

| z/TPF V1.1

TPF Users Group - Fall 2009 HTTP Client and SOAP Consumer Enhancements

Direction

Aleksandr Krymer
SOA Subcommittee

**AIM Enterprise Platform Software
IBM z/Transaction Processing Facility Enterprise Edition 1.1.0**

Agenda

- **HTTP Sub-second Timeout**
- **HTTP Client Daemon**
- **Asynchronous Requests**
- **Shared HTTP Sessions**
- **SOAP Consumer Enhancements**

How Will These Enhancements Be Incorporated Into z/TPF?

- **HTTP enhancements will be built on z/TPF's HTTP Client Support**
 - APAR PJ32013 (PUT 4)
 - libCURL library -- APAR PJ32052

How Will These Enhancements Be Incorporated Into z/TPF?

- **SOAP consumer enhancements will be built on z/TPF's SOAP Consumer Support**
 - APAR PJ35511 (PUT 6)

How Fast Can I Timeout?

- **Enhancements are planned to provide sub-second timeouts**
- **HTTP Client and SOAP Consumer Support would be able handle millisecond granularity**
 - Currently they support only second granularity

What Is Asynchronous HTTP Support?

- **The goal is to allow applications to request that an HTTP response message be processed by a new ECB.**
- **Once an HTTP request is scheduled to be sent, control will be returned immediately to the calling application**

Why Do I Need Asynchronous HTTP Support?

- **Applications can leverage HTTP client support without blocking for the request to be sent or for the response to be received**
- **This allows applications to proceed with other processing**
- **Applications can also exit their ECBs to free system resources**

How Do I Make An Asynchronous HTTP Request?

Direction

- **Support will be built into the existing HTTP Client APIs**
 - tpf_httpPerform
 - tpf_httpPerform1

