About this publication

This message reference document contains the messages that are issued by IBM®
System z® specific Linux kernel modules on SUSE Linux Enterprise Server 12.

On SUSE Linux Enterprise Server 12, these messages are issued with message
numbers, which consist of a module identifier, a dot, and six hexadecimal digits. In
this message reference the messages are grouped by the issuing module and listed
in descending sort order.

Reasonable effort has been made to capture all kernel messages that are issued
with message numbers on SUSE Linux Enterprise Server 12. For message numbers
that are not included in this book see the kernel messages book at
www.ibm.com/developerworks/linux/linux390/documentation_dev.html

You can find the latest version of this publication on the developerWorks® website

Other relevant Linux on IBM System z publications

Several Linux on IBM System z publications for SUSE Linux Enterprise Server 12
are available on developerWorks.

You can find the latest versions of these publications on developerWorks at
or on IBM Knowledge Center at
ibm.com/support/knowledgecenter/linuxonibm/linz_r_suse.html

• Device Drivers, Features, and Commands on SUSE Linux Enterprise Server 12,
  SC34-2745
• Using the Dump Tools on SUSE Linux Enterprise Server 12, SC34-2746

For each of the following publications, you can find the version that most closely
reflects SUSE Linux Enterprise Server 12:
• How to use FC-attached SCSI devices with Linux on System z, SC33-8413
• libica Programmer’s Reference, SC34-2602
• Exploiting Enterprise PKCS #11 using openCryptoki, SC34-2713
• Secure Key Solution with the Common Cryptographic Architecture Application
  Programmer’s Guide, SC33-8294
• Linux on System z Troubleshooting, SC34-2612
• Linux Health Checker User’s Guide, SC34-2609
• How to Improve Performance with PAV, SC33-8414
• How to Set up a Terminal Server Environment on z/VM, SC34-2596
Chapter 1. Displaying a message man page

This document lists System z specific kernel messages with message identifiers. SUSE Linux Enterprise Server 12 provides an RPM with a man page for each of these messages.

Before you begin

Ensure that the RPM with the message man pages is installed on your Linux system. This RPM is called kernel-default-man-<kernel-version>s390x.rpm and shipped on DVD1.

Procedure

Enter a command of this form, to display a message man page:

```bash
# man <message_identifier>
```

Example

Enter the following command to display the man page for message xpram.ab9aa4:

```bash
# man xpram.ab9aa4
```

The corresponding man page looks like this:

```
xpram.ab9aa4(9) xpram.ab9aa4(9)
Message
  xpram.ab9aa4: %d is not a valid number of XPRAM devices
Severity
  Error
Parameters
  @1: number of partitions
Description
  The number of XPRAM partitions specified for the 'devs' module parameter or with the 'xpram.parts' kernel parameter must be an integer in the range 1 to 32. The XPRAM device driver created a maximum of 32 partitions that are probably not configured as intended.
User action
  If the XPRAM device driver has been compiled as a separate module, unload the module and load it again with a correct value for the 'devs' module parameter. If the XPRAM device driver has been compiled into the kernel, correct the 'xpram.parts' parameter in the kernel parameter line and restart Linux.
```

© Copyright IBM Corp. 2009, 2014
Chapter 2. Summary of prefixes

The messages in this book are grouped by the prefixes used by the modules that issue the message.

**aes_s390**

Messages with a prefix aes_s390 are issued by the kernel module that supports the System z hardware-accelerated implementation of the AES cipher algorithms (FIPS-197).

**af_iucv**

Messages with a prefix af_iucv are issued by the kernel module that supports the AF_IUCV address family for communication and addressing with z/VM® IUCV.

**ap**

Messages with a prefix ap are issued by the kernel module that supports special processors for cryptographic operations.

**appldata**

Messages with a prefix appldata are issued by the kernel modules that gather kernel performance data and statistics, and export this data to z/VM through APPLDATA monitor records.

**cio**

Messages with a prefix cio are issued by the kernel module that provides basic I/O functions for channel-attached devices.

**claw**

Messages with a prefix claw are issued by the Common Link Access to Workstation (CLAW) device driver.

**cpcmd**

Messages with a prefix cpcmd are issued by the cpcmd kernel function.

**cpu**

Messages with a prefix cpu are issued by the System z specific CPU management functions.

**cpum Cf**

Messages with a prefix cpum Cf are issued by kernel functions that support the z/Architecture® CPU-measurement counter facility.
ctcm

Messages with a prefix ctm are issued by the Channel-to-Channel (CTC) device driver. CTC connections are high-speed point-to-point connections between two operating system instances on System z.

dasd-eckd

Messages with a prefix dasd-eckd are issued by the DASD device driver module that handles DASDs with the Extended Count Key Data (ECKD) format.

dasd-fba

Messages with a prefix dasd-fba are issued by the DASD device driver module that handles DASDs with the Fixed Block Access (FBA) format.

dasd

Messages with a prefix dasd are issued by the DASD device driver.

dcssblk

Messages with a prefix dcssblk are issued by the z/VM discontiguous saved segments (DCSS) device driver. The DCSS device driver provides disk-like fixed block access to z/VM discontiguous saved segments.

extmem

Messages with a prefix extmem are issued by the kernel module that provides an interface to the z/VM DCSS management functions.

hvc_iucv

Messages with a prefix hvc_iucv are issued by the z/VM IUCV Hypervisor Console (HVC) device driver. This device driver supports terminal access through the iucvconn program to instances of Linux on z/VM.

hypfs

Messages with a prefix hypfs are issued by the S/390 hypervisor file system, which provides access to LPAR and z/VM hypervisor data.

iucv

Messages with a prefix iucv are issued by the Inter-User Communication Vehicle (IUCV) device driver. IUCV is a z/VM communication facility that enables a program running in one z/VM guest to communicate with another z/VM guest, or with a control program, or even with itself.

lcs

Messages with a prefix lcs are issued by the LAN channel station device driver. The LCS device driver supports non-QDIO communications through Open Systems Adapters (OSA).
monreader

Messages with a prefix monreader are issued by the z/VM *MONITOR record reader device driver. This device driver enables monitoring software on Linux to access z/VM *MONITOR records, which contain data about z/VM guest virtual machines.

monwriter

Messages with a prefix monwriter are issued by the monitor stream application device driver. Applications can use this device driver to write monitor data in the form of APPLDATA records to the z/VM monitor stream.

netiucv

Messages with a prefix netiucv are issued by the NETIUCV device driver. This network device driver uses IUCV to connect instances of Linux on z/VM, or to connect an instance of Linux on z/VM to another z/VM guest such as a TCP/IP service machine.

os_info

Messages with a prefix os_info are issued by Linux in kdump mode.

perf

Messages with a prefix perf are issued by kernel functions that support the z/Architecture CPU-measurement facility.

qeth

Messages with a prefix qeth are issued by the qeth device driver. The qeth device driver supports a multitude of network connections, for example, connections through Open Systems Adapters (OSA), HiperSockets™, guest LANs, and virtual switches.

s390dbf

Messages with a prefix s390dbf are issued by the S/390 debug feature.

sclp_cmd

Messages with a prefix sclp_cmd are issued in the context of SCLP commands.

sclp_config

Messages with a prefix sclp_config are issued by SCLP configuration management events.

scm_block

Messages with a prefix scm_block are issued by the storage-class memory (SCM) device driver.
setup

Messages with a prefix “setup” are issued when Linux starts.

tape

Messages with a prefix “tape” are issued by the channel-attached tape device driver.

tape_34xx

Messages with a prefix tape_34xx are issued by the channel-attached tape device driver and relate to an IBM 3480 or IBM 3490 magnetic tape subsystem.

tape_3590

Messages with a prefix tape_3590 are issued by the channel-attached tape device driver and relate to an IBM 3590 or IBM 3592 magnetic tape subsystem.

time

Messages with a prefix “time” are issued by the System z specific time functions.

vmlogrdr

Messages with a prefix vmlogrdr are issued by the z/VM recording device driver. With the z/VM recording device driver, an instance of Linux on z/VM can read from the z/VM CP recording services.

vmur

Messages with a prefix vmur are issued by the z/VM virtual unit record device driver. This device driver provides Linux with access to z/VM virtual unit record devices like punch card readers, card punches, and line printers.

vmwatchdog

Messages with a prefix vmwatchdog are issued by the watchdog device driver. With the watchdog device driver, a watchdog application on an instance of Linux on z/VM can access the z/VM watchdog timer.

xpram

Messages with a prefix xpram are issued by the XPRAM device driver. This block device driver enables Linux on System z to access expanded storage.

zdump

Messages with a prefix zdump are issued by the zfcpdump functions.

zfcp

Messages with a prefix zfcp are issued by the SCSI-over-Fibre Channel device driver (zfcp device driver) for the QDIO-based System z SCSI-over-Fibre Channel adapter. The zfcp device driver supports Fibre Channel-attached SCSI devices on Linux on System z.
zpci

Messages with a prefix zpci are issued by the kernel module that provides PCIe support.
Chapter 3. aes_s390

Messages with a prefix aes_s390 are issued by the kernel module that supports the System z hardware-accelerated implementation of the AES cipher algorithms (FIPS-197).

aes_s390.cb83bb  AES hardware acceleration is only available for 128-bit keys

Explanation: The advanced encryption standard (AES) algorithm includes three modes with 128-bit, 192-bit, and 256-bit keys. Your hardware system only provides hardware acceleration for the 128-bit key mode. The aes_s390 module will use the less performant software fallback algorithm for the 192-bit and 256-bit key modes.

User response: None.

Severity: Informational

aes_s390.dc0a3b  Allocating AES fallback algorithm <algorithm name> failed

Explanation: The advanced encryption standard (AES) algorithm includes three modes with 128-bit, 192-bit, and 256-bit keys. Your hardware system only provides hardware acceleration for the 128-bit mode. The aes_s390 module failed to allocate a software fallback for the AES modes that are not supported by the hardware. A possible reason for this problem is that the aes_generic module that provides the fallback algorithms is not available.

User response: Use the 128-bit mode only or ensure that the aes_generic module is available and loaded and reload the aes_s390 module.

Severity: Error

aes_s390.e37463  Allocating XTS fallback algorithm <algorithm name> failed

Explanation: The aes_s390 module failed to allocate a software fallback for the AES modes that are not supported by the hardware. A possible reason for this problem is that the aes_generic module that provides the fallback algorithms is not available.

User response: Ensure that the aes_generic module is available and loaded and reload the aes_s390 module.

Severity: Error
Chapter 4. af_iucv

Messages with a prefix af_iucv are issued by the kernel module that supports the AF_IUCV address family for communication and addressing with z/VM IUCV.

af_iucv.5c08c7  Application <application name> on z/VM guest <z/VM user ID> exceeds message limit

Explanation: Messages or packets destined for the application have accumulated and reached the maximum value. The default for the message limit is 65535. You can specify a different limit as the value for MSGLIMIT within the IUCV statement of the z/VM virtual machine on which the application runs.

User response: Ensure that you do not send data faster than the application retrieves them. Ensure that the message limit on the z/VM guest virtual machine on which the application runs is high enough.

Severity: Error
Chapter 5. ap

Messages with a prefix ap are issued by the kernel module that supports special processors for cryptographic operations.

**ap.3677f7** The hardware system does not support AP instructions

**Explanation:** The ap module addresses AP adapters through AP instructions. The hardware system on which the Linux instance runs does not support AP instructions. The ap module cannot detect any AP adapters.

**User response:** Load the ap module only if your Linux instance runs on hardware that supports AP instructions. If the ap module has been compiled into the kernel, ignore this message.

**Severity:** Warning

**ap.7564a4** `<AP domain index>` is not a valid cryptographic domain

**Explanation:** The cryptographic domain specified for the `domain=` module or kernel parameter must be an integer in the range 0 to 15.

**User response:** Reload the cryptographic device driver with a correct module parameter. If the device driver has been compiled into the kernel, correct the value in the kernel parameter line and reboot Linux.

**Severity:** Warning

**ap.fce52f** Registering adapter interrupts for AP `<AP device ID>` failed

**Explanation:** The hardware system supports AP adapter interrupts but failed to enable an adapter for interrupts. Possible causes for this error are: i) The AP adapter firmware does not support AP interrupts. ii) An AP adapter firmware update to a firmware level that supports AP adapter interrupts failed. iii) The AP adapter firmware has been successfully updated to a level that supports AP interrupts but the new firmware has not been activated.

**User response:** Ensure that the firmware on your AP adapters support AP interrupts and that any firmware updates have completed successfully. If necessary, deconfigure your cryptographic adapters and reconfigure them to ensure that any firmware updates become active, then reload the ap module. If the ap module has been compiled into the kernel, reboot Linux.

**Severity:** Error
Chapter 6. appldata

Messages with a prefix appldata are issued by the kernel modules that gather kernel performance data and statistics, and export this data to z/VM through APPLDATA monitor records.

**appldata.0ae163**  Stopping the data collection for
<appldata module> failed with rc=<return code>

**Explanation:** The specified data collection module used the z/VM diagnose call DIAG 0xDC to stop writing data. z/VM returned an error and the data collection continues.

**User response:** See the section about DIAGNOSE Code X'DC' in "z/VM CP Programming Services".

**Severity:** Error

**appldata.81e326**  Maximum OS record size <no of bytes> exceeds the maximum record size <no of bytes>

**Explanation:** The OS record size grows with the number of CPUs and is adjusted by the appldata_os module in response to CPU hotplug events. For more than 110 CPUs the record size would exceed the maximum record size of 4024 bytes that is supported by the z/VM hypervisor. To prevent the maximum supported record size from being exceeded while data collection is in progress, you cannot load the appldata_os module on Linux instances that are configured for a maximum of more than 110 CPUs.

**User response:** If you do not want to collect operating system data, you can ignore this message. If you want to collect operating system data, reconfigure your Linux instance to support less than 110 CPUs.

**Severity:** Error

**appldata.887845**  Stopping a faulty OS data collection failed with rc=<return code>

**Explanation:** After a CPU hotplug event, the record size for the running operating system data collection is no longer correct. The appldata_os module tried to stop the faulty data collection but received an error from the z/VM diagnose call DIAG 0xDC. Any data collected with the current record size might be faulty.

**User response:** Try to restart appldata_os monitoring. For information about stopping and starting data collections see "Device Drivers, Features, and Commands". For information about the return codes see the section about DIAGNOSE Code X'DC' in "z/VM CP Programming Services".

**Severity:** Error
Chapter 7. cio

Messages with a prefix cio are issued by the kernel module that provides basic I/O functions for channel-attached devices.

**cio.0e0832**  
<device number>: No interrupt was received within <timeout value>  
(CS=<channel status>, DS=<device status>,  
CHPID=<channel subsystem ID>, <CHPID>)

**Explanation:** Internal I/Os are used by the common I/O layer to ensure that devices are operational and accessible. The common I/O layer did not receive an interrupt for an internal I/O during the specified timeout period. As a result, the device might assume a state that makes the device unusable to Linux until the problem is resolved.

**User response:** Make sure that the device is working correctly and try the action again.

**Severity:** Warning

**cio.2b995e**  
<device bus-ID> is not a valid device for the cioignore kernel parameter

**Explanation:** The device specification for the cioignore kernel parameter is syntactically incorrect or specifies an unknown device. This device is not excluded from being sensed and analyzed.

**User response:** Correct your device specification in the kernel parameter line to have the device excluded when you next reboot Linux. You can write the correct device specification to /proc/cioignore to add the device to the list of devices to be excluded. This does not immediately make the device inaccessible but the device is ignored if it disappears and later reappears.

**Severity:** Warning

**cio.390dfc**  
<Device bus-ID>: The device stopped operating while being set offline

**Explanation:** While the device was set offline, it was not present or not operational. The device is now inactive, but setting it online again might fail.

**User response:** None.

**Severity:** Warning

**cio.582533**  
Logging for subchannel 0.<subchannel set ID>, <subchannel number> was triggered

**Explanation:** Model-dependent logs and traces may be captured for the specified subchannel.

**User response:** None.

**Severity:** Notice

**cio.5b32ec**  
0.<from subchannel set ID>,<from device number> to 0.<to subchannel set ID>,<to device number> is not a valid range for cioignore

**Explanation:** The device range specified for the cioignore kernel parameter is syntactically incorrect. No devices specified with this range are excluded from being sensed and analyzed.

**User response:** Correct your range specification in the kernel parameter line to have the range of devices excluded when you next reboot Linux. You can write the correct range specification to /proc/cioignore to add the range of devices to the list of devices to be excluded. This does not immediately make the devices
in the range inaccessible but any of these devices are ignored if they disappear and later reappear.

Severity: Warning

cio.7a35c2  Logging for subchannel 0.<subchannel set ID>,<subchannel number> failed with errno=<errno>

Explanation: Capturing model-dependent logs and traces could not be triggered for the specified subchannel.

User response: See the errno man page to find out what caused the problem.

Severity: Warning

cio.8665f1  The CSS device driver initialization failed with errno=<Return code>

Explanation: The channel subsystem bus could not be established.

User response: See the errno man page to find out what caused the problem.

Severity: Alert

cio.8e4d4c  <Device bus-ID>; Setting the device online failed because it is boxed

Explanation: Initialization of a device did not complete because it did not respond in time or it was reserved by another operating system.

User response: Make sure that the device is working correctly, then try again to set it online. For devices that support the reserve/release mechanism (for example DASDs), you can try to override the reservation of the other system by writing 'force' to the 'online' sysfs attribute of the affected device.

Severity: Warning

cio.96a34f  <Device bus-ID>; Setting the device online failed because it is not operational

Explanation: Initialization of a device did not complete because it is not present or not operational.

User response: Make sure that the device is present and working correctly, then try again to set it online.

Severity: Warning

cio.b5d5f6  Channel measurement facility initialized using format <format> (mode <mode>)

Explanation: The channel measurement facility has been initialized successfully. Format 'extended' should be used for z990 and later mainframe systems. Format 'basic' is intended for earlier mainframes. Mode 'autodetected' means that the format has been set automatically. Mode 'parameter' means that the format has been set according to the 'format=' kernel parameter.

User response: None.

Severity: Informational
Chapter 8. claw

Messages with a prefix claw are issued by the Common Link Access to Workstation (CLAW) device driver.

claw.182198  <bus ID of the CLAW device>: Setting the write subchannel online failed with error code <errno>

Explanation: Setting the Common Link Access to Workstation (CLAW) device online failed with an error for the write subchannel. This problem occurs, for example, if the write subchannel used to create the CLAW group device is not defined as a CLAW write subchannel in the hardware definitions. The CLAW write subchannel must be for a 3088 device of type x'61' and have an uneven bus ID. The bus ID of the write subchannel can be found from the symbolic link /sys/bus/ccwgroup/drivers/claw/<device-bus-ID>/cdev1 where <device-bus-ID> is the bus ID of the CLAW device.

User response: Confirm that you are using the correct bus ID for the write subchannel. If necessary, ungroup the device and recreate it with the correct bus ID. Assure that the write subchannel has been defined correctly to the real or virtual hardware, for example, in your IOCDS or in your z/VM configuration. Assure that a valid number of write buffers has been assigned to the device. See 'Device Drivers, Features, and Commands' for details about the read buffers. See the errno man page for information about the error code.

Severity: Warning

claw.24e119  <bus ID of the CLAW device>: The communication peer of <network interface name> disconnected

Explanation: The Common Link Access to Workstation (CLAW) device driver received a device status word DEV_STAT_UNIT_CHECK and sense code 0x41. This indicates that the remote network interface is no longer available.

User response: Ensure that the remote channel adapter is operational and activate the remote interface. For information about the sense code see /Documentation/s390/cds.txt in the Linux source tree. Search for 'SNS0' to locate the information.

Severity: Warning

claw.379c1e  <bus ID of the CLAW device>: Setting the read subchannel online failed with error code <errno>

Explanation: Setting the Common Link Access to Workstation (CLAW) device online failed with an error for the read subchannel. This problem occurs, for example, if the read subchannel used to create the CLAW group device is not defined as a CLAW read subchannel in the hardware definitions. The CLAW read subchannel must be for a 3088 device of type x'61' and have an even bus ID. The bus ID of the read subchannel matches the bus ID of the CLAW device.

User response: Confirm that you are using the correct bus ID for the read subchannel. If necessary, ungroup the device and recreate it with the correct bus ID. Assure that the read subchannel has been defined correctly to the real or virtual hardware, for example, in your IOCDS or in your z/VM configuration. Assure that a valid number of read buffers has been assigned to the device. See 'Device Drivers, Features, and Commands' for details about the read buffers. See the errno man page for information about the error code.

Severity: Warning

claw.37e392  <bus ID of the CLAW device>: The status of the remote channel adapter is not valid

Explanation: During an operation, the Common Link Access to Workstation (CLAW) device driver received errno EINVAL from the common I/O layer. This indicates that the remote channel adapter was offline or not operational.

User response: Check for related error messages to find the cause of the problem. If necessary, restart the remote channel adapter.

Severity: Error

claw.3f4182  <bus ID of the CLAW device>: The local read buffer is smaller than the remote write buffer

Explanation: You set the buffer size for the local Common Link Access to Workstation (CLAW) device implicitly by setting the connection type. For connection type 'packed' the buffer size is 32 KB, for the other connection types the buffer size is 4 KB. The connection cannot be established because the read buffer size of the local CLAW device does not match the write buffer size of the communication peer.

User response: Confirm that you are using the correct connection type for the local CLAW device. Ensure that the write buffer size of the remote CLAW device is set accordingly. Restart the CLAW device, local or remote, for which you have made corrections.

Severity: Warning
claw.4b316e  <bus ID of the CLAW device>: Allocating a buffer for incoming data failed

Explanation: A Common Link Access to Workstation (CLAW) data packet was received but the CLAW device driver could not allocate a receive buffer. A possible cause of this problem is memory constraints. The data packet is dropped but the connection remains operational.

