Linux on System z

libica Programmer's Reference

Version 2.3.0

SC34-2602-05

Linux on System z

libica Programmer's Reference

Version 2.3.0

SC34-2602-05

Note
Before using this document, be sure to read the information in “Notices” on page 163.

This edition applies to version 2.3.0 of libica and to all subsequent releases and modifications until otherwise indicated in new editions.

Contents

Summary of changes

This revision reflects changes to the Development stream for libica version 2.3.0.

Updates for libica version 2.3.0

Edition SC34-2602-05

This revision reflects changes related to version 2.3.0 of libica.

New information

- An example of the openCryptoki configuration file has been added, see "Setting up tokens and daemons" on page 62
- New cryptographic mechanisms are implemented for the ica token as of openCryptoki version 3.0, see "Supported mechanism list for the ica token," on page 159

This revision also includes maintenance and editorial changes.

Edition SC34-2602-04

This revision reflects changes related to version 2.3.0 of libica.

New information

- New API added. See "ica_get_functionlist" on page 57.
- New defines and structs have been added. See Chapter 5, "libica constants, type definitions, data structures, and return codes," on page 65

Previous updates for libica version 2.2.0

This revision reflects changes related to version 2.2.0 of libica.

New information

- Cryptographic hardware support with openCryptoki
- New APIs have been added:
  - ica_3des_cbc_cs
  - ica_3des_cmac
  - ica_3des_cmac_intermediate
  - ica_3des_cmac_last
  - ica_aes_cbc_cs
  - ica_aes_ccm
  - ica_aes_cmac_intermediate
  - ica_aes_cmac_last
  - ica_aes_gcm
  - ica_des_cbc_cs
  - ica_des_cmac
  - ica_des_cmac_intermediate
  - ica_des_cmac_last

- New commands have been added. See Chapter 6, “libica tools,” on page 69.

Changed information
- Minor changes and corrections have been made to some of the APIs.

This revision also includes maintenance and editorial changes.

Deleted information
- Some obsolete examples have been removed.

Previous updates for libica version 2.1.0

This revision reflects changes related to version 2.1.0 of libica.

New information
- Support for IBM® zEnterprise® 196 has been added.
- New APIs have been added.
- New examples have been added. See Chapter 7, “Examples,” on page 73.
- New defines and structs have been added. See Chapter 5, “libica constants, type definitions, data structures, and return codes,” on page 65.

Changed information
- The example makefile has been updated. See “Makefile example” on page 143.

This revision also includes maintenance and editorial changes.

Deleted information
- The following functions are deprecated in libica version 2.1.0, and no longer documented in this book. They are, however, still available in this version of libica. For documentation on these functions, see the version 2.0 *libica Programmer's Reference*.
  - ica_des_encrypt
  - ica_des_decrypt
  - ica_3des_encrypt
  - ica_3des_decrypt
  - ica_aes_encrypt
  - ica_aes_decrypt

About this document

This document describes how to install and use version 2.3.0 of the Library for IBM Cryptographic Architecture (libica).

libica version 2.3.0 is a library of cryptographic functions used to write cryptographic applications on IBM System z®, both with and without cryptographic hardware.

Unless stated otherwise, the tools described in this book are available for the 64-bit architecture and 31-bit architectures with version 2.6 or higher of the Linux kernel.

You can find the latest version of this document on the developerWorks® website at:

`www.ibm.com/developerworks/linux/linux390/documentation_dev.html`

How this document is organized

Chapter 1, "General information about libica," on page 1 has general information about libica version 2.3.0.

Chapter 2, "Installing and using libica version 2.3.0," on page 3 contains installation and set up instructions, and coexistence information for libica version 2.3.0.

Chapter 3, "libica version 2.3.0 application programming interfaces," on page 5 describes the libica version 2.3.0 APIs.

Chapter 4, "Accessing libica version 2.3.0 functions through the PKCS #11 API (openCryptoki)," on page 59 describes how the cryptographic functions provided by libica version 2.3.0 can be accessed using the PKCS #11 API implemented by openCryptoki.

Chapter 5, "libica constants, type definitions, data structures, and return codes," on page 65 lists the defines, typedefs, structs, and return codes for libica version 2.3.0.

Chapter 6, "libica tools," on page 69 contains tools to investigate the capabilities of your cryptographic hardware and how these capabilities are used by applications that use libica.

Chapter 7, "Examples," on page 73 is a set of programming examples that use the libica version 2.3.0 APIs.

Who should read this document

This document is intended for C programmers that want to access IBM System z hardware support for cryptographic methods.

In particular, this document addresses programmers who write hardware-specific plug-ins for cryptographic libraries such as openssl and openCryptoki.

Assumptions

The following general assumptions are made about your background knowledge:

- You have an understanding of basic computer architecture, operating systems, and programs.
- You have an understanding of Linux and IBM System z terminology.
- You have knowledge about cryptographic applications and solution design, as well as the required cryptographic functions and algorithms.

Distribution independence

This book does not provide information that is specific to a particular Linux distribution.

The tools it describes are distribution independent.

Conventions used in this book

This section informs you about the styles, highlighting, and assumptions used throughout the book.

Terminology

In this book, the term *booting* is used for running boot loader code that loads the Linux operating system. *IPL* is used for issuing an IPL command or to load boot-loader code.

In this book, the term **Required hardware support** refers to specific processor instructions that must be available on the processor in order for the function to benefit from hardware support. Functions will fail on systems that do not provide the required hardware support, unless a software fallback is available as indicated in Table 2 on page 5. An example is that the **ica_des_cbc** function has KMC-DEA listed under **Required hardware support**. This function cannot benefit from hardware support unless the processor has the KMC-DEA instruction. However, **ica_des_cbc** will work on all processors because according to Table 2 on page 5 there is a software fallback for this function.

For more information, see:

- *The z/Architecture® Principles of Operation*, SA22-7832-06
- the IBM Redbooks® publication *System z Cryptographic Services and z/OS® PKI Services*, SG24-7470-00

IBM mainframes mentioned in this book have both long names and short names. They correspond as follows:

Table 1. IBM mainframes

Long name	Short name
IBM zEnterprise BC12	zBC12
IBM zEnterprise EC12	zEC12
IBM zEnterprise 114	z114
IBM zEnterprise 196	z196
IBM System z10®	z10™
IBM System z9®	z9

Table 1. IBM mainframes (continued)

Long name	Short name
IBM eServer™ zSeries® 990	z990

Highlighting

This book uses the following highlighting styles:

- Paths and URLs are highlighted in `monospace`.
- Variables are highlighted in *italics*.
- Commands in text are highlighted in **bold**.
- Input and output as normally seen on a computer screen is shown

```
within a screen frame.
Prompts are shown as number signs:
#
```

Other Linux on System z publications

Finding IBM books

The PDF version of this book contains URL links to much of the referenced literature.

For some of the referenced IBM books, links have been omitted to avoid pointing to a particular edition of a book. You can locate the latest versions of the referenced IBM books through the IBM Publications Center at:

`http://www.ibm.com/shop/publications/order`

Chapter 1. General information about libica

The libica library provides hardware support for cryptographic functions.

The cryptographic adapters are used for asymmetric encryption and decryption. The CPACF instructions are used for symmetric encryption and decryption, pseudo random number generation, message authentication, and Secure Hashing. For some of these functions, if the hardware is not available or failed, libica uses the low-level cryptographic functions of OpenSSL, if available.

This product includes software that is developed by the OpenSSL Project for use in the OpenSSL Toolkit (http://www.openssl.org). This product includes cryptographic software that is written by Eric Young (eay@cryptsoft.com).

The libica library is part of the openCryptoki project in SourceForge. It is primarily used by OpenSSL through the IBM OpenSSL CA engine or by openCryptoki through the ica_s390 token. A higher level of security can be achieved by using it through the PKCS11 API implemented by openCryptoki.

The libica library works only on IBM System z hardware.

IBM reserves the right to change or modify this API at any time. However, an effort is made to keep the API compatible with later versions within a major release.

You can use the **icastats** command, see "icastats - Show use of libica functions" on page 70, to obtain statistics about cryptographic processes. The **icastats** command shows whether libica is using cryptographic hardware or software fallback for each specific libica function.

libica examples

There is a list of sample programs in the libica source for each API, as well as instructions about how to use the functions.

You can find the open source version of libica at:
`http://sourceforge.net/projects/opencryptoki/files/libica`

Sample programs area also in Chapter 7, "Examples," on page 73.

System z cryptographic hardware support

The following lists different types of cryptographic hardware support that might be available in a System z server.

IBM CP Assist for Cryptographic Function (CPACF):

DES, TDES, AES128, AES192, AES256, SHA-1, SHA256, SHA384, SHA512, PRNG

Cryptographic cards:

Accelerator: RSA (CRT, MOD-EXPO) 1024, 2048 and 4096 bit key size

Co-processor: RSA (CRT, MOD-EXPO) 1024, 2048 and 4096 bit key size, RNG and so on

IBM cryptographic adapters

Information about how to install IBM cryptographic adapters and get status information.

Installing an IBM cryptographic adapter

Check whether you have plugged in and enabled your IBM cryptographic adapter and validate your model and type configuration (accelerator or coprocessor).

To check, enter the command:

```
$ lszcrypt
card06: CEX3A
```

If the following error message is displayed, load the z90crypt module:

```
error - cryptographic device driver zcrypt is not loaded!
```

See your Linux distribution documentation for how to load the module persistently.

Use the **chzcrypt** command to enable (online state) and disable (offline state) the IBM crypto adapter:

```
$ chzcrypt -e 0x06    // set card06 online
$ chzcrypt -d 0x06    // set card06 offline
```

For more information about the IBM crypto adapter, see *Device Drivers, Features, and Commands*, SC33-8411 available at

`www.ibm.com/developerworks/linux/linux390/documentation_dev.html`

Displaying status information

Use the **lszcrypt** command to retrieve basic status information.

For more information about using IBM cryptographic adapters with Linux on System z, see *Device Drivers, Features, and Commands*, SC33-8411 available at

`www.ibm.com/developerworks/linux/linux390/documentation_dev.html`

Chapter 2. Installing and using libica version 2.3.0

Information about where to obtain the libica version 2.3.0 library and how to install it.

Installing libica version 2.3.0

You can obtain the libica version 2.3.0 library from the SourceForge website.

The website is at:

`http://sourceforge.net/projects/opencryptoki/files/libica/`

Follow the installation instructions on this website to download the libica version 2.3.0 package and then follow the instructions in "Installing libica version 2.3.0 from the libica RPM" or "Installing libica version 2.3.0 from the source package" to install libica version 2.3.0.

Installing libica version 2.3.0 from the libica RPM

You can install libica version 2.3.0 from the libica RPM.

Procedure

The libica library is available as an RPM named `libica_<version>`. See your Linux distribution documentation for how to install an RPM. To check whether the libica library is installed, issue, for example:

```
# rpm -qa | grep -i libica
```

Installing libica version 2.3.0 from the source package

If you prefer you can install the source package.

Procedure

1. Download the latest version of the libica version 2.3.0 sources from:
   `http://sourceforge.net/projects/opencryptoki/files/libica/`
2. Extract the tar archive. There should be a new directory named `libica-2.x.x`.
3. Change to that directory and execute the following scripts and commands:

```
$ ./bootstrap
$ ./configure
$ make
$ make install
```

where:

bootstrap
: Initial setup, basic configurations

configure
: Check configurations and build the Makefile

make
: Compile and link

make install
Install the libraries

Using libica version 2.3.0

The function prototypes are provided in the header file, `include/ica_api.h`.

Applications using these functions must link libica and libcrypto. The libcrypto library is available from the OpenSSL package. You must have OpenSSL in order to run libica version 2.3.0 programs.

libica version 1, version 2, version 2.1.0, version 2.2.0, and version 2.3.0 coexistence

Some of the libica version 1 APIs are available in libica version 2, libica version 2.1.0, libica version 2.2.0, and libica version 2.3.0.

Some of them, such as those APIs that work with an environment other than Linux on IBM System z, were removed and are not present in libica version 2 or later versions. If your application program has calls to libica version 1 APIs, check to see whether these APIs are in libica version 2.3.0. If they are, these API calls should still work. However, we suggest that you convert your application to use the equivalent libica version 2.3.0 functions. See Chapter 3, “libica version 2.3.0 application programming interfaces,” on page 5.

libica key generation is restricted to the limits imposed by the OpenSSL implementation. Thus, the value of a public exponent passed to libica cannot be greater than the maximum value that would fit in an unsigned long integer.

Chapter 3. libica version 2.3.0 application programming interfaces

A list of application programming interfaces (APIs) for libica version 2.3.0.

Table 2 lists the APIs for libica version 2.3.0.

Table 2. libica version 2.3.0 APIs

Function	libica version 2.3.0 API name	Key length in bits	Supported on			CPACF function	Software fallback
			z9	z10	z196		
Open and close adapter functions							
Open adapter handle	"ica_open_adapter" on page 8	N/A	Yes	Yes	Yes	No	N/A
Close adapter handle	"ica_close_adapter" on page 8	N/A	Yes	Yes	Yes	No	N/A
Secure hash operations							
Secure hash using the SHA-1 algorithm.	"ica_sha1" on page 9	N/A	Yes	Yes	Yes	Yes	Yes
Secure hash using the SHA-224 algorithm.	"ica_sha224" on page 10	N/A	No	Yes	Yes	Yes	Yes
Secure hash using the SHA-256 algorithm.	"ica_sha256" on page 11	N/A	Yes	Yes	Yes	Yes	Yes
Secure hash using the SHA-384 algorithm.	"ica_sha384" on page 12	N/A	No	Yes	Yes	Yes	Yes
Secure hash using the SHA-512 algorithm.	"ica_sha512" on page 13	N/A	No	Yes	Yes	Yes	Yes
Random number generation							
Generate a pseudo random number.	"ica_random_number_generate" on page 14	N/A	Yes	Yes	Yes	Yes	Yes
RSA key generation functions							
Generate RSA keys in modulus/exponent format.	"ica_rsa_key_generate_mod_expo" on page 15	N/A	Yes	Yes	Yes	No	Software only
Generate RSA keys in CRT format.	"ica_rsa_key_generate_crt" on page 15	N/A	Yes	Yes	Yes	No	Software only
RSA encryption and decryption operations							
RSA encryption and decryption operation using a key in modulus/exponent format.	"ica_rsa_mod_expo" on page 16	Depending on supported key size of Crypto Express feature	Yes	Yes	Yes	No	Key length maximum 4 K bits
RSA encryption and decryption operation using a key in Chinese-Remainder Theorem (CRT) format.	"ica_rsa_crt" on page 17	Depending on supported key size of Crypto Express feature	Yes	Yes	Yes	No	Key length maximum 4 K bits

Table 2. libica version 2.3.0 APIs (continued)

Function	libica version 2.3.0 API name	Key length in bits	Supported on			CPACF function	Software fallback
			z9	z10	z196		
DES functions							
DES with Cipher Block Chaining mode	"ica_des_cbc" on page 18	56	Yes	Yes	Yes	Yes	Yes
DES with CBC-Cipher text stealing mode	"ica_des_cbc_cs" on page 19	56	Yes	Yes	Yes	Yes	Yes
DES with Cipher Feedback mode	"ica_des_cfb" on page 20	56	No	No	Yes	Yes	No
DES with CMAC mode	"ica_des_cmac" on page 21	56	No	No	Yes	Yes	No
DES with CMAC mode process intermediate chunks	"ica_des_cmac_intermediate" on page 22	56	No	No	Yes	Yes	No
DES with CMAC mode process last chunk	"ica_des_cmac_last" on page 23	56	No	No	Yes	Yes	No
DES with Counter mode	"ica_des_ctr" on page 24	56	No	No	Yes	Yes	No
DES with Counter mode, using a list of counters	"ica_des_ctrlist" on page 26	56	No	No	Yes	Yes	No
DES with Electronic Codebook mode.	"ica_des_ecb" on page 27	56	Yes	Yes	Yes	Yes	Yes
DES with Output Feedback mode	"ica_des_ofb" on page 27	56	No	No	Yes	Yes	No
TDES/3DES functions							
TDES with Cipher Block Chaining mode	"ica_3des_cbc" on page 30	168	Yes	Yes	Yes	Yes	Yes
TDES with CBC-Cipher text Stealing mode	"ica_3des_cbc_cs" on page 30	168	Yes	Yes	Yes	Yes	Yes
TDES with Cipher Feedback mode	"ica_3des_cfb" on page 32	168	No	No	Yes	Yes	No
TDES with CMAC mode	"ica_3des_cmac" on page 33	168	No	No	Yes	Yes	No
TDES with CMAC mode process intermediate chunks	"ica_3des_cmac_intermediate" on page 34	168	No	No	Yes	Yes	No
TDES with CMAC mode process last chunk	"ica_3des_cmac_last" on page 35	168	No	No	Yes	Yes	No
TDES with Counter mode	"ica_3des_ctr" on page 36	168	No	No	Yes	Yes	No
TDES with Counter mode, using a list of counters	"ica_3des_ctrlist" on page 37	168	No	No	Yes	Yes	No
TDES with Electronic Codebook mode	"ica_3des_ecb" on page 38	168	Yes	Yes	Yes	Yes	Yes
TDES with Output Feedback mode	"ica_3des_ofb" on page 39	168	No	No	Yes	Yes	No
AES functions							
AES with Cipher Block Chaining mode.	"ica_aes_cbc" on page 41	128, 192, 256	Yes	Yes	Yes	Yes	Yes

Table 2. libica version 2.3.0 APIs (continued)

Function	libica version 2.3.0 API name	Key length in bits	Supported on			CPACF function	Software fallback
			z9	z10	z196		
AES with CBC-Cipher text stealing mode.	"ica_aes_cbc_cs" on page 42	128, 192, 256	Yes	Yes	Yes	Yes	Yes
AES with Counter with Cipher Block Chaining - Message Authentication Code mode.	"ica_aes_ccm" on page 43	128, 192, 256	No	No	Yes	Yes	No
AES with Cipher Feedback mode.	"ica_aes_cfb" on page 45	128, 192, 256	No	No	Yes	Yes	No
AES with CMAC mode	"ica_aes_cmac" on page 46	128, 192, 256	No	No	Yes	Yes	No
AES with CMAC mode process intermediate chunks	"ica_aes_cmac_intermediate" on page 47	128, 192, 256	No	No	Yes	Yes	No
AES with CMAC mode process last chunk	"ica_aes_cmac_last" on page 48	128, 192, 256	No	No	Yes	Yes	No
AES with Counter mode.	"ica_aes_ctr" on page 49	128, 192, 256	No	No	Yes	Yes	No
AES with Counter mode, using a list of counters	"ica_aes_ctrlist" on page 50	128, 192, 256	No	No	Yes	Yes	No
AES with Electronic Codebook mode.	"ica_aes_ecb" on page 51	128, 192, 256	Yes	Yes	Yes	Yes	Yes
AES with Galois / Counter mode.	"ica_aes_gcm" on page 52	128, 192, 256	No	No	Yes	Yes	No
AES with Output Feedback mode.	"ica_aes_ofb" on page 54	128, 192, 256	No	No	Yes	Yes	No
AES with XEX-based Tweaked CodeBook mode (TCB) with CipherText Stealing (CTS).	"ica_aes_xts" on page 55	128, 256	No	No	Yes	Yes	No
Information retrieval functions							
Return version information for libica.	"ica_get_version" on page 57	N/A	Yes	Yes	Yes	No	N/A
Return a list of crypto mechanisms supported by libica.	"ica_get_functionlist" on page 57	N/A	Yes	Yes	Yes	No	N/A

Open and close adapter functions

These functions open or close the crypto adapter. It is recommended to open the crypto adapter before using any of the libica crypto functions, and to close it after the last usage of the libica crypto functions. However, in this version of the libica only the RSA-related functions **ica_rsa_mod_expo** and **ica_rsa_crt** require a valid adapter handle as input. A pointer to the value DRIVER_NOT_LOADED indicates an invalid adapter handle. The parameter *ica_adapter_handle_t* is a redefine of int.

