INFRASTRUCTURE & SYSTEMS

SIGNALLING

A worldwide company

25,500 employees in more than 60 countries

The second rolling stock manufacturer in the world

CONTENTS

- 1. Stating the problem**
 - Why SE for railway rolling stock?
- 2. Current approach**
 - Process, Roles & Tooling
- 3. Product Lines: a new perspective**
- 4. Looking back – Looking forward**
 - REX & Work ahead

The railways rolling stock context

- An always increasing need for better, safer and more reliable systems developed at lower costs and shorter times-to-market
- Engineers are likely to **reuse** previously developed assets into a new project ... theoretically, in order to improve quality, cost effectiveness, time to delivery or risk mitigation

Why Systems Engineering (1)?

- Coping with **complexity**
 - Avoid omissions and invalid assumptions
 - Manage real world changing issues
 - Produce the most efficient, economic and robust solution
- Better **understanding** of the system
- **Control** change and configuration effectively through the project lifecycle
 - Greater control and awareness of project requirements, interfaces and issues and the consequences of any changes
- Research shows *effective* use of SE can **save** 10-20% of the project budget

Don't rely on luck, use Systems Engineering

The ALSTOM RS context

- A wide range of product families

Rolling stock: from trams to very high speed

The ALSTOM RS context

- A system integrator role

Many potential sources of variation / diversity

Why Systems Engineering (2)?

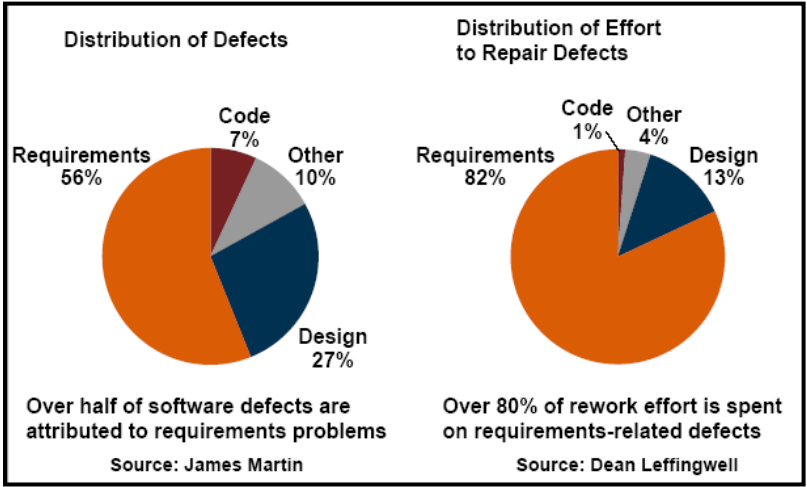

*“Misunderstanding is the most frequent form of **communication** between people”*

Peter Benary

Managing & Developing Requirements: Why?

- Many studies show the impact of Requirements on the Quality, Costs & Delivery Time of projects
 - The Chaos report, James Martin’s “56%”, Dean Leffingwell’s “82%”...

CHAOS REPORT	Finished projects (overspent € or time)	Abandoned projects
<u>Lack of user implication</u>	12,80%	12,40%
<u>Incomplete requirements and specifications</u>	12,30%	13,10%
<u>Requirements volatility</u>	11,80%	8,70%
Lack of support from leaders	7,50%	9,30%
Technological Incompetency	7,00%	4,30%
Lack of resources	6,40%	10,60%
<u>Unrealistic expectations</u>	5,90%	9,90%
<u>Poorly defined objectives</u>	5,30%	7,50% *
<u>Unrealistic time-schedule</u>	4,30%	8,10% *
New technology	3,70%	6,20% *
Others	23%	9,90%

