About this publication

This message reference document contains the messages that are issued by IBM®
System z® specific Linux kernel modules on SUSE Linux Enterprise Server 11 SP2.

On SUSE Linux Enterprise Server 11 SP2, these messages are issued with
message numbers, which consist of a module identifier, a dot, and six hexadecimal
digits. In this message reference the messages are grouped by the issuing module
and listed in descending sort order.

Reasonable effort has been made to capture all kernel messages that are issued
with message numbers on SUSE Linux Enterprise Server 11 SP2. For message
numbers that are not included in this book see the kernel messages book at
www.ibm.com/developerworks/linux/linux390/documentation_dev.html

You can find the latest version of this document on the developerWorks® website at

Other relevant Linux on IBM System z publications

Several Linux on IBM System z publications for SUSE Linux Enterprise Server 11
SP2 are available on developerWorks.

You can find the latest versions of these publications at

- Device Drivers, Features, and Commands on SUSE Linux Enterprise Server 11
  SP2, SC34-2595
- Using the Dump Tools on SUSE Linux Enterprise Server 11 SP2, SC34-2598

For each of the following documents, the same web page points to the version that
most closely reflects SUSE Linux Enterprise Server 11 SP2:

- How to use FC-attached SCSI devices with Linux on System z, SC33-8413
- How to Improve Performance with PAV, SC33-8414
- How to use Execute-in-Place Technology with Linux on z/VM, SC34-2594
- How to Set up a Terminal Server Environment on z/VM, SC34-2596
- libica Programmer's Reference, SC34-2602
Chapter 1. Displaying a message man page

This document lists System z specific kernel messages with message identifiers. SUSE Linux Enterprise Server 11 SP2 provides an RPM with a man page for each of these messages.

Before you begin

Ensure that the RPM with the message man pages is installed on your Linux system. This RPM is called kernel-default-man-<kernel-version>s390x.rpm and shipped on DVD1.

Procedure

Enter a command of this form, to display a message man page:

```
# man <message_identifier>
```

Example

Enter the following command to display the man page for message xpram.ab9aa4:

```
# man xpram.ab9aa4
```

The corresponding man page looks like this:

```
xpram.ab9aa4(9) xpram.ab9aa4(9)
Message
   xpram.ab9aa4: 50 is not a valid number of XPRAM devices
Severity
   Error
Parameters
   @1: number of partitions
Description
   The number of XPRAM partitions specified for the 'devs' module parameter or with the 'xpram.parts' kernel parameter must be an integer in the range 1 to 32. The XPRAM device driver created a maximum of 32 partitions that are probably not configured as intended.
User action
   If the XPRAM device driver has been compiled as a separate module, unload the module and load it again with a correct value for the 'devs' module parameter. If the XPRAM device driver has been compiled into the kernel, correct the 'xpram.parts' parameter in the kernel parameter line and restart Linux.
```
Chapter 2. Summary of prefixes

The messages in this book are grouped by the prefixes used by the modules that issue the message.

**aes_s390**

This section contains messages that are issued by the kernel module that provides support for the System z hardware accelerated implementation of the AES cipher algorithms (FIPS-197).

**af_iucv**

This section contains messages that are issued by the kernel module that supports the AF_IUCV address family for communication and addressing with z/VM® IUCV.

**ap**

This section contains messages that are issued by the kernel module that supports special processors for cryptographic operations.

**appldata**

This section contains messages that are issued by the kernel modules that gather kernel performance data and statistics and export this data to z/VM by means of APPLDATA monitor records.

**cio**

This section contains messages that are issued by the kernel module that provides basic I/O functions for channel-attached devices.

**claw**

This section contains messages that are issued by the Common Link Access to Workstation (CLAW) device driver.

**cpcmd**

This section contains messages that are issued by the cpcmd kernel function.

**cpu**

This section contains messages that are issued by the System z specific CPU management functions.

**ctcm**

This section contains messages that are issued by the Channel-to-Channel (CTC) device driver. CTC connections are high-speed point-to-point connections between two operating system instances on System z.
dasd-eckd

This section contains messages that are issued by the DASD device driver module that handles DASDs with the Extended Count Key Data (ECKD™) format.

dasd-fba

This section contains messages that are issued by the DASD device driver module that handles DASDs with the Fixed Block Access (FBA) format.

dasd

This section contains messages that are issued by the DASD device driver.

dcssblk

This section contains messages that are issued by the z/VM discontiguous saved segments (DCSS) device driver. The DCSS device driver provides disk-like fixed block access to z/VM discontiguous saved segments.

extmem

This section contains messages that are issued by the kernel module that provides an interface to the z/VM DCSS management functions.

hvc_iucv

This section contains messages that are issued by the z/VM IUCV Hypervisor Console (HVC) device driver. This device driver supports terminal access through the iucvconn program to instances of Linux on z/VM.

hypfs

This section contains messages that are issued by the S/390® hypervisor file system, which provides access to LPAR and z/VM hypervisor data.

iucv

This section contains messages that are issued by the Inter-User Communication Vehicle (IUCV) device driver. IUCV is a z/VM communication facility that enables a program running in one z/VM guest to communicate with another z/VM guest, or with a control program, or even with itself.

Ics

This section contains messages that are issued by the LAN channel station device driver. The LCS device driver supports non-QDIO communications through Open Systems Adapters (OSA).

monreader

This section contains messages that are issued by the z/VM *MONITOR record reader device driver. This device driver enables monitoring software on Linux to access z/VM *MONITOR records, which contain data about z/VM guest virtual machines.
monwriter

This section contains messages that are issued by the monitor stream application device driver. Applications can use this device driver to write monitor data in the form of APPLDATA records to the z/VM monitor stream.

netiucv

This section contains messages that are issued by the NETIUCV device driver. This network device driver uses IUCV to connect instances of Linux on z/VM, or to connect an instance of Linux on z/VM to another z/VM guest such as a TCP/IP service machine.

qeth

This section contains messages that are issued by the qeth device driver. The qeth device driver supports a multitude of network connections, for example, connections through Open Systems Adapters (OSA), HiperSockets™, guest LANs, and virtual switches.

s390dbf

This section contains messages that are issued by the S/390 debug feature.

sclp_cmd

This section contains messages that are issued by the sclp_cmd subsystem.

setup

This section contains messages that are issued when Linux starts.

tape

This section contains messages that are issued by the channel-attached tape device driver.

tape_34xx

This section contains messages that are issued by the channel-attached tape device driver and relate to an IBM 3480 or IBM 3490 magnetic tape subsystem.

tape_3590

This section contains messages that are issued by the channel-attached tape device driver and relate to an IBM 3590 or IBM 3592 magnetic tape subsystem.

time

This section contains messages that are issued by the System z specific time functions.

vmlogrdr

This section contains messages that are issued by the z/VM recording device driver. With the z/VM recording device driver, an instance of Linux on z/VM can
read from the z/VM CP recording services.

**vmur**

This section contains messages that are issued by the z/VM virtual unit record device driver. This device driver provides Linux with access to z/VM virtual unit record devices like punch card readers, card punches, and line printers.

**vmwatchdog**

This section contains messages that are issued by the watchdog device driver. With the watchdog device driver, a watchdog application on an instance of Linux on z/VM can access the z/VM watchdog timer.

**xpram**

This section contains messages that are issued by the XPRAM device driver. This block device driver enables Linux on System z to access expanded storage.

**zdump**

This section contains messages that are issued by the zfcpdump functions.

**zfcp**

This section contains messages that are issued by the SCSI-over-Fibre Channel device driver (zfcp device driver) for the QDIO-based System z SCSI-over-Fibre Channel adapter. The zfcp device driver provides support for Fibre Channel-attached SCSI devices on Linux on System z.
Chapter 3. aes_s390

This section contains messages that are issued by the kernel module that provides support for the System z hardware accelerated implementation of the AES cipher algorithms (FIPS-197).

**aes_s390.cb83bb AES hardware acceleration is only available for 128-bit keys**

**Explanation:** The advanced encryption standard (AES) algorithm includes three modes with 128-bit, 192-bit, and 256-bit keys. Your hardware system only provides hardware acceleration for the 128-bit key mode. The aes_s390 module will use the less performant software fallback algorithm for the 192-bit and 256-bit key modes.

**User response:** None.

**Severity:** Informational

**aes_s390.dc0a3b Allocating AES fallback algorithm failed**

**Explanation:** The advanced encryption standard (AES) algorithm includes three modes with 128-bit, 192-bit, and 256-bit keys. Your hardware system only provides hardware acceleration for the 128-bit mode. The aes_s390 module failed to allocate a software fallback for the AES modes that are not supported by the hardware. A possible reason for this problem is that the aes_generic module that provides the fallback algorithms is not available.

**User response:** Use the 128-bit mode only or ensure that the aes_generic module is available and loaded and reload the aes_s390 module.

**Severity:** Error

**aes_s390.e37463 Allocating XTS fallback algorithm failed**

**Explanation:** The aes_s390 module failed to allocate a software fallback for the AES modes that are not supported by the hardware. A possible reason for this problem is that the aes_generic module that provides the fallback algorithms is not available.

**User response:** Ensure that the aes_generic module is available and loaded and reload the aes_s390 module.

**Severity:** Error
Chapter 4. af_iucv

This section contains messages that are issued by the kernel module that supports the AF_IUCV address family for communication and addressing with z/VM IUCV.

af_iucv.5c08c7  Application <application name> on z/VM guest <z/VM user ID> exceeds message limit

Explanation: Messages or packets destined for the application have accumulated and reached the maximum value. The default for the message limit is 65535. You can specify a different limit as the value for MSGLIMIT within the IUCV statement of the z/VM virtual machine on which the application runs.

User response: Ensure that you do not send data faster than the application retrieves them. Ensure that the message limit on the z/VM guest virtual machine on which the application runs is high enough.

Severity: Error

af_iucv.cc24c0  The af_iucv module cannot be loaded without z/VM

Explanation: The AF_IUCV protocol connects socket applications running in Linux kernels on different z/VM virtual machines, or it connects a Linux application to another sockets application running in a z/VM virtual machine. On Linux instances that run in environments other than the z/VM hypervisor, the AF_IUCV protocol does not provide any useful function and the corresponding af_iucv module cannot be loaded.

User response: Load the af_iucv module only on Linux instances that run as guest operating systems of the z/VM hypervisor. If the module has been compiled into the kernel, ignore this message.

Severity: Error
Chapter 5. ap

This section contains messages that are issued by the kernel module that supports special processors for cryptographic operations.

**ap.3677f7** The hardware system does not support AP instructions

**Explanation:** The ap module addresses AP adapters through AP instructions. The hardware system on which the Linux instance runs does not support AP instructions. The ap module cannot detect any AP adapters.

**User response:** Load the ap module only if your Linux instance runs on hardware that supports AP instructions. If the ap module has been compiled into the kernel, ignore this message.

**Severity:** Warning

**ap.7564a4** <AP domain index> is not a valid cryptographic domain

**Explanation:** The cryptographic domain specified for the ‘domain’ module or kernel parameter must be an integer in the range 0 to 15.

**User response:** Reload the cryptographic device driver with a correct module parameter. If the device driver has been compiled into the kernel, correct the value in the kernel parameter line and reboot Linux.

**Severity:** Warning

**ap.fce52f** Registering adapter interrupts for AP <AP device ID> failed

**Explanation:** The hardware system supports AP adapter interrupts but failed to enable an adapter for interrupts. Possible causes for this error are: i) The AP adapter firmware does not support AP interrupts. ii) An AP adapter firmware update to a firmware level that supports AP adapter interrupts failed. iii) The AP adapter firmware has been successfully updated to a level that supports AP interrupts but the new firmware has not been activated.

**User response:** Ensure that the firmware on your AP adapters support AP interrupts and that any firmware updates have completed successfully. If necessary, deconfigure your cryptographic adapters and reconfigure them to ensure that any firmware updates become active, then reload the ap module. If the ap module has been compiled into the kernel, reboot Linux.

**Severity:** Error
Chapter 6. appldata

This section contains messages that are issued by the kernel modules that gather kernel performance data and statistics and export this data to z/VM by means of APPLDATA monitor records.

appldata.0ae163  Stopping the data collection for
<appldata module> failed with rc=<return code>

Explanation: The specified data collection module used the z/VM diagnose call DIAG 0xDC to stop writing data. z/VM returned an error and the data collection continues.

User response: See the section about DIAGNOSE Code X’DC’ in “z/VM CP Programming Services”.

Severity: Error

appldata.81e326  Maximum OS record size <no of bytes> exceeds the maximum record size <no of bytes>

Explanation: The OS record size grows with the number of CPUs and is adjusted by the appldata_os module in response to CPU hotplug events. For more than 110 CPUs the record size would exceed the maximum record size of 4024 bytes that is supported by the z/VM hypervisor. To prevent the maximum supported record size from being exceeded while data collection is in progress, you cannot load the appldata_os module on Linux instances that are configured for a maximum of more than 110 CPUs.

User response: If you do not want to collect operating system data, you can ignore this message. If you want to collect operating system data, reconfigure your Linux instance to support less than 110 CPUs.

Severity: Error

appldata.887845  Stopping a faulty OS data collection failed with rc=<return code>

Explanation: After a CPU hotplug event, the record size for the running operating system data collection is no longer correct. The appldata_os module tried to stop the faulty data collection but received an error from the z/VM diagnose call DIAG 0xDC. Any data collected with the current record size might be faulty.

User response: Try to restart appldata_os monitoring. For information about stopping and starting data collections see "Device Drivers, Features, and Commands". For information about the return codes see the section about DIAGNOSE Code X’DC’ in “z/VM CP Programming Services”.

Severity: Error
Chapter 7. cio

This section contains messages that are issued by the kernel module that provides basic I/O functions for channel-attached devices.

cio.0f6270  No CCW console was found

Explanation: Linux did not find the expected CCW console and tries to use an alternative console. A possible reason why the console was not found is that the console has been specified in the cio_ignore list.

User response: None, if an appropriate alternative console has been found, and you want to use this alternative console. If you want to use the CCW console, ensure that is not specified in the cio_ignore list, explicitly specify the console with the 'condev=' kernel parameter, and reboot Linux.

Severity: Warning

cio.1c5e61  <Device bus-ID>: The device entered boxed state while being set offline

Explanation: While the device was set offline, it did not respond in time or it was reserved by another operating system. The device is now inactive, but setting it online again might fail.

User response: None.

Severity: Warning

cio.2943d5  Processing <configuration change> for channel path <channel subsystem ID>,<CHPID>

Explanation: A configuration change is in progress for the given channel path.

User response: None.

Severity: Notice

cio.2b995e  <device bus-ID> is not a valid device for the cio_ignore kernel parameter

Explanation: The device specification for the cio_ignore kernel parameter is syntactically incorrect or specifies an unknown device. This device is not excluded from being sensed and analyzed.

User response: Correct your device specification in the kernel parameter line to have the device excluded when you next reboot Linux. You can write the correct range specification to /proc/cio_ignore to add the range of devices to the list of devices to be excluded. This does not immediately make the devices in the range inaccessible but any of these devices are ignored if they disappear and later reappear.

Severity: Warning

cio.390dcf  <Device bus-ID>: The device stopped operating while being set offline

Explanation: While the device was set offline, it was not present or not operational. The device is now inactive, but setting it online again might fail.

User response: None.

Severity: Warning

cio.582533  Logging for subchannel 0.<subchannel set ID>,<subchannel number> was triggered

Explanation: Model-dependent logs and traces may be captured for the specified subchannel.

User response: None.

Severity: Notice

cio.5b32ec  0.<from subchannel set ID>,<from device number> to 0.<to subchannel set ID>,<to device number> is not a valid range for cio_ignore

Explanation: The device range specified for the cio_ignore kernel parameter is syntactically incorrect. No devices specified with this range are excluded from being sensed and analyzed.

User response: Correct your range specification in the kernel parameter line to have the range of devices excluded when you next reboot Linux. You can write the correct range specification to /proc/cio_ignore to add the range of devices to the list of devices to be excluded. This does not immediately make the devices in the range inaccessible but any of these devices are ignored if they disappear and later reappear.

Severity: Warning

cio.7a35c2  Logging for subchannel 0.<subchannel set ID>,<subchannel number> failed with errno=<errno>

Explanation: Capturing model-dependent logs and traces could not be triggered for the specified subchannel.

User response: See the errno man page to find out what caused the problem.

Severity: Warning

cio.8665f1  The CSS device driver initialization failed with errno=<Return code>

Explanation: The channel subsystem bus could not be established.
cio.8e4d4c • cio.b5d5f6

User response:  See the errno man page to find out what caused the problem.

Severity: Alert

Explanation: Initialization of a device did not complete because it did not respond in time or it was reserved by another operating system.

User response: Make sure that the device is working correctly, then try again to set it online. For devices that support the reserve/release mechanism (for example DASDs), you can try to override the reservation of the other system by writing 'force' to the 'online' sysfs attribute of the affected device.

Severity: Warning

Explanation: Initialization of a device did not complete because it is not present or not operational.

User response: Make sure that the device is present and working correctly, then try again to set it online.

Severity: Warning

Explanation: The channel measurement facility has been initialized successfully. Format 'extended' should be used for z990 and later mainframe systems. Format 'basic' is intended for earlier mainframes. Mode 'autodetected' means that the format has been set automatically. Mode 'parameter' means that the format has been set according to the 'format=' kernel parameter.

User response: None.

Severity: Informational
This section contains messages that are issued by the Common Link Access to Workstation (CLAW) device driver.

</tbody>
</table>

Example, if the read subchannel used to create the CLAW group device is not defined as a CLAW read subchannel in the hardware definitions. The CLAW read subchannel must be for a 3088 device of type x'61' and have an even bus ID. The bus ID of the read subchannel matches the bus ID of the CLAW device.
Explanation: A Common Link Access to Workstation (CLAW) data packet was received but the CLAW device driver could not allocate a receive buffer. A possible cause of this problem is memory constraints. The data packet is dropped but the connection remains operational.

User response: Ensure that sufficient memory is available. If this problem occurs frequently, restart the remote CLAW device. If this does not resolve the error, gather logs and traces from the remote CLAW device to obtain further diagnostic data.

Severity: Informational

claw.50a02b  claw.6c9677

Explanation: The device is not a CLAW device

User response: Assure that the subchannels have been defined correctly to the real or virtual hardware, for example, in your IOCDS or in your z/VM configuration.

Severity: Warning

claw.5355ea  <bus ID of the CLAW device>: Deactivating <network interface name> completed with incorrect subchannel status (read <read subchannel status>, write <write subchannel status>)

Explanation: When the Common Link Access to Workstation (CLAW) device driver closes a CLAW device, the device driver frees all storage that is used for the device. A successful closing operation results in status DEVICE END and CHANNEL END for both the read and write subchannel. At least one of these statuses is missing for a subchannel. Data might have been lost and there might be problems when the network interface is activated again.

User response: If the network interface cannot be activated, vary the subchannels for the device offline and back online, for example, with chchp. If this does not resolve the problem, reset the remote channel adapter.

Severity: Warning

claw.68529a  <bus ID of the CLAW device>: The communication peer of <network interface name> rejected the connection

Explanation: The remote CLAW device rejected the connection because of a mismatch between the settings of the local CLAW device and the remote CLAW device.

User response: Check the settings of both the local and the remote CLAW device and ensure that the settings are consistent. Restart the CLAW device, local or remote for which you have made the correction.

Severity: Warning

claw.6c9677  <bus ID of the CLAW device>: An uninitialized CLAW device received an IRQ, c-<subchannel status> d-<device status>

Explanation: A Common Link Access to Workstation (CLAW) device was not initialized when it received a channel interrupt (IRQ). The IRQ is ignored. This might be a temporary condition while the device comes online or is taken offline.

User response: If this problem occurs frequently, use the status information from the message and the channel and device traces to analyze the problem. See "Principles of Operation" for details about of the status information.

Severity: Warning
Activating the CLAW device failed

Explanation: Activating the Common Link Access to Workstation (CLAW) device failed. A possible cause of this problem is memory constraints.

User response: Free some memory and try again to activate the CLAW device. If the problem persists, contact your support organization.

Severity: Warning

The CLAW device for <network interface name> received an unexpected IRQ

Explanation: A Common Link Access to Workstation (CLAW) device received a channel interrupt (IRQ) while the CLAW device driver had assigned a status to the device in which it cannot process IRQs. The IRQ is ignored.

User response: Restart the remote channel adapter. If the problem persists, use s390dbf traces and CCW traces to diagnose the problem.

Severity: Warning

Validating <network interface name> failed because of a frame size conflict

Explanation: You set the frame size for the local Common Link Access to Workstation (CLAW) device implicitly by setting the connection type. For connection type 'packed' the frame size is 32 KB, for the other connection types the frame size is 4 KB. The connection cannot be activated because the frame size of the local CLAW device does not match the frame size of the communication peer.

