Dynamic Position	<p>Specifies the character position, starting from 1, where the escape character is defined in the first record. $\hat{\text{A}}$ The escape character is determined at run time using the character found at the specified character position. For example, how is the following record parsed when no encapsulation character is defined and the delimiter of the record is a colon?</p> <pre>135:Caving: What You Really Need to Know:10</pre> <p>The preceding $\hat{\text{A}}$ record would be parsed into the following 4 fields:</p> <ul style="list-style-type: none"> • 135 • Caving • What You Really Need to Know • 10 <p>If you do not want the <i>Caving What You Really Need to Know</i> title broken up into two fields, you can specify a Dynamic Position of 11 and add a backslash character before the colon as shown in the following record:</p> <pre>135:Caving/: What You Really Need to Know:10</pre> <p>The escape character is now equal to the 11th character in the record: the backslash character. When this Flat File record is now parsed with the escape character is equal to the backslash character, the colon after Caving does not break this field into two sections even though the record uses the colon as a delimiter.</p>

Property	Description
Write Default	<p>Specifies the escape character to use when writing this field as Flat File data. Write Default is only used in the Write Flat File activity when converting XML data to Flat File data. Write Default is not used when converting Flat File data to XML data in the Read Flat File activity. ¹</p> <p>In the Write Default text field of the pane, enter a single character using one of the following actions:</p> <ul style="list-style-type: none"> • Type in the character. • Type in the Unicode value of the character. For example, enter <code>/u0020</code> for the space character. • Click [...] to browse for a character. The Character Selection dialog box opens listing the valid character choices for delimiters. In the Display column, the character or a mnemonic representing the character is displayed. In addition, the corresponding hexadecimal value and Unicode code point for the character is displayed. Select a character and click OK. ¹ If the selected character does not have a visual symbol, a mnemonic or the Unicode value might show for this character. For more information about any of these characters, see the Basic Latin and Latin-1 Supplement character sets at: ¹ http://www.unicode.org/charts/ <p>For example, you wanted to escape the colon with a backslash in the <code><title>Caving: What You Really Need to Know</title></code>. XML element, when converting it to Flat File data, specify a backslash in the Write Default field. ¹ The run-time result for this field is the following string:</p> <pre>Caving\: What You Need to Know</pre> <p>The character position specified in the Dynamic Position field is not used when an XML element is converted to Flat File data.</p>
Encapsulation Character	<p>Specifies a delimiter character to encapsulate data in the field because the field could contain character(s) that are being used to delimit this field in the parent record.</p> <p>In the Character text field of the pane, enter a single character using one of the following actions:</p> <ul style="list-style-type: none"> • Type in the character. • Type in the Unicode value of the character. For example, enter <code>/u0020</code> for the space character. • Click [...] to browse for a character. The Character Selection dialog box opens listing the valid character choices for delimiters. In the Display column, the character or a mnemonic representing the character is displayed. In addition, the corresponding hexadecimal value and Unicode code point for the character is displayed. Select a character and click OK. ¹ If the selected character does not have a visual symbol, a mnemonic or the Unicode value might show for this character. For more information about any of these characters, see the Basic Latin and Latin-1 Supplement character sets at: ¹ http://www.unicode.org/charts/

Property	Description
Â	<p>For example, how is the following record parsed when no encapsulation character is defined and the delimiter of the record is a colon?</p> <pre>135:Caving: What You Really Need to Know:10</pre> <p>The preceding Â record would be parsed into the following 4 fields</p> <ul style="list-style-type: none"> • 135 • Caving • What You Really Need to Know • 10 <p>If you do not want the <i>Caving What You Really Need to Know</i> title broken up into two fields, you can specify the encapsulation character to be a double quotation mark and surround the book title with double quotation marks as shown in the following record:</p> <pre>135:"Caving: What You Really Need to Know":10</pre> <p>When this Flat File record is now parsed with the encapsulation character set to double quotation marks, the colon after Caving does not break this field into two sections even though the parent record uses the colon as a delimiter. The Integration Appliance reads all the characters between two encapsulation delimiters as characters rather than delimiters.</p>
Dynamic Position	<p>Specifies the character position, starting from 1, where the delimiter is defined in the first record. Â The encapsulation delimiter is determined at run time using the character found at the specified character position</p> <p>For example, how is the following record parsed when no encapsulation character is defined and the delimiter of the record is a colon?</p> <pre>135:Caving: What You Really Need to Know:10</pre> <p>The preceding Â record would be parsed into the following 4 fields:</p> <ul style="list-style-type: none"> • 135 • Caving • What You Really Need to Know • 10 <p>If you do not want the <i>Caving What You Really Need to Know</i> title broken up into two fields, you can specify the Dynamic Position of 5 and surround the book title with double quotation marks and as shown in the following record:</p> <pre>135:"Caving: What You Really Need to Know":10</pre> <p>The encapsulation character is equal to the 5th character in the record: the double quotation mark character. When this Flat File record is now parsed with the encapsulation character is equal to the double quotation mark character, the colon after Caving does not break this field into two sections even though the record uses the colon as a delimiter. The Integration Appliance reads all the characters between two encapsulation delimiters as characters and not delimiters.</p>

Property	Description
Write Default	<p>Specifies the encapsulation character to use when writing this field as Flat File data. Write Default is only used in the Write Flat File activity when converting XML data to Flat File data. The Write Default is not used when converting Flat File data to XML data in the Read Flat File activity.</p> <p>In the Write Default text field of the pane, enter a single character using one of the following actions:</p> <ul style="list-style-type: none"> • Type in the character. • Type in the Unicode value of the character. For example, enter <code>/u0020</code> for the space character. • Click [...] to browse for a character. The Character Selection dialog box opens listing the valid character choices for delimiters. In the Display column, the character or a mnemonic representing the character is displayed. In addition, the corresponding hexadecimal value and Unicode code point for the character is displayed. Select a character and click OK. If the selected character does not have a visual symbol, a mnemonic or the Unicode value might show for this character. For more information about any of these characters, see the Basic Latin and Latin-1 Supplement character sets at: http://www.unicode.org/charts/.
^	<p>For example, you wanted to encapsulate the data found in the <code><title>Caving: What You Really Need to Know</title></code> XML element with quotation marks when converting it to Flat File data, specify the double quotation marks in the Write Default field. The runtime result for this field is the following string:</p> <pre>"Caving: What You Need to Know"</pre> <p>The character position specified in the Dynamic Position field is not used when an XML element is converted to Flat File data.</p>

Positional Properties

The Positional Properties of a field are defined in the following table. These properties are only active if the parent record has the Positional option selected for Structure property.

Field	Description
Field Offset	Specifies the number of characters to skip, starting from the end of the previous field, to reach the beginning of this field.
Field Length	Specifies the length of the data for this field.

Adding Records or a Record Type

About this task

Why add records?

You use records to define the structure of your Flat File data. Records can contain fields, groups, or other records. Records that are children of another record are used to model fields with a complex structure. Records can also be used to define additional layers of hierarchy of the data.

The fields and subrecords of a record are parsed using one of the following methods:

- **Delimited:** The fields and child records within the record use delimiters to define their beginning and end points. Some delimited formats use record IDs as identifiers and beginning delimiters. For examples of defining records that parse delimited data, see the following examples:
 - [Mixed positional and delimited example](#)
 - "Developing the BookOrder Project" section of the *Getting Started Guide*
- **Positional:** the fields within the record use no delimiters but are defined instead by their position and length. Positional fields are also known as fixed-length fields. For an example of defining a record that parses positional data, see [Mixed positional and delimited example](#).

You create records in the Schema Layout tab. Records that contain child records and fields and are not based on a record type are displayed in the Schema Layout tab using the following icon:

Records that are based on a record type are displayed in the Schema Layout tab using the following icon:

Why Add Record Types?

Record types define a set of record properties, fields, and child records that can be reused by multiple records. For example, you could define an address record type that contains a street field, a city field, a state field, and a zip code field. You could then use the address record type as the basis of all the addresses in the Flat File Schema, for example to define the shipping address record and the billing address record.

You create record types in the Type Library tab. Record types that contain child records and fields and are not based on a record type are displayed in the Type Library tab using the following icon:

Record types that are based on a record type are displayed in the Type Library tab using the following icon:

Note:

- Record types are only reusable to the current Flat File Schema and are not global to the project.
- Records based on a record type can only inherit child nodes from the record type. Child nodes cannot be added to a record that is based on a record type.

- The child nodes inherited from the record type are only visible in the Type Library tab and are not visible in the Schema Layout tab.
- Record types can also be based on other record types, inheriting both properties and children from parent record types.

To add a record or a record type:

Procedure

1. Open a Flat File Schema from the Project tab.
2. Select the appropriate tab:
 - To add a record, select the Schema Layout tab.
 - To add a record type, select the Type Library tab.
3. Right-click a node in the tab and select one of the options in the list:
 - New Child > Record: To add a record as a child of the current node. Records can only be children of the root node, another record, or a group.
 - New Sibling > Record: To add a record as a sibling after the current node.
 - New Children: to add child fields and records in bulk.
4. Enter a [valid node name](#) for the new record in the New Record pane.
5. If this record should be based on a record type, select the record type from the Based on Record list.
6. Click OK. The record node is shown in the appropriate tab (Schema Layout or Type Library) and record properties display in the Properties pane.
7. Specify the properties for the record or record type.
8. If you are creating a new record not based on a record type, add fields, groups, or records to define the content of the record. If you based the record on a record type, the record is complete and because the content of the record is defined by the record type.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/mde_Adding_Records_or_a_Record_Type.html

Record properties

When a record is selected in the Schema Layout tab or a record type is selected in the Type Library tab, the following sections of properties are available in the pane:

- Basic Properties
- Delimiters

Basic Properties

The Basic Properties of a record are defined in the following table:

Property	Description
Name	Specifies the name of this record. Attention: The field name must be a valid node name .
Type	Optional: Specifies the record type used as a basis for the record. The Type list is only active if the selected record node does not contain any children and a record type has been created. A record cannot inherit fields or subrecords from a record type if the record contains children. Attention: Selecting a new type might reset some of the existing properties of the record with the new settings.
Reset	Resets properties that have been set locally for this record to the values for the selected type. Reset is only active if a record type has been selected from the Type list.
Structure	<ul style="list-style-type: none"> Specify Delimited if the structure of the record is determined by delimiters. Specify Positional if the structure of the record is determined positions in the record.
Record Identifier	Specifies the unique string that identifies this record. Record identifiers are called segment IDs in X.12 message standards such as EDI or HL7, and typically begin each record.
Record ID Starting Position	Specifies the character position where the record ID begins after the end of the previous record. The default is 0, which places the record ID at the beginning of the record.
Minimum Occurrences	Specifies the minimum number of repetitions for this record. The default is 1, which means the record is required. Specify 0 if this record is optional. WARNING: When specifying the optional property for a record, be careful not to create an ambiguous grammar for the Flat File Schema. For more information, see Specifying Optional Fields and Records .
Maximum Occurrences	Controls repetitions of the single record. Select one of the following options: Unbounded - Specifies this record can repeat any number of times. Range - Specify the maximum number of repetitions for this record. The actual occurrences in a specific message can be less than or equal to this limit. NOTE: Multiple occurrences are only allowed when the parent node has specified

Delimiters

If the Delimited option is selected for the Structure property for the record, the following record delimiter properties are active:

- Child Delimiter
- Include Trailing Delimiters for Empty Data
- Child Delimiter Position
- Repeat Delimiter

Child delimiters

Child Delimiters

The Child property defines the character that delimits children of the record. This character is commonly called the record delimiter, segment delimiter, or line delimiter.

Specify the type of child delimiter by selecting one type from the three options listed in the following table:

Option	Definition
Character	<p>Specifies the character for the child delimiter. If the Character option is selected for the Child Delimiter, you must enter a single character using one of the following actions:</p> <ul style="list-style-type: none"> • Type in the character. • Type in the Unicode value of the character. For example, enter /u0020 for the space character. • Click [...] to browse for a character. The Character Selection dialog box opens listing the valid character choices for delimiters. In the Display column, the character or a mnemonic representing the character is displayed. In addition, the corresponding hexadecimal value and Unicode code point for the character is displayed. <p>Select a character and click OK. If the selected character does not have a visual symbol, a mnemonic or the Unicode value might show for this character.</p> <p>For more information about any of these characters, see the Basic Latin and Latin-1 Supplement character sets at: http://www.unicode.org/charts/.</p>
Line End	<p>Specifies that the child delimiter is the end of the line, either a LF (line feed) or CRLF (carriage return, line feed). If the children are delimited with just a CR (carriage return), select the Character option and specify a CR (carriage return) character as the delimiter. The Integration Appliance accepts both line end characters (LF and CRLF) when parsing data. When writing data, the character used for line ends is determined by the Write Line Ends As CRLF property.</p>
Dynamic	<p>Specifies that the character used as the child delimiter is defined dynamically within the data. Dynamic delimiters must show at a specific position within the first record of the data, such as in EDI or HL7 data. How the character is used by the Integration Appliance depends if the Flat File data is incoming or outgoing:</p> <ul style="list-style-type: none"> • While parsing incoming Flat File data in the Read Flat File activity, the Integration Appliance reads the character at the specified position and uses it as a child delimiter to parse the rest of the data. The Write Default text field is not used when incoming Flat File data is read. • While writing outgoing Flat File data in the Write Flat File activity, the Integration Appliance uses the character specified in the Write Default text field to delimit the children of the record. In addition, the specified character is written at the specified position of the first record in the outgoing data.

O p t i o n	Definition
W r i t e D e f a u l t	<p>Specifies the character that should be used as the child delimiter when the Integration Appliance writes outgoing data in the Write Flat File activity. In addition, the specified character is written at the specified position of the first record in the outgoing data. The character specified in this field is not used when incoming Flat File data is read in the Read Flat File activity.</p> <p>In the Write Default text field of the pane, enter a single character using one of the following actions:</p> <ul style="list-style-type: none"> • Type in the character. • Type in the Unicode value of the character. For example, enter <code>/u0020</code> for the space character. • Click [...] to browse for a character. The Character Selection dialog box opens listing the valid character choices for delimiters. In the Display column, the character or a mnemonic representing the character is displayed. In addition, the corresponding hexadecimal value and Unicode code point for the character is displayed. Select a character and click OK. If the selected character does not have a visual symbol, a mnemonic or the Unicode value might display for this character. For more information about any of these characters, see the Basic Latin and Latin-1 Supplement character sets at: http://www.unicode.org/charts/

Include Trailing Delimiters for Empty Data

Select the Include Trailing Delimiters for Empty Data check box to specify that delimiters for empty optional children must be present at the end of the record or field when the Integration Appliance writes outgoing Flat File data in the Write Flat File activity.

Clear this checkbox, if delimiters for empty optional children might be omitted.

This check box does not affect how the Integration Appliance reads incoming data because when reading data the Integration Appliance accepts either the absence or presence of delimiters with empty data.

Child Delimiter Position

This property defines the position of record delimiters for data. Select one option from the following table:

Position	Definition
After	<p>Specifies that the child delimiter marks the end of a child, including the last child in the data.</p> <p>After is the most common position for record delimiters.</p>
Before	<p>Specifies that the child delimiter indicates the beginning of a child. The end of the last child is marked by the delimiter of the parent.</p>
In between	<p>Specifies that delimiters are placed between children but do not show at either the beginning of the first child nor the end of the last child.</p>

For an example with all three types of child delimiter positions, see [Mixed positional and delimited example](#).

Repeat Delimiter

This property determines the delimiter used between repeated occurrences of one record in the Flat File data. Select one option from the following table:

P o s i t i o n	Definition
C h a r a c t e r	<p>Specifies the character for the repeat delimiter. If the Character option is selected for the Repeat Delimiter, you must enter a single character using one of the following actions:</p> <ul style="list-style-type: none"> • Type in the character. • Type in the Unicode value of the character. For example, enter /u0020 for the space character. • Click [...] to browse for a character. The Character Selection dialog box opens listing the valid character choices for delimiters. In the Display column, the character or a mnemonic representing the character is displayed. In addition, the corresponding hexadecimal value and Unicode code point for the character is displayed. <p>Select a character and click OK. If the selected character does not have a visual symbol, a mnemonic or the Unicode value might show for this character.</p> <p>For more information about any of these characters, see the Basic Latin and Latin-1 Supplement character sets at: http://www.unicode.org/charts/.</p>
L i n e E n d	<p>Specifies that the repeat delimiter is the end of the line, either a LF (line feed) or CRLF (carriage return, line feed). If the children are delimited with just a CR (carriage return), select the Character option and specify a CR (carriage return) character as the delimiter. The Integration Appliance accepts both line end characters (LF and CRLF) when parsing data. When writing data, the character used for line ends is determined by the Write Line Ends As CRLF property.</p>
D y n a m i c P o s i t i o n	<p>Specifies that the character used as the repeat delimiter is defined dynamically within the data. Dynamic delimiters must show at a specific position within the first record of the data, such as in EDI or HL7 data. How the character is used by the Integration Appliance depends if the Flat File data is incoming or outgoing:</p> <ul style="list-style-type: none"> • While parsing incoming Flat File data in the Read Flat File activity, the Integration Appliance reads the character at the specified position and uses it as a repeat delimiter to parse the rest of the data. The Write Default text field is not used when incoming Flat File data is read. • While writing outgoing Flat File data in the Write Flat File activity, the Integration Appliance uses the character specified in the Write Default text field to delimit the repeating children of the root node. In addition, the specified character is written at the specified position of the first record in the outgoing data.

P o s i t i o n	Definition
W r i t t e D e f a u l t	<p>Specifies the character that should be used as the repeat delimiter when the Integration Appliance writes outgoing data in the Write Flat File activity. In addition, the specified character is written at the specified position of the first record in the outgoing data. The character specified in this field is not used when incoming Flat File data is read in the Read Flat File activity.</p> <p>In the Write Default text field of the pane, enter a single character using one of the following actions:</p> <ul style="list-style-type: none"> • Type in the character. • Type if the Unicode value of the character. For example, enter /u0020 for the space character. • Click [...] to browse for a character. The Character Selection dialog box opens listing the valid character choices for delimiters. In the Display column, the character or a mnemonic representing the character is displayed. In addition, the corresponding hexadecimal value and Unicode code point for the character is displayed. Select a character and click OK. Â If the selected character does not have a visual symbol, a mnemonic or the Unicode value might display for this character. For more information about any of these characters, see the Basic Latin and Latin-1 Supplement character sets at: http://www.unicode.org/charts/

Adding Groups or Group Types

About this task

Why add groups?

Groups allow you to define repeated occurrences of sets of records, for example the groups that are used with EDI messages to define loops. Groups are only required when the data does not provide any additional delimiters or structure to clearly mark the beginning and end of repetitions that contain more than one record. Â The following example data shows a repeating set of records that can be defined using groups:

Using Groups to Define Repeating Sets of Data

Groups can contain any number of records or other groups. Groups cannot contain fields. For an example of using a group to model the preceding input Flat File data, see [Group Example](#).

You create groups in the Schema Layout tab. Groups that are not based on a group type are displayed in the Schema Layout tab using the following icon:

Groups that are based on a group type are displayed in the Schema Layout tab using the following icon:

Note: Groups are not global to the project and can only be reused in the current Flat File Schema.

Why Add Group Types?

Group types allow you to define a set of repeating records or groups once and then use it many times within a Flat File Schema. Both the occurrence properties and the content you define in a group type are inherited by any group based on that type.

Note:

- Groups based on a group type cannot contain any other content besides the nodes inherited from the group type
- The content inherited from the group type is not visible in the Schema Layout tab.
- Group types can also be based on other group types.
- Group types are not global to the project and can only be reused in the current Flat File Schema.

Create group types in the Type Library tab. Group types that are not based on a group type are displayed in the Type Library tab using the following icon:

Group types that are based on a group type are displayed in the Type Library tab using the following icon:

Adding Groups or Group Types

The procedure for adding groups and group types is identical except for the tab you initially select as described in the following procedure. To add a group or group type:

Procedure

1. Open a Flat File Schema from the Project tab.
2. Select the appropriate tab:
 - o To add a group, select the Schema Layout tab.
 - o To add a group type, select the Type Library tab.
3. Select the appropriate tab:
 - o To add a group, select the Schema Layout tab.
 - o To add a group type, select the Type Library tab.
4. Select one of the following options from the list:
 - o New Child > Group: To add a group as a child of the current node.
 - o New Sibling > Group: To add a group as a sibling of the current node.
 - o **New Children**: to bulk add groups as a child of the current group or record.
5. In the New Group dialog box, enter a [valid node name](#) in the Group Name field.
6. If this group should be based on a group type, select the group type from the Based on Group list.
7. Click OK. The group node is shown in the appropriate tab (Schema Layout or Type Library) and group properties display in the Basic Properties pane.
8. Specify the properties for the group.

If this group is based on a group type that defines the content for the group, the group is complete. If not, define the content of the group.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/mde_Adding_Groups_or_Group_Types.html

Group Properties

When a group is selected in the Schema Layout tab, the Basic Properties of a group are displayed. When a group type is selected in the Type Library tab, the Basic Properties of the group type are displayed. The Basic Properties of a group or group type are listed in the following table:

Field	Description
Name	Specifies the name of this field. Attention: The field name must be a valid node name .

Field	Description
Type	Optional: Specifies the group type used as a basis for the group. The Type list is only active if the selected group node does not contain any children and a group type has been created. A group cannot inherit groups or records from a group type if the group contains children. Attention: Selecting a new type may reset some of the existing properties of the field with the new settings.
Reset	Resets properties that were set locally for this group to the values for the selected type. Reset is only active if a group type has been selected from the Type list.
Minimum Occurrences	Specifies the minimum occurrences for the group. Defaults to 1, making the group required. Select 0 if this group is optional.
Maximum Occurrences	Specifies the maximum occurrences for the group: <ul style="list-style-type: none"> Unbounded - Specifies this group can repeat any number of times. Unbounded, optional groups must contain at least one required record. Range - Specifies the maximum number of repetitions for this group. The actual occurrences of the group can be less than or equal to this number.

Group Example

About this task

This example shows a Flat File Schema that parses a repeating set of records using groups. Each set of the repeating record contains records of different types as shown in the following example input Flat File data:

Figure 1. An example input Flat File

In this example data, the first, second, and third records of the repeating set are each a different type of record. In addition, this example shows how types stored in the Type Library tab are used in a Flat Files Schema. In this example, you view and test an existing Flat File Schema rather than creating the Flat File Schema from scratch.

To open, view, and test the Flat File Schema used to parse the input data displayed in [Figure 1](#):

Procedure

1. In this example, the Flat File Schema is already built in the FlatFileSchemasExample project. To view the Flat File Schema, you must first extract the FlatFileSchemasExample project:
 - a. Find the Default Create Path defined in Studio - the directory that new projects are created in. To view the current Default Create Path, select File > Preferences... from the Studio toolbar menu. The Preferences dialog opens. The current Default Create Path shows at the end of the pane. By default, the Default Create Path is located in the following directory:

```
C:\Documents and Settings\myLogin\My Documents
```

 Where *myLogin* represents your Windows login name.
 - b. Find the FlatFileSchemasExample.zip file that contains the files that make up the FlatFileSchemasExample project. If you accepted the defaults during the installation of Studio, this file is located in the following directory:

```
C:\Program Files\IBM\WebSphere Cast Iron Studio 3.X\Samples\FlatFileSchema
```
 - c. Copy the FlatFileSchemasExample.zip file from the FlatFileSchema directory to the Default Create Path directory.
 - d. Extract the contents of FlatFileSchemasExample.zip file into the Default Create Path directory.
2. Open the FlatFileSchemasExample project:
 - a. Select File > Open Project... from the Studio toolbar menu. The Open dialog box shows.
 - b. Browse for and open the FlatFileSchemasExample directory.
 - c. Click the FlatFileSchemasExample.sp3 file and click Open. The project is displayed.
3. Open the prebuilt vegPO Flat File Schema. In the Flat File Schemas folder of the Project tab, double-click the vegPO Flat File Schema. The nodes of the vegPO Flat File Schema are displayed in the Schema Layout tab and the properties of the vegPO root node show in the right pane.

4. Test the vegPO Flat File Schema:
 - a. In the test pane, click Browse. The Open Sample Test Data File dialog box opens.
 - b. Browse for the vegPO.txt file that contains the input data. If you accepted the defaults during the installation of Studio, this file is located in the following directory:

C:\Program Files\IBM\WebSphere Cast Iron Studio 3.X\Samples\FlatFileSchema
 - c. Click Open. The input data from the vegPO.txt file shows in the left pane of the Test tab.
 - d. Click the Test () icon. In the results pane, the result of the conversion is displayed as XML data.
5. In the Schema Layout tab, click the vegPO root node. The vegPO root node is displayed with the following properties:
 - a. Structure property is equal to Delimited - The structure of the root node is delimited.
 - b. Child delimiter is equal to Line End- The child records are delimited by an end-of-line.
 - c. Child Delimiter Position is equal to After - Expect the delimiters after each record
 - d. Repeat delimiter is equal to Line End- Repeating records are also delimited by end-of-line.
6. In the Schema Layout tab, click the orderingStore node. The first line of the input data is highlighted within the test pane as shown in the following figure:

The first record of the vegPO Flat File Schema is a header record called orderingStore that occurs only once. In the Schema Layout tab, the fields and record that make up the orderingStore record display as children. This first line is parsed into the fields and records that make up the orderingStore record.

After the first header record, the sets of repeating elements start. Each set of repeating elements contains three child records of different types as shown in the following figure:

A repeating record that contains child records of different types can be modeled in the Flat File Schema Editor using groups. Groups are only required when the data does not provide any additional delimiters or structure to clearly mark the beginning and end of repetitions that contain more than one record. The delimiters for the repetitions are inherited from the parent record or root node. In this example for the vegPO root node, the repeat delimiter is set to end-of-line. The orders group node uses end-of-line delimiter to parse its repeating records

7. In the Schema Layout tab, click the orders group node. Note the following graphical changes in the panes:
 - o In the left subpane of the test pane, all the lines after the header line are highlighted. This highlighting indicates that after parsing, all the data after the first record are all assigned to the orders group node.
 - o In the Basic Properties pane, the Occurrences of the orders group is Unbounded. This setting means that there can be one or more instances of this group.
 - o In the Basic Properties pane, for the orders group the Type is equal to order. This setting means that the orders group is based on the order group type. The contents and the properties of the order group type are defined in the Type Library tab.
8. Select the Type Library tab. The record types and group types used in the vegPO Flat File Schema display. The order group type contains three records as shown in the following figure:

The following icon represents a record that is based on a record type:

The orders group with the order group type define a set of repeating records of different records because of the following characteristics:

- o There can be one to many instances of the orders group.
- o The order group type contains three records of different types.
- o The orders group is based on or inherits from the order group type.

The repeating relationship between the orders group and the order group type is shown in the following figure:

9. In the Type Library tab, click the id record node of the order group type. Note the following graphical changes in the panes:

- o In the Basic Properties pane, the Type of the id record is equal to the record type named orderID. This setting means that the id record is based on the orderID record type.
- o In the left subpane of the test pane, the first line of each repeating record is highlighted as shown in the following figure:

This highlighting indicates that the first line of each repeating record is assigned to the id record.

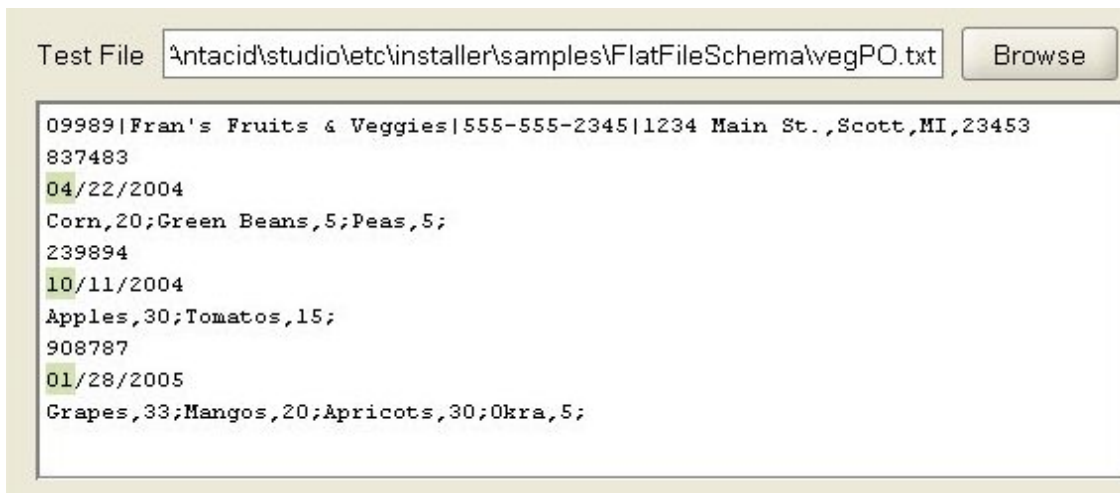

10. In the Type Library tab, click the shipdate record node of the order group type. Note the following graphical changes in the panes:

- o In the Basic Properties pane, the Type of the shipdate record is equal to the record type named shippingDate. This setting means that the shipdate record is based on the shippingDate record type.
- o In the Basic Properties pane, the Structure of the shipdate record is Positional. This setting means that the child fields of the shipDate record are determined by their position and length in the record and not by delimiters.
- o In the left subpane of the test pane, the second line of each repeating record is highlighted as shown in the following figure:

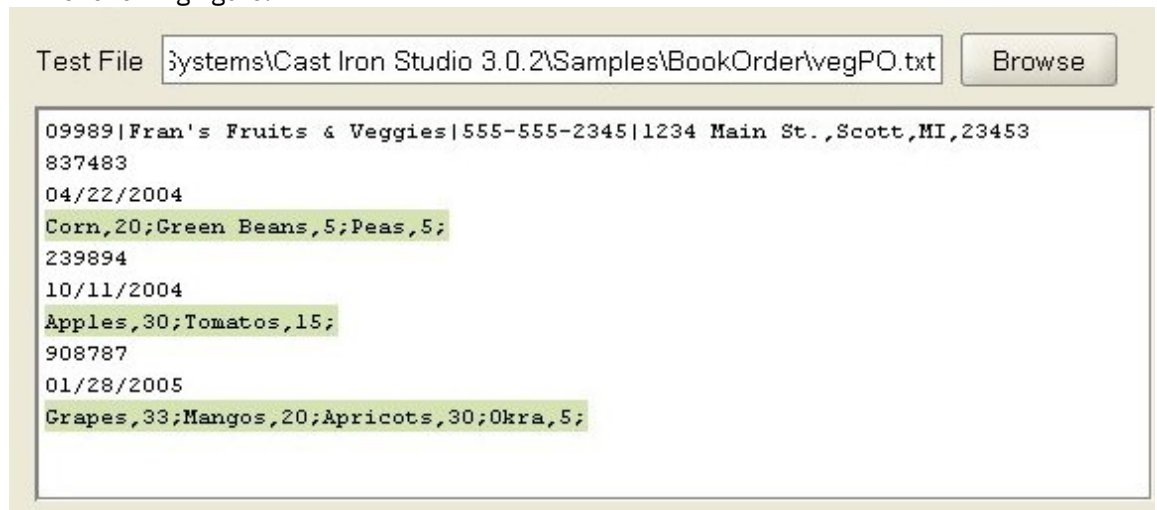

This highlighting indicates that the second line of each repeating record is assigned to the shipDate record. The shipDate record contains three positional child fields (month, day, and year) that are inherited from the shippingDate record type.

