE LOG command processing and is usually accompanied by message DSNJ353I and/or message DSNJ355I.

QUIESCED

The named member was active at the time the ARCHIVE LOG command was issued. Update activity against DB2 resources had successfully quiesced for that member (no active URs) in response to specifying MODE(QUIESCE).

QUIESCED/OFFLOADING

The named member was active at the time the ARCHIVE LOG command was issued. Update activity against DB2 resources had successfully quiesced for that member (no active URs) in response to specifying MODE(QUIESCE). The active log at the time was truncated and an offload process was initiated after all members in the data sharing group had reached a quiesce point.

STOPPED

The named member was inactive at the time the ARCHIVE LOG command was issued. Termination of the DB2 subsystem for this member was normal with no incomplete URs outstanding. Log truncation and offload processing are scheduled to be performed automatically the next time the named member is started. When the member is started, it is important to ensure that archive processing occurs automatically. Certain error conditions might require entering an ARCHIVE LOG command via the operator console to cause log truncation and offload processing to be performed. This member status is accompanied by warning message DSNJ362A.

TIME EXCEEDED

The named member could not quiesce its update activity within the allotted period of time. The incomplete quiesce operation is interrupted and update activity is resumed before command processing is terminated for the member. ARCHIVE LOG command processing for the remainder of the data sharing group is unsuccessfully terminated.

members were not available to receive the archive request. DSNJ351I messages follow to display the quiesced members.

At the next start up of the quiesced member, DB2 switches (truncates) the current active log and initiates the archive task.

DSNJ353I *csect-name* **DSNJ353I MEMBER** *member name* **NOT RESPONDING.**

Explanation: This message is displayed when a response is needed but not received within an expected period of time during ARCHIVE LOG MODE(QUIESCE) command processing. This can occur as a result of abnormal subsystem termination under the named member or, possibly from communications problems among members of the data sharing group.

Operator Response: Examine the console log of the named member for operator information messages that might relate to the problem.

DSNJ354I *csect-name* **DSNJ354I ARCHIVE LOG: ALL ACTIVE MEMBER(S) STARTED OFFLOAD TASKS**

Explanation: This message is displayed when MODE(QUIESCE) is specified with the ARCHIVE LOG command, after all active members in the data sharing group have successfully quiesced their update activity within the allotted time period. For each active member in the data sharing group, the active log is truncated and switched, and an offload task is initiated to begin the offload process. Log truncation, switch and offload processing for stopped (and quiesced) members is performed the next time they are started.

DSNJ355I *csect-name* **ARCHIVE LOG: ONE OR MORE ACTIVE MEMBERS FAILED TO RESPOND OR START OFFLOAD TASKS**

Explanation: This message is displayed when MODE(QUIESCE) is specified with the ARCHIVE LOG command, and one or more active members could not successfully quiesce their update activity in the time allotted. Subsystem activity already quiesced is resumed, and ARCHIVE LOG command processing terminates unsuccessfully for all active members in the data sharing group. Message DSNJ353I might also appear with this message.

Operator Response: See the list of DSNJ351I member status messages following message DSNJ359I to determine the reason for the archive command failure.

DSNJ352W *csect-name* **MEMBERS WERE NOT OFFLOADED**

Explanation: DB2 issues this message during processing of an ARCHIVE LOG command with the MODE(QUIESCE) option. One or more quiesced

DSNJ356I *csect-name* **COMMUNICATIONS FAILURE TERMINATED COMMAND**

Explanation: This message appears as a result of the failure of a communications request by one or more members of the data sharing group. This message is likely to be accompanied by DSN7xxx or other error messages and/or an SVC dump.

System Action: ARCHIVE LOG command processing terminates unsuccessfully for all members in the group.

DSNJ357E *csect-name* **SYSTEM QUIESCE FAILED**

Explanation: This message indicates the unsuccessful outcome of an ARCHIVE LOG MODE(QUIESCE) command. This message indicates that one or more members were unable to quiesce their update activity in the time allowed. It is usually accompanied by one or more related messages (e.g., DSNJ355I), and a list of member status messages indicating the reason for the failure.

Operator Response: Refer to messages DSNJ359I, DSNJ351I and DSNJ361I to determine archive related status of members in the data sharing group.

DSNJ359I **MEMBER RESPONSES**

Explanation: This message marks the beginning of a list of one or more DSNJ351I member status messages and precedes the first status message in the list.

DSNJ361I *csect-name* **END OF MEMBER RESPONSES LIST**

Explanation: This message marks the end of a list of one or more DSNJ351I member status messages and follows the last status message in the list.

DSNJ362E *csect-name* **WARNING: LOGS OF *nn* STOPPED OR FAILED MEMBERS NOT OFFLOADED.**

Explanation: This message is displayed when either MODE(QUIESCE) or SCOPE(GROUP) is specified with the ARCHIVE LOG command, and one or more members of the data sharing group either stopped or failed and were not available to receive the archive request. Active log truncation, log switch and offload processing for these inactive members is scheduled to be performed the next time those members are started.

Operator Response: Verify that log switch and offload processing does automatically occur when the inactive members are started. Certain error conditions might require the ARCHIVE LOG command to be individually issued for a member if ARCHIVE LOG processing does not occur automatically. Refer to messages DSNJ359I, DSNJ351I, and DSNJ361I to identify the inactive members.

DSNJ370I *csect-name* **LOG DISPLAY CURRENT COPY1 LOG = *dsname1* IS *pct%* FULL CURRENT COPY2 LOG = *dsname2* IS *pct%* FULL H/W RBA = *hw-rba*, H/O RBA = *ho-rba* FULL LOGS TO OFFLOAD = *nn* OF *mm*, OFFLOAD TASK IS *status***

Explanation: This message, in combination with message DSNJ371I, provides the output from the DISPLAY LOG command.

dsname1

The data set name of the current active log copy1 data set. If this copy of the log is not currently active, *dsname1* will display INACTIVE.

dsname2

The data set name of the current active log copy2 data set. If this copy of the log is not currently active, *dsname2* will display INACTIVE.

pct

The percentage of log space within the active log data set that has been written.

hw-rba

The RBA of the most recently written log record.

ho-rba

The highest log RBA that has been offloaded to an archive log data set.

nn

The number of full active log data sets that have not been archived.

mm

The total number of active log data sets.

status

Status of the offload task:

BUSY,ALLC

Task is busy, allocating an archive log data set. This could indicate a tape mount request is outstanding.

BUSY,BSDS

Task is busy, copying the BSDS data set.

BUSY,ACTV

Task is busy, copying an active log data set.

BUSY

Task is busy, other processing.

AVAILABLE

Task is available for work.

DSNJ371I **DB2 RESTARTED *time-date-1* RESTART RBA *rstrt-rba* CHECKPOINT FREQUENCY *quantity type* LAST SYSTEM CHECKPOINT TAKEN *time-date-2***

Explanation: This message, in combination with message DSNJ370I, provides the output from the DISPLAY LOG command.

DSNJ372I • DSNJ402I

time-date-1

The time and date when DB2 started.

rstrt-rba

The RBA that DB2 began logging when started.

quantity

The number of minutes, or the number of log records that determine the current checkpoint frequency.

type

Along with quantity, determines the current system checkpoint frequency. It indicates MINUTES for a time-based checkpoint frequency, or LOGRECORDS if the checkpoint frequency is determined by the number of log records that are written.

time-date-2

The time and date of the last system checkpoint.

DSNJ372I *csect-name* **UPDATE ACTIVITY HAS BEEN SUSPENDED FOR *aaaa* AT RBA *xxxxxxxxxxxx*, LRSN *yyyyyyyyyyyy*, PRIOR CHECKPOINT RBA *zzzzzzzzzz***

Explanation: This message indicates that the -SET LOG command with the SUSPEND option has completed successfully.

System Action: All log and database update activity has been suspended for DB2 subsystem *aaaa*. *xxxxxxxxxxxx* contains the RBA of the last record written to the log. In a data sharing environment, *yyyyyyyyyyyy* contains the LRSN of the last record written to the log. Otherwise, *yyyyyyyyyyyy* contains the high written RBA. *zzzzzzzzzz* contains the RBA of the last system checkpoint.

Operator Response: Issue the -SET LOG command with the RESUME keyword when ready to resume update activity.

DSNJ373I *csect-name* **UPDATE ACTIVITY HAS BEEN RESUMED FOR *xxxx***

Explanation: This message indicates that the -SET LOG command with the RESUME option has completed successfully.

System Action: All log and database update activity has been resumed for DB2 subsystem *xxxx*.

DSNJ374I *csect-name* **SET LOG options COMMAND FAILED, *reason***

Explanation: A -SET LOG command has failed. *options* were specified on the command. *reason* describes the cause of the failure:

ALREADY SUSPENDED

A -SET LOG SUSPEND command was issued while update activity was suspended by a previous command.

DB2 STOPPING

A -SET LOG SUSPEND command was issued, but DB2 is stopping.

QUIESCE ACTIVE

A -SET LOG SUSPEND command was issued, but a system quiesce that was initiated by an -ARCHIVE LOG command is in progress.

NOT SUSPENDED

A -SET LOG RESUME command was issued, but update activity is not suspended.

COMMAND ABEND

A -SET LOG command abnormally terminated. Update activity is not suspended.

LOCK TIMEOUT

A lock timeout has occurred. Update activity is not suspended.

System Action: Command processing terminates.

DSNJ401I *csect-name* **rrrr RECORD NOT FOUND**

Explanation: An attempt was made to read the 'rrrr' record from the BSDS. In so doing, the read routine (DSNJU01B) could not find the record.

System Action: Utility processing continues. This message is written to the SYSPRINT data set, not to a console.

DSNJ402I **UNABLE TO LOCATE *aaaa* TBLSPACE NAME IN SYSTEM CATALOG OR DIRECTORY DATABASES**

Explanation: The table space name specified on the TBLSPACE parameter of the change log inventory (DSNJU003) utility SYSTEMDB statement could not be found in any DB2 subsystem catalog or directory database. The table space name in error is named in the '*aaaa*' message keyword.

System Action: All subsequent DSNJU003 utility statements are bypassed, and DSNJU003 processing is terminated with a return code of 4. The DB2 SYSTEMDB record is not updated.

This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the table space name specified on the TBLSPACE parameter, and resubmit the change log inventory (DSNJU003) utility job.

DSNJ403I CAPACITY OF BSDS SYSTEMDB RECORD EXCEEDED

Explanation: The BSDS SYSTEMDB record contains VSAM passwords for data sets in the DB2 catalog and directory, and has a maximum capacity of 168 entries. This message is issued when the number of eligible DB2 catalog and directory data sets exceeds the maximum capacity of the BSDS SYSTEMDB record. This is an internal error.

System Action: All subsequent change log inventory (DSNJU003) utility statements are bypassed, and DSNJU003 processing is terminated with a return code of 4. The DB2 SYSTEMDB record is not updated.

This message is written to the SYSPRINT data set, not to a console.

User Response: Notify the systems programmer.

DSNJ404E keyword NOT ALLOWED FOR operation OPERATION

Explanation: An invalid keyword was used during the operation named 'operation'.

System Action: The current utility processing is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the control statement and rerun the utility.

DSNJ405E keyword1 KEYWORD MUTUALLY EXCLUSIVE WITH keyword2 KEYWORD

Explanation: 'keyword1' and 'keyword2' are mutually exclusive and cannot appear on the same control statement.

System Action: The current utility processing is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Determine the extraneous keyword and remove it from the control statement. Rerun the utility.

DSNJ406E EITHER keyword1 KEYWORD OR keyword2 KEYWORD MUST BE SPECIFIED

Explanation: A required keyword was not used on the control statement. Use either 'keyword1' or 'keyword2' with the attempted control statement type.

System Action: The current utility processing is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the control statement and rerun the utility.

DSNJ407E csect-name NO VALID CHECKPOINT RBA FOUND

Explanation: After completing its search through the resource manager status table and the checkpoint queue, no valid checkpoint RBA was found within the specified range.

System Action: The current utility processing is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: The last 100 checkpoints are recorded in the BSDS, including the log STARTRBA and log ENDRBA of the checkpoint range. When either STARTRBA/STARTLRSN or ENDRBA/ENDLRSN are specified, the change log inventory (DSNJU003) utility attempts to locate a valid checkpoint in the range. In this case, DSNJU003 was unsuccessful in finding a valid checkpoint.

Do one of the following, as appropriate:

- If no checkpoint exists in the STARTRBA/ENDRBA range (STARTLRSN/ENDLRSN in Datasharing), set STARTRBA=ENDRBA and cold start DB2.
- If the ENDRBA/ENDLRSN is less than all recorded checkpoints or the STARTRBA/STARTLRSN is higher than all recorded checkpoints, then use DSN1LOGP to locate a valid checkpoint. Use DSN1LOGP SUMMARY(ONLY) option to find a valid checkpoint. Message DSN1153I is issued if any complete checkpoint is found. DSN1153I identifies the log RBA of the checkpoint. Update the CHKPTRBA parameter using the log RBA identified in DSN1153I and resubmit DSNJU003.

DSNJ408I csect-name CHECKPOINT RBA FOUND, RBA = rba, TIME = time

Explanation: After completing its search through the resource manager status table and the checkpoint queue, 'rba' was the most recent checkpoint RBA in the specified range and 'time' was the time of the checkpoint.

System Action: Utility processing continues.

DSNJ409I UNABLE TO WRITE ACTIVE LOG RECORD TO THE BSDS DATASET. DDNAME=xxxxxx

Explanation: A program encountered an I/O error when attempting to write a BSDS active log record to the BSDS data set. 'xxxxxx' is the DDNAME of the BSDS data set being accessed.

System Action: The program will terminate.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error preceded this message. This error is considered unrecoverable and will leave the BSDS data set in an uncertain state. It will

DSNJ410E • DSNJ416I

be necessary to either: recreate the data set using access method service routines and then use change log inventory (DSNJU003) to make the active and archive log data set(s) known to the BSDS, or recover the BSDS using a backup copy.

DSNJ410E *csect-name* I/O ERROR DURING *nnn* PROCESSING OF *yyy* RECORD

Explanation: An I/O error occurred during a READ or WRITE of a record. 'nnn' is either READ or WRITE, depending on the operation. 'yyy' specifies the Conditional Restart control record, checkpoint queue record, archive log command history record, or resource manager status table.

System Action: The current utility processing is terminated. This message is written to the SYSPRINT data set, not to a console, and will be accompanied by message DSNJ212E or DSNJ213E.

User Response: Determine the cause of the I/O error based upon the error status information provided in messages DSNJ212E or DSNJ213E.

DSNJ411I *csect-name* CRESTART *nnnn* FOR CRCRID = *yyyy*, DDNAME = *ddname*

Explanation: A CRESTART request has just completed. 'nnnn' is either CREATE or CANCEL. 'yyyy' is the restart control record hexadecimal identifier and 'ddname' is the BSDS data set (SYSUT1 or SYSUT2) associated with the request.

System Action: Current utility processing continues. This message is written to the SYSPRINT data set, not to a console.

User Response: Note the record identifier for future reference.

DSNJ412E *csect-name* RESTART CONTROL RECORD NOT FOUND IN BSDS

Explanation: The CRESTART CANCEL keyword was specified but the conditional restart control record does not exist in the BSDS data set.

System Action: Current utility processing is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: CREATE the conditional restart control record prior to attempting the CANCEL function.

DSNJ413E *csect-name* INVALID LOG RANGE SCOPE OR CHECKPOINT SPECIFIED

Explanation: The values specified thru the STARTRBA, ENDRBA, and CHKPTRBA keywords are invalid.

System Action: Current utility processing is

terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Ensure that the log range values are correct and correspond to the other log range values either specified or defaulted. A valid log range is where STARTRBA is less than or equal to CHKPTRBA, and CHKPTRBA is less than ENDRBA. The STARTRBA must be less than or equal to the ENDRBA.

DSNJ414I *csect-name* COLD START WILL RESULT FROM THIS RESTART CONTROL RECORD. FORWARD AND BACKOUT SET TO NO.

Explanation: STARTRBA and ENDRBA are equal. A cold start will result if this restart control record is used during DB2 restart. No forward or backout processing will be performed.

System Action: CRESTART processing continues.

User Response: No additional actions are required if a cold start of the system is desired. If a cold start is not desired, reissue the CRESTART and either CANCEL the current restart control record, or CREATE a new restart control record.

DSNJ415E *csect-name* ENDRBA = *rba* IS INVALID, MUST BE A MULTIPLE OF 4K

Explanation: The specified ENDRBA at 'rba' is not a multiple of 4KB.

System Action: CRESTART processing is terminated.

User Response: Correct the ENDRBA value on the CRESTART statement and rerun the utility.

DSNJ416I WARNING - BSDS UTILITY TIMESTAMP MISMATCH DETECTED. PROCESSING CONTINUES.

Explanation: As a result of a change log inventory (DSNJU003) update, it was discovered that the SYSUT1 BSDS and SYSUT2 BSDS timestamps are unequal. Being unequal indicates the possibility of a BSDS mismatch.

System Action: Current utility processing continues.

User Response: Run the print log map (DSNJU004) utility against the SYSUT1 BSDS and SYSUT2 BSDS. Determine if each BSDS is current. If each BSDS is current, this warning can be ignored. If either BSDS is not current, delete the obsolete data set and define a replacement data set, then copy the current BSDS into the replacement data set.

**DSNJ417I REQUIRED xxxxxxxx PARAMETER FOR
yyyyyyyy OPERATION IS MISSING**

Explanation: A required parameter 'xxxxxxx' for a Log utility operation was missing from the Log utility control statement. The attempted operation is 'yyyyyyyy'.

System Action: The Log utility 'yyyyyyyy' operation does not perform its function. All subsequent Log utility control statements are processed. A nonzero return code is issued by the utility.

DB2 writes this message to the SYSPRINT data set, not to a console.

User Response: Add the missing parameter to the control statements associated with the specified operation and rerun the utility.

**DSNJ418I WARNING - A NOTREUSEABLE
ACTIVE LOG DATA SET WAS DELETED
FROM BSDS LOG INVENTORY,
STARTRBA=...,ENDRBA=...**

Explanation: The data set name specified on the DSNNAME parameter of the change log inventory (DSNJU003) utility DELETE statement was a NOTREUSABLE active log.

System Action: DSNJU003 processing continues, it will terminate with a return code of 4. This message is written to the SYSPRINT data set, not to a console.

User Response: No additional actions are required if a deletion of a NOTREUSABLE active log was desired. If this was not desired, recreate the deleted log by using the NEWLOG statement with the RBA values specified in the warning message.

**DSNJ419I UNABLE TO WRITE ARCHIVE LOG
RECORD TO THE BSDS DATASET.
DDNAME=xxxxxx**

Explanation: A program encountered an I/O error when attempting to write a BSDS archive record to the BSDS data set. 'xxxxxx' is the DDNAME of the BSDS data set being accessed.

System Action: The program will terminate.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error preceded this message. This error is considered unrecoverable and will leave the BSDS data set in an uncertain state. It will be necessary to either: recreate the data set using access method service routines and then use change log inventory (DSNJU003) utility to make the active and archive log data set(s) known to the BSDS, or recover the BSDS using a backup copy.

**DSNJ420I UNABLE TO WRITE BCR1 RECORD TO
BSDS DATASET. DDNAME=xxxxxx**

Explanation: A program encountered an I/O error when attempting to write the BSDS control record to the BSDS data set. 'xxxxxx' is the DDNAME of the BSDS data set being accessed.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

**DSNJ421I THE BSDS IS NOT AT THE PROPER
RELEASE LEVEL. DDNAME=xxxxxx**

Explanation: This message is issued when a program attempting to access The BSDS data set is not at a compatible release level. This can be one of the following:

- The program accessing the BSDS data set is at a NEW release level and the BSDS is at the old level.
- The program accessing the BSDS data set is at an OLD release level and the BSDS is at the NEW level.
- The program encountered an UNKNOWN release level on the BSDS data set.

System Action: The program will terminate with no action taken.

System Programmer Response: If the program that encountered the error was one of the BSDS conversion programs (DSNJMIG0 or DSNJFAL0) an unrecoverable error was found on the BSDS data set and it must be recreated. If the error was encountered running some other utility program (i.e., change log inventory or print log map), one of the following actions may be taken:

- Run a version of the program that is compatible with the release level of the BSDS.
- Run the appropriate formatting program (DSNJMIG0 or DSNJFAL0) to convert the BSDS data set to a release level compatible with the running program. If this was successful, rerun the original program.

**DSNJ422I LOG RECORDS HAVE ALREADY BEEN
FORMATTED - THIS UTILITY WILL
TERMINATE**

Explanation: This message will occur when one of the BSDS formatting programs detects the BSDS had already been re-formatted or was already at the desired format level.

System Action: The program will terminate without any action being taken.

System Programmer Response: If the appropriate BSDS formatting program was being run, no further action is necessary.

DSNJ423I ACTIVE LOG MAY NOT HAVE BEEN ARCHIVED. DSN=xxxxxx

Explanation: The program was attempting to convert an old BSDS data set with more than 31 active log data sets to the new format. The program will drop the oldest active log data set(s) to get to the new maximum (31) limit. When dropping one of the old active log data sets from the BSDS, it was found to have been flagged as NOT REUSABLE (i.e., this data set MAY NOT have been archived). 'xxxxxx' will contain the data set name of the active log in question.

System Action: The program will remove this active log data set from the BSDS and continue.

System Programmer Response: Check to see if this data set had been archived. The active log data set was not deleted on disk but removed only from the BSDS data set, so it may still be archived, if needed. Use access method service routines to copy the VSAM active log data set to a sequential archive log data set.

DSNJ424I csect-name INVALID CONTROL STATEMENT. THE SECOND WORD MUST BE 'DDNAME' OR '*' OR MUST START WITH A PARENTHESIS.

Explanation: The control statement is invalid.

System Action: The control statement is ignored. DB2 uses the SYSUT1 DD statement to locate the BSDS to be mapped. If the SYSUT1 DD statement is not available, the utility terminates.

User Response: Refer to *DB2 Utility Guide and Reference* for information on creating a print log map (DSNJU004) utility control statement. Correct or remove the control statement and rerun the job.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 32.

DSNJ425I INVALID xxxxxx VALUE/FORMAT FOR yyyyyyyy PARAMETER (YYYYDDHHMMSST)

Explanation: 'xxxxxx' is the field in the 'yyyyyyy' parameter that contains an incorrect value or incorrect format.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the control statement and rerun the utility.

DSNJ426I ENDTIME VALUE CANNOT BE LESS THAN STARTIME VALUE

Explanation: The 'STARTIME' and 'ENDTIME' parameters specify a time range. Hence, the ENDTIME value must be equal to or greater than STARTIME value.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the control statement and rerun the utility.

DSNJ427I CHECKPOINT RECORD ADDED TO QUEUE

Explanation: The checkpoint record specified has been added to the checkpoint queue.

System Action: The BSDS checkpoint queue is modified as stated. This message is written to the SYSPRINT data set, not to a console.

DSNJ428I CHECKPOINT RECORD DELETED FROM QUEUE, STARTRBA=startrba, ENDRBA=endrba

Explanation: The checkpoint record specified has been deleted from the Checkpoint Queue. 'startrba' and 'endrba' was the RBA range indicated in the deleted checkpoint record.

System Action: The BSDS checkpoint queue is modified as stated. This message is written to the SYSPRINT data set, not to a console.

DSNJ429I RBA RANGE CONFLICTS WITH EXISTING CHECKPOINT RECORD RBA RANGE

Explanation: The specified RBA range for the new checkpoint record either exists or overlaps an existing RBA range in the checkpoint queue.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Run the print log map (DSNJU004) utility against the SYSUT1 BSDS and SYSUT2 BSDS. Determine the correct RBA range and correct the STARTRBA and ENDRBA parameters and rerun the utility.

DSNJ430I SPECIFIED ENTRY CANNOT BE ADDED WITHOUT OVERLAYING EXISTING LOWEST ENTRY

Explanation: The specified RBA range for the new checkpoint record is less than the existing lowest entry. The checkpoint queue is currently full and cannot add

the new entry without overlaying the lowest entry.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Run the print log map (DSNJU004) utility against the SYSUT1 BSDS and SYSUT2 BSDS. Determine the lowest existing entry and either change the STARTRBA and ENDRBA parameters or delete the existing lowest entry and add the new low checkpoint entry and rerun the utility.

DSNJ431I STARTRBA SPECIFIED NOT FOUND IN CHECKPOINT QUEUE

Explanation: The specified STARTRBA could not be located in the checkpoint queue.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Run the print log map (DSNJU004) utility against the SYSUT1 BSDS and SYSUT2 BSDS. Determine the correct STARTRBA value and correct the STARTRBA parameter and rerun the utility.

DSNJ432I THE OFFLRBA VALUE MUST END WITH 'FFF'

Explanation: The OFFLRBA value is invalid. It must end with 'FFF'.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the control statement and rerun the utility.

DSNJ433I *csect-name* INVALID CONTROL STATEMENT. A MEMBER LIST MUST CONTAIN AT LEAST ONE MEMBER NAME.

Explanation: The control statement is invalid. The member list is either empty or in the wrong format.

System Action: The control statement is ignored. DB2 uses the SYSUT1 DD statement to locate the BSDS to be mapped. If the SYSUT1 DD statement is not available, the utility terminates.

User Response: Refer to *DB2 Utility Guide and Reference* for information on creating a print log map (DSNJU004) utility control statement. Correct or remove the control statement and rerun the job.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in

Appendix B, "Problem determination," on page 1353: 32.

DSNJ434I *csect-name* SYSIN MUST CONTAIN AT LEAST ONE RECORD.

Explanation: A SYSIN DD statement was provided, but the data set was null, or the JCL statement "//SYSIN DD *" was immediately followed by the statement "/*".

System Action: The error is ignored. DB2 uses the DD SYSUT1 statement to locate the BSDS to be mapped. If the SYSUT1 DD statement is not available, the utility terminates.

User Response: Refer to *DB2 Utility Guide and Reference* for information on creating a print log map (DSNJU004) utility control statement. Correct or remove the control statement and rerun the job.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 32.

DSNJ435I *csect-name* THE MEMBER LIST OF A CONTROL STATEMENT MUST BE TERMINATED WITH A PARENTHESIS.

Explanation: The control statement contained the correct format for starting a list of members, but the terminating parenthesis was not found.

System Action: The control statement is accepted with an assumed parenthesis after the last member name recognized, and processing continues.

User Response: Refer to *DB2 Utility Guide and Reference* for information on creating a print log map (DSNJU004) utility control statement. Correct or remove the control statement and rerun the job.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 32.

DSNJ436I *csect-name* THE DD STATEMENT FOR *ddname* IS MISSING.

Explanation: The print log map (DSNJU004) utility requested information about the identified *ddname* from the MVS Dynamic Allocation facility, but the DD statement was not found in the job.

System Action: The job is terminated.

User Response: Refer to *DB2 Utility Guide and Reference* for information on required JCL statements. Correct the JCL and rerun the job.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 32.

DSNJ437I *csect-name* **UNABLE TO ALLOCATE BSDS** *dsname*. **SVC 99 RTN CODE rc, RSN CODE rsncd, INFO infocd.**

Explanation: The print log map (DSNJU004) utility attempted to allocate a BSDS data set using the MVS Dynamic Allocation facility, but the system was unable to complete the allocation. The return code, reason code, and information code were returned by the system's SVC 99 facility. See *MVS/ESA Programming: Authorized Assembler Services Guide* for an explanation of these codes.

System Action: The processing of the BSDS named in the message is terminated. If this is the last (or only) BSDS to be processed by this job, the job is terminated.

User Response: Refer to *DB2 Utility Guide and Reference* for information on required JCL statements. Correct the JCL and rerun the job.

Problem Determination: If you suspect an error in DB2, refer to Part 2 of *DB2 Utility Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 32.

DSNJ438I *csect-name* **THE xxx VALUE MUST END WITH 'yyy'**

Explanation: The STARTRBA or ENDRBA value specified on the NEWLOG statement is invalid. 'xxx' is either STARTRBA or ENDRBA, depending on which parameter is invalid. If 'xxx' equals STARTRBA, then 'yyy' equals '000' and if 'xxx' equals ENDRBA, then 'yyy' equals 'FFF'.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the control statement and rerun the utility.

DSNJ439I *csect_name* **NEW FUNCTION MODE REQUIRED FOR xxxxxx OPERATION**

Explanation: An attempt was made to run a log utility requiring New Function mode while DB2 was in

Compatibility mode or Enabling New Function mode.

DB2 must be in New Function mode before the utility program can run successfully. xxxxxx is the name of the attempted operation requiring New Function mode.

System Action: The program will terminate with no action taken.

System Programmer Response: Convert DB2 to New Function mode and retry the program.

DSNJ440I **BSDS HAS ALREADY BEEN CONVERTED, DDNAME=nnnnnnnn**

Explanation: This message occurs when the BSDS conversion program DSNJCNVB detects that the BSDS data set that was specified by DDNAME nnnnnnnn has already been converted.

System Action: If only SYSUT1 was specified, or both SYSUT1 and SYSUT2 data sets have already been converted, the program will terminate with no action taken. In the case where both are specified, but only SYSUT1 was previously converted, the program will continue to process the conversion for SYSUT2.

System Programmer Response: No further action is necessary.

DSNJ441I **INVALID BSDS CONVERSION, DDNAME=xxxxxx**

Explanation: This message is issued when a program attempting to access the BSDS data set encounters an invalid BSDS. An invalid BSDS is the result of a failure during a prior attempt to run conversion program DSNJCNVB. xxxxxx is the DDNAME of the BSDS data set being accessed.

System Action: The program will terminate with no action taken.

System Programmer Response: The procedure for running program DSNJCNVB includes making a copy of the BSDS prior to conversion. Restore the BSDS to the original pre-conversion copy, and retry the conversion. Once the conversion is successful, retry the program.

DSNJ700I *csect_name* **ERROR ATTEMPTING TO ACCESS BSDS FOR PEER MEMBER ID= member-id, MEMBER NAME= member-name, REASON-CODE= reason-code.**

Explanation: DB2 issues this message to identify the peer member ID, and if known, the peer member name associated with listed DB2 reason code.

System Action: An execution unit issues this message and then, if this was an unconditional request, writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates.

Operator Response: Collect all relevant diagnostic

materials, including SYS1.LOGREC, SVC dump, and console output of peer and host.

System Programmer Response: Review the explanation for the associated DB2 reason code for further action.

DSNJ701E *csect-name* **MEMBER NAME (*membername*) IN BSDS DOES NOT MATCH MEMBER NAME (*membername*) IN DB2 SYSTEM PARAMETERS** *dsnzparm*

Explanation: During startup, DB2 detected that the member name listed in its bootstrap data set (BSDS) does not match the member name in the DB2 system parameters load module.

Operator Response: Notify the system programmer.

System Programmer Response: Restore the BSDS or specify a different system parameters load module on the START DB2 command.

DSNJ702E *csect_name* **GENERIC LU NAME *lu-name* IN BSDS DOES NOT MATCH THE GENERIC LU NAME *lu-name* ASSOCIATED WITH THE DATA SHARING GROUP.**

Explanation: DB2 issues this message during startup when it detects that the generic LU name in the bootstrap data set (BSDS) does not match the generic LU name in the shared communications area (SCA) structure.

System Action: DB2 startup continues.

Operator Response: Notify the system programmer.

System Programmer Response: Depending on the accuracy of the BSDS value, take one of the following actions:

- BSDS value is correct: DB2 startup will automatically replace the generic LU name in the SCA with the correct value. The BSDS for each member of this DB2 data sharing group must specify this same value for generic LU name. If any member specifies a different value for generic LU name, use the change log inventory utility (DSNJU003) to change the generic LU name, as described in *DB2 Utility Guide and Reference*.
- BSDS value is not correct: DB2 startup will replace the generic LU name in the SCA. The SCA value will be incorrect when startup is complete. Take the following actions to correct this situation:
 - Stop this DB2 subsystem.
 - Use the change log inventory utility (DSNJU003) to change the generic LU name of this member, as described in *DB2 Utility Guide and Reference*.

- Issue START DB2 for this member. START DB2 will correct the generic LU name contained in the SCA.

DSNJ703E *csect-name* **GROUP NAME (*groupname*) IN BSDS DOES NOT MATCH GROUP NAME (*groupname*) IN DB2 SYSTEM PARAMETERS** *dsnzparm*

Explanation: During startup, DB2 detected that the group name listed in its bootstrap data set (BSDS) does not match the group name in the DB2 system parameters load module.

Operator Response: Notify the system programmer.

System Programmer Response: Restore the BSDS or specify a different system parameters load module on the START DB2 command.

DSNJ704I *csect-name* **NEW MEMBER(*member-name*) START-UP NOT ALLOWED WHEN GROUP-RESTART IS REQUIRED FOR GROUP(*group-name*).**

Explanation: One of the following occurred:

- A new member *member-name* tried to start when a group restart of data sharing group *group-name* is required.
- A member other than the originating member of a data sharing group attempted to start the new DB2 data sharing group. The originating member of a group is either an existing DB2 subsystem which formed the data sharing group or a new DB2 subsystem which was installed to form the group.

System Action: The DB2 subsystem stops.

Operator Response: Start a previously active member of this group. When the required group restart is completed, start the new member again.

If this is the very first startup of the group, you must start the originating member first before starting any other member.

DSNJ705I *csect-name* **THE DB2 SYSTEM PARAMETERS SPECIFY DATA SHARING, BUT THE BSDS SPECIFIES NON-DATA SHARING.**

Explanation: The system parameters passed on the DB2 start command specified data sharing, but the bootstrap data set (BSDS) did not indicate this DB2 is a data sharing member.

System Action: The DB2 subsystem stops.

Operator Response: If this DB2 should be a member of a data sharing group, inform the system programmer. If this DB2 is not a member of a data sharing group, restart DB2 with the correct system parameters load module

System Programmer Response: If this DB2 should be a member of a data sharing group, execute the installation job DSNTIJUZ, which updates the BSDS for data sharing.

If this DB2 is not a member of a data sharing group, reassemble the system parameters load module and specify DSHARE=NO.

If this DB2 is attempting to disable the data sharing group, then reassemble the system parameters load module and specify DSHARE=NO, then execute the installation job DSNTIJGF, and then restart this DB2. Job DSNTIJGF must be used with caution, this will disable the data sharing group. For more information, see Chapter 2 of *DB2 Data Sharing: Planning and Administration*.

DSNJ706I *csect-name* **THE DB2 SYSTEM PARAMETERS SPECIFY NON-DATA SHARING, BUT THE BSDS SPECIFIES DATA SHARING.**

Explanation: The system parameters passed on the DB2 START command specified non-data sharing, but the bootstrap data set (BSDS) indicates this is a data sharing member.

System Action: The DB2 subsystem stops.

Operator Response: If this DB2 is a member of a data sharing group, restart DB2 with the correct system parameters load module. If this DB2 is not a member of a data sharing group, inform the system programmer.

System Programmer Response: If this DB2 should be a member of a data sharing group, reassemble the system parameters load module and specify DSHARE=YES. If this DB2 is not a member of a data sharing group, execute the installation job DSNTIJGF, which updates the BSDS for non-data sharing.

DSNJ707E *csect_name* **LOCATION NAME location-name IN BSDS DOES NOT MATCH THE LOCATION NAME location-name ASSOCIATED WITH THE DATA SHARING GROUP.**

Explanation: DB2 issues this message during startup when it detects that the LOCATION name in the bootstrap data set (BSDS) does not match the LOCATION name in the system communications area (SCA) structure.

System Action: DB2 startup continues.

Operator Response: Notify the system programmer.

System Programmer Response: Depending on the accuracy of the BSDS value, take one of the following actions:

- BSDS value is correct: DB2 startup will automatically replace the LOCATION name in the SCA with the correct value. The BSDS for each member of this

DB2 data sharing group must specify this same value for LOCATION. If any member specifies a different value for LOCATION, use the change log inventory utility (DSNJU003) to change the LOCATION name, as described in *DB2 Utility Guide and Reference*.

- BSDS value is not correct: DB2 startup will replace the LOCATION name in the SCA. The SCA value will be incorrect when startup is complete. Take the following actions to correct this situation:
 - Stop this DB2 subsystem.
 - Use the change log inventory utility (DSNJU003) to change the LOCATION name of this member, as described in *DB2 Utility Guide and Reference*.
 - Issue START DB2 for this member. START DB2 will correct the LOCATION name contained in the SCA.

DSNJ708I *csect-name* **NEW MEMBER START-UP IS NOT ALLOWED WHEN THE DATA SHARING GROUP IS IN SYSTEM RECOVER PENDING MODE**

Explanation: A new data sharing member attempted to join the data sharing group when the data sharing group is in System Recover Pending mode.

System Action: DB2 startup terminates.

Operator Response: When the data sharing group is no longer in System Recover Pending mode, start the new member again.

DSNJ711E *csect-name* **SCA OPEN FAILURE ENCOUNTERED.**

Explanation: A failure occurred during command processing in an attempt to open an object in the SCA.

System Action: Command processing terminates unsuccessfully.

System Programmer Response: Obtain SYS1.LOGREC and possible SVC dump for analysis.

Problem Determination: Review the DB2 system console for possible DSN7xxxx and/or SVC dump messages that could relate to this problem.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNJ712E *csect-name* **SCA READ FAILURE ENCOUNTERED.**

Explanation: A failure occurred during command processing attempting to read from the SCA.

System Action: Command processing terminates unsuccessfully.

System Programmer Response: Obtain SYS1.LOGREC and possible SVC dump for analysis.

Problem Determination: Review the DB2 system console for possible DSN7xxxx and/or SVC dump messages that could relate to this problem.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNJ713E *csect-name* **SCA WRITE FAILURE ENCOUNTERED.**

Explanation: A failure occurred during command processing attempting to write to the SCA.

System Action: Command processing terminates unsuccessfully.

System Programmer Response: Obtain SYS1.LOGREC and possible SVC dump for analysis.

Problem Determination: Review the DB2 system console for possible DSN7xxxx and/or SVC dump messages that could relate to this problem.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNJ990I *csect-name* **SHOWCB ERROR, RETURN CODE = error-code**

Explanation: SHOWCB failed with error-code *error-code*. An error-code of 4 means that the log data set was allocated greater than 4 gigabytes in size, which is not supported.

Severity: 8 (error).

System Action: Processing terminates.

User Response: Notify the system programmer.

System Programmer Response: Follow standard VSAM diagnostic procedure. Refer to *z/OS DFSMS: Macro Instructions for Data Sets*. If the log data set was allocated greater than 4 gigabytes in size, reallocate the data set less than 4 gigabytes in size.

DSNJ991I *csect-name* **START OF LOG DATA SET PREFORMAT FOR JOB** *job-name*
step-name

Explanation: The active log data set preformat utility has started.

Severity: 0 (informational)

DSNJ992I *csect-name* **LOG DATA SET NAME =**
data-set-name

Explanation: The indicated *data-set-name* is to be preformatted.

Severity: 0 (informational)

DSNJ993I *csect-name* **LOG DATA SET IS NOT A VSAM DATA SET**

Explanation: The input log dataset is not a VSAM data set.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Use the AMS IDCAMS Service to define the active log data set as a VSAM Linear data set.

DSNJ994I *csect-name* **VSAM OPEN ERROR,**
ACBERRFLG = error-code

Explanation: VSAM OPEN failed with the indicated ACB *error-code*.

Severity: 8 (error) if error is greater than or equal to 128; otherwise, 4 (warning)

System Action: Processing terminates if the error code is greater than or equal to 128; otherwise, processing continues normally.

User Response: Notify the system programmer.

System Programmer Response: Follow standard VSAM diagnostic procedure. Refer to *z/OS DFSMS: Macro Instructions for Data Sets*. See also *MVS/DFP V3R3 Diagnosis Guide* for more information about the VSAM procedures.

DSNJ995I *csect-name* **VSAM PUT**
ERROR,RPLERREG = return-code,
RPLERRCD = reason-code

Explanation: VSAM PUT failed with the indicated *return-code* and *reason-code*.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Notify system programmer.

System Programmer Response: Follow standard VSAM diagnostic procedure. Refer to *z/OS DFSMS: Macro Instructions for Data Sets*. See also *MVS/DFP V3R3 Diagnosis Guide* for more information about the VSAM procedures.

DSNJ996I *csect-name* **LOG PREFORMAT**
COMPLETED SUCCESSFULLY,nn
RECORDS FORMATTED

Explanation: The active log data set has been preformatted successfully. 'nn' records (or VSAM control intervals) have been formatted.

Severity: 0 (informational)

DSNJ997I • DSNJ998I

DSNJ997I *csect-name* **LOG PREFORMAT
TERMINATED**

Explanation: Preformatting of the active log data set did not complete successfully.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Examine other error messages associated with this job.

DSNJ998I *csect-name* **LOG DATA SET IS NOT
EMPTY**

Explanation: The input log data set is not an empty data set. The input data set must be empty to prevent the loss of actual log data.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Use the AMS IDCAMS Service to delete and redefine the active log data set or correct the input log data set name.

Chapter 12. DSNL... Messages

DSNL001I DDF IS ALREADY STARTED

Explanation: The distributed data facility (DDF) was already active when you issued -START DDF command.

System Action: The issued command is not executed.

DSNL002I DDF IS ALREADY STOPPED

Explanation: The distributed data facility (DDF) had already been stopped when the -STOP DDF command was issued.

System Action: The issued command is not executed.

DSNL003I DDF IS STARTING

Explanation: The distributed data facility (DDF) -START command is starting.

System Action: DB2 begins processing the -START DDF command.

DSNL004I *csect* **DDF START COMPLETE**
LOCATION *locname* **LU** *netname.luname*
GENERICLU *netname.gluname* **DOMAIN**
domain **TCPPORT** *tcpport* **RESPORT**
resport

Explanation: The distributed data facility (DDF) started.

locname

The LOCATION of the DB2 subsystem.

netname.luname

The fully qualified LU name for the DB2 subsystem.

netname.gluname

The fully qualified VTAM generic LU name for the DB2 subsystem. The value '-NONE' indicates that no VTAM generic LU name is used by the DB2 subsystem.

domain

For non-data sharing systems, domain is the name returned by the DNS for the system's default IP address. For data sharing systems, domain is the name that represents the DB2 group. For the remote DB2 data sharing group, the DRDA requester should use a domain name of the following form:

location.sysplex.domainname

where *location* is the DB2 location name, *sysplex* is the sysplex name in the COUPLExx parmlib member and *domainname* is the domain name specified in the TCPIP.DATA file. If you are an MVS requester, the domain name is specified in column IPADDR of catalog table

SYSIBM.IPNAMES. If you are a DB2 Connect requester, the CATALOG TCPIP NODE command (or the equivalent command for your environment) is used to specify the TCP/IP domain name. The value '-NONE' indicates that TCP/IP is not supported, TCP/IP initialization failed, or DB2 has been started in restricted access mode.

tcpport The TCP/IP port number used by this DB2 subsystem to accept incoming DRDA connection requests.

- A zero indicates TCP/IP is not supported. The BSDS DDF record is not configured with a PORT.

- A value of '-NONE' indicates that DB2 will not accept connections on this port. This may be due to specifying 0 for the DSN6SYSP MAXDBAT installation parameter defined in DSNZPARM. For more information, see the "MAX REMOTE ACTIVE" specification of the DSNTIPE installation panel in the *DB2 Installation Guide*.

resport The TCP/IP port number used by this DB2 subsystem to accept incoming two-phase commit resynchronization requests.

A zero indicates TCP/IP is not supported. The BSDS DDF record is not configured with a RESPOR.

System Action: The DDF start up process completed. However, it might fail for reasons specified by messages DSNL013I, DSNL015I, DSNL016I, DSNL017I, DSNL018I, DSNL019I, DSNL700I, or DSNL705I.

System Programmer Response: Use the recommended domain name when configuring network definitions for TCP/IP requesters.

DSNL005I DDF IS STOPPING

Explanation: The distributed data facility (DDF) -STOP command has been initiated.

System Action: The -STOP DDF command is initiated.

DSNL006I DDF STOP COMPLETE

Explanation: The distributed data facility (DDF) -STOP command has completed.

System Action: The DDF has stopped.

DSNL007I DDF IS ABNORMALLY TERMINATING

Explanation: Abnormal termination of the distributed data facility (DDF) has started.

System Action: Abnormal termination of the DDF is starting.

DSNL008I DDF ABNORMAL TERMINATION COMPLETE

Explanation: Abnormal termination of the distributed data facility (DDF) has completed.

System Action: The DDF has stopped.

**DSNL009I INVALID DDF THREAD
logical-unit-of-work-id SPECIFIED**

Explanation: No distributed transaction with the specified 'logical-unit-of-work-id' exists.

System Action: The specified thread is not canceled.

User Response: Determine the correct 'logical-unit-of-work-id' of the distributed thread that is to be canceled and then reissue the command.

Problem Determination: Determine the correct value. The -DISPLAY THREAD command can be used to display all distributed activity.

DSNL010I DDF THREAD logical-unit-of-work-id HAS BEEN CANCELED

Explanation: The distributed data facility (DDF) thread 'logical-unit-of-work-id' was canceled.

If 'logical-unit-of-work-id' is an LUWID (LU network name and an LUW instance number) instead of an LUWID TOKEN, then in rare circumstances more than one DDF thread might be canceled.

This situation only arises when an application accesses the same DB2 server by different access paths (for example, A->B->C and A->D->C). In such a case, multiple threads with the same LUWID exist at the server (for example, C). If CANCEL DDF THREAD is issued at the server specifying this LUWID, every thread at the server with the LUWID is canceled.

System Action: The specified thread is canceled.

DSNL011I VTAM STOPPING DDF

Explanation: The operator issued a HALT NET command to terminate VTAM.

System Action: The distributed data facility (DDF) -STOP command is initiated.

DSNL012I VTAM TERMINATING DDF

Explanation: The operator issued a HALT NET QUICK command or a HALT NET CANCEL command, or VTAM is terminating abnormally. This message can be issued any time after -START DDF and occurs when VTAM is stopped, which can occur prior to DDF termination. This message is not issued when DDF terminates normally.

System Action: Termination of the distributed data facility is initiated.

**DSNL013I VTAM OPEN ACB FAILED
ERROR=error-code**

Explanation: VTAM returned a nonzero return code after DB2 invoked the OPEN ACB macro instruction during termination of the distributed data facility (DDF). VTAM return codes for OPEN error conditions are defined in *VTAM for MVS/ESA Programming*.

System Action: Termination of the distributed data facility is initiated.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the cause of the OPEN ACB failure, correct the error, and issue the -START DDF command.

Problem Determination: Refer to *VTAM for MVS/ESA Programming* for failure analysis during an OPEN macro instruction.

**DSNL014I VTAM CLOSE ACB FAILED
ERROR=error-code**

Explanation: VTAM returned a nonzero return code after DB2 invoked the CLOSE ACB macro instruction during termination of the distributed data facility (DDF). VTAM return codes for CLOSE error conditions are defined in *VTAM for MVS/ESA Programming*.

System Action: Termination of DDF continues.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the cause of the failure, fix the error condition, and then issue the -START DDF command.

Problem Determination: Refer to *VTAM for MVS/ESA Programming* for failure analysis during a CLOSE macro instruction.

**DSNL015I VTAM SETLOGON FAILED
RTNCD=error-code FDBK2=open-flags**

Explanation: VTAM returned a nonzero return code after DB2 invoked the SETLOGON macro during initialization of the distributed data function (DDF). VTAM return codes are defined in *VTAM for MVS/ESA Programming*.

System Action: Termination of the DDF is started.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to *VTAM for MVS/ESA Programming* to determine the cause of the failure. After the error is fixed, issue the -START DDF command.

DSNL016I DDF RECORD NOT FOUND IN BSDS

Explanation: DDF cannot find the DDF communication record in the BSDS.

System Action: DDF termination process is initiated.

Operator Response: Notify the system programmer.

System Programmer Response: Use the change log inventory to add the DDF communication record to the BSDS.

Problem Determination: Collect the following diagnostic item:

- Print the contents of the BSDS using the print log map utility.

DSNL017I INVALID DDF RECORD FOUND IN BSDS

Explanation: A invalid or incomplete DDF communication record was found in the BSDS.

System Action: DDF termination process is initiated.

Operator Response: Notify the system programmer.

System Programmer Response: Use the change log inventory to add a valid DDF communication record to the BSDS.

Problem Determination: Collect the following diagnostic item:

- Print the contents of the BSDS using the print log map utility.

DSNL018I VSAM ERROR READING DDF RECORD IN BSDS RPLERRCD=*error-code*

Explanation: A VSAM GET command was issued that resulted in a nonzero return code. RPLERRCD '*error-code*' is the VSAM return code.

System Action: Termination of the distributed data facility (DDF) is initiated.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the cause of the failure, fix the error condition, and issue the -START DDF command.

The cause of the failure is dictated by the VSAM return code. The BSDS may have to be recovered by using a backup copy.

Problem Determination: Refer to the appropriate VSAM publications.

DSNL019I VTAM DOES NOT SUPPORT APPC FUNCTIONS

Explanation: The installed release of VTAM does not support the advanced program-to-program communications (APPC) application program interface (API). The APPC API bit is not set in the VTAM function-list vector in the access-method-support vector list.

System Action: Termination of the distributed data facility (DDF) is initiated.

Operator Response: Notify the system programmer.

System Programmer Response: Determine whether the installed release of VTAM supports the APPC API. If VTAM does not support the APPC API, a VTAM release that supports the APPC API must be installed before the DDF can be started.

DSNL020I KEYWORD 'THREAD' PARAMETER *parameter* FORMAT IN ERROR

Explanation: The parameter value specified for the logical-unit-of-work ID on the CANCEL DDF THREAD has an invalid format. The correct form is '*netid.luname.luwunique*', where:

netid A 1- to 8-character network ID.

luname A 1- to 8-character luname.

luwunique A 12-character hex number.

Luname and luwunique are separated by a '.' delimiter. Netid is optional. If netid is specified, then netid and luname are separated by a '.' delimiter. If netid is not specified, then the '.' delimiter before luname is not present.

System Action: The specified thread is not canceled.

User Response: Determine the correct logical-unit-of-work ID of the distributed thread that is to be canceled and reissue the command.

Problem Determination: Determine the correct value. The -DISPLAY THREAD command can be used to display all distributed activity.

DSNL021I *command* ACCEPTED

Explanation: The '*command*' command has been accepted and asynchronous processing of '*command*' has been initiated. The command can only be -START or -STOP the distributed data facility.

System Action: The command was accepted and asynchronous processing has been initiated.

DSNL022I *csect-name* **DDF THREAD**
logical-unit-of-work-id **WAS PREVIOUSLY**
CANCELED

Explanation: A command to cancel the distributed data facility (DDF) thread *logical-unit-of-work-id* was previously issued. Either the CANCEL DDF THREAD or the CANCEL THREAD command was entered. The thread is currently being canceled. The CANCEL command terminates a thread only if the thread is processing in DB2 or is currently suspended by DB2. The thread might not be processing in DB2 in these situations:

- The thread is processing in the application and has not made a request to DB2. The DISPLAY THREAD command indicates this.
- The user placed the thread on an MVS resource using the ENQUE command. The CANCEL command has no effect on the thread until ENQUE completes and the thread returns to DB2.
- The thread is processing in VTAM and is waiting for a response from a partner. The DISPLAY THREAD DETAIL command indicates this. In this case the thread does not terminate until VTAM returns to DB2. VTAM commands, which will terminate the session or LU, can be used to cause VTAM to return to DB2.

DSNL023I **DDF IS ALREADY IN THE PROCESS**
OF STARTING

Explanation: The distributed data facility (DDF) was starting when the -START DDF or -STOP DDF command was issued.

System Action: The issued command is not executed.

DSNL024I **DDF IS ALREADY IN THE PROCESS**
OF STOPPING

Explanation: The distributed data facility (DDF) was stopping when the -STOP DDF or -START DDF command was issued.

System Action: The -START or -STOP DDF command is not executed.

DSNL025I **A DISTRIBUTED AGENT FOR**
luw-id=token **EXISTS AT THIS**
LOCATION BUT NOT AT SITE WITH
LOCATION *location* **AND LU** *luname*

Explanation: The DDF error monitor has detected that a distributed agent exists at this location but not at the named partner location.

Where

luw-id=token

The logical unit of work ID of the thread followed by an '=' sign and a token which may be used in place of 'luw-id' in any DB2 command that accepts 'luw-id' as input.

location

The location name of the partner site where a thread with the same 'luw-id' does not exist.

luname

The 8-character LUNAME of the partner location.

Operator Response: Determine if the inconsistency is due to network conditions or a DB2 error. If a DB2 error is suspected, acquire documentation to diagnose the problem.

1. Console dump of DB2 address spaces (*ssnmDBM1*, *ssnmMSTR*, *ssnmDIST*), VTAM, and user's address space at the requesting site.
2. Console dump of DB2 address spaces (*ssnmDBM1*, *ssnmMSTR*, *ssnmDIST*), and VTAM at the server site.
3. SYSLOG from requesting and server sites.
4. LOGREC from requesting and server sites.

If an indefinite inconsistency is suspected, use the CANCEL DDF THREAD command to terminate the thread. If CANCEL DDF THREAD fails to terminate the agent, use VTAM commands to terminate the thread conversations.

Problem Determination: Use the DB2 DISPLAY THREAD command with DETAIL option at each DB2 subsystem to display information about the agent and its conversations. Use VTAM commands to display additional information about the conversations being used by the thread and also about network conditions.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5.

DSNL026I **LUW-ID** *luw-id=token* **APPEARS TO BE**
SUSPENDED PARTNER LOCATION
location **PARTNER LU** *luname*

Explanation: The DDF error monitor has detected that a distributed agent with the specified 'luw-id' at this location and at the named partner 'location' may be suspended indefinitely.

Where

luw-id=token

The logical unit of work ID of the thread followed by an '=' sign and a token which may be used in place of 'luw-id' in any DB2 command that accepts 'luw-id' as input.

location

The location name of the partner site where a thread with the same 'luw-id' exists.

luname

The 8-character LUNAME of the partner location.

Operator Response: Determine if the inconsistency is

due to network conditions or a DB2 error. If a DB2 error is suspected, acquire documentation to diagnose the problem.

1. Console dump of DB2 address spaces (*ssnmDBM1*, *ssnmMSTR*, *ssnmDIST*), VTAM, and hung user's address space at the requesting site.
2. Console dump of DB2 address spaces (*ssnmDBM1*, *ssnmMSTR*, *ssnmDIST*), and VTAM as the server site.
3. SYSLOG from requesting and server sites.
4. LOGREC from requesting and server sites.

If an indefinite inconsistency is suspected, use the CANCEL DDF THREAD command to terminate the thread. If CANCEL DDF THREAD fails to terminate the agent, use VTAM commands to terminate the thread conversations.

Problem Determination: Use the DB2 DISPLAY THREAD command with DETAIL option at each DB2 subsystem to display information about the agent and its conversations. Use VTAM commands to display additional information about the conversations being used by the thread and also about network conditions.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 3, 5.

DSNL027I *dis-agent-type* **DISTRIBUTED AGENT WITH LUW-ID** *luw-id=token*
THREAD-INFO *thread-info* **RECEIVED ABEND=abnd REASON=reason**

Explanation: A distributed agent has abended at this location. This message will be followed by zero or more occurrences of DSNL028I, each of which describes a remote location where the distributed agent also exists and where diagnostic information might also need to be collected. This message is informational and with the DSNL028I message(s) identifies the remote locations where diagnostic information may have to be collected.

Where

dis-agent-type

'REQUESTING' if the thread that abended is an allied thread that has distributed activity and SERVER if the thread that abended is a database access thread.

luw-id=token

The logical-unit-of-work ID of the thread followed by an '=' sign and a 5 digit token value which may be used in any DB2 command that accepts luw-id as input.

thread-info

Thread-info contains additional identifiers that define more specific information regarding the identity of the thread.

In many distributed configurations, the primary authorization-ID used with DB2 is not necessarily the user-ID of the end user.

The following identifiers, separated by a colon(:), are provided:

- The primary authorization-ID associated with the thread.
- Work station name of the end user's work station. An asterisk (*) indicates that it is not relevant to the thread or was not provided by the client.
- End user's user-ID. An asterisk (*) indicates that it is not relevant to the thread or was not provided by the client.
- Application name of the end user's application. An asterisk (*) indicates that it is not relevant to the thread or was not provided by the client.

abnd The abend code or zeros if the abend code is indeterminate.

reason The DB2 reason code or zeros if the reason code is indeterminate.

Problem Determination: Gather appropriate diagnostic information (refer to the System Programmer Response section of the abend reason code specified in this message if applicable). Refer to DSNL028I message(s) for the names of the other location(s).

DSNL028I *luw-id=token* **ACCESSING DATA** *preposition* **LOCATION** *location nettype netvalue*

Explanation: This message follows DSNL027I and identifies a remote location where work might have been occurring for the distributed thread. This message is informational and with the DSNL027I message identifies a remote location where diagnostic information might have to be collected.

luw-id=token

The logical unit-of-work ID of the thread followed by an '=' sign and a token which may be used in place of 'luw-id' in any DB2 command that accepts 'luw-id' as input.

preposition

'FOR' if the thread is a database access thread and 'AT' if the thread is an allied thread that has distributed activity.

location

The LOCATION name of the remote site.

nettype

Identifies the type of network used to access the remote site. There are two possible values:

LU -- indicates that VTAM is used to connect to the remote site.

IPADDR --

indicates that TCP/IP is used to connect to the remote site.

netvalue

The network address of the remote location. *netvalue* can be blank.

- If *nettype* is LU, *netvalue* specifies the VTAM LU name of the remote location.
- If *nettype* is IPADDR, *netvalue* specifies the dotted decimal IP address of the remote location.

Problem Determination: See message DSNL027I.

DSNL029I DDF IS NOT INITIALIZED

Explanation: A -START DDF or -STOP DDF command was issued before DDF was initialized during DB2 startup processing.

Operator Response: Wait for the DSN9022I 'START DB2' NORMAL COMPLETION message and re-issue the command.

DSNL030I csect-name DDF PROCESSING FAILURE FOR LUWID=*luwid* AUTHID=*authid* REASON=*reason*

Explanation: A requesting conversation was terminated because of DDF processing failure. The requesting agent is identified by the 'luwid' and 'authid' values, if they are available. If the authorization ID is not available, the value '-UNKNOWN' will be displayed. If the 'luwid' is not available, the string 'netid.luname.000000000000' will be displayed, describing the LU that made the request.

The reason code in this message describes the nature of the DDF processing failure.

System Action: The system will eventually abend the database access agent.

Operator Response: Notify the system programmer for analysis.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Inspect the reason code and determine if the system is operating as expected. Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

DSNL031I csect-name DRDA EXCEPTION CONDITION IN RESPONSE FROM SERVER LOCATION=*location* FOR THREAD WITH LUWID=*luwid* REASON=*reason* code ERROR ID=*module_name* and *source id* CORRELATION ID=*correlation-id* CONNECTION ID=*connection-id* IFCID=*ifcid* SEE TRACE RECORD WITH IFCID SEQUENCE NUMBER=*seq-no*

Explanation: A DRDA exception condition was detected in response data returned from the application server (AS) with location name *location*.

A DRDA exception condition, detected at the application requester, is one of the following:

- An error reply message and severity code received from the server.
- A parsing error detected while processing a reply message or reply data object
- A DRDA protocol violation, (for example, an object returned that is not valid for this command).

The variables have the following meanings:

luwid The logical unit of work (LUW) ID that identifies the thread and is also included in the trace record.

reason The DB2 reason code for this specific error.

error id The module name concatenated with a 4-byte source id that uniquely determines the source within the module where the exception is encountered.

correlation-id The correlation identifier of the thread that detected the DRDA exception condition. Correlation-IDs beginning with '0nn', where nn is a number from 01 to 28, identify system agents.

connection-id The connection name of the thread that detected the DRDA exception condition.

ifcid The IFCID number of the trace record that was written.

seq-no The IFCID sequence number associated with the trace record. The trace record contains information that can be used to determine what caused the DRDA exception condition, and is written to statistics class 4. Statistics class 4 is directed to SMF by default during DB2 installation, and must be directed to a permanent destination (SMF or GTF) for the trace record to be accessible. The message and the trace record are only written the first time an error is detected. This avoids flooding

the console and the trace. The sequence number is printed in hexadecimal.

If the sequence number is zero this has been caused by one of two conditions:

- statistics class 4 was not directed to a permanent destination
- statistics class 4 was directed to the resident trace table as its permanent destination.

If this message first occurred because statistics class 4 was not directed to a permanent destination, then the same message recurs later (along with trace record) when the statistics class is directed to the resident table as its permanent destination instead of SMF or GTF.

System Action: An alert was generated. Additionally, the system wrote a trace record with IFCID=*ifcid* to statistics class 4 that can be used to diagnose the problem.

Problem Determination: Determine the destination of statistics class 4 and locate and print the trace record with SEQUENCE NUMBER=*seq-no*. The reason code is described in Part 4, "Section 4. DB2 Codes," on page 773. The description of the reason code can be used in conjunction with the publication Distributed Relational Database Architecture Reference to determine the type of DRDA exception that has been detected. Use the procedures described in Part 4 of *DB2 Diagnosis Guide and Reference* to determine the problem and which system is responsible.

DSNL032I *csect-name* DRDA EXCEPTION
CONDITION IN REQUEST FROM
REQUESTER LOCATION=*location* FOR
THREAD WITH LUWID=*luwid*
REASON=*reason code* ERROR
ID=*module_name and source id*
IFCID=*ifcid* SEE TRACE RECORD WITH
IFCID SEQUENCE NUMBER=*seq-no*

Explanation: A DRDA exception condition was detected while processing a command or command data received from the application requester (AR) with location name *location*. A DRDA exception condition, detected at the application server (AS), is a parsing error detected while processing a command or a command data object.

location

This field contains one of the following:

- The requester's relational database name (location name)
- The requester's VTAM LU name (<lname>)
- The requester's dotted decimal IP address (nnn.nnn.nnn.nnn)

luwid The logical unit of work (LUW) ID that identifies the thread and is also included in the trace

record, or 'NETID.LUNAME.000000000000' if the error detected involves an invalid FMH5.

reason The DB2 reason code for this specific error.

error id

The module name concatenated with a 4-byte source id that uniquely determines the source within the module where the exception was encountered.

ifcid

The IFCID sequence number associated with the trace record. The trace record contains information that can be used to determine what caused the DRDA exception condition, and is written to statistics class 4. Statistics class 4 is directed to SMF by default during DB2 installation, and must be directed to a permanent destination (SMF or GTF) for the trace record to be accessible. The message and the trace record are only written the first time an error is detected. This avoids flooding the console and the trace. The sequence number is printed in hexadecimal.

If the sequence number is zero this has been caused by one of two conditions:

- statistics class 4 was not directed to a permanent destination
- statistics class 4 was directed to the resident trace table as its permanent destination.

If this message first occurred because statistics class 4 was not directed to a permanent destination, then the same message recurs later (along with trace record) when the statistics class is directed to the resident table as its permanent destination instead of SMF or GTF.

System Action: An alert was generated and the system wrote a trace record with IFCID=*ifcid* to statistics class 4 that can be used to diagnose the problem.

Operator Response: Notify the system programmer for analysis.

System Programmer Response: Determine the destination of statistics class 4 and locate and print the trace record with SEQUENCE NUMBER=*seq-no*. The reason code is described in Part 4, "Section 4. DB2 Codes," on page 773. The description of the reason code can be used in conjunction with the publication Distributed Relational Database Architecture Reference to determine the type of DRDA exception that has been detected. Use the procedures described in *DB2 Diagnosis Guide and Reference* to determine the problem and which system is responsible.

DSNL033I *csect-name* **DDF TERMINATION SCHEDULED DUE TO DETECTION OF ABEND** *abend* **REASON** *reason*

Explanation: A severe error was detected during DDF processing. DDF processing can no longer continue so DDF termination has been scheduled. 'Csect-name' is the DB2 module that detected the condition and requested DDF termination.

The abend and reason may also contain additional information about the cause.

abend The abend code or zeros if no abend is associated with the termination of DDF.

If the abend was a DB2 04E abend, the reason code will contain additional information about the abend.

reason The DB2 reason code or zeros if no DB2 reason code is associated with the termination of DDF.

If no abend is associated with the problem, the reason code describes the cause for the termination.

System Action: Termination of the distributed data facility (DDF) is initiated.

Operator Response: Notify the system programmer for analysis.

System Programmer Response: Determine the cause of the failure. Correct the condition and restart DDF using the -START DDF command.

Problem Determination: If an abend is associated with the failure, a dump may have been provided. LOGREC will also contain information about the abend.

DSNL034E **DDF CANNOT BE STARTED BECAUSE OF BSDS INCONSISTENCIES,** **ORIGINAL LUNAME=*luname1*, BSDS LUNAME=*luname2*, ORIGINAL LOCATION=*location1*, BSDS LOCATION=*location2***

Explanation: The LUNAME or the LOCATION name stored in the bootstrap data set (BSDS) was changed since the distributed data facility (DDF) was last started, but DDF still has resynchronization responsibility with one or more partner logical units using the old LUNAME and LOCATION name. Both the original and current BSDS values of LUNAME and LOCATION name are displayed.

luname1
The LUNAME required for resynchronization

luname2
The LUNAME currently stored in the BSDS

location1
The LOCATION name required for resynchronization

location2
The LOCATION name currently stored in the BSDS

System Action: DDF cannot be started until the inconsistencies are corrected.

Operator Response: Inform the database administrator.

Database Administrator Action: You have the following options, depending on whether there is a requirement to change the LUNAME or LOCATION name in the BSDS:

- If the names were changed in error, use the change log inventory (DSNJU003) utility to change the LUNAME and/or LOCATION name back to the correct value. Then START DDF.
- If the name must be changed, you must first remove all of the resynchronization responsibility that DB2 had using the old names. You can purge this information, allow automatic resynchronization to take place, or use a combination of both.

You can purge resynchronization information by using the RESET INDOUBT command with the FORCE option. You can purge all information regardless of partner name (LOCATION (*)), or you can selectively purge by specifying a location name. DDF does not have to be started to use this command. You can use the DISPLAY THREAD command to generate a report of indoubt threads. This report indicates all resynchronization responsibility known by DB2.

If you do not purge the resynchronization information, or only selectively purge, and you want automatic resynchronization to occur before changing the names, you must first use the change log inventory (DSNJU003) utility to change the LUNAME and/or LOCATION name back to the correct value. Then START DDF. At this point, automatic resynchronization begins. You can monitor the progress by periodically using the DISPLAY THREAD command for TYPE (INDOUBT) threads. Resynchronization does not complete until all needed communications paths are available and all needed partner logical units are available. If you cannot wait for availability, use the RESET INDOUBT command with the FORCE option to purge information associated with unavailable partners.

DSNL035I **DDF CANNOT BE STOPPED BECAUSE AN INDOUBT DATA BASE ACCESS THREAD EXISTS**

Explanation: DDF is the connection manager for a database access thread (DBAT) that is indoubt. A STOP DDF MODE(QUIESCE) command is rejected until the indoubt logical unit of work is resolved.

System Action: DDF is not stopped.

Operator Response: Inform the database administrator.

Database Administrator Action: You have the following options:

- Wait for automatic resynchronization to be performed. When this occurs, either message DSNL407I or DSNL415I is displayed.
After the indoubt thread is resolved, reissue the STOP DDF command.
- Use the DISPLAY THREAD TYPE(INDOUBT) command to find the LOCATION that has coordinator responsibility for the indoubt LUW. Contact that location and determine whether the LUW committed or aborted. Then use the RECOVER INDOUBT command to cause the indoubt DBAT to be resolved with the same decision.
After the indoubt thread is resolved, reissue the STOP DDF command.
- Issue the STOP DDF MODE(FORCE) command. The indoubt thread remains indoubt and can be resolved by using automatic resynchronization after DDF is started again, or it can be resolved manually as described above.

DSNL036I **DDF THREAD** *logical-unit-of-work-id*
SPECIFIED IS INDOUBT

Explanation: A database access thread that is indoubt cannot be canceled by using the -CANCEL DDF THREAD command.

System Action: The specified thread is not canceled.

Operator Response: Use the -DISPLAY THREAD TYPE(*) command to display all distributed activity.

DSNL037I *csect-name* **RESET GENERICLU** *lu*
SUCCESSFUL

Explanation: The RESET GENERICLU command successfully purged the VTAM sysplex information from shared memory.

lu The value supplied on the RESET
 GENERICLU command

System Action: The VTAM information contained in the sysplex shared memory for the indicated LU is purged.

DSNL038E *csect-name* **RESET GENERICLU** *lu*
FAILED DUE TO VTAM RTNCD=xx and
FDB2=yy

Explanation: The VTAM CHANGE,OPTCD=(SYN,ENDAFFIN) macro returned an unexpected return code, which is described by the indicated VTAM RTNCD and FDB2 values.

lu The value supplied on the RESET
 GENERICLU command

xx The hexadecimal value of the VTAM RTNCD
 field

yy The hexadecimal value of the VTAM FDB2
 field

System Action: VTAM was not able to purge the sysplex shared memory information for the indicated LU.

System Programmer Response: Refer to *VTAM for MVS/ESA Programming* for the meaning of the VTAM RTNCD and FDB2 values.

DSNL039E *csect-name* **RESET GENERICLU** *lu*
FAILED DUE TO ACTIVE VTAM
SESSIONS

Explanation: The RESET GENERICLU command was not accepted because one or more active VTAM sessions exist to the indicated LU. All VTAM sessions must be terminated before the command is accepted.

lu The value supplied on the RESET
 GENERICLU command

System Action: The command is rejected.

System Programmer Response: Terminate the VTAM sessions to the remote LU and reissue the -RESET GENERICLU command.

DSNL040E *csect-name* **RESET GENERICLU** *lu*
FAILED DUE TO INDOUBT
RESOLUTION INFORMATION

Explanation: The RESET GENERICLU command was not accepted because information is currently being retained for resolution of indoubt threads for the indicated partner LU. The DISPLAY THREAD TYPE(INDOUBT) command can be used to view this information.

lu The value supplied on the RESET
 GENERICLU command

System Action: The command is rejected.

System Programmer Response: Make sure that all indoubt threads at the remote site are resolved before issuing the RESET GENERICLU command.

When DB2 performs automatic indoubt thread resolution, the information contained in the DISPLAY THREAD TYPE(INDOUBT) display is purged at the end of the resynchronization process.

If required, use the -RESET INDOUBT command to manually purge the indoubt resolution information.

DSNL041E *csect-name* DB2 GENERIC LU NAME REQUESTED, BUT REQUIRED VTAM LEVEL IS NOT INSTALLED

Explanation: The DB2 GENERIC LUNAME installation option was specified. This option requires VTAM Version 4 Release 2 or a later release.

System Action: The DB2 GENERIC LUNAME installation option is ignored.

System Programmer Response: If the DB2 GENERIC LUNAME is required, install VTAM Version 4 Release 2 or a later release.

DSNL042E *csect-name* DB2 SYSPLEX TP WAS INVOKED BY LU *lu*, BUT REQUIRED MVS LEVEL IS NOT INSTALLED

Explanation: A request for the DB2 sysplex transaction program (TP) was received by a DB2 server that is a member of a data sharing group. The DB2 sysplex TP is used by the requesting systems to determine which DB2 systems within the group are currently available for DDF conversations.

The DB2 sysplex TP uses Work Load Manager (WLM) functions in MVS Version 5 Release 2 or a later release to balance distributed workload among the DB2 systems in the group. Because the required MVS release is not installed or DB2 is not registered with WLM, the DB2 sysplex TP is not able to provide the requested information.

lu The name of the LU in the network that invoked the DB2 sysplex TP

System Action: The DB2 sysplex TP returns the NETID.LUNAME of the local DB2 system as the only available DB2 server in the group. The requester is not provided the names of other DB2 systems in the group, so all sessions from the requester are routed to the local DB2 server.

System Programmer Response: Install MVS Version 5 Release 2 or a later release if you want to have the DB2 sysplex TP return multiple NETID.LUNAME values to the requester or refer to the DSNL044I on why DB2 could not register with WLM.

DSNL043I *csect-name* RESET GENERICLU *luname* INVALID

Explanation: The luname value specified is invalid. The correct format is either a

- 1 to 8 character luname, or
- 1 to 8 character network ID, a period, and a 1 to 8 character luname.

System Action: The parameter is ignored. Processing continues with the next luname, if any.

User Response: Determine the correct luname and reissue the command.

DSNL044I *csect-name* MVS *macname* MACRO FAILED WITH RETCODE=*xx* AND RSNCODE=*yy*

Explanation: An MVS Workload Manager (WLM) macro returned an unexpected return code, which is described by the indicated RETCODE and RSNCODE values. DDF uses MVS Workload Manager macros to obtain data sharing sysplex routing information for incoming DDF work requests, and to establish an MVS enclave for the execution environment of the distributed thread.

macname

The name of the MVS macro that returned the unexpected return code. The possible values are:

- IWMSRSRG: Register with WLM for sysplex routing.
- IWMSRSRS: Request sysplex routing information.
- IWMSRDRS: Deregister with WLM for sysplex routing.
- IWMECREA: Create enclave.

The WLM sysplex routing service macros will be appended with the contents of the LOCATION parameter passed to it. The contents of the LOCATION parameter will either be the member's location name or one of the alias-names being defined to subset the data sharing group. If the member's location name is displayed, then this member will not participate in WLM workload balancing. If a subsetting alias-name is displayed, then subsetting of the data sharing group by that alias-name will be disabled. However, a connection to this member of the data sharing group will be accepted when using the alias-name instead of the member's location name.

xx The hexadecimal value of the MVS RETCODE field.

yy The hexadecimal value of the MVS RSNCODE field.

System Action: If a sysplex routing macro failed, then sysplex routing may not be performed in which case, all SQL statements received from the client will be processed by this DB2 subsystem. If an enclave macro failed, the distributed thread may not be able to execute in an MVS enclave, however the distributed thread will continue to execute as an MVS SRB.

System Programmer Response: Refer to *MVS/ESA Programming: Workload Management Services* for the meaning of the MVS RETCODE and RSNCODE values.

DSNL045I *csect-name* ICSF *macname* CALL
 FAILED WITH RETCODE=*return-code*
 AND RSNCODE=*reason-code*

Explanation: An Integrated Cryptographic Service Facility (ICSF) call returned an unexpected return code, which is described by the indicate RETCODE and RSNCODE values. DDF uses ICSF calls to create connection keys, to generate a shared private key, to encrypt data, and to decrypt data.

macname

The name of the ICSF call that returned the unexpected return code. The possible values are:

- CSNBRNG: Random Number Generate.
- CSNBCKM: Multiple Clear Key Import.
- CSNDPKB: Key Token Build.
- CSNDPKE: Key Encrypt.
- CSNBENC: Encipher data.
- CSNBDEC: Decipher data.

return-code

The hexadecimal value of the ICSF return_code field.

reason-code

The hexadecimal value of the ICSF reason_code field.

System Action: The encryption function cannot be processed.

System Programmer Response: System Programmer Response: If the encryption facility is not installed, then install it before requesting encryption. If the encryption facility is installed, then verify that it is working correctly. Refer to *z/OS Integrated Cryptographic Service Facility - Application Programmer's Guide - ICSF Return Codes and ICSF Reason Codes* for further information.

DSNL065I *csect-name* CURRENT DDF STATE
 DOES NOT PERMIT STOP DDF
 MODE(SUSPEND)

Explanation: The current DDF state does not allow suspend processing to be initiated. DDF must be started for normal processing in order for suspend processing to be initiated.

System Action: The command is not executed.

DSNL066I *csect-name* STOP DDF
 MODE(SUSPEND) COMPLETE

Explanation: DDF suspend processing has completed successfully. DDF has suspended all inbound activity.

System Action: Processing continues normally.

DSNL067I *csect-name* CURRENT DDF STATE
 DOES NOT PERMIT START DDF

Explanation: The current DDF state does not allow START DDF processing to be initiated.

System Action: The command is not executed.

DSNL068I *csect-name* START DDF (RESUME
 PROCESSING) COMPLETE

Explanation: DDF has resumed normal processing.

System Action: Processing continues normally.

DSNL069I *csect-name* DDF IS SUSPENDING

Explanation: DDF has initiated suspend processing.

System Action: Processing continues normally.

DSNL070I *csect-name* DDF IS RESUMING

Explanation: DDF has initiated resume processing.

System Action: Processing continues normally.

DSNL071I *csect-name* WAIT OR CANCEL
 REQUIRES KEYWORD SUSPEND

Explanation: The WAIT(*n*) or CANCEL(*n*) keywords require that MODE(SUSPEND) be specified. For information about the STOP DDF command, see *DB2 Command Reference*.

System Action: The command is not executed.

DSNL072I *csect-name* WAIT TIME EXPIRED, DDF
 RESUME PROCESSING INITIATED

Explanation: The DDF suspend process has not completed successfully in the period of time specified for the WAIT keyword, so DDF resume processing has been initiated. For information about the STOP DDF command, see *DB2 Command Reference*.

System Action: DDF resume processing has been initiated.

DSNL073I *csect-name* CANCEL TIME EXPIRED,
 CANCEL ACTIVE DBAT PROCESSING
 HAS BEEN INITIATED

Explanation: The DDF suspend process has not completed successfully in the period of time specified for the CANCEL keyword so DDF is cancelling all active data base access threads (DBATS). For information about the STOP DDF command, see *DB2 Command Reference*.

System Action: DDF is attempting to terminate all active database access threads.

DSNL080I *csect* **DISPLAY DDF REPORT FOLLOWS:**

Explanation: This message is issued as a result of the DISPLAY DDF command. This message is always generated as the title for the DISPLAY DDF command report output. It precedes the other messages generated by this command.

System Action: Processing continues normally.

DSNL081I **STATUS=***status*

Explanation: This message is issued as a result of the DISPLAY DDF command. This message displays the status of DDF where status is

STARTD

Started

STARTG

Starting

STOPDF

Stopped Force. Last stopped abnormally, such as by "Stop DDF Mode(Force)" command

STOPDQ

Stopped Quiesce. Last stopped normally, such as by the "Stop DDF Mode(Quiesce)" command or DDF has not yet been started

STOPGF

Stopping Force. Currently stopping abnormally, such as by the "Stop DDF Mode(Force)" command

SUSPND

Suspended. Currently suspended, such as by the "Stop DDF Mode(Suspend)" command

SUSPNG

Suspending. Currently suspending, such as by the "Stop DDF Mode(Suspend)" command

NOINIT Not initialized. DDF is not configured. A "DDF STARTUP OPTION" value of "NO" is specified in the DSNTIPR installation panel.

System Action: Processing continues normally.

DSNL082I **LOCATION LUNAME GENERICLU**

Explanation: This message is issued as a result of the DISPLAY DDF command. This message displays the column headings for the DSNL083I message that follows

System Action: Processing continues normally.

DSNL083I *location luname genericlu*

Explanation: This message is issued as a result of the DISPLAY DDF command. This message provides the column values for the headings described by the DSNL082I message.

location

The location name of DDF as defined by the "DB2 LOCATION NAME" value in the DSNTIPR installation panel. Also, it is the location value of the BSDS DDF record that is defined by the 'LOCATION' value in the DDF statement of the DSNJU003 Change Log Inventory utility. A value of 'NONE' indicates that a location name has not been configured.

This information also appears in message DSNL004I when DDF is started. See the DSNL004I message for additional information.

luname

The DDF LU name. You can determine the LU name from the 'DB2 NETWORK LUNAME' value in the DSNTIPR installation panel. You may also determine the LU NAME from the LU name value of the BSDS DDF record that is defined by the 'LUNAME' value in the DDF statement of the DSNJU003 Change Log Inventory utility. A value of '-NONE' indicates that an LU name has not been configured.

If an LU name has been configured, then the field will contain the fully qualified LU name that consists of a network ID, a period delimiter, and the LU name. The network ID is determined from VTAM once DDF is started. A network ID of '-NONE' indicates that DDF has not yet been started, or initialization with VTAM has failed.

This information also appears in message DSNL004I when DDF is started. See the DSNL004I message for additional information.

genericlu

The DDF generic LU name. The generic LU name is determined from the 'DB2 GENERIC LUNAME' value in the DSNTIPR installation panel, and the generic LU name value of the BSDS DDF record which is defined by the 'GENERIC' value in the DDF statement of the DSNJU003 Change Log Inventory utility. A value of '-NONE' indicates that a generic LU name has not been configured.

If a generic LU name has been configured, then the field will contain the fully qualified generic LU name which consists of a network ID, a period delimiter, and the generic LU name. The network ID is determined from VTAM once DDF is started. A network ID of '-NONE' indicates that DDF has not yet been started, or initialization with VTAM has failed.

This information also appears in message DSNL004I when DDF is started. See the DSNL004I message for additional information.

System Action: Processing continues normally.

DSNL084I IPADDR TCPPORT RESPORT

Explanation: This message is issued as a result of the DISPLAY DDF command. This message displays the column heading for the DSNL085I message that follows.

System Action: Processing continues normally.

DSNL085I *ip-address tcpport resport*

Explanation: This message is issued as a result of the DISPLAY DDF command. This message provides the column values for the headings described by the DSNL084I message.

ip-address

The IP address of DDF.

During DDF start processing, DDF issues a GetHostID (USS BPX1HST macro) socket call to determine its IP address if the listener ports are defined. A value of '-NONE' indicates that DDF is not configured to use TCP/IP network protocols (see tcpport), DDF has not yet been started, or TCP/IP initialization has failed.

tcpport

The SQL listener TCP/IP port number.