These functions are included in: `include/ica_api.h`.

ica_open_adapter

Purpose

Opens an adapter.

Format

```
unsigned int ica_open_adapter(ica_adapter_handle_t *adapter_handle);
```

Parameters

ica_adapter_handle_t *adapter_handle
Pointer to the file descriptor for the adapter or to DRIVER_NOT_LOADED if opening the crypto adapter failed.

Opening an adapter succeeds if a cryptographic device is accessible for reading and writing. By default, cryptographic access must be available with one of the following path names: **/udev/z90crypt**, **/dev/z90crypt**, or **/dev/zcrypt** for the adapter open request to succeed. If the environment variable LIBICA_CRYPT_DEVICE is set to a valid path name of an accessible cryptographic device, accessing the device with that path name takes precedence over the default path names.

Return codes

0 Success

For return codes indicating exceptions, see “Return codes” on page 68.

ica_close_adapter

Purpose

Closes an adapter.

Comments

This API closes a device handle.

Format

```
unsigned int ica_close_adapter(ica_adapter_handle_t adapter_handle);
```

Parameters

ica_adapter_handle_t adapter_handle
Pointer to a previously opened device handle.

Return codes

0 Success

For return codes indicating exceptions, see “Return codes” on page 68.

Secure hash operations

These functions are included in: `include/ica_api.h`.

These functions perform secure hash on input data using the chosen algorithm of SHA-1, SHA-224, SHA-256, SHA-384, or SHA-512.

SHA context structs contain information about how much of the actual work was already performed. Also, it contains the part of the hash that is already produced. For the user, it is only interesting in cases where the message is not hashed at once, because the context is needed for further operations.

ica_sha1

Purpose

Performs a secure hash operation on the input data using the SHA-1 algorithm.

Format

```
unsigned int ica_sha1(unsigned int message_part,
  unsigned int input_length,
  unsigned char *input_data,
  sha_context_t *sha_context,
  unsigned char *output_data);
```

Required hardware support

KIMD-SHA-1, or KLMD-SHA-1

Parameters

unsigned int message_part
The message chaining state. This parameter must be one of the following values:
SHA_MSG_PART_ONLY
A single hash operation
SHA_MSG_PART_FIRST
The first part
SHA_MSG_PART_MIDDLE
The middle part
SHA_MSG_PART_FINAL
The last part

unsigned int input_length
Length in bytes of the input data to be hashed using the SHA-1 algorithm. This value must be greater than zero.

unsigned char *input_data
Pointer to the input data to be hashed.

sha_context_t *sha_context
Pointer to the SHA-1 context structure used to store intermediate values needed when chaining is used. The contents are ignored for message part SHA_MSG_PART_ONLY and SHA_MSG_PART_FIRST. This structure must contain the returned value of the preceding call to **ica_sha1** for message part SHA_MSG_PART_MIDDLE and SHA_MSG_PART_FINAL. For message part SHA_MSG_PART_FIRST and SHA_MSG_PART_FINAL, the returned value can be used for a chained call of **ica_sha1**. Therefore, the application must not modify the contents of this structure in between chained calls.

unsigned char *output_data
Pointer to the buffer to contain the resulting hash data. The resulting output data has a length of **SHA_HASH_LENGTH**. Make sure that the buffer is at least this size.

Return codes

0 Success

For return codes indicating exceptions, see "Return codes" on page 68.

ica_sha224

Purpose

Performs a secure hash operation on the input data using the SHA-224 algorithm.

Format

```
unsigned int ica_sha224(unsigned int message_part,
  unsigned int input_length,
  unsigned char *input_data,
  sha256_context_t *sha256_context,
  unsigned char *output_data);
```

Required hardware support

KIMD-SHA-256, or KLMD-SHA-256

Parameters

unsigned int message_part
The message chaining state. This parameter must be one of the following values:

SHA_MSG_PART_ONLY
A single hash operation

SHA_MSG_PART_FIRST
The first part

SHA_MSG_PART_MIDDLE
The middle part

SHA_MSG_PART_FINAL
The last part

unsigned int input_length
Length in bytes of the input data to be hashed using the SHA-224 algorithm. This value must be greater than zero.

unsigned char *input_data
Pointer to the input data to be hashed.

sha256_context_t *sha256_context
Pointer to the SHA-256 context structure used to store intermediate values needed when chaining is used. The contents are ignored for message part SHA_MSG_PART_ONLY and SHA_MSG_PART_FIRST. This structure must contain the returned value of the preceding call to **ica_sha224** for message part SHA_MSG_PART_MIDDLE and SHA_MSG_PART_FINAL. For message part SHA_MSG_PART_FIRST and SHA_MSG_PART_FINAL, the returned value can be used for a chained call of **ica_sha224**. Therefore, the application must not modify the contents of this structure in between chained calls.

Note: Due to the algorithm used by SHA-224, a SHA-256 context must be used.

unsigned char *output_data
Pointer to the buffer to contain the resulting hash data. The resulting output data has a length of **SHA224_HASH_LENGTH**. Make sure that the buffer is at least this size.

Return codes

0 Success

For return codes indicating exceptions, see "Return codes" on page 68.

ica_sha256

Purpose

Performs a secure hash on the input data using the SHA-256 algorithm.

Format

```
unsigned int ica_sha256(unsigned int message_part,
  unsigned int input_length,
  unsigned char *input_data,
  sha256_context_t *sha256_context,
  unsigned char *output_data);
```

Required hardware support

KIMD-SHA-256, or KLMD-SHA-256

Parameters

unsigned int message_part
The message chaining state. This parameter must be one of the following values:
SHA_MSG_PART_ONLY
A single hash operation
SHA_MSG_PART_FIRST
The first part
SHA_MSG_PART_MIDDLE
The middle part
SHA_MSG_PART_FINAL
The last part

unsigned int input_length
Length in bytes of the input data to be hashed using the SHA-256 algorithm. This value must be greater than zero.

unsigned char *input_data
Pointer to the input data to be hashed.

sha256_context_t *sha256_context
Pointer to the SHA-256 context structure used to store intermediate values needed when chaining is used. The contents are ignored for message part SHA_MSG_PART_ONLY and SHA_MSG_PART_FIRST. This structure must contain the returned value of the preceding call to **ica_sha256** for message part SHA_MSG_PART_MIDDLE and SHA_MSG_PART_FINAL. For message part SHA_MSG_PART_FIRST and SHA_MSG_PART_FINAL, the returned value can be used for a chained call of **ica_sha256**. Therefore, the application must not modify the contents of this structure in between chained calls.

unsigned char *output_data
Pointer to the buffer to contain the resulting hash data. The resulting output data has a length of **SHA256_HASH_LENGTH**. Make sure that the buffer is at least this size.

Return codes

0 Success

For return codes indicating exceptions, see "Return codes" on page 68.

ica_sha384

Purpose

Performs a secure hash on the input data using the SHA-384 algorithm.

Format

```
unsigned int ica_sha384(unsigned int message_part,
  uint64_t input_length,
  unsigned char *input_data,
  sha512_context_t *sha512_context,
  unsigned char *output_data);
```

Required hardware support

KIMD-SHA-512, or KLMD-SHA-512

Parameters

unsigned int message_part
The message chaining state. This parameter must be one of the following values:
SHA_MSG_PART_ONLY
A single hash operation
SHA_MSG_PART_FIRST
The first part
SHA_MSG_PART_MIDDLE
The middle part
SHA_MSG_PART_FINAL
The last part

uint64_t input_length
Length in bytes of the input data to be hashed using the SHA-384 algorithm. This value must be greater than zero.

unsigned char *input_data
Pointer to the input data to be hashed.

sha512_context_t *sha512_context
Pointer to the SHA-512 context structure used to store intermediate values needed when chaining is used. The contents are ignored for message part SHA_MSG_PART_ONLY and SHA_MSG_PART_FIRST. This structure must contain the returned value of the preceding call to **ica_sha384** for message part SHA_MSG_PART_MIDDLE and SHA_MSG_PART_FINAL. For message part SHA_MSG_PART_FIRST and SHA_MSG_PART_FINAL, the returned value can be used for a chained call of **ica_sha384**. Therefore, the application must not modify the contents of this structure in between chained calls.

Note: Due to the algorithm used by SHA-384, a SHA-512 context must be used.

unsigned char *output_data
Pointer to the buffer to contain the resulting hash data. The resulting output data has a length of **SHA384_HASH_LENGTH**. Make sure that the buffer is at least this size.

Return codes

0 Success

For return codes indicating exceptions, see "Return codes" on page 68.

ica_sha512

Purpose

Performs a secure hash operation on input data using the SHA-512 algorithm.

Format

```
unsigned int ica_sha512(unsigned int message_part,
  uint64_t input_length,
  unsigned char *input_data,
  sha512_context_t *sha512_context,
  unsigned char *output_data);
```

Required hardware support

KIMD-SHA-512, or KLMD-SHA-512

Parameters

unsigned int message_part
The message chaining state. This parameter must be one of the following values:
SHA_MSG_PART_ONLY
A single hash operation
SHA_MSG_PART_FIRST
The first part
SHA_MSG_PART_MIDDLE
The middle part
SHA_MSG_PART_FINAL
The last part

uint64_t input_length
Length in bytes of the input data to be hashed using the SHA-512 algorithm. This value must be greater than zero.

unsigned char *input_data
Pointer to the input data to be hashed.

sha512_context_t *sha512_context
Pointer to the SHA-512 context structure used to store intermediate values needed when chaining is used. The contents are ignored for message part SHA_MSG_PART_ONLY and SHA_MSG_PART_FIRST. This structure must contain the returned value of the preceding call to **ica_sha512** for message part SHA_MSG_PART_MIDDLE and SHA_MSG_PART_FINAL. For message part SHA_MSG_PART_FIRST and SHA_MSG_PART_FINAL, the returned value can

be used for a chained call of **ica_sha512**. Therefore, the application must not modify the contents of this structure in between chained calls.

unsigned char *output_data
Pointer to the buffer to contain the resulting hash data. The resulting output data has a length of **SHA512_HASH_LENGTH**. Make sure that the buffer is at least this size.

Return codes

0 Success

For return codes indicating exceptions, see "Return codes" on page 68.

Pseudo random number generation function

This function is included in: `include/ica_api.h`.

This function generates pseudo random data. Parameter **ouput_data* is a pointer to a buffer of byte length *output_length*. *output_length* number of bytes of pseudo random data is placed in the buffer pointed to by *output_data*.

libica initialization tries to seed the CPACF random generator. To get the seed, device `/dev/hwrng` is opened. Device `/dev/hwrng` provides true random data from crypto adapters over the crypto device driver (module name z90crypt). If that fails, the initialization mechanism uses device `/dev/urandom`. Within the initialization, a byte counter *s390_byte_count* is set to 0. If the CPACF pseudo random generator is available, after 4096 bytes of the pseudo random number are generated, the random number generator is seeded again. If the CPACF pseudo random generator is not available, random numbers are read from `/dev/urandom`.

ica_random_number_generate

Purpose

Generates a pseudo random number.

Format

```
unsigned int ica_random_number_generate(unsigned int output_length,
  unsigned char *output_data);
```

Required hardware support

KMC-PRNG

Parameters

unsigned int output_length
Length in bytes of the *output_data* buffer, and the length of the generated pseudo random number.

unsigned char *output_data
Pointer to the buffer to receive the generated pseudo random number.

Return codes

0 Success

For return codes indicating exceptions, see "Return codes" on page 68.

RSA key generation functions

These functions are included in: `include/ica_api.h`.

These functions generate an RSA public/private key pair. These functions are performed using software through OpenSSL. Hardware is not used.

ica_rsa_key_generate_mod_expo

Purpose

Generates RSA keys in modulus/exponent format.

Comments

For specific information about some of these parameters, see the considerations in "Data structures" on page 66.

Format

```
unsigned int ica_rsa_key_generate_mod_expo(ica_adapter_handle_t adapter_handle,
  unsigned int modulus_bit_length,
  ica_rsa_key_mod_expo_t *public_key,
  ica_rsa_key_mod_expo_t *private_key);
```

Parameters

`ica_adapter_handle_t adapter_handle`
Pointer to a previously opened device handle.

`unsigned int modulus_bit_length`
Length in bits of the modulus. This value should comply with the length of the keys (in bytes), according to this calculation:

```
key_length = (modulus_bits + 7) / 8
```

`ica_rsa_key_mod_expo_t *public_key`
Pointer to where the generated public key is to be placed. If the *exponent* element in the public key is not set, it is randomly generated. A poorly chosen *exponent* could result in the program looping endlessly. Common public exponents are 3 and 65537.

`ica_rsa_key_mod_expo_t *private_key`
Pointer to where the generated private key in modulus/exponent format is to be placed. The length of both the private and public keys should be set in bytes. This value should comply with the length of the keys (in bytes), according to this calculation:

```
key_length = (modulus_bits + 7) / 8
```

Return codes

0 Success

For return codes indicating exceptions, see "Return codes" on page 68.

ica_rsa_key_generate_crt

Purpose

Generates RSA keys in Chinese-Remainder Theorem (CRT) format.

Comments

For specific information about some of these parameters, see the considerations in "Data structures" on page 66.

Format

```
unsigned int ica_rsa_key_generate_crt(ica_adapter_handle_t adapter_handle,
  unsigned int modulus_bit_length,
  ica_rsa_key_mod_expo_t *public_key,
  ica_rsa_key_crt_t *private_key);
```

Parameters

ica_adapter_handle_t adapter_handle
Pointer to a previously opened device handle.

unsigned int modulus_bit_length
Length in bits of the modulus part of the key. This value should comply with the length of the keys (in bytes), according to this calculation:

```
key_length = (modulus_bits + 7) / 8
```

ica_rsa_key_mod_expo_t *public_key
Pointer to where the generated public key is to be placed. If the *exponent* element in the public key is not set, it is randomly generated. A poorly chosen *exponent* can result in the program looping endlessly. Common public exponents are 3 and 65537.

ica_rsa_key_crt_t *private_key
Pointer to where the generated private key in CRT format is to be placed. Length of both private and public keys should be set in bytes. This value should comply with the length of the keys (in bytes), according to this calculation

```
key_length = (modulus_bits + 7) / 8
```

Return codes

0 Success

For return codes indicating exceptions, see "Return codes" on page 68.

RSA encrypt and decrypt operations

These functions are included in: `include/ica_api.h`.

These functions perform a modulus/exponent operation using an RSA key whose type is either *ica_rsa_key_mod_expo_t* or *ica_rsa_key_crt_t*.

ica_rsa_mod_expo

Purpose

Performs an RSA encryption or decryption operation using a key in modulus/exponent format.

Comments

Make sure that your message is padded before using this function.

Format

```
unsigned int ica_rsa_mod_expo(ica_adapter_handle_t adapter_handle,
  unsigned char *input_data,
  ica_rsa_key_mod_expo_t *rsa_key,
  unsigned char *output_data);
```

Parameters

ica_adapter_handle_t adapter_handle
Pointer to a previously opened device handle.

unsigned char *input_data
Pointer to the input data to be encrypted or decrypted. This data must be in big endian format. Make sure that the input data is not longer than the bit length of the key. The byte length for the input data and the key must be the same. Right align the input data inside the data block.

ica_rsa_key_mod_expo_t *rsa_key
Pointer to the key to be used, in modulus/exponent format.

unsigned char *output_data
Pointer to the location where the output results are to be placed. This buffer has to be at least the same size as *input_data* and therefore at least the same size as the size of the modulus.

Return codes

0 Success

For return codes indicating exceptions, see "Return codes" on page 68.

ica_rsa_crt

Purpose

Performs an RSA encryption or decryption operation using a key in CRT format.

Comments

Make sure that your message is padded before using this function.

Format

```
unsigned int ica_rsa_crt(ica_adapter_handle_t adapter_handle,
  unsigned char *input_data,
  ica_rsa_key_crt_t *rsa_key,
  unsigned char *output_data);
```

Parameters

ica_adapter_handle_t adapter_handle
Pointer to a previously opened device handle.

unsigned char *input_data
Pointer to the input data to be encrypted or decrypted. This data must be in big endian format. Make sure that the input data is not longer than the bit length of the key. The byte length for the input data and the key must be the same. Right align the input data inside the data block.

ica_rsa_key_crt_t *rsa_key
Pointer to the key to be used, in CRT format.

unsigned char *output_data
Pointer to the location where the output results are to be placed. This buffer must be as large as the *input_data*, and as large as the length of the *modulus* specified in *rsa_key*.

Return codes

0 Success

For return codes indicating exceptions, see "Return codes" on page 68.

DES functions

These functions are included in: `include/ica_api.h`.

These functions perform encryption and decryption and computation or verification of message authentication codes using a DES (DEA) key. A DES key has a size of 8 bytes. Each byte of a DES key contains one parity bit, such that each 64-bit DES key contains only 56 security-relevant bits. The cipher block size for DES is 8 bytes.

To securely apply DES encryption to messages that are longer than the cipher block size, modes of operation can be used to chain multiple encryption, decryption, or authentication operations. Most modes of operation require an initialization vector as additional input. As long as the messages are encrypted or decrypted using such a mode of operation, and have a size that is a multiple of a particular block size (mostly the cipher block size), the functions encrypting or decrypting according to a mode of operation also compute an output vector. This output vector can be used as the initialization vector of a chained encryption or decryption operation in the same mode with the same block size and the same key.

When decrypting a cipher text, these values used for the decryption function must match the corresponding settings of the encryption function that transformed the plain text into the cipher text:

- The mode of operation
- The key
- The initialization vector (if applicable)
- For the **ica_des_cfb** function, the *lcfb* parameter

ica_des_cbc

Purpose

Encrypt or decrypt data with a DES key using Cipher Block Chaining (CBC) mode, as described in NIST Special Publication 800-38A Chapter 6.2.