11. In the Type Library, click the month field node of the shippingDate record type. In the left subpane of the test pane, the values assigned to the month field are highlighted as shown in the following figure:

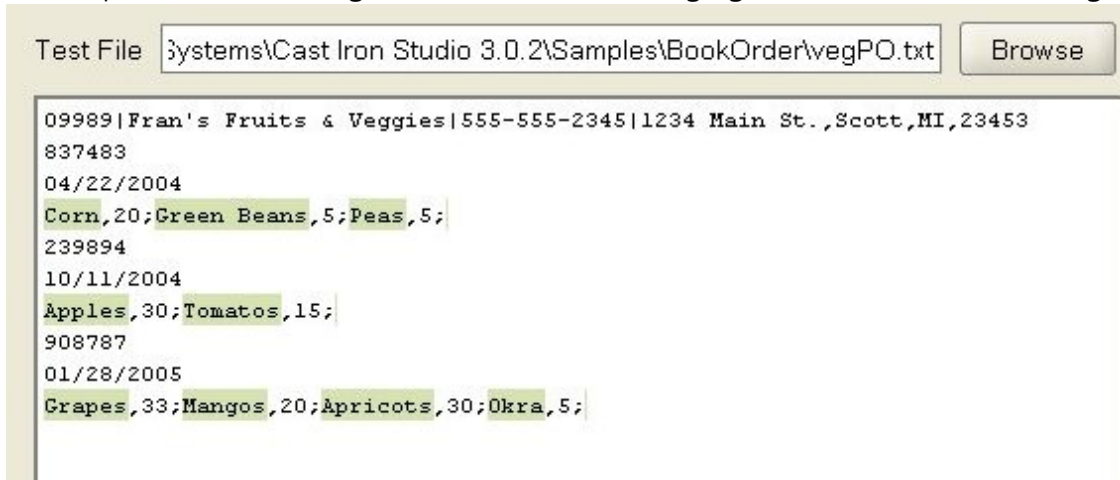

12. In the Type Library, click the contents record node of the order group type. Note the following graphical changes in the panes:
- o In the Basic Properties pane, the Type of the contents record is equal to the record type named orderContent. This setting means that the contents record is based on the orderContent record type.
 - o In the left subpane of the test pane, the third line of each repeating record is highlighted as shown in the following figure:

The orderContent record type contains the vegetables record. The vegetables record its contains a set of repeating vegetable records. The vegetable record contains a name field and a pounds field.

13. In the Type Library, click the name record node of the orderContent record type. In the left subpane of the test pane, the values assigned to the name field are highlighted as shown in the following figure:

Working with Nodes in the Schema Tabs

About this task

In the Schema tab or the Type Library tab, you can do the following actions:

- [Copy nodes](#)
- [Delete nodes](#)
- [Rename nodes](#)
- [Move nodes](#)

You can also bulk-add many children. For more information, see [Adding Several Children](#).

- [Copy nodes](#)
- [Delete nodes](#)
- [Rename nodes](#)
- [Move nodes](#)

Parent topic: [Flat File Schemas](#)

[Feedback](#) | [Notices](#)

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Working_with_Nodes_in_the_Schema_Tabs.html

Copy nodes

About this task

You can copy nodes in the Schema Layout tab or in the Type Library tab using the following procedures:

- Copy and paste a Child node
- Copy and paste a Sibling node

You can also use keyboard shortcuts (CTRL+C, CTRL+V, CTRL+X) or the Edit toolbar menu options (Edit > Cut, Edit > Copy, Edit > Paste) to copy nodes.

To copy and paste a Child node:

Pasting a node as a child places the node inside the record or group you have selected at the end of any existing children.

1. Right-click the node you want to copy.
2. Select Copy.
3. Right-click the record or group that should be the parent of the node you are pasting.
4. Select Paste As Child.

If you paste a node within the same record or group that you copied it from, the Flat File Schema Editor changes the name of the new node to copy_node-name.

To copy and paste a Sibling node:

Pasting a node as a sibling places it directly above the node you have selected. This option is not available for the root node.

1. Right-click the node you want to copy.
2. Select Copy.
3. Right-click the node that should come directly after the node you are pasting.
4. Select Paste As Sibling.

If you paste a node within the same record or group that you copied it from, the Flat File Schema Editor changes the name of the new node to copy_node-name.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Working_with_Nodes_copy.html

Delete nodes

About this task

You can delete nodes in the Schema Layout tab or the Type Library tab, using any of the following procedures:

- To delete a tree node by right-clicking the node
- To delete a tree node using the Delete key

You can also use keyboard shortcut cut (CTRL+X) or the Edit > Cut toolbar menu option to delete nodes.

To delete a tree node by right-clicking the node:

1. Right-click the node to be deleted.
2. Select Delete from the list.

To delete a tree node using the Delete key:

1. Click the node to be deleted.
2. Press Delete.

Attention: If you delete a type node in the Type Library tab that is used as the basis for records, groups, or fields within the Schema Layout tab, the nodes that are based on that type are affected in the following ways:

- The Type is changed to None.
- Node properties are left unchanged, but inherited content from the type node is removed.

Rename nodes

About this task

You can rename nodes in the Schema Layout tab or the Type Library tab, using any of the following procedures:

- Change a node name from the Basic Properties pane
- To change a node name using a shortcut menu
- To change a node name using F2

You can also use the Edit > Rename toolbar menu option to rename nodes.

To change a node name from the Basic Properties pane:

1. Double-click the node to open its properties.
2. Enter the new name into Name text field in the Basic Properties pane.

Note: Press Esc to cancel the editing of the name of a node.

To change a node name using a shortcut menu:

1. Right-click the node.
2. Select Rename from the list.
3. Enter a new [valid node name](#).

Note: Press Esc to cancel the editing of the name of a node.

To change a node name using F2:

1. Click the node to be renamed.
2. Press F2.
3. Enter a new [valid node name](#).

Parent topic: [Working with Nodes in the Schema Tabs](#)

file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Working_with_Nodes_rename.html

Move nodes

About this task

You can move nodes in the Schema Layout tab or the Type Library tab, using any of the following procedures:

- To copy and paste a Child node (as described in [Copy nodes](#)).
- To copy and paste a Sibling node (as described in [Copy nodes](#)).
- To move nodes using drag and drop

To move nodes using drag and drop:

1. Select the node you want to move in the Schema Layout or Type Library tab.
2. Drag it over another node:
 - To make it the last child, drop it over the root, record, or group that should be the new parent.

Parent topic: [Working with Nodes in the Schema Tabs](#)

Adding Several Children

About this task

Add several child records and fields to a root node or a record by right-clicking the node and selecting the New Children option from the list.

To add multiple child nodes to a Flat File Schema:

Procedure

1. [Create a new Flat File Schema](#) or open an existing Flat File Schema by selecting it in the Project tab.
2. Select either the Schema Layout or Type Library tab.

3. Right-click the root node or a record node in the tree and select New Children. The Bulk Add dialog box opens.
4. Click Add.
5. Click the Name field and enter a [valid node name](#) for the field, record, or group to be added.
6. Click the Node Type field and select a node type (Field, Group, or Record) for the child from the list.
7. If this node is based on a record type, group type, or field type, click the Based On Type field and select an existing type from the list.
8. Repeat steps 4-7 for each node you want to add.
9. To reorganize or delete the nodes in the list:
 - o Click Up to move a child up the list.
 - o Click Down to move a child down the list.
 - o Click Delete to delete a child.
10. When finished, click OK.
11. In the Schema Layout or Type Library tab, select the node and edit the properties:
 - o [Edit the field properties](#)
 - o [Edit the record properties](#)
 - o [Edit group properties](#)

Valid Node Names

When a Flat File Schema is created, an internal XML Schema-based representation of the metadata is also generated, so the node names you specify for the records, fields, and groups *must* be valid XML names. Follow the naming restrictions listed in the following tables when creating node nodes in Flat File Schema.

Attention: You might be able to enter invalid characters into the Name field but the generated Flat File Schema might be incorrect. You cannot create a variable from an invalid schema.

XML naming restrictions are listed in the following tables.

Valid Name Types	Description
Starting Name Characters	<ul style="list-style-type: none"> • Letters: both uppercase and lower case • Punctuation: underscore (_)
Non-starting Name Characters	<ul style="list-style-type: none"> • Letters: both uppercase and lowercase • Punctuation: underscore, period, and hyphen • Numbers: 0-9
Invalid Characters	Description
Â Â Â	space

Invalid Characters	Description
:	colon
~	tilde
/	forward slash
\	backslash
;	semicolon
?	question mark
\$	dollar sign
&	ampersand
%	percent sign
@	at sign
^	hat sign
=	equals sign
*	asterisk
+	plus sign
Â ()	any parentheses
	pipe
' " `	any quotation marks
{ Â } [] > <	any brackets

The Type Library Tab

In the Type Library tab, you can define reusable types for records, groups, and fields. Defining record types, group types, and field types allows you to define properties that can be reused in different parts of the Flat File Schema. Record and group types also allow you to define content that is reusable where a record or group can show in many places within the same set of Flat File Data.

Note: The type you create in the Type Library tab can only be used with the Flat File Schema visible in the Schema Layout tab. The type cannot be used by other Flat File Schemas in the same project.

Specifying Optional Fields and Records

About this task

When creating optional fields or records in a Flat File Schema, it is important to understand how the Flat File data is parsed so you can design your Flat File schema to avoid ambiguity. For example, if you create a Flat File Schema with a delimited root node and three child string fields where field1 is required, field2 is optional, and field3 is required, the grammar of the schema is ambiguous, as shown when the following data is parsed during run time:

A, C

This Flat File data could be parsed in the following two ways:

- field1 is equal to A and field2 is equal to B
- field1 is equal to A and field3 is equal to C

Specifying a required field after an optional field defines an ambiguous grammar that cannot be correctly parsed. Specifying a required record after an optional field also defines an ambiguous grammar that cannot be correctly parsed.

Redefining this Flat File Schema to contain three child string fields where field1 is required, field2 is optional, and field3 is optional does not fix this problem because when the Flat File data: A, C is parsed, field1 is equal to A, and field2 is equal to C. Again the grammar of the schema is ambiguous because this is not the wanted result, the wanted result was for the value: C to be assigned to field3. Specifying a required record followed by two optional records also defines an ambiguous grammar.

Generating a flat file schema from an IDOC

At design time, using the Project > Import > SAP IDOC Schema toolbar menu option, you can interrogate an SAP endpoint for IDOC metadata and from that metadata generate a Flat File Schema.

WARNING: In order to connect to the SAP System from Studio, you must [download and install the SAP Jar file and DLLs](#) onto your Windows development workstation.

If you receive or send your SAP data as a file through a SAP File Port to the SAP system, you must use the Project > Import > SAP IDOC Schema toolbar menu option during design time to generate a Flat File Schema for your IDOC metadata and use the Read Flat File and Write Flat File activities to read and write the SAP data during run time. For more information, see the following two example orchestrations.

If you receive or send your SAP data directly from the SAP system using an RFC port, you must use the [SAP Receive IDOC](#) and [SAP Send IDOC](#) activities.

Using the Generated Flat File Schema during Run Time

During design time, you use the Project > Import > SAP IDOC Schema toolbar menu option, to generate a Flat File Schema that describes the SAP data you receive or send to the SAP File Port. This section describes how that Flat File Schema is used by the following two example orchestrations during run time.

Receive SAP Flat File Data from a SAP System Using an SAP File Port.

This first example orchestration receives SAP data from a SAP System during run time, using the following activities:

1. An SAP data file is placed into a directory that the FTP Poll Directory activity is polling in. This starts the processing of the orchestration job.
2. The FTP Poll Directory reads the SAP Flat File data and saves the result into a string variable.
3. Using the Flat File Schema generated during design time using the Project > Import > SAP IDOC Schema toolbar menu option, the Read Flat File activity converts the SAP data stored in the string variable to XML data and saves the XML data into an XML variable.
4. The Database Insert Rows activity maps the XML data from the XML variable to some database rows and inserts these rows into a database

Send SAP Flat File Data From a SAP System Using an SAP File Port

This second example orchestration sends SAP data to a SAP System during run time, using the following activities:

1. Data is inserted into a database, triggering the Database Get Inserted Rows activity to start processing.
2. The Database Get Inserted Rows activity gets the data that was inserted into the database and converts it to XML data.
3. The Write Flat File activity converts the contents of the XML variable to the SAP Flat File data valid against the Flat File Schema generated during design time using the Project > Import > SAP IDOC Schema toolbar menu option.
4. The FTP Put File activity writes the Flat File data to a file into a directory.
5. The SAP System reads the data from the file.

To generate a Flat File Schema from an IDOC:

1. Select Project > Import > SAP IDOC Schema from the toolbar menu. The SAP IDOC Flat File Schema Generator Step 1 of 2 dialog box shows.
2. Enter the SAP connection information as described in the following table:

Field	Description
Location	Â

Field	Description
Host Name	Specifies the IP address or the workstation name that contains the SAP system.
System Number	Specifies the number that identifies the specific instance of the SAP system that Studio is to connect to. Your SAP administrator must supply this information.
SAP Client	Specifies a number that identifies Studio as a client for the SAP system. Your SAP administrator must supply this information.
Login	Â
User Name Â	Specifies the user name to use when connecting to the SAP system.
Passwor d	Specifies the password to the user name when connecting to the SAP system.

3. Click Next. The SAP IDOC Flat File Schema Generator Step 2 of 2 dialog box is displayed.
4. Select an IDOC Type and optionally an IDOC SubType using one of the following options:
 - o Click [...] to browse for the IDOC Type, the IDOC SubType, or both. The IDOC List dialog box opens with the list of IDOC Types and IDOC SubTypes available on the selected SAP endpoint. Select an IDOC Type, the IDOC SubType, or both and click OK.
 - o Enter the IDOC Type, and optionally the IDOC SubType directly into the respective fields.
5. Select the Bundled check box if the incoming IDOC contains more than one instance of the IDOC message of the same IDOC Type and IDOC SubType. If Bundled is checked, the IDOC element in the generated Flat File Schema is a repeating element.
6. Click Finish.

If the generation of the Flat File Schema was successful, the Flat File Schema is shown in the Flat File Schemas folder of the Project tab.

[Feedback](#) | [Notices](#)

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Generating_a_Flat_File_Schema_from_an_IDOC.html

Using the Flat File Wizard

The Flat File Wizard creates a schema that defines the format of a flat file based on sample data that you provide. The **Read Flat File** activity uses this schema to convert flat files into an XML document.

For the best results, provide sample data that is like the actual data. For example, if the actual data contains header and footer rows, provide sample data with a header row for field names and footer rows. If the actual data contains quoted fields, the appropriate fields in the sample data should be quoted fields as well.

The Flat File Wizard only reads the first 1000 lines of a file. If the sample file contains more than 1000 lines and contains footer rows, remove lines before the footer rows so that the total line count stays within the 1000 line limit.

Important: All rows in your sample data must have the same number of fields.

To use the Flat File Wizard:

1. From the Studio menus select Project > Flat File Wizard. The Flat File Wizard opens in a tab in the Studio workspace.
2. Enter sample data into the Sample Data text box or click Browse... to load a sample file.
3. Click Next >. The File Format page opens.
4. Choose one of the file format options:
 - o Character-delimited format (including Comma Separated Values format) - Choose this option when each line in the file has a record with fields separated by a single character, such as a comma or tab.
 - o This file is in another format - Choose this option when your file does not meet the criteria of the previous file format option. If you select this option, you cannot use the Flat File Wizard to create a schema for your flat file.
5. Click Next >. The Field Delimiters page opens.
6. Select a field separator from the Fields separated by list. If you select Other:, specify the field separator in the field that displays to the right.
7. If the field is enclosed by a specific character, select the character that encloses the field from the Fields enclosed by list. If you select Other:, specify the enclosing character in the field that displays to the right.
8. Click Next >. The Header & Trailer page opens
9. Specify whether header and trailer rows exist:
 - a. Select Treat first row as header for field names, if a header row exists.
 - b. Select Treat last __ row(s) as trailer, if a trailer row exists and specify the row number.
10. Click Next >. The Edit Schema Name page opens.
11. Enter a schema name.

Tip: Choose a schema name that describes the data and file format.
12. Click Finish. In the Project tab of the Studio Toolbox, the flat file schema you just created displays in the Flat File Schemas directory.

To read the flat file you created and convert it to XML:

1. Add the Read Flat File activity to an orchestration.
2. In the Checklist, select Configure. The Configure pane opens.
3. In the Select a Flat File Schema field, specify the name of the flat file schema you have created. Â

Â To convert XML data to a flat file:

1. Add the Write Flat File activity to an orchestration.
2. In the Checklist, select Configure. The Configure pane opens.
3. In the Select a Flat File Schema field, specify the name of the flat file schema you have created.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/toc_mapping.html

About Maps

Maps define how data is transformed by the Integration Appliance during run time. Maps can reorganize data, convert data, suppress or add data, and performing calculations or other complex conversions.

Maps can transform data from one or more sources to one or more destinations. For example, during run time a map can transform XML data valid against one XML Schema to XML data valid against another XML Schema. The XML Schemas and Flat File Schemas you use to define the source and destination nodes of a map must exist in the current project before you start creating a map. For more information about uploading an XML Schema or DTD to a project, see [Uploading Files into a Project](#). For more information about creating a Flat File Schema, see [Creating a flat file schema](#).

The following types of maps can be created in Studio:

- **Inline maps** - Inline or embedded maps are not visible in the Project tab. These maps are created automatically inline when you configure activities that contain Map Input and Map Output tasks, or when you configure a [Map Variables](#) activity. The source and destination types of an inline map are determined from the variables you select by clicking Add in the From Orchestrations and To Orchestrations panes of the Mapping Editor. Inline maps transform data from one or more source variables to one or more destination variables. The source and destination variables can be of any data type.
- **Standalone maps** - A standalone map is visible in the Transformations folder of the Project tab and represents a set of one or more mappings between source and destination nodes. You can create standalone maps by right-clicking the Transformations folder in the Project tab or from the Project > New > New Standalone Map toolbar menu option. For more information, see [Creating a Standalone Map](#). The source and destination types of an inline map are determined from the schema types you select by clicking Add in the From Orchestrations and To Orchestrations panes of the Mapping Editor.

You can also test a map against sample data, for more information see [Testing maps](#).

Parent topic: [Mapping](#)

[Feedback](#) | [Notices](#)

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_About_Maps.html

Creating a map

Create a map between the variables and the input parameter or between the output parameters and the variables.

Many Studio activities contain inline or embedded maps that you must configure in the activity **Checklist**. You configure the inline maps in an activity in either the Map Inputs or Map Outputs tasks in an activity **Checklist**.

In addition, configure an inline map in the Map Variables activity. The Mapping Editor is displayed beneath the orchestration.

For instructions about creating maps while configuring a Map Variables activity, see [Map Activity](#)

In addition to the inline maps that you create in the Map Inputs or Map Outputs tasks or when configuring a Map Variable activity, you can also create standalone maps. You can create an inline map in a Map Variables activity from a standalone map. For more information, see [Creating a Map Variables Activity from a Standalone Map](#).

In the Map Inputs task, you map variable or variables from the orchestration (From Orchestration pane) to the input parameter or parameters of the activity (To Activity pane).

In the Map Outputs task, you map output parameters from the activity (the From Activity pane) to variable or variables of the orchestration (the To Orchestration pane).

During run time, an activity typically takes data from orchestration variable or variables manipulates the data in some way and returns the result in another set of variables as shown in the following figure:

The flow of data (from left to right) through the example activity (shown in the preceding figure) is described in the following steps:

1. In this case, the contents of the variable was supplied by the previous activity in the orchestration, the FTP Poll Directory activity. Comma separated values are stored in the *flatFileRawContent* variable by the FTP Poll Directory activity.
2. The contents of the *flatFileRawContent* variable is assigned to the input parameter called Data of the Read Flat File activity.
3. The Read Flat File activity converts the comma separated values to XML data and places the resulting data into the Xml output parameter.
4. The contents of the Xml output parameter is assigned to the *batchOrderXML* variable. The *batchOrderXML* variable is available in the orchestration. The next activity in the orchestration can use the contents of the *batchOrderXML* variable.

You can also manipulate the data in the maps between parameters and variables (created in the [Map Inputs](#) and [Map Outputs](#) task) using the functions available from the Functions tab. For more information see [Assigning Function\(s\) to a Mapping Rule](#).

The following activities require mapping:

- All connection activities that are listed under the following folders in the Activities tab:
 - Database
 - Email
 - FTP
 - HTTP
 - MQ

- SAP
 - Web Services
- All the Transform activities that are listed under the Transform folder in the Activities tab.
- [Create Job Keys Activity](#)

Â

- [Mapping Inputs](#)
When you map inputs, you are mapping from the orchestration (variables) to the activity (parameters).
- [Mapping Outputs](#)
When you map outputs, you are mapping from the activity (parameters) to the orchestration (variables).

Mapping Inputs

When you map inputs, you are mapping from the orchestration (variables) to the activity (parameters).

About this task

To create a map between variables and input parameters:

Procedure

1. Open or [create](#) an orchestration.
2. If the activity is mapping variables that conform to a particular XML Schema or DTD, [upload the XML Schema or DTD file into your project](#).
3. Click the activity in the orchestration that contains the Map Inputs task in the Checklist.
4. Select the Map Inputs task from the Checklist.
5. If not already selected, click Design. The Mapping Editor is displayed and the input parameters of the activity show in the To Activity pane.
6. [Add variables](#) to the From Orchestration pane.
7. Drag a source node from the From Orchestration pane to a destination node of an input parameter listed in the To Activity pane. If the mapping is valid, a link (line) displays from the source node to the destination node, indicating that a mapping rule has been established. Repeat this step until all the required nodes have been mapped. For more information, see the help topic for an activity to determine which nodes are required.
Note: You can [find a node in a source or destination schema](#) using the Find dialog box.
8. Optional: [Assign Function\(s\) to a Mapping Rule](#).
9. If possible, [test](#) your mappings to ensure that the output is what you expect.
Note: You can replace a variable used in the map without changing the links of the map. For more information, see [Replacing a Variable used in a Map](#).

What to do next

You can show the optional input parameters of an activity using the Map > Show Optional Parameters toolbar menu option or hide the optional input parameters of an activity using the Map > Hide Optional Parameters toolbar menu option.

In addition, you can show or hide the optional input parameters of an activity by right-clicking in the To Activity pane and selecting the Show Optional Parameters to show the optional input parameters or selecting Hide Optional Parameters option to hide the optional input parameters. When the Show optional parameters option is set, the optional input parameters of an activity display in the To Activity pane of the Map Inputs pane with the prefix string: {optional}. If the Map > Show Optional Parameters option is not selectable in the toolbar menu, click a node in the Map Inputs pane to make this option active

Parent topic: [Creating a map](#)

Feedback | Notices

 Last updated: Thursday, December 17, 2015

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map_creating_a_map_mapping_inputs.html

Mapping Outputs

When you map outputs, you are mapping from the activity (parameters) to the orchestration (variables). Â

About this task

To create a map between output parameters and variables:

Procedure

1. Open or [create](#) an orchestration.
2. If the activity is mapping variables that conform to a particular XML Schema or DTD [upload the XML Schema or DTD file into your project](#).
3. Click the activity in the orchestration that contains the Map Outputs task in the Checklist.
4. Select the Map Outputs task from the Checklist.
5. If not already selected, click Design. The Mapping Editor is displayed and the output parameters of the activity show in the To Activity pane.
6. Add output variables to the To Orchestration pane:
 - o To add existing variables to the To Orchestration pane or create new variables, click [Select Outputs...](#)
 - o To create new variables and to automatically map those variables in the To Orchestration pane, click [Copy](#).
7. Drag a source node from the From Activity pane to a destination node of an input parameter listed in the To Orchestration pane. If the mapping is valid, a link (line) is displayed from the source node to the destination node, indicating that a mapping rule has been established. Repeat this step until all the required nodes have been mapped. In general, it is not a requirement that you map all the outputs from an activity.

Note: You can [find a node in a source or destination schema](#) using the Find dialog box.

8. Optional: [Assign Function\(s\) to a Mapping Rule](#).

9. If possible, [test](#) your mappings to ensure that the output is what you expect.

Note: You can replace a variable used in the map without changing the links of the map. For more information, see [Replacing a Variable used in a Map](#).

Creating a Standalone Map

A standalone map is visible in the Transformations folder of the Project tab and represents a set of one or more mappings between source and destination nodes.

About this task

The set of source nodes available in the From Orchestration pane and destination nodes in the To Orchestration panes of the Mapping Editor are determined by the schema types defined for the source and destination variables of the map. A standalone map can be used to create any number of Map Variables activities in the same orchestration or in other orchestrations in the same project. For example, you could create a standalone map called `myMap` that contains a set of mappings between an source XML Schema called `IncomingOrder` and a destination XML Schema called `ShippingOrder`.

You can reuse this map by selecting the `myMap` entity from the Transformations folder in the Project tab and dropping it onto any orchestration in the project. This dropping action creates a new Map Variables activity in the orchestration with the same set of mappings as defined for the map called `myMap`. The new inline map created for the Map Variables activity is a copy of parent standalone map. If you change the mappings between the source and destination nodes in `myMap`, the changes are not propagated to new Map Variables activity because it is a local copy. For more information see [Creating a Map Variables Activity from a Standalone Map](#).

To create a standalone map:

Procedure

1. Create a new instance of a standalone map using one of the following options:
 - Select the Project tab, right-click on the Transformations folder, and select the New Standalone Map option from the menu.
 - From the toolbar menu, select the Project > New Standalone Map option.
 - In the Project tab, click New Standalone Map ()

An instance of a standalone map shows in the Maps folder in the Project tab

2. Double-click the instance of the standalone map in the Transformations folder in the Project tab. The Mapping Editor opens in the lower part of the pane.
3. Select the source schemas.

4. Select the destination schemas
 5. Drag a source node from the From Orchestration pane to a destination node in the To Orchestration pane. If the mapping is valid, a link (line) displays from the source node to the destination node, indicating that a mapping rule has been established. Repeat this step until all the required nodes have been mapped.
Note: You can find a node in a source or destination schema using the Find dialog box. For more information about finding a node in a source or destination schema, see [Assigning Function\(s\) to a Mapping Rule](#).
 6. Optional: Assign function or functions to a mapping rule. For more information, see [Assigning Function\(s\) to a Mapping Rule](#).
 7. If possible, test your mappings to ensure that the output is what you expect. For more information about testing mappings, see [Testing maps](#).
- [Select source schemas for a standalone map](#)
 - [Select destination schemas for a standalone map](#)

Creating a Standalone Map from a Map Variables Activity

About this task

The following procedure provides instructions for creating a standalone map from a Map Variables activity. For more information about standalone maps and the inline map of a Map Variables activity, see [About Maps](#).

To create a standalone map from a **Map Variables** activity:

Procedure

1. Select the Project tab.
2. Double-click an orchestration that contains the Map Variables activity, in the Orchestrations folder of the Project tab.
3. Drag the Map Variables activity from the orchestration into the Project tab. A new Map shows under the Transformations folder of the Project tab. New schemas might also be created when this new map is created.

Important: The new standalone map is a copy of the map from the Map Variables activity. Changing the map in the Map Variables activity does not change the new standalone map. The converse is also true, changing the new standalone map does not change the map in the Map Variables activity.

Parent topic: [Mapping](#)

Creating a Map Variables Activity from a Standalone Map

About this task

The following procedure provides instructions for creating a Map Variables activity from a standalone map. For more information about standalone maps and the inline map of a Map Variables activity, see [About Maps](#).

To create a **Map Variables** activity from a standalone map:

Procedure

1. Select the Project tab.
2. Select the orchestration that you want to add the Map Variables activity to, by double-clicking the orchestration in the Orchestrations folder of the Project tab.
3. Drag a Map from the Transformations folder of the Project tab, onto the orchestration. The Link Schema Type to Variables dialog box opens.
4. For all the input and output schema types of the map, enter the name of an existing variable or a new variable in the Orchestration Variable field.
5. Click OK. The new Map Activity shows in the orchestration.

Important: The new inline map created for the Map Variables activity is a copy of the standalone map in the Project tab. Changing the map in the Map Variables activity does not change the new standalone map. The converse is also true, changing the new standalone map does not change the map in the Map Variables activity.

Adding Variables to Mapping Panes

You can add existing variables to a map or create new variables and add them to a map using the Select Inputs.. or Select Outputs... buttons available from the mapping panes of an activity.

About this task

To add a variable using the Select Inputs.. or Select Outputs... buttons:

Procedure

1. Click an activity in the orchestration.
2. Select a mapping task from the **Checklist** for the activity. The mapping tasks of an activity are typically called Mapping Inputs or Mapping Outputs.
3. To add variables:
 - o To add input variables to the map, click Select Inputs...
 - o To add output variables to the map, click Select Outputs....

The Select Inputs or Select Outputs dialog box opens.

4. Select from one of the following options:
 - o Add an existing variable to the mapping pane - Select an existing variable and click OK. The existing variable is added to the mapping pane.
 - o Add a new variable to the mapping pane - To add a new variable to the mapping pane:
 - a. Click New. The Create New Variables Step 1 of 2 dialog box opens.
 - b. Select a data type or schema to base the new variable:
 - For a variable based on a primitive data type:
 - i. Scroll to the end of the Create New Variables Step 1 of 2 dialog box.
 - ii. Select a primitive data type from the Primitive Types folder.
 - iii. Click Next.
 - For a variable based on a schema:
 - i. Optional: [To search for a node by name, click Find.](#)
 - ii. From the schema, select a node to be the root of the new variable.
 - iii. Click Next.
 - c. Enter a name for the new variable and click Finish. Click OK.

The new variable is added to Variables toolbox, and the schema is displayed in the "Schema of" pane on the Variables tab. The new variable is also added to the mapping pane

Copying Parameters

About this task

Using the Copy button () available from the Map Outputs pane, you can create new orchestration variables that match the output parameters of the current activity.

To copy variables:

Procedure

1. Click an activity in the orchestration.
2. Select the Map Outputs task from the Checklist for the activity. The mapping pane displays the output parameters of the current activity in the From Activity pane.
3. Click Copy. The Copy Parameters dialog box opens, containing a list of parameters matching those in the From Activity pane.
4. Click the output parameter or parameters to create variables from. The data type, schema, or schema fragment of the selected output parameter defines the data type, schema, or schema fragment of the new variable. To select more than one output parameter, press Shift while clicking the output parameters.
5. Click Create. The variables display in the To Orchestration pane. If required, rename the newly created variable to a more meaningful name. To rename the variable, double-click the variable in the blue section of the To Orchestration pane, enter the new name, and press Return.

Replacing a Variable used in a Map

About this task

You can change the variables used in the From Activity and To Orchestration panes without changing the links between source and destination nodes of a map.

For example, you could have a Map Variables activity that maps the nodes of the *varBatchOrder* variable to the nodes of the *varPurchaseOrder* variable as shown in the following figure.

The *varBatchOrder* variable is based on the BatchOrder XML Schema and the *varPurchaseOrder* variable is based on the PurchaseOrder XML Schema.

If you wanted another Map Variables activity in your orchestration maps source and destination nodes but you wanted to use a different set of variables. You could copy the original Map Variables activity and then paste the new Map Variables activity into the orchestration and then change the variables used in the map without changing the links of the map.

To replace an original variable used in a map:

Procedure

1. Click the Map Variables activity or the Map Inputs or Map Outputs tasks of an activity.
2. Create a new variable or replace a source or destination variable:
 - Double-click the blue area where the variable is listed in the From Activity, From Orchestration, To Activity, or To Orchestration panes and enter the name of the variable. A new variable of the same schema type is created.
 - Replace a source or destination variable using one of the following actions:
 - Right-click the blue area where the variable is listed in the From Activity, From Orchestration, To Activity, or To Orchestration panes and select the Choose Another Variable option from the list.
 - Double-click the blue area where the variable is listed in the From Activity, From Orchestration, To Activity, or To Orchestration panes.

An arrow shows to the right of the variable name as shown in the following figure.

Select another variable from the list. For this example, select the *varOrder* variable from the list.

Note: You can only change the variables used in Map Input and Map Output panes and not the parameters that are used in a map. For example in the FTP Poll Directory activity, the filename, data, and timestamp input parameters located in the From Activity pane of the Map Outputs task cannot be changed but the variables that the parameters map to in the To Orchestration pane can be changed.

Finding Nodes

About this task

You can search for nodes in the mapping panes of activities as described in the following procedure.

To find nodes:

Procedure

1. Open the mapping pane containing the node you want to search for.
2. Open the Find dialog box using one of the following options:
 - o Right-click either the source pane or the destination pane and select Find. The Find dialog box opens.
 - o Click a node in either the source pane or the destination pane. Select Edit > Find from the Studio toolbar menu. The Find dialog box opens.
3. Enter the name of the node that you want to search for in the Text to find field.
4. Select any options or change the direction of the search:
 - o Case Sensitive - Exactly matches the case of the text entered in the Text to find field.
 - o Whole Words Only - Matches the search text only as whole words. No partial matches are allowed.
 - o Wrap Search - Continues searching through the entire schema regardless of where the search was started.