User response: Ensure that sufficient memory is available. If this problem occurs frequently, restart the remote CLAW device. If this does not resolve the error, gather logs and traces from the remote CLAW device to obtain further diagnostic data.

Severity: Informational

claw.50a02b  <bus ID of the device>: The device is not a CLAW device

Explanation: The Common Link Access to Workstation (CLAW) device driver received a channel interrupt (IRQ) for a subchannel that is not a CLAW read or write subchannel. A CLAW subchannel must be configured for a 3088 device of type x'61' and have an even bus ID.

User response: Assure that the subchannels have been defined correctly to the real or virtual hardware, for example, in your IOCDS or in your z/VM configuration.

Severity: Warning

claw.5355ea  <bus ID of the device>: Deactivating <network interface name> completed with incorrect subchannel status (read <read subchannel status>, write <write subchannel status>)

Explanation: When the Common Link Access to Workstation (CLAW) device driver closes a CLAW device, the device driver frees all storage that is used for the device. A successful closing operation results in status DEVICE END and CHANNEL END for both the read and write subchannel. At least one of these statuses is missing for a subchannel. Data might have been lost and there might be problems when the network interface is activated again.

User response: If the network interface cannot be activated, vary the subchannels for the device offline and back online, for example, with chchp. If this does not resolve the problem, reset the remote channel adapter.

Severity: Warning

claw.55352b  <bus ID of the CLAW device>: The communication peer of <network interface name> uses an incorrect API version <CLAW API version>

Explanation: The Common Link Access to Workstation (CLAW) device driver received a SYSTEM_VALIDATE_REQUEST packet from the remote channel adapter. The packet included an unexpected version ID for the CLAW API. The version ID must be '2' for all packets.

User response: Ensure that the remote channel adapter is at the latest firmware level. Restart the remote channel adapter and activate the remote interface. If the problem persists, examine the subchannel trace for further diagnostic information.

Severity: Warning

claw.5bd403  <bus ID of the CLAW device>: Creating a CLAW group device failed with error code <errno>

Explanation: The Common Link Access to Workstation (CLAW) device driver failed to create a CLAW group device. A possible cause of this problem is memory constraints.

User response: Ensure that there is sufficient free memory. See the errno man page and look for related messages to find out what caused the problem. If you cannot resolve the problem, contact your support organization.

Severity: Warning

claw.68529a  <bus ID of the CLAW device>: The communication peer of <network interface name> rejected the connection

Explanation: The remote CLAW device rejected the connection because of a mismatch between the settings of the local CLAW device and the remote CLAW device.

User response: Check the settings of both the local and the remote CLAW device and ensure that the settings are consistent. Restart the CLAW device, local or remote for which you have made the correction.

Severity: Warning

claw.6e9677  <bus ID of the CLAW device>: An uninitialized CLAW device received an IRQ, c-<subchannel status> d-<device status>

Explanation: A Common Link Access to Workstation (CLAW) device was not initialized when it received a channel interrupt (IRQ). The IRQ is ignored. This might be a temporary condition while the device comes online or is taken offline.
User response: If this problem occurs frequently, use the status information from the message and the channel and device traces to analyze the problem. See "Principles of Operation" for details about the status information.

Severity: Warning

claw.6d0a8f <bus ID of the CLAW device>: Activating the CLAW device failed

Explanation: Activating the Common Link Access to Workstation (CLAW) device failed. A possible cause of this problem is memory constraints.

User response: Free some memory and try again to activate the CLAW device. If the problem persists, contact your support organization.

Severity: Warning

claw.7b434 <bus ID of the CLAW device>: The CLAW device for <network interface name> received an unexpected IRQ

Explanation: A Common Link Access to Workstation (CLAW) device received a channel interrupt (IRQ) while the CLAW device driver had assigned a status to the device in which it cannot process IRQs. The IRQ is ignored.

User response: Restart the remote channel adapter. If the problem persists, use s390dtrace traces and CCW traces to diagnose the problem.

Severity: Warning

claw.7e156 <bus ID of the CLAW device>: Validating <network interface name> failed because of a frame size conflict

Explanation: You set the frame size for the local Common Link Access to Workstation (CLAW) device implicitly by setting the connection type. For connection type 'packed' the frame size is 32 KB, for the other connection types the frame size is 4 KB. The connection cannot be activated because the the frame size of the local CLAW device does not match the frame size of the communication peer.

User response: Confirm that you are using the correct connection type for the local CLAW device. Ensure that the frame size of the remote CLAW device is set accordingly. Restart the CLAW device, local or remote, for which you have have made corrections.

Severity: Warning

claw.7466e6 <bus ID of the CLAW device>: The communication peer of <network interface name> failed

Explanation: The remote Common Link Access to Workstation (CLAW) device reported an error condition that cannot be recovered automatically.

User response: Restart the remote CLAW device. If this does not resolve the error, gather logs and traces from the remote CLAW device to obtain further diagnostic data.

Severity: Warning

claw.74be71 <bus ID of the CLAW device>: The remote channel adapter is not available

Explanation: During an operation, the Common Link Access to Workstation (CLAW) device driver received errno ENODEV from the common I/O layer. This means that the remote channel adapter was not operational or offline.

User response: Check the remote channel adapter and, if necessary, restart it.

Severity: Error

claw.76b4f5 <bus ID of the CLAW device>: The remote channel adapter for <network interface name> has been reset

Explanation: The Common Link Access to Workstation (CLAW) device driver received a device status word DEV_STAT_UNIT_CHECK and sense code 0x40. This indicates that the remote channel adapter has been reset.

User response: When the remote channel adapter is operational again, activate the remote interface. For information about the sense code see /Documentation/s390/cds.txt in the Linux source tree. Search for 'SNS0' to locate the information.

Severity: Warning

claw.7797f9 <bus ID of the CLAW device>: <network interface name> rejected a request to open multiple connections

Explanation: The Common Link Access to Workstation (CLAW) device rejected a request by its communication peer to open more than one connection. The CLAW device driver only supports a single connection for each CLAW device.

User response: Reconfigure the remote CLAW device to only use one connection. Restart the remote CLAW device.

Severity: Informational

claw.7c1758 Registering with the S/390 debug feature failed with error code <errno>

Explanation: The Common Link Access to Workstation (CLAW) device driver failed to register with the S/390 debug feature. No debug traces will be available for CLAW.
User response: Enter 'lsmod | grep dbf' or an equivalent command to check if the S/390 debug feature loaded. If the output does not show the dbf module, the S/390 debug feature has not been loaded, unload the CLAW device driver, load the debug feature, then reload the CLAW device driver. See the errno man page for information about the error code.

Severity: Error

**claw.7f27d6**  
*<bus ID of the CLAW device>*: The remote channel adapter for *<network interface name>* is faulty

Explanation: The Common Link Access to Workstation (CLAW) device driver received a device status word DEV_STAT_UNIT_CHECK and sense code 0x30. This indicates that the remote channel adapter is faulty.

User response: Check and restart the remote channel adapter and activate the remote interface. If the problem persists, perform device diagnosis for the remote channel adapter and examine the subchannel trace for further diagnostic information. For information about the sense code see /Documentation/s390/cds.txt in the Linux source tree. Search for 'SNS0' to locate the information.

Severity: Warning

**claw.81d266**  
*<bus ID of the CLAW device>*: The CLAW device received an unexpected IRQ, c-*<subchannel status>* d-*<device status>*

Explanation: A Common Link Access to Workstation (CLAW) device received a channel interrupt (IRQ) while it was in a state in which it cannot process IRQs. The IRQ is ignored. This might be a temporary condition.

User response: If this problem occurs frequently, use the status information from the message and the channel and device traces to analyze the problem. See ‘Principles of Operation’ for details about the status information.

Severity: Warning

**claw.887cf5**  
*<bus ID of the CLAW device>*: Validating *<network interface name>* failed because of a version conflict

Explanation: The Common Link Access to Workstation (CLAW) network interface cannot be activated because the remote CLAW device does not support CLAW version 2. The CLAW device driver requires CLAW version 2.

User response: Ensure that the remote channel adapter supports CLAW version 2 and that the remote CLAW device is configured for CLAW version 2.

Severity: Warning

**claw.89e5ba**  
*<bus ID of the CLAW device>*: Adapter name *<adapter name in the local CLAW device settings>* for *<network interface name>* does not match the remote host name *<host name in the remote CLAW device settings>*

Explanation: The adapter name in the local Common Link Access to Workstation (CLAW) device settings must match the host name in the CLAW device settings of the communication peer. The CLAW device driver discovered a mismatch between these settings. The connection cannot be established.

User response: Check the configuration of the CLAW device and of its communication peer. Correct the erroneous setting and restart the CLAW device, local or remote, for which you have made corrections.

Severity: Warning

**claw.9bd9c2**  
*<network interface name>* rejected a connection request because it is already active

Explanation: The Common Link Access to Workstation (CLAW) device rejected a connection request by its communication peer because the connection is already active. The CLAW device driver only supports a single connection for each CLAW device. This might be a runtime problem.

User response: None if there is an active connection. If no connection can be established, restart the remote channel adapter.

Severity: Informational

**claw.a84a95**  
*<bus ID of the CLAW device>*: The local write buffer is smaller than the remote read buffer

Explanation: You set the buffer size for the local Common Link Access to Workstation (CLAW) device implicitly by setting the connection type. For connection type ‘packed’ the buffer size is 32 KB, for the other connection types the buffer size is 4 KB. The connection cannot be established because the write
buffer size of the local CLAW device does not match the read buffer size of the communication peer.

**User response:** Confirm that you are using the correct connection type for the local CLAW device. Ensure that the read buffer size of the remote CLAW device is set accordingly. Restart the CLAW device, local or remote, for which you have made corrections.

**Severity:** Warning

---

claw.a94684  <bus ID of the CLAW device>: Validating <network interface name> failed because of a host or adapter name mismatch

**Explanation:** The Common Link Access to Workstation (CLAW) network interface cannot be activated because there is a mismatch between a host name and the corresponding adapter name. The local host name must match the remote adapter name and the local adapter name must match the remote host name.

**User response:** Correct the erroneous setting and restart the CLAW device, local or remote, for which you have made corrections.

**Severity:** Warning

---

claw.b322ac  <bus ID of the CLAW device>: The communication peer of <network interface name> sent a faulty frame of length <incorrect frame length value>

**Explanation:** The remote Common Link Access to Workstation (CLAW) device sent a frame with an incorrect value in the length field. This problem might result from data errors or incorrect packing. The connection remains operational.

**User response:** If this problem occurs frequently, restart the remote CLAW device. If this does not resolve the error, gather logs and traces from the remote CLAW device to obtain further diagnostic data.

**Severity:** Warning

---

claw.b40a6a  <bus ID of the CLAW device>: The communication peer of <network interface name> rejected a connection request because of a type mismatch

**Explanation:** The remote Common Link Access to Workstation (CLAW) device rejected a request to open a connection. A connection can only be opened if the same connection type has been set for both the local and the remote CLAW device.

**User response:** Ensure that the connection types for the local and remote CLAW device match. Restart the CLAW device, local or remote, for which you have changed the connection type.

**Severity:** Warning

---

claw.b85501  <bus ID of the CLAW device>: The communication peer of <network interface name> sent an unknown command code

**Explanation:** The remote Common Link Access to Workstation (CLAW) device sent a command code that is not defined. This might indicate that the remote CLAW device is malfunctioning. The connection remains operational.

**User response:** If this problem occurs frequently, restart the remote CLAW device. If this does not resolve the error, gather logs and traces from the remote CLAW device to obtain further diagnostic data.

**Severity:** Warning

---

claw.c06c67  <bus ID of the CLAW device>: A read data parity error occurred for <network interface name>

**Explanation:** The Common Link Access to Workstation (CLAW) device driver received a device status word DEV_STAT_UNIT_CHECK and sense code 0x10. This look for related warning messages.

**Severity:** Informational
indicates a read data parity error. The remote channel adapter might be faulty.

User response: Ensure that all cables are securely plugged. Check and restart the remote channel adapter and activate the remote interface. If the problem persists, perform device diagnosis for the remote channel adapter and examine the subchannel trace for further diagnostic information. For information about the sense code see /Documentation/s390/cds.txt in the Linux source tree. Search for 'SNS0' to locate the information.

Severity: Warning

Explaination: The host name in the local Common Link Access to Workstation (CLAW) device settings must match the adapter name in the CLAW device settings of the communication peer. The CLAW device driver discovered a mismatch between these settings. The connection cannot be established.

User response: Check the configuration of the CLAW device and of its communication peer. Correct the erroneous setting and restart the CLAW device, local or remote, for which you have made corrections.

Severity: Warning

Explaination: The Common Link Access to Workstation (CLAW) device rejected a request by its communication peer to open a connection. A connection can only be opened if the same connection type has been set for both the local and the remote CLAW device.

User response: Ensure that the connection types for the local and remote CLAW device match. Restart the CLAW device, local or remote, for which you have changed the connection type.

Severity: Informational

Explaination: The Common Link Access to Workstation (CLAW) device driver received a device status word DEV_STAT_UNIT_CHECK and sense code 0x20. This indicates a data parity error. The remote channel adapter or the channel might be faulty.

User response: Ensure that all cables are securely plugged. Restart the remote channel adapter and activate the remote interface. If the problem persists, examine the subchannel trace for further diagnostic information. For information about the sense code see /Documentation/s390/cds.txt in the Linux source tree. Search for 'SNS0' to locate the information.

Severity: Warning
Chapter 9. cpcmd

Messages with a prefix cpcmd are issued by the cpcmd kernel function.

cpcmd.5984fe  The cpcmd kernel function failed to allocate a response buffer

**Explanation:** IPL code, console detection, and device drivers like vmcp or vmlogdr use the cpcmd kernel function to send commands to the z/VM control program (CP). If a program that uses the cpcmd function does not allocate a contiguous response buffer below 2 GB guest real storage, cpcmd creates a bounce buffer to be used as the response buffer. Because of low memory or memory fragmentation, cpcmd could not create the bounce buffer.

**User response:** Look for related page allocation failure messages and at the stack trace to find out which program or operation failed. Free some memory and retry the failed operation. Consider allocating more memory to your z/VM guest virtual machine.

**Severity:** Warning
Chapter 10. cpu

Messages with a prefix cpu are issued by the System z specific CPU management functions.

**cpu.33a262**  \(<number of configured CPUs>\) configured CPUs, \(<number of standby CPUs>\) standby CPUs

**Explanation:** The kernel detected the given number of configured and standby CPUs.

**User response:** None.

**Severity:** Informational

**cpu.3748dd** The CPU configuration topology of the machine is:

**Explanation:** The first six values of the topology information represent fields Mag6 to Mag1 of system-information block (SYSIB) 15.1.2. These fields specify the maximum numbers of topology-list entries (TLE) at successive topology nesting levels. The last value represents the MNest value of SYSIB 15.1.2 which specifies the maximum possible nesting that can be configured through dynamic changes. For details see the SYSIB 15.1.2 information in the "Principles of Operation."

**User response:** None.

**Severity:** Informational

**cpu.e2917c** CPU \(<CPU number>\) exceeds the maximum \(<maximum CPU number>\) and is excluded from the dump

**Explanation:** The Linux kernel is used as a system dumper but it runs on more CPUs than it has been compiled for with the CONFIG_NR_CPUS kernel configuration option. The system dump will be created but information on one or more CPUs will be missing.

**User response:** Update the system dump kernel to a newer version that supports more CPUs or reduce the number of installed CPUs and reproduce the problem that should be analyzed. If you send the system dump that prompted this message to a support organization, be sure to communicate that the dump does not include all CPU information.

**Severity:** Warning
Chapter 11. cpum_cf

Messages with a prefix cpum_cf are issued by kernel functions that support the z/Architecture CPU-measurement counter facility.

———

**cpum_cf.094d6c**  Registering the cpum_cf PMU failed with rc=<error code>

**Explanation:** The device driver could not register the Performance Measurement Unit (PMU) for the CPU-measurement counter facility. A possible cause of this problem is memory constraints.

**User response:** If the error code is -12 (ENOMEM), consider assigning more memory to your Linux instance.

**Severity:** Error

**cpum_cf.1606b2**  Enabling the performance measuring unit failed with rc=<error condition>

**Explanation:** The device driver failed to enable CPU counter sets with the load counter controls (lcctl) instruction. See the section about lcctl in “The Load-Program-Parameter and the CPU-Measurement Facilities”, SA23-2260, for an explanation of the error conditions.

**User response:** Stop the performance measurement programs and try again.

**Severity:** Error

**cpum_cf.74a342**  Registering for CPU-measurement alerts failed with rc=<error code>

**Explanation:** The device driver could not register to receive CPU-measurement alerts. Alerts make you aware of measurement errors. A possible cause of this problem is memory constraints.

**User response:** If the error code is -12 (ENOMEM), consider assigning more memory to your Linux instance.

**Severity:** Error

**cpum_cf.a9d681**  CPU[cpu number]>] Counter data was lost

**Explanation:** CPU counter data was lost because of machine internal high-priority activities.

**User response:** None.

**Severity:** Error
Chapter 12. ctcm

Messages with a prefix ctcm are issued by the Channel-to-Channel (CTC) device driver. CTC connections are high-speed point-to-point connections between two operating system instances on System z.

ctcm.06c639 <bus ID of the CTCM device>: The adapter received a non-specific IRQ

Explanation: The adapter hardware used by the CTCM device received an IRQ that cannot be mapped to a particular device. This is a hardware problem.

User response: Check the status of the CTCM device, for example, with ifconfig. Check if the connection to the remote device still works. If the CTCM device is not operational, set it offline and back online. If this does not resolve the problem, perform a manual recovery. See "Device Drivers, Features, and Commands" for details about how to recover a CTCM device. If this problem persists, gather Linux debug data and report the problem to your support organization.

Severity: Warning

ctcm.0e17de <bus ID of the CTCM device>: An error occurred on the adapter hardware

Explanation: The CTCM device uses an adapter to physically connect to its communication peer. An operation on this adapter returned an error.

User response: Check the status of the CTCM device, for example, with ifconfig. If the device is not operational, perform a manual recovery. See "Device Drivers, Features, and Commands" for details about how to recover a CTCM device. If this problem persists, gather Linux debug data and report the problem to your support organization.

Severity: Error

ctcm.3c5812 <bus ID of the CTCM device>: Initialization failed with RX/TX init handshake error <error information>

Explanation: A problem occurred during the initialization of the connection. If the connection can be established after an automatic recovery, a success message is issued.

User response: If the problem is not resolved by the automatic recovery process, check the local and remote device. If this problem persists, gather Linux debug data and report the problem to your support organization.

Severity: Warning

ctcm.4b5292 <bus ID of the CTCM device>: A check occurred on the subchannel

Explanation: A check condition has been detected on the subchannel.

User response: Check if the connection to the remote device still works. If the CTCM device is not operational, set it offline and back online. If this does not resolve the problem, perform a manual recovery. See "Device Drivers, Features, and Commands" for details about how to recover a CTCM device. If this problem persists, gather Linux debug data and report the problem to your support organization.

Severity: Warning

ctcm.58aa19 <channel ID>: The remote operating system is not available

Explanation: The operating system instance with the communication peer has disconnected. Possible reasons are that the operating system instance has been rebooted or shut down.

User response: Ensure that the peer operating system instance is running and that the peer interface is operational.

Severity: Notice

ctcm.8079b5 <bus ID of the CTCM device>: An adapter hardware operation timed out

Explanation: The CTCM device uses an adapter to physically connect to its communication peer. An operation on this adapter timed out.

User response: Check the status of the CTCM device, for example, with ifconfig. If the device is not operational, perform a manual recovery. See "Device Drivers, Features, and Commands" for details about how to recover a CTCM device.

Severity: Error

ctcm.95ba79 <bus ID of the CTCM device>: An I/O-error occurred on the CTCM device

Explanation: An I/O error was detected on one of the subchannels of the CTCM device. Depending on the error, the CTCM device driver might attempt an automatic recovery.

User response: Check the status of the CTCM device, for example, with ifconfig. If the device is not operational, perform a manual recovery. See "Device Drivers, Features, and Commands" for details about how to recover a CTCM device.

Severity: Error
ctcm.ad45a0  •  ctcım.fde68a

**Severity:** Error

**Explanation:** A busy target device was reported. This might be a temporary problem.

**User response:** If this problem persists or is reported frequently ensure that the target device is working properly.

**Severity:** Informational

**Explanation:** A target device was called with a faulty device specification. This is an adapter hardware problem.

**User response:** Gather Linux debug data, collect the hardware logs, and contact IBM support.

**Severity:** Error

---

**ctcm.defd4f**  <bus ID of the CTCM device>: The XID used in the MPC protocol is not valid,

**Explanation:** The exchange identification (XID) used by the CTCM device driver when in MPC mode is not valid.

**User response:** Note the error information provided with this message and contact your support organization.

**Severity:** Warning
Chapter 13. dasd-eckd

Messages with a prefix dasd-eckd are issued by the DASD device driver module that handles DASDs with the Extended Count Key Data (ECKD) format.

```
dasd-eckd.00f842 <bus ID of the DASD>: An I/O control call used incorrect flags 0x<flags>
Explanation:  The DASD format I/O control was used incorrectly.
User response:  Contact the owner of the formatting tool.
Severity:  Warning
```

```
dasd-eckd.01a684 <bus ID of the DASD>: FORMAT 4 - No sync byte in key area
Explanation:  This is an operating system independent message that is issued by the storage system.
User response:  For more information see the documentation of your storage system.
Severity:  Warning
```

```
dasd-eckd.01f692 <bus ID of the DASD>: FORMAT 9 - Reserved
Explanation:  This is an operating system independent message that is issued by the storage system.
User response:  For more information see the documentation of your storage system.
Severity:  Warning
```

```
dasd-eckd.02c01a <bus ID of the DASD>: FORMAT 7 - No response to selection after a poll interruption
Explanation:  This is an operating system independent message that is issued by the storage system.
User response:  For more information see the documentation of your storage system.
Severity:  Warning
```

```
dasd-eckd.04ae78 <bus ID of the DASD>: FORMAT 7 - Missing end operation; device transfer incomplete
Explanation:  This is an operating system independent message that is issued by the storage system.
User response:  For more information see the documentation of your storage system.
Severity:  Warning
```

```
dasd-eckd.05b6e3 <bus ID of the DASD>: FORMAT 8 - End operation with transfer count zero
Explanation:  This is an operating system independent message that is issued by the storage system.
User response:  For more information see the documentation of your storage system.
Severity:  Warning
```

```
dasd-eckd.05c8ba <bus ID of the DASD>: FORMAT 6 - Overrun on channel F
Explanation:  This is an operating system independent message that is issued by the storage system.
User response:  For more information see the documentation of your storage system.
Severity:  Warning
```

```
dasd-eckd.06e412 <bus ID of the DASD>: FORMAT 0 - Status Not As Required: reason <reason code>
Explanation:  This is an operating system independent message that is issued by the storage system. There are several potential reasons for this message; byte 8 contains the reason code.
User response:  For more information see the documentation of your storage system.
Severity:  Warning
```

```
dasd-eckd.07541e <bus ID of the DASD>: FORMAT 0 - CCW Count less than required
Explanation:  The CCW count of a command is less than required. This is an operating system independent message that is issued by the storage system.
User response:  For more information see the documentation of your storage system.
Severity:  Warning
```

</tbody>
</table>
User response: None if the replacement was intentional. If the disk change is not expected, stop using the disk to prevent possible data loss.

