2009 WebSphere Service Registry and Repository Scenarios
Scenario 3 Script

Once a service has been developed and deployed, the WebSphere Service Registry and Repository helps optimize the operational efficiency and resilience of the service.

By sharing service data with other operational data stores, such as business dashboards, the service performance toward business objectives becomes readily visible to decision makers.

Management has the opportunity to apply criteria for usage and interaction of services to best suit their business needs.

Once accepted, the criteria are recorded in the Service Registry/Repository, so that the service and its performance requirements consistently represented throughout the enterprise.

As the service performs its functions, the Service Registry/Repository interacts with Operational and System Management utilities in the ongoing monitoring and managing of the service.

The results of this methodical, holistic approach are highly efficient and resilient services that continually add value to the company's bottom line.