- Forward - Searches from the root node or current node down through the schema in node-tree order.
 - Backward. Searches from the last node in the tree or the current node up through the schema in reverse node-tree order.
5. Click Find. Click Find again to continue the search through the schema.
 6. Click Cancel to close the dialog box.

Assigning a Default Value for a Destination Node

About this task

You can assign a default value for a destination node in a map. A destination node of a map is displayed in the mapping pane. The following figure shows the To Orchestration pane. How the default value is used during run time depends if a link is assigned to the destination node as described in the following cases:

- Define a default value for a destination node that does not have a link from a source node or function as shown in the following figure:

For this case, the specified constant value is always assigned to the destination node during run time.

- Define a default value for a destination node that has a link from a source node or function as shown in the following figure:

For this case, the specified value is only assigned to the destination node, if the link from the source node or a function to the destination node does not provide a value for the destination node during run time. ^

You can also use configuration properties to supply the default values for destination nodes of a map of a mapping pane as described in step 2 of the following procedure. You must [create the configuration property](#) before defining the default value as described in the following procedure.

To define a default value for a destination node:

Procedure

1. Right-click a destination node within the mapping pane. The name of the pane within the mapping pane depends on the type of map you are currently configuring as described in the following list:
 - o While configuring a Map Inputs task of an activity, the destination nodes of a map show in the To Activity pane.
 - o While configuring a Map Outputs task of an activity, the destination nodes of a map show in the To Orchestration pane.
 - o While configuring a stand-alone map or a Map Variables activity, the destination nodes of a map show in the To Orchestration pane.
2. Select the Define Default Value option from the list. The Define Default Value dialog box opens. If any configuration properties have been defined for the project, the  icon shows in the right of the Default Value field.
3. In the Default Value field, define the default value using one of the following options:
 - o Directly enter the characters that define the default value.
 - o Select a configuration property to supply the default value by clicking the  icon and selecting a configuration property from the list.
4. Click OK. The default () icon shows next to the destination node in the mapping pane.

What to do next

To clear the default value for a destination node:

1. Right-click a destination node with a default value assigned to the node within the mapping pane. A destination node with a value assigned shows the default () icon to the left of the node.
2. Select the Define Default Value option from the list. The Define Default Value dialog box opens with the text or the selected configuration property highlighted.
3. Press the Delete key.
4. Click OK. The default () icon is removed from the destination node in the mapping pane.

Mapping One Source to One Destination

About this task

To map from one Source node to one Destination node:

Procedure

1. Open the Mapping Editor.
2. Drag a Source node onto a Destination node. The Mapping Editor draws a link between the nodes and marks the destination node as mapped.
Note: You may receive a validation warning if this mapping rule is not guaranteed or is not allowed.

Automapping Matching Nodes

Automapping quickly maps source nodes to matching destination nodes. Matching is 'fuzzy' and ignores differences in case or punctuation. It does not match nodes that are at different levels within the structure or have differences such as abbreviations in names.

- To automap, select Map > Automap from the toolbar. The Mapping Editor draws mapping rules for each matching node that it finds.

The Mapping Editor also display warnings for any mapping rules that it attempts to create that are not guaranteed.

Parent topic: [Mapping](#)

[Feedback](#) | [Notices](#)

 Last updated: Thursday, December 17, 2015

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Automapping_Matching_Nodes.html

Bulk Mapping Nodes

About this task

Bulk mapping can quickly map similar structures, such as addresses, that use similar or identical names and organization. Matching is 'fuzzy' and ignores differences in case or punctuation. It does not match nodes that are at different levels within the structure or have differences such as abbreviations in names.

Bulk mapping is applied to structure nodes that you identify in the Source and Destination.

To bulk map a structure node:

Procedure

1. Right-click a structure node in the Source tree displayed in the Mapping Editor.
2. Select Map > Create Bulk Mapping Rules from the menu toolbar.
3. Drag a Source structure node onto a Destination structure node. The Mapping Editor draws mapping rules for each matching node that it finds within the structures you have selected.

Note: Bulk mapping removes any existing mapping rules for the Destination structure you select.

Mapping Recurring Nodes

About this task

Mapping rules for recurring nodes can:

- Determine the output for all occurrences
- Determine the output for specific occurrences
- Reconcile cardinality issues, such as different minimum occurrences or source and destination schemas that model recurring structures with different levels or no recurrence.

How you map recurring nodes is determined by the recurring relationships in your source and destination schemas, as outlined in the following table.

Source	Destination	Action to take
Not recurring	Recurring	Expand the destination node to map the source nodes to specific destination node occurrences.
Recurring	Not recurring	Select specific occurrences of the source and map them to the destination.
Matching Recurring Levels	Matching Recurring Levels	Map all occurrences or select/expand specific occurrences if you need to.

Source	Destination	Action to take
More Recurring Levels	Fewer Recurring Levels	Select specific occurrences of the source nodes and map them to specific occurrences of the destination. See the discussion on mapping limitations for recurring nodes in the Getting Started Guide for more information.
Fewer Recurring Levels	More Recurring Levels	Expand specific occurrences of the additional recurring levels of the destination nodes and map the source levels within the expanded destination nodes.

For more information on recurring nodes and how to limit the recurring nodes returned by a mapping activity, see [Filter Recurring Nodes](#).

Parent topic: [Mapping](#)

[Feedback](#) | [Notices](#)

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map_Mapping_Recurring_Nodes.html

Mapping All Occurrences

About this task

You can map all occurrences of a recurring source node to a recurring destination node as long as the nested levels of recurrence match or you have specified how any uneven levels should be handled.

To map all occurrences of a recurring source node:

- Drag a node in the Source tree to the appropriate node in the Destination tree. The Mapping Editor automatically creates mapping rules linking the Source occurrence nodes to the matching Destination occurrence nodes

Note: If the levels of recurrence in the source and destination schema trees do not match, you must [map specific occurrences](#) instead.

Parent topic: [Mapping](#)

[Feedback](#) | [Notices](#)

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map_Mapping_All_Occurrences.html

Mapping Specific Occurrences

About this task

When the recurring levels in the Source tree do not match those in the Destination tree, you must expand the recurring nodes and define mapping rules for specific occurrences to resolve cardinality differences:

- When source tree recurring levels are greater than destination tree levels, Select Source Occurrences
- When source tree recurring levels are less than destination tree levels, Expand Destination Occurrences

In addition, the following functionality is available for a recurring destination node that has already been expanded:

- Collapse Destination Occurrences - Removes all the occurrences of a recurring destination node, leaving just the recurring destination node.
- Add Destination Occurrence - Adds a single occurrence of a recurring destination node.
- Remove Destination Occurrence - Removes the selected occurrence.
- [Select Source Occurrences](#)
- [Expand Destination Occurrences](#)
- [Collapse Destination Occurrences](#)
- [Add destination occurrence](#)
- [Remove Destination Occurrence](#)
- [Select a substitution type in a mapping pane](#)

Select Source Occurrences

About this task

To select source occurrences:Â

Procedure

1. Open a mapping pane and right-click the source node that you want to map.
2. Select Select One Occurrence from the list. The Select One Occurrence dialog box opens.
3. This dialog box displays the path to the source node you have chosen with an occurrence property for each recurring level. Select the number of occurrences to use at each recurring level.
4. Click OK. The source node is highlighted in red in the Mapping Editor.
5. Select the source node and drag it onto the destination node to complete the mapping.

Parent topic: [Mapping Specific Occurrences](#)

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map_Mapping_Specific_Occurrences_Select_Source.html

Expand Destination Occurrences

About this task

To expand destination occurrences:

Procedure

1. Right-click the recurring () destination node in the mapping panes of activities. Destination nodes are located on the right side of mapping panes.
2. Select Expand Occurrences from the list
3. In the Expand Occurrences dialog box, specify the number of occurrences that you want to expand and map to explicitly. You can map to both the recurring node and the explicit occurrences.
4. Select a setting for the Before check box:
 - o Select the Before check box if you want the set of single occurrences to show in the map before the set of recurring nodes.
 - o Clear the Before check box if you want the set of single occurrences to show in the map after the set of recurring nodes.
5. Click OK. The specified number of occurrences shows for the selected recurring destination node.
6. Map to the expanded destination nodes as needed, treating each set as one occurrence of that structure.

You can specify the [substitution type](#) for an expanded occurrence of a recurring destination node. This [type substitution](#) of an expanded occurrence is only supported for the recurring destination nodes. Destination nodes are located on the right side of mapping panes.

Collapse Destination Occurrences

About this task

To collapse destination occurrences:

Attention: Collapsing destination occurrences removes all the current mappings for all of the expanded occurrences.

Procedure

1. Open a mapping pane and right-click the recurring destination node or any occurrence of a recurring destination node. Destination nodes are located on the right side of mapping panes.
2. Select Collapse Occurrences from the list.
3. Click OK.

Parent topic: [Mapping Specific Occurrences](#)

Add destination occurrence

About this task

To add an occurrence to a destination node with existing expanded occurrences:

Procedure

1. Open a mapping pane and right-click the recurring destination node or any occurrence of a recurring destination node. Destination nodes are located on the right of the mapping panes.
2. From the list, select one of the following options (if available) from the Add New Occurrence menu option:
 - o Add New Occurrence > After - Select this option if you want add the new occurrence after the currently selected destination occurrence.
 - o Add New Occurrence > Before - Select this option if you want add the new occurrence before the currently selected destination occurrence.
3. Click OK.

You can specify the substitution type for an expanded occurrence of a recurring destination node. This type substitution of an expanded occurrence is only supported for the recurring destination nodes. Destination nodes are located on the right of the mapping panes.

Remove Destination Occurrence

About this task

To remove a destination occurrence:

Procedure

1. Open a mapping pane and right-click the recurring destination node or any occurrence of a recurring destination node. Destination nodes are located on the right of the mapping panes.
2. From the list, select the Remove Selected Occurrence menu option. A Confirmation dialog box opens.
3. Click Yes.

Select a substitution type in a mapping pane

About this task

To select a substitution type in a mapping pane:

Procedure

1. [Upload an XML Schema](#) that contains an XML element based on derived types into the project.
2. In an activity that uses an XML Schema, select the node representing the XML element that is based on a derived type for the input or output parameter of the activity.

For example, the Read XML activity uses an XML Schema to define the output parameter of the activity. In the Configure task of the Checklist for the Read XML activity, select an XML variable that defines the node of the XML Schema to use the output parameter. Using example XML Schema shown in the preceding figure, a variable based on the `<shape>` element can be used to define the node of the XML Schema to use as the output parameter of the Read XML activity. Since the derived type for the `<shape>`

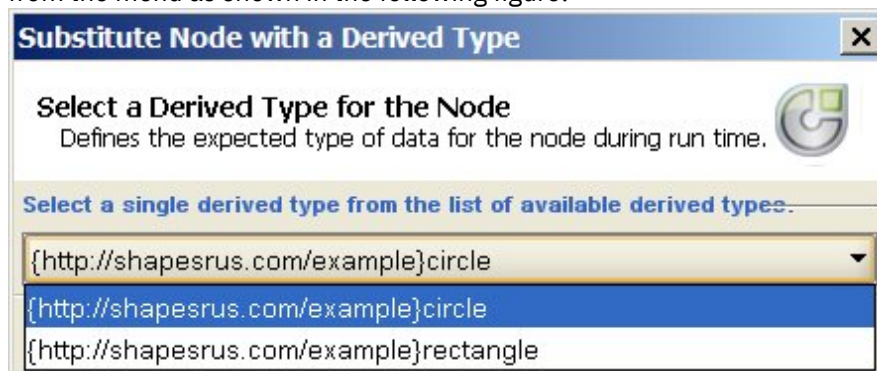

element is not selected, only the child element (named color) of the base type are displayed in the From

Activity pane as shown in the following figure:

Note that the child elements of the derived types are not listed in the mapping pane. In this example, the child element of circle which is named diameter is not listed, nor are the child elements of rectangle which are named width and length.

3. In the From Activity and To Orchestration panes of an activity, select the derived type expected during run time, by right-clicking on the node and from the menu selecting the Substitute Node With ... option. The Substitute Node with a Derived Type dialog box open the menu, the available derived types for the node as defined by the XML Schema are listed. For this example, the two derived types are available from the menu as shown in the following figure:

4. Select one of the derived types. The selected derived type determines the expected type of XML instance document during run time.

In this example, the circle derived type is selected, so the XML data expected for this node during run time is of type circle as shown in the XML instance document displayed at the top of this page.

In addition to the child elements of the base type, the child elements of the derived type show in the mapping panes. In this example, the child element named diameter is displayed with the child element named color (inherited from the base type) in the From Activity pane of the Read XML activity as shown

in the following figure:

Mapping Destination Nodes

When you map a destination node, you indicate the data source used to complete the node and create a mapping rule. Mapping rules provide data to a destination node in various ways, as described in the following topics.

From source nodes

Mapping from a source node to a destination node creates a link between them. This is the most common way to define a mapping rule. There are several ways to link source and destination nodes as described in these topics:

[Mapping Techniques](#)

[Mapping Recurring Nodes](#)

[Automapping Matching Nodes](#)

[Bulk Mapping Nodes](#)

By assignment

Mapping by assignment means that you provide a default value or use functions to determine the value of the destination node. See [Assigning a Default Value for a Destination Node](#) and [Assigning a Function Without a Source Node Link](#) for more information.

Using a combination of source nodes and functions

Mapping using a combination of source nodes and functions refers to manipulating the link between source and destination nodes with functions to convert data, calculate or assign data. See the [Assigning Function\(s\) to a Mapping Rule](#) for details

Parent topic: [Mapping](#)

[Feedback](#) | [Notices](#)

 Last updated: Thursday, December 17, 2015
<file:///dcs/markdown/workspace/Transform/out.html>

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Mapping_Destination_Nodes.html

Selecting a substitution type

The XML Schema specification supports the ability to derive complex types by extension.

In the XML instance document, you declare the type of an XML element from a set of types that are all derived from the same base type, rather than explicitly declaring the type for the XML element in the XML Schema. The

type for the element is defined using the type attribute as shown by the following example XML instance document:

```
<?xml version="1.0" encoding="UTF-8"?>
<shape xmlns="http://shapesrus.com/example"
        xmlns:xsd="http://www.w3.org/2001/XMLSchema-instance"
        xsd:type="circle">
  &Amp; <color xmlns="">blue</color>
  &Amp; <diameter xmlns="">10</diameter> &Amp;
</shape>
```

In the preceding XML instance document, the <shape> element is declared as a `circle` type. The <shape> element in the XML instance document can also be defined as a `rectangle` type as defined in the following example XML instance document:

```
<?xml version="1.0" encoding="UTF-8"?>
<shape xmlns="http://shapesrus.com/example"
        xmlns:xsd="http://www.w3.org/2001/XMLSchema-instance"
        xsd:type="rectangle">
  &Amp; <color xmlns="">blue</color>
  &Amp; <length xmlns="">5</length>
  &Amp; <width xmlns="">8</width> &Amp;
</shape>
```

In this example, the <shape> element is based on one of the derived types of `shapeType` base type. The derived types of `shapeType` are named `circle` and `rectangle`, as shown in the following example XML Schema:

```

<xsd:schema xmlns:xsd="http://www.w3.org/2001/XMLSchema"
            targetNamespace="http://shapesrus.com/example"
            xmlns:sru="http://shapesrus.com/example">
    <xsd:element name="shape" type="sru:shapeType"/>
    <xsd:complexType name="shapeType" abstract="true">
        <xsd:sequence>
            <xsd:element name="color" type="xsd:string"/>
        </xsd:sequence>
    </xsd:complexType>
    <xsd:complexType name="circle">
        <xsd:complexContent>
            <xsd:extension base="sru:shapeType">
                <xsd:sequence>
                    <xsd:element name="diameter" type="xsd:integer"/>
                </xsd:sequence>
            </xsd:extension>
        </xsd:complexContent>
    </xsd:complexType>
    <xsd:complexType name="rectangle">
        <xsd:complexContent>
            <xsd:extension base="sru:shapeType">
                <xsd:sequence>
                    <xsd:element name="length" type="xsd:integer"/>
                    <xsd:element name="width" type="xsd:integer"/>
                </xsd:sequence>
            </xsd:extension>
        </xsd:complexContent>
    </xsd:complexType>
</xsd:schema>

```

Defines an element based on one of the derived types of shapeType.

Base type named shapeType.

Derived type named circle that extends the base type named shapeType.

Derived type named rectangle that extends the base type named shapeType.

When an XML Schema defines an XML element based on derived types, you must specify the derived type (or substitution type) expected for the XML element during run time. For the preceding example XML Schema, you must specify the type of the <shape> element either `circle` or `rectangle`. In Studio, you specify the expected substitution type of an XML element using the Substitute Node With ... menu option:

- For a variable based on a substitution type - Select the expected type of the XML element by right-clicking the node in the Schema of pane in the Variables tab and by selecting the Substitute Node With ... option from the menu. For more information see [Selecting a Substitution Type for Variables](#).
- For a node based on substitution type in a mapping pane - Select the expected type of the XML element by right-clicking the node in the Schema of pane in the Variables tab and by selecting the Substitute Node With ... option from the menu, as described in the following procedure. 

In the preceding example XML Schema, the base type called <shapeType> is defined as abstract. An abstract base type cannot be used in the XML instance document to define the type for the element - one of the derived types must be specified instead. In this example, the <shape> element in the XML instance document cannot be declared as `shapeType`, it must be declared as one of the derived types; either `circle` or `rectangle`.

In the preceding example, the base type is defined as abstract but type substitution of derived types based on a base type that is not abstract is also supported. To make the complexType called `shapeType` not abstract in the example XML Schema, remove the `abstract=true` attribute as shown in the following XML Schema segment:

```
<xsd:complexType name="shapeType">
  Â Â <xsd:sequence>
  Â Â Â Â <xsd:element name="color" type="xsd:string"/>
  Â Â </xsd:sequence>
  Â </xsd:complexType>
```

A WSDL is a specific XML Schema that defines a Web Service. Using type substitution with a WSDL is also supported.

You can specify the substitution type for an [expanded occurrence](#) of a recurring destination node. This type substitution of an expanded occurrence is only supported for the recurring destination nodes. Destination nodes are located on the right side of mapping panes.

Attention: Type substitution of complex types is supported in the mapping panes of activities and for variables. However, deriving elements by extension using substitution groups is not supported in the mapping panes of activities or for variables. For more information, see [Unsupported XML Schema Features](#).

Example XML Schema

The example XML Schema used in this topic is provided for reference:

```
<xsd:schema xmlns:xsd="http://www.w3.org/2001/XMLSchema"
  Â Â Â Â Â Â Â Â Â Â targetNamespace="http://shapesrus.com/example"
  Â Â Â Â Â Â Â Â Â Â xmlns:sru="http://shapesrus.com/example">
  Â Â <xsd:element name="shape" type="sru:shapeType"/>
  Â Â Â Â <xsd:complexType name="shapeType" abstract="true">
  Â Â Â Â Â Â <xsd:sequence>
  Â Â Â Â Â Â Â Â <xsd:element name="color" type="xsd:string"/>
  Â Â Â Â Â Â </xsd:sequence>
  Â Â Â Â </xsd:complexType>
  Â Â Â Â <xsd:complexType name="circle">
  Â Â Â Â Â Â <xsd:complexContent>
  Â Â Â Â Â Â Â Â <xsd:extension base="sru:shapeType">
  Â Â Â Â Â Â Â Â <xsd:sequence>
  Â Â Â Â Â Â Â Â Â Â <xsd:element name="diameter" type="xsd:integer"/>
  Â Â Â Â Â Â Â Â </xsd:sequence>
  Â Â Â Â Â Â </xsd:extension>
  Â Â </xsd:complexContent>
  Â Â </xsd:complexType>
  Â Â <xsd:complexType name="rectangle">
  Â Â Â Â <xsd:complexContent>
  Â Â Â Â Â Â <xsd:extension base="sru:shapeType">
  Â Â Â Â Â Â <xsd:sequence>
  Â Â Â Â Â Â Â Â <xsd:element name="length" type="xsd:integer"/>
  Â Â Â Â Â Â Â Â <xsd:element name="width" type="xsd:integer"/>
  Â Â Â Â Â Â </xsd:sequence>
  Â Â Â Â Â Â </xsd:extension>
  Â Â </xsd:complexContent>
  Â Â </xsd:complexType>
</xsd:schema>
```

- [Select a substitution type in a mapping pane](#)
- [Remove the Derived Type Associated with a Node](#)

Parent topic: [Mapping](#)

Select a substitution type in a mapping pane

About this task

To select a substitution type in a mapping pane:

Procedure

1. [Upload an XML Schema](#) that contains an XML element based on derived types into the project.
2. In an activity that uses an XML Schema, select the node representing the XML element that is based on a derived type for the input or output parameter of the activity.

For example, the Read XML activity uses an XML Schema to define the output parameter of the activity. In the Configure task of the Checklist for the Read XML activity, select an XML variable that defines the node of the XML Schema to use the output parameter. Using example XML Schema shown in the preceding figure, a variable based on the `<shape>` element can be used to define the node of the XML Schema to use as the output parameter of the Read XML activity. Since the derived type for the `<shape>` element is not selected, only the child element (named `color`) of the base type are displayed in the From

Activity pane as shown in the following figure:

Note that the child elements of the derived types are not listed in the mapping pane. In this example, the child element of circle which is named `diameter` is not listed, nor are the child elements of rectangle which are named `width` and `length`.

3. In the From Activity and To Orchestration panes of an activity, select the derived type expected during run time, by right-clicking on the node and from the menu selecting the `Substitute Node With ...` option. The `Substitute Node with a Derived Type` dialog box opens the menu, the available derived types for the node as defined by the XML Schema are listed. For this example, the two derived types are available from the menu as shown in the following figure:

4. Select one of the derived types. The selected derived type determines the expected type of XML instance document during run time.

In this example, the circle derived type is selected, so the XML data expected for this node during run time is of type circle as shown in the XML instance document displayed at the top of this page.

In addition to the child elements of the base type, the child elements of the derived type show in the mapping panes. In this example, the child element named diameter is displayed with the child element named color (inherited from the base type) in the From Activity pane of the Read XML activity as shown

in the following figure:

Mapping Rules That Are Automatically Deleted

When you open a map, the Mapping Editor automatically deletes mapping rules from the map in two cases:

Case 1: One or both of the XML Schemas that the map refers to have been changed.

Schemas can change due to changes in the connection activities or message definitions they are generated from. Schemas that you add to the project can also be edited directly.

Note: The warning message from the Mapping Editor lists the mapping rules that were deleted. This list might also include rules for property nodes, such as `ihmap:exists` for the optional property node.

Review the map and recreate or alter mapping rules to handle the schema changes properly.

Case 2: One of the XML Schemas that the map refers to has been deleted from the project.

In this case, the Mapping Editor deletes all mapping rules, and the map cannot be recreated. Close the map and delete it from the project.

Assigning a Count of Occurrences

About this task

You can assign a value to a destination node that counts the actual occurrences in a message of a specific recurring node.

To assign a count of occurrences:

Procedure

1. Drag the Count function from the Functions tab to the Function Graph pane in the Mapping Editor.
2. Link the recurring node that should be counted to the Count function.
Note: Count works with any recurring node, including recurring structure nodes.
3. Link the Count function to the destination node.

Removing mapping rules with links

About this task

To remove a mapping rule that has a link from source to destination node:

Procedure

Delete the mapping rule in one of the following ways:

- Select the link for the mapping rule and press Delete.
- Right-click the link and select Delete Mapping.

Results

The Mapping Editor prompts you to confirm the removal if the mapping rule you select links occurrence property nodes. Removing occurrence mapping rules also removes all the mapping rules for descendant nodes within that recurring structure.

Finding Sample or Result Content

About this task

You can search the sample messages or the test result to find specific nodes or content:

Procedure

1. Open the Mapping pane containing the node you want to search for and click Test.
2. Right-click either the Selected Test Files pane or the Test Result pane and select Find from the shortcut menu.
3. Enter the text that you want to search for in the Text to find field.
4. Select any options or change the direction of the search:
 - Case Sensitive - Exactly matches the case of the text entered in the Text to find field.
 - Whole Words Only - Matches the search text only as whole words. No partial matches are allowed.
 - Wrap Search - Continues searching through the entire schema regardless of where the search was started.
 - Forward - Searches from the root node or current node down through the schema in node-tree order.
 - Backward. Searches from the last node in the tree or the current node up through the schema in reverse node-tree order.
5. Click Find. Click Find again to continue the search through the schema.
6. Click Cancel to close the dialog box.

Loading a Sample Message

About this task

It is recommended that you test the mapping rules you set up in the Mapping Editor before mapping the next activity in your orchestration. You do this by loading a sample message into the project and testing against it to verify that the mapping rules are applied correctly.

To load a sample message into the project:

Procedure

1. Click Test. The Test Files pane opens.
2. In the Find Test Files pane, click Browse and search for the message you want to load.
3. Select the XML file to use as a sample message in the window and click OK.

If the sample is valid, it displays in the Selected Test Files pane. If there are several source schemas for this map, test files are displayed in source schema order.

4. If the map uses several source schemas, you can load sample messages for other source schemas before you test the transformation. Repeat steps 2 and 3 for each sample you want to test

Parent topic: [Mapping](#)

Feedback | Notices

 Last updated: Thursday, December 17, 2015

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map>Loading_a_Sample_Message.html

Testing maps

You can test the transformation defined in a map using one or more sample messages that match the source schemas for the map.

About this task

To test a map:

Procedure

1. Click Test from either the Map Inputs or Map Outputs pane. The Test pane is displayed. The variables or parameters that show in the Select Input Test Files table depend on the type of task:
 - In the Test pane of a **Map Inputs** task, the variables that are mapped to the input parameters of the activity are displayed in the Select Input Test Files table.
 - In the Test pane of a **Map Outputs** task, input parameters of the activity are displayed in the Select Input Test Files table.
2. Get sample data to use as input to the map, using one of the following options:

- Generate sample data - To generate sample XML data valid against the source schema, select the Map > Generate Test Data from the toolbar menu.
 - Import sample data from files - For each parameter in the Find Test Files list, click [...] to [browse for a sample message](#) from your computer or a network drive. The selected message is displayed in the Selected Test Files table.
Note: The sample message must be valid XML that meets the requirements defined in the source XML Schema for the map. If the map uses several source schemas, you can load a sample message for any or all of the schemas.
3. Click Run Test. The transformation defined in your map is run against the sample message you specified in the Location column. The result of the transformation is displayed in the Test Result pane.

What to do next

Either [save the transformation result](#), or [clear](#) it from the Mapping Editor panes.

Parent topic: [Mapping](#)

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map_testing_maps.html

Saving or Clearing the Transformation Result

About this task

You can save the result of the map test to a file on your computer or a network drive. This can be useful if you would like to review the result using XML tools outside of Studio. It can also be useful if the result of the transformation is input to another activity, such as a message definition or another map.

To save the result of a map test:

Procedure

1. Test your mapping. For more information, see [Testing maps](#).
2. Select Map > Save Results. The Save Results Message dialog box opens.
3. Navigate to the directory where you want to save the file and enter a file name.
4. Click Save.

Parent topic: [Mapping](#)

Clearing the transformation result

Procedure

Select Map > Clear Results. The results are cleared.

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map_Saving_or_Clearing_the_Transformation_Result.html

The Emit CData Option

About this task

Select the Emit CData option for a destination node for the text in the destination XML element to be treated as an XML CDATA section and assigned to the destination node as a block and is not parsed during run time. It is equivalent to specifying data for an XML element using the following XML syntax:

```
<![CDATA [  
text  
]]>
```

The Emit CData option can be selected for any destination nodes (located on the right pane of the Mapping Editor). You can also select the Emit CData option for default values.

Note: The Emit CData option is not available for input nodes (located on the left pane of the Mapping Editor.)

To select the Emit CData option:

Procedure

1. In the Mapping Editor, right-click a destination node that is linked (or mapped) or has a default value associated with it. Destination nodes are located in the right pane of the Mapping Editor either in the To Activity or To Orchestration pane
2. Select the Emit CData option from the list. During run time, the Integration Appliance treats that destination node as a CDATA section.

Parent topic: [Mapping](#)

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map_The_Emit_CData_Option.html

The Emit Only If Option

About this task

The Emit Only If condition allows you to map elements conditionally (based on a condition) by evaluating XPath expressions.

This mapping option is available when the target node is a recurrent node with `minOccurs="0"`, which means it is optional. Mapping occurs only if the condition is `True`.

To select the Emit Only If option:

Procedure

1. In the Mapping Editor, right-click a destination node that is linked (or mapped). Destination nodes are located in the right pane of the Mapping Editor either in the To Activity or To Orchestration pane.
2. Select the Emit Only If option from the list. The Emit Condition dialog box is displayed.
3. Specify an XPath expression in the Left Hand Expression column using the browse button, select the operator, and then specify the value in the Right Hand Expression column.

For example, `bpws:getVariableData('fullName')/fullName/firstName = 'John'` and `bpws:getVariableData('fullName')/fullName/lastName = 'Smith'`

Note: If the condition compares a `STRING` to the Right Hand Expression it needs to be specified in single quotes (' ').

Note: To add multiple conditions, click the Add button. The conditions can be clubbed by `AND` or `OR`, and parenthesis is not supported.

Note: To specify conditions that are more complex than what can be specified in the Enter Condition dialog, click the Advanced button.

Unsupported XML Schema Features

Using the following XML Schema features can cause maps to display or transform incorrectly, and can cause validation warnings:

Choice

Limitations to mapping rules might not allow you to correctly define transformation requirements for nodes within a choice. The guaranteed status of mapping rules involving choice structures might be incorrect. Transformations to destination schemas that have choice structures might incorrectly include all choices.

Mixed Content

Elements that allow mixed content can contain both data and other nodes. These nodes display correctly and can be mapped. However, transformation of messages with mixed content nodes might not be complete.

Recursive Content

You cannot create a map with unlimited levels of recursive elements. You can specify mapping rules for no more than five recursive levels.

Substitution Groups

Substitution groups support deriving elements by extension. Using substitution groups in an XML Schema to extend an `xs:anyType` element to different types of elements is not supported. For example, extending an `xs:anyType` element to either an element based on a simple type or an element based on a `complexType` is not supported.

The ability to derive complex types by extension using type substitution is supported. For more information, see [Selecting a substitution type](#) and [Selecting a Substitution Type for Variables](#).

Unique, Key, or Keyref

The Mapping Editor does not provide information about elements that have unique, key, or keyref constraints and mapping rules do not evaluate.

Various facets for restrictions or extensions

Information about the following facets is not available within the Mapping Editor and these facets are not considered when you create mapping rules:

- `minInclusive`, `maxInclusive`, `minExclusive`, and `maxExclusive`
- `length`, `minLength`, and `maxLength`
- `totalDigits` and `fractionDigits`
- `whitespace`
- `patterns`
- `enumeration`

About Unmapped Destination Nodes

During transformations, the Integration Appliance includes all destination nodes in the result message. Destination nodes that are not mapped become empty nodes in the resulting message.

In most cases, this is desired behavior. With updates to databases, however, the Integration Appliance treats an empty node in the outbound message as a NULL value for the database.

To prevent NULL values from being saved to the database, you must remove the unmapped nodes from the XML Schema by clearing the columns from the database activity in the Configure pane. See the following topics for more details:

[Single-Table Inbound Database Activities](#)

[Single-Table Outbound Database Activities](#)

Filter Recurring Nodes

By specifying an XPath predicate to filter against during run time, you can limit the recurring nodes returned by a mapping activity.

About this task

Filtering using a predicate directly in the mapping panes of activities eliminates the need for the following activities:

- A While Loop or For Each activity that loops through the recurring structures
- An If...Then activity to test for values.

Eliminating the looping and If..Then activities improves orchestration performance.