Systems Engineering for ALSTOM

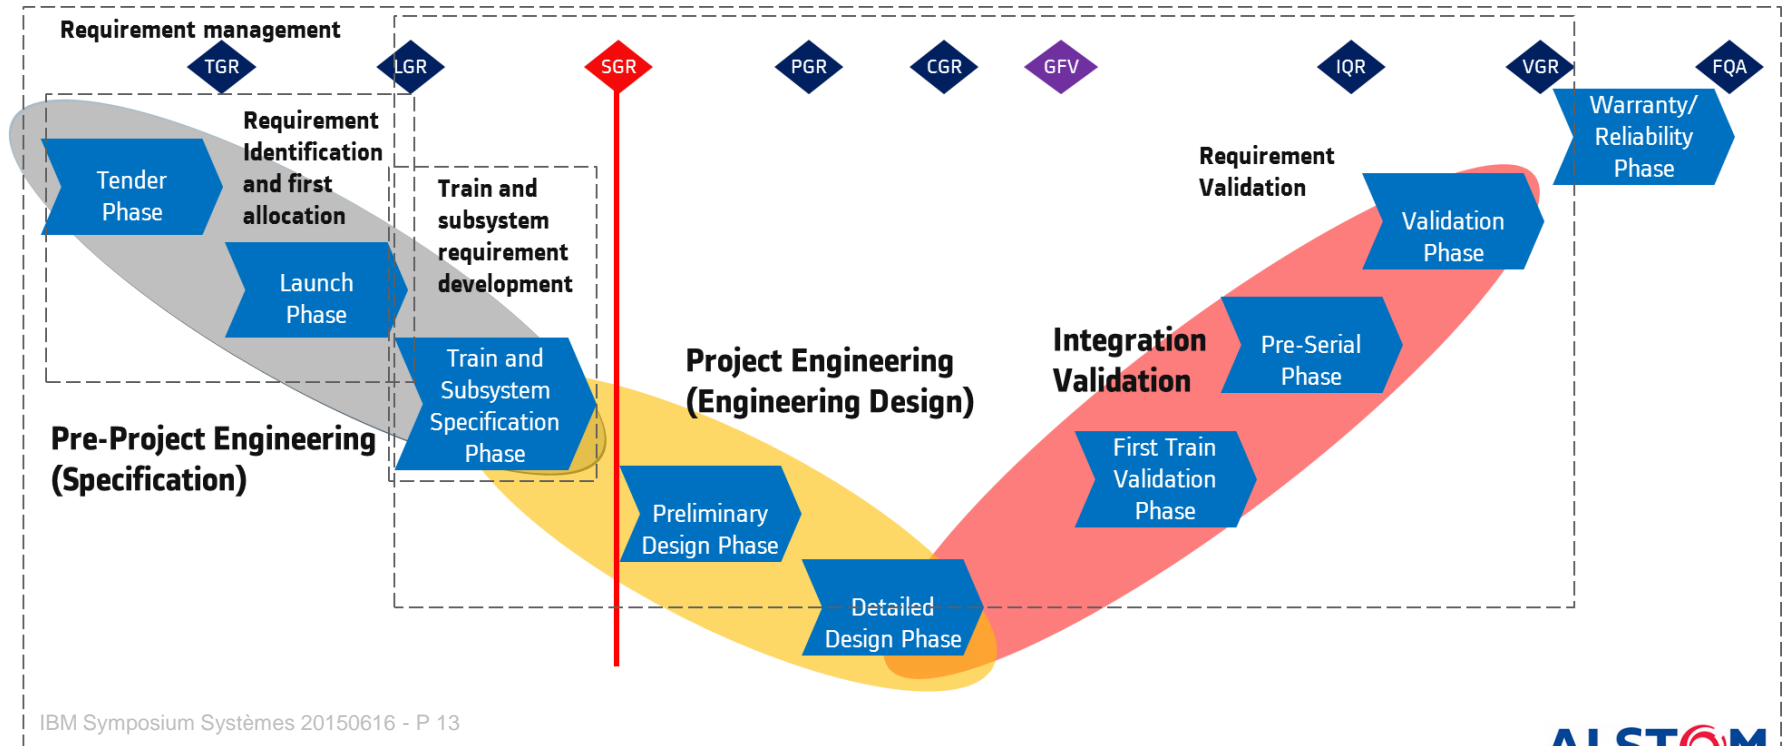

- “*SE is an interdisciplinary approach and means to **enable the realization of successful systems***”
- Very simple principles
 - Understand the problem – Investigate alternative solutions – Define and agree upon system architecture – Agree and manage the requirements – Agree and manage the interfaces – Prepare the test and support systems – Track progress against plan