The SQL listener port is determined from the 'DRDA PORT' value in the DSNTIP5 installation panel, and the port value of the BSDS DDF record. The 'PORT' value in the DDF statement of the DSNJU003 Change Log Inventory utility defines the port value of the BSDS DDF record.

- A value of 0 indicates that an SQL listener port has not been specified, and DDF is not configured to use TCP/IP network protocols.
- A value of 'NONE' indicates that DB2 will not accept connections on this port. This may be due to specifying 0 for the DSN6SYSP MAXDBAT installation parameter defined in DSNZPARM. For more information, see the 'MAX REMOTE ACTIVE' specification in the DSNTIPE installation panel in the DB2 Installation Guide. The current 'MAX REMOTE ACTIVE' value can also be seen in the 'MDBAT' value of the DSNL090I message that is included in the 'DISPLAY DDF DETAIL' report.

This information also appears in message DSNL004I when DDF is started. See the DSNL004I message for additional information.

resport

The two phase commit resynchronization (resync) listener TCP/IP port number.

The resync listener port is determined from the 'RESYNC PORT' value in the DSNTIP5 installation panel, and the resynchronization

port value of the BSDS record. The 'RESPORT' value in the DDF statement of the DSNJU003 Change Log Inventory utility defines the resynchronization port value of the BSDS DDF record. A value of 0 indicates that a resynchronization listener port has not been specified, and DDF is not configured to use TCP/IP network protocols.

This information also appears in message DSNL004I when DDF is started. See the DSNL004I message for additional information.

System Action: Processing continues normally.

DSNL086I *domain-type DOMAIN=domain-name*

Explanation: This message is issued as a result of the DISPLAY DDF command. This message displays a TCP/IP domain name associated with DDF.

domain-type

The type of domain name that is displayed, which can be one of the following:

SQL The domain name is used to accept inbound SQL requests from remote partners. The *tcpport* value of message DSNL085I provides the port number that is used to accept inbound connections.

RESYNC

The domain name is used to accept inbound two-phase commit resynchronization requests from remote partners. The *resport* value of message DSNL085I provides the port number that is being used to accept inbound connections.

Normally, the SQL and RESYNC domain names will be the same. However, in data sharing environments, the SQL domain name will be different than the RESYNC domain name. See *DB2 Data Sharing: Planning and Administration* for more information.

domain-name

The domain name associated with the domain type. A value of "-NONE" indicates that the use of TCP/IP is not configured or that TCP/IP initialization has failed.

This information also appears in message DSNL519I and/or message DSNL004I when DDF is started. See the DSNL519I and DSNL004I messages for additional information.

System Action: Processing continues normally.

DSNL090I DT=*dt* CONDBAT=*condbat*
MDBAT=*mdbat*

Explanation: This message is issued as a result of the DISPLAY DDF DETAIL command. This message displays some of the system parameter information associated with DDF.

dt DDF thread value. It indicates the "DDF THREADS" value specified in the DSNTIPR installation panel.

- A - DDF is configured with DDF THREADS ACTIVE
- I - DDF is configured with DDF THREADS INACTIVE

condbat Maximum number of inbound connections as determined by the "MAX REMOTE CONNECTED" value in the DSNTIPE installation panel.

mdbat Maximum number of database access threads as determined by the "MAX REMOTE ACTIVE" value in the DSNTIPE installation panel. This effectively determines the maximum number of active *slots*. That is, the maximum number of concurrent active database access threads that could potentially be executing SQL.

System Action: Processing continues normally.

DSNL092I ADBAT=*adbat* QUEDBAT=*quedbat*
IN1DBAT=*in1dbat* CONQUED=*conqued*

Explanation: This message is issued as a result of the DISPLAY DDF DETAIL command.

adbat Current number of active database access threads. This value increases as new database access threads get created or become active. The value decreases as database access threads terminate or become inactive. When this value reaches or exceeds the *mdbat* value that is indicated in the DSNL090I message, then new or inactive (previously called type 1) database access threads (DBATs), or new or inactive (previously called type 2) connections must be queued.

quedbat This value reflects a cumulative counter that is always incremented when the *mdbat* has been reached. When this message is issued, the value for *quedbat* is equal to the cumulative number of database access threads that have been suspended because the *mdbat* value has been reached. See message DSNL090I for information about the *mdbat* and *adbat* values. Also note that the *quedbat* counter is only reset at restart for this DB2 subsystem.

in1dbat Current number of inactive DBATs (previously

called type 1 inactive threads). This value only applies if the *dt* value specified in the DSNL090I message indicates that DDF INACTIVE support is enabled. Any database access threads reflected here can also be observed in the DISPLAY THREAD TYPE(INACTIVE) command report.

conqued Current number of connection requests that have been queued and are waiting to be serviced. Only applies if the *dt* value that is specified in the DSNL090I message indicates that DDF INACTIVE support is enabled.

These connections can represent newly attached connections, or inactive connections for which a new request has arrived from the client (connections that were represented in the *inaconn* value of the DSNL093I message).

If the maximum number of database access threads has been reached (*adbat* value is equal to or greater than the DSNL090I *mdbat* value) and there are no disconnected database access threads to service the request (see DSNL093I *dscdbat* value), or if DDF is suspended or suspending (see DSNL081I *status* value), then these requests cannot yet be serviced.

If DDF is suspending or stopped suspended (see DSNL081I *status* value), then these conquered connections will not be processed until DDF is started (resumed). If the *adbat* value is equal to or greater than the DSNL090I *mdbat* value, then these conquered connections will not be processed until another active database access thread releases its slot by either terminating or by moving to the inactive state (see the *in1dbat* or DSNL093I *inaconn* value).

System Action: Processing continues normally.

DSNL093I DSCDBAT=*dscdbat* IN2CONS=*in2cons*

Explanation: This message is issued as a result of the DISPLAY DDF DETAIL command.

dscdbat Current number of disconnected database access threads. Only applies if the *dt* value specified in the DSNL090I message indicates that DDF INACTIVE support is enabled. This is effectively the number of DBAT pool threads. DBAT pool threads are the database access threads that are available to service queued connections requests (see DSNL092I *conqued* value). Database access threads reflected here will also be accounted for in the DSNL092I *adbat* value.

Over time, disconnected DBATs may hold allocation duration locks, such as locks related to DDL. These disconnected DBATs can be terminated by the STOP DDF MODE SUSPEND command, which allows their held allocation duration locks to be released. Stopping DDF with mode SUSPEND allows these disconnected DBATs to be terminated without affecting current or new connections, although activity on these current or new connections will not be processed until DDF is started (resumed). Disconnect DBATs can also be made to terminate when they have been unused for a certain length of time, thus releasing their allocated duration locks. This can be done by adjusting the DBAT pool thread timeout value as described by "POOL THREAD TIMEOUT" in the DSNTIP5 installation panel.

inaconn

Current number of inactive (previously called type 2) connections. This value only applies if the *dt* value specified in the DSNL090I message indicates that DDF INACTIVE support is enabled. This value represents connections with clients where the client last ended a unit of work (commit or rollback) and thus DB2 changes the state of the connection to inactive. That means that the DBAT is separated from the connection, and the connection becomes inactive while the DBAT is made available to service new client connections or to service new requests on existing client connections. This value is not included in the DSNL092I *in1dbat* value. When a new request arrives from the client system on the connection, the connection will then be moved to the DSNL092I *conqued* value. Any connections reflected here can also be observed in the DISPLAY THREAD TYPE(INACTIVE) command report.

System Action: Processing continues normally.

DSNL099I *csect* **DISPLAY DDF REPORT COMPLETE**

Explanation: This message indicates that the DISPLAY DDF report successfully completed.

System Action: Processing continues normally.

DSNL200I **DISPLAY LOCATION REPORT FOLLOWS-**

Explanation: This message is the title for the -DISPLAY LOCATION command report output. It precedes the other messages generated by this command. This message is followed by messages DSNL201I and DSNL202I. The final message for the report is the message DSNL205I.

System Action: The -DISPLAY LOCATION command continues normally.

DSNL201I **LOCATION PRDID LINKNAME REQUESTERS SERVERS CONVS**

Explanation: The column headings for the list of locations generated by the -DISPLAY LOCATION command are displayed. The definitions are listed below:

Heading	Description
LOCATION	The location name associated with the remote site
PRDID	Identifies the database product at the location
LINKNAME	The VTAM LU name associated with the remote location
REQUESTERS	The number of agents at this site that are requesting data from the remote location
SERVERS	The number of agents at this site that are acting as a server to the remote location
CONVS	The total number of conversations in use between this site and the remote location

See message DSNL202I for a more specific description of these items.

The message number and subsystem recognition character are not included in this message.

System Action: Processing continues normally.

DSNL202I **LOCATION PRDID LINKNAME REQUESTERS SERVERS CONVS**

Explanation: This message lists the status of communications between a remote location and this DB2 subsystem. Information about the status appears below:

Item	Description
LOCATION	A 16-byte name for the remote site.
PRDID	Identifies the database product at the location in the form nnnvrrm. <ul style="list-style-type: none"> • nnn - Identifies the database product. E.g., DSN=DB2. • vv - Product version. • rr - Product release. • m - Product modification level.

LINKNAME

The VTAM LU name or dotted decimal IP address associated with the remote location.

REQUESTERS

A count of the threads at this location that access data at the remote location. The count includes all the allied threads associated with the remote location, and any database access threads that are accessing data at the remote location.

SERVERS

A count of the database access threads at this location that access data for agents at the remote location.

CONVS

A count of the total number of conversations between the two systems. The count includes both allied and database threads.

The message number and subsystem recognition character are not included in this message.

System Action: Processing continues normally.

DSNL203I L203-SYSTASK SESSID A ST TIME

Explanation: This message forms the heading for the listing of DB2 system threads that communicate with other locations. It follows each occurrence of message DSNL202I if the DETAIL keyword of the DISPLAY LOCATION command is used. This message is followed by one or more occurrences of message DSNL204I, which describe the DB2 system threads communicating with the remote site and its conversation information. Items in this part of the heading are:

SYSTASK

Heading that describes the DB2 system thread

SESSID

Heading for the associated conversation identifiers

A Heading for the associated active indicators

ST Heading for the associated status indicators

TIME Heading for the associated timestamps

See message DSNL204I for descriptions of these items.

The message number and subsystem recognition character are not included in this message. However, L203 is included in the message text to identify the message.

System Action: Processing continues normally.

DSNL204I L204-SYSTASK SESSID ACTIVE STATUS TIME

Explanation: This message follows the DSNL203I message for a remote location when a detail display is specified on the DISPLAY LOCATION command. This message is displayed for each conversation owned by a DB2 system thread that communicates with the site. It lists detailed information about the conversations associated with the DB2 system thread.

systask

Describes the DB2 system threads as follows:

- SYSCON-x

Where x =

- O** The system thread that manages 'outbound' DB2 system conversations.
- I** The system thread that manages 'inbound' DB2 system conversations.

When DB2 is communicating with other DB2 locations using system-directed access, DB2 establishes 'system conversations' to the remote DB2 location. DB2 uses these conversations internally. The conversations created are one directional. That is, DB2 has a conversation that it uses to send information to the remote site, and another that it uses to receive information from the remote site. A DB2 system thread is created to manage 'outbound' (used for sending) conversations and another to manage 'inbound' (used for receiving) conversations.

- RESYNC

A conversation used to resynchronize a unit of work that encountered a previous thread or communication error. There can be one entry representing each thread needing resynchronization with the remote site.

sessid Two possible values can appear in this column:

1. For VTAM network connections, this column contains the VTAM-defined session instance identifier of the session on which the conversation is executing. If the session identifier is not applicable, this field contains zeros.

VTAM does not supply the entire session id to DB2. The first two digits of the session id are incorrect. Therefore, the session id, as presented in this message, is not acceptable in VTAM commands. Use the VTAM DISPLAY NET,ID=db2-luname,SCOPE=ACT command to obtain the full session ID. The DISPLAY NET command lists all sessions (SID) for the

DB2 logical unit. Scan the DISPLAY NET output for the complete SID.

- For TCP/IP network connections, this column contains a string of the form 'local:remote', where:

local -- specifies the local DB2 system's TCP/IP port number

remote --
specifies the remote partner's TCP/IP port number

active One of the following:

- V The conversation is active within VTAM or TCP/IP.
 - W The conversation is suspended in DB2 waiting for VTAM or TCP/IP notification that the function is complete.
- Blank, otherwise.

status Status of the conversation:

- A Conversation in allocation.
 - C Session limits are being negotiated with the partner (CNOS) prior to conversation allocation.
 - D Conversation in deallocation.
 - R Receiving.
 - S Sending.
- Blank otherwise.

time The timestamp (yyddhhmmssth) of the last message sent or received on the conversation.

The message number and subsystem recognition character are not included in this message. However, L204 is included in the message text to identify the message.

System Action: Command processing continues

DSNL205I DISPLAY LOCATION REPORT COMPLETE

Explanation: This message follows messages DSNL200I, DSNL201I, and DSNL202I and indicates that the -DISPLAY LOCATION report successfully completed.

The message number and subsystem recognition character are not included in this message.

System Action: Processing continues normally.

DSNL206I csect-name named-command COMMAND INVALID, DDF NOT STARTED

Explanation: The 'named-command' command was issued before the distributed data facility (DDF) was started. The 'named-command' command executes successfully only if the DDF is operating.

System Action: Processing continues normally.

DSNL207I DISPLAY LOCATION NO LOCATIONS FOUND

Explanation: The -DISPLAY LOCATION command was unable to find any locations associated with the specified list of locations. If all locations were specified, there is no distributed activity.

System Action: Processing completed normally.

User Response: If a location list was specified, reissue the -DISPLAY LOCATION command using the LOCATION(*) parameter to display information for all locations, if desired.

DSNL208I DISPLAY LOCATION TERMINATED WITH MAX LINES

Explanation: The message indicates the -DISPLAY LOCATION report was truncated. The report was generated in response to a command from an MVS console and more than 254 response messages were generated. Only 254 response messages are returned.

System Action: Command processing completes. The truncated report is written to the MVS console.

User Response: Reissue the -DISPLAY LOCATION request specifying a specific location or list of locations.

DSNL400E INDOUBT THREAD RESOLUTION WITH COORDINATOR location SHOWS HEURISTIC DAMAGE FOR luwid=token - REMOTE COMMIT VERSUS LOCAL ABORT. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=207 AND IFCID SEQUENCE NUMBER=seq-no1 AND IN TRACE RECORD WITH IFCID=203 AND IFCID SEQUENCE NUMBER=seq-no2

Explanation: DB2 has participant responsibility in the logical unit of work identified by 'luwid=token'. Resolution with the coordinator identified by 'location' shows heuristic damage occurred. The DB2 thread representing the logical unit of work was previously resolved using the RECOVER INDOUBT command. The action taken was to abort the thread. Subsequently, communication was reestablished with the coordinator and resolution shows that the coordinator committed the thread.

- The application was told that commit succeeded.

DSNL401E

- Any resources updated at the coordinator were committed.
- Updated resources at this DB2 were rolled back.

location

The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<luname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

luwid=token

The global logical unit of work id and the local token that identify the thread.

seq-no1

The IFCID sequence number associated with the 207 trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, IFCID 207 was not active or it was active with a destination of the resident trace table only. IFCID 207 is a member of statistics class 4, which has a default destination of SMF. This trace record is written when the heuristic damage condition was detected and contains information about the damage condition.

seq-no2

The IFCID sequence number associated with the 203 trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, IFCID 203 was not active or it was active with a destination of the resident trace table only. IFCID 203 is a member of statistics class 4, which has a default destination of SMF. This trace record was written when the heuristic decision to commit or abort was made and contains information about the decision, including the names of any downstream participants.

System Action: Alert A004 is generated. A trace record whose IFCID=207 is written. Indoubt resolution with the coordinator completes.

System Programmer Response: Determine the destination of statistics class 4 and locate and print the trace record with SEQUENCE NUMBER='seq-no1'. Call the database administrator.

Database Administrator Action: Correct the damage. This is not an easy task. Since the time of the heuristic action, the data that was aborted with the RECOVER INDOUBT command might have been used by many applications - read and/or write. Correcting the damage might involve reversing the effects of these applications as well. Tools available are:

- The statistics trace class 4 contains an IFCID 207 trace record. This record contains the RBA of the first DB2 log record written for the logical unit of work whose LUWID is included in this message.

- The DSN1LOGP utility provides a summary report that identifies the table spaces modified by the logical unit of work and any downstream participant locations involved in the logical unit of work.
- DISPLAY THREAD TYPE(INDOUBT) displays the RBA of the first DB2 log record written for the logical unit of work whose LUWID is included in this message. This information continues to appear in the DISPLAY THREAD report until it is purged with the RESET INDOUBT command.

Contact your IBM Support Center for further assistance.

DSNL401E INDOUBT THREAD RESOLUTION WITH COORDINATOR *location* SHOWS HEURISTIC DAMAGE FOR *luwid=token* - REMOTE ABORT VERSUS LOCAL COMMIT. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=207 AND IFCID SEQUENCE NUMBER=*seq-no1* AND IN TRACE RECORD WITH IFCID=203 AND IFCID SEQUENCE NUMBER=*seq-no2*

Explanation: DB2 has participant responsibility in the logical unit of work identified by 'luwid=token'. Resolution with the coordinator identified by 'location' shows heuristic damage occurred. The DB2 thread representing the logical unit of work was previously resolved with the RECOVER INDOUBT command. The action taken was to commit the thread. Subsequently, communication was reestablished with the coordinator and resolution shows that the coordinator aborted the thread.

- The application was told that commit failed.
- Any resources updated at the coordinator were rolled back.
- Updated resources at this DB2 were committed.

location

The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<luname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

luwid=token

The global logical unit of work id and the local token that identify the thread.

seq-no1

The IFCID sequence number associated with the 207 trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, IFCID 207 was not active or it was active with a destination of the resident trace table only. IFCID 207 is a member of statistics class 4, which has a default destination of SMF. This trace record is written

when the heuristic damage condition was detected and contains information about the damage condition.

seq-no2

The IFCID sequence number associated with the 203 trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, IFCID 203 was not active or it was active with a destination of the resident trace table only. IFCID 203 is a member of statistics class 4, which has a default destination of SMF. This trace record was written when the heuristic decision to commit or abort was made and contains information about the decision, including the names of any downstream participants.

System Action: Alert A004 is generated. A trace record whose IFCID=207 is written. Indoubt resolution with the coordinator completes.

System Programmer Response: Determine the destination of statistics class 4. Locate and print the trace record with SEQUENCE NUMBER='seq-no1'. Call the database administrator.

Database Administrator Action: Correct the damage. This is not an easy task. Since the time of the heuristic action, the data that was committed with the RECOVER INDOUBT command might have been used by many applications - read and/or write. Correcting the damage might involve reversing the effects of these applications as well. Tools available are:

- The statistics trace class 4 contains an IFCID 207 trace record. This record contains the RBA of the first DB2 log record written for the logical unit of work whose LUWID is included in this message.
- The DSN1LOGP utility provides a summary report that identifies the table spaces modified by the logical unit of work, and any downstream participant locations involved in the logical unit of work.
- DISPLAY THREAD TYPE(INDOUBT) displays the RBA of the first DB2 log record written for the logical unit of work whose LUWID is included in this message. This information continues to appear in the DISPLAY THREAD report until it is purged with the RESET INDOUBT command.

Contact your IBM Support Center for further assistance.

DSNL402I INDOUBT THREAD RESOLUTION WITH PARTICIPANT *location* SHOWS HEURISTIC DAMAGE FOR *luwid=token* - REMOTE COMMIT VERSUS LOCAL ABORT. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=207 AND IFCID SEQUENCE NUMBER=*seq-no*

Explanation: DB2 has coordinator responsibility for the logical unit of work identified by 'luwid=token'. Resolution with a participant shows heuristic damage

occurred. The participant identified by 'location' manually resolved the indoubt thread identified by 'luwid=token'. The action taken was to commit the thread. This is inconsistent with the abort decision of the coordinator.

- The application was told that commit failed.
- Any resources updated at the participant were committed.
- Updated resources at this DB2 were rolled back.

location

The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<lname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

luwid=token

The global logical unit of work id and the local token that identify the thread.

seq-no

The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, then IFCID 207 was not active or it was active with a destination of the resident trace table only. IFCID 207 is a member of statistics class 4, which has a default destination of SMF.

System Action: Alert A004 is generated. A trace record whose IFCID=207 is written. Indoubt resolution with the participant completes.

System Programmer Response: Call the database administrator.

Database Administrator Action: Inform the database administrator at 'location' that heuristic damage occurred for the logical unit of work with LUWID='luwid'. DB2 was the coordinator for the logical unit of work and made the decision to abort the database updates made by 'luwid'. At 'location' a heuristic decision was made to COMMIT the updates made by 'luwid'.

Information about the heuristic damage continues to appear in the DISPLAY THREAD TYPE(INDOUBT) report until it is purged with the RESET INDOUBT command.

DSNL403I INDOUBT THREAD RESOLUTION WITH PARTICIPANT *location* SHOWS HEURISTIC DAMAGE FOR *luwid=token* - REMOTE ABORT VERSUS LOCAL COMMIT. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=207 AND IFCID SEQUENCE NUMBER=*seq-no*

Explanation: DB2 has coordinator responsibility for the logical unit of work identified by 'luwid=token'. Resolution with a participant shows heuristic damage occurred. The participant identified by 'location'

DSNL404E

manually resolved the indoubt thread identified by 'luwid=token'. The action taken was to abort the thread. This is inconsistent with the commit decision of the coordinator.

- The application was told that commit succeeded.
- Any resources updated at the participant were rolled back.
- Updated resources at this DB2 were committed.

location

The relational database name (location-name), SNA LU name (<luname>), or dotted decimal IP address of the participant.

luwid=token

The global logical unit of work id and the local token that identify the thread.

seq-no

The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, IFCID 207 was not active or it was active with a destination of the resident trace table only. IFCID 207 is a member of statistics class 4, which has a default destination of SMF.

System Action: Alert A004 is generated. A trace record with IFCID 207 is written. Indoubt resolution with the participant completes.

System Programmer Response: Call the database administrator.

Database Administrator Action: Inform the database administrator at 'location' that heuristic damage occurred for the logical unit of work with LUWID='luwid'. DB2 was the coordinator for the logical unit of work and made the decision to COMMIT the database updates made by 'luwid'. At 'location' a heuristic decision was made to back out (ABORT) the updates made by 'luwid'.

Information about the heuristic damage continues to appear in the DISPLAY THREAD TYPE(INDOUBT) report until it is purged with the RESET INDOUBT command.

DSNL404E **PROTOCOL ERROR DURING INDOUBT THREAD RESOLUTION WITH COORDINATOR** *location*
LUWID=luwid=token **INFORMATION RECORDED IN TRACE RECORD WITH IFCID=206 AND IFCID SEQUENCE NUMBER=seq-no**

Explanation: DB2 has participant responsibility for the logical unit of work identified by 'luwid=token'. The DB2 thread associated with the logical unit of work is indoubt. A protocol error occurred during indoubt resolution with the coordinator identified by 'location'.

location

Either the relational database name

(location-name) or the logical unit name (<luname>) of the coordinator.

luwid=token

The global logical unit of work id and the local token that identify the thread.

seq-no

The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, IFCID 206 was not active or it was active with a destination of the resident trace table only. IFCID 206 is a member of statistics class 4, which has a default destination of SMF.

System Action: The indoubt thread remains indoubt. Alert A003 is generated. A trace record whose IFCID=206 is written.

System Programmer Response: This is an APARable error, probably at the coordinator, but possibly at the DB2 participant. The DB2 documentation required is contained in the statistics class 4 trace record that was written. Determine the destination of statistics class 4. Locate and print the trace record with SEQUENCE NUMBER='seq-no'.

Call the database administrator.

Database Administrator Action: DB2 does not attempt to automatically resolve the indoubt thread. The indoubt thread must be manually resolved. The commit or abort decision made at the coordinator must be determined so that the same decision can be made at this participant DB2.

Contact the database administrator at the coordinator location to determine whether the thread with LUWID=luwid committed or aborted.

If the coordinator system is another DB2, the following steps can be taken at the DB2 coordinator to determine the commit or abort decision.

1. If the coordinator DB2 system is running and a DB2 conditional restart was not performed since the error was detected at this (the participant) location, ask the database administrator at the DB2 coordinator location to issue one of the following DISPLAY THREAD TYPE(INDOUBT) commands:
 - A -DISPLAY THREAD TYPE(INDOUBT), using the LOCATION keyword and specifying the location name of the local DB2.
 - A -DISPLAY THREAD TYPE(INDOUBT) LUWID(luwid)

If a thread with LUWID=luwid appears in the display, then the display also includes the commit or abort decision. If no thread with LUWID=luwid appears in the display, the thread was aborted.

2. If the DB2 coordinator is down, or if a conditional restart was performed there, ask the database administrator at the DB2 coordinator to run DSN1LOGP, specifying SUMMARY(ONLY) FILTER

LUWID(luwid). The output from DSN1LOGP includes the commit or abort decision.

Use the RECOVER INDOUBT command at this (the participant) location to resolve the indoubt thread.

DSNL405I **THREAD *luwid=token* PLACED IN INDOUBT STATE BECAUSE OF COMMUNICATION FAILURE WITH COORDINATOR *location*. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=209 AND IFCID SEQUENCE NUMBER=*seq-no***

Explanation: During execution of the two phase commit protocol with the coordinator identified by 'location', communication failed. Phase 1 of the protocol completed and the thread is prepared for either commit or abort.

The thread is placed in the indoubt state and appears in a DISPLAY THREAD TYPE (INDOUBT) report. Periodic attempts are made to reestablish communication with the coordinator for automatic indoubt resolution. If successful, message DSNL407 or DSNL415 is written.

luwid=token

The global logical unit of work id and the local token that identify the thread.

location

The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<luname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

seq-no The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, IFCID 209 was not active or it was active with a destination of the resident trace table only. IFCID 209 is a member of statistics class 4, which has a default destination of SMF.

System Action: Alert A006 is generated. A trace record whose IFCID=209 is written.

Operator Response: If message DSNL407 or DSNL415 for the LUWID specified in the DSNL405 message does not appear in a reasonable amount of time, call the system programmer.

System Programmer Response: Determine the cause of the communication failure and have the problem fixed. DB2 periodically attempts to reestablish communication. If the problem cannot be fixed in a reasonable amount of time, call the database administrator. Manual resolution of the indoubt thread might be necessary to release locked resources.

Database Administrator Action: Take the following

actions to resolve this thread using manual means (that is, take heuristic action) if it is necessary to release locks held by this thread.

- Determine the proper commit or abort decision by contacting the database administrator at the coordinator 'location' shown in this message in order to determine whether the thread with LUWID=luwid committed or aborted.

If the coordinator system is another DB2, the following steps can be taken at the DB2 coordinator to determine the commit or abort decision.

1. If the coordinator DB2 system is running and a DB2 conditional restart was not performed since the error was detected at this (the participant) location, ask the database administrator at the DB2 coordinator location to issue one of the following DISPLAY THREAD TYPE(INDOUBT) commands:
 - A -DISPLAY THREAD TYPE(INDOUBT), using the LOCATION keyword and specifying the location name of the local DB2.
 - A -DISPLAY THREAD TYPE(INDOUBT) LUWID(luwid)

If a thread with LUWID=luwid appears in the display, then the display also includes the commit or abort decision. If no thread with LUWID=luwid appears in the display, then the thread was aborted.

2. If the DB2 coordinator is down or if a conditional restart was performed there, ask the database administrator at the DB2 coordinator to run DSN1LOGP, specifying SUMMARY(ONLY) FILTER LUWID(luwid). The output from DSN1LOGP includes the commit or abort decision.

- Use the RECOVER INDOUBT command to commit or abort the thread.

DSNL406I **THREAD *luwid=token* AT PARTICIPANT *location* MAY BE INDOUBT BECAUSE OF A COMMUNICATION FAILURE. DB2 COMMITTED THE THREAD. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=209 AND IFCID SEQUENCE NUMBER=*seq-no***

Explanation: During execution of the two phase commit protocol with the participant identified by 'location', communications failed. Phase 1 of the protocol completed with the participant, which is prepared to either commit or abort. The decision to commit the thread was made, but cannot be communicated to the participant at this time. The participant is indoubt.

DB2 becomes responsible for indoubt resolution with the participant. This responsibility appears in a DISPLAY THREAD TYPE (INDOUBT) report. Periodic attempts are made to reestablish communication with

DSNL407I • DSNL408I

the participant for automatic indoubt resolution. If successful, message DSNL423 is written.

luwid=token

The global logical unit of work id and the local token that identify the thread.

location

The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<luname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

seq-no The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, IFCID 209 was not active or it was active with a destination of the resident trace table only. IFCID 209 is a member of statistics class 4, which has a default destination of SMF.

System Action: Alert A006 is generated. A trace record whose IFCID=209 is written.

Operator Response: If message DSNL423 for the LUWID specified in message DSNL406 does not appear in a reasonable amount of time, call the system programmer.

System Programmer Response: Determine the cause of the communication failure and have the problem fixed. DB2 periodically attempts to reestablish communication. If the problem cannot be fixed in a reasonable amount of time, call the database administrator. The participant might need to manually resolve the indoubt state to release locked resources.

Database Administrator Action: If the unit of work with LUWID=luwid is indoubt at 'location', inform the database administrator there that the logical unit of work with LUWID=luwid was committed to assist in manual resolution of the indoubt thread at 'location'.

DSNL407I AUTOMATIC RESOLUTION OF *luwid=token* WITH COORDINATOR *location* RESULTED IN COMMIT

Explanation: The identified indoubt logical unit of work was automatically resolved by communication with the coordinator location. After automatic resolution, this message is issued if message DSNL405 was previously issued to report the thread as indoubt. This message is not issued if message DSNL405 occurs in one restart of DDF or DB2, and automatic resolution occurs in a different restart of DDF or DB2.

luwid=token

The global logical unit of work id and the local token that identify the thread

location

The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<luname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

System Action: Processing continues normally.

DSNL408I INDOUBT THREAD RESOLUTION WITH COORDINATOR *location* SHOWS HEURISTIC DAMAGE AT PARTICIPANT *location* FOR *luwid=token* - COORDINATOR COMMIT VERSUS PARTICIPANT ABORT. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=207 AND IFCID SEQUENCE NUMBER=*seq-no*

Explanation: DB2 has participant responsibility in the logical unit of work identified by 'luwid=token' for the coordinator at COORDINATOR 'location' and coordination responsibility in the same logical unit of work for the participant at PARTICIPANT 'location'. Heuristic damage occurred.

- The application was told that commit succeeded.
- Any resources updated at the coordinator and at this DB2 were committed.
- Updated resources at the participant were rolled back.

location

The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<luname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

luwid=token

The global logical unit of work id and the local token that identify the thread.

seq-no The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, then IFCID 207 was not active or it was active with a destination of the resident trace table only. IFCID 207 is a member of statistics class 4, which has a default destination of SMF.

System Action: Alert A004 is generated. A trace record whose IFCID=207 is written. Indoubt resolution with the coordinator completes.

System Programmer Response: Determine the destination of statistics class 4. Locate and print the trace record with SEQUENCE NUMBER='seq-no'. Call the database administrator.

Database Administrator Action: Inform the database

administrator at the coordinator 'location' and at the participant 'location' of the problem.

Correcting the damage at the participant is not an easy task. Since the time of the heuristic action, the data that was aborted using manual means might have been used by many applications - read and/or write. Correcting the damage might involve reversing the effects of these applications as well. The following information that is available at DB2 might be helpful in correcting the problem:

- The statistics trace class 4 contains an IFCID 207 trace record. This record contains the RBA of the first DB2 log record written for the logical unit of work whose LUWID is included in this message.
- The DSN1LOGP utility provides a summary report that identifies the table spaces modified by the logical unit of work at the local DB2 as well as any downstream participant locations involved in the logical unit of work. This information, while not directly related to the damage at the participant, might be useful in determining the scope of the problem.
- DISPLAY THREAD TYPE(INDOUBT) displays the RBA of the first DB2 log record written for the logical unit of work whose LUWID is included in this message. This information continues to appear in the DISPLAY THREAD report until it is purged with the RESET INDOUBT command.

Contact your IBM Support Center for further assistance.

DSNL409I INDOUBT THREAD RESOLUTION WITH COORDINATOR *location* SHOWS HEURISTIC DAMAGE AT PARTICIPANT *location* FOR *luwid=token* - COORDINATOR ABORT VERSUS PARTICIPANT COMMIT. INFORMATION RECORDED IN TRACE RECORD WITH IFCID 207 AND IFCID SEQUENCE NUMBER=*seq-no*

Explanation: DB2 has participant responsibility in the logical unit of work identified by 'luwid=token' for the coordinator at COORDINATOR 'location' and coordination responsibility in the same logical unit of work for the participant at PARTICIPANT 'location'. Heuristic damage occurred.

- The application was told that commit failed.
- Any resources updated at the coordinator and at this DB2 were rolled back.
- Updated resources at the participant were committed.

location

The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<luname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

luwid=token

The global logical unit of work id and the local token that identify the thread.

seq-no

The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, then IFCID 207 was not active or it was active with a destination of the resident trace table only. IFCID 207 is a member of statistics class 4, which has a default destination of SMF.

System Action: Alert A004 is generated. A trace record whose IFCID=207 is written. Indoubt resolution with the coordinator completes.

System Programmer Response: Determine the destination of statistics class 4. Locate and print the trace record with SEQUENCE NUMBER='seq-no'. Call the database administrator.

Database Administrator Action: Inform the database administrator at the coordinator 'location' and at the participant 'location' of the problem.

Correcting the damage at the participant is not an easy task. Since the time of the heuristic action, the data that was committed using manual means might have been used by many applications - read and/or write. Correcting the damage might involve reversing the effects of these applications as well. This information is available at DB2 and might be helpful in correcting the problem.

- The statistics trace class 4 contains an IFCID 207 trace record. This record contains the RBA of the first DB2 log record written for the logical unit of work whose LUWID is included in this message.
- The DSN1LOGP utility provides a summary report that identifies the table spaces modified by the logical unit of work at the local DB2 and any downstream participant locations involved in the logical unit of work. This information, while not directly related to the damage at the participant, might be useful in determining the scope of the problem.
- DISPLAY THREAD TYPE(INDOUBT) displays the RBA of the first DB2 log record written for the logical unit of work whose LUWID is included in this message. This information continues to appear in the DISPLAY THREAD report until it is purged with the RESET INDOUBT command.

Contact your IBM support center for further assistance.

DSNL410I WARM START CONNECTION BY PARTNER *location* REJECTED. PARTNER CHANGED AT LEAST 1 OF - OUR LOG NAME *oldourname(newourname)*, THEIR LOG NAME *oldtheirname(newtheirname)*, PA_SUPPORT *oldpa(newpa)*, FLAG_BYTE_SENT *oldfb(newfb)*, CCLUNAME_SENT *oldcccls(newcccls)*, AND INDOUBT THREADS REQUIRE RESOLUTION. SEE IFCID=205 TRACE RECORD WITH IFCID SEQUENCE NUMBER=*seq-no*.

Explanation: An attempt to make a warm start connection with a partner was rejected because the partner specified a different set of sync point parameters than the ones that were in use when communications were lost. DB2 has knowledge of indoubt threads that involve the partner as either the coordinator or a participant. This error might be a recoverable error if the partner can restart with the original sync point parameters. If this is not possible, then the partner must perform a cold start connection with DB2.

location

The 'location' with which the connection failed: either the relational database name (location-name) or the logical unit name (<luname>) of the partner.

oldourname

The log name for this DB2 subsystem. This value is null if the partner did not initiate the log name exchange.

newourname

The log name for this DB2 subsystem, as remembered by our partner and sent to us in the attempted warm start connection. This value is null if the partner did not initiate the log name exchange.

oldtheirname

The log name used by the partner during the last connection, as remembered by DB2.

newtheirname

The log name used by the partner in the attempted warm start connection.

oldpa

The sync point protocol used during the last connection, as remembered by the DB2 (PA - Presumed Abort, PN - Presumed Nothing).

newpa

The sync point protocol used during the last connection, as remembered by the partner (PA - Presumed Abort, PN - Presumed Nothing).

oldfb

The use of the PS header byte 2 during the last connection, as remembered by DB2 (F - used as flag byte, N - not used as flag byte).

newfb

The use of the PS header byte 2 during the

last connection, as remembered by the partner (F - used as flag byte, N - not used as flag byte).

oldcccls

Whether the luname of the conversation correlator was exchanged as part of the sync point protocol during the last connection, as remembered by DB2. (E - was exchanged, N - was not exchanged).

newcccls

Whether the luname of the conversation correlator was exchanged as part of the sync point protocol during the last connection, as remembered by the partner (E - was exchanged, N - was not exchanged).

seq-no

The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, then IFCID 0205 was not active or it was active with a destination of the resident trace table only. IFCID 0205 is a member of statistics class 4, which has a default destination of SMF.

System Action: The connection with the partner is rejected. Alert A002 is generated. DB2 retains indoubt knowledge.

System Programmer Response: Call the database administrator.

Database Administrator Action: Contact the database administrator at the partner 'location' and determine if it is possible for the partner to perform a warm start with same sync point parameters as ours ('oldourname', 'oldtheirname', 'oldpa', 'oldfb', 'oldcccls'). If this is possible, the next attempt to connect will succeed.

If this cannot be done, then there are two other possible solutions:

- Have the partner 'location' perform a cold start connection with this DB2 subsystem.
- Use the RESET INDOUBT command with the FORCE option in conjunction with the LOCATION parameter to cause the next connection with the partner to be a cold start connection.

DSNL411E COLD START CONNECTION BY COORDINATOR *location* ACCEPTED. INDOUBT THREADS NEED MANUAL RESOLUTION. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=204 AND IFCID SEQUENCE NUMBER=*seq-no*

Explanation: DB2 has participant responsibility for indoubt threads. The coordinator informed DB2 that it performed a cold start operation and lost all knowledge of indoubt threads. The indoubt threads at this DB2 must be manually resolved with the RECOVER INDOUBT command.

location

The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<luname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

seq-no The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, then IFCID 204 was not active or it was active with a destination of the resident trace table only. IFCID 204 is a member of statistics class 4, which has a default destination of SMF.

System Action: The connection with the partner is accepted. Alert A001 is generated. A trace record whose IFCID=204 is written.

System Programmer Response: Call the database administrator.

Database Administrator Action: DB2 is a participant with one or more indoubt threads where the coordinator is 'location'. The DBMS at 'location' performed a cold start. The DB2 participant assumes that the coordinator recovery log was lost or damaged and indoubt thread resolution cannot be achieved. There is probably inconsistent data at the coordinator. A list of indoubt threads involving the coordinator 'location' can be displayed using the DISPLAY THREAD command for indoubt type threads by including the LOCATION('location') parameter in the command.

The heuristic decision (that is, to commit or abort the logical unit of work) should be coordinated with any other participants. The existence of other participants might not be easy to determine. The information might be available in the coordinators recovery log even though the coordinator performed a cold start. If the coordinator is a DB2, then it might be possible to execute the DSN1LOGP utility to produce a summary report. If this is possible, the following information might be produced:

- The LUWID of the thread.
- The NID used by IMS or CICS to identify the thread.
- The name of all participants.
- The name of an upstream coordinator if the coordinator is also a participant. This could happen when an application requester accesses a DB2 AS using application-directed access, which in turn accesses another DB2 server with system-directed access. (The local DB2 might be the third system in this scenario.)

At this DB2 participant, all indoubt threads coordinated by the cold starting location must be resolved with the RECOVER INDOUBT command. Locked data remains unavailable until resolution. Threads that were already

resolved with this command are discarded. Threads not yet resolved are discarded after resolution with the command.

The commit or abort decision provided using the RECOVER INDOUBT command for a logical unit of work are propagated to all downstream participants, if any.

DSNL412I **PROTOCOL ERROR DETECTED IN SYNCPOINT REQUEST/RESPONSE FROM COORDINATOR** *location*
LUWID=*luwid=token*. **INFORMATION RECORDED IN TRACE RECORD WITH IFCID=208 AND IFCID SEQUENCE NUMBER=***seq-no*

Explanation: DB2 is a participant in the logical unit of work identified by 'luwid=token'. A protocol error occurred during the SNA sync point exchange with the coordinator identified by 'location'. The protocol error fits into one of the following categories:

- An unknown SNA PS header was received.
- An SNA PS header was received in the wrong sequence.
- An invalid LU6.2 verb sequence was used to deliver the SNA PS header.
- A DEALLOCATE TYPE(ABEND_SVC) was received from the coordinator, indicating that the coordinator detected a protocol violation in the PS headers transmitted by DB2.

location

Either the relational database name (location-name) or the logical unit name (<luname>) of the coordinator.

luwid=token

The global logical unit of work id and the local token that identify the thread.

seq-no The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, IFCID 208 was not active or it was active with a destination of the resident trace table only. IFCID 208 is a member of statistics class 4, which has a default destination of SMF.

If the protocol error was detected before the commit decision, the unit of work at the DB2 system might be indoubt. DB2 does not automatically resolve such an indoubt thread.

If the protocol error was detected after the commit decision, the unit of work either completed commit or abort processing.

System Action: Alert A005 is generated. A trace record whose IFCID=208 is written.

DSNL413I

System Programmer Response: This is an APARable error, probably at the coordinator, but possibly at DB2. The DB2 documentation required is contained in the statistics class 4 trace record. Determine the destination of statistics class 4. Locate and print the trace record with SEQUENCE NUMBER='seq-no'.

The database administrator might need to manually resolve the indoubt thread.

Database Administrator Action: Determine if the 'luwid' is indoubt by using the DISPLAY THREAD command for type indoubt threads and including the LUWID('token') parameter in the command. If the thread is indoubt, it must be manually resolved using the RECOVER INDOUBT command. The commit or abort decision made at the coordinator must be determined so that the same decision can be made at DB2.

Contact the database administrator at the coordinator location to determine whether the thread with LUWID=luwid committed or aborted.

If the coordinator system is another DB2, then the following steps can be taken at the DB2 coordinator to determine the commit or abort decision.

1. If the coordinator DB2 system is running and a DB2 conditional restart was not performed since the error was detected at this (the participant) location, ask the database administrator at the DB2 coordinator location to issue one of the following DISPLAY THREAD TYPE(INDOUBT) commands:
 - A -DISPLAY THREAD TYPE(INDOUBT), using the LOCATION keyword and specifying the location name of the local DB2.
 - A -DISPLAY THREAD TYPE(INDOUBT) LUWID(luwid)

If a thread with LUWID=luwid appears in the display, then the display also includes the commit or abort decision. If no thread with LUWID=luwid appears in the display, then the thread was aborted.

2. If the DB2 coordinator is down or if a conditional restart was performed there, ask the database administrator at the DB2 coordinator to run DSN1LOGP, specifying SUMMARY(ONLY) FILTER LUWID(luwid). The output from DSN1LOGP includes the commit or abort decision.

DSNL413I **PROTOCOL ERROR DETECTED IN SYNCPOINT REQUEST/RESPONSE FROM PARTICIPANT** *location*
LUWID=luwid=token. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=208 AND IFCID SEQUENCE NUMBER=seq-no

Explanation: DB2 is the coordinator of the logical unit of work identified by 'luwid=token'. A protocol error occurred during the SNA sync point exchange with the participant identified by 'location'. The protocol error fits

into one of the following categories:

- An unknown SNA PS header was received.
- An SNA PS header was received in the wrong sequence.
- An invalid LU6.2 verb sequence was used to deliver the SNA PS header.
- A DEALLOCATE TYPE(ABEND_SVC) was received from the participant, indicating that the participant detected a protocol violation in the PS headers transmitted by DB2.

location

The relational database name (location-name) of the participant.

luwid=token

The global logical unit of work id and the local token that identify the thread.

seq-no The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, IFCID 208 was not active or it was active with a destination of the resident trace table only. IFCID 208 is a member of statistics class 4, which has a default destination of SMF.

If the protocol error is detected before the commit decision, the unit of work is backed out.

If the protocol error is detected after the commit decision, the outcome of the unit of work is unchanged. In this case, the remote participant might be indoubt. DB2 does not automatically resolve the indoubt thread with the partner 'location' after a protocol error is detected.

System Action: Alert A005 is generated. A trace record whose IFCID=208 is written.

System Programmer Response: This is an APARable error, probably at the participant, but possibly at the DB2 coordinator. The DB2 documentation required is contained in the statistics class 4 trace record. Determine the destination of statistics class 4. Locate and print the trace record with SEQUENCE NUMBER='seq-no'.

Call the database administrator. The participant might need to manually resolve the indoubt thread.

Database Administrator Action: The DB2 coordinator does not know the status of the thread at the participant. The DB2 coordinator assumes that it is indoubt and maintains knowledge of the indoubt participant until it is purged with the RESET INDOUBT command. If the thread is indoubt at the participant, it must be resolved using manual (heuristic) means. The status of the thread at the local DB2 (the coordinator) can be determined with the DISPLAY THREAD command for type indoubt threads by including the LUWID('token') parameter in the command.

If the 'participant' location is also a DB2, the RECOVER INDOUBT command can be used at the participant to resolve the indoubt thread.

DSNL414E **PROTOCOL ERROR DURING INDOUBT THREAD RESOLUTION WITH PARTICIPANT** *location*
LUWID=luwid=token **INFORMATION RECORDED IN TRACE RECORD WITH IFCID=206 AND IFCID SEQUENCE NUMBER=seq-no**

Explanation: DB2 has coordinator responsibility for the logical unit of work identified by 'luwid=token'. The DB2 thread associated with the logical unit of work is either committed or aborted. A protocol error occurred during indoubt resolution with the participant identified by 'location'.

The thread at the participant remains indoubt. DB2 rejects further attempts to automatically resolve the indoubt thread.

location

The relational database name (location-name) of the participant.

luwid=token

The global logical unit of work id and the local token that identify the thread.

seq-no The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, IFCID 206 was not active or it was active with a destination of the resident trace table only. IFCID 206 is a member of statistics class 4, which has a default destination of SMF.

System Action: Alert A003 is generated. A trace record whose IFCID=206 is written.

System Programmer Response: This is an APARable error, probably at the participant, but possibly at the DB2 coordinator. The DB2 documentation required is contained in the statistics class 4 trace record. Determine the destination of statistics class 4. Locate and print the trace record with SEQUENCE NUMBER='seq-no'.

Call the database administrator. The participant might need to manually resolve the indoubt thread.

Database Administrator Action: The DB2 coordinator maintains knowledge of the indoubt participant until it is purged with the RESET INDOUBT command. If the thread is indoubt at the participant, it must be manually (heuristically) resolved. The status of the thread at the local DB2 (the coordinator) can be determined with the DISPLAY THREAD command for type indoubt threads by including the LUWID('token') parameter in the command.

If the participant is another DB2, the RECOVER

INDOUBT command can be used to resolve the indoubt thread.

DSNL415I **AUTOMATIC RESOLUTION OF** *luwid=token* **WITH COORDINATOR**
location **RESULTED IN ABORT**

Explanation: The identified indoubt logical unit of work was automatically resolved by communication with the coordinator location. After automatic resolution, this message is issued if message DSNL405 was previously issued to report the thread as indoubt. This message is not issued if message DSNL405 occurs in one restart of DDF or DB2, and automatic resolution occurs in a different restart of DDF or DB2.

luwid=token

The global logical unit of work id and the local token that identify the thread

location

The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<lname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

System Action: Processing continues normally.

DSNL416I **COLD START CONNECTION**
REJECTED BY PARTNER *location*

Explanation: DB2 attempted to make a cold-start connection with a partner location. The partner rejected this attempted connection. DB2 never rejects cold-start connections by partners.

location

Either the relational database name (location-name) or the logical unit name (<lname>) of the partner.

System Action: The connection was not made.

System Programmer Response: Call the database administrator.

Database Administrator Action: DB2 is not able to connect the partner 'location' until the partner 'location' allows a cold-start connection with DB2. Contact the database administrator at the partner 'location'.

Contact your IBM Support Center for further assistance.

DSNL417E *csect-name* **COLD START DETECTED AT COORDINATOR LOCATION** *location* **FOR INDOUBT THREAD WITH** *luwid=token*. **MANUAL RESOLUTION IS REQUIRED. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=204 and IFC SEQUENCE NUMBER=seq-no.**

Explanation: DB2 has resync responsibility for the indoubt thread identified. The partner location informed DB2 that it had performed a cold start operation and lost all knowledge of this indoubt thread. This indoubt thread must be manually resolved with the RECOVER INDOUBT command, followed by the RESET INDOUBT command.

location

The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<luname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

luwid=token

The logical unit of work id and the local token that identify the thread.

seq-no The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, then IFCID 204 was not active or it was active with a destination of the resident trace table only. IFCID 204 is a member of statistics class 4, which has a default destination of SMF and contains information about a partner's cold start.

System Action: Alert A001 is generated. A trace record whose IFCID=204 is written.

System Programmer Response: Call the database administrator.

Database Administrator Action: DB2 is a participant with one or more indoubt threads where the coordinator is 'location'. The DBMS at 'location' performed a cold start. The DB2 participant assumes that the coordinator recovery log was lost or damaged and indoubt thread resolution cannot be achieved. There may be inconsistent data at the coordinator. A list of indoubt threads involving the coordinator 'location' can be displayed using the DISPLAY THREAD command for indoubt type threads by including the LOCATION('location') parameter in the command.

The heuristic decision (that is, to commit or abort the logical unit of work) should be coordinated with any other participants. The existence of other participants might not be easy to determine. The information might be available in the coordinators recovery log even though the coordinator performed a cold start. If the coordinator is a DB2, then it might be possible to

execute the DSN1LOGP utility to produce a summary report. If this is possible, the following information might be produced:

- The LUWID of the thread.
- The NID used by IMS or CICS to identify the thread.
- The name of all participants.
- The name of an upstream coordinator if the coordinator is also a participant. This could happen when an application requester accesses a DB2 AS using application-directed access, which in turn accesses another DB2 server with system-directed access. (The local DB2 might be the third system in this scenario.)

At this DB2 participant, all indoubt threads coordinated by the cold starting location must be resolved with the RECOVER INDOUBT command. Locked data remains unavailable until resolution. Threads that were already resolved with this command are discarded. Threads not yet resolved are discarded after resolution with the command.

The commit or abort decision provided using the RECOVER INDOUBT command for a logical unit of work are propagated to all downstream participants, if any.

DSNL418E *csect-name* **COLD START DETECTED AT PARTICIPANT LOCATION** *location* **FOR INDOUBT THREAD WITH** *luwid=token*. **POSSIBLE DAMAGE. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=204 and IFC SEQUENCE NUMBER=seq-no.**

Explanation: DB2 has coordinator responsibility for the indoubt thread identified. The partner location informed DB2 that it had performed a cold start operation and lost all knowledge of this indoubt thread. There might be damage at the participant.

location

The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<luname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

luwid=token

The global logical unit of work id and the local token that identify the thread.

seq-no The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, then IFCID 204 was not active or it was active with a destination of the resident trace table only. IFCID 204 is a

member of statistics class 4, which has a default destination of SMF.

System Action: Alert A001 is generated. A trace record whose IFCID=204 is written.

System Programmer Response: Call the database administrator.

Database Administrator Action: DB2 is the coordinator with indoubt thread resolution responsibility for one or more indoubt logical units of work at 'location'. The DBMS at 'location' performed a cold start. DB2 assumes that the participant recovery log was lost or damaged and indoubt thread resolution cannot be achieved. There is probably inconsistent data at the participant. Minimally, the participant might not completely reflect the final outcome of the threads that were indoubt at the time the failure occurred. A list of indoubt threads involving the partner 'location' can be displayed using the DISPLAY THREAD command for type indoubt threads by including the LOCATION('location) parameter in the command.

Information about the indoubt participant continues to appear in the DISPLAY THREAD TYPE(INDOUBT) report until it is purged with the RESET INDOUBT command.

DSNL419I PARTNER *location* HAS RESOLVED WARM START STATUS AND CONNECTION IS ACCEPTED

Explanation: A successful warm start connection was made with a partner. A previous attempt to make a warm start connection with the partner was rejected with a DSNL410I message because the partner specified an incorrect log name.

location

Either the relational database name (location-name) or the logical unit name (<luname>) of the partner

System Action: The connection was successful. Normal processing continues.

DSNL420I COLD START CONNECTION BY PARTICIPANT *location* ACCEPTED. POSSIBLE DAMAGE. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=204 AND IFCID SEQUENCE NUMBER=*seq-no*

Explanation: DB2 has coordinator responsibility for indoubt threads at a participant and just connected with the participant, which lost all knowledge of indoubt threads because of a previous cold start. There might be damage at the participant.

location

The field contains one of the following:

- The relational database name (location name)

- The VTAM LU name (<luname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

seq-no The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, then IFCID 204 was not active or it was active with a destination of the resident trace table only. IFCID 204 is a member of statistics class 4, which has a default destination of SMF.

System Action: The connection with the partner is accepted. Alert A001 is generated. A trace record whose IFCID=204 is written.

System Programmer Response: Call the database administrator.

Database Administrator Action: DB2 is the coordinator with indoubt thread resolution responsibility for one or more indoubt logical units of work at 'location'. The DBMS at 'location' performed a cold start. DB2 assumes that the participant recovery log was lost or damaged and indoubt thread resolution cannot be achieved. There is probably inconsistent data at the participant. Minimally, the participant might not completely reflect the final outcome of the threads that were indoubt at the time the failure occurred. A list of indoubt threads involving the partner 'location' can be displayed using the DISPLAY THREAD command for type indoubt threads by including the LOCATION('location) parameter in the command.

Information about the indoubt participant continues to appear in the DISPLAY THREAD TYPE(INDOUBT) report until it is purged with the RESET INDOUBT command.

DSNL421I SNA XLN PROTOCOL VIOLATION BY PARTNER *location*. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=0236 AND IFCID SEQUENCE NUMBER=*seq-no*

Explanation: DB2 detected a protocol violation in the SNA Exchange Log Names (XLN) exchange with the partner at the specified location.

location

Either the relational database name (location-name) or the logical unit name (<luname>) of the partner that sent the invalid XLN message.

seq-no The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, then IFCID 0236 was not active or it was active with a destination of the resident trace table only. IFCID 0236 is a member of statistics class 4, which has a default destination of SMF.

System Action: The attempt to connect with the remote site fails. DB2 writes a trace record with IFCID 0236.

Operator Response: Call the system programmer.

System Programmer Response: Contact the system programmer for the remote site. The invalid XLN message is recorded in the IFCID 0236 trace record. The system logic error that causes the invalid XLN message must be corrected at the remote site.

DSNL422I WARM START CONNECTION BY PARTNER *location* REJECTED BECAUSE THE PARTNER REMEMBERS OUR LOG NAME INCORRECTLY. OUR LOG NAME IS *name1* AND THE PARTNER REMEMBERS IT AS *name2*

Explanation: An attempt to make a warm start connection with a partner was rejected because the partner specified our log name as *name2*. Our log name is *name1*, which is the LUNAME of the local DB2. This error might be a recoverable error if the partner can restart with our log name as *name1*. If this is not possible, then the partner must perform a cold start connection with DB2.

location

The 'location' with which the connection failed: either the relational database name (location-name) or the logical unit name (<luname>) of the partner.

name1 Our log name, as remembered by us.

name2 Our log name, as remembered by our partner and sent to us in the attempted warm start connection.

System Action: The connection with the partner is rejected. DB2 retains indoubt knowledge.

System Programmer Response: Call the database administrator.

Database Administrator Action: Contact the database administrator at the partner 'location' and determine if it is possible for the partner to perform a warm start with our log name specified as the LUNAME of this DB2. If this is possible, the next attempt to connect will succeed.

If this cannot be done, then there are two other possible solutions.

- Have the partner 'location' perform a cold start connection with this DB2 subsystem.
- Use the RESET INDOUBT command with the FORCE option in conjunction with the LOCATION parameter to cause the next connection with the partner to be a cold start connection.

DSNL423I AUTOMATIC RESOLUTION OF *luwid=token* WITH PARTICIPANT *location* RESULTED IN COMMIT

Explanation: The identified indoubt logical unit of work was automatically resolved through communication with the participant location. After automatic resolution, this message is issued if message DSNL406 was previously issued reporting the thread as indoubt. This message is not issued if message DSNL406 occurs in one restart of DDF or DB2, and automatic resolution occurs in a different restart of DDF or DB2.

luwid=token

The global logical unit of work id and the local token that identify the thread.

location

The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<luname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

System Action: Processing continues normally.

DSNL424I AUTOMATIC RESOLUTION OF *luwid=token* WITH PARTICIPANT *location* RESULTED IN ABORT

Explanation: The identified indoubt logical unit of work was automatically resolved by communication with the participant location. After automatic resolution, this message is issued if message DSNL425 was previously issued reporting the thread as being indoubt. This message is not issued if message DSNL425 occurs in one restart of DDF or DB2, and automatic resolution occurs in a different restart of DDF or DB2.

luwid=token

The global logical unit of work id and the local token that identify the thread

location

The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<luname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

System Action: Processing continues normally.

DSNL425I **THREAD *luwid=token* AT PARTICIPANT *location* MAY BE INDOUBT BECAUSE OF A COMMUNICATION FAILURE. DB2 ABORTED THE THREAD. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=209 AND IFCID SEQUENCE NUMBER=*seq-no***

Explanation: During execution of the two phase commit protocol with the participant identified by 'location', communications failed. Phase 1 of the protocol completed with the participant and it is prepared for either commit or abort. The decision to abort the thread was made, but cannot be communicated to the participant at this time. The participant is indoubt.

DB2 becomes responsible for indoubt resolution with the participant. This responsibility appears in a DISPLAY THREAD TYPE (INDOUBT) report. Periodic attempts are made to reestablish communication with the participant for automatic indoubt resolution. If successful, message DSNL424 is written.

luwid=token

The global logical unit of work id and the local token that identify the thread.

location

The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<luname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

seq-no The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, IFCID 209 was not active or it was active with a destination of the resident trace table only. IFCID 209 is a member of statistics class 4, which has a default destination of SMF.

System Action: Alert A006 is generated. A trace record whose IFCID=209 is written.

Operator Response: If message DSNL424 for the LUWID specified in message DSNL406 does not appear in a reasonable amount of time, call the system programmer.

System Programmer Response: Determine the cause of the communication failure and have the problem fixed. DB2 periodically attempts to reestablish communication. If the problem cannot be fixed in a reasonable amount of time, call the database administrator. The participant might need to resolve the indoubt state manually in order to release locked resources.

Database Administrator Action: If the unit of work with LUWID=*luwid* is indoubt at '*location*', inform the

database administrator there that the logical unit of work with LUWID=*luwid* was aborted to assist in manual resolution of the indoubt thread at '*location*'.

DSNL429I **INCONSISTENT DDF LOG DATA, THE FIRST CONNECTION WITH EACH REMOTE LOCATION WILL BE A COLD START CONNECTION**

Explanation: DB2 detected an inconsistency in the DB2 log during restart operations. Since the log is inconsistent and cannot be trusted, DB2 performs a cold start connection with each partner LU the next time a connection with that LU is attempted. If DB2 has indoubt resolution responsibility either as a coordinator or as a participant, then this information is lost as indicated by messages DSNL438 and/or DSNL439, which might follow this message. This means that:

- All information that DB2 maintained about having coordinator responsibility for remote participants was purged. These remote participants need manual resolution for any indoubt threads for which DB2 was the coordinator. A DSNL439I message is displayed for each indoubt remote participant.
- All information that DB2 maintained about having participant responsibility for remote coordinators was purged. A DSNL438I message is displayed for each database access thread that has a remote coordinator. If a database access thread remains indoubt at the end of restart, then the thread must be manually resolved. A -DISPLAY THREAD (*) TYPE(INDOUBT) LOCATION (*) command provides a report that lists the indoubt threads that need manual resolution.

System Action: Processing continues normally.

System Programmer Response: Call the database administrator.

Database Administrator Action: See the DSNL438I and DSNL439I messages to determine what action to take.

DSNL432I **DDF IS COORDINATOR FOR *nnnn* THREADS WITH *mmmm* INDOUBT REMOTE PARTNERS**

Explanation: This message is issued when DDF is started or stopped, if DDF determines that this DB2 has coordinator responsibility for one or more indoubt threads with one or more partners. This is a summary status message.

nnnn The number of indoubt threads for which DB2 is the coordinator

mmmm The number of remote partners where the threads are indoubt

System Action: Processing continues normally.

Operator Response: If the message was issued as a

DSNL433I • DSNL438I

result of DDF starting, no action is necessary. If the message was issued as a result of DDF stopping, contact the database administrator.

Database Administrator Action: If the message was issued as a result of stopping DDF, then DB2 maintained all information necessary to perform automatic resynchronization with partner locations and resolve all indoubt units of work. Issue the START DDF command to initiate this process.

If the message was issued as a result of starting DDF, then DDF started automatic resynchronization.

DSNL433I DDF IS PARTICIPANT FOR *nnnn* INDOUBT THREADS WITH *mmmm* REMOTE PARTNERS

Explanation: This message is issued when DDF is started or stopped, if DDF determines that this DB2 has participant responsibility for one or more indoubt threads with one or more partners. This is a summary status message.

nnnn The number of indoubt threads for which DB2 is the participant

mmmm The number of remote partners that have coordinator responsibility

System Action: Processing continues normally.

Operator Response: If the message was issued as a result of DDF starting, no action is necessary. If the message was issued as a result of DDF stopping, contact the database administrator.

Database Administrator Action: If the message was issued as a result of stopping DDF, then DB2 maintained all information necessary to perform automatic resynchronization with partner locations and resolve all indoubt units of work. Issue the START DDF command to initiate this process.

If you do not want to perform automatic resynchronization, you can still resolve the indoubt units of work for which DB2 is a participant and which hold database resources locked. Use the DISPLAY THREAD command for type indoubt threads to produce a display that lists these threads. Then use the RECOVER INDOUBT command to either commit or abort these units of work.

To avoid data inconsistency, coordinate this manual resolution with the database administrators at the locations that have coordinator responsibility for each indoubt unit of work. If any of the indoubt units of work at DB2 also have coordinator responsibility for participant locations, then you should notify the database administrators at the participant locations of the commit or abort decision so they can make the same decision.

DSNL434E DDF NOT STARTED - INCORRECT VTAM RELEASE LEVEL

Explanation: The local VTAM release level is older than the minimum release level required by DB2. When DB2 issues the VTAM OPEN macro, the VTAM release level is returned to DB2. DB2 examines the VTAM release level to determine whether the local VTAM system provides the function required by DB2.

System Action: The attempt to START DDF fails.

Operator Response: Call the system programmer.

System Programmer Response: Install a release of VTAM that is compatible with the DB2 system. The DB2 Program Directory identifies the required VTAM release level.

DSNL438I RESYNC STATUS PURGED FOR COORDINATOR *location*. LUWID=*luwid*, URID=*urid*, STATUS=*s* INFORMATION RECORDED IN TRACE RECORD WITH IFCID=235 and IFCID SEQUENCE NUMBER=*seq-no*

Explanation: The information related to resynchronization with the remote coordinator location for the logical unit of work identified by 'luwid', which is displayed in this message, is being purged by DB2. Automatic indoubt resolution responsibility for this distributed logical unit of work can no longer be performed.

This situation can arise in one of two ways;

- A DB2 conditional restart (other than a DB2 cold start; that is, a DB2 conditional restart with STARTRBA=ENDRBA) is being performed.
- An inconsistency in the DB2 log was detected during DB2 restart processing (indicated by a DSNL429I message).

location

The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<lname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

luwid The global logical unit of work id that identifies the logical unit of work.

urid The unit of recovery identifier. This is the RBA on the DB2 recovery log of the log record that marks the beginning of the logical unit of work. This is the earliest RBA required to process the logical unit of work during restart.

s Restart status of the logical unit of work. When DB2 came down, the logical unit of work was in one of these states:

A INABORT: The logical unit of work

was in the “must-complete” phase of abort, but abort has not yet completed.

- C** INCOMMIT: The logical unit of work was in the “must-complete” phase of commit, but commit has not yet completed.
- D** INDOUBT: The logical unit of work completed the first phase of commit, but DB2 has not yet received the commit or abort decision from the coordinator.
- F** INFLIGHT: The logical unit of work has not yet completed the first phase of commit and should be backed out.
- U** UNKNOWN: The status of the logical unit of work is not known to DB2 because of conditional restart.

seq-no The IFCID sequence number associated with the trace record. The trace record is written to statistics class 4, which is started to SMF as a default during DB2 installation. Statistics class 4 must be started to a permanent destination (SMF or GTF) for the trace record to be accessible. The sequence number is printed in hexadecimal.

System Action: Processing continues normally.

System Programmer Response: Call the database administrator.

Database Administrator Action: The resynchronization information that was purged by DB2 is recorded in this message. To determine the proper commit or abort decision made by the coordinator at 'location', use the status code as follows:

- A** The correct decision is to abort the logical unit of work.
- C** The correct decision is to commit the logical unit of work.
- D** Contact the database administrator at 'location' to determine the correct decision.
- F** The correct decision is to abort the logical unit of work.
- U** Contact the database administrator at 'location' to determine the correct decision.

the logical unit of work identified by 'luwid', which is displayed in this message. Automatic indoubt resolution responsibility for this distributed logical unit of work can no longer be performed.

This situation can arise in one of two ways:

- A DB2 conditional restart (other than a DB2 cold start; that is, a DB2 conditional restart with STARTRBA=ENDRBA) is being performed.
- An inconsistency in the DB2 log was detected during DB2 restart processing (indicated by a DSNL429I message).

location

The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<lname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

luwid The global logical unit of work id that identifies the logical unit of work.

urid The unit of recovery identifier. This is the RBA on the DB2 recovery log of the log record that marks the beginning of the logical unit of work. This is the earliest RBA required to process the logical unit of work during restart.

s Restart status of the logical unit of work. When DB2 came down, the logical unit of work was in one of these states:

- A** INABORT: The logical unit of work was in the “must-complete” phase of abort, but abort has not yet completed.
- C** INCOMMIT: The logical unit of work was in the “must-complete” phase of commit, but commit has not yet completed.
- D** INDOUBT: The logical unit of work completed the first phase of commit, but DB2 has not yet received the commit or abort decision from the coordinator.
- F** INFLIGHT: The logical unit of work has not yet completed the first phase of commit and should be backed out.
- U** UNKNOWN: The status of the logical unit of work is not known to DB2 because of conditional restart.

seq-no The IFCID sequence number associated with the trace record. The trace record is written to statistics class 4, which is started to SMF as a default during DB2 installation. Statistics class 4 must be started to a permanent destination

DSNL439I RESYNC STATUS PURGED FOR PARTICIPANT location. LUWID=luwid, URID=urid, STATUS=s INFORMATION RECORDED IN TRACE RECORD WITH IFCID=235 and IFCID SEQUENCE NUMBER=seq-no

Explanation: DB2 is purging the information related to resynchronization with the remote participant location for

DSNL440I • DSNL442I

(SMF or GTF) for the trace record to be accessible. The sequence number is printed in hexadecimal.

System Action: Processing continues normally.

System Programmer Response: Call the database administrator.

Database Administrator Action: The resynchronization information that was purged by DB2 is recorded in this message. When communicating the proper commit or abort decision to the database administrator at 'location', use the status code as follows:

- A** Abort the logical unit of work.
- C** Commit the logical unit of work.
- D** See the DSNL438I message produced for the same 'luwid' and 'urid' to determine the coordinator 'location'. Contact the database administrator at 'location' to determine the correct decision.
- F** Abort the logical unit of work.
- U** If there is a DSNL438I message for the same 'luwid' and 'urid', proceed as described above under 'D'. Otherwise, there might be information available on the DB2 log that a DSN1LOGP summary report can provide. If this is not successful, contact the IBM Support Center.

DSNL440I *csect-name* RESET INDOUBT COMMAND SPECIFICATION IN ERROR

Explanation: A RESET INDOUBT command was issued, but the specification of keywords or keyword parameter values was in error.

System Action: No indoubt information was purged. System processing continues normally.

User Response: One of the following errors was made in the RESET INDOUBT command specification:

- RESET INDOUBT was issued without any other keywords specified. At least one of the following keywords must also be specified: LUNAME, IPADDR, LOCATION, or LUWID.
- RESET INDOUBT was issued with both the LUWID and LOCATION keywords specified, but a list of LOCATION keyword parameter values was specified. When both the LUWID and LOCATION keywords are specified only one LOCATION keyword parameter value is allowed.
- RESET INDOUBT was issued with at least one LOCATION keyword parameter value that began with a '<', but did not end with a '>', or the length of the bracketed value was not 1 to 8 characters. When the LOCATION keyword parameter value is specified in the <luname> format, the luname value must be bracketed with '<' and '>' and be 1 to 8 characters long.

- RESET INDOUBT was issued with an invalid IPADDR keyword parameter value. Verify that the specified IPADDRs are in the proper dotted decimal form, that there is a colon delimiter between the IPADDR and port, and that the port number is valid.

If needed, issue the DISPLAY THREAD TYPE(INDOUBT) command to display information (including LOCATION, LUWID, and LUNAME values) about all indoubt threads. Correct the RESET INDOUBT command specification, and reissue the command.

DSNL441I KEYWORD 'LUWID' PARAMETER VALUE *parmvalue* FORMAT IN ERROR

Explanation: A RESET INDOUBT command with the LUWID parameter was issued, but the specified parameter value (*parmvalue*) has an invalid format for an LUWID. There are two correct formats for the LUWID parameter. The first correct format is called a token, and is a 1 to 5 digit decimal number. The second correct format is 'netid.luname.luwnunique.comseq', where:

netid A 1 to 8 character network ID

luname A 1 to 8 character luname

luwnunique A 12 character hexadecimal number

comseq A 4 character hexadecimal number

All fields in the second correct format must be separated by a period (.) delimiter.

System Action: Indoubt information about the specified logical unit of work is not purged from the system.

User Response: To determine the correct LUWID value for the unit of work indoubt information that you want to purge, issue the DISPLAY THREAD TYPE(INDOUBT) command to display all units of work for which indoubt information exists. Then reissue the RESET INDOUBT command, specifying the correct LUWID parameter value.

DSNL442I QUALIFYING INDOUBT INFORMATION FOR LOCATION *location* NOT FOUND

Explanation: A -RESET INDOUBT LOCATION('location') command was issued, but DB2 has no indoubt information about the specified location.

location The value specified after the LOCATION keyword in the RESET INDOUBT command.

System Action: No indoubt information was purged. System processing continues normally.

User Response: Use the -DISPLAY THREAD(*)

TYPE(INDOUBT) LOCATION(*) command to list the locations for which DB2 has indoubt information. After determining the correct location, reissue the command.

DSNL443I QUALIFYING INDOUBT INFORMATION FOR LUWID=*value* NOT FOUND

Explanation: A -RESET INDOUBT LUWID('value') command was issued where 'value' is either an luwid or the local token that represents an luwid. Either DB2 has no indoubt information about the specified luwid or token, or DB2 has indoubt information that cannot be purged using the -RESET INDOUBT command with the LUWID option.

value The global logical unit of work id or the local token that was specified for the LUWID keyword in the RESET INDOUBT command.

System Action: No indoubt information was purged. System processing continues normally.

User Response: Use the -DISPLAY THREAD(*) TYPE(INDOUBT) LOCATION(*) command to list the indoubt information known to DB2. If the -DISPLAY THREAD output does not include information about the specified luwid, then that is the reason the message was issued. If the -DISPLAY THREAD output does include information about the specified luwid, this information cannot be purged using the -RESET INDOUBT command with the LUWID option. Refer to the description of each message produced by the -DISPLAY THREAD output that relates to the specified luwid in order to determine how to proceed. After determining the correct luwid or token, reissue the command.

DSNL444I QUALIFYING INDOUBT INFORMATION FOR LOCATION *location* HAS BEEN PURGED

Explanation: A -RESET INDOUBT LOCATION('location') command issued to purge indoubt information about the named location completed successfully and the indoubt information was purged.

location

Either the relational database name (location-name) or the logical unit name (<lname>) that was specified after the LOCATION keyword on the RESET INDOUBT command.

System Action: The specified indoubt information was purged. System processing continues normally.

DSNL445I QUALIFYING INDOUBT INFORMATION FOR LUWID *value* HAS BEEN PURGED

Explanation: A -RESET INDOUBT LUWID('value') command, which was issued to purge indoubt information about the specified luwid, completed successfully. The indoubt information was purged.

value The value specified for the LUWID keyword in the -RESET INDOUBT LUWID(value) command that is being processed.

System Action: System processing continues normally.

DSNL446I COLD START WILL BE PERFORMED WITH *nettype netvalue*

Explanation: A -RESET INDOUBT LUNAME('lname') FORCE or a -RESET INDOUBT IPADDR('ipaddr') FORCE command issued to force a cold start completed successfully. The next connection with 'lname' or 'ipaddr' is a cold start.

nettype

Identifies the type of network used to access the remote site. There are two possible values:

LU -- indicates that VTAM is used to connect to the remote site.

IPADDR -- indicates that TCP/IP is used to connect to the remote site.

netvalue

The network address of the remote location.

- If *nettype* is LU, *netvalue* specifies the VTAM LU name of the remote location.
- If *nettype* is IPADDR, *netvalue* specifies the dotted decimal IP address of the remote location.

System Action: System processing continues normally.

DSNL447I CANNOT DELETE ENTRY '*value*' BECAUSE THERE IS AN INDOUBT THREAD TO BE RESOLVED FIRST

Explanation: A -RESET INDOUBT command was issued with LUNAME(value), IPADDR(value), LOCATION(value), or LUWID(value). The 'value' is an LU name, an IP address, a location, or a LUWID (or its token), that identifies a logical unit of work for which DB2 has participant indoubt resolution responsibility, coordinator indoubt resolution responsibility, or both.

System Action: Resynchronization responsibility information was not purged. System processing continues normally.

User Response: Use the information in this section to determine the correct action to take. Then issue the proper command to perform that action.

The two most probable causes for the problem are that the -RESET INDOUBT command was issued with the wrong parameters, or that an incorrect 'value' was specified. Use the -DISPLAY THREAD(*) TYPE(INDOUBT) LOCATION(*) command to display the indoubt information known to DB2.

1. If the intent was to purge participant or coordinator indoubt resolution responsibility, then examine the -DISPLAY THREAD output to determine the location name, or names, for which this responsibility is to be purged. Then use the -RESET INDOUBT LUNAME(luname) command with the FORCE option or the -RESET INDOUBT IPADDR(ipaddr) command with the FORCE option to purge this responsibility.

To determine the luname or IP address and resync port for an upstream coordinator that can be used with the FORCE option, look at the coordinator information from the DSNV408I message in the -DISPLAY THREAD output. There are two tokens associated with the coordinator information that are delimited by a colon (":").

- The first token is the partner location name or "<luname>" for an SNA connection, or the dotted decimal IP address for a TCP/IP connection (nnn.nnn.nnn.nnn).
- The second token is the partner LU name for an SNA connection, or the resync port number for a TCP/IP connection.

To determine the luname or IP address and resync port for downstream participants that can be used with the FORCE option, look at the location names from the DSNV450I and DSNV446I messages. There are two or three tokens associated with the participant location which are delimited by a colon (":").

- The first token is the partner location name.
- The second token is the partner LU name for an SNA connection, or the dotted decimal IP address for a TCP/IP connection (nnn.nnn.nnn.nnn).
- The third token only appears if the second token is an IP address in which case the third token is the partner resync port number.

See the description of the -RESET INDOUBT command in *DB2 Command Reference* for more information.

Remember that the FORCE option causes DB2 to purge all knowledge of indoubt resolution responsibility involving the luname or ipaddrspecified on the command.

Use caution when using the FORCE parameter to purge participant indoubt information when no errors are precluding automatic resolution. Normally, after the use of the RECOVER INDOUBT command, automatic resolution with the coordinator determines if heuristic damage occurred. This detection is lost if RESET INDOUBT is used before automatic resolution with the coordinator can be achieved.

Use caution when using the FORCE parameter to purge coordinator indoubt information when no errors are precluding automatic resolution. Once the

information is purged, any participant that is indoubt is forced to use a heuristic decision process to resolve the indoubt logical unit of work.

2. Examine the -DISPLAY THREAD output. If the value specified in the command (and displayed in the DSNL447I message) is incorrect, determine the correct value and reissue the command using the correct value.

DSNL448I UNABLE TO FORCE COLD START WITH *nettype netvalue*, SESSION STILL EXISTS

Explanation: A -RESET INDOUBT LUNAME('luname') FORCE or a -RESET INDOUBT IPADDR('ipaddr') FORCE command was issued to force a cold start, but network connections still exist between DB2 and the partner 'luname' or 'ipaddr'. The information related to this partner was not purged, so a cold start is not performed.

nettype

Identifies the type of network used to access the remote site. There are two possible values:

LU -- indicates that VTAM is used to connect to the remote site.

IPADDR -- indicates that TCP/IP is used to connect to the remote site.

netvalue

The network address of the remote location.

- If *nettype* is LU, *netvalue* specifies the VTAM LU name of the remote location.
- If *nettype* is IPADDR, *netvalue* specifies the dotted decimal IP address of the remote location.

System Action: System processing continues normally.

User Response: For SNA, you can use the VTAM command DISPLAY NET to determine the existence of sessions between two logical units. Terminate the sessions by using the VTAM command VARY NET,TERM to allow the RESET INDOUBT to occur. For TCP/IP, terminate all connections to the IP address. Determine the correct luname or ipaddr and reissue the command.

DSNL449I DB2 HAS NO INFORMATION RELATED TO LUNAME *luname*

Explanation: A -RESET INDOUBT LUNAME('luname') FORCE command was issued but DB2 has no knowledge of the specified 'luname'.

luname

The logical unit name, as defined to VTAM, of the coordinator or participant

System Action: No information was purged. System

processing continues normally.

User Response: Determine the correct luname as follows:

- Use the -DISPLAY THREAD(*) TYPE(INDOUBT) LOCATION(*) command to determine locations for which DB2 has indoubt responsibility.
- Query the SYSIBM.LOCATIONS table to correlate a location name with an luname. The LINKNAME column contains the luname associated with the location name in the LOCATION column.

Then reissue the command, specifying the correct luname.

DSNL450I DDF THREAD *luwid=token* IS BETWEEN PHASE 1 AND PHASE 2 OF COMMIT. THREAD IS NOW AN INDOUBT THREAD AS A RESULT OF CANCEL REQUEST.

Explanation: The identified DDF thread was in a prepared state waiting for the commit or backout decision of the commit coordinator. The thread cannot be canceled in this state. However, the thread was removed from the active state and placed into the indoubt state. The conversation with the coordinator was deallocated. The thread is now indoubt and appears in the display thread report for indoubt threads. The resources held by the thread continue to be held. Automatic resolution of the indoubt state is attempted periodically. Resources held by the thread are released after indoubt resolution occurs.

luwid=token

The global logical unit of work id and the local token that identify the thread

System Action: Processing continues normally.

Operator Response: If the purpose of canceling this thread was to free the resources held by the thread, call the database administrator.

Database Administrator Action: To release the resources held by the indoubt thread before automatic resolution with the coordinator, a manual commit or abort decision can be made with the RECOVER INDOUBT command. First, issue the DISPLAY THREAD command for an indoubt thread report, which includes the subject thread. From this report, determine the name of the coordinator. Contact the coordinator system and find out whether a commit or abort decision was made.

DSNL451I QUALIFYING INDOUBT INFORMATION FOR LUNAME *luname* NOT FOUND

Explanation: A -RESET INDOUBT LUNAME('luname') command was issued, but DB2 has no indoubt information about the specified luname.

luname

The logical unit name, as defined to VTAM, of the coordinator or participant

System Action: No indoubt information was purged. System processing continues normally.

User Response: Use the -DISPLAY THREAD(*) TYPE(INDOUBT) LOCATION(*) command to list the locations for which DB2 has indoubt information. Entries associated with a particular LUNAME have a location name in this form: '<luname>'. Use 'luname' (without the enclosing brackets) as the input string to RECOVER INDOUBT.

After determining the correct luname, reissue the command.

DSNL452I QUALIFYING INDOUBT INFORMATION FOR LUNAME *luname* HAS BEEN PURGED

Explanation: A -RESET INDOUBT LUNAME('luname') command, which was issued to purge indoubt information about the specified luname completed successfully. The indoubt information was purged.

luname

The luname specified for the LUNAME keyword in the -RESET INDOUBT LUNAME(luname) command being processed.

System Action: The specified indoubt information was purged. System processing continues normally.

DSNL453I *csect* QUALIFYING INDOUBT INFORMATION FOR IPADDR *ipaddr* NOT FOUND

Explanation: A -RESET INDOUBT IPADDR('ipaddr') command was issued, but DB2 has no indoubt information about the specified IP address.

csect The CSECT name of the DB2 module that issued the message

ipaddr The dotted decimal IP address of the coordinator or participant

System Action: No indoubt information was purged. System processing continues normally.

User Response: Use the -DISPLAY THREAD(*) TYPE(INDOUBT) LOCATION(*) command to list the locations for which DB2 has indoubt information. Entries associated with TCP/IP have a string with this format in the LOCATION field: "nnn.nnn.nnn.nnn".

After determining the correct *ipaddr*, reissue the command.