Severity: Error

dasd-eckd.423705  <bus ID of the DASD>: FORMAT 0 - Channel Returned with Incorrect retry CCW

Explanation: A command portion of the CCW returned after a command retry sequence does not match the command for which retry was signaled. This is an operating system independent message that is issued by the storage system.

User response: For more information see the documentation of your storage system.

Severity: Warning

dasd-eckd.423d5b  <bus ID of the DASD>: FORMAT 7 - Missing end operation; device transfer complete

Explanation: This is an operating system independent message that is issued by the storage system.

User response: For more information see the documentation of your storage system.

Severity: Warning

dasd-eckd.42a207  <bus ID of the DASD>: The specified record was not found

Explanation: The record to be accessed does not exist. The DASD might be unformatted or defect.

User response: Try to format the DASD or replace it. ATTENTION: Formatting irreversibly destroys all data on the DASD.

Severity: Error

dasd-eckd.43830c  <bus ID of the DASD>: FORMAT F - Caching reinitiated

Explanation: Caching has been automatically reinitiated following an error. This is an operating system independent message that is issued by the storage system.

User response: For more information see the documentation of your storage system.

Severity: Warning

dasd-eckd.45f2d1  <bus ID of the DASD>: The disk layout of the DASD is not supported

Explanation: The DASD device driver only supports the following disk layouts: CDL, LDL, FBA, CMS, and CMS RESERVED.

User response: None.

Severity: Warning

dasd-eckd.46d841  <bus ID of the DASD>: FORMAT 5 - Data Check in the key area

Explanation: This is an operating system independent message that is issued by the storage system.

User response: For more information see the documentation of your storage system.

Severity: Warning

dasd-eckd.47fcac  <bus ID of the DASD>: ERP <pointer to ERP> (<ERP status>) refers to <cqr>

Explanation: This message provides debug information for the enhanced error recovery procedure (ERP).

User response: If you do not need this information, you can suppress this message by switching off ERP logging, for example, by writing '1' to the 'erplog' sysfs attribute of the DASD.

Severity: Error

dasd-eckd.481dec  <bus ID of the DASD>: FORMAT F - Cache fast write access not authorized

Explanation: A request for Cache Fast Write Data access cannot be satisfied because of missing access authorization for the storage system. This is an operating system independent message that is issued by the storage system.

User response: For more information see the documentation of your storage system.

Severity: Warning

dasd-eckd.487b65  <bus ID of the DASD>: SIM - SRC: <sense byte><sense byte><sense byte><sense byte>

Explanation: This error message is a System Information Message (SIM) generated by the storage system. The System Reference Code (SRC) defines the error in detail.
**User response:** Look up the SRC in the storage server documentation.

**Severity:** Error

**Explanation:** This is an operating system independent message that is issued by the storage system.

**User response:** For more information see the documentation of your storage system.

---

**User response:** For more information see the documentation of your storage system.

**Severity:** Warning

---

**User response:** For more information see the documentation of your storage system.

**Severity:** Warning

---

**User response:** If you do not need this information, you can suppress this message by switching off ERP logging, for example, by writing '1' to the 'erplog' sysfs attribute of the DASD.

**Severity:** Error

---

**User response:** For more information see the documentation of your storage system.

**Severity:** Warning

---
dasd-eckd.5efa1b <bus ID of the DASD>: FORMAT 4 - No sync byte in count address area

Explanation: This is an operating system independent message that is issued by the storage system.

User response: For more information see the documentation of your storage system.

Severity: Warning

dasd-eckd.637cf1 <bus ID of the DASD>: Reading device feature codes failed with rc=<return code>

Explanation: The device feature codes state which advanced features are supported by a device. Examples for advanced features are PAV or high performance FICON. Some early devices do not provide feature codes and no advanced features are available on these devices.

User response: None, if the DASD does not provide feature codes. If the DASD provides feature codes, make sure that it is working correctly, then set it offline and back online.

Severity: Warning

dasd-eckd.648dca <bus ID of the DASD>: FORMAT 6 - Overrun on channel D

Explanation: This is an operating system independent message that is issued by the storage system.

User response: For more information see the documentation of your storage system.

Severity: Warning

dasd-eckd.64917e <bus ID of the DASD>: Data recovered during retry with PCI fetch mode active

Explanation: A data error has been recovered on the storages system but the Linux file system cannot be informed about the data mismatch. To prevent Linux from running with incorrect data, the DASD device driver will trigger a kernel panic.

User response: Reset your real or virtual hardware and reboot Linux.

Severity: Emerg

dasd-eckd.65b8de <bus ID of the DASD>: FORMAT 7 - Reserved

Explanation: This is an operating system independent message that is issued by the storage system.

User response: For more information see the documentation of your storage system.

Severity: Warning

dasd-eckd.680aac <bus ID of the DASD>: Allocating memory for private DASD data failed

Explanation: The DASD device driver maintains data structures for each DASD it manages. There is not enough memory to allocate these data structures for one or more DASD.

User response: Free some memory and try the operation again.

Severity: Warning

dasd-eckd.6e3fde <bus ID of the DASD>: FORMAT 6 - Overrun on channel G

Explanation: This is an operating system independent message that is issued by the storage system.

User response: For more information see the documentation of your storage system.

Severity: Warning

dasd-eckd.6eae2d <bus ID of the DASD>: is offline or not installed - INTERVENTION REQUIRED!!

Explanation: The DASD to be accessed is not in an accessible state. The I/O operation will wait until the device is operational again. This is an operating system independent message that is issued by the storage system.

User response: Make the DASD accessible again. For details see the storage system documentation.

Severity: Error

dasd-eckd.7109ed <bus ID of the DASD>: FORMAT 1 - Interruption cannot be reset

Explanation: This is an operating system independent message that is issued by the storage system.

User response: For more information see the documentation of your storage system.

Severity: Warning

dasd-eckd.72eaa3 <bus ID of the DASD>: FORMAT 6 - Overrun on channel A

Explanation: This is an operating system independent message that is issued by the storage system.

User response: For more information see the documentation of your storage system.

Severity: Warning
**dasd-eckd.74be4d**  *dasd-eckd.840169*

---

dasd-eckd.74be4d  <bus ID of the DASD>: FORMAT 8
- DPS cannot be filled

**Explanation:** This is an operating system independent message that is issued by the storage system.

**User response:** For more information see the documentation of your storage system.

**Severity:** Warning

---

dasd-eckd.75ca81  <bus ID of the DASD>: FORMAT 0 - Device Error Source

**Explanation:** The device has completed soft error logging. This is an operating system independent message that is issued by the storage system.

**User response:** For more information see the documentation of your storage system.

**Severity:** Warning

---

dasd-eckd.792e2f  <bus ID of the DASD>: FORMAT 8 - End operation with transfer count not zero

**Explanation:** This is an operating system independent message that is issued by the storage system.

**User response:** For more information see the documentation of your storage system.

**Severity:** Warning

---

dasd-eckd.7b19bf  <bus ID of the DASD>: FORMAT 3 - Allegiance terminated

**Explanation:** Allegiance terminated because of a Reset Allegiance or an Unconditional Reserve command on another channel. This is an operating system independent message that is issued by the storage system.

**User response:** For more information see the documentation of your storage system.

**Severity:** Warning

---

dasd-eckd.7bb394  <bus ID of the DASD>: FORMAT 7 - Invalid DCC selection response or timeout

**Explanation:** This is an operating system independent message that is issued by the storage system.

**User response:** For more information see the documentation of your storage system.

**Severity:** Warning

---

dasd-eckd.7c1681  <bus ID of the DASD>: FORMAT 0 - Storage Path Restart

**Explanation:** An operation for an active channel program was queued in a Storage Control when a warm start was received by the path. This is an operating system independent message that is issued by the storage system.

**User response:** For more information see the documentation of your storage system.

**Severity:** Warning

---

dasd-eckd.7eabfd  <bus ID of the DASD>: FORMAT 0 - Diagnostic of Special Command Violates File Mask

**Explanation:** A command is not allowed under the Access Authorization specified by the File Mask. This is an operating system independent message that is issued by the storage system.

**User response:** For more information see the documentation of your storage system.

**Severity:** Warning

---

dasd-eckd.7f0765  <bus ID of the DASD>: Track 0 has no records following the VTOC

**Explanation:** Linux has identified a volume table of contents (VTOC) on the DASD but cannot read any data records following the VTOC. A possible cause of this problem is that the DASD has been used with another System z operating system.

**User response:** Format the DASD for usage with Linux, for example, with dasdfmt. ATTENTION: Formatting irreversibly destroys all data on the DASD.

**Severity:** Warning

---

dasd-eckd.81757d  <bus ID of the DASD>: FORMAT 1 - Device Status 1 not as expected

**Explanation:** This is an operating system independent message that is issued by the storage system.

**User response:** For more information see the documentation of your storage system.

**Severity:** Warning

---

dasd-eckd.840169  <bus ID of the DASD>: FORMAT 6 - Overrun on channel E

**Explanation:** This is an operating system independent message that is issued by the storage system.

**User response:** For more information see the documentation of your storage system.

**Severity:** Warning

---
dasd-eckd.869e5e <bus ID of the DASD>: FORMAT 6 - Overrun on channel H
Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

dasd-eckd.87ddea <bus ID of the DASD>: A channel path group could not be established
Explanation: Initialization of a DASD did not complete because a channel path group could not be established.
User response: Make sure that the DASD is working correctly, then try again to set it online. If initialization still fails, reboot.
Severity: Warning

dasd-eckd.894a4b <bus ID of the DASD>: FORMAT 7 - 3990 microcode time out when stopping selection
Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

dasd-eckd.8b4bdf <bus ID of the DASD>: FORMAT 2 - Microcode detected error <error code>
Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

dasd-eckd.910d5f <bus ID of the DASD>: FORMAT 0 - Data Pinned for Device
Explanation: Modified data in cache or in persistent storage exists for the DASD. The data cannot be destaged to the device. This track is the first track pinned for this device. This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

dasd-eckd.948ccf <bus ID of the DASD>: FORMAT 4 - Key area error
Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

dasd-eckd.96f088 <bus ID of the DASD>: FORMAT 7 - RCC 1 sequence not successful
Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

dasd-eckd.9957b7 <bus ID of the DASD>: FORMAT 1 - Head address does not compare
Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

dasd-eckd.9a48d5 <bus ID of the DASD>: FORMAT 4 - No syn byte in data area; offset active
Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

dasd-eckd.9bb776 <bus ID of the DASD>: FORMAT 4 - Data area error; offset active
Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

dasd-eckd.9e183a <bus ID of the DASD>: FORMAT 4 - Count area error
Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning
dasd-eckd.9f31f9: FORMAT 7 - RCC initiated by a connection check alert

Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

dasd-eckd.a0ce75: FORMAT 4 - No sync byte in key area; offset active

Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

dasd-eckd.a28dc6: The DASD cache mode was set to <operation mode> (<number of cylinders> cylinder prestage)

Explanation: The DASD cache mode has been changed. See the storage system documentation for information about the different cache operation modes.
User response: None.
Severity: Informational

dasd-eckd.a3c651: FORMAT 9 - Device check-2 error

Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

dasd-eckd.a4325c: FORMAT 0 - Reset Notification

Explanation: A system reset or its equivalent was received on an interface. The Unit Check that generates this sense is posted to the next channel initiated selection following the resetting event. This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

dasd-eckd.a56dba: The DASD cannot be formatted with block size <block size>

Explanation: The block size specified for a format instruction is not valid. The block size must be between 512 and 4096 byte and must be a power of 2.
User response: Call the format command with a supported block size.
Severity: Warning

dasd-eckd.a77e4f: FORMAT 1 - Track physical address did not compare

Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

dasd-eckd.a9cbd8: FORMAT 1 - Drive motor switch is off

Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

dasd-eckd.aac43a: FORMAT 0 - Device Fenced - device = <sense data byte 4>

Explanation: The device shown in sense byte 4 has been fenced. This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

dasd-eckd.ac6397: FORMAT 1 - Index missing

Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

dasd-eckd.acd228: FORMAT 7 - extra RCC required

Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning
documentation of your storage system.

**Severity:** Warning

---

**dasd-eckd.adb621** <bus ID of the DASD>: ERP failed for the DASD

**Explanation:** An error recovery procedure (ERP) was performed for the DASD but failed.

**User response:** Check the message log for previous related error messages.

**Severity:** Error

---

**dasd-eckd.b14557** <bus ID of the DASD>: FORMAT 4 - Data area error

**Explanation:** This is an operating system independent message that is issued by the storage system.

**User response:** For more information see the documentation of your storage system.

**Severity:** Warning

---

**dasd-eckd.b22b7e** <bus ID of the DASD>: An I/O request was rejected because writing is inhibited

**Explanation:** An I/O request was returned with an error indication of 'command reject' and 'write inhibited'. The most likely reason for this error is a failed write request to a device that was attached as read-only in z/VM.

**User response:** Set the device offline, ensure that the device is configured correctly in z/VM, then set the device online again.

**Severity:** Error

---

**dasd-eckd.b281ed** <bus ID of the DASD>: The DASD is not formatted

**Explanation:** A DASD has been set online but it has not been formatted yet. You must format the DASD before you can use it.

**User response:** Format the DASD, for example, with dasdfmt.

**Severity:** Warning

---

**dasd-eckd.b3193d** <bus ID of the DASD>: An error occurred in the DASD device driver, reason=<reason code>

**Explanation:** This problem indicates a program error in the DASD device driver.

**User response:** Note the reason code and contact your support organization.

**Severity:** Error

---

**dasd-eckd.b3f650** <bus ID of the DASD>: The newly added channel path <logical path mask> will not be used because it leads to a different device <UID>

**Explanation:** The newly added channel path has a different UID than the DASD device. This indicates an incorrect cabling. This path is not going to be used.

**User response:** Check the cabling of the DASD device. Disconnect and reconnect the cable.

**Severity:** Error

---

**dasd-eckd.b81b6c** <bus ID of the DASD>: The DASD cannot be reached on any path (lpum=<last path used mask>/opm=<online path mask>)

**Explanation:** After a path to the DASD failed, the error recovery procedure of the DASD device driver tried but failed to reconnect the DASD through an alternative path.

**User response:** Ensure that the cabling between the storage server and the mainframe system is securely in place. Check the file systems on the DASD when it is accessible again.

**Severity:** Error

---

**dasd-eckd.b98207** <bus ID of the DASD>: FORMAT 7 - Invalid tag-in for an extended command sequence

**Explanation:** This is an operating system independent message that is issued by the storage system.

**User response:** For more information see the documentation of your storage system.

**Severity:** Warning

---

**dasd-eckd.bbe891** <bus ID of the DASD>: FORMAT F - Subsystem status cannot be determined

**Explanation:** The status of a DASD Fast Write or PPRC volume cannot be determined. This is an operating system independent message that is issued by the storage system.

**User response:** For more information see the documentation of your storage system.

**Severity:** Warning
documentation of your storage system.

**Severity:** Warning

---

**dasd-eckd.be85b8**  
*bus ID of the DASD*: FORMAT F  
- Cache or nonvolatile storage  
  equipment failure

**Explanation:** An equipment failure has occurred in the cache storage or nonvolatile storage of the storage system. This is an operating system independent message that is issued by the storage system.

**User response:** For more information see the documentation of your storage system.

**Severity:** Warning

---

**dasd-eckd.bfc2cb**  
*bus ID of the DASD*: FORMAT F  
- Nonvolatile storage terminated

**Explanation:** The storage director has stopped using nonvolatile storage or cannot initiate nonvolatile storage. If this problem is caused by a failure, an additional message will provide more information about the failure. This is an operating system independent message that is issued by the storage system.

**User response:** Check for additional messages that point out possible failures. For more information see the documentation of your storage system.

**Severity:** Warning

---

**dasd-eckd.c28ccc**  
*bus ID of the DASD*: FORMAT 0  
- DPS Installation Check

**Explanation:** This operating system independent message is issued by the storage system for one of the following reasons: - A 3380 Model D or E DASD does not have the Dynamic Path Selection (DPS) feature in the DASD A-unit. - The device type of an attached DASD is not supported by the firmware. - A type 3390 DASD is attached to a 3 MB channel.

**User response:** For more information see the documentation of your storage system.

**Severity:** Warning

---

**dasd-eckd.c55c2f**  
*bus ID of the DASD*: Unable to  
allocate DCTL-CQR

**Explanation:** This is an internal error.

**User response:** Contact your support organization.

**Severity:** Error

---

**dasd-eckd.c67479**  
*bus ID of the DASD*: FORMAT 1  
- Seek incomplete

**Explanation:** This is an operating system independent message that is issued by the storage system.

**User response:** For more information see the documentation of your storage system.

**Severity:** Warning

---

**dasd-eckd.ca8dfc**  
*bus ID of the DASD*: FORMAT 7  
- Permanent path error (DASD controller  
not available)

**Explanation:** This is an operating system independent message that is issued by the storage system.

**User response:** For more information see the documentation of your storage system.

**Severity:** Warning
dasd-eckd.cf8d3d  <bus ID of the DASD>: FORMAT 5 - Data Check in the count area
Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

dasd-eckd.d1a88a  <bus ID of the DASD>: Detecting the DASD disk layout failed because of an I/O error
Explanation: The disk layout of the DASD could not be detected because of an unexpected I/O error. The DASD device driver treats the device like an unformatted DASD, and partitions on the device are not accessible.
User response: If the DASD is formatted, make sure that the DASD is working correctly, then set it offline and back online. If the DASD is unformatted, format the DASD, for example, with dasdfmt. ATTENTION: Formatting irreversibly destroys all data on the DASD.
Severity: Error

dasd-eckd.d2af02  <bus ID of the DASD>: FORMAT 0 - Channel requested ...<reason code>
Explanation: This is an operating system independent message that is issued by the storage system. The possible reason codes indicate the following problems:
00 No Message. 01 The channel has requested unit check sense data. 02 The channel has requested retry and retry is exhausted. 03 A SA Check-2 error has occurred. This sense is presented with Equipment Check. 04 The channel has requested retry and retry is not possible.
User response: For more information see the documentation of your storage system.
Severity: Warning

dasd-eckd.d2bf98  <bus ID of the DASD>: ERP pointer> has run out of retries and failed
Explanation: The error recovery procedure (ERP) tried to recover an error but the number of retries for the I/O was exceeded before the error could be resolved.
User response: Check for related previous error messages.
Severity: Error

dasd-eckd.d4a740  <bus ID of the DASD>: Write inhibited path encountered
Explanation: This is an informational message.
User response: None.
Severity: Informational

dasd-eckd.d4d6d2  <bus ID of the DASD>: FORMAT F - DASD Fast Write inhibited
Explanation: DASD Fast Write is not allowed because of a nonvolatile storage battery check condition. This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

dasd-eckd.d608df  <bus ID of the DASD>: Start track number <track number> used in formatting is too big
Explanation: The DASD format I/O control was used incorrectly by a formatting tool.
User response: Contact the owner of the formatting tool.
Severity: Warning

dasd-eckd.d66c5d  <bus ID of the DASD>: FORMAT 4 - No sync byte in home address area; offset active
Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

dasd-eckd.d74b52  <bus ID of the DASD>: FORMAT F - Track format incorrect
Explanation: A track format error occurred while data was being written to the DASD or while a duplex pair was being established. This is an operating system

---

Chapter 13. dasd-eckd  45
dasd-eckd.d7a598 • dasd-eckd.ec6f52

independent message that is issued by the storage system.