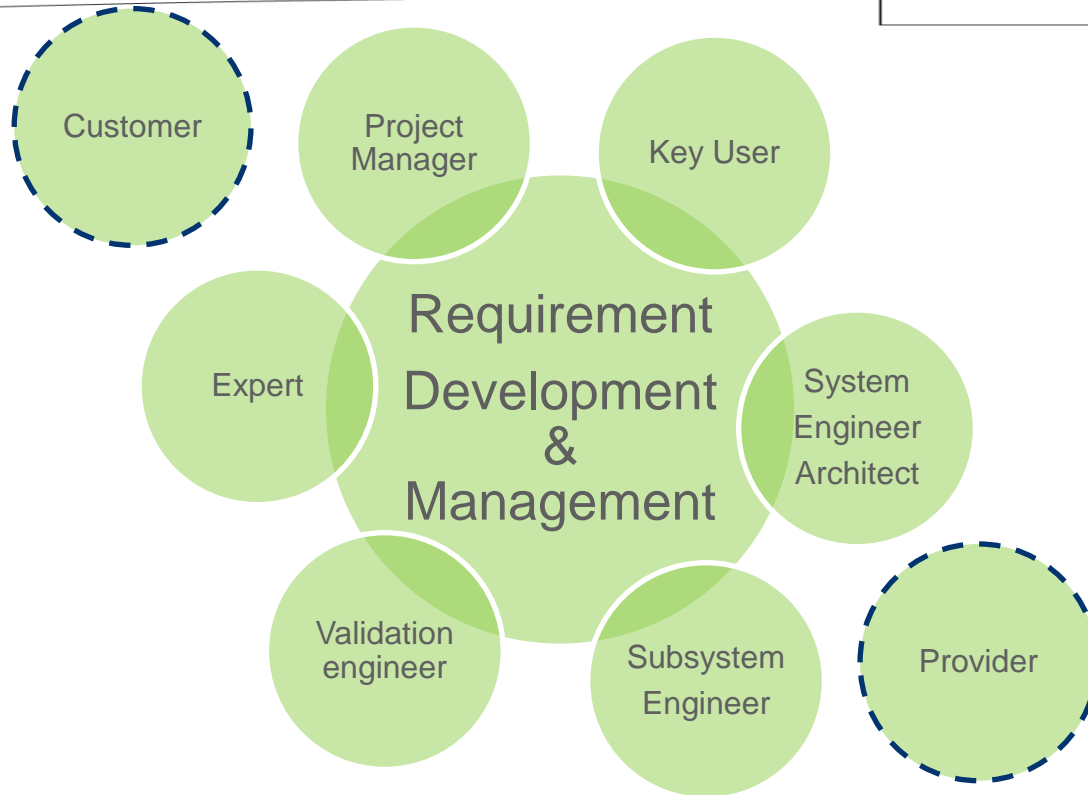

Increasing project success, Reducing risks

Current SE approach at Alstom RSC

Focus on Requirements Engineering

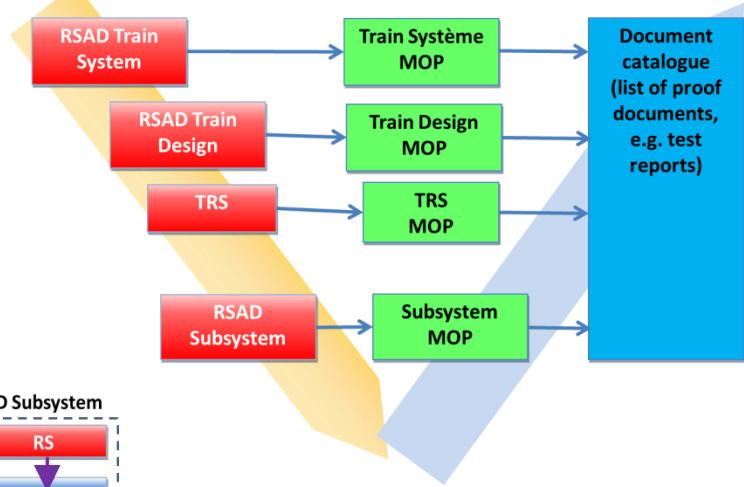

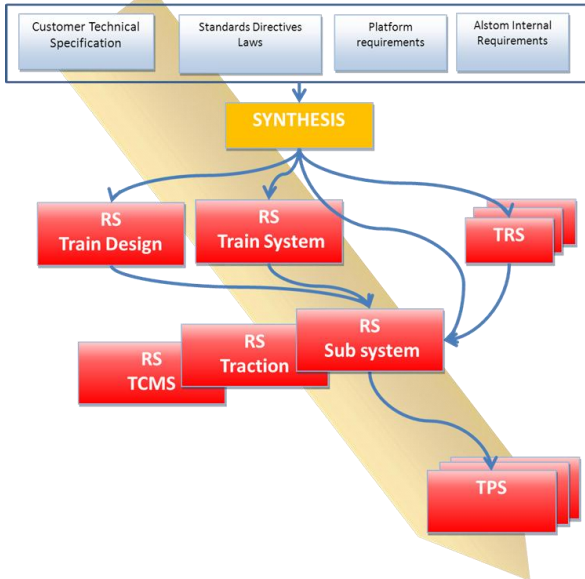

Roles and responsibilities

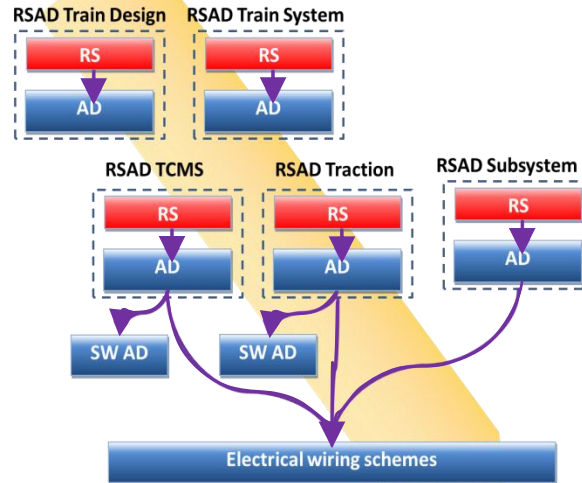

Full traceability process architecture

Requirement DEVELOPMENT traceability

Requirement VALIDATION traceability

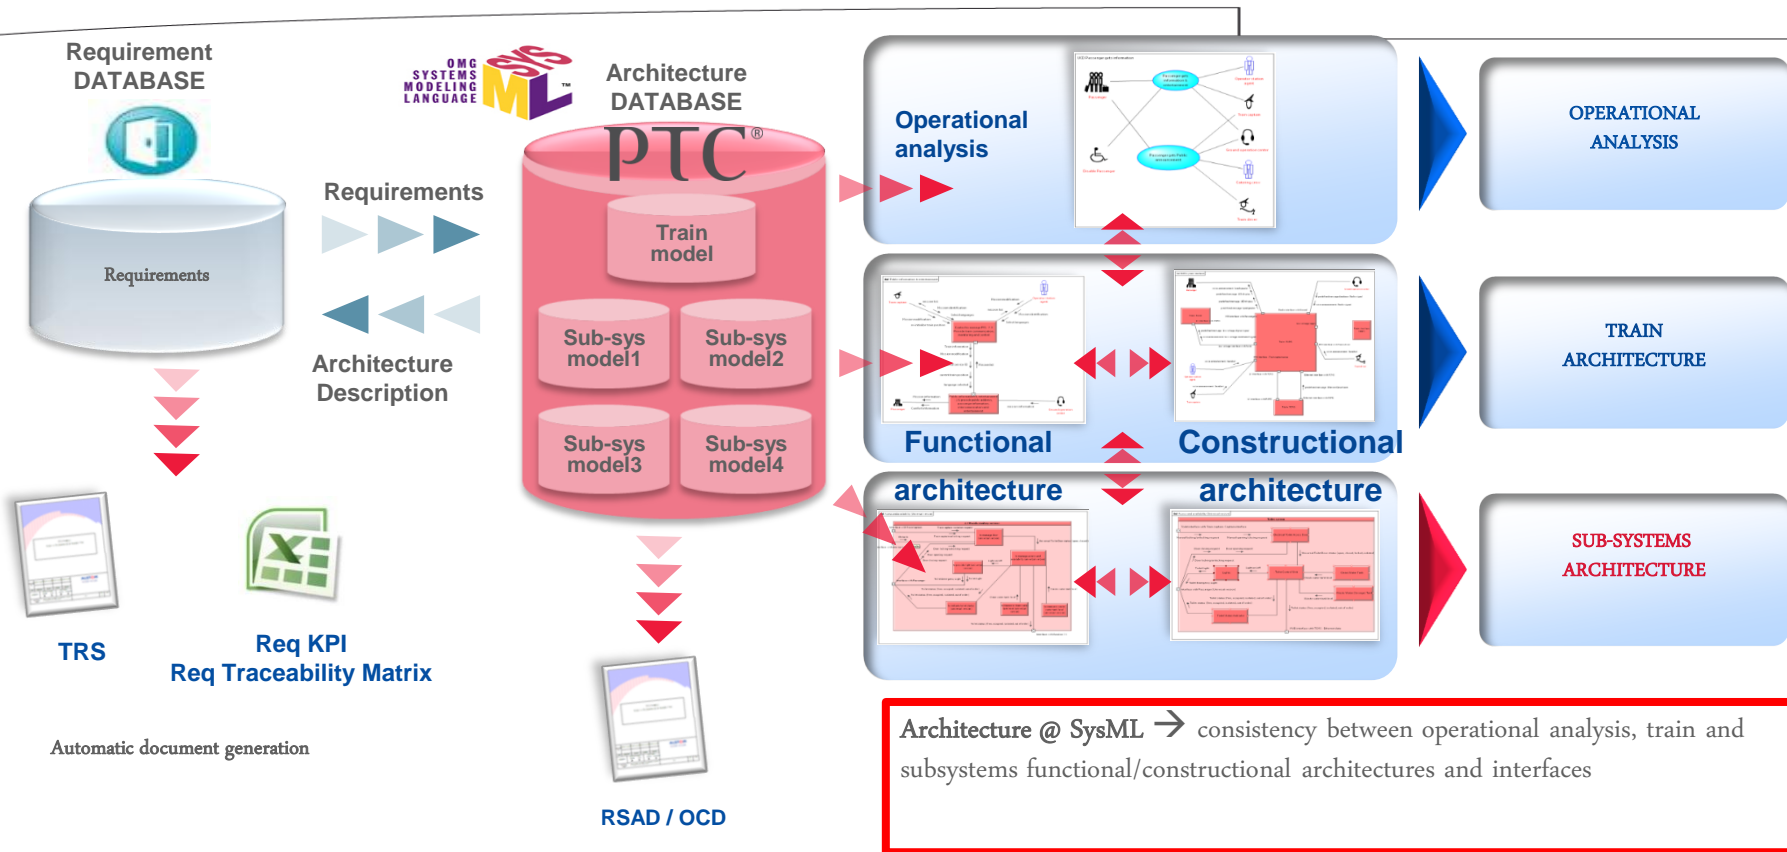

SATISFACTION links

Focus on Architectural Design

Functional (train level)	<p>Sequence diagrams or Activity diagrams</p>
Constructional (train / subsystem levels)	<p>Block definition diagram Internal block diagram</p>

Current SE tool architecture at Alstom RSC

Product Line Engineering & Reuse

- Reuse is related to concepts like **platform** engineering, **product family** engineering or Product Line Engineering (**PLE**)
- PLE defines a process to manage the underlying architectures of the product platforms (or portfolio) of an organization in order to maximize the benefits of reuse
 - “Architectures”: all kinds of structured, organized data used to characterize our systems in their entirety
- **Reuse** should be the result of a well-documented decision process
 - Implementing PLE requires upfront investment and thought

Alstom Transport Vision on PLE

Combine MBSE and PLE into something like “MBPLSE” (Model-Based Product Line Systems Engineering) in order to yield even more benefits than each of these practices alone can.