For example, you can limit the books processed by the BatchOrderProcessingSample orchestration to only return book titles that start with the letter B using either of the following methods:

- After the Read Flat File activity which converts flat file data to XML, you can add a While Loop activity that contains an If..Then activity that tests for all book titles that start with the letter B. When the While Loop activity completes at run time, it returns the set of recurring BookOrder nodes that have titles beginning with the letter B.
- Filter by specifying a predicate directly in the To Orchestration pane of the Map Outputs task of the Read Flat File activity that converts flat file data to XML. This is the preferred method because it reduces the processing during run time - improving orchestration performance. For example, you can specify the following predicate on the recurring BookOrder node to limit the Bookorder nodes returned during run time to only those titles that begin with the letter B: `*:title/starts-with(., 'B')`

This example predicate is explained in the following table:

Predicate Characters	Description
<code>*:</code>	Specifies this predicate applies to any namespace of the source node.
<code>title/</code>	Specifies to apply this predicate against the title node of the current source node.

Predicate Characters	Description
starts-with(., 'B')	Specifies this predicate returns only nodes that have title nodes that start with the letter B. The starts-with function is a built-in XPath function.

For more information about the BookOrder sample, see the *Getting Started Guide*. If you accepted the defaults during the installation of Studio, you can find the reference implementation of the sample in the following directory: C:\Program Files\IBM\WebSphere Cast Iron Studio 3.X\Samples\BookOrder

To specify a predicate on a recurring node:

Procedure

1. You can only apply a filter on a recurring destination node which is mapped to a recurring source node in the mapping panes of activities, as shown in the following Map Outputs pane of the Read Flat File activity in the BatchOrderProcessingSample orchestration:

2. Right-click on the destination occurrence node (in this example BookOrder/occurrence) and select Filter Recurring Nodes from the menu. The Filter Recurring Nodes dialog box opens.
3. Enter the XPath predicate. For this example, enter the predicate shown in the following figure:

4. Click OK. The predicate is evaluated to determine if it is valid:
 - If the predicate is invalid, an error message is reported.
 - If the predicate is valid, the filter icon () shows next to the destination occurrence node.

About Lookup Tables

Lookup tables define a set of key-value (name-value) pairs. During run time, these key-value pairs are used to translate the passed in key to the associated value.

A lookup table is similar to a function that has one input string parameter (the source value to translate) and a string return value (the result of the translation). In the Mapping Editor, a lookup table can be dragged onto a mapping rule in the same way that a function can be.

Lookup tables are available to use in any map in the project where they were defined.

Defining Lookup Tables

About this task

To define or create a lookup table:

Procedure

1. Select the Functions tab. In the Function tab, the list of standard functions shows. In addition, the Actions pane is displayed.
2. To display the Lookup Table dialog box, choose from one of the following options:
 - o Right-click the Lookup Tables node in the Functions tab and from the menu select Add New Lookup Table... .
 - o In the Actions pane, select Add New Lookup Table.The Lookup Table dialog box opens.
3. In the Table Name field of the Lookup Table dialog box, enter a name for your lookup table.
Note: This name must be unique for all tables in the current project. The name of the table is not case sensitive - the case of a character is not considered. For example, the table name: Aaa is equivalent to the table name: AAA.
4. Optional: In the Description field enter descriptive information about the table.
5. Define the Key Value pairs for the table.
Repeat the following steps for each Key Value pair in the table:
 - a. Click Add.
 - b. In the Key field, enter the value of the key. During run time, this key will be matched by the specified value.
 - c. In the Value field, enter the value that the key will be translated to during run time. Press the Return key.
6. Optional: Enter a value in the Default Value field. Enter a value in this field, if you want the lookup table to supply a value even when no keys are matched during run time. Leave this field blank, if the lookup table should not return a value when no keys are matched during run time.
7. Optional: Enter a value in the Value if "nil" field. This property only affects nillable nodes. Enter a value in this field, if during run time you want the lookup table to supply a value even when the source node is empty and the source node is nillable. Leave this field blank, if during run time the lookup table should not return any value when the source node is empty and the source node is nillable.
8. Click OK.

Editing Lookup Tables

About this task

To edit an existing lookup table:

Procedure

1. Select the Functions tab. In the Function tab, the list of standard functions shows. In addition, the Actions pane is displayed.
2. In the Function tab, expand Lookup Tables.
3. Select the table to edit.
4. To display the Lookup Table dialog box, choose from one of the following options:

- o Right-click the table node in the Functions tab and from the menu select Edit....
- o In the Actions pane, select Add New Lookup Table.

The Lookup Table dialog box opens.

5. Edit your table using one of the following actions:

- o **Add a Key Value pair** - To add another key value pair to your table, follow these steps:
 - a. Click Add.
 - b. In the Key field, enter the name of the key. During run time, this key will be replaced by the specified value.
 - c. In the Value field, enter the value that the key will be translated to during run time. Press the Return key.
- o **Delete a Key Value pair** - To delete a key value pair from your table, follow these steps:
 - a. Select a key value pair.
 - b. Click Delete.
- o **Change the Default Value field** - Edit the current setting of the Default Value field. Enter a value in this field, if you want the lookup table to supply a value even when no keys are matched during run time. Leave this field blank, if the lookup table should not return a value when no keys are matched during run time.
- o **Change the Value if "nil" value field** - Edit the current setting of the Value if "nil" value field. This property only affects nillable nodes. Enter a value in this field, if during run time you want the Lookup table to supply a value even when the source node is empty and the nillable. Leave this field blank, if during run time the lookup table should not return any value when the source node is empty and the source node is nillable.

6. Click OK.

What to do next

Lookup tables are added to mapping rules like functions. For more information about adding functions to mapping rules, see [Assigning Function\(s\) to a Mapping Rule](#).

About Custom Functions

Custom functions are JavaScript functions that you develop to use in the Mapping Editor. The following script standards are supported:

- JavaScript 1.5
- ECMAScript 3.0

Parent topic: [Using Custom Functions and Lookup Tables](#)

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref>About_Custom_Functions.html

Defining a custom function

About this task

To define or create a custom function:

Procedure

1. Select the Functions tab. In the Function tab, the list of standard functions is displayed. In addition, the Actions pane opens.
2. To display the Custom Function dialog box, choose from one of the following options:
 - o Right-click the Custom Functions node in the Functions tab and from the menu select Add New Custom Function... .
 - o In the Actions pane, select Add New Custom Function.

The Custom Function dialog box opens.

3. In the Function Name field of the Custom Function dialog box, enter a valid JavaScript name for your custom function.
Note: This name must be unique for all custom functions in the current project. The name of the function is not case sensitive - the case of a character is not considered. For example the function name: Aaa is equivalent to the function name: AAA.
4. Select a Return Type for your custom function from one of the following options:
 - o string
 - o number
 - o boolean

For more information about these datatypes, see [Custom Function Parameter and Return Datatypes](#).

5. Define the parameters for your custom function. Repeat the following steps for each parameter in your custom function:
 - a. Click Add.
 - b. In the Name field of the Parameters table, enter the name of the parameter and press the Return key.
 - c. Select a Type for the parameter, from one of the following options:
 - string
 - number
 - boolean
 - d. For more information about these datatypes, see [Custom Function Parameter and Return Datatypes](#).
6. Enter the source code for your custom function by following these steps:
 - a. Click Next.
 - b. In the white area displayed between the braces enter the JavaScript code of your custom function. \hat{A}
 - c. Click Compile. The syntax of the function will be checked and any errors reported. The location of the errors are highlighted in red in the source code.
 - d. Fix any syntax errors and once the function compiles successfully, click OK and then Finish.

Results

The custom function is now available from the Custom Functions folder of the Functions tab.

Editing a custom function

About this task

To edit an existing custom function:

Procedure

1. Select the Functions tab. In the Function tab, the list of standard functions is displayed. In addition, the Actions pane opens.
2. In the Function tab, expand Custom Functions.
3. Select the custom function to edit.
4. To display the Custom Function dialog box, choose from one of the following options:
 - o Right-click the function node in the Functions tab and from the menu select Edit....
 - o In the Actions pane, select Add New Lookup Table.

The Custom Function dialog box opens.

5. In the Custom Function dialog box, edit your custom function using one of the following actions:
 - o **Add a Parameter** - To add a parameter to your custom function follow these steps:
 - a. Click Add.
 - b. In the Name field of the Parameters table, enter the name of the parameter.
 - c. Select a Type for the parameter, from one of the following options:
 - string
 - number
 - boolean

For more information about these datatypes, see [Custom Function Parameter and Return Datatypes](#).
 - o **Delete a Parameter** - To delete a parameter from your custom function follow these steps:
 - a. In the Name field of the Parameters table, select the parameter and press the Return key.
 - b. Click Delete.
 - o **Change the Return Type** - To select one of the following options from the Return Type field:
 - string
 - number
 - boolean

For more information about these datatypes, see [Custom Function Parameter and Return Datatypes](#).

- o **Edit the source code** - To edit the source code of your custom function, follow these steps:

- a. Click Next.
- b. In the white area displayed between the braces enter the JavaScript code of your custom function.
- c. Click Compile.

The syntax of the function will be checked and any errors reported. The location of the errors is highlighted in red in the source code.

- d. Fix any syntax errors and once the function compiles successfully, click OK and then Finish.

The custom function is now available from the Custom Functions folder of the Functions tab.

Assigning a Function Without a Source Node Link

About this task

To define a mapping rule in which the input for the destination node is provided by the return value of a function and not from a source node:

Procedure

1. Select the Functions tab. In the Functions tab, the list of available functions is displayed. 
2. In the Functions tab, expand folder that contains the function to assign to the destination node. This function must have no input parameters. For example, the **Get Current® Date and Time** function has no parameters and returns the current date and time.
3. Select the function icon and drag it into the Mapping Editors middle pane, near the destination node you want to map.
4. In the Mapping Editor, drag from the function icon to the destination node. A link from the function to the destination node is displayed.
5. Optional: Test if the mapping rule is valid by right-clicking on the function in the mapping rule and selecting Apply Function Graph. If the mapping rule is valid, the square function icon in the graphical representation of the mapping link is not displayed and a function icon is shown to the left of the destination node icon, as shown in [Figure 1](#).

Results

Figure 1. No source node function icon

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map_Assigning_a_Function_Without_a_Source_Node_Link.html

Assigning a Function While Creating Maps

About this task

To assign a function while creating maps:

Procedure

1. Select the Function tab. In the Function tab, the list of available functions is displayed.
2. From the Function tab, drag a function between the two nodes you want to map in the Mapping Editor.
3. Drag the source node onto the function icon to create a link. The source node is assigned to the first parameter of the function. During run time, the value of this source node is provided as the first parameter of the function.
4. Drag the destination node onto the function to create the link. During run time, the return value of the function populates the destination node.

5. If the function has more than one input parameter, you must assign the remaining input parameters using one of the following options:
 - o Create links from other source nodes (as described in step 3) or from functions used in the current mapping rule.
 - o Edit the assignment of input parameters using the Functions Properties dialog box. To open the Functions Properties dialog box, double-click the function in the Mapping Editor.
6. Optional: Add additional functions to the mapping rule using the procedure described in the topic [Adding a Function to an Existing Mapping Rule](#). For an example, see [Example: Chaining Multiple Functions](#).
7. Optional: If any functions are still associated with the mapping rule, test if the mapping rule is valid by right-clicking on the function in the mapping rule and selecting Apply Function Graph. If the mapping rule is *valid*, the square function icon or icons in the graphical representation of the mapping link are not displayed and a blue bar with small squares at each end is displayed (). If the mapping rule is not valid, the graphical representation of the mapping rule does not change, the function icons are still visible, (for example ) and an error dialog opens.

Note: A mapping rule with function or functions is considered valid if all the input parameters of the function or functions are assigned with values of the correct datatype and if the return value of the last function matches the datatype of the destination node. The input parameters of a function can be provided by source nodes or by the return type of other functions associated with that mapping rule.

Adding a Function to an Existing Mapping Rule

About this task

To add a function to an existing mapping rule:

Procedure

1. Select the Function tab. In the Function tab, the list of available functions is displayed.
2. From the Function tab, drag a function onto an existing mapping rule in the Mapping Editor.

The source node of the mapping rule is assigned to the first parameter of the function. During run time, the value of the source node is provided to the first parameter of the function.

The destination node of the mapping rule is assigned to the return type of the function. During run time, the return value of the function populates the destination node.

3. If the function has more than one input parameter, you must assign the remaining input parameters using one of the following options:

- Create links from other source nodes (as described in step 3 of [Assigning a Function While Creating Maps](#)) or from functions used in the current mapping rule.
 - Edit the assignment of input parameters using the Functions Properties dialog box. To open the Functions Properties dialog box double-click the function in the Mapping Editor.
4. Optional: Add additional functions to the mapping rule using this same procedure. For more information, see [Example: Chaining Multiple Functions](#).
 5. Optional: Test if the mapping rule is valid by right-clicking on the function in the mapping rule and selecting Apply Function Graph. If the mapping rule is valid, the square function icon or icons in the graphical representation of the mapping link are not displayed and a blue bar with small squares at each end is displayed (). If the mapping rule is not valid, the graphical representation of the mapping rule does not change, the function icons are still visible, (for example: ) and an error dialog opens.

Note: A mapping rule with function or functions is considered valid if all the input parameters of the function or functions are assigned with values of the correct datatype and if the return value of the last function matches the datatype of the destination node. The input parameters of a function can be provided by source nodes or by the return type of other functions associated with that mapping rule.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/map_assigning_functions_add_to_existing_rule.html

Example: Chaining Multiple Functions

About this task

Multiple functions can be chained together in a single mapping rule. The flow of execution of the functions in the mapping rule is from left to right.

For example, you could build a mapping rule that uses multiple functions as described in the following sequence:

Procedure

1. A source node of type: string is the input parameter to the **trim** function.
2. The **trim** function removes trailing and leading white space from the input parameter and the resulting string is returned.
3. The return string of the **trim** function is the input parameter to the **lowercase** function.
4. The **lowercase** function converts each of the uppercase characters of the input string into their lowercase form and the resulting string is returned.
5. The return string of the **lowercase** function populates the destination node of type: string.

Results

In the Mapping Editor, this mapping rule is displayed as shown in the following figure.

Deleting a Function from a Mapping Rule

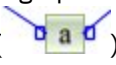

About this task

To delete a function used in a mapping rule in the Mapping Editor:

Procedure

1. Display the mapping link with the functions visible. If the mapping link with function or functions has functions associated with it but the functions are not displayed (as shown here: ) , right-click the mapping rule and from the list and select Edit Function Graph. The functions associated with the mapping rule are displayed.
2. Choose one of the following options:
 - o Select the function to delete and press the Delete key.
 - o Right-click the function and select Delete Function in the list.

Depending on your mapping rule, links between source nodes, other functions, or the destination node might be deleted.

3. Repair any missing links in the mapping rule.
 4. Optional: If any functions are still associated with the mapping rule, test if the mapping rule is valid by right-clicking on the function in the mapping rule and selecting Apply Function Graph. If the mapping rule is *valid*, the square function icon or icons in the graphical representation of the mapping link are not displayed and a blue bar with small squares at each end displays (■——■). If the mapping rule is not valid, the graphical representation of the mapping rule does not change, the function icons are still visible, () and an error dialog opens
- Note: A mapping rule with function or functions is considered *valid* if all the input parameters of the function or functions are assigned with values of the correct datatype and if the return value of the last function matches the datatype of the destination node. The input parameters of a function can be provided by source nodes or by the return type of other functions associated with that mapping rule.

Math Functions with Node Set Constraints

The following math functions calculate values from sets of nodes:

- **Average**
- **Count**
- **Maximum**
- **Minimum**
- **Sum**

For example, the Sum function calculates the total value of all ItemPrice nodes when ItemPrice is a recurring source node.

You can use several node sets as parameters with these functions, including single nodes. You can also use literal numbers or the results of other math functions as parameters for functions that accept node sets.

Limitations in Combining Other Math Functions or Literals

When using numbers or other functions to supply node set parameters, some math functions use the first occurrence of a node set in calculations. In a mapping rule, if you link functions that work with only one node of the set as a parameter to another function that works with the full node set, the final result will not include values from the full node set.

For example, the Multiply function is linked with the Sum function in a mapping rule and so during run time, the result of the Multiply function becomes the input to the Sum function. If the input to the Multiply function is a recurring item structure, the **Multiply** function multiplies the UnitPrice with the Quantity and then passes the

result to the Sum function. The result from Sum function would be the product of the first UnitPrice and Quantity “ not the total extended price for all items.

Note: The Count function accepts any source node as a parameter, including structure or choice nodes which you usually cannot map.

Adding a Parameter

About this task

You can only add parameters if required parameters are missing or if the maximum number of optional parameters has not been filled.

To add a parameter:

Procedure

1. Click Add from the Function Parameters dialog box.
2. Enter a value for that parameter in the Value cell.
3. Click OK.

Note: Some functions can only accept source nodes as parameters. For more information, see [Math Functions with Node Set Constraints](#).

Editing a Parameter

About this task

To edit a parameter:

Procedure

1. Open the Function Parameters dialog box for the function to be edited.
2. Click the cell containing the value you want to change. Alternatively, click one of the buttons in the dialog box to add, delete, or reorder the selected parameter.
3. When finished editing, click OK to save changes and close the dialog box.

Deleting a Parameter

About this task

To delete a parameter:

Procedure

1. Open the Function Parameters dialog box for the function to be edited.
2. Select the *optional* parameter you want to delete from the parameter list.
3. Click Delete.

Parent topic: [Using Custom Functions and Lookup Tables](#)

Specifying Default Values for Functions that Accept Recurring Nodes as Input

About this task

The following math functions calculate values from sets of nodes:

- **Average**
- **Count**
- **Maximum**
- **Minimum**
- **Sum**

You cannot specify a default value (or constant) for the input parameters of these functions in their Functions Properties dialog box. To specify default values for the input parameters of these functions, complete these steps:

Procedure

1. Create a variable with the same data type as the input parameter for the function.
2. In the "Properties of" pane of the Variables tab, enter the constant value in the Default Value field for the variable
3. In the From Orchestration pane of the activity, add the variable that has the default value.
4. Map the variable to the input parameter of the function.

Mapping Function Reference

- [Mapping functions overview](#)
There are seven mapping function types: String, Mathematical, HTTP Header, Miscellaneous, Binary Data, Date, and Security functions.
- [Mapping Function Syntax and Datatypes](#)
Use the Mapping Function to describe the purpose of the function, set valid input parameters and syntax, and set what the function returns.
- [Absolute Value function](#)
The **Absolute Value** function determines the absolute value of the parameter.
- [Add function](#)
The **Add** function adds all the parameters.
- [AES Decrypt function](#)
The **AES Decrypt** function decrypts fields and content using the Advanced Encryption Standard (AES) algorithm with 128 bit strength. 128-bit encryption level requires an 8-byte key, which must be a 32-character hexadecimal string.
- [AES Encrypt function](#)
The **AES Encrypt** function encrypts fields and content using the Advanced Encryption Standard (AES) algorithm with 128 bit strength. 128-bit encryption level requires an 8-byte key, which must be a 32-character hexadecimal string.
- [Align Center function](#)
The **Align Center** function centers a string within a padding string. If the padding for both sides is uneven, the lesser amount of padding is placed on the left.
- [Align Left function](#)
The **Align Left** function places a string within a padding string starting from the left-most character.
- [Align Right function](#)
The **Align Right** function places a string within a padding string ending at the right-most character.
- [Average function](#)
The **Average** function determines the average value for the sets of numeric nodes in all parameters.
- [Base64 Encode and Decode functions](#)
Base64 refers to a specific MIME content transfer encoding. Base64 encoding represents arbitrary sequences of octets in a form that requires case sensitivity but need not be humanly readable.
- [Boolean function](#)
The **Boolean** function evaluates the parameter and returns either 'true' or 'false' depending on the datatype of the input:
- [Ceiling function](#)
The **Ceiling** function rounds the parameter up to the next closest integer.
- [Concatenate function](#)
The **Concatenate** function joins all parameter strings into a single result in the order you specify the parameters.
- [Cast From Base64Binary function](#)
The **Cast From Base64Binary** function casts from one specific XML Schema data type to another XML Schema data type.
- [Casts From HexBinary function](#)
The **Casts From HexBinary** function casts from one specific XML Schema data type to another XML Schema data type.
- [Cast To Base64Binary function](#)
The **Cast To Base64Binary** function casts from one specific XML Schema data type to another XML Schema data type.

- [Cast To HexBinary function](#)
The **Cast To HexBinary** function casts from one specific XML Schema data type to another XML Schema data type.
- [CopyOf function](#)
The **CopyOf** function copies the entire contents of the source node to the destination node.
- [Count Function](#)
The **Count** function determines the number of nodes in all of the sets of nodes in parameters.
- [Decode Configuration Property of Type Password](#)
The **Decode Configuration Property** of type Password decodes base64-encoded passwords between two orchestrations.
- [Digest/Hash function](#)
The **Digest/Hash** function produces a digital summary of information called a message digest. Message digests provide a digital identifier for a digital document. The message digest produced by the Digest/Hash function is Base64 encoded.
- [Divide function](#)
The **Divide** function returns the decimal quotient of the first parameter divided by all subsequent parameters.
- [Extract HTTP Header Field function](#)
The **Extract HTTP Header Field** function extracts a string with a specified delimiter. It can be used to further extract strings from HTTP headers.
- [Extract Query Parameter function](#)
The **Extract Query Parameter** function extracts a query string from the HTTP header's URI string.
- [Extract URI Path function](#)
The **Extract URI Path** function extracts a URI from the HTTP header's URI string.
- [Floor function](#)
The **Floor** function rounds the parameter down to the next closest integer.
- [Format Date String function](#)
The **Format Date String** function converts the XML Schema data type: xs:dateTime to a string in the format defined by the second parameter.
- [Format Number function](#)
The **Format Number** function returns a string that is a number formatted to fit the specified pattern.
- [Generate RFC2104 HMAC Compliant Signature](#)
HMAC is a mechanism for message authentication using cryptographic hash functions.
- [Get Current Date and Time function](#)
The **Get Current® Date and Time** function returns the current date and time as a specific XML Schema data type.
- [Get Current Date function](#)
The **Get Current Date** function returns the current date (with the local timezone) as a XML Schema data type: xs:date.
- [Get Current Time function](#)
The **Get Current Time** function returns the current time (with the local timezone) as a XML Schema data type: xs:time
- [Length function](#)
The **Length** function determines the number of character in the parameter.
- [Lowercase function](#)
The **Lowercase** function converts all uppercase characters to lowercase characters.
- [Maximum function](#)
The **Maximum** function determines the highest value in the nodes, sets of numeric nodes, or numbers in parameters.
- [Minimum function](#)
The **Minimum** function determines the lowest value in the nodes, sets of numeric nodes, or numbers in parameters.

- [Modulo function](#)
The **Modulo** function determines the remainder from dividing the first parameter by all subsequent parameters.
- [Multiply function](#)
The **Multiply** function returns the product of all parameters.
- [Not function](#)
The **Not** function is typically used in conditions to specify negative or complimentary conditions.
- [Number function](#)
The **Number** function changes the datatype of the parameter to number.
- [Padding String function](#)
The **Padding String** function returns a padding string of the specified length and characters. Padding strings are used in alignment functions.
- [Position function](#)
The **Position** function is used with conditions to represent the index to the current node within the set of its siblings. The function works only within the context of a recurring node and has no parameters.
- [Read Date String function](#)
The **Read Date String** function converts a string (that contains a date and time) to the XML Schema data type: xs:dateTime.
- [Replace function](#)
The **Replace** function replaces individual characters with other individual characters.
- [Replace String function](#)
The **Replace String** function replaces individual characters or a string with other individual characters or string.
- [Round function](#)
The **Round** function rounds a number to the closest integer.
- [Starts With function](#)
The **Starts With** function determines whether or not the first parameter begins with the characters in the second parameter.
- [String function](#)
The **String** function changes the datatype of the parameter to string.
- [Substring function](#)
The **Substring** function extracts a portion of the parameter based on the specified character placement.
- [Substring After function](#)
The **Substring After** function extracts all the characters in a string starting after the first occurrence of a specified substring (one or more characters) through the end of the string.
- [Substring Before function](#)
The **Substring Before** function extracts all the characters in a string starting at the beginning up to the first occurrence of a specified substring (one or more characters).
- [Subtract function](#)
The **Subtract** function returns the difference of the first parameter less all subsequent parameters.
- [Sum function](#)
The **Sum** function determines the sum of values in the numeric node, sets of numeric nodes, or numbers in parameters.
- [Trim function](#)
The **Trim** function trims all leading and trailing spaces and replaces continuous sets of white space characters by a single space.
- [Uppercase function](#)
The **Uppercase** function converts all lowercase characters to the corresponding uppercase character.

Mapping functions overview

There are seven mapping function types: String, Mathematical, HTTP Header, Miscellaneous, Binary Data, Date, and Security functions.

The mapping functions can be displayed by clicking the Functions tab. Mapping functions are divided into the following categories:

- [String](#)
- [Mathematical](#)
- [HTTP Header](#)
- [Miscellaneous](#)
- [Binary Data](#)
- [Date](#)
- [Security](#)

String functions	Definition
Align Center	Centers a string within the specified padding string.
Align Left	Places a string inside a padding string starting from the leftmost character.
Align Right	Places a string inside a padding string ending with the rightmost character.
Concatenate	Joins all the parameter strings into a single string.
Format Number	Returns a string that is a number formatted to fit the specified pattern.
Length	Determines the number of characters in the parameter.
Lowercase	Converts all uppercase English characters to lowercase characters.
Padding String	Returns a padding string of the specified length and characters.
Replace	Replaces individual characters with other individual characters.
Starts With	Determines whether the first parameter begins with the characters in the second parameter.
Substring	Extracts a portion of the parameter that is based on the specified character placement.
Substring After	Extracts all the characters in a string starting after the first occurrence of a specified substring (one or more characters) through the end of the string.
Substring Before	Extracts all the characters in a string from the beginning to the first occurrence of a specified substring (one or more characters).

String functions	Definition
Trim	Trims all leading and trailing space from the parameter and normalizes all space within the parameter.
Uppercase	Converts all lowercase English characters to the corresponding uppercase character.
Mathematical functions	Description
Absolute Value	Determines the absolute value of a parameter.
Add	Adds all parameters.
Average	Determines the average value of the numeric nodes or sets of nodes in parameters.
Ceiling	Rounds the parameter up to the next closest integer.
Count	Counts the number of nodes in all the nodes or sets of nodes in parameters.
Divide	Returns the quotient of the first parameter that is divided by all the subsequent parameters.
Floor	Rounds the parameter down to the next closest integer.
Maximum	Determines the highest value in the numeric nodes or sets of nodes in parameters.
Minimum	Determines the lowest value in the numeric nodes or sets of nodes in parameters.
Modulo	Determines the remainder from dividing the first parameter by all subsequent parameters.
Multiply	Returns the product of all parameters.
Round	Rounds a number to the closest integer.
Subtract	Returns the difference of the first parameter less all subsequent parameters.
Sum	Adds all the numeric nodes or sets of node in parameters.
HTTP Header functions	Description
Extract HTTP Header Field function	Extracts a string with a specified delimiter. It can also be used to further extract strings from HTTP headers.
Extract URI Path function	Extracts a URI from the HTTP header's URI string.
Extract Query Parameter function	Extracts a query string from the HTTP header's URI string.
Miscellaneous functions	Description
Boolean	Evaluates the parameter and returns either true or false depending on the data type of the input.
CopyOf	When the name of the source node matches the passed in value, this function copies the entire contents of the source node (the entire subtree of the source node including all children) to the destination node.
Not	Returns true if the parameter evaluates as false. Returns false if the parameter evaluates as true.
Number	Changes the data type of the parameter to number.

Miscellaneous functions	Description
Position	Determines the index to the current node within the set of its siblings.
String	Changes the data type of the parameter to string.
Functions for Binary Data	Description
Cast From Base64Binary function	Casts from the XML schema data type: <code>xs:base64Binary</code> to the XML schema data type: <code>xs:string</code> .
Cast From HexBinary function	Casts from the XML schema data type: <code>xs:hexBinary</code> to the XML schema data type: <code>xs:string</code> .
Cast To Base64Binary function	Casts from the XML schema data type: <code>xs:string</code> to the XML schema data type: <code>xs:base64Binary</code> .
Cast To HexBinary function	Casts from the XML schema data type: <code>xs:string</code> to the XML schema data type: <code>xs:hexBinary</code> .
Date functions	Description
Get Current® Date and Time function	Returns the current date and time (with the local timezone) as an XML schema data type: <code>xs:dateTime</code> .
Get Current Date function	Returns the current date (with the local timezone) as an XML schema data type: <code>xs:date</code> .
Get Current Time function	Returns the current time (with the local timezone) as an XML schema data type: <code>xs:time</code> .
Read Date String function	Converts a string (that contains a date and time) to the XML schema data type: <code>xs:dateTime</code> .
Format Date String function	Converts an XML schema data type: <code>xs:dateTime</code> to a string in the format that is defined by the second parameter.
Security functions	Description
AES Encrypt function	Encrypts the fields and content using the Advanced Encryption Standard (AES) algorithm.
AES Decrypt function	Decrypts the fields and content using the Advanced Encryption Standard (AES) algorithm.

Mapping Function Syntax and Datatypes

Use the Mapping Function to describe the purpose of the function, set valid input parameters and syntax, and set what the function returns.

Mapping function topic descriptions include the following:

- A brief description of the purpose of the function.
- Valid input parameters. Parameters are listed in order as the order is significant for most functions. The following syntax is used with parameters:

datatypeⁿ where n indicates an order if several parameters of the same type are allowed

[datatype] where [] indicates that the parameter is optional.

- What the function returns.

Mapping functions can process the following datatypes:

anysimpletype

Any type of data is allowed including numbers, strings, dates, or boolean.

boolean

Either *true* or *false*.

date

A string representing a date in the format YYYY-MM-DD (see datetime for the component descriptions).

datetime

A string representing a date and time in the format:YYYY-MM-DDThh:mm:ss.ssss

Where:

- YYYY = year
- MM = month
- DD = day
- T = date/time separator character
- hh = hour
- mm = minute
- ss = second
- ssss = optional millisecond

day

A string representing the day portion of a date in the format: DD

dt

Several different date or time datatypes can be supplied. See the description of the parameter for a list of the datatypes that are valid.

duration

A string representing a time interval in the form [-]PnYnMnDTnHnMnS:

- [-] = an optional minus sign
- P = period indicator
- nY = the number of years
- nM = the number of months
- nD = the number of days
- T = date/time separator
- nH = the number of hours
- nM = the number of minutes

- nS = the number of seconds

empty string

A string with no contents (for example, ""). This is typically returned for error conditions when the result is normally a string.

month

A string representing the month portion of a date in the format: MM

monthday

A string representing the month and day portion of a date in the format: MM-DD

nodeset

A set of nodes within the schema. Node sets are identified by a specific path to a node or structure in the schema. Node sets are used in certain math functions. The datatype of the nodes within the set should be number.

number

Any integer or decimal number including:

- positive and negative zero
- positive and negative infinity
- NaN (This is a value indicating that the result is not a number.)

string

Text characters within the character encoding of the message

time

A string representing a time of day in the format:

hh:mm:ss.sss[-time-zone-indicator]

See datetime for the component descriptions.

tm

Several different time datatypes can be supplied. See the description of the parameter for a list of the datatypes that are valid.

year

A string representing the year portion of a date in the format: YYYY

yearmonth

A string representing the year and month portion of a date in the format: YYYY-MM

Absolute Value function

The **Absolute Value** function determines the absolute value of the parameter.

Parameter: number

The number for which an absolute value is determined. This can be a source node, the result of another function, or a value you specify.

Returns: number

The absolute value of the parameter.

Â **Example:**

10 is the result for both 10 and -10.

Add function

The **Add** function adds all the parameters.

Parameter: number1, [number2 - 1000]

Each parameter can be a source node, the result of another function, or a value you specify. At least one parameter is required.

Returns: number

The sum of all parameters.

Parent topic: [Mapping Function Reference](#)

AES Decrypt function

The **AES Decrypt** function decrypts fields and content using the Advanced Encryption Standard (AES) algorithm with 128 bit strength. 128-bit encryption level requires an 8-byte key, which must be a 32-character hexadecimal string.

Parameter: data, key

Data that is passed as the encrypted content is decrypted to the original content using the AES key.

Returns: string

The decrypted content is returned and stored as a string.

Parent topic: [Mapping Function Reference](#)

[Feedback](#) | [Notices](#)

AES Encrypt function

The **AES Encrypt** function encrypts fields and content using the Advanced Encryption Standard (AES) algorithm with 128 bit strength. 128-bit encryption level requires an 8-byte key, which must be a 32-character hexadecimal string.