User response: For more information see the documentation of your storage system.
Severity: Warning

---
dasd-eckd.d7a598 <bus ID of the DASD>: FORMAT 5 - Data Check in the home address area

Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

---
dasd-eckd.d82ca0 <bus ID of the DASD>: FORMAT 2 - Support facility errors

Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

---
dasd-eckd.dc4849 <bus ID of the DASD>: The maximum data size for zHPF requests <size in bytes> on a new path <path mask> is below the active maximum <size in bytes>

Explanation: High Performance FICON (zHPF) requests are limited to a hardware-dependent maximum data size. The maximum of the new path is below the previously established common maximum for the existing paths for this device. This could cause requests on the new path to fail. The new path will not be used for I/O.
User response: Set the device offline and online again to establish a new common maximum data size for the device.
Severity: Warning

---
dasd-eckd.ec6f52 <bus ID of the DASD>: FORMAT 0 - Invalid Parameter

Explanation: A data argument of a command is not valid. This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

---
dasd-eckd.e0558d <bus ID of the DASD>: FORMAT 9 - Cylinder address did not compare

Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

---
dasd-eckd.e0679b <bus ID of the DASD>: FORMAT 8 - Short busy time-out during device selection

Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

---
dasd-eckd.e181a1 <bus ID of the DASD>: FORMAT 4 - Home address area error

Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

---
dasd-eckd.e698e6 <bus ID of the DASD>: FORMAT 8 - Error correction code hardware fault

Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

---
dasd-eckd.e951ba <bus ID of the DASD>: FORMAT 4 - Count area error; offset active

Explanation: This is an operating system independent message that is issued by the storage system.
User response: For more information see the documentation of your storage system.
Severity: Warning

---
dasd-eckd.ec6f52 <bus ID of the DASD>: Stop track number <track number> used in formatting is too big

Explanation: The DASD format I/O control was used incorrectly by a formatting tool.
User response: Contact the owner of the formatting tool.
Severity: Warning
Severity: Warning

dasd-eckd.ed1a53 <bus ID of the DASD>: FORMAT 5 -
Data Check in the home address area; offset active

Explanation: This is an operating system independent message that is issued by the storage system.

User response: For more information see the documentation of your storage system.

Severity: Warning

---

dasd-eckd.f02333 <bus ID of the DASD>: The cylinder data for accessing the DASD is inconsistent

Explanation: An error occurred in the storage system hardware.

User response: For more information see the documentation of your storage system.

Severity: Error

---

dasd-eckd.f0ba2c <bus ID of the DASD>: FORMAT 4 -
Home address area error; offset active

Explanation: This is an operating system independent message that is issued by the storage system.

User response: For more information see the documentation of your storage system.

Severity: Warning

---

dasd-eckd.f4346b <bus ID of the DASD>: The device reservation was lost

Explanation: This Linux instance has lost its reservation of the device to another operating system instance. Depending on the reservation policy for the device, I/O might be blocked until the other operating system instance surrenders the reservation or all I/O requests might fail until the device is reset.

User response: None, if this situation is handled by system automation software. If this situation is not handled by automation, check the last_known_reservation_state attribute of the device in sysfs. If the value is 'lost', verify that the device is no longer reserved by another operating system instance, then set the device offline and online again. For any other value of the last_known_reservation_state no action is required. I/O will resume when the device reservation is surrendered by the other operating system instance.

Severity: Error

---

dasd-eckd.f453eb <bus ID of the DASD>: FORMAT 1 -
Device did not respond to selection

Explanation: This is an operating system independent message that is issued by the storage system.

User response: For more information see the documentation of your storage system.

Severity: Warning

---

dasd-eckd.f4cb9 <bus ID of the alias>: An Alias device was reassigned to a new base device with UID: <UID of new base device>

Explanation: The alias device with the indicated bus ID has been reassigned. The UID of the new base device is shown in the message.

User response: None.

Severity: Warning

---

dasd-eckd.f546ed <bus ID of the DASD>: Detecting the maximum data size for zHPF requests failed (rc=<return code>) for a new path <path mask>

Explanation: High Performance FICON (zHPF) requests are limited to a hardware-dependent maximum data size. A command to detect this size for a new path returned an error. The new path will not be used for I/O.

User response: Set the new path offline and online again to repeat the path verification. Alternatively, set the device offline and online again to verify all available paths for this device. If this problem persists, gather Linux debug data and report the problem to your support organization.

Severity: Warning
**dasd-eckd.f58554 • dasd-eckd.ffd164**

**dasd-eckd.f6f541** <bus ID of the DASD>: FORMAT F -
Caching status reset to default

Explanation: The storage director has assigned two new subsystem status devices and resets the status to its default value. This is an operating system independent message that is issued by the storage system.

User response: For more information see the documentation of your storage system.

Severity: Warning

**dasd-eckd.f716c1** <bus ID of the DASD>: The storage server does not support raw-track access

Explanation: The DASD cannot be accessed in raw-track access mode because the storage server does not have all required features for this access mode. In raw-track access mode, the DASD device driver accesses complete ECKD tracks. By default, the DASD device driver accesses only the data fields of ECKD devices and omits the count and key data fields.

User response: Ensure that the raw_track_access sysfs attribute of the DASD has the value 0 to access the device in default ECKD mode.

Severity: Error

**dasd-eckd.f99a70** <bus ID of the DASD>: FORMAT F -
Operation Terminated

Explanation: The storage system ends an operation related to an active channel program when termination and redrive are required and logging is not desired. This is an operating system independent message that is issued by the storage system.

User response: For more information see the documentation of your storage system.

Severity: Error
Chapter 14. dasd-fba

Messages with a prefix dasd-fba are issued by the DASD device driver module that handles DASDs with the Fixed Block Access (FBA) format.

dasd-fba.680aac  <bus ID of the DASD>: Allocating memory for private DASD data failed

Explanation: The DASD device driver maintains data structures for each DASD it manages. There is not enough memory to allocate these data structures for one or more DASD.

User response: Free some memory and try the operation again.

Severity: Warning

dasd-fba.f36f2f  <bus ID of the DASD>: New FBA DASD <device type>/<device model> (<control unit type>/<control unit model>) with <size> MB and <bytes per block> B/blk<access mode>

Explanation: A DASD with the shown characteristics has been set online. If the DASD is configured as read-only to the real or virtual hardware, the message includes an indication of this hardware access mode. The hardware access mode is independent from the ‘readonly’ attribute of the device in sysfs.

User response: None.

Severity: Informational
Chapter 15. dasd

Messages with a prefix dasd are issued by the DASD device driver.

dasd.042e  Registering the device driver with major number &lt;DASD major&gt; failed

Explanation: Major number 94 is reserved for the DASD device driver. The DASD device driver failed to register with this major number. Another device driver might have used major number 94.

User response: Determine which device driver uses major number 94 instead of the DASD device driver and unload this device driver. Then try again to load the DASD device driver.

Severity: Warning

dasd.0ae5e4  Discipline &lt;discipline name&gt; cannot be used without z/VM

Explanation: The discipline that is specified with the dasd= kernel or module parameter is only available for Linux instances that run as guest operating systems of the z/VM hypervisor.

User response: Remove the unsupported discipline from the parameter string.

Severity: Informational

dasd.121d0  &lt;value&gt; is not a supported value for /proc/dasd/statistics

Explanation: An incorrect value has been written to /proc/dasd/statistics. The supported values are: 'set on', 'set off', and 'reset'.

User response: Write a supported value to /proc/dasd/statistics.

Severity: Warning

dasd.1ac0f4  &lt;bus ID of the DASD&gt;: Flushing the DASD request queue failed for request &lt:pointer to request&gt;

Explanation: As part of the unloading process, the DASD device driver flushes the request queue. This failed because a previously started I/O operation could not be canceled.

User response: Try again to unload the DASD device driver or to shut down Linux.

Severity: Error

dasd.1c9171  &lt;bus ID of the DASD&gt;: DIAG initialization failed with rc=&lt:return code&gt;

Explanation: Initializing the DASD with the DIAG discipline failed. Possible reasons for this problem are that the device has a device type other than FBA or ECKD, or has a block size other than one of the supported sizes: 512 byte, 1024 byte, 2048 byte, or 4096 byte.

User response: Ensure that the device can be written to and has a supported device type and block size. For details about the return code see the section about the INITIALIZE function for DIAGNOSE Code X'250' in "z/VM CP Programming Services". If you cannot resolve the error, note the error code and contact your support organization.

Severity: Warning

dasd.1e2d81  'nopav' is not supported on z/VM

Explanation: For Linux instances that run as guest operating systems of the z/VM hypervisor Parallel Access Volume (PAV) support is controlled by z/VM not by Linux.

User response: Remove 'nopav' from the dasd= module or kernel parameter specification.

Severity: Informational

dasd.25f2  &lt;bus ID of the DASD&gt;: Accessing the DASD failed because it is in probeonly mode

Explanation: The dasd= module or kernel parameter specified the probeonly attribute for the DASD you are trying to access. The DASD device driver cannot access DASDs that are in probeonly mode.
User response: Change the dasd= parameter as to omit probeonly for the DASD and reload the DASD device driver. If the DASD device driver has been compiled into the kernel, reboot Linux.

Severity: Informational

User response: Note the return code, check for related I/O errors, and report this problem to your support organization.

Severity: Warning

User response: None.

Severity: Informational

User response: Look for previous error messages. If you cannot resolve the error, note the return code and contact your support organization.

Severity: Warning

User response: Ensure that each channel path to the device has been set up correctly and that the related physical cable connections are in place. If the 'failfast' attribute of the DASD is set to 1, verify that this setting
is intentional and change it to 0 if required.

**Severity:** Error

---

**dasd.696eb5** *option* is not a supported device option

**Explanation:** The dasd= parameter includes an unknown option for a DASD or a device range. Options are specified in parenthesis and immediately follow a device or device range.

**User response:** Check the dasd= syntax and remove any unsupported options from the dasd= parameter specification.

**Severity:** Warning

---

**dasd.75373e** *bus ID of the DASD*: Cancelling request *pointer to request* failed with rc=*return code of previous function*

**Explanation:** In response to a user action, the DASD device driver tried but failed to cancel a previously started I/O operation.

**User response:** Try the action again.

**Severity:** Error

---

**dasd.781738** High Performance FICON support has been deactivated

**Explanation:** The ‘nofcx’ keyword has been specified with the dasd= kernel or module parameter. The High Performance FICON (transport mode) support of the DASD device driver has been deactivated.

**User response:** None.

**Severity:** Informational

---

**dasd.7854e0** *bus ID of the DASD*: The DASD cannot be set offline while it is in use

**Explanation:** The DASD cannot be set offline because it is in use by an internal process. An action to free the DASD might not have completed yet.

**User response:** Wait some time and set the DASD offline later.

**Severity:** Warning

---

**dasd.78e1df** A closing parenthesis ')' is missing in the dasd= parameter

**Explanation:** The specification for the dasd= kernel or module parameter has an opening parenthesis '(' without a matching closing parenthesis ')'.

**User response:** Correct the parameter value.

**Severity:** Warning

---

**dasd.939f75** The statistics have been reset

**Explanation:** The DASD statistics data have been reset.

**User response:** None.

**Severity:** Informational

---

**dasd.966201** The statistics feature has been switched on

**Explanation:** The statistics feature of the DASD device driver has been switched on.

**User response:** None.

**Severity:** Informational

---

**dasd.a2cf19** *bus ID of the DASD*: Unable to terminate request *pointer to request* on suspend

**Explanation:** As part of the suspend process, the DASD device driver terminates requests on the request queue. This failed because a previously started I/O operation could not be canceled. The suspend process will be stopped.

**User response:** Try again to suspend the system.

**Severity:** Error

---

**dasd.a35e01** *bus ID of the DASD*: Setting the DASD online failed because of a missing discipline

**Explanation:** The DASD was to be set online with a DASD device driver discipline that is not available.

**User response:** Ensure that all DASD modules are loaded correctly.

**Severity:** Warning

---

Chapter 15. dasd 53
**dasd.a3baba • dasd.c1bf11**

<td>A channel queued request (cqr) failed because it timed out. One possible reason for this error is that a request did not complete within the timeout interval specified for the DASD. The timeout interval is set as the value of the 'timeout' sysfs attribute of a DASD. A value of 0 disables the timeout function. The timeout function can be used; for example, by mirroring setups; to quickly process a request queue for a DASD that has become unavailable.</td>
<td></td>
<td>Error</td>
</tr>
</tbody>
</table>

**Kernel Messages - SUSE Linux Enterprise Server 12**
dasd.c533c6  <bus ID of the DASD>: No operational channel path is left for the device

Explanation: All channel paths to the device have become non-operational. The DASD device driver suspends I/O operations and queues I/O requests for this device until at least one channel path becomes operational again.

User response: Ensure that each channel path to the device has been set up correctly and that the related physical cable connections are in place.

Severity: Warning

---

dasd.eac657  <bus ID of the DASD>: A 64-bit DIAG call failed

Explanation: 64-bit DIAG calls require a 64-bit z/VM version.

User response: Use z/VM 5.2 or later or set the sysfs `use_diag' attribute of the DASD to 0 to switch off DIAG.

Severity: Warning

---

dasd.e8d084  <bus ID of the DASD>: Accessing the DASD failed because of an incorrect format (rc=<return code>)

Explanation: The format of the DASD is not correct.

User response: Check the device format. For details about the return code see the section about the INITIALIZE function for DIAGNOSE Code X'250' in "z/VM CP Programming Services". If you cannot resolve the error, note the return code and contact your support organization.

Severity: Warning

---

dasd.de3a76  The DASD device driver could not be initialized

Explanation: The initialization of the DASD device driver failed because of previous errors.

User response: Check for related previous error messages.

Severity: Informational

---

dasd.df34c6  The IPL device is not a CCW device

Explanation: The value for the dasd= parameter contains the 'ipldev' keyword. During the boot process this keyword is replaced with the device from which the IPL was performed. The 'ipldev' keyword is not valid if the IPL device is not a CCW device.

User response: Do not specify the 'ipldev' keyword when performing an IPL from a device other than a CCW device.

Severity: Error

---

dasd.d303ec  <bus ID of the DASD>: The access mode of a DIAG device changed to read-only

Explanation: A device changed its access mode from writeable to read-only while in use.

User response: Set the device offline, ensure that the device is configured correctly in z/VM, then set the device online again.

Severity: Warning

---

dasd.da6176  <bus ID of the DASD>: cqr <request> timed out (<timeout value>) but cannot be ended, retrying in 5 s

Explanation: A try of the error recovery procedure (ERP) for the channel queued request (cqr) timed out and failed to recover the error. The I/O request submitted during the try could not be canceled. The ERP waits for 5 seconds before trying again.

User response: Ignore this message if it occurs infrequently and if the recovery succeeds during one of the retries. If this error persists, check for related previous error messages and report the problem to your support organization. The timeout can be changed by writing a new value to the sysfs 'expires' attribute of the DASD. The value specifies the timeout in seconds.

Severity: Error

---

dasd.d8d048  The DASD device driver could not be initialized

Explanation: The initialization of the DASD device driver failed because of previous errors.

User response: Check for related previous error messages.

Severity: Informational

---

dasd.c81491  <bus ID of the DASD>: Device type <device type> is not supported in DIAG mode

Explanation: Only DASD of type FBA and ECKD are supported in DIAG mode.

User response: Set the sysfs 'use_diag' attribute of the DASD to 0 and try again to access the DASD.

Severity: Warning

---

dasd.d0c64e  <bus ID of the DASD>: 64-bit DIAG call failed

Explanation: 64-bit DIAG calls require a 64-bit z/VM version.

User response: Use z/VM 5.2 or later or set the sysfs 'use_diag' attribute of the DASD to 0 to switch off DIAG.

Severity: Warning

---

dasd.d303ec  <bus ID of the DASD>: The access mode of a DIAG device changed to read-only

Explanation: A device changed its access mode from writeable to read-only while in use.

User response: Set the device offline, ensure that the device is configured correctly in z/VM, then set the device online again.

Severity: Warning

---

dasd.dac657  <bus ID of the DASD>: New DASD with <bytes per block> byte/block, total size <size> KB<access mode>

Explanation: A DASD with the indicated block size and total size has been set online. If the DASD is configured as read-only to the real or virtual hardware, the message includes an indication of this hardware access mode. The hardware access mode is independent from the 'readonly' attribute of the device in sysfs.

User response: None.

Severity: Informational
dasd.f97899 • dasd.ff4c45

dasd.f97899  <bus ID of the DASD>: Setting the DASD online failed with rc=<return code>

Explanation: The DASD could not be set online because of previous errors.

User response: Look for previous error messages. If you cannot resolve the error, note the return code and contact your support organization.

Severity: Warning

dasd.ff4c45  <range> is not a valid device range

Explanation: A device range specified with the dasd= parameter is not valid.

User response: Examine the dasd= parameter and correct the device range.

Severity: Error
Chapter 16. dcssblk

Messages with a prefix dcssblk are issued by the z/VM discontiguous saved segments (DCSS) device driver. The DCSS device driver provides disk-like fixed block access to z/VM discontiguous saved segments.

**dcssblk.0a9a59** The address range of DCSS <device name> changed while the system was suspended

**Explanation:** After resuming the system, the start address or end address of a DCSS does not match the address when the system was suspended. DCSSs must not be changed after the system was suspended. This error cannot be recovered. The system is stopped with a kernel panic.

**User response:** Reboot Linux.

**Severity:** Error

**dcssblk.14ff71** Device <device name> cannot be removed because it is not a known device

**Explanation:** The DCSS device you are trying to remove is not known to the DCSS device driver.

**User response:** List the entries under /sys/devices/dcssblk/ to see the names of the existing DCSS devices.

**Severity:** Warning

**dcssblk.1e441c** Suspending the system failed because DCSS device <device name> is writable

**Explanation:** A system cannot be suspended if one or more DCSSs are accessed in exclusive-writable mode. DCSS segment types EW, SW, and EN are always writable and must be removed before a system is suspended.

**User response:** Remove all DCSSs of segment types EW, SW, and EN by writing the DCSS name to the sysfs 'remove' attribute. Set the access mode for all DCSSs of segment types SR and ER to read-only by writing 1 to the sysfs 'shared' attribute of the DCSS. Then try again to suspend the system.

**Severity:** Error

**dcssblk.247a44** Device <device name> cannot be removed while it is in use

**Explanation:** You are trying to remove a device that is in use.

**User response:** Make sure that all users of the device close the device before you try to remove it.

**Severity:** Warning

**dcssblk.257c8b** Device <device name> is in use, its DCSSs will be saved when it becomes idle

**Explanation:** A save request for the device has been deferred until the device becomes idle. Then changes to all DCSSs that the device maps to will be saved permanently.

**User response:** None.

**Severity:** Informational

**dcssblk.3c90ef** Writing to <device name> failed because it is a read-only device

**Explanation:** The DCSS device is in shared access mode and cannot be written to. Depending on the type of the DCSSs that the device maps to, you might be able to change the access mode to exclusive-writable.

**User response:** If the DCSSs of the device are of type SC, do not attempt to write to the device. If the DCSSs of the device are of type ER or SR, change the access mode to exclusive-writable before writing to the device.

**Severity:** Warning

**dcssblk.3d858e** DCSS <device name> is of type SC and cannot be loaded as exclusive-writable

**Explanation:** You cannot load a DCSS device in exclusive-writable access mode if the DCSS device maps to one or more DCSSs of type SC.

**User response:** Load the DCSS in shared access mode.

**Severity:** Error

**dcssblk.50ebd0** Device <device name> has become idle and is being saved now

**Explanation:** A save request for the DCSSs that map to a DCSS device has been pending while the device was in use. The device has become idle and all changes to the DCSSs are now saved permanently.

**User response:** None.

**Severity:** Informational
DCS device `<device name>` is removed after a failed access mode change

**Explanation:** To change the access mode of a DCSS device, all DCSSs that map to the device were unloaded. Reloading the DCSSs for the new access mode failed and the device is removed.

**User response:** Look for related messages to find out why the DCSSs could not be reloaded. If necessary, add the device again.

**Severity:** Error

A pending save request for device `<device name>` has been canceled

**Explanation:** A save request for the DCSSs that map to a DCSS device has been pending while the device was in use. This save request has been canceled. Changes to the DCSSs will not be saved permanently.

**User response:** None.

**Severity:** Informational

All DCSSs that map to device `<device name>` are saved

**Explanation:** A save request has been submitted for the DCSS device. Changes to all DCSSs that map to the device are saved permanently.

**User response:** None.

**Severity:** Informational

DCSS `<name 1>` and DCSS `<name 2>` have incompatible types

**Explanation:** You can only map a set of two or more DCSSs to a single DCSS device if the DCSSs in the set form a contiguous memory space. The DCSS device cannot be created because there is a memory gap between two adjacent DCSSs.

**User response:** Ensure that you have specified all DCSSs that belong to the set. Check the definitions of the DCSSs on the z/VM hypervisor to verify that they form a contiguous memory space.

**Severity:** Error

Loaded `<DCSS names>` with total size `<total size in bytes>` bytes and capacity `<total size in 512 byte sectors>` sectors

**Explanation:** The listed DCSSs have been verified as contiguous and successfully loaded. The displayed sizes are the sums of all DCSSs.

**User response:** None.

**Severity:** Informational
Chapter 17. extmem

Messages with a prefix extmem are issued by the kernel module that provides an interface to the z/VM DCSS management functions.

**extmem.06a5dd DCSS <DCSS name> has multiple page ranges and cannot be loaded or queried**

**Explanation:** You can only load or query a DCSS with multiple page ranges if: - The DCSS has 6 or fewer page ranges - The page ranges form a contiguous address space - The page ranges are of type EW or EN

**User response:** Check the definition of the DCSS to make sure that the conditions for DCSSs with multiple page ranges are met.

**Severity:** Error

**extmem.262f7b Loading or querying DCSS <DCSS name> resulted in a hardware error**

**Explanation:** Either the z/VM DIAGNOSE X'64' query or load call issued for the DCSS returned with an error.

**User response:** Look for previous extmem message to find the return code from the DIAGNOSE X'64' query or load call. For details about the return codes see the section about DIAGNOSE Code X'64' in "z/VM CP Programming Services".

**Severity:** Error

**extmem.326775 DCSS <DCSS name> overlaps with used memory resources and cannot be reloaded**

**Explanation:** The DCSS has been unloaded and cannot be reloaded because it overlaps with another loaded DCSS or with the memory of the z/VM guest virtual machine (guest storage).

**User response:** Ensure that no DCSS is loaded that has overlapping memory resources with the DCSS you want to reload. If the DCSS overlaps with guest storage, use the DEF STORE CONFIG z/VM CP command to create a sufficient storage gap for the DCSS. For details, see the section about the DCSS device driver in "Device Drivers, Features, and Commands".