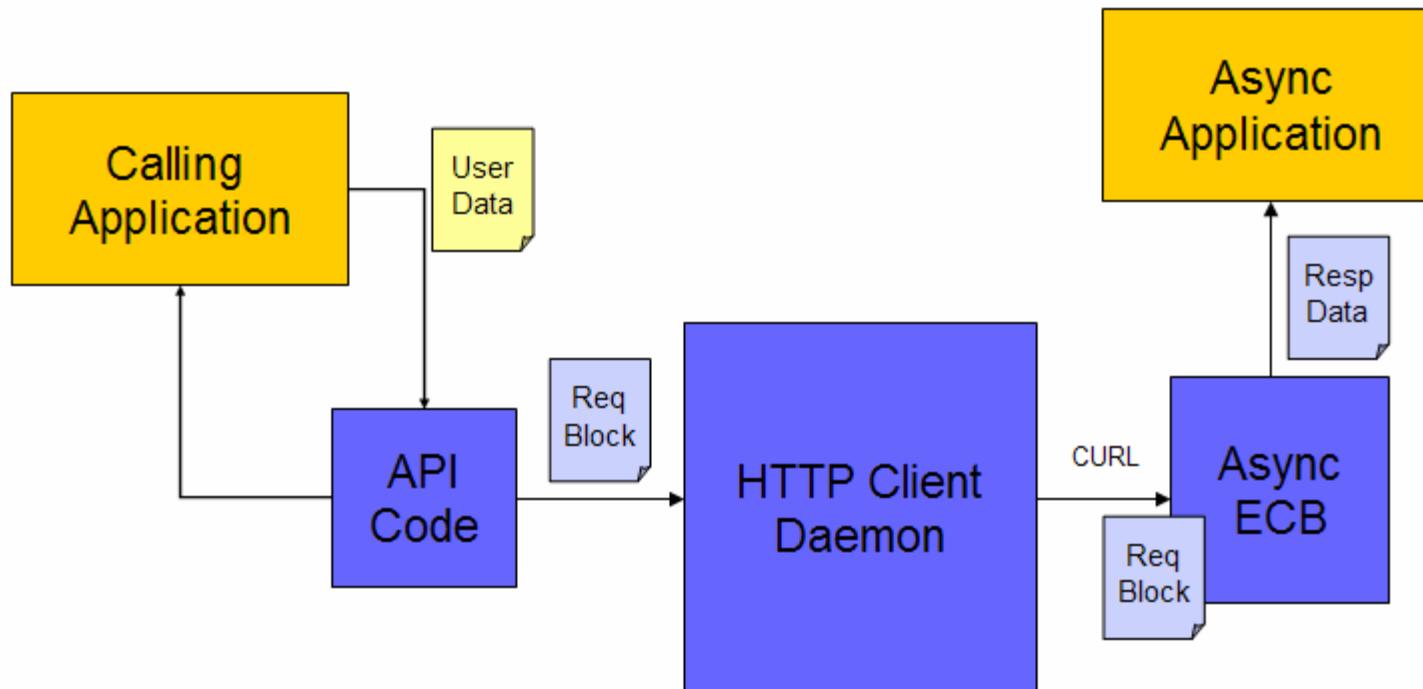

What Happens When I Make An Asynchronous HTTP Request?

Direction

- 1. The request is sent to the HTTP client daemon which submits the HTTP request on behalf of the application**
- 2. Control is return to the application once the daemon has successfully scheduled the HTTP request**
- 3. The daemon will poll the HTTP session for a response**
- 4. Once the response is received or the request times out, the daemon will created a new ECB and enter the program the application specified to gain control**