DSNL454I *csect* **QUALIFYING INDOUBT INFORMATION FOR IP ADDRESS** *ipaddr*
HAS BEEN PURGED

Explanation: A -RESET INDOUBT IPADDR('ipaddr') command, which was issued to purge indoubt information about the specified IP address completed successfully. The indoubt information was purged.

csect The CSECT name of the DB2 module that issued the message

ipaddr The IP address specified for the IPADDR keyword in the -RESET INDOUBT IPADDR(ipaddr) command being processed

System Action: The specified indoubt information was purged. System processing continues normally.

DSNL455I *csect* **DB2 HAS NO INFORMATION RELATED TO IP ADDRESS** *ipaddr*

Explanation: A -RESET INDOUBT IPADDR('ipaddr') FORCE command was issued but DB2 has no knowledge of the specified 'ipaddr'.

csect The CSECT name of the DB2 module that issued the message.

ipaddr The dotted decimal TCP/IP address of the coordinator or participant

System Action: No information was purged. System processing continues normally.

User Response: Determine the correct luname as follows:

- Use the -DISPLAY THREAD(*) TYPE(INDOUBT) LOCATION(*) command to determine locations for which DB2 has indoubt responsibility. Entries associated with TCP/IP locations specify "nnn.nnn.nnn.nnn" in the LOCATION field.

Reissue the command; specify the correct ipaddr.

DSNL500I **CONVERSATION FAILED TO LOCATION=locname**
RESOURCE=luname.modename.
convid.sessid RTNCD=global vtam
primary return code FDBK2=global vtam
secondary return code
RCPRI=appc-specific primary return code
RCSEC=appc-specific secondary return
code SENSE=sna sense code

Explanation: An advanced program-to-program communications (APPC) conversation failed, or could not be allocated, because a VTAM return code indicates a conversation failure. VTAM return codes are defined in *VTAM for MVS/ESA Programming for LU 6.2*.

SNA sense codes that start with 00 represent DB2 reason codes. Refer to Part 6, "SNA codes," on page 1341 for a description of more common SNA sense codes returned to DB2 by VTAM.

The variables that are not return codes are described as follows:

Variable	Description
<i>locname</i>	The location name associated with the remote site.
<i>luname</i>	The VTAM LU name associated with the remote location.
<i>modename</i>	The logon mode used by DB2 to allocate the conversation.
<i>convid</i>	The conversation identifier given DB2 by VTAM when the conversation was allocated.
<i>sessid</i>	The session identifier given DB2 by VTAM when the conversation was allocated.

System Action: Communication on the conversation is discontinued.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to *VTAM for MVS/ESA Programming for LU 6.2* for failure analysis or Part 4, "Section 4. DB2 Codes," on page 773 for information on reason codes.

DSNL501I **CNOS PROCESSING FAILED FOR LU**
luname AND MODE modename
RTNCD=global vtam return code
FDBK2=global vtam secondary return
code RCPRI=appc-specific primary return
code RCSEC=appc-specific secondary
return code SENSE=vtam sense code

Explanation: A failure occurred while attempting to negotiate limits with the specified location for a LU and mode. VTAM return codes are described in *VTAM for MVS/ESA Programming for LU 6.2*. VTAM sense codes that start with 00 represent DB2 reason codes.

The variables are described as follows:

Variable	Description
luname	The VTAM LU name associated with the remote location.
modename	The logon mode used by DB2 to allocate the conversation.

System Action: All communication to the remote location fails until the limits can be negotiated with the remote location.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to *VTAM for MVS/ESA Programming for LU 6.2* for failure analysis or

Part 4, "Section 4. DB2 Codes," on page 773 for information on reason codes.

DSNL502I **SYSTEM CONVERSATION FAILED TO LOCATION** *locname*
RESOURCE=*luname.modename*.
convid.sessid **RTNCD=***global vtam*
primary return code **FDBK2=***global vtam*
secondary return code
RCPRI=*appc-specific primary return code*
RCSEC=*appc-specific secondary return code* **SENSE=***sna sense code*

Explanation: A system conversation failed, or could not be allocated, because VTAM returned a nonzero return code. VTAM return codes are defined in *VTAM for MVS/ESA Programming for LU 6.2*.

SNA sense codes that start with 00 represent DB2 reason codes. Refer to Part 6, "SNA codes," on page 1341 for a description of more common SNA sense codes returned to DB2 by VTAM.

The variables are described as follows:

Variable	Description
<i>locname</i>	The location name associated with the remote site.
<i>luname</i>	The VTAM LU name associated with the remote location.
<i>modename</i>	The logon mode used by DB2 to allocate the conversation.
<i>convid</i>	The conversation identifier given DB2 by VTAM when the conversation was allocated.
<i>sessid</i>	The session identifier given DB2 by VTAM when the conversation was allocated.

System Action: Communication on the conversation is not allowed.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to *VTAM for MVS/ESA Programming for LU 6.2* for failure analysis or Part 4, "Section 4. DB2 Codes," on page 773 for information on reason codes.

DSNL504I *csect-name* **RESOURCE UNAVAILABLE**
REASON=*reason* **TYPE=***type*
LOCATION=*location* **NAME=***name*

Explanation: The requested function requires a resource that is currently unavailable. The reason code, type, location, and name identifies the resource.

Operator Response: Note the reason, type codes, location, and name.

Problem Determination: The reason for the

resource's unavailability is identified by the reason code. The reason codes that appear in this message are described in Part 4, "Section 4. DB2 Codes," on page 773. Refer to Table 3 in Appendix B, "Problem determination," on page 1353 for an explanation of resource type codes.

DSNL510I *csect-name* **CONVLIMIT NEGOTIATED**
FROM *x* **TO** *y* **WITH LOCATION** *locname*
FOR LU *luname* **AND MODE** *modename*

Explanation: The maximum conversation limit is changed for a mode with a remote subsystem. The limit might change when a CNOS request is received from or sent to a remote subsystem, and the limit is determined by VTAM.

x The most recent value of CONVLIMIT before the last CNOS request was processed by advanced program-to-program communications (APPC)/VTAM for the specified mode name to the specified location.

y The current value of CONVLIMIT for the specified mode name to the specified location.

locname
The location name associated with the remote site that sent the CNOS request to the local DB2 subsystem, or received the CNOS request from the local DB2 subsystem.

luname
The VTAM LU name associated with the remote location that had its CONVLIMIT changed.

modename
The logon mode for the specified location that had its CONVLIMIT changed.

System Action: Conversation requests are queued when the maximum conversation limit is reached for a mode to remote subsystem.

DSNL511I *csect* **TCP/IP CONVERSATION FAILED TO LOCATION** *locname* **IPADDR=***ipaddr*
PORT=*port* **SOCKET=***socket* **RETURN CODE=***'rc'X* **REASON CODE=***'reason'X*

Explanation: A TCP/IP socket call failed with the error condition identified by *rc* and *reason*.

Variable	Description
csect	The CSECT name of the DB2 module that issued the message.
locname	The location name associated with the remote site.
ipaddr	The IP address of the remote site in dotted decimal format.

DSNL512I

- port** The TCP/IP port used by the remote site.
- socket** The TCP/IP socket call that returned the error.
- rc** The error condition reported by TCP/IP. The return code values are documented in *z/OS UNIX System Services Programming: Assembler Callable Services Reference*.
- reason** Provides further detail associated with the TCP/IP return code. The reason code values are documented in *z/OS UNIX System Services Programming: Assembler Callable Services Reference*.

System Action: Communication on the conversation is discontinued.

User Response: Notify the system programmer.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to *z/OS UNIX System Services Programming: Assembler Callable Services Reference* for an explanation of the error.

Problem Determination: See System Programmer Response.

DSNL512I *csect* TCP/IP *socket* FAILED WITH RETURN CODE=*rc*X AND REASON CODE=*reason*X

Explanation: A TCP/IP socket call used to establish communication between DB2 and TCP/IP failed.

Variable

	Description
<i>csect</i>	The CSECT name of the DB2 module that issued the message.
<i>socket</i>	The name of the TCP/IP socket call that failed.
<i>rc</i>	The return code reported by TCP/IP. The return code values are documented in <i>z/OS UNIX System Services Programming: Assembler Callable Services Reference</i> .
<i>reason</i>	The reason code reported by TCP/IP. The reason code values are documented in <i>z/OS UNIX System Services Programming: Assembler Callable Services Reference</i> .

System Action: DB2 may periodically retry the socket call to establish TCP/IP communication.

User Response: Notify the system programmer.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to *z/OS UNIX System Services Programming: Assembler Callable Services Reference* for an explanation of the error.

- If *socket*=SETRLIMIT and *reason code*=1148033C, then you should define DB2 as a superuser. See *DB2 Installation Guide* for instructions on enabling DDF as a superuser.

- If *socket*=TCPKEEPALIVE, then DB2 issues this socket call as a result of the TCP/IP KeepAlive value specified in the DB2 parameters module (usually DSNZPARM). You may specify this value by the TCP/IP KEEPALIVE value in the DSNTIP5 installation panel. Another way to specify the value is through the TCPKPALV value in the DSN6FAC macro, used to build the DB2 parameters module.

In this situation, processing continues, and DB2 does not retry the socket call. Verify that the TCP/IP stack being used by DB2 contains the required companion support for this function. If not, modify the DB2 parameter module to prevent DB2 from attempting to override the TCP/IP stack value.

- If *socket*=GETHOSTBYADDR(ip-address), then DB2 invoked a TCP/IP GetHostByAddr socket call to determine the domain name for the specified IP address. However, the call failed, and DB2 is not able to determine the domain name. DB2 retries the socket call periodically.

During DDF initialization, DB2 first determines the IP address via a GetHostID socket call. The IP address returned is the first IP address listed in the HOME statement of the TCP/IP profile for the selected TCP/IP stack. Verify the IP address. DDF must be stopped and restarted in order for DDF to obtain a new IP address.

Note: The IP address returned could depend on the selected TCP/IP stack, in the event that there are multiple TCP/IP stacks. DB2 requires OS/390 Open Edition sockets, and it is Open Edition that determines the TCP/IP stack to use. OS/390 Open Edition provides a way for users to select a specific TCP/IP stack by using the BPXTCAFF utility. For more information on BPXTCAFF, see *UNIX System Services Planning, SC28-1890*.

Using this IP address, DB2 issues a GetHostByAddr socket call to determine the associated domain name. The OS/390 Resolver handles the GetHostByAddr socket call because DB2 uses the OS/390 Open Edition Asynchronous Sockets interface. This resolver uses the resolver configuration information available to DDF. Until this information for the selected TCP/IP stack is correctly specified for DDF, the OS/390 Resolver will be unable to determine the domain name for DDF. You can find the search order for the "resolver configuration files" for an OS/390 application, such as DDF, in the IP Configuration manual for the appropriate level of the Communication Server for your OS/390 operating system.

Problem Determination: See System Programmer Response.

DSNL513I *csect* TCP/IP GETHOSTBYNAME
 FAILED WITH ERRNO=*errno* FOR
 DOMAIN *domain*

Explanation: DB2 encountered a TCP/IP gethostbyname socket call error when attempting to convert a TCP/IP domain name into an IP address.

Variable

Description

- csect** The CSECT name of the DB2 module that issued the message.
- errno** The error condition reported by TCP/IP. The *errno* values are documented in *IBM TCP/IP for MVS: Application Programming Reference*.
- domain** The TCP/IP domain name that DB2 wants to convert into an IP address. DB2 obtains the *domain* value from the IPADDR column of the SYSIBM.IPNames communications database table.

System Action: The row in SYSIBM.IPNames containing the specified *domain* in the IPADDR column is invalid. If the error occurs during DDF startup, the row in SYSIBM.IPNames is ignored. If the error occurs during an SQL statement, the SQL statement fails and the location associated with the SYSIBM.IPNames row is not available for TCP/IP communication.

User Response: Notify the system programmer.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to *IBM TCP/IP for MVS: Application Programming Reference* for an explanation of the error. Correct the IPADDR column value in SYSIBM.IPNames or register the *domain* with TCP/IP.

Problem Determination: See System Programmer Response.

DSNL514I *csect-name* TCP/IP SERVICE *serv* IS
 NOT DEFINED

Explanation: The TCP/IP getservbyname socket call did not find a matching definition for *serv*.

Variable

Description

- serv** The TCP/IP service name that DB2 wants to convert into a TCP/IP port number. DB2 obtains the service name from the PORT column of the SYSIBM.LOCATIONS communication database table.

System Action: The row in SYSIBM.LOCATIONS containing the specified service name in the PORT column is invalid. The associated LOCATION cannot be used for TCP/IP communication. If the error occurs during an SQL statement, the SQL statement fails.

User Response: Notify the system programmer.

Operator Response: Notify the system programmer.

System Programmer Response: If the value specified by *serv* is incorrect, correct the PORT column value in SYSIBM.LOCATIONS.

If the value specified by *serv* is correct, register the service name with TCP/IP.

TCP/IP service names are case sensitive, so make sure that the PORT column in SYSIBM.LOCATIONS is an exact match for the service name defined to TCP/IP.

Problem Determination: See System Programmer Response.

DSNL515I *csect* TCP/IP BIND FOR PORT *port*
 FAILED WITH RETURN CODE=*rc*
 AND REASON CODE=*reason*X

Explanation: DB2 encountered an error on the TCP/IP bind socket call while attempting to register a TCP/IP port number with the TCP/IP instance.

Variable

Description

- csect** The CSECT name of the DB2 module that issued the message.
- port** The TCP/IP port number DB2 wants to register with the TCP/IP instance.
- rc** The return code reported by TCP/IP. The return code values are documented in *z/OS UNIX System Services Programming: Assembler Callable Services Reference*.
- reason** The reason code reported by TCP/IP. The reason code values are documented in *z/OS UNIX System Services Programming: Assembler Callable Services Reference*.

System Action: If this error occurs for the TCP/IP port that is used for incoming DRDA requests, the error is probably caused by DB2 restarting on a CEC that already has another DB2 subsystem using the DRDA port number. DB2 will continue to try to activate the TCP/IP port number periodically.

If this error occurs for a TCP/IP port that is used for incoming DRDA requests to an ALIAS, the error is probably caused by some of the reasons that an error would occur for the normal DRDA request port. Check to ensure that the port value was also not previously reserved for another application in the system's TCP/IP profile. DB2 will continue to try to periodically activate the TCP/IP port number.

If this error occurs for the DRDA resynchronization port, DB2 invokes internal processing that is equivalent to STOP DDF MODE(FORCE).

User Response: Notify the system programmer.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to *z/OS UNIX System Services Programming: Assembler Callable Services Reference* for an explanation of the error.

Define DB2's TCP/IP port number to the TCP/IP instance, or use the change log inventory utility to correct the TCP/IP port number used by DB2.

Problem Determination: See System Programmer Response.

DSNL516I *csect-name* **LANGUAGE ENVIRONMENT SERVICES NOT AVAILABLE. CEEPIPI ROUTINE CANNOT BE LOADED**

Explanation: DB2 must load the Language Environment interface module (CEEPIPI) to process functions requiring Language Environment services. These Language Environment services are required for TCP/IP socket calls, encryption and decryption, and so on. If the CEEPIPI module is not included in an accessible data set such as STEPLIB data sets or the LPA library, DDF is unable to use the Language Environment.

System Action: DDF startup continues, but DDF users cannot use DB2 functions that require Language Environment services.

System Programmer Response: Add the Language Environment library to the DDF STEPLIB concatenation or to the LPA library. The Language Environment library must be APF authorized when it appears in the DDF STEPLIB concatenation.

Problem Determination: Collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 1.

DSNL517I *csect-name* **CEEPIPI func SERVICE FAILED WITH RETURN CODE=rc**

Explanation: DB2 uses the Language Environment CEEPIPI service to issue certain TCP/IP socket calls. The Language Environment return code *rc* was not expected for the indicated Language Environment function call.

func The function requested by DB2. Possible values are:

add_entry(module-name)

Add an entry to the Language Environment PIPI table dynamically. Module-name is the name of the module that failed to be added to the PIPI table.

call_sub

Run a program that issues a TCP/IP socket call using an existing Language Environment run time environment.

del_sub

Delete an entry from the Language Environment PIPI table dynamically.

init_sub

Create Language Environment sub run time environment.

term

Terminate the Language Environment run time environment.

rc The return code received from CEEPIPI.

System Action: The attempt to issue the LE/370 request fails.

If this message is issued during DDF startup, DDF startup continues.

If this message is issued during an SQL statement, a -904 SQLCODE is returned to the calling application.

System Programmer Response: See Problem Determination.

Problem Determination: Collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 1.

Refer to the Language Environment return codes from CEEPIPI in *Language Environment for OS/390 & VM Programming Guide* for additional information.

If the function requested by DB2 was *add_entry(module-name)*, an incorrect link edit of the module could create unresolved references. To determine if link edit problems exist, run the OS/390 AMBLIST utility with LISTLOAD and OUTPUT=XREF.

DSNL518I *csect-name* **LE/370 ENCLAVE FAILED WITH RETURN CODE=erc AND FEEDBACK=fi**

Explanation: DB2 uses the Language Environment CEEPIPI call_sub service to execute certain TCP/IP socket calls. The CEEPIPI interface returned information indicating a failure occurred while executing the TCP/IP socket.

erc The Language Environment enclave return code.

fi Contains one or two message identifiers. The message identifiers are constructed from the Language Environment condition token.

The message identifiers are constructed as follows:

- Single message: Facility_Id combined with Msg_No
- Two messages: Facility_Id combined with Class_Code and Facility_Id combined with Cause_Code

System Action: The SQL statement fails with SQLCODE -904.

System Programmer Response: A description of the

Language Environment enclave return code and the condition token are documented in *Language Environment for OS/390 & VM Programming Guide*.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1. 4.

DSNL519I *csect* **TCP/IP SERVICES AVAILABLE FOR DOMAIN** *tcpdomain* **PORT** *tcpport*

Explanation: DB2 encountered a TCP/IP failure during DDF startup processing. The DSNL515I message identifies the cause of the failure. After the failure is detected, DDF periodically attempts to reinitialize TCP/IP to allow remote connections. This message is issued when reinitialization is successful.

Variable

Description

csect The CSECT name of the DB2 module that issued the message.

domain

The TCP/IP port number used by this DB2 subsystem to accept incoming DRDA connection requests.

System Action: The DB2 TCP/IP port number is available to accept incoming DRDA connection requests.

- If PORT is non-zero, RESPORT must also be non-zero.
- If RESPORT is non-zero, PORT must also be non-zero.
- PORT and RESPORT must not specify the same value.

Variable

Description

port The TCP/IP port number used by this DB2 subsystem to accept incoming DRDA SQL connection requests.

rport The TCP/IP port number used by this DB2 subsystem to accept incoming 2-phase commit resynchronization requests.

System Action: DDF startup terminates abnormally.

System Programmer Response: Use the Change Log Inventory utility (DSNJU003) to correct the TCP/IP port numbers used by DB2.

DSNL520I *csect* **TCP/IP SERVICES AVAILABLE FOR RESPORT** *port*

Explanation: DB2 encountered a TCP/IP failure during DDF startup processing. The DSNL515I message identifies the cause of the failure. After the failure is detected, DDF periodically attempts to reinitialize TCP/IP to allow TCP/IP resynchronization to occur. This message is issued when reinitialization is successful.

Variable

Description

csect The CSECT name of the DB2 module that issued the message.

port The TCP/IP port number used by this DB2 subsystem to accept incoming resynchronization connection requests.

System Action: The DB2 TCP/IP port is available to accept incoming resynchronization connection requests.

DSNL522I *csect-name* **REQUIRED TCP/IP SUPPORT NOT AVAILABLE**

Explanation: The DB2 BSDS indicated that TCP/IP access was required, but the required TCP/IP interfaces were not available on this system. The required TCP/IP interfaces are provided by OS/390 Release 3.

System Action: DDF startup terminates abnormally.

System Programmer Response: Take one of the following actions:

- Install OS/390 Release 3 or later, so that the required TCP/IP interfaces are available.
- Use the Change Log Inventory utility (DSNJU003) to deactivate DB2's TCP/IP support, by specifying PORT=0 and RESPORT=0 on the DDF statement.

DSNL600I **RESOURCE UNAVAILABLE CORRELATION ID=*correlation-id* CONNECTION ID=*connection-id* LUW ID=*luw-id*=*token* REASON=*reason-code* TYPE=*resource-type* LOCATION=*location-name* NAME=*resource-name***

Explanation: This message is produced at the requesting site when a distributed request requires a resource that is not available.

The resource identified by 'resource-name' and 'resource-type' was not available at 'location-name' due to the indicated reason code.

correlation-id

The correlation identifier of the thread associated with the requester of the resource. Correlation IDs beginning with '0nn' where 'nn' is a number from 01 to 28, identify system agents.

DSNL521I *csect-name* **INVALID DDF BSDS VALUES DETECTED (PORT=*port*,RESPORT=*rport*).**

Explanation: DB2 encountered invalid values for the TCP/IP port numbers in the DDF record of the BSDS. Valid TCP/IP port numbers must obey the following rules:

DSNL700I • DSNL704I

connection-id

The connection identifier of the requester.

luw-id=token

The logical unit of work ID of the thread followed by an '=' sign and a token which may be used in place of luw-id in any DB2 command that accepts luw-id as input.

Refer to message DSNT500I under Chapter 18, "DSNT... Messages," on page 417 for an explanation of the resource type and resource name.

System Action: The SQL statement cannot be executed.

Operator Response: See Problem Determination.

Problem Determination: The reason the resource is unavailable is identified by the reason code. The reason codes are described in Part 4, "Section 4. DB2 Codes," on page 773. Collect the information described for the reason code received.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1.

DSNL700I *csect-name* **CDB RESOURCE UNAVAILABLE, DEFAULTS MAY BE USED REASON=*reason* TYPE=*type* NAME=*name***

Explanation: This message indicates that a requested function required the CDB which is currently unavailable. Defaults can be used to allocate conversations or set conversation limits with VTAM and TCP/IP partners.

System Action: If the SYSIBM.MODESELECT table is unavailable, VTAM defaults are used to allocate conversations. If the the SYSIBM.LUMODES table is unavailable, VTAM defaults can be used for conversation limits. If the SYSIBM.LOCATIONS, SYSIBM.IPNAMES, SYSIBM.LULIST, or SYSIBM.LUNAMES tables are unavailable, conversations can not be allocated to remote LOCATIONS.

Operator Response: Note the REASON code, the TYPE code, and the NAME. See Problem Determination section for an explanation of the collected data.

Problem Determination: The reason the resource is unavailable is identified by a reason code. The reason codes that appear in this message are described in Part 4, "Section 4. DB2 Codes," on page 773. Use the table defined for message DSNT500I to find the TYPE of resource identified in the message.

DSNL701I **CDB OBJECT *object-name* DOES NOT EXIST**

Explanation: The communications database (CDB) does not contain *object-name*. The incorrect

object-name can be the database name, the table space name, or the table name.

System Action: Termination of the distributed data facility (DDF) is initiated.

Operator Response: Notify the system programmer.

System Programmer Response: Determine what caused the failure, define the object as required, and issue the -START DDF command.

Problem Determination: Print the definition of the communications database (CDB).

DSNL702I **CDB TABLE *table-name* DOES NOT HAVE PROPER COLUMN DEFINITIONS, COLUMN *column-name* IS MISSING OR INCORRECTLY DEFINED**

Explanation: The communications database (CDB) needs a definition for '*column-name*' in '*tablename*'. The current definition is missing or incorrect.

System Action: Termination of the distributed data facility (DDF) is initiated.

Operator Response: Notify the system programmer.

System Programmer Response: Determine what caused the failure, define the column as required, and issue the -START DDF command.

Problem Determination: Print the definition of the communications database (CDB).

DSNL703I **CDB TABLE *table-name* DOES NOT HAVE PROPER INDEX DEFINITIONS, INDEX *index-name* IS MISSING OR INCORRECTLY DEFINED**

Explanation: The communications database (CDB) requires an index name for *table-name*. The current definition is missing or incorrect.

System Action: The distributed data facility (DDF) terminates.

Operator Response: Notify the system programmer.

System Programmer Response: Define the index as required and issue the -START DDF command. Refer to Part 3 of *DB2 Installation Guide*.

Problem Determination: Print the definition of the communications database (CDB).

DSNL704I **CDB OBJECT *object-name* DOES NOT HAVE PROPER REFERENTIAL CONSTRAINT DEFINITIONS**

Explanation: The communications database (CDB) requires referential constraint definitions for '*object-name*'. The current definition is missing or incorrect.

System Action: Termination of the distributed data facility (DDF) is initiated.

Operator Response: Notify the system programmer.

System Programmer Response: Determine what caused the failure, define the missing referential constraint, and issue the -START DDF command. Refer to Part 3 of *DB2 Installation Guide* .

Problem Determination: Print the definition of the communications database (CDB).

DSNL705I CDB IS UNAVAILABLE OR INCORRECTLY DEFINED

Explanation: During start-up of the distributed data facility, the required CDB was unavailable or incorrectly defined.

System Action: Termination of the DDF is initiated.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to the previous message that specifies the cause of the CDB failure (DSNL700I, DSNL701, DSNL702I, DSNL703I, or DSNL704I). Determine what caused the failure, fix the error condition, and issue the -START DDF command.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1.

DSNL706I *csect-name* AN ERROR HAS OCCURRED IN DDF EXIT ROUTINE *routine*

Explanation: An error occurred following invocation of a DDF exit routine by DB2.

The variable "routine" is the name of the exit routine, DSNLHLLx, invoked by DB2.

System Action: The system abends the failing database-access agent.

Chapter 13. DSNM... messages

All of the DSNM... messages are sent to the IMS master terminal operator (MTO), and to the appropriate MVS console.

DSNM001I IMS/TM xxxx CONNECTED TO SUBSYSTEM yyyy

Explanation: This is an information message only. The control region of the IMS/TM system specified in the message as 'xxxx' has successfully connected to the DB2 subsystem specified in the message as 'yyyy'. The message is sent to the IMS/TM master terminal operator.

System Action: IMS/TM transactions can access DB2 resources.

DSNM002I IMS/TM xxxx DISCONNECTED FROM SUBSYSTEM yyyy RC=rc

Explanation: The IMS/TM system named 'xxxx' control region has disconnected from the DB2 subsystem named 'yyyy' for the RC, reason code, of 'rc'. The message is sent to the IMS/TM master terminal operator. The reason code values are:

Value Description

- | | |
|----------|------------------------------------------------------------------------------------------------------------------|
| A | IMS/TM is terminating normally (for example, /CKPT FREEZE command). |
| B | IMS/TM is terminating abnormally. |
| C | DB2 is terminating in a quiesce fashion (for example, DB2 stop quiesce command). |
| D | DB2 is terminating abnormally. |
| E | The connection between IMS/TM and the DB2 subsystem is terminating; however, both subsystems remain operational. |

System Action: The connection between IMS/TM and DB2 terminated. IMS/TM transactions can no longer access DB2 resources.

Operator Response: Notify the system programmer.

System Programmer Response: Reason code A, C, or E makes this an information message. Reason code D indicates that a serious problem occurred in the DB2 subsystem, and that the SYS1.LOGREC should be examined. For reason code B or D, determine the failing subcomponent, and if you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: SYS1.LOGREC and/or dump information may be available for reason codes B and D.

DSNM003I IMS/TM xxxx FAILED TO CONNECT TO SUBSYSTEM yyyy RC=rc

Explanation: The IMS/TM system (named 'xxxx') control region did not connect to the DB2 subsystem (named 'yyyy'). This message is sent to the IMS/TM master terminal operator. The return code 'rc' indicates the reason for the failure.

Value Description

- | | |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 00 | The DB2 subsystem is not operational. However, a notify message has been queued and, when the DB2 subsystem is started, it will automatically connect to IMS/TM. |
| 04 | The connection attempt failed between IMS/TM and the DB2 subsystem. |

System Action: IMS/TM transactions cannot access DB2 resources.

Operator Response: For return code 00, start the DB2 subsystem. For return code 04, notify the system programmer.

System Programmer Response: For return code 04, refer to Part 4 (Volume 1) of *DB2 Administration Guide* for failure analysis procedures.

Problem Determination: For return code 04, an IMS/TM attachment facility snap record (code X'5501FF') is written to the IMS/TM log to indicate the reason for the failure.

DSNM004I RESOLVE INDOUBT ENTRY(S) ARE OUTSTANDING FOR SUBSYSTEM xxxx

Explanation: The DB2 subsystem ID of 'xxxx' has 'indoubt' entry(s) remaining after the IMS/TM subsystem has attempted to resolve the work units that are indoubt. This message is sent to the IMS/TM master terminal operator.

System Action: The connection between the DB2 and IMS/TM subsystems remains active, and applications can access DB2 resources.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for failure analysis procedures. DB2 commands (DISPLAY THREAD and RECOVER INDOUBT) may be used to display and resolve the work unit(s) that are indoubt.

Problem Determination: Recovery information is available on the DB2 log and IMS/TM log to assist in the resolution of the work unit(s) indoubt. For each

DSNM005I • DSNM104I

indoubt work unit, an IMS/TM attachment facility snap record (code X'5501FE') is written to the IMS/TM log.

DSNM005I IMS/TM RESOLVE INDOUBT PROTOCOL PROBLEM WITH SUBSYSTEM xxxx

Explanation: The DB2 subsystem ID of 'xxxx' has protocol incompatibilities with IMS/TM. The DB2 resolve indoubt process received an unknown or invalid recovery request (RRE) from IMS/TM. The request was rejected by DB2 and kept by IMS/TM. The message is sent to the IMS/TM master terminal operator.

System Action: The connection between the DB2 and IMS/TM subsystems remains active, and applications can access DB2 resources.

Operator Response: Notify the system programmer.

System Programmer Response: Call the support center after extracting from the IMS/TM log the IMS/TM attachment facility snap records (code X'5501FE') using the IMS/TM utility DFSERA10.

These records contain the complete request from IMS/TM to DB2, the request type is at offset X'01C', this is a four-character identifier which should contain any of the following words:

'SHOW', 'IDBT', 'COMM', or 'ABRT'.

If the IMS/TM recovery request (RRE) found in the log is an invalid one, (not 'COMM' or 'ABRT'), you may manually delete it using the IMS/TM/CHANGE SUBSYS RESET command after consulting with the support center.

If the IMS/TM request is a valid one (abort or commit), you must find the action that IMS/TM performed for that RRE by locating the X'3730' (commit) or X'3801' (abort) record in the IMS/TM log and perform the same action under DB2 by using the -RECOVER INDOUBT command. Also refer to Part 4 (Volume 1) of *DB2 Administration Guide* for more information about resolve-indoubt failure analysis.

Problem Determination: Recovery information is available on the DB2 log and IMS log to assist in the resolution of the problem. For each indoubt work unit, an IMS/TM attachment facility snap record (code X'5501FE') is written to the IMS/TM log.

DSNM100I SUBSYSTEM xxxx NOT AVAILABLE

Explanation: The IMS/TM command facility which routes commands to the DB2 subsystem cannot perform its functions because the DB2 subsystem named 'xxxx' is considered not operational.

System Action: The connection to the DB2 subsystem failed for the command. The command is rejected.

System Programmer Response: If the DB2

subsystem is operational, and if you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem. The person entering the request may not be authorized to execute the command. If the DB2 subsystem is not operational, DB2 commands from IMS/TM cannot be processed.

Problem Determination: A snap record (X'5501FF') is written to the IMS/TM log if a connection request failed.

DSNM104I xxxx COMMAND FAILED

Explanation: The DB2 command specified by 'xxxx' failed to complete.

System Action: The command terminated without providing an output message. Commands will still be allowed by the IMS/TM attachment facility.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: If the command failed because of an abend, a snap record (X'5501FF') is written to the IMS/TM log and SYS1.LOGREC information is available.

Chapter 14. DSNN... message

**DSNN40 THE NUMBER YOU SELECTED IS NOT
A VALID SQL RETURN CODE NUMBER**

Explanation: The user looking at the SQL Return Codes Menu in DB2 HELP selected a number that is not a valid SQL return code.

System Action: The SQL Return Codes Menu continues to be displayed.

User Response: Select a valid SQL return code number, and try again.

Operator Response: Select a valid SQL return code number, and try again.

Chapter 15. DSNP... messages

The DSNP-prefixed messages contain a connection ID, a correlation ID, and a logical-unit-of-work ID. Messages that have the same connection ID, correlation ID, and logical-unit-of-work ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

DSNP0011 *csect – data-set-name IS WITHIN nk*
BYTES OF AVAILABLE SPACE.
RC=rrrrrrr CONNECTION-ID=xxxxxxx,
CORRELATION-ID=yyyyyyyyyyy,
LUW-ID=logical-unit-of-work-id=token

Explanation: This message warns of an impending space shortage. The data space manager (DSM) extend function CSECT 'DSNPmmmm' detected the space shortage through the use of a 'hedge' quantity 'n'. Reason code 'rrrrrrr' gives some information about why space could not be obtained. (See Part 4, "Section 4. DB2 Codes," on page 773.)

There might also be some preceding DSM and VSAM messages that can help to determine why space cannot be obtained. The connection, correlation, and logical-unit-of-work IDs identify the user or application that encountered the problem. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

A LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

System Action: If sufficient space is available for the current request, continue. Otherwise, message DSNP007I follows, and the current SQL request fails.

Operator Response: DSM messages are directed to the database administrator (DBA) or system administrator. However, the DBA or system administrator can request that the operator issue an MVS WRITELOG operator command (for example, 'W A') to obtain MVS SYSLOG output. The SYSLOG sometimes contains media manager messages that might be helpful to the DBA or system administrator in determining why space could not be allocated.

System Programmer Response: Based on the reason code (RC) in the message, as well as information that might be available in access method services or VSAM messages preceding this one, try one of the following:

- If you do not anticipate further extension of this table space or index, ignore the message.

- If the table space or index is backed by storage group-defined data sets and this data set is not at maximum (123) extents, use the ALTER STOGROUP statement to add volumes to the storage group (up to 133 of them).
- If the table space or index is backed by 'user-defined' data sets, and not at maximum (123) extents for the data set, issue an ALTER ADDVOLUMES access method services command to provide additional volumes (up to 133 of them). Or, if the table space is nonpartitioned and the high allocated RBA is greater than or equal to 2GB (2,147,483,648) for the indicated data set, define the data set required for the next sequential piece. (Actually, in this case, there should be an indication in console messages or the reason code that the data set required for the next piece was not found.)
- If the data set is at maximum (123) extents, try reorganizing the table space or index into a data set or data sets having larger primary and secondary values. This process is discussed in Part 2 (Volume 1) of *DB2 Administration Guide*.

Problem Determination: Examine the console messages, SYS1.LOGREC information, and SYSLOG to determine the reason for the condition. Try to resolve it by the methods described in the Operator Response section of this message. If you feel that this message indicates a problem in an IBM program, you should provide the following sources of information about the problem:

- Console sheet showing the message and related messages that might precede or follow it.
- System log printout (obtained via MVS WRITELOG operator command) showing related VSAM/media manager messages that might appear there (usually needed only if you have a message or reason code that indicates a media manager services problem occurred).
- Integrated catalog facility (ICF) catalog listing showing characteristics of the data set in question and of the ICF catalog itself.
- VTOC listing of packs associated with the request, showing space available for data sets, catalogs, VTOC index, and the VTOC itself, as well as data set extent information.
- Any associated dumps.
- SYS1.LOGREC listing showing entries at or near the time of the problem (unless these appear in an associated dump).

DSNP002I • DSNP004I

- Depending on the reason code, the results of certain SQL SELECT operations on DB2 catalog tables may be needed. (See Part 4, "Section 4. DB2 Codes," on page 773.)

DSNP002I *csect – DEFINE FAILED FOR data-set-name RC=rrrrrrrr CONNECTION-ID=xxxxxxxx, CORRELATION-ID=yyyyyyyyyy, LUW-ID=logical-unit-of-work-id =token*

Explanation: Data set definition failed (in CSECT 'DSNPmmmm') for the reason identified by RC. (See Part 4, "Section 4. DB2 Codes," on page 773.) The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem. The connection, correlation, and logical-unit-of-work IDs identify the user or application that encountered the problem. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

A LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

System Action: The data space manager (DSM) terminates its actions associated with the current SQL request. Higher level functions might terminate the current SQL request or the unit of recovery that issued the request.

Operator Response: This message is directed to either the database administrator or the system administrator. Bring the message to their attention if it appears on the MVS operator's console. The installation should consider directing DB2 messages to a console other than the operator's console.

System Programmer Response: Investigate the problem indicated by the reason code and preceding access method services messages, if any, and correct it, if possible. If an out-of-space condition exists, see the description of message DSNP001I for actions to consider.

Problem Determination: See Problem Determination of message DSNP001I for this information.

DSNP003I *csect – RESET FAILED FOR data-set-name. RC=rrrrrrrr CONNECTION-ID=xxxxxxxx, CORRELATION-ID=yyyyyyyyyyyyyy, LUW-ID=logical-unit-of-work-id=token*

Explanation: Reset, a data space manager (DSM) function invoked by DB2 utilities, failed in CSECT 'DSNPmmmm' for the reason identified by RC. (See Part 4, "Section 4. DB2 Codes," on page 773.) The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

A LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and tie together activities involving a given user.

System Action: DSM terminates its actions associated with the current SQL request. Higher level functions might terminate the current SQL request or the unit of recovery that issued the request.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person's attention if it appears on the MVS operator's console. The installation should consider directing DB2 messages to a console other than the operator's console.

System Programmer Response: Investigate the problem indicated by the reason code and preceding DB2, access method services, or VSAM messages, if any, and correct it, if possible.

It might be necessary to delete and redefine the data set using access method services. Consider making a backup copy before doing this. (Use DB2 utilities to make the copy; in general, VSAM utilities do not work on DB2 database services data sets.)

Problem Determination: See Problem Determination for message DSNP001I for this information.

DSNP004I *csect – DELETE FAILED FOR data-set-name. RC=rrrrrrrr CONNECTION-ID=xxxxxxxx, CORRELATION-ID=yyyyyyyyyyyyyy, LUW-ID=logical-unit-of-work-id=token*

Explanation: Deletion failed in CSECT 'DSNPmmmm' for the reason identified by RC. (See Part 4, "Section 4. DB2 Codes," on page 773.) The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the

problem. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

The value of the LUWID is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUWID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

Severity: 8 (error)

System Action: DB2 terminates its actions associated with the current SQL request. DB2 might terminate the current SQL request or the unit of recovery that issued the request.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person's attention if it appears on the MVS operator's console. The installation should consider directing DB2 messages to a console other than the operator's console.

System Programmer Response: Investigate the problem indicated by the reason code and preceding access method services messages if any, and correct it, if possible. Check the data set and delete it by using access method services directly if reasonable to do so. Consider making a backup copy before doing this. (Use DB2 utilities to make the copy; in general, VSAM utilities do not work on DB2 data sets.)

Problem Determination: See Problem Determination for message DSNP001I for this information.

DSNP005I *csect* – **COULD NOT REMOVE EXCESS VOLUMES FROM CANDIDATE LIST OF**
data-set-name **CONNECTION-**
ID=xxxxxxx, CORRELATION-
ID=yyyyyyyyyyy, LUW-ID=logical-unit-of-
work-id=token

Explanation: Volumes from a storage group were entered in the data set's candidate list and could not be removed by CSECT 'DSNPmmmm' after some data space manager (DSM) operation. The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

A LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it

possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

This is not a major problem. However, the data set will not properly reflect subsequent deletions from the volume list in its storage group (via ALTER STOGROUP command in SQL), because the data set's integrated catalog facility (ICF) catalog entry still contains the volume serial numbers.

If needed, the storage group in question can be identified by issuing an SQL SELECT to get information about the table space or index that is identified by the third and fourth qualifiers (database name, table space name) in the data set name.

System Action: Operation continues.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person's attention if it appears on the MVS operator's console. The installation should consider directing DB2 messages to a console other than the operator's console.

System Programmer Response: Look for associated DSM and access method services messages preceding this one to get additional information. Attempt an ALTER REMOVEVOLUMES access method services command, if appropriate, after issuing a LISTCAT to see which volumes are recorded as 'candidate' in the integrated catalog facility (ICF) catalog.

Problem Determination: See Problem Determination for message DSNP001I for this information. (However, there should not be a need for VTOC or SYSLOG information for this case.)

DSNP006I *csect* – **REQUIRED STOGROUP**
DEFINED DATA SET NOT AVAILABLE—
data-set-name **RC=rrrrrrrr**
CONNECTION-ID=xxxxxxx,
CORRELATION-ID=yyyyyyyyyyy,
LUW-ID=logical-unit-of-work-id=token

Explanation: An attempt to alter the shareoptions of this data set failed. The data set could not be accessed for the reason indicated by RC. (See Part 4, "Section 4. DB2 Codes," on page 773.) The connection ID, correlation ID, and logical-unit-of-work ID (LUWID) identify the user or application that encountered the problem. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

The value of the LUWID is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of the logical-unit-of-work-id in any DB2 command that accepts the logical-unit-of-work-id as input.

Messages having the same connection ID, correlation ID, and LUWID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

DSNP007I • DSNP008I

Severity: 8 (error)

System Action: DB2 terminates its actions associated with the current SQL request. DB2 might terminate the current SQL request or the unit of recovery that issued the request.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person's attention if it appears on the MVS operator's console. The installation should consider directing DB2 messages to a console other than the operator's console.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: See Problem Determination for message DSNP001I for this information.

DSNP007I *csect* – EXTEND FAILED FOR
data-set-name. RC=rrrrrrr
CONNECTION-ID=xxxxxxx,
CORRELATION-ID=yyyyyyyyyyy,
LUW-ID=*logical-unit-of-work-id* =token

Explanation: Extension failed in CSECT 'DSNPmmmm' of the data space manager (DSM). The 'data-set-name' identifies the data set that is being extended. RC is the reason code, which indicates why the extend process failed. (See Part 4, "Section 4. DB2 Codes," on page 773.) The 'connection ID', 'correlation ID', and 'logical-unit-of-work ID' (LUW-ID) identify the user or application that encountered the problem. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

A LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the 'LUW-ID' is not an '*', the value is a 'logical-unit-of-work-id' that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of 'logical-unit-of-work-id' in any DB2 command that accepts 'logical-unit-of-work-id' as input.

Messages that have the same 'connection ID', 'correlation ID', and 'LUW-ID' relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

System Action: The DSM terminates its actions associated with this extend request. Higher level functions might terminate if they cannot continue without a successful extend. In this case, additional console messages and/or SQL codes are produced. In other cases, higher level functions might be able to resolve the space need without the extend, so they continue normally.

System Programmer Response: The following sources of information are available to help determine the cause of the failure:

- See the Programmer Response for message DSNP001I.
- Analyze the RC value in conjunction with the console messages.
- The reason code might apply to the data set identified in the message or to another data set that is needed for the extend process. If the reason code indicates a data set access failure, the console messages indicate the data set name. For example, if the RC indicates 'resource unavailable', console messages identify the resource that is unavailable. Most likely, the message will be DSNT500I.
- Retrieve diagnostic information from the output of the DISPLAY DB...RESTRICT or DISPLAY UTIL(*)... commands.
- If the extend failed on a result table space, refer to "Sort Data Sets" in Part 5 (Volume 2) of *DB2 Administration Guide*.
- If the extend failed on an SQL insert or update, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.
- If you need to enlarge your data set, refer to "Out of DASD Space" in Part 4 (Volume 1) of *DB2 Administration Guide*.
- To find out how the extend function operates, refer to "Improving DASD Utilization" in Part 5 (Volume 2) of *DB2 Administration Guide*.

Operator Response: See Operator Response for message DSNP001I for this information.

System Programmer Response: See System Programmer Response for message DSNP001I for this information.

Problem Determination: See Problem Determination for message DSNP001I

DSNP008I *csect*– REQUIRED USER–DEFINED
DATA SET NOT AVAILABLE—*data-set-*
name RC=rrrrrrr CONNECTION-
ID=xxxxxxx, CORRELATION-
ID=yyyyyyyyyyy, LUW-ID=*logical-unit-of-*
work-id=token

Explanation: One of the following actions applied against user-defined data sets failed in CSECT 'DSNPmmmm' of the data space manager (DSM):

- Create table space or index
- Extend table space or index
- Process the SQL ALTER DATABASE statement
- Process the REORG TABLESPACE utility with SHRLEVEL REFERENCE or CHANGE

Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

One or more of the data sets could not be accessed for the reason indicated by RC. (See Part 4, "Section 4. DB2 Codes," on page 773.) The connection ID,

correlation ID, and logical-unit-of-work ID (LUWID) identify the user or application that encountered the problem.

The value of the LUWID is logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages having the same connection ID, correlation ID, and LUWID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

If the name of the data set in the message is different from the name of the original data set (for example, '...A002' instead of '...A001'), a new data set might need to be created. A different name indicates that the original data set exceeded its limit.

Severity: 8 (error)

System Action: DB2 terminates its actions associated with the current SQL request or utility. DB2 might terminate the current SQL request or utility or the unit of recovery that issued the request.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person's attention if it appears on the MVS operator's console. The installation should consider directing DB2 messages to a console other than the operator's console.

System Programmer Response: Refer to the reason code in Part 4, "Section 4. DB2 Codes," on page 773. The return code description might indicate that one of the following actions needs to be performed or it indicates the necessary steps:

- If the data set does not exist, create it before attempting the create table space/index or extend data set again.
- If the data set shareoptions are incorrect, modify the shareoptions with access method services (AMS).
- The appropriate AMS command is ALTER SHAREOPTIONS.

Problem Determination: See Problem Determination for message DSNP001I for this information.

DSNP009I THE FOLLOWING ERROR MESSAGES WERE RECEIVED FOR *operation* ON *data-set-name*

DSNP010I END OF ERROR MESSAGES.
CONNECTION-ID=xxxxxxx,
CORRELATION-ID=yyyyyyyyyyy,
LUW-ID=*logical-unit-of-work-id*=token

Explanation: Messages DSNP009I and DSNP010I enclose a block of messages that are received by the

data space manager (DSM) subcomponent of DB2 in response to an access method services (AMS) operation.

operation

The access method services operation that was being performed.

data-set-name

The data set on which the operation was being performed.

The prefix of the messages in the block is usually IDC (access method services messages). However, the prefix can also be IKJ (dynamic allocation) or other system subcomponent IDs. Refer to the appropriate MVS publication for descriptions of the enclosed messages.

The operation can be DEFINE CLUSTER, ALTER ADDVOLUMES, ALTER REMOVEVOLUMES, or DELETE CLUSTER. One or more other DSM messages follow this message to explain what happened as a result of the failure of this access method services request. The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem.

A LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

System Action: Operation continues.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person's attention if it appears on the MVS operator's console. The installation should consider directing DB2 messages to a console other than the operator's console.

System Programmer Response: Use this information to help resolve problems indicated by other DSM messages that follow this one.

Problem Determination: See Problem Determination for message DSNP001I for this information.

DSNP011I *csect* – **MEDIA MANAGER SERVICES ERROR FOR** *data-set-name*.
MMRC=cccccccc DSMRC=ffffff
CONNECTION-ID=xxxxxxx,
CORRELATION-ID=yyyyyyyyyyy,
LUW-ID=logical-unit-of-work-id =token

Explanation: The MMRC is the return code that DB2 received from media manager services. Refer to the appropriate MVS publication for a description of these codes. DSMRC is a DSM reason code that indicates which of the media manager services functions, update or extend, failed. (See Part 4, "Section 4. DB2 Codes," on page 773.) The message is from CSECT 'DSNPmmmm' of the data space manager (DSM). The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

A LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

System Action: The DSM terminates its actions associated with the current SQL request. Higher level functions might terminate the current SQL request or the unit of recovery that issued the request.

Operator Response: DSM messages are directed to either the database administrator (DBA) or the system administrator. However, they can request that the operator issue an MVS WRITELOG operator command (for example, 'W A') to obtain MVS SYSLOG output. The SYSLOG sometimes contains media manager messages that might be helpful to the DBA or system administrator in determining why space could not be allocated.

System Programmer Response: This message might be preceded by one or more IEC or ICY messages on the console or in SYSLOG. These messages help to determine what happened and what action to take.

Problem Determination: See Problem Determination for message DSNP001I for this information.

DSNP012I *csect* – **ERROR IN ICF CATALOG LOCATE FUNCTION FOR** *data-set-name*
CTLGRC=cc CTLGRSN=zzzzrrrr
CONNECTION-ID=xxxxxxx,
CORRELATION-ID=yyyyyyyyyyy,
LUW-ID=logical-unit-of-work-id=token

Explanation: CTLGRC and CTLGRSN are the return and reason codes that DB2 received from the SVC 26

(ICF catalog locate function). The reason code is in the same format as that returned to DB2 by the SVC 26. In it, zzzz is the hexadecimal value of the last two characters of the SVC 26 CSECT that set the code. The full CSECT name is derived by appending these two characters to 'IGG0CL'; rrrr is the numeric part of the reason code, in hexadecimal.

See the description of access method services message IDC3009I in the appropriate MVS publication for explanations of the return code and the numeric portion (rrrr) of the reason code. The values documented there are decimal, whereas the value in this message is hexadecimal.

The connection ID, correlation ID, and LUW-ID identify the user or application that encountered the problem. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

An LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a 'logical-unit-of-work-id' that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of 'logical-unit-of-work-id' in any DB2 command that accepts 'logical-unit-of-work-id' as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

System Action: DB2 terminates its actions associated with the current SQL request. Higher level functions might terminate the current SQL request or the unit of recovery that issued the request.

System Programmer Response: Correct the problem indicated by the catalog return and reason codes.

Problem Determination: See Problem Determination for message DSNP001I for this information.

DSNP013I **INSUFFICIENT PRIMARY ALLOCATION SPACE TO FORMAT CONTROL PAGES IN DATA SET** *data-set-name*
CONNECTION-ID=xxxxxxx,
CORRELATION-ID=yyyyyyyyyyy,
LUW-ID=logical-unit-of-work-id =token

Explanation: Data space manager (DSM) discovered that the primary space quantity given in the data set definition was not large enough. Formatting of required control information in the first several pages was not possible. The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem.

A LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

System Action: DSM terminates its actions associated with the current SQL request. Higher level functions might terminate the current SQL request or the unit of recovery that issued the request.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person's attention if it appears on the MVS operator's console. The installation should consider directing DB2 messages to a console other than the operator's console.

System Programmer Response: This should occur only for table spaces or indexes that are not storage group defined. (The DB2 interpreter forces the initial allocation to be large enough if a storage group is used.) Check both the page size specification (4KB or 32KB) and the number of control pages required (2 for table space, 3 for index space). Specify the primary allocation value again so that at least (pages x page size) bytes are allocated.

Problem Determination: See Problem Determination for message DSNP001I for this information.

DSNP014I IRLM MANUAL LOCK REQUEST FAILED FOR *data-set-name*.
RC=rr,SC=ssssssss,
CONNECTION-ID=xxxxxxxx,
CORRELATION-ID=yyyyyyyyyyyyyy,
LUW-ID=logical-unit-of-work-id=token

Explanation: DB2 requested a manual lock on a data set, but the lock could not be obtained for reasons specified in RC and SC. RC and SC are the return code and reason code from IRLM. RC and the first two digits of SC are documented in Part 5, "IRLM messages and codes," on page 1307. The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem.

A LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user. DSNP001I or DSNP007I follow this message. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

If message DSNT376I was received before message

DSNP014I, the lock request failed because of a timeout condition. Otherwise, refer to the IRLM return and reason codes for an explanation of the failure.

System Action: The current SQL or the unit of recovery that issued the request might be terminated.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person's attention if it appears on the MVS operator's console. The installation should consider directing DB2 messages to a console other than the operator's console.

System Programmer Response: Investigate the problem indicated by the IRLM return and reason code.

Problem Determination: Provide the console sheet and a dump. A GTF trace might also be required. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem. Refer to the explanation section of this message for additional problem determination information.

DSNP015I csect – IRLM MANUAL UNLOCK REQUEST FAILED FOR *data-set-name*.
RC=rr,SC=ssssssss,
CONNECTION-ID=xxxxxxxx,
CORRELATION-ID=yyyyyyyyyyyyyy,
LUW-ID=logical-unit-of-work-id=token

Explanation: DB2 requested a manual unlock on a data set, but the unlock could not be performed for reasons specified in RC and SC. RC and SC are the return code and reason code from IRLM. RC and the first two digits of SC are documented in Part 5, "IRLM messages and codes," on page 1307. The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem.

A LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

System Action: The current SQL or the unit of recovery that issued the request might be terminated.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person's attention if it appears on the MVS operator's console. The installation should consider directing DB2 messages to a console other than the operator's console.

System Programmer Response: Investigate the problem indicated by the IRLM return and reason code.

Problem Determination: Provide the console sheet and a dump. A GTF trace might also be required. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem. See the explanation section of this message for additional problem determination information.

DSNP016I CREATE FAILED FOR *pageset-name*.
RC=rrrrrrr CONNECTION-ID=xxxxxxx,
CORRELATION-ID=yyyyyyyyyyy,
LUW-ID=logical-unit-of-work-id =token

Explanation: Creation of a table space or index space failed in the data space manager (DSM) for the reason given in RC. (See Part 4, "Section 4. DB2 Codes," on page 773.) The *pageset-name* format is 'dbname.tiname.instance', where 'dbname' is the database name and 'tiname' is the table space or index space name.

This message identifies the function that was in progress at the time of a failure. The specific failure is usually identified by a preceding message. The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem.

A LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

System Action: DSM terminates its actions associated with the current SQL request. Higher level functions might terminate the current SQL request or the unit of recovery that issued the request.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person's attention if it appears on the MVS operator's console. The installation should consider directing DB2 messages to a console other than the operator's console.

System Programmer Response: Investigate the problem indicated by reason code and preceding messages, and correct it, if possible.

Problem Determination: See Problem Determination for message DSNP001I for this information.

DSNP017I RESET FAILED FOR *pageset-name*.
RC=rrrrrrr CONNECTION-ID=xxxxxxx,
CORRELATION-ID=yyyyyyyyyyy,
LUW-ID=logical-unit-of-work-id =token

Explanation: Reset failed in the data space manager (DSM) subcomponent of DB2 for a table space or index space for the reason given in RC. (See Part 4, "Section 4. DB2 Codes," on page 773.) The '*pageset-name*' format is 'dbname.tiname', where 'dbname' is the database name and 'tiname' is the table space or index space name.

This message identifies the function that was in progress at the time of a failure. The specific failure is usually identified by a preceding message. The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem.

A LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

System Action: DSM terminates its actions associated with the current SQL request. Higher level functions might terminate the current SQL request or the unit of recovery that issued the request.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person's attention if it appears on the MVS operator's console. The installation should consider directing DB2 messages to a console other than the operator's console.

System Programmer Response: Investigate the problem indicated by the reason code and preceding messages, and correct it, if possible.

Problem Determination: See Problem Determination for message DSNP001I for this information.

DSNP018I DROP FAILED FOR *pageset-name*.
RC=rrrrrrr CONNECTION-ID=xxxxxxx,
CORRELATION-ID=yyyyyyyyyyy,
LUW-ID=logical-unit-of-work-id =token

Explanation: Drop failed in the data space manager (DSM) subcomponent of DB2 for a table space or index space for the reason given in RC. Refer to Part 4, "Section 4. DB2 Codes," on page 773. The '*pageset-name*' format is 'dbname.tiname', where 'dbname' is the database name and 'tiname' is the table

space or index space name. This message identifies the function that was in progress at the time of a failure. The specific failure is usually identified by a preceding message. The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem.

A LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

System Action: DSM terminates its actions associated with the current SQL request. Higher level functions might terminate the current SQL request or the unit of recovery that issued the request.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person's attention if it appears on the MVS operator's console. The installation should consider directing DB2 messages to a console other than the operator's console.

System Programmer Response: Investigate the problem indicated by the reason code and preceding messages, and correct it, if possible.

Problem Determination: See Problem Determination for message DSNP001I for this information.

DSNP019I *csect* – **REALLOCATE FAILED FOR**
data-set-name. RC=rrrrrrrr
CONNECTION-ID=xxxxxxx,
CORRELATION-ID=yyyyyyyyyy,
LUW-ID=logical-unit-of-work-id =token

Explanation: After a successful ALTER REMOVEVOLUMES request, the data space manager (DSM) subcomponent of DB2 was unable to reallocate the data set for the reason indicated by RC. (See Part 4, "Section 4. DB2 Codes," on page 773.) The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem.

A LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages

and group activities involving a given user. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

System Action: Operation continues.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person's attention if it appears on the MVS operator's console.

System Programmer Response: The data set and corresponding page set piece or partition can usually continue to be used by the DB2 subsystem. However, they should be stopped and restarted at the earliest possible time in order to synchronize the allocation control blocks with the integrated catalog facility (ICF) catalog volume list.

Problem Determination: See Problem Determination for message DSNP001I for this information.

DSNP020I *csect-name* - **USER DEFINED**
ATTRIBUTES INCORRECT FOR
data-set-name. RC=rrrrrrrr
CONNECTION-ID=xxxxxxx,
CORRELATION-ID=yyyyyyyy,
LUW-ID=logical-unit-of-work-id =token

Explanation: The specified data set was access method services user-defined and does not have the required DB2 attributes. The connection ID, correlation ID, and LUW-ID identify the user or application that encountered the problem.

The value of the LUWID is a 'logical-unit-of-work-id' that is assigned to the thread, followed by an '=' sign and a token value, which can be used in place of 'logical-unit-of-work-id' in any DB2 command that accepts 'logical-unit-of-work-id' as input.

Messages having the same connection ID, correlation ID, and LUWID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

This message is issued by the following CSECTs:
 DSNPATS0 DSNPSC0 DSNPSC0 DSNPRNM0

Severity: 8 (error)

System Action: No action is taken with the named data set. An error code is returned and a dump is not taken.

Operator Response: Notify the system programmer.

System Programmer Response: Delete the named data set and define it with the correct attributes.

Problem Determination: Obtain an access method services LISTCAT for the named data set's attributes. Refer to Part 2 (Volume 1) of *DB2 Administration Guide* for the correct data set definition attributes.

DSNP021I *csect-name* **EXTEND NOTIFY FAILED FOR** *data-set-name*, **SC=ssssssss**, **NOTESC=nnnnnnnn**, **CONNECTION-ID=xxxxxxx**, **CORRELATION-ID=yyyyyyyyyyyy**, **LUW-ID=logical-unit-of-work-id=token**

Explanation: This is an internal error. The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem.

An LUW-ID of '*' indicates that the thread does not have an LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of the logical-unit-of-work-id in any DB2 command that accepts the logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

If message DSNT376I was received before message DSNP021I, the notify request failed because of a timeout condition.

System Action: The current SQL statement or the unit of recovery that issued the request might be terminated.

Problem Determination: Obtain the console sheet and a dump. A GTF trace might also be required.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNP022I *csect-name* **EXTEND DBET RECORDING FAILED FOR** *data-set-name*, **RC=rrrrrrr**, **SC=ssssssss**, **DBETSC=nnnnnnnn**, **CONNECTION-ID=xxxxxxx**, **CORRELATION-ID=yyyyyyyyyyyy**, **LUW-ID=logical-unit-of-work-id=token**

Explanation: This is an internal error. The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem.

An LUW-ID of '*' indicates that the thread does not have an LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of the logical-unit-of-work-id in any DB2 command that accepts the logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user. Correlation

IDs beginning with '0nn', where 'nn' is a number, identify system agents.

System Action: The current SQL statement or the unit of recovery that issued the request might be terminated.

Problem Determination: Obtain the console sheet and a dump. A GTF trace might also be required.

Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNP026I *csect-name* **DATASET IS NOT ALLOWED TO BE DELETED** *data-set-name*, **RC=rrrrrrr**, **CONNECTION-ID=xxxxxxx**, **CORRELATION-ID=yyyyyyyyyyyy**, **LUW-ID=logical-unit-of-work-id=token**

Explanation: During clean up of the shadow data set in the final step of online REORG, an error is detected due to an attempt to delete a regular table or index space data set. Refer to Part 2 of *DB2 SQL Reference* for information about online REORG. The connection ID, correlation ID, and logical unit of work ID (LUWID) identify the user or application that encountered the problem. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

The value of the LUWID is assigned to the thread followed by an '=' sign and a token value, that can be used in place of the LUWID in any DB2 command that accepts it as input.

Messages that have the same connection ID, correlation ID, and LUWID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

System Action: No action is taken with the named data set. An error code is returned and a dump is not taken.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the failing environment. Refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: This is an internal error in the online REORG of utility. See the 'Problem Determination' section of message DSNP001I for this information.

DSNP027I *csect-name* **RENAME FAILED OLD DATASET=***data-set-name*, **NEW DATASET=***data-set-name*, **RC=rrrrrrr**, **CONNECTION-ID=xxxxxxx**, **CORRELATION-ID=yyyyyyyyyyyy**, **LUW-ID=logical-unit-of-work-id=token**

Explanation: An attempt to alter the data set name failed. The connection ID, correlation ID, and logical unit of work ID (LUWID) identify the user or application that

encountered the problem. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

The value of the LUWID is assigned to the thread followed by an '=' sign and a token value, that can be used in place of the LUWID in any DB2 command that accepts it as input.

Messages that have the same connection ID, correlation ID, and LUWID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

Severity: 8 (error)

System Action: DB2 terminates its actions associated with the current SQL request. DB2 might terminate the current SQL request or the unit of recovery that issued the request.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person's attention if it appears on the MVS operator's console. The installation should consider directing DB2 messages to a console other than the operator's console.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: See 'Problem Determination' for message DSNP0011 for this information.

DSNP028I *csect-name* **HSM RECALL FAILED FOR DSNAME = *dsn***
HSMRC=rrrrrrr,HSMRSN=sssssss
CONNECTION ID=xxxxxxx,
CORRELATION ID=yyyyyyyyyyy,
LUW-ID=logical-unit-of-work-id =token

Explanation: This message indicates that a required data set was migrated by HSM and an attempt to recall the data set failed, preventing DB2 from accessing the data set. The HSMRC and HSMRSN fields can be used to determine the HSM failure. See Problem Determination below. The connection ID, correlation ID, and 'logical-unit-of-work ID' (LUW-ID) identify the user or application that encountered the problem.

A LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a 'logical-unit-of-work-id' that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of 'logical-unit-of-work-id' in any DB2 command that accepts 'logical-unit-of-work-id' as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

System Action: DSM terminates its action with the

associated data set. Higher level functions that issued the recall request might terminate.

Operator Response: Notify the system programmer.

System Programmer Response: Investigate the reason for the HSM recall failure. Use the information in this message to help resolve this problem. Additional messages on the MVS operator's console might be associated with this message.

Problem Determination: If the HSMRSN is 999, refer to the following list for the explanation:

HSMRC Description

- 4** HSM is not active.
- 8** No storage is available for MWE in CSA.
- 36** Input MWE is not within user storage.
- 40** Allocated amount of CSA for MWEs was exceeded.
- 100** There was an invalid function used.

For all other reason codes (HSMRSN), refer to the z/OS *DFSMSHsm Managing Your Own Data* for an explanation of HSM user messages. The HSM user messages can be determined by appending the value in the HSMRC field of this message to ARC1100I (that is, HSMRC=12, HSM message is ARC112I). The HSMRSN reason code is referenced in the ARC1100I messages.

DSNP030I *csect-name* **THE CURRENT EXTENT REACHES THE LAST VOLUME FOR *data-set-name*. CONNECTION-ID=xxxxxxx, CORRELATION-ID=yyyyyyyyyyy, LUW-ID=logical-unit-of-work-id=token**

Explanation: This message indicates that the last volume to which the data set *data-set-name* can extend has been reached. You cannot add more volumes if the current volume runs out of space.

The connection, correlation, and logical-unit-of-work IDs identify the user or application that encountered the problem. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

A LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a 'logical-unit-of-work-id' that is assigned to the thread followed by an '=' sign and a *token* value, which can be used in place of *logical-unit-of-work-id* in any DB2 command that accepts *logical-unit-of-work-id* as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

Severity: 0 (informational)

System Action: If sufficient space in current volume is available for the current request, DB2 continues.

DSNP031I

Otherwise, message DSNP007I is issued, and the current SQL request fails.

Operator Response: For more information, issue an MVS WRITELOG operator command (for example, 'W A') to obtain MVS SYSLOG output. The SYSLOG sometimes contains VSAM or media manager messages that might be helpful in determining why space could not be allocated.

System Programmer Response: Depending on what information is available in the access method services or VSAM messages preceding this one, try one of the following:

- If you do not anticipate further extension of this table space or index, ignore the message.
- If the table space or index is backed by SMS-managed data sets, use LISTCAT to choose another SMS storage group that has more space available and recover or reorganize the table space or index into the new SMS storage group.
- If the table space or index is DB2-managed but is not SMS-managed, rearrange the DB2 storage group volume list by shifting volumes with free space or by adding new volumes. Use the SQL statements ALTER STOGROUP ADD VOLUMES and ALTER STOGROUP REMOVE VOLUMES and then recover or reorganize the table space or index.
- If the table space or index is user-managed and not SMS-managed, delete and redefine the data set with more space and then recover or reorganize the table space or index.

Problem Determination: Obtain an access method services LISTCAT for the named data set's VOLUME list for current extent space distribution of volumes.

See the Problem Determination section of message DSNP001I for more information.

DSNP031I *csect-name* **CURRENT SPACE HAS** *cc*
EXTENTS FOR *data-set-name*. **THE**
MAXIMUM EXTENTS WITH DFSMS *vv,rr*
IS *mm*. **CONNECTION-ID=xxxxxxx,**
CORRELATION-ID=yyyyyyyyyyy,
LUW-ID=logical-unit-of-work-id=token

Explanation: This message indicates that data set *data-set-name* has almost reached the maximum number of extents. The maximum number is indicated by *mm*. You cannot add more volumes if the current volume runs out of space.

The current version and release of DFSMS are indicated by *vv* and *rr*.

The connection, correlation, and logical-unit-of-work IDs identify the user or application that encountered the problem. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

A LUW-ID of '*' indicates that the thread does not have

a LUW-ID. If the LUW-ID is not an '*', the value is a *logical-unit-of-work-id* that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

Severity: 0 (informational)

System Action: DB2 continues. If the table space or index space is not able to extend when needed, Message DSNP007I is issued and the current SQL request fails.

Operator Response: For more information, issue an MVS WRITELOG operator command (for example, 'W A') to obtain MVS SYSLOG output. The SYSLOG sometimes contains VSAM or media manager messages that might be helpful in determining why space could not be allocated.

System Programmer Response: Based on the information that might be available in the access method services or VSAM messages preceding this one, try one of the following actions:

- If you do not anticipate further extension of this table space or index, ignore the message.
- If the table space or index is DB2-managed and has not yet reached the maximum number of extents, obtain an access method services LISTCAT for the named data set's to see how the extensions are distributed. Your options then include:
 - If there are multiple small extents, you can use the SQL statement ALTER TABLESPACE SECQTY to alter to a larger secondary space allocation quantity.
 - Otherwise, use the ALTER STOGROUP statement to add volumes to the storage group (up to 133 of them).
- If the table space or index is user-managed and has not yet reached the maximum number of extents, issue the access method services command ALTER ADDVOLUMES to provide additional volumes (up to 59 of them).
- If the data set is at the maximum number of extents, recover or reorganize the table space or index into a data set or data sets having larger primary and secondary values. This process is discussed in Part 2 (Volume 1) of *DB2 Administration Guide*.

Problem Determination: Obtain an access method services LISTCAT for the named data set's VOLUME list for the extent space distribution.

See the Problem Determination section of message DSNP001I for more information.

Chapter 16. DSNQ... messages

DSNQ001I MQListener was invoked with no major function on the command line.

Explanation: The MQListener command line failed to specify a major function, such as help, run, add, remove, or show.

Severity: 8 (Error)

User Response: Consult MQListener documentation and re-run MQListener with the function that was intended. For more information, run:

- db2mqIn1/db2mqIn2 help

DSNQ002I MQListener was invoked with an unknown command line parameter *parameter name*.

Explanation: The MQListener command line contained an unknown parameter *parameter name*.

Severity: 8 (Error)

User Response: Consult MQListener documentation and re-run MQListener with the desired parameters. For more information, run

- db2mqIn1/db2mqIn2 help

DSNQ003I MQListener was invoked without the required command line parameter *parameter name*.

Explanation: The MQListener command line was missing the parameter *parameter name*, which was required.

Severity: 8 (Error)

User Response: Consult MQListener documentation and re-run MQListener with the parameter that was required. For more information, run

- db2mqIn1/db2mqIn2 help

DSNQ004I MQListener was invoked with an illegal value for the *parameter name* command line parameter: *parameter value*.

Explanation: The MQListener command line contained an illegal value for the *parameter name* parameter. The illegal value was *parameter value*.

Severity: 8 (Error)

User Response: Consult MQListener documentation and re-run MQListener with the desired parameters. For more information, run

- db2mqIn1/db2mqIn2 help

DSNQ010I MQListener encountered a database error accessing subsystem *subsystem name* during operation *operation name*: sqlstate = *sqlstate value* (sqlcode = *sqlcode value*).

Explanation: MQListener encountered a DB2 database error accessing subsystem *subsystem name* while executing operation *operation name*. The resulting sqlstate was *sqlstate value* (sqlcode *sqlcode value*).

Severity: 8 (Error)

User Response: Consult MQListener documentation and ensure that MQListener is properly installed in the specified DB2 subsystem and access to MQListener packages and configuration tables has been granted to the user running MQListener.

DSNQ011I MQListener failed to make RRS connection to the subsystem *subsystem name* during operation *operation name*: reason code = *reason code value* (return code = *return code value*).

Explanation: MQListener encountered a DB2 database error while attempting to connect to subsystem *subsystem name* during operation *operation name*. The resulting reason code was *reason code value* (return code *return code value*).

Severity: 8 (Error)

User Response: Ensure that the DB2 subsystem *subsystem name* is active and running.

DSNQ012I MQListener failed to terminate RRS connection from the subsystem *subsystem name* during operation *operation name*: reason code = *reason code value* (return code = *return code value*).

Explanation: MQListener encountered a DB2 database error while attempting to disconnect from subsystem *subsystem name* during operation *operation name*. The resulting reason code was *reason code value* (return code *return code value*).

Severity: 4 (Warning)

User Response: Ensure that the DB2 subsystem *subsystem name* is active and running. Consult the DB2 documentation, regarding the exact meaning of the reason and return code.

DSNQ020I MQListener encountered a MQ error error executing operation *operation name* on object *object name* in queue manager *queue manager name*: reason code = *reason code value*.

Explanation: MQListener encountered a MQ error error while executing operation *operation name* on object *object name* in queue manager *queue manager name*. The resulting reason code was *reason code value*.

Severity: 8 (Error)

User Response: Ensure that MQSeries is properly installed and configured, and accessible to the user running MQListener. Consult the MQSeries documentation for more information, particularly the Application Programming Reference for more information about the reason code.

DSNQ021I MQListener failed to connect to MQ queue manager *queue manager name*: reason code = *reason code value*.

Explanation: MQListener encountered a MQ error error while attempting to connect to MQ queue manager *queue manager name*. The resulting reason code was *reason code value*.

Severity: 8 (Error)

User Response: Ensure that MQSeries is properly installed and configured, and accessible to the user running MQListener. Consult the MQSeries documentation for more information, particularly the Application Programming Reference for more information about the reason code.

DSNQ022I MQListener failed to disconnect from MQ queue manager *queue manager name*: reason code = *reason code value*.

Explanation: MQListener encountered a MQ error error while attempting to disconnect from MQ queue manager *queue manager name*. The resulting reason code was *reason code value*.

Severity: 4 (Warning)

User Response: Ensure that MQSeries is properly installed and running. Consult the MQSeries documentation for more information, particularly the Application Programming Reference for more information about the reason code.

DSNQ030I MQListener encountered a DB2 database error attempting to add a new task to the MQListener configuration *configuration name* in the subsystem *subsystem name*. The input queue specified in the task was *input queue name* and the specified queue manager was *queue manager name*. The resulting sqlstate was *sqlstate value* (*sqlcode* = *sqlcode value*).

Explanation: MQListener encountered a DB2 database error while attempting to add a new task to the MQListener configuration *configuration name* in the subsystem *subsystem name*. The input queue specified in the task was *input queue name* and the specified queue manager was *queue manager name*. The resulting sqlstate was *sqlstate value* (*sqlcode* = *sqlcode value*).

Severity: 8 (Error)

User Response: Consult MQListener documentation and ensure that MQListener is properly installed in the specified subsystem and access to MQListener packages and configuration tables has been granted to the user running MQListener. Ensure that the combination of configuration name, input queue, and queue manager is unique among the MQListener configuration tasks in the subsystem. Use MQListener "show" command to inspect the configuration.

DSNQ040I MQListener encountered a DB2 database error retrieving configuration *configuration name* from subsystem *subsystem name* during operation *operation name*. The resulting sqlstate was *sqlstate value* (*sqlcode* = *sqlcode value*).

Explanation: MQListener encountered a DB2 database error while retrieving configuration *configuration name* from subsystem *subsystem name* during operation *operation name*. The resulting sqlstate was *sqlstate value* (*sqlcode*= *sqlcode value*).

Severity: 8 (Error)

User Response: Consult MQListener documentation and ensure that MQListener is properly installed in the specified subsystem and access to MQListener packages and configuration tables has been granted to the user running MQListener.

DSNQ060I MQListener encountered a DB2 database error while removing a task from configuration *configuration name* in subsystem *subsystem name*. The input queue specified was *input queue name* and the queue manager specified was *queue manager name*. The resulting sqlstate was *sqlstate value* (*sqlcode = sqlcode value*).

Explanation: MQListener encountered a DB2 database error while removing a task from configuration *configuration name* in subsystem *subsystem name*. The input queue that was specified was *input queue name*, and the queue manager that was specified was *queue manager name*. The resulting sqlstate was *sqlstate value* (*sqlcode = sqlcode value*).

Severity: 8 (Error)

User Response: Consult MQListener documentation and ensure that MQListener is properly installed in the specified subsystem. Also, ensure that access to MQListener packages and configuration tables has been granted to the user who is running MQListener.

DSNQ070I MQListener has encountered a DB2 database error preparing to run the stored procedure *schema name.procedure name* in subsystem *subsystem name*: *sqlstate = sqlstate value* (*sqlcode = sqlcode value*).

Explanation: MQListener has encountered a DB2 database error while preparing to run the stored procedure *schema name.procedure name* in subsystem *subsystem name*. The resulting sqlstate was *sqlstate value* (*sqlcode = sqlcode value*).

Severity: 8 (Error)

User Response: Ensure that MQListener configuration is correctly specified and that a stored procedure of the specified schema and name exists with a correct signature and is accessible to the user running MQListener.

DSNQ071I MQListener encountered an unsupported datatype in the signature of the stored procedure *schema name.procedure name* in the subsystem *subsystem name*: *datatype = datatype value*.

Explanation: MQListener encountered an unsupported datatype in the signature of the stored procedure *schema name.procedure name* in the subsystem *subsystem name*. The datatype was *datatype value*.

Severity: 8 (Error)

User Response: Consult the MQListener documentation and ensure that the stored procedure has the correct datatype.

DSNQ072I MQListener was unable to start a thread running a task specified in the configuration *configuration name* by the input queue *input queue name* and queue manager *queue manager name*. The ECF error code was *error code value*.

Explanation: MQListener was unable to start a thread running a task that was specified in the configuration *configuration name* by the input queue *input queue name* and queue manager *queue manager name*. The ECF error code was *error code value*.

Severity: 8 (Error)

User Response: Ensure that MQListener configuration is correct, especially the `-numInstances` parameter, and that the MQListener process has sufficient system resources to execute the required number of simultaneous tasks.

DSNQ073I MQListener started a thread running the task specified in the configuration *configuration name* by the input queue *input queue name* and queue manager *queue manager name*.

Explanation: MQListener started a thread running the task that was specified in the configuration *configuration name* by the input queue *input queue name* and queue manager *queue manager name*.

Severity: 0 (Informational)

User Response: None. This is the formal notification of a thread start, expected during startup or restart.

DSNQ074I A thread running the task specified in the configuration *configuration name* by the input queue *input queue name* and queue manager *queue manager name* has exited.

Explanation: A thread running the task specified in the configuration *configuration name* by the input queue *input queue name* and queue manager *queue manager name* has exited.

Severity: 0 (Informational)

User Response: None. This is the formal notification of a thread exit, expected during shutdown or restart.

DSNQ075I MQListener encountered a DB2 database error while running the stored procedure *schema name.procedure name* in subsystem *subsystem name* during operation *operation name*. The resulting sqlstate was *sqlstate value* (*sqlcode = sqlcode value*).

Explanation: MQListener encountered a DB2 database error while running the stored procedure *schema name.procedure name* in subsystem *subsystem name* during operation *operation name*. The resulting sqlstate was *sqlstate value* (*sqlcode = sqlcode value*).

Severity: 8 (Error)

User Response: Consult MQListener documentation and ensure that MQListener is properly installed in the specified subsystem and access to MQListener packages and configuration tables has been granted to the user running MQListener. Ensure that the stored procedure executes correctly.

DSNQ081I MQListener received a shutdown message on admin queue *admin queue name*, queue manager *queue manager name*.

Explanation: MQListener received a shutdown message on admin queue *admin queue name*, queue

manager *queue manager name*.

Severity: 0 (Informational)

User Response: None. This is a formal notification on receiving a shutdown message.

DSNQ082I MQListener received a restart message on admin queue *admin queue name*, queue manager *queue manager name*.

Explanation: MQListener received a restart message on admin queue *admin queue name*, queue manager *queue manager name*.

Severity: 0 (Informational)

User Response: None. This is a formal notification on receiving a restart message.

Chapter 17. DSNR... Messages

The following information messages indicate the progress of DB2 through a restart process.

DSNR001I RESTART INITIATED

Explanation: This message delimits the beginning of the restart process within startup. The phases of restart are about to begin. These phases are necessary to restore the operational environment to that which existed at the time of the previous termination and to perform any recovery actions that may be necessary to return DB2-managed resources to a consistent state.

DSNR002I RESTART COMPLETED

Explanation: This message delimits the completion of the restart process within startup.

DSNR003I RESTART...PRIOR CHECKPOINT RBA=xxxxxxxxxxxx

Explanation: The message indicates the first phase of the restart process is in progress and identifies (as 'xxxxxxxxxxxx') the log positioning RBA of the checkpoint from which the restart process will obtain its initial recovery information.

DSNR004I RESTART...UR STATUS COUNTS IN COMMIT=nnnn, INDOUBT=nnnn, INFLIGHT=nnnn, IN ABORT=nnnn, POSTPONED ABORT=nnnn

Explanation: This message indicates the completion of the first phase of the restart process. The counts indicate the number of units of work whose execution state during a previous DB2 termination was such that (to ensure DB2 resource consistency) some recovery action must be performed during this restart process or (by the user) upon completion of the restart process. The counts of IN COMMIT, INDOUBT, INFLIGHT and IN ABORT may provide an indication of the time required to perform the remaining two phases of restart (forward and backward recovery). The counts of POSTPONED ABORT URs may provide an indication of the time required to perform -RECOVER POSTPONED processing.

The IN COMMIT count specifies the number that had started but not completed phase 2 of the commit process. These must undergo forward recovery to complete the commit process.

The INDOUBT count specifies the number that were interrupted between phase 1 and phase 2 of the commit process. These must undergo forward recovery to ensure resources modified by them are unavailable until their indoubt status is resolved.

The INFLIGHT count specifies the number that neither completed phase 1 of the commit process nor began the process of backing out. These must undergo backward recovery to restore resources modified by them to their previous consistent state.

The IN ABORT count specifies the number that were in the process of backing out. These must undergo backward recovery to restore resources modified by them to their previous consistent state.

The POSTPONED ABORT count specifies the number whose backout was postponed in an earlier restart process and not attended to prior to this restart process. These must undergo backward recovery after completion of restart, via the -RECOVER POSTPONED command, to restore resources modified by them to their previous consistent state.

This message is issued by the following CSECT:
DSNRRCSR

DSNR005I RESTART...COUNTS AFTER FORWARD RECOVERY IN COMMIT=nnnn, INDOUBT=nnnn

Explanation: The message indicates the completion of the forward recovery restart phase. The counts indicate the number of units of work whose recovery actions could not be completed during the phase. Typically, those in an IN COMMIT state remain because the recovery actions of some subcomponents have not been completed. Those units of work in an INDOUBT state will remain until connection is made with the subsystem that acts as their commit coordinator.

Operator Response: No action is required unless the conditions persist beyond some installation-defined period of time. Recovery action will be initiated when the resource is brought online. Indoubt resolution will be initiated as part of the process of reconnecting the subsystems.

DSNR006I RESTART...COUNTS AFTER BACKWARD RECOVERY INFLIGHT=nnnn, IN ABORT=nnnn, POSTPONED ABORT=nnnn

Explanation: The message indicates the completion of the backward recovery restart phase. The counts indicate the number of units of work whose recovery actions could not be completed during the phase.

When INFLIGHT or IN ABORT URs do not complete backout during restart, they are converted to POSTPONED ABORT status, so the INFLIGHT and IN

DSNR007I • DSNR009I

ABORT counts should be zero. The POSTPONED ABORT count indicates the number of URs for which backout work still exists (from this or a previous restart).

Backout work for the POSTPONED ABORT URs should be completed by the user (via the -RECOVER POSTPONED command), once DB2 restart has completed.

This message is issued by the following CSECT:
DSNRRAUB

Operator Response: No action is required unless the condition persists beyond some installation-defined period of time. Recovery action will be initiated when the resource collection is brought online.