User response: Confirm that you are using the correct connection type for the local CLAW device. Ensure that the frame size of the remote CLAW device is set accordingly. Restart the CLAW device, local or remote, for which you have made corrections.

Severity: Warning

The communication peer of <network interface name> failed

Explanation: The remote Common Link Access to Workstation (CLAW) device reported an error condition that cannot be recovered automatically.

User response: Restart the remote CLAW device. If this does not resolve the error, gather logs and traces from the remote CLAW device to obtain further diagnostic data.

Severity: Warning

Registering with the S/390 debug feature failed with error code <errno>

Explanation: The Common Link Access to Workstation (CLAW) device driver failed to register with the S/390 debug feature. No debug traces will be available for CLAW.

User response: Enter 'lsmod | grep dbf' or an equivalent command to check if the S/390 debug feature loaded. If the output does not show the dbf module, the S/390 debug feature has not been loaded, unload the CLAW device driver, load the debug feature, then reload the CLAW device driver. See the errno man page for information about the error code.
claw.7f27d6 • claw.9bd9c2

Severity:  Error

claw.7f27d6 <bus ID of the CLAW device>: The remote channel adapter for <network interface name> is faulty

Explanation: The Common Link Access to Workstation (CLAW) device driver received a device status word DEV_STAT_UNIT_CHECK and sense code 0x30. This indicates that the remote channel adapter is faulty.

User response: Check and restart the remote channel adapter and activate the remote interface. If the problem persists, perform device diagnosis for the remote channel adapter and examine the subchannel trace for further diagnostic information. For information about the sense code see /Documentation/s390/cds.txt in the Linux source tree. Search for 'SNS0' to locate the information.

Severity:  Warning

claw.81d266 <bus ID of the CLAW device>: The CLAW device received an unexpected IRQ, c-<subchannel status> d-<device status>

Explanation: A Common Link Access to Workstation (CLAW) device received a channel interrupt (IRQ) while it was in a state in which it cannot process IRQs. The IRQ is ignored. This might be a temporary condition.

User response: If this problem occurs frequently, use the status information from the message and the channel and device traces to analyze the problem. See "Principles of Operation" for details about the status information.

Severity:  Warning

claw.823401 <bus ID of the failed CLAW device>: Creating the /proc files for a new CLAW device failed

Explanation: For each Common Link Access to Workstation (CLAW) device the CLAW device driver maintains files in the proc file system. The CLAW device driver failed to create a new CLAW device because it could not create these /proc files for the new device. You cannot create CLAW devices for Linux kernels that do not include a proc file system.

User response: Ensure that your Linux kernel provides a proc file system. Reboot Linux. If your kernel provides a proc file system and the problem persists, contact your support organization.

Severity:  Error

claw.858a92 <bus ID of the CLAW device>: The communication peer of <network interface name> rejected a connection request

Explanation: The remote CLAW device detected an inconsistency in the configurations of the local and the remote CLAW device and rejected a connection request.

User response: Examine the settings of your local and remote CLAW device. Correct the erroneous setting and restart the CLAW device, local or remote, for which you have made corrections.

Severity:  Warning

claw.887cf5 <bus ID of the CLAW device>: Validating <network interface name> failed because of a version conflict

Explanation: The Common Link Access to Workstation (CLAW) network interface cannot be activated because the remote CLAW device does not support CLAW version 2. The CLAW device driver requires CLAW version 2.

User response: Ensure that the remote channel adapter supports CLAW version 2 and that the remote CLAW device is configured for CLAW version 2.

Severity:  Warning

claw.89e5ba <bus ID of the CLAW device>: Adapter name <adapter name in the local CLAW device settings> for <network interface name> does not match the remote host name <host name in the remote CLAW device settings>

Explanation: The adapter name in the local Common Link Access to Workstation (CLAW) device settings must match the host name in the CLAW device settings of the communication peer. The CLAW device driver discovered a mismatch between these settings. The connection cannot be established.

User response: Check the configuration of the CLAW device and of its communication peer. Correct the erroneous setting and restart the CLAW device, local or remote, for which you have made corrections.

Severity:  Warning

claw.9bd9c2 <bus ID of the CLAW device>: <network interface name> rejected a connection request because it is already active

Explanation: The Common Link Access to Workstation (CLAW) device rejected a connection request by its communication peer because the connection is already active. The CLAW device driver only supports a single connection for each CLAW device. This might be a runtime problem.
User response: None if there is an active connection. If no connection can be established, restart the remote channel adapter.

Severity: Informational

claw.a84a95 <bus ID of the CLAW device>: The local write buffer is smaller than the remote read buffer

Explanation: You set the buffer size for the local Common Link Access to Workstation (CLAW) device implicitly by setting the connection type. For connection type 'packed' the buffer size is 32 KB, for the other connection types the buffer size is 4 KB. The connection cannot be established because the write buffer size of the local CLAW device does not match the read buffer size of the communication peer.

User response: Confirm that you are using the correct connection type for the local CLAW device. Ensure that the read buffer size of the remote CLAW device is set accordingly. Restart the CLAW device, local or remote, for which you have made corrections.

Severity: Warning

claw.b13754 <bus ID of the CLAW device>: Settings for <network interface name> validated (version=<CLAW API version>, remote device=<identifier for the remote CLAW device>, rc=<return code received from the remote CLAW device>, adapter name=<adapter name>, host name=<host name>)

Explanation: The settings of the local Common Link Access to Workstation (CLAW) device have been validated by the communication peer. The message summarizes the content of the response. If the return code is zero, the validation was successful and the connection is activated.

User response: If the return code is not equal to zero, look for related warning messages.

Severity: Informational

claw.b322ac <bus ID of the CLAW device>: The communication peer of <network interface name> sent a faulty frame of length <incorrect frame length value>

Explanation: The remote Common Link Access to Workstation (CLAW) device sent a frame with an incorrect value in the length field. This problem might result from data errors or incorrect packing. The connection remains operational.

User response: If this problem occurs frequently, restart the remote CLAW device. If this does not resolve the error, gather logs and traces from the remote CLAW device to obtain further diagnostic data.

Severity: Warning

claw.b40a6a <bus ID of the CLAW device>: The communication peer of <network interface name> rejected a connection request because of a type mismatch

Explanation: The remote Common Link Access to Workstation (CLAW) device rejected a request to open a connection. A connection can only be opened if the same connection type has been set for both the local and the remote CLAW device.

User response: Ensure that the connection types for the local and remote CLAW device match. Restart the CLAW device, local or remote, for which you have changed the connection type.

Severity: Warning

claw.b85501 <bus ID of the CLAW device>: The communication peer of <network interface name> sent an unknown command code

Explanation: The remote Common Link Access to Workstation (CLAW) device sent a command code that
claw.c06c67  claw.f26e3d

is not defined. This might indicate that the remote CLAW device is malfunctioning. The connection remains operational.

**User response:** If this problem occurs frequently, restart the remote CLAW device. If this does not resolve the error, gather logs and traces from the remote CLAW device to obtain further diagnostic data.

**Severity:** Warning

---

**claw.c06c67:** A read data parity error occurred for `<network interface name>`

**Explanation:** The Common Link Access to Workstation (CLAW) device driver received a device status word DEV_STAT_UNIT_CHECK and sense code 0x10. This indicates a read data parity error. The remote channel adapter might be faulty.

**User response:** Ensure that all cables are securely plugged. Check and restart the remote channel adapter and activate the remote interface. If the problem persists, perform device diagnosis for the remote channel adapter and examine the subchannel trace for further diagnostic information. For information about the sense code see /Documentation/s390/cds.txt in the Linux source tree. Search for ‘SNS0’ to locate the information.

**Severity:** Warning

---

**claw.f10136:** Activating `<network interface name>` failed because of an incorrect link ID=<link ID returned from the remote CLAW device>

**Explanation:** The remote Common Link Access to Workstation (CLAW) device accepted a connection request but returned an incorrect link ID. The CLAW device driver only supports a single connection at a time (link ID=1) for each network interface.

**User response:** Restart the remote CLAW device and try again to activate the network interface.

**Severity:** Warning

---

**claw.e52567:** A data transfer parity error occurred for `<network interface name>`

**Explanation:** The Common Link Access to Workstation (CLAW) device driver received a device status word DEV_STAT_UNIT_CHECK and sense code 0x20. This indicates a data parity error. The remote channel adapter or the channel might be faulty.

**User response:** Ensure that all cables are securely plugged. Restart the remote channel adapter and activate the remote interface. If the problem persists, examine the subchannel trace for further diagnostic information. For information about the sense code see /Documentation/s390/cds.txt in the Linux source tree. Search for ‘SNS0’ to locate the information.

**Severity:** Warning

---

**claw.d99a9c:** `<network interface name>` rejected a connection request because of a type mismatch

**Explanation:** The Common Link Access to Workstation (CLAW) device rejected a request by its communication peer to open a connection. A connection can only be opened if the same connection type has been set for both the local and the remote CLAW device.

**User response:** See the errno man page to find out what the error code means. Check for related messages. Restart the remote channel adapter. If the problem persists, examine the subchannel trace for further diagnostic information.

**Severity:** Error
Chapter 9. cpcmd

This section contains messages that are issued by the cpcmd kernel function.

cpcmd.5984fe  The cpcmd kernel function failed to allocate a response buffer

Explanation:  IPL code, console detection, and device drivers like vmcp or vmlogdr use the cpcmd kernel function to send commands to the z/VM control program (CP). If a program that uses the cpcmd function does not allocate a contiguous response buffer below 2 GB guest real storage, cpcmd creates a bounce buffer to be used as the response buffer. Because of low memory or memory fragmentation, cpcmd could not create the bounce buffer.

User response:  Look for related page allocation failure messages and at the stack trace to find out which program or operation failed. Free some memory and retry the failed operation. Consider allocating more memory to your z/VM guest virtual machine.

Severity:  Warning
Chapter 10. cpu

This section contains messages that are issued by the System z specific CPU management functions.

cpu.33a262  <number of configured CPUs>
            configured CPUs, <number of standby CPUs>
            standby CPUs

Explanation:  The kernel detected the given number of configured and standby CPUs.

User response:  None.

Severity:  Informational

cpu.3748dd  The CPU configuration topology of the machine is:

Explanation:  The first six values of the topology information represent fields Mag6 to Mag1 of system-information block (SYSIB) 15.1.2. These fields specify the maximum numbers of topology-list entries (TLE) at successive topology nesting levels. The last value represents the MNest value of SYSIB 15.1.2 which specifies the maximum possible nesting that can be configured through dynamic changes. For details see the SYSIB 15.1.2 information in the "Principles of Operation."

User response:  None.

Severity:  Informational

cpu.e2917c  CPU <CPU number> exceeds the maximum <maximum CPU number> and is excluded from the dump

Explanation:  The Linux kernel is used as a system dumper but it runs on more CPUs than it has been compiled for with the CONFIG_NR_CPUS kernel configuration option. The system dump will be created but information on one or more CPUs will be missing.

User response:  Update the system dump kernel to a newer version that supports more CPUs or reduce the number of installed CPUs and reproduce the problem that should be analyzed. If you send the system dump that prompted this message to a support organization, be sure to communicate that the dump does not include all CPU information.

Severity:  Warning
This section contains messages that are issued by the Channel-to-Channel (CTC) device driver. CTC connections are high-speed point-to-point connections between two operating system instances on System z.

**ctcm.06c639 <bus ID of the CTCM device>: The adapter received a non-specific IRQ**

**Explanation:** The adapter hardware used by the CTCM device received an IRQ that cannot be mapped to a particular device. This is a hardware problem.

**User response:** Check the status of the CTCM device, for example, with ifconfig. Check if the connection to the remote device still works. If the CTCM device is not operational, set it offline and back online. If this does not resolve the problem, perform a manual recovery. See "Device Drivers, Features, and Commands" for details about how to recover a CTCM device. If this problem persists, gather Linux debug data and report the problem to your support organization.

**Severity:** Warning

**ctcm.0e17de <bus ID of the CTCM device>: An error occurred on the adapter hardware**

**Explanation:** The CTCM device uses an adapter to physically connect to its communication peer. An operation on this adapter returned an error.

**User response:** Check the status of the CTCM device, for example, with ifconfig. If the device is not operational, perform a manual recovery. See "Device Drivers, Features, and Commands" for details about how to recover a CTCM device.

**Severity:** Error

**ctcm.3c5812 <bus ID of the CTCM device>: Initialization failed with RX/TX init handshake error <error information>**

**Explanation:** A problem occurred during the initialization of the connection. If the connection can be established after an automatic recovery, a success message is issued.

**User response:** If the problem is not resolved by the automatic recovery process, check the local and remote device. If this problem persists, gather Linux debug data and report the problem to your support organization.

**Severity:** Warning

**ctcm.4b5292 <bus ID of the CTCM device>: A check occurred on the subchannel**

**Explanation:** A check condition has been detected on the subchannel.

**User response:** Check if the connection to the remote device still works. If the CTCM device is not operational, set it offline and back online. If this does not resolve the problem, perform a manual recovery. See "Device Drivers, Features, and Commands" for details about how to recover a CTCM device. If this problem persists, gather Linux debug data and report the problem to your support organization.

**Severity:** Warning

**ctcm.58aa19 <channel ID>: The remote operating system is not available**

**Explanation:** The operating system instance with the communication peer has disconnected. Possible reasons are that the operating system instance has been rebooted or shut down.

**User response:** Ensure that the peer operating system instance is running and that the peer interface is operational.

**Severity:** Notice

**ctcm.8079b5 <bus ID of the CTCM device>: An adapter hardware operation timed out**

**Explanation:** The CTCM device uses an adapter to physically connect to its communication peer. An operation on this adapter timed out.

**User response:** Check the status of the CTCM device, for example, with ifconfig. If the device is not operational, perform a manual recovery. See "Device Drivers, Features, and Commands" for details about how to recover a CTCM device.

**Severity:** Error

**ctcm.95ba79 <bus ID of the CTCM device>: An I/O-error occurred on the CTCM device**

**Explanation:** An I/O error was detected on one of the subchannels of the CTCM device. Depending on the error, the CTCM device driver might attempt an automatic recovery.

**User response:** Check the status of the CTCM device, for example, with ifconfig. If the device is not operational, perform a manual recovery. See "Device Drivers, Features, and Commands" for details about how to recover a CTCM device.

**Severity:** Error
ctcm.ad45a0  •  ctm.fde68a

ctcm.ad45a0  <channel ID>: The communication peer is busy

Explanation: A busy target device was reported. This might be a temporary problem.

User response: If this problem persists or is reported frequently ensure that the target device is working properly.

Severity: Informational

ctcmafe161 <channel ID>: The communication peer has disconnected

Explanation: The remote device has disconnected. Possible reasons are that the remote interface has been closed or that the operating system instance with the communication peer has been rebooted or shut down.

User response: Check the status of the peer device. Ensure that the peer operating system instance is running and that the peer interface is operational.

Severity: Notice

ctcm.c97a8e An I/O operation resulted in error
<channel ID>

Explanation: A hardware operation ended with an error.

User response: Check the status of the CTCM device, for example, with ifconfig. If the device is not operational, perform a manual recovery. See “Device Drivers, Features, and Commands” for details about how to recover a CTCM device. If this problem persists, gather Linux debug data, collect the hardware logs, and report the problem to your support organization.

Severity: Error

ctcm.defd4f <bus ID of the CTCM device>: The XID used in the MPC protocol is not valid, rc = <return code>

Explanation: The exchange identification (XID) used by the CTCM device driver when in MPC mode is not valid.

User response: Note the error information provided with this message and contact your support organization.

Severity: Warning

ctcm.ec4b8d <bus ID of the CTCM device>: The network backlog for <calling function> is exceeded, package dropped

Explanation: There is more network traffic than can be handled by the device. The device is closed and some data has not been transmitted. The device might be recovered automatically.

User response: Investigate and resolve the congestion. If necessary, set the device online to make it operational.

Severity: Warning
Chapter 12. dasd-eckd

This section contains messages that are issued by the DASD device driver module that handles DASDs with the Extended Count Key Data (ECKD) format.

dasd-eckd.00f842 <bus ID of the DASD>: An I/O control call used incorrect flags 0x<flags>

Explanation: The DASD format I/O control was used incorrectly.
User response: Contact the owner of the formatting tool.
Severity: Warning

---

dasd-eckd.01a684 <bus ID of the DASD>: FORMAT 4 - No sync byte in key area

Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

---

dasd-eckd.01f692 <bus ID of the DASD>: FORMAT 9 - Reserved

Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

---

dasd-eckd.02c01a <bus ID of the DASD>: FORMAT 7 - No response to selection after a poll interruption

Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

---

dasd-eckd.04ae78 <bus ID of the DASD>: FORMAT 7 - Missing end operation; device transfer incomplete

Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

---

dasd-eckd.05b6e3 <bus ID of the DASD>: FORMAT 8 - End operation with transfer count zero

Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

---

dasd-eckd.05c8ba <bus ID of the DASD>: FORMAT 6 - Overrun on channel F

Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

---

dasd-eckd.06e412 <bus ID of the DASD>: FORMAT 0 - Status Not As Required: reason <reason code>

Explanation: This is an operating system independent message that is issued by the storage system. There are several potential reasons for this message; byte 8 contains the reason code.
User response: For more information see the documentation of your storage system.
Severity: Warning

---

dasd-eckd.07541e <bus ID of the DASD>: FORMAT 0 - CCW Count less than required

Explanation: The CCW count of a command is less than required. This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

---
**Dasd-eckd.08b7b8**  
**Dasd-eckd.1577ff**

**Dasd-eckd.08b7b8**  
<bus ID of the DASD>: FORMAT 4 - No sync byte in data area  
**Explanation:** This is an operating system independent message that is issued by the storage system.  
**User response:** For more information see the documentation of your storage system.  
**Severity:** Warning

**Dasd-eckd.08d1ee**  
<bus ID of the DASD>: FORMAT 9 - Head address did not compare  
**Explanation:** This is an operating system independent message that is issued by the storage system.  
**User response:** For more information see the documentation of your storage system.  
**Severity:** Warning

**Dasd-eckd.094439**  
<bus ID of the DASD>: FORMAT 3 - Reserved  
**Explanation:** This is an operating system independent message that is issued by the storage system.  
**User response:** For more information see the documentation of your storage system.  
**Severity:** Warning

**Dasd-eckd.0ad5d2**  
<bus ID of the DASD>: FORMAT 4 - No sync byte in home address area  
**Explanation:** This is an operating system independent message that is issued by the storage system.  
**User response:** For more information see the documentation of your storage system.  
**Severity:** Warning

**Dasd-eckd.0af728**  
<bus ID of the DASD>: FORMAT 6 - Overrun on channel B  
**Explanation:** This is an operating system independent message that is issued by the storage system.  
**User response:** For more information see the documentation of your storage system.  
**Severity:** Warning

**Dasd-eckd.0d6cb0**  
<bus ID of the DASD>: FORMAT F - Subsystem Processing Error  
**Explanation:** A firmware logic error has been detected. This is an operating system independent message that is issued by the storage system.  
**User response:** For more information see the documentation of your storage system.  
**Severity:** Warning

**Dasd-eckd.0e881a**  
<bus ID of the DASD>: FORMAT 7 - Invalid tag-in for an immediate command sequence  
**Explanation:** This is an operating system independent message that is issued by the storage system.  
**User response:** For more information see the documentation of your storage system.  
**Severity:** Warning

**Dasd-eckd.0ec8bb**  
<bus ID of the DASD>: Reading device feature codes failed (rc=<return code>) for new path <path mask>  
**Explanation:** A new path has been made available to the device. A command to read the device feature codes on this device returned an error. The new path will not be used for I/O.  
**User response:** Set the new path offline and online again to repeat the path verification. Alternatively, set the device offline and online again to verify all available paths for this device. If this problem persists, gather Linux debug data and report the problem to your support organization.  
**Severity:** Warning

**Dasd-eckd.126bfe**  
<bus ID of the DASD>: ERP chain at BEGINNING of ERP-ACTION  
**Explanation:** This message provides debug information for the enhanced error recovery procedure (ERP).  
**User response:** If you do not need this information, you can suppress this message by switching off ERP logging, for example, by writing '1' to the 'erplog' sysfs attribute of the DASD.  
**Severity:** Error

**Dasd-eckd.1577ff**  
<bus ID of the DASD>: FORMAT F - Caching terminated  
**Explanation:** The storage system was unable to initiate caching or had to suspend caching for a 3990 control unit. If this problem is caused by a failure condition, an additional message will provide more information about the failure. This is an operating system independent message that is issued by the storage system.  
**User response:** Check for additional messages that point out possible failures. For more information see the documentation of your storage system.  
**Severity:** Warning
dasd-eckd.190a3f  <bus ID of the DASD>: The DASD cannot be formatted with block size <block size>
Explanation: The block size specified for a format instruction is not valid. The block size must be between 512 and 4096 byte and must be a power of 2.
User response: Call the format command with a supported block size.
Severity: Warning

dasd-eckd.20b59b  <bus ID of the DASD>: FORMAT 0 - Invalid Command Sequence
Explanation: An incorrect sequence of commands has occurred. This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

dasd-eckd.22e514  <bus ID of the DASD>: FORMAT 4 - No syn byte in count address area; offset active
Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

dasd-eckd.2567a1  <bus ID of the DASD>: FORMAT 0 - Invalid Command
Explanation: A command was issued that is not in the 2107/1750 command set. This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

dasd-eckd.27f2cd  <bus ID of the DASD>: The DASD is not operating in multipath mode
Explanation: The DASD channel path group could not be configured to use multipath mode. This might negatively affect I/O performance on this DASD.
User response: Make sure that the DASD is working correctly, then try again to set it online. If initialization still fails, reboot.
Severity: Informational

dasd-eckd.292792  <bus ID of the DASD>: FORMAT D - Reserved
Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
dasd-eckd.29f189  
Severity: Warning

Explanation: This problem is likely to be caused by a programming error.

