Opportunity Identification – TSM for VE

Questions to ask:

- Do you use VMware virtual machines as production servers?
  - By 2012, most x86 server workloads will be running in VMs

- Do you need to improve the protection of data in virtual servers?
  - Traditional in-guest backup solutions drag down the performance of virtual servers and may not provide adequate Recovery Point Objectives for more critical data

- Do you need to improve the recoverability of virtual server data?
  - Can you easily recover an individual file, a disk volume or an entire virtual machine?
  - Would you like to recover disk volumes within a couple of minutes?

Pricing

- Priced by Process Value Units (PVUs) for the cores of the vSphere host running the protected guests
  - US Price = $35.00 per 10 PVU
  - TSM or TSM EE is a prerequisite product for TSM for VE; the price is in addition to the TSM or TSM EE b/a client license covering the vSphere server

- No licensing is required for the vStorage backup server, whether it is a physical or a virtual system

- Sub-capacity pricing is available

Smarter Storage Management

Backup used to be so easy

Production Servers

Backup Server

Tiered Storage

- Install a backup agent on production server, schedule the backup, copy the data periodically to the backup server

It's not so easy anymore

Infrastructure	Applications	Failure Types	Recovery Considerations
Hardware Platforms	File and Print	File/Email Deletion	RPO
Operating Systems	Messaging	Virus Attack	RTO
Locations	Database	Disk/Server Crash	Labor, Systems Bandwidth Costs
Networks	Mission Critical	Local Disaster	Impact on Applications
Desktops Laptops		Regional Outage	

- Proliferation of different system platforms, applications, physical locations all with different service level requirements

- Lots of different things can go wrong, all requiring different recovery capabilities

- Need to balance the needs of the business (data availability, resiliency) against the needs of the business (costs, resources, system availability)

Virtual server environments have changed the game

- Virtual machines take advantage of the growth in processor power, memory and I/O
  – The computers get bigger, but the application workloads have remained flat

- Virtual machines can be created very quickly
  – Minutes to provision, rather than weeks to request, procure, install and test

- Tremendous savings in hardware, power/cooling, floor space and management costs

- VMs enable new levels of service management and new delivery models
  – Quickly create new servers for application development and testing, special projects, periodic workflows like financial reporting, or to expand capacity on demand
  – Virtual servers are a basic component of public and private cloud infrastructures

Changing the game, for better and for worse …
"Virtualized servers have been a boon to the systems side of the house, but a bane for storage managers."

Hot Technologies for 2011,

STORAGE Magazine, Dec 2010 (link)

VMs have made data and storage management more complex

- Data continues to grow at unprecedented rates, across all industries
- Sever virtualization does not reduce the data
- When a virtual server is de-commissioned or moved, what happens to its data, and the storage capacity that it consumed?
- How do you manage data management processes in virtual environments?
  - Backup / Restore
  - Disaster Recovery
  - Data Lifecycle Management

Analyst Predictions

More than 90% of users deploying virtual machines are doing so specifically to reduce x86 server space and energy costs.

VM densities are increasing on physical servers, 1:15 today

By 2012, most x86 server workloads will be running in a VM.

Roughly 80% of the virtual machines today are utilizing "traditional" in-guest backup or host backups.

How do you manage data protection and recovery in your virtual servers?

Sources – Gartner, IDC, ESG

Traditional in-guest backup and recovery model

- Install a backup agent in the guest OS, just like a physical server

- Run and manage backups just like in a physical server environment

- Downside: deploying, managing, maintaining 'backup agent sprawl'

- Downside: can put a serious drain on processor, memory, I/O resources
  - From running multiple backups at once; file system scans during incremental backups; etc.