Application Flow – Asynchronous Case

Direction

Application Flow – Asynchronous Case

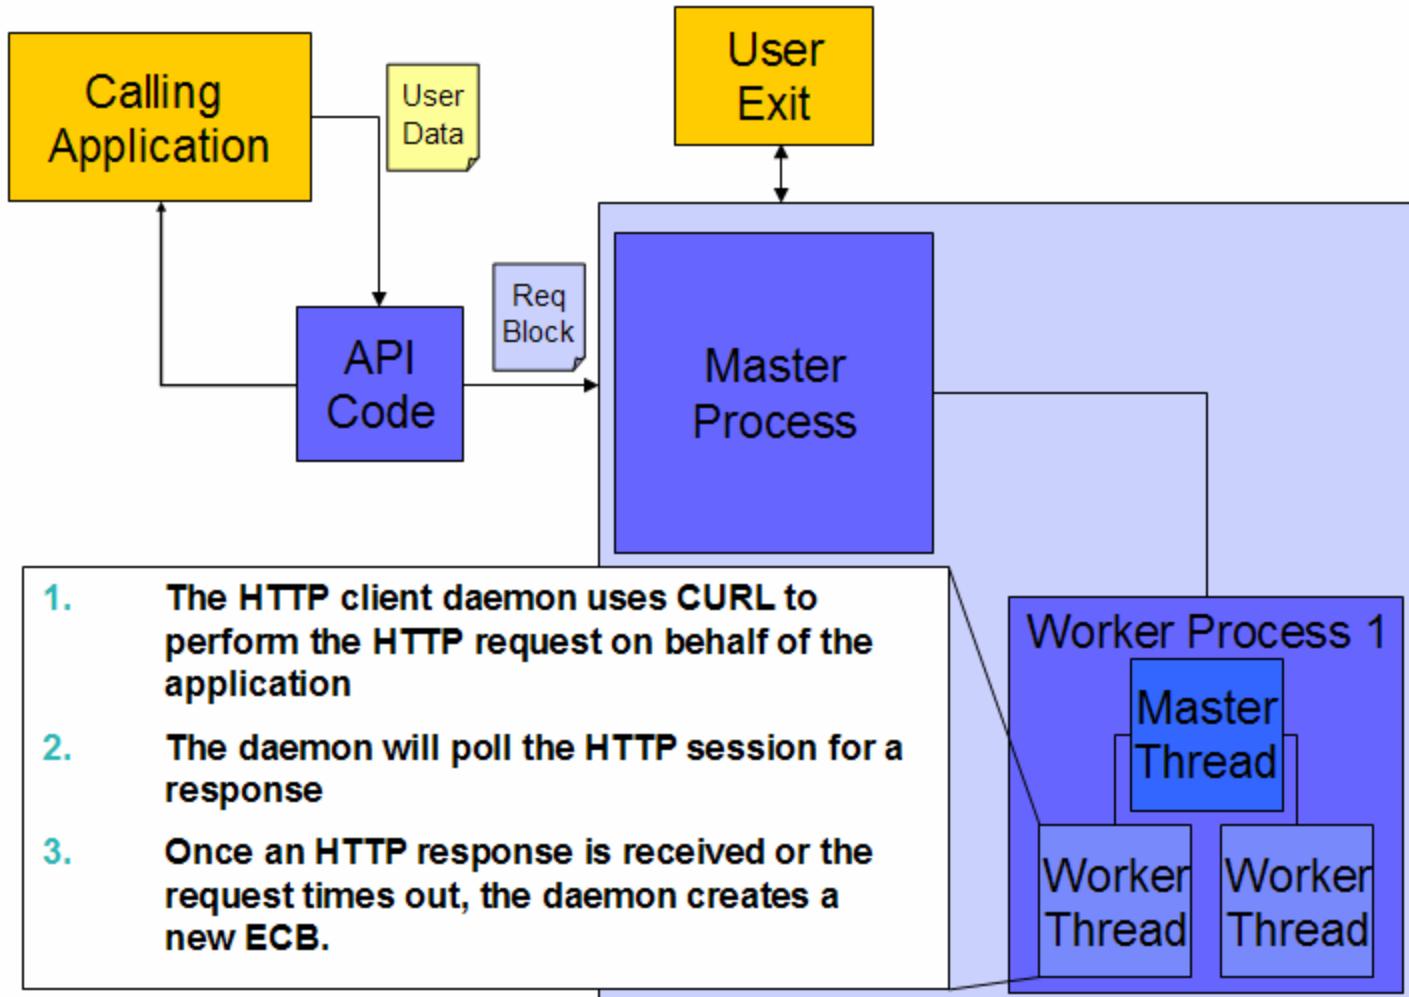

Direction

Calling
Application