User response: Contact your support organization.

Severity: Error

Explanation: This problem is likely to be caused by a programming error.

User response: None.

Severity: Informational

Explanation: A DASD with the shown characteristics has been set online. If the DASD is configured as read-only to the real or virtual hardware, the message includes an indication of this hardware access mode. The hardware access mode is independent from the 'readonly' attribute of the device in sysfs.

User response: None.

Severity: Warning

Explanation: This is an operating system independent message that is issued by the storage system.

User response: For more information see the documentation of your storage system.

Severity: Warning

Explanation: This is an operating system independent message that is issued by the storage system.

User response: None.

Severity: Warning

Explanation: This is an operating system independent message that is issued by the storage system.

User response: For more information see the documentation of your storage system.

Severity: Warning

Explanation: This is an operating system independent message that is issued by the storage system.

User response: For more information see the documentation of your storage system.

Severity: Warning

Explanation: This is an operating system independent message that is issued by the storage system.

User response: For more information see the documentation of your storage system.

Severity: Warning

Explanation: This is an operating system independent message that is issued by the storage system.

User response: For more information see the documentation of your storage system.

Severity: Warning

Explanation: This is an operating system independent message that is issued by the storage system.

User response: For more information see the documentation of your storage system.

Severity: Warning

Explanation: A DASD with the shown characteristics has been set online.

User response: None.
**dasd-eckd.4170f2**  
**Severity:** Informational

*The UID of the DASD has changed*

*Explanation:* The Unique Identifier (UID) of a DASD that is currently in use has changed. This indicates that the physical disk has been replaced.

*User response:* None if the replacement was intentional. If the disk change is not expected, stop using the disk to prevent possible data loss.

**Severity:** Error

---

**dasd-eckd.423705**  
*<bus ID of the DASD>: FORMAT 0 - Channel Returned with Incorrect retry CCW*

*Explanation:* A command portion of the CCW returned after a command retry sequence does not match the command for which retry was signaled. This is an operating system independent message that is issued by the storage system.

*User response:* For more information see the documentation of your storage system.

**Severity:** Warning

---

**dasd-eckd.423d5b**  
*<bus ID of the DASD>: FORMAT 7 - Missing end operation; device transfer complete*

*Explanation:* This is an operating system independent message that is issued by the storage system.

*User response:* For more information see the documentation of your storage system.

**Severity:** Warning

---

**dasd-eckd.42a207**  
*<bus ID of the DASD>: The specified record was not found*

*Explanation:* The record to be accessed does not exist. The DASD might be unformatted or defect.

*User response:* Try to format the DASD or replace it. ATTENTION: Formatting irreversibly destroys all data on the DASD.

**Severity:** Error

---

**dasd-eckd.43830c**  
*<bus ID of the DASD>: FORMAT F - Caching reinitiated*

*Explanation:* Caching has been automatically reinitiated following an error. This is an operating system independent message that is issued by the storage system.

*User response:* For more information see the documentation of your storage system.
Severity: Warning
dasd-eckd.487b65 <bus ID of the DASD>: SIM -
SRC: <sense byte><sense byte><sense byte><sense byte>
Explanation: This error message is a System Information Message (SIM) generated by the storage system. The System Reference Code (SRC) defines the error in detail.
User response: Look up the SRC in the storage server documentation.
Severity: Error
dasd-eckd.55aa2f <bus ID of the DASD>: FORMAT 1 - Missing device address bit
Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning
dasd-eckd.58c328 <bus ID of the DASD>: FORMAT 0 - Invalid Defective/Alternate Track Pointer
Explanation: A defective track has been accessed. The subsystem generates an invalid Defective/Alternate Track Pointer as a part of RAID Recovery. This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning
dasd-eckd.5cf324 <bus ID of the DASD>: FORMAT F
- Volume is suspended duplex

**Explanation:** The duplex pair volume has entered the suspended duplex state because of a failure. This is an operating system independent message that is issued by the storage system.

**User response:** For more information see the documentation of your storage system.

**Severity:** Warning

---

dasd-eckd.5efa1b <bus ID of the DASD>: FORMAT 4
- No sync byte in count address area

**Explanation:** This is an operating system independent message that is issued by the storage system.

**User response:** For more information see the documentation of your storage system.

**Severity:** Warning

---

dasd-eckd.637cf1 <bus ID of the DASD>: Reading device feature codes failed with rc=<return code>

**Explanation:** The device feature codes state which advanced features are supported by a device. Examples for advanced features are PAV or high performance FICON. Some early devices do not provide feature codes and no advanced features are available on these devices.

**User response:** None, if the DASD does not provide feature codes. If the DASD provides feature codes, make sure that it is working correctly, then set it offline and back online.

**Severity:** Warning

---

dasd-eckd.648dca <bus ID of the DASD>: FORMAT 6 - Overrun on channel D

**Explanation:** This is an operating system independent message that is issued by the storage system.

**User response:** For more information see the documentation of your storage system.

**Severity:** Warning

---

dasd-eckd.6e3fdc <bus ID of the DASD>: FORMAT 6 - Overrun on channel G

**Explanation:** This is an operating system independent message that is issued by the storage system.

**User response:** For more information see the documentation of your storage system.

**Severity:** Warning

---

dasd-eckd.6eae2d <bus ID of the DASD>: Allocating memory for private DASD data failed

**Explanation:** The DASD device driver maintains data structures for each DASD it manages. There is not enough memory to allocate these data structures for one or more DASD.

**User response:** Free some memory and try the operation again.

**Severity:** Warning

---

dasd-eckd.65917e <bus ID of the DASD>: Data recovered during retry with PCI fetch mode active

**Explanation:** A data error has been recovered on the storages system but the Linux file system cannot be informed about the data mismatch. To prevent Linux from running with incorrect data, the DASD device driver will trigger a kernel panic.

**User response:** Reset your real or virtual hardware and reboot Linux.

**Severity:** Warning

---

dasd-eckd.7109ed <bus ID of the DASD>: FORMAT 1 - Interruption cannot be reset

**Explanation:** This is an operating system independent message that is issued by the storage system.

**User response:** For more information see the documentation of your storage system.

**Severity:** Warning
dasd-eckd.72eaa3 • dasd-eckd.81757d

dasd-eckd.acd228 <bus ID of the DASD>: FORMAT 7 - extra RCC required

Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

dasd-eckd.adb621 <bus ID of the DASD>: ERP failed for the DASD

Explanation: An error recovery procedure (ERP) was performed for the DASD but failed.
User response: Check the message log for previous related error messages.
Severity: Error

dasd-eckd.b14557 <bus ID of the DASD>: FORMAT 4 - Data area error

Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Error

dasd-eckd.b22b7e <bus ID of the DASD>: An I/O request was rejected because writing is inhibited

Explanation: An I/O request was returned with an error indication of 'command reject' and 'write inhibited'. The most likely reason for this error is a failed write request to a device that was attached as read-only in z/VM.
User response: Set the device offline, ensure that the device is configured correctly in z/VM, then set the device online again.
Severity: Error

dasd-eckd.b281ed <bus ID of the DASD>: The DASD is not formatted

Explanation: A DASD has been set online but it has not been formatted yet. You must format the DASD before you can use it.
User response: Format the DASD, for example, with dasdfmt.
Severity: Warning

Chapter 12. dasd-eckd
dasd-eckd.bd1a0f • dasd-eckd.c9f7f5

Severity: Warning
dasd-eckd.bd1a0f  <bus ID of the DASD>: Start track
<track number> used in formatting exceeds end track
Explanation: The DASD format I/O control was used incorrectly by a formatting tool.
User response: Contact the owner of the formatting tool.
Severity: Warning
dasd-eckd.be85b8  <bus ID of the DASD>: FORMAT F - Cache or nonvolatile storage equipment failure
Explanation: An equipment failure has occurred in the cache storage or nonvolatile storage of the storage system. This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning
dasd-eckd.bfc2cb  <bus ID of the DASD>: FORMAT F - Nonvolatile storage terminated
Explanation: The storage director has stopped using nonvolatile storage or cannot initiate nonvolatile storage. If this problem is caused by a failure, an additional message will provide more information about the failure. This is an operating system independent message that is issued by the storage system.
User response: Check for additional messages that point out possible failures. For more information see the documentation of your storage system.
Severity: Warning
dasd-eckd.c28ccc  <bus ID of the DASD>: FORMAT 0 - DPS Installation Check
Explanation: This operating system independent message is issued by the storage system for one of the following reasons: - A 3380 Model D or E DASD does not have the Dynamic Path Selection (DPS) feature in the DASD A-unit. - The device type of an attached DASD is not supported by the firmware. - A type 3390 DASD is attached to a 3 MB channel.
User response: For more information see the documentation of your storage system.
Severity: Warning
dasd-eckd.c3ebff  <bus ID of the DASD>: FORMAT 5 - Data Check in the data area
Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning
dasd-eckd.c55c2f  <bus ID of the DASD>: Unable to allocate DCTL-CQR
Explanation: This is an internal error.
User response: Contact your support organization.
Severity: Error
dasd-eckd.c67479  <bus ID of the DASD>: FORMAT 1 - Seek incomplete
Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning
dasd-eckd.c87cc2  <bus ID of the DASD>: FORMAT 5 - Data Check in the key area; offset active
Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning
dasd-eckd.c9cc06  <bus ID of the DASD>: FORMAT 1 - Device status 1 not valid
Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning
dasd-eckd.c9f7f5  <bus ID of the DASD>: FORMAT 7 - Invalid tag-in during selection sequence
Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning
dasd-eckd.ca8dfc: FORMAT 7
- Permanent path error (DASD controller not available)

**Explanation:** This is an operating system independent message that is issued by the storage system.

**User response:** For more information see the documentation of your storage system.

**Severity:** Warning

---

dasd-eckd.cf8d3d: FORMAT 5
- Data Check in the count area

**Explanation:** This is an operating system independent message that is issued by the storage system.

**User response:** For more information see the documentation of your storage system.

**Severity:** Warning

---

dasd-eckd.d1a88a: Detecting the DASD disk layout failed because of an I/O error

**Explanation:** The disk layout of the DASD could not be detected because of an unexpected I/O error. The DASD device driver treats the device like an unformatted DASD, and partitions on the device are not accessible.

**User response:** If the DASD is formatted, make sure that the DASD is working correctly, then set it offline and back online. If the DASD is unformatted, format the DASD, for example, with dasdfmt. **ATTENTION:** Formatting irreversibly destroys all data on the DASD.

**Severity:** Error

---

dasd-eckd.d2af02: FORMAT 0
- Channel requested ... <reason code>

**Explanation:** This is an operating system independent message that is issued by the storage system. The possible reason codes indicate the following problems:
- 00 No Message
- 01 The channel has requested unit check sense data
- 02 The channel has requested retry and retry is exhausted
- 03 A SA Check-2 error has occurred. This sense is presented with Equipment Check
- 04 The channel has requested retry and retry is not possible

**User response:** For more information see the documentation of your storage system.

**Severity:** Warning

---

dasd-eckd.d35646: FORMAT 8 - No interruption from device during a command chain

**Explanation:** This is an operating system independent message that is issued by the storage system.

**User response:** For more information see the documentation of your storage system.

**Severity:** Warning

---

dasd-eckd.d4a740: Write inhibited path encountered

**Explanation:** This is an informational message.

**User response:** None.

**Severity:** Informational

---

dasd-eckd.d4d6d2: FORMAT F - DASD Fast Write inhibited

**Explanation:** DASD Fast Write is not allowed because of a nonvolatile storage battery check condition. This is an operating system independent message that is issued by the storage system.

**User response:** For more information see the documentation of your storage system.

**Severity:** Warning

---

dasd-eckd.d66c5d: FORMAT 4 - No sync byte in home address area; offset active

**Explanation:** This is an operating system independent message that is issued by the storage system.

**User response:** For more information see the documentation of your storage system.

**Severity:** Warning

---

dasd-eckd.d74b52: FORMAT F - Track format incorrect

**Explanation:** A track format error occurred while data was being written to the DASD or while a duplex pair was being established. This is an operating system independent message that is issued by the storage system.

**User response:** For more information see the documentation of your storage system.

**Severity:** Warning
The document contains a list of kernel messages with their explanations and user responses. Each message is highlighted with a unique identifier and categorized by severity. Here is a structured representation of the extracted text:

**dasd-eckd.d7a598 • dasd-eckd.ed1a53**

- **Independent message** that is issued by the storage system.
- **User response:** For more information see the documentation of your storage system.
- **Severity:** Warning

</table>
dasd-eckd.f02333 <bus ID of the DASD>: The cylinder data for accessing the DASD is inconsistent

Explanation: An error occurred in the storage system hardware.

User response: For more information see the documentation of your storage system.

Severity: Error

dasd-eckd.f0ba2c <bus ID of the DASD>: FORMAT 4
- Home address area error; offset active

Explanation: This is an operating system independent message that is issued by the storage system.

User response: For more information see the documentation of your storage system.

Severity: Warning

dasd-eckd.f4346b <bus ID of the DASD>: The device reservation was lost

Explanation: This Linux instance has lost its reservation of the device to another operating system instance. Depending on the reservation policy for the device, I/O might be blocked until the other operating system instance surrenders the reservation or all I/O requests might fail until the device is reset.

User response: None, if this situation is handled by system automation software. If this situation is not handled by automation, check the last_known_reservation_state attribute of the device in sysfs. If the value is ‘lost’, verify that the device is no longer reserved by another operating system instance, then set the device offline and online again. For any other value of the last_known_reservation_state no action is required. I/O will resume when the device reservation is surrendered by the other operating system instance.

Severity: Error

dasd-eckd.f453eb <bus ID of the DASD>: FORMAT 1
- Device did not respond to selection

Explanation: This is an operating system independent message that is issued by the storage system.

User response: For more information see the documentation of your storage system.

Severity: Warning

dasd-eckd.f4a01e <bus ID of the DASD>: FORMAT 0
- Command Invalid on Secondary Address

Explanation: A command or order not allowed on a PPRC secondary device has been received by the secondary device. This is an operating system independent message that is issued by the storage system.

User response: For more information see the documentation of your storage system.

Severity: Warning

dasd-eckd.f4ccb9 <bus ID of the alias>: An Alias device was reassigned to a new base device with UID: <UID of new base device>

Explanation: The alias device with the indicated bus ID has been reassigned. The UID of the new base device is shown in the message.

User response: None.

Severity: Informational

dasd-eckd.f546ed <bus ID of the DASD>: Detecting the maximum data size for zHPF requests failed (rc=<return code>) for a new path <path mask>

Explanation: High Performance FICON (zHPF) requests are limited to a hardware-dependent maximum data size. A command to detect this size for a new path returned an error. The new path will not be used for I/O.

User response: Set the new path offline and online again to repeat the path verification. Alternatively, set the device offline and online again to verify all available paths for this device. If this problem persists, gather Linux debug data and report the problem to your support organization.

Severity: Warning

dasd-eckd.f58554 <bus ID of the DASD>: FORMAT 5
- Data Check in the data area; offset active

Explanation: This is an operating system independent message that is issued by the storage system.

User response: For more information see the documentation of your storage system.

**User response:** For more information see the documentation of your storage system.

**Severity:** Warning
Chapter 13. dasd-fba

This section contains messages that are issued by the DASD device driver module that handles DASDs with the Fixed Block Access (FBA) format.

dasd-fba.680aac  <bus ID of the DASD>: Allocating memory for private DASD data failed

Explanation: The DASD device driver maintains data structures for each DASD it manages. There is not enough memory to allocate these data structures for one or more DASD.

User response: Free some memory and try the operation again.

Severity: Warning

dasd-fba.f36f2f  <bus ID of the DASD>: New FBA DASD <device type>/<device model> (CU <control unit type>/<control unit model>) with <size> MB and <bytes per block> B/blk<access mode>

Explanation: A DASD with the shown characteristics has been set online. If the DASD is configured as read-only to the real or virtual hardware, the message includes an indication of this hardware access mode. The hardware access mode is independent from the 'readonly' attribute of the device in sysfs.

User response: None.

Severity: Informational
Chapter 14. dasd

This section contains messages that are issued by the DASD device driver.

**dasd.04422e Registering the device driver with major number <DASD major> failed**

*Explanation:* Major number 94 is reserved for the DASD device driver. The DASD device driver failed to register with this major number. Another device driver might have used major number 94.

*User response:* Determine which device driver uses major number 94 instead of the DASD device driver and unload this device driver. Then try again to load the DASD device driver.

*Severity:* Warning

**dasd.0ae5e4 Discipline <discipline name> cannot be used without z/VM**

*Explanation:* The discipline that is specified with the dasd= kernel or module parameter is only available for Linux instances that run as guest operating systems of the z/VM hypervisor.

*User response:* Remove the unsupported discipline from the parameter string.

*Severity:* Informational

**dasd.1211d0 <value> is not a supported value for /proc/dasd/statistics**

*Explanation:* An incorrect value has been written to /proc/dasd/statistics. The supported values are: 'set on', 'set off', and 'reset'.

*User response:* Write a supported value to /proc/dasd/statistics.

*Severity:* Warning

**dasd.1ac0f4 <bus ID of the DASD>: Flushing the DASD request queue failed for request <pointer to request>**

*Explanation:* As part of the unloading process, the DASD device driver flushes the request queue. This failed because a previously started I/O operation could not be canceled.

*User response:* Try again to unload the DASD device driver or to shut down Linux.

*Severity:* Error

**dasd.1c9171 <bus ID of the DASD>: DIAG initialization failed with rc=<return code>**

*Explanation:* Initializing the DASD with the DIAG discipline failed. Possible reasons for this problem are that the device has a device type other than FBA or ECKD, or has a block size other than one of the supported sizes: 512 byte, 1024 byte, 2048 byte, or 4096 byte.

*User response:* Ensure that the device can be written to and has a supported device type and block size. For details about the return code see the section about the INITIALIZE function for DIAGNOSE Code X'250' in "z/VM CP Programming Services". If you cannot resolve the error, note the error code and contact your support organization.

*Severity:* Warning

**dasd.1e2d81 'nopav' is not supported on z/VM**

*Explanation:* For Linux instances that run as guest operating systems of the z/VM hypervisor Parallel Access Volume (PAV) support is controlled by z/VM not by Linux.

*User response:* Remove 'nopav' from the dasd= module or kernel parameter specification.

*Severity:* Warning

**dasd.157e58 <bus ID of the DASD>: cqr <request> timed out (<timeout value>), <number of retries left> retries remaining**

*Explanation:* A try of the error recovery procedure (ERP) for the channel queued request (cqr) timed out and failed to recover the error. ERP continues for the DASD.

*User response:* Ignore this message if it occurs infrequently and if the recovery succeeds during one of the retries. If this error persists, check for related previous error messages and report the problem to your support organization. The timeout can be changed by writing a new value to the sysfs 'expires' attribute of the DASD. The value specifies the timeout in seconds.

*Severity:* Error
### dasd.2741d8  •  dasd.696eb5

#### dasd.2741d8
- **Severity:** Informational
- **Explanation:** An error in the DIAG processing could not be recovered by the error recovery procedure (ERP) of the DIAG discipline.
- **User response:** Note the return code, check for related I/O errors, and report this problem to your support organization.

#### dasd.2f6a90
- **Severity:** Warning
- **Explanation:** The probeonly mode has been activated.
- **User response:** None.

#### dasd.3dba87
- **Severity:** Informational
- **Explanation:** The autodetection mode has been activated.
- **User response:** None.

#### dasd.3e7d29
- **Severity:** Informational
- **Explanation:** Setting the DASD online with discipline failed with rc=<return code>.
- **User response:** Look for previous error messages. If you cannot resolve the error, note the return code and contact your support organization.