Improve our business (our profitability) by maximizing the benefits of reuse

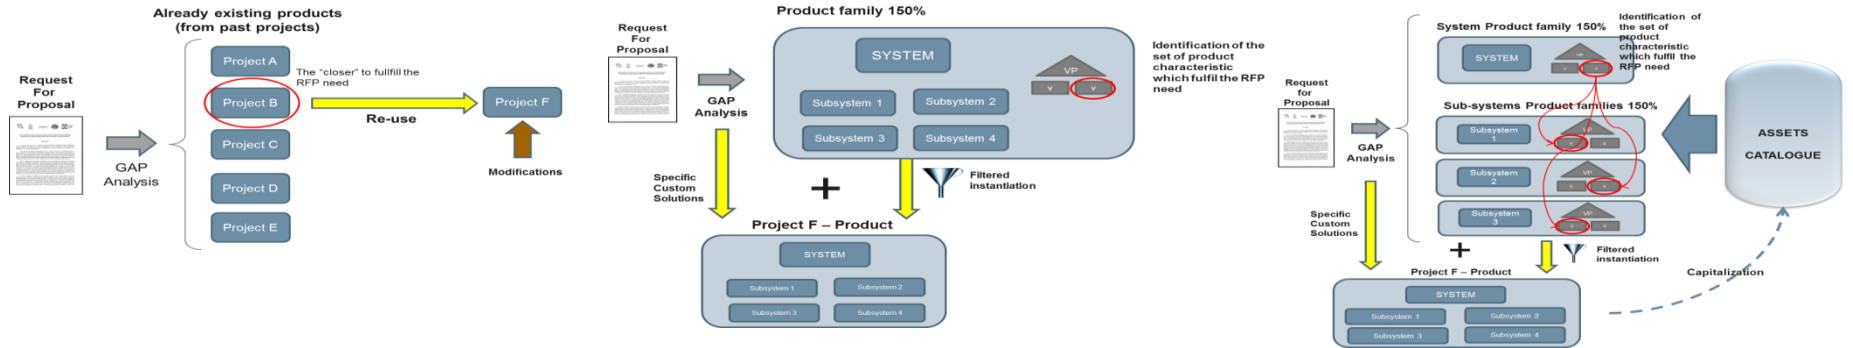

Defining the reuse strategy

A specific strategy according to **business opportunities** and the level of “PLE maturity”

basic reuse

150%” rolling stock product family.

System and Subsystems catalogue of buildings blocks

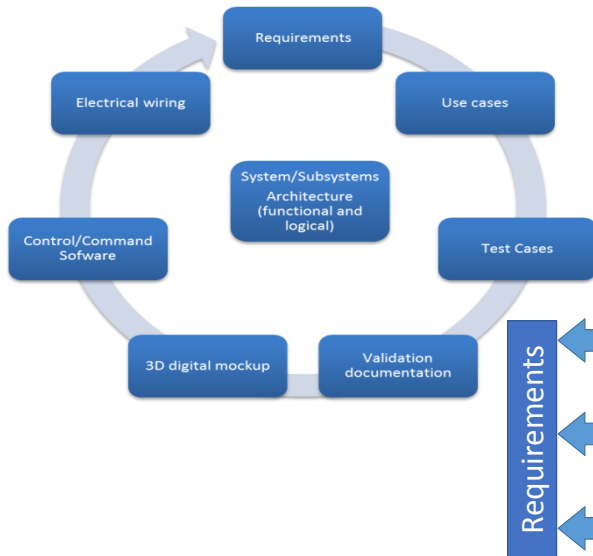

Model Based PLE Framework – Needs (1)

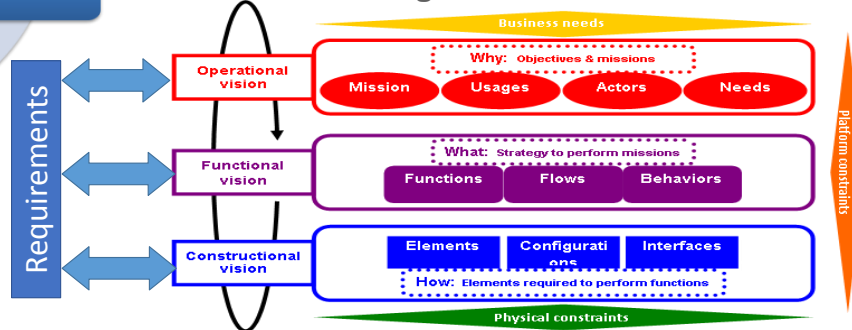

Upgrade the Engineering Artefacts must be

- Properly linked to each other: consistency of the problem and design spaces
- **Variability-ready**: possess a *configurability* capability