**Severity:** Warning

**extmem.584f8e Unloading unknown DCSS <DCSS name> failed**

**Explanation:** The specified DCSS cannot be unloaded. The DCSS is known to the DCSS device driver but not to the DCSS kernel interface. This problem indicates a program error in extmem.c.

**User response:** Report this problem to your support organization.

**Severity:** Error

**extmem.6bd595 Loading DCSS <DCSS name> failed with rc=<return code>**

**Explanation:** The DCSS kernel interface used diagnose call X'64' to load a DCSS. z/VM failed to load the DCSS and returned an error.

**User response:** For details about the return codes see the section about DIAGNOSE Code X'64' in "z/VM CP Programming Services".

**Severity:** Warning

**extmem.7c6a46 Querying a DCSS type failed with rc=<return code>**

**Explanation:** The DCSS kernel interface used z/VM diagnose call X'64' to query the type of a DCSS. z/VM failed to determine the type and returned an error.

**User response:** Look for related messages to find out which DCSS is affected. For details about the return codes see the section about DIAGNOSE Code X'64' in "z/VM CP Programming Services".

**Severity:** Warning

**extmem.7fb545 DCSS <DCSS name> is already in the requested access mode**

**Explanation:** A request to reload a DCSS with a new access mode has been rejected because the new access mode is the same as the current access mode.

**User response:** None.

**Severity:** Informational

**extmem.8b00b5 DCSS <DCSS name> cannot be loaded or queried**

**Explanation:** You cannot load or query the specified DCSS because it either is not defined in the z/VM hypervisor, or it is a class S DCSS, or it is above 2047 MB and the Linux system is a 31-bit system.

**User response:** Use the CP command "QUERY NSS" to find out if the DCSS is a valid DCSS that can be loaded.

**Severity:** Error
extmem.8e36b2  DCSS <DCSS name> exceeds the kernel mapping range (<kernel mapping range in bytes>) and cannot be loaded
Explanation: You cannot load the DCSS because it exceeds the kernel mapping range limit.
User response: Ensure that the DCSS range is defined below the kernel mapping range.
Severity: Error

extmem.972edd  Reloading DCSS <DCSS name> failed with rc=<return code>
Explanation: The DCSS kernel interface used z/VM diagnose call X'64' to reload a DCSS in a different access mode. The DCSS was unloaded but z/VM failed to reload the DCSS.
User response: For details about the return codes see the section about DIAGNOSE Code X'64' in "z/VM CP Programming Services".
Severity: Warning

extmem.99ae11  DCSS <DCSS name> is already loaded in a different access mode
Explanation: The DCSS you are trying to load has already been loaded in a different access mode. You cannot simultaneously load the DCSS in different modes.
User response: Reload the DCSS in a different mode or load it with the same mode in which it has already been loaded.
Severity: Error

extmem.9e2ee4  DCSS <DCSS name> cannot be loaded or queried without z/VM
Explanation: A DCSS is a z/VM resource. Your Linux instance is not running as a z/VM guest operating system and, therefore, cannot load DCSSs.
User response: Load DCSSs only on Linux instances that run as z/VM guest operating systems.
Severity: Error

extmem.a62ef4  DCSS <DCSS name> of range <starting page address> to <ending page address> and type <DCSS type> loaded in shared access mode
Explanation: The DCSS was loaded successfully in shared access mode.
User response: None.
Severity: Informational

extmem.b8acd6  Saving a DCSS failed with DEFSEG response code <response-code>
Explanation: The DEFSEG z/VM CP command failed to permanently save changes to a DCSS.
User response: Ensure that the z/VM guest virtual machine is authorized to issue the CP DEFSEG command (typically privilege class E). Look for related messages to find the cause of this error. See also message HCP<response-code>E in the DEFSEG section of the "z/VM CP Command and Utility Reference".
Severity: Error

extmem.c55583  Saving a DCSS failed with SAVESEG response code <response-code>
Explanation: The SAVESEG z/VM CP command failed to permanently save changes to a DCSS.
User response: Ensure that the z/VM guest virtual machine is authorized to issue the CP SAVESEG command (typically privilege class E). Look for related messages to find the cause of this error. See also message HCP<response-code>E in the SAVESEG section of the "z/VM CP Command and Utility Reference".
Severity: Error

extmem.cb0afe  <DCSS name> needs used memory resources and cannot be loaded or queried
Explanation: You cannot load or query the DCSS because it overlaps with an already loaded DCSS or with the memory of the z/VM guest virtual machine (guest storage).
User response: Ensure that no DCSS is loaded that has overlapping memory resources with the DCSS you want to load or query. If the DCSS overlaps with guest storage, use the DEF STORE CONFIG z/VM CP command to create a sufficient storage gap for the DCSS. For details, see the section about the DCSS device driver in "Device Drivers, Features, and Commands".
Severity: Error

extmem.d03247  Saving unknown DCSS <DCSS name> failed
Explanation: The specified DCSS cannot be saved. The DCSS is known to the DCSS device driver but not to the DCSS kernel interface. This problem indicates a program error in extmem.c.
User response: Report this problem to your support organization.
Severity: Error
extmem.da1614 DCSS <DCSS name> of range <starting page address> to <ending page address> and type <DCSS type> loaded as exclusive-writable

Explanation: The DCSS was loaded successfully in exclusive-writable access mode.

User response: None.

Severity: Informational

extmem.e08a4c DCSS <DCSS name> overlaps with used storage and cannot be loaded

Explanation: You cannot load the DCSS because it overlaps with an already loaded DCSS or with the memory of the z/VM guest virtual machine (guest storage).

User response: Ensure that no DCSS is loaded that has overlapping memory resources with the DCSS you want to load. If the DCSS overlaps with guest storage, use the DEF STORE CONFIG z/VM CP command to create a sufficient storage gap for the DCSS. For details, see the section about the DCSS device driver in "Device Drivers, Features, and Commands".

Severity: Error

extmem.f0af04 DCSS <DCSS name> is in use and cannot be reloaded

Explanation: Reloading a DCSS in a different access mode has failed because the DCSS is being used by one or more device drivers. The DCSS remains loaded with the current access mode.

User response: Ensure that the DCSS is not used by any device driver then try again to load the DCSS with the new access mode.

Severity: Warning

extmem.febf72 There is not enough memory to load or query DCSS <DCSS name>

Explanation: The available memory is not enough to load or query the DCSS.

User response: Free some memory and repeat the failed operation.

Severity: Error
Chapter 18. hvc_iucv

Messages with a prefix hvc_iucv are issued by the z/VM IUCV Hypervisor Console (HVC) device driver. This device driver supports terminal access through the iucvconn program to instances of Linux on z/VM.

__hvc_iucv.09cae6__ A connection request from z/VM user ID <ID> was refused

**Explanation:** An IUCV connection request from another z/VM guest virtual machine has been refused. The request was from a z/VM guest virtual machine that is not listed by the "hvc_iucv_allow=" kernel parameter.

**User response:** Check the "hvc_iucv_allow=" kernel parameter setting. Consider adding the z/VM user ID to the "hvc_iucv_allow=" list in the kernel parameter line and reboot Linux.

**Severity:** Informational

__hvc_iucv.1bc1e0__ hvc_iucv_allow= specifies too many z/VM user IDs

**Explanation:** The "hvc_iucv_allow=" kernel parameter specifies a comma-separated list of z/VM user IDs that are permitted to connect to the z/VM IUCV hypervisor device driver. The number of z/VM user IDs that are specified with the "hvc_iucv_allow=" kernel parameter exceeds the maximum of 500.

**User response:** Correct the "hvc_iucv_allow=" setting by reducing the z/VM user IDs in the list and reboot Linux.

**Severity:** Error

__hvc_iucv.339854__ Creating a new HVC terminal device failed with error code=<errno>

**Explanation:** The device driver initialization failed to allocate a new HVC terminal device. A possible cause of this problem is memory constraints.

**User response:** If the error code is -12 (ENOMEM), consider assigning more memory to your z/VM guest virtual machine.

**Severity:** Error

__hvc_iucv.5a5e90__ Registering HVC terminal device as Linux console failed

**Explanation:** The device driver initialization failed to set up the first HVC terminal device for use as Linux console.

__hvc_iucv.5bc646__ Allocating memory failed with reason code=<reason>

**Explanation:** The z/VM IUCV hypervisor console (HVC) device driver initialization failed, because of a general memory allocation failure. The reason code indicates the memory operation that has failed: kmem_cache (reason code=1), mempool (reason code=2), or hvc_iucv_allow= (reason code=3)

**User response:** Consider assigning more memory to your z/VM guest virtual machine.

**Severity:** Error

__hvc_iucv.691dff__ The z/VM IUCV HVC device driver cannot be used without z/VM

**Explanation:** The z/VM IUCV hypervisor console (HVC) device driver requires the z/VM inter-user communication vehicle (IUCV).

**User response:** Set "hvc_iucv=" to zero in the kernel parameter line and reboot Linux.

**Severity:** Notice

__hvc_iucv.9f5b40__ hvc_iucv_allow= does not specify a valid z/VM user ID list

**Explanation:** The "hvc_iucv_allow=" kernel parameter specifies a comma-separated list of z/VM user IDs that are permitted to connect to the z/VM IUCV hypervisor device driver. The z/VM user IDs in the list must not exceed eight characters and must not contain spaces.

**User response:** Correct the "hvc_iucv_allow=" setting in the kernel parameter line and reboot Linux.

**Severity:** Error

__hvc_iucv.d4f2c0__ Registering IUCV handlers failed with error code=<errno>

**Explanation:** The device driver initialization failed to register with z/VM IUCV to handle IUCV connections, as well as sending and receiving of IUCV messages.

**User response:** Check for related IUCV error messages and see the errno manual page to find out what caused the problem.

**Severity:** Error
**hvc_iucv.e38b47**

*hvc_iucv.e38b47*  *<hvc_iucv_devices>* is not a valid value for the *hvc_iucv=* kernel parameter

**Explanation:** The "hvc_iucv=" kernel parameter specifies the number of z/VM IUCV hypervisor console (HVC) terminal devices. The parameter value ranges from 0 to 8. If zero is specified, the z/VM IUCV HVC device driver is disabled and no IUCV-based terminal access is available.

**User response:** Correct the "hvc_iucv=" setting in the kernel parameter line and reboot Linux.

**Severity:** Error
Chapter 19. hypfs

Messages with a prefix hypfs are issued by the S/390 hypervisor file system, which provides access to LPAR and z/VM hypervisor data.

**hypfs.7a79f0** Initialization of hypfs failed with rc=<error code>

**Explanation:** Initialization of hypfs failed because of resource or hardware constraints. Possible reasons for this problem are insufficient free memory or missing hardware interfaces.

**User response:** See errno.h for information about the error codes.

**Severity:** Error

**hypfs.7f5705** The hardware system does not support hypfs

**Explanation:** hypfs requires DIAGNOSE Code X'204' but this diagnose code is not available on your hardware. You need more recent hardware to use hypfs.

**User response:** None.

**Severity:** None.

**hypfs.90c29b** Updating the hypfs tree failed

**Explanation:** There was not enough memory available to update the hypfs tree.

**User response:** Free some memory and try again to update the hypfs tree. Consider assigning more memory to your LPAR or z/VM guest virtual machine.

**Severity:** Error

**hypfs.a2406e** `<mount option>` is not a valid mount option

**Explanation:** hypfs has detected mount options that are not valid.

**User response:** See "Device Drivers Features and Commands" for information about valid mount options for hypfs.

**Severity:** Error

**hypfs.cccfb8** The hardware system does not provide all functions required by hypfs

**Explanation:** hypfs requires DIAGNOSE Code X'224' but this diagnose code is not available on your hardware. You need more recent hardware to use hypfs.
Chapter 20. iucv

Messages with a prefix iucv are issued by the Inter-User Communication Vehicle (IUCV) device driver. IUCV is a z/VM communication facility that enables a program running in one z/VM guest to communicate with another z/VM guest, or with a control program, or even with itself.

**iucv.1d65b1 Suspending Linux did not completely close all IUCV connections**

**Explanation:** When resuming a suspended Linux instance, the IUCV base code found data structures from one or more IUCV connections that existed before the Linux instance was suspended. Modules that use IUCV connections must close these connections when a Linux instance is suspended. This problem indicates an error in a program that used an IUCV connection.

**User response:** Report this problem to your support organization.

**Severity:** Warning

**iucv.beb348 Defining an interrupt buffer on CPU <CPU number> failed with 0x<hexadecimal error value> (<short error code explanation>)**

**Explanation:** Defining an interrupt buffer for external interrupts failed. Error value 0x03 indicates a problem with the z/VM directory entry of the z/VM guest virtual machine. This problem can also be caused by a program error.

**User response:** If the error value is 0x03, examine the z/VM directory entry of your z/VM guest virtual machine. If the directory entry is correct or if the error value is not 0x03, report this problem to your support organization.

**Severity:** Warning
Chapter 21. lcs

Messages with a prefix lcs are issued by the LAN channel station device driver. The LCS device driver supports non-QDIO communications through Open Systems Adapters (OSA).

**Explanation:** The LAN channel station (LCS) device driver could not send data to the LAN using the LCS device. This might be a temporary problem. Operations continue on the LCS device.

**User response:** If this problem occurs frequently, initiate a recovery process, for example, by writing '1' to the 'recover' sysfs attribute of the device. If the problem persists, contact IBM support.

**Severity:** Error

---

**Explanation:** A request to shut down a LAN channel station (LCS) device resulted in an error. The error is logged in the LCS trace at trace level 4.

**User response:** Try again to shut down the device. If the error persists, see the LCS trace to find out what causes the error.

**Severity:** Error

---

**Explanation:** The LAN channel station (LCS) device reported a problem that can be recovered by the LCS device driver. Repeated occurrences of this problem indicate a malfunctioning device.

**User response:** If this problem occurs frequently, initiate a recovery process for the device, for example, by writing '1' to the 'recover' sysfs attribute of the device.

**Severity:** Warning

---

**Explanation:** LAN channel station (LCS) devices require a socket buffer (SKB) structure for storing incoming data. The LCS device driver failed to allocate an SKB structure to the LCS device. A likely cause of this problem is memory constraints.

**User response:** Free some memory and repeat the failed operation.

**Severity:** Error

---

**Explanation:** The LAN channel station (LCS) device reported a problem that can be recovered by the LCS device driver. Repeated occurrences of this problem indicate a malfunctioning device.

**User response:** If this problem occurs frequently, initiate a recovery process for the device, for example, by writing '1' to the 'recover' sysfs attribute of the device.

**Severity:** Warning
**lcs.c375fd • lcs.f3f094**

---

**lcs.c375fd**

<bus ID of the LCS device>: Detecting a network adapter for LCS devices failed with rc=<lcs_detect return code in decimal notation> (0x<lcs_detect return code in hexadecimal notation>)

**Explanation:** The LCS device driver could not initialize a network adapter.

**User response:** Note the return codes from the error message and contact IBM support.

**Severity:** Error

---

**lcs.e47e1f**

<bus ID of the LCS device>: Starting an LCS device resulted in an error, rc=<ccw_device_start return code in decimal notation>!

**Explanation:** The LAN channel station (LCS) device driver failed to initialize an LCS device. The device is not operational.

**User response:** Initiate a recovery process, for example, by writing '1' to the 'recover' sysfs attribute of the device. If the problem persists, contact IBM support.

**Severity:** Error

---

**lcs.f3f094**

<bus ID of the LCS device>: A recovery process has been started for the LCS device

**Explanation:** The LAN channel station (LCS) device is shut down and restarted. The recovery process might have been initiated by a user or started automatically as a response to a device problem.

**User response:** Wait until a message indicates the completion of the recovery process.

**Severity:** Warning
Chapter 22. monreader

Messages with a prefix monreader are issued by the z/VM *MONITOR record reader device driver. This device driver enables monitoring software on Linux to access z/VM *MONITOR records, which contain data about z/VM guest virtual machines.

monreader.0111fc  The specified *MONITOR DCSS <DCSS name> does not have the required type SC
Explanation: The DCSS that was specified with the monreader.mondcss kernel parameter or with the mondcss module parameter cannot be a *MONITOR DCSS because it is not of type SC.
User response: Confirm that you are using the name of the DCSS that has been configured as the *MONITOR DCSS on the z/VM hypervisor. If the default name, MONDCSS, is used, omit the monreader.mondcss or mondcss parameter.
Severity: Error

monreader.029e2e  The read queue for monitor data is full
Explanation: The read function of the z/VM *MONITOR device driver returns EOVERFLOW because not enough monitor data has been read since the monitor device has been opened. Monitor data already read are valid and subsequent reads return valid data but some intermediate data might be missing.
User response: Be aware that monitor data might be missing. Assure that you regularly read monitor data after opening the monitor record device.
Severity: Warning

monreader.1a46fe  The z/VM *MONITOR record device driver cannot be loaded without z/VM
Explanation: The z/VM *MONITOR record device driver uses z/VM system services to provide monitor data about z/VM guest operating systems to applications on Linux. On Linux instances that run in environments other than the z/VM hypervisor, the z/VM *MONITOR record device driver does not provide any useful function and the corresponding monreader module cannot be loaded.
User response: Load the z/VM *MONITOR record device driver only on Linux instances that run as guest operating systems of the z/VM hypervisor. If the z/VM *MONITOR record device driver has been compiled into the kernel, ignore this message.
Severity: Error

monreader.6f04b5  The z/VM *MONITOR record device driver failed to register with IUCV
Explanation: The z/VM *MONITOR record device driver receives monitor data through an IUCV connection and needs to register with the IUCV device driver. This registration failed and the z/VM *MONITOR record device driver was not loaded. A possible cause of this problem is insufficient memory.
User response: Free some memory and try again to load the module. If the z/VM *MONITOR record device driver has been compiled into the kernel, you might have to configure more memory and reboot Linux. If you do not want to read monitor data, ignore this message.
Severity: Error

monreader.88c26a  Connecting to the z/VM *MONITOR system service failed with rc=<IUCV CONNECT return code>
Explanation: The z/VM *MONITOR record device driver receives monitor records through an IUCV connection to the z/VM *MONITOR system service. This connection could not be established when the monitor record device was opened. If the return code is 15, your z/VM guest virtual machine is not authorized to connect to the *MONITOR system service.
User response: If the return code is 15, ensure that the IUCV *MONITOR statement is included in the z/VM directory entry for your z/VM guest virtual machine. For other IUCV CONNECT return codes see the IUCV section in "CP Programming Services" and the

© Copyright IBM Corp. 2009, 2014
monreader.c042b6 • monreader.ca6466

*MONITOR section in "z/VM Performance".

Severity: Error

---

monreader.c042b6  Reading monitor data failed with
rc=<return code>

Explanation: The z/VM *MONITOR record device
driver failed to read monitor data because the IUCV
REPLY function failed. The read function against the
monitor record device returns EIO. All monitor data
that has been read since the last read with 0 size is
incorrect.

User response: Disregard all monitor data that has
been read since the last read with 0 size. If the device
driver has been compiled as a separate module, unload
and reload the monreader module. If the device driver
has been compiled into the kernel, reboot Linux. For
more information about possible causes of the error see
the IUCV section in "z/VM CP Programming Services"
and the *MONITOR section in "z/VM Performance".

Severity: Error

---

monreader.ca6466  Disconnecting the z/VM
*MONITOR system service failed with
rc=<IUCV SEVER return code>

Explanation: The z/VM *MONITOR record device
driver receives monitor data through an IUCV
connection to the z/VM *MONITOR system service.
This connection could not be closed when the monitor
record device was closed. You might not be able to
resume monitoring.

User response: No immediate action is necessary. If
you cannot open the monitor record device in the
future, reboot Linux. For information about the IUCV
SEVER return codes see the IUCV section in "CP
Programming Services" and the *MONITOR section in
"z/VM Performance".

Severity: Warning
Chapter 23. monwriter

Messages with a prefix monwriter are issued by the monitor stream application device driver. Applications can use this device driver to write monitor data in the form of APPLDATA records to the z/VM monitor stream.

---

**monwriter.fcbea9**  Writing monitor data failed with
    rc=<return code>

**Explanation:** The monitor stream application device driver used the z/VM diagnose call DIAG X'DC' to start writing monitor data. z/VM returned an error and the monitor data cannot be written. If the return code is 5, your z/VM guest virtual machine is not authorized to write monitor data.

**User response:** If the return code is 5, ensure that your z/VM guest virtual machine's entry in the z/VM directory includes the OPTION APPLMON statement. For other return codes see the section about DIAGNOSE Code X'DC' in "z/VM CP Programming Services".

**Severity:** Error
Chapter 24. netiucv

Messages with a prefix netiucv are issued by the NETIUCV device driver. This network device driver uses IUCV to connect instances of Linux on z/VM, or to connect an instance of Linux on z/VM to another z/VM guest such as a TCP/IP service machine.

netiucv.04ce63 <bus ID of the IUCV device>: The IUCV device failed to connect to the peer on z/VM guest <z/VM user ID>

Explanation: The connection cannot be established because the z/VM guest virtual machine with the peer interface is not configured for IUCV connections.

User response: Configure the z/VM guest virtual machine with the peer interface for IUCV connections; then try again to establish the connection.

Severity: Warning

netiucv.297069 <bus ID of the IUCV device>: z/VM guest <remote z/VM user ID> has too many IUCV connections to connect with the IUCV device

Explanation: Connecting to the remote z/VM guest virtual machine failed because the maximum number of IUCV connections for the remote z/VM guest virtual machine has been reached.

User response: Close some of the established IUCV connections on the remote z/VM guest virtual machine; then try again to establish the connection.

Severity: Error

netiucv.55da31 <bus ID of the IUCV device>: The IUCV interface to <remote z/VM user ID> has been established successfully

Explanation: The IUCV interface to the remote z/VM guest virtual machine has been established and can be activated with "ifconfig up" or an equivalent command.

User response: None.