#### dasd.50a6e5
- **Severity:** Error
- **Explanation:** Formatting unit <start track> failed with rc=<return code>.
- **User response:** Retry to format the device. If the error persists, check the log file for related error messages. If you cannot resolve the error, note the return code and contact your support organization.

#### dasd.518c6a
- **Severity:** Error
- **Explanation:** The dasd= parameter value <parameter value> has an invalid ending.
- **User response:** Check the module or the kernel parameter.

#### dasd.5303a1
- **Severity:** Warning
- **Explanation:** PAV support has been deactivated.
- **User response:** None.

#### dasd.5c0c98
- **Severity:** Informational
- **Explanation:** The DASD could not be set online because of previous errors.
- **User response:** Look for previous error messages. If you cannot resolve the error, note the return code and contact your support organization.

#### dasd.696eb5
- **Severity:** Informational
- **Explanation:** A channel path to the device has become operational.
- **User response:** None.

---

48  Kernel Messages - SLES11 SP2
dasd.75373e <bus ID of the DASD>: Cancellation of request <pointer to request> failed with rc=<return code of previous function>

Explanation: In response to a user action, the DASD device driver tried but failed to cancel a previously started I/O operation.
User response: Try the action again.
Severity: Error

---

dasd.a2cf19 <bus ID of the DASD>: Unable to terminate request <pointer to request> on suspend

Explanation: As part of the suspend process, the DASD device driver terminates requests on the request queue. This failed because a previously started I/O operation could not be canceled. The suspend process will be stopped.
User response: Try again to suspend the system.
Severity: Error

---

dasd.a35e01 <bus ID of the DASD> Setting the DASD online failed because of a missing discipline

Explanation: The DASD was to be set online with a DASD device driver discipline that is not available.
User response: Ensure that all DASD modules are loaded correctly.
Severity: Warning

---

dasd.a3baba <bus ID of the DASD>: I/O operations have been resumed on the DASD

Explanation: The DASD is no longer in state quiesce and I/O operations can be performed on the device.
User response: None.
Severity: Informational

---

dasd.a3bece <bus ID of the DASD>: The DASD cannot be formatted while it is enabled

Explanation: The DASD you try to format is enabled. Enabled devices cannot be formatted.
User response: Contact the owner of the formatting tool.
Severity: Warning

---

dasd.a6cafa The statistics feature has been switched off

Explanation: The statistics feature of the DASD device driver has been switched off.
User response: None.
Severity: Informational

---

dasd.a7b0fb <bus ID of the DASD>: The DASD has been put in the quiesce state

Explanation: No I/O operation is possible on this device.
User response: Resume the DASD to enable I/O operations.
Severity: Informational

dasd.adb621 <bus ID of the DASD>: ERP failed for the DASD
Explanation: An error recovery procedure (ERP) was performed for the DASD but failed.
User response: Check the message log for previous related error messages.
Severity: Error

dasd.b3193d <bus ID of the DASD>: An error occurred in the DASD device driver, reason="reason code"
Explanation: This problem indicates a program error in the DASD device driver.
User response: Note the reason code and contact your support organization.
Severity: Error

dasd.bba7e6 <bus ID of the DASD>: The specified DASD is a partition and cannot be formatted
Explanation: The DASD you try to format is a partition. Partitions cannot be formatted separately. You can only format a complete DASD including all its partitions.
User response: Format the complete DASD. ATTENTION: Formatting irreversibly destroys all data on all partitions of the DASD.
Severity: Warning

dasd.c0aa71 <bus ID of the DASD>: Setting the DASD online failed because of missing DIAG discipline
Explanation: The DASD was to be set online with discipline DIAG but this discipline of the DASD device driver is not available.
User response: Ensure that the dasd_diag_mod module is loaded. If your Linux system does not include this module, you cannot set DASDs online with the DIAG discipline.
Severity: Warning

dasd.c1bf11 <bus ID of the DASD>: The DASD cannot be set offline with open count <count>
Explanation: The DASD is being used by one or more processes and cannot be set offline.
User response: Ensure that the DASD is not in use anymore, for example, unmount all partitions. Then try again to set the DASD offline.
Severity: Error
dasd.da6176 <bus ID of the DASD>: cqr <request> timed out (<timeout value>) but cannot be ended, retrying in 5 s

Explanation: A try of the error recovery procedure (ERP) for the channel queued request (cqr) timed out and failed to recover the error. The I/O request submitted during the try could not be canceled. The ERP waits for 5 seconds before trying again.

User response: Ignore this message if it occurs infrequently and if the recovery succeeds during one of the retries. If this error persists, check for related previous error messages and report the problem to your support organization. The timeout can be changed by writing a new value to the sysfs 'expires' attribute of the DASD. The value specifies the timeout in seconds.

Severity: Error

dasd.de3a76 The DASD device driver could not be initialized

Explanation: The initialization of the DASD device driver failed because of previous errors.

User response: Check for related previous error messages.

Severity: Informational

dasd.df34c6 The IPL device is not a CCW device

Explanation: The value for the dasd= parameter contains the 'ipldev' keyword. During the boot process this keyword is replaced with the device from which the IPL was performed. The 'ipldev' keyword is not valid if the IPL device is not a CCW device.

User response: Do not specify the 'ipldev' keyword when performing an IPL from a device other than a CCW device.

Severity: Error

dasd.e8d084 <bus ID of the DASD>: Accessing the DASD failed because of an incorrect format (rc=<return code>)

Explanation: The format of the DASD is not correct.

User response: Check the device format. For details about the return code see the section about the INITIALIZE function for DIAGNOSE Code X'250' in "z/VM CP Programming Services". If you cannot resolve the error, note the return code and contact your support organization.

Severity: Warning

dasd.eac5657 <bus ID of the DASD>: New DASD with <bytes per block> byte/block, total size <size> KB <access mode>

Explanation: A DASD with the indicated block size and total size has been set online. If the DASD is configured as read-only to the real or virtual hardware, the message includes an indication of this hardware access mode. The hardware access mode is independent from the 'readonly' attribute of the device in sysfs.

User response: None.

Severity: Informational

dasd.f97899 <bus ID of the DASD>: Setting the DASD online failed with rc=<return code>

Explanation: The DASD could not be set online because of previous errors.

User response: Look for previous error messages. If you cannot resolve the error, note the return code and contact your support organization.

Severity: Warning

dasd.ff4c45 <range> is not a valid device range

Explanation: A device range specified with the dasd= parameter is not valid.

User response: Examine the dasd= parameter and correct the device range.

Severity: Error
Chapter 15. dcssblk

This section contains messages that are issued by the z/VM discontiguous saved segments (DCSS) device driver. The DCSS device driver provides disk-like fixed block access to z/VM discontiguous saved segments.

dcssblk.0a9a59 The address range of DCSS <device name> changed while the system was suspended

Explanation: After resuming the system, the start address or end address of a DCSS does not match the address when the system was suspended. DCSSs must not be changed after the system was suspended. This error cannot be recovered. The system is stopped with a kernel panic.

User response: Reboot Linux.

Severity: Error

dcssblk.14ff71 Device <device name> cannot be removed because it is not a known device

Explanation: The DCSS device you are trying to remove is not known to the DCSS device driver.

User response: List the entries under /sys/devices/dcssblk/ to see the names of the existing DCSS devices.

Severity: Warning

dcssblk.1e441c Suspending the system failed because DCSS device <device name> is writable

Explanation: A system cannot be suspended if one or more DCSSs are accessed in exclusive-writable mode. DCSS segment types EW, SW, and EN are always writable and must be removed before a system is suspended.

User response: Remove all DCSSs of segment types EW, SW, and EN by writing the DCSS name to the sysfs 'remove' attribute. Set the access mode for all DCSSs of segment types SR and ER to read-only by writing 1 to the sysfs 'shared' attribute of the DCSS. Then try again to suspend the system.

Severity: Error

User response: None.

Severity: Informational

dcssblk.247a44 Device <device name> cannot be removed while it is in use

Explanation: You are trying to remove a device that is in use.

User response: Make sure that all users of the device close the device before you try to remove it.

Severity: Warning

User response: None.

Severity: Informational

dcssblk.257c8b Device <device name> is in use, its DCSSs will be saved when it becomes idle

Explanation: A save request for the device has been deferred until the device becomes idle. Then changes to all DCSSs that the device maps to will be saved permanently.

User response: None.

Severity: Informational

dcssblk.3c90ef Writing to <device name> failed because it is a read-only device

Explanation: The DCSS device is in shared access mode and cannot be written to. Depending on the type of the DCSSs that the device maps to, you might be able to change the access mode to exclusive-writable.

User response: If the DCSSs of the device are of type SC, do not attempt to write to the device. If the DCSSs of the device are of type ER or SR, change the access mode to exclusive-writable before writing to the device.

Severity: Warning

User response: None.

Severity: Informational

dcssblk.3d858e DCSS <device name> is of type SC and cannot be loaded as exclusive-writable

Explanation: You cannot load a DCSS device in exclusive-writable access mode if the DCSS device maps to one or more DCSSs of type SC.

User response: Load the DCSS in shared access mode.

Severity: Error

User response: None.

Severity: Informational

dcssblk.50ebd0 Device <device name> has become idle and is being saved now

Explanation: A save request for the DCSSs that map to a DCSS device has been pending while the device was in use. The device has become idle and all changes to the DCSSs are now saved permanently.

User response: None.

Severity: Informational

User response: None.

Severity: Informational

User response: None.

Severity: Informational

© Copyright IBM Corp. 2009, 2011
**Explanation:** To change the access mode of a DCSS device, all DCSSs that map to the device were unloaded. Reloading the DCSSs for the new access mode failed and the device is removed.

**User response:** Look for related messages to find out why the DCSSs could not be reloaded. If necessary, add the device again.

**Severity:** Error

**Explanation:** A pending save request for device <device name> has been canceled

**User response:** None.

**Severity:** Informational

**Explanation:** A save request for the DCSSs that map to a DCSS device has been pending while the device was in use. This save request has been canceled. Changes to the DCSSs will not be saved permanently.

**User response:** None.

**Severity:** Informational

**Explanation:** A save request has been submitted for the DCSS device. Changes to all DCSSs that map to the device are saved permanently.

**User response:** None.

**Severity:** Informational

**Explanation:** You can only map a set of two or more DCSSs to a single DCSS device if the DCSSs in the set form a contiguous memory space. The DCSS device cannot be created because there is a memory gap between two adjacent DCSSs.

**User response:** Ensure that you have specified all DCSSs that belong to the set. Check the definitions of the DCSSs on the z/VM hypervisor to verify that they form a contiguous memory space.

**Severity:** Error

**Explanation:** You can only map a set of two or more DCSSs to a single DCSS device if either all DCSSs in the set have the same type or if the set contains DCSSs of the two types EW and EN but no other type. The DCSS device cannot be created because at least two of the specified DCSSs are not compatible.

**User response:** Check the definitions of the DCSSs on the z/VM hypervisor to verify that their types are compatible.

**Severity:** Error

**Explanation:** The listed DCSSs have been verified as contiguous and successfully loaded. The displayed sizes are the sums of all DCSSs.

**User response:** None.

**Severity:** Informational
Chapter 16. extmem

This section contains messages that are issued by the kernel module that provides an interface to the z/VM DCSS management functions.

**extmem.06a5dd** DCSS `<DCSS name>` has multiple page ranges and cannot be loaded or queried

Explanation: You can only load or query a DCSS with multiple page ranges if: - The DCSS has 6 or fewer page ranges - The page ranges form a contiguous address space - The page ranges are of type EW or EN

User response: Check the definition of the DCSS to make sure that the conditions for DCSSs with multiple page ranges are met.

Severity: Error

**extmem.262f7b** Loading or querying DCSS `<DCSS name>` resulted in a hardware error

Explanation: Either the z/VM DIAGNOSE X'64' query or load call issued for the DCSS returned with an error.

User response: Look for previous extmem message to find the return code from the DIAGNOSE X'64' query or load call. For details about the return codes see the section about DIAGNOSE Code X'64' in "z/VM CP Programming Services".

Severity: Warning

**extmem.326775** DCSS `<DCSS name>` overlaps with used memory resources and cannot be reloaded

Explanation: The DCSS has been unloaded and cannot be reloaded because it overlaps with another loaded DCSS or with the memory of the z/VM guest virtual machine (guest storage).

User response: Ensure that no DCSS is loaded that has overlapping memory resources with the DCSS you want to reload. If the DCSS overlaps with guest storage, use the DEF STORE CONFIG z/VM CP command to create a sufficient storage gap for the DCSS. For details, see the section about the DCSS device driver in "Device Drivers, Features, and Commands".

Severity: Informational

**extmem.584f8e** Unloading unknown DCSS `<DCSS name>` failed

Explanation: The specified DCSS cannot be unloaded. The DCSS is known to the DCSS device driver but not to the DCSS kernel interface. This problem indicates a program error in extmem.c.

User response: Report this problem to your support organization.

Severity: Error

**extmem.6bd595** Loading DCSS `<DCSS name>` failed with rc=<return code>

Explanation: The DCSS kernel interface used diagnose call X'64' to load a DCSS. z/VM failed to load the DCSS and returned an error.

User response: For details about the return codes see the section about DIAGNOSE Code X'64' in "z/VM CP Programming Services".

Severity: Warning

**extmem.7c6a46** Querying a DCSS type failed with rc=<return code>

Explanation: The DCSS kernel interface used z/VM diagnose call X'64' to query the type of a DCSS. z/VM failed to determine the type and returned an error.

User response: Look for related messages to find out which DCSS is affected. For details about the return codes see the section about DIAGNOSE Code X'64' in "z/VM CP Programming Services".

Severity: Warning

**extmem.7fb545** DCSS `<DCSS name>` is already in the requested access mode

Explanation: A request to reload a DCSS with a new access mode has been rejected because the new access mode is the same as the current access mode.

User response: None.

Severity: Informational

**extmem.8b00b5** DCSS `<DCSS name>` cannot be loaded or queried

Explanation: You cannot load or query the specified DCSS because it either is not defined in the z/VM hypervisor, or it is a class S DCSS, or it is above 2047 MB and the Linux system is a 31-bit system.

User response: Use the CP command "QUERY NSS" to find out if the DCSS is a valid DCSS that can be loaded.

Severity: Error

**extmem.8e36b2** DCSS `<DCSS name>` exceeds the kernel mapping range (<kernel mapping range in bytes>) and cannot be loaded
extmem.972edd  •  extmem.d03247

Explanation: You cannot load the DCSS because it exceeds the kernel mapping range limit.
User response: Ensure that the DCSS range is defined below the kernel mapping range.
Severity: Error

extmem.972edd  Reloading DCSS <DCSS name> failed with rc=<return code>

Explanation: The DCSS kernel interface used z/VM diagnose call X'64' to reload a DCSS in a different access mode. The DCSS was unloaded but z/VM failed to reload the DCSS.
User response: For details about the return codes see the section about DIAGNOSE Code X'64' in "z/VM CP Programming Services".
Severity: Warning

extmem.99ae11  DCSS <DCSS name> is already loaded in a different access mode

Explanation: The DCSS you are trying to load has already been loaded in a different access mode. You cannot simultaneously load the DCSS in different modes.
User response: Reload the DCSS in a different mode or load it with the same mode in which it has already been loaded.
Severity: Error

extmem.9e2ee4  DCSS <DCSS name> cannot be loaded or queried without z/VM

Explanation: A DCSS is a z/VM resource. Your Linux instance is not running as a z/VM guest operating system and, therefore, cannot load DCSSs.
User response: Load DCSSs only on Linux instances that run as z/VM guest operating systems.
Severity: Error

extmem.a622ff  DCSS <DCSS name> of range <starting page address> to <ending page address> and type <DCSS type> loaded in shared access mode

Explanation: The DCSS was loaded successfully in shared access mode.
User response: None.
Severity: Informational

extmem.b8acd6  Saving a DCSS failed with DEFSEG response code <response-code>

Explanation: The DEFSEG z/VM CP command failed to permanently save changes to a DCSS.
User response: Ensure that the z/VM guest virtual machine is authorized to issue the CP DEFSEG command (typically privilege class E). Look for related messages to find the cause of this error. See also message HCP<response-code>E in the DEFSEG section of the "z/VM CP Command and Utility Reference".
Severity: Error

extmem.c55583  Saving a DCSS failed with SAVESEG response code <response-code>

Explanation: The SAVESEG z/VM CP command failed to permanently save changes to a DCSS.
User response: Ensure that the z/VM guest virtual machine is authorized to issue the CP SAVESEG command (typically privilege class E). Look for related messages to find the cause of this error. See also message HCP<response-code>E in the SAVESEG section of the "z/VM CP Command and Utility Reference".
Severity: Error

extmem.cb0afe  <DCSS name> needs used memory resources and cannot be loaded or queried

Explanation: You cannot load or query the DCSS because it overlaps with an already loaded DCSS or with the memory of the z/VM guest virtual machine (guest storage).
User response: Ensure that no DCSS is loaded that has overlapping memory resources with the DCSS you want to load or query. If the DCSS overlaps with guest storage, use the DEF STORE CONFIG z/VM CP command to create a sufficient storage gap for the DCSS. For details, see the section about the DCSS device driver in "Device Drivers, Features, and Commands".
Severity: Error

extmem.d03247  Saving unknown DCSS <DCSS name> failed

Explanation: The specified DCSS cannot be saved. The DCSS is known to the DCSS device driver but not to the DCSS kernel interface. This problem indicates a program error in extmem.c.
User response: Report this problem to your support organization.
Severity: Error

**extmem.da1614**  DCSS <DCSS name> of range
<starting page address> to <ending page address> and type <DCSS type> loaded as exclusive-writable

Explanation: The DCSS was loaded successfully in exclusive-writable access mode.

User response: None.

Severity: Informational

**extmem.e08a4c**  DCSS <DCSS name> overlaps with used storage and cannot be loaded

Explanation: You cannot load the DCSS because it overlaps with an already loaded DCSS or with the memory of the z/VM guest virtual machine (guest storage).

User response: Ensure that no DCSS is loaded that has overlapping memory resources with the DCSS you want to load. If the DCSS overlaps with guest storage, use the DEF STORE CONFIG z/VM CP command to create a sufficient storage gap for the DCSS. For details, see the section about the DCSS device driver in "Device Drivers, Features, and Commands".

Severity: Error

**extmem.f0af04**  DCSS <DCSS name> is in use and cannot be reloaded

Explanation: Reloading a DCSS in a different access mode has failed because the DCSS is being used by one or more device drivers. The DCSS remains loaded with the current access mode.

User response: Ensure that the DCSS is not used by any device driver then try again to load the DCSS with the new access mode.

Severity: Warning

**extmem.febf72**  There is not enough memory to load or query DCSS <DCSS name>

Explanation: The available memory is not enough to load or query the DCSS.

User response: Free some memory and repeat the failed operation.

Severity: Error
Chapter 17. hvc_iucv

This section contains messages that are issued by the z/VM IUCV Hypervisor Console (HVC) device driver. This device driver supports terminal access through the iucvconn program to instances of Linux on z/VM.

---

**hvc_iucv.09cae6** A connection request from z/VM user ID `<ID>` was refused

**Explanation:** An IUCV connection request from another z/VM guest virtual machine has been refused. The request was from a z/VM guest virtual machine that is not listed by the "hvc_iucv_allow=" kernel parameter.

**User response:** Check the "hvc_iucv_allow=" kernel parameter setting. Consider adding the z/VM user ID to the "hvc_iucv_allow=" list in the kernel parameter line and reboot Linux.

**Severity:** Informational

---

**hvc_iucv.1bc1e0** hvc_iucv_allow= specifies too many z/VM user IDs

**Explanation:** The "hvc_iucv_allow=" kernel parameter specifies a comma-separated list of z/VM user IDs that are permitted to connect to the z/VM IUCV hypervisor device driver. The number of z/VM user IDs that are specified with the "hvc_iucv_allow=" kernel parameter exceeds the maximum of 500.

**User response:** Correct the "hvc_iucv_allow=" setting by reducing the z/VM user IDs in the list and reboot Linux.

**Severity:** Error

---

**hvc_iucv.339854** Creating a new HVC terminal device failed with error code=<errno>

**Explanation:** The device driver initialization failed to allocate a new HVC terminal device. A possible cause of this problem is memory constraints.

**User response:** If the error code is -12 (ENOMEM), consider assigning more memory to your z/VM guest virtual machine.

**Severity:** Error

---

**hvc_iucv.5a5e90** Registering HVC terminal device as Linux console failed

**Explanation:** The device driver initialization failed to set up the first HVC terminal device for use as Linux console.

**User response:** If the error code is -12 (ENOMEM), consider assigning more memory to your z/VM guest virtual machine.

**Severity:** Error

---

**hvc_iucv.691dff** The z/VM IUCV HVC device driver cannot be used without z/VM

**Explanation:** The z/VM IUCV hypervisor console (HVC) device driver requires the z/VM inter-user communication vehicle (IUCV).