Format

```
unsigned int ica_des_cbc(const unsigned char *in_data,
   unsigned char *out_data,
   unsigned long data_length,
   const unsigned char *key,
   unsigned char *iv,
   unsigned int direction);
```

Required hardware support

KMC-DEA

Parameters

const unsigned char *in_data
Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is *data_length*. This buffer must be at least as large as *data_length*.

unsigned char *out_data
Pointer to a writable buffer to contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as *data_length*.

unsigned long data_length
Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of *in_data*. *data_length* must be a multiple of the cipher block size (a multiple of 8 bytes for DES).

const unsigned char *key
Pointer to a valid DES key of 8 bytes in length.

unsigned char *iv
Pointer to a valid initialization vector of cipher block size number of bytes (8 bytes for DES). This vector is overwritten by this function. The result value in *iv* can be used as the initialization vector for a chained **ica_des_cbc** or **ica_des_cbc_cs** call with the same key.

unsigned int direction
0 Use the decrypt function.
1 Use the encrypt function.

Return codes
0 Success

For return codes indicating exceptions, see “Return codes” on page 68.

ica_des_cbc_cs
Purpose

Encrypt or decrypt data with a DES key using Cipher Block Chaining with Ciphertext Stealing (CBC-CS) mode, as described in NIST Special Publication 800-38A, Chapter 6.2 and the Addendum to NIST Special Publication 800-38A on "Recommendation for Block Cipher Modes of Operation: Three Variants of Ciphertext Stealing for CBC Mode".

ica_des_cbc_cs can be used to encrypt or decrypt the last chunk of a message consisting of multiple chunks, where all chunks except the last one are encrypted or decrypted by chained calls to **ica_des_cbc**. To do this, the resulting *iv* of the last call to **ica_des_cbc** is fed into the *iv* of the **ica_des_cbc_cs** call, provided that the chunk is greater than the cipher block size (8 bytes for DES).

Format

```
unsigned int ica_des_cbc_cs(const unsigned char *in_data,
  unsigned char *out_data,
  unsigned long data_length,
  const unsigned char *key,
  unsigned char *iv,
  unsigned int direction,
  unsigned int variant);
```

Required hardware support

KMC-DEA

Parameters

const unsigned char *in_data
Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is *data_length*. The size of this buffer must be at least as large as the *data_length*.

unsigned char *out_data
Pointer to a writable buffer to contain the resulting encrypted or decrypted message. This buffer must be at least as large as *data_length*.

unsigned long data_length
Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of *in_data*. *data_length* must be greater than or equal to the cipher block size (8 bytes for DES).

const unsigned char *key
Pointer to a valid DES key of 8 bytes in length.

unsigned char *iv
Pointer to a valid initialization vector of cipher block size number of bytes. This vector is overwritten during the function. For *variant* equal to 1 or *variant* equal to 2, the result value in *iv* can be used as the initialization vector for a chained **ica_des_cbc** or **ica_des_cbc_cs** call with the same key, if *data_length* is a multiple of the cipher block size.

unsigned int direction
0 Use the decrypt function.
1 Use the encrypt function.

unsigned int variant
1 Use variant CBC-CS1 of the Addendum to NIST Special Publication 800-38A to encrypt or decrypt the message: always keep last two blocks in order.
2 Use variant CBC-CS2 of the Addendum to NIST Special Publication 800-38A to encrypt or decrypt the message: switch order of the last two blocks if *data_length* is not a multiple of the cipher block size (a multiple of 8 bytes for DES).
3 Use variant CBC-CS3 of the Addendum to NIST Special Publication 800-38A to encrypt or decrypt the message: always switch order of the last two blocks.

Return codes

0 Success

For return codes indicating exceptions, see “Return codes” on page 68.

ica_des_cfb

Purpose

Encrypt or decrypt data with a DES key using Cipher Feedback (CFB) mode, as described in NIST Special Publication 800-38A Chapter 6.3.

Format

```
unsigned int ica_des_cfb(const unsigned char *in_data,
  unsigned char *out_data,
  unsigned long data_length,
  const unsigned char *key,
  unsigned char *iv,
  unsigned int lcfb,
  unsigned int direction);
```

Required hardware support

KMF-DEA

Parameters

const unsigned char *in_data
Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is *data_length*. The size of this buffer must be at least as large as the *data_length* parameter.

unsigned char *out_data
Pointer to a writable buffer to contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as the *data_length* parameter.

unsigned long data_length
Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of *in_data*.

const unsigned char *key
Pointer to a valid DES key of 8 bytes in length.

unsigned char *iv
Pointer to a valid initialization vector of cipher block size bytes (8 bytes for DES). This vector is overwritten during the function. The result value in *iv* can be used as the initialization vector for a chained **ica_des_cfb** call with the same key, if *data_length* in the preceding call is a multiple of the *lcfb* parameter.

unsigned int lcfb
Length in bytes of the cipher feedback, which is a value greater than or equal to 1 and less than or equal to the cipher block size (8 bytes for DES).

unsigned int direction
0 Use the decrypt function.
1 Use the encrypt function.

Return codes

0 Success

For return codes indicating exceptions, see “Return codes” on page 68.

ica_des_cmac

Purpose

Authenticate data or verify the authenticity of data with a DES key using the Block Cipher Based Message Authentication Code (CMAC) mode, as described in NIST Special Publication 800-38B. **ica_des_cmac** can be used to authenticate or verify the authenticity of a complete message.

Format

```
unsigned int ica_des_cmac(const unsigned char *message,
  unsigned long message_length,
  unsigned char *mac,
  unsigned int mac_length,
  const unsigned char *key,
  unsigned int direction);
```

Required hardware support

KMAC-DEA
PCC-Compute-Last_block-CMAC-Using-DEA

Parameters

const unsigned char *message
Pointer to a readable buffer of size greater than or equal to *message_length* bytes. This buffer contains a message to be authenticated or of which the authenticity is to be verified.

unsigned long message_length
Length in bytes of the message to be authenticated or verified.

unsigned char *mac
Pointer to a buffer of size greater than or equal to *mac_length* bytes. If *direction* is equal to 1, the buffer must be writable and a message authentication code for the message in *message* of size *mac_length* bytes is written to the buffer. If *direction* is equal to 0, the buffer must be readable and contain a message authentication code to be verified against the message in *message*.

unsigned int mac_length
Length in bytes of the message authentication code *mac*, which is less than or equal to the cipher block size (8 bytes for DES). It is recommended to use a *mac_length* of 8.

const unsigned char *key
Pointer to a valid DES key of 8 bytes in length.

unsigned int direction
0 Verify message authentication code.
1 Compute message authentication code for the message.

Return codes

0 Success
EFAULT
If *direction* is equal to 0 and the verification of the message authentication code fails.

For return codes indicating exceptions, see "Return codes" on page 68.

ica_des_cmac_intermediate

Purpose

Authenticate data or verify the authenticity of data with a DES key using the Block Cipher Based Message Authentication Code (CMAC) mode, as described in NIST Special Publication 800-38B. **ica_des_cmac_intermediate** and **ica_des_cmac_last** can be used when the message to be authenticated or to be verified using CMAC is supplied in multiple chunks. **ica_des_cmac_intermediate** is used to process all but the last chunk. All message chunks to be processed by **ica_des_cmac_intermediate** must have a size that is a multiple of the cipher block size (8 bytes for DES).

Note that **ica_des_cmac_intermediate** has no direction argument. This function can be used during authentication and during authenticity verification.

Format

```
unsigned int ica_des_cmac_intermediate(const unsigned char *message,
  unsigned long message_length,
  const unsigned char *key,
  unsigned char *iv);
```

Required hardware support

KMAC-DEA

Parameters

const unsigned char *message
Pointer to a readable buffer of size greater than or equal to *message_length* bytes. This buffer contains a non-final part of a message to be authenticated, or of which the authenticity is to be verified.

unsigned long message_length
Length in bytes of the message part in *message*. This value must be a multiple of the cipher block size.

const unsigned char *key
Pointer to a valid DES key of 8 bytes in length.

unsigned char *iv
Pointer to a valid initialization vector of cipher block size bytes (8 bytes for DES). For the first message part, this parameter must be set to a string of zeros. For processing the *n*-th message part, this parameter must be the resulting *iv* value of the **ica_des_cmac_intermediate** function applied to the (*n-1*)-th message part. This vector is overwritten during the function. The result value in *iv* can be used as the initialization vector for a chained call to **ica_des_cmac_initermediate**, or to **ica_des_cmac_last** with the same key.

Return codes

0 Success

For return codes indicating exceptions, see "Return codes" on page 68.

ica_des_cmac_last

Purpose

Authenticate data or verify the authenticity of data with a DES key using the Block Cipher Based Message Authentication Code (CMAC) mode, as described in NIST Special Publication 800-38B. **ica_des_cmac_last** can be used to authenticate or verify the authenticity of a complete message or of the final part of a message for which all preceding parts were processed with **ica_des_cmac_intermediate**.

Format

```
unsigned int ica_des_cmac_last(const unsigned char *message,
  unsigned long message_length,
  unsigned char *mac,
  unsigned int mac_length,
  const unsigned char *key,
  unsigned char *iv,
  unsigned int direction);
```

Required hardware support

KMAC-DEA
PCC-Compute-Last_block-CMAC-Using-DEA

Parameters

const unsigned char *message
Pointer to a readable buffer of size greater than or equal to *message_length* bytes. This buffer contains a message or the final part of a message, to be either authenticated or of which the authenticity is to be verified.

unsigned long message_length
Length in bytes of the message to be authenticated or verified.

unsigned char *mac
Pointer to a buffer of size greater than or equal to *mac_length* bytes. If *direction* is equal to 1, the buffer must be writable and a message authentication code for the message in *message* of size *mac_length* bytes is written to the buffer. If *direction* is equal to 0, the buffer must be readable and contain a message authentication code that is verified against the message in *message*.

unsigned int mac_length
Length in bytes of the message authentication code *mac* that is less than or equal to the cipher block size (8 bytes for DES). It is recommended to use a *mac_length* of 8.

const unsigned char *key
Pointer to a valid DES key of 8 bytes in length.

unsigned char *iv
Pointer to a valid initialization vector of cipher block size number of bytes. If *iv* is NULL, *message* is assumed to be the complete message to be processed. Otherwise, *message* is the final part of a composite message to be processed and *iv* contains the output vector resulting from processing all previous parts with chained calls to **ica_des_cmac_intermediate** (the value returned in *iv* of the **ica_des_cmac_intermediate** call applied to the penultimate message part).

unsigned int direction
0 Verify message authentication code.
1 Compute message authentication code for the message.

Return codes

0 Success
EFAULT
If *direction* is equal to 0 and the verification of the message authentication code fails.

For return codes indicating exceptions, see "Return codes" on page 68.

ica_des_ctr

Purpose

Encrypt or decrypt data with a DES key using Counter (CTR) mode, as described in NIST Special Publication 800-38A Chapter 6.5. With the counter mode, each message block of the same size as the cipher block (8 bytes for DES) is combined with a counter value of the same size during encryption and decryption.

Starting with an initial counter value to be combined with the first message block, subsequent counter values to be combined with subsequent message blocks are

derived from preceding counter values by an increment function. The increment function used in **ica_des_ctr** is an arithmetic increment without carry on the *M* least significant bytes in the counter, where *M* is a parameter to **ica_des_ctr**.

Format

```
unsigned int ica_des_ctr(const unsigned char *in_data,
  unsigned char *out_data,
  unsigned long data_length,
  const unsigned char *key,
  unsigned char *ctr,
  unsigned int ctr_width,
  unsigned int direction);
```

Required hardware support

KMCTR-DEA

Parameters

const unsigned char *in_data
Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is *data_length*. The size of this buffer must be at least as large as *data_length*.

unsigned char *out_data
Pointer to a writable buffer to contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as *data_length*.

unsigned long data_length
Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of *in_data*.

const unsigned char *key
Pointer to a valid DES key of 8 bytes in length.

unsigned char *ctr
Pointer to a readable and writable buffer of the same size as the cipher block in bytes. *ctr* contains an initialization value for a counter function, and it is replaced by a new value. That new value can be used as the initialization value for a counter function in a chained **ica_des_ctr** call with the same key, if the *data_length* used in the preceding call is a multiple of the cipher block size.

unsigned int ctr_width
A number *M* between 1 and the cipher block size. This value is used by the counter increment function, which increments a counter value by incrementing without carry the least significant *M* bytes of the counter value.

unsigned int direction
0 Use the decrypt function.
1 Use the encrypt function.

Return codes

0 Success

For return codes indicating exceptions, see “Return codes” on page 68.

ica_des_ctrlist

Purpose

Encrypt or decrypt data with a DES key using Counter (CTR) mode, as described in NIST Special Publication 800-38A ,Chapter 6.5. With the counter mode, each message block of the same size as the cipher block is combined with a counter value of the same size during encryption and decryption.

The **ica_des_ctrlist** function assumes that a list *n* of precomputed counter values is provided, where *n* is the smallest integer that is less than or equal to the message size divided by the cipher block size. This function is used to optimally utilize IBM System z hardware support for non-standard counter functions.

Format

```
unsigned int ica_des_ctrlist(const unsigned char *in_data,
  unsigned char *out_data,
  unsigned long data_length,
  const unsigned char *key,
  const unsigned char *ctrlist,
  unsigned int direction);
```

Required hardware support

KMCTR-DEA

Parameters

const unsigned char *in_data
Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is *data_length*. The size of this buffer must be at least as large as *data_length*.

unsigned char *out_data
Pointer to a writable buffer to contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as *data_length*.

unsigned long data_length
Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of *in_data*.

Calls to **ica_des_ctrlist** with the same key can be chained if:
- With the possible exception of the last call in the chain the *data_length* used is a multiple of the cipher block size.
- The *ctrlist* argument of each chained call contains a list of counters that follows the counters used in the preceding call.

const unsigned char *key
Pointer to a valid DES key of 8 bytes in length.

const unsigned char *ctrlist
Pointer to a readable buffer of a size greater than or equal to *data_length*, and a multiple of the cipher block size (8 bytes for DES). *ctrlist* should contain a list of precomputed counter values, each of the same size as the cipher block.

unsigned int direction
0 Use the decrypt function.
1 Use the encrypt function.

Return codes

0 Success

For return codes indicating exceptions, see "Return codes" on page 68.

ica_des_ecb

Purpose

Encrypt or decrypt data with a DES key using Electronic Code Book (ECB) mode, as described in NIST Special Publication 800-38A Chapter 6.1.

Format

```
unsigned int ica_des_ecb(const unsigned char *in_data,
  unsigned char *out_data,
  unsigned long data_length,
  const unsigned char *key,
  unsigned int direction);
```

Required hardware support

KM-DEA

Parameters

const unsigned char *in_data
Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is *data_length*. The size of this buffer must be at least as large as *data_length*.

unsigned char *out_data
Pointer to a writeable buffer to contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as *data_length*.

unsigned long data_length
Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of *in_data*. *data_length* must be a multiple of the cipher block size (8 bytes for DES).

const unsigned char *key
Pointer to a valid DES key of 8 bytes in length.

unsigned int direction
0 Use the decrypt function.
1 Use the encrypt function.

Return codes

0 Success

For return codes indicating exceptions, see "Return codes" on page 68.

ica_des_ofb

Purpose

Encrypt or decrypt data with a DES key using Output Feedback (OFB) mode, as described in NIST Special Publication 800-38A Chapter 6.4.

Format

```
unsigned int ica_des_ofb(const unsigned char *in_data,
  unsigned char *out_data,
  unsigned long data_length,
```

```
  const unsigned char *key,
  unsigned int key_length,
  unsigned char *iv,
  unsigned int direction);
```

Required hardware support

KMO-DEA

Parameters

const unsigned char *in_data
Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is *data_length*. The size of this buffer must be at least as large as *data_length*.

unsigned char *out_data
Pointer to a writable buffer that contains the resulting encrypted or decrypted message. The size of this buffer must be at least as large as *data_length*.

unsigned long data_length
Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of *in_data*.

const unsigned char *key
Pointer to a valid DES key of 8 bytes in length.

unsigned char *iv
Pointer to a valid initialization vector of the same size as the cipher block in bytes (8 bytes for DES). This vector is overwritten during the function. If *data_length* is a multiple of the cipher block size (8 bytes for DES), the result value in *iv* can be used as the initialization vector for a chained **ica_des_ofb** call with the same key.

unsigned int direction
0 Use the decrypt function.
1 Use the encrypt function.

Return codes

0 Success

For return codes indicating exceptions, see "Return codes" on page 68.

Compatibility with earlier versions

In order to stay compatible with earlier versions of libica, the following DES interfaces remain supported:

```
unsigned int ica_des_encrypt(unsigned int mode,
 unsigned int data_length, unsigned char *input_data,
 ica_des_vector_t *iv, ica_des_key_single_t *des_key,
 unsigned char *output_data);

unsigned int ica_des_decrypt(unsigned int mode,
 unsigned int data_length, unsigned char *input_data,
 ica_des_vector_t *iv, ica_des_key_single_t *des_key,
 unsigned char *output_data);
```

Table 3 on page 29 shows libica version 2.0 DES functions calls, and their corresponding libica version 2.3.0 DES function calls.

Table 3. Compatibility of libica version 2.0 DES functions calls to libica version 2.3.0 DES function calls

Calling this libica version 2.0 DES function	Corresponds to calling this libica version 2.3.0 DES function
`ica_des_encrypt(MODE_ECB, data_length,in_data,NULL, key, out_data);`	`ica_des_ecb(in_data,out_data,(long)data_length, key,1);`
`ica_des_encrypt(MODE_CBC,data_length,in_data,iv, key,out_data);`	`ica_des_cbc(in_data,out_data,(long)data_length, key,iv,1);`
`ica_des_decrypt(MODE_ECB,data_length,in_data,NULL, key,out_data);`	`ica_des_ecb(in_data,out_data,(long)data_length, key,0);`
`ica_des_decrypt(MODE_CBC,data_length,in_data,iv, key,out_data);`	`ica_des_cbc(in_data,out_data,(long)data_length, key,iv,0);`

The functions **ica_des_encrypt** and **ica_des_decrypt** remain supported, but their use is discouraged in favor of **ica_des_ecb** and **ica_des_cbc**.

For a detailed description of the earlier APIs, see *libica Programmers Reference* version 2.0.

TDES/3DES functions

These functions are included in: `include/ica_api.h`.

These functions perform encryption and decryption or computation and verification of message authentication codes using a triple-DES (3DES, TDES or TDEA) key. A 3DES key consists of a concatenation of three DES keys, each of which has a size of 8 bytes. Note that each byte of a DES key contains one parity bit, such that each 64-bit DES key contains only 56 security-relevant bits. The cipher block size for 3DES is 8 bytes.

3DES is known in two variants: a two key variant and a three key variant. This library implements only the three key variant. The two key variant can be derived from functions for the three key variant by using the same key as the first and third key.

To securely apply 3DES encryption to messages that are longer than the cipher block size, modes of operation can be used to chain multiple encryption, decryption, or authentication operations. Most modes of operation require an initialization vector as additional input. As long as the messages are encrypted or decrypted using such a mode of operation and have a size that is a multiple of a particular block size (mostly the cipher block size), the functions encrypting or decryption according to that mode of operation also compute an output vector that can be used as the initialization vector of a chained encryption or decryption operation in the same mode with the same block size and the same key.