Parameter: data, key

Data that is passed as the input is encrypted using the AES key.

Returns: string

The encrypted content is returned and stored as a string.

Parent topic: [Mapping Function Reference](#)

[Feedback](#) | [Notices](#)

 Last updated: Thursday, December 17, 2015

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/AES_Encrypt_function.html

Align Center function

The **Align Center** function centers a string within a padding string. If the padding for both sides is uneven, the lesser amount of padding is placed on the left.

Parameter: string1

The string to be aligned. This can come from a source node, the result of another function, or a value you specify.

Parameter: string2

A padding string. This string must be long enough to create a result and must contain the character or characters to use for padding. This can come from a source node, the result of another function, or a value that you specify. You can use the [Padding String](#) function to produce a padding string.

Returns: string

The padded and centered string.

Example:

```
align-center(â€ˆwidgets', '-----') = '-widgets--'
```

Parent topic: [Mapping Function Reference](#)

[Feedback](#) | [Notices](#)

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Align_Center.html

Align Left function

The **Align Left** function places a string within a padding string starting from the left-most character.

Parameter: string1

The string to be aligned. This can come from a source node, the result of another function, or a value you specify.

Parameter: string2

A padding string. This string must be long enough to create a result and must contain the character or characters to use for padding. This can come from a source node, the result of another function, or a value that you specify. You can use the [Padding String](#) function to produce a padding string.

Returns: string

The padded and left-aligned string.

```
Example: align-left(â€ˆwidgets', '-----') = 'widgets---'
```

Example:

```
align-center(â€ˆwidgets', '-----') = '-widgets--'
```

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Align_Left.html

Align Right function

The **Align Right** function places a string within a padding string ending at the right-most character.

Parameter: string1

The string to be aligned. This can come from a source node, the result of another function, or a value you specify.

Parameter: string2

A padding string. This string must be long enough to create the result and must contain the character or characters to use for padding. This can come from a source node, the result of another function, or a value that you specify. You can use the [Padding String](#) function to produce a padding string.

Example:

```
align-center(â€ˆwidgets', '-----') = '-widgets--'
```

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Align_Right.html

Average function

The **Average** function determines the average value for the sets of numeric nodes in all parameters.

If you use literal numbers or the results of other functions as parameters to this function, the numbers are added to the total. They are also counted as nodes to determine the average.

Parameter: input, input...

The numeric nodes to calculate an average from. These can come from recurring or nonrecurring source nodes, the results of other functions, or values that you specify.

You cannot specify a default value (or constant) for the input parameters of this function but you can specify a variable with a default value and then pass that variable as an input parameter to this function. For more information, see [Specifying Default Values for Functions that Allow Recurring Nodes as Input](#). Attention: In the Mapping Editor, if you chain together a recurring source node, a function that does not support recurring nodes, and then map that result to this function, during run time you may get an unexpected result. For more information, see [Limitations in Combining Other Math Functions or Literals](#).

Returns: number

The average value of all parameters. This returns NaN (not a number) in the following cases:

- If any parameters are not numeric nodes.
- If both the sum of all values and the count of node sets are zero (the average of 0 / 0).

Parent topic: [Mapping Function Reference](#)

Base64 Encode and Decode functions

Base64 refers to a specific MIME content transfer encoding. Base64 encoding represents arbitrary sequences of octets in a form that requires case sensitivity but need not be humanly readable.

A 65-character subset of US-ASCII is used, enabling 6 bits to be represented per printable character. The 65th character, "=", is used to signify a special processing function.

The encoding process represents 24-bit groups of input bits as output strings of 4 encoded characters. Proceeding from left to right, a 24-bit input group is formed by concatenating 3 8-bit input groups. These 24 bits are then treated as 4 concatenated 6-bit groups, each of which is translated into a single digit in the base 64 alphabet.

Each 6-bit group is used as an index into an array of 64 printable characters. The character referenced by the index is placed in the output string.

Base64 Alphabet

Value	Encoding	Value	Encoding	Value	Encoding	Value	Encoding
0	A	17	R	34	i	51	z
1	B	18	S	35	j	52	0
2	C	19	T	36	k	53	1
3	D	20	U	37	l	54	2
4	E	21	V	38	m	55	3
5	F	22	W	39	n	56	4
6	G	23	X	40	o	57	5
7	H	24	Y	41	p	58	6
8	I	25	Z	42	q	59	7
9	J	26	a	43	r	60	8
10	K	27	b	44	s	61	9
11	L	28	c	45	t	62	+

12 M	29 d	46 u	63 /
13 N	30 e	47 v	
14 O	31 f	48 w	(pad) =
15 P	32 g	49 x	
16 Q	33 h	50 y	

Special processing is performed if fewer than 24 bits are available at the end of the data being encoded. A full encoding quantum is always completed at the end of a quantity. When fewer than 24 input bits are available in an input group, zero bits are added (on the right) to form an integral number of 6-bit groups. Padding at the end of the data is performed using the '=' character. Since all base 64 input is an integral number of octets, only the following cases can arise:

- The final quantum of encoding input is an integral multiple of 24 bits; here, the final unit of encoded output will be an integral multiple of 4 characters with no "=" padding,
- The final quantum of encoding input is exactly 8 bits; here, the final unit of encoded output will be two characters followed by two "=" padding characters.
- The final quantum of encoding input is exactly 16 bits; here, the final unit of encoded output will be three characters followed by one "=" padding character.

Boolean function

The **Boolean** function evaluates the parameter and returns either 'true' or 'false' depending on the datatype of the input:

- string "true" unless the string is empty
- number "true" if the number is not zero, "false" if the number is zero

Parameter: anysimplotype

The value to be evaluated. This can come from a source node, the result of another function, or a value that you specify.

Returns: boolean

Either *true* or *false*.

Parent topic: [Mapping Function Reference](#)

[Feedback](#) | [Notices](#)

Ceiling function

The **Ceiling** function rounds the parameter up to the next closest integer.

Parameter: number

The number to round up to an integer. This can come from a source node, the result of another function, or a value that you specify.

Returns: number

The closest integer that is greater than the parameter.

Example:

```
ceiling(4.2) = 5
```

Parent topic: [Mapping Function Reference](#)

[Feedback](#) | [Notices](#)

 Last updated: Thursday, December 17, 2015

Concatenate function

The **Concatenate** function joins all parameter strings into a single result in the order you specify the parameters.

Parameters: string1, string2, [string3-string1000]

Each parameter can be a source node, the result of another function, or a value that you specify. The order of the parameters determines the order in which the parameters are joined (that is, the first parameter displays as left-most in the resulting string).

Note: You must specify at least two parameters in order for the function to be valid. While configuring the properties of the **Concatenate** function in the Function Properties dialog box, you cannot click Delete for the top two parameters in the list. (The Delete button is not active for the top two parameters.) You can only click Delete, if there are more than two parameters in the list and only for the parameters at the bottom of the list. To delete a parameter from the top two positions of the list, first move the parameter down the list clicking Down and then click Delete.

Returns: string

The joined strings.

Cast From Base64Binary function

The **Cast From Base64Binary** function casts from one specific XML Schema data type to another XML Schema data type.

About this task

Casts from the XML Schema data type: `xs:base64Binary` to the XML Schema data type: `xs:string`. The data is not converted, only the type associated with the data is changed.

Parameter: `base64Binary`

The data to cast from the XML Schema data type: `xs:base64Binary`.

Returns: `string`

The data that has been cast to the XML Schema data type `xs:string`.

CopyOf function

The **CopyOf** function copies the entire contents of the source node to the destination node.

The **CopyOf** function () copies the entire contents of the source node (the entire subtree of the source node including all children) to the destination node.

Attention: The XML Schema of the destination node must match the XML Schema of the source node for the CopyOf function to correctly copy the values of the source nodes to the destination nodes.

For example, if the Call Procedure activity returns the following result set nodes (through the any node) during run time:

- results/result/resultSet/column1, where column1 is an integer.
- results/result/resultSet/column2, where column2 is an integer.

The XML Schema of the destination nodes in the To Orchestration pane, must match the expected XML Schema of the result set that is returned from the Call Procedure activity, as shown in the following figure:

In the preceding figure, the CopyOf function () is linking the source result node and the destination result node.

Parameter: input

The name of the source nodes to copy. ^ ^

Returns: anySimpleType

The resulting subtree of XML data.

Parent topic: [Mapping Function Reference](#)

Count Function

The **Count** function determines the number of nodes in all of the sets of nodes in parameters.

For recurring nodes, this function determines the actual number of occurrences.

This function accepts any source node as a parameter. This includes structure or choice nodes which you normally cannot map.

If you use literal numbers as parameters in this function, the numbers are considered one node and incremented by a count of one.

Parameter: input, input...

The sets of nodes to count. These can come from recurring or nonrecurring source nodes, the results of other functions, or values that you specify.

You cannot specify a default value (or constant) for the input parameters of this function but you can specify a variable with a default value and then pass that variable as an input parameter to this function. ^ For more information see [Specifying Default Values for Functions that Allow Recurring Nodes as Input](#). ^ ^

Attention: In the Mapping Editor, if you chain together a recurring source node, a function that does not support recurring nodes, and then map that result to this function, during run time you might get an unexpected result. ^ For more information see [Limitations in Combining Other Math Functions or Literals](#).

Returns: number

The total number of nodes in the parameters.

Parent topic: [Mapping Function Reference](#)

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Decode_Password_Configuration_Property.html

Digest/Hash function

The **Digest/Hash** function produces a digital summary of information called a message digest. Message digests provide a digital identifier for a digital document. The message digest produced by the Digest/Hash function is Base64 encoded.

Message digest functions are mathematical functions that process information to produce a message digest for each unique document. Identical documents have the same message digest, which can be used to ensure that the message received is the same as the message sent.

There are three **Digest/Hash** functions in Studio:

- **Digest/Hash the Input Data with MD5**
- **Digest/Hash the Input Data with SHA-1**
- **Digest/Hash the Input Data with SHA-256**

The input is the document or string for which you want a digest. For example, MD5 ("Austin was happy that the band played on") =NjJhODJhNTViZmI3Y2YwZDc2NDkxYjc0ZTkzZDlmMTQ=

MD5 is defined in RFC 1321. IBM® Cast Iron® uses the MD5 algorithm included in the JDK security package. The algorithm takes a message of undefined length and outputs a message digest of 128 bits.

SHA-1 is defined by the Federal Information Processing Standards Publication 180-1 (FIPS PUB 180-1). IBM Cast Iron uses the SHA-1 algorithm included in the JDK security package. SHA-1 takes an input message of any length less than 264 bits and produces a message digest of 160-bits.

SHA-256 is a 256-bit hash function and is compliant with the National Institute of Standards SP 800-131a specification. IBM Cast Iron uses the SHA-256 algorithm included in the JDK security package. The input is the document or string for which you want a digest. For example, SHA-56 ("Sample Input") = `bEzV+7Tz6afzJhY0E5u0Zt1+9uBURb/2pgi2PT9Ms/s=`. The hash value is 32 bytes or 256 bits length.

Use **Digest/Hash the Input Data with MD5** function to create a Base64 encoded digest of the input data using MD5.

Use the **Digest/Hash the Input Data with SHA-1** function to create a Base64 encoded digest of the input data using SHA-1.

Use the **Digest/Hash the Input Data with SHA-256** function to create a Base64 encoded digest of the input data using SHA-256.

Divide function

The **Divide** function returns the decimal quotient of the first parameter divided by all subsequent parameters.

Parameter: number1

The number to be divided (dividend). This can be a source node, the result of another function, or a value that you specify.

Parameter: number2, [number3-999]

The numbers to divide by (divisor). These can be source nodes, the results of other functions, or values that you specify. At least one parameter is required.

Returns: number

The result of the division operation. If the divisor is zero (positive or negative), the result is infinity (positive or negative), or NaN (not a number) if the dividend is also zero.

Extract HTTP Header Field function

The **Extract HTTP Header Field** function extracts a string with a specified delimiter. It can be used to further extract strings from HTTP headers.

Input1 â€œ Header string, for example: *text/html; char-set=UTF-8* or *text/*;q=0.3, text/html;q=0.7, text/html;level=1*

Input2 â€œ A string that specifies the name value, for example: *char-set*

Input3 â€œ Specified delimiter, for example: *;* or *,*

Output â€œ The value string. For example: *UTF-8* when *char-set* is extracted from **Content-Type** header.

Floor function

The **Floor** function rounds the parameter down to the next closest integer.

Parameter: number

The number to round down to an integer. This can come from a source node, the result of another function or a value that you specify.

Returns: number

The closest integer that is less than the parameter.

Example:

```
floor(4.7) = 4
```

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Floor.html

Format Date String function

The **Format Date String** function converts the XML Schema data type: `xs:dateTime` to a string in the format defined by the second parameter.

Parameter: `dateTime`

The date and time as a XML Schema data type: `xs:dateTime`.

Parameter: string

This string defines the format of the date and time string returned from this function. For example, the format string could be equal to MM/dd/yyyy. For more information about the supported date and time pattern strings see the SimpleDateFormat class in the Sun J2SE 1.4.2 JavaDoc:

<http://www.science.uva.nl/ict/osdocs/java/jdk1.3/docs/api/java/text/SimpleDateFormat.html>.

Pattern Letter	Description	Example1	Example2
G	Era Â designation	AD	BC
y	Year	2004	2001
M	Month in a year	April	04
w	Week in a year	12	24
W	Week in a month	3	1
D	Day in a year	234	333
d	Day in a month	13	20
F	Day of week in a month	1	3
E	Day in a week	Monday	Friday
a	AM or PM designation	AM	PM
H	Hour in a day - a number between 0 and 23	12	13
k	Hour in a day - a number between 1 and 24	14	23
K	Hour in AM or PM - a number between 0 and 11	0	10
h	Hour in AM or PM - a number between 1 and 12	11	12
m	Minute in an hour	20	50
s	Second in a minute	10	30
S	Milliseconds	224	338
z	Time zone in General time zone designation	PDT	EDT
Z	Time zone in ISO-8601 time zone designation	-03:00	+02:00

Parameter: string Â (Optional)

This string defines the locale. For example, the English United States locale is defined with the following string: en_US.

The locale string can be defined by any of the following formats:

- LANGUAGE
- LANGUAGE_COUNTRY
- LANGUAGE_COUNTRY_VARIANT

Where LANGUAGE represents a two letter code as defined by the ISO-639 standard, COUNTRY represents a two letter code defined by the ISO-3166, and VARIANT represents a vendor or browser-specific code, for example WIN for Windows.

This parameter is optional.

To add this parameter:

1. Drop the Format Date String function into the middle pane of the Mapping Editor.
2. Double-click the function. The Function Properties pane opens.
3. Click Add. The Locale input parameter shows in the list of parameters.

Returns: string

The passed in date and time as a string in the format defined by the second parameter.

For example, if the Format Date String function was called with the following input parameters:

dateTime: 2005-02-22T16:18:00.852-08:00

format string: MM/dd/yyyy

locale string: en_US

The following string would be returned: 02/22/2005.

Parent topic: [Mapping Function Reference](#)

Format Number function

The **Format Number** function returns a string that is a number formatted to fit the specified pattern.

Parameter: number

The number to format. This can come from a source node, the result of another function, or a value that you specify.

Parameter: string

A pattern that specifies how the first parameter should be formatted. This pattern uses these symbols to define the pattern:

- Required digits = 0
- Optional digits = #
- Minus symbol = -
- Decimal symbol = .
- Grouping separator = ,. Typically used to separate groups of three digits.
- Percent symbol = %. When the percent symbol is present, the input number is multiplied by 100 and the result is shown as a percentage.
- Per mille symbol = ‰ (Unicode x2030). This symbol multiplies the number by 1000 and shows the result as a per mille.
- Positive/negative separator = ;
- Infinity = infinity
- Not a number = NaN

- \$ = \$

Patterns can have constant text as a prefix, suffix, or both. Common uses are to specify the currency symbol or some unit of measurement.

- `$$,##0.00` formats a number in the standard format for United States dollars with the dollar sign, commas for separators and at least one dollar digit and two digits for cents.
- `#0.000%` formats a decimal number as a percentage with at least three decimal places.
- `#,##0.00;(#,##0.00)` formats negative number with parentheses, a format commonly used in accounting.

Returns: string

The first parameter reformatted to reflect the pattern specified by the second parameter.

Examples

Patterns can have constant text as a prefix, suffix, or both. Common uses are to specify the currency symbol or some unit of measurement. [^]

Example 1

`$$,##0.00` formats a number in the standard format for United States dollars with the dollar sign, commas for separators and at least one dollar digit and two digits for cents.

```
format-number(12345.6789, '$$,##0.00') = '$12,345.67'
```

Example 2

`#0.000%` formats a decimal number as a percentage with at least three decimal places.

```
format-number(.67890123, '#0.000%') = '67.890%'
```

When the percent symbol is present, the input number is multiplied by 100.

Example 3

`#,##0.00;(#,##0.00)` formats negative number with parentheses, a format commonly used in accounting.

```
format-number(-12345.6789, '#,##0.00;(#,##0.00)') = '(12,345.67)'
```

Generate RFC2104 HMAC Compliant Signature

HMAC is a mechanism for message authentication using cryptographic hash functions.

This HMAC function uses the iterative cryptographic hash function SHA-1 with a secret shared key.

Use this function to generate a digital signature that is compliant with HMAC.

Parameter: data (type=string)

The information or message to be validated.

Parameter: key (type=string)

The key used to validate the data.

Parameter: encoding (type=string)

The encoding to apply to the data and key. This can be one of:

- **US-ASCII** - Seven-bit ASCII. Also called ISO646-US. The Basic Latin block of the Unicode character set.
- **ISO-8859-1** - ISO Latin Alphabet No. 1. Also called ISO-LATIN-1.
- **UTF-8** - Eight-bit UCS Transformation Format.
- **UTF-16BE** - Sixteen-bit UCS Transformation Format, big-endian byte order.
- **UTF-16LE** - Sixteen-bit UCS Transformation Format, little-endian byte order.
- **UTF-16** - Sixteen-bit UCS Transformation Format, byte order identified by an optional byte-order mark.

Returns: HMAC signature (type string)

The generated HMAC signature in UTF-8 encoding.

Get Current Date and Time function

The **Get Current[®] Date and Time** function returns the current date and time as a specific XML Schema data type.

About this task

The Get Current Date and Time function returns the current date and time (with the local timezone) as an XML Schema data type: xs:dateTime.

Parameter: none

Returns: dateTime

The current date and time as the XML Schema data type: xs:dateTime. For example, if this function is run on February 22, 2005, at 12:43 PM in the PST timezone (- 08:00) this function returns the following dateTime:

```
2005-02-22T12:43:51-08:00
```

Note: If this function is called twice in a map, it is not guaranteed that the same dateTime is returned. This function is not [stable](#) as defined by the W3C.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/Get_Current_Time_function.html

Length function

The **Length** function determines the number of character in the parameter.

Returns: number

The number of characters in the parameter.

Parameter: string

The string to count. This can come from a source node, the result of another function, or a value you specify.

Example

```
length('The string to count') = 19
```

Lowercase function

The **Lowercase** function converts all uppercase characters to lowercase characters.

Parameter: string

The string to convert. This can come from a source node, the result of another function, or a value you specify.

Returns: string

The converted string.

Parent topic: [Mapping Function Reference](#)

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Lowercase.html

Maximum function

The **Maximum** function determines the highest value in the nodes, sets of numeric nodes, or numbers in parameters.

Parameter: input, input ...

The numeric nodes to compare. These can come from recurring or nonrecurring source nodes, the results of other functions, or values that you specify.

You cannot specify a default value (or constant) for the input parameters of this function but you can specify a variable with a default value and then pass that variable as an input parameter to this function. For more information see [Specifying Default Values for Functions that Allow Recurring Nodes as Input](#).

Attention: In the Mapping Editor, if you chain together a recurring source node, a function that does not support recurring nodes, and then map that result to this function, during run time you might get an unexpected result. For more information see [Limitations in Combining Other Math Functions or Literals](#).

Returns: number

The maximum value of all nodes in the parameters. For recurring nodes, values for every occurrence in the recurring set is used to find the maximum. If any parameter is not a set of numeric nodes or is an empty node set, the function returns NaN (not a number).

Parent topic: [Mapping Function Reference](#)

[Feedback](#) | [Notices](#)

file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Maximum.html

Minimum function

The **Minimum** function determines the lowest value in the nodes, sets of numeric nodes, or numbers in parameters.

Parameter: input, input ...

The numeric nodes to compare. These can come from recurring or nonrecurring source nodes, the results of other functions, or values that you specify.

You cannot specify a default value (or constant) for the input parameters of this function but you can specify a variable with a default value and then pass that variable as an input parameter to this function. For more information see [Specifying Default Values for Functions that Allow Recurring Nodes as Input](#).

Attention: In the Mapping Editor, if you chain together a recurring source node, a function that does not support recurring nodes, and then map that result to this function, during run time you might get an unexpected result. For more information see [Limitations in Combining Other Math Functions or Literals](#).

Returns: number

The minimum value of all nodes in the parameters. For recurring nodes, values for every occurrence in the recurring set is used to find the minimum. If any parameter is not a number, not a set of numeric nodes, or is an empty node set, the function returns NaN (not a number).

Parent topic: [Mapping Function Reference](#)

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Minimum_function.html

Modulo function

The **Modulo** function determines the remainder from dividing the first parameter by all subsequent parameters.

Returns: number

The remainder from dividing the first parameter by the remaining parameters. If the divisor is zero, returns NaN (not a number).

Parameter: number1

The number to be divided (dividend). This can come from a source node, the result of a function, or a value you specify.

Parameter: number2, [number3-999]

The numbers to divide with (divisor). These can come from source nodes, the results of other functions, or values you specify. At least one divisor parameter is required.

If multiple parameters are specified as divisors, the order of operations is as follows: the remainder returned from the first division operation becomes the dividend for the second operation, and so forth. See Example 2.

Example 1: Using one divisor parameter

`modulo(42, 5) = 2`

`42 / 5 = 8 R2`

Example 2: Using multiple divisor parameters

`modulo(61, 7, 2) = 1`

`61 / 7 = 8 R5`

`5 / 2 = 2 R1`

Multiply function

The **Multiply** function returns the product of all parameters.

Parameter(s): number1, number2, [number3-1,000]

The numbers to multiply. At least two parameters are required. Each parameter can come from a source node, the result of a function, or a value you specify.

Returns: number

The product of the parameters.

Parent topic: [Mapping Function Reference](#)

[Feedback](#) | [Notices](#)

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Multiply.html

Not function

The **Not** function is typically used in conditions to specify negative or complimentary conditions.

Returns true if the parameter evaluates as false. Returns false if the parameter evaluates as true.

Parameter: datatype

Any number, string, date, time, or boolean value. This can come from a source node, the result of a function, or a value you specify.

Returns: boolean

The boolean inverse of the parameter. The evaluation rules depend on the datatype of the parameter.

For number datatypes:

- Positive and negative zero evaluate as false
- Any other number evaluates as true

For string, any date or any time datatypes:

- An empty string evaluates as false
- Any other string, date or time evaluates as true

For the boolean datatype:

- The evaluation returns the inverse value

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Not.html

Number function

The **Number** function changes the datatype of the parameter to number.

Parameter: datatype

Any number, string, date, time, or boolean value. This can come from a source node, the result of a function, or a value you specify.

Returns: number

The numeric value of the parameter or NaN (not a number). The conversion rules depend on the datatype of the parameter:

For number datatypes:

- NaN for NaN, positive infinity or negative infinity
- The same number for any other value

For string, any date, or any time datatypes:

- The corresponding number if the string is in any of these formats, where n represents any set of digits:

n or -n

n. or -n.

n.n or -n.n

.n or -.n

NaN for any other value

For the boolean datatype:

- 'true' evaluates to 1
- 'false' evaluates to 0

Padding String function

The **Padding String** function returns a padding string of the specified length and characters. Padding strings are used in alignment functions.

Parameter: number

The total length to make the padding string. This can come from a source node, the result of another function, or a value you specify.

Parameter: [string]

One or more characters to use to build the padding string. If you use multiple characters and the length of the padding string is not an even multiple, these characters are truncated at the end of the string to fit the overall length. This can come from a source node, the result of another function, or a value you specify. If you omit this parameter, it defaults to the space character.

Returns: string

The string to use for padding.

Position function

The **Position** function is used with conditions to represent the index to the current node within the set of its siblings. The function works only within the context of a recurring node and has no parameters.

Returns: number

The index or number identifying the position of the current node within the set of its siblings.

Parent topic: [Mapping Function Reference](#)

Read Date String function

The **Read Date String** function converts a string (that contains a date and time) to the XML Schema data type: xs:dateTime.

Purpose

Parameter: string

The date and time as a string.

Parameter: string

This string defines the format of the date and time string of the first parameter. For example, the format string could be equal to MM/dd/yyyy. For more information about the supported date and time pattern strings see SimpleDateFormat class in the Sun J2SE 1.4.2 Javadoc:

<http://www.science.uva.nl/ict/osdocs/java/jdk1.3/docs/api/java/text/SimpleDateFormat.html>.

Pattern Letter	Description	Example1	Example2
G	Era Â designation	AD	BC
y	Year	2004	2001
M	Month in a year	April	04
w	Week in a year	12	24
W	Week in a month	3	1
D	Day in a year	234	333
d	Day in a month	13	20
F	Day of week in a month	1	3

Pattern Letter	Description	Example1	Example2
E	Day in a week	Monday	Friday
a	AM or PM designation	AM	PM
H	Hour in a day - a number between 0 and 23	12	13
k	Hour in a day - a number between 1 and 24	14	23
K	Hour in AM or PM - a number between 0 and 11	0	10
h	Hour in AM or PM - a number between 1 and 12	11	12
m	Minute in an hour	20	50
s	Second in a minute	10	30
S	Milliseconds	224	338
z	Time zone in General time zone designation	PDT	EDT
Z	Time zone in RFC 822 time zone designation	-0300	+0200

Parameter: string \hat{A} (Optional)

This string defines the locale. For example, the English United States locale is defined with the following string: en_US.

The locale string can be defined by any of the following formats:

- LANGUAGE
- LANGUAGE_COUNTRY
- LANGUAGE_COUNTRY_VARIANT

Where LANGUAGE represents a two letter code as defined by the ISO-639 standard, COUNTRY represents a two letter code defined by the ISO-3166, and VARIANT represents a vendor or browser-specific code, for example WIN for Windows.

This parameter is optional.

To add this parameter:

1. Drop the Format Date String function into the middle pane of the Mapping Editor.
2. Double-click the function. The Function Properties pane opens.
3. Click Add. The Locale input parameter shows in the list of parameters.

Returns: dateTime

The date and time as an XML Schema data type: xs:dateTime is returned. For example, if the Read Date String function was run with the following input parameters:

date and time string: 02/22/2005/12/20/44

format string: MM/dd/yyyy/HH/mm/ss

A dateTime representing February 22, 2005 at 12:20 and 44 seconds is returned from Read Date String Function.

Parent topic: [Mapping Function Reference](#)

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Read_Date_String.html

Replace function

The **Replace** function replaces individual characters with other individual characters.

The replacement is done at the individual character level and not the string level. Every occurrence of a character is replaced with specified replacement character as shown in the following example:

- list of characters to be replaced is equal to 'abc'
- list or replacement characters is equal to 'ABC'
- input string is equal to 'aWWWbYYYYcPPPPabc'

The result string is equal to 'AWWWBYYYYCPPPPABC' because the replacement is done at the character level - every character is replaced. (If the replacement was done at the string level the resulting string would be equal to 'aWWWbYYYYcPPPPABC'.)

Parameter: input

The string to search for characters to replace. The value for this parameter can be provided by a source node, the result of another function, or a value you specify.

Parameter: fromChars

A list of the character or characters to be replaced. If you need to replace several characters, they should be listed without any separation. The value for this parameter can be provided by a source node, the result of another function, or a value you specify.

Parameter: toChars

A list of character or characters to use as replacements. List the replacement characters in this parameter in the same order as characters to be replaced in the fromChars parameter because the first character from the fromChars parameter is replaced by the first character in toChars parameter and so on. For more information, see Example 2. The value for this parameter can be provided by a source node, the result of another function, or a value you specify.

Note: You can not directly replace a single character with an empty string because the toChars parameter cannot equal a empty string - a string with no characters. For a workaround, see Example 3.

Returns: string

The result of replacing all occurrences of characters in the second parameter (fromChars) that are found in the first parameter (input) with the matching characters in the third parameter (toChars).

Example 1

This example shows a simple one-to-one character replacement as shown in the following figure:

The run-time result of running this function is the following string:

```
A list of chArActers
```

All lowercase a characters are replaced with uppercase A characters.

Note: In this example, the input parameter is hardcoded to a specific value. Typically this value is supplied by a source node in a map.

Example 2

In this example, the first character from the fromChars parameter is replaced by the first character of the toChars parameter, the second character from the fromChars parameter is replaced by the second character of the toChars parameter, and so on. The replacement of multiple characters is shown in the following figure:

In this example, the non-numeric characters (specified at the end of the fromChars parameter) are removed from the phone number string. All the numeric characters are replaced with the same numeric character; for example, the 1 character is replaced by the 1 character. The other non-numeric characters at the end of the fromChars do not have a replacement character specified in the toChars, so they are removed from the returned string.

The run-time result of running this function is the following string:

```
000238882349940
```

Note: In this example, the input parameter is hardcoded to a specific value. Typically this value is supplied by a source node in a map.

Example 3

This example shows a workaround to the limitation that you cannot replace a single character with an empty string. This limitation exists because the toChars parameter cannot be set to an empty string - a string with no characters. You can workaround this limitation by supplying a dummy character like a hyphen (-) that is not found in the input parameter. For example, you could specify the following values for the parameters of the **Replace** function as shown in the following figure:

In this example, the input parameter is equal to '1 2 3' (1, space, 2, space, 3), the fromChars parameter is equal to '-' (hyphen, space), and the toChars parameter is equal to '-' (hyphen). During run time, the **Replace** function with these values strips the spaces from input parameter and the run-time result is the following string:

123

Attention: When you specify the strings in the Value field of the Function Properties dialog box, do not enter the quotes. Enter just the hyphen and the space and not the quote characters.

Note: In this example, the input parameter is hardcoded to a specific value. Typically this value is supplied by a source node in a map.

Replace String function

The **Replace String** function replaces individual characters or a string with other individual characters or string.

Parameter: input

The string to search for characters to be replaced. The value for this parameter can be provided by a source node, the result of another function, or a value you specify.

Parameter: pattern

A regular expression pattern that needs to be replaced. The value for this parameter can be provided by a source node, the result of another function, or a value you specify.

Parameter: replace

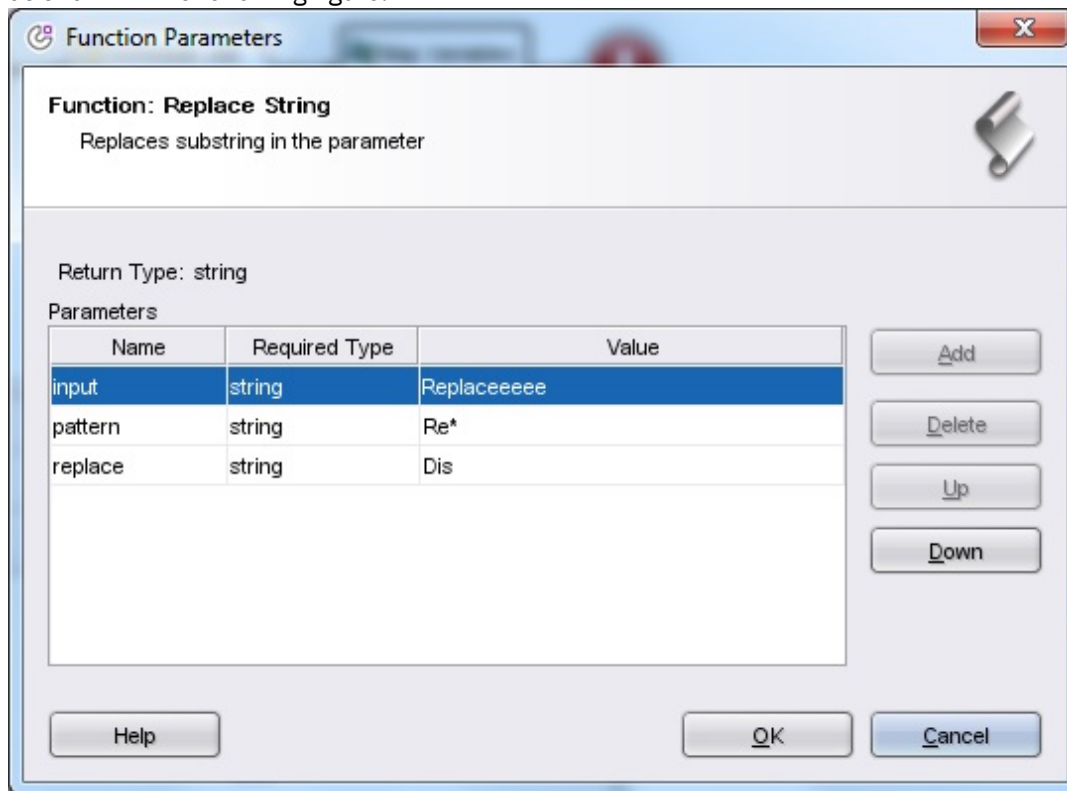

Any substring within the input that matches the `pattern` will be replaced with the `Replace String`. The value for this parameter can be provided by a source node, the result of another function, or a value you specify.