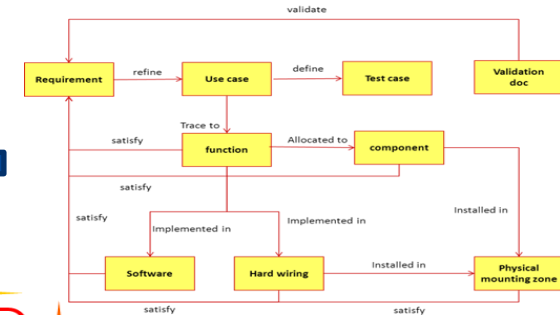

Engineering artefacts

Design framework

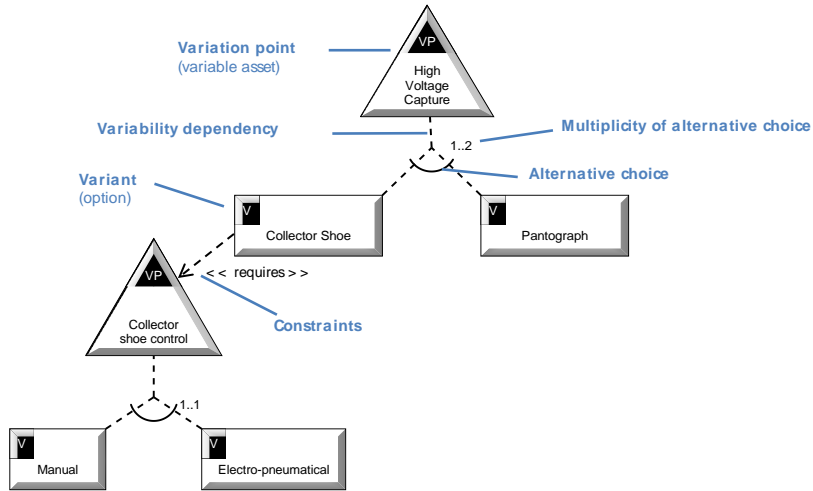

Meta model

Model Based PLE Framework – Needs (2)

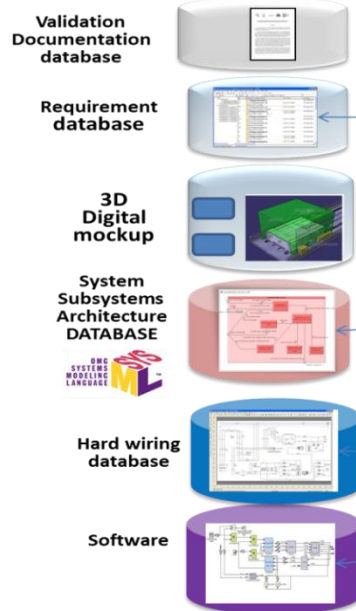

Describe the product line **variability**
(e.g. using OVM*)

