WebSphere Business Events

Design

@business on demand.

© 2009 IBM Corporation
Updated April 28, 2015

In the previous sections you have been introduced to the basic concepts of complex event processing and have seen the building blocks which WebSphere® Business Events uses to implement a complex event processing solution.

Overview

- Designing interaction sets
- Designing filters
- Complex event processing

In the next three presentations you will see how the WebSphere Business Events tools allow you to develop interaction sets and filters and then how these can be used to design and build complex event processing solutions. If you are unfamiliar with the terms ‘interaction sets’ or ‘filters’ then you should review the earlier presentations in this series. These provide an introduction to these concepts and what they mean in a WebSphere Business Events context.

U.S.A.

Performance is based on measurements and projections using standard IBM benchmarks in a controlled environment. All customer examples described are presented as illustrations of how those customers have used IBM products and the results they may have achieved. The actual throughput or performance that any user will experience will vary depending upon considerations such as the amount of multiprogramming in the user's job stream, the I/O configuration, the storage configuration, and the workload processed. Therefore, no assurance can be given that an individual user will achieve throughput or performance improvements equivalent to the ratios stated here.