Note that when decrypting a cipher text, the mode of operation, the key, the initialization vector (if applicable), and for **ica_3des_cfb** the *lcfb* value used for the decryption function must match the corresponding settings of the encryption function that was used to transform the plain text into the cipher text.

ica_3des_cbc

Purpose

Encrypt or decrypt data with an 3DES key using Cipher Block Chaining (CBC) mode, as described in NIST Special Publication 800-38A Chapter 6.2.

Format

```
unsigned int ica_3des_cbc(const unsigned char *in_data,
  unsigned char *out_data,
  unsigned long data_length,
  const unsigned char *key,
  unsigned char *iv,
  unsigned int direction);
```

Required hardware support

KMC-TDEA-192

Parameters

const unsigned char *in_data
Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is *data_length*. The size of this buffer must be at least as large as *data_length*.

unsigned char *out_data
Pointer to a writable buffer to contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as *data_length*.

unsigned long data_length
Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of *in_data*. *data_length* must be a multiple of the cipher block size (8 bytes for 3DES).

const unsigned char *key
Pointer to a valid 3DES key of 24 bytes in length.

unsigned char *iv
Pointer to a valid initialization vector of cipher block size number of bytes. This vector is overwritten during the function. The result value in *iv* can be used as the initialization vector for a chained **ica_3des_cbc** or **ica_3des_cbc_cs** call with the same key.

unsigned int direction
0 Use the decrypt function.
1 Use the encrypt function.

Return codes

0 Success

For return codes indicating exceptions, see “Return codes” on page 68.

ica_3des_cbc_cs

Purpose

Encrypt or decrypt data with a 3DES key using Cipher Block Chaining with Ciphertext Stealing (CBC-CS) mode, as described in NIST Special Publication

800-38A Chapter 6.2 and the Addendum to NIST Special Publication 800-38A on "Recommendation for Block Cipher Modes of Operation: Three Variants of Ciphertext Stealing for CBC Mode".

ica_3des_cbc_cs can be used to encrypt or decrypt the last chunk of a message consisting of multiple chunks, where all chinks except the last one are encrypted or decrypted by chained calls to **ica_3des_cbc**. To do this, the resulting *iv* of the last call to **ica_3des_cbc** is fed into the *iv* of the **ica_3des_cbc_cs** call, provided that the chunk is greater than the cipher block size (8 bytes for 3DES).

Format

```
unsigned int ica_3des_cbc_cs(const unsigned char *in_data,
  unsigned char *out_data,
  unsigned long data_length,
  const unsigned char *key,
  unsigned char *iv,
  unsigned int direction,
  unsigned int variant);
```

Required hardware support

KMC-TDEA-192

Parameters

const unsigned char *in_data
Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is *data_length*. The size of this buffer must be at least as large as *data_length*.

unsigned char *out_data
Pointer to a writable buffer to contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as *data_length*.

unsigned long data_length
Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of *in_data*. *data_length* must be greater than or equal to the cipher block size (8 bytes for 3DES).

const unsigned char *key
Pointer to a valid 3DES key of 24 bytes in length.

unsigned char *iv
Pointer to a valid initialization vector of the same size as the cipher block in bytes. This vector is overwritten during the function. For *variant* equal to 1 or *variant* equal to 2, the result value in *iv* can be used as the initialization vector for a chained **ica_3des_cbc** or **ica_3des_cbc_cs** call with the same key, if *data_length* is a multiple of the cipher block size.

unsigned int direction
0 Use the decrypt function.
1 Use the encrypt function.

unsigned int variant
1 Use variant CBC-CS1 of the Addendum to NIST Special Publication 800-38A to encrypt or decrypt the message: always keep last two blocks in order.
2 Use variant CBC-CS2 of the Addendum to NIST Special Publication

800-38A to encrypt or decrypt the message: switch order of the last two blocks if *data_length* is not a multiple of the cipher block size (a multiple of 8 bytes for 3DES).

3 Use variant CBC-CS3 of the Addendum to NIST Special Publication 800-38A to encrypt or decrypt the message: always switch order of the last two blocks.

Return codes

0 Success

For return codes indicating exceptions, see "Return codes" on page 68.

ica_3des_cfb

Purpose

Encrypt or decrypt data with a 3DES key using Cipher Feedback (CFB) mode, as described in NIST Special Publication 800-38A Chapter 6.3.

Format

```
unsigned int ica_3des_cfb(const unsigned char *in_data,
  unsigned char *out_data,
  unsigned long data_length,
  const unsigned char *key,
  unsigned char *iv,
  unsigned int lcfb,
  unsigned int direction);
```

Required hardware support

KMF-TDEA-192

Parameters

const unsigned char *in_data
Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is *data_length*. The size of this buffer must be at least as large as *data_length*.

unsigned char *out_data
Pointer to a writable buffer to contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as *data_length*.

unsigned long data_length
Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of *in_data*.

const unsigned char *key
Pointer to a valid 3DES key of 24 bytes in length.

unsigned char *iv
Pointer to a valid initialization vector of cipher block size number of bytes (8 bytes for 3DES). This vector is overwritten during the function. The result value in *iv* can be used as the initialization vector for a chained **ica_3des_cfb** call with the same key, if the *data_length* in the preceding call is a multiple of *lcfb*.

unsigned int lcfb
Length in bytes of the cipher feedback, which is a value greater than or equal to 1 and less than or equal to the cipher block size (8 bytes for 3DES).

unsigned int direction

0 Use the decrypt function.

1 Use the encrypt function.

Return codes

0 Success

For return codes indicating exceptions, see "Return codes" on page 68.

ica_3des_cmac

Purpose

Authenticate data or verify the authenticity of data with an 3DES key using the Block Cipher Based Message Authentication Code (CMAC) mode, as described in NIST Special Publication 800-38B. **ica_3des_cmac** can be used to authenticate or verify the authenticity of a complete message.

Format

```
unsigned int ica_3des_cmac(const unsigned char *message,
  unsigned long message_length,
  unsigned char *mac,
  unsigned int mac_length,
  const unsigned char *key,
  unsigned int direction);
```

Required hardware support

KMAC-TDEA-192

PCC-Compute-Last_block-CMAC-Using-TDEA-192

Parameters

const unsigned char *message

Pointer to a readable buffer of size greater than or equal to *message_length* bytes. This buffer contains a message to be authenticated, or of which the authenticity is to be verified.

unsigned long message_length

Length in bytes of the message to be authenticated or verified.

unsigned char *mac

Pointer to a buffer of size greater than or equal to *mac_length* bytes. If *direction* is equal to 1, the buffer must be writable and a message authentication code for the message in *message* of size *mac_length* bytes is written to the buffer. If *direction* is equal to 0, the buffer must be readable and contain a message authentication code to be verified against the message in *message*.

unsigned int mac_length

Length in bytes of the message authentication code *mac*, which is less than or equal to the cipher block size (8 bytes for 3DES). It is recommended to use a *mac_length* of 8.

const unsigned char *key

Pointer to a valid 3DES key of 24 bytes in length.

unsigned int direction

0 Verify message authentication code.

1 Compute message authentication code for the message.

Return codes

0 Success

EFAULT

If *direction* is equal to 0 and the verification of the message authentication code fails.

For return codes indicating exceptions, see "Return codes" on page 68.

ica_3des_cmac_intermediate

Purpose

Authenticate data or verify the authenticity of data with an 3DES key using the Block Cipher Based Message Authentication Code (CMAC) mode, as described in NIST Special Publication 800-38B. **ica_3des_cmac_intermediate** and **ica_3des_cmac_last** can be used when the message to be authenticated or to be verified using CMAC is supplied in multiple chunks. **ica_3des_cmac_intermediate** is used to process all but the last chunk. All message chunks to be processed by **ica_3des_cmac_intermediate** must have a size that is a multiple of the cipher block size (a multiple of 8 bytes for 3DES).

Note that **ica_3des_cmac_intermediate** has no direction argument. This function can be used during authentication and during authenticity verification.

Format

```
unsigned int ica_3des_cmac_intermediate(const unsigned char *message,
  unsigned long message_length,
  const unsigned char *key,
  unsigned char *iv);
```

Required hardware support

KMAC-TDEA-192

Parameters

const unsigned char *message

Pointer to a readable buffer of size greater than or equal to *message_length* bytes. This buffer contains a non-final part of a message to be authenticated, or of which the authenticity is to be verified.

unsigned long message_length

Length in bytes of the message part in *message*. This value must be a multiple of the cipher block size.

const unsigned char *key

Pointer to a valid 3DES key of 24 bytes in length.

unsigned char *iv

Pointer to a valid initialization vector of size cipher block size (8 bytes for 3DES). For the first message part, this parameter must be set to a string of zeros. For processing the *n*-th message part, this parameter must be the resulting *iv* value of the **ica_3des_cmac_intermediate** applied to the (*n-1*)-th message part. This vector is overwritten during the function. The result value in *iv* can be used as the initialization vector for a chained call to **ica_3des_cmac_initermediate** or to **ica_3des_cmac_last** with the same key.

Return codes

0 Success

For return codes indicating exceptions, see "Return codes" on page 68.

ica_3des_cmac_last

Purpose

Authenticate data or verify the authenticity of data with an 3DES key using the Block Cipher Based Message Authentication Code (CMAC) mode, as described in NIST Special Publication 800-38B. **ica_3des_cmac_last** can be used to authenticate or verify the authenticity of a complete message or of the final part of a message, for which all preceding parts were processed with **ica_3des_cmac_intermediate**.

Format

```
unsigned int ica_3des_cmac_last(const unsigned char *message,
  unsigned long message_length,
  unsigned char *mac,
  unsigned int mac_length,
  const unsigned char *key,
  unsigned char *iv,
  unsigned int direction);
```

Required hardware support

KMAC-TDEA,-192
PCC-Compute-Last_block-CMAC-Using-TDEA-192

Parameters

const unsigned char *message
Pointer to a readable buffer of size greater than or equal to *message_length* bytes. It contains a message or the final part of a message to be authenticated, or of which the authenticity is to be verified.

unsigned long message_length
Length in bytes of the message to be authenticated or verified.

unsigned char *mac
Pointer to a buffer of size greater than or equal to *mac_length* bytes. If *direction* is equal to 1, the buffer must be writable and a message authentication code for the message in *message* of size *mac_length* bytes is written to the buffer. If *direction* is equal to 0, the buffer must be readable and contain a message authentication code that is to be verified against the message in *message*.

unsigned int mac_length
Length in bytes of the message authentication code *mac* in bytes that is less than or equal to the cipher block size (8 bytes for 3DES). It is recommended to use a *mac_length* of 8.

const unsigned char *key
Pointer to a valid 3DES key of 24 bytes in length.

unsigned char *iv
Pointer to a valid initialization vector of cipher block size number of bytes. If *iv* is NULL, *message* is assumed to be the complete message to be processed. Otherwise, *message* is the final part of a composite message to be processed and *iv* contains the output vector resulting from processing all previous parts with chained calls to **ica_des_cmac_intermediate** (the value returned in *iv* of the **ica_des_cmac_intermediate** call applied to the penultimate message part.

unsigned int direction
0 Verify message authentication code.
1 Compute message authentication code for the message.

Return codes

0 Success

EFAULT
If *direction* is equal to 0 and the verification of the message authentication code fails.

For return codes indicating exceptions, see "Return codes" on page 68.

ica_3des_ctr

Purpose

Encrypt or decrypt data with a triple-length DES key using Counter (CTR) mode, as described in NIST Special Publication 800-38A Chapter 6.5. With the counter mode, each message block of size cipher block size (8 bytes for 3DES) is combined with a counter value of the same size during encryption and decryption.

Starting with an initial counter value to be combined with the first message block, subsequent counter values to be combined with subsequent message blocks are derived from preceding counter values by an increment function. The increment function used in **ica_3des_ctr** is an arithmetic increment without carry on the *M* least significant bytes in the counter, where *M* is a parameter to **ica_3des_ctr**.

Format

```
unsigned int ica_3des_ctr(const unsigned char *in_data,
  unsigned char *out_data,
  unsigned long data_length,
  const unsigned char *key,
  unsigned char *ctr,
  unsigned int ctr_width,
  unsigned int direction);
```

Required hardware support

KMCTR-TDEA-192

Parameters

const unsigned char *in_data
Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is *data_length*. The size of this buffer must be at least as large as *data_length*.

unsigned char *out_data
Pointer to a writable buffer to contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as *data_length*.

unsigned long data_length
Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of *in_data*.

const unsigned char *key
Pointer to a valid 3DES key of 24 bytes in length.

unsigned char *ctr
Pointer to a readable and writable buffer of the same size as the cipher block in bytes. *ctr* contains an initialization value for a counter function that is replaced by a new value. The new value can be used as an initialization value for a counter function in a chained **ica_3des_ctr** call with the same key, if the *data_length* used in the preceding call is a multiple of the cipher block size.

unsigned int ctr_width
A number *M* between 1 and the cipher block size. The value is used by the counter increment function, which increments a counter value by incrementing without carry the least significant *M* bytes of the counter value.

unsigned int direction
0 Use the decrypt function.
1 Use the encrypt function.

Return codes
0 Success

For return codes indicating exceptions, see "Return codes" on page 68.

ica_3des_ctrlist
Purpose

Encrypt or decrypt data with an 3DES key using Counter (CTR) mode, as described in NIST Special Publication 800-38A ,Chapter 6.5. With the counter mode, each message block of the same size as the cipher block is combined with a counter value of the same size during encryption and decryption.

The **ica_3des_ctrlist** function assumes that a list *n* of precomputed counter values is provided where *n* is the smallest integer that is less than or equal to the message size divided by the cipher block size. This function is used to optimally utilize IBM System z hardware support for non-standard counter functions.

Format
```
unsigned int ica_3des_ctrlist(const unsigned char *in_data,
  unsigned char *out_data,
  unsigned long data_length,
  const unsigned char *key,
  const unsigned char *ctrlist,
  unsigned int direction);
```

Required hardware support

KMCTR-TDEA-192

Parameters

const unsigned char *in_data
Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is *data_length*. The size of this buffer must be at least as large as *data_length*.

unsigned char *out_data
Pointer to a writable buffer to contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as *data_length*.

unsigned long data_length
Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of *in_data*.

Calls to **ica_3des_ctrlist** with the same key can be chained if:
- With the possible exception of the last call in the chain the *data_length* used is a multiple of the cipher block size.
- The *ctrlist* argument of each chained call contains a list of counters that follows the counters used in the preceding call.

const unsigned char *key
Pointer to a valid 3DES key of 24 bytes in length.

const unsigned char *ctrlist
Pointer to a readable buffer that is both of size greater than or equal to *data_length*, and a multiple of the cipher block size (8 bytes for 3DES). *ctrlist* should contain a list of precomputed counter values, each of the same size as the cipher block.

unsigned int direction
0 Use the decrypt function.
1 Use the encrypt function.

Return codes
0 Success

For return codes indicating exceptions, see "Return codes" on page 68.

ica_3des_ecb
Purpose

Encrypt or decrypt data with an 3DES key using Electronic Code Book (ECB) mode, as described in NIST Special Publication 800-38A Chapter 6.1.

Format
```
unsigned int ica_3des_ecb(const unsigned char *in_data,
  unsigned char *out_data,
  unsigned long data_length,
  const unsigned char *key,
  unsigned int direction);
```

Required hardware support

KM-DEA-192

Parameters

const unsigned char *in_data
Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is *data_length*. The size of this buffer must be at least as large as *data_length*.

unsigned char *out_data
Pointer to a writeable buffer to contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as *data_length*.

unsigned long data_length
Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of *in_data*. *data_length* must be a multiple of the cipher block size (8 bytes for 3DES).

const unsigned char *key
Pointer to a valid 3DES key of 24 bytes in length.

unsigned int direction
0 Use the decrypt function.
1 Use the encrypt function.

Return codes

0 Success

For return codes indicating exceptions, see "Return codes" on page 68.

ica_3des_ofb

Purpose

Encrypt or decrypt data with an 3DES key using Output Feedback (OFB) mode, as described in NIST Special Publication 800-38A Chapter 6.4.

Format

```
unsigned int ica_3des_ofb(const unsigned char *in_data,
  unsigned char *out_data,
  unsigned long data_length,
  const unsigned char *key,
  unsigned int key_length,
  unsigned char *iv,
  unsigned int direction);
```

Required hardware support

KMO-TDEA-192

Parameters

const unsigned char *in_data
Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is *data_length*. The size of this buffer must be at least as large as *data_length*.

unsigned char *out_data
Pointer to a writable buffer that contains the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as *data_length*.

unsigned long data_length
Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of *in_data*.

const unsigned char *key
Pointer to a valid 3DES key of 24 bytes in length.

unsigned char *iv
Pointer to a valid initialization vector of the same size as the cipher block in bytes (8 bytes for 3DES). This vector is overwritten during the function. If *data_length* is a multiple of the cipher block size (a multiple of 8 for 3DES), the result value in *iv* can be used as the initialization vector for a chained **ica_3des_ofb** call with the same key.

unsigned int direction
0 Use the decrypt function.
1 Use the encrypt function.

Return codes

0 Success

For return codes indicating exceptions, see "Return codes" on page 68.

Compatibility with earlier versions

In order to stay compatible with earlier versions of libica, the following 3DES interfaces remain supported:

```
unsigned int ica_3des_encrypt(unsigned int mode,
 unsigned int data_length, unsigned char *input_data,
 ica_des_vector_t *iv, ica_des_key_triple_t *des_key,
 unsigned char *output_data);
unsigned int ica_3des_decrypt(unsigned int mode,
 unsigned int data_length, unsigned char *input_data,
 ica_des_vector_t *iv, ica_des_key_triple_t *des_key,
 unsigned char *output_data);
```

Table 4 shows libica version 2.0 TDES functions calls, and their corresponding libica version 2.3.0 TDES function calls.

Table 4. Compatibility of libica version 2.0 TDES functions calls to libica version 2.3.0 TDES function calls

Calling this libica version 2.0 TDES function	**Corresponds to calling this libica version 2.3.0 TDES function**
`ica_3des_encrypt(MODE_ECB, data_length,in_data,NULL, key, out_data);`	`ica_3des_ecb(in_data,out_data,(long)data_length, key,1);`
`ica_3des_encrypt(MODE_CBC,data_length,in_data,iv, key,out_data);`	`ica_3des_cbc(in_data,out_data,(long)data_length, key,iv,1);`
`ica_3des_decrypt(MODE_ECB,data_length,in_data,NULL, key,out_data);`	`ica_3des_ecb(in_data,out_data,(long)data_length, key,0);`
`ica_3des_decrypt(MODE_CBC,data_length,in_data,iv, key,out_data);`	`ica_3des_cbc(in_data,out_data,(long)data_length,, key,iv,0);`

The functions **ica_3des_encrypt** and **ica_3des_decrypt** remain supported, but their use is discouraged in favor of **ica_3des_ecb** and **ica_3des_cbc**.

For a detailed description of the earlier APIs, see *libica Programmers Reference* version 2.0.

AES functions

These functions are included in: `include/ica_api.h`.

These functions perform encryption and decryption or computation or verification of message authentication codes using an AES key. Supported key lengths are 16, 24 or 32 bytes for AES-128, AES-192 and AES-256 respectively. The cipher block size for AES is 16 bytes.