**User response:** Set "hvc_iucv=" to zero in the kernel parameter line and reboot Linux.

**Severity:** Notice

---

**hvc_iucv.e38b47** hvc_iucv_allow= does not specify a valid z/VM user ID list

**Explanation:** The "hvc_iucv_allow=" kernel parameter specifies a comma-separated list of z/VM user IDs that are permitted to connect to the z/VM IUCV hypervisor device driver. The z/VM user IDs in the list must not exceed eight characters and must not contain spaces.

**User response:** Correct the "hvc_iucv_allow=" setting in the kernel parameter line and reboot Linux.

**Severity:** Error

---

**hvc_iucv.d4fcff** Registering IUCV handlers failed with error code=<errno>

**Explanation:** The device driver initialization failed to register with z/VM IUCV to handle IUCV connections, as well as sending and receiving of IUCV messages.

**User response:** Check for related IUCV error messages and see the errno manual page to find out what caused the problem.

**Severity:** Error

---

**hvc_iucv.e38b47** <hvc_iucv_devices> is not a valid value for the hvc_iucv= kernel parameter

**Explanation:** The "hvc_iucv=" kernel parameter
specifies the number of z/VM IUCV hypervisor console (HVC) terminal devices. The parameter value ranges from 0 to 8. If zero is specified, the z/VM IUCV HVC device driver is disabled and no IUCV-based terminal access is available.

**User response:** Correct the “hvc_iucv=” setting in the kernel parameter line and reboot Linux.

**Severity:** Error
Chapter 18. hypfs

This section contains messages that are issued by the S/390 hypervisor file system, which provides access to LPAR and z/VM hypervisor data.

```plaintext
hypfs.7a79f0  Initialization of hypfs failed with
              rc=<error code>

Explanation:  Initialization of hypfs failed because of resource or hardware constraints. Possible reasons for this problem are insufficient free memory or missing hardware interfaces.

User response:  See errno.h for information about the error codes.

Severity:  Error
```

```plaintext
hypfs.7f5705  The hardware system does not support hypfs

Explanation:  hypfs requires DIAGNOSE Code X'204' but this diagnose code is not available on your hardware. You need more recent hardware to use hypfs.

User response:  None.

Severity:  Error
```

```plaintext
hypfs.90c29b  Updating the hypfs tree failed

Explanation:  There was not enough memory available to update the hypfs tree.

User response:  Free some memory and try again to update the hypfs tree. Consider assigning more memory to your LPAR or z/VM guest virtual machine.

Severity:  Error
```

```plaintext
hypfs.a2406e  <mount option> is not a valid mount option

Explanation:  hypfs has detected mount options that are not valid.

User response:  See "Device Drivers Features and Commands" for information about valid mount options for hypfs.

Severity:  Error
```

```plaintext
hypfs.cccfb8  The hardware system does not provide all functions required by hypfs

Explanation:  hypfs requires DIAGNOSE Code X'224' but this diagnose code is not available on your hardware. You need more recent hardware to use hypfs.

User response:  None.

Severity:  Error
```
Chapter 19. iucv

This section contains messages that are issued by the Inter-User Communication Vehicle (IUCV) device driver. IUCV is a z/VM communication facility that enables a program running in one z/VM guest to communicate with another z/VM guest, or with a control program, or even with itself.

---

**iucv.1d65b1 Suspending Linux did not completely close all IUCV connections**

**Explanation:** When resuming a suspended Linux instance, the IUCV base code found data structures from one or more IUCV connections that existed before the Linux instance was suspended. Modules that use IUCV connections must close these connections when a Linux instance is suspended. This problem indicates an error in a program that used an IUCV connection.

**User response:** Report this problem to your support organization.

**Severity:** Warning

---

**iucv.beb348 Defining an interrupt buffer on CPU <CPU number> failed with 0x<hexadecimal error value> (<short error code explanation>)**

**Explanation:** Defining an interrupt buffer for external interrupts failed. Error value 0x03 indicates a problem with the z/VM directory entry of the z/VM guest virtual machine. This problem can also be caused by a program error.

**User response:** If the error value is 0x03, examine the z/VM directory entry of your z/VM guest virtual machine. If the directory entry is correct or if the error value is not 0x03, report this problem to your support organization.

**Severity:** Warning
Chapter 20. lcs

This section contains messages that are issued by the LAN channel station device driver. The LCS device driver supports non-QDIO communications through Open Systems Adapters (OSA).

**lcs.23ff8e**

<bus ID of the LCS device>: Sending data from the LCS device to the LAN failed with rc=<ccw_device_resume return code in decimal notation>

**Explanation:** The LAN channel station (LCS) device driver could not send data to the LAN using the LCS device. This might be a temporary problem. Operations continue on the LCS device.

**User response:** If this problem occurs frequently, initiate a recovery process, for example, by writing '1' to the 'recover' sysfs attribute of the device. If the problem persists, contact IBM support.

**Severity:** Error

**lcs.2a7553**

<bus ID of the LCS device>: The LCS device stopped because of an error, dstat=0x<device status>, cstat=0x<subchannel status>

**Explanation:** The LAN channel station (LCS) device reported an error. The LCS device driver might start a device recovery process.

**User response:** If the device driver does not start a recovery process, initiate a recovery process, for example, by writing '1' to the 'recover' sysfs attribute of the device. If the problem persists, note the status information provided with the message and contact IBM support.

**Severity:** Warning

**lcs.432fb3**

<bus ID of the LCS device>: An I/O-error occurred on the LCS device

**Explanation:** The LAN channel station (LCS) device reported a problem that can be recovered by the LCS device driver. Repeated occurrences of this problem indicate a malfunctioning device.

**User response:** If this problem occurs frequently, initiate a recovery process for the device, for example, by writing '1' to the 'recover' sysfs attribute of the device.

**Severity:** Warning

**lcs.b44620**

<bus ID of the LCS device>: An error occurred on the LCS device, rc=<return code>

**Explanation:** The LAN channel station (LCS) device reported a problem that can be recovered by the LCS device driver. Repeated occurrences of this problem indicate a malfunctioning device.

**User response:** If this problem occurs frequently, initiate a recovery process for the device, for example, by writing '1' to the 'recover' sysfs attribute of the device.

**Severity:** Warning

**lcs.c375fd**

<bus ID of the LCS device>: Detecting a network adapter for LCS devices failed with rc=<lcs_detect return code in decimal notation> (0x<lcs_detect return code in hexadecimal notation>)
**lcs.e47e1f • lcs.f3f094**

**Explanation:** The LCS device driver could not initialize a network adapter.

**User response:** Note the return codes from the error message and contact IBM support.

**Severity:** Error

---

<table>
<thead>
<tr>
<th>lcs.e47e1f</th>
<th>&lt;bus ID of the LCS device&gt;: Starting an LCS device resulted in an error, rc=&lt;ccw_device_start return code in decimal notation&gt;</th>
</tr>
</thead>
</table>

**Explanation:** The LAN channel station (LCS) device driver failed to initialize an LCS device. The device is not operational.

**User response:** Initiate a recovery process, for example, by writing ‘1’ to the ‘recover’ sysfs attribute of the device. If the problem persists, contact IBM support.

**Severity:** Error

---

<table>
<thead>
<tr>
<th>lcs.f3f094</th>
<th>&lt;bus ID of the LCS device&gt;: A recovery process has been started for the LCS device</th>
</tr>
</thead>
</table>

**Explanation:** The LAN channel station (LCS) device is shut down and restarted. The recovery process might have been initiated by a user or started automatically as a response to a device problem.

**User response:** Wait until a message indicates the completion of the recovery process.

**Severity:** Warning
Chapter 21. monreader

This section contains messages that are issued by the z/VM *MONITOR record reader device driver. This device driver enables monitoring software on Linux to access z/VM *MONITOR records, which contain data about z/VM guest virtual machines.

**monreader.0111fc**  The specified *MONITOR DCSS <DCSS name> does not have the required type SC

**Explanation:** The DCSS that was specified with the monreader.mondcss kernel parameter or with the mondcss module parameter cannot be a *MONITOR DCSS because it is not of type SC.

**User response:** Confirm that you are using the name of the DCSS that has been configured as the *MONITOR DCSS on the z/VM hypervisor. If the default name, MONDCSS, is used, omit the monreader.mondcss or mondcss parameter.

**Severity:** Error

**monreader.029e2e**  The read queue for monitor data is full

**Explanation:** The read function of the z/VM *MONITOR device driver returns EOVERFLOW because not enough monitor data has been read since the monitor device has been opened. Monitor data already read are valid and subsequent reads return valid data but some intermediate data might be missing.

**User response:** Be aware that monitor data might be missing. Assure that you regularly read monitor data after opening the monitor record device.

**Severity:** Warning

**monreader.1a46fe**  The z/VM *MONITOR record device driver cannot be loaded without z/VM

**Explanation:** The z/VM *MONITOR record device driver uses z/VM system services to provide monitor data about z/VM guest operating systems to applications on Linux. On Linux instances that run in environments other than the z/VM hypervisor, the z/VM *MONITOR record device driver does not provide any useful function and the corresponding monreader module cannot be loaded.

**User response:** Load the z/VM *MONITOR record device driver only on Linux instances that run as guest operating systems of the z/VM hypervisor. If the z/VM *MONITOR record device driver has been compiled into the kernel, ignore this message.

**Severity:** Error

**monreader.6f04b5**  The z/VM *MONITOR record device driver failed to register with IUCV

**Explanation:** The z/VM *MONITOR record device driver receives monitor data through an IUCV connection and needs to register with the IUCV device driver. This registration failed and the z/VM *MONITOR record device driver was not loaded. A possible cause of this problem is insufficient memory.

**User response:** Free some memory and try again to load the module. If the z/VM *MONITOR record device driver has been compiled into the kernel, you might have to configure more memory and reboot Linux. If you do not want to read monitor data, ignore this message.

**Severity:** Error

**monreader.88c26a**  Connecting to the z/VM *MONITOR system service failed with rc=<IUCV CONNECT return code>

**Explanation:** The z/VM *MONITOR record device driver receives monitor records through an IUCV connection to the z/VM *MONITOR system service. This connection could not be established when the monitor record device was opened. If the return code is 15, your z/VM guest virtual machine is not authorized to connect to the *MONITOR system service.

**User response:** If the return code is 15, ensure that the IUCV *MONITOR statement is included in the z/VM directory entry for your z/VM guest virtual machine. For other IUCV CONNECT return codes see the IUCV section in "CP Programming Services" and the *MONITOR section in "z/VM Performance".

**Severity:** Error
**monreader.c042b6** • **monreader.ca6466**

**monreader.c042b6**  Reading monitor data failed with
__rc=\<return code>\

**Explanation:** The z/VM *MONITOR record device
driver failed to read monitor data because the IUCV
REPLY function failed. The read function against the
monitor record device returns EIO. All monitor data that
has been read since the last read with 0 size is
incorrect.

**User response:** Disregard all monitor data that has
been read since the last read with 0 size. If the device
driver has been compiled as a separate module, unload
and reload the monreader module. If the device driver
has been compiled into the kernel, reboot Linux. For
more information about possible causes of the error see
the IUCV section in “z/VM CP Programming Services”
and the “*MONITOR section in “z/VM Performance”.

**Severity:** Error

**monreader.ca6466**  Disconnecting the z/VM
*MONITOR system service failed with
__rc=\<IUCV SEVER return code>\

**Explanation:** The z/VM *MONITOR record device
driver receives monitor data through an IUCV
connection to the z/VM *MONITOR system service. This
connection could not be closed when the monitor record
device was closed. You might not be able to resume
monitoring.

**User response:** No immediate action is necessary. If
you cannot open the monitor record device in the future,
reboot Linux. For information about the IUCV SEVER
return codes see the IUCV section in “CP Programming
Services” and the “*MONITOR section in “z/VM
Performance”.

**Severity:** Warning
Chapter 22. monwriter

This section contains messages that are issued by the monitor stream application device driver. Applications can use this device driver to write monitor data in the form of APPLDATA records to the z/VM monitor stream.

monwriter.fcbea9  Writing monitor data failed with 
rc= <return code>

Explanation: The monitor stream application device driver used the z/VM diagnost call DIAG X'DC' to start writing monitor data. z/VM returned an error and the monitor data cannot be written. If the return code is 5, your z/VM guest virtual machine is not authorized to write monitor data.

User response: If the return code is 5, ensure that your z/VM guest virtual machine's entry in the z/VM directory includes the OPTION APPLMON statement. For other return codes see the section about DIAGNOSE Code X'DC' in "z/VM CP Programming Services".

Severity: Error
Chapter 23. netiucv

This section contains messages that are issued by the NETIUCV device driver. This network device driver uses IUCV to connect instances of Linux on z/VM, or to connect an instance of Linux on z/VM to another z/VM guest such as a TCP/IP service machine.

netiucv.04ce63 <bus ID of the IUCV device>: The IUCV device failed to connect to the peer on z/VM guest <z/VM user ID>

Explanation: The connection cannot be established because the z/VM guest virtual machine with the peer interface is not configured for IUCV connections.

User response: Configure the z/VM guest virtual machine with the peer interface for IUCV connections; then try again to establish the connection.

Severity: Warning

netiucv.297069 <bus ID of the IUCV device>: z/VM guest <remote z/VM user ID> has too many IUCV connections to connect with the IUCV device

Explanation: Connecting to the remote z/VM guest virtual machine failed because the maximum number of IUCV connections for the remote z/VM guest virtual machine has been reached.

User response: Close some of the established IUCV connections on the remote z/VM guest virtual machine; then try again to establish the connection.

Severity: Error

netiucv.55da31 <bus ID of the IUCV device>: The IUCV interface to <remote z/VM user ID> has been established successfully

Explanation: The IUCV interface to the remote z/VM guest virtual machine has been established and can be activated with "ifconfig up" or an equivalent command.

User response: None.

Severity: Informational

netiucv.56149b <bus ID of the IUCV device>: Connecting the IUCV device failed with error <error code>

Explanation: The connection cannot be established because of an IUCV CONNECT error.

User response: Report this problem to your support organization.

Severity: Error

netiucv.5be5dc <bus ID of the IUCV device>: The peer interface of the IUCV device has closed the connection

Explanation: The peer interface on the remote z/VM guest virtual machine has closed the connection. Do not expect further packets on this interface. Any packets you send to this interface will be dropped.

User response: None.

Severity: Informational

netiucv.6b758f <bus ID of the IUCV device>: The IUCV device has been connected successfully to <remote z/VM user ID>

Explanation: The connection has been established and the interface is ready to transmit communication packages.

User response: None.

Severity: Informational

netiucv.863549 <bus ID of the IUCV device>: The IUCV device cannot connect to a z/VM guest with no IUCV authorization

Explanation: Because the remote z/VM guest virtual machine is not authorized for IUCV connections, the connection cannot be established.

User response: Add the statements 'IUCV ALLOW' and 'IUCV ANY' to the z/VM directory entry of the remote z/VM guest virtual machine; then try again to establish the connection. See "z/VM CP Planning and Administration" for details about the IUCV statements.

Severity: Error

netiucv.bcbc54 <bus ID of the IUCV device>: The IUCV device failed to connect to z/VM guest <z/VM user ID>

Explanation: The connection cannot be established because the z/VM guest virtual machine with the peer interface is not running.

User response: Ensure that the z/VM guest virtual machine with the peer interface is running; then try again to establish the connection.

Severity: Warning

netiucv.c1b7ef <bus ID of the IUCV device>: The IUCV device is connected to <remote z/VM user ID> and cannot be removed

Explanation: Removing a connection failed because
netiucv.cfb810

the interface is active with a peer interface on a remote
z/VM guest virtual machine.

User response: Deactivate the interface with "ifconfig
down" or an equivalent command; then try again to
remove the interface.

Severity: Warning

netiucv.cfb810  <bus ID of the IUCV device>:
Connecting the IUCV device would
exceed the maximum number of IUCV
connections

Explanation: The connection cannot be established
because the maximum number of IUCV connections
has been reached on the local z/VM guest virtual
machine.

User response: Close some of the established IUCV
connections on the local z/VM guest virtual machine;
then try again to establish the connection.

Severity: Error
Chapter 24. qeth

This section contains messages that are issued by the qeth device driver. The qeth device driver supports a multitude of network connections, for example, connections through Open Systems Adapters (OSA), HiperSockets, guest LANs, and virtual switches.

qeth.1d3c1d <bus ID of the qeth device>: Registering IP address <IP address> failed

Explanation: An IP address could not be registered with the network adapter.

User response: Check if another operating system instance has already registered the IP address with the same network adapter or at the same logical IP subnet.

Severity: Warning

qeth.1e4c70 <bus ID of the qeth device>: The device is not authorized to run as a HiperSockets network traffic analyzer

Explanation: The sysfs 'sniffer' attribute of the HiperSockets device has the value '1'. The corresponding HiperSockets interface is switched into promiscuous mode but the network traffic analyzer (NTA) rules configured at the Support Element (SE) do not allow tracing. Possible reasons are: - Tracing is not authorized for all HiperSockets channels in the mainframe system - Tracing is not authorized for this HiperSockets channel - LPAR is not authorized to enable an NTA

User response: Configure appropriate HiperSockets NTA rules at the SE.

Severity: Warning

qeth.21a074 <bus ID of the qeth device>: There is no kernel module to support discipline <discipline>

Explanation: The qeth device driver or a user command requested a kernel module for a particular qeth discipline. Either the discipline is not supported by the qeth device driver or the requested module is not available to your Linux system.

User response: Check if the requested discipline module has been compiled into the kernel or is present in /lib/modules/<version>/kernel/drivers/s390/net.

Severity: Error

qeth.2211d4 <bus ID of the qeth device>: The LAN is offline

Explanation: A start LAN command was sent by the qeth device driver but the physical or virtual adapter has not started the LAN. The LAN might take a few seconds to become available.

User response: Check the status of the qeth device, for example, with the lsqeth command. If the device does not become operational within a few seconds, initiate a recovery process, for example, by writing '1' to the 'recover' sysfs attribute of the device.

Severity: Warning

qeth.2f18a4 <bus ID of the qeth device>: Starting multicast support for <network interface name> failed

Explanation: The qeth device driver could not start multicast support on the network adapter.

User response: Ungroup and regroup the subchannel triplet of the device. If this does not resolve the problem, reboot Linux. If the problem persists, gather Linux debug data and report the problem to your support organization.

Severity: Warning

qeth.3acf0c <bus ID of the qeth device>: The qeth device driver failed to recover an error on the device

Explanation: The qeth device driver performed an automatic recovery operation to recover an error on a qeth device. The recovery operation failed.

User response: Try the following actions in the given order: i) Check the status of the qeth device, for example, with the lsqeth command. ii) Initiate a recovery process by writing '1' to the 'recover' sysfs attribute of the device. iii) Ungroup and regroup the subchannel triplet of the device. vi) Reboot Linux. v) If the problem persists, gather Linux debug data and report the problem to your support organization.

Severity: Warning

qeth.3d0305 <bus ID of the qeth device>: The adapter is used exclusively by another host

Explanation: The qeth adapter is exclusively used by another host.

User response: Use another qeth adapter or configure this one not exclusively to a particular host.

Severity: Error

qeth.48d0da <bus ID of the qeth device>: The network adapter failed to generate a unique ID

Explanation: In IBM mainframe environments, network
interfaces are not identified by a specific MAC address. Therefore, the network adapters provide the network interfaces with unique IDs to be used in their IPv6 link local addresses. Without such a unique ID, duplicate addresses might be assigned in other LPARs.

User response: Install the latest firmware on the adapter hardware. Manually, configure an IPv6 link local address for this device.

Severity: Warning

qeth.4a588d <bus ID of the qeth device>: Completion Queue support disabled

Explanation: The HiperSockets device is disabled for completion queueing. This device cannot or no longer be used to set up AF_IUCV communication in an LPAR.

User response: None.

Severity: Informational

qeth.4da7f2 Initializing the qeth device driver failed

Explanation: The base module of the qeth device driver could not be initialized.

User response: See errno.h to determine the reason for the error. i) Reboot Linux. ii) If the problem persists, gather Linux debug data and report the problem to your support organization.

Severity: Error

qeth.53237e <bus ID of the qeth device>: A connection could not be established because of an OLM limit

Explanation: z/OS® has activated Optimized Latency Mode (OLM) for a connection through an OSA Express3 adapter. This reduces the maximum number of concurrent connections per physical port for shared adapters. The new connection would exceed the maximum. Linux cannot establish further connections using this adapter.

User response: If possible, deactivate an existing connection that uses this adapter and try again to establish the new connection. If you cannot free an existing connection, use a different adapter for the new connection.