DSNR007I RESTART...STATUS TABLE

Explanation: This message precedes a table showing the status of units of recovery (URs) after each restart phase. The message and the table will accompany the DSNR004I, DSNR005I, or DSNR006I message after each nested phase. At the end of the current status rebuild phase, it shows the status of any URs that require processing. At the end of the forward recovery and backoutphases, it shows the status of only those URs which needed processing but were not processed. The table helps to identify the URs that were active when DB2 came down, and to determine the log scope required to bring DB2 up.

The format of the table is shown below:

```
T CONID CORRID AUTHORIZATION ID PLAN S URID DAY TIME
```

where the columns contain the following information:

T Connection type. The values may be:

- B** Batch: a batch program or QMF user.
- I** Internal: a system service being performed on some user's behalf.
- S** Subsystem: work that originated from an attached subsystem, either CICS or IMS/VS.

CONID Connection identifier for related URs. Batch connections are not related to any other connection. Subsystem connections with the same identifier indicate URs that originated from the same subsystem.

CORRID Correlation identifier; unique within a subsystem connection, it relates a UR to a particular CICS or IMS/VS transaction.

AUTHORIZATION ID Authorization identifier of the user for whom this UR was created.

PLAN Name of the plan allocated to the UR.

S Restart status of the UR. When DB2 came down, the UR was in one of these situations:

A INABORT: The UR was in the 'must-complete' phase of abort, and is yet to be completed.

C INCOMMIT: The UR was in the 'must-complete' phase of commit, and is yet to be completed.

D INDOUBT: The UR had completed the first phase of commit, but DB2 had not received the second phase instruction. The UR must be remembered so it can be resolved when the owning subsystem reattaches.

F INFLIGHT: The UR had not completed the first phase of commit, and will be backed out.

P POSTPONED ABORT: The UR has not yet completed backout. Backout must be completed outside of DB2 restart by means of the -RECOVER POSTPONED command.

URID UR identifier, the log RBA of the beginning of this unit of work. It is the earliest RBA required to process the UR during Restart.

DAY The day the UR was created, in the format 'ddd'. It is approximately the time of the first SQL statement of the application or the first SQL statement following a commit point.

TIME The time the UR was created, in the format 'hh mm ss '. It is approximately the time of the first SQL statement of the application or the first SQL statement following a commit point.

This message is issued by the following CSECT:
DSNRUDIS

DSNR009I STORAGE IS NOT AVAILABLE FOR THE UR DISPLAY TABLE, THE SIZE REQUESTED = xxxx, STORAGE MANAGER REASON CODE = yyyyyyyy

Explanation: There was not enough storage available during the creation of the recoverable UR (RURE) display table (DSNDRUDT).

System Action: The system continues to restart but the RESTART... STATUS TABLE is not displayed.

System Programmer Response: Increase the region size of the *ssnmMSTR* address space before restarting DB2 again.

Operator Response: Save the console output and inform the system programmer.

Problem Determination: The size requested is approximately 110 bytes for each unit of recovery (UR). See the message DSNR004I to determine the total number of URs to process. Then get the 00E2xxxx

reason code from the DSNR009I header. Use these two numbers to determine the reason for the shortage.

DSNR010I AN ERROR OCCURRED IN THE RURE STATUS TABLE SORT/TRANSLATE MODULE (DSNRUSOR), THE ERROR LOCATION CODE = xxxx

Explanation: There was an error in processing the RURE display table. One of these ERROR LOCATION CODES tells what function the module was attempting to perform:

- X'0001' Trace entry to the module
- X'0002' Sort the recoverable UR display table
- X'0003' Translate the recoverable UR table
- X'0004' Convert the store clock value for display
- X'0005' Trace exit from the module

System Action: The system continues to restart but the RESTART... STATUS TABLE is not displayed.

System Programmer Response: Use the error code in the message to fill in the problem description.

Operator Response: Save the console output and inform the system programmer.

Problem Determination: The ERROR CODE tells the problem area and should be used in the problem description. A record was added to the SYS1.LOGREC that contains the PSW and module at the time of the error. This error indicates an application program check of some type.

DSNR011I AN ERROR OCCURRED IN THE RURE STATUS TABLE DISPLAY MODULE (DSNRUDIS), THE ERROR LOCATION CODE = xxxx

Explanation: There was an error in processing the RURE display table. One of these ERROR LOCATION CODES tells what function the module was attempting to perform:

- X'0001' Trace entry to the module
- X'0002' Build header for the display table
- X'0003' Build entries for the display table
- X'0004' Call DSNRWTO to display the table
- X'0005' Trace exit from the module
- X'0006' Get message text

System Action: The system continues to restart but the RESTART... STATUS TABLE is not displayed.

System Programmer Response: Use the error code in the message to fill in the problem description.

Operator Response: Save the console output and inform the system programmer.

Problem Determination: The ERROR CODE describes the problem area and should be used in the problem description. A record was added to the SYS1.LOGREC containing the value DSNRUDIS, and the PSW and CSECT at the time of the error. This error indicates an application program check of some type.

Error codes other than X'0006' indicate an application program check of some type. Code X'0006' indicates an error attempting to locate the table text. The trace entry for DSNRUDIS contains the return and reason codes from the Get Text request. That information should be used to fill in the problem description.

DSNR014I EXCLUDED RURE TABLE

Explanation: This is a list of RUREs which are being bypassed because of the conditional restart. Either they were to be processed in a phase that was bypassed or they were outside the log range.

The following shows the format of the table headings. See message DSNR007I for an explanation of the table columns.

```
T CONID CORRID AUTHORIZATION ID PLAN S URID DAY TIME
```

System Action: Restart continues.

DSNR015I THE CHKPTRBA xxxxxxxxxxxx SPECIFIED IN THE CRCR IS INVALID

Explanation: The checkpoint RBA specified in the conditional restart control record (CRCR) is either not available or is not a begin checkpoint record.

System Action: Restart is abended with reason code '00D99001'.

Operator Response: Inform the system programmer.

System Programmer Response: By specifying the STARTRBA and/or ENDRBA on the CRESTART control statement, change log inventory (DSNJU003) utility selects an appropriate RBA.

Problem Determination: Print the complete checkpoint records queue by using the print log map (DSNJU004) utility. Select a checkpoint RBA from this queue or let the change log inventory (DSNJU003) utility make the selection.

DSNR016I STARTRBA xxxxxxxxxxxx VALIDATION FAILED

Explanation: A scan from the STARTRBA failed to find a complete log record. Either the entire log was scanned and no complete record was found, or the log manager found an invalid log record. The log manager sends the error messages to the console indicating a bad log record.

System Action: Restart abends.

Operator Response: Record the log manager message numbers and inform the system programmer.

System Programmer Response: Use DSN1LOGP to determine a STARTRBA to use for restart. The recovery manager uses the STARTRBA as a starting point for its search of the beginning of a valid log record.

**DSNR017I RESTART IS BEING TERMINATED
BECAUSE OF CSRONLY
SPECIFICATION IN CRCR**

Explanation: The restart procedure only completed the first phase of startup. The status displayed during this partial restart can be used to build the conditional restart control record (CRCR).

System Action: Restart is abended.

System Programmer Response: To prevent the restart control record from being reused during the next restart attempt, the current restart control record must be canceled. Use the change log inventory (DSNJU003) CRESTART CANCEL option, or create a new restart control record. The newly created restart control record will automatically cancel the previous record.

**DSNR018I csect-name RESTART...BACKWARD
RECOVERY PROCESSED FROM RBA
ffffffff TO RBA tttttttttt**

Explanation: This message indicates the range of log processed during the backward phase of RESTART when postponed backout processing has been requested. Processing began with the LR of RBA *ffffffff* and proceeded backwards to the LR of RBA *tttttttttt*.

System Action: This message is followed by messages DSNR006I and DSNR007I. The former tells how many URs had some backout work postponed. The latter, identifies the postponed abort URs. The amount of log that need to be processed to complete backout processing for the postponed abort URs can be gauged by comparing the RBA reached during RESTART's backward processing (RBA *tttttttttt*), and the URIDs of the postponed abort URs.

**DSNR020I csect-name START MEMBER member,
OR REPLY 'NO' OR 'QUIESCED'**

Explanation: During a group restart, the group member issuing this message attempted to access the BSDS for member *member*, and either was not able to access the BSDS, or discovered that the BSDS was modified by the change log inventory (DSNJU003) utility since that member was last started. In either case, this DB2 is not able to perform peer restart for member *member*.

For group restart to continue, the identified member must be started.

If it is not possible to start the other member and you want to terminate this group restart, you can reply 'NO' to this message. Replying 'NO' to this message causes this DB2 to terminate with a reason code of 00D900E1. You then have to reply 'NO' to this message for all remaining members participating in this group restart.

If you are sure that the identified member was quiesced the last time it was started, that is, it was stopped with a

-STOP DB2 MODE(QUIESCE) command and it stopped with no indoubt units of recovery and no distributed resynchronization responsibility, then you can reply 'QUIESCED' to this message. Replying 'QUIESCED' to this message causes message DSNR030I to be issued as a reminder that group restart will continue **without using the log** from the identified member.

System Action: This group member waits for the identified member to be started or for a valid reply to this message.

- If the identified member is started, group restart continues.
- If the reply is 'NO', this DB2 terminates with a reason code of 00D900E1.
- If the reply is 'QUIESCED', group restart continues **without using the log** from the identified member.

**DSNR021I csect-name DB2 SUBSYSTEM MUST
PERFORM GROUP RESTART FOR
PEER MEMBERS**

Explanation: This DB2 subsystem must perform the group restart phase to recover either the shared communications area (SCA) or the retained locks for nonstarting members in the data sharing group.

This message marks the beginning of group restart processing for peer members. Messages DSNR023I and DSNR024I or messages DSNR025I and DSNR026I are issued for each peer that is processed by this DB2 subsystem. Message DSNR022I marks the end of group restart processing for peer members.

This message is issued before this DB2 member enters the group restart process. The group restart process is synchronized among all group members that are starting and therefore participating in this group restart. After this DB2 member synchronizes with other members, it is possible that no peer processing will be necessary; in that case message DSNR022I immediately follows this message.

If it is necessary to recover both the SCA and retained locks, this message is issued twice; once for SCA recovery and again for the recovery of the retained locks.

System Action: The subsystem begins group restart processing.

**DSNR022I csect-name DB2 SUBSYSTEM HAS
COMPLETED GROUP RESTART FOR
PEER MEMBERS**

Explanation: This DB2 subsystem, which previously issued message DSNR021I, completed the group restart phase to recover the shared communications area (SCA) or retained locks for nonstarting DB2 members in the data sharing group.

System Action: The subsystem continues with the next restart phase of its own subsystem.

DSNR023I *csect-name* **GROUP RESTART INITIATED TO RECOVER THE SCA FOR GROUP MEMBER *memname***

Explanation: The DB2 subsystem that issued this message is performing the group restart phase to recover the shared communications area (SCA) for nonstarting member *memname* of the data sharing group.

This message is followed by message DSNR024I after the group restart phase to recover the SCA for the identified member is complete.

System Action: The subsystem continues the group restart process.

DSNR024I *csect-name* **GROUP RESTART COMPLETED TO RECOVER THE SCA FOR GROUP MEMBER *memname***

Explanation: The DB2 subsystem that issued this message completed the group restart phase to recover the shared communications area (SCA) for member *memname* of the data sharing group.

This message is issued only if messages DSNR021I and DSNR023I were issued.

System Action: The subsystem continues the group restart process.

DSNR025I *csect-name* **GROUP RESTART INITIATED TO RECOVER RETAINED LOCKS FOR GROUP MEMBER *memname***

Explanation: The DB2 subsystem that issued this message is performing the group restart phase to recover the retained locks for nonstarting member *memname* of the data sharing group.

This message is followed by message DSNR026I after the group restart phase to recover the retained locks for the identified member is complete.

System Action: The subsystem continues the group restart process.

DSNR026I *csect-name* **GROUP RESTART COMPLETED TO RECOVER RETAINED LOCKS FOR GROUP MEMBER *memname***

Explanation: The DB2 subsystem that issued this message completed the group restart phase to recover the retained locks for member *memname* of the data sharing group.

This message is issued only if messages DSNR021I and DSNR025I were issued.

System Action: The subsystem continues the group restart process.

DSNR030I *csect-name* **WILL CONTINUE WITHOUT THE *member* MEMBER'S LOG, REPLY 'YES' OR 'NO'**

Explanation: The reply to message DSNR020I was 'QUIESCED'. This message is issued as a reminder that group restart will continue **without using the log** from the identified member.

If you are sure that the identified member was quiesced the last time it was started, that is, it was stopped with a -STOP DB2 MODE(QUIESCE) command and it stopped with no indoubt units of recovery and no distributed resynchronization responsibility, then reply 'YES'; otherwise, reply 'NO'.

System Action: This group member waits for a valid reply to this message.

- If the reply is 'YES', group restart continues **without using the log** from the identified member.
- If the reply is 'NO', message DSNR020I is reissued to allow you to enter a different response.

DSNR031I *csect-name* **PROCESSING LOG RECORD AT RBA *rba1* TO RBA *rba2***

Explanation: This message is produced periodically during the forward and backward processing phases of restart. The RBAs presented in this message can be used to monitor the progress of the phases of restart.

Forward processing occurs between messages DSNR004I and DSNR005I. During forward processing, the log is read in a forward direction.

Backward processing occurs between messages DSNR005I and DSNR006I. During backward processing, the log is read in a backward direction and will stop reading at the RBA matching the URID of the oldest in-flight or in-abort UR.

rba1 is the RBA of the log record currently being processed. *rba2* is the RBA of the last log record that will be read in this phase of restart.

System Action: DB2 restart continues.

User Response: This is an information only message.

DSNR032E *csect-name* **DB2 IS STARTING AT RELEASE LEVEL *code-level-1*, WHICH IS NOT COMPATIBLE WITH RELEASE LEVEL *code-level-2***

Explanation: The DB2 you tried to start is not at the proper code release, or does not have the correct fallback/coexistence SPE applied.

code-level-1 and *code-level-2* are a string of three numeric characters as follows:

- Version
- Release
- Modification level

code-level-1

The current release level of the starting DB2.

code-level-2

One of the following:

- In non-data-sharing, the highest release with which this DB2 has ever been started.
- In a data sharing environment, the highest release with which any DB2 in the data sharing group has ever been started. This is known as the *group release level*.

This message can occur in the following situations:

- The starting DB2 fell back from a later release and does not have the proper fallback SPE applied.
- The starting DB2 does not have the proper coexistence SPE to start in a data sharing group, which is at the higher release level.
- The starting DB2 is at a release in which coexistence with the current group release level is not supported.

System Action: DB2 terminates with reason code 00D900FA.

System Programmer Response: Verify that:

- Coexistence is supported between the releases you are trying to run.
- The startup procedure is pointing to the correct set of load libraries.
- The correct SPE has been applied.

For more information about what SPE is needed, see the program directory or preventative service planning (PSP) updates.

DSNR033E *csect-name* **MEMBER** *member-name* **IS AT RELEASE LEVEL** *code-level-1* **WHICH IS NOT COMPATIBLE WITH THE STARTING MEMBER AT RELEASE LEVEL** *code-level-2*

Explanation: The code level for the started DB2 member and the starting DB2 member are not compatible until you apply the correct SPE to the lower level release.

code-level-1 and *code-level-2* are a string of three numeric characters as follows:

- Version
- Release
- Modification level

code-level-1

The release level of the active DB2 member *member-name*.

code-level-2

The release level of the starting DB2.

This message occurs when a starting DB2 member is at a higher release than can coexist with an existing DB2 member.

System Action: After detecting the first member with which it cannot coexist, DB2 terminates with reason code 00D900FA.

System Programmer Response: If you want to start a higher release level of DB2, you must ensure that all active members in the group have the proper SPE applied. If you intended to start a lower release level of DB2, make sure your startup procedure is pointing to the correct set of load libraries.

For more information about what SPE is needed, see the program directory or preventative service planning (PSP) updates.

DSNR034E *csect-name* **THERE CANNOT BE MORE THAN TWO RELEASE LEVELS OF DB2 RUNNING IN THE GROUP**

Explanation: You attempted to start a DB2 that was at a release level that cannot coexist in the data sharing group. There are already two different releases of DB2 currently running in the data sharing group.

System Action: DB2 terminates.

System Programmer Response: If you are sure that the startup procedure is pointing to the correct set of load libraries, you must stop any DB2 subsystems that cannot coexist with the one you are attempting to start.

See *DB2 Data Sharing: Planning and Administration* for more information about release coexistence in a data sharing group.

DSNR035I *csect-name* **WARNING - UNCOMMITTED UR AFTER** *nn* **CHECKPOINTS - CORRELATION NAME =** *xxxxxxxxxxxx* **CONNECTION ID =** *yyyyyyy* **LUWID =** *logical-unit-of-work-id=token* **PLAN NAME =** *xxxxxxx* **AUTHID =** *xxxxxxx* **END USER ID =** *xxxxxxx* **TRANSACTION NAME =** *xxxxxxx* **WORKSTATION NAME =** *xxxxxxx*

Explanation: This message indicates that during checkpoint, DB2 encountered an uncommitted UR that has an INFLIGHT status.

The value *nn* is cumulative, and it indicates the number of checkpoints taken since the beginning of the UR. CORRELATION name, CONNECTION ID, and LUWID together identify a thread associated with the UR. If the LUWID is an '*', it indicates that the thread originated at this site. *token* is a unique token number associated with the LUWID. PLAN NAME and AUTHID further identify the thread associated with the UR. If the thread was created with client End User information, the End User's ID, TRANSACTION NAME, and WORKSTATION NAME will be displayed. Otherwise, these fields will contain an '*'.

System Action: DB2 continues processing. If statistics class 3 is turned on, IFCID 0313 is written.

System Programmer Response: Consult with the application programmer to determine if this is a problem UR. See Part 4 (Volume 1) of *DB2 Administration Guide* for more information about problems caused by uncommitted URs. If the UR is caused by an application program, you can use CANCEL THREAD to delete the UR, if necessary. If an uncommitted UR is deleted, DB2 will undo the changes. The amount of time required for this process depends on the amount of work done by the UR.

Programmer Response: Ensure that the application commits frequently enough, or consult with your DB2 administrator about decreasing the frequency of the check.

DSNR036I *csect-name* **UNRESOLVED UR ENCOUNTERED DURING CHECKPOINT - CORRELATION NAME = xxxxxxxxxxxx CONNECTION ID = yyyyyyyy LUWID = logical-unit-of-work-id PLAN NAME = xxxxxxxx AUTHID = xxxxxxxx**

Explanation: DB2 has detected an INDOUBT unit of recovery (UR) during a checkpoint. The purpose of this message is to remind the operator that an INDOUBT UR or POSTPONED ABORT UR exists.

CORRELATION name, CONNECTION ID, and LUWID together identify a thread associated with the UR. If the LUWID is an '*', it indicates that the thread originated at this site. PLAN NAME and AUTHID further identify the thread associated with the indoubt UR.

System Action: DB2 continues processing. If statistics class 3 is turned on, IFCID 0313 is written.

System Programmer Response: Consult with the application programmer to determine whether this is a problem UR. See Part 4 (Volume 1) of *DB2 Administration Guide* for more information about resolving INDOUBT URs.

DSNR037I *csect-name* **WARNING - THE TCP/IP DRDA PORT NUMBER IS CHANGED FROM port_1 TO port_2**

Explanation: The TCP/IP DRDA port number specified in the DB2 BSDS is different from the value used the last time a member of the DB2 data sharing group started. All members of a DB2 data sharing group must use the same TCP/IP DRDA port number.

port_1 The TCP/IP DRDA port number that was obtained from the DB2 BSDS during DB2 startup.

port_2 The TCP/IP DRDA port number that was obtained from the coupling facility during DB2 startup. This is the TCP/IP DRDA port number that was used the last time a member of the data sharing group was started.

System Action: DB2 accepts the new TCP/IP DRDA

port number, and DB2 startup continues.

Operator Response: Contact the system programmer.

System Programmer Response: If the TCP/IP DRDA port number was changed inadvertently, stop DB2 immediately. Use the change log inventory utility (DSNJU003) to correct the PORT value, and restart DB2.

If this message reflects a change that you want to make to DB2's DRDA port number, no action is required. The DRDA port number stored in the coupling facility is updated, and this new port number will be used when DB2 validates each member's DRDA port number.

DSNR038I *csect-name* **WARNING - THE TCP/IP RESYNCHRONIZATION PORT NUMBER IS CHANGED FROM port_1 TO port_2**

Explanation: The TCP/IP resynchronization port number obtained from the DDF record of the BSDS is different than the value specified the last time DB2 started.

Changing the TCP/IP resynchronization port number can cause problems during distributed 2-phase commit processing. Remote DRDA partners record DB2's resynchronization port number in their recovery logs. The resynchronization port number is used to reconnect to the appropriate DB2 member when communication failures occur during 2-phase commit processing. If a DB2 member changes its resynchronization port number, the remote DRDA partners may be unable to resolve indoubt units of work.

port_1 The TCP/IP resynchronization port number that was obtained from the DB2 BSDS during DB2 startup.

port_2 The TCP/IP resynchronization port number that was obtained from the coupling facility during DB2 startup. This is the TCP/IP resynchronization port number that was used the last time this member was started.

System Action: DB2 accepts the new TCP/IP resynchronization port number, and DB2 startup continues.

Operator Response: Contact the system programmer.

System Programmer Response: If the DB2 resynchronization port number was changed inadvertently, stop DB2 immediately. Use the change log inventory utility (DSNJU003) to correct the RESPORT value, and restart DB2.

If this message reflects a change that you want to make to DB2's resynchronization port number, no action is required. The resynchronization port number stored in the coupling facility for this member is updated, and this new port number will be used when DB2 validates the resynchronization port number for other DB2 members.

DSNR039I *csect-name* **WARNING - TCP/IP RESYNCHRONIZATION PORT NUMBER *port_1* IS THE SAME AS MEMBER *member_name***

Explanation: The TCP/IP resynchronization port of the starting DB2 is the same as the member indicated by *member_name*.

port_1 The TCP/IP resynchronization port number that was obtained from the DB2 BSDS during DB2 startup.

member_name
The member name of the DB2 data sharing member that used the same resynchronization port number.

System Action: The TCP/IP port number specified in the BSDS is accepted, and DB2 startup continues.

Operator Response: Contact the system programmer.

System Programmer Response: Each member of the DB2 data sharing group should have a unique TCP/IP resynchronization port number. Use the change log inventory utility (DSNJU003) to specify a unique RESPORT value for this DB2 member and the DB2 member identified by *member_name*.

DSNR040I *csect-name* **TRACKER RESTART ENDLRSN *Irsn* DOES NOT MATCH ENDLRSN *Irsn* ASSOCIATED WITH THE DATA SHARING GROUP**

Explanation: In a data sharing environment, a TRKRSITE DB2 will not restart if it detects inconsistencies in the reported values for ENDLRSN. The ENDLRSN specified on the Conditional Restart Control Record does not match the ENDLRSN in the system communications area (SCA) structure for the data sharing group.

System Action: DB2 startup terminates.

Operator Response: Collect the SYS1.LOGREC and SVC dump, and contact the system programmer.

System Programmer Response: If the ENDLRSN value for this member is incorrect, take the following actions:

- Restore the BSDS and Logs for this Tracker DB2 from the primary DB2
- Ensure the Conditional Restart Control Record is correct
- Restart DB2

If the ENDLRSN value in the SCA is incorrect, delete the SCA structure and restart all members of the TRKRSITE data sharing group with the same ENDLRSN.

DSNR042I *csect-name* **WARNING - UR ROLLBACK HAS BEEN CANCELED AND IS INCOMPLETE FOR CORRELATION NAME = *corrid* CONNECTION ID = *connid* AUTHID = *authid* PLAN NAME = *plan-name* URID = *urid***

Explanation: DB2 issues this message when rollback for the indicated thread has been canceled by either the CANCEL THREAD NOBACKOUT command or the RECOVER POSTPONED CANCEL command.

System Action: Rollback processing for the thread stops and the unit of recovery is logged as canceled and complete.

User Response: Examine the console for messages indicating what objects are being marked as REFP,RECP; those objects will need to be recovered.

DSNR043E *csect-name* **DB2 IS STARTING WITH AN UNSUPPORTED CODE LEVEL. CURRENT LEVEL: *current-code-level* VALID LEVEL(S): *valid-code-levels***

Explanation: The DB2 that is starting is not at the proper code level. Some required maintenance, such as a fallback or coexistence SPE, has not been applied. The level information is different for each SPE level and each release. This information is for the use of your IBM service representative.

This message can occur in the following situations:

- The DB2 that is starting has completed a fallback from a later release and does not have the proper fallback SPE applied.
- The DB2 that is starting does not have the proper coexistence SPE to start in a data sharing group, which is at a later release level.
- The DB2 that is starting is not at a release level that supports coexistence with the data sharing group.

System Action: DB2 terminates with reason code 00D900FA.

Operator Response: Save the console output and inform the system programmer.

System Programmer Response: Check the DB2 Program Directory and Preventive Service Planning updates (PSP) to determine what SPE you need.

Verify that:

- Coexistence is supported between the releases you are trying to run.
- The DB2 startup procedure points to the correct set of load libraries.
- The correct SPE has been applied.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 16, 69.

DSNR044E *csect-name* **MEMBER *member-name* IS STARTED AT A LEVEL OF CODE *started-code-level* WHICH IS NOT COMPATIBLE WITH THE STARTING MEMBER. VALID LEVEL(S) *valid-code-levels***

Explanation: The code levels are not compatible between the DB2 member that has already started and the DB2 member that is starting. You need to apply the correct SPE to the DB2 member that is at the earlier level.

The level information is different for each SPE level and each release. This information is for the use of your IBM service representative.

This message occurs when a starting DB2 member is at a later release level that cannot coexist with an existing DB2 member.

System Action: After detecting the first member with which it cannot coexist, DB2 terminates with reason code 00D900FA.

Operator Response: Save the console output and inform the system programmer.

System Programmer Response: Check the Program Directory and Preventive Service Planning updates (PSP) to ensure that all active members in the group have the proper SPE applied.

Verify that:

- Coexistence is supported between the releases you are trying to run.
- The DB2 startup procedure points to the correct set of load libraries.
- The correct SPE has been applied.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 16, 69.

DSNR045I *csect-name* **DB2 SUBSYSTEM IS STARTING AND IT WAS NOT STARTED IN A PREVIOUS RELEASE WITH THE FALLBACK SPE APPLIED. FALLBACK SPE APAR: *apar-number* NEW RELEASE LEVEL: *release* KNOWN LEVEL(S): *level***

Explanation: DB2 was not started with the FALLBACK SPE active before an attempt was made to start DB2 in a new release. The FALLBACK SPE must be applied, and the system must be started before DB2 can be started in a new release.

release level

The release and level are different for each release, and are for the use of the IBM service representative.

apar-number

The apar-number is the FALLBACK SPE that is missing.

System Action: DB2 terminates with reason code 00D96001.

User Response: Ensure that the FALLBACK SPE is applied, and DB2 is started before starting DB2 in a new release.

DSNR046I *csect-name* **INCOMPLETE UNITS OF RECOVERY EXIST FOR *subsys***

Explanation: This message is issued during DB2 shutdown if any incomplete units of recovery exist for the referenced member of a data sharing group. The message indicates that retained locks will be held by subsystem *subsys*.

System Action: DB2 shutdown continues normally.

User Response: Restart DB2 and resolve the incomplete units of recovery to release the retained locks held by subsystem *subsys*.

DSNR047I *csect-name* **POSTPONED ABORT BACKOUT PROCESSING LOG RECORD AT RBA *rba1* TO RBA *rba2***

Explanation: This message is produced periodically during the backout processing of postponed abort units of recovery, initiated by the -RECOVER POSTPONED command. The RBAs in this message can be used to monitor the backout progress.

During the backout process, DB2 reads the log in a backward direction and stops reading the log at the RBA matching the URID of the oldest postponed-abort UR *rba2*. *rba1* is the RBA of the log record currently being processed.

System Action: Backout processing continues.

System Programmer Response: This is an information-only message. If the message continues to be issued and *rba1* remains the same, make sure there are no outstanding archive tape mounts that may be delaying the log read process. Otherwise, obtain a dump of the DB2 address spaces for problem determination.

The -DISPLAY THREAD TYPE(POSTPONED) command can be issued to display information about the postponed abort units of recovery. It is also possible to stop the backout process with the -RECOVER POSTPONED CANCEL command, but this will leave objects in an inconsistent state. See the *DB2 Command Reference* for more information regarding the CANCEL option of the -RECOVER POSTPONED command.

DSNR048I *csect-name* **UR BACKOUT
PROCESSING LOG RECORD AT RBA
rba1 TO RBA rba2 FOR CORRELATION
NAME = xxxxxxxxxxxx CONNECTION
ID = yyyyyyyy LUWID =
logical-unit-of-work-ID=token PLAN
NAME = xxxxxxxx AUTHID = xxxxxxxx
END USER ID = xxxxxxxx
TRANSACTION NAME = xxxxxxxx
WORKSTATION NAME = xxxxxxxx**

Explanation: This message is produced periodically during the backout process of an in-abort unit of recovery. The RBAs in this message can be used to monitor the backout progress. Together, CORRELATION name, CONNECTION ID, and LUWID identify a thread associated with the UR. If the LUWID is '*', the thread originated at this site. *token* is a unique token number associated with the LUWID. PLAN NAME and AUTHID further identify the thread associated with the UR. If the thread was created with client end user information, the end user's USERID, TRANSACTION NAME, and WORKSTATION NAME are displayed. Otherwise, these fields contain an '*'.

During the backout process, DB2 reads the log in a backward direction and stops reading the log at the RBA matching the URID of the in-abort UR *rba2*. *rba1* is the RBA of the log record currently being processed.

System Action: Backout processing continues.

System Programmer Response: This is an information-only message. If the message continues to be issued and *rba1* remains the same, make sure there are no outstanding archive tape mounts that might be delaying the log read process. Otherwise, obtain a dump of the DB2 address spaces for problem determination.

It might be possible to stop the backout process with the NOBACKOUT option of the -CANCEL THREAD command, but this leaves objects in an inconsistent state. See the *DB2 Command Reference* for more information regarding the NOBACKOUT option of the -CANCEL THREAD command.

DSNR050I *csect-name* **DB2 STARTED IN SYSTEM
RECOVER PENDING MODE**

Explanation: DB2 has started in System Recover Pending mode in preparation for the RESTORE SYSTEM utility. No database update activity is allowed, and DB2 is in restricted access mode.

System Action: DB2 startup continues.

DSNR051I *csect-name* **SYSPITR RESTART
ENDLRSN *Irsn* DOES NOT MATCH
ENDLRSN *Irsn* ASSOCIATED WITH THE
DATA SHARING GROUP**

Explanation: For a System Level Recovery restart, all members of the data sharing group must truncate their logs with the same LRSN value that was specified in the SYSPITR conditional restart parameter.

System Action: DB2 startup terminates.

Operator Response: Collect the SYS1.LOGREC and SVC dump, and contact the system programmer.

System Programmer Response: Ensure that the conditional restart control record is correct, and then restart DB2. You can run the Print Log Map utility (DSNJU004) to examine the current conditional restart record.

DSNR052I *csect-name* **DB2 MEMBER TO REMAIN
ACTIVE IN LIGHT MODE TO RESOLVE
INDOUBT UNITS OF RECOVERY**

Explanation: This message is issued at the end of restart when the DB2 member has been restarted with the LIGHT(YES) parameter and there are indoubt units of recovery (URs).

System Action: The DB2 member remains up and running in light mode. This DB2 member will only allow connections for the purpose of resolving the indoubt URs. Also, certain commands are allowed. Any attempt to connect to this DB2 to submit new SQL work will be disallowed with reason code 00F300A2.

User Response: Ensure that the appropriate commit coordinators are started so that they can resync with the DB2 member to resolve the indoubts. Alternatively the -RECOVER INDOUBT command can be used to manually resolve the indoubts.

DSNR053I *csect-name* **ALL INDOUBT UNITS OF
RECOVERY HAVE BEEN RESOLVED.
LIGHT MODE DB2 NORMAL
TERMINATION TO FOLLOW**

Explanation: This message is issued following DSNR052I after all indoubt units of recovery have been resolved for this DB2 member, which was restarted with the LIGHT(YES) parameter.

System Action: DB2 subsystem shutdown is initiated.

Chapter 18. DSNT... Messages

Messages issued by DSNTINST, DSNTINS1, and DSNTINS2 installation CLISTs have an internal severity level as follows:

- 0 Successful execution: CLIST progress and tracing messages (processing continues)
- 4 Warning: some adjustments might be made by the installation CLISTs (processing and JCL editing continues)
- 8 Error: unable to continue (no JCL is edited)

DSNT101I A VSAM ERROR HAS BEEN ENCOUNTERED WHILE CSECT DSNTSTR2 WAS READING THE DB2 BSDS VSAM RETURN CODE = x, VSAM REASON CODE = y

Explanation: CSECT DSNTSTR2 attempted to read the DB2 bootstrap data set (BSDS), and a VSAM error has occurred. In the message, 'x' is a 1-byte VSAM return code and 'y' is a 1-byte VSAM reason code.

System Action: The start up process continues. However, any references to password-protected system databases will cause a 'resource unavailable' error. Any agent-related requests for subsystem database resources will result in an SQLCODE -904. Any requests that are not agent-related for unavailable resources will result in the following messages:

DSNI001I	DSNI002I	DSNI003I	DSNI004I
DSNI005I	DSNI006I	DSNT408I	DSNT414I
DSNT415I	DSNT416I	DSNT417I	DSNT500I

Abend X'04E' with reason code X'00E30010' is also produced. However, the error results in a retry. DB2 does not terminate, but a dump is produced.

Operator Response: Notify the system programmer.

System Programmer Response: A VSAM error occurred while reading the BSDS record with key '200000001'. Either the BSDS record does not exist or an I/O error occurred (indicating that the record is bad). Further information may be obtained from a VSAM diagnostics manual. Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for procedures on recovering or repairing the DB2 bootstrap data set.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 16.

DSNT102I CSECT DSBTSTR2 ENCOUNTERED AN INVALID DATABASE SERVICES BOOTSTRAP RECORD

Explanation: CSECT DSNTSTR2 attempted to read the DB2 bootstrap data set (BSDS), and an invalid

record was read by the recovery log manager (RLM) subcomponent. This is a DB2 error.

System Action: The DB2 start up process continues. However, any references to DB2 password-protected system databases will cause a 'resource unavailable' error. Any agent-related requests for DB2 subsystem database resources will result in an SQLCODE -904. Any requests that are not agent-related for unavailable resources will result in the following messages:

DSNI001I	DSNI002I	DSNI003I	DSNI004I
DSNI005I	DSNI006I	DSNT408I	DSNT414I
DSNT415I	DSNT416I	DSNT417I	DSNT500I

Abend X'04E' with reason code X'00E30010' is also produced. However, the error results in a retry. DB2 does not terminate, but a dump is produced.

Operator Response: Notify the system programmer.

System Programmer Response: Obtain a copy of SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: This message is generated when the recovery log manager (RLM) subcomponent of DB2 encounters an invalid DB2 database services password record. A copy of the BSDS record with key '200000001', which is the invalid database services record retrieved, should be obtained.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 16.

DSNT103I THE CURRENTLY LOADED DSN6SPRM IS NOT THE MVS/XA VERSION

Explanation: A -START DB2 PARM=xxxxxxx was issued where 'xxxxxxx' is the version of the system parameter CSECTs. DB2 executes in a MVS/XA environment and will not execute in any other environment.

System Action: The message DSNV086E is generated with a reason code of X'00E30008'. DB2 is

DSNT104I • DSNT107I

terminated with abend code X'04F'.

Operator Response: Notify the system programmer.

System Programmer Response: Restart DB2 with a -START DB2 PARM= command, where the parameter block that follows the 'PARM=' parameter specifies an MVS/XA version of the DB2 subsystem parameters.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 3, 5, 9.

DSNT104I THE CURRENTLY LOADED DSN6SPRM IS NOT THE MVS/370 VERSION

Explanation: A -START DB2 PARM=xxxxxxx was issued, where 'xxxxxxx' is the version of the system parameter CSECTs. DB2 executes in an MVS/370 environment and does not execute in any other environment.

System Action: Message DSNV086E is generated with reason code X'00E30009'. DB2 is terminated with abend code X'04F'.

Operator Response: Notify the system programmer.

System Programmer Response: Restart DB2 with a -START DB2 PARM= command, where the parameter block that follows the PARM= parameter specifies an MVS/370 version of the DB2 subsystem parameters.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 3, 5, 9.

DSNT105I THE LOADED DSN6SPRM CSECT IS OBSOLETE. PLEASE REASSEMBLE THE DSN6SPRM CSECT AND RELINKEDIT THE DSNZPARM LOAD MODULE.

Explanation: DSNTSTR2 loaded an out-of-date system parameter CSECT DSN6SPRM. This error can only occur if code maintenance has been applied and CSECT DSN6SPRM has not been reassembled. This CSECT is contained in the load module specified in the 'PARM=' parameter of the -START DB2 command.

System Action: The message DSNV086E is generated with a reason code of X'00E30008'. DB2 is terminated with abend code X'04F'.

Operator Response: Notify the system programmer.

System Programmer Response: Reassemble DSN6SPRM, and relink-edit the DSNZPARM load module. This is done by resubmitting the install job stream, DSNTIJUZ, that built the load module that is named following the 'PARM=' parameter of the -START DB2 command.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 3, 5, 9.

DSNT106I THE LOADED DSN6SYSP CSECT IS OBSOLETE. PLEASE REASSEMBLE THE DSN6SYSP CSECT AND RELINKEDIT THE DSNZPARM LOAD MODULE.

Explanation: DSNTSTR2 loaded an out-of-date system parameter CSECT DSN6SYSP. This error can only occur if code maintenance has been applied and CSECT DSN6SYSP has not been reassembled. This CSECT is contained in the load module specified in the 'PARM=' parameter of the -START DB2 command.

System Action: The message DSNV086E is generated with a reason code of X'00E30008'. DB2 is terminated with abend code X'04F'.

Operator Response: Notify the system programmer.

System Programmer Response: Reassemble DSN6SYSP, and relink-edit the DSNZPARM load module. This is done by resubmitting the install job stream, DSNTIJUZ, that built the load module that is named following the 'PARM=' parameter of the -START DB2 command.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 3, 5, 9.

DSNT107I INVALID AMODE OR RMODE ATTRIBUTE FOUND FOR LOAD MODULE *module-name*

Explanation: During DB2 startup, the service controller establishes the addressability to the DB2 database services functional recovery and the emergency shutdown routines. Two load modules, DSNTF, and DSNTLCLE, are loaded into CSA. In the MVS/XA environment, DSNTLCLE must be link-edited with attributes AMODE(24) and RMODE(ANY). At least one of the modules did not have the correct addressing attribute when it was loaded. 'module-name' in the error message is the name of the first load module that has an invalid addressing mode.

System Action: DB2 database services start up is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: Verify that all install and maintenance activities against these modules were executed using SMP. Verify that the JCLIN for SMP includes the correct AMODE and RMODE control statements, and that the linkage editor provided with the Data Facility Product (DFP) was invoked by SMP for the link edits. Correct the procedure or JCL which caused the error and rerun the necessary SMP jobs.

Problem Determination: A DB2 dump was requested to an MVS/XA SYS1.DUMP data set.

The MVS service aid AMBLIST provides linkage editor

module attributes in the summary section of the LISTLOAD function output.

DSNT200I *type bind-type* FOR PLAN *plan-id*
SUCCESSFUL

Explanation: A BIND, REBIND or FREE PLAN subcommand has completed successfully.

type Indicates that a test bind was in progress. A test bind means that no plan name was specified. The token is omitted if a normal BIND PLAN was processed.

bind-type
Type of bind subcommand: BIND, REBIND, or FREE.

plan-id Name of application plan specified in the subcommand.

System Action: The plan was successfully bound, rebound, or freed.

DSNT201I *type bind-type* FOR PLAN *plan-id* NOT
SUCCESSFUL

Explanation: Errors have been detected during the processing of the indicated BIND, REBIND, or FREE PLAN subcommand.

type Indicates that a test bind was in progress. A test bind means that no plan name was specified. The token is omitted if a normal BIND PLAN was processed.

bind-type
Type of bind subcommand: BIND, REBIND, or FREE.

plan-id Name of application plan specified in the subcommand.

System Action: The BIND, REBIND, or FREE PLAN was not performed.

System Programmer Response: See other messages issued to determine the error that caused the bind subcommand to terminate unsuccessfully.

DSNT202I MESSAGE LIMIT EXCEEDED

Explanation: A fixed amount of space exists in which to generate bind subcommand messages. This message says that the bind subcommand generated more messages than will fit in that space.

System Action: For bind subcommands that affect a single plan, the bind subcommand process continues. However, no other messages are generated except for message DSNT200I or DSNT201I. For bind subcommands that affect more than one plan, the bind subcommand process terminates and no other messages are generated.

System Programmer Response: The 'FLAG'

parameter of the bind subcommand can be used to limit the types of messages that are generated.

DSNT205I *name* IS A DUPLICATE *name-type*, IT
WILL BE USED ONLY ONCE

Explanation: Name 'name' has been specified more than once in a list of names.

name Name that was specified more than once.

name-type
Indicates the type of list in which the name was duplicated.

- MEMBER NAME - List of DBRM Members
- PLAN-ID - List of plan IDs
- SYSTEM NAME - List of system connection names on a DISABLE or ENABLE list.
- PACKAGE NAME - List of package IDs

System Action: Duplicates are removed from 'name-type' list and the bind process continues.

System Programmer Response: Verify the list that contains the duplicate. If the error is only in entering a name incorrectly, which happens to duplicate another entry, enter the name correctly and reissue the bind statement. If the entry is really a duplicate, no action is required.

**DSNT207I PROGRAM *program-name* WITH MARK
release-dependency-mark FAILED
BECAUSE IT DEPENDS ON
FUNCTIONS OF THE RELEASE FROM
WHICH FALL BACK HAS OCCURRED**

Explanation: Program 'program-name' depends on a function of DB2 that is not supported by the current active release.

program-name
Name of the application program.

release-dependency-mark
A one-character mark showing the oldest DB2 release supporting this program.

This message is issued by the following CSECTs:
DSNTBCM1, DSNTBCM2

System Action: The bind operation for this plan or package is not performed.

User Response: The program cannot be used until the DB2 subsystem is remigrated to the newer release. Notify the system programmer.

System Programmer Response: Warn users not to use plans or packages containing this program until the DB2 subsystem has been remigrated to the newer release.

DSNT208I PROGRAM *program-name*
**PRECOMPILED WITH INCORRECT
 LEVEL FOR THIS RELEASE**

Explanation: Program 'program-name' was precompiled under a release not supported by the current level of DB2, or the contents of the DBRM have been modified after the precompilation phase.

System Action: The BIND operation was not performed.

User Response: Precompile the named program again using the current precompiler. Reissue the BIND command.

Problem Determination: If the application program was precompiled at an appropriate release, and the problem persists, collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 79, 80, 81.

DSNT209I *bind-type* FOR PLAN *plan-id* WITH
**MARK *release-dependency-mark* FAILED
 BECAUSE PLAN DEPENDS ON
 FUNCTIONS OF THE RELEASE FROM
 WHICH FALL BACK HAS OCCURRED.**

Explanation: Plan 'plan-id' depends on a function of DB2 which is not supported by the currently active release.

bind-type
 REBIND

plan-id Name of the application plan

release-dependency-mark
 A one-character mark showing the oldest release of DB2 which can support this plan. The release dependency mark for the plan is kept in the IBMREQD columns in the DB2 catalog in SYSIBM.SYSPLAN.

System Action: The REBIND operation for this plan is not performed.

User Response: The plan cannot be used until the DB2 subsystem is remigrated to the newer release.

Operator Response: Notify the system programmer.

System Programmer Response: Warn users not to use the plan until the DB2 subsystem has been remigrated to the newer release.

DSNT210I *bind-type* AUTHORIZATION ERROR
**USING *authorization-id* AUTHORITY
 PLAN=*plan-id* PRIVILEGE=*privilege***

Explanation: The indicated authorization ID does not have the indicated privilege and therefore cannot invoke the indicated BIND subcommand against the indicated application plan.

bind-type
 Type of BIND subcommand: BIND, REBIND, FREE.

authorization ID
 Authorization ID of the plan owner.

plan-id Application plan specified in the BIND subcommand.

privilege
 Missing privilege: BIND, BINDADD

System Action: The BIND, REBIND, or FREE operation for 'plan-id' is not performed.

System Programmer Response: If the indicated privilege is BINDADD, then the privilege to invoke the BIND subcommand with the ACTION(ADD) option must be granted to the indicated authorization ID. If the indicated privilege is BIND, the privilege to invoke a BIND subcommand against the indicated application plan must be granted to the indicated authorization ID.

DSNT211I REBIND FOR PLAN *plan-id* FAILED
**BECAUSE IBMREQD OF *ibmreqd* IS
 INVALID**

Explanation: The IBMREQD column of the SYSIBM.SYSPLAN catalog table for the named plan contains an unrecognizable character.

System Action: The REBIND operation for the plan was not performed.

System Programmer Response: You must do a BIND ACTION(REPLACE) for this plan.

DSNT212I *bind-type* AUTHORIZATION ID *auth-id* IN
THE OWNER KEYWORD IS INVALID

Explanation: The authorization ID specified in the OWNER keyword of the BIND or REBIND subcommand is invalid. To specify an OWNER that is not the primary authorization ID, or one of the secondary IDs of the process requires additional authority. See *DB2 Command Reference* for the authority required.

bind-type
 Type of bind subcommand: BIND or REBIND

auth-id The authorization ID specified as owner.

System Action: The BIND or REBIND subcommand is not executed.

System Programmer Response: Rerun the subcommand and specify a valid authorization ID for the OWNER keyword. You may need to add the required authorization ID for this user to the security system.

DSNT213I THE DCB BLOCK SIZE OF THE INPUT DBRM LIBRARY IS INVALID

Explanation: An invalid DCB block size is specified for the DBRM library of the BIND subcommand.

System Programmer Response: Correct the DCB block size of the DBRM library, and reissue the BIND subcommand.

DSNT214I I/O ERROR ON DBRM LIBRARY DBRM MEMBER= *dbrm-name* DBRM LIBRARY= *dbrm-pds-name xxxxxx*

Explanation: An I/O error was encountered attempting to read database request module (DBRM) during a BIND subcommand. 'xxxxxx' is a portion of the message text generated by the SYNADAF macro instruction to describe the permanent I/O error. This text may contain information such as jobname, stepname, unit address, device type, ddname, operation attempted, and error description.

dbrm-name

Name of the DBRM associated with the error.

dbrm-pds-name

Partitioned data set associated with the error.

System Action: No application plan is created.

System Programmer Response: Determine if an incorrect dbrm-pds-name was specified in the LIBRARY parameter of the BIND subcommand, or an incorrect data set name was specified for the DBRMLIB DD statement. Check correctly specified data sets for I/O errors or modified DCB attributes.

DSNT220I BIND ADD ERROR USING *auth-id* AUTHORITY PLAN *plan-id* ALREADY EXISTS

Explanation: An attempt was made to use the BIND subcommand with the 'ACTION(ADD)' option that specified a 'plan-id' that already exists.

auth-id Authorization ID of the owner of the plan.

plan-id Application plan specified in the BIND subcommand.

System Action: No application plan is created.

System Programmer Response: Check the SYSIBM.SYSPLAN catalog table for names of existing application plans. Reinvoke the BIND subcommand with a 'plan-id' that is not in use.

DSNT221I *bind-type* ERROR USING *auth-id* AUTHORITY PLAN *plan-id* DOES NOT EXIST

Explanation: The indicated bind subcommand was issued against an application plan that does not exist. The individual variable fields contain:

bind-type

Type of bind subcommand: REBIND or FREE.

auth-id Authorization ID of the plan owner.

plan-id Application plan specified in the BIND subcommand.

System Programmer Response: Check the SYSPLAN catalog table for the correct 'plan-id' to use.

DSNT223I *csect-name bind-type* WARNING FOR *object-type* = *object-name* USE OF OPTHINT IS DISALLOWED BY A DB2 SUBSYSTEM PARAMETER. THE DEFAULT OPTHINT VALUE IS USED.

Explanation: The DB2 subsystem parameters have not been configured to enable the use of OPTHINT in the *bind-type* subcommand. The default OPTHINT value of all blanks is used.

bind-type

Type of BIND subcommand: BIND or REBIND.

object-type

PLAN or PACKAGE

object-name

If *object-type* is PLAN, *object-name* is the name of the plan.

If *object-type* is PACKAGE, *object-name* is the name of the package in the format 'location-id.collection-id.package-id'.

System Action: Processing continues normally using the default OPTHINT value.

System Programmer Response: Enable the use of OPTHINT by changing the value of OPTIMIZATION HINTS on the DB2 Installation panel, DSNTIP4.

If, after further consideration, you do not want to use OPTHINT, remove OPTHINT from the *bind-type* subcommand or set the value to all blanks.

DSNT224I *csect-name bind-type* ERROR FOR *object-type object-name* CCSID = *ccsid* IS INVALID FOR ENCODING SCHEME = *scheme*

Explanation: The system does not have a valid CCSID defined for the specified encoding scheme, or the specified CCSID is not defined on the system.

bind-type

Type of bind subcommand: BIND or REBIND.

object-type

PLAN or PACKAGE.

object-name

If *object-type* is PLAN, *object-name* is the name of the application. Otherwise, it is the name of the package in 'location.collection.package' format.

scheme

The encoding scheme specified in the ENCODING bind option on the subcommand or defaulted from the system default Application Encoding Scheme. If *scheme* is UNKNOWN, then the CCSID value specified in the ENCODING bind option or defaulted from the system default Application Encoding Scheme is not defined, and therefore the encoding scheme is not known.

ccsid The numeric CCSID corresponding to the specified *ccsid-type*.

Severity: 8 (error)

System Action: The *bind-type* operation is not performed

User Response: Verify that the correct encoding scheme was specified in the ENCODING bind option on the *bind-type* subcommand. If correct, see System Programmer Response and contact the System Programmer. If incorrect, specify the correct scheme in the ENCODING option and reissue the *bind-type* subcommand.

System Programmer Response: If the bind option ENCODING was not specified, and instead the value for ENCODING was defaulted from the system default Application Encoding Scheme, verify the Application Encoding Scheme is set to a defined CCSID.

If the value specified for the ENCODING option was ASCII, EBCDIC or UNICODE, verify the corresponding CODED CHAR SET subsystem parameter on the installation panel DSNTIPF has been set to a defined CCSID.

Otherwise, inform the user of the correct CCSID. Refer to Appendix A of *DB2 Installation Guide* for more information regarding CCSIDs and character sets.

DSNT228I BIND ERROR, ATTEMPTING TO REPLACE PACKAGE = *package_name* WITH VERSION = (*version2*) BUT THIS VERSION ALREADY EXISTS

Explanation: An attempt is made to create a version of a package that already exists. The version specified in the REPLVER keyword is different from the version specified for the precompile. The version specified for the precompile already exists in the catalog. The combination of 'location.collection.package.version' must be unique in the SYSIBM.SYSPACKAGE catalog table. A common mistake is that the user may believe that the version he is creating is the one specified in the REPLVER keyword. This is not the case. The version specified in the REPLVER keyword is the name of the version being replaced. The version that will be created is the version that was given to the program when it was precompiled.

package_name

Fully qualified package name

version2

Version-id of package that is to be created

System Action: The bind will fail.

System Programmer Response: There are two approaches to solve this problem. The first is to re-compile the program with a new version name and re-issue the original BIND subcommand. The other approach is not to do the precompile but re-issue the BIND subcommand without the REPLVER parameter.

DSNT229I BIND ERROR, ATTEMPTING TO REPLACE PACKAGE = *package-name* THERE ARE ENABLE OR DISABLE ENTRIES CURRENTLY ASSOCIATED WITH THE PACKAGE

Explanation: The BIND subcommand was issued to replace a package that has ENABLE or DISABLE entries currently associated with the package. The individual variable fields contain:

package-name

Name of the package
(location.collection.package)

System Action: Package not bound.

System Programmer Response: FREE the package first and then BIND the package.

DSNT230I BIND DBRM MEMBER NAME ERROR USING *auth-id* AUTHORITY *object-type* = *object-name* MEMBER *dbrm-name* NOT FOUND IN PDS SEARCH ORDER

Explanation: The indicated 'dbrm-name' was not found in the search order in the PDSs specified on the BIND PLAN or BIND PACKAGE subcommand.

auth-id Authorization ID of the plan or package owner

object-type

The type of object being bound: PLAN or PACKAGE

object-name

If 'object-type' is PLAN, 'object-name' is the name of the application plan. Otherwise, it is the name of the package in 'location.collection.package' format.

dbrm-name

Member name of the DBRM that was not found.

System Action: The bind is unsuccessful.

System Programmer Response: Determine if an incorrect 'dbrm-member-name' or PDS was specified. Reinvoke the BIND subcommand specifying the correct names.

DSNT231I BIND DBRM ERROR USING *auth-id* AUTHORITY *object-type* = *object-name* DBRM *dbrm-name* IS IN AN INCONSISTENT STATE

Explanation: The contents of a DBRM have been modified after the precompilation process, or the DBRM contains incorrect information in the header.

auth-id Authorization ID of the invoker of the BIND subcommand.

object-type

The type of object being bound: PLAN or PACKAGE

object-name

If 'object-type' is PLAN, 'object-name' is the name of the application plan. Otherwise, it is the name of the package in 'location.collection.package' format.

dbrm-name

Name of the DBRM that is in error.

System Action: The bind is unsuccessful.

System Programmer Response: Precompile the application program associated with the indicated DBRM. Reinvoke the BIND subcommand.

DSNT232I SUCCESSFUL *bind-type* FOR PACKAGE = *package-name*

Explanation: A BIND, REBIND or FREE PACKAGE subcommand has completed successfully.

bind-type

Type of bind subcommand: BIND, REBIND, or FREE

package-name

Name of the package in the following format: 'location.collection.package.(version)'

System Action: The package was successfully bound, rebound, or freed.

DSNT233I UNSUCCESSFUL *bind-type* FOR PACKAGE = *package-name*

Explanation: Errors have been detected during the processing of the indicated BIND, REBIND, or FREE PACKAGE subcommand.

bind-type

Type of bind subcommand: BIND, REBIND, or FREE

package-name

Name of the package in the following format: 'location.collection.package.(version)'

System Action: The indicated package was not bound, rebound, or freed.

System Programmer Response: See other

messages issued to determine the error that caused the subcommand to terminate unsuccessfully.

DSNT234I MESSAGE LIMIT EXCEEDED

Explanation: A fixed amount of space exists in which to generate bind subcommand messages. This message says that the bind subcommand generated more messages than will fit in that space.

System Action: For bind subcommands that affect a single package, the bind subcommand process continues. However, no other messages are generated except for completion message DSNT232I or DSNT233I. For bind subcommands that affect more than one package, the bind subcommand process terminates and no other messages are generated.

System Programmer Response: The 'FLAG' parameter of the bind subcommand may be used to limit the types of messages that are generated.

DSNT235I *csect-name bind-type* AUTHORIZATION ERROR USING *auth-id* AUTHORITY PACKAGE = *package-name* PRIVILEGE = *privilege*

Explanation: The authorization ID given does not have the *privilege* indicated and cannot invoke the bind subcommand on the named package.

bind-type

Type of bind subcommand: BIND, REBIND, or FREE

auth-id Authorization ID of the package owner

package-name

Name of the package in the following format: 'location.collection.package.(version)'

privilege

Name of the privilege not held:

BINDADD or BINDADD *

The authority to create a new package using BIND with the ADD option.

BIND The authority to BIND (REPLACE) or REBIND a package.

BIND * The authority to add a new version of an existing package using BIND with the ADD option.

FREE There is no FREE privilege, but the user needs the proper authority to free the package.

COPY The authority to COPY from the indicated package.

CREATE IN or CREATE IN *

The authority to create a package in the indicated collection.

DSNT236I • DSNT239I

A blank and asterisk (*) in the privilege values 'BINDADD *', 'BIND *', and 'CREATE IN *' in the message indicates that the DB2 system parameter BIND NEW PACKAGE has the value BIND. When ' *' does not appear in these privilege values, BIND NEW PACKAGE has the value BINDADD.

The system parameter BIND NEW PACKAGE affects the authorization required to add a new package or a new version of an existing package to a collection. For more information about this system parameter, see:

- "Installing, Migrating, and Updating System Parameters" (Panel: DSNTIPP) in Part 2 of *DB2 Installation Guide*.
- "Controlling Access to DB2 Objects" in Part 3 (Volume 1) of *DB2 Administration Guide*.

System Action: The indicated package is not bound, rebound, or freed.

System Programmer Response: You must grant the indicated privilege to the authorization ID of the package owner.

DSNT236I REBIND FOR PACKAGE *package-name*
FAILED BECAUSE IBMREQD OF
ibmreqd IS INVALID

Explanation: The IBMREQD column of the SYSIBM.SYSPACKAGE catalog table for the named package contains an unrecognizable character. This usually means that the package depends on a function of DB2 which is not supported by the currently active release.

This message is issued by the following CSECT:
DSNTBRB2

package-name

Name of the package in the following format:
'location.collection.package.(version)'

System Action: The package was not rebound.

System Programmer Response: Warn users not to use the package until the DB2 subsystem is remigrated to the newer release.

DSNT237I *csect-name* BIND *sub-type* ERROR
USING *auth-id* AUTHORITY PACKAGE =
package-name ALREADY EXISTS

Explanation: An attempt is made to add a package that already exists. The combination of 'location.collection.package.version' must be unique in the SYSIBM.SYSPACKAGE table. In addition, the combination of 'location.collection.package.consistency-token' must be unique.

sub-type

The sub-type can have the values: COPY, ADD or REPLACE.

auth-id Authorization ID of the owner of the package.

package-name

Name of the package in the following format:
'location.collection.package.(version)'

System Action: No package is created.

System Programmer Response: Check the SYSIBM.SYSPACKAGE catalog table for names of existing application packages. Re-invoke the BIND subcommand with a 'location.collection.package.version' that is not in use.

DSNT238I *bind-type error-type* USING *auth-id*
AUTHORITY PACKAGE = *package-name*
DOES NOT EXIST

Explanation: The indicated subcommand was issued against a package that does not exist. The individual variable fields contain:

bind-type

Type of bind subcommand (BIND COPY | BIND REPLACE | REBIND | FREE | BIND PLAN | REBIND PLAN | DROP PACKAGE). If BIND or REBIND PLAN is specified, the package-name refers to a package on the PKLIST for the plan.

error-type

Type of error: WARNING or ERROR.

auth-id Authorization ID of the invoker of the BIND subcommand.

package-name

Name of the package in the following format
'location.collection.package.(version)'

System Action: Package not rebound or freed.

System Programmer Response: Check the SYSPACKAGE catalog table for the correct 'location.collection.package.version' to use.

DSNT239I PLAN *plan-id* CONTAINS NO DBRMS
AND NO PACKAGES

Explanation: A plan with no DBRMs was rebound with the NOPKLIST option specified. This creates an empty plan. No SQL can be executed. The individual variable fields contain:

plan-id Plan name specified on the REBIND command.

System Action: This is a warning message. The REBIND process will continue.

System Programmer Response: If an empty plan is not desired, reissue the REBIND command with the PKLIST keyword specifying a new list.

DSNT240I *csect-name bind-type* **ERROR, ASTERISK NOT ALLOWED ON REMOTE *bind-type* PACKAGE**

Explanation: When remotely rebinding or freeing a package, an asterisk (*) cannot be specified anywhere in the name of a package. In other words, it is not possible to remotely rebind or free multiple packages.

System Programmer Response: Remove the asterisk and rebind, or free a specific package. Refer to *DB2 Command Reference* for the correct syntax for REBIND or FREE PACKAGE.

DSNT241I *bind-type AUTHORIZATION error-type ON PLAN *plan-id* AUTHORIZATION ID *auth-id* NOT AUTHORIZED TO EXECUTE PACKAGE *package-name**

Explanation: The indicated authorization ID does not have EXECUTE authority on the specified package in the package list.

bind-type

Type of bind subcommand: BIND or REBIND

error-type

Type of error: WARNING or ERROR. If VALIDATE(BIND) was specified, this is an ERROR message. Otherwise, it is a WARNING message.

plan-id Name of application plan specified in the subcommand.

auth-id Authorization ID of the plan owner.

package-name

Name of the package (collection.package). The location of the package is the local DB2 location name.

System Action: If the bind subcommand was invoked with VALIDATE(BIND), the BIND or REBIND operation is not performed. If VALIDATE(RUN) was used then the BIND or REBIND operation will continue.

System Programmer Response: The indicated plan owner should be granted the EXECUTE privilege on the package.

DSNT242I *bind-type* **ERROR USING *auth-id* AUTHORITY NO BIND OR REBIND SUBCOMMANDS ARE ALLOWED FOR THIS AUTHID**

Explanation: The authorization ID is not allowed to perform the indicated 'bind-type' against a plan or package because entries in the RLST table prohibit binding and rebinding by this authorization ID, or all authorization IDs.

bind-type

Type of bind subcommand: BIND or REBIND

auth-id Authorization ID of the plan or package owner.

System Action: The plan or package is not bound or rebound.

System Programmer Response: If the indicated authorization ID should be allowed to bind, change the entry in the active RLST table.

DSNT243I *pkg-id* **BIND ERROR FOR PACKAGE = *pkg-id* CONTOKEN = '*contoken*'X IS NOT UNIQUE SO IT CANNOT BE CREATED**

Explanation: An attempt is made to add or replace a package with a consistency token that is not unique for that package. In other words, the combination of 'location.collection.package.consistency-token' already exists.

pkg-id Fully qualified name of the package.

contoken

Consistency token in hexadecimal.

System Action: The BIND will fail.

System Programmer Response: Check the SYSIBM.SYSPACKAGE catalog table for names of existing application packages with the indicated consistency token. Re-issue the BIND subcommand such that the 'location.collection.package.consistency-token' is unique within the catalog. The following SQL statement can be used to query the catalog,

```
SELECT COLLID,NAME
FROM loc-id.SYSIBM.SYSPACKAGE
WHERE HEX(CONTOKEN) = 'contokn';
```

DSNT244I *bind-type* **ERROR *keyword* KEYWORD IS NOT SUPPORTED FOR REMOTE PROCESSING**

Explanation: The indicated keyword is not supported for the remote bind or rebind subcommand.

bind-type

Type of bind subcommand: BIND or REBIND

keyword

Name of the keyword that is not supported.

Programmer Response: Check *DB2 Command Reference* for the correct syntax.

DSNT245I *location* **LOCATION *location* CANNOT BE SPECIFIED. THE LOCAL DB2 IS NOT DEFINED**

Explanation: Since the local DB2 location name is undefined, no location name may be given when specifying a package name on a bind subcommand.

location

Location specified on the bind subcommand.

System Action: The bind subcommand was not performed.

System Programmer Response: The location name of the local DB2 must be defined in BSDS if the location is used in the BIND, REBIND, or FREE subcommand.

DSNT246I *bind-type* **FOR PACKAGE** *package-name*
WITH MARK *release-dependency-mark*
FAILED BECAUSE PACKAGE
DEPENDS ON FUNCTIONS OF THE
RELEASE FROM WHICH FALL BACK
HAS OCCURRED

Explanation: The named package depends on a function of DB2 which is not supported by the currently active release.

bind-type

Type of bind subcommand: REBIND

package-name

Name of the package in the following format:
'location.collection.package.(version)'

release-dependency-mark

A one-character mark showing the oldest release of the DB2 which can support this package. The release dependency mark for the package is kept in the IBMREQD column in the DB2 catalog in SYSIBM.SYSPACKAGE.

System Action: The 'bind-type' operation for this package is not performed.

User Response: The package cannot be bound until the DB2 subsystem is remigrated to the newer release.

System Programmer Response: Warn users not to use plans containing this package until the DB2 subsystem has been remigrated to the newer release.

DSNT247I *bind-type* **ERROR** *object-type* **NOT**
FOUND FOR *object-type = object-name*

Explanation: You attempted to FREE or REBIND multiple plans or packages using the asterisk (*) but no plans or packages were found.

bind-type

Type of bind subcommand: REBIND or FREE

object-type

Type of object to be freed or rebound: PLAN or PACKAGE

object-name

If object-type is PLAN, object-name is the name of the application plan. Otherwise, it is the name of the package in 'location.collection.package' format.

System Action: The REBIND or FREE operation is not performed.

User Response: Check the plan or package name. If it is correct, no plans or packages were found and no operation can be performed; otherwise, correct the plan

or package name and reissue the REBIND or FREE subcommand.

DSNT248I *csect-name bind-type* **ERROR FOR**
object-type object-name **CCSID = ccsid IS**
INVALID FOR ENCODING SCHEME =
scheme

Explanation: The system does not have a valid CCSID defined for the specified encoding scheme, or the specified CCSID is not defined on the system.

bind-type

Type of bind subcommand: BIND or REBIND.

object-type

PLAN or PACKAGE

object-name

If *object-type* is PLAN, *object-name* is the name of the application. Otherwise, it is the name of the PACKAGE in 'location.collection.package' format.

scheme

This field displays the encoding scheme specified in the ENCODING bind option on the *bind-type* subcommand or defaulted from the system default Application Encoding Scheme. If *scheme* is UNKNOWN, then the CCSID value has not been defined in the ENCODING bind option or by the system default Application Encoding Scheme, and therefore the encoding scheme is not known.

ccsid

This field displays the numeric CCSID specified in the ENCODING bind option or the numeric CCSID corresponding to the scheme specified in the ENCODING bind option. Otherwise, *ccsid* displays the numeric CCSID corresponding to the specified *ccsid-type*.

Severity: 8 (error)

System Action: The *bind-type* operation is not performed

User Response: Verify that the correct encoding scheme was specified in the ENCODING bind option on the *bind-type* subcommand. If correct, see System Programmer Response and contact the system programmer. If incorrect, specify the correct scheme in the ENCODING option and reissue the *bind-type* subcommand.

System Programmer Response: If the bind option ENCODING was not specified, and the value for ENCODING was defaulted from the system default Application Encoding Scheme instead, verify the Application Encoding Scheme is set to a defined CCSID.

If the value specified for the ENCODING option was ASCII, EBCDIC or UNICODE, verify the corresponding CODED CHAR SET subsystem parameter on the

installation panel DSNTIPF has been set to a defined CCSID.

Otherwise, inform the user of the correct CCSID. Refer to Appendix A of *DB2 Installation Guide* for more information regarding CCSIDs and character sets.

DSNT249I *csect-name bind-type* **WARNING FOR PLAN *plan-name* keyword LOCATION-ID *location-id* NOT FOUND IN SYSIBM.LOCATION**

Explanation: A 'location-id' was specified on the PKLIST or CURRENTSERVER keyword on a bind subcommand. That location is not defined in the SYSIBM.LOCATIONS table.

bind-type

Type of bind subcommand: BIND or REBIND

plan-name

Name of the plan

keyword

The bind subcommand containing the nonexistent location: PKLIST or CURRENTSERVER

location-id

The nonexistent location

System Action: The bind process will continue.

System Programmer Response: Define the appropriate 'location-ids' in the SYSIBM.LOCATION catalog table prior to executing the plan.

DSNT250I **BIND UNABLE TO OPEN DBRM LIBRARY USING *authorization-id* AUTHORITY *object-type* = *object-name***

Explanation: The BIND subcommand was unable to open the DBRM partitioned data set(s).

authorization-id

Authorization ID of the invoker of the BIND subcommand.

object-type

PLAN | PACKAGE

object-name

If 'object-type' is PLAN, 'object-name' is the name of the application plan. Otherwise, it is the name of the package in 'location.collection.package' format.

User Response: Contact the system programmer, providing all material associated with the error.

System Programmer Response: Determine why the BIND subcommand was unable to open the DBRM library, and correct the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem

determination," on page 1353: 1, 2, 5, 32.

DSNT251I **BIND UNABLE TO LOCATE DBRM LIBRARY MEMBERS USING *authorization-id* AUTHORITY *object-type* = *object-name***

Explanation: The BIND subcommand received an I/O error while attempting to locate the specified DBRM library member(s).

authorization-id

Authorization ID of the invoker of the BIND subcommand.

object-type

PLAN | PACKAGE

object-name

If object-type is PLAN, object-name is the name of the application plan. Otherwise, it is the name of the package in 'location.collection.package' format.

System Programmer Response: Correct the reason for the I/O error, and reissue the BIND subcommand.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 32.

Severity: 0 (informational)

DSNT256I **DBRM MEMBER** *member-name* **IS EMPTY, A PACKAGE CANNOT BE BOUND**

Explanation: The named DBRM member is empty, a package cannot be created.

System Action: No package is created.

DSNT257I **BIND ERROR, PACKAGE** *package-name* **CANNOT BE CREATED BECAUSE IT HAS THE SAME NAME AS THE PACKAGE BEING COPIED**

Explanation: The location and collection-id of the package being created are the same as the local location and the collection-id specified with the COPY keyword. You cannot create a package that is the same name as the package being copied.

package-name
Name of the package
(location.collection.package.(version))

System Action: The package is not bound.

System Programmer Response: Choose a different collection id for the package you are creating and resubmit the subcommand.

DSNT258I *bind-type* **WARNING FOR PLAN** *plan-name* **THE LOCATION-ID** *location-id* **SPECIFIED IN CURRENTSERVER MAY NEED A PACKAGE LIST**

Explanation: If binding a PLAN with a nonlocal location specified in the CURRENTSERVER, a package list is required using the PKLIST keyword to access any packages at the location specified.

bind-type

Type of bind subcommand: BIND or REBIND

plan-name

Name of plan

location-id

Location of CURRENTSERVER

System Action: The bind process will continue.

System Programmer Response: Add a package list with package(s) that reference the location specified in the CURRENTSERVER or delete the CURRENTSERVER from the BIND or REBIND subcommand.

DSNT259I *bind-type* **WARNING FOR PLAN *plan-name* NO PACKAGES IN THE PACKAGE LIST REFERENCE THE LOCATION-ID *location-id* SPECIFIED IN CURRENTSERVER**

Explanation: There are no packages in the package list that reference the location specified in the CURRENTSERVER keyword.

bind-type

Type of bind subcommand: BIND or REBIND

plan-name

Name of plan

location-id

Location of CURRENTSERVER

System Action: The bind process will continue.

System Programmer Response: Change 'location-ids' for the packages in the package list to reference the location in the CURRENTSERVER or change the location specified in CURRENTSERVER.

DSNT260I *csect-name bind-type* - **THE SUBMITTED PARAMETERS RESULT IN AN INVALID COMBINATION OF *bind-option1* AND *bind-option2* FOR *object-type* = *object-name***

Explanation: The BIND or REBIND subcommand has been submitted with an invalid combination of bind option or parameter values.

bind-type

Type of bind subcommand: BIND or REBIND.

object-type

PLAN or PACKAGE

object_name

If *object-type* is PLAN, *object-name* is the name of the application plan. If *object_type* is PACKAGE, *object_name* is the name of the package in the format 'location-id.collection-id.package-id'.

bind-option1 and bind-option2

The invalid combination of bind option values, where *bind-option1* and *bind-option2* are each an option name and value.

If *object-type* is PLAN, then one of the following applies:

- *bind-option1* was used on the REBIND subcommand and *bind-option2* exists in the SYSIBM.SYSPLAN catalog table for PLAN *object-name*, or
- *bind-option2* was used on the REBIND subcommand and *bind-option1* exists in the SYSIBM.SYSPLAN catalog table for PLAN *object-name*.

If *object-type* is PACKAGE, then one of the following applies:

- *bind-option1* was used on the BIND COPY or REBIND subcommand and *bind-option2* exists in the SYSIBM.SYSPACKAGE catalog table for PACKAGE *object-name*, or
- *bind-option2* was used on the BIND COPY or REBIND subcommand and *bind-option1* exists in the SYSIBM.SYSPACKAGE catalog table for PACKAGE *object-name*.

The combination of *bind-option1* and *bind-option2* is not supported by DB2.

System Action: The BIND or REBIND process is terminated for the indicated plan or package.

User Response: Refer to *DB2 Command Reference* for valid combinations of the indicated bind option values, and reissue the BIND or REBIND subcommand with a valid combination.

Problem Determination: See the Explanation section of this message.

DSNT261I *bind-type* **WARNING FOR *object-type* = *object-name* ALL CONNECTION TYPES ARE DISABLED**

Explanation: All possible connection types are disabled. The plan or package cannot be executed.

bind-type

Type of bind subcommand: BIND or REBIND

object-type

PLAN or PACKAGE

object-name

If *object-type* is PLAN, *object-name* is the name of the application plan. Otherwise, it is the name of the package in 'location.collection.package' format.

System Action: The bind process will continue.

System Programmer Response: Delete one or more connection types from DISABLE clause or add a list of

DSNT262I • DSNT265I

connection names associated with one of the connection types (DLIBATCH, CICS, IMSBMP, IMSMPP, or REMOTE. REMOTE is only valid for BIND/REBIND PACKAGE)

DSNT262I *csect-name bind-type* **WARNING - ISOLATION *old-iso* NOT SUPPORTED. CHANGING TO ISOLATION *new-iso***

Explanation: DB2 does not support the isolation level specified on the local BIND or REBIND PACKAGE subcommand. The isolation level specified by *new-iso* is used instead.

Severity: 4

System Action: Processing continues

User Response: If the new isolation level is not satisfactory, change the ISOLATION option on the BIND or REBIND PACKAGE subcommand and rebind the package. Use a value that DB2 supports.

DSNT263I *csect-name bind-type* **FOR *object-type* = *object-name* FAILED BECAUSE THE *bind-type* DEPENDS ON FUNCTIONS IN A LATER DB2 RELEASE WITH MARK *release-dependency-mark* OR HIGHER**

Explanation: The current DB2 does not support a bind option or feature specified in the indicated bind subcommand. The bind option or feature depends on functions in a later DB2 release.

bind-type

Type of bind subcommand: BIND or REBIND

object-type

PLAN or PACKAGE

object-name

If *object-type* is PLAN, *object-name* is the name of the plan.

If *object-type* is PACKAGE, *object-name* is the name of the package in the format 'location-id.collection-id.package-id'.

release-dependency-mark

A one-character mark indicating the oldest DB2 release that can support the bind subcommand.

This message can be issued in the following situations:

- When the DSN command explicitly or implicitly uses the name of a DB2 subsystem that does not support a bind option or feature used in the DSN bind subcommand *bind-type*, or
- When the DSN command uses a group attachment name for a DB2 data sharing group and the receiving DB2 data sharing member does not support a bind option or feature used in the DSN bind subcommand *bind-type*.

System Action: The *bind-type* operation is not performed.

User Response: In the DSN command, specify the name of a DB2 subsystem having release dependency mark *release-dependency-mark* or higher that supports all of the bind options or features used in the *bind-type* subcommand.

For a list of the DB2 release dependency marks and their meanings, refer to the IBMREQD column in the SYSIBM.SYSPLAN or SYSIBM.SYSPACKAGE DB2 catalog tables described in Appendix D of *DB2 SQL Reference*.

System Programmer Response: See the 'User Response' section of this message.

DSNT264I *csect-name bind-type bind-subtype* **ERROR USING *auth-id* AUTHORITY PACKAGE *package-name* IS A TRIGGER PACKAGE**

Explanation: To rebind a trigger package, you must use the DSN subcommand REBIND TRIGGER PACKAGE. To free a trigger package, you must use the SQL statement DROP TRIGGER. You cannot copy a trigger package.

bind-type

Type of bind subcommand: BIND, REBIND, or FREE

bind-subtype

Subtype of bind subcommand: COPY or blank

auth-id Authorization ID attempting the prohibited action

package-name

Name of the package in the following format: 'collection.package'

System Action: The trigger package is not copied, rebound, or freed.

System Programmer Response: Check the SYSIBM.SYSPACKAGE catalog table for names of existing trigger packages. Re-invoke the bind subcommand with a 'collection.package' that is not a trigger package.

DSNT265I *csect-name bind-type bind-subtype* **ERROR USING *auth-id* AUTHORITY PACKAGE *package-name* IS NOT A TRIGGER PACKAGE**

Explanation: The subcommand REBIND TRIGGER PACKAGE can be used only for trigger packages.

bind-type

Type of bind subcommand: REBIND

bind-subtype

Subtype of bind subcommand: TRIGGER

auth-id Authorization ID attempting the REBIND

package-name

Name of the package in the following format:
'collection.package'

System Action: The package specified is not rebound.

System Programmer Response: For a package that is not a trigger package, rebind using the subcommand REBIND PACKAGE. Re-invoke the bind subcommand with a 'collection.package' that is a trigger package.

DSNT266I *csect-name bind-type* FOR *object-type* = *object-name* FAILED. THE TOTAL LENGTH OF THE PATH SCHEMA NAME LIST EXCEEDS 254 CHARACTERS WITH SCHEMA NAME *schema-name*

Explanation: DB2 uses the schema name list you specified in the bind option PATH to set the DB2 SQL Path that will be used for the bind process. The SQL Path is a VARCHAR(254) string containing the list of schema names you specified, where each schema name is delimited with double quotes and separated from the next schema name by a comma. The total length of this SQL Path string, including the delimiters and commas, cannot exceed 254 characters. The indicated schema name *schema-name* in the bind option PATH causes the SQL Path string to exceed 254 characters.

bind-type

Type of bind subcommand: BIND or REBIND

object-type

PLAN or PACKAGE

object-name

If *object-type* is PLAN, *object-name* is the name of the plan.

If *object-type* is PACKAGE, *object-name* is the name of the package in the format 'location-id.collection-id.package-id.(version-id)'.
'location-id.collection-id.package-id.(version-id)'

schema-name

The schema name specified in the bind option PATH causing the SQL Path to exceed 254 characters.

System Action: The *bind-type* operation is not performed.

User Response: In the bind option PATH, specify a schema name list that does not cause the SQL Path to exceed 254 characters.

For more information about the bind option PATH and the schema name list, please see: Command Reference.

System Programmer Response: See the 'User Response' section of this message.

DSNT267I *csect-name* A TRIGGER PACKAGE CANNOT BE FREED USING THE FREE PACKAGE COMMAND

Explanation: A FREE PACKAGE command was received that identified the trigger package to be freed. Trigger packages can only be deleted using the DROP TRIGGER SQL statement.

System Action: The TSO Attachment Facility is ready for more input.

User Response: Use the SQL statement DROP TRIGGER to delete the trigger package.

DSNT268I *csect-name* A BIND COMMAND USING THE COPY OPTION NAMED A TRIGGER PACKAGE AS THE SOURCE FOR THE BIND

Explanation: A trigger package cannot be used as the source for a BIND COPY command.

System Action: The TSO Attachment Facility is ready for more input.

User Response: Correct the BIND command and resubmit.

DSNT270I THE FOLLOWING SQLCA INFORMATION WAS RETURNED FROM *subsystem*

:

SQLCODE = sqlcode
SQLSTATE = sqlstate
SQLERRMT = tokens
SQLWARN warn_fields

Explanation: A warning or error has been received from a database server using Advanced SQL protocols (ASP) of the Distributed Relational Database Architecture (DRDA), during remote program BIND processing. The tokens of the message are:

1. subsystem - the database server,
2. sqlcode - SQL return code,
3. sqlstate - additional set of return codes common to the four relational products,
4. tokens - specific tokens passed in the message portion of the SQLCA for problem determination, and
5. warn_fields - the warning information indicators.

This message is issued by the following CSECT:
DSNLXMSG

System Action: See the System Action associated with the indicated SQL return code.

System Programmer Response: See the Programmer Response associated with the indicated SQLCODE and/or SQLSTATE. Take note of the warning or error (as indicated in the SQLCODE, SQLSTATE, or one or more of the SQLWARN fields), and determine if

a program change is necessary. SQLWARNx fields are described in Appendix C of *DB2 SQL Reference*. A change to the application may be necessary or the system programmer may have to be consulted depending on the situation.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

DSNT271I THE FOLLOWING SQLCA INFORMATION WAS RETURNED FROM subsystem

```

:
  SQLCODE = sqlcode
  SQLSTATE = sqlstate
  SQLERRMT = tokens
  SQLWARN warn_fields
  STATEMENT = stmt_num
    
```

Explanation: A warning or error has been received from a database server using advanced SQL protocols (ASP) of the Distributed Relational Database Architecture (DRDA), during remote program BIND processing. The tokens of the message are:

1. subsystem - database server,
2. sqlcode - SQL return code,
3. sqlstate - additional set of return codes common to the four relational products,
4. tokens - specific tokens passed in the message portion of the SQLCA for problem determination,
5. warn_fields - the warning information indicators, and
6. stmt_num - the statement number of the failing statement.

This message is issued by the following CSECT: DSNLXMSG

System Action: See the System Action associated with the indicated SQLCODE.

System Programmer Response: Take note of the warning or error (as indicated in the SQLCODE, SQLSTATE, or one or more of the SQLWARN fields), and determine if a program change is necessary. SQLWARNx fields are described in Appendix C of *DB2 SQL Reference*. A change to the application may be necessary or the system programmer may have to be consulted depending on the situation.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

DSNT300I AUTH-ID authorization-id NOT AUTHORIZED TO PERFORM function ON DATABASE dbname. REQUEST REJECTED

Explanation: The invoker's 'authorization-id' as designated by AUTHORIZATION ID is not authorized to perform the specified database control command function on this database. The 'function' is either -START, -STOP, or -DISPLAY. The name of the database is 'dbname'.