To securely apply AES encryption to messages that are longer than the cipher block size, modes of operation can be used to chain multiple encryption, decryption, or authentication operations. Most modes of operation require an initialization vector as additional input.

As long as the messages are encrypted or decrypted using such a mode of operation, have a size that is a multiple of a particular block size (mostly the cipher block size), the functions encrypting or decryption according to a mode of operation also compute an output vector. The output vector can be used as the initialization vector of a chained encryption or decryption operation in the same mode with the same block size and the same key.

Note that when decrypting a cipher text the mode of operation, the key, the initialization vector (if applicable), and for **ica_aes_cfb** the *lcfb* value used for the decryption function must match the corresponding settings of the encryption function that transformed the plain text into the cipher text.

ica_aes_cbc

Purpose

Encrypt or decrypt data with an AES key using Cipher Block Chaining (CBC) mode, as described in NIST Special Publication 800-38A Chapter 6.2.

Format

```
unsigned int ica_aes_cbc(const unsigned char *in_data,
  unsigned char *out_data,
  unsigned long data_length,
  const unsigned char *key,
  unsigned int key_length,
  unsigned char *iv,
  unsigned int direction);
```

Required hardware support

KMC-AES-128, KMC-AES-192, or KMC-AES-256

Parameters

const unsigned char *in_data
Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is *data_length*. The size of this buffer must be at least as large as *data_length*.

unsigned char *out_data
Pointer to a writable buffer to contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as *data_length*.

unsigned long data_length
Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of *in_data*. *data_length* must be a multiple of the cipher block size (a multiple of 16 for AES).

const unsigned char *key
Pointer to a valid AES key.

unsigned int key_length
Length in bytes of the AES key. Supported sizes are 16, 24, and 32, for AES-128, AES-192, and AES-256 respectively. Therefore, you can use the definitions: **AES_KEY_LEN128**, **AES_KEY_LEN192**, and **AES_KEY_LEN256**.

unsigned char *iv
Pointer to a valid initialization vector of the same size as the cipher block in bytes. This vector is overwritten during the function. The result value in *iv* can be used as the initialization vector for a chained **ica_aes_cbc** or **ica_aes_cbc_cs** call with the same key.

unsigned int direction
0 Use the decrypt function.
1 Use the encrypt function.

Return codes

0 Success

For return codes indicating exceptions, see “Return codes” on page 68.

ica_aes_cbc_cs

Purpose

Encrypt or decrypt data with an AES key using Cipher Block Chaining with Ciphertext Stealing (CBC-CS) mode, as described in NIST Special Publication 800-38A Chapter 6.2, and the Addendum to NIST Special Publication 800-38A on "Recommendation for Block Cipher Modes of Operation: Three Variants of Ciphertext Stealing for CBC Mode".

ica_aes_cbc_cs can be used to encrypt or decrypt the last chunk of a message consisting of multiple chunks, where all chunks except the last one are encrypted or decrypted by chained calls to **ica_aes_cbc**. To do this, the resulting *iv* of the last call to **ica_aes_cbc** is fed into the *iv* of the **ica_aes_cbc_cs** call, provided that the chunk is greater than the cipher block size (greater than 16 bytes for AES).

Format

```
unsigned int ica_aes_cbc_cs(const unsigned char *in_data,
  unsigned char *out_data,
  unsigned long data_length,
  const unsigned char *key,
  unsigned int key_length,
  unsigned char *iv,
  unsigned int direction,
  unsigned int variant);
```

Required hardware support

KMC-AES-128, KMC-AES-192 or KMC-AES-256

Parameters

const unsigned char *in_data
Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is *data_length*. The size of this buffer must be at least as large as *data_length*.

unsigned char *out_data
Pointer to a writable buffer to contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as *data_length*.

unsigned long data_length
Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of *in_data*. *data_length* must be greater than or equal to the cipher block size (16 bytes for AES).

const unsigned char *key
Pointer to a valid AES key.

unsigned int key_length
Length in bytes of the AES key. Supported sizes are 16, 24, and 32, for AES-128, AES-192, and AES-256 respectively. . Therefore, you can use the definitions: **AES_KEY_LEN128**, **AES_KEY_LEN192**, and **AES_KEY_LEN256**.

unsigned char *iv
Pointer to a valid initialization vector of cipher block size number of bytes. This vector is overwritten during the function. For *variant* equal to 1 or *variant*

equal to 2, the result value in *iv* can be used as the initialization vector for a chained **ica_aes_cbc** or **ica_aes_cbc_cs** call with the same key, if *data_length* is a multiple of the cipher block size.

unsigned int direction

0 Use the decrypt function.

1 Use the encrypt function.

unsigned int variant

1 Use variant CBC-CS1 of the Addendum to NIST Special Publication 800-38A to encrypt or decrypt the message: always keep last two blocks in order.

2 Use variant CBC-CS2 of the Addendum to NIST Special Publication 800-38A to encrypt or decrypt the message: switch order of the last two blocks if *data_length* is not a multiple of the cipher block size (a multiple of 16 bytes for AES).

3 Use variant CBC-CS3 of the Addendum to NIST Special Publication 800-38A to encrypt or decrypt the message: always switch order of the last two blocks.

Return codes

0 Success

For return codes indicating exceptions, see "Return codes" on page 68.

ica_aes_ccm

Purpose

Encrypt and authenticate or decrypt data and check authenticity of data with an AES key using Counter with Cipher Block Chaining Message Authentication Code (CCM) mode, as described in NIST Special Publication 800-38C. Formatting and counter functions are implemented according to NIST 800-38C Appendix A.

Format

```
unsigned int ica_aes_ccm(unsigned char *payload,
  unsigned long payload_length,
  unsigned char *ciphertext_n_mac,
  unsigned int mac_length,
  const unsigned char *assoc_data,
  unsigned long assoc_data_length,
  const unsigned char *nonce,
  unsigned int nonce_length,
  const unsigned char *key,
  unsigned int key_length,
  unsigned int direction);
```

Required hardware support

KMCTR-AES-128, KMCTR-AES-192, or KMCTR-AES-256
KMAC-AES-128, KMAC-AES-192, or KMAC-AES-256

Parameters

unsigned char *payload

Pointer to a buffer of size greater than or equal to *payload_length* bytes. If *direction* is equal to 1, the payload buffer must be readable and contain a payload message of size *payload_length* to be encrypted. If direction is equal to 0, the payload buffer must be writable. If the authentication verification

succeeds, the decrypted message in the most significant *payload_length* bytes of *ciphertext_n_mac* is written to this buffer. Otherwise, the contents of this buffer is undefined.

unsigned long payload_length
Length in bytes of the message to be encrypted or decrypted. This value can be 0 unless *assoc_data_length* is equal to 0.

unsigned char *ciphertext_n_mac
Pointer to a buffer of size greater than or equal to *payload_length* plus *mac_length* bytes. If *direction* is equal to 1, the buffer must be writable and the encrypted message from *payload* followed by the message authentication code for the nonce, the payload, and associated data are written to that buffer. If direction is equal to 0, then the buffer is readable and contains an encrypted message of length *payload_length* followed by a message authentication code of length *mac_length*.

unsigned int mac_length
Length in bytes of the message authentication code. Valid values are: 4, 6, 8, 10, 12, and 16.

const unsigned char *assoc_data
Pointer to a readable buffer of size greater than or equal to *assoc_data_length* bytes. The associated data in the most significant *assoc_data_length* bytes is subject to the authentication code computation, but is not encrypted.

unsigned long assoc_data_length
Length of the associated data in *assoc_data*. This value can be 0 unless *payload_length* is equal to 0.

const unsigned char *nonce
Pointer to readable buffer of size greater than or equal to *nonce_length* bytes, which contains a nonce (number used once) of size *nonce_length* bytes.

unsigned int nonce_length
Length of the *nonce* in bytes. Valid values are greater than 6 and less than 14.

const unsigned char *key
Specifies a pointer to a valid AES key.

unsigned int key_length
Length in bytes of the AES key. Supported sizes are 16, 24, and 32 for AES-128, AES-192 and AES-256 respectively. Therefore, you can use the definitions: **AES_KEY_LEN128**, **AES_KEY_LEN192**, and **AES_KEY_LEN256**.

unsigned int direction
0 Use the decrypt function.
1 Use the encrypt function.

Return codes

0 Success

EFAULT
If *direction* is equal to 0 and the verification of the message authentication code fails.

For return codes indicating exceptions, see “Return codes” on page 68.

ica_aes_cfb

Purpose

Encrypt or decrypt data with an AES key using Cipher Feedback (CFB) mode, as described in NIST Special Publication 800-38A Chapter 6.3.

Format

```
unsigned int ica_aes_cfb(const unsigned char *in_data,
  unsigned char *out_data,
  unsigned long data_length,
  const unsigned char *key,
  unsigned int key_length,
  unsigned char *iv,
  unsigned int lcfb,
  unsigned int direction);
```

Required hardware support

KMF-AES-128, KMF-AES-192, or KMF-AES-256

Parameters

const unsigned char *in_data
Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is *data_length*. The size of this buffer must be at least as large as *data_length*.

unsigned char *out_data
Pointer to a writable buffer to contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as *data_length*.

unsigned long data_length
Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of *in_data*.

const unsigned char *key
Pointer to a valid AES key.

unsigned int key_length
Length in bytes of the AES key. Supported sizes are 16, 24, and 32, for AES-128, AES-192, and AES-256 respectively. Therefore, you can use the definitions: **AES_KEY_LEN128**, **AES_KEY_LEN192**, and **AES_KEY_LEN256**.

unsigned char *iv
Pointer to a valid initialization vector of the same size as the cipher block in bytes (16 bytes for AES). This vector is overwritten during the function. The result value in *iv* can be used as the initialization vector for a chained **ica_aes_cfb** call with the same key, if the *data_length* in the preceding call is a multiple of *lcfb*.

unsigned int lcfb
Length in bytes of the cipher feedback, which is a value greater than or equal to 1 and less than or equal to the cipher block size (16 bytes for AES).

unsigned int direction
0 Use the decrypt function.
1 Use the encrypt function.

Return codes

0 Success

For return codes indicating exceptions, see "Return codes" on page 68.

ica_aes_cmac

Purpose

Authenticate data or verify the authenticity of data with an AES key using the Block Cipher Based Message Authentication Code (CMAC) mode, as described in NIST Special Publication 800-38B. **ica_aes_cmac** can be used to authenticate or verify the authenticity of a complete message.

Format

```
unsigned int ica_aes_cmac(const unsigned char *message,
  unsigned long message_length,
  unsigned char *mac,
  unsigned int mac_length,
  const unsigned char *key,
  unsigned int key_length,
  unsigned int direction);
```

Required hardware support

KMAC-AES-128, KMAC-AES-192 or KMAC-AES-256
PCC-Compute-Last_block-CMAC-Using-AES-128, PCC-Compute-Last_block-CMAC-Using-AES-192, or PCC-Compute-Last_block-CMAC-Using-AES-256

Parameters

const unsigned char *message
Pointer to a readable buffer of size greater than or equal to *message_length* bytes. This buffer contains a message to be authenticated, or of which the authenticity is to be verified.

unsigned long message_length
Length in bytes of the message to be authenticated or verified.

unsigned char *mac
Pointer to a buffer of size greater than or equal to *mac_length* bytes. If *direction* is equal to 1, the buffer must be writable and a message authentication code for the message in message of size *mac_length* bytes is written to this buffer. If direction is equal to 0, this buffer must be readable and contain a message authentication code to be verified against the message in *message*.

unsigned int mac_length
Length in bytes of the message authentication code *mac* in bytes, which is less than or equal to the cipher block size (16 bytes for AES). It is recommended to use values greater than or equal to 8.

const unsigned char *key
Pointer to a valid AES key.

unsigned int key_length
Length in bytes of the AES key. Supported sizes are 16, 24, and 32 for AES-128, AES-192, and AES-256 respectively. Therefore, you can use the definitions: **AES_KEY_LEN128**, **AES_KEY_LEN192**, and **AES_KEY_LEN256**.

unsigned int direction
0 Verify message authentication code.
1 Compute message authentication code for the message.

Return codes

0 Success

EFAULT
If *direction* is equal to 0 and the verification of the message authentication code fails.

For return codes indicating exceptions, see "Return codes" on page 68.

ica_aes_cmac_intermediate

Purpose

Authenticate data or verify the authenticity of data with an AES key using the Block Cipher Based Message Authentication Code (CMAC) mode, as described in NIST Special Publication 800-38B. **ica_aes_cmac_intermediate** and **ica_aes_cmac_last** can be used when the message to be authenticated or to be verified using CMAC is supplied in multiple chunks. **ica_aes_cmac_intermediate** is used to process all but the last chunk. All message chunks to be processed by **ica_aes_cmac_intermediate** must have a size that is a multiple of the cipher block size (a multiple of 16 bytes for AES).

Note that **ica_aes_cmac_intermediate** has no direction argument. This function can be used during authentication and during authenticity verification.

Format

```
unsigned int ica_aes_cmac_intermediate(const unsigned char *message,
  unsigned long message_length,
  const unsigned char *key,
  unsigned int key_length,
  unsigned char *iv);
```

Required hardware support

KMAC-AES-128, KMAC-AES-192, or KMAC-AES-256

Parameters

const unsigned char *message
Pointer to a readable buffer of size greater than or equal to *message_length* bytes. This buffer contains a non-final part of a message, to be authenticated or of which the authenticity is to be verified.

unsigned long message_length
Length in bytes of the message part in *message*. This value must be a multiple of the cipher block size.

const unsigned char *key
Pointer to a valid AES key.

unsigned int key_length
Length in bytes of the AES key. Supported sizes are 16, 24, and 32 for AES-128, AES-192, and AES-256 respectively. Therefore, you can use the definitions: **AES_KEY_LEN128**, **AES_KEY_LEN192**, and **AES_KEY_LEN256**.

unsigned char *iv
Pointer to a valid initialization vector of cipher block size number of bytes (16 bytes for AES). For the first message part, this parameter must be set to a string of zeros. For processing the *n*-th message part, this parameter must be the resulting *iv* value of the **ica_aes_cmac_intermediate** function applied to the (*n-1*)-th message part. This vector is overwritten during the function. The result

value in *iv* can be used as the initialization vector for a chained call to **ica_aes_cmac_initermediate** or to **ica_aes_cmac_last** with the same key.

Return codes

0 Success

For return codes indicating exceptions, see "Return codes" on page 68.

ica_aes_cmac_last

Purpose

Authenticate data or verify the authenticity of data with an AES key using the Block Cipher Based Message Authentication Code (CMAC) mode, as described in NIST Special Publication 800-38B. **ica_aes_cmac_last** can be used to authenticate or verify the authenticity of a complete message, or of the final part of a message for which all preceding parts were processed with **ica_aes_cmac_intermediate**.

Format

```
unsigned int ica_aes_cmac_last(const unsigned char *message,
  unsigned long message_length,
  unsigned char *mac,
  unsigned int mac_length,
  const unsigned char *key,
  unsigned int key_length,
  unsigned char *iv,
  unsigned int direction);
```

Required hardware support

KMAC-AES-128, KMAC-AES-192 or KMAC-AES-256
PCC-Compute-Last_block-CMAC-Using-AES-128, PCC-Compute-Last_block-CMAC-Using-AES-192, or PCC-Compute-Last_block-CMAC-Using-AES-256

Parameters

const unsigned char *message
Pointer to a readable buffer of size greater than or equal to *message_length* bytes. This buffer contains a message or the final part of a message to be authenticated, or of which the authenticity is to be verified.

unsigned long message_length
Length in bytes of the message to be authenticated or verified.

unsigned char *mac
Pointer to a buffer of size greater than or equal to *mac_length* bytes. If *direction* is equal to 1, the buffer must be writable and a message authentication code for the message in *message* of size *mac_length* bytes is written to the buffer. If *direction* is equal to 0, the buffer must be readable and contain a message authentication code that is verified against the message in *message*.

unsigned int mac_length
Length in bytes of the message authentication code *mac* in bytes, which is less than or equal to the cipher block size (16 bytes for AES). It is recommended to use values greater than or equal to 8.

const unsigned char *key
Pointer to a valid AES key.

unsigned int key_length
Length in bytes of the AES key. Supported sizes are 16, 24, and 32 for AES-128,

AES-192, and AES-256 respectively. Therefore, you can use the definitions: **AES_KEY_LEN128**, **AES_KEY_LEN192**, and **AES_KEY_LEN256**.

unsigned char *iv
Pointer to a valid initialization vector of cipher block size number of bytes. If *iv* is NULL, *message* is assumed to be the complete message to be processed. Otherwise, *message* is the final part of a composite message to be processed, and *iv* contains the output vector resulting from processing all previous parts with chained calls to **ica_aes_cmac_intermediate** (the value returned in *iv* of the **ica_aes_cmac_intermediate** call applied to the penultimate message part).

unsigned int direction
0 Verify message authentication code.
1 Compute message authentication code for the message.

Return codes

0 Success
EFAULT
If *direction* is equal to 0 and the verification of the message authentication code fails.

For return codes indicating exceptions, see "Return codes" on page 68.

ica_aes_ctr

Purpose

Encrypt or decrypt data with an AES key using Counter (CTR) mode, as described in NIST Special Publication 800-38A Chapter 6.5. With the counter mode, each message block of size cipher block size (16 bytes for AES) is combined with a counter value of the same size during encryption and decryption.

Starting with an initial counter value to be combined with the first message block, subsequent counter values to be combined with subsequent message blocks are derived from preceding counter values by an increment function. The increment function used in **ica_aes_ctr** is an arithmetic increment without carry on the *M* least significant bytes in the counter where *M* is a parameter to **ica_aes_ctr**.

Format

```
unsigned int ica_aes_ctr(const unsigned char *in_data,
  unsigned char *out_data,
  unsigned long data_length,
  const unsigned char *key,
  unsigned int key_length,
  unsigned char *ctr,
  unsigned int ctr_width,
  unsigned int direction);
```

Required hardware support

KMCTR-AES-128, KMCTR-AES-192, or KMCTR-AES-256

Parameters

const unsigned char *in_data
Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is *data_length*. The size of this buffer must be at least as large as *data_length*.

unsigned char *out_data
Pointer to a writable buffer to contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as *data_length*.

unsigned long data_length
Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of *in_data*.

const unsigned char *key
Pointer to a valid AES key.

unsigned int key_length
Length in bytes of the AES key. Supported sizes are 16, 24, and 32 for AES-128, AES-192, and AES-256 respectively. Therefore, you can use the definitions: **AES_KEY_LEN128**, **AES_KEY_LEN192**, and **AES_KEY_LEN256**.

unsigned char *ctr
Pointer to a readable and writable buffer of the same size as the cipher block in bytes. *ctr* contains an initialization value for a counter function, and it is replaced by a new value. That new value can be used as an initialization value for a counter function in a chained **ica_aes_ctr** call with the same key, if the *data_length* used in the preceding call is a multiple of the cipher block size.

unsigned int ctr_width
A number *M* between 1 and the cipher block size. The value is used by the counter increment function, which increments a counter value by incrementing without carry the least significant *M* bytes of the counter value.

unsigned int direction
0 Use the decrypt function.
1 Use the encrypt function.