Severity: Error

qeth.5cb8a3 <bus ID of the qeth device>: The qeth device is not configured for the OSI layer required by z/VM

Explanation: A qeth device that connects to a virtual network on z/VM must be configured for the same Open Systems Interconnection (OSI) layer as the virtual network. An ETHERNET guest LAN or VSWITCH uses the data link layer (layer 2) while an IP guest LAN or VSWITCH uses the network layer (layer 3).

User response: If you are connecting to an ETHERNET guest LAN or VSWITCH, set the layer2 sysfs attribute of the qeth device to 1. If you are connecting to an IP guest LAN or VSWITCH, set the layer2 sysfs attribute of the qeth device to 0.

Severity: Error

qeth.5d5e5c There is no IPv6 support for the layer 3 discipline

Explanation: If you want to use IPv6 with the layer 3 discipline, you need a Linux kernel with IPv6 support. Because your Linux kernel has not been compiled with IPv6 support, you cannot use IPv6 with the layer 3 discipline, even if your adapter supports IPv6.

User response: Use a Linux kernel that has been compiled to include IPv6 support if you want to use IPv6 with layer 3 qeth devices.

Severity: Error

qeth.5ff844 <bus ID of the qeth device>: Completion Queue support enabled

Explanation: The HiperSockets device is enabled for completion queueing. This is part of the process to set up AF_IUCV communication in an LPAR.

User response: None.

Severity: Informational

qeth.666544 <bus ID of the qeth device>: MAC address <MAC-address> already exists

Explanation: Setting the MAC address for the qeth device fails, because this MAC address is already defined on the OSA CHPID.

User response: Use a different MAC address for this qeth device.

Severity: Warning

qeth.72880f <bus ID of the qeth device>: A HiperSockets network traffic analyzer is already active in the HiperSockets LAN

Explanation: The sysfs 'sniffer' attribute of the HiperSockets device has the value '1'. The HiperSockets interface is switched into promiscuous mode but another HiperSockets device on the same HiperSockets channel is already running as a network traffic analyzer. A HiperSockets channel can only have one active network traffic analyzer.

User response: Do not configure multiple HiperSockets devices in the same HiperSockets channel as tracing devices.
qeth.77cf86 <bus ID of the qeth device>: Enabling broadcast filtering for <network interface name> failed

Explanation: The qeth device driver could not enable broadcast filtering on the network adapter.

User response: Ungroup and regroup the subchannel triplet of the device. If this does not resolve the problem, reboot Linux. If the problem persists, gather Linux debug data and report the problem to your support organization.

Severity: Warning

qeth.7ade71 <bus ID of the qeth device>: Starting VLAN support for <network interface name> failed

Explanation: The qeth device driver could not start VLAN support on the network adapter.

User response: None if you do not require VLAN support. If you need VLAN support, ungroup and regroup the subchannel triplet of the device. If this does not resolve the problem, reboot Linux. If the problem persists, gather Linux debug data and report the problem to your support organization.

Severity: Warning

qeth.883aa0 <bus ID of the qeth device>: Starting HW checksumming for <network interface name> failed, using SW checksumming

Explanation: The network adapter supports hardware checksumming for incoming IP packages but the qeth device driver could not start hardware checksumming on the adapter. The qeth device driver continues to use software checksumming for incoming IP packages.

User response: None if you do not require hardware checksumming for incoming network traffic. If you want to enable hardware checksumming, ungroup and regroup the subchannel triplet of the device. If this does not resolve the problem, reboot Linux. If the problem persists, gather Linux debug data and report the problem to your support organization.

Severity: Warning

qeth.8a7bb9 <bus ID of the qeth device>: Starting IP fragmentation support for <network interface name> failed

Explanation: The qeth device driver could not start IP fragmentation support on the network adapter.

User response: Ungroup and regroup the subchannel triplet of the device. If this does not resolve the problem, reboot Linux. If the problem persists, gather Linux debug data and report the problem to your support organization.

Severity: Warning

qeth.90d7eb <bus ID of the qeth device>: MAC address <MAC-address> is not authorized

Explanation: This qeth device is a virtual network interface card (NIC), to which z/VM has already assigned a MAC address. z/VM MAC address verification does not allow you to change this predefined address.

User response: None; use the MAC address that has been assigned by z/VM.

Severity: Warning

qeth.96f275 <bus ID of the qeth device>: Starting proxy ARP support for <network interface name> failed

Explanation: The qeth device driver could not start proxy ARP support on the network adapter.

User response: None if you do not require proxy ARP support. If you need proxy ARP, ungroup and regroup the subchannel triplet of the device. If this does not resolve the problem, reboot Linux. If the problem persists, gather Linux debug data and report the problem to your support organization.

Severity: Warning

qeth.9b3034 <bus ID of the qeth device>: Setting the device online failed because of insufficient authorization

Explanation: The qeth device is configured with OSX CHPIDs. An OSX CHPID cannot be activated unless the LPAR is explicitly authorized to access it. For z/VM guest operating systems, the z/VM user ID must be explicitly authorized in addition to the LPAR. You grant these authorizations through the Service Element.

User response: At the Service Element, authorize the LPAR and, if applicable, the z/VM user ID for using the OSX CHPIDs with which the qeth device has been configured. Then try again to set the device online.

Severity: Error

qeth.9e9f31 <bus ID of the qeth device>: Setting up broadcast echo filtering for <network interface name> failed

Explanation: The qeth device driver could not set up broadcast echo filtering on the network adapter.

User response: Ungroup and regroup the subchannel triplet of the device. If this does not resolve the problem, reboot Linux. If the problem persists, gather Linux debug data and report the problem to your support organization.

Severity: Warning
qeth.a4a7ee  qeth.c98a58

debug data and report the problem to your support organization.

Severity:  Warning

qeth.a4a7ee  <bus ID of the qeth device>: The link for <network interface name> on CHPID 0x<CHPID> has been restored

Explanation:  A failed network link has been re-established. A device recovery is in progress.

User response:  Wait until a message indicates the completion of the recovery process.

Severity:  Informational

qeth.a853bd  <bus ID of the qeth device>: Reading the adapter MAC address failed

Explanation:  The qeth device driver could not read the MAC address from the network adapter.

User response:  Ungroup and regroup the subchannel triplet of the device. If this does not resolve the problem, reboot Linux. If the problem persists, gather Linux debug data and report the problem to your support organization.

Severity:  Warning

qeth.aa2df0  <bus ID of the qeth device>: The HiperSockets network traffic analyzer is deactivated

Explanation:  The sysfs 'sniffer' attribute of the HiperSockets device has the value '1'. Promiscuous mode has been switched off for the corresponding HiperSockets interface. As a result, the HiperSockets network traffic analyzer is stopped on the device.

User response:  None.

Severity:  Informational

qeth.aa55b2  <bus ID of the qeth device>: The adapter hardware is of an unknown type

Explanation:  The qeth device driver does not recognize the adapter hardware. The cause of this problem could be a hardware error or a Linux level that does not support your adapter hardware.

User response:  i) Investigate if your adapter hardware is supported by your Linux level. Consider using hardware that is supported by your Linux level or upgrading to a Linux level that supports your hardware. ii) Install the latest firmware on your adapter hardware. iii) If the problem persists and is not caused by a version mismatch, contact IBM support.

Severity:  Error

qeth.bfc665  <bus ID of the qeth device>: The user canceled setting the qeth device offline

Explanation:  A user initiated setting the device offline but subsequently canceled the operation, for example, with CTRL+C.

User response:  Check the status of the qeth device, for example, with the lsqeth command. If necessary, repeat the operation to set the device offline.

Severity:  Warning

qeth.c0a93c  <bus ID of the qeth device>: Enabling HW checksumming for <network interface name> failed, using SW checksumming

Explanation:  The network adapter supports hardware checksumming for incoming IP packages but the qeth device driver could not enable hardware checksumming on the adapter. The qeth device driver continues to use software checksumming for incoming IP packages.

User response:  None if you do not require hardware checksumming for incoming network traffic. If you want to enable hardware checksumming, ungroup and regroup the subchannel triplet of the device. If this does not resolve the problem, reboot Linux. If the problem persists, gather Linux debug data and report the problem to your support organization.

Severity:  Warning

qeth.c4e1a6  <bus ID of the qeth device>: The HiperSockets network traffic analyzer is activated

Explanation:  The sysfs 'sniffer' attribute of the HiperSockets device has the value '1'. The corresponding HiperSockets interface has been switched into promiscuous mode. As a result, the HiperSockets network traffic analyzer is started on the device.

User response:  None.

Severity:  Informational

qeth.c98a58  <bus ID of the qeth device>: Enabling HW TX checksumming for <network interface name> failed, using SW TX checksumming

Explanation:  The network adapter supports hardware checksumming for outgoing IP packages but the qeth device driver could not enable hardware TX checksumming on the adapter. The qeth device driver continues to use software checksumming for outgoing IP packages.

User response:  None if you do not require hardware checksumming for outgoing network traffic. If you want to enable hardware checksumming, ungroup and
regroup the subchannel triplet of the device. If this does
not resolve the problem, reboot Linux. If the problem
persists, gather Linux debug data and report the
problem to your support organization.

Severity: Warning

qeth.cc86d9 <bus ID of the qeth device>: Activating
IPv6 support for <network interface
name> failed

Explanation: The qeth device driver could not activate
IPv6 support on the network adapter.

User response: None if you do not require IPv6
communication. If you need IPv6 support, ungroup and
regroup the subchannel triplet of the device. If this does
not resolve the problem, reboot Linux. If the problem
persists, gather Linux debug data and report the
problem to your support organization.

Severity: Error

qeth.d41e42 <bus ID of the qeth device>: Completion
Queueing supported

Explanation: The HiperSockets device supports
completion queueing. This is required to set up
AF_IUCV communication in an LPAR.

User response: None.

Severity: Informational

qeth.d5b6b3 <bus ID of the qeth device>: Starting
outbound TCP segmentation offload
for <network interface name> failed

Explanation: The network adapter supports TCP
segmentation offload, but the qeth device driver could
not start this support on the adapter.

User response: None if you do not require TCP
segmentation offload. If you want to enable TCP
segmentation offload, ungroup and regroup the
subchannel triplet of the device. If this does not resolve
the problem, reboot Linux. If the problem persists,
gather Linux debug data and report the problem to your
support organization.

Severity: Warning

qeth.e73874 <bus ID of the qeth device>: Starting
ARP processing support for <network
interface name> failed

Explanation: The qeth device driver could not start
ARP support on the network adapter.

User response: Ungroup and regroup the subchannel
triplet of the device. If this does not resolve the problem,
reboot Linux. If the problem persists, gather Linux
debug data and report the problem to your support
organization.

Severity: Warning

qeth.eb4e01 <bus ID of the qeth device>: Failed to
create completion queue

Explanation: The HiperSockets device could not be
configured with a completion queue. A completion
queue is required to operate AF_IUCV communication
in an LPAR.

User response: i) Investigate if you have the latest
firmware level in place. ii) If the problem persists and is
not caused by a version mismatch, contact IBM support.

Severity: Error

qeth.ef9329 <bus ID of the qeth device>: A hardware
operation timed out on the device

Explanation: A hardware operation timed out on the
qeth device.

User response: Check the status of the qeth device,
for example, with the lsqeth command. If the device is
not operational, initiate a recovery process, for example,
by writing '1' to the 'recover' sysfs attribute of the
device.

Severity: Warning

qeth.f56315 <bus ID of the qeth device>: The link for
interface <network interface name> on
CHPID 0x<CHPID> failed

Explanation: A network link failed. A possible reason
for this error is that a physical network cable has been
disconnected.

User response: Ensure that the network cable on the
adapter hardware is connected properly. If the
connection is to a guest LAN, ensure that the device is
still coupled to the guest LAN.

Severity: Warning

qeth.f6c89f <bus ID of the qeth device>: Enabling
the passthrough mode for <network
interface name> failed

Explanation: The qeth device driver could not enable
the passthrough mode on the network adapter. The
passthrough mode is required for all network traffic
other than IPv4. In particular, the passthrough mode is
required for IPv6 traffic.

User response: None if all you want to support is
IPv4 communication. If you want to support IPv6 or
other network traffic apart from IPv4, ungroup and
regroup the subchannel triplet of the device. If this does
not resolve the problem, reboot Linux. If the problem
persists, gather Linux debug data and report the
problem to your support organization.

Severity: Warning
qeth.f823af  qeth.fd0b7c

qeth.f823af  <bus ID of the qeth device>: QDIO reported an error, rc=<return code>

**Explanation:** The QDIO subsystem reported an error.

**User response:** Check for related QDIO errors. Check the status of the qeth device, for example, with the lsqeth command. If the device is not operational, initiate a recovery process, for example, by writing '1' to the 'recover' sysfs attribute of the device.

**Severity:** Warning

qeth.faf3f3  <bus ID of the qeth device>: Starting source MAC-address support for <network interface name> failed

**Explanation:** The qeth device driver could not enable source MAC-address on the network adapter.

**User response:** Ungroup and regroup the subchannel triplet of the device. If this does not resolve the problem, reboot Linux. If the problem persists, gather Linux debug data and report the problem to your support organization.

**Severity:** Warning

qeth.fce5bf  <bus ID of the qeth device>: Setting up broadcast filtering for <network interface name> failed

**Explanation:** The qeth device driver could not set up broadcast filtering on the network adapter.

**User response:** Ungroup and regroup the subchannel triplet of the device. If this does not resolve the problem, reboot Linux. If the problem persists, gather Linux debug data and report the problem to your support organization.

**Severity:** Warning

qeth.fd0b7c  <bus ID of the qeth device>: A recovery process has been started for the device

**Explanation:** A recovery process was started either by the qeth device driver or through a user command.

**User response:** Wait until a message indicates the completion of the recovery process.

**Severity:** Warning
Chapter 25. s390dbf

This section contains messages that are issued by the S/390 debug feature.

**s390dbf.2d934d**  Root becomes the owner of all s390dbf files in sysfs

**Explanation:** The S/390 debug feature you are using only supports uid/gid = 0.

**User response:** None.

**Severity:** Warning

**s390dbf.8e20d2**  Flushing debug data failed because <debug area number> is not a valid area

**Explanation:** Flushing a debug area by using the 'flush' sysfs attribute failed. Valid values are the minus sign (-) for flushing all areas, or the number of the respective area for flushing a single area.

**User response:** Write a valid area number or the minus sign (-) to the 'flush' sysfs attribute.

**Severity:** Informational

**s390dbf.a1b9ad**  Registering view <feature name>/<view name> would exceed the maximum number of views <maximum>

**Explanation:** The maximum number of allowed debug feature views has been reached. The view has not been registered. The system keeps running but the new view will not be available in sysfs. This is a program error.

**User response:** Report this problem to your support partner.

**Severity:** Error

**s390dbf.ac1eb1**  Registering debug feature <feature name> failed

**Explanation:** The initialization of an S/390 debug feature failed. A likely cause of this problem is memory constraints. The system keeps running, but the debug data for this feature will not be available in sysfs.

**User response:** Consider assigning more memory to your LPAR or z/VM guest virtual machine.

**Severity:** Error

**s390dbf.d8734b**  Allocating memory for <number of pages> pages failed

**Explanation:** Setting the debug feature size by using the 'page' sysfs attribute failed. Linux did not have enough memory for expanding the debug feature to the requested size.

**User response:** Use a smaller number of pages for the debug feature or allocate more memory to your LPAR or z/VM guest virtual machine.

**Severity:** Informational

**s390dbf.ee54db**  <level> is not a valid level for a debug feature

**Explanation:** Setting a new level for a debug feature by using the 'level' sysfs attribute failed. Valid levels are the minus sign (-) and the integers in the range 0 to 6. The minus sign switches off the feature. The numbers switch the feature on, where higher numbers produce more debug output.

**User response:** Write a valid value to the 'level' sysfs attribute.

**Severity:** Warning
Chapter 26. sclp_cmd

This section contains messages that are issued by the sclp_cmd subsystem.

sclp_cmd.c01fec  Memory hotplug state changed,
suspend refused.

Explanation: Suspend is refused after a memory hotplug operation was performed.

User response: The system needs to be restarted and no memory hotplug operation must be performed in order to allow suspend.

Severity: Error
This section contains messages that are issued when Linux starts.

**setup.0713cd** Address spaces switched, mvkos not available

**Explanation:** The kernel parameter 'switch_amode' has been specified. The kernel will use the primary address space for user space processes and the home address space for the kernel. The mvkos instruction is not available and the kernel will use the slower page table walk method to copy between the user and kernel address space.

**User response:** None.

**Severity:** Informational

**setup.0961dd** Linux is running as a z/VM guest operating system in 31-bit mode

**Explanation:** The 31-bit Linux kernel detected that it is running as a guest operating system of the z/VM hypervisor.

**User response:** None.

**Severity:** Informational

**setup.0cb929** Address spaces switched, mvkos available

**Explanation:** The kernel parameter 'switch_amode' has been specified. The kernel will use the primary address space for user space processes and the home address space for the kernel. The mvkos instruction is used to copy between the user and kernel address space.

**User response:** None.

**Severity:** Informational

**setup.1a06a7** Linux is running as a z/VM guest operating system in 64-bit mode

**Explanation:** The 64-bit Linux kernel detected that it is running as a guest operating system of the z/VM hypervisor.

**User response:** None.

**Severity:** Informational

**setup.262f23** The hardware system has IEEE compatible floating point units

**Explanation:** The Linux kernel detected that it is running on a hardware system with CPUs that have IEEE compatible floating point units.

**User response:** None.

**Severity:** Informational

**setup.6bac7a** Linux is running natively in 64-bit mode

**Explanation:** The 64-bit Linux kernel detected that it is running on an IBM mainframe, either as the sole operating system in an LPAR or as the sole operating system on the entire mainframe. The Linux kernel is not running as a guest operating system of the z/VM hypervisor.

**User response:** None.

**Severity:** Informational

**setup.904d83** initrd extends beyond end of memory (0x<start address of the initial RAM disk> > 0x<memory end address>) disabling initrd

**Explanation:** The load address and the size of the initial RAM disk result in an end address of the initial RAM disk that is beyond the end of the system memory.

**User response:** Lower the load address of the initial RAM disk, reduce the size of the initial RAM disk, or increase the size of the system memory to make the initial RAM disk fit into the memory.

**Severity:** Error

**setup.9d71f8** The hardware system has no IEEE compatible floating point units

**Explanation:** The Linux kernel detected that it is running on a hardware system with CPUs that do not have IEEE compatible floating point units.

**User response:** None.

**Severity:** Informational

**setup.d5d221** Saving the Linux kernel NSS failed with rc=<return code>

**Explanation:** The Linux kernel could not save the named saved system (NSS) with the z/VM CP SAVESYS command. The return code represents the numeric portion of the CP SAVESYS error message.

**User response:** For return code 1, the z/VM guest virtual machine is not authorized to save named saved systems. Ensure that the z/VM guest virtual machine is authorized to issue the CP SAVESYS command (typically privilege class E). For other return codes, see the help and message documentation for the CP SAVESYS command.
Severity: Error

**setup.db58c7  Linux is running natively in 31-bit mode**

**Explanation:** The 31-bit Linux kernel detected that it is running on an IBM mainframe, either as the sole operating system in an LPAR or as the sole operating system on the entire mainframe. The Linux kernel is not running as a guest operating system of the z/VM hypervisor.

**User response:** None.

Severity: Informational

**setup.df70d5  Defining the Linux kernel NSS failed**

**Explanation:** The Linux kernel could not define the named saved system (NSS) with the z/VM CP DEFSYS command. The return code represents the numeric portion of the CP DEFSYS error message.

**User response:** For return code 1, the z/VM guest virtual machine is not authorized to define named saved systems. Ensure that the z/VM guest virtual machine is authorized to issue the CP DEFSYS command (typically privilege class E). For other return codes, see the help and message documentation for the CP DEFSYS command.

Severity: Error

**setup.f47455  Moving initrd**

**Explanation:** The location of the initial RAM disk conflicted with the boot memory bitmap. To resolve the conflict the initial RAM disk has been moved to a new location.

**User response:** None.

Severity: Informational
This section contains messages that are issued by the channel-attached tape device driver.

**tapedevice.1e4d72** <bus ID of the tape device>: Opening the tape failed because of missing end-of-file marks

**Explanation:** The tape block device driver requires end-of-file marks at the end of the recorded area on a tape. If the tape device was to be opened in response to a mount command, the mount command will fail.

**User response:** Insert a tape cartridge that has been prepared for use with the tape block device driver and try the operation again.

**Severity:** Warning

**tapedevice.6e320b** <bus ID of the tape device>: The size of the recorded area is <number of blocks> blocks

**Explanation:** The tape block device driver has successfully determined the size of the recorded area on the tape medium. The tape device can now be used as a block device. See the mount(8) man page for details on how to access block devices.