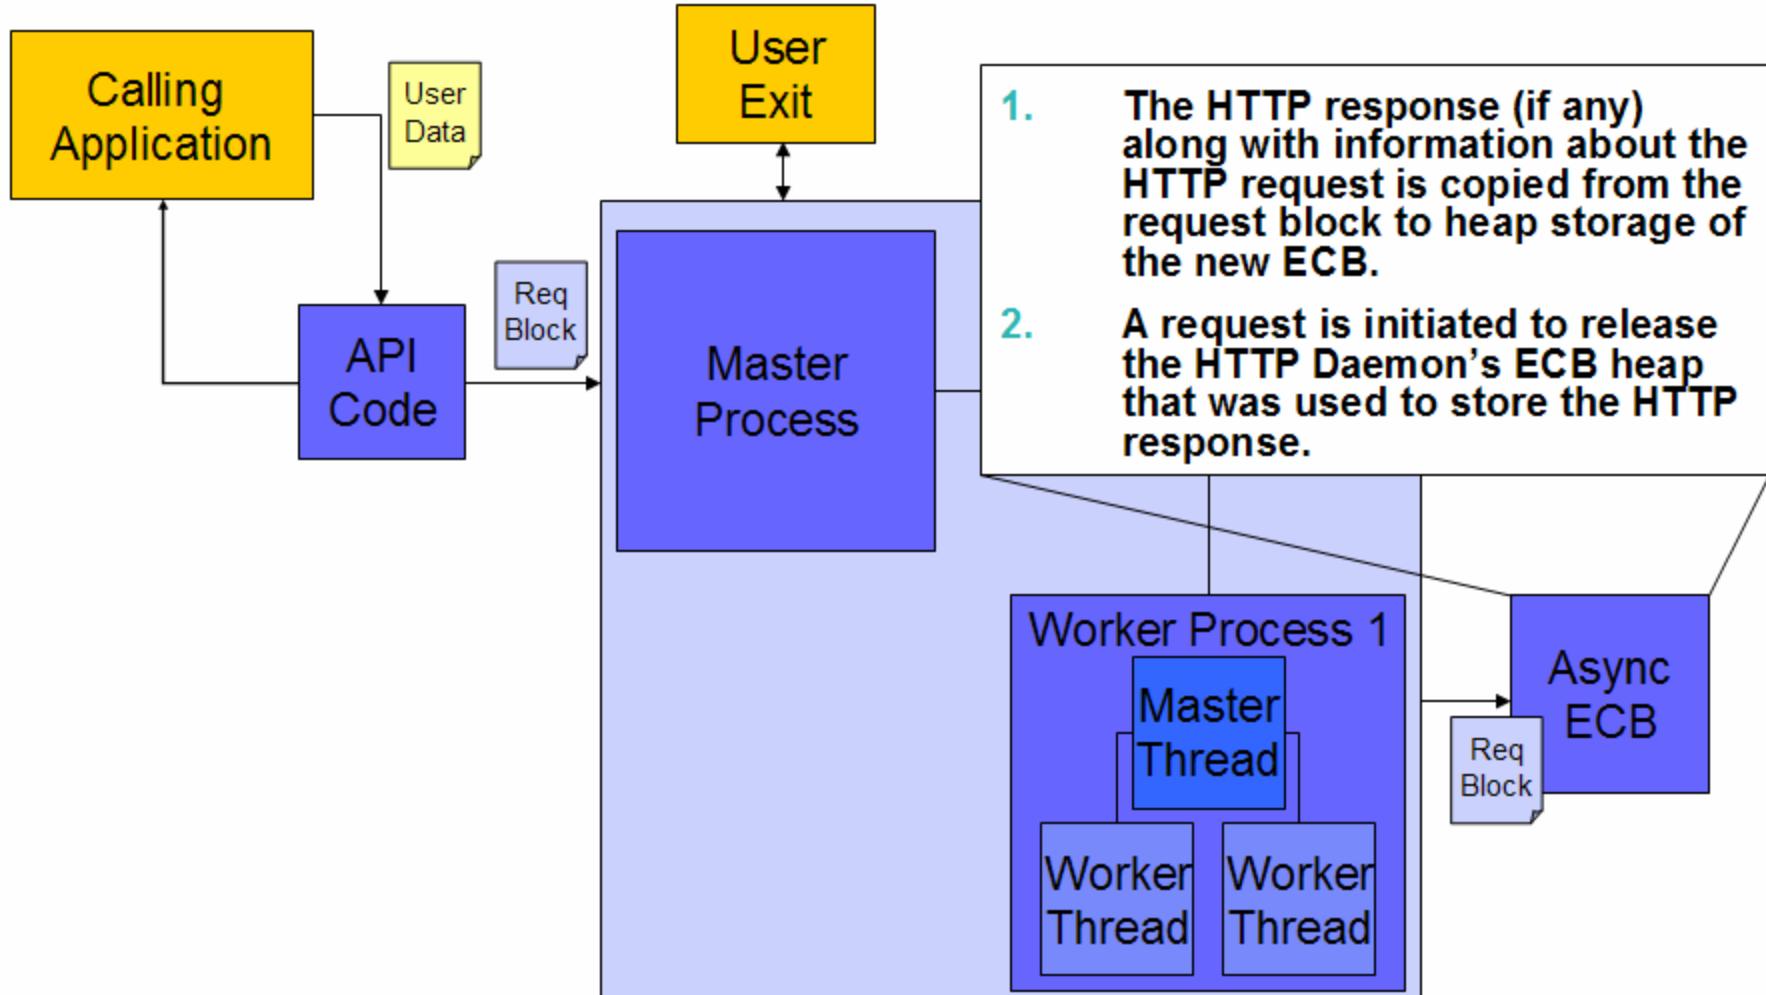

- **Use existing HTTP client interface**
- **Same APIs**
- **Same input structures**
- **New fields within existing structures**