Return codes
0 Success

For return codes indicating exceptions, see "Return codes" on page 68.

ica_aes_ctrlist
Purpose

Encrypt or decrypt data with an AES key using Counter (CTR) mode, as described in NIST Special Publication 800-38A ,Chapter 6.5. With the counter mode, each message block of the same size as the cipher block in bytes is combined with a counter value of the same size during encryption and decryption.

The **ica_aes_ctrlist** function assumes that a list *n* of precomputed counter values is provided, where *n* is the smallest integer that is less than or equal to the message size divided by the cipher block size. This function optimally uses IBM System z hardware support for non-standard counter functions.

Format
```
unsigned int ica_aes_ctrlist(const unsigned char *in_data,
  unsigned char *out_data,
  unsigned long data_length,
  const unsigned char *key,
  unsigned int key_length,
  const unsigned char *ctrlist,
  unsigned int direction);
```

Required hardware support

KMCTR-DEAKMCTR-AES-128, KMCTR-AES-192, or KMCTR-AES-256

Parameters

const unsigned char *in_data
Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is *data_length*. The size of this buffer must be at least as large as *data_length*.

unsigned char *out_data
Pointer to a writable buffer to contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as *data_length*.

unsigned long data_length
Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of *in_data*.

Calls to **ica_aes_ctrlist** with the same key can be chained if:
- With the possible exception of the last call in the chain the *data_length* used is a multiple of the cipher block size.
- The *ctrlist* argument of each chained call contains a list of counters that follows the counters used in the preceding call.

const unsigned char *key
Pointer to a valid AES key.

unsigned int key_length
Length in bytes of the AES key. Supported sizes are 16, 24, and 32 for AES-128, AES-192, and AES-256 respectively. Therefore, you can use the definitions: **AES_KEY_LEN128**, **AES_KEY_LEN192**, and **AES_KEY_LEN256**.

const unsigned char *ctrlist
Pointer to a readable buffer that is both of a size greater than or equal to *data_length*, and a multiple of the cipher block size (16 bytes for AES). *ctrlist* should contain a list of precomputed counter values, each of the same size as the cipher block.

unsigned int direction
0 Use the decrypt function.
1 Use the encrypt function.

Return codes
0 Success

For return codes indicating exceptions, see “Return codes” on page 68.

ica_aes_ecb
Purpose

Encrypt or decrypt data with an AES key using Electronic Code Book (ECB) mode, as described in NIST Special Publication 800-38A Chapter 6.1.

Format

```
unsigned int ica_aes_ecb(const unsigned char *in_data,
  unsigned char *output,
  unsigned int data_length,
  const unsigned char *key,
  unsigned int key_length,
  unsigned int direction);
```

Required hardware support

KM-AES-128, KM-AES-192, or KM-AES-256

Parameters

const unsigned char *in_data
Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is *data_length*. The size of this buffer must be at least as large as *data_length*.

unsigned char *out_data
Pointer to a writable buffer to contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as *data_length*.

unsigned long data_length
Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of *in_data*. *data_length* must be a multiple of the cipher block size (a multiple of 16 for AES).

const unsigned char *key
Pointer to a valid AES key.

unsigned int key_length
Length in bytes of the AES key. Supported sizes are 16, 24, and 32 for AES-128, AES-192, and AES-256 respectively. Therefore, you can use the definitions: **AES_KEY_LEN128**, **AES_KEY_LEN192**, and **AES_KEY_LEN256**.

unsigned int direction
0 Use the decrypt function.
1 Use the encrypt function.

Return codes

0 Success

For return codes indicating exceptions, see “Return codes” on page 68.

ica_aes_gcm

Purpose

Encrypt data and authenticate data or decrypt data and check authenticity of data with an AES key using the Galois/Counter (GCM) mode, as described in NIST Special Publication 800-38D. If no message needs to be encrypted or decrypted and only authentication or authentication checks are requested, then this method implements the GMAC mode.

Format

```
unsigned int ica_aes_gcm(unsigned char *plaintext,
  unsigned long plaintext_length,
  unsigned char *ciphertext,
  const unsigned char *iv,
  unsigned int iv_length,
```

```
const unsigned char *aad,
unsigned long aad_length,
unsigned char *tag,
unsigned int tag_length,
const unsigned char *key,
unsigned int key_length,
unsigned int direction);
```

Required hardware support

KM-AES-128, KM-AES-192 or KM-AES-256
KIMD-GHASH
KMCTR-AES-128, KMCTR_AES-192 or KMCTR-AES-256

Parameters

unsigned char *plaintext
Pointer to a buffer of size greater than or equal to *plaintext_length* bytes. If *direction* is equal to 1, the *plaintext* buffer must be readable and contain a payload message of size *plaintext_length* to be encrypted. If direction is equal to 0, the *plaintext* buffer must be writable and if the authentication verification succeeds, the decrypted message in the most significant *plaintext_length* bytes of *ciphertext* is written to the buffer. Otherwise, the contents of the buffer are undefined.

unsigned long plaintext_length
Length in bytes of the message to be encrypted or decrypted. This value can be 0 unless *aad_length* is equal to 0. The value must be greater than or equal to 0 and less than (2**36) - 32.

unsigned char *ciphertext
Pointer to a buffer of size greater than or equal to *plaintext_length* bytes. If *direction* is equal to 1, then this buffer must be writable and the encrypted message from *plaintext* is written to that buffer. If *direction* is equal to 0, then this buffer is readable and contains an encrypted message of length *plaintext_length*.

const unsigned char *iv
Pointer to a readable buffer of size greater than or equal to *iv_length* bytes, which contains an initialization vector of size *iv_length*.

unsigned int iv_length
Length in bytes of the initialization vector in *iv*. The value must be greater than 0 and less than 2**61. A length of 12 is recommended.

const unsigned char *aad
Pointer to a readable buffer of size greater than or equal to *aad_length* bytes. The additional authenticated data in the most significant *aad_length* bytes is subject to the message authentication code computation, but is not encrypted.

unsigned int aad_length
Length in bytes of the additional authenticated data in *aad*. The value must be greater than or equal to 0 and less than 2**61.

unsigned char *tag
Pointer to a buffer of size greater than or equal to *tag_length* bytes. If *direction* is equal to 1, this buffer must be writable, and a message authentication code for the additional authenticated data in *aad* and the plain text in *plaintext* of size *tag_length* bytes is written to this buffer. If *direction* is equal to 0, this buffer must be readable and contain a message authentication code to be verified against the additional authenticated data in *aad* and the decrypted cipher text from *ciphertext*.

unsigned int tag_length
Length in bytes of the message authentication code *tag* in bytes. Valid values are: 4, 8, 12, 13, 14, 15, and 16.

const unsigned char *key
Pointer to a valid AES key.

unsigned int key_length
Length in bytes of the AES key. Supported sizes are 16, 24, and 32 for AES-128, AES-192, and AES-256 respectively. Therefore, you can use the definitions: **AES_KEY_LEN128**, **AES_KEY_LEN192**, and **AES_KEY_LEN256**.

unsigned int direction
0 Verify message authentication code and decrypt encrypted payload.
1 Encrypt payload and compute message authentication code for the additional authenticated data and the payload.

Return codes
0 Success
EFAULT
If *direction* is equal to 0 and the verification of the message authentication code fails.

For return codes indicating exceptions, see "Return codes" on page 68.

ica_aes_ofb
Purpose

Encrypt or decrypt data with an AES key using Output Feedback (OFB) mode, as described in NIST Special Publication 800-38A Chapter 6.4.

Format
```
unsigned int ica_aes_ofb(const unsigned char *in_data,
  unsigned char *out_data,
  unsigned long data_length,
  const unsigned char *key,
  unsigned int key_length,
  unsigned char *iv,
  unsigned int direction);
```

Required hardware support

KMO-AES-128, KMO-AES-192, or KMO-AES-256

Parameters

const unsigned char *in_data
Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is *data_length*. The size of this buffer must be at least as large as *data_length*.

unsigned char *out_data
Pointer to a writable buffer that to contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as *data_length*.

unsigned long data_length
Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of *in_data*.

const unsigned char *key
Pointer to a valid AES key.

unsigned int key_length
Length in bytes of the AES key. Supported sizes are 16, 24, and 32 for AES-128, AES-192, and AES-256 respectively. Therefore, you can use the definitions: **AES_KEY_LEN128**, **AES_KEY_LEN192**, and **AES_KEY_LEN256**.

unsigned char *iv
Pointer to a valid initialization vector of the same size as the cipher block, in bytes (16 bytes for AES). This vector is overwritten during the function. If *data_length* is a multiple of the cipher block size (16 bytes for AES), the result value in *iv* can be used as the initialization vector for a chained **ica_aes_ofb** call with the same key.

unsigned int direction
0 Use the decrypt function.
1 Use the encrypt function.

Return codes
0 Success

For return codes indicating exceptions, see "Return codes" on page 68.

ica_aes_xts
Purpose

Encrypt or decrypt data with an AES key using the XEX Tweakable Bloc Cipher with Ciphertext Stealing (XTS) mode, as described in NIST Special Publication 800-38E and IEEE standard 1619-2007.

Format
```
unsigned int ica_aes_xts(const unsigned char *in_data,
  unsigned char *out_data,
  unsigned long data_length,
  const unsigned char *key1,
  const unsigned char *key2,
  unsigned int key_length,
  unsigned char *tweak,
  unsigned int direction);
```

Required hardware support
KM-XTS-AES-128, or KM-XTS-AES-256
PCC-Compute-XTS-Parameter-Using-AES-128, or PCC-Compute-XTS-Parameter-Using-AES-256

Parameters
const unsigned char *in_data
Pointer to a readable buffer that contains the message to be encrypted or decrypted. The size of the message in bytes is *data_length*. The size of this buffer must be at least as large as *data_length*.

unsigned char *out_data
Pointer to a writable buffer to contain the resulting encrypted or decrypted message. The size of this buffer in bytes must be at least as large as *data_length*.

unsigned long data_length
Length in bytes of the message to be encrypted or decrypted, which resides at the beginning of *in_data*. The minimal value of data_length is 16.

const unsigned char *key1
Pointer to a buffer containing a valid AES key. *key1* is used for the actual encryption of the message buffer, combined with some vector computed from the *tweak* value (Key1 in IEEE Std 1619-2007).

const unsigned char *key2
Pointer to a buffer containing a valid AES key *key2* is used to encrypt the tweak (Key2 in IEEE Std 1619-2007).

unsigned int key_length
The length in bytes of the AES key. XTS supported AES key sizes are 16 and 32, for AES-128 and AES-256 respectively. Therefore, you can use:

2 * **AES_KEY_LEN128** and 2 * **AES_KEY_LEN256**.

unsigned char *tweak
Pointer to a valid 16-byte tweak value (as in IEEE standard 1619-2007). This tweak is overwritten during the function. If *data_length* is a multiple of the cipher block size (a multiple of 16 for AES), the result value in *tweak* can be used as the *tweak* value for a chained **ica_aes_xts** call with the same key pair.

unsigned int direction
0 Use the decrypt function.
1 Use the encrypt function.

Return codes
0 Success

For return codes indicating exceptions, see "Return codes" on page 68.

Compatibility with earlier versions
In order to stay compatible with earlier versions of libica, the following AES interfaces remain supported:

```
unsigned int ica_aes_encrypt(unsigned int mode,
 unsigned int data_length, unsigned char *input_data,
 ica_aes_vector_t *iv, unsigned int key_length, unsigned char *aes_key,
 unsigned char *output_data);
unsigned int ica_aes_decrypt(unsigned int mode,
 unsigned int data_length, unsigned char *input_data,
 ica_aes_vector_t *iv, unsigned int key_length, unsigned char *aes_key,
 unsigned char *output_data);
```

Table 5 shows libica version 2.0 AES functions calls, and their corresponding libica version 2.3.0 AES function calls.

Table 5. Compatibility of libica version 2.0 AES functions calls to libica version 2.3.0 AES function calls

Calling this libica version 2.0 AES function	Corresponds to calling this libica version 2.3.0 AES function
`ica_aes_encrypt(MODE_ECB, data_length,in_data,NULL, key_length,key,out_data);`	`ica_aes_ecb(in_data,out_data,(long)data_length, key,key_length,1);`
`ica_aes_encrypt(MODE_CBC,data_length,in_data,iv, key_length,key,out_data);`	`ica_des_cbc(in_data,out_data,(long)data_length, key,key_length,iv,1);`
`ica_aes_decrypt(MODE_ECB,data_length,in_data,NULL, key_length,key,out_data);`	`ica_aes_ecb(in_data,out_data,(long)data_length, key,key_length,0);`

Table 5. Compatibility of libica version 2.0 AES functions calls to libica version 2.3.0 AES function calls (continued)

Calling this libica version 2.0 AES function	Corresponds to calling this libica version 2.3.0 AES function
`ica_aes_decrypt(MODE_CBC,data_length,in_data,iv, key_length,key,out_data);`	`ica_aes_cbc(in_data,out_data,(long)data_length, key,key_length,iv,0);`

The functions **ica_aes_encrypt** and **ica_aes_decrypt** remain supported, but their use is discouraged in favor of **ica_aes_ecb** and **ica_aes_cbc**.

For a detailed description of the earlier APIs, see *libica Programmers Reference* version 2.0.

Information retrieval function

These functions are included in: `include/ica_api.h`.

ica_get_version

Purpose

Return libica version information.

Format

```
unsigned int ica_get_version(libica_version_info *version_info);
```

Parameters

`libica_version_info *version_info`
Pointer to a *libica_version_info* structure. The structure is filled with the current libica version information.

Return codes

0 Success

For return codes indicating exceptions, see "Return codes" on page 68.

ica_get_functionlist

Purpose

Returns a list of crypto mechanisms supported by libica.

Format

```
unsigned int ica_get_functionlist(libica_func_list_element *mech_list,
unsigned int *mech_list_len);
```

Parameters

`libica_func_list_element *mech_list`
Null or pointer to an array of at least as many *libica_func_list_element* structures as denoted in the **mech_list_len* argument. If the value in the **mech_list_len* argument is equal to or greater than the number of mechanisms available in libica then the *libica_func_list_element* structures in **mech_list* are filled (in the order of the array indices) with information for the supported otherwise the **mech_list* argument remains unchanged.

unsigned int *mech_list_len
Pointer to an integer which contain the actual number of array elements (number of structures). If **mech_list* was NULL the contents of **mech_list_len* will be replaced by the number of mechanisms available in libica.

Return codes

0 Success

EINVAL
The value in **mech_list* is to small

For return codes indicating exceptions, see "Return codes" on page 68.

Recommended usage

First call **ica_get_functionlist** with a NULL mechanism list, then allocate the mechanism list according to number of mechanisms in libica returned by that function, and then call **ica_get_functionlist** with the allocated mechanism list.

Chapter 4. Accessing libica version 2.3.0 functions through the PKCS #11 API (openCryptoki)

How the cryptographic functions provided by libica version 2.3.0 can be accessed using the PKCS #11 API implemented by openCryptoki is described in this section.

For more information about the PKCS #11 standard, see
`http://www.rsa.com/rsalabs/`

Introduction

In order to enable hardware cryptographic function support on System z you need to prepare some hardware components, install and load specific driver modules and libraries, configure and start daemons, and set up your system environment.

openCryptoki, and in particular the slot manager, can handle several tokens, which can have different support for different hardware devices or software solutions. This section focusses on the **`ica-token`**, which interacts with the libica version 2.3.0 library. libica version 2.3.0 is able to operate with the IBM CP Assist for Cryptographic Function (CPACF) for symmetric cryptographic functions as well as with the IBM Crypto adapter cards (for asymmetric cryptographic functions). In some special cases where the hardware crypto engines do not support a specific algorithm, libica version 2.3.0 is able to fall back to a software solution.

Stack overview

openCryptoki consists of a slot manager and an API for slot token dynamic link libraries (STDLLs).

The slot manager runs as a daemon to control the number of token slots provided to applications, and it interacts with applications using a shared memory region.

Slot manager

The slot manager (**`pkcsslotd`**) assigns tokens to slots within the system. The slot manager runs as a daemon to control the number of token slots provided, and it interacts with applications.

openCryptoki API

The openCryptoki API (`libopencryptoki.so`) provides the interfaces as outlined in the PKCS #11 specification and supplies each application with the slot management facility. This API also loads token-specific modules (STDLLs) that provide the token specific implementation of the cryptographic functions (cryptographic operations, session management, object management, and so on).

For more details about this standard, refer to the RSA web site:
`http://www.rsa.com/rsalabs/`

Slot token dynamic link libraries (STDLLs)

STDLLs are plug-in modules to the openCryptoki (main) API. They provide token-specific functions that implement the interfaces. Specific devices can be

supported by building an appropriate STDLL.

Figure 1 illustrates the stack and the process flow:

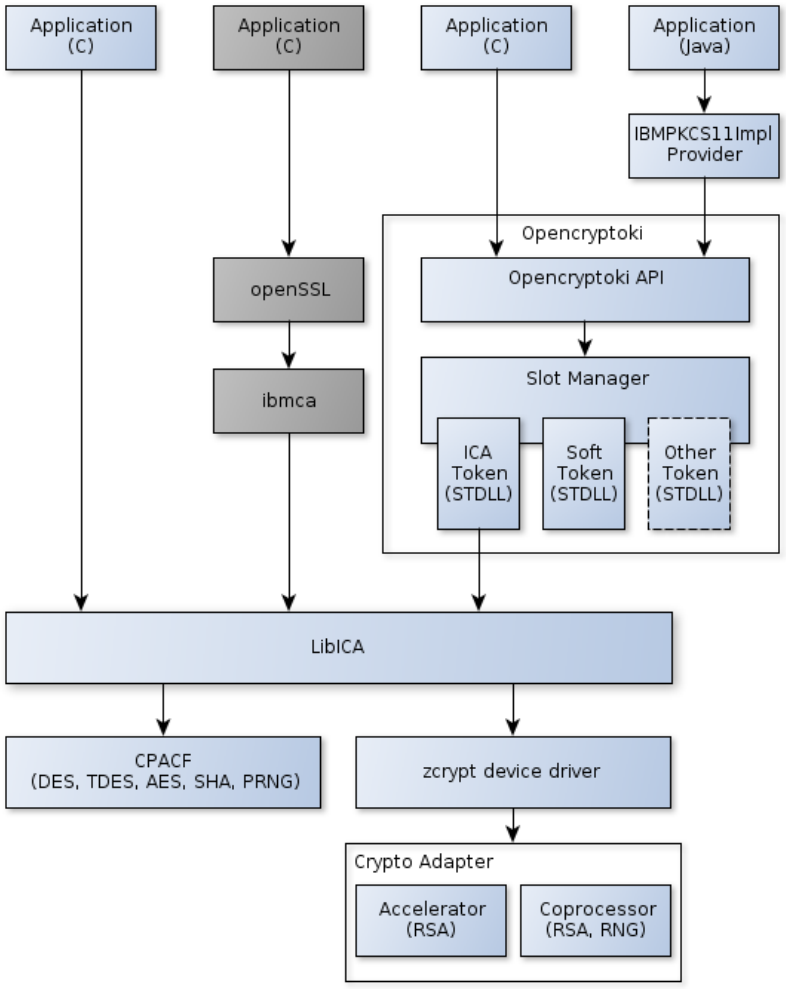

Figure 1. Stack and process flow

Functions provided by openCryptoki with ica token

The PKCS #11 functions that manage tokens, slots, and sessions are described in the PKCS #11 standard.