**User response:** None.

**Severity:** Informational

**tapedevice.8ce1c3** <bus ID of the tape device>: The tape cartridge has been successfully unloaded

**Explanation:** The tape cartridge has been unloaded from the tape unit. Insert a tape cartridge before accessing the tape device.

**User response:** None.

**Severity:** Informational

**tapedevice.a6fc3e** <bus ID of the tape device>: Determining the size of the recorded area...

**Explanation:** The tape block device driver is currently determining the size of the recorded area on the tape medium. This operation typically takes a few minutes.

**User response:** Wait until the size is shown in a completion message.

**Severity:** Informational

**tapedevice.aae0e3** <bus ID of the tape device>: A tape unit was detached while in use

**Explanation:** A tape unit has been detached from the I/O configuration while a tape was being accessed. This typically results in I/O error messages and potentially in damaged data on the tape.

**User response:** Check the output of the application that accesses the tape device. If this problem occurred during a write-type operation, consider repeating the operation after bringing the tape device back online.

**Severity:** Warning

**tapedevice.bedee0** Tape device <bus ID of the tape device> is busy, refusing to suspend

**Explanation:** A request to suspend a tape device being currently in use is rejected.

**User response:** Terminate applications performing tape operations and then try to suspend the system again.

**Severity:** Error

**tapedevice.d10f9d** A cartridge is loaded in tape device <bus ID of the tape device>, refusing to suspend

**Explanation:** A request to suspend a tape device currently loaded with a cartridge is rejected.

**User response:** Unload the tape device. Then try to suspend the system again.

**Severity:** Error

**tapedevice.fbea0c** <bus ID of the tape device>: A tape cartridge has been mounted

**Explanation:** A tape cartridge has been inserted into the tape unit. The tape in the tape unit is ready to be accessed.

**User response:** None.

**Severity:** Informational
Chapter 29. tape_34xx

This section contains messages that are issued by the channel-attached tape device driver and relate to an IBM 3480 or IBM 3490 magnetic tape subsystem.

tape_34xx.01b705  <bus ID of the tape device>: The tape unit is not ready
Explanation:  The tape unit is online but not ready.
User response:  Turn the ready switch on the tape unit to the ready position and try the operation again.
Severity:  Warning

tape_34xx.0a2df0  <bus ID of the tape device>: The tape information states an incorrect length
Explanation:  The tape is shorter than stated at the beginning of the tape data. A possible reason for this problem is that the tape might have been physically truncated. Data written to the tape might be incomplete or damaged.
User response:  If this problem occurred during a write-type operation, consider repeating the operation with a different tape cartridge.
Severity:  Warning

tape_34xx.0dcb6e  <bus ID of the tape device>: A parity error occurred on the tape bus
Explanation:  A data parity check error occurred on the bus. Data that was read or written while the error occurred is not valid.
User response:  Reposition the tape and repeat the read-type or write-type operation.
Severity:  Warning

tape_34xx.1438e6  <bus ID of the tape device>: A channel interface error cannot be recovered
Explanation:  An error has occurred on the channel interface. This error cannot be recovered by the control unit error recovery process.
User response:  See the documentation of the control unit.
Severity:  Warning

tape_34xx.150bb7  <bus ID of the tape device>: The tape unit does not support tape format 3480-2 XF
Explanation:  The tape unit does not support tapes recorded in the 3480-2 XF format.
User response:  If you do not need the data recorded on the current tape, rewind the tape and overwrite it with a supported format. If you need the data on the current tape, use a tape unit that supports the tape format.
Severity:  Warning

tape_34xx.15d49e  <bus ID of the tape device>: The maximum block size for buffered mode is exceeded
Explanation:  The block to be written is larger than allowed for the buffered mode.
User response:  Use a smaller block size.
Severity:  Warning

tape_34xx.257c56  <bus ID of the tape device>: A path equipment check occurred for the tape device
Explanation:  A path equipment check has occurred. This check indicates problems with the connection between the mainframe system and the tape control unit.
User response:  Ensure that the cable connections between the mainframe system and the control unit are securely in place and not damaged.
Severity:  Warning

tape_34xx.2caadc  <bus ID of the tape device>: I/O error recovery failed on the tape control unit
Explanation:  An I/O error occurred that cannot be recovered by the automatic error recovery process of the tape control unit. The application that operates the tape unit will receive a return value of -EIO which indicates an I/O error. The data on the tape might be damaged.
User response:  If this problem occurred during a write-type operation, consider repositioning the tape and repeating the operation.
Severity:  Warning

tape_34xx.33278e  <bus ID of the tape device>: A write error on the tape cannot be recovered
Explanation:  A write error has occurred that could not be recovered by the automatic error recovery process.
User response:  Use a different tape cartridge.
tape_34xx.3be0ed • tape_34xx.6bcece

Severity: Warning

**tape_34xx.3be0ed** <bus ID of the tape device>: Reading the tape beyond the end of the recorded area failed

Explanation: A read-type operation failed because it extended beyond the end of the recorded area on the tape medium.

User response: None.

Severity: Warning

**tape_34xx.6bcece** <bus ID of the tape device>: A data overrun occurred between the control unit and tape unit

Explanation: A data overrun error has occurred on the connection between the control unit and the tape unit. If this problem occurred during a write-type operation, the integrity of the data on the tape might be compromised.

User response: Use a faster connection. If this problem occurred during a write-type operation, consider repositioning the tape and repeating the operation.

Severity: Warning

**tape_34xx.3f2d36** <bus ID of the tape device>: The tape unit does not support format 3480 XF

Explanation: The tape unit does not support tapes recorded in the 3480 XF format.

User response: If you do not need the data recorded on the current tape, rewind the tape and overwrite it with a supported format. If you need the data on the current tape, use a tape unit that supports the tape format.

Severity: Warning

**tape_34xx.3f38f7** <bus ID of the tape device>: A data overrun occurred between the control unit and tape unit

Explanation: A data overrun error has occurred on the connection between the control unit and the tape unit. If this problem occurred during a write-type operation, the integrity of the data on the tape might be compromised.

User response: Use a faster connection. If this problem occurred during a write-type operation, consider repositioning the tape and repeating the operation.

Severity: Warning

**tape_34xx.442701** <bus ID of the tape device>: The tape unit does not support the tape length

Explanation: The length of the tape in the cartridge is incompatible with the tape unit.

User response: Either use a different tape unit or use a tape with a supported length.

Severity: Warning

**tape_34xx.553e40** <bus ID of the tape device>: Writing the ID-mark failed

Explanation: The ID-mark at the beginning of tape could not be written. The tape medium might be write-protected.

User response: Try a different tape cartridge. Ensure that the write-protection on the cartridge is switched off.

Severity: Warning

**tape_34xx.64dd87** <bus ID of the tape device>: The tape medium has been rewound or unloaded manually

Explanation: The tape unit rewind button, unload button, or both have been used to rewind or unload the tape cartridge. A tape cartridge other than the intended cartridge might have been inserted or the tape medium might not be at the expected position.

User response: Verify that the correct tape cartridge has been inserted and that the tape medium is at the required position before continuing to work with the tape.

Severity: Warning

**tape_34xx.696dc8** <bus ID of the tape device>: The tape medium is write-protected

Explanation: A write-type operation failed because the tape medium is write-protected.

User response: Eject the tape cartridge, switch off the write protection on the cartridge, insert the cartridge, and try the operation again.

Severity: Warning

**tape_34xx.69f60e** <bus ID of the tape device>: The tape unit does not support the current tape length

Explanation: The length of the tape in the cartridge is incompatible with the tape unit.

User response: Either use a different tape unit or use a tape with a supported length.

Severity: Warning

**tape_34xx.6bcece** <bus ID of the tape device>: The tape unit is already assigned

Explanation: The tape unit is already assigned to another channel path.
User response: Free the tape unit from the operating system instance to which it is currently assigned then try again.

Severity: Warning

---

tape_34xx.7f9ae4  <bus ID of the tape device>: A channel protocol error occurred

Explanation: An error was detected in the channel protocol.

User response: Reposition the tape and try the operation again.

Severity: Warning

---

tape_34xx.85efa7  <bus ID of the tape device>: The block ID sequence on the tape is incorrect

Explanation: The control unit has detected an incorrect block ID sequence on the tape. This problem typically indicates that the data on the tape is damaged.

User response: If this problem occurred during a write-type operation reposition the tape and repeat the operation.

Severity: Warning

---

tape_34xx.956e53  <bus ID of the tape device>: The tape does not have the required tape tension

Explanation: The tape does not have the required tape tension.

User response: Rewind and reposition the tape, then repeat the operation.

Severity: Warning

---

tape_34xx.b334e9  <bus ID of the tape device>: The tape unit is not online

Explanation: The tape unit is not online to the tape device driver.

User response: Ensure that the tape unit is operational and that the cable connections between the control unit and the tape unit are securely in place and not damaged.

Severity: Warning

---

tape_34xx.c5ee4a  <bus ID of the tape device>: Automatic unloading of the tape cartridge failed

Explanation: The tape unit failed to unload the cartridge.

User response: Unload the cartridge manually by using the eject button on the tape unit.

Severity: Warning

---

tape_34xx.c7fc10  <bus ID of the tape device>: The tape unit does not support the compaction algorithm

Explanation: The tape unit cannot read the current tape. The data on the tape has been compressed with an algorithm that is not supported by the tape unit.

User response: Use a tape unit that supports the compaction algorithm used for the current tape.

Severity: Warning

---

tape_34xx.ccc5ad  <bus ID of the tape device>: The tape unit failed to load the cartridge

Explanation: An error has occurred while loading the tape cartridge.

User response: Unload the cartridge and load it again.

Severity: Warning

---

tape_34xx.cfc6c4  <bus ID of the tape device>: An equipment check has occurred on the tape unit

Explanation: Possible reasons for the check condition are a unit adapter error, a buffer error on the lower interface, an unusable internal path, or an error that has occurred while loading the cartridge.

User response: Examine the tape unit and the cartridge loader. Consult the tape unit documentation for details.

Severity: Warning

---

tape_34xx.d2b071  <bus ID of the tape device>: A read error occurred that cannot be recovered

Explanation: A read error has occurred that cannot be recovered. The current tape might be damaged.

User response: None.

Severity: Warning

---

tape_34xx.d56330  <bus ID of the tape device>: The tape contains an incorrect block ID sequence

Explanation: The control unit has detected an incorrect block ID sequence on the tape. This problem typically indicates that the data on the tape is damaged.

User response: If this problem occurred during a write-type operation reposition the tape and repeat the operation.

Severity: Warning
The control unit has fenced access to the tape volume.

**Explanation:** The control unit fences further access to the current tape volume. The data integrity on the tape volume might have been compromised.

**User response:** Rewind and unload the tape cartridge.

**Severity:** Warning

The tape subsystem is running in degraded mode.

**Explanation:** The tape subsystem is not operating at its maximum performance.

**User response:** Contact your service representative for the tape unit and report this problem.

**Severity:** Warning

The tape unit cannot process the tape format.

**Explanation:** Either the tape unit is not able to read the format ID mark, or the specified format is not supported by the tape unit.

**User response:** If you do not need the data recorded on the current tape, use a different tape or write a new format ID mark at the beginning of the tape. Be aware that writing a new ID mark leads to a loss of all data that has been recorded on the tape. If you need the data on the current tape, use a tape unit that supports the tape format.

**Severity:** Warning

An unexpected condition occurred in tape error recovery.

**Explanation:** The control unit has reported an error condition that is not recognized by the error recovery process of the tape device driver.

**User response:** Report this problem and the condition number from the message to your support organization.

**Severity:** Error
Chapter 30. tape_3590

This section contains messages that are issued by the channel-attached tape device driver and relate to an IBM 3590 or IBM 3592 magnetic tape subsystem.

**tape_3590.07e630**  
**<bus ID of the tape device>:**  
DEVSIM SEV=<SEV>,  
DEVTYPE=3590/<model>,  
MC=<message code>,  
ES=<exception>/<required service action>, REF=0x<refcode1>-0x<refcode2>-0x<refcode3>

**Explanation:** This is an operating system independent device subsystem information message issued by the tape unit. The information in the message is intended for the IBM customer engineer.

**User response:** See the documentation for the tape unit for further information.

**Severity:** Warning

**tape_3590.497827**  
**<bus ID of the tape device>:** The tape unit failed to obtain the encryption key from EKM

**Explanation:** The tape unit was unable to retrieve the encryption key required to decode the data on the tape from the enterprise key manager (EKM).

**User response:** See the EKM and tape unit documentation for information about how to enable the tape unit to retrieve the encryption key.

**Severity:** Error

**tape_3590.4b2253**  
**<bus ID of the tape device>:** Device subsystem information: exception <exception>, service <required service action>

**Explanation:** This is an operating system independent device subsystem information message that was issued by the tape unit. The information in the message is intended for the IBM customer engineer.

**User response:** See the documentation for the tape unit for further information.

**Severity:** Warning

**tape_3590.575a6b**  
**<bus ID of the tape device>:** The tape unit has issued sense message <sense message code>

**Explanation:** The tape unit has issued an operating system independent sense message.

**User response:** See the documentation for the tape unit for further information.

**Severity:** Warning

**tape_3590.601044**  
**<bus ID of the tape device>:** The tape unit has issued an unknown sense message code 0x<code>

**Explanation:** The tape device driver has received an unknown sense message from the tape unit.

**User response:** See the documentation for the tape unit for further information.

**Severity:** Warning
**tape_3590.7ad0ac • tape_3590.ff1db8**

**tape_3590.7ad0ac**<br>);

```plaintext
<bus ID of the tape device>: MIM
SEV=SEV, MC=message code,
ES=exception|<required service
action>, RC=refcode><mid><fid>
```

**Explanation:** This is an operating system independent information message that was issued by the tape unit. The information in the message is intended for the IBM customer engineer.

**User response:** See to the documentation for the tape unit for further information.

**Severity:** Warning

---

**tape_3590.991401**<br>

```plaintext
<bus ID of the tape device>: Tape media information: exception
<exception>, service <service>
```

**Explanation:** This is an operating system independent tape medium information message that was issued by the tape unit. The information in the message is intended for the IBM customer engineer.

**User response:** See the documentation for the tape unit for further information.

**Severity:** Warning

---

**tape_3590.fca498**<br>

```plaintext
<bus ID of the tape device>: A different host has privileged access to the tape unit
```

**Explanation:** You cannot access the tape unit because a different operating system instance has privileged access to the unit.

**User response:** Unload the current cartridge to solve this problem.

**Severity:** Warning

---

**tape_3590.ff1db8**<br>

```plaintext
<bus ID of the tape device>: The tape unit has issued an unknown sense message code <code>
```

**Explanation:** The tape device has issued a sense message, that is unknown to the device driver.

**User response:** Use the message code printed as hexadecimal value and see the documentation for the tape unit for further information.

**Severity:** Warning
Chapter 31. time

This section contains messages that are issued by the System z specific time functions.

---

**time.93fc64  The real or virtual hardware system does not provide an STP interface**

**Explanation:** The 'stp=' parameter has been passed on the kernel parameter line for a Linux instance that does not have access to the server time protocol (STP) facility.

**User response:** To avoid this warning remove the 'stp=' kernel parameter.

**Severity:** Warning

---

**time.c4bd65  The real or virtual hardware system does not provide an ETR interface**

**Explanation:** The 'etr=' parameter has been passed on the kernel parameter line for a Linux instance that does not have access to the external time reference (ETR) facility.

**User response:** To avoid this warning remove the 'etr=' kernel parameter.

**Severity:** Warning

---

**time.eb7580  The ETR interface has adjusted the clock by <number of microseconds> microseconds**

**Explanation:** The external time reference (ETR) interface has synchronized the system clock with the external reference and set it to a new value. The time difference between the old and new clock value has been passed to the network time protocol (NTP) as a single shot adjustment.

**User response:** None.

**Severity:** Notice
Chapter 32. vmlogrdr

This section contains messages that are issued by the z/VM recording device driver. With the z/VM recording device driver, an instance of Linux on z/VM can read from the z/VM CP recording services.

vmlogrdr.c1d147  vmlogrdr: device <device name> is busy. Refuse to suspend.

Explanation: Suspending vmlogrdr devices that are in uses is not supported. A request to suspend such a device is refused.

User response: Close all applications that use any of the vmlogrdr devices and then try to suspend the system again.

Severity: Error
Chapter 33. vmur

This section contains messages that are issued by the z/VM virtual unit record device driver. This device driver provides Linux with access to z/VM virtual unit record devices like punch card readers, card punches, and line printers.

vmur.386675  Unit record device <bus ID of the unit record device> is busy, <z/VM virtual unit record device driver> refusing to suspend.

Explanation: Linux cannot be suspended while a unit record device is in use.

User response: Stop all applications that work on z/VM spool file queues, for example, the vmur tool. Then try again to suspend Linux.

Severity: Error

vmur.53bf56 The <z/VM virtual unit record device driver> cannot be loaded without z/VM

Explanation: The z/VM virtual unit record device driver provides Linux with access to z/VM virtual unit record devices like punch card readers, card punches, and line printers. On Linux instances that run in environments other than the z/VM hypervisor, the device driver does not provide any useful function and the corresponding vmur module cannot be loaded.

User response: Load the vmur module only on Linux instances that run as guest operating systems of the z/VM hypervisor. If the z/VM virtual unit record device has been compiled into the kernel, ignore this message.

Severity: Error

vmur.ff8847 Kernel function alloc_chrdev_region failed with error code <error code according to errno definitions>

Explanation: The z/VM virtual unit record device driver (vmur) needs to register a range of character device minor numbers from 0x0000 to 0xffff. This registration failed, probably because of memory constraints.

User response: Free some memory and reload the vmur module. If the z/VM virtual unit record device driver has been compiled into the kernel reboot Linux. Consider assigning more memory to your LPAR or z/VM guest virtual machine.

Severity: Error
Chapter 34. vmwatchdog

This section contains messages that are issued by the watchdog device driver. With the watchdog device driver, a watchdog application on an instance of Linux on z/VM can access the z/VM watchdog timer.

vmwatchdog.8f03fb  The system cannot be suspended while the watchdog is running

Explanation:  The watchdog must not time out during hibernation. The watchdog device driver prevents the system from being suspended while the watchdog timer is running.

User response:  If you want to suspend the system, stop the watchdog, for example, by entering the command: 'echo V > /dev/vmwatchdog'. Alternatively, stop the program that uses the watchdog or reconfigure the program to not use the watchdog.

Severity:  Error

vmwatchdog.bfeb9c  The system cannot be suspended while the watchdog is in use

Explanation:  A program is currently using the vmwatchdog device node. The watchdog device driver prevents the system from being suspended while the watchdog device is in use.

User response:  If you want to suspend the system, find out which program uses the watchdog device. Stop the program or reconfigure it to not use the watchdog.

Severity:  Error
Chapter 35. xpram

This section contains messages that are issued by the XPRAM device driver. This block device driver enables Linux on System z to access expanded storage.

---

**xpram.9f7762**  Resuming the system failed: <cause of the failure>

**Explanation:** A system cannot be resumed if the expanded memory setup changes after hibernation. Possible reasons for the failure are: - Expanded memory was removed after hibernation. - Size of the expanded memory changed after hibernation. The system is stopped with a kernel panic.

**User response:** Reboot Linux.

**Severity:** Error

---

**xpram.ab9aa4**  <number of partitions> is not a valid number of XPRAM devices

**Explanation:** The number of XPRAM partitions specified for the 'devs' module parameter or with the 'xpram.parts' kernel parameter must be an integer in the range 1 to 32. The XPRAM device driver created a maximum of 32 partitions that are probably not configured as intended.

**User response:** If the XPRAM device driver has been compiled as a separate module, unload the module and load it again with a correct value for the 'devs' module parameter. If the XPRAM device driver has been compiled into the kernel, correct the 'xpram.parts' parameter in the kernel command line and restart Linux.

**Severity:** Error

---

**xpram.f004d1**  Not enough expanded memory available

**Explanation:** The amount of expanded memory required to set up your XPRAM partitions depends on the 'sizes' parameter specified for the xpram module or on the specifications for the 'xpram.parts' parameter if the XPRAM device driver has been compiled into the kernel. Your current specification exceed the amount of available expanded memory. Your XPRAM partitions are probably not configured as intended.

**User response:** If the XPRAM device driver has been compiled as a separate module, unload the xpram module and load it again with an appropriate value for the 'sizes' module parameter. If the XPRAM device driver has been compiled into the kernel, adjust the 'xpram.parts' parameter in the kernel command line and restart Linux. If you need more than the available expanded memory, increase the expanded memory allocation for your virtual hardware or LPAR.

**Severity:** Error

---

**xpram.f6ae78**  No expanded memory available

**Explanation:** The XPRAM device driver has been loaded in a Linux instance that runs in an LPAR or virtual hardware without expanded memory. No XPRAM partitions are created.