Application Flow

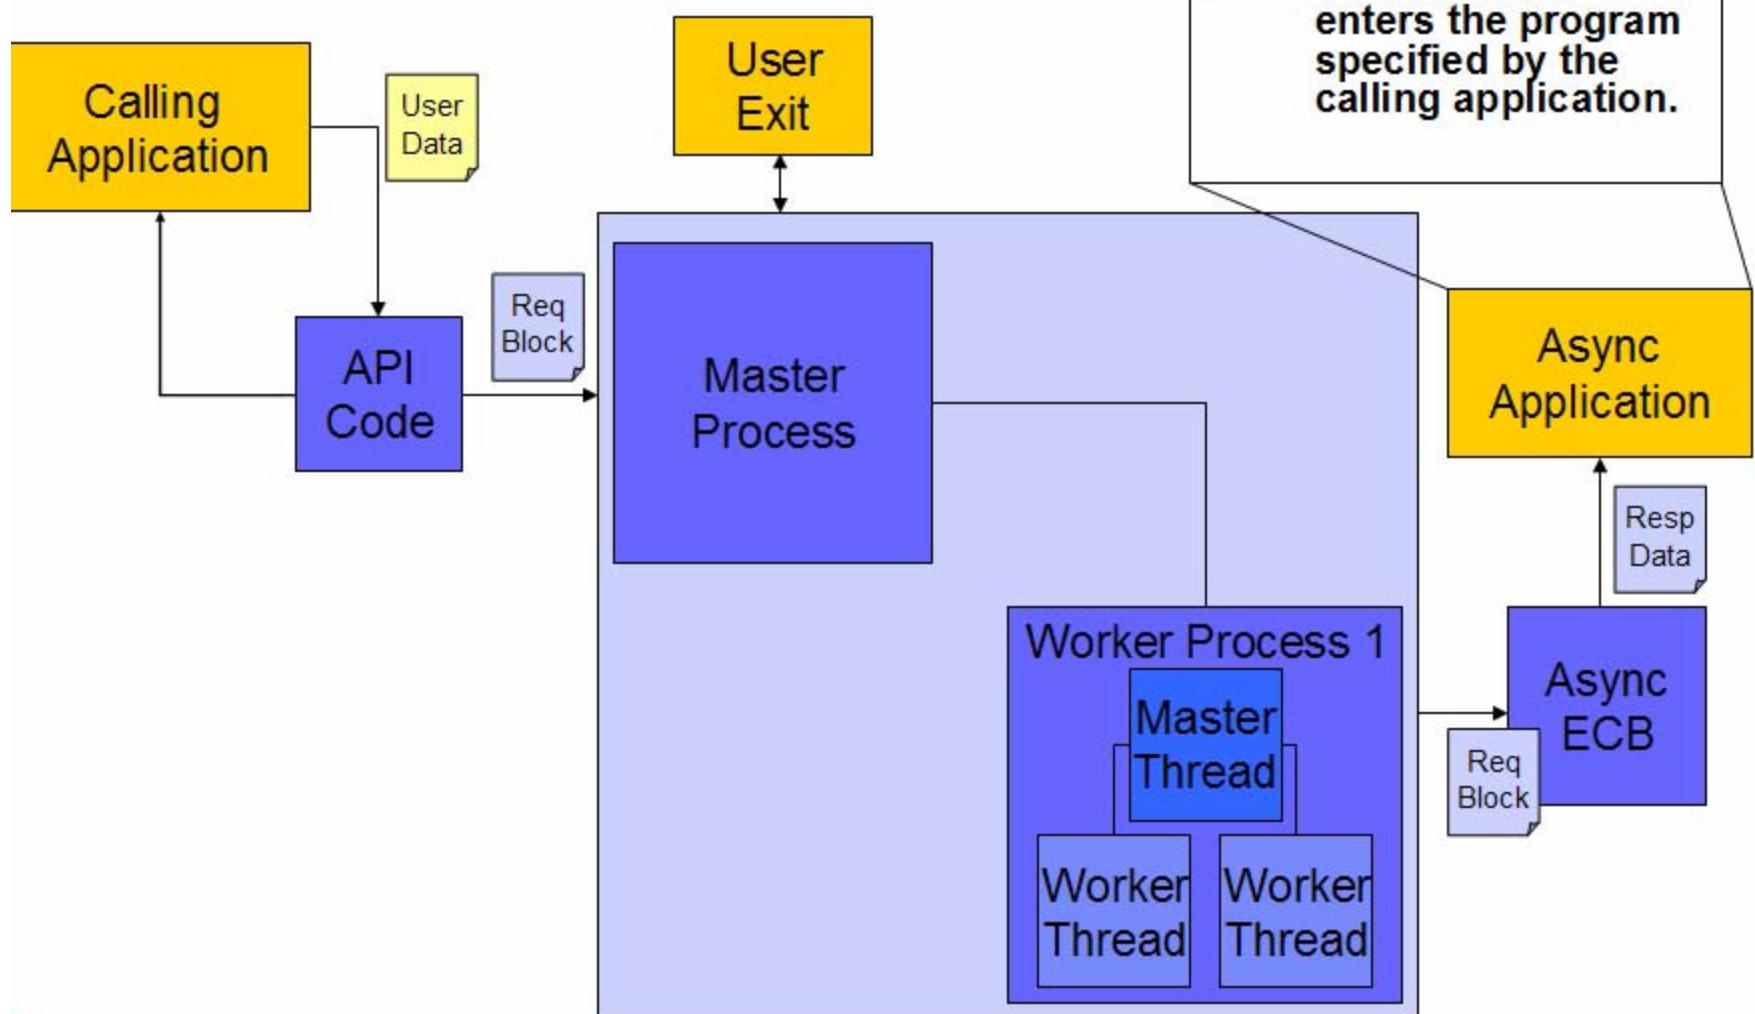

Direction

Application Flow Direction

Application Flow Direction

What Is Shared HTTP Session Support?