For an overview of the algorithms supported by the ica token, see "Supported mechanism list for the ica token," on page 159

The PKCS #11 standard describes the exact API for the above mechanisms, for more information, see

`http://www.rsa.com/rsalabs/`

For more details about how to use openCryptoki, see "Using openCryptoki" on page 63.

Installing openCryptoki

Follow the instructions in this section to install openCryptoki.

Installing from the RPM

The current distributions already provide the openCryptoki binary RPMs.

Check whether you have already installed openCryptoki in your current environment:

```
$ rpm -qa | grep -i opencryptoki
```

You should see a deamon package, a 31-bit package and a 64-bit package. If these packages are not installed, use the installation tool of your Linux distribution to install the openCryptoki RPM.

Installing from the source package

If you prefer you can install openCryptoki from the source package.

1. Download the latest version of the openCryptoki sources from:
   `http://sourceforge.net/projects/opencryptoki/`
2. Decompress the tar archive. There should be a new directory named `opencryptoki-3.0-x.x.x`.
3. Change to that directory and issue the following scripts and commands:

```
$ ./bootstrap
$ ./configure
$ make
$ make install
```

where:

bootstrap
: Initial setup, basic configurations

configure
: Check configurations and build the Makefile

make Compile and link

make install
: Install the libraries

Installing libica version 2.3.0

To make use of the hardware support of cryptographic functions it is necessary to install the libica version 2.3.0 package.

For information about how to install libica version 2.3.0, see Chapter 2, “Installing and using libica version 2.3.0,” on page 3.

Configuring openCryptoki

To configure openCryptoki, you need to set up tokens and daemons and then initialize the token.

Setting up tokens and daemons

Table 6 lists the libraries that are in place after you have successfully installed openCryptoki.

Table 6. openCryptoki libraries

Library	Explanation
/usr/lib64/opencryptoki/libopencryptoki.so	openCryptoki base library
/usr/lib64/opencryptoki/stdll/libpkcs11_ica.so	libica token library
/usr/lib64/opencryptoki/stdll/libpkcs11_swk.so	software token library

Note: An analogous set of libraries is available for 32 bit compatibility mode.

You must configure the list of tokens to be attached to the opencryptoki slot-manager in the opencryptoki.conf file, `/etc/opencryptoki/opencryptoki.conf`.

Sample configuration file:

```
-------------- content of opencryptoki.conf ---------
version opencryptoki-3.0

# The following defaults are defined:
#       hwversion = 0.0
#       firmwareversion = 0.0
#       description = Linux
#       manufacturer = IBM
#
# The slot definitions below may be overriden and/or customized.
# See man(5) opencryptoki.conf for further information.

slot 0
{
stdll = libpkcs11_ep11.so
description = "Ep11 Token"
manufacturer = "IBM"
hwversion = 4.11
firmwareversion = 2.0
}

slot 1
{
stdll = libpkcs11_ica.so
description = "ICA Token"
manufacturer = "IBM"
hwversion = 4.10
firmwareversion = 2.0
}
---------------------------- end ---------------------------------
```

Start the slot-daemon, which reads out the configuration information and sets up the tokens:

```
$ pkcsslotd start
```

For a permanent solution, set up:

```
$ chkconfig pkcsslotd on
```

Initializing the token

The daemon including all registered tokens is now ready to operate, but before you can start requesting cryptographic operations you need to initialize the token and set up the PINs.

In openCryptoki there is a SO PIN (Security Officer) for administrative purposes and a User PIN (standard PIN) which is used for cryptographic functions that require a session login. The following command provides some useful slot information:

```
# pkcsconf -s

Slot #0 Info
        Description: EP11 Token
        Manufacturer: IBM
        Flags: 0x1 (TOKEN_PRESENT)
        Hardware Version: 4.0
        Firmware Version: 2.11
Slot #1 Info
        Description: ICA Token
        Manufacturer: IBM
        Flags: 0x1 (TOKEN_PRESENT)
        Hardware Version: 4.0
        Firmware Version: 2.10
```

Find your preferred token in the details list and select the correct slot number. This number is used in the next initialization steps to identify your token:

```
$ pkcsconf -I -c <slot> // Initialize the Token and setup a Token Label

$ pkcsconf -u -c <slot> // Initialize the user PIN (SO PIN required)

$ pkcsconf -P -c <slot> // change the SO PIN (recommended)

$ pkcsconf -p -c <slot> // change the user PIN (optional)
```

`pkcsconf -I`: During token initialization you are asked for a token label. Provide a meaningful name, you may need this reference later for identification purposes.

`pkcsconf -u`: When you enter the user PIN initialization you are asked for the SO PIN, which is by default `87654321`. The length of the user PIN must be between 4 to 8 characters.

`pkcsconf -P`: For security reasons it is recommended that you change the default SO PIN. Use the `pkcsconf -P` option to change the SO PIN.

`pkcsconf -p`: You can also change the user PIN with `pkcsconf -p` option. After you have completed the PIN setup the token is prepared and ready for use.

Note: It's recommended that you define a user PIN that is different from `12345678`. This is because this pattern is checked internally and marked as default PIN.

Using openCryptoki

How you can get status information about openCryptoki is described in this section.

For a list of code samples, refer to “Coding samples (C)” on page 147.

Getting openCryptoki status information

You can check the slot and token information, and the PIN status at any time.

This information is provided by the **pkcsconf** command.

```
$ pkcsconf -t

Label: IBM ICA Token
Model: IBM ICA
Flags: 0x44D
  (RNG|LOGIN_REQUIRED|USER_PIN_INITIALIZED|CLOCK_ON_TOKEN|TOKEN_INITIALIZED)
PIN Length: 4-8
```

The most important information is as follows:

- The token **Label** you assigned at the initialization phase.
- The **Model** name provides information of the token that is in use (here the ica token).
- The **Flags** provide information about the token initialization state, the PIN state, and features such as “Random Number Generator”, “Clock on token” and requirements such as “Login required”, which means there are some (at least one) mechanisms that require a session login to make use of that cryptographic function.
- The **PIN length** range declared for this token.

Use the following command to retrieve a complete list of algorithms (or mechanisms) that are supported by the token:

```
$ pkcsconf -m -c <slot>
Mechanism #2
        Mechanism: 0x131 (CKM_DES3_KEY_GEN)
        Key Size: 24-24
        Flags: 0x8001 (CKF_HW|CKF_GENERATE)
...
Mechanism #10
        Mechanism: 0x132 (CKM_DES3_ECB)
        Key Size: 24-24
        Flags: 0x60301 (CKF_HW|CKF_ENCRYPT|CKF_DECRYPT|CKF_WRAP|CKF_UNWRAP)
Mechanism #11
        Mechanism: 0x133 (CKM_DES3_CBC)
        Key Size: 24-24
        Flags: 0x60301 (CKF_HW|CKF_ENCRYPT|CKF_DECRYPT|CKF_WRAP|CKF_UNWRAP)
...
```

The list displays all mechanisms supported by this token. The mechanism ID and name corresponds to the PKCS #11 specification. Each mechanism provides its supported key size and the some properties such as hardware support and mechanism information flags. These flags provide information about the modes of operation for this mechanism. Typical operations are encrypt, decrypt, wrap key, unwrap key, sign, verify and so on.

Chapter 5. libica constants, type definitions, data structures, and return codes

Use these constants, type definitions, data structures, and return codes when you program with the libica version 2.3.0 APIs.

The APIs are described in Chapter 3, "libica version 2.3.0 application programming interfaces," on page 5. To use them, include `ica_api.h` in your programs.

libica constants

These constants are new with libica version 2.3.0 or were changed from libica version 1 or libica version 2.

Use these constants instead of the equivalent libica version 1 constants. There is no difference in their values.

```
#define ica_adapter_handle_t int
#define SHA_HASH_LENGTH 20
#define SHA1_HASH_LENGTH SHA_HASH_LENGTH
#define SHA224_HASH_LENGTH 28
#define SHA256_HASH_LENGTH 32
#define SHA384_HASH_LENGTH 48
#define SHA512_HASH_LENGTH 64
#define ica_aes_key_t ica_key_t
#define ICA_ENCRYPT 1
#define ICA_DECRYPT 0
```

Type definitions

These type definitions are available to ensure compatibility with libica version 1 types.

```
typedef ica_des_vector_t ICA_DES_VECTOR;
typedef ica_des_key_single_t ICA_KEY_DES_SINGLE;
typedef ica_des_key_triple_t ICA_KEY_DES_TRIPLE;
typedef ica_aes_vector_t ICA_AES_VECTOR;
typedef ica_aes_key_single_t ICA_KEY_AES_SINGLE;
typedef ica_aes_key_len_128_t ICA_KEY_AES_LEN128;
typedef ica_aes_key_len_192_t ICA_KEY_AES_LEN192;
typedef ica_aes_key_len_256_t ICA_KEY_AES_LEN256;
typedef sha_context_t SHA_CONTEXT;
typedef sha256_context_t SHA256_CONTEXT;
typedef sha512_context_t SHA512_CONTEXT;
typedef unsigned char ica_des_vector_t[8];
typedef unsigned char ica_des_key_single_t[8];
typedef unsigned char ica_key_t[8];
typedef unsigned char ica_aes_vector_t[16];
typedef unsigned char ica_aes_key_single_t[8];
typedef unsigned char ica_aes_key_len_128_t[16];
```

```
typedef unsigned char ica_aes_key_len_192_t[24];
typedef unsigned char ica_aes_key_len_256_t[32];
```

Data structures

These structures are used in the API of libica version 2.3.0.

For the definitions of older functions, see previous versions of this book. The older functions are no longer recommended for use, but they are supported.

```
typedef struct {
unsigned int key_length;
unsigned char* modulus;
unsigned char* exponent;
} ica_rsa_key_mod_expo_t;
```

```
typedef struct {
unsigned int key_length;
unsigned char* p;
unsigned char* q;
unsigned char* dp;
unsigned char* dq;
unsigned char* qInverse;
} ica_rsa_key_crt_t;
```

```
typedef struct {
unsigned int mech_mode_id;
unsigned int flags;
unsigned int property;
} libica_func_list_element;
```

* `mech_mode_id`: Unique mechanism ID for each mechanism implemented in libica

```
#define SHA1 1
#define SHA224 2
#define SHA256 3
#define SHA384 4
#define SHA512 5
#define DES_ECB 20
#define DES_CBC 21
#define DES_CBC_CS 22
#define DES_OFB 23
#define DES_CFB 24
#define DES_CTR 25
#define DES_CTRLST 26
#define DES_CBC_MAC 27
#define DES_CMAC 28
#define DES3_ECB 41
#define DES3_CBC 42
#define DES3_CBC_CS 43
#define DES3_OFB 44
#define DES3_CFB 45
#define DES3_CTR 46
#define DES3_CTRLST 47
#define DES3_CBC_MAC 48
#define DES3_CMAC 49
#define AES_ECB 60
#define AES_CBC 61
#define AES_CBC_CS 62
#define AES_OFB 63
#define AES_CFB 64
#define AES_CTR 65
#define AES_CTRLST 66
#define AES_CBC_MAC 67
#define AES_CMAC 68
#define AES_CCM 69
#define AES_GCM 70
```

```
#define AES_XTS 71
#define P_RNG 80
#define RSA_ME 90
#define RSA_CRT 91
#define RSA_KEY_GEN_ME 92
#define RSA_KEY_GEN_CRT 93
```

For more details regarding these mechanism please refer to the openCryptoki v 2.20 specification.

*** flags**
This flag represents the type of hardware/software support for each mechanism.

#define ICA_FLAG_SHW 4
Static hardware support (operations on CPACF). Hardware support will be available unless a hardware error occurs.

#define ICA_FLAG_DHW 2
Dynamic hardware support (operations on crypto cards). Hardware support will be available unless the hardware is reconfigured.

#define ICA_FLAG_SW 1
Software support. If both static and dynamic hardware support as well as software support are available, then software support is used as fall back if hardware support fails.

*** property**
This property field is optional depending on the mechanism. It is used to declare mechanism specific parameters, such as key sizes for RSA and AES.

For RSA mechanisms:

- bit 0
512 bit key size support

- bit 1
1024 bit key size support

- bit 2
2048 bit key size support

- bit 3
4096 bit key size support

For AES mechanisms:

- bit 0
128 bit key size support

- bit 1
192 bit key size support

- bit 2
256 bit key size support

For all non-RSA/AES mechanisms this field is empty.

Take note of these considerations:

- The buffers pointed to by members of type *unsigned char* * must be manually allocated and deallocated by the user.
- Key parts must always be right-aligned in their fields.

- All buffers pointed to by members *modulus* and *exponent* in struct *ica_rsa_key_mod_expo_t* must be of length *key_length*.
- All buffers pointed to by members *p*, *q*, *dp*, *dq*, and *qInverse* in struct *ica_rsa_key_crt_t* must be of size *key_length* / 2 or larger.
- In the struct *ica_rsa_key_crt_t*, the buffers *p*, *dp*, and *qInverse* must contain 8 bytes of zero padding in front of the actual values.
- If an exponent is set in struct *ica_rsa_key_mod_expo_t* as part of a public key for key generation, be aware that due to a restriction in OpenSSL, the public exponent cannot be larger than a size of unsigned long. Therefore, you must have zeros left padded in the buffer pointed to by *exponent* in the struct *ica_rsa_key_mod_expo_t* struct. Be aware that this buffer also must be of size *key_length*.
- This *key_length* value should be calculated from the length of the modulus in bits, according to this calculation:

```
key_length = (modulus_bits + 7) / 8
```

```
typedef struct {
        uint64_t runningLength;
        unsigned char shaHash[LENGTH_SHA_HASH];
} sha_context_t;
```

```
typedef struct {
        uint64_t runningLength;
        unsigned char sha256Hash[LENGTH_SHA256_HASH];
} sha256_context_t;
```

```
typedef struct {
        uint64_t runningLengthHigh;
        uint64_t runningLengthLow;
        unsigned char sha512Hash[LENGTH_SHA512_HASH];
} sha512_context_t;
```

```
typedef struct {
        unsigned int major_version;
        unsigned int minor_version;
        unsigned int fixpack_version;
} libica_version_info;
```

Return codes

The libica version 2 and libica version 2.3.0 functions use these standard Linux return codes:

0 Success

EFAULT
The message authentication failed.

EINVAL
Incorrect parameter

EIO I/O error

EPERM
Operation not permitted by Hardware (CPACF).

ENODEV
No such device

ENOMEM
Not enough memory

errno When libica calls **open**, **close**, **begin_sigill_section**, or OpenSSL function **RSA_generate_key**, the error codes of these programs are returned.

Chapter 6. libica tools

The libica package includes tools to investigate the capabilities of your cryptographic hardware and how these capabilities are used by applications that use libica.

icainfo - Show available libica functions

Use the **icainfo** command to find out which libica functions are available on your Linux system.

Format

icainfo syntax

Where:

-q or --quiet
Suppresses an explanatory introduction to the list of functions in the command output.

-v or --version
Displays the version number of **icainfo**, then exits.

-h or --help
Displays help information for the command.

Examples

1. To show which libica functions are available on your Linux system enter:

```
# icainfo

The following CP Assist for Cryptographic Function (CPACF) operations are
supported by libica on this system:
SHA-1:        yes
SHA-256:      yes
SHA-512:      yes
DES:          yes
TDES-128:     yes
TDES-192:     yes
AES-128:      yes
AES-192:      yes
AES-256:      yes
PRNG:         yes
CCM-AES-128:  yes
CMAC-AES-128: yes
CMAC-AES-192: yes
CMAC-AES-256: yes
```

2. To list the libica functions without the introduction enter:

```
# icainfo -q
SHA-1:        yes
SHA-256:      yes
SHA-512:      yes
DES:          yes
TDES-128:     yes
TDES-192:     yes
AES-128:      yes
AES-192:      yes
AES-256:      yes
PRNG:         yes
CCM-AES-128:  yes
CMAC-AES-128: yes
CMAC-AES-192: yes
CMAC-AES-256: yes
```

icastats - Show use of libica functions

Use the **icastats** command to find out whether libica uses hardware acceleration features or works with software fallbacks.

The command also shows which specific functions of libica are used.

Format

icastats syntax

Where:

-r or --reset
Sets the function counters to zero.

-v or --version
Displays the version number of **icastats**, then exits.

-h or --help
Displays help information for the command.

Examples

To display the current use of libica functions issue:

```
# icastats

 function | # hardware | # software
----------+------------+------------
    SHA-1 |          0 |          0
  SHA-224 |          0 |          0
  SHA-256 |          0 |          0
  SHA-384 |          0 |          0
  SHA-512 |          0 |          0
   RANDOM |          1 |          0
 MOD EXPO |          0 |          0
  RSA CRT |          0 |          0
```

DES ENC	0	0
DES DEC	0	0
3DES ENC	0	0
3DES DEC	0	0

Chapter 7. Examples

These sample program segments illustrate the libica version 2.3.0 APIs.

These sample programs are from the libica version 2.3.0 RPM, and they were enhanced to use the libica version 2.3.0 APIs.

These examples are released under the Common Public License - V1.0, which is stated in full at the end of this chapter. See "Common Public License - V1.0" on page 143.

Table 7 lists the examples for libica, and the makefile used to create the library.

DES with ECB mode example

This program prints the version of libica and then encrypts the contents of a character array (plain_data[]) using DES in ECE mode and a key stored in another character array (des_key[]). The program then decrypts the result and prints it as a string. Intermediate results are written as hex dumps.

```
/* This program is released under the Common Public License V1.0
 *
 * You should have received a copy of Common Public License V1.0 along with
 * with this program.

Pseudo random number generation example

This example uses the old (libica version 1) API. Examples for using the new (libica version 2.3.0) API for random number generation are located in other examples, such as the DES with CTR mode example.

Common Public License - V1.0

```
 Common Public License - V1.0

 THE ACCOMPANYING PROGRAM IS PROVIDED UNDER THE TERMS OF THIS COMMON
 PUBLIC LICENSE ("AGREEMENT"). ANY USE, REPRODUCTION OR DISTRIBUTION OF
 THE PROGRAM CONSTITUTES RECIPIENT'S ACCEPTANCE OF THIS AGREEMENT.

 1. DEFINITIONS

 "Contribution" means:
  1. in the case of the initial Contributor, the initial code and
  documentation distributed under this Agreement, and

  2. in the case of each subsequent Contributor:
         1. changes to the Program, and
         2. additions to the Program;

  where such changes and/or additions to the Program originate
  from and are distributed by that particular Contributor. A
  Contribution 'originates' from a Contributor if it was added to
  the Program by such Contributor itself or anyone acting on such
  Contributor's behalf. Contributions do not include additions to
  the Program which: (i) are separate modules of software
  distributed in conjunction with the Program under their own
  license agreement, and (ii) are not derivative works of the
  Program.