Severity: Informational

netiucv.5be5dc <bus ID of the IUCV device>: The peer interface of the IUCV device has closed the connection

Explanation: The peer interface on the remote z/VM guest virtual machine has closed the connection. Do not expect further packets on this interface. Any packets you send to this interface will be dropped.

User response: None.

Severity: Informational

netiucv.6b758f <bus ID of the IUCV device>: The IUCV device has been connected successfully to <remote z/VM user ID>

Explanation: The connection has been established and the interface is ready to transmit communication packages.

User response: None.

Severity: Informational

netiucv.863549 <bus ID of the IUCV device>: The IUCV device cannot connect to a z/VM guest with no IUCV authorization

Explanation: Because the remote z/VM guest virtual machine is not authorized for IUCV connections, the connection cannot be established.

User response: Add the statements 'IUCV ALLOW' and 'IUCV ANY' to the z/VM directory entry of the remote z/VM guest virtual machine; then try again to establish the connection. See "z/VM CP Planning and Administration" for details about the IUCV statements.

Severity: Error

netiucv.bc54 <bus ID of the IUCV device>: The IUCV device failed to connect to z/VM guest <z/VM user ID>

Explanation: The connection cannot be established because the z/VM guest virtual machine with the peer interface is not running.

User response: Ensure that the z/VM guest virtual machine with the peer interface is running; then try again to establish the connection.

Severity: Warning
**netiucv.c1b7ef**  •  **netiucv.e9590c**

**netiucv.c1b7ef**  •  **<bus ID of the IUCV device>**: The IUCV device is connected to **<remote z/VM user ID>** and cannot be removed

**Explanation:** Removing a connection failed because the interface is active with a peer interface on a remote z/VM guest virtual machine.

**User response:** Deactivate the interface with "ifconfig down" or an equivalent command; then try again to remove the interface.

**Severity:** Warning

**netiucv.cfb810**  •  **<bus ID of the IUCV device>**: Connecting the IUCV device would exceed the maximum number of IUCV connections

**Explanation:** The connection cannot be established because the maximum number of IUCV connections has been reached on the local z/VM guest virtual machine.

**User response:** Close some of the established IUCV connections on the local z/VM guest virtual machine; then try again to establish the connection.

**Severity:** Error

**netiucv.e9590c**  •  **<bus ID of the IUCV device>**: The peer z/VM guest **<remote z/VM user ID>** has closed the connection

**Explanation:** The peer interface is no longer available.

**User response:** Either deactivate and remove the interface, or wait for the peer z/VM guest to re-establish the interface.

**Severity:** Informational
Chapter 25. os_info

Messages with a prefix os_info are issued by Linux in kdump mode.

```
  os_info.2fdede  entry <entry ID>: <entry state>
                  (addr=0x<entry address> size=<entry size>)
```

**Explanation:** Linux is running in kdump mode and reports information defined by the previously running production kernel. Possible values for "entry state" are:
- copied: The entry has been found, verified, and copied
- not available: The entry has not been defined
- checksum failed: The entry has been found, but it is not valid

**User response:** If kdump fails, contact your service organization and include this message in the error report.

**Severity:** Informational

```
  os_info.d3cf4c  crashkernel: addr=0x<address>
                   size=<size>
```

**Explanation:** Linux is running in kdump mode and reports the address and size of the memory area that was reserved for kdump by the previously running production kernel.

**User response:** None.

**Severity:** Informational
Chapter 26. perf

Messages with a prefix perf are issued by kernel functions that support the z/Architecture CPU-measurement facility.

```
perf.ee05c5 CPU[<cpu number>] CPUM_CF:
  ver=<first version number>,<second version number> A=<counter set authorization>
  E=<counter set enable controls> C=<counter set activation controls>
```

Explanation: This message displays information about the CPU-measurement counter facility (CPUM_CF) on a particular CPU. For details, see "The Load-Program-Parameter and the CPU-Measurement Facilities", SA23-2260.

User response: None.

Severity: Informational
Chapter 27. qeth

Messages with a prefix qeth are issued by the qeth device driver. The qeth device driver supports a multitude of network connections, for example, connections through Open Systems Adapters (OSA), HiperSockets, guest LANs, and virtual switches.

qeth.03aa42  <bus ID of the qeth device>: Interface `<interface name>` is down because the adjacent port is no longer in reflective relay mode

Explanation: The ISOLATION_FORWARD policy is active for the QDIO data connection isolation of the qeth device. This policy requires a network adapter in Virtual Ethernet Port Aggregator (VEPA) mode with an adjacent switch port in reflective relay mode. The reflective relay mode on the adjacent switch port was disabled. The qeth device was set offline and the interface was deactivated to prevent any unintended network traffic.

User response: Enable the reflective relay mode again on the adjacent port or use the ‘isolation’ sysfs attribute of the qeth device to set a different policy for the QDIO data connection isolation. You can then resume operations by setting the qeth device back online and activating the interface.

Severity: Error

qeth.1d3c1d  <bus ID of the qeth device>: Registering IP address `<IP address>` failed

Explanation: An IP address could not be registered with the network adapter.

User response: Check if another operating system instance has already registered the IP address with the same network adapter or at the same logical IP subnet.

Severity: Warning

qeth.1e4c70  <bus ID of the qeth device>: The device is not authorized to run as a HiperSockets network traffic analyzer

Explanation: The sysfs ‘sniffer’ attribute of the HiperSockets device has the value ‘1’. The corresponding HiperSockets interface is switched into promiscuous mode but the network traffic analyzer (NTA) rules configured at the Support Element (SE) do not allow tracing. Possible reasons are: - Tracing is not authorized for all HiperSockets channels in the mainframe system - Tracing is not authorized for this HiperSockets channel - LPAR is not authorized to enable an NTA

User response: Configure appropriate HiperSockets NTA rules at the SE.

Severity: Warning

qeth.21a074  <bus ID of the qeth device>: There is no kernel module to support discipline `<discipline>`

Explanation: The qeth device driver or a user command requested a kernel module for a particular qeth discipline. Either the discipline is not supported by the qeth device driver or the requested module is not available to your Linux system.

User response: Check if the requested discipline module has been compiled into the kernel or is present in /lib/modules/<version>/kernel/drivers/s390/net.

Severity: Error

qeth.2211d4  <bus ID of the qeth device>: The LAN is offline

Explanation: A start LAN command was sent by the qeth device driver but the physical or virtual adapter has not started the LAN. The LAN might take a few seconds to become available.

User response: Check the status of the qeth device, for example, with the lsqeth command. If the device does not become operational within a few seconds, initiate a recovery process, for example, by writing '1' to the ‘recover’ sysfs attribute of the device.

Severity: Warning

qeth.2f18a4  <bus ID of the qeth device>: Starting multicast support for `<network interface name>` failed

Explanation: The qeth device driver could not start multicast support on the network adapter.

User response: Ungroup and regroup the subchannel triplet of the device. If this does not resolve the problem, reboot Linux. If the problem persists, gather Linux debug data and report the problem to your support organization.

Severity: Warning

qeth.3acf0c  <bus ID of the qeth device>: The qeth device driver failed to recover an error on the device

Explanation: The qeth device driver performed an automatic recovery operation to recover an error on a qeth device. The recovery operation failed.
User response: Try the following actions in the given order: i) Check the status of the qeth device, for example, with the lsqeth command. ii) Initiate a recovery process by writing '1' to the 'recover' sysfs attribute of the device. iii) Ungroup and regroup the subchannel triplet of the device. vi) Reboot Linux. v) If the problem persists, gather Linux debug data and report the problem to your support organization.

Severity: Warning

qeth.3d0305  <bus ID of the qeth device>: The adapter is used exclusively by another host
Explanation: The qeth adapter is exclusively used by another host.
User response: Use another qeth adapter or configure this one not exclusively to a particular host.
Severity: Error

qeth.48d0da  <bus ID of the qeth device>: The network adapter failed to generate a unique ID
Explanation: In IBM mainframe environments, network interfaces are not identified by a specific MAC address. Therefore, the network adapters provide the network interfaces with unique IDs to be used in their IPv6 link local addresses. Without such a unique ID, duplicate addresses might be assigned in other LPARs.
User response: Install the latest firmware on the adapter hardware. Manually, configure an IPv6 link local address for this device.
Severity: Warning

qeth.4a588d  <bus ID of the qeth device>: Completion Queue support disabled
Explanation: The HiperSockets device is disabled for completion queuing. This device cannot or no longer be used to set up AF_IUCV communication in an LPAR.
User response: None.
Severity: Informational

qeth.4da7f2  Initializing the qeth device driver failed
Explanation: The base module of the qeth device driver could not be initialized.
User response: See errno.h to determine the reason for the error. i) Reboot Linux. ii) If the problem persists, gather Linux debug data and report the problem to your support organization.
Severity: Error

qeth.53237e  <bus ID of the qeth device>: A connection could not be established because of an OLM limit
Explanation: z/OS® has activated Optimized Latency Mode (OLM) for a connection through an OSA Express3 adapter. This reduces the maximum number of concurrent connections per physical port for shared adapters. The new connection would exceed the maximum. Linux cannot establish further connections using this adapter.
User response: If possible, deactivate an existing connection that uses this adapter and try again to establish the new connection. If you cannot free an existing connection, use a different adapter for the new connection.
Severity: Error

qeth.5cb8a3  <bus ID of the qeth device>: The qeth device is not configured for the OSI layer required by z/VM
Explanation: A qeth device that connects to a virtual network on z/VM must be configured for the same Open Systems Interconnection (OSI) layer as the virtual network. An ETHERNET guest LAN or VSWITCH uses the data link layer (layer 2) while an IP guest LAN or VSWITCH uses the network layer (layer 3).
User response: If you are connecting to an ETHERNET guest LAN or VSWITCH, set the layer2 sysfs attribute of the qeth device to 1. If you are connecting to an IP guest LAN or VSWITCH, set the layer2 sysfs attribute of the qeth device to 0.
Severity: Error

qeth.5d5e5c  There is no IPv6 support for the layer 3 discipline
Explanation: If you want to use IPv6 with the layer 3 discipline, you need a Linux kernel with IPv6 support. Because your Linux kernel has not been compiled with IPv6 support, you cannot use IPv6 with the layer 3 discipline, even if your adapter supports IPv6.
User response: Use a Linux kernel that has been complied to include IPv6 support if you want to use IPv6 with layer 3 qeth devices.
Severity: Warning

qeth.5ff844  <bus ID of the qeth device>: Completion Queue support enabled
Explanation: The HiperSockets device is enabled for completion queuing. This is part of the process to set up AF_IUCV communication in an LPAR.
User response: None.
Severity: Informational
qeth.666544 <bus ID of the qeth device>: MAC address <MAC-address> already exists

**Explanation:** Setting the MAC address for the qeth device fails, because this MAC address is already defined on the OSA CHPID.

**User response:** Use a different MAC address for this qeth device.

**Severity:** Warning

---

qeth.72880f <bus ID of the qeth device>: A HiperSockets network traffic analyzer is already active in the HiperSockets LAN

**Explanation:** The sysfs ‘sniffer’ attribute of the HiperSockets device has the value ‘1’. The HiperSockets interface is switched into promiscuous mode but another HiperSockets device on the same HiperSockets channel is already running as a network traffic analyzer. A HiperSockets channel can only have one active network traffic analyzer.

**User response:** Do not configure multiple HiperSockets devices in the same HiperSockets channel as tracing devices.

**Severity:** Warning

---

qeth.760272 <bus ID of the qeth device>: The reflective relay mode cannot be enabled at the adjacent switch port

**Explanation:** The 'isolation' sysfs attribute of the qeth device could not be set to 'forward'. This setting selects the ISOLATION_FORWARD policy for the QDIO data connection isolation. The ISOLATION_FORWARD policy requires a network adapter in Virtual Ethernet Port Aggregator (VEPA) mode with an adjacent switch port in reflective relay mode. The qeth device driver failed to enable the required reflective relay mode on the adjacent switch port although the switch port supports this mode.

**User response:** Enable reflective relay mode on the switch for the adjacent port and try again.

**Severity:** Error

---

qeth.77cf86 <bus ID of the qeth device>: Enabling broadcast filtering for <network interface name> failed

**Explanation:** The qeth device driver could not enable broadcast filtering on the network adapter.

**User response:** Ungroup and regroup the subchannel triplet of the device. If this does not resolve the problem, reboot Linux. If the problem persists, gather Linux debug data and report the problem to your support organization.

**Severity:** Warning

---

qeth.883aa0 <bus ID of the qeth device>: Starting HW checksumming for <network interface name> failed, using SW checksumming

**Explanation:** The network adapter supports hardware checksumming for incoming IP packages but the qeth device driver could not start hardware checksumming on the adapter. The qeth device driver continues to use software checksumming for incoming IP packages.

**User response:** None if you do not require hardware checksumming for incoming network traffic. If you want to enable hardware checksumming, ungroup and regroup the subchannel triplet of the device. If this does not resolve the problem, reboot Linux. If the problem persists, gather Linux debug data and report the problem to your support organization.

**Severity:** Warning

---

qeth.8a7bb9 <bus ID of the qeth device>: Starting IP fragmentation support for <network interface name> failed

**Explanation:** The qeth device driver could not start IP fragmentation support on the network adapter.

**User response:** Ungroup and regroup the subchannel triplet of the device. If this does not resolve the problem, reboot Linux. If the problem persists, gather Linux debug data and report the problem to your support organization.
Severity: Warning

**qeth.90d7eb**<bus ID of the qeth device>: MAC address <MAC-address> is not authorized

Explanation: This qeth device is a virtual network interface card (NIC), to which z/VM has already assigned a MAC address. z/VM MAC address verification does not allow you to change this predefined address.

User response: None; use the MAC address that has been assigned by z/VM.

Severity: Warning

**qeth.9b3034**<bus ID of the qeth device>: Setting the device online failed because of insufficient authorization

Explanation: The qeth device is configured with OSX CHPIDs. An OSX CHPID cannot be activated unless the LPAR is explicitly authorized to access it. For z/VM guest operating systems, the z/VM user ID must be explicitly authorized in addition to the LPAR. You grant these authorizations through the Service Element.

User response: At the Service Element, authorize the LPAR and, if applicable, the z/VM user ID for using the OSX CHPIDs with which the qeth device has been configured. Then try again to set the device online.

Severity: Error

**qeth.a4a7ee**<bus ID of the qeth device>: The link for <network interface name> on CHPID 0x<CHPID> has been restored

Explanation: A failed network link has been re-established. A device recovery is in progress.

User response: Wait until a message indicates the completion of the recovery process.

Severity: Informational
qeth.c13293  <bus ID of the qeth device>: The adjacent switch port does not support reflective relay mode

Explanation: The ‘isolation’ sysfs attribute of the qeth device could not be set to ‘forward’. This setting selects the ISOLATION_FORWARD policy for the QDIO data connection isolation. The ISOLATION_FORWARD policy requires a network adapter in Virtual Ethernet Port Aggregator (VEPA) mode with an adjacent switch port in reflective relay mode.

User response: Use a switch port that supports reflective relay mode if you want to use the ISOLATION_FORWARD policy for the qeth device.

qeth.d41e42  <bus ID of the qeth device>: Completion Queueing supported

Explanation: The HiperSockets device supports completion queueing. This is required to set up AF_IUCV communication in an LPAR.

User response: None.

qeth.d5b6b3  <bus ID of the qeth device>: Starting outbound TCP segmentation offload for <network interface name> failed

Explanation: The network adapter supports TCP segmentation offload, but the qeth device driver could not start this support on the adapter.

User response: None if you do not require TCP segmentation offload. If you want to enable TCP segmentation offload, ungroup and regroup the subchannel triplet of the device. If this still does not resolve the problem, reboot Linux. If the problem persists, gather Linux debug data and report the problem to your support organization.

qeth.e73874  <bus ID of the qeth device>: Starting ARP processing support for <network interface name> failed

Explanation: The qeth device driver could not start ARP support on the network adapter.

User response: Ungroup and regroup the subchannel triplet of the device. If this still does not resolve the problem, reboot Linux. If the problem persists, gather Linux debug data and report the problem to your support organization.

qeth.eb4e01  <bus ID of the qeth device>: Failed to create completion queue

Explanation: The HiperSockets device could not be configured with a completion queue. A completion queue is required to operate AF_IUCV communication in an LPAR.

User response: i) Investigate if you have the latest firmware level in place. ii) If the problem persists and
**qeth.ef9329 • qeth.fd0b7c**

is not caused by a version mismatch, contact IBM support.

**Severity:** Error

**qeth.ef9329**  <bus ID of the qeth device>: A hardware operation timed out on the device

**Explanation:** A hardware operation timed out on the qeth device.

**User response:** Check the status of the qeth device, for example, with the lsqeth command. If the device is not operational, initiate a recovery process, for example, by writing '1' to the 'recover' sysfs attribute of the device.

**Severity:** Warning

**qeth.f56315**  <bus ID of the qeth device>: The link for interface <network interface name> on CHPID 0x<CHPID> failed

**Explanation:** A network link failed. A possible reason for this error is that a physical network cable has been disconnected.

**User response:** Ensure that the network cable on the adapter hardware is connected properly. If the connection is to a guest LAN, ensure that the device is still coupled to the guest LAN.

**Severity:** Warning

**qeth.f6c89f**  <bus ID of the qeth device>: Enabling the passthrough mode for <network interface name> failed

**Explanation:** The qeth device driver could not enable the passthrough mode on the network adapter. The passthrough mode is required for all network traffic other than IPv4. In particular, the passthrough mode is required for IPv6 traffic.

**User response:** None if all you want to support is IPv4 communication. If you want to support IPv6 or other network traffic apart from IPv4, ungroup and regroup the subchannel triplet of the device. If this does not resolve the problem, reboot Linux. If the problem persists, gather Linux debug data and report the problem to your support organization.

**Severity:** Warning

**qeth.f823af**  <bus ID of the qeth device>: QDIO reported an error, rc=<return code>

**Explanation:** The QDIO subsystem reported an error.

**User response:** Check for related QDIO errors. Check the status of the qeth device, for example, with the lsqeth command. If the device is not operational, initiate a recovery process, for example, by writing '1' to the 'recover' sysfs attribute of the device.

**Severity:** Warning

**qeth.faf3f3**  <bus ID of the qeth device>: Starting source MAC-address support for <network interface name> failed

**Explanation:** The qeth device driver could not enable source MAC-address on the network adapter.

**User response:** Ungroup and regroup the subchannel triplet of the device. If this does not resolve the problem, reboot Linux. If the problem persists, gather Linux debug data and report the problem to your support organization.

**Severity:** Warning

**qeth.fce5bf**  <bus ID of the qeth device>: Setting up broadcast filtering for <network interface name> failed

**Explanation:** The qeth device driver could not set up broadcast filtering on the network adapter.

**User response:** Ungroup and regroup the subchannel triplet of the device. If this does not resolve the problem, reboot Linux. If the problem persists, gather Linux debug data and report the problem to your support organization.

**Severity:** Warning

**qeth.fd0b7c**  <bus ID of the qeth device>: A recovery process has been started for the device

**Explanation:** A recovery process was started either by the qeth device driver or through a user command.

**User response:** Wait until a message indicates the completion of the recovery process.

**Severity:** Warning
Chapter 28. s390dbf

Messages with a prefix s390dbf are issued by the S/390 debug feature.

s390dbf.2d934d  Root becomes the owner of all s390dbf files in sysfs
Explanation: The S/390 debug feature you are using only supports uid/gid = 0.
User response: None.
Severity: Warning

s390dbf.8e20d2  Flushing debug data failed because <debug area number> is not a valid area
Explanation: Flushing a debug area by using the 'flush' sysfs attribute failed. Valid values are the minus sign (-) for flushing all areas, or the number of the respective area for flushing a single area.
User response: Write a valid area number or the minus sign (-) to the 'flush' sysfs attribute.
Severity: Informational

s390dbf.a1b9ad  Registering view <feature name>/<view name> would exceed the maximum number of views <maximum>
Explanation: The maximum number of allowed debug feature views has been reached. The view has not been registered. The system keeps running but the new view will not be available in sysfs. This is a program error.
User response: Report this problem to your support partner.
Severity: Error

s390dbf.ac1eb1  Registering debug feature <feature name> failed
Explanation: The initialization of an S/390 debug feature failed. A likely cause of this problem is memory constraints. The system keeps running, but the debug data for this feature will not be available in sysfs.
User response: Consider assigning more memory to your LPAR or z/VM guest virtual machine.
Severity: Error

s390dbf.d8734b  Allocating memory for <number of pages> pages failed
Explanation: Setting the debug feature size by using the 'page' sysfs attribute failed. Linux did not have enough memory for expanding the debug feature to the requested size.
User response: Use a smaller number of pages for the debug feature or allocate more memory to your LPAR or z/VM guest virtual machine.
Severity: Informational

© Copyright IBM Corp. 2009, 2014
Chapter 29. sclp_cmd

Messages with a prefix sclp_cmd are issued in the context of SCLP commands.

sclp_cmd.c01fec  Memory hotplug state changed, suspend refused.

Explanation: Suspend is refused after a memory hotplug operation was performed.

User response: The system needs to be restarted and no memory hotplug operation must be performed in order to allow suspend.

Severity: Error
Chapter 30. sclp_config

Messages with a prefix sclp_config are issued by SCLP configuration management events.

```
sclp_config.12c7a1 CPU capability may have changed
```

**Explanation:** The capability of the CPUs in the configuration may have been upgraded or downgraded. This message may also appear if the capability of the CPUs in the configuration did not change. For details see the STORE SYSTEM INFORMATION description in the "Principles of Operation."

**User response:** The user can examine /proc/sysinfo for CPU capability values.

**Severity:** Informational
Chapter 31. scm_block

Messages with a prefix scm_block are issued by the storage-class memory (SCM) device driver.

An I/O operation to SCM failed with rc=<return code>

Explanation: An error occurred during I/O to storage class memory (SCM). The operation was repeated, but the maximum number of retries was exceeded before the request could be fulfilled.