System Action: The request is rejected.

User Response: Notify the system programmer.

System Programmer Response: The privilege to issue the command must be granted to the indicated 'authorization-id'.

DSNT301I INVALID DATABASE dbname

Explanation: The databases named in the -START, -STOP, or -DISPLAY DATABASE command do not exist. The name of the database is 'dbname'.

System Action: The request is rejected. This message may be repeated.

System Programmer Response: Reissue the command with a valid name.

DSNT302I INVALID NAME spname

Explanation: In the message, 'spname' is the name of the table space or index space. The 'spname' specified in the SPACENAM keyword on the -START, -STOP, or -DISPLAY DATABASE command does not exist.

System Action: The request is rejected. This message may be repeated.

System Programmer Response: Reissue the command with a valid table space name or index name.

DSNT304I csect-name INSTALLATION SYSOPR IS NOT AUTHORIZED TO CHANGE OBJECT STATUS ON DATABASE dbname. REQUEST IS REJECTED.

Explanation: INSTALLATION SYSOPR is not authorized to perform the START DATABASE command function on this database because the command can change an objects status in this database. INSTALL SYSOPR can use the START DATABASE command only to recover LPL pages or GRECP objects. The name of the database is *dbname*.

System Action: The request is rejected.

Operator Response: Reissue the -START DATABASE command using the correct access mode or contact your system programmer.

DSNT305I SUBSYSTEM FAILURE DURING
command-name **DATABASE COMMAND**
PROCESSING. RC = yy, REASON = zz

Explanation: An error was found while processing the -START, -STOP or -DISPLAY DATABASE command. In the message, 'command-name' is the string 'DISPLAY', 'STOP', or 'START' (depending upon the command processed).

System Action: Originating from CSECT DSNTDCST:

- For relational data system (RDS) subcomponent errors:
 - 'yy' is a 4-byte return code of 8.
 - 'zz' is a 4-byte abend code of '00E30085'.
 - For data manager (DM) subcomponent errors:
 - 'yy' is a 4-byte return code consisting of a 2-byte return code and a 2-byte reason code returned by the data manager function invoked by DSNTDCST.
 - 'zz' is a 4-byte abend code '00E30086'.
- A record is written to SYS1.LOGREC, and an SVC dump is requested before the execution unit is abended.

Originating from CSECT DSNTDDIS:

- 'yy' is a 4-byte return code of 12.
- 'zz' is a 4-byte abend code of '00E30089'.

The request is abended.

Originating from CSECTs DSNTDMUL or DSNTDMMSG:

- 'yy' is a 4-byte return code returned by the message generator.
- 'zz' is a 4-byte abend code of '00E30084'.

The request is abended.

System Programmer Response: Refer to Part 4, "Section 4. DB2 Codes," on page 773 for the particular abend reason code issued.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 17.

DSNT306I RESPONSE MESSAGE LIMIT HAS
BEEN REACHED

Explanation: A fixed amount of space exists in which to generate DISPLAY, START, or STOP database command messages. This message indicates that the DISPLAY, START, or STOP database command that was specified generated more messages than will fit in that space.

User Response: Specify individual databases and/or table spaces rather than specifying '*' (that is, all names).

DSNT307I INVALID RANGE SPECIFICATION
string1 **IS GREATER THAN** *string2*

Explanation: A range was specified on a DISPLAY DB(string1:string2) or DISPLAY DB(..) SPACENAM(string1:string2) command or on a database command (START DB, STOP DB, or DISPLAY DB) on PART(string1:string2) keyword where the first string, specified alphanumerically, collates after the second string.

User Response: Specify the command again. Make sure the first string does not alphanumerically collate after the second string specified.

DSNT308I AFTER KEYWORD ONLY VALID FOR A
SINGLE DATABASE OR A SINGLE
TABLESPACE/INDEXSPACE WITHIN A
DATABASE. REQUEST REJECTED

Explanation: The AFTER keyword may be specified by one of the following:

- A single database name after the keyword DATABASE
- A single table space name or index space name after the keyword SPACENAM.

User Response: Specify the command correctly.

DSNT309I csect-name object_name IS CURRENTLY
state.

Explanation: One of the following is already in the requested state:

- A database listed in START DB(list) or STOP DB(list)
- A table space listed in START DB(name) SPACENAM(list) or STOP DB(name) SPACENAM(list)
- An index space listed in START DB(name) SPACENAM(list) or STOP DB(name) SPACENAM(list)
- A partition of a partitioned table space listed in START DB(list) SPACENAM(list) PART(n), STOP DB(list) SPACENAM(list) PART(n), START DB(list) SPACENAM(list), or STOP DB(list) SPACENAM(list)

In the message:

- The 'object' is the database, table space, index space or partition number with table space name or the index space name.
 - TABLESPACE, if the specified table space was currently in the requested state
 - INDEXSPACE, if the specified index space was currently in the requested state
 - DATABASE, if the database was currently in the requested state
 - PARTITION, if the specified partition of a partitioned table space or partitioned index was currently in the requested state

DSNT310I • DSNT314I

- The 'state' is:
 - START RW, if the specified object is currently started read/write
 - START RO, if the specified object is currently started read only
 - START UT, if the specified object is currently started for utility processing
 - STOPPED, if the specified object is currently stopped or is stopping
 - STOP PENDING, if the specified object currently is in stop pending status.

If there are pages in the logical page list (LPL) for the object, or if the object is in group buffer pool recovery pending (GRECP) status, a START DATABASE ACCESS(RO) or START DATABASE ACCESS(RW) command triggers a recovery of that object even if this message is issued for that object. For each object that has LPL or GRECP recovery that is initiated, DB2 issues a DSNI006 message followed by either a DSNI021 message (when the recovery completes successfully) or a DSNI005 message (when the recovery is unsuccessful).

User Response: No response is necessary. This message is informational only.

DSNT310I *csect-name* **ALL** *object* **CURRENTLY** *state*.

Explanation: A database and all of its table spaces and index spaces are already in the requested state. This occurred following the processing of one of these commands:

- START DB(*)
- STOP DB(name)
- START DB(name) SPACENAM(*)
- STOP DB(name) SPACENAM(*)

In this message:

- The 'object' is either:
 - TABLESPACE(S) if the specified table space was currently in the requested state
 - INDEXSPACE(S) if the specified index space was currently in the requested state
 - DATABASE(S) if the database was currently in the requested state.
- The 'state' is either:
 - START RW if the specified table space is currently started read/write
 - START RO if the specified table space is currently started read only
 - START UT if the specified table space is currently started for utility processing
 - STOPPED if the specified table space is currently stopped, has a stop pending against it, or is stopping.

If there are pages in the logical page list (LPL) for the object, or if the object is in group buffer pool recovery pending (GRECP) status, a START DATABASE ACCESS(RO) or START DATABASE ACCESS(RW) command triggers a recovery of that object even if this message is issued for that object. For each object that has LPL or GRECP recovery that is initiated, DB2 issues a DSNI006 message followed by either a DSNI021 message (when the recovery completes successfully) or a DSNI005 message (when the recovery is unsuccessful).

User Response: No response is necessary. This message is informational only.

DSNT311I **MESSAGE LIMIT EXCEEDED. DISPLAY IS TERMINATED.**

Explanation: The number of messages generated exceeds the maximum number of messages specified in the LIMIT keyword or exceeds the system default.

DSNT312I *object name* **MUST BE STARTED RW. NO ACTION TAKEN.**

Explanation: The ACCESS keyword is either RO or UT, and the object must be started ACCESS (RW).

In the message, 'object' is either:

- TABLESPACE(S) IN if the START DB(name) SPACENAM(...) is specified, or
- DATABASE if the START DB(name) is specified.

DSNT313I **ACCESS(FORCE) IS VALID ONLY WITH EXPLICIT TABLESPACE OR INDEXSPACE NAMES. COMMAND IS REJECTED**

Explanation: The ACCESS(FORCE) keyword can be specified when either:

- A single table space or index space name appears after the keyword SPACENAM in a START DATABASE command.
- A list of table space and/or index space names appears after the keyword SPACENAM in a START DATABASE command.

Operator Response: Specify the command correctly.

DSNT314I *csect_name* **INVALID PARTITION SPECIFICATION FOR OBJECT** *object-name*

Explanation: The PART keyword is invalidly specified in a START DATABASE, STOP DATABASE, or DISPLAY DATABASE command.

The PART keyword is invalid if it is specified for:

- A nonpartitioned table space
- A nonpartitioned type 1 index
- A type 2 index not defined on a partitioned table space

The object *object-name* can be either a table space or an index space.

No action for this table space or index space is performed by the START DATABASE, STOP DATABASE or DISPLAY DATABASE command. Any other valid table space or index space specified is processed by the command.

Severity: 8 (error)

System Action: The desired command is not processed for the table space or index space in question. All other valid table spaces or index spaces specified in the command are processed.

User Response: Resubmit the command for the nonpartitioned table space or index space without using the PART keyword.

Problem Determination: SYSIBM.SYSTABLESPACE in the DB2 catalog indicates whether a table space is partitioned. SYSIBM.SYSINDEXSPACE in the DB2 catalog indicates whether an index space is partitioned and whether the index space is a type 1 or a type 2 index. Type 2 nonpartitioned indexes can be started, stopped, or displayed at the logical partition level; type 1 cannot.

DSNT315I *csect_name* **INVALID PARTITION NUMBER OR RANGE SPECIFIED -**
part-num **FOR OBJECT** *object-name*

Explanation: An invalid partition number or range was specified in the PART keyword for a START DATABASE, STOP DATABASE or DISPLAY DATABASE command.

Partition number or range *part-num* is invalid for the object *object-name*.

Severity: 8 (error)

System Action: The part number or range is ignored. All other valid partitions specified are processed if PART was specified as list.

User Response: Determine the correct partition specification for the table space or index that was the subject of the specified command and resubmit the command.

Problem Determination: SYSIBM.SYSTABLESPACE in the DB2 catalog indicates the correct range of partition numbers for the table space. SYSIBM.SYSINDEXSPACE in the DB2 catalog indicates whether an index space is partitioned and whether the index space is a type 1 or a type 2 index. Type 2 indexes can be started, stopped, or displayed at the logical partition level; type 1 cannot.

DSNT316I *csect-name* **A LOGICAL PARTITION OF AN INDEX WHICH HAS PAGES IN THE LPL OR HAS BEEN MARKED GRECP CANNOT BE STARTED FOR RW OR RO ACCESS**

Explanation: The START DATABASE command was specified for a logical partition of a nonpartitioned index which has pages in the logical page list (LPL) or is marked group buffer pool recovery pending (GRECP). To start a nonpartitioned index with one of these exception conditions, the START DB command must be specified without the PART keyword.

Severity: 8 (error)

System Action: The command is not processed for the index space. All other valid table spaces or index spaces specified in the command are processed.

User Response: Submit the command for the nonpartitioned index space without using the PART keyword.

Problem Determination: If more information on the status of the index space is required, use the -DISPLAY DATABASE command.

DSNT317I *csect-name* **ANY USER-DEFINED INDEXES ON DSNDB06 COULD NOT BE** *cmd-type* **DUE TO A RESOURCE UNAVAILABLE ON THE CATALOG OR DIRECTORY.**

Explanation: If user-defined indexes exist on DSNDB06, they could not be displayed, started or stopped (depending on *cmd-type*) because the catalog or directory was not available. DB2-defined indexes and table spaces are not affected by this unavailability.

Programmer Response: When you get this message, correct the resource unavailable problem and reissue the command.

System Action: Any user-defined indexes on DSNDB06 were not affected by the command issued. All other table spaces and index spaces were processed by the command.

DSNT331I *csect-name* **DATABASE** *name* **AND ANY SPACE IT CONTAINS CANNOT BE STOPPED. IT IS THE ACTIVE COMMUNICATIONS DATABASE**

Explanation: The database specified in the message cannot be stopped because it is the active communications database. In addition, spaces within the active communications database cannot be stopped.

System Action: Nothing is stopped.

Operator Response: If the database or any space within it must be stopped, you must stop the distributed data facility (STOP DDF). In a DB2 data sharing environment, you must stop the distributed data facility

on all members of the DB2 data sharing group.

DSNT332I TABLESPACES AND INDEXSPACES ARE UNAVAILABLE BECAUSE DATABASE name IS STOPPED

Explanation: The database 'name' is currently marked as stopped. Consequently, its table spaces and index spaces are unavailable even though they may have been started.

DSNT350I -luw-id ACCESSING DATA FOR location

Explanation: This message follows message DSNT394I or DSNT396I for each thread reported that is participating in distributed data access (database access thread). This additional line reports the distributed identification as follows:

luw-id=token

The logical-unit-of-work identifier (LUW-ID) is a unique identifier that is assigned to the thread followed by an '=' sign and a token. The token can be used in place of luw-id in any DB2 command that accepts luw-id as input.

location

The LOCATION name assigned to the requesting site.

The message number and subsystem recognition character are not included in this message.

This message is issued by the following CSECT: DSNTDMUL

DSNT358I csect_name INVALID PARTITION SPECIFICATION FOR OBJECT object-name

Explanation: Specification of the PART keyword in a DISPLAY DATABASE command is invalid.

The PART keyword is invalid if it is specified for:

- A nonpartitioned table space
- A nonpartitioned type 1 index
- A type 2 index not defined on a partitioned table space

The object *object-name* can be either a table space or an index space.

No action for this table space or index space is performed by the DISPLAY DATABASE command. Any other valid table space or index space specified is processed by the command.

Severity: 8 (error)

System Action: The desired command is not processed for the table space or index space in question. All other valid table spaces or index spaces

specified in the command are processed.

User Response: Resubmit the command for the nonpartitioned table space or index space without using the PART keyword.

Problem Determination: SYSIBM.SYSTABLESPACE indicates whether a table space is partitioned. SYSIBM.SYSINDEXSPACE indicates whether an index space is partitioned and whether the index space is a type 1 or a type 2 index. Type 2 nonpartitioned indexes can be displayed at the logical partition level; type 1 indexes cannot.

DSNT359I csect_name INVALID PARTITION NUMBER SPECIFIED - part-num FOR OBJECT object-name

Explanation: An invalid partition number was specified in the PART keyword for a DISPLAY DATABASE command.

Partition number *part-num* is invalid for the object *object-name*.

Severity: 8 (error)

System Action: The part number is ignored. All other valid partitions specified are processed.

User Response: Determine the correct partition specification for the table space or index that was the subject of the specified command and resubmit the command.

Problem Determination: SYSIBM.SYSTABLESPACE in the DB2 catalog indicates the correct range of partition numbers for the table space. SYSIBM.SYSINDEXSPACE in the DB2 catalog indicates whether an index space is partitioned and whether the index space is a type 1 or a type 2 index. The PART keyword can be used to display the status of logical partitions of type 2 indexes but not type 1 indexes.

DSNT360I *****

Explanation: This message consists of 35 asterisks that begin the display of any database and the display of space names for any database.

DSNT361I *DISPLAY DATABASE SUMMARY* report-type-list

Explanation: This message is a multiple-line message that labels the requested set of databases, table spaces, and index spaces.

In the message, 'report-type-list' lists all options specified on the command delimited by spaces. Possible values are:

ACTIVE

All allocated databases are listed.

GLOBAL

All requested database information is listed. This title is produced if ACTIVE, DISABLED, and RESTRICT are omitted.

LOCKS

The connection identifiers and correlation identifiers of all applications holding, retaining, or waiting for locks on the specified table spaces or index spaces are displayed.

RESTRICT

All databases with restricted usage (that is, RO, started UT) are listed.

USE

The connection identifiers and correlation identifiers of all allocated applications are listed.

CLAIMERS

The connection identifiers and correlation identifiers of all applications holding claims on the specified database are displayed.

LPL

The page number ranges of the pages that are included in the logical page list for the table space or index space.

OVERVIEW

All table spaces and index spaces that are contained within the databased that are specified.

DSNT362I **DATABASE =** *data-base-name* **STATUS**
 = *status* **DBD LENGTH =** *dbd-length*

Explanation: This message signals the beginning of display information from the DISPLAY DATABASE command. It lists the name, status, and DBD length of the database. All table space and index space names listed in the following DSNT392I, DSNT394I, or DSNT396I messages are contained within this database.

data-base-name

The database name.

status All a combination of one or more of the following strings delimited by a comma. The maximum length of the string is 18 characters.

RO The database is started for read activity only.

RW The database is started for read and write activity.

STOP The database is stopped.

STOPP A stop is pending or is in progress for this database.

UT The database is started for utility processing only.

DSNT363I **PHYSICAL ERROR PAGE RANGE FOR DATA SET** *data-set-name* **LOW=lowphy, HIGH=hiphy**

Explanation: This message is the response to a -DISPLAY DATABASE command when the SPACENAM keyword is specified in order to notify the user of any physical I/O errors encountered on a data set.

In the message, 'data-set-name' is the name of the data set with errors. The variables 'lowphy' and 'hiphy' identify the range of physical pages, within the data set, that were being read when the I/O errors occurred. Physical page numbers are assigned in relationship to the beginning of the data set in which the pages reside.

This message is always preceded by messages DSNT360I and DSNT361I, which identify the name of the database and page set that the specified data set supports.

Page sets (table spaces or index spaces) are made up of supporting data sets. Physical pages are pages in supporting data sets that are numbered from the beginning of the particular data set in which they reside. This message refers to physical pages in a data set that support (are part of) some page set.

System Action: See the Explanation section for this message.

DSNT364I *csect-name* **KEYWORD ONLY IS USED INCORRECTLY**

Explanation: Keyword *ONLY* is used incorrectly in the DISPLAY DATABASE command. When the SPACENAM keyword is specified, keyword *ONLY* is valid only if one of the following keywords is also used:

- LOCKS
- LPL
- CLAIMERS
- WEPR
- USE

System Action: The DISPLAY DATABASE command is not processed.

User Response: Add one of the keywords mentioned above in the explanation to the DISPLAY DATABASE command and issue the command again.

DSNT365I **NO DATABASES FOUND**

Explanation: This message is produced when a DISPLAY DB(name) is entered and no databases were found to satisfy the request.

System Action: The process continues normally.

DSNT366I DATABASE name NOT type

Explanation: A database listed in the DISPLAY DB(...) is not of the correct type. The variables are as follows:

- name** The name of the object.
- type** The type of request specified: ACTIVE, RESTRICTED, ACTIVE OR RESTRICTED

Note that either DSNT301I or DSNT302I is produced if no object is found and the keywords ACTIVE and RESTRICT are omitted.

System Action: Processing continues normally.

DSNT368I csect-name MORE THAN ONE MUTUALLY EXCLUSIVE KEYWORD WAS SPECIFIED IN THE DISPLAY DATABASE COMMAND.

Explanation: The keywords, LOCKS, LPL, CLAIMERS, WEPR and USE are mutually exclusive. Only one should be specified in a DISPLAY DATABASE command. The precedence order for which keyword takes precedence over the others is:

1. LPL
2. CLAIMERS
3. LOCKS
4. USE
5. WEPR

System Action: The DISPLAY DATABASE command is processed with this warning message.

User Response: Remove keywords from DISPLAY DATABASE command until only one of these mutually exclusive keywords is specified.

DSNT367I NO INFORMATION AVAILABLE

Explanation: This message indicated there is no LOCK, USE, LPL, WEPR or CLAIMER information available when DISPLAY DB(...) SPACENAM(...) ONLY is entered with the keywords LOCKS, USE, LPL, WEPR or CLAIMERS.

System Action: The process continues normally.

DSNT375I PLAN=*plan-id1* WITH CORRELATION-ID=*id1* CONNECTION-ID=*id2* LUW-ID=*id3* THREAD-INFO=*id4* IS DEADLOCKED WITH PLAN=*plan-id2* WITH CORRELATION-ID=*id5* CONNECTION-ID=*id6* LUW-ID=*id7* THREAD-INFO=*id8* ON MEMBER *id9*

Explanation: This message is issued whenever plan *plan-id1* with correlation *id1*, connection *id2*, and LUW *id3* is denied an IRLM lock because of a detected deadlock. Plan *plan-id2* identifies one of the members of the deadlock.

DB2 does not attempt to identify all survivors of a deadlock or all participants in a deadlock in the DSNT375I message. Plan *plan-id2* in message DSNT375I might be just one of several plans holding locks on the desired resource.

If multiple deadlocks are detected during the same deadlock-detection interval, the lock holder identified by *plan-id2* in one DSNT375I message might be selected to break a deadlock identified by a different DSNT375I message. The lock holder identified by *plan-id2* is not guaranteed to be a winner in all deadlocks in which it participates.

A DB2 IFCID 172 trace record contains the information needed to determine all participants in, and survivors of, a given deadlock.

plan-id1, plan-id2

The names of the executing plans.

- id1** The correlation identifier of the thread associated with *plan-id1*. Correlation IDs beginning with '0nn', where 'nn' is a number from 01 to 28, identify a system agent.
- id2** The connection identifier of the thread associated with *plan-id1*.
- id3** The logical-unit-of-work identifier of the thread associated with *plan-id1*. An asterisk (*) indicates that the thread does not have an LUW-ID. If the LUW-ID is not an asterisk, the value is a logical-unit-of-work identifier that is assigned to the thread. It is followed by an equal (=) sign and a token value, which can be used in place of the logical-unit-of-work identifier in any DB2 command that accepts a logical-unit-of-work identifier as input.
- id4** This ID contains additional identifiers that define more specific information regarding the identity of the agent.

In many distributed configurations, the primary authorization-ID used with DB2 is not necessarily the user-ID of the end-user. If provided by the client, the additional tokens further assist in identifying the client end-user.

The following identifiers, separated by a colon (:), are provided:

- The primary authorization-ID associated with the thread.
- Workstation name of the end-user's workstation. An asterisk (*) indicates it is not relevant to the thread or was not provided by the client.
- End-user's user-ID. An asterisk (*) indicates it is not relevant to the thread or was not provided by the client.

- Application name of the end-user's application. An asterisk (*) indicates that is not relevant to the thread or was not provided by the client.

- id5** The correlation identifier of the thread associated with *plan-id2*.
- id6** The connection identifier of the thread associated with *plan-id2*.
- id7** The logical-unit-of-work identifier of the thread associated with *plan-id2*. An asterisk (*) indicates that the thread does not have an LUW-ID. If the LUW-ID is not an asterisk, the value is a logical-unit-of-work-identifier that is assigned to the thread followed by an equal (=) sign and a token value, which can be used in place of logical-unit-of-work identifier in any DB2 command that accepts logical-unit-of-work identifier as input.
- id8** This ID contains additional identifiers that define more specific information regarding the identity of the agent.
- In many distributed configurations, the primary authorization-ID used with DB2 is not necessarily the user-ID of the end-user. If provided by the client, the additional tokens further assist in identifying the client end-user.
- The following identifiers, separated by a colon (:), are provided:
- The primary authorization-ID associated with the thread.
 - Workstation name of the end-user's workstation. An asterisk (*) indicates it is not relevant to the thread or was not provided by the client.
 - End-user's user-ID. An asterisk (*) indicates it is not relevant to the thread or was not provided by the client.
 - Application name of the end-user's application. An asterisk (*) indicates that is not relevant to the thread or was not provided by the client.
- id9** Identifies the member name of the DB2 subsystem on which the thread associated with *plan-id2* is executing.

DB2 can recover from a lock denial in some cases and can complete successfully. In such a case, the SQLCA is not filled in. One example is during setup of performance enhancements during bind time for execution time.

The SQLCA corresponding to correlation id *id1*, connection id *id2*, and LUW-ID *id3* contains an SQLCODE of -904, -911, -913, or -923 and the name of the resource involved in the deadlock.

If you receive a system plan in this message, see the information about system plans in message DSNT376I.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 18.

DSNT376I PLAN=*plan-id1* WITH
CORRELATION-ID=*id1*
CONNECTION-ID=*id2* LUW-ID=*id3*
THREAD-INFO=*id4* IS DEADLOCKED
WITH PLAN=*plan-id2* WITH
CORRELATION-ID=*id5*
CONNECTION-ID=*id6* LUW-ID=*id7*
THREAD-INFO= *id8* ON MEMBER *id9*

Explanation: This message is issued whenever plan *plan-id1* with correlation *id1*, connection *id2*, and LUW *id3* is denied a lock by IRLM, because the amount of time to wait for a locked resource was exceeded. Plan *plan-id2* identifies one of the plans holding a lock on the desired resource. The listed plan is not necessarily responsible for the time-out condition.

plan-id1, plan-id2

The names of the executing plans.

- id1** The correlation identifier of the thread associated with *plan-id1*. If the execution of the plan was switched by DB2 to a system agent, the correlation identifier identifies the system agent. Correlation IDs beginning with '0nn', where 'nn' is a number from 01 to 28, identify system agents.
- id2** The connection identifier of the thread associated with *plan-id1*. If the execution of the plan was switched by DB2 to a system agent, the connection identifier is the DB2 subsystem name.
- id3** The logical-unit-of-work identifier of the thread associated with *plan-id1*. An '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-ID that is assigned to the thread followed by an "=" sign and a token value, which can be used in place of logical-unit-of-work-ID in any DB2 command that accepts logical-unit-of-work-ID as input.
- id4** This ID contains additional identifiers that define more specific information regarding the identity of the agent.

In many distributed configurations, the primary authorization-ID used with DB2 is not necessarily the user-ID of the end-user. If provided by the client, the additional tokens further assist in identifying the client end-user.

The following identifiers, separated by a colon (:), are provided:

- The primary authorization-ID associated with the thread.
- Workstation name of the end-user's workstation. An asterisk (*) indicates it is not relevant to the thread or was not provided by the client.
- End-user's user-ID. An asterisk (*) indicates it is not relevant to the thread or was not provided by the client.
- Application name of the end-user's application. An asterisk (*) indicates that is not relevant to the thread or was not provided by the client.

id5 The correlation identifier of the thread associated with *plan-id2*. If the execution of the plan was switched by DB2 to a system agent, the correlation identifier identifies the system agent. Correlation IDs beginning with '0nn', where 'nn' is a number from 01 to 28, identify system agents.

id6 The connection identifier of the thread associated with *plan-id2*. If the execution of the plan was switched by DB2 to a system agent, the connection identifier is the DB2 subsystem name.

id7 The logical-unit-of-work identifier of the thread associated with *plan-id2*. An '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-ID that is assigned to the thread followed by an "=" sign and a token value, which can be used in place of logical-unit-of-work-ID in any DB2 command that accepts logical-unit-of-work-ID as input.

id8 This ID contains additional identifiers that define more specific information regarding the identity of the agent.

In many distributed configurations, the primary authorization-ID used with DB2 is not necessarily the user-ID of the end-user. If provided by the client, the additional tokens further assist in identifying the client end-user.

The following identifiers, separated by a colon (:), are provided:

- The primary authorization-ID associated with the thread.
- Workstation name of the end-user's workstation. An asterisk (*) indicates it is not relevant to the thread or was not provided by the client.
- End-user's user-ID. An asterisk (*) indicates it is not relevant to the thread or was not provided by the client.

- Application name of the end-user's application. An asterisk (*) indicates that is not relevant to the thread or was not provided by the client.

id9 Identifies the member name of the DB2 subsystem on which the thread associated with *plan-id2* is executing.

DB2 can recover from a lock denial in some cases and can complete successfully. In such a case, the SQLCA is not filled in. One example is during setup of performance enhancements during bind time for execution time.

The SQLCA corresponding to correlation-ID *id1*, connection-ID *id2*, and LUW-ID *id3* contains an SQLCODE of -904 or -923 and the name of the resource involved in the timeout.

Several different system plans can appear in *plan-id1* and *plan-id2*. These system plans are not documented in SYSIBM.SYSPLAN. If you receive a system plan in this message, you are in contention with another user. If you are not doing an automatic rebind, message DSNT500I or DSNT501I might accompany this message and identify that resource. If you need additional information, refer to the SQLCA and any additional bind messages. If you are doing an auto rebind, the SQLCA is not available. Refer to Part 5 of *DB2 Application Programming and SQL Guide* for more information about automatic rebinding. The system plans are:

- ACT
- BCT
- DISTSERV
- DSNBIND
- STARTCT
- DSNUTIL.

Operator Response: Notify the system programmer.

System Programmer Response: Timeouts can happen for many reasons, including factors relating to DB2 or IRLM. Some of those reasons are listed below along with possible ways to reduce or eliminate your timeout. Refer to Part 5 (Volume 2) of *DB2 Administration Guide* for more detail about the concepts discussed in this list. See also SQLCODEs -911 and -913.

Timeouts can result from the definition of objects or the structure of applications as explained below.

- If the resource involved in the timeout is listed in the DSNT500I/DSNT501I message as a table or table space, check the following items for other possible causes of timeout:
 1. Check the LOCKRULE column value in SYSIBM.SYSTABLESPACES for the table space being accessed. A lock size of TABLE or TABLESPACE could cause a timeout. If your application does not need to lock the entire table

or table space, you can resolve the timeout by changing the lock size to PAGE or ANY using the ALTER statement.

2. Check the number of LOCKS PER TABLE(SPACE), which was set at the time DB2 was installed. If a large number of page or row locks are acquired and held, a small value for LOCKS PER TABLE(SPACE) could be causing lock escalation to a table or table space lock. The timeout can be resolved by changing the value on the DSNTIPK update panel or by binding the application's plan with RELEASE(COMMIT) and doing commits more frequently.
 3. You can use EXPLAIN (described in Part 5 of *DB2 Application Programming and SQL Guide*) with the failing SQL statement and check the TSLOCKMODE column for every table/table space in the EXPLAIN output. If the competing applications are attempting to obtain incompatible locks, you might be able to resolve the timeout by running the applications sequentially rather than concurrently or by following the suggestions in other steps listed here, such as changing lock size, ACQUIRE/RELEASE parameters or ISOLATION type.
 4. Check the ACQUIRE/RELEASE values specified on the plan. ACQUIRE(ALLOCATE) acquires all locks for all tables and table spaces referenced in the plan, even if the program logic does not cause the table/table space to be accessed. Binding with RELEASE(DEALLOCATE) causes table, table space and DBD locks to be held longer than binding with RELEASE(COMMIT), possibly causing a timeout.
 5. Use the DISPLAY DB LOCKS command during program execution to verify that the locks being held at the time of the timeout are as expected. If they are not, you may need to use ALTER to change the locksize of the table space if possible, or rebind your plan with different ACQUIRE, RELEASE or ISOLATION values.
 6. ISOLATION level affects the mode of table/table space locks chosen and may be of concern if the plan is bound with RR and there is a page set scan.
- Check the ISOLATION level specified on the plan in SYSIBM.SYSPLAN. A value of RR is more likely to cause a timeout because it requires more page or row locks and also has a greater potential than CS for causing lock escalation, which can cause timeouts as noted above.
 - Check the frequency of COMMITs in the application. A large number of updates without any COMMITs can cause a timeout because the more pages that are changed, the more page or row locks held, and the greater potential for lock escalation.

This condition might be caused by an undetected deadlock, for example, an agent holding a lock on the

resource for a period of time that exceeds either the specified time or the IRLM default wait time.

If the time limit is too small, you can increase the limit by specifying a new IRLM locked resource wait time limit. To do this, you can either use the parameter in the DSN6SPRM assembler macro in the DSNTIJUZ job stream or update the 'wait-time' field of the DB2 installation IMS Resource Lock Manager panel, IRLMRWT. You must also specify all other parameters contained in this version of the CSECT. Then do one of the following:

- Resubmit installation job DSNTIJUZ with the link-edit SYSIN file 'NAME' parameter that matches the -START DB2 'PARM=' parameter.
- Reassemble DSN6SPRM and relink-edit DSNZPARM by resubmitting installation job DSNTIJUZ. The link-edit SYSIN file 'NAME' parameter must match the -START DB2 'PARM=' parameter.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 9, 18.

DSNT377I PLAN=*plan-id1* WITH
CORRELATION-ID=*id1*
CONNECTION-ID=*id2* LUW-ID=*id3*
THREAD-INFO=*id4* IS IN CONFLICT
WITH AN INDOUBT THREAD ON
MEMBER *id5*

Explanation: This message is issued by the service controller subcomponent. A plan cannot gain an IRLM lock because a required resource is currently undergoing recovery. The message identifies the plan in this way:

plan-id1

The name of the executing plan.

id1 The correlation identifier (ID) of the thread associated with plan *plan-id1*. Correlation IDs beginning with '0nn', where 'nn' is a number from 01 to 28, identify system agents.

id2 The connection-ID of plan *plan-id1*.

id3 The logical-unit-of-work identifier ('LUW-ID') of *plan-id1*. An '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work ID that is assigned to the thread followed by an "=" sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

id4 This ID contains additional identifiers that define more specific information regarding the identity of the agent.

In many distributed configurations, the primary authorization-ID used with DB2 is not necessarily the user-ID of the end-user. If

DSNT378I • DSNT379I

provided by the client, the additional tokens further assist in identifying the client end-user.

The following identifiers, separated by a colon (:), are provided:

- The primary authorization-ID associated with the thread.
- Workstation name of the end-user's workstation. An asterisk (*) indicates it is not relevant to the thread or was not provided by the client.
- End-user's user-ID. An asterisk (*) indicates it is not relevant to the thread or was not provided by the client.
- Application name of the end-user's application. An asterisk (*) indicates that is not relevant to the thread or was not provided by the client.

id5 Identifies the member name of the DB2 subsystem on which the indoubt thread is executing.

The SQLCA corresponding to correlation-ID *id1*, connection-ID *id2*, and LUW-ID *id3* contains an SQLCODE -904, -911, -913, or -923 and the name of the resource currently being recovered by DB2.

If you receive a system plan in this message, see the information about system plans in message DSNT376I.

System Action: Processing continues.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 4.

DSNT378I *csect-name* **PLAN=*plan-id1* WITH CORRELATION-ID=*id1* CONNECTION-ID=*id2* LUW-ID=*id3* THREAD-INFO=*id4* TIMED OUT BECAUSE OF A RETAINED LOCK HELD BY MEMBER *id5***

Explanation: A plan cannot get an IRLM lock because the resource is held by a retained lock on behalf of another member in the data sharing group, and the amount of time to wait for the locked resource was exceeded. The member holding the retained lock is either failed, or is in the process of restarting to recover its retained locks. This message is only issued if the RETLWAIT installation parameter in DSN6SPRM is set to 'YES'. If RETLWAIT is set to 'NO' (this is the default), then any IRLM lock that conflicts with a retained lock will not wait, but instead will be immediately rejected (see reason codes 00C900BE and 00C20254).

The following identifiers are used in the message:

plan-id1

The name of the executing plan.

id1 The correlation identifier (ID) of the thread

associated with plan *plan-id1*. Correlation IDs beginning with '0nn', where 'nn' is a number from 01 to 28, identify system agents.

id2 The connection-ID of plan *plan-id1*.

id3 The logical-unit-of-work identifier ('LUW-ID') of *plan-id1*. An '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work id that is assigned to the thread followed by an "=" sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

id4 This ID contains additional identifiers that define more specific information regarding the identity of the agent.

In many distributed configurations, the primary authorization-ID used with DB2 is not necessarily the user-ID of the end-user. If provided by the client, the additional tokens further assist in identifying the client end-user.

The following identifiers, separated by a colon (:), are provided:

- The primary authorization-ID associated with the thread.
- Workstation name of the end-user's workstation. An asterisk (*) indicates it is not relevant to the thread or was not provided by the client.
- End-user's user-ID. An asterisk (*) indicates it is not relevant to the thread or was not provided by the client.
- Application name of the end-user's application. An asterisk (*) indicates that is not relevant to the thread or was not provided by the client.

id5 Identifies the member name of the failed or restarting DB2 subsystem which holds the conflicting retained lock.

System Action: The SQLCA corresponding to correlation-ID *id1*, connection-ID *id2*, and LUW-ID *id3* contains an SQLCODE -904, -911, -913 or -923 and the name of the resource involved in the timeout.

System Programmer Response: Restart the member holding the retained lock if it has not yet been restarted.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 4.

DSNT379I **CANNOT IDENTIFY TO IRLM. INVALID SSNAME OR IRLM IS NOT CURRENTLY ACTIVE**

Explanation: Either an attempt was made to identify the IRLM with a subsystem name not recognized by MVS, or the IRLM is not currently active. This message

is also issued if common service area (CSA) storage is insufficient.

System Action: DB2 abends with a reason code of X'04E'.

Operator Response: Notify system programmer.

System Programmer Response: This is probably a user error. Change the IRLMSID parameter in the DB2 DSN6SPRM initialization macro to match the MVS subsystem table, or start IRLM if IRLM is not already up. See return code 00E30079 for further information about determining the cause of the error.

DSNT380I CANNOT IDENTIFY TO IRLM, SSNAME ALREADY IN USE

Explanation: Either DB2 previously terminated and did not successfully sign off from IRLM, or another subsystem is identified to IRLM with this installation-defined SSNAME. This message accompanies abend reason code X'00E30071'.

System Action: DB2 is abended with an abend code of X'04E'.

Operator Response: Notify the system programmer.

System Programmer Response: Either manually stop IRLM, or change the installation-defined SSNAME.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 9, 18.

DSNT381I IRLM QUIT REQUEST FAILED, RC = xx, SC = yy

Explanation: During the QUIT (or signoff) request to the IMS/VS Resource Lock Manager, a return code and subcode were returned indicating an unsuccessful completion of the request. Refer to Part 5, "IRLM messages and codes," on page 1307, for IRLM return codes and subcode meanings.

System Action: This message indicates that the DB2 subsystem shutdown could not be completed normally.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the cause of the failure from the return code and subcode, and correct the error. Refer to Part 5, "IRLM messages and codes," on page 1307, for IRLM return codes and subcode meanings. DB2 has terminated but has not signed off from IRLM. It will be necessary to issue the 'F irlmproc, ABDUMP' command to stop the IRLM. This must be done before issuing another -START DB2 command.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 9, 18.

DSNT382I IRLM AUTO-START FAILED

Explanation: During the IDENTIFY to IRLM, the AUTO-START of IRLM using SVC 34 failed. This message accompanies abend code X'00E30080'.

System Action: DB2 is terminated with an abend code of X'04E'.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the cause of failure from the SVC 34 return code preserved in register 2.

DSNT383I csect-name IRLM AUTO-STOP FAILED

Explanation: During a sign off from IRLM caused by either DB2 normal shutdown (CSECT DSNTLQUI) or DB2 subsystem termination (CSECT DSNTLCLE), an AUTO-STOP of IRLM using SVC 34 failed. If this occurred during normal sign off, this message accompanies abend reason code X'00E30075'.

System Action: DB2 abends.

Operator Response: Notify the system programmer.

System Programmer Response: Manually stop IRLM.

Problem Determination: Determine the cause of failure from the SVC return code preserved in register 2.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 9.

DSNT384I IRLM AUTO-START WAIT TIME EXCEEDED

Explanation: An attempt was made to automatically start IRLM. However, the wait time specified was exceeded.

System Action: DB2 is abended.

Operator Response: Notify the system programmer.

System Programmer Response: Either manually start IRLM or modify the installation-defined auto-start wait time. Restart DB2.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5, 9.

Check the IRLMID given in the IRLM procedure against the IRLMSID in macro DSN6SPRM which was in the DSNZPARM used at startup.

DSNT386I NAME TYPE PARTS

Explanation: This message forms the headings of a display for a set of messages. This message is always followed by multiple DSNT387I messages. These DSNT387I messages are used to display information

DSNT387I • DSNT389I

that is received as a result of a DISPLAY DATABASE command when the keyword OVERVIEW is specified. Refer to message DSNT387I for a description of the data these headings identify.

DSNT387I *space type parts*

Explanation: This message contains the results from a DISPLAY DATABASE command when the keyword OVERVIEW is specified. This message contains data that describes the status of a tablespace or index space in the database that is listed in the preceding DSNT362I message. The data in this message is always preceded by the column headings in message DSNT386I. The message number for this message is not displayed. However, messages DSNT386I, DSNT387I, and DSNT390I are always produced with a multiple line WTO and are never interrupted.

space Tablespace name, index space name, or table OBID.

type TS for a tablespace, IX for an index space, LS for a LOB tablespace, or TB for a table

parts Indicates the number of partitions in the tablespace, index space, or LOB tablespace. It is blank for a simple tablespace, simple index space, or segmented tablespace.

DSNT388I NAME TYPE PART STATUS CONNID CORRID CLAIMINFO

Explanation: This message is the heading for a set of messages that display information as a result of a -DISPLAY DATABASE command when the keyword CLAIMERS is specified. The message number for this message is not displayed. This message is always followed by multiple DSNT389I messages containing the column data. Refer to message DSNT389I for a description of the data these headings identify.

DSNT389I *space type part status conn-id corr-id claims*

Explanation: This message contains the display information that results from a -DISPLAY DATABASE command when the keyword CLAIMERS is specified. This message contains the column data describing the status of a table space or index space in the database listed in message DSNT362I.

space The table space name or index space name.

type TS for a table space, IX for an index space, LS for a LOB table space.

part The partition number. For a nonpartitioned table space or an index on a nonpartitioned table space, it is blank. For nonpartitioned indexes on a partitioned table space, it is the logical partition number preceded by the character L (for example, L0001). For

data-partitioned secondary indexes, the prefix for this value will be the character D (for example, D0001).

status Blank, or one or more of the following, delimited by commas. The maximum length of the string is 17 characters.

ACHKP

The table space is in aux check pending state. ACHKP on a table space indicates that CHECK DATA detected an orphan or missing LOB or an out-of-sync condition between the row in the base table and the LOB in the LOB table space.

ARBDP

Advisory Rebuild Pending status is set when indexes with varying length columns are changed from VARYING NO to VARYING YES.

AREO* The table space is placed in Advisory Reorg status. This may be because of a change in the table or index information. It also occurs because the table space, index, or partition identified in this status should be reorganized for optimal performance.

AREST The object (a table space, index space, or a physical partition of a table space or index space) is in an Advisory Restart Pending state. If backout activity against the object is not already underway, it should be initiated either by issuing the RECOVER POSTPONED command or by recycling the system with the system parameter LBACKOUT=AUTO.

AUXW The table space is in aux warning state. AUXW on a LOB table space indicates that one or more LOBs in the LOB table space is invalid. AUXW on a base table space indicates that CHECK DATA detected an orphan or missing LOB or an out-of-sync condition between the row in the base table and the LOB in the LOB table space.

CHKP The object (a table space or a partition within a table space) is in check pending status.

COPY The object (a table space or a partition within a table space) is in copy pending status. An image copy is required for this object.

GRECP

The object (a table space, a table space partition, index space, or index space partition) is marked recovery pending because of the failure of a group buffer pool. This status value appears only on spaces. It does not

	apply to databases. See <i>DB2 Data Sharing: Planning and Administration</i> for information about resolving this restricted status.		
ICOPY	The object (an index space or index partition) is in informational copy pending status.	STOPP	A stop is pending for the database, table space, table space partition, index space or index space partition.
LPL	The object has pages or ranges of pages that are unavailable because of logical or physical damage.	UT	The table space, table space partition, index space or index space partition is started for utility processing only.
LSTOP	The logical partition is stopped.	UTRO	A utility is in process on the table space, table space partition, index space, or index space partition that allows only RO access.
PSRBD	The index space is in page set rebuild pending status.	UTRW	A utility is in process on the table space, table space partition, index space or index space partition that allows RW access.
RBDP	The object (an index space, index partition or logical index partition) is in rebuild pending status. For logical partitions, the RBDP status can appear as RBDP*.	UTUT	A utility is in process on the table space, table space partition, index space or index space partition that allows only UT access.
RBDP	Indicates that the entire index is inaccessible to SQL applications, however only the logical partition needs to be recovered.	WEPR	This object has pages or ranges of pages that are unavailable because of physical damage. To reset this flag, you can use either the RECOVER utility with the option as ERROR RANGE or the LOAD utility with the option as REPLACE.
RECP	The object (a table space, table space partition, index space, index partition or logical index partition) is in recovery pending status.		
REFP	The object (a table space, a table space partition, index space, or index space partition) is in refresh pending status. For a table space, run LOAD REPLACE or the RECOVER utility to resolve this restricted status, or use the REBUILD INDEX utility to rebuild the index from the data.		If the status for a nonpartitioned index is blank, then the status information is displayed at the logical partition level. If the type is TB, the status is blank.
REORP	The object (a table space or table space partition) is in recovery pending status.	<i>conn-id</i>	A connection identifier for the thread.
RESTP	The object is in the Restart Pending state. Backout activity against the object must be completed by using the -RECOVER POSTPONED command, or by recycling the system with system parameter LBACKOUT=AUTO.	<i>corr-id</i>	A correlation identifier of the thread associated with the space name.
RO	The table space, table space partition, index space or index space partition is started for read-only activity.	<i>claims</i>	The type and duration of currently held claims. The claim is composed of a claim class descriptor and a claim duration descriptor.
RW	The table space, table space partition, index space or index space partition is started for read and write activity.		The claim class descriptor has one of the following values:
STOP	The table space, table space partition, index space or index space partition is stopped.	CS	Cursor stability claim class
STOPE	The table space or index space was implicitly stopped because there is a problem with the log RBA in a page. Message DSNT500I or DSNT501I is issued when the error is detected to indicate the inconsistency.	RR	Repeatable-read claim class
		WR	Write claim class
			The claim duration descriptor describes the duration of the claims as follows:
		A	The claim is held until deallocation.
		C	The claim is held until the next commit point.
		H	The claim is held across commit.

DSNT390I * DISPLAY OF DATABASE name action*

Explanation: This message indicates the end of a set of DSNT391I and DSNT392I messages, a set of DSNT393I and DSNT394I messages, or a set of DSNT395I and DSNT396I messages.

In this message:

- The 'name' is the name of the database.
- The 'action' is one of the following:

CONTINUES

The remaining table space and index space names within this database are continued to a new display.

TERMINATED

The remaining table space and index space names within this database are terminated.

ENDS The display for this database is complete.

**DSNT391I NAME TYPE STATUS PHYERRLOW
PHYERRHI CATALOG PIECE**

Explanation: This message indicates the beginning of a set of messages used to display information as a result of a DISPLAY DATABASE command when the keywords WEPR, LOCKS, LPL, CLAIMERS and USE are omitted. (The message appears in one continuous line across the screen, not as shown above.) This message forms the headings of the display and is always followed by multiple DSNT392I messages containing the column data. Refer to message DSNT392I for a description of the data these headings identify.

DSNT392I *space type part status lo-page hi-page
cat-name piece*

Explanation: This message contains the display information as a result of a DISPLAY DATABASE command when the keywords LOCK, CLAIMERS, LPL and USE are omitted. This message contains the column data describing the status of a table space or index space in the database listed in the preceding DSNT362I message. This message is always preceded by its column headings in message DSNT391I. The message number for this message is not displayed. However, messages DSNT391I, DSNT392I, and DSNT390I are always produced with a multiple line WTO and are never interrupted.

In this message:

- The *space* is the table space name or index space name.
- The *type* is TS for a table space, IX for an index space or LS for a LOB table space.
- The *part* is the partition number. It is blank for a simple table space, simple index space, or segmented table space. For nonpartitioned secondary indexes, it is the logical partition number preceded by the character L (for example, L0001). For data-partitioned secondary indexes, the prefix for this value will be the character D (for example, D0001).
- See DSNT389I for a list of the possible *status* display strings.
- When a data set supporting the specified table space or index space has physical I/O errors, *lo-page* is a hexadecimal number identifying the lowest page

number containing an I/O error. This column is blank if there are no physical errors.

- When a data set supporting the specified table space or index space has physical I/O errors, *hi-page* is a hexadecimal number identifying the highest page number containing an I/O error. This column is blank if there are no physical errors.
- When a data set supporting the specified table space or index space has physical I/O errors, *cat-name* identifies the catalog owning the data set with the I/O errors. This column is blank if there are no physical errors.
- When a data set supporting the specified table space or index space has physical I/O errors, *piece* is an integer number identifying the piece within the table space or index space having the error. This column is blank if there are no physical errors.

The piece number can be used to construct the name of the data set supporting the space containing the physical error as follows:

```
cat-name.DSNDBC.databases
name.space-name.I0001.Axxxx
```

The value xxxx is the piece number plus one and database-name is the name displayed in the preceding DSNT362I message. If the table space or index space is partitioned, the partition number should equal the piece number plus one.

**DSNT393I NAME TYPE PART STATUS CONNID
CORRID USERID**

Explanation: This message indicates the beginning of a set of messages used to display information as a result of a DISPLAY DATABASE command when the keyword USE is specified. This message contains the headings of the display. (The message appears in one continuous line across the screen, not as shown above.) This message is always followed by multiple DSNT394I messages containing the column data. Refer to message DSNT394I for a description of the data these headings identify.

DSNT394I *space type part status conn-id corr-id
user-id*

Explanation: This message contains the display information resulting from a DISPLAY DATABASE command when the keyword USE is specified. This message contains the column data describing the status of a table space or index space in the database listed in the preceding DSNT362I message. This message is always preceded by message DSNT393I containing the column headings. The message number for this message is not displayed. However, messages DSNT393I, DSNT394I, and DSNT390I are always produced with a multiple line WTO and are never interrupted.

In this message:

- The *type* is TS for a table space, IX for an index space or LS for a LOB table space.
- The *type* is TS for a table space or IX for an index space.
- The *part* is the partition number. It is blank for a simple table space, simple index space, or segmented table space. For nonpartitioned secondary indexes, it is the logical partition number preceded by the character L (for example, L0001). For data-partitioned secondary indexes, the prefix for this value will be the character D (for example, D0001).
- See DSNT389I for a list of the possible *status* display strings.
- The *conn-id* is a connection identifier for the thread. It is one of the following:
 - BATCH if the thread is from a batch region.
 - TSO if the thread is from a TSO terminal.
 - UTILITY if the thread is from a utility.
 - 'IMS identifier' if the thread is from an IMS terminal.
 - 'CICS identifier' if the thread is from a CICS terminal.
 - CONSOLE if the thread is from the console.
- The *corr-id* is a correlation identifier of the thread associated with the space name. It is one of the following:
 - 'job name' if the thread is from a batch region.
 - 'TSO logon identifier' if the thread is from a TSO terminal.
 - PST#.PSBNAME if the thread is from an IMS terminal.
 - 'entry ID.thread number.tran id' if the thread is from a CICS terminal.
 - CONSOLE if the thread is from the console.
 - '0nn', where 'nn' is a number , if the thread is for a system agent.
 - For distributed database access threads, this field contains the following:
 - While the thread is being created:
 1. '028.DBAA nn', where nn ranges from 01 to 99. This indicates that the database access agent (DBAA) is in its connection processing, which consists of establishing the DBAA thread, and validating and verifying the user's ID. Refer to "Controlling Access to a DB2 Subsystem" in *DB2 Administration Guide* for descriptions of the authorization checks that might be performed.
All RACF requests are serialized on a single DB2 RACF service task, which might increase the validation time when multiple DBAAs are being created concurr
 - After the thread is created:

1. For threads using system-directed access and threads using application-direct access from a DB2 requester, this variable displays the correlation ID of the thread at the requesting location.
 2. For threads using application-directed access from a non-DB2 requester, this variable displays the first twelve characters in the DDM external name (EXTNAM) parameter of the DDM EXCSAT command received as part of the SQL CONNECT
- The *user-id* is one of the following:
 - 'TSO logon identifier' if the thread is from a TSO terminal.
 - 'sign-on id' or the LTERM if the thread is from an IMS message-drive region.
 - AXBUSER if the thread is from an IMS message-driven region and RACF is used.
 - 'PSB name' if the thread is from an IMS nonmessage-driven region and RACF is not used.
 - 'user-id', 'term id', 'tran id' or other, as specified in the resource control table (RCT), if the thread is from CICS.

**DSNT395I NAME TYPE PART STATUS CONNID
CORRID LOCKINFO**

Explanation: This message indicates the beginning of a set of messages used to display information as a result of a DISPLAY DATABASE command when the keyword LOCKS is specified. This message forms the headings of the display. (The message appears in one continuous line across the screen, not as shown above.) This message is always followed by multiple DSNT396I messages containing the column data. Refer to message DSNT396I for a description of the data these headings identify.

DSNT396I space type part status conn-id corr-id lock

Explanation: This message contains the display information that results from a DISPLAY DATABASE command when the keyword LOCKS is specified. This message contains the column data describing the status of a table space or index space in the database listed in the preceding DSNT362I message. This message is always preceded by its column headings in message DSNT395I. The message number for this message is not displayed. However, the messages DSNT395I, DSNT396I, and DSNT390I are always produced with a multiple line WTO and are never interrupted.

In this message:

- The *space* is the table space name, index space name, or table OBID.
- The *type* is TS for a table space, IX for an index space, LS for a LOB table space or TB for a table.
- The *part* is the partition number. It is blank for a simple table space, simple index space, or

segmented table space. For nonpartitioned secondary indexes, it is the logical partition number preceded by the character L (for example, L0001). For data-partitioned secondary indexes, the prefix for this value will be the character D (for example, D0001).

- See DSNT389I for a list of the possible *status* display strings. If the *type* is TB, the *status* field is blank.
- The *conn-id* is a connection identifier for the thread. It is one of the following:
 - BATCH if the thread is from a batch region.
 - TSO if the thread is from a TSO terminal.
 - UTILITY if the thread is from a utility.
 - 'IMS identifier' if the thread is from an IMS terminal.
 - 'CICS identifier' if the thread is from a CICS terminal.
 - CONSOLE if the thread is from the console.

When the displayed lock is a P-lock or a retained lock, *conn-id* is not specified.

- The *corr-id* is a correlation identifier of the thread associated with the space name. It is one of the following:
 - 'job-name' if the thread is from a batch region.
 - 'TSO logon identifier' if the thread is from a TSO terminal.
 - PST#.PSBNAME if the thread is from an IMS terminal.
 - 'entry ID.thread number.tran id' if the thread is from a CICS terminal.
 - CONSOLE if the thread is from the console.
 - For distributed database access threads, this field contains the following:
 - While the thread is being created:
 1. '028.DBAA nn', where nn ranges from 01 to 99. This indicates that the database access agent (DBAA) is in its connection processing, which consists of establishing the DBAA thread, and validating and verifying the user's ID. Refer to "Controlling Access to a DB2 Subsystem" in *DB2 Administration Guide* for descriptions of the authorization checks that might be performed.
All RACF requests are serialized on a single DB2 RACF service task, which might increase the validation time when multiple DBAAs are being created concurr
 - After the thread is created:
 1. For threads using system-directed access and threads using application-direc access from a DB2 requester, this variable displays the correlation ID of the thread at the requesting location.

2. For threads using application-directed access from a non-DB2 requester, this variable displays the first twelve characters in the DDM external name (EXTNAM) parameter of the DDM EXCSAT command received as part of the SQL CONNECT

corr-id is not specified when the displayed lock is a P-lock or a retained lock.

- The *lock* describes the type and duration of locks:
 - Transaction locks (also called L-locks) are identified by their correspondin agents' connection and correlation IDs
Multiple locks held by an agent are listed on multiple lines of the report followed by any locks the agent is currently awaiting.
 - Physical locks (P-locks) and retained locks are identified by their DB2 data sharing member names.
Multiple P-locks or retained locks held by a DB2 data sharing member are listed on multiple lines of the report followed by any locks the member is currently awaiting.

The *lock* is composed of a 'lock status' and followed by a dash '-', a 'lock state' followed by a 'lock type', and a 'lock duration' delimited by commas.

- The 'lock status' is a value of:

- H** The lock is held by the agent or the DB2 member.
- W** The agent or the member is awaiting the lock.
- R** The lock is retained.

- The 'lock state' describes themode of the lock as follows:

- For L-locks and drain locks,

- IS** A lock with read intentions.
- IX** A lock with update intentions.
- S** A lock with read-only capability.
- U** A lock with update capability.
- SIX** A table space or table lock with a protocol that does not lock a page while reading, but locks the page with update intention while updating.

- X** An exclusive lock.

- For L-locks on LOB table spaces,

- IS** A lock with intent to reserve space within the LOB table space
- IX** A lock with intent to insert LOBs in the LOB table space.
- S** A lock which reserves space within the LOB table space.

- SIX** A lock which allows the owner to read and update LOBs.
- X** An exclusive lock.
- For P-locks,
 - IS** This DB2 member has R/O interest. The page set or partition is group buffer pool (GBP) dependent.
 - IX** This DB2 member has R/W interest. The page set or partition is GBP-depende
 - S** This DB2 member has R/O interest. The page set or partition is not GBP-dep
 - SIX** This DB2 member has R/W interest. The page set or partition is GBP-depende
 - NSU** This DB2 member has R/W interest. The page set or partition is GBP-depende
 - X** This DB2 member has R/W interest. The page set or partition is not GBP-dep
- The 'lock type' describes the type of locking as follows:
 - S** A table space L-lock
 - T** A table L-lock
 - C** A cursor-stability read drain lock
 - R** A repeatable-read drain lock
 - W** A write drain lock
 - P** A partition L-lock
 - PP** A page set or partition P-lock
- If the 'lock status' is H, the 'lock duration' describes the duration of the lock:
 - A** The lock is freed at deallocation.
 - C** The lock is freed at commit.
 - H** The lock is freed when all cursors are closed.
 - M** The lock is freed by the system.
 - P** The lock is freed when the plan is complete.
 - I** The lock is a page set or partition P-lock. It is released when the pageset or partition data set is closed.
- If the 'lock status' is W, the 'lock duration' is a 2-digit number indicating the waiter's position in the local DB2 system's lock waiting queue. When this lock is acquired, its duration is the same as all locks held by the user.

- For a P-lock, the lock is owned by the system, not the user, and its duratio is not related to the duration of the locks that are owned by the user.
- Retained locks do not have a lock duration.

All index spaces on tables are implicitly locked with transaction locks at the same level as the table spaces containing those tables. P-locks are acquired by DB2 on index spaces as well as on table spaces.

DSNT397I

Explanation: This message indicates the beginning of a multiple line display generated as a result of a DISPLAY DATABASE command. The format of this multiple line display has three parts:

- The column headers, which are dependent on the keywords issued. The headers are underlined.
- The space information for all spaces and partitions requested by the command
- An ending message to state whether the spaces were displayed or not.

There are six different headers for the DISPLAY DATABASE commands. The headers are dependent on the presence of the keywords: CLAIMERS, LOCKS, USE, LPL, OVERVIEW, or no keyword. These five different DISPLAY DATABASE command formats are described below.

- **DISPLAY DATABASE CLAIMERS**

This DISPLAY DATABASE command displays the claims that are on certain table spaces, index spaces, and partitions.

The column headers in this command are as follows:

```
NAME TYPE PART STATUS CONNID CORRID
CLAIMINFO
```

- **NAME** is the table space name or index space name.
- **TYPE** is TS for a table space, IX for an index space, LS for a LOB table space.
- **PART** is the partition number. It is blank for a simple table space or simple index space. For nonpartitioned indexes on a partitioned table space, it is the logical partition number preceded by the character L (for example, L0001). For data-partitioned secondary indexes, the prefix for this value will be the character D (for example, D0001).
- See DSNT389I for a list of the possible *status* display strings.
- For L-locks on LOB table spaces,
 - IS** A lock with intent to reserve space within the LOB table space
 - IX** A lock with intent to insert LOBs in the LOB table space.
 - S** A lock which reserves space within the LOB table space.

- SIX** A lock which allows the owner to read and update LOBs.
- X** An exclusive lock.

If the *type* is TB, the *status* field is blank.

If the status for an index is blank, then the status information is displayed at the logical partition level.

- The CONNID is a connection identifier for the thread. It is one of the following:
 - BATCH if the thread is from a batch region.
 - TSO if the thread is from a TSO terminal.
 - UTILITY if the thread is from a utility.
 - 'IMS identifier' if the thread is from an IMS terminal.
 - 'CICS identifier' if the thread is from a CICS terminal.
 - CONSOLE if the thread is from the console.
 - For distributed database access threads, this field contains the following:
 - For threads using system-directed access and for threads using application-directed access from a DB2 Version 3 or later requester, this variable displays the connection name of the thread at the requesting location.
 - For threads using application-directed access from a non-DB2 requester or from a DB2 Version 2 Release 3 requester, this field displays the constant SERVER.
- CORRID is a correlation identifier of the thread associated with the space name. It is one of the following:
 - 'job name' if the thread is from a batch region.
 - 'TSO logon identifier' if the thread is from a TSO terminal.
 - PST#.PSBNAME if the thread is from an IMS terminal.
 - 'entry ID.thread number.tran id' if the thread is from a CICS terminal.
 - CONSOLE if the thread is from the console.
 - '0nn', where 'nn' is a number, if the thread is for a system agent.
 - For distributed database access threads, this field contains the following:
 - While the thread is being created:
 1. '028.DBAA nn', where nn ranges from 01 to 99. This indicates that the database access agent (DBAA) is in its connection processing, which consists of establishing the DBAA thread, and validating and verifying the user's ID. Refer to "Controlling Access to a DB2 Subsystem" in *DB2 Administration Guide* for

descriptions of the authorization checks that might be performed.

All RACF requests are serialized on a single DB2 RACF service task, which might increase the validation time when multiple DBAAs are being created concurr

- After the thread is created:
 1. For threads using system-directed access and threads using application-direct access from a DB2 requester, this variable displays the correlation ID of the thread at the requesting location.
 2. For threads using application-directed access from a non-DB2 requester, this variable displays the first twelve characters in the DDM external name (EXTNAM) parameter of the DDM EXCSAT command received as part of the SQL CONNECT

- CLAIMINFO is the type and duration of currently held claims. The claim is composed of a claim class descriptor and a claim duration descriptor.

The claim class descriptor has one of the following values:

- CS** Cursor stability claim class
- RR** Repeatable-read claim class
- WR** Write claim class

The claim duration descriptor describes the duration of the claims as follows:

- A** The claim is held until deallocation.
- C** The claim is held until the next commit point.
- H** The claim is held across commit.

• DISPLAY DATABASE LOCKS

This DISPLAY DATABASE command displays the locks that are on certain table spaces, index spaces and partitions.

The column headers in this command are as follows:

NAME TYPE PART STATUS CONNID CORRID LOCKINFO

- The NAME column states the table space name, index space name, or table object ID.
- The TYPE column states TS for table space, IX for index, or TB for table.
- The PART, STATUS, CONNID, and CORRID columns are described in the DISPLAY DATABASE CLAIMERS section.
- The *conn-id* and *corr-id* are not specified when the display lock is a P-lock or a retained lock (either L-lock or P-lock). For page set P-locks, the DB2 member name is used to identify the lock.
- The LOCKINFO describes the type and duration of locks used by corresponding agents identified by their connection and correlation IDs (for transaction locks, which are also called L-locks) or

used by corresponding subsystems identified by their DB2 data sharing member names (for physical locks, which are called P-locks, and retained locks). Multiple locks held by an agent are listed on multiple lines of the report followed by any locks the agent is currently awaiting. Multiple P-locks or retained locks held by a DB2 data sharing member are listed on multiple lines of the report followed by any locks the member is currently awaiting. The LOCKINFO consists of a 'lock status', followed by a dash '-', a 'lock state', a 'lock type' and a 'lock duration' delimited by commas.

- The 'lock status' is a value of:

- H** The lock is held by the agent or the DB2 member.
- W** The agent or the member is awaiting the lock.
- R** The lock is retained.

- The 'lock state' describes the mode of lock as follows:

- For L-locks and drain locks,
 - IS** A lock with read intentions.
 - IX** A lock with update intentions.
 - S** A lock with read-only capability.
 - U** A lock with update capability.
 - SIX** A lock with a protocol that does not lock a page while reading, but locks the page with update intention while updating.
 - X** An exclusive lock.
- For P-locks,

- IS** This DB2 member has R/O interest. The page set or partition is group buffer pool (GBP) dependent.
- IX** This DB2 member has R/W interest. The page set or partition is GBP-depend
- S** This DB2 member has R/O interest. The page set or partition is not GBP-dependent.
- SIX** This DB2 member has R/W interest. The page set or partition is GBP-depend
- NSU** This DB2 member has R/W interest. The page set or partition is GBP-depend
- X** This DB2 member has R/W interest. The page set or partition is not GBP-dependent.

- The 'lock type' describes the type of locking as follows:

- S** A table space L-lock
- T** A table L-lock
- C** A cursor-stability read drain lock

R A repeatable-read drain lock

W A write drain lock

P A partition L-lock

PP A page set or partition P-lock

- If the 'lock status' is H, the 'lock duration' describes the duration of the lock:

A The lock is freed at deallocation.

C The lock is freed at commit.

H The lock is freed when all cursors are closed.

M The lock is freed by the system.

P The lock is freed when the plan is complete.

I The lock is a page set or partition P-lock. It is released when the page set or partition data set is closed.

- If the 'lock status' is W, the 'lock duration' is a 2-digit number indicating the waiter's position in the local DB2 system's lock waiting queue. When this lock is acquired, its duration is the same as all locks held by the user.

- For a P-lock, the lock is owned by the system, not the user, and its duration is not related to the duration of the locks that are owned by the user.

- Retained locks do not have a lock duration.

There are no explicit index space locks. However, all index spaces on tables are implicitly locked at the same level as the table spaces containing those tables. P-locks are acquired by DB2 on index spaces as well as on table spaces.

• DISPLAY DATABASE USE

This DISPLAY DATABASE command displays the user IDs that are accessing certain table spaces, index spaces, and partitions.

The column headers in this command are as follows:

```
NAME TYPE PART STATUS CONNID CORRID
USERID
```

- The NAME, TYPE, PART, STATUS, CONNID, and CORRID columns are described in the DISPLAY DATABASE CLAIMERS section.

- The USERID is one of the following:

- 'TSO logon identifier' if the thread is from a TSO terminal.
- 'sign-on id' or the LTERM if the thread is from an IMS message-drive region.
- AXBUSER if the thread is from an IMS message-driven region and RACF is used.
- 'PSB name' if the thread is from an IMS nonmessage-driven region and RACF is not used.

- 'userid', 'term id', 'tran id' or other, as specified in the resource control table (RCT), if the thread is from CICS.

• DISPLAY DATABASE LPL

NAME TYPE PART STATUS LPL PAGES

This message contains the display information resulting from a DISPLAY DATABASE command when the keyword LPL is specified. It contains the column data describing the status of a table space or index space in the database listed in the preceding DSNT362I message. This message is always preceded by its column headings message DSNT805I. The message number for this message is not displayed.

In this message:

- The LPL PAGES column lists the pages in the specified *space* that are unavailable because of logical or physical damage.

• DISPLAY DATABASE (with no LOCKS, USE, LPL or CLAIMERS keyword).

This DISPLAY DATABASE command displays the error page range information for certain table spaces, index spaces, and partitions.

The column headers in this command are as follows:

NAME TYPE PART STATUS PHYERRLO PHYERRHI
CATALOG PIECE

In this message:

- The NAME, TYPE, PART, and STATUS columns are described in the DISPLAY DATABASE CLAIMERS section.
- When a data set supporting the specified table space or index space has physical I/O errors, PHYERRLO is a hexadecimal number identifying the lowest page number containing an I/O error. This column is blank if there are no physical errors.
- When a data set supporting the specified table space or index space has physical I/O errors, PHYERRHI is a hexadecimal number identifying the highest page number containing an I/O error. This column is blank if there are no physical errors.
- When a data set supporting the specified table space or index space has physical I/O errors, CATALOG identifies the catalog owning the data set with the I/O errors. This column is blank if there are no physical errors.
- When a data set supporting the specified table space or index space has physical I/O errors, PIECE is an integer number identifying the piece within the table space or index space having the error. This column is blank if there are no physical errors.

The piece number can be used to construct the name of the data set supporting the space containing the physical error as follows:

cat-name.DSNUBC.database-
name.space-name.I0001.Axxxx

The value xxxx is the piece number plus one and database-name is the name displayed in the preceding DSNT362I message. Note that if the table space or index space is partitioned, the partition number should equal the piece number plus one.

There are other informational messages that can be displayed that are not related to one specific keyword. They are listed below:

• -luw-id ACCESSING DATA FOR location

This message is issued for each thread reported that is participating in distributed data access (database access thread). The thread that corresponds to this message is the thread named by the correlation id and connection id of the data line preceding this message. This additional line reports the distributed identification as follows:

luw-id=token

The logical-unit-of-work identifier (LUW-ID) is a unique identifier that is assigned to the thread followed by an '=' sign and a token. The token can be used in place of luw-id in any DB2 command that accepts luw-id as input.

location

The LOCATION name assigned to the requesting site.

• -MEMBER NAME *member-name*

This message is issued with messages DSNT389I, DSNT394I or DSNT396I for each thread in a data sharing environment. This additional line reports the member name of the DB2 subsystem accessing this object.

If the characters '(CO)' follow the member name, then this member is the castout owner for the page set or partition. The castout owner for a page set or partition is the DB2 member responsible for doing all of the castout I/O for that page set or partition.

The message number and subsystem recognition character are not included in this message.

• INVALID space-name

The space-name specified in the SPACENAM keyword on the -DISPLAY DATABASE command does not exist. The name of the table space or index space is 'space-name'. The request is rejected.

• NO SPACES FOUND

This message is produced when a DISPLAY DB(name) SPACENAM is entered and no spaces were found to satisfy the request. SPACENAM(...) might have been entered as a range, a subset, or a list of spaces.

• spacetype name NOT type

This message is produced when no table space or index space listed in the DISPLAY DB(...) SPACENAM(...) satisfies your request.

spacetype

TABLESPACE if the space is a table space or INDEXSPACE if the space is an index space.

name The name of the space.

type A character string that indicates the type of request specified. The string is a list of the following, delimited by 'OR':

- ACTIVE if the keyword ACTIVE is specified
- RESTRICTED if the keyword RESTRICT is specified.

- NO INFORMATION AVAILABLE

This message is produced when there is no LOCK or USE information available. When DISPLAY DB(...) is entered, and DB(...) is a list of databases or a list of names, this message indicates that no listed database has LOCK or USE information available.

If DISPLAY DB(...) or DISPLAY DB(...) SPACENAM(*) is entered, and DB(...) is a range or subset of databases, or all databases (*), this message indicates that no databases, for which the invoker has authority to display, have LOCK or USE information available. This message is produced only when the keywords USE and LOCKS are specified.

The ending message looks like this:

* DISPLAY OF DATABASE name action *

In this message:

name The name of the database

action One of the following:

CONTINUES

The remaining table space and index space names within this database are continued to a new display.

TERMINATED

The remaining table space and index space names within this database are terminated.

ENDS The display for this database is complete.

DSNT398I

Explanation: This message appears within a multiple line WTO message set and precedes DSNT391I, DSNT393I, and DSNT395I. It is used to underscore the column headings.

This message is issued by CSECT: DSNTDMUL

DSNT399I INVALID space-name

Explanation: The space-name specified in the SPACENAM keyword on the -DISPLAY DATABASE command does not exist. The name of the table space or index space is 'space-name'. The request is rejected.

DSNT400I SQLCODE = 0, SUCCESSFUL EXECUTION

Explanation: The SQLCODE was 0, indicating successful execution of the function. SQLWARN indicators may note some warnings. SQLWARNx fields are described in Appendix C of *DB2 SQL Reference*.

DSNT401I DSNT401I WARNING - HELP IS NOT INSTALLED

Explanation: You invoked the installation process with the DSNTINST CLIST. To enable online help, you must use the DSNTINS0 CLIST instead of the DSNTINST CLIST.

This message is issued by panel: DSNTIPA1

System Action: The panel is displayed with the warning message.

User Response: No response is necessary if you do not desire online help for the panel. Press ENTER to continue with the installation process after filling in desired panel values. If panel help is desired: exit this panel, make sure BookManager or the online help reader is installed on your system, and invoke the installation process with the DSNTINS0 CLIST.

DSNT402I ONLINE BOOK DATA SET NAMES MUST END IN '.BOOK'

Explanation: All book names entered on this panel must end in ".BOOK".

This message is issued by panel: DSNTIPA0

System Action: The panel is redisplayed with the error message.

User Response: Replace the book name or names with a value that ends in ".BOOK".

DSNT404I SQLCODE = xxx, explanation

Explanation: This message contains an SQL return code and a brief explanation, with text inserted from the SQLERRM field. The SQL return code is positive, indicating a warning condition. For more information about this SQL return code, see Part 2, "SQL return codes," on page 11.

System Programmer Response: Determine the cause for the SQL warning code, and correct the situation if needed. Rerun the application program or SQL statement.

DSNT405E csect-name DISPATCH PRIORITIES NOT IN SYNC: ccccc1: hhh1 COMPARED TO ccccc2: hhh2

Explanation: The dispatch priorities of task 'cccccc1' (dispatch priority 'hhh1') and task 'cccccc2' (dispatch priority 'hhh2') are found to be incorrect in relation to each other. This can cause severe performance problems and possible failure of either task 'cccccc1', task 'cccccc2', or other tasks.

System Action: DB2 continues with possible problems described above.

Operator Response: Notify the system programmer.

System Programmer Response: Modify the dispatch priority algorithms for the two tasks to meet documented requirements. For instance, IRLM must have a higher dispatch priority than DB2.

DSNT406I THE ART/ORT ESCAPE CHARACTER CANNOT BE % OR _

Explanation: You specified the percent sign (%) or the underscore character (_) as the application registration table/object registration table (ART/ORT) escape character. The ART/ORT escape character can be any other character.

System Action: The panel is redisplayed and the cursor is placed on the field that produced the error.

User Response: Change the ART/ORT escape character value.

DSNT407I THIS FIELD HAS AN INVALID FORMAT

Explanation: The field must be NOLIMIT, 1440, 0, or minutes and seconds separated by a comma.

This message is issued by the following panel: DSNTIPA

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Correct the input.

DSNT408I SQLCODE = -xxx, explanation

Explanation: This message contains an SQL return code and a brief explanation, with text inserted from the SQLERRM field. The SQL return code is negative, indicating that an error has occurred. For more information about this SQL return code, see Part 2, "SQL return codes," on page 11.

System Programmer Response: Determine the cause for the SQL error by using information about that specific SQLCODE. Correct the error if desired. Rerun the application program or SQL statement.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem

determination," on page 1353: 1, 2, 5, 14, 17.

DSNT409I BUFFERPOOL SIZES SHOWN MAY BE OBSOLETE

Explanation: The buffer pool sizes shown here were set at installation or migration time and might not be the most current. Updates might have occurred using the ALTER BUFFERPOOL command.

System Action: Processing continues.

User Response: No response is required.

DSNT410I THE SUBSYSTEM COMMAND PREFIX ENTERED IS INCORRECT

Explanation: You entered an incorrect command prefix. The first character of the command prefix must be one of the following:

@	\$	#	.	/	'	?	"	%	!	<
)	*	+	-	=	¢	:	_	;		

The remaining characters of the command prefix must be one of the above, A-Z, or 0-9.

This message is issued by the following panel: DSNTIPM

System Action: The panel is redisplayed and the cursor is placed on the field in error

User Response: Enter a valid command prefix

DSNT411I SQLCAID = xxxx, SQLCA IDENTIFIER

Explanation: The SQLCA ID field (SQLCAID) is not the expected value, C'SQLCA'.

System Programmer Response: The SQLCA area is invalid. This type of error is usually the result of one of the following:

- Calling the DSNTIAR formatting routine before an SQL statement initializes the area
- Overlaying the SQLCA area
- Passing the wrong address to the DSNTIAR routine.

Correct the error, and rerun the application program.

DSNT412I SQLCABC = xxxx, SQLCA BYTE COUNT

Explanation: The size of the SQLCA is not the expected value (136 bytes).

System Programmer Response: The SQLCA area is invalid. Correct the error. It is probably an overlay or an incorrect SQLCA address. Rerun the application program.

DSNT413I SQLCODE = xxxx, INVALID SQLCODE

Explanation: The SQL return code is not a valid value.

System Programmer Response: Either the SQLCA area is invalid or the maintenance was not coordinated correctly. As a result, the SQL return code was added to the DB2 subsystem but not to the formatting routine.

An invalid SQLCA area is usually the result of one of the following:

- Calling the DSNTIAR formatting routine before an SQL statement initializes the area
- Overlaying the SQLCA area
- Passing the wrong address to the DSNTIAR routine.

If the maintenance was not coordinated correctly, the DSNTIAR and DSNTIAM CSECTs were probably not replaced in the code that is now running. Link-edit the load module, and replace DSNTIAR and DSNTIAM. Correct the error, and rerun the application program.

DSNT414I SQLERRM = xxxx, SQLCA ERROR MESSAGE INSERTION TEXT

Explanation: This message results from an SQL return code that is not recognized by DSNTIAR. SQLERRM contains error message text.

System Programmer Response: Either the SQLCA area is invalid or the maintenance was not coordinated correctly. As a result, the SQL return code was added to the DB2 subsystem but not to the formatting routine.

An invalid SQLCA area is usually the result of one of the following:

- Calling the DSNTIAR formatting routine before an SQL statement initializes the area
- Overlaying the SQLCA area
- Passing the wrong address to the DSNTIAR routine.

If the maintenance was not coordinated correctly, the DSNTIAR and DSNTIAM CSECTs were probably not replaced in the code that is now running. Link-edit the load module, and replace DSNTIAR and DSNTIAM. Correct the error, and rerun the application program.

DSNT415I SQLERRP = xxxx, SQL PROCEDURE DETECTING ERROR

Explanation: The name of the procedure detecting the error is provided in the SQLERRP.

System Programmer Response: (The SQL procedure detecting the error may be of help in diagnosing an error or warning.) Correct the error if there is one noted in other messages. Rerun the program or SQL statement.

DSNT416I SQLERRD = xx,xx,xx,xx,xx,xx SQL DIAGNOSTIC INFORMATION

Explanation: At least one of the six diagnostic fields is not the expected value. The expected values are:

- 00, 00, 00, 00, 00, 00 or
- 00, 00, 00, -1, 00, 00

The SQL diagnostic information for each of the six values is as follows:

- 1 DB2 unique internal relational data system code
- 2 DB2 internal data manager error code
- 3 One of the following:
 - Number of rows inserted, updated, or deleted following an INSERT, UPDATE, or DELETE statement

Note: A '-1' in this field indicates that a mass delete of a table in a segmented table space was performed, wherein DB2 does not access nor count individual rows.

- For SQLCODE -911 or -913, a reason code that indicates whether a deadlock or timeout occurred.

Note: The most common reason codes are:

- 00C90088 - deadlock
- 00C9009E - timeout

- 4 Reserved
- 5 Position or column of a syntax error for PREPARE or EXECUTE IMMEDIATE
- 6 DB2 internal buffer manager error code

System Programmer Response: Refer to Appendix C of *DB2 SQL Reference* for further information on the contents of the SQLERRD fields. The SQL diagnostic information may be of help in diagnosing an error or in indicating the results of successful execution. If this error or warning should not occur, correct the error. Rerun the program or SQL statement.

DSNT417I SQLWARNn-n SQL WARNINGS

Explanation: At least one of the 11 warning values is not the expected value (a blank). A nonblank value in one of the 11 warning fields has the following meaning:

SQLWARN0
Any other warning code is set.

SQLWARN1
String truncation.

SQLWARN2
Null value(s) eliminated.

SQLWARN3
Number of host variables provided did not equal degree of the table.

DSNT418I • DSNT422I

SQLWARN4

No WHERE clause on UPDATE or DELETE.

SQLWARN5

Not a DB2 SQL statement.

SQLWARN6

Date or timestamp value adjusted.

SQLWARN7

Conversion of decimal number from precision 31 to precision 15 caused truncation of fractional digits.

SQLWARN8

Untranslatable character replaced with substitute.

SQLWARN9

Arithmetic exceptions have been ignored during processing of COUNT DISTINCT.

SQLWARNA

At least one character field of the SQLCA is invalid due to a string translation error.

User Response: The SQL warning information may be of help in diagnosing an error or in indicating the results of successful execution. If this warning should occur, correct the error and rerun the program or SQL statement.

DSNT418I SQLSTATE = sqlstate, SQLSTATE RETURN CODE

Explanation: The SQLSTATE is a return code that indicates the outcome of the most recently executed SQL statement. The execution of every SQL statement sets SQLSTATE to a five-digit code in the range of 00000 to 65535. This has no effect on the existing use of any other field in the SQLCA.

User Response: For further information on the meaning of an SQLSTATE return code, see the Part 2, "SQL return codes," on page 11. If necessary, correct the SQL statement and return it.

DSNT419I WARNING - MAX REMOTE ACTIVE PREVIOUSLY SPECIFIED AS 0.

Explanation: You specified a value of 0 for the number of active database access threads on a previous panel. This value might be inconsistent with a DDF STARTUP OPTION of AUTO or COMMAND.

This message is issued by the following panel: DSNTIPR

Severity: 4 (warning)

System Action: The panel is redisplayed and the cursor is placed on the DDF STARTUP OPTION field.

User Response: No response is necessary if your intent is to have DDF started with no active database access threads allocated and DDF is used as a

requester only. Press ENTER to continue. Otherwise, either change the DDF STARTUP OPTION to NO or MAX REMOTE ACTIVE to the number of threads you want.

DSNT420I YOU NEED AT LEAST 1 32K DS IF THE TEMP 32K SPACE IS GREATER THAN 0

Explanation: You entered zero for the TEMP 32K DATA SETS field on the SIZES panel. You need at least one TEMP 32K DATA SET if TEMP 32K SPACE on DSNTIPD is not zero.