 "Contributor" means any person or entity that distributes the Program.

 "Licensed Patents " mean patent claims licensable by a Contributor
 which are necessarily infringed by the use or sale of its Contribution
 alone or when combined with the Program.

 "Program" means the Contributions distributed in accordance with this
 Agreement.

 "Recipient" means anyone who receives the Program under this Agreement,
 including all Contributors.

 2. GRANT OF RIGHTS

  1. Subject to the terms of this Agreement, each Contributor
  hereby grants Recipient a non-exclusive, worldwide,
```

royalty-free copyright license to reproduce, prepare derivative works of, publicly display, publicly perform, distribute and sublicense the Contribution of such Contributor, if any, and such derivative works, in source code and object code form.

2. Subject to the terms of this Agreement, each Contributor hereby grants Recipient a non-exclusive, worldwide, royalty-free patent license under Licensed Patents to make, use, sell, offer to sell, import and otherwise transfer the Contribution of such Contributor, if any, in source code and object code form. This patent license shall apply to the combination of the Contribution and the Program if, at the time the Contribution is added by the Contributor, such addition of the Contribution causes such combination to be covered by the Licensed Patents. The patent license shall not apply to any other combinations which include the Contribution. No hardware per se is licensed hereunder.

3. Recipient understands that although each Contributor grants the licenses to its Contributions set forth herein, no assurances are provided by any Contributor that the Program does not infringe the patent or other intellectual property rights of any other entity. Each Contributor disclaims any liability to Recipient for claims brought by any other entity based on infringement of intellectual property rights or otherwise. As a condition to exercising the rights and licenses granted hereunder, each Recipient hereby assumes sole responsibility to secure any other intellectual property rights needed, if any. For example, if a third party patent license is required to allow Recipient to distribute the Program, it is Recipient's responsibility to acquire that license before distributing the Program.

4. Each Contributor represents that to its knowledge it has sufficient copyright rights in its Contribution, if any, to grant the copyright license set forth in this Agreement.

3. REQUIREMENTS

A Contributor may choose to distribute the Program in object code form under its own license agreement, provided that:

1. it complies with the terms and conditions of this Agreement; and

2. its license agreement:
 1. effectively disclaims on behalf of all Contributors all warranties and conditions, express and implied, including warranties or conditions of title and non-infringement, and implied warranties or conditions of merchantability and fitness for a particular purpose;

 2. effectively excludes on behalf of all Contributors all liability for damages, including direct, indirect, special, incidental and consequential damages, such as lost profits;

 3. states that any provisions which differ from this Agreement are offered by that Contributor alone and not by any other party; and

 4. states that source code for the Program is available from such Contributor, and informs licensees how to obtain it in a reasonable manner on or through a medium customarily used for software exchange.

When the Program is made available in source code form:
 1. it must be made available under this Agreement; and
        2. a copy of this Agreement must be included with each
 copy of the Program.

Contributors may not remove or alter any copyright notices
contained within the Program.

Each Contributor must identify itself as the originator of its
Contribution, if any, in a manner that reasonably allows
subsequent Recipients to identify the originator of the
Contribution.

4. COMMERCIAL DISTRIBUTION

Commercial distributors of software may accept certain responsibilities
with respect to end users, business partners and the like. While this
license is intended to facilitate the commercial use of the Program,
the Contributor who includes the Program in a commercial product
offering should do so in a manner which does not create potential
liability for other Contributors. Therefore, if a Contributor includes
the Program in a commercial product offering, such Contributor
("Commercial Contributor") hereby agrees to defend and indemnify every
other Contributor ("Indemnified Contributor") against any losses,
damages and costs (collectively "Losses") arising from claims, lawsuits
and other legal actions brought by a third party against the
Indemnified Contributor to the extent caused by the acts or omissions
of such Commercial Contributor in connection with its distribution of
the Program in a commercial product offering. The obligations in this
section do not apply to any claims or Losses relating to any actual or
alleged intellectual property infringement. In order to qualify, an
Indemnified Contributor must: a) promptly notify the Commercial
Contributor in writing of such claim, and b) allow the Commercial
Contributor to control, and cooperate with the Commercial Contributor
in, the defense and any related settlement negotiations. The
Indemnified Contributor may participate in any such claim at its own
expense.

For example, a Contributor might include the Program in a commercial
product offering, Product X. That Contributor is then a Commercial
Contributor. If that Commercial Contributor then makes performance
claims, or offers warranties related to Product X, those performance
claims and warranties are such Commercial Contributor's responsibility
alone. Under this section, the Commercial Contributor would have to
defend claims against the other Contributors related to those
performance claims and warranties, and if a court requires any other
Contributor to pay any damages as a result, the Commercial Contributor
must pay those damages.

5. NO WARRANTY

EXCEPT AS EXPRESSLY SET FORTH IN THIS AGREEMENT, THE PROGRAM IS
PROVIDED ON AN "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY
KIND, EITHER EXPRESS OR IMPLIED INCLUDING, WITHOUT LIMITATION, ANY
WARRANTIES OR CONDITIONS OF TITLE, NON-INFRINGEMENT, MERCHANTABILITY OR
FITNESS FOR A PARTICULAR PURPOSE. Each Recipient is solely responsible
for determining the appropriateness of using and distributing the
Program and assumes all risks associated with its exercise of rights
under this Agreement, including but not limited to the risks and costs
of program errors, compliance with applicable laws, damage to or loss
of data, programs or equipment, and unavailability or interruption of
operations.

6. DISCLAIMER OF LIABILITY

EXCEPT AS EXPRESSLY SET FORTH IN THIS AGREEMENT, NEITHER RECIPIENT NOR ANY CONTRIBUTORS SHALL HAVE ANY LIABILITY FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING WITHOUT LIMITATION LOST PROFITS), HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OR DISTRIBUTION OF THE PROGRAM OR THE EXERCISE OF ANY RIGHTS GRANTED HEREUNDER, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

7. GENERAL

If any provision of this Agreement is invalid or unenforceable under applicable law, it shall not affect the validity or enforceability of the remainder of the terms of this Agreement, and without further action by the parties hereto, such provision shall be reformed to the minimum extent necessary to make such provision valid and enforceable.

If Recipient institutes patent litigation against a Contributor with respect to a patent applicable to software (including a cross-claim or counterclaim in a lawsuit), then any patent licenses granted by that Contributor to such Recipient under this Agreement shall terminate as of the date such litigation is filed. In addition, if Recipient institutes patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Program itself (excluding combinations of the Program with other software or hardware) infringes such Recipient's patent(s), then such Recipient's rights granted under Section 2(b) shall terminate as of the date such litigation is filed.

All Recipient's rights under this Agreement shall terminate if it fails to comply with any of the material terms or conditions of this Agreement and does not cure such failure in a reasonable period of time after becoming aware of such noncompliance. If all Recipient's rights under this Agreement terminate, Recipient agrees to cease use and distribution of the Program as soon as reasonably practicable. However, Recipient's obligations under this Agreement and any licenses granted by Recipient relating to the Program shall continue and survive.

Everyone is permitted to copy and distribute copies of this Agreement, but in order to avoid inconsistency the Agreement is copyrighted and may only be modified in the following manner. The Agreement Steward reserves the right to publish new versions (including revisions) of this Agreement from time to time. No one other than the Agreement Steward has the right to modify this Agreement. IBM is the initial Agreement Steward. IBM may assign the responsibility to serve as the Agreement Steward to a suitable separate entity. Each new version of the Agreement will be given a distinguishing version number. The Program (including Contributions) may always be distributed subject to the version of the Agreement under which it was received. In addition, after a new version of the Agreement is published, Contributor may elect to distribute the Program (including its Contributions) under the new version. Except as expressly stated in Sections 2(a) and 2(b) above, Recipient receives no rights or licenses to the intellectual property of any Contributor under this Agreement, whether expressly, by implication, estoppel or otherwise. All rights in the Program not expressly granted under this Agreement are reserved.

This Agreement is governed by the laws of the State of New York and the intellectual property laws of the United States of America. No party to this Agreement will bring a legal action under this Agreement more than one year after the cause of action arose. Each party waives its rights to a jury trial in any resulting litigation.

Getting libica version 2.3.0 status information

A list of hardware supported algorithms can be retrieved by **icainfo**.

```
$ icainfo
The following CP Assist for Cryptographic Function (CPACF) operations
are supported by libica on this system:
SHA-1:          yes
SHA-256:        yes
SHA-512:        yes
DES:            yes
TDES-128:       yes
TDES-192:       yes
AES-128:        yes
AES-192:        yes
AES-256:        yes
PRNG:           yes
CCM-AES-128:    yes
CMAC-AES-128:   yes
CMAC-AES-192:   yes
CMAC-AES-256:   yes
```

Use **icastats** to retrieve the actual statistics about cryptographic algorithms that have already been used:

```
# icastats
 function | # hardware | # software

For more information about libica version 2.3.0 refer to the other sections in this document.

openCryptoki code samples

This section provides the following code samples:

- "Dynamic library call" on page 148
- "Shared linked library" on page 148

Coding samples (C)

To develop an application that uses openCryptoki, you need to access the library.

There are two ways to access the library:

- Load shared objects using dynamic library calls (dlopen)
- Link the library(statically) to your application during built time

For a list of supported mechanisms for ica-token, refer to "Supported mechanism list for the ica token," on page 159.

Dynamic library call

openCryptoki code samples for a dynamic library call.

```
#include <stdlib.h>
#include <errno.h>
#include <stdio.h>
#include <dlfcn.h>
#include <pkcs11types.h>

CK_RV init();
CK_RV cleanup();
CK_RV rc;                                   /* return code */
void *dllPtr, (*symPtr)();                  /* pointer to the ock library */
CK_FUNCTION_LIST_PTR  FunctionPtr = NULL;   /* pointer to function list */

int main(int argc, char *argv[]){
  init("/usr/lib64/opencryptoki/libopencryptoki.so"); /* opencryptoki initialization */
  /* .... other opencryptoki commands.... */
  cleanup();        /* cleanup/close shared library */
  return 0;
}

CK_RV init(char *libPath){

  dllPtr = dlopen(libPath, RTLD_NOW);       /* open the PKCS11 library */
  if (!dllPtr) {
     printf("Error loading PKCS#11 library \n");
     return errno;
  }
  symPtr = (void (*)())dlsym(dllPtr, "C_GetFunctionList"); /* Get ock function list */
  if (!symPtr) {
     printf("Error getting function list \n");
     return errno;
  }
  symPtr(&FunctionPtr);
  rc = FunctionPtr->C_Initialize(NULL);     /* initialize opencryptoki/tokens) */
   if (rc != CKR_OK) {
    printf("Error initializing the opencryptoki library: 0x%X\n", rc);
    cleanup();
    }
    printf("Opencryptoki initialized.\n");
    return CKR_OK;
}

  CK_RV cleanup(void) {
      rc = FunctionPtr->C_Finalize(NULL);
      if (dllPtr)
          dlclose(dllPtr);
      return rc;
}
```

To compile your sample code you need to provide the path of the source/include files. Issue a command of the form:

```
gcc sample_dynamic.c -g -O0 -o sample_dynamic -I <include filepath>
```

The exact location of the include files depends on your Linux distribution.

Shared linked library

When you use your sample code with a static linked library you can access the APIs directly.

At the compile time you need to specify the openCryptoki library:

```
gcc sample_shared.c -g -O0 -o sample_shared /usr/lib64/opencryptoki/libopencryptoki.so
-I /usr/<include filepath>
```

The exact location of the include files depend on your Linux distribution.

The following code samples that interact with the openCryptoki API are based on the shared linked openCryptoki library.

Base procedures:
The following code sample provides an insight into how to deal with the openCryptoki API's. After describing some basic functions such as initialization, session and login handling, the sample shows how to retrieve data, such as get slot and token information and also detailed mechanism information. It also provides an introduction about how to create key objects and process symmetric encryption/decryption (DES). The last section shows RSA key generation with RSA encrypt and decrypt operations.

Main program

```
#include <stdlib.h>
#include <errno.h>
#include <stdio.h>
#include <dlfcn.h>
#include <pkcs11types.h>
#include <defs.h>

K_SLOT_ID   slotID;
CK_SLOT_ID_PTR         pSlotList = NULL;

  CK_BYTE_PTR pEncryptText = malloc(rsaLen*sizeof(CK_BYTE));
  CK_BYTE_PTR pClearText = malloc(rsaLen*sizeof(CK_BYTE));
  RSAencrypt(hSession, hPublicKey, (CK_BYTE_PTR)&msg, msgLen, pEncryptText, &rsaLen);
  RSAdecrypt(hSession, hPrivateKey, pEncryptText, rsaLen, pClearText, &rsaLen);
  logoutSession(hSession);   closeSession(hSession);
  finalize();
  return 0;
 }
```

C_Initialize:

```
CK_RV init(void){
  CK_RV rc;
  rc = C_Initialize(NULL);
  if (rc != CKR_OK) {
      printf("Error initializing the opencryptoki library: 0x%X\n", rc);
  }
  return CKR_OK;
}
```

C_GetSlotList:

```
CK_RV getSlotList(CK_SLOT_ID_PTR pSlotList, CK_ULONG_PTR pSlotCount){
   CK_RV rc;
   rc = C_GetSlotList(TRUE, pSlotList, pSlotCount);
   if (rc != CKR_OK) {
      printf("Error getting number of slots: %x \n", rc);
      return rc;
   }
   return CKR_OK;
}
```

C_GetSlotInfo:

```
CK_RV getSlotInfo(CK_SLOT_ID slotID){
      CK_RV         rc;
      CK_SLOT_INFO   slotInfo;

       rc = C_GetSlotInfo(slotID, &slotInfo);
       if (rc != CKR_OK) {
          printf("Error getting slot information: %x \n", rc);
          return rc;
       }
       printf("Slot %d Information:\n", slotID);
       printf("  Description: %.64s\n", slotInfo.slotDescription);
       printf("  Manufacturer: %.32s\n", slotInfo.manufacturerID);
       printf("  Flags: 0x%X\n", slotInfo.flags);
       if ((slotInfo.flags & CKF_TOKEN_PRESENT) == CKF_TOKEN_PRESENT) {
           printf("Token Present!\n");
       }
       if ((slotInfo.flags & CKF_REMOVABLE_DEVICE) ==
              CKF_REMOVABLE_DEVICE) {
          printf("Removable Device!\n");
       }
       if ((slotInfo.flags & CKF_HW_SLOT) == CKF_HW_SLOT){
          printf("Hardware support!\n");
       }
       else { printf("Software support!\n");}
       printf("  Hardware Version: %d.%d\n",
            slotInfo.hardwareVersion.major,
            slotInfo.hardwareVersion.minor);
       printf("  Firmware Version: %d.%d\n",
            slotInfo.firmwareVersion.major,
            slotInfo.firmwareVersion.minor);
   return CKR_OK;
 }
```

C_GetTokenInfo:

```
CK_RV getTokenInfo(CK_SLOT_ID slotID){
  CK_RV          rc;
  CK_TOKEN_INFO tokInfo;
  rc = C_GetTokenInfo(slotID, &tokinfo);

Glossary

Central Processor Assist for Cryptographic Function (CPACF)
Hardware that provides support for symmetric ciphers and secure hash algorithms (SHA) on every central processor. Hence the potential encryption/decryption throughput scales with the number of central processors in the system.

Chinese-Remainder Theorem (CRT)
A mathematical problem described by Sun Tsu Suan-Ching using the remainder from a division operation.

Cipher Block Chaining (CBC)
A method of reducing repetitive patterns in ciphertext by performing an exclusive-OR operation on each 8-byte block of data with the previously encrypted 8-byte block before it is encrypted.

Cipher block length
The length of a block that can be encrypted or decrypted by a symmetric cipher. Each symmetric cipher has a specific cipher block length.

CPACF instructions
Instruction set for the CPACF hardware.

Crypto Express2 (CEX2)
The two PCI-X adapters on a CEX2 feature can be configured in two ways: Either as cryptographic Coprocessor (CEX2C) for secure key encrypted transactions, or as cryptographic Accelerator (CEX2A) for Secure Sockets Layer (SSL) acceleration. A CEX2A works only in clear key mode. Both adapters can be of the same type, or you can configure one adapter as CEX2A and the other as CEX2C.

Crypto Express3 (CEX3)
Successor to the Crypto Express2 feature. The two PCI-X adapters on a CEX3 feature can be configured in two ways: Either as cryptographic Coprocessor (CEX3C) for secure key encrypted transactions, or as cryptographic Accelerator (CEX3A) for Secure Sockets Layer (SSL) acceleration. A CEX3A works only in clear key mode. Both adapters can be of the same type, or you can configure one adapter as CEX3A and the other as CEX3C.

electronic code book mode (ECB mode)
A method of enciphering and deciphering data in address spaces or data spaces. Each 64-bit block of plaintext is separately enciphered and each block of the ciphertext is separately deciphered.

libica Library for IBM Cryptographic Architecture.

Mode of operation
A schema describing how to apply a symmetric cipher to encrypt or decrypt a message that is longer than the cipher block length. The goal of most modes of operation is to keep the security level of the cipher by avoiding the situation where blocks that occur more than once will always be translated to the same value. Some modes of operations allow handling messages of arbitrary lengths.

modulus-exponent (Mod-Expo)
A type of exponentiation performed using a modulus.

Rivest-Shamir-Adleman (RSA)
An algorithm used in public key cryptography. These are the surnames of the three researchers responsible for creating this asymmetric or public/private key algorithm.

Secure Hash Algorithm (SHA)
An encryption method in which data is encrypted in a way that is mathematically impossible to reverse. Different data can possibly produce the same hash value, but there is no way to use the hash value to determine the original data.

symmetric cipher
An encryption method that uses the same key for encryption and decryption. Keys of symmetric ciphers are private keys.

z90crypt
Linux device driver for cryptographic adapters of IBM System z. The libica version 2, libica version 2.1.0, and libica version 2.3.0 libraries interact directly with the z90crypt device driver.

Publication No. SC34-2602-05

We appreciate your comments about this publication. Please comment on specific errors or omissions, accuracy, organization, subject matter, or completeness of this book. The comments you send should pertain to only the information in this manual or product and the way in which the information is presented.

For technical questions and information about products and prices, please contact your IBM branch office, your IBM business partner, or your authorized remarketer.

When you send comments to IBM, you grant IBM a nonexclusive right to use or distribute your comments in any way it believes appropriate without incurring any obligation to you. IBM or any other organizations will only use the personal information that you supply to contact you about the issues that you state on this form.

Comments:

Thank you for your support.

Submit your comments using one of these channels:
- Send your comments to the address on the reverse side of this form.
- Send your comments via email to: eservdoc@de.ibm.com

If you would like a response from IBM, please fill in the following information:

Name	Address
Company or Organization	
Phone No.	Email address