User response: Contact your support organization.

Severity: Error

The capabilities of the SCM increment changed

Explanation: A configuration change is in progress for the storage class memory (SCM) increment.

User response: Verify that the capability of the SCM increment is as intended; for example, with lsscm.

Severity: Informational

Write access to the SCM increment is restored

Explanation: Write access to the storage class memory (SCM) increment was restored after a temporary suspension during a concurrent firmware upgrade.

User response: None.

Severity: Informational

Write access to the SCM increment is suspended

Explanation: A concurrent firmware upgrade is in progress. For the duration of the upgrade, write access to the storage class memory (SCM) increment has been suspended.

User response: None.

Severity: Informational
Chapter 32. setup

Messages with a prefix “setup ” are issued when Linux starts.

setup.0471f6 crashkernel reservation failed: <reason string>

Explanation: The memory reservation for the kdump "crashkernel" parameter was not successful. The Linux kernel was either not able to find a free memory area or an invalid area has been defined. The reason string describes the cause of the failure in more detail.

User response: Increase the memory footprint of your virtual machine or adjust the values for the "crashkernel" kernel parameter. Then boot your Linux system again.

Severity: Informational

setup.0713cd Address spaces switched, mvcos not available

Explanation: The kernel parameter ‘switch_amode’ has been specified. The kernel will use the primary address space for user space processes and the home address space for the kernel. The mvcos instruction is not available and the kernel will use the slower page table walk method to copy between the user and kernel address space.

User response: None.

Severity: Informational

setup.0961dd Linux is running as a z/VM guest operating system in 31-bit mode

Explanation: The 31-bit Linux kernel detected that it is running as a guest operating system of the z/VM hypervisor.

User response: None.

Severity: Informational

setup.6bac7a Linux is running natively in 64-bit mode

Explanation: The 64-bit Linux kernel detected that it is running on an IBM mainframe, either as the sole operating system in an LPAR or as the sole operating system on the entire mainframe. The Linux kernel is not running as a guest operating system of the z/VM hypervisor.

User response: None.

Severity: Informational

setup.904d83 initrd extends beyond end of memory

Explanation: The load address and the size of the initial RAM disk result in an end address of the initial RAM disk that is beyond the end of the system memory.

User response: Lower the load address of the initial RAM disk, reduce the size of the initial RAM disk, or increase the size of the system memory to make the initial RAM disk fit into the memory.

Severity: Error

setup.9d71f8 The hardware system has no IEEE compatible floating point units

Explanation: The Linux kernel detected that it is running on a hardware system with CPUs that do not have IEEE compatible floating point units.

User response: None.
Severity: Informational

setup.d5d221 Saving the Linux kernel NSS failed with rc=<return code>

Explanation: The Linux kernel could not save the named saved system (NSS) with the z/VM CP SAVESYS command. The return code represents the numeric portion of the CP SAVESYS error message.

User response: For return code 1, the z/VM guest virtual machine is not authorized to save named saved systems. Ensure that the z/VM guest virtual machine is authorized to issue the CP SAVESYS command (typically privilege class E). For other return codes, see the help and message documentation for the CP SAVESYS command.

Severity: Error

setup.dae2e8 Reserving <amount of reserved memory> of memory at <storage location of reserved memory> for crashkernel (System RAM: <amount of system RAM>)

Explanation: The memory reservation for the kdump "crashkernel" parameter was successful and a kdump kernel can now be loaded with the kexec tool.

User response: None.

Severity: Informational

setup.db58c7 Linux is running natively in 31-bit mode

Explanation: The 31-bit Linux kernel detected that it is running on an IBM mainframe, either as the sole operating system in an LPAR or as the sole operating system on the entire mainframe. The Linux kernel is not running as a guest operating system of the z/VM hypervisor.

User response: None.

Severity: Informational

setup.df70d5 Defining the Linux kernel NSS failed with rc=<return code>

Explanation: The Linux kernel could not define the named saved system (NSS) with the z/VM CP DEFSYS command. The return code represents the numeric portion of the CP DEFSYS error message.

User response: For return code 1, the z/VM guest virtual machine is not authorized to define named saved systems. Ensure that the z/VM guest virtual machine is authorized to issue the CP DEFSYS command (typically privilege class E). For other return codes, see the help and message documentation for the CP DEFSYS command.

Severity: Error
Chapter 33. tape

Messages with a prefix “tape” are issued by the channel-attached tape device driver.

User response: None.
Severity: Informational

---

**tape.8ce1c3**  
<bus ID of the tape device>: The tape cartridge has been successfully unloaded

Explanation: The tape cartridge has been unloaded from the tape unit. Insert a tape cartridge before accessing the tape device.

User response: None.
Severity: Informational

---

**tape.aeef3e**  
<bus ID of the tape device>: A tape unit was detached while in use

Explanation: A tape unit has been detached from the I/O configuration while a tape was being accessed. This typically results in I/O error messages and potentially in damaged data on the tape.

User response: Check the output of the application that accesses the tape device. If this problem occurred during a write-type operation, consider repeating the operation after bringing the tape device back online.

Severity: Warning

---

**tape.bedee0**  
Tape device <bus ID of the tape device> is busy, refusing to suspend

Explanation: A request to suspend a tape device being currently in use is rejected.

User response: Terminate applications performing tape operations and then try to suspend the system again.

Severity: Error

---

**tape.d10f9d**  
A cartridge is loaded in tape device <bus ID of the tape device>, refusing to suspend

Explanation: A request to suspend a tape device currently loaded with a cartridge is rejected.

User response: Unload the tape device. Then try to suspend the system again.

Severity: Error

---

**tape.fbea0c**  
<bus ID of the tape device>: A tape cartridge has been mounted

Explanation: A tape cartridge has been inserted into the tape unit. The tape in the tape unit is ready to be accessed.
Chapter 34. tape_34xx

Messages with a prefix tape_34xx are issued by the channel-attached tape device driver and relate to an IBM 3480 or IBM 3490 magnetic tape subsystem.

tape_34xx.01b705 <bus ID of the tape device>: The tape unit is not ready
Explanation: The tape unit is online but not ready.
User response: Turn the ready switch on the tape unit to the ready position and try the operation again.
Severity: Warning

tape_34xx.0a2df0 <bus ID of the tape device>: The tape information states an incorrect length
Explanation: The tape is shorter than stated at the beginning of the tape data. A possible reason for this problem is that the tape might have been physically truncated. Data written to the tape might be incomplete or damaged.
User response: If this problem occurred during a write-type operation, consider repeating the operation with a different tape cartridge.
Severity: Warning

tape_34xx.0dcb6e <bus ID of the tape device>: A parity error occurred on the tape bus
Explanation: A data parity check error occurred on the bus. Data that was read or written while the error occurred is not valid.
User response: Reposition the tape and repeat the read-type or write-type operation.
Severity: Warning

tape_34xx.1438e6 <bus ID of the tape device>: A channel interface error cannot be recovered
Explanation: An error has occurred on the channel interface. This error cannot be recovered by the control unit error recovery process.
User response: See the documentation of the control unit.
Severity: Warning

tape_34xx.150bb7 <bus ID of the tape device>: The tape unit does not support tape format 3480-2 XF
Explanation: The tape unit does not support tapes recorded in the 3480-2 XF format.
User response: If you do not need the data recorded on the current tape, rewind the tape and overwrite it with a supported format. If you need the data on the current tape, use a tape unit that supports the tape format.
Severity: Warning

tape_34xx.15d49e <bus ID of the tape device>: The maximum block size for buffered mode is exceeded
Explanation: The block to be written is larger than allowed for the buffered mode.
User response: Use a smaller block size.
Severity: Warning

tape_34xx.257c56 <bus ID of the tape device>: A path equipment check occurred for the tape device
Explanation: A path equipment check has occurred. This check indicates problems with the connection between the mainframe system and the tape control unit.
User response: Ensure that the cable connections between the mainframe system and the control unit are securely in place and not damaged.
Severity: Warning

tape_34xx.2caadc <bus ID of the tape device>: I/O error recovery failed on the tape control unit
Explanation: An I/O error occurred that cannot be recovered by the automatic error recovery process of the tape control unit. The application that operates the tape unit will receive a return value of -EIO which indicates an I/O error. The data on the tape might be damaged.
User response: If this problem occurred during a write-type operation, consider repositioning the tape and repeating the operation.
Severity: Warning

tape_34xx.33278e <bus ID of the tape device>: A write error on the tape cannot be recovered
Explanation: A write error has occurred that could not be recovered by the automatic error recovery process.
User response: Use a different tape cartridge.
taped_34xx.3be0ed • tape_34xx.6bcece

Severity: Warning

tape_34xx.3be0ed <bus ID of the tape device>: Reading the tape beyond the end of the recorded area failed

Explanation: A read-type operation failed because it extended beyond the end of the recorded area on the tape medium.

User response: None.

Severity: Warning

---

tape_34xx.3f2d36 <bus ID of the tape device>: The tape unit does not support format 3480 XF

Explanation: The tape unit does not support tapes recorded in the 3480 XF format.

User response: If you do not need the data recorded on the current tape, rewind the tape and overwrite it with a supported format. If you need the data on the current tape, use a tape unit that supports the tape format.

Severity: Warning

---

tape_34xx.3f38f7 <bus ID of the tape device>: A data overrun occurred between the control unit and tape unit

Explanation: A data overrun error has occurred on the connection between the control unit and the tape unit. If this problem occurred during a write-type operation, the integrity of the data on the tape might be compromised.

User response: Use a faster connection. If this problem occurred during a write-type operation, consider repositioning the tape and repeating the operation.

Severity: Warning

---

tape_34xx.442701 <bus ID of the tape device>: The tape unit does not support the tape length

Explanation: The length of the tape in the cartridge is incompatible with the tape unit.

User response: Either use a different tape unit or use a tape with a supported length.

Severity: Warning

---

tape_34xx.553e40 <bus ID of the tape device>: Writing the ID-mark failed

Explanation: The ID-mark at the beginning of tape could not be written. The tape medium might be write-protected.

User response: Try a different tape cartridge. Ensure that the write-protection on the cartridge is switched off.

Severity: Warning

---

tape_34xx.633cc6 <bus ID of the tape device>: The tape unit requires a firmware update

Explanation: The tape unit requires firmware patches from the tape control unit but the required patches are not available on the control unit.

User response: Make the require patches available on the control unit then reposition the tape and retry the operation. For details about obtaining and installing firmware updates see the control unit documentation.

Severity: Warning

---

tape_34xx.64dd87 <bus ID of the tape device>: The tape medium has been rewound or unloaded manually

Explanation: The tape unit rewind button, unload button, or both have been used to rewind or unload the tape cartridge. A tape cartridge other than the intended cartridge might have been inserted or the tape medium might not be at the expected position.

User response: Verify that the correct tape cartridge has been inserted and that the tape medium is at the required position before continuing to work with the tape.

Severity: Warning

---

tape_34xx.696dc8 <bus ID of the tape device>: The tape medium is write-protected

Explanation: A write-type operation failed because the tape medium is write-protected.

User response: Eject the tape cartridge, switch off the write protection on the cartridge, insert the cartridge, and try the operation again.

Severity: Warning

---

tape_34xx.69f60e <bus ID of the tape device>: The tape unit does not support the current tape length

Explanation: The length of the tape in the cartridge is incompatible with the tape unit.

User response: Either use a different tape unit or use a tape with a supported length.

Severity: Warning

---

tape_34xx.6bcece <bus ID of the tape device>: The tape unit is already assigned

Explanation: The tape unit is already assigned to another channel path.

User response: Free the tape unit from the operating
system instance to which it is currently assigned then try again.

Severity: Warning

tape_34xx.7f9ae4  <bus ID of the tape device>: A channel protocol error occurred

Explanation: An error was detected in the channel protocol.
User response: Reposition the tape and try the operation again.
Severity: Warning

tape_34xx.85efa7  <bus ID of the tape device>: The block ID sequence on the tape is incorrect

Explanation: The control unit has detected an incorrect block ID sequence on the tape. This problem typically indicates that the data on the tape is damaged.
User response: If this problem occurred during a write-type operation reposition the tape and repeat the operation.
Severity: Warning

tape_34xx.956e53  <bus ID of the tape device>: The tape does not have the required tape tension

Explanation: The tape does not have the required tape tension.
User response: Rewind and reposition the tape, then repeat the operation.
Severity: Warning

tape_34xx.b334e9  <bus ID of the tape device>: The tape unit is not online

Explanation: The tape unit is not online to the tape device driver.
User response: Ensure that the tape unit is operational and that the cable connections between the control unit and the tape unit are securely in place and not damaged.
Severity: Warning

tape_34xx.c5ee4a  <bus ID of the tape device>: Automatic unloading of the tape cartridge failed

Explanation: The tape unit failed to unload the cartridge.
User response: Unload the cartridge manually by using the eject button on the tape unit.
Severity: Warning

---

tape_34xx.c7fc10  <bus ID of the tape device>: The tape unit does not support the compaction algorithm

Explanation: The tape unit cannot read the current tape. The data on the tape has been compressed with an algorithm that is not supported by the tape unit.
User response: Use a tape unit that supports the compaction algorithm used for the current tape.
Severity: Warning

tape_34xx.ccc5ad  <bus ID of the tape device>: The tape unit failed to load the cartridge

Explanation: An error has occurred while loading the tape cartridge.
User response: Unload the cartridge and load it again.
Severity: Warning

tape_34xx.cfc6c4  <bus ID of the tape device>: An equipment check has occurred on the tape unit

Explanation: Possible reasons for the check condition are a unit adapter error, a buffer error on the lower interface, an unusable internal path, or an error that has occurred while loading the cartridge.
User response: Examine the tape unit and the cartridge loader. Consult the tape unit documentation for details.
Severity: Warning

tape_34xx.d2b071  <bus ID of the tape device>: A read error occurred that cannot be recovered

Explanation: A read error has occurred that cannot be recovered. The current tape might be damaged.
User response: None.
Severity: Warning

tape_34xx.d56330  <bus ID of the tape device>: The tape contains an incorrect block ID sequence

Explanation: The control unit has detected an incorrect block ID sequence on the tape. This problem typically indicates that the data on the tape is damaged.
User response: If this problem occurred during a write-type operation reposition the tape and repeat the operation.
Severity: Warning

---

Chapter 34. tape_34xx  101
taped_34xx.d608a6 • taped_34xx.f06a05

taped_34xx.d608a6  <bus ID of the tape device>: The control unit has fenced access to the tape volume

Explanation: The control unit fences further access to the current tape volume. The data integrity on the tape volume might have been compromised.

User response: Rewind and unload the tape cartridge.

Severity: Warning

taped_34xx.e473c9  <bus ID of the tape device>: The tape subsystem is running in degraded mode

Explanation: The tape subsystem is not operating at its maximum performance.

User response: Contact your service representative for the tape unit and report this problem.

Severity: Warning

taped_34xx.e96040  <bus ID of the tape device>: The tape unit cannot process the tape format

Explanation: Either the tape unit is not able to read the format ID mark, or the specified format is not supported by the tape unit.

User response: If you do not need the data recorded on the current tape, use a different tape or write a new format ID mark at the beginning of the tape. Be aware that writing a new ID mark leads to a loss of all data that has been recorded on the tape. If you need the data on the current tape, use a tape unit that supports the tape format.

Severity: Warning

taped_34xx.d608a6  taped_34xx.f06a05  An unexpected condition <number> occurred in tape error recovery

Explanation: The control unit has reported an error condition that is not recognized by the error recovery process of the tape device driver.

User response: Report this problem and the condition number from the message to your support organization.

Severity: Error
Chapter 35. tape_3590

Messages with a prefix tape_3590 are issued by the channel-attached tape device driver and relate to an IBM 3590 or IBM 3592 magnetic tape subsystem.

tape_3590.07e630 <bus ID of the tape device>: DEVSIM  
SEV=<SEV>, DEVTYPE=3590/<model>, 
MC=<message code>, ES=<exception>/ <required service action>,  
REF=0x<refcode1>-0x<refcode2>-0x<refcode3>

Explanation: This is an operating system independent device subsystem information message issued by the tape unit. The information in the message is intended for the IBM customer engineer.

User response: See the documentation for the tape unit for further information.

Severity: Warning

tape_3590.18dc29 <bus ID of the tape device>: The tape medium must be loaded into a different tape unit

Explanation: The tape device has indicated an error condition that requires loading the tape cartridge into a different tape unit to recover.

User response: Unload the cartridge and use a different tape unit to retry the operation.

Severity: Warning

tape_3590.3c5600 <bus ID of the tape device>: I/O subsystem information: exception <exception>, service <required service action>

Explanation: This is an operating system independent I/O subsystem information message that was issued by the tape unit. The information in the message is intended for the IBM customer engineer.

User response: See the documentation for the tape unit for further information.

Severity: Warning

tape_3590.3f6a17 <bus ID of the tape device>: IOSIM  
SEV=<SEV>, DEVTYPE=3590/<model>,  
MC=<message code>, ES=<exception>/ <required service action>,  
REF=0x<refcode1>-0x<refcode2>-0x<refcode3>

Explanation: This is an operating system independent I/O subsystem information message that was issued by the tape unit. The information in the message is intended for the IBM customer engineer.

User response: See the documentation for the tape unit for further information.

Severity: Warning

tape_3590.497827 <bus ID of the tape device>: The tape unit failed to obtain the encryption key from EKM

Explanation: The tape unit was unable to retrieve the encryption key required to decode the data on the tape from the enterprise key manager (EKM).

User response: See the EKM and tape unit documentation for information about how to enable the tape unit to retrieve the encryption key.

Severity: Error

tape_3590.4b2253 <bus ID of the tape device>: Device subsystem information: exception <exception>, service <required service action>

Explanation: This is an operating system independent device subsystem information message that was issued by the tape unit. The information in the message is intended for the IBM customer engineer.

User response: See the documentation for the tape unit for further information.

Severity: Warning

tape_3590.575a6b <bus ID of the tape device>: The tape unit has issued sense message <sense message code>

Explanation: The tape unit has issued an operating system independent sense message.

User response: See the documentation for the tape unit for further information.

Severity: Warning

tape_3590.601044 <bus ID of the tape device>: The tape unit has issued an unknown sense message code 0x<code>

Explanation: The tape device driver has received an unknown sense message from the tape unit.

User response: See the documentation for the tape unit for further information.
Severity: Warning

tape_3590.7ad0ac  bus ID of the tape device>: MIM
SEV=<SEV>, MC=<message code>,
ES=<exception>/required service action>,
RC=<refcode>-<mid>-<fid>

Explanation: This is an operating system independent
information message that was issued by the tape unit.
The information in the message is intended for the IBM
customer engineer.

User response: See to the documentation for the tape
unit for further information.

Severity: Warning

---

tape_3590.991401  bus ID of the tape device>: Tape
media information: exception
<exception>, service <service>

Explanation: This is an operating system independent
tape medium information message that was issued by
the tape unit. The information in the message is
intended for the IBM customer engineer.

User response: See the documentation for the tape
unit for further information.

Severity: Warning

---

tape_3590.fca498  bus ID of the tape device>: A
different host has privileged access to
the tape unit

Explanation: You cannot access the tape unit because
a different operating system instance has privileged
access to the unit.

User response: Unload the current cartridge to solve
this problem.

Severity: Warning

---

tape_3590.ff1db8  bus ID of the tape device>: The tape
unit has issued an unknown sense
message code <code>

Explanation: The tape device has issued a sense
message, that is unknown to the device driver.

User response: Use the message code printed as
hexadecimal value and see the documentation for
the tape unit for further information.

Severity: Warning
Chapter 36. time

Messages with a prefix “time” are issued by the System z specific time functions.

---

**time.93fc64**  The real or virtual hardware system does not provide an STP interface

**Explanation:** The ‘stp=’ parameter has been passed on the kernel parameter line for a Linux instance that does not have access to the server time protocol (STP) facility.

**User response:** To avoid this warning remove the ‘stp=’ kernel parameter.

**Severity:** Warning

---

**time.c4bd65**  The real or virtual hardware system does not provide an ETR interface

**Explanation:** The ‘etr=’ parameter has been passed on the kernel parameter line for a Linux instance that does not have access to the external time reference (ETR) facility.

**User response:** To avoid this warning remove the ‘etr=’ kernel parameter.

**Severity:** Warning

---

**time.eb7580**  The ETR interface has adjusted the clock by <number of microseconds> microseconds

**Explanation:** The external time reference (ETR) interface has synchronized the system clock with the external reference and set it to a new value. The time difference between the old and new clock value has been passed to the network time protocol (NTP) as a single shot adjustment.

**User response:** None.

**Severity:** Notice
Chapter 37. vmlogrdr

Messages with a prefix vmlogrdr are issued by the z/VM recording device driver. With the z/VM recording device driver, an instance of Linux on z/VM can read from the z/VM CP recording services.

vmlogrdr.c1d147  vmlogrdr: device <device name> is busy. Refuse to suspend.

Explanation: Suspending vmlogrdr devices that are in uses is not supported. A request to suspend such a device is refused.

User response: Close all applications that use any of the vmlogrdr devices and then try to suspend the system again.

Severity: Error
Chapter 38. vmur

Messages with a prefix vmur are issued by the z/VM virtual unit record device driver. This device driver provides Linux with access to z/VM virtual unit record devices like punch card readers, card punches, and line printers.

vmur.386675  Unit record device <bus ID of the unit record device> is busy, <z/VM virtual unit record device driver> refusing to suspend.

Explanation: Linux cannot be suspended while a unit record device is in use.

User response: Stop all applications that work on z/VM spool file queues, for example, the vmur tool. Then try again to suspend Linux.

Severity: Error

vmur.53bf56  The <z/VM virtual unit record device driver> cannot be loaded without z/VM

Explanation: The z/VM virtual unit record device driver provides Linux with access to z/VM virtual unit record devices like punch card readers, card punches, and line printers. On Linux instances that run in environments other than the z/VM hypervisor, the device driver does not provide any useful function and the corresponding vmur module cannot be loaded.