This message is issued by the following panel: DSNTIPD

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Enter a value of one or greater for the TEMP 32K DATA SETS field or change the TEMP 32K SPACE value to zero.

DSNT421I YOU NEED AT LEAST 1 32K BUFFER FOR THE <num32kds> 32K DATA SETS

Explanation: You specified zero for the 32KB buffers. If field TEMP 32K DATA SETS on installation panel DSNTIPD is greater than zero, you need at least one 32KB buffer on installation panel DSNTIP2.

This message is issued by the following panel: DSNTIP2

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Enter a value of 1 or more for at least one of the buffer pools (BP32K - BP32K9) on panel DSNTIP2, or change the TEMP 32K DATA SETS value to zero.

DSNT422I THE ART TABLE NAME MUST BE DIFFERENT FROM THE CRT TABLE NAME

Explanation: You entered the same name for the Application Registration Table and the Object Registration Table on the Data Definition Control Support panel.

This message is issued by the following panel: DSNTIPZ

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Change either the APPL REGISTRATION TABLE field or the OBJT REGISTRATION TABLE field to make these two fields unique with respect to each other.

DSNT424I OUTPUT DATA SETS MUST BE DIFFERENT FROM THE INPUT DATA SETS

Explanation: You specified an output data set name that is the same as one of the input data set names built from the PREFIX and SUFFIX fields on the main panel DSNTIPA1.

This message is issued by the following panel:
DSNTIPT

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Either change the data set name under the cursor or change the PREFIX or SUFFIX fields on panel DSNTIPA1.

DSNT425I ALL THREE OUTPUT DATA SETS MUST BE UNIQUE

Explanation: You specified the same name for two or more of the output data sets.

This message is issued by the following panel:
DSNTIPV

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Change the data set name under the cursor or the data set field(s) that are the same as the one under the cursor.

DSNT426I ALL THREE DATA SETS ARE REQUIRED FOR OUTPUT

Explanation: You specified one or more output data sets and left one or more output data set fields blank.

This message is issued by the following panel:
DSNTIPT

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: You must specify all or none of the output data set fields. Leave blank all output data set fields if you do not want the installation CLIST to edit any CLISTs or JCL.

DSNT427I THE DATA SET OR MEMBER SPECIFIED COULD NOT BE LOCATED

Explanation: The input parameter member for the INPUT MEMBER NAME field or the DATA SET NAME(MEMBER) field for migration could not be found.

This message is issued by the following panel:
DSNTIPA1

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Verify that you entered an existing

data set and member in that data set. Also verify that the data set is cataloged.

DSNT428I WHEN USING TIMESTAMPS, THE PREFIX MUST BE <= *preflen* CHARACTERS LONG

Explanation: YOU HAVE ENTERED AN ARCHIVE LOG PREFIX LONGER THAN ALLOWED. The archive log prefix names must not exceed 19 characters when the TIMESTAMP ARCHIVES value is YES and must not exceed 17 characters when the TIMESTAMP ARCHIVES value is EXT.

This message is issued by the following panel:
DSNTIPH

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Reduce the length of the prefix or change the TIMESTAMP ARCHIVES value to NO.

DSNT429I THE SUM OF MAX USERS AND MAX REMOTE ACTIVE MUST BE <= TO 5000

Explanation: The total number of threads determined by MAX USERS and MAX REMOTE fields is too large.

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Reduce the MAX USERS field, or the MAX REMOTE field, or both.

DSNT430I THIS FIELD MAY ONLY BE FILLED IN FOR MIGRATE MODE

Explanation: You can only specify the FROM RELEASE or DATA SET NAME(MEMBER) fields for INSTALL TYPE of MIGRATE.

This message is issued by the following panel:
DSNTIPA1

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Change the INSTALL TYPE to MIGRATE or blank out the field under the cursor.

DSNT431I DDF, MIXED DATA, OR DEF ENCODING SCHEME CONFLICTS WITH CODED CHAR SET

Explanation: You have entered an invalid EBCDIC or ASCII coded character set (CCSID) value for the DDF, MIXED DATA, or DEF ENCODING SCHEME value you specified. The following restrictions apply to these values:

- With a MIXED DATA value of 'YES', you must choose a valid mixed CCSID value for the EBCDIC CODED CHAR SET. The ASCII CODED CHAR SET must be a valid mixed value or zero.

DSNT433I • DSNT437I

- With a MIXED DATA value of 'NO', you must choose a valid SBCS CCSID value or zero for EBCDIC or ASCII CODED CHAR SETs.
- With a DDF value of 'AUTO' or 'COMMAND', you must choose a non-zero value for the EBCDIC CODED CHAR SET.
- With a DEF ENCODING SCHEME value of 'ASCII', you must choose non-zero values for EBCDIC and ASCII CODED CHAR SETs.

Refer to Appendix C of *DB2 Installation Guide* for a list of the best general CCSID for each country.

This message is issued by the following panels:
DSNTIPF, DSNTIPR

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Correct either the DDF, MIXED DATA, or DEF ENCODING SCHEME value or the EBCDIC or ASCII CODED CHAR SET value to correct the incompatibility.

DSNT433I MAX REMOTE ACTIVE MUST BE <= MAX REMOTE CONNECTED.

Explanation: The number of active database access threads cannot be larger than the number of concurrent database access threads.

This message is issued by the following panel:
DSNTIPE

Severity: 8 (error)

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Reduce the MAX REMOTE ACTIVE field, increase the MAX REMOTE CONNECTED field, or both.

DSNT434I WARNING, DATA SETS MARKED WITH ASTERISKS EXIST AND WILL BE OVERWRITTEN

Explanation: The data sets marked with asterisks already exist. If you continue, the installation process will delete the existing data set and allocate a new one for tailored job output.

This message is issued by the following panel:
DSNTIPT

Severity: 4

User Response: You should:

1. Press ENTER to continue; the data set(s) will be deleted and reallocated OR
2. Press RETURN to leave the installation process; the data set(s) will not be deleted OR

3. Change the data set name(s); the new name will be checked for existence.

DSNT435I DSNT435I OVERRIDE VALUES ARE IN EFFECT

Explanation: Calculated values for EDMPOOL, SORTPOOL, or RIDPOOL on panel DSNTIPC were previously overridden. Installation uses any override values displayed.

Severity: 4

System Action: Override values are used instead of calculated values, when displayed.

User Response: No response is necessary if you want to use the override values. If you want to use the calculated values, erase the values in the override column.

DSNT436I REGION SIZE MAY BE TOO LARGE

Explanation: The numbers you specified produced a region size estimate of more than 5000KB. This region size estimate does not include the storage required for SWA because it is assumed that SWA has been placed above the line. If a larger private area is permitted, you should increase the region size on the DB2 start procedures. The region size calculation is shown in the DSNT485I through DSNT487I messages and is discussed in Part 2 of *DB2 Installation Guide*.

This message is issued by the following installation CLIST: DSNTINST

Severity: 4 (warning)

System Action: The CLIST continues.

User Response: Check the values entered for numbers of concurrent users and databases, buffers, and plan sizes. Check the available private region size. If this region size is not permitted, these numbers need to be reduced. If the size is permitted, this warning can be ignored.

Problem Determination: If you suspect an error in the process, set CONTROL(CONLIST) and invoke the CLIST. This produces tracing for error documentation.

DSNT437I REGION SIZE IS TOO LARGE

Explanation: The numbers you specified produced a region size estimate of more than 8000KB. This estimate does not include the storage required for SWA, because it is assumed that you placed SWA above the 16MB line. The region size calculation is discussed in Part 2 of *DB2 Installation Guide*.

This message is issued by the following installation CLIST: DSNTINST

Severity: 8 (error)

System Action: The CLIST continues, but does not produce edited jobs.

User Response: Check the numbers entered for numbers of concurrent users and databases, buffers, and plan sizes. One or more of these numbers needs to be reduced.

Problem Determination: If you suspect an error in the process, set CONTROL(CONLIST) and invoke the CLIST. This produces tracing for error documentation.

DSNT438I WARNING, IRLM LOCK MAXIMUM SPACE = *irlmreg* G, AVAILABLE SPACE = *irlmax* G

Explanation: You specified a maximum number of locks per user that could use a total space larger than that available to the IRLM, causing it to abend. It is not likely that all threads will have the maximum number of locks, but if the maximum exceeds the amount of space by a significant factor, the possibility of abends in the IRLM is increased.

The available space is specified in the MAX STORAGE FOR LOCKS field of the DSNTIPJ installation panel, and is never less than 2 GB. The maximum space used is estimated as the sum of the MAX USERS and MAX REMOTE ACTIVE values from the DSNTIPE panel times the number of LOCKS PER USER value on the DSNTIPJ panel times 540 bytes per lock.

Severity: 4 (warning)

System Action: The CLIST will continue.

User Response: Choose one of the following responses:

- Ensure that you can run with the overcommitment of lock address space, or
- Lower the value(s) of the MAX USERS, MAX REMOTE ACTIVE, or LOCKS PER USER fields, or
- Increase the value of the MAX STORAGE FOR LOCKS field.

DSNT439I IRLM NO LOCK ESCALATION OR NO USER MAXIMUM

Explanation: You specified the number 0 for:

- The number of table or table space locks that will cause lock escalation, or
- The number of locks that will terminate a DB2 user.

A lock escalation value of 0 turns off lock escalation and means that DB2 cannot use this means of conserving lock space. A user maximum of 0 means that the calculation noted in the DSNT438 message cannot be performed to see if the IRLM has sufficient address space for all users, since there is no maximum per user.

This message is issued by the following installation CLIST: DSNTINST

Severity: 4 (warning)

System Action: The CLIST will continue. This is only a warning.

User Response: Turn off lock escalation and/or user lock limiting.

DSNT440I TOTAL BP SIZE TOO LARGE

Explanation: The total size of a buffer pool is too large. The summation of the *ssnm*DBM1 address space storage requirements for all buffer pools cannot exceed 1TB. When calculating the storage requirements for the buffer pools, DB2 uses the page size (4K, 8K, 16K, or 32K) for each buffer.

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Reduce one or more of the buffer pool sizes.

DSNT442E ERROR, VIRTUAL STORAGE OF main EXCEEDS THE SYSTEM LIMIT OF 2 GIGABYTES

Explanation: The total of all virtual storage calculations exceeds the maximum amount possible for an address space.

This message is issued by the following CLIST: DSNTINST

Severity: 8 (error)

System Action: The installation CLIST returns to the initial panel without editing the installation jobs.

User Response: Respecify installation values that determine storage sizes so that the 2 GB limit is not exceeded.

DSNT443I VALUES MARKED WITH AN ASTERISK HAVE BEEN UPDATED

Explanation: An asterisk is placed before the description of fields which were generated by the DSNTINST CLIST. This message only appears when you update field(s) from a prior panel used to generate the fields on the current panel.

This message is issued by the following panels: DSNTIPA, DSNTIPL

System Action: The panel is displayed.

User Response: Verify that the current value is what you want. If it is not, enter the desired value.

DSNT444I SCROLLING BACKWARD MAY CHANGE FIELDS MARKED WITH ASTERISKS

Explanation: The marked fields on the current panel are generated from fields on other panels. If you scroll backward, these fields may be updated to reflect new

DSNT445I • DSNT451I

values from other panels. For example, the ARCHIVE PREFIX field is generated from the CATALOG ALIAS field on DSNTIPA2. Message DSNT443I will be displayed to inform you when fields are changed by the DSNTINST CLIST.

This message is issued by the following panels: DSNTIPA, DSNITPL

System Action: The panel is displayed.

User Response: No action required.

DSNT445I REMOTE LOCATION NAME MUST NOT BE THE SAME AS LOCAL LOCATION

Explanation: The name entered for the remote sample location was the same as the local location name.

This message is issued by the following installation panel: DSNTIPY

System Action: The panel is displayed.

User Response: Enter a remote location name or leave the field blank to indicate that the organization sample will only be executed locally.

DSNT446I SAMPLE LOCATION MUST BE BLANK IF LOCAL LOCATION IS BLANK

Explanation: In order to edit the remote sample jobs, both the DB2 LOCATION NAME (local location) on panel DSNTIPR and the REMOTE LOCATION must have valid names. If the DB2 LOCATION NAME is unknown, leave both fields blank and the remote sample jobs will not be edited.

This message is issued by the following panel: DSNTIPY

System Action: The panel is displayed.

User Response: Either scroll back to the DISTRIBUTED DATA FACILITY panel and enter a value for the DB2 LOCATION NAME, or enter a blank in the REMOTE LOCATION field on the job editing panel.

DSNT448I STG AVAILABLE ABOVE 2GB = size T

Explanation: This is the estimated amount of real storage recommended to support the virtual storage sizes chosen.

The amount of real storage needed will vary greatly. Some customers will find that they need several times the estimate shown. For more information on storage calculations, refer to Part 2 of *DB2 Installation Guide*.

This message is issued by the following CLIST: DSNTINST

Severity: 0 (successful execution)

System Action: The CLIST continues.

User Response: Compare this recommended value with the actual available real storage.

DSNT449I NUMBER OF LOGS REDUCED FROM old-num TO MAXIMUM OF 31

Explanation: The number of active log data sets used in the DB2 release you are migrating from is greater than the new maximum number of data sets allowed for the current release of DB2. Installation job DSNTIJUZ will update your bootstrap data sets to contain only the last 31 data sets.

This message is issued by the following panel: DSNITPL

System Action: The value is reduced to the maximum of 31 and the panel is displayed.

User Response: Update any other fields on the panel and continue.

DSNT450I type ENTRY MUST BE EXACTLY TWO CHARACTERS

Explanation: These entries are used to complete SYS1.PARMLIB member names and must be exactly two characters. The type is:

APF AUTH

For the APF-authorized library list IEAAPFxx

LINK LIST

For the link list library concatenation LNKLSTxx

MVS SUBSYS

For the MVS subsystem list IEFSSNxx

This message is issued by the following installation CLIST: DSNTINST

Severity: 8 (error)

System Action: The CLIST will continue.

User Response: Check your entries for these fields on the MVS panel and make them exactly two characters. See job DSNTIJMV that was produced and correct the IEBUPDTE CHANGE statement.

DSNT451I WARNING-THE LOCAL DATE LENGTH OR LOCAL TIME LENGTH HAS BEEN INCREASED

Explanation: The LOCAL DATE LENGTH or LOCAL TIME LENGTH has been increased and a REBIND command must be issued for any dependent plans.

This message is issued by the following installation CLIST: DSNTINST

Severity: 4 (warning)

System Action: Processing continues.

User Response: Rebind all application plans that depend upon the length of the local format that was changed.

DSNT454I ERROR CODE = errcode, CNT = count

Explanation: An error was encountered during CLIST processing for reading the parameter member. Most of these errors are caused by having a mismatch between the level of the CLIST and that of the parameter member being read.

The 'errcode' is an error code defined for the CLIST. The error code values and associated meanings are found in *TSO/E CLISTS*.

The 'count' value is the number of parameter values already read.

This message is issued by the following installation CLIST: DSNTINST

System Action: The CLIST will terminate.

User Response: Be sure the parameter member and the CLIST are at the same level.

Problem Determination: If you suspect an error in the process, set CONTROL(CONLIST) and invoke the CLIST in batch, so that the tracing can be sent with the error documentation. You will also need the listing of the CLIST and the parameter member being read.

DSNT456I ERROR IN VARIABLE varname, VALUE IS value

Explanation: The variable named 'varname' does not have a valid value. Its current value is 'value'. Subsequent messages will describe the reason the value is invalid and the action taken by the CLIST.

If the error is in the CONTROL value, the value was specified when the CLIST was invoked. The value is not valid, and no additional tracing will be done. The permitted values are NONE, LIST, CONLIST, and SYMLIST. Each value produces more CLIST tracing information than those which precede it. If the error is in other values, the value was specified when the CLIST was invoked on the ISPF panels.

This message is issued by the following installation CLIST: DSNTINST

Severity: 8 (error)

System Action: The CLIST will continue, but will not produce edited jobs or parameter data.

User Response: Check the subsequent messages. Exit, then invoke the CLIST with a valid value for the variable.

Problem Determination: If you suspect an error in the process, set CONTROL(CONLIST) and invoke the CLIST in batch, so that the tracing can be sent with the error documentation. The CLIST itself and the parameter member read in should be sent as well.

DSNT457I The SUBSYSTEM NAME MUST BE DIFFERENT THAN THE PROC NAME

Explanation: Internal MVS restrictions require that the IRLM subsystem name be different than the procedure name.

This message is issued by the following panel: DSNTIPI

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Change either the SUBSYSTEM NAME or the PROC NAME so these fields are unique with respect to each other.

DSNT458I VALUE MUST BE NUMERIC

Explanation: The variable named in message DSNT456I must be an integer. Only digits are allowed, with no decimal point or fractions. If the value is a number suffixed by K or M, it is interpreted as the indicated number multiplied by 1024 or 1048676. If any other non-numeric character is present in the value, or if the K or M is not the final character, this message is produced.

This message is issued by the following installation CLIST: DSNTINST

Severity: 8 (error)

System Action: The CLIST will continue, but will not produce edited jobs or parameter data.

User Response: This CLIST will continue, but will not produce edited jobs. The value of the variable has been set to the value shown in message DSNT465I. You will need to reenter the output parameter and output data set prefix. Examine the value and reset it if needed.

DSNT459I VALUE IS TOO LOW, MINIMUM IS min

Explanation: The variable named in message DSNT456I must be larger than its current value. The minimum value allowed is 'min'.

This message is issued by the following installation CLIST: DSNTINST

Severity: 8 (error)

System Action: The CLIST will continue, but will not produce edited jobs. The CLIST resets the incorrect value to 'min'.

User Response: See message DSNT465I for the CLIST action.

DSNT460I VALUE IS TOO HIGH, MAXIMUM IS max

Explanation: The variable named in message DSNT456I must be smaller than its current value. The maximum value allowed is 'max'.

DSNT461I • DSNT467I

This message is issued by the following installation
CLIST: DSNTINST

Severity: 8 (error)

System Action: The CLIST will continue, but will not produce edited jobs. The CLIST resets the incorrect value to 'max'.

User Response: See message DSNT465I for the CLIST action.

DSNT461I THE BUFFER POOL MAXIMUM IS LESS THAN THE MINIMUM VALUE ENTERED

Explanation: Buffer pool maximums must be greater than or equal to the minimum value for the same buffer pool.

This message is issued by the following panel:
DSNTIPE

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Either reduce the minimum value or increase the maximum value for the indicated buffer pool buffer.

DSNT462I VALUE IS TOO LONG, MAXIMUM IS length CHARACTERS

Explanation: The variable named in message DSNT456I must be shorter than its current value. The maximum length allowed is 'length'.

This message is issued by the following installation
CLIST: DSNTINST

Severity: 8 (error)

System Action: The CLIST will continue, but will not produce edited jobs. The CLIST resets the value to the default value.

User Response: See message DSNT465I for the CLIST action.

DSNT463I DATA SHARING FIELD MUST BE BLANK IN UPDATE MODE.

Explanation: This field is not relevant in Update mode and must be blank. This message is issued by panel:
DSNTIPA1

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Replace the value with a blank.

DSNT464I VALUES PERMITTED ARE values

Explanation: The variable named in message DSNT456I must be one of the 'values' listed.

This message is issued by the following installation
CLIST: DSNTINST

Severity: 8 (error)

System Action: The CLIST will continue, but will not produce edited jobs.

User Response: See message DSNT465I for the CLIST action.

DSNT465I VARIABLE varname SET TO value

Explanation: The variable, 'varname', named in message DSNT456I is in error. Possible reasons for the error are listed in messages: DSNT458I, DSNT459I, DSNT460I, DSNT462I, DSNT463I, DSNT464I.

This message is issued by the following installation
CLIST: DSNTINST

System Action: The CLIST will continue, but will not produce edited jobs. The value has been set to the value shown.

User Response: Specify the output data again on the primary install panel. You will be able to see and change the value. If this value is not acceptable, change it, noting the limits.

DSNT466I Output member CANNOT BE DSNTIDVB OR DSNTIDXA

Explanation: The OUTPUT MEMBER NAME field must not be DSNTIDVB or DSNTIDXA. These two members are shipped with DB2 and must not be overwritten.

This message is issued by the following panel:
DSNTIPA1

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Change the value of the field under the cursor.

Note: If the member you specify already exists, it will be overwritten.

DSNT467I OUTPUT MEMBER SHOULD BEGIN WITH DSNTID

Explanation: The output parameter member will be placed into *prefix*.SDSNSAMP. This data set already has a large number of members. To avoid replacing a member that you need, a naming convention with prefix 'DSNTID' is strongly suggested. The suffixes 'VB' and 'XA' are not allowed (see message DSNT466I).

This message is issued by the following installation
CLIST: DSNTINST

Severity: 4 (warning)

System Action: The CLIST will continue.

User Response: Specify a different name for the output member.

DSNT468I ERROR(S) ENCOUNTERED, OUTPUT IS BYPASSED

Explanation: An error was detected earlier in this run. Because of the error, data set editing was not performed.

This message is issued by the following installation
CLIST: DSNTINST

Severity: 8 (error)

System Action: The CLIST will continue, but will not produce edited jobs.

User Response: Correct the errors noted earlier, and specify the output prefix name again to produce the edited data.

DSNT469I INPUT PARAMETERS MUST BE READ BEFORE MIGRATION

Explanation: The INPUT MEMBER NAME on panel DSNTIPA1 must have a value to allow migration values to be read. This is to permit the new values to be initialized.

This message is issued by the following installation
CLIST: DSNTINST

Severity: 8 (error)

System Action: The CLIST will return to the main install panel, DSNTIPA1.

User Response: Specify DSNTIDXA as the INPUT MEMBER NAME and specify the current value for the migration member.

DSNT470I WARNING, ONLY ONE VOLUME WAS SPECIFIED

Explanation: Only one volume serial number was specified on the install panel or CLIST invocation. This does not allow adequate recovery or performance unless it is intended to be a single volume test system.

This message is issued by the following installation
CLIST: DSNTINST

Severity: 4 (warning)

System Action: The CLIST will continue.

User Response: If this subsystem is intended to be recoverable, more than one volume is needed. Rerun the installation tailoring process, specifying at least one more volume on the DSNTIPA2 panel. If this is just a single volume test system, be sure that you specify a single copy of the log data sets. The boot strap data sets are small and not active, so that two are recommended even on a single volume system.

DSNT471I BEGINNING PARAMETER INPUT MEMBER inmem

Explanation: The input parameter member, 'inmem', is being read. This data includes values for all of the installation parameters.

This message is issued by the following installation
CLIST: DSNTINST

Severity: 0 (successful execution)

System Action: The CLIST will continue.

DSNT472I WORK FILE DATABASE NAME CANNOT START WITH DSNDDB EXCEPT FOR DSNDDB07

Explanation: The work file database name cannot start with the characters DSNDDB unless the name is DSNDDB07.

This message is issued by the following panel:
DSNTIPK

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Change the name so that it does not start with DSNDDB.

DSNT473I BEGINNING CHECK PHASE

Explanation: This message indicates the following:

- The values entered on the panels are being checked.
- Values which use the K or M suffix are being translated to numbers.

This message is issued by the following installation
CLIST: DSNTINST

Severity: 0 (successful execution)

System Action: The CLIST will continue.

DSNT474I READING count, varname, datatype, data sharing scope, minval, maxval, currentval

Explanation: The values are being read from the parameter member. The count, the variable name, the data type, the data sharing scope, the minimum value, the maximum value, and the current value are shown. This message occurs when the CONTROL keyword requests a trace.

This message is issued by the following installation
CLIST: DSNTINST

Severity: 0 (successful execution)

System Action: The CLIST will continue.

DSNT475I CHECK count, varname, type, minval, maxval, currentval

Explanation: This message indicates the following:

- The values read in or entered on the panels are being checked.
- Values which use the K or M suffix are being translated to numbers.

The count, the variable name, the data type, the minimum value, the maximum value, and the current value are shown. This message occurs when the CONTROL keyword requests a trace.

This message is issued by the following installation CLIST: DSNTINST

Severity: 0 (successful execution)

System Action: The CLIST will continue.

DSNT476I BEGINNING PARAMETER OUTPUT MEMBER outmem

Explanation: The output parameter member named 'outmem' is being written. This data includes values for all the install parameters.

This message is issued by the following installation CLIST: DSNTINST

Severity: 0 (successful execution)

System Action: The CLIST will continue.

DSNT477I OUTPUT count, varname, type, minval, maxval, currentval

Explanation: The values entered on the panels are being written to the output parameter member. The count, the variable name, the data type, the minimum value, the maximum value, and the current value are shown. This message occurs when the CONTROL keyword requests a trace.

This message is issued by the following installation CLIST: DSNTINST

Severity: 0 (successful execution)

System Action: The CLIST will continue.

DSNT478I BEGINNING EDITED DATA SET OUTPUT

Explanation: The output jobs and data are being edited to tailor them. Edited JCL output was requested and no severe errors were encountered.

This message is issued by the following installation CLIST: DSNTINST

Severity: 0 (successful execution)

System Action: The CLIST will continue.

DSNT479I THE IRLM GROUP NAME AND DB2 GROUP NAME MUST BE DIFFERENT

Explanation: You entered an IRLM group name on panel DSNTIPJ that is the same as the DB2 group name entered on panel DSNTIPK. The names must be different.

This message is issued by the following panel: DSNTIPJ

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Either change the DB2 group name entered on panel DSNTIPK or the IRLM group name on panel DSNTIPJ.

DSNT480I NAME MUST BE 1-16 CHARS, BEGIN WITH A-Z, AND NOT INCLUDE #, @, OR \$.

Explanation: The location name specified on panel DSNTIPR is invalid. The location name must be 1-16 alphanumeric characters, excluding the alphabetic extenders #, @ or \$, and must begin with a letter.

This message is issued by panel: DSNTIPR

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Change the location name to meet the allowable criteria.

DSNT481I DSNTINST data set DATA SET SIZE MAY BE TOO SMALL

Explanation: The DSNTINST CLIST encountered an arithmetic overflow during calculation of this data set's size.

System Action: DSNTINST continues processing and uses 2147483647 for the result of the calculation that caused the overflow. Thus, the size of the data set might be too small.

User Response: Check the data set size in installation job DSNTIJIN. If it is too small, increase it.

DSNT482I TOO MANY CONCURRENTLY ALLOCATED DATA SETS, opnds

Explanation: The number (*opnds*) calculated for the number of concurrent databases, tables per database, and table spaces per database, is too large. The maximum number of data sets that are allowed is 100,000. However, please note that virtual storage below the 16 MB line may be the limiting factor for releases prior to z/OS Version 1 Release 2. See DSNT436I and DSNT437I for more information.

The number of concurrently allocated data sets is calculated using the formula:

OPNDS = (NUMCONDB X NUMTABLE X NUMINDEX) +
(NUMCONDB X NUMTABSP)

Where Represents

NUMCONDB

The maximum number of concurrently active databases (DATABASES on panel DSNTIPE)

NUMTABLE

The estimated average number of tables per database (TABLES on panel DSNTIPD)

NUMINDEX

The estimated average number of indexes per table (set to 2)

NUMTABSP

The estimated average number of table spaces per database (TABLE SPACES on panel DSNTIPD)

This message is issued by the following installation CLIST: DSNTINST

Severity: 4 (warning)

System Action: The CLIST reduces the value of NUMCONDB so that the calculated value for OPNDS is within the allowed range. CLIST processing continues.

User Response: Do one of the following:

- Accept the reduced value for NUMCONDB calculated by the CLIST.
- Reenter smaller values for NUMCONDB, NUMTABLE, or NUMTABSP on the SIZES and STORAGE SIZES panels. You can do this by either using the END key to go back to those panels or by running the CLIST again.

DSNT483I NAME MUST BE 1-8 CHARS AND MUST BEGIN WITH A-Z

Explanation: The DB2 data sharing group name specified on panel DSNTIPK or the IRLM data sharing group name specified on panel DSNTIPJ is invalid. The DB2 or IRLM group name must be 1-8 characters, and must begin with a letter.

This message is issued by panels: DSNTIPJ, DSNTIPK

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Change the group name to meet the allowable criteria.

DSNT485I type SIZE = size K

Explanation: This is the estimated main storage size for part of the DB2 database address space. This is the most constrained address space. The 'type' can be BUFFER POOL, SORT POOL SIZE, RID POOL SIZE, EDMPOOL STORAGE, DATA SET STORAGE, CODE STORAGE, or WORKING STORAGE.

The storage for buffer pools, sort pools, rid pools, EDMPOOL, and code is above the 16MB line. Most of the main storage for data set control blocks is below the 16MB line and is included in the region size. Working storage includes storage above and below the 16MB line, but storage above the line is not included in the region. Refer to Part 2 of *DB2 Installation Guide* for more information regarding this calculation.

This message is issued by the following installation CLIST: DSNTINST

Severity: 0 (successful execution)

System Action: The CLIST continues.

DSNT486I TOTAL MAIN STORAGE = totregion K

Explanation: This is the estimated total region size. It includes storage above the 16MB line. Refer to Part 2 of *DB2 Installation Guide* for more details regarding this calculation.

This message is issued by the following installation CLIST: DSNTINST

Severity: 0 (successful execution)

System Action: The CLIST continues.

DSNT487I TOTAL STORAGE BELOW 16MB = region K (ASSUMING SWA IS ABOVE THE LINE)

Explanation: This message provides an estimate of the virtual storage required below the 16MB line to check for virtual storage constraints. This calculation presumes that you have moved the SWA for DB2 above the 16MB line. Refer to Part 2 of *DB2 Installation Guide* for details regarding this calculation.

This message is issued by the following installation CLIST: DSNTINST

Severity: 0 (successful execution)

System Action: The CLIST continues.

User Response: Check for virtual storage constraints. Your MVS should permit at least this amount of virtual storage below the 16MB line.

DSNT488I VOLUME voln WILL REQUIRE AT LEAST nn 4K BLOCKS

Explanation: This message states the number of 4KB blocks of space that will be required for the specified volume in order to install or migrate the current release of DB2.

Volume 'voln' is specified in the VOLUME SERIAL fields on install panel DSNTIPA2, or with the VOLSDATn input parameters to the Install CLIST. The message indicates how much space will be needed on the selected volume to install or migrate this release of DB2.

DSNT489I • DSNT493I

This message is issued by the following installation
CLIST: DSNTINST

Severity: 0 (successful execution)

System Action: Processing continues.

User Response: Ensure that the volume has at least as much available storage as the message indicates it should have. If it does not, rerun the INSTALL CLIST specifying different volumes, or create more available space on the originally specified volume.

In order to convert the number of 4KB blocks required to the number of cylinders required, use the table below. Divide the number of 4KB blocks (in the DSNT488I message) by the number of 4KB blocks per cylinder (in the table) to get the number of cylinders required.

Device Type	4KB Blocks per Cylinder	4KB Blocks per Track
3330	57	3
3340	24	2
3350	120	4
3375	96	8
3380	150	10

These size estimates are for system data only. They do not include: user data, archive logs, image copies, or temporary work data sets other than the temporary database.

DSNT489I CLIST EDITING *dsname(member), explanation*

Explanation: The CLIST is editing the data set and member *dsname(member)*. The *explanation* is the type of data being edited and has one of these values:

INSTALL JCL

Jobs that are edited and run as directed during the installation process.

MIGRATE JCL

Jobs that are edited and run as directed only during the migration process.

FALL BACK JCL

A job that is only run as directed when falling back to the previous release.

RECOVERY JCL

A job that is only run as directed during a recovery process. It deletes the DB2 data sets.

SAMPLE JCL

Jobs that are edited and run during installation verification to add the sample application.

SAMPLE DATA

Edited data that installation verification jobs require.

CLIST Customized CLISTs to reflect your names used during the installation process.

This message is issued by the following installation
CLISTs:

DSNTINST DSNTINS1 DSNTINS2

Severity: 0 (successful execution)

System Action: The CLIST continues.

DSNT490I SAMPLE DATA UNLOAD PROGRAM

Explanation: This is the header, indicating a normal start for the application program.

DSNT491I TOO MANY TABLES ENTERED (MAXIMUM OF 100 TABLES)

Explanation: The number of tables entered for unloading exceeded the maximum of 100 tables. The first 100 tables in the input should have been processed.

System Action: The application program is terminated.

User Response: Split the run into multiple runs, none with more than 100 tables.

Problem Determination: Check the application program input. Make sure there are no more than 100 tables.

DSNT492I SQL WARNING DURING SQL STATEMENT func, TABLE ttttttt

Explanation: The SQL statement may not be executed correctly. The function 'func' may be PREPARE, OPEN, FETCH, or CLOSE, indicating the type of SQL statement encountering the error. Table 'ttttttt' is the name of the table or view being unloaded.

System Action: The request may not be executed correctly.

User Response: Refer to Part 2, "SQL return codes," on page 11.

Problem Determination: Determine which SQL statement in the application program caused the warning and see if it is reproducible. Follow the diagnosis approach suggested for the warning.

DSNT493I SQL ERROR DURING SQL STATEMENT func, TABLE ttttttt

Explanation: The SQL statement may not be executed correctly. The function 'func' may be PREPARE, OPEN, FETCH, or CLOSE, indicating the type of SQL statement encountering the error. Table 'ttttttt' is the name of the table or view being unloaded.

System Action: The request was not executed correctly.

User Response: Refer to Part 2, "SQL return codes," on page 11.

Problem Determination: Determine which SQL statement in the application program caused the error and see if it is reproducible. Follow the diagnosis approach suggested for the SQL return code.

DSNT494I ERROR DURING OPEN OF DDNAME SYSRECnn

Explanation: The ddname listed, where 'nn' ranges from 00 to 99, could not be successfully opened. A possible reason is that the DD statement to the data set was not present in the JCL.

System Action: The application program is terminated.

User Response: Check the JCL to ensure that this DD statement is provided and is able to be used for output.

Problem Determination: Make sure that the same number of DD statements and table names were provided.

DSNT495I SUCCESSFUL UNLOAD n ROWS OF TABLE ttttttt

Explanation: The message indicates that 'n' rows of table or view 'ttttttt' were unloaded. The 'n' rows were counted during the unload processing.

System Action: The request was executed successfully.

DSNT496I UNRECOGNIZED DATA TYPE CODE OF nnnnn

Explanation: The PREPARE returned an invalid data type code of decimal 'nnnnn'.

System Action: The next table is processed.

User Response: Notify the system programmer.

System Programmer Response: See the Problem Determination section.

Problem Determination: There is an error in the unload program or a new data type has been added. The recognized data types are fullword integer, halfword integer, fixed-length character, variable length character, packed decimal, floating-point, fixed-length graphic, variable length graphic, and long, variable length graphic.

DSNT497I RETURN CODE FROM MESSAGE ROUTINE DSNTIAR

Explanation: The message formatting routine detected an error.

System Action: The application program is terminated.

User Response: Notify the system programmer.

System Programmer Response: See the Problem Determination section.

Problem Determination: There is an error in the unload program. The return code from DSNTIAR is given in the MVS output of your job. When reporting this problem, have the return code, the application program listing, and JCL available.

DSNT498I ERROR, NO VALID COLUMNS FOUND

Explanation: The PREPARE returned data which did not produce a valid output record. The data was not recognized as valid, so the columns were not unloaded.

System Action: The next table is processed.

User Response: Notify the system programmer.

System Programmer Response: See the Problem Determination section.

Problem Determination: There is an error in the unload program. When reporting this problem, have the application program listing and its JCL available.

DSNT499I ERROR IN INPUT PARAMETER LIST

Explanation: The parameter list specified when DSNTIAUL or DSNTPE2 was invoked contains one or more invalid values.

System Action: The application program is terminated.

User Response: Notify the system programmer.

System Programmer Response: Check the parameter values entered when DSNTIAUL or DSNTPE2 was invoked. For DSNTIAUL, the correct parameter value is 'SQL'. This parameter indicates that DSNTIAUL input is in complete SQL statements terminated by a semicolon. For DSNTPE2, the correct parameter values are either 'ALIGN(LHS)', 'ALIGN(MID)', 'MIXED', or 'NOMIXED'. The first two parameter values represent the two output alignment options available in DSNTPE2 where 'ALIGN(LHS)' will align the output on the left margin and 'ALIGN(MID)' will center the output. The remaining two parameter values designate whether or not DSNTPE2 will recognize mixed character data where 'MIXED' means that it will and 'NOMIXED' means that it will not recognize mixed character data.

DSNT500I *csect-name* RESOURCE UNAVAILABLE REASON *reason* TYPE *type* NAME *name*

Explanation: The requested function requires a resource that is currently unavailable. In conjunction with other messages this message will identify the

DSNT501I • DSNT503I

system action and the action that should be taken by the installation or operator.

'type' and 'name' identify the resource that is currently unavailable. The type code identifies the type, format, and content of the resource named.

Operator Response: Note the reason code, the type code, and the name. See the Problem Determination section for an explanation of the collected data.

Problem Determination: The reason the resource is unavailable is identified by a reason code. The reason codes that appear in this message are described in Part 4, "Section 4. DB2 Codes," on page 773. Use Table 3 in Appendix B, "Problem determination," on page 1353 to find the type of resource identified in the message.

If type is X'D00' or X'D01', the table name can be determined by using the following SQL statement:

```
SELECT CREATOR, NAME
FROM SYSIBM.SYSTABLES
WHERE DBID = dbid AND OBID = obid;
```

However, if the failing table has been dropped, then the above SELECT fails or possibly might return an incorrect name.

Collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 1.

DSNT501I *csect-name* RESOURCE UNAVAILABLE

:

CORRELATION-ID	= id1
CONNECTION-ID	= id2
LUW-ID	= id3
REASON	= reason
TYPE	= type
NAME	= name

Explanation: The requested function requires a resource that is currently unavailable. This message is issued with other messages that identify the system action and the action the installer or operator should take.

DB2 can recover from a resource not available in some cases and can complete successfully. One example is during setup of a performance enhancement during bind time for execution time. If DB2 recovers successfully, then no action is necessary.

For type=905, reason=00C90092, and name=IRLM, message DSNT501I is usually issued once. It is suppressed at the DB2 subsystem level until the IRLM out-of-storage condition is relieved.

id1 The correlation identifier of the thread associated with the requester of the resource.

id2 The connection identifier of the requester.

id3 The logical-unit-of-work identifier (LUW-ID) of the thread associated with the requester of the resource. An asterisk (*) indicates that the thread does not have a LUW-ID. If the LUW-ID is not an asterisk, the value is a logical-unit-of-work-id assigned to the thread. This is followed by an equal sign (=) and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

type The type of resource that is currently unavailable. The 'type' identifies the type, as well as the format and content, of the resource 'name'. Use Table 3 in Appendix B, "Problem determination," on page 1353 to find the type of resource identified in the message.

name The name of the resource that is currently unavailable.

reason The reason code that tells why the resource is unavailable.

Operator Response: Note the 'reason' code, the 'type' code, and the 'name'.

Problem Determination: A type X'401' indicates that a cascading revoke of SYSADM or SYSCTRL in a lower-level release attempted to revoke privileges or grants on objects that are available only in a higher-level release. Because the cascading revoke affects objects that are unknown to the lower-level release, you can only revoke SYSADM or SYSCTRL from the higher-level release.

Collect the following diagnostic item listed in Appendix B, "Problem determination," on page 1353: 1.

DSNT502I ERROR IN DSNTIAUL SQL INPUT: statement

Explanation: The DSNTIAUL input SQL statement could not be prepared.

System Action: The application program terminates.

User Response: Notify the system programmer.

System Programmer Response: Check that the DSNTIAUL input statement is a complete SQL statement, ending with a semicolon.

DSNT503I UNLOAD DATA SET *ddname* RECORD LENGTH SET TO *nnnnn*.

Explanation: If the *ddname* is SYSRECnn, the record length specified in the JCL for the data set is not large enough to contain an entire row of unloaded data, or the record length was not specified in the JCL.

If the *ddname* is SYSPUNCH, the record length specified in the JCL is not between 80 and 255, or the record length was not specified in the JCL.

System Action: DB2 sets the record length of the

unload data set to the value specified in the message text.

**DSNT504I UNLOAD DATA SET *ddname*
BLOCKSIZE SET TO *nnnnn*.**

Explanation: The block size for the SYSRECnn or SYSPUNCH data set was one of the following:

- Not specified in the JCL
- Set to zero in the JCL
- Less than the required record length
- Not an even multiple of the required record length

System Action: DB2 sets the block size of the unload data set to the value specified in the message text.

DSNT505I DSNTIAUL OPTIONS USED: 'nnn'.

Explanation: You specified these options when you invoked DSNTIAUL. 'SQL' is the only valid option.

Severity: 0 (informational)

**DSNT506I INPUT STATEMENT WAS NOT SELECT
* FROM A SINGLE TABLE. LOAD
STATEMENT WILL NEED
MODIFICATION.**

Explanation: The SELECT statement used to request a table unload contained one of the following:

- A SELECT clause other than "SELECT * FROM"
- A FROM clause that does not contain exactly one table name

The table to be loaded is therefore not the same as the table from which the data is unloaded. DSNTIAUL is unable to determine the table name and all column names for the table to be loaded.

Severity: 4 (warning)

System Action: DSNTIAUL generates a LOAD statement containing the string 'TBLNAME' for the table name. Some column names may be blank.

User Response: Change the LOAD statement table name to the name of a table with the indicated column descriptions.

**DSNT507I *csect-name* RECORD LENGTH NEEDED
IS GREATER THAN MAXIMUM
ALLOWED FOR TABLE *table-name***

Explanation: In order to unload table *table-name*, DB2 needs an output data set with a record length greater than the system maximum of 32760 bytes. This occurs when the table to be unloaded is in a 32KB page table space and contains a combination of long columns and a number of date, time, or timestamp columns.

Severity: 8 (error)

System Action: The application program is terminated.

**DSNT508I WARNING - NONSTANDARD JOB
CARD (*cardstat*), NO JOB CARDS WILL
BE ADDED TO THE EDITED JOBS**

Explanation: The job card you entered in field 3 of panel DSNTIPY contains one or more of the following errors:

- Less than 7 characters ('cardstat' = TOO SHORT)
- "/" missing as the first 2 characters ('cardstat' = MISSING //)
- Missing the word "JOB" ('cardstat' = MISSING "JOB"TOKEN)

This message is issued by the following installation CLIST: DSNTINST

System Action: The message is written to the screen, after all panels are displayed and before any job editing. No JCL is added to the edited jobs.

User Response: You can continue with job editing and manually add JCL to the edited jobs. Alternatively, you can repeat the installation process and make corrections to the job card entered on panel DSNTIPY.

**DSNT509I WARNING - MIGRATION INPUT
MEMBER LEVEL IS *rel_ind*. LEVEL
prev_rel IS REQUIRED. RETURN TO
PANEL DSNTIPA1 TO CHANGE
MIGRATION INPUT MEMBER**

Explanation: The migration input member you entered on panel DSNTIPA1 contains incorrect release indicator 'rel_ind'. It should contain the indicator for the prior release ('prev_rel'). If your input member does not contain a release indicator, 'rel_ind' will be <null>. This probably indicates that you are using a down-level member.

This message is issued by the following installation CLIST: DSNTINST

System Action: The message is written to the screen, after display of panel DSNTIPA1.

User Response: Press ENTER to proceed to the next panel, and then PF3 to return to panel DSNTIPA1 in order to enter an input member with the correct release indicator.

**DSNT510I WARNING - INPUT MEMBER *inmem*
LEVEL IS *rel_ind*. LEVEL *curr_rel* IS
REQUIRED. RETURN TO PANEL
DSNTIPA1 TO CHANGE INPUT
MEMBER**

Explanation: The input member 'inmem' you entered in field 6 on panel DSNTIPA1 contains incorrect release indicator 'rel_ind'. It should contain the indicator for the

DSNT511I • DSNT517I

current release ('curr_rel'). If your input member does not contain a release indicator, 'rel_ind' will be <null>. This probably indicates that you are using a down-level member.

This message is issued by the following installation CLIST: DSNTINST

System Action: The message is written to the screen, after display of panel DSNTIPA1.

User Response: Press ENTER to proceed to the next panel, and then PF3 to return to panel DSNTIPA1 in order to enter an input member with the correct release indicator.

DSNT511I FIELDS 2 AND 5 MUST BE UNIQUE FOR EACH NEW MEMBER INSTALLED

Explanation: This warning message is issued to remind you that the IRLM SUBSYSTEM and IRLM PROC names must be unique for each new member installed within a DB2 data sharing group. The installation process does not check for uniqueness of these names within a group.

This message is issued by the following panel: DSNTIPI

User Response: Enter unique names in these fields for each member of a DB2 data sharing group.

DSNT512I DSNT512I WARNING: ENTER UNIQUE NAMES FOR LUNAME AND LOCATION NAME

Explanation: This warning message is issued to remind you that you must enter values for DB2 LOCATION NAME and DB2 NETWORK LUNAME fields.

LUNAME is used to uniquely identify this DB2 subsystem within the network and to uniquely identify trace records for correlation of accounting records. The NETWORK LUNAME must be unique within the network. The installation process does not check for uniqueness of this name within a data sharing group.

The LOCATION NAME must be unique within the network, but must be the same on all members within a DB2 data sharing group.

This message is issued by the following panel: DSNTIPR

User Response: Enter unique names in these fields.

DSNT513I FIELD 2 MUST BE UNIQUE FOR EACH NEW MEMBER INSTALLED

Explanation: This warning message is issued to remind you that the DB2 PROC NAME field on panel DSNTIPX or the RESYNC PORT field on panel DSNTIP5 must be unique for each new member installed within a DB2 data sharing group. The

installation process does not check for uniqueness of these values within a group.

This message is issued by the following panels: DSNTIPX and DSNTIP5

User Response: Enter unique values in these fields for each member of a DB2 data sharing group.

DSNT514I FIELDS 2 AND 3 MUST BE UNIQUE FOR EACH NEW MEMBER INSTALLED

Explanation: This warning message is issued to remind you that the MEMBER NAME and WORK FILE DB NAME must be unique for each new member installed within a DB2 data sharing group. The installation process does not check for uniqueness of these names within a group.

This message is issued by the following panel: DSNTIPK

User Response: Enter unique names in these fields for each member of a DB2 data sharing group.

DSNT515I FIELD 7 MUST BE UNIQUE FOR EACH NEW MEMBER INSTALLED

Explanation: This warning message is issued to remind you that the MEMBER IDENTIFIER field on panel DSNTIPJ or the DSNZPARM NAME field on panel DSNTIPO must be unique for each new member installed within a DB2 data sharing group. The installation process does not check for uniqueness of these values within a group.

This message is issued by the following panels: DSNTIPJ and DSNTIPO

User Response: Enter unique values in these fields for each member of a DB2 data sharing group.

DSNT516I FIELDS 1, 2, AND 4 MUST BE UNIQUE FOR EACH NEW MEMBER INSTALLED

Explanation: This warning message is issued to remind you that the SUBSYSTEM NAME, COMMAND PREFIX, and SUBSYSTEM SEQUENCE fields must be unique for each new member installed within a DB2 data sharing group. The installation process does not check for uniqueness of these values within a group.

This message is issued by the following panel: DSNTIPM

User Response: Enter unique values in these fields for each member of a DB2 data sharing group.

DSNT517I CHARACTERS 2-18 MUST BE A-Z, 0-9, #, @, \$, OR UNDERSCORE

Explanation: WLM environment names that do not meet the following criteria are not allowed. A WLM environment name may contain up to eighteen

characters. The first character of a WLM environment name must either be an alphabetic character (A-Z) or a standard alphabetic extender (in the United States, the standard alphabetic extenders are '#', '@', '\$'). For characters two through eighteen, a character may be an alphabetic character (A-Z), an alphabetic extender ('#', '@', '\$'), a numeric character (0-9), or the underscore character ('_').

This message is issued by panel: DSNTIPX

System Action: The panel is redisplayed, and the cursor is placed on the field with the error.

User Response: Change the WLM environment name to meet the criteria described above.

DSNT518I THE VALUES FOR DRDA PORT AND RESYNC PORT CANNOT BE THE SAME

Explanation: You entered the same value for DRDA PORT and RESYNC PORT. The values for these fields must be different.

This message is issued by the following panel: DSNTIP5

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Change either the DRDA PORT or the RESYNC PORT value so that they are different.

DSNT519I IF YOU SPECIFY EITHER DRDA OR RESYNC PORT, BOTH MUST BE SPECIFIED

Explanation: You entered a value for either DRDA PORT or RESYNC PORT, but not the other. If either DRDA PORT or RESYNC PORT is specified, both must be specified.

This message is issued by the following panel: DSNTIP5

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Either enter a value for the null field, or blank out both DRDA PORT and RESYNC PORT.

DSNT520I DB2's default sizes for index and table spaces are increased in V8

Explanation: This message appears on DB2 installation panel DSNTIP7 when the CLIST is in MIGRATE mode and an entry of 0 appears in either field 4 TABLE SPACE ALLOCATION or field 5 INDEX SPACE ALLOCATION (or both). An entry of 0 indicates that DB2 default allocation sizes are to be assigned for table spaces or index spaces created without the USING clause. The purpose of the message is to alert you that the DB2 default allocation sizes have changed in Version 8.

- If you specify 0 for the TABLE SPACE ALLOCATION field, then 1 cylinder will be the default PRIQTY space allocation for non-LOB tablespaces and 10 cylinders will be the default PRIQTY space allocation for LOB tablespaces.
- If you specify 0 for the INDEX SPACE ALLOCATION field, then 1 cylinder will be the default PRIQTY space allocation for indexes.

The DB2 default SECQTY quantity depends on the setting you specify for DSNTIP7 field 7 OPTIMIZE EXTENT SIZING. See the discussion of OPTIMIZE EXTENT SIZING for more information.

Severity: 4

System Action: Processing continues.

User Response: To assign the new DB2 default allocation sizes to table spaces created without the USING clause, specify 0 in field 4 TABLE SPACE ALLOCATION. Otherwise, specify an explicit size.

To assign the new DB2 default allocation size to index spaces created without the USING clause, specify 0 in field 5 INDEX SPACE ALLOCATION. Otherwise, specify an explicit size.

DSNT522I csect-name REQUIRED TCP/IP SUPPORT NOT AVAILABLE

Explanation: The DB2 BSDS indicated that TCP/IP access was required, but the required TCP/IP interfaces were not available on this system. The required TCP/IP interfaces are provided by OS/390 Release 3.

System Action: DDF startup terminates abnormally.

System Programmer Response: Take one of the following actions:

- Install OS/390 Release 3 or later, so that the required TCP/IP interfaces are available.
- Use the change log inventory utility (DSNJU003) to deactivate DB2's TCP/IP support, by specifying PORT=0 and RESPORT=0 on the DDF statement.

DSNT524I SQL PROCEDURE DATA MIGRATION HAS COMPLETED SUCCESSFULLY. rowcount ROWS WERE COPIED FROM TABLE SYSIBM.SYSPSM TO TABLE SYSIBM.SYSROUTINES_SRC. rowcount ROWS WERE COPIED FROM TABLE SYSIBM.SYSPSMOPTS TO TABLE TO SYSIBM.SYSROUTINES_OPTS

Explanation: DB2 program DSNTIGR issued this message after it completed a one-time migration of SQL procedure data. DSNTIGR migrated the SQL procedure data from user-maintained tables SYSIBM.SYSPSM and SYSIBM.SYSPSMOPTS to the DB2 catalog tables SYSIBM.SYSROUTINES_SRC and SYSIBM.SYSROUTINES_OPTS.

DSNT525I

System Action: Migration of SQL procedure data to the DB2 catalog is complete. All changes were committed.

User Response: None.

DSNT525I SQL PROCEDURE DATA MIGRATION CANCELLED, ERROR CODE *error-code*

Explanation: DB2 program DSNTIGR issued this message after it encountered errors during a once-only migration of SQL procedure data. DSNTIGR attempted to migrate the SQL procedure data from user-maintained tables SYSIBM.SYSPSM and SYSIBM.SYSPSMOPTS to the DB2 catalog tables SYSIBM.SYSROUTINES_SRC and SYSIBM.SYSROUTINES_OPTS. The *error-code* identifies the specific cause of the problem as follows:

- 01 SQL procedure data cannot be migrated to the DB2 catalog because the user-maintained SQL procedure source table, SYSIBM.SYSPSM, does not exist.
- 02 An SQL error occurred when DSNTIGR searched SYSIBM.SYSTABLES for table SYSIBM.SYSPSM. Message DSNT408I provides more information about the SQL error.
- 03 An object named SYSIBM.SYSPSM exists, but it is not a table. This situation can occur if DSNTIGR was run before, and SYSIBM.SYSPSM is now a view of SYSIBM.SYSROUTINES_SRC.
- 07 SQL procedure data cannot be migrated to the DB2 catalog because the user-maintained SQL procedure options table, SYSIBM.SYSPSMOPTS, does not exist.
- 08 An SQL error occurred when DSNTIGR searched SYSIBM.SYSTABLES for table SYSIBM.SYSPSMOPTS. Message DSNT408I provides more information about the SQL error.
- 09 An object named SYSIBM.SYSPSMOPTS exists but it is not a table. This situation can occur if DSNTIGR was run before, and SYSIBM.SYSPSMOPTS is now a view of SYSIBM.SYSROUTINES_OPTS.
- 10 An SQL error occurred when DSNTIGR requested an exclusive lock on table SYSIBM.SYSPSM. Message DSNT408I provides more information about the SQL error.
- 12 An SQL error occurred when DSNTIGR requested an exclusive lock on table SYSIBM.SYSPSMOPTS. Message DSNT408I provides more information about the SQL error.
- 21 Catalog table SYSIBM.SYSROUTINES_SRC already contains data. DSNTIGR was cancelled because the migration integrity cannot be guaranteed.

- 23 Catalog table SYSIBM.SYSROUTINES_OPTS already contains data. DSNTIGR was cancelled because the migration integrity cannot be guaranteed.
- 30 An SQL error occurred when DSNTIGR copied data from table SYSIBM.SYSPSM to table SYSIBM.SYSROUTINES_SRC. Message DSNT408I provides more information about the SQL error.
- 40 An SQL error occurred when DSNTIGR copied data from table SYSIBM.SYSPSMOPTS to table SYSIBM.SYSROUTINES_OPTS. Message DSNT408I provides more information about the SQL error.
- 50 An SQL error occurred when DSNTIGR requested a row count of table SYSIBM.SYSPSM. Message DSNT408I provides more information about the SQL error.
- 52 An SQL error occurred when DSNTIGR requested a row count of table SYSIBM.SYSPSMOPTS. Message DSNT408I provides more information about the SQL error.
- 54 An SQL error occurred when DSNTIGR requested a row count of table SYSIBM.SYSROUTINES_SRC. Message DSNT408I provides more information about the SQL error.
- 56 An SQL error occurred when DSNTIGR requested a row count of table SYSIBM.SYSROUTINES_OPTS. Message DSNT408I provides more information about the SQL error.
- 57 After all rows were copied from the SYSIBM.SYSPSM to SYSIBM.SYSROUTINES_SRC, the row counts of the tables did not match. This indicates that a data integrity error has occurred.
- 59 After all rows were copied from the SYSIBM.SYSPSMOPTS to SYSIBM.SYSROUTINES_OPTS, the row counts of the tables did not match. This indicates that a data integrity error has occurred.
- 60 An SQL error occurred when DSNTIGR tried to drop the database that contains the user-maintained SQL procedures tables, SYSIBM.SYSPSM and SYSIBM.SYSPSMOPTS. Message DSNT408I provides more information about the SQL error.
- 70 An SQL error occurred when DSNTIGR tried to create view SYSIBM.SYSPSM on table SYSIBM.SYSROUTINES_SRC. Message DSNT408I provides more information about the SQL error.
- 72 An SQL error occurred when DSNTIGR tried to

create view SYSIBM.SYSPSMOPTS on table SYSIBM.SYSROUTINES_OPTS. Message DSNT408I provides more information about the SQL error.

- 80** An SQL error occurred during a COMMIT operation. Message DSNT408I provides more information about the SQL error.
- 82** An SQL error occurred during a ROLLBACK operation. Message DSNT408I provides more information about the SQL error.

System Action: DB2 discontinues the migration of SQL procedure data to the DB2 catalog, and all changes are rolled back.

User Response: If an SQL error has occurred, see message DSNT408I to determine the specific error. Refer to Part 2, "SQL return codes," on page 11 for more information on the SQL error.

If table SYSIBM.SYSPSM or SYSIBM.SYSPSMOPTS has been deleted, recover database DSNDBPSM to restore the table.

You can run DSNTIGR successfully only once. For data sharing migration, run DSNTIGR only on the first member of the group to migrate. Do not run DSNTIGR after remigration.

Catalog tables SYSIBM.SYSROUTINES_SRC and SYSIBM.SYSROUTINES_OPTS must be empty before you run DSNTIGR. If you have already added rows to these catalog tables, drop the SQL procedures whose creation added the rows. Run job DSNTIGR to migrate SYSIBM.SYSPSM and SYSIBM.SYSPSMOPTS, then recreate the dropped SQL procedures.

If the error code indicates a data integrity problem, notify the system programmer.

DSNT526I WARNING: DSNHDECP SPECIFIES AN UNDEFINED (0) VALUE FOR *ccsid-parm* NOTIFY THE SYSTEM PROGRAMMER.

Explanation: The DSNHDECP module that is used by the DB2 precompiler contains an undefined (0) value for the CCSID parameter that is indicated by *ccsid-parm*. The use of CCSIDs that are undefined will be disallowed by DB2 in the near future.

System Action: Processing continues.

User Response: Notify the System Programmer.

System Programmer Response: DSNHDECP needs to specify a valid, non-zero default CCSID (Coded Character Set Identifier) for each of the three encoding schemes that are supported: ASCII, EBCDIC, and UNICODE. Processing character data with an undefined CCSID can lead to unpredictable results, including loss or corruption of the data. A default CCSID must be defined even for encoding schemes not used on your DB2 system.

If *ccsid-parm* is ASCCSID, then the default CCSID for single-byte ASCII-encoded character data is undefined (set to 0). If *ccsid-parm* is SCCSID, then the default CCSID for single-byte EBCDIC-encoded character data is undefined (set to 0).

Using the undefined CCSID for EBCDIC will be disallowed in the near future by APAR PQ71079. Using the undefined CCSID for ASCII will be disallowed in a future release of DB2.

You need to take steps now to select an appropriate CCSID for each undefined CCSID, and to plan for and schedule deployment of the updated DSNHDECPs on your DB2 subsystem or data sharing system. See the documentation provided with the PTF for APAR PQ56697 for further guidance.

Do not attempt to choose or change a CCSID without guidance from IBM. Using the wrong CCSID can corrupt your data and render it unrecoverable.

DSNT527I ERROR: DB2 ATTEMPTED TO START USING THE DB2-SUPPLIED DSNHDECP MODULE. NOTIFY THE SYSTEM PROGRAMMER.

Explanation: The DSNHDECP module that is supplied by DB2 is being used to run the DB2 precompiler. DB2 requires site-dependent settings that are specified in the DSNHDECP module that was created when DB2 was installed. The DSNHDECP that was generated during installation module typically is located in the SDSNEXIT library.

System Action: DB2 startup is discontinued.

User Response: Notify the System Programmer.

System Programmer Response: Check the STEPLIB, JOBLIB, or system linklist concatenation used in the DB2 address spaces. To ensure that the proper DSNHDECP module is used, verify that the library that contains the DSNHDECP module that is generated during installation precedes the SDSNLOAD library that contains the DSNHDECP module that was supplied by DB2.

DSNT528I USE PROTECTION MUST BE YES WHEN CACHE DYNAMIC SQL IS YES

Explanation: You entered NO for USE PROTECTION on panel DSNTIPP and YES for CACHE DYNAMIC SQL on panel DSNTIP4. You must enter YES for USE PROTECTION if CACHE DYNAMIC SQL is YES.

System Action: The panel is redisplayed, and the cursor is placed on the field that is in error.

User Response: If you see this message on panel DSNTIPP, enter a value of YES for USE PROTECTION, or return to panel DSNTIP4 and enter NO for CACHE DYNAMIC SQL. If you see this message on panel DSNTIP4, enter a value of NO for CACHE DYNAMIC

SQL, or go to panel DSNTIPP and enter YES for USE PROTECTION.

DSNT530I *program-name* **COULD NOT RUN BECAUSE IT WAS NOT INVOKED FROM AN APF-AUTHORIZED LIBRARY**

Explanation: *program-name* could not run for one of the following reasons:

- *program-name* was not invoked from an APF-authorized library.
- One or more libraries in the STEPLIB or JOBLIB concatenation the job that invokes *program-name* is not APF-authorized.

System Action: The program terminates.

User Response: Notify the system programmer.

System Programmer Response: Ensure that *program-name* is link-edited with option AC(1) and resides in an APF-authorized library. Ensure that all libraries in the STEPLIB and JOBLIB concatenation for the job that invokes *program-name* are APF authorized. If *program-name* is an external module for a DB2 stored procedure or user-defined function, ensure that the corresponding SYSIBM.SYSROUTINES entry specifies a WLM-established address space.

DSNT531I *schema.routine-name* **RECEIVED SQLCODE *sqlcode* FROM SQL STATEMENT *sql-statement***

Explanation: When *schema.routine-name* executed *sql-statement*, DB2 returned the SQL warning or error *sql-code*.

System Action: *schema.routine-name* terminates.

User Response: Notify the system programmer.

System Programmer Response: Check the messages in the SYSPRINT data set for the stored procedures address space where routine *schema.routine-name* runs. Message DSNT408I provides specific information about the SQL warning or error. Refer to Section 2. SQL Return Codes for more information on the SQL error.

DSNT532I *schema.routine-name* **RECEIVED SAF RETURN CODE *return-code* FROM RACROUTE COMMAND *command*.**

Explanation: When *schema.routine-name* executed RACROUTE command *command*, the OS/390 System Authorization Facility (SAF) returned an unexpected code *return-code*.

System Action: *schema.routine-name* terminates.

User Response: Notify the system programmer.

System Programmer Response: Refer to the OS/390 Security Server RACROUTE Macro Reference for more

information about the SAF error.

DSNT540I *wlm-environment-name* **WAS REFRESHED BY *user* USING AUTHORITY FROM SQL ID *sqlid***

Explanation: DB2 stored procedure WLM_REFRESH refreshed WLM environment *wlm-environment-name*. User ID *user* issued the request, using authority from SQL ID *sqlid*.

System Action: WLM environment *wlm-environment-name* is refreshed.

User Response: None

System Programmer Response: None

DSNT541I **WLM REFRESH REQUEST FAILED. RESOURCE PROFILE *subsystem-name*.WLM_REFRESH.*wlm-environment-name* IS UNDEFINED**

Explanation: DB2 stored procedure WLM_REFRESH rejected a request to refresh WLM environment *wlm-environment-name* because SAF resource profile *subsystem-name*.WLM_REFRESH.*wlm-environment-name* does not exist. WLM_REFRESH uses the resource profile to verify whether the requestor is authorized to refresh the WLM environment. The requestor was connected to DB2 subsystem *subsystem-name*.

System Action: WLM_REFRESH rejects the refresh request.

User Response: Notify the system programmer.

System Programmer Response: Create the SAF resource profile in resource class DSNR, and permit READ access to all primary and secondary authorization IDs that need to refresh the WLM environment.

DSNT542I **SQL ID *sqlid* IS NOT AUTHORIZED TO REFRESH WLM ENVIRONMENT *wlm-environment-name***

Explanation: DB2 stored procedure WLM_REFRESH rejected a request to refresh WLM environment *wlm-environment-name* because *sqlid* is not authorized. *sqlid* is the current SQLID of the requestor.

System Action: WLM_REFRESH rejects the refresh request.

User Response: Notify the system programmer.

System Programmer Response: Give *sqlid* READ access or higher on the appropriate SAF resource profile. That profile resides in SAF resource class DSNR and has the format *ssid*.WLM_REFRESH.*wlm-environment-name*.

DSNT543I WLM REFRESH REQUEST FAILED: PARAMETER *parameter* IS NULL, BLANK, OR CONTAINS INVALID CHARACTERS

Explanation: The argument passed to WLM_REFRESH for *parameter* cannot be used for one of the following reasons:

- It is null or blank
- It contains characters that are not allowed for a SAF resource profile or for a DB2 subsystem name

System Action: The program terminates.

User Response: Notify the system programmer.

System Programmer Response:

- For the WLM_ENV_NAME parameter, specify a non-null, non-blank argument. That argument must conform to the rules for a SAF resource profile. See Appendix A of *z/OS Security Server RACF Auditor's Guide* for more information.
- For the SSID parameter, specify a null or blank argument, or a value that conforms to the rules for a DB2 subsystem name, as documented in the *DB2 Installation Guide*. If you specify a null or blank value, DB2 determines the subsystem name.

DSNT550I '*data-set-name*' IS UNAVAILABLE FOR CLIST OUTPUT BECAUSE *reason*

Explanation: Data set *data-set-name* is required for output by the DB2 Install CLIST, but cannot be allocated for the reason that is indicated by *reason*. Possible reasons are:

- **IT CANNOT BE ALLOCATED OR OPENED FOR OUTPUT**
An error occurred during an allocate, open, or close operation on *data-set-name*.
- **ERROR PROCESSING REQUESTED DATA SET**
The request for *data-set-name* could not be processed.
- **MEMBER SPECIFIED, BUT DATASET IS NOT PARTITIONED**
data-set-name already exists, but is not a partitioned data set as required by the CLIST.
- **PROTECTED DATASET**
Your userid is not authorized to use *data-set-name*.
- **VOLUME NOT ON SYSTEM**
data-set-name is registered in the system catalog on a DASD or tape volume which is currently unmounted or unavailable.
- **UNAVAILABLE DATASET**
data-set-name is currently allocated by another user.

System Action: The Install panel for specifying *data-set-name* is redisplayed. You cannot proceed to the next DB2 Install panel until the problem is resolved.

User Response: Take one of the following actions according to *reason*:

- For errors allocating, opening, or processing *data-set-name*, specific diagnostic messages are displayed by TSO. If you are not seeing these messages, enter the command TSO PROFILE WTPMSG in the command line of the current DB2 install panel. Consult the appropriate MVS system messages and codes documentation for further information about these messages.
- If *data-set-name* is indicated as a non-partitioned data set, verify that you have entered the intended data set name for CLIST output. If so, rename or delete the existing data set.
- Consult your system security administrator to obtain access to a protected data set.
- In the event of an unavailable data set, ask the current user(s) to release it. Ask your system programmer to identify the user(s) if you are unable to do so. Otherwise, try later when the data set has been freed.

DSNT552I *csect-name* CHARACTER CONVERSION FROM CCSID *from-ccsid* TO CCSID *to-ccsid* FAILED WITH ERROR CODE *error-code*

Explanation: A conversion error occurred during the conversion of a string to a different coded character set.

from-ccsid

identifies the coded character set of the string to be converted.

to-ccsid

identifies the coded character set to which it must be converted.

error-code

indicates the type of error as defined as follows:

- | | |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 8 | Length exception (for example, expansion required for PC MIXED data exceeds the maximum length of the string). |
| 12 | Invalid code point. |
| 16 | Form exception (for example, invalid MIXED data). |
| 20 | Translate procedure error (for example, an error during Unicode/390 stage 2 conversions or an exit set the length control field of the string to an invalid value). |
| 24 | The conversion services have not been setup correctly or the conversion is not supported. |

Severity: 8

System Action: The operation is not performed.

User Response: If the *error-code* is 24 and the conversion request is correct, refer to *DB2 Installation Guide* for information on how to add conversion support. The MVS Command D UNI,ALL can be used to see the conversions that have been defined. For all other *error-codes*, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

- 'ACTIVE' if the keyword ACTIVE is specified
- 'RESTRICTED' if the keyword RESTRICT is specified.

System Action: Message DSNT301I or DSNT302I is produced if no object is found and the keywords ACTIVE and RESTRICT are omitted.

DSNT601I THE DESCRIPTOR FOR type name DOES NOT EXIST IN DBD01

Explanation: This message is issued for multiple-line WTO. The database, table space, or index space 'name' is in the DB2 catalog but a descriptor for the object does not exist in the DBD01 table space of database DSNDB01. This error can be produced when one of the following is true:

- The Version 8 catalog has been migrated into Version 7. There is an object in the Version 7 catalog but there is not a descriptor for the object in the Version 7 directory (DBD01).
- The user did not completely restore the DBD01 table space during a recovery process.
- There is a DB2 logic error.

In the message, 'type' is either 'DATABASE' or 'SPACE' and 'name' is the eight character name of the database, table space, or index space.

System Action: The process continues normally.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNT602I NO SPACES FOUND

Explanation: This message is issued for multiple line WTO. It is produced when a DISPLAY DB(name) SPACENAM(...) is entered and no spaces were found to satisfy the request. SPACENAM(...) might have been entered as a range, a subset, or a list of spaces.

DSNT603I spacetype name NOT type

Explanation: This message is issued for multiple-line WTO. It is produced when no table space or index space listed in the DISPLAY DB(...) SPACENAM(...) satisfies your request.

spacetype

TABLESPACE if the space is a table space or INDEXSPACE if the space is an index space.

name The name of the space.

type A character string that indicates the type of request specified. The string is a list of the following, delimited by 'OR':

DSNT604I NO INFORMATION AVAILABLE

Explanation: This message is issued for multiple line WTO. It is produced when there is no LOCK or USE information available. When DISPLAY DB(name) SPACENAM(...) is entered, and SPACENAM(...) is a list of spaces, this message indicates that no table spaces or index spaces whose names are listed have LOCK or USE information available. If DISPLAY DB(name) SPACENAM(...) is entered, and SPACENAM(...) is a range or a subset of spaces, no table spaces and index spaces within the specified database have LOCK or USE information available. This message is produced only when the keywords USE and LOCKS are specified.

DSNT694I DATABASE name CANNOT BE STOPPED. IT CONTAINS THE DDL REGISTRATION TABLES

Explanation: The database specified in the message cannot be stopped because it contains the application and object registration tables. Install SYSADM or install SYSOPR authority is needed to stop the database.

System Action: The database specified in the message is not stopped.

User Response: Reissue the command with the proper authority.

DSNT695I TABLESPACE name CANNOT BE STOPPED. IT CONTAINS A DDL REGISTRATION TABLE

Explanation: The table space specified in the message cannot be stopped because it contains an application or object registration table. Install SYSADM or install SYSOPR authority is needed to stop the table space.

System Action: The table space specified in the message is not stopped.

User Response: Reissue the command with the proper authority.

DSNT696I INDEXSPACE name CANNOT BE STOPPED. IT IS DEFINED ON A DDL REGISTRATION TABLE

Explanation: The index space specified in the message cannot be stopped because it is defined on an application or object registration table. Install SYSADM or install SYSOPR authority is needed to stop the index space.

System Action: The index space specified in the message is not stopped.

User Response: Reissue the command with the proper authority.

DSNT700I table-name IS THE ACTIVE RESOURCE LIMIT SPECIFICATION TABLE

Explanation: This is a response message to the DISPLAY RLIMIT command. The resource limit facility (governor) is currently active and is using table 'table-name' to determine resource limits.

System Action: The system continues normal processing.

User Response: See Operator Response.

Operator Response: To have the governor active while utilizing a different resource limit specification table, issue the START RLIMIT command specifying the ID of the desired table. If you do not want the facility to be active, issue the STOP RLIMIT command.

System Programmer Response: May be used to resolve questions about what table is being used.

DSNT701I RESOURCE LIMIT FACILITY IS INACTIVE

Explanation: This is a response message to the DISPLAY RLIMIT command. It results whenever the governor is not active.

System Action: Normal processing continues.

User Response: See Operator Response.

Operator Response: If you want to activate the governor, specify the ID of the resource limit specification table to be used and issue the START RLIMIT command.

System Programmer Response: If the facility is already active (that is, a DSNT703 message was previously received), verify that the DSNT703 message appeared *before* the DISPLAY RLIMIT command was entered. If uncertain, reissue the DISPLAY RLIMIT command. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5.

DSNT702I RESOURCE LIMIT FACILITY HAS BEEN STOPPED. WAS USING table-name

Explanation: This message is the normal response for a STOP RLIMIT command. Table 'table-name' was being used to determine resource limits.

System Action: The governor is stopped.

System Programmer Response: May be used to resolve questions about what table was being used.

DSNT703I RESOURCE LIMIT FACILITY IS ALREADY INACTIVE. STOP RLIMIT COMMAND IS IGNORED

Explanation: A STOP RLIMIT command was entered but the resource limit facility was already stopped. The command is ignored.

System Action: The system continues normal processing.

DSNT704I table-name HAS BEEN STARTED FOR THE RESOURCE LIMIT FACILITY

Explanation: This message is the normal response for a START RLIMIT command. Table 'table-name' is currently being used to determine resource limits.

System Action: The governor has started utilizing the specified table.

System Programmer Response: May be used to resolve questions about what table is being used.

DSNT705I csect-name DATABASE name CANNOT BE STOPPED. IT CONTAINS AN ACTIVE RESOURCE LIMIT SPECIFICATION TABLE

Explanation: Database *name* cannot be stopped because it contains an active resource limit specification table.

System Action: The database is not stopped.

Operator Response: If the database must be stopped, either stop the resource limit facility (STOP RLIMIT), or switch it to use a resource limit specification table that is not in the database (START RLIMIT, ID=xx). In a DB2 data sharing environment, you must either stop the resource limit facility on all members of the DB2 data sharing group or switch it to use a resource limit specification table that is not in the database.

DSNT706I table-name DOES NOT EXIST. START RLIMIT COMMAND FAILED

Explanation: The START RLIMIT command has been entered but failed because table 'table-name' does not exist.

System Action: The START RLIMIT command is ignored.

User Response: See Operator Response.

Operator Response: Verify that the 1 or 2 characters following DSNRLST are what was intended to be entered as the ID on the START RLIMIT command. If not, reenter the command specifying the proper ID. If the ID appears correct, contact the system programmer.

DSNT707I • DSNT710I

System Programmer Response: DB2 was unable to find the specified table in the catalog. Verify that the FULLY QUALIFIED name is the one expected. The table name is built by appending the 1 or 2 character ID specified on the START RLIMIT command to the authorization ID.DSNRLST. The authorization ID is determined from the DSNZPARMs used when starting the subsystem.

If everything appears to be in order, from a TSO terminal with the proper authorization, enter the following SQL statement:

```
SELECT * FROM SYSIBM.SYSTABLES WHERE NAME=DSNRLSTxx  
AND CREATOR=authorization ID
```

Where

DSNRLSTxx

Table-name starting with the DSNRLST authorization ID

Table-name up to but not including the period.

If an entry is found, save the output and if you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items:

- Console output showing the failing START command
- The output of the SELECT command.

DSNT707I **START RLIMIT COMMAND FAILED.**
COLUMN column-name IN TABLE
table-name IS INCORRECTLY DEFINED.
THE COLUMN DEFINITION IS attribute
WITH LENGTH length AND NULL
ATTRIBUTE null-attribute. THE
COLUMN DEFINITION SHOULD BE
attribute WITH LENGTH length AND
NULL ATTRIBUTE null-attribute

Explanation: The START RLIMIT command has been entered but failed because TABLE 'table-name' does not have the proper column definition for a resource limit specification table. The current column definition is given as well as the proper column definition.

System Action: The START RLIMIT command is ignored.

User Response: See Operator Response.

Operator Response: Verify that the 1 or 2 characters following DSNRLST are what was intended to be entered as the ID on the START RLIMIT command. If not, reenter the command specifying the proper ID. If the ID appears to be correct, contact the system programmer.

System Programmer Response: TABLE 'table-name' does not have the proper column definition for a resource limit specification table. Compare the current

table column definition to the proper column definition given in the message.

Problem Determination: Collect the console output showing the failing START command.

DSNT708I **INDEX index-name DOES NOT EXIST.**
START RLIMIT COMMAND FAILED

Explanation: The START RLIMIT command has been entered but failed because INDEX DSNARLxx does not exist for the corresponding resource limit specification table, DSNRLSTxx.

System Action: The START RLIMIT command is ignored.

User Response: See Operator Response.

Operator Response: Verify that the 1 or 2 characters following DSNRLST are what was intended to be entered as the ID on the START RLIMIT command. If not, reenter the command specifying the proper ID. If the ID appears to be correct, contact the system programmer.

System Programmer Response: The resource limit specification table DSNRLSTxx does not define the required index DSNARLxx. Create the required index and reissue the START RLIMIT command.

Problem Determination: Collect the console output showing the failing START command.

DSNT709I **new-table-name NOW ACTIVE.**
old-table-name WAS OLD RESOURCE
LIMIT SPECIFICATION TABLE

Explanation: A START RLIMIT command was entered while the facility was already active. The facility remains active and switches from using the old table name to the new one.

User Response: Notify the system programmer.

Operator Response: Notify the system programmer.

DSNT710I **table-name ALREADY ACTIVE. START**
LIMIT COMMAND IGNORED

Explanation: A START RLIMIT command was entered and the governor is already active utilizing the specified table. The command is ignored.

System Action: The governor continues to use table 'table-name'.

User Response: See Operator Response.

Operator Response: Verify that the ID specified on the START RLIMIT command was the one desired. If not, reenter the command specifying the correct ID. If it is correct, no action is needed since the facility is already active and is using the desired table.

System Programmer Response: If you suspect an

error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5.

DSNT711I COLUMN column-name IS MISSING IN TABLE table-name. SHOULD BE DEFINED AS attribute WITH LENGTH length AND NULL INDICATOR OF null-attribute

Explanation: The START RLIMIT command has been entered but failed because COLUMN 'column-name' in resource limit specification table 'table-name' is not defined. The proper column definition is given in the message.

System Action: The START RLIMIT command is ignored.

User Response: See Operator Response.

Operator Response: Verify that the 1 or 2 characters following DSNRLST are what was intended to be entered as the ID on the START RLIMIT command. If not, reenter the command specifying the proper ID. If the ID appears to be correct, contact the system programmer.

System Programmer Response: TABLE 'table-name' does not have COLUMN 'column-name' defined. Use ALTER TABLE to define the column as specified in the message.

Problem Determination: Collect the console output showing the failing START command.

DSNT712I INDEX index-name IS NOT FOR TABLE table-name. START RLIMIT COMMAND FAILED

Explanation: The START RLIMIT command has been entered but failed because INDEX 'index-name' is not defined for resource limit specification table 'table-name'.

System Action: The START RLIMIT command is ignored.

User Response: See Operator Response.

Operator Response: Verify that the 1 or 2 characters following DSNRLST are what was intended to be entered as the ID on the START RLIMIT command. If not, reenter the command specifying the proper ID. If the ID appears to be correct, contact the system programmer.

System Programmer Response: INDEX 'index-name' is not defined in resource limit specification table 'table-name'. resource limit specification table DSNRLSTxx does not define the required index

DSNARLxx. The last two characters of the table name correspond to the last two characters of the index. Drop the existing DSNARLxx index and create the correct index in the resource limit specification Table.

Problem Determination: Collect the console output showing the failing START command.

DSNT713I INDEX index-name IS NOT UNIQUE. START RLIMIT COMMAND FAILED

Explanation: The START RLIMIT command has been entered but failed because INDEX 'index-name' in the resource limit specification table is not defined as a UNIQUE index.

System Action: The START RLIMIT command is ignored.

User Response: See Operator Response.

Operator Response: Verify that the 1 or 2 characters following DSNRLST are what was intended to be entered as the ID on the START RLIMIT command. If not, reenter the command specifying the proper ID. If the ID appears to be correct, contact the system programmer.

System Programmer Response: INDEX 'index-name' in resource limit specification table is not UNIQUE. Redefine it as unique.

Problem Determination: Collect the console output showing the failing START command.

DSNT714I INDEX index-name IS INCORRECTLY DEFINED. START RLIMIT COMMAND FAILED

Explanation: The START RLIMIT command has been entered but failed because INDEX 'index-name' in resource limit specification table 'table-name' is not properly defined.

System Action: The START RLIMIT command is ignored.

User Response: Contact the system programmer.

Operator Response: Contact the system programmer.

System Programmer Response: INDEX 'index-name' in the resource limit specification table does not have the proper definition. Refer to Part 5 (Volume 2) of *DB2 Administration Guide* for an example to define the resource limit specification table.

Problem Determination: Collect the console output showing the failing START command.

DSNT715E ERROR reason-code READING table-name. default WILL BE RESOURCE LIMIT FOR CORRELATION-ID correlation-id, CONNECTION-ID connection-id, LUW-ID luw-id =token

Explanation: An error occurred while the resource limit specification table 'table-name' was being read. The limit is determined from the default specified in the system parameters. This default can be:

NOLIMIT

No limit applies.

NORUN

Zero time limit.

integer The limit to be used.

The reason code that defines the read error is included in the message text, as are the 'connection-ID', 'correlation-ID', and the logical-unit-of-work identifier (LUW-ID) of the thread. An LUW-ID of an '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input. Correlation IDs beginning with '0nn', where 'nn' is a number from 01 to 28, identify system agents.

System Action: Processing continues using the system-defined default.

Operator Response: Notify the system programmer.

System Programmer Response: This is an I/O error. Investigate the problem indicated by the reason code and preceding messages. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5.

DSNT716E AN ERROR OCCURRED ESTABLISHING A RESOURCE LIMIT FOR CORRELATION-ID correlation-id, CONNECTION-ID connection-id, LUW-ID luw-id =token. limit WILL BE USED AS THE LIMIT

Explanation: An internal error occurred while the resource limit for the specified requester was being established. The 'limit' is determined from the default specified in the system parameters. This default can be:

NOLIMIT

No limit applies.