Returns: string

The result of replacing all occurrences of `pattern` that are found in the first parameter (input) with the matching string in the second parameter (pattern).

Example

This example shows a simple replacement of a substring matching a regular expression in pattern parameter, as shown in the following figure:

The runtime result of running this function is the following string:

Replaceeeee

The string that matches the pattern with the value `Re*` will be replaced by the replace string `Dis`.

Note: In this example, the input parameter is hardcoded to a specific value. Typically this value is supplied by a source node in a map.

Parent topic: [Mapping Function Reference](#)

Round function

The **Round** function rounds a number to the closest integer.

Parameter: number

The number to be rounded. This can come from a source node, the result of another function, or a value you specify.

Returns: number

The closest integer to the parameter, rounding up if two integers are equally close. This can come from a source node, the result of another function, or a value you specify.

Example:

- `round(4.2) = 4`
- `round(4.5) = 5`

Parent topic: [Mapping Function Reference](#)

[Feedback](#) | [Notices](#)

Starts With function

The **Starts With** function determines whether or not the first parameter begins with the characters in the second parameter.

Parameter: string1

The string to test. This can come from a source node, the result of another function, or a value that you specify.

Parameter: string2

The beginning string to test for. This can come from a source node, the result of another function, or a value that you specify.

Returns: boolean

True or false indicating whether the first parameter begins with the second parameter.

Parent topic: [Mapping Function Reference](#)

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_StartsWith.html

String function

The **String** function changes the datatype of the parameter to string.

Parameter: datatype

Any string, boolean, date, or numeric datatype. This can come from a source node, the result of another function, or a value that you specify.

Returns: string

The result of changing the parameter to string. The conversion rules depend on the datatype of the parameter:

- For boolean datatypes, returns the string *true* or *false*
- For date or time datatypes, returns the date or time as a string in the specific format for that datatype, such as '2003-01-20T05:00:00' for a datetime datatype.
- For number datatypes, this returns:
 - 'NaN' if the value is NaN (not a number)
 - '0' if the value is positive or negative zero.
 - 'Infinity' or '-Infinity' if the value is positive or negative infinity (respectively).
 - The corresponding numeral, with a minus sign if negative and no leading zeroes. Decimal values have at least one numeral before the decimal point and as many decimal places as needed.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_String.html

Substring function

The **Substring** function extracts a portion of the parameter based on the specified character placement.

Parameter: string

The string to extract from. This can come from a source node, the result of another function, or a value you specify.

Parameter: number1

The position of the first character to extract. Characters are numbered in the string beginning from 1.

Parameter: [number2]

The total number of characters to extract. If you omit this parameter, it defaults to the length from the starting position to the end of the first parameter.

Returns: string

The substring for the specified character places.

Example

```
substring('abcde',3,2) = 'cd'
```

Substring After function

The **Substring After** function extracts all the characters in a string starting after the first occurrence of a specified substring (one or more characters) through the end of the string.

Parameter: string

The string to extract a substring from. This can come from a source node, the result of another function, or a value you specify.

Parameter: string

The character to use as a starting point for the extraction. The first occurrence of the character is used as the starting point. This parameter can come from a source node, the result of another function, or a value you specify.

Returns: string

A substring of the first parameter which starts after the first occurrence of the specified start string through the end of the string. If the start string is not present, returns an empty string.

Example

```
substring-after('12/31/1999','/') = '31/1999',
```

Parent topic: [Mapping Function Reference](#)

file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Substring_After.html

Substring Before function

The **Substring Before** function extracts all the characters in a string starting at the beginning up to the first occurrence of a specified substring (one or more characters).

Parameter: string

The string to extract a substring from. This can come from a source node, the result of another function, or a value you specify.

Parameter: string

The characters to use as the ending point for the extraction. The first occurrence of these characters is used as the ending point. This can come from a source node, the result of another function, or a value you specify.

Returns: string

The substring in the first parameter starting at the beginning up to the first occurrence of the specified end string. If the end string is not present, this returns an empty string.

Example

```
substring-before('12/31/1999','/') = '12'
```

Parent topic: [Mapping Function Reference](#)

Subtract function

The **Subtract** function returns the difference of the first parameter less all subsequent parameters.

Parameter: number1

The number to subtract from. This can come from a source node, the result of another function, or a value that you specify.

Parameter: number2,, [number3-999]

The numbers to subtract. These can come from source nodes, the results of other functions, or values that you specify. You can specify multiple parameters here, but at least one parameter is required.

Returns: number

The difference of the two parameters. If either parameter is not a number, returns NaN (not a number).

Example

number 1 = 42

number 2 = 7

number 3 = 8

returns: 27

Sum function

The **Sum** function determines the sum of values in the numeric node, sets of numeric nodes, or numbers in parameters.

Parameter: input, input ...

The numeric nodes to add. These can come from recurring or nonrecurring source nodes, the results of other functions, or values that you specify.

You cannot specify a default value (or constant) for the input parameters of this function but you can specify a variable with a default value and then pass that variable as an input parameter to this function. For more information see [Specifying Default Values for Functions that Allow Recurring Nodes as Input](#).

Attention: In the Mapping Editor, if you chain together a recurring source node, a function that does not support recurring nodes, and then map that result to this function, during run time you might get an unexpected result. For more information see [Limitations in Combining Other Math Functions or Literals](#).

.

Returns: number

The total sum of all parameters. If any parameter is a nodeset, the total includes values for every node in the set. If any parameter is not a number or a numeric node set, returns NaN (not a number).

Parent topic: [Mapping Function Reference](#)

Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.doc/ref_Sum.html

Trim function

The **Trim** function trims all leading and trailing spaces and replaces continuous sets of white space characters by a single space.

The string value of the parameter is normalized, as described in the following steps:

1. All tabs, carriage returns, and line feeds are replaced with spaces.
2. Contiguous sequences of spaces are reduced to a single space.
3. Trailing and leading spaces are removed.

Parameter: string

The string to trim and normalize. This can come from a source node, the result of another function, or a value you specify

Returns: string

The trimmed and normalized parameter.

Examples:

Input String Equals...	The Trim Function Returns...
' The string to trim and normalize. '	'The string to trim and normalize.'
' first line second line third line '	'first line second line third line'

A

Activity

A complete, functional unit of processing within an orchestration. Activities include flow-control (logic) activities; data activities to facilitate consumption and transmission of data; and activities that enable integration with database systems, enterprise systems, Web servers, email servers, and other systems. An orchestration comprises a series of activities.

Assets

Supplemental configuration files, scripts, or other materials associated with a specific activity. For example, the buffer table scripts created for a database insert activity are assets. Assets are controlled by the Web Management Console (WMC). Access privileges to assets can be given to users beyond the users of the WMC. For example, DBAs can be given privileges to the assets associated with a database activity so that they can create the required tables or triggers.

B

Buffer table

An auxiliary table used in conjunction with various database activities, such as the single-table insert, update, or delete database activities. When you configure one of the database DML (data manipulation language) activities, Studio generates a SQL script that can be used to create the appropriate trigger on the database table; the buffer table gets populated when the triggering event (INSERT, UPDATE, DELETE) occurs. The buffer table provides the means to capture database changes and initiate processing by the orchestration.

C

Cast Iron® Studio

An integrated development environment (IDE) for creating, configuring, and publishing integration projects and the orchestrations they comprise. Studio projects run on the WebSphere® Cast Iron Appliance.

Command-line interface

A text-based alternative to the Web Management Console (WMC) for configuring, managing, and querying an Integration Appliance.

Control table

A database table that facilitates using database endpoints in integrations. As it does with buffer tables, Studio generates scripts to create control tables that can be used to ensure that inserts, updates, and deletes to specific tables occur once and only once.

Copy parameters

Copy creates new default orchestration variables that match the output from the parameters.

D

Deploy

Create an instance of an integration project (instantiate) on an Integration Appliance.

Document

Any of the XML Schema files, DTDs, and other configuration files that comprise integration projects.

Dynamic delimiter

A delimiter that is obtained from within the fields of the message itself, such as an HL7 PID (patient ID) message header that denotes the beginning of a new record in a file containing a batch of electronic health records.

E

Empty Placeholder

Appears in activities that have multiple branches as an initial placeholder for the activities in that branch. Dropping other activities on this icon removes it.

Endpoint

Represents the properties of an external system, such as a database server, FTP server, email system, or enterprise application that is either the source of data to the Integration Appliance or the target of processing by the Integration Appliance.

F

For Each

A function that iterates over a message structure.

Flat File

A file containing non-XML data. Flat Files are typically of two types: delimited, in which a comma, tab, white space, or other delimiter is used to separate variable-length fields and records; or positional, in which fields and records have a fixed width.

Flat File Schema

Defines how to interpret a specific set of Flat Files. Cast Iron Studio creates Flat File Schema (XML Schema) based on the configuration you define in the Flat File Schema Editor. A Flat File Schema is used by the Read Flat File activity to convert a source Flat File into XML.

Function

String, mathematical, and miscellaneous functions provided by Studio that you can use in defining processing in your orchestrations. In addition to the pre-built functions, Studio lets you build your own custom functions and add lookup tables.

I

Integration project

The various inputs, outputs (endpoints), mapping and schema definitions (transformations, message formats), orchestrations, and configuration information that comprise an integration solution as designed in Studio and deployed to the Integration Appliance.

J

Job

A specific run-time instance of an orchestration.

M

Map

A component that lets you bind input parameters to variables, and variables to the orchestration. Many Studio activities contain embedded maps that you must configure at design time, in the context of an orchestration, to define how actual parameters should map to variables, and how the variables should be processed in the orchestration. In addition to the embedded activity maps, Studio has a stand-alone Map Variables activity that can be used to bind any type of input and output to the orchestration

N

Node

All data input to or output from the Integration Appliance is materialized in Studio as a series of nodes, as in a tree-like, hierarchical structure. In many cases, the nodes represent the structure and content of an XML document, but in many cases they don't (e.g., rows in a database table are displayed as nodes). Nodes in Studio convey information about structure; the type of content that can be supported; or additional characteristics of the data.

Notification policy

Applies across an entire orchestration. Rules are based on event levels from 0 (no logging) to 9 for complete logging information.

O

Orchestration

The specific sequence of processing activities (such as data mapping, transformation, and control logic activities), endpoints, and data types defined and configured using Studio and deployed to run on the Integration Appliance.

P

Parameter

A value passed to an activity or to an orchestration. For example, Filename and data are two of the parameters that can be passed from an FTP endpoint to an orchestration.

Parameterized query

A database SQL statement that contains input or output database parameters. The **Execute Query** activity supports parameterized queries.

Parse

The converse of serialize. To convert to constituent pieces according to some established rules.

Pick

An activity that chooses from two or more alternatives. Typically used to start an orchestration, the **Pick** activity can support either synchronous or asynchronous messaging.

Project

An integration project defined and created using Cast Iron Studio. Each project has a properties file (filename.sp3) and several additional metadata files and folders that comprise all integration elements - orchestrations, endpoints, XML schemas, flat files - and their specific configuration (variables, parameters)

Publish

Copy all project files from Studio to an Integration Appliance or to an intermediate staging area, such as a shared directory on a file server, for subsequent runtime configuration and deployment to a specific environment. The Publish process encompasses validating the project; creating a .par file of project configuration documents; and sending the package to the Integration Appliance specified.

R

Raw message

The configuration that defines the character encoding for raw messages

Record identifier

A special field that delimits records in certain types of flat files, such as EDI (electronic data interchange) or HL7 (Health Level 7) files. For example, an HL7 PID (patient ID) number is a record identifier.

Repetition delimiters

A delimiter in a flat file that is used when the data lacks a unique value, such as record ID, to distinguish one record from another.

Replace

Appears in activity branches as an initial placeholder for the endpoint activity to receive a message for that branch. Dropping a **Receive endpoint** activity on this icon removes it.

Reply

Sends an acknowledgement when it receives a message.

Repository

Persistent storage for various types of data. Cast Iron Appliance has a configuration repository and a message repository.

S

Serialize

The converse of parse. Serialization assumes that the data is in XML format

Stored procedure

A functional code unit that resides in a database and is started explicitly by name. Stored procedures can be used to populate buffer tables when specific insert, update, or delete activities occur on a particular database table.

System store

A repository containing Appliance configuration information. Same as configuration repository.

T

Terminate

Stops orchestration processing.

Toolbox

The five-tab-set of Project, Activities, Variables, Functions, and Verify available in the right corner of Studio. These tabs provide access to all the entities you need to create new projects, create new orchestrations within projects, and develop the processing logic.

Trigger

A type of database stored procedure that is called implicitly when a triggering event occurs such as an INSERT, UPDATE, or DELETE on a table.

V

Variable

Used to pass data values processed by an orchestration. Variables are used by maps to identify the source and target. Some Activities create variables automatically.

W

While Loop

Initiates and continually processes any children activities for as long as a specified condition is true.

Getting started with Cast Iron Express

By using IBM® WebSphere® Cast Iron® Express®, you can quickly sign up for a free trial account, create integrations, and manage your Cast Iron Express environment securely. You can also analyze your integration usage by using the analytics provided.

Why use Cast Iron Express?

WebSphere Cast Iron Express is a purpose-built solution for you to quickly create, define, run, and manage integration projects. Within minutes, you can create integrations between your salesforce.com account and other data sources.

The emphasis is on speed and simplicity, therefore, integrations are defined by using a configuration approach. You do not code the integration.

When complete, you can run your integration to move data in and out of salesforce.com, from remote databases, local files, and Dropbox.

At any time, you can extend the capability of your Cast Iron Express account by selecting one or more of the available add-on function packages.

You can invite other users to your Cast Iron Express account. You can also monitor and administer your account.

To Sign Up, go to the WebSphere Cast Iron Express home page <https://express.castiron.com/express/>.

What do you need to know?

Depending on your role, there are different tasks that are outlined in the following documentation. Each task is explained in sequence, starting with how to register for a Cast Iron Express account.

For security reasons, your session times out if you leave your user name signed in and there is no activity.

Some of the Cast Iron Express function uses pop-up windows. Therefore, you might want to prevent pop-up windows from being blocked in your web browser.

Before you start, check that the browser you are using is supported and meets the required minimum levels:

- Google Chrome 18
- Mozilla Firefox 10
- Windows Internet Explorer 8

You can select the following tasks to learn about Cast Iron Express. Then you can start to create and manage your integrations, invite other users to your account, and monitor the activity within your account.

To learn how to create an integration from a local file to your salesforce.com account, see [Tutorial: Creating a local file to salesforce.com integration](#).

- [Registering an account](#)
You can register for an IBM Cast Iron Express account by clicking Sign Up on the Cast Iron Express home page.
- [Help with getting started](#)
When you sign in with the user name and password that you received, the Getting Started with Cast Iron Express view opens.
- [Managing your account profile](#)
You can add details, or change your current details by using the Manage Profile view. You can also change your account password.
- [Managing users](#)
Administrators can manage the users for an Cast Iron Express account. Only administrators can add new users to an account, and remove existing users that no longer require access.
- [The Cast Iron Express Help Center](#)
When you sign in to Cast Iron Express, a Help Center which contains a series of useful resources is available to help you to understand and use the function available in the product.
- [Adding function to your Express account](#)
You can customize your Cast Iron Express account by requesting extra function. By selecting one or more of the available function packages, you can increase the capability of your account.
- [Keeping up to date with Cast Iron Express](#)
You can find out What's New in Cast Iron Express, by looking at the Cast Iron Express Help Center.

[Feedback](#) | [Notices](#)

Registering an account

You can register for an IBM® Cast Iron® Express® account by clicking Sign Up on the Cast Iron Express home page.

You can register for an IBM Cast Iron Express account by going to <https://express.castiron.com/express/>.

There is no commitment to buy the product. The registration link from the Cast Iron Express home page sets up a free trial account. You can extend the function within your account by requesting the available add-on packages. For more information, see [Adding function to your Express account](#).

When registering an account, you must identify a single user for login purposes. Every Cast Iron Express account has one user with administrator privileges. This user is named *admin* and is created when you first complete your registration. The admin user can invite additional users to the same Cast Iron Express account.

Procedure

1. With the Cast Iron Express home page open, click Sign Up. The Sign Up page opens.
2. Complete all of the fields by entering the requested details. If you omit a field, you are prompted to enter the information.
3. Read the Terms of Use. When you submit your registration request, you are agreeing to the Cast Iron Express terms.
4. When complete, click Sign Up. A confirmation message is displayed which shows that an email is being sent to the registered address.
5. Go to your email account and open the Welcome to IBM WebSphere Cast Iron Express note. To confirm the registration and activate your account you must click the link provided. An account verification message is displayed.
6. Following your confirmation, two further emails are sent. One note contains your *admin@YourCompanyName* Cast Iron Express user name. The other note contains your password. The *admin* user ID has the authority to create and define integrations, to invite other users to access the account, and manage the company Cast Iron Express account.
7. Sign in with the provided credentials to begin using your free trial account.

Restriction: Cast Iron Express limits users to a single trial account per company. If you receive an error message which indicates that the company name you provided is already registered, please contact the administrator at your company. The administrator can invite additional users within the existing account.

Help with getting started

When you sign in with the user name and password that you received, the Getting Started with Cast Iron Express view opens.

To help you to understand the function available within your Cast Iron® Express® account, you can click each of the options displayed in the Getting Started view.

You can access the Getting Started page, at any time, by clicking the Help icon in the toolbar. The following screen capture shows the Help icon and the various help options:

Procedure

1. Sign in with the user name and password that you received from IBM® Cast Iron Express. The Getting Started with Express view opens.
2. In the Getting Started with Express view, you can click one of the three options displayed:
 - Create to quickly define and run your integrations.
 - Monitor to open the dashboard page and analyze your integrations in real time. You can also check for any reported problems.
 - Extend to add more function to your account and extend the capability of your integrations.

You can now start to define your Cast Iron Express environment.

Managing your account profile

You can add details, or change your current details by using the Manage Profile view. You can also change your account password.

Sign in to your Cast Iron® Express® account.

Procedure

1. Click your sign-in name in the upper right of the page to display the menu options. Click Manage Profile. The following screen capture shows the menu.

2. You can add or update the details in the following fields:
 - o First Name
 - o Last Name
 - o E-mail
 - o Country
 - o Phone
 - o Job Title
3. To change your password, click Change Password. You must provide your existing password before entering your new password.

The typical password rules apply. Passwords must have a minimum of eight characters and can contain special characters.

4. Optional: If you want to receive the Cast Iron Express newsletter, you can select Sign me up for the Cast Iron Express Newsletter and let IBM contact me with special offers.
5. To modify your profile, click Save. To cancel the addition or amendment, click the close icon .

Managing users

Administrators can manage the users for an Cast Iron[®] Express[®] account. Only administrators can add new users to an account, and remove existing users that no longer require access.

By default, when you register for a Cast Iron Express account, the Manage Users function is disabled. To use this additional function, click Add-ons and select the *Collaboration* package. For more information, see [Adding function to your Express account](#).

Complete the following steps to invite one or more users to access your Cast Iron Express account.

Procedure

1. To open the Manage Users page, click Manage Users.
2. In the Add New Users section, enter the email address of the user that you want to add to your Cast Iron Express account. If you want to invite several people, separate each email address with a comma.
3. Optional: To customize the email that is sent to the users, select Customize email, and edit the content in the text area provided.
4. When you are finished, click Send. A message is displayed to confirm that an email is being sent.
5. The people that you invite receive a note which includes a link that guides them through the sign-up process. The first time they sign in the license agreement is displayed. The invited author must click Accept to complete the sign-in process.

6. After the new users sign in, you can see the details of their last login to Cast Iron Express in the Active Users section.
7. If required, you can delete a user by clicking the delete icon next to the Last Login field.

The Cast Iron Express Help Center

When you sign in to Cast Iron® Express®, a Help Center which contains a series of useful resources is available to help you to understand and use the function available in the product.

The Cast Iron Express Help Center contains the following information:

- What's New details
- A series of short video tutorials
- Documented tutorials
- A frequently asked questions (FAQ) section

You can open the Help Center by clicking the Help icon, at any time. The following screen capture shows the Help icon and menu options:

The Help Center section can be closed by clicking the close icon in the upper right of the page.

You can also access the Cast Iron Express Information Center from the help menu options.

Adding function to your Express account

You can customize your Cast Iron® Express® account by requesting extra function. By selecting one or more of the available function packages, you can increase the capability of your account.

Sign in to your Cast Iron Express account.

Depending on which additional function you select, you might be charged for some of the function packages. You are redirected to the IBM® Software and services online site, where you can add the Cast Iron Express product item to your basket. When prompted, sign in with your IBM user ID (which must be configured separately from your Cast Iron Express sign-in name).

At the end of the order process, record the confirmation number for future reference.

Important: The payment system opens in a new window. Therefore, you must ensure that your web browser does not block pop-up windows.

Procedure

1. To see a list of available packages, click Add-ons.

The available function packages include:

- Mapping Functions. To define transformations to manipulate the data, mapped from the source endpoint before it populates the target endpoint.
- On-premise Support. To provide continuous synchronization between your local and remote systems.
- Collaboration. To invite other users to help create and manage integrations in your Cast Iron Express account.

Each package details the function included and whether there is a free trial. You can use the one-off free trial to experience how the function can enhance your business applications.

2. To select all of the extra function, click Try All for 90 Days. To continue to use the function when the free 90 day trial finishes, you must purchase the package.
3. To select individual packages, click Free for 90 Days for the specific function that you want to use. When you choose only some of the packages, you cannot then select Try All for 90 Days.
4. If relevant, complete the purchase on the IBM Software and services online site.
5. Submit your new function request.

The Add-ons view shows the status of your request, your current package usage, and indicates the time remaining for the free trials.

Integrating with Cast Iron Express

- [Supported Source and Target systems](#)
Cast Iron® Express® provides the capability to integrate between databases, FTP servers, local files, Dropbox, and salesforce.com accounts.
- [Managing secure connectors](#)
To communicate with on-site systems such as databases and FTP servers, Cast Iron Express provides the use of a secure connector. The secure connectors are managed from the Integrations page.
- [Creating integrations](#)
Integrations can be created in Cast Iron Express from the Integrations page.
- [Using the Integration editor](#)
You can use the Integration editor to customize all information about an integration.
- [Composite functions](#)
A composite function is a combination of two separate functions, where the output of one function is chained as input to a subsequent function. The following topics provide information on creating, editing, or deleting composite functions.
- [List of functions](#)
Cast Iron Express offers a selection of functions for use within mappings. These functions can be used to manipulate the field values being mapped, such as altering the content of strings, performing numeric operations on numbers, and manipulating date and time values.
- [Managing integrations](#)
Cast Iron Express displays a list of all of the integrations defined in an account on the Integrations page.
- [Monitoring integration activity](#)
You can use the Cast Iron Express Activities page to see details of all of the activity within your account.

- [Utilization Charts](#)

Utilization charts allow you to quickly identify the most active integrations and endpoints for a specific tenant. A summary of job successes and failures and a breakdown of integration activity is presented in a monthly and yearly chart.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations_ManagingSecureConnectors.html

Creating a secure connector

You can create secure connectors from the Cast Iron[®] Express[®] Integrations page.

By default, when you register for a Cast Iron Express account, the Secure Connector function is disabled. To use this additional function, click Add-ons and select the *On-premise Support* package. For more information, see [Adding function to your Express account](#).

Procedure

1. With the Integrations page open, click the Add icon: .
2. Enter a unique and descriptive name for the secure connector.
3. Click Create.

The secure connector is created in the background, and when ready, it is displayed in the list of Secure Connectors.

Download the installation and configuration files and install the secure connector on the host system. For more information, see [Installing a secure connector](#).

Parent topic: [Managing secure connectors](#)

Feedback | Notices

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

Installing a secure connector

You can install a secure connector on the host system.

Restriction: The host system must be on the same local network as the target system.

Procedure

1. Log in to the host system, and go to <http://express.castiron.com> in a web browser.
2. Click the download icon next to the secure connector that you want to install:  A dialog box is displayed containing links to download the installation and configuration files for both Windows and Linux platforms, and an option to download just the configuration file itself.
3. Download the relevant files on to the host system and run the installation program. You are prompted during the installation for the configuration file.

Parent topic: [Managing secure connectors](#)

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations_InstallingASecureConnector.html

Starting and stopping the secure connector

When you install a secure connect, menu items to start and stop the secure connector are added to your operating system in a group called Cast Iron[®] Secure Connector 1.6.2.0.0.

You can find the menu items to start and stop the secure connector in your Start menu (Windows), or Applications menu (Linux).

Important: If you are running the secure connector on a Windows 7 system, run the secure connector as the administrator. Right-click the Start Secure Connector option and choose Run as Administrator.

When started, the secure connector communicates with your Cast Iron Express[®] account, and signals that it is running.

Tip: During the installation on a Windows system, the secure connector can be installed as a Windows service. Installing the secure connector as a Windows service means that you do not need to use the Start menu to start the secure connector.

Procedure

When the secure connector is started, on the Cast Iron Express Integrations page click the Refresh icon  in the Secure Connectors section. The status changes to Running.

The refresh updates the secure connector list with the latest status.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations_creatingintegrations1.html

Using the Integration editor

You can use the Integration editor to customize all information about an integration.

You can provide a custom name for the integration by entering it in the text field in the upper section of the editor. You can click Save to save the integration changes. To close the integration editor without saving, click Close. An integration can be saved at any time, but the integration cannot be run until it is complete.

The Integration editor contains three large panels:

- Source
- Transformation
- Target

For more information about the configuring of Source and Target sections, see the following topics:

- [Configuring the connection](#)
- [Selecting an operation](#)
- [Selecting an object](#)
- [Selecting the fields](#)
- [Setting up your integration](#)

Procedure

1. Select the Source section. The Source editor opens.
 - Configure the Connection
 - Select an Operation
 - Select an Object
 - Select the Fields

When the Source is configured, a tick is displayed to indicate that the step is complete.

2. Select the Target section The Target editor opens.
 - Configure the Connection
 - Select an Operation
 - Select an Object

- Select the Fields

When the Target is configured, a tick is displayed to indicate that the step is complete.

3. Create the Transformation
 - Define the Mappings
 - Define the Functions

When both the Source and Target endpoints are configured, the Integration editor displays a list of Source fields on the left side and a list of Target fields on the right side. Step 3 of the procedure creates the data transformation between the Source and Target by interacting with the Transformation section. For more information, see the following topics:

- [Defining the mappings](#)
- [Defining the functions](#)
- [Setting up your integration](#)

When the transformation is complete, the integration can be saved, then closed to return to the Integrations page. For more information about starting and stopping your new integration, see [Managing integrations](#).

- [Configuring the connection](#)

You must provide the connection details of the system which the integration is going to connect to. The set of connection details must be given a name, which can then later be used to identify these connection details for reuse in other integrations.
- [Connecting to a MySQL database](#)

To successfully connect to a MySQL instance, the relevant MySQL JDBC driver must be installed in to the secure connector.
- [Selecting an operation](#)

The choice of operation determines how Cast Iron Express monitors and interacts with your Source and Target endpoints. Support for individual operations can vary between implementations. For example, FTP utilizes get and put operations, while salesforce.com supports the upsert and get updated operations.
- [Database trigger tables](#)

When using a database system as a Source, Cast Iron Express requires a trigger table to be created within the database system.
- [Selecting an object](#)

When a Source or Target is successfully connected, Cast Iron Express queries the system for the available objects with which it can work.
- [Selecting the fields](#)

When an object is selected, Cast Iron Express automatically queries the Source or Target system to identify the fields within that object.
- [Using an external ID when connecting to salesforce.com](#)

When connecting to salesforce.com, you can configure Cast Iron Express to use an external ID on an Upsert objects operation. You can also use external ID fields to relate target salesforce.com objects to other salesforce.com objects.
- [Filtering source objects](#)

The Cast Iron Express filtering capability lets you control which records are passed from your source application to your integration, based on field values displayed in the Integrations page.
- [Setting up your integration](#)

After the Source and Target endpoints are configured, you are ready to define the mappings. Understanding the Cast Iron guidelines for implicit conversion between data types is key to setting up your integration. Before proceeding, familiarize yourself with the information in this section.
- [Defining the mappings](#)

When both the Source and the Target are configured, you are presented with a list of source fields on the

left, a list of target fields on the right, and two columns of anchors. You define mappings by connecting these anchor points.

- [Defining the functions](#)

Simple mappings can copy data from a source field and place it in the target field. However, sometimes more complex transformations are required. All mappings have an add function icon which is used to define functions.

- [Configuring functions](#)

You can configure functions to meet your specific requirements. To do this, you edit source fields and parameters to add or remove sources or change the order in which they appear.

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations_UsingTheIntegrationEditor.html

Configuring the connection

You must provide the connection details of the system which the integration is going to connect to. The set of connection details must be given a name, which can then later be used to identify these connection details for reuse in other integrations.

For on-premise systems such as databases and FTP servers, the connection details require a secure connector to be specified. For more information, see [Managing secure connectors](#).

When the connection details are complete, click Connect to connect to the system to validate the connection details. A message is displayed at the top of the Connection Details panel to indicate whether the connection was successful.

Parent topic: [Using the Integration editor](#)

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations_ConfiguringTheConnection.html

Connecting to a MySQL database

To successfully connect to a MySQL instance, the relevant MySQL JDBC driver must be installed in to the secure connector.

Attention: If Cast Iron® Express® detects that the secure connector does not have the driver available, an error message is displayed which contains information about how to install the driver.

Procedure

1. Download the driver from [here](#).
2. Go to the machine where your Secure Connector is running and stop the Secure Connector.
3. Copy the file to *Secure Connector install root*\lib\plugins where *Secure Connector install root* is the directory in which the Secure Connector is installed. For example, C:\Program Files\IBM\Secure Connector.
4. Start the Secure Connector.

Selecting an operation

The choice of operation determines how Cast Iron® Express® monitors and interacts with your Source and Target endpoints. Support for individual operations can vary between implementations. For example, FTP utilizes get and put operations, while salesforce.com supports the upsert and get updated operations.

Before selecting an operation, review the following information to ensure that the activity that you want to use, is supported by the specific endpoint that you are working with.

Table 1. FTP as a Source endpoint

Operation	Resulting activity
Poll directory	Monitors the chosen file for updates on a 30 second interval.

Table 2. Databases (MySQL, SQL Server, DB2®, Oracle) as a Source endpoint

Operation	Resulting activity
Get inserted rows	Retrieves newly inserted entries from the database table and triggers the integration.
Get updated rows	Retrieves newly modified entries from the database table and triggers the integration.
Get deleted rows	Passes newly deleted entries from the database table and triggers the integration.

Table 3. Databases (MySQL, SQL Server, DB2, Oracle) as a Target endpoint

Operation	Resulting activity
Insert rows	Creates database entries based upon the data flowing through the integration.
Update rows	Modifies database entries based upon the data flowing through the integration.
Delete rows	Deletes database entries based upon the data flowing through the integration.

Table 4. salesforce.com as a Source endpoint

Operation	Resulting activity
Get deleted objects	Passes newly deleted objects of the selected type from salesforce.com and triggers the integration.
Get updated objects	Passes newly modified objects of the selected type from salesforce.com and triggers the integration.