User response: Load the vmur module only on Linux instances that run as guest operating systems of the z/VM hypervisor. If the z/VM virtual unit record device has been compiled into the kernel, ignore this message.

Severity: Error

vmur.ff8847  Kernel function alloc_chrdev_region failed with error code <error code according to errno definitions>

Explanation: The z/VM virtual unit record device driver (vmur) needs to register a range of character device minor numbers from 0x0000 to 0xffff. This registration failed, probably because of memory constraints.

User response: Free some memory and reload the vmur module. If the z/VM virtual unit record device driver has been compiled into the kernel reboot Linux. Consider assigning more memory to your LPAR or z/VM guest virtual machine.

Severity: Error
Chapter 39. vmwatchdog

Messages with a prefix vmwatchdog are issued by the watchdog device driver. With the watchdog device driver, a watchdog application on an instance of Linux on z/VM can access the z/VM watchdog timer.

vmwatchdog.8f03fb  The system cannot be suspended while the watchdog is running

Explanation: The watchdog must not time out during hibernation. The watchdog device driver prevents the system from being suspended while the watchdog timer is running.

User response: If you want to suspend the system, stop the watchdog, for example, by entering the command: 'echo V > /dev/vmwatchdog'. Alternatively, stop the program that uses the watchdog or reconfigure the program to not use the watchdog.

Severity: Error

vmwatchdog.bfeb9c  The system cannot be suspended while the watchdog is in use

Explanation: A program is currently using the vmwatchdog device node. The watchdog device driver prevents the system from being suspended while the watchdog device is in use.

User response: If you want to suspend the system, find out which program uses the watchdog device. Stop the program or reconfigure it to not use the watchdog.

Severity: Error
Chapter 40. xpram

Messages with a prefix xpram are issued by the XPRAM device driver. This block device driver enables Linux on System z to access expanded storage.

xpram.917762 Resuming the system failed: <cause of the failure>

Explanation: A system cannot be resumed if the expanded memory setup changes after hibernation. Possible reasons for the failure are: - Expanded memory was removed after hibernation. - Size of the expanded memory changed after hibernation. The system is stopped with a kernel panic.
User response: Reboot Linux.
Severity: Error

xpram.ab9aa4 <number of partitions> is not a valid number of XPRAM devices

Explanation: The number of XPRAM partitions specified for the 'devs' module parameter or with the 'xpram.parts' kernel parameter must be an integer in the range 1 to 32. The XPRAM device driver created a maximum of 32 partitions that are probably not configured as intended.
User response: If the XPRAM device driver has been compiled as a separate module, unload the module and load it again with a correct value for the 'devs' module parameter. If the XPRAM device driver has been compiled into the kernel, correct the 'xpram.parts' parameter in the kernel command line and restart Linux.
Severity: Error

xpram.f004d1 Not enough expanded memory available

Explanation: The amount of expanded memory required to set up your XPRAM partitions depends on the 'sizes' parameter specified for the xpram module or on the specifications for the 'xpram.parts' parameter if the XPRAM device driver has been compiled into the kernel. Your current specification exceed the amount of available expanded memory. Your XPRAM partitions are probably not configured as intended.
User response: If the XPRAM device driver has been compiled as a separate module, unload the xpram module and load it again with an appropriate value for the 'sizes' module parameter. If the XPRAM device driver has been compiled into the kernel, adjust the 'xpram.parts' parameter in the kernel command line and restart Linux. If you need more than the available expanded memory, increase the expanded memory allocation for your virtual hardware or LPAR.
Severity: Error

xpram.f6ae78 No expanded memory available

Explanation: The XPRAM device driver has been loaded in a Linux instance that runs in an LPAR or virtual hardware without expanded memory. No XPRAM partitions are created.
User response: Allocate expanded memory for your LPAR or virtual hardware or do not load the xpram module. You can ignore this message, if you do not want to create XPRAM partitions.
Severity: Error
Chapter 41. zdump

Messages with a prefix zdump are issued by the zfcpdump functions.

zdump.54a0dd  The 32-bit dump tool cannot be used for a 64-bit system

Explanation: The dump process ends without creating a system dump.

User response: Use a 64-bit dump tool to obtain a system dump for 64-bit Linux instance.

Severity: Alert

zdump.d05784  The 64-bit dump tool cannot be used for a 32-bit system

Explanation: The dump process ends without creating a system dump.

User response: Use a 32-bit dump tool to obtain a system dump for 32-bit Linux instance.

Severity: Alert
Chapter 42. zfcp

Messages with a prefix zfcp are issued by the SCSI-over-Fibre Channel device driver (zfcp device driver) for the QDIO-based System z SCSI-over-Fibre Channel adapter. The zfcp device driver supports Fibre Channel-attached SCSI devices on Linux on System z.

zfcp.000866 <bus ID of the zfcp device>: The FCP adapter cannot support more NPIV ports

Explanation: N_Port ID Virtualization (NPIV) ports consume physical resources on the FCP adapter. The FCP adapter resources are exhausted. The connection is not operational.

User response: Analyze the number of available NPIV ports and which operating system instances use them. If necessary, reconfigure your setup to move some NPIV ports to an FCP adapter with free resources.

Severity: Warning

zfcp.01a8f2 <bus ID of the zfcp device>: All NPIV ports on the FCP adapter have been assigned

Explanation: The number of N_Port ID Virtualization (NPIV) ports that can be assigned on an FCP adapter is limited. Once assigned, NPIV ports are not released automatically but have to be released explicitly through the support element (SE).

User response: Identify NPIV ports that have been assigned but are no longer in use and release them from the SE.

Severity: Warning

zfcp.020115 <bus ID of the zfcp device>: Registering port 0x<WWPN> failed

Explanation: The Linux kernel could not allocate enough memory to register the remote port with the indicated WWPN with the SCSI stack. The remote port is not available.

User response: Free some memory and trigger the rescan for ports.

Severity: Error

zfcp.058803 <bus ID of the zfcp device>: FCP adapter maximum QTCB size <maximum supported size> bytes is too small

Explanation: The queue transfer control block (QTCB) size requested by the zfcp device driver is not supported by the FCP adapter hardware.

User response: Update the firmware on your FCP adapter hardware to the latest available level and update the Linux kernel to the latest supported level. If the problem persists, contact your support organization.

Severity: Error

zfcp.0cf3fa <bus ID of the zfcp device>: Creating an ERP thread for the FCP device failed

Explanation: The zfcp device driver could not set up error recovery procedure (ERP) processing for the FCP device. The FCP device is not available for use in Linux.

User response: Free some memory and try again to load the zfcp device driver. If the zfcp device driver has been compiled into the kernel, reboot Linux. Consider assigning more memory to your LPAR or z/VM guest virtual machine. If the problem persists, contact your support organization.

Severity: Error

zfcp.10efb5 <bus ID of the zfcp device>: Opening WKA port 0x<destination ID of the WKA port> failed

Explanation: The FCP adapter rejected a request to open the specified well-known address (WKA) port. No retry is possible.

User response: Verify the setup and check if the maximum number of remote ports used through this adapter is below the maximum allowed. If the problem persists, gather Linux debug data, collect the FCP adapter hardware logs, and report the problem to your support organization.

Severity: Warning

zfcp.128ff1 <bus ID of the zfcp device>: The WWPN assignment file on the FCP adapter has been damaged

Explanation: This is an FCP adapter hardware problem.

User response: Report this problem with FCP hardware logs to IBM support.

Severity: Warning

zfcp.19bff2 <bus ID of the zfcp device>: Incorrect CDB length <value in length field>, LUN 0x<LUN> on port 0x<WWPN> closed

Explanation: The control-data-block (CDB) length field in a SCSI request is not valid or too large for the FCP
adapter. The zfcp device driver closed down the SCSI device at the indicated LUN.

User response: Gather Linux debug data and report this problem to your support organization.

Severity: Error

---

zfcp.219537  <bus ID of the zfcp device>: The fibre channel fabric does not support NPIV

Explanation: The FCP adapter requires N_P ort ID Virtualization (NPIV) from the adjacent fibre channel node. Either the FCP adapter is connected to a fibre channel switch that does not support NPIV or the FCP adapter tries to use NPIV in a point-to-point setup. The connection is not operational.

User response: Verify that NPIV is correctly used for this connection. Check the FCP adapter configuration and the fibre channel switch configuration. If necessary, update the fibre channel switch firmware.

Severity: Warning

---

zfcp.29fa1a  <bus ID of the zfcp device>: The adjacent fibre channel node does not support FCP

Explanation: The fibre channel switch or storage system that is connected to the FCP channel does not support the fibre channel protocol (FCP). The zfcp device driver stopped using the FCP device.

User response: Check the adjacent fibre channel node.

Severity: Warning

---

zfcp.2a747e  <bus ID of the zfcp device>: No handle is available for LUN 0x<LUN> on port 0x<WWPN>

Explanation: The FCP adapter can only open a limited number of SCSI devices. This limit has been reached and the SCSI device at the indicated LUN cannot be opened.

User response: For FCP subchannels running in non-NPIV mode, check all SCSI devices opened through the FCP adapter and close some of them. For FCP subchannels running in NPIV mode, verify the SAN zoning and host connections on the storage systems. Ensure that the zoning and host connections only allow access to the required LUNs. As a workaround, disable the automatic LUN scanning by setting the zfcp.allow_lun_scan kernel parameter or the allow_lun_scan module parameter to 0.

Severity: Error

---

zfcp.306272  <bus ID of thezf cp device>: The FCP adapter reported a problem that cannot be recovered

Explanation: The FCP adapter has a problem that cannot be recovered by the zfcp device driver. Thezf cp device driver stopped using the FCP device.

User response: Gather Linux debug data, collect the FCP adapter hardware logs, and report this problem to your support organization.

Severity: Error

---

zfcp.307c0c  <bus ID of the zfcp device>: FCP device not operational because of an unsupported FC class

Explanation: The FCP adapter hardware does not support the fibre channel service class requested by thezf cp device driver. This problem indicates a program error in the zfcp device driver.

User response: Gather Linux debug data, collect the FCP adapter hardware logs, and report this problem to your support organization.

Severity: Error

---

zfcp.308f45  <bus ID of the zfcp device>: The mode table on the FCP adapter has been damaged

Explanation: This is an FCP adapter hardware problem.

User response: Report this problem with FCP hardware logs to IBM support.

Severity: Warning

---

zfcp.3df9c  <bus ID of the zfcp device>: Setting up the QDIO connection to the FCP adapter failed

Explanation: The zfcp device driver failed to establish a QDIO connection with the FCP adapter.

User response: Set the FCP adapter offline or detach it from the Linux system, free some memory and set the FCP adapter online again or attach it again. If this problem persists, gather Linux debug data, collect the
FCP adapter hardware logs, and report the problem to your support organization.

**Severity:** Error

**zfcp.4a463f**  
*bus ID of the zfcp device*: ERP failed for remote port 0x<WWPN>

**Explanation:** An error occurred on a remote port. The error recovery procedure (ERP) could not resolve the error. The port is not available.

**User response:** Verify that the WWPN is correct and check the fibre channel fabric for errors related to the WWPN.

**Severity:** Error

**zfcp.4c0e02**  
*bus ID of the zfcp device*: The FCP adapter does not recognize the command 0x<command>

**Explanation:** A command code that was sent from the zfcp device driver to the FCP adapter is not valid. The zfcp device driver stopped using the FCP device.

**User response:** Gather Linux debug data, collect the FCP adapter hardware logs, and report this problem to your support organization.

**Severity:** Error

**zfcp.566303**  
*bus ID of the zfcp device*: The CHPID for the FCP device is offline

**Explanation:** The CHPID for an FCP device has been set offline, either logically in Linux or on the hardware.

**User response:** Find out which CHPID corresponds to the FCP device, for example, with the lcss command. Check if the CHPID has been set logically offline in sysfs. Write 'on' to the CHPID's status attribute to set it online. If the CHPID is online in sysfs, find out if it has been varied offline through a hardware management interface, for example the service element (SE).

**Severity:** Warning

**zfcp.56747f**  
*bus ID of the zfcp device*: Incorrect direction <value in direction field>, LUN 0x<LUN> on port 0x<WWPN> closed

**Explanation:** The direction field in a SCSI request contains an incorrect value. The zfcp device driver closed down the SCSI device at the indicated LUN.

**User response:** Gather Linux debug data and report this problem to your support organization.

**Severity:** Error
zfcp.7059a3 • zfcp.82bb71

**Explanation:** The transfer protocol status information reported by the FCP adapter is not a valid status for the zfcp device driver. The zfcp device driver stopped using the FCP device.

**User response:** Gather Linux debug data, collect the FCP adapter hardware logs, and report this problem to your support organization.

**Severity:** Error

**Explanation:** The SCSI device at the indicated LUN is already in use by another system. Only one system at a time can use the SCSI device.

**User response:** Ensure that the other system stops using the device before trying to use it.

**Severity:** Warning

**Explanation:** The FCP device is connected to a fibre channel arbitrated loop or the FCP adapter reported an unknown fibre channel topology. The zfcp device driver supports point-to-point connections and switched fibre channel fabrics but not arbitrated loop topologies. The FCP device cannot be used.

**User response:** Check the fibre channel setup and ensure that only supported topologies are connected to the FCP adapter.

**Severity:** Error

**Explanation:** A remote port was opened successfully, but it reported an unexpected WWPN in the returned port login (PLOGI) data. This condition might have been caused by a change applied to the SAN configuration while the port was being opened.

**User response:** If this condition is only temporary and access to the remote port is possible, no action is required. If the condition persists, identify the storage system with the specified WWPN and contact the support organization of the storage system.

**Severity:** Warning

**Explanation:** The FCP device has been detached

**User response:** Ensure that the FCP adapter is operational and attached to the LPAR or z/VM virtual machine.

**Severity:** Warning

**Explanation:** There is no light signal from the local fibre channel cable

**User response:** Ensure that the cable is in place and connected properly to the FCP adapter and to the adjacent fibre channel switch or storage system.

**Severity:** Warning

**Explanation:** The fibre channel name server sent too much information about remote ports. The zfcp device driver did not receive sufficient information to attach all available remote ports in the SAN.

**User response:** Verify that you are running the latest firmware level on the FCP adapter. Check your SAN setup and consider reducing the number of ports visible to the FCP adapter by using more restrictive zoning in the SAN.

**Severity:** Warning

**Explanation:** The common I/O layer waited for a response from the FCP adapter but no response was received within the specified time limit. This might indicate a hardware problem.

**User response:** Consult your hardware administrator. If this problem persists, gather Linux debug data, collect the FCP adapter hardware logs, and report the problem to your support organization.

**Severity:** Warning
**zfcp.87c4d0**  
<bus ID of the zfcp device>: The error threshold for checksum statistics has been exceeded

**Explanation:** The FCP adapter has reported a large number of bit errors. This might indicate a problem with the physical components of the fibre channel fabric. Details about the errors have been written to the HBA trace for the FCP adapter.

**User response:** Check for problems in the fibre channel fabric and ensure that all cables are properly plugged.

**Severity:** Warning

**zfcp.8bdb34**  
<bus ID of the zfcp device>: ERP failed for LUN 0x<LUN> on port 0x<WWPN>

**Explanation:** An error occurred on the SCSI device at the specified LUN. The error recovery procedure (ERP) could not resolve the error. The SCSI device is not available.

**User response:** Verify that the LUN is correct. Check the fibre channel fabric for errors related to the specified WWPN and LUN, the storage server, and Linux.

**Severity:** Error

**zfcp.9b70c0**  
<bus ID of the zfcp device>: Not enough FCP adapter resources to open remote port 0x<WWPN>

**Explanation:** Each port that is opened consumes physical resources of the FCP adapter to which it is attached. These resources are exhausted and the specified port cannot be opened.

**User response:** Reduce the total number of remote ports that are attached to the FCP adapter.

**Severity:** Warning

**zfcp.9d2a6b**  
<bus ID of the zfcp device>: There is a wrap plug instead of a fibre channel cable

**Explanation:** The FCP adapter is not physically connected to the fibre channel fabric.

**User response:** Remove the wrap plug from the FCP adapter and connect the adapter with the fibre channel fabric.

**Severity:** Warning

**zfcp.a9953d**  
<bus ID of the zfcp device>: The FCP device is suspended because of a firmware update

**Explanation:** The FCP device is not available while a firmware update is in progress. This problem is temporary. The FCP device will resume operations when the firmware update is completed.

**User response:** Wait 10 seconds and try the operation again.

**Severity:** Warning

**zfcp.ac341f**  
<bus ID of the zfcp device>: The local link has been restored

**Explanation:** A problem with the connection between the FCP adapter and the adjacent node on the fibre channel fabric has been resolved. The FCP adapter is now available again.

**User response:** None.

**Severity:** Informational

**zfcp.ad5387**  
<bus ID of the zfcp device>: Registering the FCP device with the SCSI stack failed

**Explanation:** The FCP adapter could not be registered with the Linux SCSI stack. A possible reason for this problem is memory constraints.

**User response:** Set the FCP adapter offline or detach it from the Linux system, free some memory and set the FCP adapter online again or attach it again. If this problem persists, gather Linux debug data, collect the FCP adapter hardware logs, and report the problem to your support organization.

**Severity:** Error

**zfcp.afba9a**  
<bus ID of the zfcp device>: The link between the FCP adapter and the FC fabric is down

**Explanation:** The FCP adapter is not usable. Specific error information is not available.

**User response:** Check the cabling and the fibre channel fabric configuration. If this problem persists, gather Linux debug data, collect the FCP adapter hardware logs, and report the problem to your support organization.

**Severity:** Warning

**zfcp.b2d959**  
The zfcp device driver could not register with the common I/O layer

**Explanation:** The device driver initialization failed. A possible cause of this problem is memory constraints.

**User response:** Free some memory and try again to load the zfcp device driver. If the zfcp device driver has been compiled into the kernel, reboot Linux. Consider assigning more memory to your LPAR or z/VM guest virtual machine. If the problem persists, contact your support organization.
**zfcp.b2ef0a • zfcp.f16820**

**Severity:** Error

**Explanation:** The FCP device is operational again.

**User response:** None.

**Severity:** Informational

**Explanation:** The FCP adapter could not log in to the fibre channel fabric.

**User response:** Check the fibre channel fabric or switch logs for possible errors.

**Severity:** Warning

**Explanation:** The queue transfer control block (QTCB) type is not supported by the FCP adapter.

**User response:** Install the latest firmware on your FCP adapter hardware. If this does not resolve the problem, upgrade to a Linux level with a more recent zfcp device driver. If the problem persists, contact your support organization.

**Severity:** Error

**Explanation:** The specification for an initial SCSI device provided with the 'zfcp.device' kernel parameter or with the 'device' module parameter is syntactically incorrect. The specified SCSI device could not be attached to the Linux system.

**User response:** Correct the value for the 'zfcp.device' or 'device' parameter and reboot Linux. See "Device Drivers, Features, and Commands" for information about the syntax.

**Severity:** Error

**Explanation:** The FCP adapter reported that it received the same request ID twice. This is an error. The zfcp device driver stopped using the FCP device.

**User response:** Gather Linux debug data, collect the FCP adapter hardware logs, and report this problem to your support organization.

**Severity:** Error

**Explanation:** This condition indicates an error in the FCP adapter hardware or in the z/VM hypervisor.

**User response:** Gather Linux debug data, collect the FCP adapter hardware logs, and report this problem to IBM support.

**Severity:** Warning

**Explanation:** QDIO reported a problem to the zfcp device driver. The zfcp device driver tries to recover this problem.

**User response:** Check for related error messages. If this problem occurs frequently, gather Linux debug data and contact your support organization.

**Severity:** Warning

**Explanation:** The protocol supported by the FCP adapter is not compatible with the zfcp device driver.

**User response:** Upgrade your Linux kernel to a level that includes a zfcp device driver with support for the control block version required by your FCP adapter.
Chapter 43. zpci

Messages with a prefix zpci are issued by the kernel module that provides PCIe support.

**User response:** None.

**Severity:** Informational

---

**Explanation:** The availability of a PCI function has changed. Possible reasons for the change include PCI configuration actions on the Hardware Management Console or hypervisor. For shared PCI functions, the function might also have been reserved or released by another system. If the device name of a function is shown as 'n/a', the device registration with the PCI device driver has not completed. The function ID identifies the function to the I/O configuration (IOCDS). The PCI event code can be useful diagnostic information for your support organization.

---

**User response:** Trigger a recovery action by writing '1' to the 'recovery' sysfs attribute of the PCI function. In sysfs, PCI functions are represented as /sys/bus/pci/devices/<name>, where <name> is the device name of the function. If the problem persists, contact your support organization.

**Severity:** Error
Accessibility

Accessibility features help users who have a disability, such as restricted mobility or limited vision, to use information technology products successfully.

Documentation accessibility

The Linux on System z publications are in Adobe Portable Document Format (PDF) and should be compliant with accessibility standards. If you experience difficulties when you use the PDF file and want to request a Web-based format for this publication, use the Readers' Comments form in the back of this publication, send an email to eservdoc@de.ibm.com, or write to:

We appreciate your comments about this publication. Please comment on specific errors or omissions, accuracy, organization, subject matter, or completeness of this book. The comments you send should pertain to only the information in this manual or product and the way in which the information is presented.

For technical questions and information about products and prices, please contact your IBM branch office, your IBM business partner, or your authorized remarketer.

When you send comments to IBM, you grant IBM a nonexclusive right to use or distribute your comments in any way it believes appropriate without incurring any obligation to you. IBM or any other organizations will only use the personal information that you supply to contact you about the issues that you state on this form.

Comments:

Thank you for your support.
Submit your comments using one of these channels:
• Send your comments to the address on the reverse side of this form.
• Send your comments via email to: eservdoc@de.ibm.com