**User response:** Allocate expanded memory for your LPAR or virtual hardware or do not load the xpram module. You can ignore this message, if you do not want to create XPRAM partitions.

**Severity:** Error
Chapter 36. zdump

This section contains messages that are issued by the zfcpdump functions.

zdump.54a0dd  The 32-bit dump tool cannot be used for a 64-bit system

Explanation: The dump process ends without creating a system dump.

User response: Use a 64-bit dump tool to obtain a system dump for 64-bit Linux instance.

Severity: Alert

zdump.d05784  The 64-bit dump tool cannot be used for a 32-bit system

Explanation: The dump process ends without creating a system dump.

User response: Use a 32-bit dump tool to obtain a system dump for 32-bit Linux instance.

Severity: Alert
Chapter 37. zfcp

This section contains messages that are issued by the SCSI-over-Fibre Channel device driver (zfcp device driver) for the QDIO-based System z SCSI-over-Fibre Channel adapter. The zfcp device driver provides support for Fibre Channel-attached SCSI devices on Linux on System z.

**zfcp.000866** <bus ID of the zfcp device>: The FCP adapter cannot support more NPIV ports

**Explanation:** N_Port ID Virtualization (NPIV) ports consume physical resources on the FCP adapter. The FCP adapter resources are exhausted. The connection is not operational.

**User response:** Analyze the number of available NPIV ports and which operating system instances use them. If necessary, reconfigure your setup to move some NPIV ports to an FCP adapter with free resources.

**Severity:** Warning

**zfcp.01a8f2** <bus ID of the zfcp device>: All NPIV ports on the FCP adapter have been assigned

**Explanation:** The number of N_Port ID Virtualization (NPIV) ports that can be assigned on an FCP adapter is limited. Once assigned, NPIV ports are not released automatically but have to be released explicitly through the support element (SE).

**User response:** Identify NPIV ports that have been assigned but are no longer in use and release them from the SE.

**Severity:** Warning

**zfcp.020115** <bus ID of the zfcp device>: Registering port 0x<WWPN> failed

**Explanation:** The Linux kernel could not allocate enough memory to register the remote port with the indicated WWPN with the SCSI stack. The remote port is not available.

**User response:** Free some memory and trigger the rescan for ports.

**Severity:** Error

**zfcp.058803** <bus ID of the zfcp device>: FCP adapter maximum QTCB size (<maximum supported size> bytes) is too small

**Explanation:** The queue transfer control block (QTCB) size requested by the zfcp device driver is not supported by the FCP adapter hardware.

**User response:** Update the firmware on your FCP adapter hardware to the latest available level and update the Linux kernel to the latest supported level. If the problem persists, contact your support organization.

**Severity:** Error

**zfcp.069af1** <bus ID of the zfcp device>: Access denied to LUN 0x<LUN> on port 0x<WWPN>

**Explanation:** The Linux system is not allowed to access the SCSI device at the indicated LUN.

**User response:** Update the access control table of the FCP device to grant the Linux system access to the LUN or remove the LUN from the Linux system.

**Severity:** Warning

**zfcp.0cf3fa** <bus ID of the zfcp device>: Creating an ERP thread for the FCP device failed.

**Explanation:** The zfcp device driver could not set up error recovery procedure (ERP) processing for the FCP device. The FCP device is not available for use in Linux.

**User response:** Free some memory and try again to load the zfcp device driver. If the zfcp device driver has been compiled into the kernel, reboot Linux. Consider assigning more memory to your LPAR or z/VM guest virtual machine. If the problem persists, contact your support organization.

**Severity:** Error

**zfcp.10efb5** <bus ID of the zfcp device>: Opening WKA port 0x<destination ID of the WKA port> failed

**Explanation:** The FCP adapter rejected a request to open the specified well-known address (WKA) port. No retry is possible.

**User response:** Verify the setup and check if the maximum number of remote ports used through this adapter is below the maximum allowed. If the problem persists, gather Linux debug data, collect the FCP adapter hardware logs, and report the problem to your support organization.

**Severity:** Warning

**zfcp.128ff1** <bus ID of the zfcp device>: The WWPN assignment file on the FCP adapter has been damaged

**Explanation:** This is an FCP adapter hardware problem.
zfcp.17ac1c  zfcp.307c0c

**User response:** Report this problem with FCP hardware logs to IBM support.

**Severity:** Warning

---

zfcp.17ac1c <bus ID of the zfcp device>: Attaching the name server port to the FCP device failed

**Explanation:** The zfcp device driver could not attach the name server port of the fibre channel fabric to an FCP device. A possible cause of this problem is memory constraints.

**User response:** Set the FCP device offline, free some memory, then set the FCP device online again. If this does not resolve the problem, reboot Linux and try again to set the FCP device online.

**Severity:** Error

---

zfcp.2a747e <bus ID of the zfcp device>: No handle is available for LUN 0x<LUN> on port 0x<WWPN>

**Explanation:** The FCP adapter can only open a limited number of SCSI devices. This limit has been reached and the SCSI device at the indicated LUN cannot be opened.

**User response:** For FCP subchannels running in non-NPIV mode, check all SCSI devices opened through the FCP adapter and close some of them. For FCP subchannels running in NPIV mode, verify the SAN zoning and host connections on the storage systems. Ensure that the zoning and host connections only allow access to the required LUNs. As a workaround, disable the automatic LUN scanning by setting the zfcp.allow_lun_scan kernel parameter or the allow_lun_scan module parameter to 0.

**Severity:** Warning

---

zfcp.29fa1a <bus ID of the zfcp device>: The fibre channel fabric does not support FCP

**Explanation:** The fibre channel switch or storage system that is connected to the FCP channel does not support the fibre channel protocol (FCP). The zfcp device driver stopped using the FCP device.

**User response:** Check the adjacent fibre channel node.

**Severity:** Warning
**zfcp.308f45**  <bus ID of the zfcp device>: The mode table on the FCP adapter has been damaged

**Explanation**: This is an FCP adapter hardware problem.

**User response**: Report this problem with FCP hardware logs to IBM support.

**Severity**: Warning

**zfcp.3dff9c**  <bus ID of the zfcp device>: Setting up the QDIO connection to the FCP adapter failed

**Explanation**: The zfcp device driver failed to establish a QDIO connection with the FCP adapter.

**User response**: Set the FCP adapter offline or detach it from the Linux system, free some memory and set the FCP adapter online again or attach it again. If this problem persists, gather Linux debug data, collect the FCP adapter hardware logs, and report the problem to your support organization.

**Severity**: Error

**zfcp.4a463f**  <bus ID of the zfcp device>: ERP failed for remote port 0x<WWPN>

**Explanation**: An error occurred on a remote port. The error recovery procedure (ERP) could not resolve the error. The port is not available.

**User response**: Verify that the WWPN is correct and check the fibre channel fabric for errors related to the WWPN.

**Severity**: Error

**zfcp.4c0e02**  <bus ID of the zfcp device>: The FCP adapter does not recognize the command 0x<command>

**Explanation**: A command code that was sent from the zfcp device driver to the FCP adapter is not valid. The zfcp device driver stopped using the FCP device.

**User response**: Gather Linux debug data, collect the FCP adapter hardware logs, and report this problem to your support organization.

**Severity**: Error

**zfcp.4fed50**  <bus ID of the zfcp device>: Exclusive read-only access not supported (LUN 0x<LUN>, port 0x<WWPN>)

**Explanation**: The access configuration specified in the access control tables of the FCP adapter is not valid. The SCSI device at the indicated LUN cannot be accessed.

**User response**: Change the access control tables in the FCP adapter.

**Severity**: Error

**zfcp.566303**  <bus ID of the zfcp device>: The CHPID for the FCP device is offline

**Explanation**: The CHPID for an FCP device has been set offline, either logically in Linux or on the hardware.

**User response**: Find out which CHPID corresponds to the FCP device, for example, with the Isccs command. Check if the CHPID has been set logically offline in sysfs. Write ‘on’ to the CHPID’s status attribute to set it online. If the CHPID is online in sysfs, find out if it has been varied offline through a hardware management interface, for example the service element (SE).

**Severity**: Warning

**zfcp.56747f**  <bus ID of the zfcp device>: The adjacent switch cannot support more NPIV ports

**Explanation**: N_Port ID Virtualization (NPIV) ports consume physical resources. The resources of the fibre channel switch that is connected to the FCP adapter are exhausted. The connection is not operational.

**User response**: Analyze the number of available NPIV ports on the adjacent fibre channel switch and how they are used. If necessary, reconfigure your fibre channel fabric to accommodate the required NPIV ports.

**Severity**: Warning

**zfcp.574d43**  <bus ID of the zfcp device>: ERP cannot recover an error on the FCP device

**Explanation**: An error occurred on an FCP device. The error recovery procedure (ERP) could not resolve the error. The FCP device driver cannot use the FCP device.

**User response**: Check for previous error messages for the same FCP device to find the cause of the problem.

**Severity**: Error

**zfcp.5cd78f**  Registering the misc device zfcp_cfdc failed

**Explanation**: The zfcp device driver failed to register the device that provides access to the adapter access control file (ACL tables). The device driver initialization failed. A possible cause for this problem is memory constraints.

**User response**: Free some memory and try again to load the zfcp device driver. If the zfcp device driver has been compiled into the kernel, reboot Linux. Consider assigning more memory to your LPAR or z/VM guest
virtual machine. If the problem persists, contact your support organization.

**Severity:** Error

**zfcp.63f95d**  
<bus ID of the zfcp device>: Registering unit 0x<LUN> on port 0x<WWPN> failed

**Explanation:** The Linux kernel could not allocate enough memory to register the SCSI device at the indicated LUN with the SCSI stack. The SCSI device is not available.

**User response:** Free some memory then detach the LUN and attach it again.

**Severity:** Error

**zfcp.646ca0**  
<bus ID of the zfcp device>: QTCB version 0x<requested version> not supported by FCP adapter (0x<lowest supported version> to 0x<highest supported version>)

**Explanation:** See message text. The queue transfer control block (QTCB) version requested by the zfcp device driver is not supported by the FCP adapter hardware.

**User response:** If the requested version is higher than the highest version supported by the hardware, install more recent firmware on the FCP adapter. If the requested version is lower then the lowest version supported by the hardware, upgrade to a Linux level with a more recent zfcp device driver.

**Severity:** Error

**zfcp.657cf6**  
<bus ID of the zfcp device>: Setting up data structures for the FCP adapter failed

**Explanation:** The zfcp device driver could not allocate data structures for an FCP adapter. A possible reason for this problem is memory constraints.

**User response:** Set the FCP adapter offline or detach it from the Linux system, free some memory and set the FCP adapter online again or attach it again. If this problem persists, gather Linux debug data, collect the FCP adapter hardware logs, and report the problem to your support organization.

**Severity:** Error

**zfcp.6dbb23**  
<bus ID of the zfcp device>: Incorrect direction <value in direction field>, LUN 0x<LUN> on port 0x<WWPN> closed

**Explanation:** The direction field in a SCSI request contains an incorrect value. The zfcp device driver closed down the SCSI device at the indicated LUN.

**User response:** If this condition is only temporary and
access to the remote port is possible, no action is required. If the condition persists, identify the storage system with the specified WWPN and contact the support organization of the storage system.

Severity: Warning

zfcp.7d0b42 <bus ID of the zfcp device>: The FCP device has been detached

Explanation: An FCP device is no longer available to Linux.

User response: Ensure that the FCP adapter is operational and attached to the LPAR or z/VM virtual machine.

Severity: Warning

zfcp.7d6999 <bus ID of the zfcp device>: There is no light signal from the local fibre channel cable

Explanation: There is no signal on the fibre channel cable that connects the FCP adapter to the fibre channel fabric.

User response: Ensure that the cable is in place and connected properly to the FCP adapter and to the adjacent fibre channel switch or storage system.

Severity: Warning

zfcp.7f96f9 <bus ID of the zfcp device>: The name server reported <number of words in residual data> words residual data

Explanation: The fibre channel name server sent too much information about remote ports. The zfcp device driver did not receive sufficient information to attach all available remote ports in the SAN.

User response: Verify that you are running the latest firmware level on the FCP adapter. Check your SAN setup and consider reducing the number of ports visible to the FCP adapter by using more restrictive zoning in the SAN.

Severity: Warning

zfcp.82bb71 <bus ID of the zfcp device>: The FCP device did not respond within the specified time

Explanation: The common I/O layer waited for a response from the FCP adapter but no response was received within the specified time limit. This might indicate a hardware problem.

User response: Consult your hardware administrator. If this problem persists, gather Linux debug data, collect the FCP adapter hardware logs, and report the problem to your support organization.

Severity: Warning

zfcp.87c4d0 <bus ID of the zfcp device>: The error threshold for checksum statistics has been exceeded

Explanation: The FCP adapter has reported a large number of bit errors. This might indicate a problem with the physical components of the fibre channel fabric. Details about the errors have been written to the HBA trace for the FCP adapter.

User response: Check for problems in the fibre channel fabric and ensure that all cables are properly plugged.

Severity: Warning

zfcp.8a704c <bus ID of the zfcp device>: Access denied according to ACT rule type <access rule type>, rule <access rule>

Explanation: A rule in the access control table (ACT) for the FCP device denies access to a remote port or a LUN.

User response: Examine the access control tables for the FCP device to see if the specified rule is correct.

Severity: Warning

zfcp.8bd3b4 <bus ID of the zfcp device>: ERP failed for LUN 0x<LUN> on port 0x<WWPN>

Explanation: An error occurred on the SCSI device at the specified LUN. The error recovery procedure (ERP) could not resolve the error. The SCSI device is not available.

User response: Verify that the LUN is correct. Check the fibre channel fabric for errors related to the specified WWPN and LUN, the storage server, and Linux.

Severity: Error

zfcp.9b70c0 <bus ID of the zfcp device>: Not enough FCP adapter resources to open remote port 0x<WWPN>

Explanation: Each port that is opened consumes physical resources of the FCP adapter to which it is attached. These resources are exhausted and the specified port cannot be opened.

User response: Reduce the total number of remote ports that are attached to the FCP adapter.

Severity: Warning

zfcp.9d2550 <bus ID of the zfcp device>: SCSI device at LUN 0x<LUN> on port 0x<WWPN> opened read-only

Explanation: The access control tables in the FCP adapter allow read-only access for the LUN. Write access is not permitted for your Linux instance. The
SCSI device has been opened successfully in read-only access mode.

**User response:** None if read-only access is sufficient. If you require write access, change the access control tables in the FCP adapter.

**Severity:** Informational

---

zfcp.9d2a6b <bus ID of the zfcp device>: There is a wrap plug instead of a fibre channel cable

**Explanation:** The FCP adapter is not physically connected to the fibre channel fabric.

**User response:** Remove the wrap plug from the FCP adapter and connect the adapter with the fibre channel fabric.

**Severity:** Warning

---

zfcp.a9953d <bus ID of the zfcp device>: The FCP device is suspended because of a firmware update

**Explanation:** The FCP device is not available while a firmware update is in progress. This problem is temporary. The FCP device will resume operations when the firmware update is completed.

**User response:** Wait 10 seconds and try the operation again.

**Severity:** Warning

---

zfcp.ac341f <bus ID of the zfcp device>: The local link has been restored

**Explanation:** A problem with the connection between the FCP adapter and the adjacent node on the fibre channel fabric has been resolved. The FCP adapter is now available again.

**User response:** None.

**Severity:** Informational

---

zfcp.ad5387 <bus ID of the zfcp device>: Registering the FCP device with the SCSI stack failed

**Explanation:** The FCP adapter could not be registered with the Linux SCSI stack. A possible reason for this problem is memory constraints.

**User response:** Set the FCP adapter offline or detach it from the Linux system, free some memory and set the FCP adapter online again or attach it again. If this problem persists, gather Linux debug data, collect the FCP adapter hardware logs, and report the problem to your support organization.

**Severity:** Error

---

zfcp.afba9a <bus ID of the zfcp device>: The link between the FCP adapter and the FC fabric is down

**Explanation:** The FCP adapter is not usable. Specific error information is not available.

**User response:** Check the cabling and the fibre channel fabric configuration. If this problem persists, gather Linux debug data, collect the FCP adapter hardware logs, and report the problem to your support organization.

**Severity:** Warning

---

zfcp.b2d959 The zfcp device driver could not register with the common I/O layer

**Explanation:** The device driver initialization failed. A possible cause of this problem is memory constraints.

**User response:** Free some memory and try again to load the zfcp device driver. If the zfcp device driver has been compiled into the kernel, reboot Linux. Consider assigning more memory to your LPAR or z/VM guest virtual machine. If the problem persists, contact your support organization.

**Severity:** Error

---

zfcp.b2ef0a <bus ID of the zfcp device>: The FCP device is operational again

**Explanation:** An FCP device has been unavailable because it had been detached from the Linux system or because the corresponding CHPID was offline. The FCP device is now available again and the zfcp device driver resumes all operations to the FCP device.

**User response:** None.

**Severity:** Informational

---

zfcp.c0fd29 <bus ID of the zfcp device>: Shared read-write access not supported (LUN 0x<LUN>, port 0x<WWPN>)

**Explanation:** The access configuration specified in the access control tables of the FCP adapter is not valid. The SCSI device at the indicated LUN cannot be accessed.

**User response:** Change the access control tables in the FCP adapter.

**Severity:** Error

---

zfcp.c2c546 <bus ID of the zfcp device>: The FCP adapter could not log in to the fibre channel fabric

**Explanation:** The fibre channel switch rejected the login request from the FCP adapter.

**User response:** Check the fibre channel fabric or...
switch logs for possible errors.

**Severity:** Warning

---

**zfcp.cf1c58**  
*<bus ID of the zfcp device>: The QTCB type is not supported by the FCP adapter*

**Explanation:** The queue transfer control block (QTCB) type requested by the zfcp device driver is not supported by the FCP adapter hardware.

**User response:** Install the latest firmware on your FCP adapter hardware. If this does not resolve the problem, upgrade to a Linux level with a more recent zfcp device driver. If the problem persists, contact your support organization.

**Severity:** Error

---

**zfcp.cfb51a**  
*<device specification> is not a valid SCSI device*

**Explanation:** The specification for an initial SCSI device provided with the 'zfcp.device' kernel parameter or with the 'device' module parameter is syntactically incorrect. The specified SCSI device could not be attached to the Linux system.

**User response:** Correct the value for the 'zfcp.device' or 'device' parameter and reboot Linux. See "Device Drivers, Features, and Commands" for information about the syntax.

**Severity:** Error

---

**zfcp.d4aea8**  
*<bus ID of the zfcp device>: 0x<request ID> is an ambiguous request identifier*

**Explanation:** The FCP adapter reported that it received the same request ID twice. This is an error. The zfcp device driver stopped using the FCP device.

**User response:** Gather Linux debug data, collect the FCP adapter hardware logs, and report this problem to your support organization.

**Severity:** Error

---

**zfcp.dda2e3**  
*<bus ID of the zfcp device>: The FCP device detected a WWPN that is duplicate or not valid*

**Explanation:** This condition indicates an error in the FCP adapter hardware or in the z/VM hypervisor.

**User response:** Gather Linux debug data, collect the FCP adapter hardware logs, and report this problem to IBM support.

**Severity:** Warning

---

**zfcp.de56fd**  
*<bus ID of the zfcp device>: A QDIO protocol error occurred, operations continue*

**Explanation:** The zfcp device driver detected a missing flag in a QDIO queue. The device driver tries to keep the FCP device operational.

**User response:** Check for related error messages. If this problem occurs frequently, gather Linux debug data, collect the FCP adapter hardware logs, and report the problem to your support organization.

**Severity:** Warning

---

**zfcp.e78dec**  
*<bus ID of the zfcp device>: A QDIO problem occurred*

**Explanation:** QDIO reported a problem to the zfcp device driver. The zfcp device driver tries to recover this problem.

**User response:** Check for related error messages. If this problem occurs frequently, gather Linux debug data and contact your support organization.

**Severity:** Error

---

**zfcp.ea662c**  
*<bus ID of the zfcp device>: Access denied to port 0x<WWPN>*

**Explanation:** The Linux system is not allowed to access the remote port with the specified WWPN.

**User response:** Update the access control table of the FCP device to grant the Linux system access to the WWPN or remove the WWPN from the Linux system.

**Severity:** Warning

---

**zfcp.f16820**  
*<bus ID of the zfcp device>: The FCP adapter only supports newer control block versions*

**Explanation:** The protocol supported by the FCP adapter is not compatible with the zfcp device driver.

**User response:** Upgrade your Linux kernel to a level that includes a zfcp device driver with support for the control block version required by your FCP adapter.

**Severity:** Error
Accessibility

Accessibility features help users who have a disability, such as restricted mobility or limited vision, to use information technology products successfully.

Documentation accessibility