NORUN

Zero time limit.

integer The limit to be used.

A logical-unit-of-work identifier (LUW-ID) of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input. Correlation IDs beginning with '0nn', where 'nn' is a number from 01 to 28, identify system agents.

This message is issued by the following CSECT:
DSNTCGET

System Action: Processing continues using the system-defined default.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 5.

DSNT717I csect-name TABLE SPACE name CANNOT BE STOPPED. IT CONTAINS AN ACTIVE RESOURCE LIMIT SPECIFICATION TABLE

Explanation: Table space *name* cannot be stopped because it contains an active resource limit specification table.

System Action: The table space is not stopped.

Operator Response: If the table space must be stopped, either stop the resource limit facility (STOP RLIMIT), or switch it to use a resource limit specification table that is not in the table space (START RLIMIT,ID=xx). In a DB2 data sharing environment, you must either stop the resource limit facility on all members of the DB2 data sharing group or switch it to use a resource limit specification table that is not in the table space.

DSNT718I csect-name INDEX SPACE name CANNOT BE STOPPED. IT IS DEFINED ON AN ACTIVE RESOURCE LIMIT SPECIFICATION TABLE

Explanation: Index space *name* cannot be stopped because it contains an index on an active resource limit specification table.

System Action: The index space is not stopped.

Operator Response: If the index space must be stopped, either stop the resource limit facility (STOP RLIMIT), or switch it to use a different resource limit specification table that does not have an index in the index space (START RLIMIT,ID=xx). In a DB2 data

sharing environment, you must either stop the resource limit facility on all members of the DB2 data sharing group or switch it to use a different resource limit specification table that does not have an index in the index space.

DSNT719I TABLE *table-name* CANNOT BE READ. START RLIMIT COMMAND FAILED

Explanation: TABLE 'table-name' cannot be accessed. This message may be preceded by related error messages that explain why the table cannot be accessed.

System Action: The START RLIMIT command failed.

User Response: See Operator Response.

Operator Response: TABLE 'table-name' cannot currently be accessed for reading. In the case of a deadlock or timeout, reissue the START RLIMIT command.

DSNT720I *csect-name* INDEX *index-name* NEEDS TO BE *index-type*

Explanation: The START RLIMIT command was entered but failed because the named index defined for the resource limit specification table is not defined properly.

System Action: The system ignores the START RLIMIT command.

User Response: Contact the system programmer.

Operator Response: Contact the system programmer.

System Programmer Response: The named index defined on the resource limit specification table does not have the proper definition.

Problem Determination: Collect the console output showing the failing START command.

DSNT721I *csect-name* DATABASE *name* CANNOT BE STARTED WITH ACCESS (UT). IT CONTAINS AN ACTIVE RESOURCE LIMIT SPECIFICATION TABLE

Explanation: Database *name* cannot be started with access (UT) because it contains an active resource limit specification table.

System Action: The START DATABASE command is ignored.

Operator Response: If the database must be started with access (UT), either stop the resource limit facility (STOP RLIMIT), or switch it to use a resource limit specification table that is not in the database (START RLIMIT, ID=*xx*). In a DB2 data sharing environment, you must either stop the resource limit facility on all members of the DB2 data sharing group or switch it to

use a resource limit specification table that is not in the database.

DSNT722I *csect-name* TABLE SPACE *name* CANNOT BE STARTED WITH ACCESS (UT). IT CONTAINS AN ACTIVE RESOURCE LIMIT SPECIFICATION TABLE

Explanation: Table space *name* cannot be started with access (UT) because it contains an active resource limit specification table.

System Action: The START DATABASE command is ignored.

Operator Response: If the table space must be started with access (UT), either stop the resource limit facility (STOP RLIMIT), or switch it to use a resource limit specification table that is not in the table space (START RLIMIT, ID=*xx*). In a DB2 data sharing environment, you must either stop the resource limit facility on all members of the DB2 data sharing group or switch it to use a resource limit specification table that is not in the table space.

DSNT723I *csect-name* INDEX SPACE *name* CANNOT BE STARTED WITH ACCESS (UT). IT IS DEFINED ON AN ACTIVE RESOURCE LIMIT SPECIFICATION TABLE

Explanation: Index space *name* cannot be started with access (UT) because it contains an index on an active resource limit specification table.

System Action: The START DATABASE command is ignored.

Operator Response: If the index space must be started with access (UT), either stop the resource limit facility (STOP RLIMIT), or switch it to use a different resource limit specification table that does not have an index in the index space (START RLIMIT, ID=*xx*). In a DB2 data sharing environment, you must either stop the resource limit facility on all members of the DB2 data sharing group or switch it to use a resource limit specification table that does not have an index in the index space.

DSNT724E *csect-name* ERROR *reason-code* IN READING RESOURCE LIMIT SPECIFICATION TABLE *table-name*. FOR AUTHORIZATION ID *auth-id* RUNNING THREAD WITH CORRELATION ID *correlation-id*, CONNECTION ID *connection-id*, AND LUWID *luw-id*, USE OF *operation-name* IS NOT GOVERNED.

Explanation: An error occurred reading resource limit specification table 'table-name'. 'Auth-id' is assumed to be allowed to perform 'operation-name'.

'Operation-name' is BIND or PARALLEL PROCESSING.

The reason code defining the read error is included in the message text as well as the connection ID, correlation ID, and logical unit of work (LUW) ID of the thread. An LUW-ID '*' indicates that the request originated at this site. If not an '*', the LUW-ID is assigned to the allied thread at the requesting site. Correlation IDs beginning with '0nn', where 'nn' is a number from 01 to 28, identify system agents.

System Action: If the 'operation-name' is BIND, processing continues if the 'auth-id' is authorized to perform the BIND. If the 'operation-name' is PARALLEL PROCESSING, query parallelism is not disabled and can be used if the value of the CURRENT DEGREE special register is 'ANY'.

User Response: Notify the system programmer.

System Programmer Response: Investigate the problem indicated by the reason code and preceding messages. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Operator Response: Notify the system programmer.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

DSNT725E AN ERROR OCCURRED WHILE GOVERNING BIND OPERATIONS OF auth-id RUNNING WITH CORRELATION-ID correlation-id, CONNECTION-ID connection-id, LUW-ID luw-id. auth-id IS ALLOWED TO PERFORM BIND OPERATIONS

Explanation: An internal error occurred while determining whether or not 'auth-id' is allowed to perform bind operations. It is assumed that 'auth-id' is allowed to perform bind operations.

An LUW-ID '*' indicates that the request originated at this site. If not an '*', the LUW-ID is assigned to the allied thread at the requesting site. Correlation IDs beginning with '0nn' where 'nn' is a number from 01 to 28, identify system agents.

This message is issued by the following module:
DSNTCAUT

System Action: Processing occurs assuming the authorization ID is allowed to perform bind operations.

User Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Operator Response: Notify the system programmer.

Problem Determination: Collect the following

diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

DSNT726I csect-name DATABASE name AND ANY SPACE IT CONTAINS CANNOT BE STARTED WITH ACCESS (UT). IT IS THE ACTIVE COMMUNICATIONS DATABASE

Explanation: The database specified in the message cannot be started with access (UT) because it is the active communications database. In addition, spaces within the active communications database cannot be started with access (UT).

System Action: The START DATABASE command is ignored.

Operator Response: If the database or any space within it must be started with access (UT), you must stop the distributed data facility (STOP DDF). In a DB2 data sharing environment, you must stop the distributed data facility on all members of the DB2 data sharing group.

DSNT735I object name CANNOT BE STARTED. IT CONTAINS OR IS DEFINED ON THE DDL REGISTRATION TABLE(S)

Explanation: The object specified in the message cannot be started because it contains or is defined on the DDL registration table(s). Install SYSADM or install SYSOPR authority is needed to start the object.

In the message, 'object' is either:

- DATABASE if the specified database contains the application and object registration tables
- TABLESPACE if the specified table space contains an application or object registration table
- INDEXSPACE if the specified index space is defined on an application or object registration table

System Action: The object specified in the message is not started.

User Response: Reissue the command with the proper authority.

DSNT736I csect-name ASYNCHRONOUS STOP DATABASE COMMAND HAS COMPLETED FOR COMMAND command_string

Explanation: Asynchronous processing for the STOP DATABASE command completed for the command whose syntax is shown in the message.

command_string is the STOP DATABASE command string for the command that is completed. The string always uses the abbreviation DB for DATABASE and SPACE for SPACENAM to save characters.

Only the first 100 characters of the STOP DATABASE command are displayed.

System Action: Asynchronous processing for the STOP DATABASE command is complete.

System Programmer Response: No action is required.

DSNT800I *csect-name* **DB2 CANNOT IDENTIFY TO IRLM. IRLM CANNOT CONNECT TO ITS DATA SHARING GROUP. THE LOCK STRUCTURE THAT IRLM ATTEMPTED TO ACCESS WAS *strname*.**

Explanation: IRLM failed to connect to the IRLM data sharing group. This message accompanies abend reason code 00E30806.

System Action: DB2 terminates abnormally with reason code 00E30806.

System Programmer Response: Some possible reasons why IRLM could not connect to its data sharing group are:

- The lock structure is not properly defined in the active MVS CFRM administrative policy. The lock structure name is a concatenation of the DB2 data sharing group name and the string 'LOCK1' separated by an underscore (_). For example, if the DB2 data sharing group name is DSNCAT, DSNCAT_LOCK1 is the lock structure name.
Ensure that the lock structure is properly defined in the active CFRM policy. The name of the lock structure that IRLM attempted to access is given in this message. IRLM issues message DXR138E to indicate that the lock structure definition could not be accessed in the active CFRM policy.
- IRLM could not connect the lock structure. The reason for the connect failure is given in IRLM message DXR135E.
- IRLM could not join its data sharing group. The reason for the join failure is given in IRLM message DXR134E.
- IRLM joined the wrong group. The set of IRLMs that are connected to a given lock structure must all be members of the same group. Ensure that the GROUP parameter is correctly specified in the IRLM startup procedure. If you give an incorrect group name, IRLM connects the lock structure, and then times out waiting for responses from other connectors. IRLM issues message DXR133I for the timeout.

DSNT801I **ACTION A (ADD) DOES NOT ALLOW GENERIC DISPLAY (% IN DATA FIELD).**

Explanation: You have to specify a specific data item in the DATA field.

This message is issued by the following panel:
DSN8SSH

System Action: The panel is redisplayed, and the cursor is placed on the field in error.

User Response: Enter specific data in the DATA field.

DSNT802I **ONLY ACTION D (DISPLAY) IS ALLOWED FOR DEPARTMENT STRUCTURE.**

Explanation: You cannot add, update, or erase a department structure. You can only display it.

This message is issued by the following panel:
DSN8SSH

System Action: The panel is redisplayed, and the cursor is placed on the field in error.

User Response: Change the ACTION field to D, or change the OBJECT field to DE or EM.

DSNT803I *csect-name* **DB2 CANNOT IDENTIFY TO IRLM. THE REQUESTED FUNCTION LEVEL IS NOT SUPPORTED.**

Explanation: An attempt was made to identify to an IRLM that does not support the level of function DB2 needs. This message accompanies abend reason code 00E30800.

System Action: DB2 terminates abnormally with reason code 00E30800.

System Programmer Response: Ensure that the STEPLIB statement in your IRLM startup procedure is referencing the correct IRLM code library and that IRLM is at the appropriate level of maintenance.

DSNT804I *csect-name* **THERE ARE MODIFY LOCKS OWNED BY THIS DB2 THAT HAVE BEEN RETAINED**

Explanation: When DB2 disconnected from IRLM during DB2 shutdown, IRLM indicated that there were still outstanding modify locks. These locks were retained by IRLM. The retained locks continue to protect the resources on which they are held from requests from other DB2s in the data sharing group. That is, IRLM rejects any lock request from another DB2 that is incompatible with the retained state of the lock. The locks are retained until the terminating DB2 subsystem is restarted and the resources on which the locks are held are recovered.

System Action: DB2 continues with its shutdown processing.

System Programmer Response: No response is necessary.

DSNT805I **NAME TYPE PART STATUS LPL PAGES**

Explanation: This message indicates the beginning of a set of messages used to display information as a result of a DISPLAY DATABASE command when the keyword LPL is specified. This message contains the headings of the display. (The message appears in one continuous line across the screen, not as shown above.) This message is always followed by one or more DSNT806I messages containing the column data. Refer to message DSNT806I for a description of the data these headings identify.

DSNT806I *space type part status LPL pages*

Explanation: This message contains the display information resulting from a DISPLAY DATABASE command when the keyword LPL is specified. It contains the column data describing the status of a table space or index space in the database listed in the preceding DSNT362I message. This message is always preceded by its column headings message DSNT805I. The message number for this message is not displayed.

The message fields have the following meanings:

- space* The table space name or index space name.
- type* TS for a table space, IX for an index space, LS for a LOB table space.
- part* The partition number. It is blank for a nonpartitioned table space or index space. For nonpartitioned secondary indexes, it is the logical partition number preceded by the character L (for example, L0001). For data-partitioned secondary indexes, the prefix for this value will be the character D (for example, D0001).
- status* One or more of the following, delimited by commas. The maximum length is 18 characters:

ACHKP

The table space is in aux check pending state. ACHKP on a table space indicates that CHECK DATA detected an orphan or missing LOB or an out-of-sync condition between the row in the base table and the LOB in the LOB table space.

AUXW

The table space is in aux warning state. AUXW on a LOB table space indicates that one or more LOBs in the LOB table space is invalid. AUXW on a base table space indicates that CHECK DATA detected an orphan or missing LOB or an out-of-sync condition between the row in the base table and the LOB in the LOB table space.

- CHKP** The table space is in check pending status.
- COPY** An image copy is required for this object (table space or data set within this table space). STOP is also displayed. If the image copy is required because DB2 encountered a problem during RESTART, STOPE is displayed instead of STOP.
- GRECP** The object (a table space, a table space partition, index space, or index space partition) is marked recovery pending because of the failure of a group buffer pool. This status value appears only on spaces. It does not apply to databases. See *DB2 Data Sharing: Planning and Administration* for information about resolving this restricted status.
- LPL** The object has pages or ranges of pages that are unavailable because of logical or physical damage.
- LSTOP** The logical partition is stopped.
- RECP** The table space or index space is in recovery pending status. The member must be restarted to restore full access to the data. For logical partitions, the RECP status can appear as RBDP*.
- RBDP*** indicates that the entire index is inaccessible to SQL applications, however only the logical partition needs to be recovered.
- RO** The database, table space, or index space is started for read activity only.
- RW** The database, table space, or index space is started for read and write activity.
- STOP** The database, table space, or index space is stopped.
- STOPE** DB2 implicitly stopped the table space or index space because of an internal inconsistency. A DSNT500I or DSNT501I message is issued at time of error detection to indicate the inconsistency.
- STOPP** A stop is pending or is in process for this database, table space, or index space.
- UT** The database, table space, or index space is started for utility processing only.
- UTRO** Although the table space or index

space is started as RW, a utility is in process and only RO access is allowed.

UTRW The table space or index space is started as RW and a utility is in process.

UTUT Although the table space or index space is started as RW, a utility is in process and only UT access is allowed.

LPL pages

The pages in the specified *space* that are unavailable because of logical or physical damage.

DSNT807I *csect-name* IRLM PURGE OF RETAINED LOCKS FAILED. RETURN CODE = *retcode* SUB-CODE = *subcode*

Explanation: DB2 issued a PURGE request to IRLM to purge retained locks for this DB2. The PURGE request did not complete successfully. This message shows the return code and subcode from IRLM.

This message is issued by the following CSECT:
DSNTRSTE

System Action: DB2 abends with reason code 00E30808. Restart processing is terminated.

System Programmer Response: Refer to the IRLM codes.

DSNT809E *csect-name* FEEDBACK FROM IRLM IDENTIFY INDICATED IRLM DID NOT CONNECT TO THE LOCK STRUCTURE

Explanation: DB2 identified to IRLM, but cannot continue because IRLM did not connect to the lock structure. Global locking is ignored. This message accompanies abend reason code 00E30809.

System Action: DB2 abnormally terminates with reason code 00E30809.

System Programmer Response: This condition happens if you are running DB2 in data sharing mode, but the associated IRLM is running with local scope (SCOPE=LOCAL in the IRLM startup procedure). If you are running DB2 in data sharing mode, ensure that the associated IRLM startup procedure specifies SCOPE=GLOBAL. Conversely, if you are not running DB2 in data sharing mode, ensure that the associated IRLM startup procedure specifies SCOPE=LOCAL.

DSNT810E *csect-name* DB2 CANNOT IDENTIFY TO IRLM. AN INVALID LOCK STRUCTURE NAME WAS DETECTED.

Explanation: DB2 could not identify to IRLM because of an invalid lock structure name. This message

accompanies abend reason code 00E30807.

System Action: DB2 startup terminates abnormally with reason code 00E30807.

System Programmer Response: This condition happens if you are not running DB2 in data sharing mode, but the associated IRLM is running with global scope (SCOPE=GLOBAL in the IRLM startup procedure). If you are not running DB2 in data sharing mode, ensure that the associated IRLM startup procedure specifies SCOPE=LOCAL. Conversely, if you are running DB2 in data sharing mode, ensure that the associated IRLM startup procedure specifies SCOPE=GLOBAL.

DSNT811E *csect-name* DB2 CANNOT IDENTIFY TO IRLM. REQUEST VIOLATES ONE DB2 PER IRLM RULE.

Explanation: DB2 could not identify to IRLM because another DBMS is already identified to the IRLM. This message accompanies abend reason code 00E30802.

System Action: DB2 abends with reason code 00E30802.

System Programmer Response: IRLM Version 2.1 enforces a one to one (1:1) mapping between IRLM and DB2. Multiple DBMS subsystems can no longer use the same IRLM. Ensure that:

- Each DB2 subsystem is associated with its own IRLM subsystem.
- The correct IRLM procedure name and subsystem name are specified in the DB2 system parameters.

DSNT812I -MEMBER NAME *member-name*

Explanation: This message is issued with messages DSNT389I, DSNT394I or DSNT396I for each thread in a data sharing environment. This additional line reports the member name of the DB2 subsystem accessing this object.

If the characters '(CO)' follow the member name, then this member is the castout owner for the page set or partition. The castout owner for a page set or partition is the DB2 member responsible for doing all of the castout I/O for that page set or partition.

The message number and subsystem recognition character are not included in this message.

DSNT813I ---- *status(es) page(s)*

Explanation: This message follows message DSNT389I, DSNT392I, DSNT394I, DSNT396I or DSNT806I to display more statuses, or more pages that are in the logical page list (LPL).

LPL pages can be in two formats, single pages (represented by the page number) or a range of pages (represented by the starting page number followed by a

DSNT814I • DSNT818I

dash and the ending page number in the range).

The message number and subsystem recognition character are not included in this message because this message is part of a DISPLAY DATABASE data line.

DSNT814I **NON-LOCAL INFORMATION UNAVAILABLE FOR** *object = name*

Explanation: One member of the DB2 data sharing group was unable to obtain information from another member for one of these reasons:

- Overflow of the maximum buffer area sent to the DB2 subsystem running the DISPLAY. This buffer area contains the DISPLAY information.
- Problems occurred while requesting DISPLAY DB information from peer DB2 subsystems.

Terms pertinent to this message:

object Either DATABASE or SPACE

name The name of the DATABASE or SPACE

User Response:

- Issue DISPLAY GROUP to see if any DB2 members are down or unresponsive and then reissue the DISPLAY DATABASE command.
- Specify individual database names or space names instead of specifying '**'.

DSNT815I *csect-name* **THE REAL-TIME STATISTICS COLLECTION PROCESS IS NOT STOPPED**

Explanation: An error prevents DB2 from externalizing the in-memory statistics. The error is generally a persistent error and must be remedied before the process can be enabled. Look for prior messages to identify the nature of the problem.

Severity: 0 (informational)

System Action: The statistics database is implicitly stopped and no further attempt will be made to externalize the in-memory statistics.

Problem Determination: Inspect the console for prior messages, and refer to those messages for problem determination.

User Response: Notify the system programmer.

DSNT818I *csect-name* **INVALID SPACENAME SPECIFIED**

Explanation: Incorrect syntax is specified for the table space name while issuing START/STOP/DISPLAY Database Commands.

Severity: 0 (informational)

System Action: DB2 will not process the command.

Chapter 19. DSNU... messages

The severity values shown for the utility messages that follow are returned as the job-step condition code from the job step during which the message is issued. If additional messages having higher severity values are issued during the same job step, the higher value is reflected as the job-step condition code.

Severity values have the following meanings:

0	Informational	No error occurred
4	Warning	A condition was detected; the user might need to take further action
8	Error	An error was detected and processing could not continue

DSNU000I *csect-name* **OUTPUT START FOR UTILITY, UTILID = uuuuuuu**

Explanation: This message marks the start of output for the given utility job. The utility ID used to identify the utility job is 'uuuuuuu'.

Severity: 0 (informational)

System Action: Utility processing continues.

System Action: The utility job is abended.

User Response: Refer to the appropriate MVS publication.

DSNU001I *csect-name*- **RELEASE DEPENDENT MODULE *module-name* WAS NOT FOUND**

Explanation: The system could not find the specified module in the indicated library (private library, job library, or link library).

System Action: The utility job is abended.

User Response: Ensure that the load module library is indicated correctly and that the indicated library contains the requested program. If the indicated library does not contain the requested program, contact the system programmer.

System Programmer Response: The last three characters of the module name indicate the DB2 release level of the subsystem identified in the parameters passed to DSNUTILB. However, LOAD could not find the release dependent utility module for that release in the indicated library. This is probably a maintenance problem.

DSNU003I *csect-name* **NOT INVOKED APF AUTHORIZED**

Explanation: The DSNUTILS stored procedure was not invoked authorized.

Severity: 8 (error)

System Action: The utility is not run by the stored procedure.

User Response: Notify the system programmer.

System Programmer Response: Make sure that the DSNUTILS entry in SYSIBM.SYSPROCEDURES specifies that the stored procedure runs in a WLM-established address space (WLM_ENV not blank), make sure that the DSNUTILS load module is link edited with AC(1), make sure the DSNUTILS load module is in an APF authorized library, and make sure all the libraries in STEPLIB JOBLIB are APF authorized. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 532, 46, 60, 61.

DSNU002I *csect-name* - **COULD NOT LOAD RELEASE DEPENDENT MODULE *module-name* CODE=code REASON=reason**

Explanation: During the load of 'module-name', MVS returned the indicated system completion code and reason.

DSNU004I *csect-name* **UTILITY utility NOT SUPPORTED**

Explanation: Refer to *DB2 Utility Guide and Reference* for a description of utilities supported by the stored procedure.

Severity: 8 (error)

System Action: The utility is not run by the stored procedure.

DSNU005I • DSNU010I

User Response: Run the utility as a batch job.

DSNU005I *csect-name input record*

Explanation: This message displays the utility statements as they were provided as input to the utility parser. An additional error message follows this message and identifies why the utility statement caused a parser error.

Severity: 8 (error)

System Action: Utility processing is not initiated. No SYSIBM.SYSUTIL record is created.

User Response: Correct the input error, and resubmit the job. Do not restart the job.

DSNU006I *csect-name DB2 SYSTEM system-name*
HAS NOT BEEN STARTED

Explanation: Utility startup processing has been unable to connect to the indicated DB2 subsystem, because a -START DB2 command has not been issued for that subsystem.

Severity: 8 (error)

System Action: Utility processing is terminated without invoking the requested utility or utilities.

User Response: Correct your JCL to specify the correct subsystem-name on the EXEC statement, and resubmit the job. Otherwise, contact the system programmer to determine when the subsystem will be available for processing.

Operator Response: Contact the system programmer to determine if a -START DB2 command should be issued for the indicated subsystem.

System Programmer Response: Have the operator issue a -START DB2 command for the indicated subsystem.

Problem Determination: DB2 must be started in order to execute DB2 utilities.

DSNU007I *csect-name DB2 SYSTEM system-name*
DOES NOT EXIST

Explanation: Utility startup processing has been unable to connect to the indicated DB2 subsystem, because it does not exist on this system.

Severity: 8 (error)

System Action: Utility processing is terminated without invoking the requested utility or utilities.

User Response: Correct your JCL to specify the correct subsystem-name on the EXEC statement, and resubmit the job. Contact your system programmer if you are not sure which DB2 subsystem you should specify.

System Programmer Response: Ensure that the

correct DB2 subsystem has been started via the -START DB2 command.

Problem Determination: DB2 must be started in order to execute DB2 utilities.

DSNU008I *csect-name* **SPECIFIED USER FAILED VALIDITY CHECK**

Explanation: Utility startup processing has been unable to connect to DB2, because the user failed the connection validity check.

Severity: 8 (error)

System Action: Utility processing is terminated without invoking the requested utility or utilities.

User Response: Contact the system programmer for assistance with your installation's security checking.

System Programmer Response: Locally defined RACF or equivalent security system connection authorization have denied the user access to DB2. Permit DB2 connection authorization if this user should be allowed access.

DSNU009I *csect-name* **SPECIFIED USER NOT AUTHORIZED FOR DB2 UTILITIES**

Explanation: Utility startup processing for the user indicated on the job statement failed, because the user is not authorized to execute DB2 utilities.

Severity: 8 (error)

System Action: Utility processing is terminated without invoking the requested utility or utilities.

User Response: Contact your system programmer for assistance with your installation's security checking.

System Programmer Response: If the USER specified something on the job statement that is incorrect, correct it, and resubmit the job. Use the SQL GRANT command to give the user the desired authority.

DSNU010I *csect-name* **UTILITY EXECUTION COMPLETE, HIGHEST RETURN CODE = rr**

Explanation: The utility completed processing with a return code of 'rr'. This indicates that no terminating error was detected.

Severity: 0 (informational) or 4 (warning)

System Action: In most cases, the SYSIBM.SYSUTIL record for this job step is deleted from SYSIBM.SYSUTIL. However, if the utility used was REORG and UNLOAD(PAUSE), the SYSIBM.SYSUTIL record remains intact so that REORG can be restarted at the RELOAD phase.

User Response: If the return code ('rr') is 0, no response is required.

If the return code ('rr') is 4, the utility output should be examined for other messages.

DSNU012I *csect-name* **UTILITY EXECUTION
TERMINATED, HIGHEST RETURN
CODE = rr**

Explanation: The utility execution was terminated. An error was detected that would not allow processing to continue. The return code has a value of 8.

Severity: 8 (error)

System Action: Utility processing is terminated.

User Response: Examine utility output for other error messages.

DSNU013I *csect-name* **JOB WITH DUPLICATE
UTILID FOUND IN SYSUTIL**

Explanation: An entry with the same qualifier was found in the SYSIBM.SYSUTIL table. The current job did not specify restart.

System Action: The utility job is abended with reason code X'00E40018'.

User Response: If the job was intended to restart the utility, RESTART should be added to the EXEC parameters. If the job was intended to rerun the utility, the -TERM utility command should be used to delete the entry that has the same qualifier from the SYSIBM.SYSUTIL table. If the job had no relation to the SYSIBM.SYSUTIL entry job, a new qualifier should be used.

DSNU014I *csect-name* **JOB WITH DUPLICATE
UTILID CURRENTLY EXECUTING**

Explanation: A job with the same qualifier was found to be executing.

System Action: The utility job is abended with reason code X'00E40018'.

User Response: If the job with the same qualifier that is currently executing is correct, either wait for the job to complete before using the same qualifier, or use another qualifier. If the job currently executing is incorrect, the -TERM command can be used to terminate it, and the failing job can be resubmitted. Do not -TERM UTILITY a utility job step that is currently active in REORG beyond the UNLOAD phase.

DSNU015I *csect-name* **JOB WITH UTILID NOT
FOUND IN SYSUTIL FOR RESTART**

Explanation: A utility job was submitted to restart a utility job that had previously failed. The SYSIBM.SYSUTIL entry for the specified qualifier provided was not found.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Use the -DISPLAY utility command to determine the correct qualifier. The job can then be resubmitted.

DSNU016I *csect-name* **UTILITY BATCH MEMORY
EXECUTION ABENDED, REASON=X0rrr
cause**

Explanation: The utility batch address space has abended. If X'0rrr' is four characters in length (that is, X'00C1'), the abend was a system X'rrr' abend. If X'0rrr' is four characters in length and system abend X'000' was indicated, a user abend was issued. If X'0rrr' is eight characters in length, the abend was a system X'04E' abend, and X'0rrr' is an abend reason code.

If the value of general register 2 is not zero, then *cause* will contain CAUSE=X'ccccccc' where X'ccccccc' is the value of general register 2. This information is for service purposes only.

System Action: The utility job is abended. The SYSIBM.SYSUTIL entry for the job is retained in the SYSUTIL table.

User Response: Consult the system programmer to obtain information on failure analysis. If the cause of the failure is correctable, the utility job can be restarted. If the error cannot be corrected, the -TERM command should be used to delete the failing job's utility id from SYSIBM.SYSUTIL.

System Programmer Response: If a system abend was encountered (4 characters), refer to the appropriate MVS publication. If an abend reason code was encountered (8 characters), refer to *DB2 Utility Guide and Reference* for problem determination.

DSNU017I *csect-name* **UTILITY DATA BASE
SERVICES MEMORY EXECUTION
ABENDED, REASON=X0rrr**

Explanation: The database services address space has abended. If X'0rrr' is four hexadecimal digits in length (for example, X'00C1'), the abend was an MVS X'rrr' abend. If X'0rrr' is eight hexadecimal digits in length, the abend was a DB2 subsystem X'04E' abend, and X'0rrr' is an abend reason code.

If the value of general register 2 is not zero, then *cause* will contain CAUSE=X'ccccccc' where X'ccccccc' is the value of general register 2. This information is for service purposes only.

System Action: The utility job is abended. The entry for the job is retained in the SYSIBM.SYSUTIL table.

User Response: Consult with the system programmer to obtain information about failure analysis. If the cause of the failure is correctable, the utility job can be restarted. If the error cannot be corrected, the -TERM command should be used to delete the failing job's utility id from SYSIBM.SYSUTIL.

System Programmer Response: If an MVS system abend was encountered (4 hexadecimal digits), refer to the appropriate MVS publication. If an abend reason code was encountered (8 hexadecimal digits), look up the reason code in Part 4, "Section 4. DB2 Codes," on page 773, and if you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU018I *csect-name* **JOB IS NOT RESTARTABLE DUE TO -START ACCESS FORCE COMMAND**

Explanation: A utility job was submitted to restart a utility job that previously failed. Although the SYSIBM.SYSUTIL entry for the specified qualifier was found, the job is not restartable because of a -START DATABASE ACCESS FORCE command. The -START DATABASE ACCESS FORCE command deleted the utility-in-process state of one or more (but not all) target objects in the job.

System Action: The utility job is abended with reason code X'00E40018'.

User Response: If the specified qualifier is correct, use the -TERM UTILITY command to terminate the utility and resubmit the job as a nonrestartable job. If the -TERM UTILITY command fails, use the -START DATABASE ACCESS FORCE command to force ALL target objects (table spaces and indexes) in the job. When the last object is forced, the SYSIBM.SYSUTIL record is deleted. If the qualifier is incorrect, correct it and restart the job.

DSNU019I *csect-name* **THIS UTILITY IS NOT ALLOWED AT A DB2 TRACKER SITE**

Explanation: When a DB2 subsystem serves as a tracker site, it cannot run utility *csect-name*. A DB2 subsystem is also a tracker site if the value of subsystem parameter TRKRSITE is YES. You may run only the following utilities at a tracker site DB2:

- REPORT
- RECOVER without the TORBA, TOLOGPOINT, or TOCOPY options
- DIAGNOSE

Severity: 8 (error)

System Action: The utility terminates.

System Programmer Response: If this DB2 subsystem does not need to serve as a remote site tracker system, remove its tracker site status before re-trying the utility. You may remove the tracker site status by stopping the DB2 subsystem, then restarting it with TRKRSITE = NO.

User Response: Contact the system programmer.

DSNU020I *csect-name* **JOB STEP INCOMPLETE**

Explanation: The REORG utility was invoked with the UNLOAD PAUSE option. This causes the immediate suspension of the job after the unload phase completes. Subsequent utilities that are invoked in the same job step are not run.

Severity: 4 (warning)

System Action: Further utility processing is terminated.

User Response: Resubmit the job with the RESTART(PHASE) parameter after the desired user action has been taken with the unload data set.

Problem Determination: Refer to *DB2 Utility Guide and Reference* for a description of the REORG utility and the UNLOAD PAUSE option.

DSNU024I *csect-name* **PARAM FIELD ERROR**
parm-field

Explanation: An error was detected in the PARM field on the EXEC statement. 'parm-field' was the input parameter field.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the indicated parameter on the EXEC DD statement, and resubmit the job.

Problem Determination: Refer to *DB2 Utility Guide and Reference* for parameter requirements.

DSNU025I *csect-name* **INVALID RESTART PARAMETER (restart)**

Explanation: Only the following values may be specified for the *restart* parameter: NO or null, CURRENT, or PHASE.

Severity: 8 (error)

System Action: The utility is not run by the stored procedure.

User Response: Correct and re-run.

DSNU028I *csect-name* **UNABLE TO CONNECT TO DB2, REASON=Xreason code**

Explanation: A connection to the DB2 subsystem failed. 'reason-code' is the DB2 reason code that was returned.

Severity: 8 (error)

System Action: The utility job is terminated.

User Response: Check the subsystem ID specified in the EXEC DD statement. If it is correct, the subsystem was not ready for processing. Ask the system

programmer when the requested subsystem will again be available for processing.

DSNU030I *csect-name* **UNABLE TO ALLOCATE**
dsn, RC=rr, CODE=ccc

Explanation: The utility was unable to allocate a necessary image copy data set. *dsn* is the data set name that the utility attempted to dynamically allocate. *rr* is the return code from the MVS dynamic allocation service, and *ccc* is the reason code associated with the return code.

System Action: The utility proceeds along one or the following paths:

If the data set was an incremental image copy data set, the utility proceeds as if it and any later incremental image copies did not exist.

If the data set was a full image copy data set, the utility attempts to use the most recent prior full image copy data set.

If the data set is used by the COPYTOCOPY utility, and the utility job step includes an OPTIONS control statement with the EVENT(ITEMERROR,SKIP) option, COPYTOCOPY processes the next item in the list.

The allocation failure may create other problems that will cause the utility to fail. This is indicated by other messages.

User Response: If the job fails, contact the system programmer.

System Programmer Response: If the utility fails because of the allocation error (as shown by a subsequent message), correct the error, then resubmit the job.

Problem Determination: Refer to the appropriate MVS publication for a complete description of the possible return and reason codes from dynamic allocation.

DSNU031I *csect-name* **UNABLE TO UNALLOCATE**
dsn, RC=rr, CODE=ccc

Explanation: The recover utility was unable to unallocate an image copy data set. The data set name that the utility attempted to unallocate is *dsn*. The return code from the MVS dynamic unallocation service is *rr*. The reason code associated with the return code is *ccc*.

System Action: The unallocation error is ignored and the utility execution continues.

Problem Determination: Refer to *MVS/ESA Programming: Authorized Assembler Services Guide* for a complete description of the possible return and reason codes from dynamic allocation.

DSNU032I **I/O ERROR ON WORKFILE, xxxxxx**

Explanation: An I/O error was encountered on a necessary OS/VS data set. 'xxxxxx' is a message that describes the error and the data set in error. This message is returned to the DB2 utility by SVC 68 (SYNADAF) from BSAM. The data set may have been needed for an unload data set, image copy data set, or load or reorganization work file data set. The utility is stopped at the beginning of the phase that used the OS/VS data set.

System Action: The utility job is abended. The utility job step is in the stopped state.

Operator Response: Except in the case of an unload data set during the RELOAD phase, the job can be restarted if an undamaged output data set is provided.

Problem Determination: Refer to the appropriate MVS publication for the format of the error message.

DSNU033I *csect-name* **THE CONTROL STATEMENT DOES NOT IDENTIFY THE OBJECT ON WHICH THE UTILITY OPERATES**

Explanation: In the utility control statement, a keyword or operand was specified before the name of the table space, index, index space, or list on which the utility operates.

Severity: 8 (error)

System Action: Parsing is discontinued and utility processing is terminated.

User Response: Specify the object of the utility before any keywords or operands that relate to the object.

Problem Determination: Refer to *DB2 Utility Guide and Reference* for correct utility syntax.

DSNU034I **DATA SET TYPE INVALID FOR DDNAME 'ddddddd'**

Explanation: A required DD statement with DDNAME='ddddddd' was found to have a data set type which is not valid for this application.

Severity: 8 (error)

System Action: The utility is terminated with a return code 8.

User Response: The data set must be capable of storing intermediate data that can be retrieved by DB2. Check that the data set is not specified as type DUMMY, SYSIN, or SYSOUT. If you require assistance in specifying a valid data set type, consult the system programmer.

System Programmer Response: Correct the JCL and resubmit the job.

DSNU035I *csect-name* **UNABLE TO FIND DD CARD FOR DDNAME, 'dddddddd'**

Explanation: A DD statement with ddname = 'dddddddd' was expected, but not found.

Severity: 8 (error)

System Action: The utility is terminated with a return code 8.

User Response: If the DDNAME is one you submitted, review and correct it. If the DDNAME was not provided by you, but by the system, consult the system programmer.

System Programmer Response: Correct the JCL and resubmit the job.

DSNU036I *csect-name* **UNABLE TO OPEN DCB FOR DDNAME dddddddd**

Explanation: The DCB associated with DDNAME 'dddddddd' could not be opened.

System Action: The utility job is abended with a reason code of X'00E40070'. The utility job step is in the stopped state.

User Response: If the ddname is one you submitted, review and correct it. If the ddname was not provided by you but by the system, consult the system programmer.

System Programmer Response: Correct the job control language and resubmit the job.

DSNU037I *csect-name* - **RECFM=U FOR DDNAME dddddddd**

Explanation: A data set to be used by the utility has an undefined record format RECFM=U. All data sets must be fixed or variable, blocked or unblocked.

System Action: The utility job is abended with a reason code of X'00E40070'. The utility job step is in the stopped state.

Operator Response: Notify the system programmer.

System Programmer Response: Ensure that no data sets involved in the utility job have RECFM=U. Resubmit the job after ending the stopped utility by the TERM UTILITY command, or do a RESTART(PHASE) of the stopped utility.

DSNU038I *csect-name* **BLOCK SIZE FOR DCB, DDNAME dddddddd, IS TOO SMALL, MUST BE AT LEAST bbbbb BYTES**

Explanation: The data set with DDNAME 'ddddddd' has a block size that is too small to accommodate a record that needs to be written.

System Action: The utility job is abended with a reason code of X'00E40079'. The utility job step is left in the stopped state.

User Response: Delete the data set in error. Change the JCL so that the block size for the data set with DDNAME 'dddddddd' is at least 'bbbb' bytes. Resubmit the utility job with the RESTART(PHASE) option.

DSNU039I *csect-name* - **LRECL=0 FOR DDNAME dddddddd**

Explanation: A data set to be used by the DB2 utility has a record length of zero after OPEN. All data sets with a record format of fixed or fixed blocked must have a valid record length greater than zero.

System Action: The utility job is abended with reason code X'00E40070'. The utility job step is left in the stopped state.

User Response: If the DDNAME is for a data set that you submitted, review and correct it. It might be necessary to provide a valid LRECL in the DCB parameter in the JCL. If the DDNAME was not provided by you but by the system, consult the system programmer.

Operator Response: Notify the user or system programmer.

System Programmer Response: Correct the data set definition, or add DCB information to the JCL. Do a RESTART(PHASE) of the stopped utility, or resubmit the job after issuing a -TERM UTILITY command for the stopped utility.

DSNU040I *csect-name* **ERROR ACCESSING DDNAME ddname, DECB=Xhex string**

Explanation: An error has occurred during BSAM access of a utility temporary file identified by 'ddname'. The DECB indicating the error is given as a hexadecimal string.

System Action: The executing utility issues an X'04E' abend with abend reason code '00E40071' following this message.

User Response: Refer to the information given in the Problem Determination section of this message. Correct the problem. Either issue the -TERM command to terminate the utility job and resubmit it, or specify the RESTART parameter and resubmit it.

Operator Response: An operator with SYSOPR authority can issue the -TERM UTILITY command to release the resources claimed by the stopped utility (this may not be necessary).

Problem Determination: The DECB provided contains the ECB in the first four bytes. The first byte of the ECB contains status bits that indicate the cause of the error. Refer to the appropriate MVS publication for the meaning of the status bits.

DSNU041I *csect-name* **INVALID CONCATENATED DATA SET FOR DDNAME dddddd**

Explanation: A non-input concatenated data set was detected. Only input data sets can be concatenated.

System Action: The utility job abended with reason code X'00E40070'. The utility job step is in the stopped state.

Operator Response: Notify the system programmer.

System Programmer Response: Remove the concatenated data sets from the data set with DDNAME 'ddddddd'. Resubmit the job after ending the stopped utility with the TERM UTILITY command, or restart the utility at the beginning of the stopped phase by using RESTART(PHASE).

DSNU042I *csect-name* **SORT PHASE STATISTICS. NUMBER OF RECORDS=*n* ELAPSED TIME=*hh/mm/ss***

Explanation: This message provides statistics on the SORT phase of a utility. The number of records sorted, 'n', and the duration of the SORT phase in hours, minutes, and seconds are provided.

Severity: 0 (informational)

System Action: The system continues to process normally.

DSNU044I *csect-name* **ERROR FROM SORT COMPONENT RC=*n*, UTILITY STOPPED**

Explanation: A nonzero return code 'n' was returned from an MVS sort. Error messages from sort are printed on the UTPRINT data set.

System Action: The executing utility job is placed in the stopped state.

User Response: Determine the cause of the error. If the error can be corrected, the utility may be restarted from the beginning of the sort phase by using the RESTART(PHASE) option. If the error is such that the utility cannot complete, the -TERM command should be issued to remove the stopped utility from the system. The -TERM utility option should rarely be exercised when the stopped utility is REORG.

Operator Response: An operator with SYSOPR authority can issue the -TERM UTILITY command to release the resources claimed by the stopped utility (this may not be necessary).

Problem Determination: This abend is accompanied by abend reason code X'00E40005', and an SVC dump is requested. In most cases, error messages from MVS sort identify the problem and the dump is not needed. If sort is unable to open the UTPRINT data set, only the message and the abend are provided. For example, if the UTPRINT DD statement is omitted, correct the problem with UTPRINT, and resubmit the job.

DSNU046I *csect-name* **UTILITY STATEMENT IS TOO LONG OR TOO COMPLEX**

Explanation: The utility command and associated control statements have caused internal fields to exceed DB2 subsystem limits.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Reduce the size or complexity of the utility statement where possible. For example, a LOAD into several tables may be broken up into a separate load statement for each table or the size of comparison fields for 'when', 'continueif', and 'nullif' operands may be reduced in size.

Problem Determination: Refer to *DB2 Utility Guide and Reference* for correct operand definitions.

DSNU047I *csect-name* **A REQUIRED DD CAR OR TEMPLATE IS MISSING. NAME=*missing-dd***

Explanation: The DB2 utility being executed requires a data set to continue processing. The DDNAME or TEMPLATE name for the missing data set is provided.

Severity: 8 (error)

System Action: Utility processing terminates.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the JCL to include the indicated DD statement or add a TEMPLATE control statement. Refer to *DB2 Utility Guide and Reference* for information about required DD statements.

DSNU048I *csect-name* **INVALID OPERAND FOR KEYWORD kkkkkkkk**

Explanation: The utility parser has determined that the operand specified for keyword 'kkkkkkkk' is invalid.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the operand in error, and resubmit the utility job. Refer to *DB2 Utility Guide and Reference* for correct operand definitions.

DSNU049I *csect-name* **- INVALID OPERAND 00000000 FOR KEYWORD kkkkkkkk**

Explanation: The utility parser has determined that operand '00000000' cannot be specified for keyword 'kkkkkkkk'. This includes a negative value following the keywords MAXRO or DELAY.

Severity: 8 (error)

System Action: Utility processing is not initiated.

DSNU050I • DSNU057I

User Response: Correct the operand in error, and resubmit the utility job. Refer to *DB2 Utility Guide and Reference* for proper option specifications.

DSNU050I *csect-name utility-statement*

Explanation: This message echoes the utility statement that was input from SYSIN.

Severity: 0 (informational)

System Action: Utility processing continues.

DSNU051I *csect-name INSUFFICIENT OPERANDS FOR KEYWORD kkkkkkkk*

Explanation: An operand that is required when the keyword 'kkkkkkkk' is specified was omitted.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the operand specification, and resubmit the job. Refer to *DB2 Utility Guide and Reference* to determine the correct set of operands for 'kkkkkkkk'.

DSNU052I *csect-name KEYWORD kkk INCOMPATIBLE WITH OTHER KEYWORDS OR OPERANDS*

Explanation: The specified keyword 'kkk' cannot be used with other keywords or operands.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Refer to the *DB2 Utility Guide and Reference* for the right syntax for the specified keyword.

DSNU053I *csect-name FIELD ccccccc NOT FOUND*

Explanation: Either the column name specified, 'ccccccc', was not found in the catalog as a valid column name for the table being processed, or a WHEN keyword field name was not found in the field name list.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the LOAD utility statement, and resubmit the job.

Problem Determination: Valid column names can be found in the SYSIBM.SYSCOLUMNS table.

DSNU054I *csect-name TABLESPACE ssssssss NOT FOUND*

Explanation: The operand of the TABLESPACE keyword, 'sssssss', did not specify an existing table space name.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the table space name and/or database name, and resubmit the job.

Problem Determination: Valid table space names can be found in the SYSIBM.SYSTABLESPACE catalog table.

DSNU055I *csect-name INDEX iiiiii NOT FOUND*

Explanation: The index name specified, 'iiiiiii', was invalid.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the index name, and resubmit the job.

Problem Determination: Valid index names can be found in the SYSIBM.SYSINDEXES catalog table.

DSNU056I *csect-name TABLE ttttttt NOT FOUND*

Explanation: A utility specified a table name 'ttttttt', but the table does not exist.

Severity: 8 (error)

System Action: The error is sufficient to terminate further processing of the utility job step. The utility job step is terminated, and resources are released to their prior state.

User Response: Correct the table name and/or database name, and resubmit the utility job step.

Problem Determination: The correct table names can be found by querying the SYSIBM.SYSTABLES catalog table.

DSNU057I *csect-name DATABASE database-name NOT FOUND*

Explanation: The operand of the DATABASE keyword, 'database-name', did not specify an existing database name.

Severity: 8

System Action: The error is sufficient to terminate further processing of the utility job step. The utility job step is terminated, and resources are released to their prior state.

User Response: Correct the database name and resubmit the utility job step.

Problem Determination: The correct database names can be found by querying the SYSIBM.SYSDATABASE catalog table.

DSNU058I *csect-name utility-name* **UTILITY NOT ALLOWED AGAINST AN OBJECT IN RECOVER PENDING STATE**

Explanation: An attempt has been made to execute a utility against an object that is in RECOVER PENDING STATE. CHECK, COPY, MODIFY, LOAD, QUIESCE, REORG, and RUNSTAT are not allowed.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Remove the object from the RECOVERY PENDING STATE by using either LOAD REPLACE, RECOVER, or REPAIR against the object. Resubmit the job.

System Programmer Response: Determine which of the three utilities, LOAD REPLACE, RECOVER, or REPAIR, should be used to remove the object from the RECOVER PENDING STATE.

DSNU059I *csect-name utility-name* **UTILITY NOT ALLOWED TO RUN ON A ROSHARE READ DATABASE**

Explanation: An attempt was made to execute a utility on a ROSHARE READ database. Only the RUNSTATS, DIAGNOSE, and REPAIR DBD utilities are allowed to run on read-only shared databases.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Resubmit the utility job on the owning system, if necessary.

DSNU060I *csect-name USER userid* **NOT AUTHORIZED FOR *util-name* UTILITY ON DATABASE *dbase-name***

Explanation: User *userid* attempted to execute utility *util-name* against an object in database *dbase-name*. The user was not authorized to execute utilities for database *dbase-name*, the user's authorization did not include this utility, or the user's authorization did not have a valid seclabel.

Severity: 12 (severe error)

System Action: Utility processing is not initiated.

User Response: Ensure that the correct database was specified. If this operation involves a table with Multilevel security with row level granularity, then this user needs to have a valid security label to execute this utility.

System Programmer Response: Determine why the user was denied access. Either the authorization should be corrected, or another authorized user should invoke the utility.

Problem Determination: The following catalog tables

can be examined to determine who has proper authority: SYSIBM.SYSUSERAUTH, SYSIBM.SYSDBAUTH, or SYSIBM.SYSRESAUTH.

DSNU061I *csect-name* **USER *userid* NOT AUTHORIZED, UTILID=*utilid***

Explanation: The named user issued a utility command and was not authorized to do so.

The -TERM UTILITY command can only be issued by:

- The submitter of the utility job.
- Users with SYSOPR, SYSADM, or SYSCTRL authority.
- Users with DBADM, DBCTRL, or DBMAINT authority over every database used by the utility.

Even for users with sufficient database authority, the TERM UTILITY command will fail in these situations:

- The user issued the command before the utility determined what databases it would access.
- The utility job included the DIAGNOSE, REPORT, or STOSPACE utility. Those utilities must be terminated by the submitter of the job or by a holder of SYSOPR, SYSCTRL, or SYSADM authority.

Any user can issue a -DISPLAY UTILITY command.

System Action: The -TERM UTILITY request for utility identifier *utilid* is rejected.

User Response: Take the appropriate action:

- Wait to allow the utility to identify the databases it will access; then reissue the command.
- Obtain the required authorization and reissue the command.
- Have another user with proper authorization issue the command.

DSNU062I *csect-name util-name* **UTILITY MAY NOT BE RUN ON OBJECT *qualifier.object-name***

Explanation: An attempt was made to execute utility '*util-name*' against object '*qualifier.object-name*'. This is not allowed. The named object cannot be processed by the named DB2 utility.

Severity: 8 (error)

System Action: The utility job is terminated.

User Response: Remove the invalid utility control statements and resubmit the job.

DSNU063I *csect-name utility-name* **UTILITY NOT ALLOWED AGAINST AN OBJECT IN REBUILD PENDING STATE**

Explanation: An attempt has been made to execute a utility against an object that is in REBUILD PENDING

DSNU064I • DSNU071I

STATE, CHECK, COPY, MODIFY, LOAD, QUIESCE, REORG, and RUNSTAT are not allowed.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Remove the object from the REBUILD PENDING STATE by using either LOAD REPLACE, RECOVER, or REPAIR against the object. Resubmit the job.

System Programmer Response: Rebuild the index with the REBUILD utility to remove the object from REBUILD PENDING state.

DSNU064I *csect-name* UTILITY NOT ALLOWED AGAINST SYSTEM DATABASE

Explanation: An attempt was made to execute a utility against database DSNDDB01 or DSNDDB06. The following utilities are not allowed against DSNDDB01:

LOAD
REORG TABLESPACE against SYSUTILX (allowed against other DSNDDB01 table spaces)
CHECK DATA
REPAIR DBD
RUNSTATS
MODIFY STATISTICS

The following utilities are not allowed against DSNDDB06:

LOAD (except SYSIBM.SYSSTRINGS)
CHECK DATA
REPAIR DBD

Severity: 8 (error)

System Action: Execution of the utility job is stopped.

User Response: Remove the invalid utility control statements and resubmit the job.

DSNU065I *csect-name* UTILITY NOT ALLOWED AGAINST A WORK FILE

Explanation: An attempt has been made to execute a utility against database DSNDDB07. Utilities are not allowed against work files.

Severity: 8 (error)

System Action: Execution of the utility job is stopped.

User Response: Remove the invalid utility control statement(s) and resubmit the job.

DSNU066I *csect-name* OPERAND *oooooo* NOT ALLOWED FOR *uuuuuu* UTILITY against *ttttt* TABLE

Explanation: An attempt was made to specify the REPLACE option when executing the LOAD utility on a DB2 catalog table. It is not permissible to replace existing rows in a DB2 catalog table. Rows can only be added to the existing rows in a DB2 catalog table.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the operand, and resubmit the job.

DSNU067I *csect-name* - TABLE SPACE *table-space-name* IS NOT A LOB TABLE SPACE

Explanation: The table space specified, *table-space-name*, is not a LOB table space. The object of the utility must be LOB table space.

System Action: Utility returns completion code=8.

Programmer Response: Correct the utility statement.

DSNU068I *csect-name* - *function* IS NOT SUPPORTED FOR LOB TABLE SPACES

Explanation: The function specified, *function*, is not supported for the LOB table space specified. The LOB table space reported by the message may not be explicitly named in the utility statement.

System Action: The utility processing proceeds.

DSNU069I *csect-name* - AUXILIARY TABLE *table-name* NOT PERMITTED AS EXCEPTION TABLE

Explanation: A auxiliary table was specified as an exception table.

System Action: Utility returns completion code=8.

Programmer Response: Specify an exception table that is not an auxiliary table.

DSNU070I *csect-name* KEYWORD OR OPERAND *x* INVALID WITH *y*

Explanation: The use of KEYWORD or OPERAND '*x*' is inconsistent with KEYWORD or OPERAND '*y*'.

Severity: 8 (error)

System Action: The control statement in error is rejected and processing is halted.

User Response: Correct the control statement in error and resubmit the job.

DSNU071I *csect-name* KEYWORD *x* REQUIRES KEYWORD *y*

Explanation: When keyword '*x*' is specified, keyword '*y*' must also be specified.

Severity: 8 (error)

System Action: The control statement in error is rejected and processing is halted.

User Response: Correct the control statement in error, and resubmit the job.

DSNU072I *csect-name* **INVALID KEYWORD(S) SPECIFIED FOR TABLESPACE LIST**

Explanation: The specified keyword cannot be included in a list of table spaces.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Remove the specified keyword from the list of table spaces.

DSNU073I *csect-name* - **KEYWORD 'wwwww' IGNORED**

Explanation: The keyword, 'wwwww' is no longer supported.

Severity: 0 (informational)

System Action: Utility processing proceeds.

Problem Determination: Refer to *DB2 Utility Guide and Reference* for the current syntax.

DSNU074I *csect-name - utility* **UTILITY NOT SUPPORTED FOR LOB TABLE SPACE:**
table-space-name

Explanation: The utility statement failed because the table space specified was a LOB space and the utility does not support LOB table spaces.

System Action: The statement cannot be executed.

Programmer Response: Correct the utility statement.

DSNU075I *csect-name* - **TABLE** *table_name*, **LOB COLUMN** *column-name* - **DEFINITION IS NOT COMPLETE**

Explanation: The definition of the LOB column, *column-name* in table *table_name* is not complete.

System Action: Utility returns completion code=8.

Programmer Response: Complete the LOB column definitions. A LOB column definition is not complete until the LOB table space, auxiliary table and index on the auxiliary table have been created for the LOB column.

DSNU076I *csect-name* - **KEYWORD=keyword INVALID FOR** *type* **TABLE SPACE=***table_space_name*

Explanation: The keyword, *keyword*, is invalid when the object of the utility is a *type* table space.

System Action: Utility returns completion code=8.

Programmer Response: Correct the utility statement.

DSNU077I *csect-name - utility* **IS PROHIBITED BECAUSE** *object* **IS** *pending-state*

Explanation: The *utility* specified is prohibited because the *object* is in a *pending-state*.

Severity: 8 (error)

System Action: Utility terminates and returns completion code=8.

Programmer Response:

- Run the CHECK LOB utility if the object is a LOB table space and the state is CHECK PENDING.
- Run the REBUILD INDEX utility if the object is an auxiliary index and the state is REBUILD PENDING.
- Run the CHECK INDEX utility if the object is an auxiliary index and the state is CHECK PENDING.

DSNU078I *csect-name* **INVALID DBCS IDENTIFIER**
iiii

Explanation: The DBCS identifier *iiii* is invalid. Reason codes are:

- 101** An odd number of bytes exists between the shift-out and the shift-in
- 102** No shift-in was found at the end of the identifier
- 103** DBCS blanks X'4040' are not allowed
- 104** There are no characters between the shift-out and the shift-in
- 105** Shift-out can not be the first byte of the DBCS character between the shift-out and the shift-in.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Correct the DBCS identifier and resubmit the job.

Problem Determination: Refer to Chapter 2 of *DB2 SQL Reference* to determine the correct syntax for DBCS identifiers.

DSNU079I *csect-name* **UNBALANCED PARENTHESES IN CONTROL STATEMENT**

Explanation: The utility parser has determined that there are unbalanced parentheses in the input string.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Determine the location of the missing parenthesis and insert it. The utility job can then be resubmitted.

Problem Determination: Refer to *DB2 Utility Guide*

DSNU080I • DSNU086I

and Reference to determine the correct syntax for option specification.

DSNU080I *csect-name* NO UTILITY STATEMENTS FOUND IN *dd-name*

Explanation: The data set identified by *dd-name* did not contain any text. The system might have processed the end of file prematurely, or this job requires that the utility statements be skipped.

Severity: 4 (warning)

System Action: Processing continues.

User Response: If the data set is SYSIN, provide at least one utility statement, if none now exists, or verify that this job executes no utility statements. If the data set is the LISTDEF (SYSLISTD) or TEMPLATE (SYSTEMPL) data set, provide the required control statements in that data set or in SYSIN.

DSNU081I *csect-name* OPERAND 'ooooooo' EXCEEDS KEYWORD 'kkkkkkkk' MAXIMUM LENGTH

Explanation: The utility parser has determined that operand 'ooooooo' exceeds the maximum length for keyword 'kkkkkkkk'.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the operand, and resubmit the job.

Problem Determination: Refer to *DB2 Utility Guide and Reference* to determine the correct operand specification.

DSNU082I *csect-name* INVALID KEYWORD *kkkkkkkk*

Explanation: The given keyword was not recognized within the context of this control statement.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the keyword, and resubmit the job.

DSNU083I *csect-name* INVALID HEXADECEIMAL OPERAND *hhhhhhh*

Explanation: The utility parser has determined that the operand *hhhhhhh* is invalid as a hexadecimal operand. It contains one of the following errors:

- the operand contains a character that is not hexadecimal
- it has an odd number of characters

- for a UX or GX string constant, it consists of a number of characters that is not a multiple of 4

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the keyword, and resubmit the job.

DSNU084I *csect-name* INVALID GRAPHIC OPERAND *gggg*

Explanation: The utility parser has determined that the operand 'gggg' is invalid as a hexadecimal operand. The graphic operand is either missing one or both of the shift characters or is not an even number of characters.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Correct the utility statement, and resubmit the job.

DSNU085I *csect-name* INVALID SPECIAL CHARACTER OPERAND *ssss*

Explanation: The utility parser has determined that the operand 'ssss' is invalid as a special character operand. For a special character operand to be invalid, it must have either a shift-out or a shift-in character and be missing the corresponding shift character, or not have an even number of characters between the shift-out, shift-in characters.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Correct the utility statement, and resubmit the job.

DSNU086I *csect-name* *tttt* I/O ERRORS ON SPACE= *ddddddd*. DATA SET NUMBER= *nnn*. I/O ERROR PAGE RANGE= *aaaaaa*, *bbbbbb*.

Explanation: DB2 detected an error. This message is issued for, but not limited to the following reasons:

- I/O errors were detected on the named object. *tttt* is either 'READ' or 'WRITE'. *nnn*; is the data set number. *aaaaaa* is the first damaged page and *bbbbbb* is the last damaged page of the data set.
- A broken page was detected.
- A page parity error was detected for a 'must complete' agent.
- A read or write I/O error was detected. A LPL recovery might be in progress so the page is added to the WEPR instead of the LPL.

Severity: 0 (informational)

System Action: Processing continues, but the pages within the error range are no longer accessible.

System Programmer Response: Determine the appropriate level of recovery, and invoke the recovery utility. If user-defined data sets are being used and full data set or table space RECOVER is to be used, then, prior to invoking the RECOVER utility, the table space must be stopped, new data set(s) defined, and the table space restarted. If the data set is part of a ROSHARE READ database, determine whether it was a link or DASD failure. If there was a link failure, then fix the link, and issue a -START DATABASE with the ACCESS(FORCE) parameter. If the error was caused by a DASD failure, then correct the problem from the system on which the database was defined as ROSHARE OWNER.

Problem Determination: Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for a discussion of database recovery procedures.

There may be an IOS message on the MVS console SYSLOG indicating the type of I/O error that occurred. If an IOS message was issued, follow the Problem Determination directions for the message.

DSNU087I *csect-name* **INVALID OPERAND TYPE FOR KEYWORD** *kkkkkkkk - oooooooo*

Explanation: The utility parser has determined that the operand 'ooooooo' is the wrong type for the keyword 'kkkkkkkk'. An example of such an error would be a decimal operand where only a hexadecimal operand is allowed.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the keyword, and resubmit the job.

Problem Determination: Refer to *DB2 Utility Guide and Reference* to determine valid operand types for the designated keyword.

DSNU088I *csect-name* **INVALID CHARACTER OPERAND** *ccccccc*

Explanation: The utility parser has determined that the operand 'ccccccc' is invalid as a character operand.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the keyword, and resubmit the job.

Problem Determination: Refer to *DB2 Utility Guide and Reference* for correct specification of the character operand.

DSNU089I *csect-name* **OPERAND** *ooooooo* **IS TOO LONG**

Explanation: The utility parser has determined that the operand 'ooooooo' is too long for the keyword specified.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the keyword, and resubmit the job.

Problem Determination: Refer to *DB2 Utility Guide and Reference* for correct operand length specification.

DSNU090I *csect-name* **DD OR TEMPLATE NAME** *nnn* **IS INVALID FOR KEYWORD** *kkk*

Explanation: The DDNAME or TEMPLATE *nnn* was used as an improper input of the specified keyword *kkk* or from one of the reserved ddnames: SYSIN, SYSPRINT, UTPRINT, SORTWKnn, SORTLIB.

Severity: 8 (error)

System Action: Processing terminates.

User Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU091I *csect-name* **DDNAME** *nnn* **IS A DUPLICATE**

Explanation: The DDNAME 'nnn' was used as operand in the input statement more than once.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Change the ddname to a different one.

DSNU092I *csect-name* **NUMBER OF OPERANDS FOR KEYWORD** *kkk* **EXCEEDS MAXIMUM**

Explanation: The keyword 'kkk' contains more than the maximum number of operands.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Refer to *DB2 Utility Guide and Reference* for the limit on the number of operands for the specified keyword.

DSNU093I *csect -* **INVALID CHARACTER STRING** *string* **IN CONTROL STATEMENT**

Explanation: An invalid character string *string* was found in a utility control statement where a keyword, operand, operator or punctuation was expected.

DSNU094I • DSNU099I

Severity: 8 (error)

System Action: Processing terminates.

User Response: Correct the utility control statement, and resubmit the job.

DSNU094I *csect-name* KEYWORD 'wwwww' IS DUPLICATED

Explanation: The keyword 'wwwww' is not allowed twice.

Severity: 8

System Action: The control statement in error is rejected and the processing is halted.

User Response: Correct the control statement in error, and resubmit the job.

DSNU095I *csect-name* UTILITY uuuuuuuu INCONSISTENT WITH LAST INVOCATION

Explanation: This message can occur when a utility job step is restarted and a utility statement was modified, added or deleted from SYSIN.

Severity: 8 (error)

System Action: Utility processing is terminated. The utility job step remains in SYSIBM.SYSUTIL in the stopped state.

User Response: Restart the utility job with the statements in the same order as they were in when the job was first run. If a statement was modified, change the statement back to the format in the original invocation and restart the job. Utility statements should not be altered for restart.

DSNU096I *csect-name* OPERAND 00000000 INCONSISTENT WITH LAST INVOCATION

Explanation: When the utility job step was restarted, the indicated operand was found to be inconsistent with the restart point.

System Action: The restart of utility processing is not initiated.

User Response: To restart, restore the operand to its prior definition. If this is not acceptable, terminate the utility job step, take corrective action, and resubmit the job.

Operator Response: An operator with SYSOPR authority can terminate the utility job step (this may not be necessary). A REORG utility that is beyond the UNLOAD phase should rarely be terminated.

Problem Determination: Refer to *DB2 Utility Guide and Reference* for operand definitions. Refer to Part 4 (Volume 1) of *DB2 Administration Guide* for a

discussion of utility restart constraints.

DSNU097I *csect-name - input* WILL BE REQUIRED SYNTAX IN FUTURE RELEASES

Explanation: The identified 'input' is not required in this release, but it will be part of the required syntax in future releases.

Severity: 4 (warning)

System Action: Utility processing continues.

Programmer Response: Refer to *DB2 Utility Guide and Reference* for the current syntax.

DSNU099I *csect-name - IRLM 'req-type'* REQUEST FAILED, IRLM RETURN CODE = X'*return-code*' IRLM REASON CODE = X'*reason-code*'

Explanation: The request to the IRLM to obtain or release a lock failed for the reasons specified in *return-code* and *reason-code*. In a non data-sharing environment, the requested lock is the utility serialization lock. In a data sharing environment, the requested lock is the utility serialization lock, the utility identifier lock, or the utility execution lock. The IRLM return and reason codes are documented in Part 5, "IRLM messages and codes," on page 1307. The type of request is indicated by *req-type*.

System Action: Utility and command processing terminates.

User Response: Refer to the IRLM messages and codes section for problem determination and the appropriate action. Restart the utility by specifying the RESTART parameter, or terminate the utility with the -TERM command and then resubmit the job. If this message was received during the -DIS UTIL, -TERM UTIL, or -START DATABASE ACCESS(FORCE) command, then the command can be reissued.

System Programmer Response: Determine the cause of the IRLM error and take appropriate action.

Problem Determination: Obtain the system console log output, dump, and SYS1.LOGREC information. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU100I *csect-name* **USERID =** *userid* **MEMBER =** *member-name* **UTILID =** *utilid*
PROCESSING UTILITY STATEMENT
statement-number **UTILITY =** *utility-name*
PHASE = *utility-phase* **COUNT =** *object-count* **NUMBER OF OBJECTS IN LIST =** *list-size* **LAST OBJECT STARTED =** *last-started* **STATUS = STOPPED**

Explanation: This message is issued in response to a DISPLAY UTILITY command. The utility job with identifier *utilid* stopped during processing. The utility stopped for one of these reasons:

- The REORG utility stopped in response to its UNLOAD(PAUSE) option. The utility is stopped in the RELOAD phase.
- The utility is stopped because of a DB2 subsystem failure or cancellation (for example, a STOP DB2 command).

In a data sharing environment, *member-name* identifies the DB2 member. In a non data-sharing environment, *member-name* is blank. At the time of the request, *object-count* records or pages were processed.

If the utility job step is restarted with the RESTART(PHASE) option, it begins with PHASE *utility-phase*. However, not all utilities have phases. Those that do have phases restart from the beginning of that phase.

COUNT indicates the number of pages or records processed in a utility phase. COUNT has different meanings for different utilities. For utilities not mentioned below, ignore this field.

- For CHECK INDEX, LOAD, REBUILD INDEX, and REORG: number of records processed (log records for the LOG phase of REORG), or 0 (for the SWITCH or BUILD2 phase of REORG).
- For COPY, MERGECOPY, RECOVER (restore phase), and RUNSTATS: number of pages processed.
- For STOSPACE: number of table spaces or indexes processed.

If the utility is processing a list of objects, *list-size* gives the total number of objects in the list and *last-started* gives the item number of the last object for which processing was started. These values may not be accurate in the UTILINIT before the list size has been determined.

Severity: 0 (informational)

System Action: DB2 waits for directions to either restart or terminate the utility.

User Response: If you have the required authority, restart or terminate the utility job step.

To restart the job step, you must have authority to run

the indicated utility and to complete any other utility functions in the utility job step.

To terminate the utility with the -TERM UTILITY command, you must be the originator or have SYSOPR or SYSADM authority.

Operator Response: If necessary, and if you have SYSOPR authority, you can issue the -TERM UTILITY command to release the resources claimed by the stopped utility.

DSNU103I *csect-name* - **UNABLE TO ACCESS SYSUTIL TABLE AT THIS TIME**

Explanation: An -ALTER UTILITY, -DISPLAY UTILITY, or -TERM UTILITY command was issued at the same time that the DSNDB01.SYSUTILX table space was the object of an active utility job. The utility job might be holding locks that would cause a deadlock condition to occur.

Severity: 8 (error)

System Action: The command processing is terminated.

User Response: Enter the command again. This message is issued in response to each command until the utility action on the DSNDB01.SYSUTILX table space completes.

DSNU104I *csect-name* - **DSNDB01.SYSUTILX IN A PENDING STATE PROHIBITS FURTHER PROCESSING**

Explanation: The -ALTER UTILITY, -TERM UTILITY, or -DISPLAY UTILITY command was issued when the DSNDB01.SYSUTILX table space was in a pending state, which prohibits further processing. The pending state was either copy or recovery pending.

Severity: 0 (informational)

System Action: Command processing is terminated.

User Response: Notify the system programmer so that the pending condition can be resolved.

System Programmer Response: Issue a -DISPLAY DATABASE command to determine the state of the DSNDB01.SYSUTILX table space. If the state is copy pending, do a full image copy. If the state is recovery pending, use the RECOVER utility to recover DSNDB01.SYSUTILX. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU105I *csect-name* - **USERID=userid**
MEMBER=member-name UTILID=utilid
PROCESSING UTILITY STATEMENT n
UTILITY=utility-name
PHASE=phase-name COUNT=n
NUMBER OF OBJECTS IN LIST=list-size
LAST OBJECT STARTED=last-started
STATUS=ACTIVE

Explanation: This message is issued in response to a DISPLAY UTILITY command.

It is also issued by the REORG utility if the user specified SHRLEVEL REFERENCE or CHANGE and DB2 *estimates* that the switch phase will not start by the deadline specified by the DEADLINE phrase.

This message gives the user an estimate of how much processing the utility completed. The *utility-name* utility in the utility job step identified by *utilid* was executing in phase *utility-phase* at the time the -DISPLAY UTILITY request was made. In a data sharing environment, *member-name* identifies the DB2 member. In a non-data-sharing environment, *member-name* is blank.

COUNT *n* is the number of pages or records processed in a utility phase. COUNT has different meanings for different utilities. For utilities not mentioned below, ignore this field.

- For CHECK INDEX, LOAD, REBUILD INDEX, and REORG: number of records processed (log records for the LOG phase of REORG), or 0 (for the SWITCH or BUILD2 phase of REORG).
- For COPY, MERGECOPY, RECOVER(restore phase), and RUNSTATS: number of pages processed
- For STOSPACE: number of table spaces or indexes processed.

If the utility is processing a list of objects, *list-size* gives the total number of objects in the list and *last-started* gives the item number of the last object on which processing was started. These values may not be accurate in the UTILINIT before the list size has been determined.

Severity: 0 (informational)

System Action: The message reflects the state of DB2 at the time of the -DISPLAY UTILITY command or the time when DB2 estimated that the switch phase in the REORG utility with SHRLEVEL REFERENCE or CHANGE would not start by the deadline specified by the DEADLINE phrase.

If this message was issued for -DISPLAY UTILITY, the system continues processing. A subsequent -DISPLAY UTILITY command reflects that processing.

DSNU106I *csect-name utility-name* **UTILITY,**
MEMBER = member-name UTILID =
utilid **TERMINATING**

Explanation: This message is issued in response to a DISPLAY UTILITY command. The *utility-name* utility in the utility job step identified by *utilid* was in the process of terminating at the time the DISPLAY UTILITY request was issued. The utility is terminating in response to a previous TERM UTILITY request.

In a data sharing environment, *member-name* identifies the DB2 member. In a non data-sharing environment, *member-name* is blank.

Severity: 0 (informational)

System Action: The system is stopping the utility and releasing all resources associated with the utility. After the utility terminates, DB2 can reuse the utility identifier.

DSNU107I *csect-name* **MEMBER NAME**
member-name **IS NOT A MEMBER OF**
THIS DATA SHARING GROUP.

Explanation: This message is issued by the DISPLAY UTILITY command when an invalid *member-name* is encountered in the member list.

Severity: 4

System Action: The DISPLAY UTILITY command ignores the invalid *member-name* and continues to process the next member name specified.

User Response: Correct the member name and reissue the command.

DSNU108I *csect-name* **DATA SHARING**
ENVIRONMENT IS NOT ACTIVE,
MEMBER KEYWORD NOT
APPLICABLE.

Explanation: This message is issued by the DISPLAY UTILITY command when the MEMBER keyword is specified, but data sharing is not active.

Severity: 4

System Action: The DISPLAY UTILITY command ignores the MEMBER keyword and its associated parameters, but continues processing.

User Response: Make sure data sharing is active before issuing the DISPLAY UTILITY command with the MEMBER keyword.

DSNU109I *csect-name* **UTILITY utilid CAN ONLY BE**
TERMINATED OR ALTERED BY
MEMBER = member-name

Explanation: The -TERM UTILITY or -ALTER UTILITY command cannot terminate or alter the utility job with identifier *utilid*, because it belongs to member *member-name* of the DB2 data sharing group.

Activeutility jobs can be terminated or altered only from the system on which they were running.

Severity: 8 (error)

System Action: If this message was issued for the -TERM UTILITY command, the command ignores the *utilid* and continues to process the next utilid, if any. If this message was issued for the -ALTER UTILITY command, the command is rejected, and further processing of the command is ended.

User Response: Make sure the *utilid* identifies the utility you want to terminate or alter. If it does, issue the command from the DB2 member identified in the message.

DSNU110I *csect-name* UTILID = *uuuu* INVALID

Explanation: This message is issued in response to an invalid specification of a UTILID on an -ALTER UTILITY, -DISPLAY UTILITY, or -TERM UTILITY command. A UTILID is a 1- to 16-byte alphanumeric token that can contain any number of periods.

Severity: 8 (error)

System Action: The -ALTER UTILITY, -DISPLAY UTILITY, or -TERM UTILITY command is rejected. Further processing of the command is ended.

User Response: Review the UTILID provided in the message to determine why it does not conform to the syntax rules of a utility identifier token, and reissue the request.

DSNU111I *csect-name* - SUBPHASE=*subphase-name* COUNT=*n*

Explanation: This message is issued in response to a -DISPLAY UTILITY command. It immediately follows a prior DSNU105I message if the utility is using subtasks to perform processing in parallel. There will be one of these messages for each subtask.

This message gives the user an estimate of how much processing the utility subtask has completed.

SUBPHASE *subphase-name* identifies the activity that the subtask was performing at the time the -DISPLAY UTILITY command was issued.

COUNT *n* is the number of records processed by the utility subtask.

Severity: 0 (informational)

System Action: The system continues processing.

DSNU112I *csect-name* - NO AUTHORIZED UTILITY FOUND FOR UTILID = *utilid*

Explanation: This message is issued in response to an -ALTER UTILITY, -DISPLAY UTILITY, or -TERM UTILITY command. DB2 has no record of the utility job identified by the utility identifier *utilid*. The *utilid* might

not be correct, or the utility might have already terminated.

Severity: 4 (warning)

System Action: The system rejects the -ALTER UTILITY, -DISPLAY UTILITY, or -TERM UTILITY request for the indicated utility job.

User Response: Verify that the utility identifier of the utility job to be altered, displayed, or terminated was correctly entered. To view all currently valid identifiers, issue the -DISPLAY UTILITY (*) or (partial-utility-id*) command.

DSNU114I *csect-name* UTILITY COMMANDS SUBSYSTEM FAILURE, REASON=*Xcode*

Explanation: This message indicates an abend has occurred in the utility commands subsystem.

System Action: The command abends. In the case of the -TERM command, termination actions taken previously under this command are backed out.

User Response: Prior messages and/or the SVC dump identify the failure. If the condition can be corrected, the command may be reissued.

Problem Determination: In most cases, the failure is not user related. In some cases, prior messages indicate a user error that may be corrected. The problem may be as simple as SYSIBM.SYSUTIL being temporarily locked by another command or a utility job. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU115I *csect-name utility-name* UTILITY WITH UTILID = *utilid* CAN ONLY BE TERMINATED BY A MEMBER WITH THE SAME RELEASE = *release*

Explanation: Command TERM UTILITY cannot terminate the utility job with identifier *utilid* because it belongs to a member with a release level identified in the message. Some utilities can be terminated only from a member of the DB2 data sharing group with the same release level.

Severity: 0 (informational)

System Action: Command TERM UTILITY is rejected for the indicated utility job.

User Response: Make sure the *utilid* identifies the utility you want to terminate. If it does, issue command TERM UTILITY from a member with a release level identified in the message in the DB2 data sharing group.

DSNU160I *csect-name - utility-name* **UTILITY, UTILID = *utilid* REQUESTED TO TERMINATE, PHASE = *utility-phase* WAS ACTIVE**

Explanation: This message is issued in response to a -TERM UTILITY command. It acknowledges that the request for termination was received and verified. At the time the -TERM UTILITY request was received, utility '*utility-name*' was ACTIVE in the utility job step identified by UTILID '*utilid*'.

System Action: DB2 has accepted the request to terminate the indicated utility job step. The utility terminates at its next cleanup point.

User Response: This message is an acknowledgement that the request has been accepted and is in progress.

DSNU161I *csect-name - utility-name* **UTILITY WITH UTILID = *util-id* CAN NOT BE TERMINATED AT THE DB2 TRACKER SITE**

Explanation: DB2 does not permit the termination of certain utilities at a tracker site because terminating these utilities may leave the target objects in an unpredictable state. The next recovery cycle should cause the utilities to resolve. You may not terminate the following utilities at a tracker site:

- COPY
- LOAD
- REORG
- REPAIR

Severity: 8 (error)

System Action: The utility does not terminate.

System Programmer Response: Monitor the status of these utilities after the next tracker site recovery cycle.

User Response: Contact the system programmer.

DSNU162I *csect-name - utility-name* **UTILITY WITH UTILID = *util-id* IS TERMINATING WITH OBJECTS THAT HAVE BEEN STARTED WITH ACCESS(FORCE) AND THEN DROPPED**

Explanation: Database objects that are used by the terminating utility were started with the command START DATABASE ACCESS(FORCE) and then dropped.

Severity: 4 (warning)

System Action: Termination process continues.

User Response: If the terminating utility is Online Reorg, TERM UTILITY does not rename and delete residual DB2-managed or user-defined data sets. Those

datasets must be deleted manually.

DSNU164I *csect-name cccccccc* **UTILITY, UTILID = *uuuuu* ALREADY TERMINATING**

Explanation: This message is in response to a -TERM UTILITY command. It indicates that the utility job step indicated by UTILID '*uuuuu*' has already been requested to terminate and is in the process of doing so now.

Severity: 0 (informational)

System Action: DB2 is currently in the process of terminating the indicated utility job step. Upon completion, all resources will have been released to their prior state, and all tracking of the indicated UTILID will have been removed. At that point, the UTILID is available for reuse.

User Response: This message indicates that either the request was redundant, or someone else is also interested in the termination of the subject utility job step.

DSNU166I *csect-name utility-name* **UTILITY, UTILID = *uid* NOT EXECUTING, CLEANUP COMPLETE**

Explanation: This message is in response to a -TERM UTILITY command. The '*utility-name*' utility identified by UTILID '*uid*' was found to be stopped at the time of the request to terminate.

Severity: 0 (informational)

System Action: Cleanup is performed for the indicated stopped utility. All resources held by the utility are freed and all storage of the utility job is deleted. The utility job is no longer restartable.

System Programmer Response: Resources held by this utility may have prevented applications, commands, and other utilities from executing. These have been freed, so that the inhibited tasks may now be performed.

DSNU170I *csect-name* **UTILITY JOB TERMINATED BY TERM COMMAND**

Explanation: A -TERM UTILITY command was issued for this utility job step.

Severity: 8 (error)

System Action: The executing utility terminates processing and frees all held resources. All storage of the utility job has been deleted. Therefore, the job is not restartable. Subsequent utilities in the same job step are not executed.

User Response: All or portions of the utility job step can be resubmitted as needed.

DSNU172I *csect-name* **UTILITY JOB STOPPED BY STOP DB2 COMMAND**

Explanation: A -STOP DB2 command was issued during execution of the utility job step.

Severity: 8 (error)

System Action: The executing utility stops processing but continues to hold resources. Subsequent utilities in the same job step are not executed. The storage of the utility job is retained. Therefore, the utility job step is restartable.

User Response: Following a -START DB2 command, the utility job step may be restarted. Alternatively, the utility may be terminated using the -TERM UTILITY command and resubmitted as a new job. A REORG utility that has passed the UNLOAD phase should rarely be terminated.

DSNU180I *csect-name* **UTILITY IS NOT COMPATIBLE WITH THE** *utility-name* **UTILITY UTILID = uid OBJECT =** *spacename.object-name*

Explanation: Certain utilities cannot process the same table or index space at the same time. The message identifies the objects for which the incompatibility occurred.

These objects might be target objects of the utilities, a mapping table, or they might be catalog or directory table spaces that are updated by the utilities. For example, DSNDB06.SYSCOPY is updated by LOAD.

Severity: 8 (error)

System Action: The starting utility is not initiated, and further utility processing in that utility job step is terminated.

User Response: Use -DISPLAY UTILITY with the provided 'uid' to determine when the utility that caused your utility to be rejected is completed. Refer to Part 5 (Volume 2) of *DB2 Administration Guide* for a discussion of which utilities are mutually compatible.

DSNU181I *csect-name* **RESTART NOT ALLOWED FOR** *utility-name* **UTILITY**

Explanation: An attempt was made to restart the named utility. DB2 does not allow this utility to be restarted.