*Orthogonal Variability Model

State the **dependencies** between
variants and engineering **artefacts**

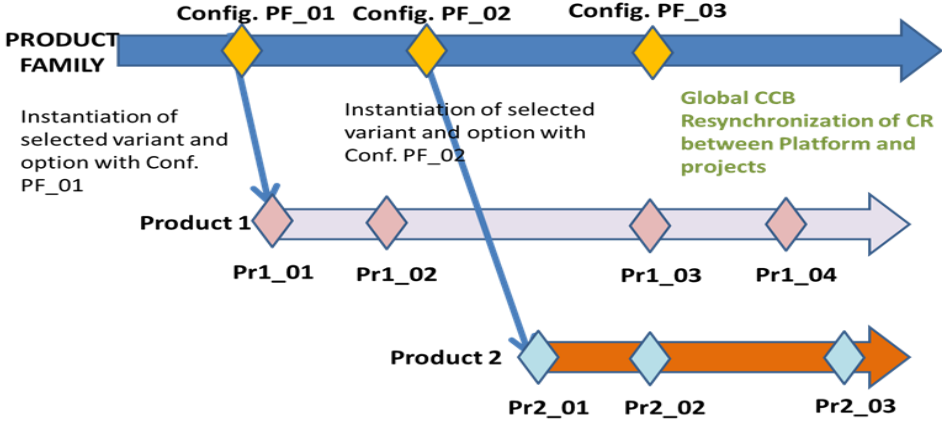

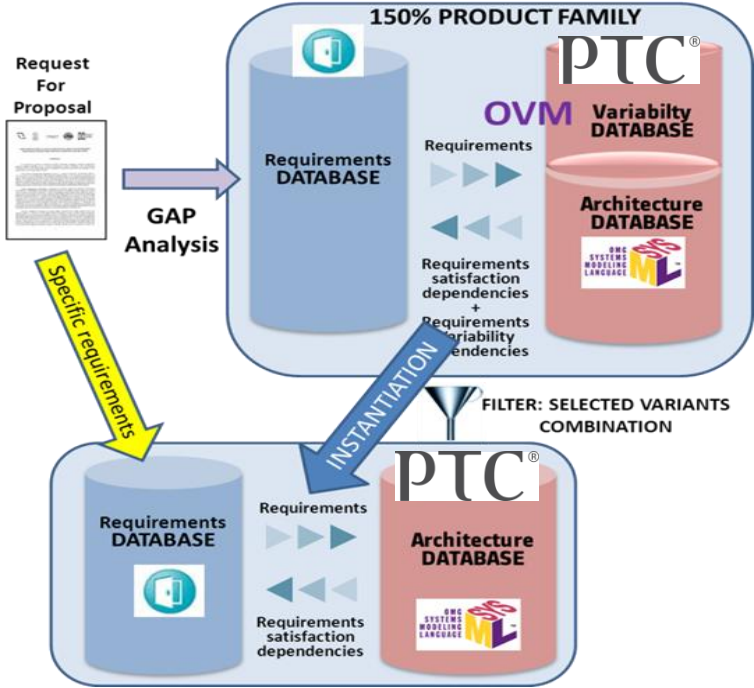

Product family – engineering models

Product family - variability model

Change & configuration management on another dimension

Application of a 2nd generation reuse strategy to a Metro product family

Variability DATABASE

OMG SYSTEMS MODELING LANGUAGE

Requirements

Requirements satisfaction dependencies + Requirements Variability dependencies

VARIABILITY ANALYSIS

Requirement view

OPERATIONAL ANALYSIS

TRAIN ARCHITECTURE

SUB-SYSTEMS ARCHITECTURE

First results on PLE

- **1st project.** The application of the new approach resulted in the reduction of fixed engineering costs of about 50% during the requirement development phase for an estimated 80% carry-over scheme
- **2nd project.** Similar results: estimated benefit (50%), higher carry-over (nearly 95%) but in a completely different context (different team, novice users, off shore site, IT environment)

State of the SE deployment

On **Rolling Stock** product lines

- First pilot project involved 8-10 system engineers for 6 months in 2012 → Feasibility of the approach and process refinement
- **Today**
 - ~18 projects are using Requirement Management and Development process with DOORS, involving around 200 engineers
 - 3 major projects (+ 2 candidates) launched with the application of the full MBSE process involving around 40 MBSE engineers
 - **Standby**: rethink modelling rules, improve tooling and competency

On **Information solution** product lines

- First pilot project involved 5 system engineers for 1 year (September 2009)
- **Today** several projects (R&D and running projects) launched with the application of the full process, involving almost 40 system engineers

Future work

- Repository of *modular assets* and *composable* train architectures
 - Modify our modelling practices: ***design for variability & reuse***
- Define reuse efficiency measurements to support the decision making process in our projects
- Deeper reflection to move closer to a ***Full Product Line*** for Rolling Stock and Components
 - Commonality between product lines or product families

Key points for the deployment of MBSE and PLE

COMMUNICATE CLEARLY and keep EXPECTATIONS and SCOPE under control. Cultural Change is a challenge

Other key factors to be carefully considered

- Demonstrate the **feasibility** and the **benefits** of the new process with a real **full application** of the new methodology (pilot project)
- Provide a well structured **training**
- Provide a **strong support** during the deployment on site
- **Management** shall actively **support** the **change** of the way of working

It is all about people