Table 5. salesforce.com as a Target endpoint

Operation	Resulting activity
Create objects	Creates object entries based upon the data flowing through the integration.
Update objects	Modifies object entries based upon the data flowing through the integration.
Upsert objects	Updates and/or inserts object entries based upon the data flowing through the integration.
Delete objects	Deletes object entries based upon the data flowing through the integration.

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations_SelectingAnOperation.html

Database trigger tables

When using a database system as a Source, Cast Iron® Express® requires a trigger table to be created within the database system.

When starting an integration which uses a table in a database for the first time, Cast Iron Express notifies the user that this trigger table needs to be created. An information dialog is displayed containing an explanation of what is required and two links. One link attempts to connect to the database, and automatically creates the trigger table on behalf of the user. To use this method means that the connection details configured in the integration include the required permissions within the database system to create the tables. If the configured user does not have the required permissions, a second link is displayed which makes available a DDL document for creating the required table.

This document link can be passed to the database administrator who can create the required table on behalf of the user.

Restriction: The Cast Iron Express buffer table uses the following field names:

- IH_PK
- IH_OPERATION_NAME
- IH_FLAG

Therefore, these field names are not supported when you create your own table because they clash with the trigger mechanism.

Parent topic: [Using the Integration editor](#)

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/DatabaseTriggerTables.html>

Selecting an object

When a Source or Target is successfully connected, Cast Iron® Express® queries the system for the available objects with which it can work.

Objects can be files on an FTP server, database schemas and tables, or salesforce.com objects. All available objects are represented as a tree structure for navigation to the intended object for the integration.

At any time, the Source or Target system might change. For example, a new custom object can be added to the connected salesforce.com account, a new table might be added to a database schema, or a new file uploaded to an FTP server.

Procedure

1. To choose an object with which to work, select the object from the available list.
2. To refresh the list of objects, click the refresh icon  in the Available Objects section.

Parent topic: [Using the Integration editor](#)

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations_SelectingAnObject.html

Selecting the fields

When an object is selected, Cast Iron® Express® automatically queries the Source or Target system to identify the fields within that object.

Fields within an object can be:

- Records in a CSV file.
- Columns in a table.
- Fields in a salesforce.com object.

The fields are displayed in a list with check boxes next to each field name.

Note: When the source endpoint is an FTP server, you have extra options on the Available Fields panel, where you can specify how Cast Iron Express interprets the selected file. These options are:

- Separator character. This identifies the character used to delimit individual fields within the file.
- Quote character. This identifies the character used to enclose field values, that may span more than one line.
- File has header row checkbox. This determines whether Cast Iron Express processes the first row of the file as a header row.
- Number of footer rows. This determines the number of rows at the bottom of the file to be ignored. For example, if the file contains totals or summaries.

Some fields are marked as optional by the Target system and some are marked as required. For example, you must provide a name to create an Account object using salesforce.com. Cast Iron Express pre-selects these required fields and disables the check-box for that field to prevent de-selection. These fields are marked with an asterisk (*) after their name.

Other fields may be optional but commonly used; Cast Iron Express pre-selects these fields to save time, but you can alter these selections.

Note: Select All and Clear All links are provided above the list of fields.

At any time, the Source or Target system may change; a new custom field may be added to the connected salesforce.com account, a new column may be added to a database table, or a new file format uploaded to an FTP server. Refresh the list of fields for a given object by clicking the refresh icon  in the Available Fields section.

Once field selections are complete, click the Done button.

The Source or Target is now completely defined and you are returned to the main integration overview. The Source or Target is marked as complete with a green tick .

Using an external ID when connecting to salesforce.com

When connecting to salesforce.com, you can configure Cast Iron[®] Express[®] to use an external ID on an Upsert objects operation. You can also use external ID fields to relate target salesforce.com objects to other salesforce.com objects.

External IDs are used to identify objects in salesforce.com, based on identifiers or key values that originate in other systems. An external ID field can be added to salesforce.com objects by your salesforce.com administrator. For more information, see your salesforce.com documentation.

When a salesforce.com object is selected, Cast Iron Express automatically queries the target system to identify the fields within that object.

- [Using an external ID with the Upsert operation](#)
In salesforce.com, when an *Upsert* operation is selected, you can choose which external ID to use in the Available Fields section.
- [Using an external ID with related objects](#)
In salesforce.com, when a *Create* or *Upsert* operation is selected, you can use external ID fields to relate target objects to other objects. For example, a Contact object can relate to an Account object, based on the value of an external ID field defined in the Account object.

Filtering source objects

The Cast Iron® Express® filtering capability lets you control which records are passed from your source application to your integration, based on field values displayed in the Integrations page.

For this task, you use the Integrations page to specify search criteria for what is retrieved from your source application. Each field in the Source area of the Integrations page has a filter icon displayed immediately next to it: 

When you click a filter icon, a pop-up window is displayed, enabling you to set parameters that control the data processed by your integration. You can specify single or multiple filters on a source field. For example, instead of retrieving all current sales orders, you may want to retrieve only orders with values that exceed a specific amount and originate in another country.

Procedure

1. To filter a source object, click an object in the Source area of the Integrations page. A list of fields related to the source object is displayed.
2. In the list of source fields, find the field that you want to filter and click the filter icon next to it. The Filters pop-up window is displayed. The field that you selected in the Integrations window is displayed in the Filters window.
3. In the **Add new filter** section of the Filters window, click the drop-down menu and select a filtering option.
Available options are:
 - is equal to
 - is not equal to
 - is less than
 - is greater than
 - is in the range
4. In the text field, enter your filter parameters.
5. Click **Add**. The new filter is displayed in the shaded area of the Filters window.

6. To add additional filters to a source field, repeat the preceding steps.
7. To control how multiple filters are applied to a source field, use the Match which filters button. If you wish to have *any* of your filter parameters used on the source, click Any. If you want *all* of your filters to apply to the source field, click the Any button to toggle it to All.
8. When you are finished, click Close.

The filter icon on the Integrations page next to the source field is shaded green to indicate that a filter is defined.

Parent topic: [Using the Integration editor](#)

Modifying filters

You also use the Integrations page to modify an existing filter setting or to delete a filter.

Procedure

1. Click the green filter icon that is next to the source field in the Integrations page. The Filters window is displayed.
 - a. To modify a specific filter, go to the filter definition and click Edit. The filter parameters are displayed. Use the drop-down menu and the text field to modify your filter settings. When you are finished, click Save.
 - b. To delete a filter, go to the filter that you want to delete and click the delete icon next to it.
2. Click Close to return to the Integrations page.

The modified filter is displayed in the shaded area of the Filters window. If you deleted a filter, it is removed from the Filters window and the filter icon next to the source field is no longer green in color.

Feedback | Notices

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations_filtering.html

Setting up your integration

After the Source and Target endpoints are configured, you are ready to define the mappings. Understanding the Cast Iron® guidelines for implicit conversion between data types is key to setting up your integration. Before proceeding, familiarize yourself with the information in this section.

When you use the Integration editor to define your mappings, you are presented with a list of source and target fields with two columns of anchor points. You define mappings by connecting these anchor points. For more information about mappings, details on valid data types, and how to convert data types, see [Defining the mappings](#).

The following table shows the specific guidelines for implicit casting between data types. The Source column specifies the source data used in the mapping conversion. The Target column shows the derived target. The Comment column provides any necessary additional information about the selected operation.

Table 1. Cast Iron Express® guidelines for casting between data types.

Source	Target Comment
Any	All data types are converted to string.
Boolean	"T," "t," "true," "TRUE," "RuE," "1" and similar are cast to "TRUE." Anything else is cast as "FALSE."
String	Converts a string that contains a numeric representation such as "10" or "3.14" into a decimal number type. Note: Strings which do not contain numbers result in a failure when the source data is processed.
String	Converts a string that contains an integer numeric representation such as "10" into an integer number type. Strings which do not contain integer numbers result in a failure when the source data is processed. Users can avoid this situation by using Round, Ceiling, or Floor functions to convert from decimal number strings to integer types.
Number	Converts a decimal number such as 10 or 3.14 into an integer. For non-integer numbers the value is automatically converted in the same way as if the user applied the Round function. Users can enforce more specific control of the conversion by using a Round, Ceiling, or Floor function.

Parent topic: [Using the Integration editor](#)

[Feedback](#) | [Notices](#)

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

Defining the mappings

When both the Source and the Target are configured, you are presented with a list of source fields on the left, a list of target fields on the right, and two columns of anchors. You define mappings by connecting these anchor points.

Each field has an anchor point displayed immediately next to it: ●

You use anchor points to map source fields to target fields by drawing a wire to connect them.

Mappings are displayed in one of three colors:

Green

Indicates that the source and target data types match and that the mapping is valid.

Amber

Indicates that there is a mismatch in data type, but it is possible to automatically convert from one data type to the other. For example, a numeric data type can be automatically converted to a string. In this situation, a warning icon ⚠ is displayed in the Result column on the right. Click this icon to see detailed information about the warning.

Red

Indicates that the source field cannot be mapped to the target field because of data type incompatibility.

You cannot save any integrations with red mappings. In this situation, an error icon ❌ is displayed in the Result column on the right. Click this icon to see detailed information about the error.

Procedure

To draw a wire, either click the chosen source anchor followed by the intended target anchor or drag the source anchor and drop it on the target anchor.

A wire is drawn connecting the two fields. This signifies that when the integration is running and receives data from the source system, the value of the source field is copied unchanged into the target field. Cast Iron® Express® provides sample data from the Source system on the left side and uses this sample data to populate the results of the mapping in the Target Result column on the right side.

Parent topic: [Using the Integration editor](#)

[Feedback](#) | [Notices](#)

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

Defining the functions

Simple mappings can copy data from a source field and place it in the target field. However, sometimes more complex transformations are required. All mappings have an add function icon which is used to define functions.

By default, when you register for a Cast Iron® Express® account, this function is disabled. To use this additional function, click Add-ons and select the *Mapping Functions* package. For more information, see [Adding function to your Express account](#).

The Add function icon  can be clicked to open a list of available functions. The functions are group in to the following categories:

- String
- Mathematical
- Boolean
- Date
- Utility

For more information about these functions, see the [Glossary](#).

Procedure

Click the required function. A function box is inserted into the mapping.

Example

This example shows a simple String Length function.

Also, the Result column on the right is updated to reflect the result of the function instead of a simple copy.

Some functions are more configurable and can accept multiple input fields. For example, the following screen capture shows a Concatenate function.

Additional source fields can be connected to the anchor point on the left side of the function, as shown in the following screen capture.

The Concatenate function also has configuration options which can be displayed by clicking the Edit icon . You can change the order of the inputs and specify configuration options for the Concatenate function such as prefix, defaultDelimiter, and postfix.

Click Apply to save your changes. The Target Results column on the right is updated.

Restriction: If the result is too long to display on the screen, it is truncated. Click the truncated result to see the full result in a tooltip.

Parent topic: [Using the Integration editor](#)

Feedback | Notices

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations_DefiningTheFunctions.html

Configuring functions

You can configure functions to meet your specific requirements. To do this, you edit source fields and parameters to add or remove sources or change the order in which they appear.

By default, when you register for a Cast Iron® Express® account, this function is disabled. To use this additional function, click Add-ons and select the *Mapping Functions* package. For more information, see [Adding function to your Express account](#).

Complete the following steps to specify configuration options for concatenate and other functions.

Procedure

1. On the Integrations page, click the integration that you want to edit. The integration is displayed in the integration editor with the fields that you previously selected shown in the Transformation view.
2. In the Transformation view, map a field by clicking the anchor point on a source object field and then clicking a field on the target object. The Add function icon  is displayed.
3. Click the Add function icon  to view a list of available functions. The Configure Function pop-up window is displayed showing a list of available functions.
4. In the Configure Function window, click the function that you want to apply to the mapping. If the function permits or requires additional information to be configured, the Edit icon  is displayed.
5. Click on the Edit icon. The Edit Source Fields window is displayed showing the source fields and parameters.
6. To edit a source field, click on a row in the Edit Source Fields window that contains the source field you want to edit. The field is highlighted.
 - a. To delete a source field, click the Delete icon. 
 - b. To move a source field up or down, click the appropriate Up or Down arrow.
7. When you are finished, click **Apply**.
8. On the Integrations page, click **Save** to save the changes to the integration.

Your edits are saved.

If you are using function composites, see [Composite functions](#).

Parent topic: [Using the Integration editor](#)

Composite functions

A composite function is a combination of two separate functions, where the output of one function is chained as input to a subsequent function. The following topics provide information on creating, editing, or deleting composite functions.

By default, when you register for a Cast Iron[®] Express[®] account, this function is disabled. To use this additional function, click Add-ons and select the *Mapping Functions* package. For more information, see [Adding function to your Express account](#).

- [Working with composite functions](#)
You can add a function to an existing composite, change the order of a composite, and delete a function.

Parent topic: [Integrating with Cast Iron Express](#)

[Feedback](#) | [Notices](#)

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations_compositefunctions.html

Working with composite functions

You can add a function to an existing composite, change the order of a composite, and delete a function.

By default, when you register for a Cast Iron[®] Express[®] account, this function is disabled. To use this additional function, click Add-ons and select the *Mapping Functions* package. For more information, see [Adding function to your Express account](#).

Complete the following steps to add a function to an existing composite function.

Procedure

1. On the **Integrations** page, click the integration that you want to edit. The integration is displayed in the Integration editor with the fields that you previously selected shown in the Transformations view.
2. In the Transformations view, click the anchor point of a field from the source object and then click the anchor point of a field on the target object. The Add Function  icon is displayed.
3. Click the Add Function icon to view a list of available functions. The Configure Function pop-up window is displayed showing a list of available functions.
4. In the Configure Function window, click the function that you want to apply to the mapping. If the function permits editing or requires additional information to be configured, the Edit icon  is displayed adjacent to it.
5. Click the Edit icon. A pop-up window is displayed containing Edit Composites, Edit Source Fields and Edit Parameters window sections.

Note:

 - o The Edit Composites window section displays the available composite functions.
 - o The Edit Source Fields window section defines the source (input) to the first composite function.
 - o The Edit Parameters window section displays the configured parameters for the composite that you selected in the Edit Composites section.
6. In the Edit Composites window section click **Concatenate**. A drop-down menu is displayed showing a list of available concatenate function parameters.
7. Select a parameter from the drop-down menu. The window is updated with your selection.
8. Click **Apply**. The composite function is updated.
9. On the Integrations page, click **Save** to save the integration.

The composite function is updated with the new function.

Note: Because a **subsequent** function receives a single input, functions that require two or more inputs cannot be chosen as a **subsequent** composite function. Additionally, attempting to create a composite function within a composite is not allowed and is not displayed as an option.

Parent topic: [Composite functions](#)

Editing composite functions

You can also edit composites to move, delete, or change the order of functions.

Complete the following steps to delete or move a composite function.

Procedure

1. On the **Integrations** page, click the integration that you want to edit. The integration is displayed in the Integration editor with the fields that you previously selected shown in the Transformations view.
2. In the Transformations view, click the anchor point of a field from the source object and then click the anchor point of a field on the target object. The Add Function  icon is displayed.
3. Click the Add Function icon. The Configure Function window is displayed showing a list of available functions.
4. In the Configure Function window, click the function that you want to apply to the mapping. If the function permits editing or requires additional information to be configured, the Edit icon  is displayed adjacent to it.
5. Click the Edit icon. A pop-up window is displayed containing Edit Composites, Edit Source Fields and Edit Parameters window sections.
6. In the Edit Source Fields, select the function you want to delete or move. Use the  icon or the Up and Down arrows, to delete the function or move it up and down. The source (input) to the function is modified or moved to its new position.
7. When you are finished, click **Apply**.
8. On the Integrations page, click **Save** to save the integration.

List of functions

Cast Iron® Express® offers a selection of functions for use within mappings. These functions can be used to manipulate the field values being mapped, such as altering the content of strings, performing numeric operations on numbers, and manipulating date and time values.

By default, when you register for a Cast Iron Express account, this function is disabled. To use this additional function, click Add-ons and select the *Mapping Functions* package. For more information, see [Adding function to your Express account](#).

Table 1. String functions. This table lists and describes string functions

Mapping function	Description
Concatenate	Accepts two or more arguments and casts them to string. Returns the string that is the concatenation of the values of its arguments after conversion. The user can also configure prefix and/or postfix strings, plus a delimiter that is inserted between each of the arguments.
Length	Returns an integer equal to the length in characters of the value of the argument. If the value of the argument is the empty sequence, the integer 0 is returned.
Lowercase	Returns the value of the argument after translating every character to its lowercase correspondent as defined in the appropriate case mappings section in the Unicode standard.
Uppercase	Returns the value of the argument after translating every character to its uppercase correspondent as defined in the appropriate case mappings section in the Unicode standard.

M a p p i n g f u n c t i o n	Description
Re pl a c e	Returns the string that is obtained by replacing each non-overlapping substring of the input that matches the supplied pattern with an occurrence of the replacement string.
St a r t s w i t h	Returns a boolean result indicating whether the value of the first argument starts with the value of the second argument.
Str i n g	Returns the value of the argument represented as a string. This value can be used to cast numeric data types into strings to prevent mappings from displaying a warning.
Su b s t r i n g	Returns the portion of the value of the first argument beginning at the position indicated by the value of the second argument and continuing for the number of characters indicated by the value of the third argument. For substring, there is only one field as "input" to the function. However, for the function, the start index and length values are configured in the function dialog window. In the existing text (and all other descriptions) <i>argument</i> is used in both cases.
Tri m	Returns the value of the argument with white space normalized by stripping leading and trailing white space and replacing sequences of one or more than one white space character with a single space.

Table 2. Mathematical functions. This table lists and describes mathematical functions

Mappi ng functi on	Description
Absol ute value	Returns the numeric value (or modulus) of a number without regard to its sign.
Mean	Returns the average of the values in the input sequence, that is, the sum of the values divided by the number of values.
Ceilin g	Returns the smallest integer not less than X.
Divide	Returns a result value when the first argument is divided by the second.
Floor	Returns the largest integer not greater than X.

Mapping function	Description
Format	<p>The format-number function converts its first argument to a string by using the format pattern string specified by the second argument and the decimal-format named by the third argument, or the default decimal-format, if there is no third argument.</p> <p>The formatting options for the second parameter are as follows:</p> <ul style="list-style-type: none"> • 0 - Digit • # - Digit (zero shows as absent) • . - The position of the decimal point. For example: ###.## • , - The group separator for thousands. For example: ###,###.## • % - Displays the number as a percentage. For example: ##% • ; - Pattern separator. The first pattern is used for positive numbers and the second for negative numbers <p>The decimal format of the third parameter assists with localization of the number, and the following options can be used:</p> <ul style="list-style-type: none"> • 0 - Digit • # - Digit (zero shows as absent) • . - Decimal separator or monetary decimal separator • - - Minus sign • , - Grouping separator • E - Separates mantissa and exponent in scientific notation. Need not be quoted in prefix or suffix • ; - Separates positive and negative subpatterns • % - Multiply by 100 and show as percentage • \u2030 - Multiply by 1000 and show as per mille value • Å (\u00A4) - Currency sign, replaced by currency symbol. If doubled, replaced by international currency symbol. If present in a pattern, the monetary decimal separator is used instead of the decimal separator • ' - Used to quote special characters in a prefix or suffix. For example, '#'# formats 123 to #123. To create a single quote itself, use two in a row: # o' 'clock
Maximum	Returns the largest value of the nodes passed as the argument.
Minimum	Returns the smallest value of the nodes passed as the argument.
Modulo	Returns the modulus, or remainder value after the first argument is divided by the second.
Multiply	Returns the value of all arguments multiplied together.
Number	Converts the argument to a decimal.
Round	Returns the number with no fractional part that is closest to the argument. If there are two such numbers, then the one that is closest to positive infinity is returned.

Mapping function	Description
Subtract	Returns a value whereby the second argument is subtracted from the first
Sum	Returns a value obtained by adding the values in the argument.

Table 3. Boolean functions. This table lists and describes boolean functions

Mapping function	Description
Boolean	Computes the effective boolean value of the argument.
Not	Returns true if the effective boolean value is false, and false if the effective boolean value is true.

Table 4. Date functions. This table lists and describes date functions

Mapping function	Description
Date Time (Date)	The first argument must be in date format, the second argument is a time format. The result is a DateTime format that has both the date, and time, from the arguments
Date to String (Date)	<p>The second argument is a string that shows how to format the date/time. The following key characters are replaced by parts of the date/time:</p> <ul style="list-style-type: none"> • <code>yy</code> - Last two digits of year. For example, 86 from 1986 • <code>MM</code> - Two-digit month • <code>dd</code> - Two-digit date • <code>HH</code> - Two-digit hour • <code>mm</code> - Two-digit minutes • <code>ss</code> - Two-digit seconds <p>For example, if the Format Date String function was called with the following input parameters:</p> <p>dateTime: 2012-02-22T16:18:00.852-08:00</p> <p>format string: MM/dd/yyyy</p> <p>locale string: en_US</p> <p>The following string would be returned: 02/22/2012.</p> <p>For more information about the Date to String function, see the Format Date String topic in the Studio help section.</p>
Adjust to Timezone (Date)	<p>Converts the TimeDate to hold a particular time zone, or to none. Time zone applied is the second argument, for example:</p> <ul style="list-style-type: none"> • <code>-10H</code> - A timezone of minus ten hours • <code>+5H30M</code> - A timezone of plus 5 hours and 30 minutes • <code>0H</code> - A timezone at 0 hours

Table 5. Utility functions. This table lists and describes utility functions

Mapping function	Description
Composite	Chains together a series of functions.

Managing integrations

Cast Iron® Express® displays a list of all of the integrations defined in an account on the Integrations page.

The list contains the name of each integration, the date and time that the integration was last updated, and the sign-in name that made the last change.

The current status of the integration is also displayed:

- Running. The integration runs continuously until stopped.
- Stopped. By default, when an integration is defined the status is stopped. You must click Stopped to run the integration. When the integration status shows as stopped, no updates are made to the target system.

You can remove an integration by clicking the delete icon. You must confirm the deletion before any action is taken.

- [Modifying integrations](#)
You can modify an integration at any time by clicking its name in the list on the Integrations page.
- [Deleting integrations](#)
You can delete an integration at any time from the Integrations page.

Parent topic: [Integrating with Cast Iron Express](#)

[Feedback](#) | [Notices](#)

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations_ManagingIntegrations.html

Modifying integrations

You can modify an integration at any time by clicking its name in the list on the Integrations page.

The Integration Editor displays the integration as it was last saved. You can change the configuration for the integration, except the Source and Target system types.

Users can change

- The name of the integration Connection details for the Source or Target system.
- The operations used in connecting with the Source and Target systems.
- The object with which the integration interacts.
- The list of fields the integration uses.
- The transformation between the Source and Target systems.

When you are finished, click Save. If the integration is in Running state, it is stopped first, then updated, and started again

Parent topic: [Managing integrations](#)

[Feedback](#) | [Notices](#)

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations_ModifyingIntegrations.html

Deleting integrations

You can delete an integration at any time from the Integrations page.

Procedure

1. Click the delete icon 
2. Click OK. If the integration was in Running state, it is stopped first and then deleted.

Parent topic: [Managing integrations](#)

[Feedback](#) | [Notices](#)

 Last updated: Thursday, December 17, 2015

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/integrations_DeletingIntegrations.html

Monitoring integration activity

You can use the Cast Iron® Express® Activities page to see details of all of the activity within your account.

The Activities page shows a number of different types of events:

- Integration creation, modification, and deletion.
- The jobs that were run by the integration. A job is a single instance of data that arrives from the Source system that is transformed and then pushed to the Target system.
- Alerts detailing potential problems with the account. For example, if a secure connector is not available for a running integration, an alert is displayed indicating it must be started before any jobs can run.

The Activity feed can be filtered by clicking the three buttons at the top of the page. The options are:

- All Activity, which shows all the different types of activity message in one list.
- Integration Activity, which shows only activity messages that relate to jobs that are running in the system.
- Alerts, which shows only warnings and errors that might require user intervention.

The Activities page displays the most recent messages first.

This list is automatically updated every time the Activities page is opened and automatically, in the background every 60 seconds, to ensure that the latest information is available.

Utilization Charts

Utilization charts allow you to quickly identify the most active integrations and endpoints for a specific tenant. A summary of job successes and failures and a breakdown of integration activity is presented in a monthly and yearly chart.

From the Integrations page, open the charts display by clicking the charts icon:

To close the utilization charts display, click the charts icon again.

You can use the left and right arrows to scroll through various utilization charts:

- Top most active integrations over the last thirty days
- Top most active endpoints over the last thirty days
- Total activity over the last twelve months

Information displayed in the utilization charts is refreshed every 60 seconds.

An example of a *Total activity over the last twelve months* chart is shown in the following screen capture:

Top most active integrations over the last thirty days

This chart provides data on the integrations that processed the most jobs during the last 30 days. The top ten integrations display in the chart in order of activity: the most active integration is at the top of the chart descending the least active integration at the bottom of the chart. For each of the top ten integrations, the chart further breaks down the total number of successful jobs (represented by a green bar) and failed jobs (represented by a red bar). Click the green or red bar to see more detailed job information.

Top most active endpoints over the last thirty days

This chart provides data on the endpoints that processed the most jobs during the last 30 days. The chart displays the most active endpoint at the top. For each endpoint, the chart further breaks down the total number of successful jobs (represented by a green bar) and failed jobs (represented by a red bar). Click the green or red bar to see more detailed job information.

Total activity over the last twelve months

This chart provides a view of all integration activity that occurred during the last 12 months for a specific tenant. All integration activity that occurred over the last 12 months is displayed in monthly intervals. Click a specific bar to obtain more details about the breakdown of successful and failed invocations for that month.

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.omniapps.doc/tutorials.html>

Tutorial: Creating a local file to salesforce.com integration

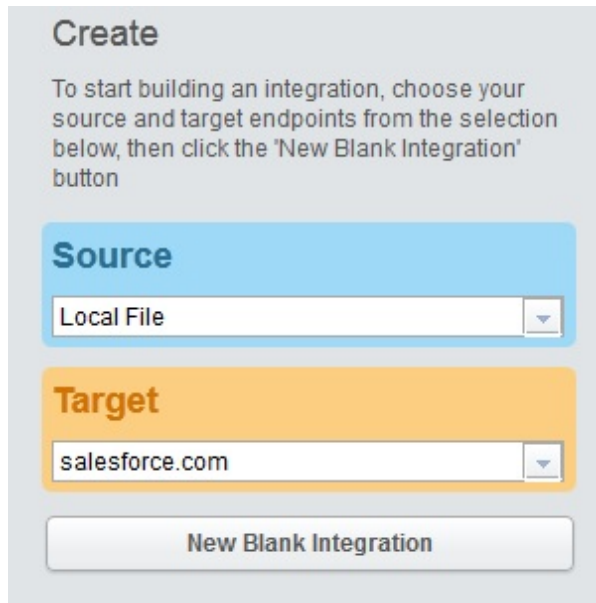

You can create and run integrations with IBM® Cast Iron® Express®. This tutorial describes how to create an integration from a local file to salesforce.com. You can quickly define the integration and upload your data in a one-off operation.

Step 1: Create the Integration

After signing in to Cast Iron Express, click Integrations. With the Integrations view open, create an integration by selecting your source and target endpoints.

Tip: You might want to click Save at regular intervals when creating and defining an integration. Your work is not lost if you then experience web browser problems or you are signed out of Cast Iron Express because of inactivity.

For this tutorial, select Local File as the Source and salesforce.com as the Target.

Create

To start building an integration, choose your source and target endpoints from the selection below, then click the 'New Blank Integration' button

Source

Local File

Target

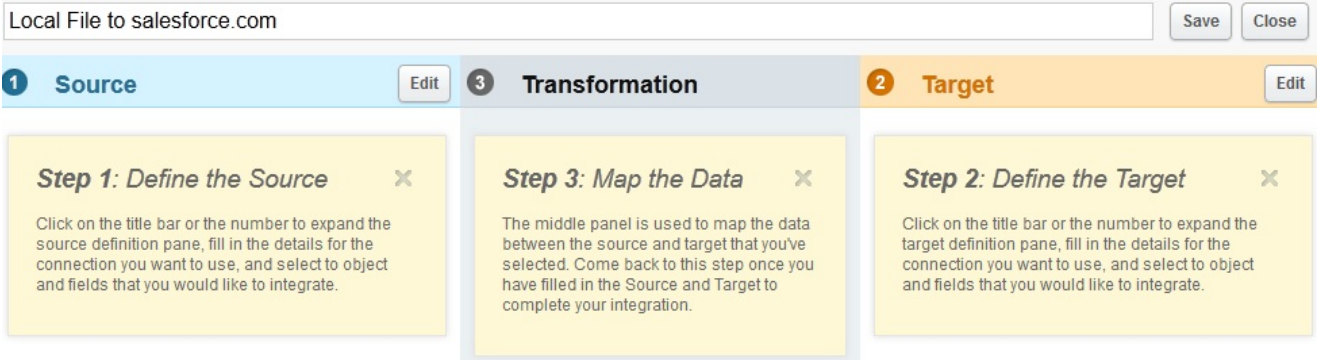

salesforce.com

New Blank Integration

Click New Blank Integration, which is displayed under the Target selection.

An outline integration is displayed in which the Source, Transformation, and Target, must be defined. The numerals indicate the integration definition sequence:

1. Define the source endpoint
2. Define the target endpoint
3. Define the transformation by mapping the data path from the source endpoint to the target endpoint

Step 2: Configure the endpoints

In the Source header, click Edit.

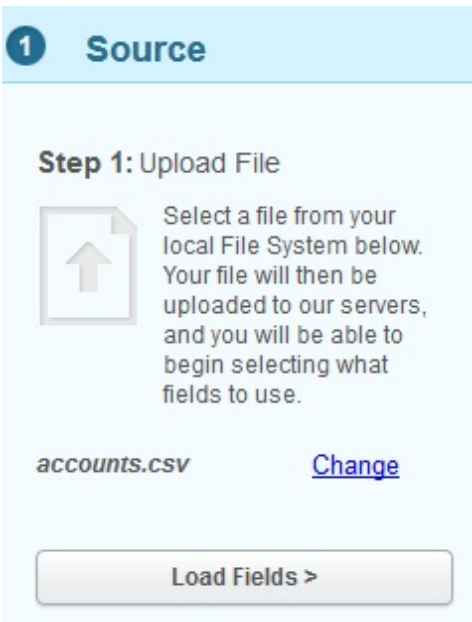

The source endpoint configuration view opens.

Click Select File and choose the local file that you want to upload the data from. The file must be a delimited file.

For this tutorial, we are using a file named *accounts.csv*.

The file contains some account information and includes a field called "id" that uniquely identifies each of the account records in the file. The contents of the *accounts.csv* file used is included here:

```
id,name,streetAddress,city,postcode,phoneNumber
0,AcmeCo,10 Downing Street,London,SW1A 2AA,02012345678
1,MyOtherCompany,221b Baker Street,London,SW2B 3FG,020654321
```

If you want to select a different file, click Change.

Click Load Fields and verify the details that are automatically generated about your selected file. For example, the delimiter character used in the file.

For this tutorial, the *accounts.csv* file uses a comma as the delimiter character. Also, the remaining fields can be left with their default values.

Local File to salesforce.com Save

1 Source Done

Step 1: Upload File

Select a file from your local File System below. Your file will then be uploaded to our servers, and you will be able to begin selecting what fields to use.

Field	Type	Sample Data
...	Record	...
<input checked="" type="checkbox"/> id	string	0
<input checked="" type="checkbox"/> name	string	AcmeCo
<input checked="" type="checkbox"/> streetAddress	string	10 Downing Street
<input checked="" type="checkbox"/> city	string	London
<input checked="" type="checkbox"/> postcode	string	SW1A2AA
<input checked="" type="checkbox"/> phoneNumber	string	02012345678

Select the fields that you want to upload the data from. By default, all of the fields are selected.

For this tutorial, we are using all of the selected fields.

When you are finished, click Done.

The source endpoint is defined for this integration.

You return to the integration overview and the selected Source fields are displayed.