System Action: Utility processing is abended. Abend reason code 00E40018 might be issued.

User Response: Issue the -TERM UTIL command to terminate the utility job and then rerun the job without the RESTART parameter.

System Programmer Response: If necessary, take actions to prevent access to the table space before terminating the utility.

DSNU182I *csect-name utility-name* **MUST BE THE ONLY UTILITY IN SYSIN**

Explanation: The submitted utility control statements contain a utility on the table space DSNDB01.SYSUTILX. This table space is integral to controlling the execution of utilities. Control over previous or subsequent utilities in the job step would be lost if the utility were allowed to execute. Therefore, the identified utility must be the only utility in a job step.

This message is also issued if you recover the SYSUTILX indexes, DSNLUX01 and DSNLUX02, or table space DSNDB01.DBD01 and include other utility control statements in the same job step.

Additionally, this message will be issued if you invoke either the BACKUP SYSTEM or RESTORE SYSTEM utilities and include additional commands.

Severity: 8 (error)

System Action: Work performed by utilities in the same utility job step prior to the starting utility persist. The utility identified and subsequent utilities are not allowed to execute, and the utility job step is placed in the stopped state.

User Response: Terminate the utility execution that received this message using the -TERM UTILITY command. Submit a subsequent job step containing only the identified utility. Execute additional utilities, if any, in a separate job step.

DSNU183I *csect-name - utility-name* **UTILITY NOT COMPATIBLE WITH OTHER ACTIVE UTILITIES**

Explanation: The utility identified by 'utility-name' is executing against table space DSNDB01.SYSUTILX. This table space is integral to controlling the execution of utilities. Control over other utilities running at the same time would be lost if the utility were allowed to execute. Therefore, the identified utility must be executed alone. There must be no other active DB2 utilities in the system.

Severity: 8 (error)

System Action: Utility execution is terminated.

User Response: Rerun the utility when there are no other utilities executing. Use the -DISPLAY UTILITY command to see what utilities are ACTIVE. Utilities in the STOPPED state are allowed.

DSNU184I *csect-name* **- DO NOT RECOVER OBJECT qual.obj-nm UNTIL THE NEXT TRACKER SITE RECOVERY CYCLE**

Explanation: If DB2 detects an inconsistency relating to a utility's status on object 'qual.obj-nm' at the tracker site, DB2 issues this message. This event can occur if the SYSUTIL record for the utility either does not exist,

or reflects incorrect information about the status of the utility.

Severity: 8 (error)

System Action: The utility issues ABEND04E with return code 00E40009.

User Response: Contact the system programmer.

System Programmer Response: Wait for the next recovery cycle to recover the object named in this message. If the object named in this message is a catalog or directory object, you cannot recover this object, or any other objects in the list of catalog and directory objects, or any user data or indexes. Wait until the next recovery cycle to recover the object.

DSNU185I *csect-name* **THE VSAM DATA SET DOES NOT EXIST FOR** *obj-type*
obj-qual.obj-name part part-number

Explanation: The VSAM data set(s) for the specified object has not been defined yet because the object was created with DEFINE NO.

Severity: 0 (informational)

System Action: The utility skips the object that was created with DEFINE NO, and processing continues.

DSNU200I *csect-name* - **ERROR RANGE ON TABLE SPACE** *database.tablespace-name* **PROHIBITS PROCESSING**

Explanation: The utility encountered an error range on the identified table space or partition, which prohibits it from continuing.

Severity: 8 (error)

System Action: The utility fails serialization and terminates.

User Response: Correct the error range for the table space by running RECOVER ERROR RANGE. Then resubmit the original failing utility.

DSNU201I *csect-name* - **ERROR RANGE ON INDEX** *creator.index-name* **PROHIBITS PROCESSING**

Explanation: The utility encountered an error range on the identified index space or partition which prohibits it from continuing.

Severity: 8 (error)

System Action: The utility fails serialization and terminates.

User Response: Identify the incorrect error range by issuing the DISPLAY command for the index. Run the RECOVER or REBUILD INDEX utility to restore the index or index partition that has the error range. Then resubmit the original failing utility.

DSNU202I *csect-name* - **RECOVER PENDING ON TABLE SPACE** *database.tablespace-name* **PROHIBITS PROCESSING**

Explanation: An attempt was made to execute a utility against a table space that is in a rebuild pending state.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Remove the table space from the rebuild pending state by using either LOAD REPLACE, REBUILD, or REPAIR against the object. LOAD REPLACE with KEEPDICTIONARY is not allowed on a table space (with compression active) in the rebuild pending state. Resubmit the job.

System Programmer Response: Determine which of the three utilities, LOAD REPLACE, REBUILD, or REPAIR, should be used to remove the object from the rebuild pending state.

DSNU203I *csect-name* - **RECOVER PENDING ON INDEX** *creator.index-name* **PROHIBITS PROCESSING**

Explanation: An attempt was made to execute a utility against an index that is in a rebuild pending state.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Remove the index from the rebuild pending state by using the REBUILD INDEX utility against the index. . Resubmit the job.

DSNU204I *csect-name* - **PAGESET REBUILD PENDING ON INDEX** *creator.name* **PROHIBITS PROCESSING**

Explanation: An attempt was made to execute a utility against a logical partition of an index when the index is in PAGESET REBUILD pending state,

Severity: 8 (error)

System Action: Utility processing terminates.

User Response: Remove the index space from PAGESET rebuild pending state by running the REBUILD INDEX utility against the entire index, not just a single logical partition. Resubmit the job.

DSNU205I *csect-name* - **LOGICAL ERROR RANGE (LOGICAL PAGE LIST) ON TABLE SPACE** *database.tablespace-name* **PROHIBITS PROCESSING**

Explanation: The utility cannot continue because it encountered a logical error range (logical page list) on the identified table space or partition.

Severity: 8 (error)

System Action: The utility terminates.

User Response: Use the -START DATABASE command to correct the logical error range (LPL) for the table space. Then resubmit the original failing utility.

DSNU206I *csect-name* - **LOGICAL ERROR RANGE (LOGICAL PAGE LIST) ON INDEX**
creator.index-name **PROHIBITS PROCESSING**

Explanation: The utility cannot continue because it encountered a logical error range (logical page list) on the identified index space or partition.

Severity: 8 (error)

System Action: The utility terminates.

User Response: Issue the -DISPLAY command for the index to identify the logical error range (LPL). There are two ways to restore the index or index partition that has the LPL before resubmitting the original failed utility.

- Issue the START DATABASE command to clear the LPL status, then run the RECOVER or REBUILD INDEX utility.
- Run the RECOVER or REBUILD INDEX utility to restore the entire nonpartitioning index (NPI).

DSNU207I *csect-name* - **GROUP BUFFER POOL RECOVERY PENDING ON TABLE SPACE** *database.tablespace-name*
PROHIBITS PROCESSING

Explanation: You cannot execute a utility on a table space that is in a group buffer pool recovery pending status.

Severity: 8 (error)

System Action: Utility processing does not start.

User Response: Use the -START DATABASE command to remove the table space from the group buffer pool recovery pending status. Then resubmit the job.

DSNU208I *csect-name* - **GROUP BUFFER POOL RECOVERY PENDING ON INDEX**
creator.index-name **PROHIBITS PROCESSING**

Explanation: You cannot execute a utility on an index that is in a group buffer pool recovery pending (GRECP) status.

Severity: 8 (error)

System Action: Utility processing does not start.

User Response: Run the REBUILD INDEX utility on the index to remove the table space from the group buffer pool recovery pending status. Then resubmit the job.

DSNU209I *csect-name* - **RESTART PENDING ON**
obj-type database.tablespace-name
PROHIBITS PROCESSING

Explanation: An attempt was made to execute a utility against a table space or index space that is in a restart pending state.

Severity: 8 (error)

System Action: Utility processing is not initiated.

System Programmer Response: Use the DISPLAY THREAD TYPE(POSTPONED) to determine the status of the resource. Use the RECOVER POSTPONED command if recover has not already been started. Resubmit the job.

DSNU210I *csect-name* - **INFORMATIONAL COPY PENDING ON** *obj-type obj-qual.obj-name*
PROHIBITS PROCESSING

Explanation: An attempt was made to execute the RECOVER utility with the ERROR RANGE or PAGE options against an index in the informational copy pending state.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Use the REBUILD INDEX utility instead.

DSNU211I *csect-name* **CHECK PENDING ON**
obj-type obj-qual.obj-name **PROHIBITS PROCESSING**

Explanation: The requested utility can not be run against an index in the check pending state. The index may be out of sync with its table space.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Run either the CHECK INDEX utility or the REBUILD INDEX utility. The CHECK INDEX utility will identify any errors (for example, if the index keys do not match the data in the table space.) If there are no errors, the check pending state will be reset. The REBUILD INDEX utility will rebuild the index from the data in the table space.

DSNU212I *csect-name* - **REORG PENDING ON TABLE SPACE** *database.index-name*
PROHIBITS PROCESSING

Explanation: An attempt was made to execute a utility against a table space that is in a REORG PENDING state.

Severity: 8 (error)

System Action: Utility processing is not initiated.

DSNU213I • DSNU234I

User Response: Execute REORG with SHRLEVEL NONE against the partitions in REORG PENDING state to rebalance the partitions and remove the REORG PENDING state.

DSNU213I *csect-name* - **AUX CHECK PENDING ON TABLE SPACE** *table-space* **PROHIBITS PROCESSING**

Explanation: The *processing* is prohibited because the *table-space* is in an AUX CHECK PENDING state.

System Action: Utility terminates and returns completion code=8.

Programmer Response:

Run the CHECK DATA utility with the AUXERROR INVALIDATE option. If there are no AUX CHECK errors, AUX CHECK PENDING will be reset. If AUX CHECK errors are found, AUX CHECK PENDING will be reset and the table space will be set to an AUX WARNING state. This allows the rows with AUX CHECK errors to be corrected. Correct the errors and rerun CHECK DATA. If no more AUX CHECK errors are found, the AUX WARNING state will be reset.

DSNU214I *csect-name* - **REBUILD PENDING ON INDEX** *creator.index-name* **PROHIBITS PROCESSING**

Explanation: An attempt was made to execute a utility against an index that is in rebuild pending state.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Remove the index from the rebuild pending state by using REBUILD INDEX against the index, then resubmit the job.

DSNU215I *csect-name* **REFRESH PENDING ON** *ob-type database.objectname* **PROHIBITS PROCESSING**

Explanation: DB2 attempted to execute a utility against a table space or index that has refresh pending status.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: If the object in refresh pending status is a table space, use the RECOVER utility to recover the table space to a prior point in time. You can also reload the table space with LOAD REPLACE. If the object in refresh pending status is an index, use the REBUILD INDEX utility to rebuild the index from the data.

DSNU231I *csect-name* **DICTIONARY WITH n ENTRIES HAS BEEN SUCCESSFULLY BUILT FROM m ROWS FOR TABLESPACE** *tablespace-name*

Explanation: A compression dictionary was built for the specified tablespace. This message is issued during the RELOAD phase of the LOAD utility and at the end of the UNLOAD phase of the REORG utility.

The variable n is the number of dictionary entries, and can be any of the following values: 512, 1024, 2048, 4096, or 8192. n depends on the number of rows being loaded or reorganized.

m is the number of rows used to build the dictionary.

Severity: 0 (informational)

System Action: Processing continues.

DSNU232I *csect-name* **KEEPDICTIONARY REQUESTED BUT COMPRESS ATTRIBUTE NOT DEFINED FOR TABLE SPACE** *table-space-name*

Explanation: The KEEPDICTIONARY option was specified in the LOAD or REORG TABLESPACE statement. This keyword should only be used with table spaces that have the COMPRESS YES attribute. Otherwise, it is ignored. The COMPRESS column of SYSIBM.SYSTABLEPART contains the current compression status.

Severity: 4 (warning)

System Action: Processing continues. If the dictionary exists, it is erased if LOAD REPLACE or REORG is specified.

DSNU233I *csect-name* **COMPRESSION DICTIONARY DOES NOT EXIST FOR TABLE SPACE** *table-space-name*

Explanation: The KEEPDICTIONARY option was specified in the LOAD or REORG TABLESPACE utility statement for a table space that does not have a compression dictionary.

Severity: 4 (warning)

System Action: Processing continues. A dictionary is built for the table space.

DSNU234I *csect-name* **COMPRESSION REPORT FOR TABLE SPACE** *table-space-name*

:
noncmpbytes
KB WITHOUT COMPRESSION
cmpbytes
KB WITH COMPRESSION

percsave
PERCENT OF THE BYTES SAVED FROM
COMPRESSED DATA ROWS

pctrowcomp
PERCENT OF THE LOADED ROWS WERE
COMPRESSED

noncmppages
PAGES REQUIRED WITHOUT
COMPRESSION

cmppages
PAGES REQUIRED WITH COMPRESSION

auncmprowlen
BYTES FOR AVERAGE UNCOMPRESSED
ROW LENGTH

avgcmpprowlen
BYTES FOR AVERAGE COMPRESSED ROW
LENGTH

pagesave
PERCENT OF THE DB2 DATA PAGES SAVED
USING COMPRESSED DATA

Explanation: The data in the table space was compressed. This message is issued at the end of the RELOAD phase for the LOAD and REORG utility. The statistics that follow apply only to the data that was loaded or reorganized. For example, RESUME(YES) reports statistics only on the additional rows that were loaded, not what was previously in the table space.

The compression statistics follow:

noncmpbytes
The total number of uncompressed KB (where KB = 1024 bytes) for the loaded or reorganized data rows (including the row prefix). This number was rounded to the nearest KB.

cmpbytes
The total number of compressed KB for the loaded or reorganized data rows (including the row prefix). This number was rounded to the nearest KB.

percsave
The percentage of bytes saved from the loaded or reorganized data rows as a result of compression.

The values above reflect only the number of bytes for the data row and the respective row prefix (6 bytes). DB2 page and dictionary page overhead is not included.

pctrowcomp
The percentage of the rows that were compressed within the total number of rows that were loaded or reorganized. The stored length and the external length of a row was compared to determine if the row was compressed. If an EDITPROC is involved, its effect on the length of the row is considered in the calculation.

noncmppages
The estimated number of DB2 pages required

by the uncompressed data rows that were loaded or reorganized. Space required for PCTFREE and FREEPAGE is included. This number was rounded up to the next integer.

cmppages
The estimated number of DB2 pages required by the compressed data rows that were loaded or reorganized. Space required for PCTFREE and FREEPAGE is included. Dictionary pages are also included unless a LOAD RESUME(YES) was run. This number was rounded up to the next integer.

auncmprowlen
Average uncompressed row length.

avgcmpprowlen
Average compressed row length.

pagesave
An estimate of the percentage of DB2 pages saved by compressing the loaded or reorganized data rows.

Severity: 0 (informational)

System Action: Processing continues.

DSNU235I *csect-name* **THE COMPRESSION
DICTIONARY WAS NOT BUILT FOR
TABLE SPACE** *table-space-name*

Explanation: There is insufficient data to build a compression dictionary. For the LOAD utility, the input data set is empty or all of the input records were discarded. For the REORG TABLESPACE utility, the table space is empty. The data was not compressed.

Severity: 4 (warning)

System Action: Processing continues.

User Response: The input data set must contain data in order to build a compression dictionary while running the LOAD utility. Ensure that the input records are not discarded by the WHEN clause or conversion errors. For the REORG TABLESPACE utility, the table space must be populated with data in order to build a compression dictionary.

DSNU236I *csect-name* **DICTIONARY FOR TABLE
SPACE** *table-space-name* **HAS BEEN
ERASED.**

Explanation: The compression dictionary of the specified table space was erased.

The COMPRESS attribute of the table space is NO, and there are no active rows in this table space. In this case, the LOAD RESUME NO utility erases the dictionary.

Severity: 0 (informational)

System Action: Processing continues.

DSNU237I TABLE *table2* IS NOT IN SAME TABLESPACE AS TABLE *table1*

Explanation: All source tables for a single LOAD utility statement must be in the same table space.

Severity: 8 (error)

System Action: Utility processing terminates.

User Response: Remove the INTO TABLE control statement that specifies *table2* from the current LOAD request. Create another LOAD utility statement that contains the INTO TABLE control statement for *table2* so that all source tables in a single LOAD request are from the same table space. Resubmit the job.

DSNU241I *csect-name* DICTIONARY WITH *n* ENTRIES HAS BEEN SUCCESSFULLY BUILT FROM *m* ROWS FOR TABLE SPACE *table-space-name*, PARTITION *part-num*

Explanation: A compression dictionary was built for the specified partition of the table space. This message is issued during the RELOAD phase of the LOAD utility and at the end of the UNLOAD phase of the REORG utility.

The variable *n* is the number of dictionary entries: 512, 1024, 2048, 4096, or 8192. *n* depends on the number of rows being loaded or reorganized.

m is the number of rows used to build the dictionary.

Severity: 0 (informational)

System Action: Processing continues.

DSNU242I *csect-name* KEEPDICTIONARY REQUESTED BUT COMPRESS ATTRIBUTE NOT DEFINED ON TABLE SPACE *table-space-name*, PARTITION *part-num*

Explanation: The KEEPDICTIONARY option was specified in the LOAD or REORG TABLESPACE utility statement. This keyword should only be used with table space partitions that have the COMPRESS YES attribute. Otherwise, it is ignored. The COMPRESS column of SYSIBM.SYSTABLEPART contains the current compression status.

Severity: 4 (warning)

System Action: Processing continues. If the dictionary exists, it is erased if LOAD REPLACE or REORG is specified.

DSNU243I *csect-name* COMPRESSION DICTIONARY DOES NOT EXIST FOR TABLE SPACE *table-space-name*, PARTITION *part-num*

Explanation: The KEEPDICTIONARY option was specified in the LOAD or REORG TABLESPACE utility statement for a table space partition that does not have a compression dictionary.

Severity: 4 (warning)

System Action: Processing continues. A dictionary is built for the table space partition.

DSNU244I *csect-name* COMPRESSION REPORT FOR TABLE SPACE *table-space-name*, PARTITION *part-num*

:

auncmprowlen
BYTES FOR AVERAGE UNCOMPRESSED ROW LENGTH

avgcmprowlen
BYTES FOR AVERAGE COMPRESSED ROW LENGTH

pagesave
PERCENT OF THE DB2 DATA PAGES SAVED USING COMPRESSED DATA

Explanation: The data in the table space partition was compressed. This message is issued at the end of the RELOAD phase for the LOAD and REORG utility. The statistics that follow apply only to the data that was loaded or reorganized. For example, RESUME(YES) reports statistics only on the additional rows that were loaded, not what was previously in the table space.

The compression statistics follow:

noncmpbytes
The total number of uncompressed KB (where KB = 1024 bytes) for the loaded or reorganized data rows (including the row prefix). This number was rounded to the nearest KB.

cmpbytes
The total number of compressed KB for the

loaded or reorganized data rows (including the row prefix). This number was rounded to the nearest KB.

percsave

The percentage of bytes saved from the loaded or reorganized data rows as a result of compression.

The values above reflect only the number of bytes for the data row and the respective row prefix (6 bytes). DB2 page and dictionary page overhead is not included.

pctrowcomp

The percentage of the rows that were compressed within the total number of rows that were loaded or reorganized. The stored length and the external length of a row was compared to determine if the row was compressed. If an EDITPROC is involved, its effect on the length of the row is considered in the calculation.

noncmppages

The estimated number of DB2 pages required by the uncompressed data rows that were loaded or reorganized. Space required for PCTFREE and FREEPAGE is included. This number was rounded up to the next integer.

cmppages

The estimated number of DB2 pages required by the compressed data rows that were loaded or reorganized. Space required for PCTFREE and FREEPAGE is included. Dictionary pages are also included unless a LOAD RESUME(YES) was run. This number was rounded up to the next integer.

auncmprowlen

Average uncompressed row length.

avgcmprowlen

Average compressed row length.

pagesave

An estimate of the percentage of DB2 pages saved by compressing the loaded or reorganized data rows.

Severity: 0 (informational)

System Action: Processing continues.

DSNU245I *csect-name* **THE COMPRESSION DICTIONARY WAS NOT BUILT FOR TABLE SPACE** *table-space-name*, **PARTITION** *part-num*

Explanation: There is insufficient data to build a compression dictionary. For the LOAD utility, the input data set is empty or all of the input records were discarded. For the REORG TABLESPACE utility, the partition is empty. The data was not compressed.

Severity: 4 (warning)

System Action: Processing continues.

User Response: The input data set must contain data in order to build a compression dictionary while running the LOAD utility. Ensure that the input records are not all being discarded by the WHEN clause or conversion errors. For the REORG TABLESPACE utility, the partition must be populated with data in order to build a compression dictionary.

DSNU246I *csect-name* **DICTIONARY FOR TABLE SPACE** *table-space-name*, **PARTITION** *part-num* **HAS BEEN ERASED.**

Explanation: The compression dictionary of the specified partition of the table space was erased.

The COMPRESS attribute of the table space partition is NO, and there are no active rows in this partition. In this case, the LOAD RESUME NO utility erases the dictionary.

Severity: 0 (informational)

System Action: Processing continues.

DSNU250I *csect-name* **UNLOAD PHASE COMPLETE, ELAPSED TIME =** *hh/mm/ss*

Explanation: The UNLOAD phase of the REORG utility completed normally. The time that elapsed between the beginning of the REORG utility and the completion of the UNLOAD phase was hh/mm/ss, hours, minutes, and seconds, respectively.

Severity: 0 (informational)

System Action: Action subsequent to this message depends on the UNLOAD option of the REORG utility statement:

- If the UNLOAD option is CONTINUE, execution of the utility continues into the RELOAD phase.
- If the UNLOAD option is PAUSE, execution of the utility is stopped at the beginning of the RELOAD phase.
- If the UNLOAD option is ONLY or EXTERNAL, the REORG utility is finished. Processing continues to the next utility in the utility job step, or, if there are no more utility statements, the utility job step terminates normally.

User Response: The user's response depends on the UNLOAD option in the REORG utility statement.

- If the UNLOAD option is CONTINUE, no user response is required. The message is informational only.
- If the UNLOAD option is PAUSE, the REORG utility is stopped in the reload phase. To complete the REORG process, the user must explicitly restart the utility job step using the RESTART(PHASE) option.

- If the UNLOAD option is ONLY or EXTERNAL, the REORG utility has completed, and the requested output is on the data set identified by the DD statement of the UNLDDN REORG utility statement option.

Operator Response: The operator's response depends on the UNLOAD option of the REORG statement:

- If the UNLOAD option is CONTINUE, no operator response is required. The execution of the REORG utility is proceeding.
- If the UNLOAD option is PAUSE, further processing is dependent upon restarting the utility job step with the RESTART(PHASE) option. Until that time, resources are held exclusively by the REORG utility job step.
- If the UNLOAD option is ONLY or EXTERNAL, the REORG utility processing is complete. The data set defined by the DD statement nominated by the UNLDDN option is available for installation disposition.

DSNU251I *csect-name* **UNLOAD PHASE STATISTICS. NUMBER OF RECORDS UNLOADED=** *mmmmmm* **FOR** *obj-type qbj-qual.obj-name* **PART** *nn*

Explanation: This message is issued at the completion of the UNLOAD phase of the REORG utility. It gives the number of records that were unloaded *mmmmmm* for partition *nn* of the tablespace, index, or indexspace that was specified. The count can indicate the amount of processing.

Severity: 0 (informational)

System Action: Only valid table records are unloaded. Dropped table record counts are not reported.

User Response: The record count represents the current cardinality of the table or index that was indicated in the error message. Consider invoking the RUNSTATS utility and then rebinding the involved PLANS if this value differs greatly from the SYSTABLE.CARD value so that the SQL optimizer can bring the PLANS up to date.

Operator Response: Count can be indicative of the amount of processing that remains.

DSNU252I *csect-name* **UNLOAD PHASE STATISTICS. NUMBER OF RECORDS UNLOADED=** *mmmmmm* **FOR** *obj-type qbj-qual.obj-name*

Explanation: This message is issued at the completion of the UNLOAD phase of the REORG utility. It gives the number of records that were unloaded *mmmmmm* for the tablespace, index, or indexspace that was indicated in the error message.

Severity: 0 (informational)

System Action: Only valid table or index records are unloaded. Dropped table record counts are not reported.

User Response: Record count represents the current cardinality of the table or index that was specified in the error message. Invocation of the RUNSTATS utility and a subsequent rebinding of the involved PLANS should be considered if this value differs greatly from the SYSTABLE.CARD value, so that the SQL optimizer can bring the PLANS up to date.

Operator Response: Count can be indicative of the amount of processing remaining.

DSNU253I *csect-name* **UNLOAD PHASE STATISTICS. NUMBER OF RECORDS** *action= mmmmmm* **FOR TABLE** *table-name*

Explanation: This message is issued at the completion of the UNLOAD phase of the REORG utility. If *action* is "UNLOADED", it gives the number of records *mmmmmm* that were unloaded for the specified table name. If *action* is "DISCARDED", it gives the number of records *mmmmmm* that were discarded for the specified table name.

Severity: 0 (informational)

System Action: Table records were unloaded or discarded.

DSNU254I *csect-name* - **RECORD COUNTS INCONSISTENT FOR** *pppppppp* **PHASE, NUMBER OF RECORDS EXPECTED =** *nnnnnnnn*, **NUMBER OF RECORDS PROCESSED =** *aaaaaaaa*

Explanation: This message is issued during the *pppppppp* phase for the REORG utility to report the condition where the number of records, *nnnnnnnn*, passed to the current phase is not equal to the number of records, *aaaaaaaa*, processed in this phase.

Severity: 4 (warning)

System Action: Processing continues if UNLOAD PAUSE option was used.

User Response: Check if unload data set was altered by user. Determine if the inconsistent record counts between the unload and reload phases is a potential problem. If it is an internal DB2 problem, report to system programmer.

System Programmer Response: Determine the failing environment. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: If the unload data set was manipulated by user during restart process, make sure it was handled properly. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference*

for information on identifying and reporting the problem.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

DSNU255I *csect-name* - **KEY COUNT INCONSISTENT FOR *pppppppp* PHASE, NUMBER OF KEYS EXPECTED = *nnnnnnnn*, NUMBER OF KEYS PROCESSED = *aaaaaaa*.**

Explanation: This message is issued during the *pppppppp* phase for the LOAD or REORG utility to report the condition where the number of keys, *nnnnnnnn*, passed to the current phase is not equal to the number of keys, *aaaaaaa*, processed in this phase. One or more of the affected indexes may be inconsistent.

Severity: 8 (error)

System Action: Processing stops and all indexes are placed in rebuild pending state.

User Response: TERM the utility and re-access the indexes by running REPAIR utility to reset the rebuild-pending states on indexes. Run the CHECK INDEX utility to determine if any of the affected indexes are inconsistent. Inconsistent indexes can be rebuilt by the REBUILD INDEX utility.

System Programmer Response: Determine the failing environment. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: If the working data set was manipulated by the user during the restart process, make sure it was handled properly. Refer to *DB2 Utility Guide and Reference*.

If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU256I *csect-name* **INVALID PARTITION SPECIFICATION**

Explanation: This message is issued by the utility in response to an invalid PART option specification.

The PART option is invalid in the following situations:

- when it is specified for a nonpartitioned table space
- if the indicated PART integer is not pertinent to the partitions existing for the indicated table space
- or if a ROWID column is part of the partitioning key
- if LOAD INTO TABLE PART *x* is performed on a table space where an identity column is part of the partitioning key

The utility job step is terminated.

System Action: The error is sufficient to terminate

further processing of the utility job step. The utility job step is terminated, and resources are released to their previous state.

User Response: Determine the correct partition specification for the table space that was the subject of the specified control utility statement, and resubmit the utility job step. Examine the SYSIBM.SYSTABLESPACE in the DB2 catalog for the correct range of partition numbers for the table space. If a ROWID column is part of the partitioning key, the PART option is invalid.

DSNU257I *csect-name* **UNABLE TO RESTART BUILD PHASE**

Explanation: Restarting in the BUILD PHASE or the SORTBLD phase of the LOAD utility with the RESUME(YES) option is not permitted.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Recover all indexes within the table space which were left in a rebuild pending state when the LOAD utility failed.

Problem Determination: Refer to *DB2 Utility Guide and Reference* and Part 2 (Volume 1) of *DB2 Administration Guide* for a discussion of LOAD restarting constraints.

DSNU258I *csect-name* **BUILD PHASE STATISTICS. NUMBER OF INDEXES = *mmm***

Explanation: This message is issued at normal completion of the BUILD phase of the LOAD or REORG or REBUILD INDEX utility. The number of indexes that were updated is indicated as '*mmm*'.

Severity: 0 (informational)

System Action: The BUILD phase of either the LOAD or REORG or REBUILD INDEX utility is completed. Upon completion of the utility job step, they are available for REFERENCE processing.

DSNU259I *csect-name* **BUILD PHASE COMPLETE, ELAPSED TIME = *hh/mm/ss***

Explanation: This message is issued at the normal completion of the BUILD phase of the REORG, LOAD, and REBUILD INDEX utilities. The time that has elapsed between the beginning of the phase and the completion of this phase was '*hh*' hours, '*mm*' minutes, and '*ss*' seconds.

System Action: Processing continues to the next phase of the LOAD or REORG or REBUILD INDEX utility. If this is the last phase, processing continues to the next utility statement in the utility job step, if any.

DSNU260I *csect-name obj-type obj-qual.obj-name* IS
EMPTY

Explanation: This message is issued as a warning when REBUILD INDEX(ALL) or REORG TABLESPACE are executed on an empty table space.

This message is also issued when COPY detects that the first space map page in the table space or partition is missing. This is an error condition that might be caused by a delete and redefine of the data set outside of DB2, or by a previous DB2 failure that occurred on the data set.

Severity: 4 (warning) or 8 (error)

System Action: For REBUILD INDEX or REORG TABLESPACE, the return code of 4 will allow the next utility function in the job step, if any, to be initiated.

For COPY, the table space, index space, or partition being copied will be placed in recover pending status. The return code of 8 will prohibit further utility processing in the job step.

User Response: Notify the system programmer if the return code is 8. If the return code is 4, no action is required.

System Programmer Response: If the return code is 8, the table space, indexspace, or partition being copied should be recovered with the RECOVER utility.

DSNU269I *csect-name* FIELD *field-name* IS NOT
ALLOWED

Explanation: You specified a ROWID GENERATED ALWAYS in the field specification list. Only a ROWID GENERATED BY DEFAULT is allowed to be specified in the field specification list.

Identity columns that were defined as GENERATED ALWAYS can not be specified in a LOAD field specification list, nor can these columns be implied in LOAD FORMAT UNLOAD or LOAD with no field specification list.

Severity: 8 (error)

System Action: The LOAD utility is terminated

User Response: Omit the ROWID GENERATED ALWAYS column from the LOAD field specification list and rerun the job.

DSNU270I *csect-name - table-name, column-name*
IN VIOLATION OF INSTALLATION
DEFINED FIELD PROCEDURE
procedure-name. function-code,
return-code, reason-code, message-token

Explanation: An installation-supplied field procedure has returned an error during encoding for LOAD or decoding for REORG. See SQLCODE -681 for more detail.

Severity: 8 (error)

System Action: The utility will issue a system '04E' abend with a reason code of '00E40336'.

User Response: Request the dump produced as a result of the error to the system programmer so that the cause of the error can be determined and corrected.

System Programmer Response: Examine the field procedure to determine why an error return code was generated. Refer to *DB2 Utility Guide and Reference* for more information.

DSNU271I *csect-name - REORG PENDING ON FOR*
TABLE SPACE *database.index-name*
PART *part number* PROHIBITS
PROCESSING

Explanation: An attempt was made to execute a REORG utility to redistribute data in a partitioned table space. The partition number stated in this message was found to have the REORP state on, but was not specified on the PART *n1:n2* parameter of the REORG utility.

If you are running REORG to materialize identity column values, you must reorganize the entire table space.

Severity: 8 (error)

System Action: Utility processing is not initiated.

System Programmer Response: Identify the correct partition range specification for the REORG utility by issuing the DISPLAY command for the table space, and resubmit the utility job step.

DSNU272I *csect-name - FIELD PROCEDURE*
procedure-name COULD NOT BE
LOADED

Explanation: An installation supplied field procedure could not be loaded during encoding for LOAD or decoding for REORG. See SQLCODE -682 for more detail.

Severity: 8 (error)

System Action: The utility will terminate with a return code of 8.

User Response: Take the job output to the system programmer.

System Programmer Response: Determine why the field procedure could not be loaded.

DSNU273I *csect-name - REORG WITH SHRLEVEL*
REFERENCE OR CHANGE CANNOT
APPLY TO TABLE SPACE *name* PART
n1:n2

Explanation: REORG with SHRLEVEL REFERENCE or CHANGE cannot be used on table space partitions with REORG PENDING restrictive state.

Severity: 8 (error)

System Action: The REORG utility job is terminated.

User Response: Execute REORG with SHRLEVEL NONE against the partitions in REORG PENDING state to rebalance the partitions and remove the REORG PENDING state.

DSNU280I *csect-name* - ERROR=X'reason-code'
FROM EDIT ROUTINE *procedure-name*
FOR *table-name*

Explanation: The edit routine provided by your installation has returned an error during the load of a record into the table indicated. The reason code is set by the edit routine.

Severity: 8 (error)

System Action: The LOAD or REORG utility will receive ABEND04E RC00E40323.

User Response: Correct any errors in the input data. Ensure that the edit routine provided is correct. The utility can be restarted or terminated.

System Programmer Response: Verify that the edit routine is correct.

DSNU281I *csect-name* RECORD (*n*) OF TABLE
table-name VIOLATING VALID ROUTINE
validproc-name, ERROR
CODE=X'reason-code'

Explanation: The validation exit routine provided by your installation blocked the load of record 'n' into TABLE 'table-name'. The reason-code was set by the exit routine.

Severity: 4 (warning)

System Action: The LOAD utility continues to process the following input record.

User Response: Check the error input records against the error reason code returned from the validation procedure. Refer to *DB2 Utility Guide and Reference* for a definition of LOAD input field column specifications.

System Programmer Response: Verify that the validation routine is correct.

DSNU282I *csect-name* UNABLE TO RESTART AT
LAST CHECKPOINT WITH DDNAME
'ddddddd'

Explanation: The data set with DDNAME 'ddddddd' is a concatenated data set and the utility can be restarted only at the beginning of the phase (RESTART PHASE), not at the last checkpoint (RESTART CURRENT).

Severity: 8

System Action: The utility will issue a system '04E'

abend with a reason code of '00E40323'.

User Response: Change the RESTART option to RESTART PHASE and resubmit the job step.

Collect the following diagnostic items listed in Appendix B, "Problem determination," on page 1353: 1, 2, 5.

DSNU283I *csect-name* TRIGGER ERROR:
SQLCODE = *sqlcode*, SQLERRM =
sqlerrm, SQLSTATE = *sqlstate*,
SQLERRP = *sqlerrp*, SQLERRD =
sqlerrd1 sqlerrd2 sqlerrd3 sqlerrd4
sqlerrd5 sqlerrd6

Explanation: This message contains multiple components. SQLCODE is the SQL return code. If the SQL return code is negative, this indicates that an error has occurred. For more information about this SQL return code, see Part 2, "SQL return codes," on page 11. SQLERRP is the name of the procedure that detected an error. The SQL diagnostic information can be found in the SQLERRD1, SQLERRD2, SQLERRD3, SQLERRD4, SQLERRD5, and SQLERRD6 fields.

Severity: 8 (Error)

System Action: Processing terminates.

User Response: Determine the cause for the SQL error by using information about the specific SQLCODE. Correct the error, and rerun the utility.

DSNU284I *csect-name* - LOAD UTILITY NOT
ALLOWED AGAINST A
SYSTEM-MAINTAINED MATERIALIZED
QUERY TABLE *table-name*

Explanation: An attempt has been made to run the LOAD utility against a system-maintained materialized query table. This is not allowed.

Severity: 8

System Action: Utility processing terminates.

User Response: If the table name was incorrect, correct the table name and resubmit the utility job step. Otherwise, take one of the following actions:

- Use the REFRESH TABLE SQL statement to insert data into the system-maintained materialized query table.
- Use the ALTER statement to change the materialized query table to a user-maintained materialized query table or a base table, and resubmit the utility job step.

DSNU286I *csect-name* REORG TABLESPACE
dbname.tsname OFFPOSLIMIT
SYSINDEXPART ROWS

Explanation: This is the header message for the SYSINDEXPART section of the REORG TABLESPACE

DSNU287I • DSNU289I

OFFPOSLIMIT output. This section lists the SYSINDEXPART rows for the table space or table space partition as specified in the REORG TABLESPACE input statement. The fields from SYSINDEXPART are:

CREATOR

Index creator name

IXNAME

Index name

CREATOR

Table creator name

TBNAME

Table name

PART Partition number

CARDF

Number of rows referenced (floating point)

FAROFFPOSF

Number of rows referenced afar (floating point)

NEAROFFPOSF

Number of rows referenced nearby (floating point)

STATTIME

TIMESTAMP of RUNSTATS update

Rows which meet the OFFPOSLIMIT criteria are prefaced with '*'.
Severity: 0 (informational)

System Action: Processing continues normally

User Response: If the TIMESTAMP reported in the STATTIME column is not recent, the OFFPOSLIMIT criteria might be evaluated with obsolete statistics.

DSNU287I *csect-name* **REORG TABLESPACE**
dbname.tsname **INDREFLIMIT**
SYSTABLEPART ROWS

Explanation: This is the header message for the SYSTABLEPART section of the REORG TABLESPACE INDREFLIMIT output. This section lists the SYSTABLEPART rows for the table space or table space partition as specified in the REORG TABLESPACE input statement. The fields from SYSTABLEPART are:

DBNAME

Database name

TSNAME

Table space name

PART Partition number

CARD Number of rows in table space

FARINDREF

Number of rows relocated afar

NEARINDREF

Number of rows relocated nearby

STATTIME

TIMESTAMP of RUNSTATS update

Rows which meet the INDREFLIMIT criteria are prefaced with '*'.
Severity: 0 (informational)

System Action: Processing continues normally

User Response: If the TIMESTAMP reported in the STATTIME column is not recent, the INDREFLIMIT criteria might be evaluated with obsolete statistics.

DSNU288I *csect-name* **REORG INDEX**
dbname.ixname **LEAFDISTLIMIT**
SYSINDEXPART ROWS

Explanation: This is the header message for the SYSINDEXPART section of the REORG INDEX LEAFDISTLIMIT output. This section lists the SYSINDEXPART rows for the index or index partition as specified in the REORG INDEX input statement. The fields from SYSINDEXPART are:

CREATOR

Index creator name

IXNAME

Index name

PART Partition number

LEAFDIST

Number of pages between leaf pages multiplied by 100

STATTIME

TIMESTAMP of RUNSTATS update

Rows which meet the LEAFDISTLIMIT criteria are prefaced with '*'.
Severity: 0 (informational)

System Action: Processing continues normally

User Response: If the TIMESTAMP reported in the STATTIME column is not recent, the LEAFDISTLIMIT criteria might be evaluated with obsolete statistics.

DSNU289I *csect-name type* **REORG LIMITS HAVE BEEN MET**

Explanation: The REORG utility is indicating whether any specified limits have been met. For REORG TABLESPACE, this might be the OFFPOSLIMIT or the INDREFLIMIT. For REORG INDEX, this is the LEAFDISTLIMIT. *type* values:

NO If no limits are met.

blank If at least one limit is met.

Severity: The return codes are:

1 (informational)

If no limit is met.

2 (informational)

If at least one limit is met.

System Action: Utility processing continues.

User Response: If the REPORTONLY option is specified and the result of this job step is not used to conditionally execute other job steps, examine the utility messages for this table space, partition, or index to determine if a REORG should be performed.

DSNU290I *csect-name type* **REORG WILL BE PERFORMED**

Explanation: The REORG utility is indicating whether any specified limits have been met and whether a REORG will be performed. For REORG TABLESPACE, this might be the OFFPOSLIMIT or the INDREFLIMIT. For REORG INDEX, this is the LEAFDISTLIMIT. *type* values:

NO If no limits are met.

blank If at least one limit is met.

Severity: 0 (informational)

System Action: Utility processing continues. A REORG is performed if any limits are met.

DSNU291I **MAXIMUM COMPOSITE UNLOAD RECORD SIZE TOO LARGE FOR SORT. SORTDATA KEYWORD IS IGNORED.**

Explanation: The SORTDATA keyword was specified for a REORG utility job. However, the largest possible record in the table space, prefixed by the largest key, produces a composite record that is too large to be processed by the SORT component. The SORTDATA keyword is ignored.

This message is issued by the following CSECT:
DSNURFIT

Severity: 0

System Action: Processing continues normally.

User Response: If you must use SORTDATA for the table space, try reducing the size of either the largest record or key field by redefining the table. In some cases, changing a field from LONG VARCHAR to VARCHAR with a specified maximum length might help.

Problem Determination: This problem should only occur on a table space with a 32KB page size. Analyze the requirement for maximum data length in VARCHAR and LONG VARCHAR columns to see if a shorter length can be specified. It might be necessary to remove the SORTDATA keyword from the utility statement.

DSNU292I *csect-name* - **-ALTER UTILITY CANNOT APPLY TO THIS UTILITY, REASON=c**

Explanation: The -ALTER UTILITY command only applies to a job that is executing REORG with SHRLEVEL REFERENCE or CHANGE. In addition, if -ALTER UTILITY specifies MAXRO, LONGLOG, or DELAY, the job must be executing REORG with SHRLEVEL CHANGE.

1 The job is not executing REORG with SHRLEVEL REFERENCE or CHANGE.

2 -ALTER UTILITY specifies MAXRO, LONGLOG, or DELAY, but the job is executing REORG with SHRLEVEL REFERENCE.

Severity: 8 (error)

System Action: -ALTER UTILITY does not execute.

User Response: Apply -ALTER UTILITY to a job that is executing the proper utility.

DSNU293I *csect-name* - **REORG WITH SHRLEVEL REFERENCE OR CHANGE CANNOT APPLY TO THE *name* TABLE SPACE**

Explanation: REORG with SHRLEVEL REFERENCE or CHANGE cannot operate on the following catalog and directory table spaces: DSNDB06.SYSDBASE, DSNDB06.SYSDBAUT, DSNDB06.SYSGROUP, DSNDB06.SYSPLAN, DSNDB06.SYSVIEWS, and DSNDB01.DBD01.

Severity: 8 (error)

System Action: REORG does not execute.

User Response: Execute REORG with SHRLEVEL NONE.

DSNU294I *csect-name* - **LARGEST COMPOSITE RECORD IS TOO BIG FOR REORG WITH SHRLEVEL CHANGE**

Explanation: SHRLEVEL CHANGE was specified for a REORG utility job, and the table has a clustering index. However, the largest possible record in the table space, prefixed by the largest key, produces a composite record that is too large to be processed by the SORT component. See the computation of the length under REORG in the *DB2 Utility Guide and Reference*. If the largest possible composite record to be sorted exceeds 32760 bytes in length, which is the maximum record size for a BSAM data set, REORG cannot operate if SHRLEVEL CHANGE is specified.

Severity: 8 (error)

System Action: REORG does not execute.

User Response: Execute REORG with SHRLEVEL NONE or REFERENCE. If you must use SHRLEVEL CHANGE for the table space, try reducing the size of either the largest record or key field by redefining the

table. In some cases, changing a field from LONG VARCHAR to VARCHAR with a specified maximum length might help.

Problem Determination: This problem should only occur on a table space with a 32KB page size. Analyze the requirement for maximum data length in VARCHAR and LONG VARCHAR columns to see whether a shorter length can be specified.

DSNU295I *csect-name* - IN UTILTERM PHASE OF REORG WITH SHRLEVEL REFERENCE OR CHANGE, DATA SET *name* COULD NOT BE DELETED, DFP REASON CODE = *rrrrrrrr*

Explanation: For the area (table space or partition) being reorganized, REORG with SHRLEVEL REFERENCE or CHANGE unloads data from the original data sets and reloads data into shadow data sets. REORG then exchanges the names of the original and shadow data sets. The original name of a data set is in the form "*catname.DSNDBx.dbname.pname.I0001.Annn*". The shadow name of a data set is in the form "*catname.DSNDBx.dbname.pname.J0001.Annn*". REORG uses such data sets for indexes as well as data.

If a data set is DB2-managed, the utilterm phase of REORG deletes the shadow data set, which was the original data set. This message indicates that the shadow data set *name* could not be deleted. *rrrrrrrr* indicates the DFP reason code.

Severity: 4 (warning)

System Action: REORG continues execution, but it does not delete the specified data set.

User Response: Try to delete the data set. If you cannot delete it, notify the system programmer.

System Programmer Response: Look up the DFP reason code, and try to determine why the data set could not be deleted.

DSNU296I *csect-name* - IN REORG WITH SHRLEVEL REFERENCE OR CHANGE, DATA SET *name* DOES NOT EXIST, CONTEXT=*c*

Explanation: For the area (table space or partition) being reorganized, REORG with SHRLEVEL REFERENCE or CHANGE unloads data from the original data sets and reloads data into shadow data sets. REORG then exchanges the names of the original and shadow data sets, using temporary names during the renaming. The original name of a data set is in the form "*catname.DSNDBx.dbname.pname.I0001.Annn*". The shadow name of a data set is in the form "*catname.DSNDBx.dbname.pname. J 0001.Annn*". The temporary name of a data set is in the form "*catname.DSNDBx.dbname.pname.T0001.Annn*".

REORG uses such data sets for indexes as well as data.

During its initialization, REORG cannot execute if:

- Data sets with the temporary names already exist
- DB2-managed data sets with the shadow names already exist
- User-managed data sets with the shadow names do not already exist

To exchange the names of the original and shadow data sets, REORG renames in the following ways:

- 1 In the switch phase, it renames the original data set from the original name to the temporary name.
- 2 In the switch phase, it renames the shadow data set from the shadow name to the original name.
- 3 In the utilterm phase, it renames the original data set from the temporary name to the shadow name (for user-managed data sets). It deletes the temporary name for DB2-managed data sets.

If either a -TERM UTILITY command is issued, or the REORG switch phase is restarted after REORG has begun renaming data sets, the names revert back to their original form prior to the utilterm phase of REORG:

The context code indicates the specific type of error:

- 1 During the switch phase of REORG, on rename 1, REORG detected that a data set with an original name does not exist. This error condition can arise for a DB2-managed or user-managed data set.

During the switch phase restart or a -TERM UTILITY during the switch phase, on rename 4, REORG detected that a data set with an original name does not exist. This error condition can arise for a DB2-managed or user-managed data set.
- 2 During the switch phase of REORG, on rename 2, REORG detected that a data set with a shadow name does not exist. This error condition can arise for a DB2-managed or user-managed data set.

During the switch phase restart or a -TERM UTILITY during the switch phase, on rename 5, REORG detected that a data set with a shadow name does not exist. This error condition can arise for a DB2-managed or user-managed data set.
- 3 During the utilterm phase of REORG, on

rename 3, REORG detected that a data set with a temporary name does not exist. This error condition can arise for a user-managed data set.

- 7 During initialization of REORG, REORG detected that the shadow data set did not exist. This error can only occur with a table space, index, or partition that is stored in user-managed data sets.

Severity: 4 (warning) or 8 (error)

System Action: For context codes 1 or 2, utility processing is abended. ABEND reason code 00E4031B is issued. The object is left in a recovery pending state.

For context code 3, the utility job step that caused the function to be requested continues with no renaming. The utility job is placed in the stopped state. The object is left in a recovery pending state, and a message will be issued.

For context code 7, REORG does not execute.

For context codes 1, 2, or 3, the following messages are issued:

- If the data set is part of a nonpartitioned table space, the object is the table space, and the message is DSNU562I.
- If the data set is part of a partition of a table space, the object is the partition, and the message is DSNU560I.
- If the data set is part of a nonpartitioned index, the object is the index, and the message is DSNU557I.
- If the data set is part of a partition of a partitioned index, the object is the partition of the index, and the message is DSNU559I.

User Response: For context codes 1 or 2, execute the RECOVER TABLESPACE or RECOVER or REBUILD utilities.

For context code 3, do nothing.

For context code 7, define all shadow objects prior to running REORG.

DSNU297I *csect-name* **COMPOSITE RECORD SIZE TOO LARGE FOR** *table-name*

Explanation: The size of the record that would be unloaded for REORG DISCARD or REORG UNLOAD EXTERNAL is greater than the largest allowed data set logical record length (32760 bytes).

Severity: 8 (error)

System Action: The utility will terminate with a return code of 8.

User Response: If you are attempting to discard records during REORG, you will have to use SQL to DELETE the records prior to the REORG. If you are attempting to unload records in an external format, you

must use an application instead. If you are using the SORTDATA option with REORG UNLOAD EXTERNAL or REORG DISCARD, try removing the SORTDATA keyword.

Problem Determination: This problem will most likely occur only on a table with BLOB, CLOB, or DBCLOB columns.

DSNU298I *csect-name* - **RESTART NOT ALLOWED IN** *phase-name* **PHASE OF REORG UTILITY WITH SHRLEVEL CHANGE**

Explanation: An attempt was made to restart the REORG utility with SHRLEVEL CHANGE in the *phase-name* phase. DB2 does not allow you to restart the REORG utility with SHRLEVEL CHANGE in that phase.

Severity: 8 (error)

System Action: Utility processing abends. Abend reason code 00E40018 or 00E40310 might be issued.

User Response: Issue the -TERM UTILITY command to terminate the utility job; then rerun the job without the RESTART parameter.

System Programmer Response: If necessary, take actions to prevent access to the table space or partition before terminating the utility.

DSNU299I *csect-name* **CHARACTER CONVERSION FROM CCSID** *from-ccsid* **TO CCSID** *to-ccsid* **FAILED WITH ERROR CODE** **'error-code'** **FOR** *object-type* *object-name-qualifier*.*object-name* *column* *column-name*.

Explanation: A conversion error occurred during the conversion of a string to a different coded character set. The error occurred during the processing of the utility statement.

The *from-ccsid* identifies the coded character set of the string to be converted.

The *to-ccsid* identifies the coded character set to which it must be converted.

The *error-code* indicates the type of error as defined as follows:

- 8 - Length exception (for example, expansion required for PC MIXED data exceeds the maximum length of the string).
- 12 - Invalid code point.
- 16 - Form exception (for example, invalid MIXED data).
- 20 - Translate procedure error (for example, an error during Unicode/390 stage 2 conversions or an exit set the length control field of the string to an invalid value).

DSNU300I • DSNU303I

- 24 - the conversion services have not been setup correctly or the conversion is not supported.

The *object_type* gives the type of the failed object. It could be a USERID or a SQLID or a TABLE with the conversion error. This could be either the target or the source of the conversion.

The *object-name-qualifier.object-name* is applicable for object type TABLE only. If the failed object type is TABLE, then the object qualifier name will be the table creator id and the object name will be the table name.

The *column* is applicable only if the failed object is TABLE. 'COLUMN' will be given immediately before the column-name is given.

The *column-name* gives the column name of the failing object. This could be either the target or the source of the conversion.

Severity: 8 (error)

System Action: The utility job is terminated.

User Response: Refer to *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem. The user may generate a dump by adding the DIAGNOSE ABEND statement in the utility job and re-running the utility. If the error can be fixed, correct the error and resubmit the utility, else issue the TERM utility command to terminate the utility.

DSNU300I *csect-name* (RE)LOAD PHASE
COMPLETE, ELAPSED TIME =
hh/mm/ss

Explanation: The reload phase of the REORG or LOAD utility has completed normally. The elapsed time for the execution was 'hh' hours, 'mm' minutes, and 'ss' seconds.

DSNU301I *csect-name* - KEYWORD 'SORTDATA'
SPECIFIED AND/OR KEYWORD
'NOSYSREC' WAS SPECIFIED BUT NO
CLUSTERINGINDEX EXISTS,
KEYWORD IS IGNORED

Explanation: The 'SORTDATA' keyword was specified or the 'NOSYSREC' keyword was specified for a REORG utility job, or implied by the use of SHRLEVEL CHANGE. But it was found that no clustering index existed for the table space being reorganized. The keyword is ignored and processing continues normally.

Severity: 0

System Action: Processing continues normally.

User Response: If a clustering index was expected to be found for the table space being reorganized, determine the reason the index could not be found.

Problem Determination: Probably a user error.

Determine if a cluster index should be defined on one of the tables in the table space being reorganized. If so, define the cluster index; otherwise, remove the 'SORTDATA' and/or 'NOSYSREC' keyword from the utility statement if necessary.

DSNU302I *csect-name* (RE)LOAD PHASE
STATISTICS - NUMBER OF INPUT
RECORDS PROCESSED = *nnnnnnnn*

Explanation: This message is issued at the normal completion of the RELOAD phase of the REORG utility and the LOAD phase of the LOAD utility.

It indicates the number of records processed from the input record data set (that is, the data set identified either by the JCL DD statement identified in the UNLDDN option for REORG or the INDDN option for LOAD).

Severity: 0 (informational)

System Action: The LOAD or REORG utility completes the phase in which the records are (re-)introduced into the DB2 database. This is also the last phase of the utility unless there are some indexes that need to be built and/or updated.

User Response: The user can verify that the number of records (re-)loaded is consistent with expectations. For example, in REORG it matches the total number of records unloaded. For LOAD, it matches the number of records submitted minus the number of records reported rejected.

DSNU303I *csect-name* (RE)LOAD PHASE
STATISTICS - NUMBER OF RECORDS=
nnnnnn FOR TABLE *table-name*
PART=*part-number*

Explanation: This message is issued at the normal completion of the RELOAD phase of the REORG utility and the LOAD phase of the LOAD utility.

It indicates the number of records loaded into PART 'part-number' of 'table-name' from the source record data set. This data set is identified by the JCL DD statement in the UNLDDN option for REORG, or the INDDN option for LOAD.

This message is repeated for each INTO TABLE PART clause in the LOAD utility statement or each TABLESPACE PART clause in the REORG utility statement.

Severity: 0 (informational)

System Action: The LOAD or RELOAD phase maintains a separate count for each table part. Rejected rows are not included in the count. Each count is reported as a separate message at the end of the LOAD or RELOAD phase.

The user can verify the number of records loaded or reloaded into the table part. In REORG, it should match

the number of records unloaded for that table part. In LOAD, it should match the number of records processed.

DSNU304I *csect-name* (RE)LOAD PHASE
STATISTICS - NUMBER OF RECORDS
= *nnnnn* FOR TABLE *table-name*

Explanation: This message is issued at the normal completion of the RELOAD phase of the REORG utility and the LOAD phase of the LOAD utility.

It indicates the number of records loaded into TABLE 'table-name' from the source record data set (that is, the data set identified by the JCL DD statement identified in the UNLDDN option for REORG, or the INDDN option for LOAD).

This message is repeated for each TABLE loaded by the current REORG or LOAD utility statement.

If the LOAD or REORG was restarted in a LOAD or RELOAD phase from the last commit point (i.e., the 'RESTART' parm was specified), 'nnnnn' indicates the number of records loaded after the restart.

Severity: 0 (informational)

System Action: The LOAD or RELOAD phase maintains a separate count for each table populated by this phase. Rejected rows are not included in the count. Each count is reported as a separate message at the end of the LOAD or RELOAD phase.

The user can verify that the number of records (re-)loaded into the table is consistent with expectations. For example, in REORG it matches the number of records unloaded for that table. For LOAD, it matches the number of records processed.

DSNU305I *csect-name* - TABLE=*table-name* HAS
AN INCOMPLETE TABLE DEFINITION

Explanation: Table 'table-name' does not have an index defined to enforce the uniqueness of its primary key or unique key.

Severity: 8 (error)

System Action: Processing stops. No table in the table space is loaded.

User Response: The user can resubmit the LOAD job after performing one of the following:

- Creating a unique index over the table's primary key
- Creating a unique index over the table's unique key(s)
- Dropping the definition of the table's primary key
- Dropping the definition of the table's unique key(s)

Problem Determination: Issue SQL SELECT against the catalog to determine which indexes and relations exist against 'table-name'. Determine whether uniqueness of the primary key or unique key has been

guaranteed through omission or through faulty definition of an index.

DSNU306I *csect-name* - UNABLE TO DRAIN
WRITERS FROM *object-type object-name*

Explanation: The utility was unable to drain the writers from an object because the resource was unavailable. The object is identified by type and name. Message DSNT500I tells why the resource was unavailable. If the QUIESCE utility issues this message, DSNT500I is not issued, but message DSNT501I might be issued.

Severity: 8 (error)

System Action: Utility processing terminates.

Problem Determination: Refer to message DSNT500I or DSNT501I.

DSNU307I *csect-name* PARENT TABLE
parent-table-name OF *table-name* IN
RELATIONSHIP *relationship-name* HAS
AN INCOMPLETE TABLE DEFINITION

Explanation: The 'table-name' identifies the target table of the job for the LOAD utility or the dependent table to be checked by the CHECK DATA utility. The 'parent-table-name' identifies the parent table of the target table for the LOAD utility or the dependent table for the CHECK DATA utility in RELATIONSHIP 'relationship-name'. The primary index of PARENT TABLE 'parent-table-name' has been dropped.

This message is repeated for each incompletely defined parent table in each relationship where the target table is a child.

Severity: 8 (error)

System Action: The LOAD and CHECK DATA utilities stop further processing. No data is loaded by the LOAD utility and no relationships are checked by the CHECK DATA utility.

User Response: Check the existence of the primary index and its parent tables identified by RELATIONSHIP 'relationship-name'.

Problem Determination: If the incompletely defined tables were targets of the LOAD job, message DSNU305I has been issued for each such table. Refer to the catalog to determine if any tables in the table space that were not targets of the LOAD job are incompletely defined.

DSNU308I *csect-name* INDEX KEY LIST RECORD
LENGTH EXCEEDS MAXIMUM KEY
BUFFER SIZE

Explanation: The length of the index key list that will be built in the Data Base Services address space while loading a data record may be larger than the maximum

key buffer size. The LOAD statement may be too complex.

Severity: 8 (error)

System Action: Utility processing is terminated.

User Response: Examine the preceding DSNU650I INTO TABLE statements. The key size and number of indexes affected by each INTO TABLE statement are accumulative. The combination of these elements may produce a list of index keys, including header bytes, that is too large to be contained within the maximum size buffer area during the load of each input data record. It may be necessary to reduce the number of INTO TABLE statements or to drop some of the indexes that are affected by the load.

DSNU309I *csect-name* **NOT ALL REQUIRED UNIQUE INDEXES HAVE BEEN DEFINED FOR TABLE** *table-name*

Explanation: The table 'table-name' was created with unique index requirements. Not all of these indexes have been defined.

Severity: 8

System Action: Processing stops. No table in the table space is loaded.

User Response: The user may resubmit the LOAD job after either:

- Creating all the required unique indexes, or
- Dropping the table and re-creating it without the unique index requirements.

Problem Determination: Determine which unique indexes need to be created. Determine if the uniqueness requirement for the table is valid.

DSNU310I *csect-name* **RECORD 'n' WILL BE DISCARDED DUE TO** *field-name* **CONVERSION ERROR FOR** *table-name*

Explanation: The load utility found the input data provided for a field to be incorrect. The corresponding input data set record 'n' will be placed in the DISCARDS data set.

If the NOSUBS keyword was specified, it is possible that the record was discarded because the input contained a code point that when translated from the source CCSID to the target CCSID resulted in a substitution character being placed in the target string.

Severity: 4 (warning)

System Action: The input data set record is noted and will be discarded in the DISCARD phase. The LOAD utility continues to process additional records in the input data set.

User Response: Following the completion of the current LOAD utility invocation, examine the record in

the DISCARDS data set. Correct the error in the discarded input data. Submit a RESUME(YES) LOAD invocation with the DISCARDS data set as the input data set. Refer to *DB2 Utility Guide and Reference* for a definition of LOAD input field column specifications.

DSNU311I *csect-name* **RECORD 'n' WILL BE DISCARDED DUE TO INVALID** *field-name* **COLUMN SPECIFICATION**

Explanation: The load utility calculated the location of an input data value using the field specifications supplied and VARCHAR length fields present within the input data set record. The calculated position for the field was determined to be incorrect.

Severity: 4 (warning)

System Action: The input data set record number is noted and will be discarded in the DISCARD phase. The LOAD utility continues to process additional records in the input data set.

User Response: Following the completion of the current LOAD utility invocation, examine the record in the DISCARDS data set. Correct the error in the discarded input data, if one exists. Otherwise, correct the input field specification. Submit a RESUME(YES) LOAD invocation, which uses the DISCARDS data set and the verified LOAD utility statement and field specifications. Refer to *DB2 Utility Guide and Reference* for a definition of LOAD input field column specifications.

DSNU312I *csect-name* **RECORD 'n' WILL BE DISCARDED DUE TO ERROR =** *X'reason-code'* **FROM EXIT ROUTINE** *procedure-name* **FOR** *table-name*

Explanation: The exit routine provided by your installation blocked the load of record 'n' into the table indicated. The reason-code was set by the exit routine.

Severity: 4 (warning)

System Action: The input data set record number is noted and will be discarded in the DISCARD phase. error is placed in the DISCARDS data set. The LOAD utility continues to process additional records in the input data set.

User Response: Following the completion of the current LOAD utility invocation, examine the record in the DISCARDS data set. Correct the error in the discarded input data, if one exists. Ensure that the exit routine provided is correct. Submit a RESUME(YES) LOAD invocation, which uses the DISCARDS data set and the verified LOAD utility statement and field specifications. Refer to *DB2 Utility Guide and Reference* for a definition of LOAD input field column specifications.

System Programmer Response: Verify that the validation routine is correct.

DSNU313I *csect-name* RECORD 'n' WILL BE DISCARDED DUE TO PART OR HIGH KEY VALUESPECIFICATION(S)

Explanation: The discarded record does not belong to any of the partitions being loaded. For a LARGE table space, this might be because the key is higher than the high key value specified for the last partition.

Severity: 4 (warning)

System Action: The input data set record number is noted and will be discarded in the DISCARD phase. The LOAD utility continues to process additional records in the input data set.

User Response: Following the completion of the current LOAD utility invocation, examine the record in the DISCARDS data set. Correct the error in the discarded input data, if one exists. Submit a RESUME(YES) LOAD invocation with the DISCARDS data set as the input data set. Refer to Part 2 of *DB2 Utility Guide and Reference* for a definition of LOAD input field column specifications.

System Programmer Response: Verify that the validation routine is correct.

DSNU314I *csect-name* RECORD 'n' WILL BE DISCARDED DUE TO WHEN SPECIFICATION(S)

Explanation: The discarded record satisfies none of the WHEN selection expressions provided.

Severity: 4 (warning)

System Action: The input data set record is noted and will be discarded in the DISCARD phase. The LOAD utility continues to process additional records in the input data set.

User Response: Following the completion of the current LOAD utility invocation, examine the record in the DISCARDS data set. Correct the error in the discarded input data, if one exists. Submit a RESUME(YES) LOAD invocation with the DISCARDS data set as the input data set. Refer to *DB2 Utility Guide and Reference* for a definition of LOAD input field column specifications. If FORMAT UNLOAD was specified on the load statement, the WHEN specifications are built internally. This ensures that the rows are loaded back into the same object from which they were unloaded. Refer to *DB2 Utility Guide and Reference* for a description of the FORMAT UNLOAD option of LOAD.

DSNU315I *csect-name* RECORD 'n' WILL BE DISCARDED DUE TO UNEXPECTED ERROR

Explanation: The LOAD of input data set record number 'n' was attempted but was not successful due to an unexpected error.

Severity: 8 (error)

System Action: If the error was caused because a resource was not available, a DSNT500I message will be issued.

The utility step will be abended with a system X'04E' and an abend reason code of '00E40318'. If a DSNT500I message is not issued, an SVC dump will be requested. A SYSABEND dump of batch storage is also requested.

User Response: If a DSNT500I message was issued, refer to the description under that message number. If the unavailable resource becomes available, the utility step is restartable.

If there is no DSNT500I message, the error is an unexpected internal error and you should consult your system programmer.

Operator Response: An operator with SYSOPR authority can issue a TERM UTIL to free any held resources if that is necessary.

System Programmer Response: Refer to *DB2 Command Reference* for information about the TERM UTIL command. If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU316I *csect-name* - UNABLE TO DRAIN WRITERS FROM *object-type object-name* PART *part-num*

Explanation: The utility was unable to drain the class of writers from a partition of an object because the resource was unavailable. The partition is identified by object type (object-type), object name (object-name), and partition number (part-num). Message DSNT500I tells why the resource was unavailable.

Severity: 8 (error)

System Action: Utility processing terminates.

Problem Determination: Refer to message DSNT500I.

DSNU317I *csect-name* DISCARD LIMIT HAS BEEN REACHED

Explanation: The DISCARDS limit specified on the LOAD utility statement was reached.

Severity: 8 (error)

System Action: Processing abends to allow users to increase the discard limit and restart the utility.

User Response: Increase the discard limit and restart the utility. Otherwise -TERM the utility. Review the file of input records provided to LOAD and review table definitions to determine why the number of records discarded exceeds expectations.

Problem Determination: See user response.

DSNU318I *csect-name* **RECORD 'n' WILL BE DISCARDED DUE TO INVALID *field-name* COLUMN SPECIFICATION FOR *table-name***

Explanation: The load utility calculated the location of an input data value using the field specifications supplied and VARCHAR length fields present within the input data set record 'n'. The calculated position for the field was determined to be incorrect.

Severity: 4 (warning)

System Action: The input data set record number is noted and will be discarded in the DISCARD phase. The LOAD utility continues to process additional records in the input data set.

User Response: Following the completion of the current LOAD utility invocation, examine the record in the DISCARDS data set. Correct the error in the discarded input data, if one exists. Otherwise, correct the input field specification. Submit a RESUME(YES) LOAD invocation, which uses the DISCARDS data set and the verified LOAD utility statement and field specifications. Refer to *DB2 Utility Guide and Reference* for a definition of LOAD input field column specifications.

DSNU319I *csect-name* **RESUME(YES) WAS SPECIFIED FOR EMPTY PARTITION *nn*. RESUME(NO) IS ASSUMED**

Explanation: This message is issued in response to a LOAD utility request containing a partition level RESUME(YES) option. The RESUME(YES) option implies that the specified partition 'nn' is populated, but in this case it was not. The message alerts the invoker to this fact, and continues as if RESUME(YES) was not specified.

Severity: 4 (warning)

System Action: The LOAD utility, in attempting to honor the RESUME(YES), found the partition was empty, ignored the option, and continued as if RESUME(NO) was specified.

User Response: The user is alerted to the fact that the requested partition was empty rather than populated as the RESUME LOAD option implied.

DSNU320I *csect-name* **RESUME(YES) WAS SPECIFIED FOR AN EMPTY TABLESPACE**

Explanation: RESUME(YES) was specified within the LOAD utility statement. However, the RESUME(YES) option implies that the specified table space is populated.

Severity: 4 (warning)

System Action: Processing continues. The LOAD utility, in attempting to honor the RESUME(YES), found

the table space empty, so ignored the option, and proceeded as if RESUME(NO) was specified. If this table is currently defined as COMPRESS YES, a dictionary is not built.

User Response: The user is alerted to the fact that the requested table space was empty rather than populated as the RESUME LOAD option implied. Use the RESUME(NO) option if you want a compression dictionary built.

DSNU321I *csect-name* **CHECK PENDING ON TABLESPACE *tablespace-name* PROHIBITS PROCESSING**

Explanation: The requested utility cannot be run against a tablespace or tablespace partition in a check pending state.

Severity: 8 (error)

System Action: Processing terminates after the check pending states of all target tablespaces or partitions of the utility are analyzed.

User Response: Remove the named tablespace or partition from its check pending state by using the CHECK DATA or REPAIR utility. If you want more information on the extent of questionable data in the table space, query the SYSTABLES and SYSTABLEPART catalog tables.

DSNU322I *csect-name* **DEFERRED STATUS OF TABLE SPACE *database-name.table-space-name* PROHIBITS PROCESSING**

Explanation: The requested utility cannot be run against a table space or table space partition in a deferred state.

Severity: 8 (error)

System Action: Processing terminates after the deferred state of all target table spaces or table space partitions of the utility are analyzed.

User Response: To remove the deferred state, use the RECOVER TABLESPACE, LOAD REPLACE utility, or -START DATABASE command with ACCESS(RW) or ACCESS(RO). If you want more information on the status of the table space, use the -DISPLAY DATABASE command.

DSNU323I *csect-name* **COLUMN *ccc* IS OMITTED**

Explanation: The column 'ccc' is a nonnullable column and is not being loaded. Field specifications must include all nonnullable columns. The identified column name was missing from the field specification.

Severity: 8 (error)

System Action: Further utility processing is terminated.

User Response: Determine if the input data contains the nonnullable column as a field. If it does, change the field specification to include it. If the input data does not contain the nonnullable column as a field, determine which is in error, the input data or the column specification. Make the corresponding correction. Resubmit the job if that is still appropriate.

System Programmer Response: Corrective procedures may require that a table be dropped and created again. Refer to Part 2 (Volume 1) of *DB2 Administration Guide* for a discussion of how this can be accomplished. Refer to *DB2 Utility Guide and Reference* for a discussion of field specification constraints with regard to nonnullable columns.

DSNU324I *csect-name* **DEFERRED STATUS OF INDEX SPACE** *creator-name.index-name* **PROHIBITS PROCESSING**

Explanation: The requested utility cannot be run against an index space or index space partition in a deferred state.

Severity: 8 (error)

System Action: Processing terminates after the deferred state of all target index spaces or index partitions of the utility are analyzed.

User Response: The deferred state can be removed through recovery or rebuild of the index space or the physical index partition. It can also be removed by the -START DATABASE command with ACCESS(RW) or ACCESS(RO). The RECOVER or REBUILD INDEX utility can be run at either the index space or index partition level. If more information on the status of the index space is required, use the -DISPLAY DATABASE command.

DSNU325I *csect-name* **- AN INVALID SQL/DS FORMAT RECORD WAS ENCOUNTERED**

Explanation: The LOAD utility detected an invalid SQL/DS format record type.

Severity: 8 (error)

System Action: Utility execution is terminated.

User Response: Correct the input data and resubmit the job. Data that has been transmitted from an SQL/DS unload disk data set in a VM/370 system may have extra block descriptors and record descriptors at the beginning of each record. Ensure that this situation does not exist.

Problem Determination: Refer to Part 2 (Volume 1) of *DB2 Administration Guide* for additional information regarding loading data from SQL/DS and resubmitting a partially completed load step.

DSNU326I *csect-name* **- USER NOT AUTHORIZED FOR LOAD REPLACE ON TABLESPACE**

Explanation: The user attempted to use the REPLACE option of LOAD, and it will reset to empty all tables in the table space before loading data. This option requires load authorization on each table in the table space, but the user did not have authority for one or more tables. In addition, if a table in the table space has a security label column, the user must have the write-down privilege when write-down is in effect.

Severity: 12 (severe error)

System Action: When LOAD REPLACE validation encounters the first nonauthorized table in the table space, the job step is terminated.

User Response: Obtaining the LOAD on DATABASE privilege for the database will allow you to rev="tech" proceed using the REPLACE option. If a table in the table space has a security label column, ensure that the user has write-down privilege when write-down is in effect before using the REPLAC Eoption. The other alternative is to first delete all rows from the tables which are to be loaded, and then use the RESUME option instead of the REPLACE option.

DSNU327I *csect-name* **TABLE b IS NOT IN SAME TABLESPACE AS TABLE a**

Explanation: All tables that are the subject of a single LOAD utility statement must belong to the same table space.

Severity: 8 (error)

System Action: Further utility processing is terminated.

User Response: Remove the INTO TABLE control statement that specifies TABLE 'b' from the current LOAD request. If the data is to be loaded into TABLE 'b', create another LOAD utility statement that contains the INTO TABLE control statement for TABLE 'b' and resubmit the job.

DSNU328I *csect-name* **CANNOT PROCESS THE NON-EMPTY PARTITION nn WITH RESUME(NO). PROCESSING TERMINATES**

Explanation: The partition level RESUME keyword either specified or defaulted to a value of NO, which requires the partition to be empty. However, the LOAD command named partition 'nn', which was not empty.

Severity: 8 (error)

System Action: Further utility processing is terminated.

User Response: Determine why the assumption of an empty partition was wrong. This may require

DSNU329I • DSNU333I

consultation with the system programmer. Either remove the current partition's rows using an SQL DELETE, or change the LOAD option to RESUME YES. Resubmit the job. Refer to *DB2 Utility Guide and Reference* for a description of the partition-level RESUME option of LOAD.

System Programmer Response: Determine whether the partition should be empty. If it should, use SQL DELETE to empty it. Otherwise, instruct the user to use the RESUME(YES) option for that partition.

DSNU329I *csect-name* - FIELD *field-name* IS NOT DEFAULTABLE

Explanation: You specified a NULLIF or DEFAULTIF field specification option for:

- A column defined to be not nullable or not defaultable
- A field with no column counterpart.

Severity: 8 (error)

System Action: The utility abends to allow restart.

User Response: Determine whether the field specification refers to the correct column. If it does, remove the NULLIF option from the field specification, and restart the job. Alternatively, TERM the utility. Refer to *DB2 Utility Guide and Reference* for LOAD NULLIF option constraints.

DSNU330I *csect-name* TABLESPACE IS NOT EMPTY

Explanation: The RESUME keyword either specified or defaulted to a value of 'NO', which requires an empty table space. However, the LOAD command named a table space that was not empty.

Severity: 8 (error)

System Action: Further utility processing is terminated.

User Response: Determine why the assumption of an empty table space was wrong. This may require consultation with the system programmer. Either remove the current table(s) rows using an SQL DELETE, or change the LOAD option to RESUME YES. Resubmit the job. Refer to *DB2 Utility Guide and Reference* for a definition of the RESUME option of LOAD.

System Programmer Response: If the table space is used by more than one application, determine whether the table space should be empty. If it should be, use SQL DELETE to make it empty. Otherwise, instruct the user to use the RESUME(YES) option.

DSNU331I *csect-name* FIELD LISTS ARE NOT ALLOWED WITH FORMAT KEYWORD

Explanation: Field lists are not allowed with FORMAT UNLOAD or FORMAT SQL/DS keywords.

Severity: 8 (error)

System Action: Further utility processing is terminated.

User Response: Determine whether the field specifications or the FORMAT option is correct. Eliminate whichever is incorrect, and resubmit the job. Refer to *DB2 Utility Guide and Reference* for a definition of the LOAD FORMAT option constraints.

DSNU332I *csect-name* - INPUT VALUE X'hex-data' OUT OF RANGE FOR COLUMN 'column-name'

Explanation: The LOAD utility detected a numeric value outside of the range of permissible values for the column in the DB2 table. A loss of significant digits results if the LOAD process continues. The input data type is SMALL INTEGER, INTEGER, DECIMAL, or FLOAT and is displayed in hexadecimal.

Severity: 8 (error)

System Action: Further utility processing is terminated unless DISCARD processing is active.

User Response: Correct the input data and resubmit the job. Make sure that the 'field specification' on the LOAD statement is consistent with the table definition and the input data. This might mean changing:

- The table definition
- The LOAD statement
- The input data.

Refer to *DB2 Utility Guide and Reference* to determine input constraints. Refer to Part 2 (Volume 1) of *DB2 Administration Guide* for information on resubmitting a partially completed LOAD step.

DSNU333I *csect-name* - INPUT VALUE 'ebcdic-data' OUT OF RANGE FOR COLUMN 'column-name'

Explanation: The LOAD utility detected a numeric value outside the range of permissible values for the column in the DB2 table. A loss of significant digits results if the LOAD process continues. The input data type is INTEGER EXTERNAL, DECIMAL EXTERNAL, or FLOAT EXTERNAL.

Severity: 8 (error)

System Action: Further utility processing is terminated.

User Response: Correct the input data and resubmit the job. Make sure that the 'field specification' on the LOAD statement is consistent with the table definition and the input data. This might mean changing:

- The table definition
- The LOAD statement
- The input data.

Refer to *DB2 Utility Guide and Reference* to determine input constraints. Refer to Part 2 (Volume 1) of *DB2*

Administration Guide for information on resubmitting a partially completed LOAD step.

DSNU334I *csect-name* INPUT FIELD *fffffff* INVALID FOR *ttttttt*, ERROR CODE *cc*

Explanation: The LOAD utility found the input data provided for field *fffffff* in table *ttttttt* to be incorrect. The error code *cc*, if present, identifies the problem. Possible error codes are:

- 01 Input numeric value is out of the range for the table column.
- 02 Input numeric field contains invalid numeric data.
- 03 There was an error converting input numeric data to floating-point data.
- 04 Input packed decimal data is in error.
- 05 Input is too long for a date column.
- 06 Input is too short for a date column.
- 07 Input is too long for a time column.
- 08 Input is too short for a time column.
- 09 Input is too long for a time stamp column.
- 10 Input is too short for a time stamp column.
- 11 Input character field is too long for the table column.
- 12 Input variable character field is too long for the table column.
- 13 Input is out of range for the date/time column.
- 14 Input is invalid for the date/time column.
- 15 Input length is incorrect for numeric column.
- 16 Input contains a blank character.
- 17 Input is too long for a graphic column.
- 18 Input is invalid for a graphic column.
- 19 Input is too long for the table column after a required CCSID conversion.
- 20 Input contained an invalid code point for a required CCSID conversion.
- 21 Input does not conform to the rules for valid data for a required CCSID conversion.
- 22 Input causes an error during CCSID conversion. An example of this type of error would be an error in a user exit routine.
- 23 Input is invalid for a *rowid* column.
- 24 Input contained a code point that when translated from the source CCSID to the target CCSID resulted in a substitution character being placed in the target string. This condition

can occur when the NOSUBS keyword was specified and no discard data set was specified.

- 25 The range of values for an identity column is exhausted.
- 26 A null value has been supplied for a not null column.
- 27 Input is invalid for a security label column.

Severity: 8 (error)

System Action: Further utility processing is terminated.

User Response: Correct the input data and resubmit the job. Make sure that the 'field specification' on the LOAD statement is consistent with the table definition and the input data. This might mean changing:

- The table definition
- The LOAD statement
- The input data.

Refer to *DB2 Utility Guide and Reference* to determine input constraints. Refer to Part 2 (Volume 1) of *DB2 Administration Guide* for information on resubmitting a partially completed LOAD step.

DSNU335I *csect-name* INPUT FIELD '*fffffff*' NOT ENTIRELY WITHIN INPUT RECORD

Explanation: The LOAD utility found that the input field '*fffffff*' extends beyond the end of the input record.

If DISCARDS processing is active, the message severity is 4 (warning).

Severity: 4 (warning) or 8 (error)

System Action: For fixed length records, with no VARCHARs included, the length needed by the LOAD utility can be calculated before processing. In this case, when the LOAD utility determines that no records can be loaded because ALL of the INTO TABLE statements require input longer than the defined lengths, the LOAD job terminates on the first record without discarding any records. Further utility processing with mixed or non-fixed length records is terminated unless DISCARDS processing is active.

User Response: Correct the input data and resubmit the job. Make sure that the 'field specification' on the LOAD statement is consistent with the table definition and the input data. This might mean changing:

- The table definition
- The LOAD statement
- The input data.

Refer to *DB2 Utility Guide and Reference* to determine input constraints. Refer to Part 2 (Volume 1) of *DB2 Administration Guide* for information on resubmitting a partially completed LOAD step.

DSNU336I *csect-name* INVALID nullif
SPECIFICATION FOR INPUT FIELD
ffffff

Explanation: The LOAD utility found the 'nullif' field specification to be incorrect.

Severity: 8 (error)

System Action: Further utility processing is terminated.

User Response: Correct the 'nullif' specification and resubmit the job. Refer to *DB2 Utility Guide and Reference* for a description of 'nullif' field selection options and Part 2 (Volume 1) of *DB2 Administration Guide* for information on resubmitting a partially completed LOAD step.

DSNU337I *csect-name* RECORD(n),
CONCATENATED CONTINUEIF
RECORD IS TOO LARGE

Explanation: The CONTINUEIF option was specified during LOAD to concatenate multiple physical records into one logical record for loading. The resultant concatenated record is too large to be processed. The maximum length allowed is 32767 bytes.

Severity: 8

System Action: When discard processing is specified, the input data set logical record is noted and will be discarded in the DISCARD phase. The LOAD utility continues to process additional records in the input data set, and the severity level is 4. When discard process is not specified, the severity is 8 and the LOAD utility will terminate.

User Response: When discard processing is specified, following the completion of the current LOAD utility invocation, examine the record in the DISCARDS data set. Correct the error in the discarded input data, and submit a RESUME(YES) LOAD invocation with the DISCARDS data set as the input data set. When discard processing is not specified: correct the error in the input data set and rerun the job.

System Programmer Response: If you suspect an error in DB2, refer to Part 2 of *DB2 Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items: Appendix B, "Problem determination," on page 1353: 1, 2, 5.

DSNU338I *csect-name* INVALID COLUMN
SPECIFICATION FOR *column name*

Explanation: The LOAD utility found the dynamically determined column location for an input field to be incorrect.

Severity: 8 (error)

System Action: The utility abends to allow restart.

User Response: Correct the input field specification or the input data and restart the job. Alternatively, TERM the utility.

DSNU339I *csect-name* INVALID CONTINUEIF
SPECIFICATION

Explanation: The CONTINUEIF clause of a LOAD utility extends beyond the end of the input record.

Severity: 8 (error)

System Action: The LOAD utility is terminated.