Direction

- **Ability to create an HTTP session with a persistent connection to a remote destination.**
- **This HTTP session is tied to an HTTP client daemon ECB (process) rather than an application's ECB (process)**
- **This allows the HTTP session to be used by multiple ECBs (processes).**

Why Do I Need Shared HTTP Sessions?

- **Currently, an HTTP session is tied to a single ECB (process). If HTTP requests to the same destination are made by multiple ECBS (processes) each ECB (process) will have to establish an HTTP connection to that destination.**
- **This creates overhead by repeatedly starting and ending TCP/IP sessions for a single request/reply. The use of HTTPS dramatically increases this overhead due to SSL handshakes.**

How Do I Define a Shared HTTP Session?

Direction

- **A mechanism to define a list of destinations for which the daemon will maintain a persistent connection**
- **Ability to specify the maximum number of connections to establish to each destination in the list**
- **Ability to pre-establish shared HTTP sessions**
 - Specify a list of destinations that the daemon should establish connections to prior to application usage

How Do I Use A Shared HTTP Session?

Direction

- **Support for this feature will also be built into the existing HTTP Client APIs**
 - tpf_httpPerform
 - tpf_httpPerform1
- **Support will be transparent to the application**
 - Application changes = **NONE**

What Happens When I Use A Shared HTTP Session?

Direction

- 1. The request is sent to the HTTP client daemon which does one of the following:**
 - Searches for an existing shared HTTP connection to the requested remote destination
 - Creates an HTTP session with a persistent connection to the remote destination
- 2. The daemon submits the HTTP request on behalf of the application**
- 3. Control is return to the application based on whether the request was synchronous or asynchronous**

What About SOAP Consumer Support?

Direction

- **Sub-second timeout**
 - Selectable via an API (`tpf_soapInvokeService`)
 - Enabled for the following transports:
 - WebSphere MQ
 - HTTP
 - TPF-to-TPF
- **Ability to use shared sessions for SOAP over HTTP.**
 - Selectable via:
 - Deployment descriptor
 - API (`tpf_soapSetOpts`)
- **True asynchronous response handling for SOAP over HTTP**
 - Selectable via an API (`tpf_soapInvokeService`)

What Changes Are Needed To My Existing Asynchronous SOAP Consumer Application To Use a TRUE Asynchronous HTTP Transport?

Direction

- **NONE**

Questions/Feedback

Trademarks

- IBM is a trademarks of the International Business Machines Corporation in the United States, other countries, or both.
- Other company, product, or service names may be trademarks or service marks of others.
- Notes
- Performance is in Internal Throughput Rate (ITR) ratio based on measurements and projections using standard IBM benchmarks in a controlled environment. The actual throughput that any user will experience will vary depending upon considerations such as the amount of multiprogramming in the user's job stream, the I/O configuration, the storage configuration, and the workload processed. Therefore, no assurance can be given that an individual user will achieve throughput improvements equivalent to the performance ratios stated here.
- All customer examples cited or described in this presentation are presented as illustrations of the manner in which some customers have used IBM products and the results they may have achieved. Actual environmental costs and performance characteristics will vary depending on individual customer configurations and conditions.
- This publication was produced in the United States. IBM may not offer the products, services or features discussed in this document in other countries, and the information may be subject to change without notice. Consult your local IBM business contact for information on the product or services available in your area.
- All statements regarding IBM's future direction and intent are subject to change or withdrawal without notice, and represent goals and objectives only.
- Information about non-IBM products is obtained from the manufacturers of those products or their published announcements. IBM has not tested those products and cannot confirm the performance, compatibility, or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.
- Prices subject to change without notice. Contact your IBM representative or Business Partner for the most current pricing in your geography.
- This presentation and the claims outlined in it were reviewed for compliance with US law. Adaptations of these claims for use in other geographies must be reviewed by the local country counsel for compliance with local laws.