# Traditional in-guest backup using TSM and TSM FastBack

- Still the predominant approach

- Heterogeneous support for …
  - Hypervisors: **KVM, Hyper-V, VMware, LPARs, Solaris Containers, HP nPartitions, etc.**
  - Guest Operating Systems: **Windows, Linux, z/Linux, z/OS, Solaris, more**

- TSM Fastback is a very good fit for this approach (on supported platforms)
  - Block-level incremental forever backup, in the background
  - Very low overhead and minimal impact on production application performance

Pros	Cons
Better granularity in recovery	Multiple agents
Application awareness during backup	No VMware integration
Better recovery for applications	Management challenges
Business as usual, use existing management methodologies	Possible resource constraints

VMware Consolidated Backup (VCB)
VMware's first approach to offload backups from VMs

- Snapshots of the VMs are taken by the Hypervisor and sent to a Proxy Server, which is then backed up by the Backup Server

- Downside: requires more hardware (server and storage)

- Downside: multi-step recovery through the Proxy Server

Proxy Server

Virtual Disk Volumes

Using VCB with Tivoli Storage Manager

- Supported only on VMware

- This approach tries to combine the benefits of the traditional and host based approaches

- Provides an API to talk to the console and move the data through the proxy server

Pros	Cons
"LAN Free" backup	Questionable application integration (VMware triggers VSS for Windows guests)
Backup is off-loaded to the proxy server	VCB requires an additional data hop
Flexibility – supports both file level and image level backup.	Recovery might be challenging (depending on the type of backup used)
Utilizes VMware API	

The new approach: VMware vStorage APIs for Data Protection

- Data is accessed directly from the VM storage and passed directly to the backup server (single hop, data is not stored on the vStorage Server)

- Changed Block Tracking allows incremental backups (with periodic fulls) without forcing a scan of the guest OS file system

Introducing Tivoli Storage Manager for Virtual Environments v6.2

- Announce – 22 Feb 2011;   eGA – 13 Mar 2011

- Utilizes VMware's vStorage APIs for Data Protection, including block-level incremental backups based on VMware's Change Block Tracking

- Offloads the backup workload from virtual machines and production ESX hosts to vStorage backup servers

- Provides flexible recovery options – file, volume or image – from a single-pass backup

- Near-instant restore of Windows and Linux disk volumes
  – Data is made available immediately while it is copied in the background

- Simplifies day-to-day administration with the centralized Tivoli Storage Manager console
  – TSM for VE is supported on TSM Server v5.5 and above

- Automated discovery of new VMs; automatically applies backup policies

Advanced capabilities, flexible recovery options

Near-Instant File and Volume Recovery (Windows and Linux Guest OS)

1. User launches the restore UI from within the guest (or any other machine)

Choose mount destination

Add a new drive letter or path for:
snapshot of E:\ from XRDC, taken on 2005-Feb-15 17:30:01

- ⦿ Assign the following drive letter: H:
- ○ Mount in the following empty NTFS folder:
  Browse...

☑ Mount virtual volume as read only   OK   Cancel

3. User performs VM file restore or near-instant volume restore

Advanced capabilities, flexible recovery options

Full Virtual Machine Recovery (any supported Guest OS)

1. Administrator launches the restore UI from within the vStorage Server (or any other machine)

Tivoli Storage Manager for Virtual Environments - Summary

- Advanced data protection for VMware ESX and ESXi servers

- Leverages vStorage APIs for Data Protection (VADP)

- Non-disruptive, single-pass, block-level backup

- Flexible recovery options: file, volume, VM image

- Near-instant restore of files and disk volumes (Windows and Linux)

- No additional hardware required

- Simplified agent management – one agent supports multiple VMs

- Automated discovery of new VMs

- Support for LAN-free data transfer from the VMware server's storage to the backup server —preserving bandwidth for other uses

- Integrated with Tivoli Storage Manager for:
  - Unmatched scalability – manage up to 2 billion objects in a single TSM Server
  - Unified Recovery Management
  - Built-in data reduction / data deduplication
  - Policy-based tiered storage / data lifecycle management

Why IBM

- IBM has the global resources to help solve the IT and service management problems of even the largest organizations, almost anywhere they do business

- IBM is on solid financial footing and will be here to support our customers for the long term

- IBM continues to invest heavily in research and development, providing customers with product roadmaps that will continue to add value to their relationship with IBM

- IBM offers the broadest range of products, services and financing options to help customers realize significant return on their investment