Local File to salesforce.com Save Close

Source Edit

Field	Type	Sample	
File		...	
Record		...	
id	xy	0	⇄
name	xy	AcmeCo	⇄
streetAddress	xy	10	⇄
city	xy	London	⇄
postcode	xy	SW1A 2AA	⇄
phoneNumber	xy	0201234	⇄

3 Transformation

Step 3: Map the Data ✕

The middle panel is used to map the data between the source and target that you've selected. Come back to this step once you have filled in the Source and Target to complete your integration.

2 Target Edit

Step 2: Define the Target ✕

Click on the title bar or the number to expand the target definition pane, fill in the details for the connection you want to use, and select to object and fields that you would like to integrate.

You can now define the target endpoint.

In the Target header, click Edit. Enter the credentials required to sign in to salesforce.com.

These credentials are validated, and if correct, you are signed in to the salesforce.com account. The available business objects that you can use in your integration are listed.

For this tutorial, from the list of objects, select Account. The description of the Account object is presented in the Available Fields section which shows all fields in the Account object.

Note: You can select the fields that you are interested in and want to load with the data from your local file. You do not have to integrate the whole object, only the fields that are required for your integration definition.

Use the Operations option to specify the context of the data operation that you want for your integration.

For this tutorial, select Update objects as the operation. When the integration is running, it automatically updates the selected Accounts fields in salesforce.com.

Select the required Account fields as shown in the following screen capture:

2 Target

Existing Connections:

Operations: Update objects

Connection information

Name *

Available Fields Select All | Clear All

Field	Type
<input checked="" type="checkbox"/> Id *	tns:ID
<input type="checkbox"/> IsDeleted	xsd:boolean
<input type="checkbox"/> MasterRecordId	SalesForce.c... <i>i</i>
<input checked="" type="checkbox"/> Name	xsd:string
<input type="checkbox"/> Type	xsd:string
<input type="checkbox"/> ParentId	SalesForce.c... <i>i</i>
<input checked="" type="checkbox"/> BillingStreet	xsd:string
<input checked="" type="checkbox"/> BillingCity	xsd:string
<input type="checkbox"/> BillingState	xsd:string
<input checked="" type="checkbox"/> BillingPostalCode	xsd:string
<input type="checkbox"/> BillingCountry	xsd:string
<input type="checkbox"/> ShippingStreet	xsd:string
<input type="checkbox"/> ShippingCity	xsd:string
<input type="checkbox"/> ShippingState	xsd:string
<input type="checkbox"/> ShippingPostalCode	xsd:string
<input type="checkbox"/> ShippingCountry	xsd:string
<input checked="" type="checkbox"/> Phone	xsd:string

When complete, click Done.

The target endpoint is defined for this integration.

You return to the integration overview. The integration is updated with the Target selected fields in salesforce.com.

Local File to salesforce.com

Source				Transformation		Target		
Field	Type	Sample			Field	Type	Result	
File		...			Account			
Record		...			Account			
id	xy	0	⇄	●	Id *	xy	[⚙]	
name	xy	AcmeCo	⇄	●	Name	xy	[⚙]	
streetAddress	xy	10	⇄	●	BillingStreet	xy	[⚙]	
city	xy	London	⇄	●	BillingCity	xy	[⚙]	
postcode	xy	SW1A2AA	⇄	●	BillingPostalCode	xy	[⚙]	
phoneNumber	xy	02012345	⇄	●	Phone	xy	[⚙]	

In the integration overview, you can now see both the source and the target fields that are ready to be mapped.

Step 3: Define the transformation

To complete the integration you must map the fields from the source to the target.

Connect the source and target fields as required. For each source field, click the anchor point and then click the corresponding target field anchor point.

In this tutorial, you map the data from the source fields to the target fields as shown in the following screen capture. You are not required to define functions on the data.

Local File to salesforce.com Save Close

Source			3 Transformation	Target		
Field	Type	Sample		Field	Type	Result
File		...		Account		
Record		...		Account		
id	xy	0	● — (+) — ○	Id *	xy	0 [⚙]
name	xy	AcmeCo	● — (+) — ○	Name	xy	Acm... [⚙]
streetAddress	xy	10	● — (+) — ○	BillingStreet	xy	10 ... [⚙]
city	xy	London	● — (+) — ○	BillingCity	xy	Lon... [⚙]
postcode	xy	SW1A 2AA	● — (+) — ○	BillingPostalCode	xy	SW... [⚙]
phoneNumber	xy	02012345	● — (+) — ○	Phone	xy	020... [⚙]

Defining functions and more complex transforms is covered in the tutorial on transformations.

Enter a name that is meaningful and representative of the integration. For example, Local File Accounts to salesforce.com Account.

Local File Accounts to salesforce.com Account Save Close

Save the completed integration by clicking Save. Then, click Close to return to the Integrations view.

The Integrations view lists all of the defined integrations and their current state.

Integrations

Name	Updated	Status	Actions
Local File Accounts to salesforce.com Account <small>LOCAL FILE SALESFORCE.COM</small>	Sep 11, 2012 12:41:37 PM by admin@CompanyName	Stopped	Run Change

Step 4: Run the integration

Now that integration is defined, you must run the integration to copy the data from the source endpoint to the target endpoint.

Click Run, displayed to the right of the integration that you created.

The integration runs and the data is uploaded from your defined source local file to the defined target salesforce.com object in a one-off operation.

The integration status changes to running:

Integrations

Name	Updated	Status	Actions
Local File Accounts to salesforce.com Account LOCAL FILE SALESFORCE.COM	Sep 11, 2012 12:41:37 PM by admin@CompanyName	Running...	Run accounts.csv Change

You can click Activities > Integration Activity to view the recent Cast Iron Express integration activities. The activities are displayed with the most recent at the top of the list.

For this tutorial, the following screen capture shows the completed integration details.

12 All Activity	4 Integration Activity	0 Alerts
Integration Local File Accounts to salesforce.com Account completed Job 8211C9A1B1A89AC337CB654A34E64B42 at 2012-09-08 13:40:19.728 08 September 2012 14:40:21		

To verify the successful integration, go to the target system and check that the data arrived.

When the integration completes, a successful integration acknowledgment message is also displayed momentarily in the lower part of the view.

✓ Integration Local File Accounts to salesforce.com Account completed Job 8211C9A1B1A89AC337CB654A34E64B42 at 2012-09-08 13:40:19.728	×

Glossary

This glossary includes terms and definitions for Cast Iron® Express®.

- [Bundles](#)
Bundles are a collection of endpoints.
- [Connection](#)
A set of properties that together can be used to establish a connection to a source or target (db user name, password, server, port etc).
- [Endpoint](#)
Represents the properties of an external system, such as a database server, FTP server, email system, or enterprise application. This can be either the source of data to the Integration Appliance, or the target of processing by the Integration Appliance.

- [Fields](#)
Properties of the object / table / file (depending on the context).
- [Functions](#)
Simple XSLT-style functions for manipulating data. For example, move, concat, not, or max.
- [Integration](#)
The specific sequence of processing activities (such as data mapping, transformation, and control logic activities), endpoints, and data types, defined and configured using Cast Iron Express.
- [Operations](#)
Actions that have been used during transformation. On the source side, these are in the past tense, for example created, updated, deleted, or upserted. On the target side, these are in the active voice, for example create, update, delete, or upsert.
- [Source](#)
The originating endpoint, located on the left side of an integration.
- [Target](#)
The target endpoint, located on the right side of an integration.
- [Transformation](#)
The definition of the process for transforming the in-flight data, from the source format, to the target format. This may or may not include lookups, filtering, and functions.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.live.doc/About_the_Cloud/toc_about_the_cloud.html

About Environment Dashboards

An environment dashboard provides multiple snapshot views of project configurations and jobs, a list of unresolved critical system errors, and an overall project configurations summary, and status of Secure Connectors. The Dashboard also allows you to search for orchestration jobs by job key. The Search box is located in the Results section of the dashboard.

To expand the views of the Critical Alerts and Secure Connector Summary, click the icon in the upper right corner. An expanded view of Project Configuration is available by selecting Repository > Configurations from the navigation pane. An expanded view of Results is available by selecting Repository > Job Log from the navigation pane.

A dashboard is available for each environment in a multi-environment cloud. The information the dashboard displays is specific to its environment.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.live.doc/About_the_Cloud/aboutDashboard.html

About the Cloud

The IBM® WebSphere® Cast Iron® Cloud (Cloud) administrator provisions a tenant for your organization and can create multiple environments for you to deploy your projects in. The Cloud administrator also provides a username and password for the tenant administrator.

After the tenant, and any environments are created, it is the tenant administrator that creates users and groups, and manages environments in the tenant.

Cloud Tenants

The IBM WebSphere Cast Iron Cloud (Cloud) supports multiple organizations (tenants). Each cloud tenant is managed by a tenant administrator. The tenant administrator creates and manages users and groups, for a specific cloud tenant.

Contact Cast Iron Systems for a tenant administrator login. After the Cast Iron administrator creates a tenant, the administrator sends you the tenant administrator login and cloud URL.

Cloud Environments

The Cloud supports multiple environments for each tenant. The environments allow you to stage project development or isolate project development.

For example, you can have a Development, Staging, and Production environment. These environments display as tabs in the Cloud Web Application. While the Cloud administrator, not the tenant administrator, creates these environments for each tenant, it is the tenant administrator that grants permissions to individual users/groups for each environment.

Note: Some connectors require you to install 3rd party libraries before you can deploy a project to an environment. In a multi-environment tenant, verify that the environment to which you deploy a project has all required libraries installed.

Note: To use Studio Verify in a multi-environment tenant, you must specify the environment from which Studio will retrieve connector libraries.

For example, SAP libraries are installed in the Development environment and Production environment. You specify the Development environment in your user profile. When you execute Studio Verify for your SAP project, Studio uses the libraries in the Development environment. You can then chose to deploy your project to the Development environment or Production environment.

To specify the environment from which Studio Verify retrieves connector libraries:

1. Click your username, located in the upper right corner of the console. The User Profile dialog is displayed.
2. Click Change Libraries Environment.
3. Select a libraries environment from the list.
4. Click Save.

Studio Cloud

In addition to the desktop version of Studio, you can launch and work with the Studio directly in the Cloud. This cloud version of Studio (Studio Cloud) allows you to create and deploy projects from the cloud.

Functionally, Studio Cloud is similar to Studio Desktop with a few differences listed here:

- The Recently Opened Project option is not available in Studio Cloud.
- The Save Remotely toolbar is not available in Studio Cloud, but is available in Studio Desktop when you are logged in to the Cloud.
- For Studio Cloud, when you select Save As Project [Cloud] or Rename Project [Cloud], the wizard does not display the location on the local file system where the wizard saves a project.
- Instead of a New Project option, Studio Cloud has a New Project Local option. The new option creates a new project on the local file system.

- Instead of a Open Project option, Studio Cloud has an Open Project Local option. The new option opens a project from the local file system.
- Instead of the Save Project option, Studio Cloud has two new options, which depend on whether you are logged in. If you are logged in, the Save Project [Cloud] options saves projects to the cloud. If you are not logged in, Save Project [Local] saves the project locally.
- Instead of the Save As option, Studio Cloud has a Save As to Local option.
- In Studio Cloud, you can select the Save As To Cloud option, which saves a copy of a project to the cloud.
- Instead of Rename Project, Studio Cloud has two new options, which depend on whether you are logged in. If you are logged in, the Rename Project [Cloud] option renames the project locally and remotely. If you are not logged in, the Rename Project [Local] option only renames the project locally.

Cloud TIPs Wizard

You can now access the TIP Wizard in the Cloud. The TIP Wizard steps you through an integration project template to help you quickly build your own integration project.

The Cloud Management Console allows you to search all the templates available in the Solutions Repository. When search results are returned, a check mark in the Certified column of the Solutions page identifies templates that Cast Iron has tested and certified. User rating information is also available in the Template Details pane. The final step in the TIP Wizard allows you to rate the template.

To launch the TIP Wizard:

1. In the cloud, select the Create tab. The Solutions page is displayed.
2. In the Search Templates by keyword(s) field, enter a keyword. For example: SAP.
3. Click Search. All templates that match the keyword display.

Note: You can select the Advanced Search option to filter templates by first endpoint or second endpoint.

4. Click the appropriate template. The Templates Details pane is displayed.
5. Click the Create a Project Based on this Template link.

Secure Connector

The Secure Connector allows you to access the cloud using endpoints that sit behind your internal firewalls and transfers data using a secure protocol.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.live.doc/Managing_Integration_Appliances/toc_managing_cloud_instances.html

Downloading and Installing SAP JAR Files and DLLs

Before you begin

You must have an SAP User ID and password to enter the SAP Support Portal to download the files.

About this task

In order to connect to an SAP system, you must install SAP DLLs and JAR files onto your development environment.

To download and install the SAP jar files and DLLs:

1. Contact SAP Technical Support to obtain the zip files for the following SAP Components:
 - If the secure connector is running on Windows:
 - SAP 32 bit JCo version 3.0.10 or later versions - Windows
 - SAP Java IDoc Class Library 3.0.10 or later versions
 - If the secure connector is running on Linux:
 - 32 bit SAP JCo 3.0.10 or later versions - Linux (for Intel compatible processors)
 - SAP Java IDoc Class Library 3.0.10 or later versions
2. Unzip the SAP JCo zip file:
 - Double-click the `sapjdoc30P_x-1000xxxx.zip` file.

- Use the decompression tool to extract the contents of the compressed file to a temporary directory. This zip file contains another zip file `sapjco3-NTintel-3.0.x.zip`. Extract this zip also to a temporary directory, for example, in Windows: `C:\temp\sapjco3-NTintel-3.0.x`. This directory contains the required libraries `sapjco3.jar` and `sapjco3.dll`. For example in Linux: `/tmp/sapjco-linuxintel-3.0.x`. This directory contains the required libraries `sapjco3.jar` and `libsapjco3.so`.
3. Unzip the SAP IDoc JCo zip file:
- Double-click the `sapjdoc30P_x-1000xxxx.zip` file.
 - Use the decompression tool to extract the contents of the compressed file to a temporary directory, for example, `C:\temp\sapjdoc30P_x-1000xxxx`. This directory contains the required library `sapidoc3.jar`.

Procedure

1. Log on to the Management Console and select System > Connectors. The Connectors page is displayed.
2. Click Update Libraries. The Update Connector Libraries window is displayed.
3. Select SAP in the Connector column.
4. Click the plus (+) button and repeat the following substeps until you have imported all the jar files you just downloaded.
 - a. Locate one of the jar files you just downloaded.
 - b. Click Open to import the jar file. The file displays in the Files to Add column.
5. Click Update.

The files that display in the Files to Add column are not committed until you click Update. If you click Reset before you click Update, the Management Console does not add the files you uploaded. If the Management Console times out before you click Update and commit the added files, repeat the last two steps.

Results

You can now run SAP projects.

Installing Vendor Supplied Libraries

About this task

If your integration project uses a connector that requires additional libraries, you must install the additional libraries before you deploy the project configuration. Deploying the project configuration before installing the additional libraries generates runtime errors. For a complete list of connectors that require vendor supplied libraries, open the Update Connector Libraries page. See the following procedure.

If you have a multi-environment tenant, you must install the 3rd party libraries in each environment where you deploy a project configuration with a connector that requires the additional libraries.

For example, you have a tenant with three environments: Development, Staging, and Production. You publish a project configuration for an SAP endpoint in the Development and Production environments. Before you can deploy the project configuration, you must install additional SAP libraries on both the Development and Production environments.

Procedure

1. Click an environment tab.
2. Select System > Connector Libraries to open the Update Connector Libraries page.
3. In the Connector column, select the connector for which you want to install additional files.

Any files that have already been installed display in the Installed Files column.

4. Click the (+) icon and select the library file or files to upload. In the cloud, . jar and .dll are valid library files types. The files you select display in the Files to Add column.
5. Click Update.

The files that display in the Files to Add column are not committed until you click Update. If you click Reset before you click Update, the Cloud Management Console does not add the files you uploaded. If the Cloud Management Console times out before you click Update and commit the added files, repeat the last two steps.

Scheduling Downtime

About this task

Scheduling downtime allows you to perform maintenance on an environment or related system. You can create downtime rules for project configurations that stop or suspend all enabled orchestration jobs in that project configuration for a specified duration of time. The project configuration does not have to be undeployed to create or edit a downtime rule. Downtime rules can occur once or repeat at specific intervals. You must have administrator or publisher permissions to create, edit, or delete a downtime rule.

By default, downtime rules are stored in GMT time zone. If an administrator modifies the system clock from GMT to another time zone, downtime rules are executed at the same absolute time. For example: You create a downtime rule to stop all orchestration between 4:00pm - 4:15pm GMT. The administrator then modifies the system clock to display PDT. Your downtime rule is modified to now stop all orchestration between 8:00am - 8:15am PDT. To execute the downtime rule at 4:00pm - 4:15pm PDT, you must edit the downtime rule. Times differences caused by daylight savings are automatically adjusted.

If the environment is offline when a downtime rule is scheduled to occur, all unexecuted rules are identified and executed in the appropriate order when the environment returns online. After all the backlogged downtime rules are executed, you regain control to modify the deployment state of a project configuration.

Procedure

1. From the Navigation pane, select Repository > Configurations. The Project Configurations page is displayed.
2. Click the project configuration, which contains the downtime rule you want to work with. The Configuration Details page is displayed.
3. In the Scheduled Downtimes section, click New Rule. The New Downtime Rule dialog box is displayed.
4. Select one of the following actions from the list:
 - o **Stop (allows jobs to finish)** - At the specified time, prevents any new orchestration jobs from starting while allowing current jobs to finish processing. This action allows all jobs to end.
 - o **Stop (cancel running jobs)** - At the specified time, prevents any new orchestration jobs from starting and stops all currently running jobs. This action immediately stops all jobs.
 - o **Suspend** - At the specified time, prevents any new orchestrations from starting and pauses any jobs that are currently running. At the end of the scheduled downtime, the runtime processes the suspended job from the point it paused.
5. Specify the duration of the downtime by specifying a date and time for Start Downtime and End Downtime.
6. Optional: Select the Repeat option to create a repeat downtime rule.
 - a. Specify a repeat interval (numeric value).
 - b. Specify frequency from the list: Days, Weeks, Months, or Years.
7. Click Save.

Results

The new downtime rule displays in the Scheduled Downtimes section and the Scheduled Downtime counter increases by one.

Parent topic: [Managing Cloud Instances](#)

Edit Downtime Rules

Procedure

1. From the Navigation pane, select Repository > Configurations. The Project Configurations page is displayed.
2. Click the project configuration, which contains the downtime rule you want to work with. The Configuration Details page is displayed.
3. In the Scheduled Downtime section, click the downtime rule you want to edit. The Edit Downtime Rule is displayed.
4. Select one of the following actions from the list:
 - o **Stop (allows jobs to finish)** - At the specified time, prevents any new orchestration jobs from starting while allowing current jobs to finish processing. This action allows all jobs to end.
 - o **Stop (cancel running jobs)** - At the specified time, prevents any new orchestration jobs from starting and stops all currently running jobs. This action immediately stops all jobs.
 - o **Suspend** - At the specified time, prevents any new orchestrations from starting and pauses any jobs that are currently running. At the end of the scheduled downtime, the runtime processes the suspended job from the point it paused.
5. Specify the duration of the downtime by specifying a date and time for Start Downtime and End Downtime.

6. Optional: Select the Repeat option to create a repeat downtime rule.
 - a. Specify a repeat interval (numeric value).
 - b. Specify frequency from the list: Days, Weeks, Months, or Years.
7. Click Save.

Deleting Downtime Rules

Procedure

1. From the Navigation pane, select Repository > Configurations. The Project Configurations page is displayed.
2. Click the project configuration, which contains the downtime rule you want to work with. The Configuration Details page is displayed.
3. In the Scheduled Downtime section, select the downtime rule you want to delete. The Delete Rules confirmation window is displayed.
4. Click Yes.

Results

The downtime rule no longer displays.

Managing Orchestrations

Managing Orchestrations topics provide information about editing orchestration settings and exporting job reports.

- [About Orchestration Settings](#)
Orchestration settings allow you to configure properties for individual orchestrations in a project configuration. For each orchestration you can specify whether the orchestration is enabled, the logging levels, logging behavior, and the maximum number of jobs that the orchestration can simultaneously run.
- [Editing Orchestration Settings](#)

Feedback | Notices

 Last updated: Friday, February 5, 2016
file:///dcs/markdown/workspace/Transform/out.html

About Orchestration Settings

Orchestration settings allow you to configure properties for individual orchestrations in a project configuration. For each orchestration you can specify whether the orchestration is enabled, the logging levels, logging behavior, and the maximum number of jobs that the orchestration can simultaneously run.

When a project configuration is undeployed you can edit the following orchestration settings:

Orchestration Settings	Description
Enabled	Indicates whether an orchestration is enabled and can be deployed. At least one orchestration in a project configuration must be enabled to deploy a project configuration. By default, all orchestrations in a project configuration are enabled.
Logging Level	Allows you to specify the level of orchestration details that are logged in the System Logs. <ul style="list-style-type: none">• None - Orchestration status and activity are not logged.• Initial Values - Only the initial values of orchestration variables are logged.• Initial and Error Values- Both the initial values of orchestration variables and orchestration errors are logged.• Error Values- Only orchestration errors are logged.• Inline - Orchestration job details are logged for suborchestrations inline with the job details of the calling orchestration.• All- The highest level of logging. All orchestration activity is logged.
Log Synchronously	Allows the runtime to synchronize the writing of orchestration events to the orchestration monitoring logs as the orchestration is running. By default, this orchestration setting is disabled and orchestration jobs are not synchronously logged. Note: When you enable this orchestration setting, the time it takes to process an orchestration job increases.
Max Simultaneous Job	Allows you to specify the number of orchestration jobs that can run simultaneously.

Parent topic: [Managing Orchestrations](#)

[Feedback](#) | [Notices](#)

Editing Orchestration Settings

Before you begin

To edit orchestration settings, the project configuration must be undeployed.

Tenant administrators, environment administrators (for the environment where the project is published), and publisher of a project can edit its orchestration properties.

About this task

Note: If you grant project configuration permissions to a group, the users in that group will have full access to the project configuration- the user will be able to create new versions of the project configuration, as well as edit and delete the project configuration.

Procedure

1. Select the environment tab, where the project configuration is published.
2. From the navigation pane, select Repository > Configurations. The Project Configuration page is displayed.
3. If the project configuration you want to edit is running, stop the project configuration by clicking the  Stop icon in the Actions column. When the Stop Configuration dialog box displays, click one of the following options:
 - o **Finish Jobs** - At the specified time, prevents any new orchestration jobs from starting while allowing current jobs to finish processing. Allow the jobs to end.
 - o **Cancel Jobs** - At the specified time, prevents any new orchestration jobs from starting and stops all currently running jobs. This action immediately stops all jobs.
4. Undeploy the project Configuration, by clicking the  Undeploy icon in the Action Column.
5. Click the project configuration you want to edit. The Configuration Details page displays.
6. In the Orchestration section, click Edit to edit the orchestration settings. The Edit Orchestration Settings window is displayed.
7. Click Save.
8. Deploy the project configuration to begin processing orchestration jobs.

Results

The updates you made display in the Orchestration section of the Configuration Details page and the runtime processes the orchestration as specified.

About Naming Projects and Configurations

Project and project configuration names cannot be longer than 42 characters. When you create a project or project configurations avoid using the following list of reserved characters.

Reserved Characters	Description
â€ˆ & â€™	ampersand
â€ˆ { â€ˆ â€ˆ } â€™â€ˆ [â€ˆâ€ˆ] â€™ ' < " > '	any brackets
â€ˆ * â€™	asterisk
â€ˆ \ â€™	backslash
' ^ '	caret
â€ˆ : â€™	colon

Reserved Characters	Description
â€˜ \$ â€™™	dollar sign
â€˜ / â€™™	forward slash
' # '	number sign
' () '	parenthesis
' '	pipe
â€˜ . â€™™	period
â€˜ ? â€™™	question mark
â€˜ ; â€™™	semicolon
' '	space
â€˜ ~ â€™™	tilde

Parent topic: [Managing Projects](#)

[Feedback](#) | [Notices](#)

 Last updated: Friday, February 5, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.live.doc/Managing_Projects/aboutNamingProjects.html

About Project Configurations

Project configurations allow you to create multiple variations of the same integration project, so you can create and publish one project and deploy it to many different scenarios. Within a project configuration you can specify which orchestrations are enabled, modify configuration properties for endpoints, generate or modify assets, manage scheduled downtime rules, and control permissions for the project configuration.

Each project you publish has a Default project configuration. In the Management Console, you can create additional project configurations. The project name, project version, configuration name, and project state uniquely identify each project configuration.

You must have Administrator privileges or be the publisher of the specific project to create, edit, and delete project configurations. Administrators and publishers can grant users and groups permissions that allow them to create, edit, and delete project configurations.

Enabling and Disabling Orchestrations

The runtime only runs orchestration jobs for enabled orchestration. Before you can deploy a project configuration, the project configuration must contain at least one enabled orchestration. By default, all orchestrations are enabled.

Specifying the orchestration logging level allows you to control the type of orchestration errors that are written to the system logs. The Management Console also allows you to limit the number of jobs that run simultaneously. The number of jobs that run simultaneously can affect performance.

You must have administrator or publisher permissions to specify orchestration properties.

Understanding Configuration Properties

You create these configuration properties for a project in Studio. For more information about creating project properties and specifying a project version, see the Studio online help.

When you publish the project, you can specify values for the configuration properties. The values you specify for the configuration properties determine how the project is deployed. For example, in a project that contains database endpoints, you can create properties for database connection parameters. This allows you to create a project configuration for a test environment connecting to a test database and then use the same project to create another project configuration for a production environment that connects to another database.

You must have administrator or publisher permissions to edit configuration properties in the Management Console.

Modifying Assets

If your project configuration contains a database or WebServices endpoint, you must generate assets before you can deploy the project configuration. If your project does not contain a database or WebServices endpoint, assets are irrelevant to your project configuration.

You must have administrator or publisher permissions to generate or modify assets.

Scheduling Downtimes

Scheduling downtime allows you to perform maintenance. You can create downtime rules for project configurations that stop or suspend all enabled orchestration jobs in that project configuration for a specified duration of time. The project configuration does not have to be undeployed to create or edit a downtime rule. Downtime rules can occur once or repeat at specific intervals.

You must have administrator or publisher permissions to create, edit, or delete a downtime rule.

Editing Project Configuration Permissions

As an administrator or project publisher, you can grant permissions for project configurations to other users and groups. When you grant users or groups permissions to a project configuration they are able to create, edit, and delete the project configuration. By default, permissions to project configurations are granted to only the Administrator Group. If you want to grant permissions to another group you must explicitly do so.

For example, you are a user with publisher rights and belong to the built-in Publisher group. You publish a project. Only the Administrator Group and you have permissions to the project configuration. Members of the Publisher group, of which you are a member, do not have permissions to the project configuration. You must edit the permission on the project configuration to include another group like Publisher. For more information, see [Granting Project Configuration Permissions](#).

Parent topic: [Managing Projects](#)

[Feedback](#) | [Notices](#)

 Last updated: Friday, February 5, 2016
file:///dcs/markdown/workspace/Transform/out.html

About Projects

Projects contain components that the runtime needs to execute an integration scenario: orchestrations, endpoints, maps, and other documents. Use Studio to create and test projects without being connected to an integration environment.

Multiple people can publish multiple projects to the same integration environment. Use Studio to publish projects to an integration environment or export projects to a staging location. You can later use the Management Console to upload the exported project. You must have Administrator or Publisher privileges to publish or upload a project to the integration environment.

When you publish a project from Studio, the Management Console displays the project with default project settings; creating a default project configuration. You can clone this default project configuration to create new project configurations, which you can configure for separate development and production environments.

Use the Studio to create projects and specify endpoint configurations properties and then use the Management Console to specify project configurations and deploy project configurations.

Cloning Project Configurations

Before you begin

You must have Administrator privileges or be the publisher of a project to clone project configurations.

About this task

Project configurations contain properties and assets that you can configure in the Management Console to create multiple variations of the same integration project. When you create a new configuration you can choose to clone an existing project configuration. A cloned project configuration inherits all the configurations from the original project configurations. However, if you edit the original configuration project, the changes are not propagated to the cloned project.

Note: The project configuration you clone does not display on the Favorites view, unless you explicitly add the project configuration to the view.

Procedure

1. From the Navigation pane, select Repository > Configurations. The Project Configurations page is displayed.
2. From the Configuration Filter list, select All. All project configurations display.
3. Locate the project configuration you want to clone.
4. Click the Clone icon . The Create Project Configuration dialog box is displayed.
5. Provide a unique name for the new project configuration.
6. Click OK.

Results

The cloned project configuration is displayed on the Project Configurations page. The cloned project has all the same project configuration details as the original project configuration.

Copying Projects

About this task

The Management Console allows you to copy a project by assigning a new version number to an existing project.

Procedure

1. Click the Modify tab. The Projects page is displayed.
2. Click the project you want to copy. The Copy Project dialog is displayed.
3. Enter a new project version. The version number can contain a decimal.
4. Click Save.

Results

The copy of the project is displayed in alphabetical order in the Projects page.

Creating Projects From Scratch

About this task

You can create a project from scratch in the cloud.

Procedure

1. Click the Create tab. The Solutions page is displayed.
2. Click Create One From Scratch. The Create Project dialog box is displayed.
3. Specify a unique project name.
4. Click Save. The project displays in the Projects page of the Modify tab.

Results

You can now take edit, publish, delete or copy your project. Select the project to view the project details and assign permissions to your project. If you do assign permissions, click Save to save your updates.

Project details include the environment to which the project configuration was published, a timestamp of the last time you published the project, and the current state of the project configuration. For example: deployed.

Creating Projects From a Template

About this task

You can create a project from a template. Templates are stored in the Solutions Repository. All users can create a template solution and upload it to the Solutions Repository.

Note: Not all templates in the Solutions Repository are certified. The templates that are certified are denoted with a Cast Iron[®] logo.

Procedure

1. Click the Create tab. The Solutions page is displayed.
2. Search for a template.

- a. Select a source endpoint.
- b. Select a target endpoint.
- c. Click Search

You can also select the Keyword Search option to search for a template using a keyword.

3. Choose a template from the solutions that are returned. The template details are displayed.
4. Click Create a project based on this template. Studio Cloud opens and the wizard guides you through the process of creating your project.

Deleting Project Configurations

Before you begin

The publisher of a project configuration, the environment administrator, or tenant administrator can delete project configurations. The publisher of a project configuration can grant permissions that allow other users to delete his project configuration. The environment administrator can grant permissions that allow other users to delete any project configuration in the environment. The tenant administrator can grant permissions that allow other users to delete any project configuration in the tenant.

Project configurations must be undeployed before you can delete them.

About this task

When you delete a project configuration, all monitoring history associated with the project configuration is also deleted.

Procedure

1. Select the environment tab, where the project configuration is published. A list of project configurations is displayed in the Project Configuration section of the Dashboard.
2. Verify that the project configuration you want to delete is undeployed. The state displays in parentheses () at the end of the project configuration name. For example, (undeployed)
3. If the project configuration is in any other state but undeployed, undeploy the project configuration by clicking the Undeploy icon in the Actions column.
4. In the Actions column, click the Delete icon. The Delete Project Configuration dialog box is displayed.
5. Click Yes.

Results

The project configuration is deleted and no longer available.

Deploying Project Configurations

Before you begin

To deploy or undeploy project configurations, you must have tenant administrator or environment administrator privileges, or be the publisher of the project configuration.

About this task

The type of endpoint in an orchestration determines the steps you must complete to deploy a project configuration. A project configuration must contain at least one enabled orchestration before you can deploy the project configuration. If the orchestration contains a database or Web Services endpoint, you must also generate assets for the endpoints before you can deploy the project configuration.

By default, all the orchestrations in a project configuration are enabled. Therefore, if the orchestrations in a project configuration do not require additional configuration and do not access database or Web Services endpoints, you can deploy your project configuration by clicking the deploy icon next to the project configuration in any of the Project tabs. If your project configuration requires assets or additional configuration, see the following deployment procedure.

Note: A project configuration must be in the stopped state for you to undeploy the project configuration.

Procedure

1. Select the environment tab to which you published your project.
2. In the Project Configuration section, select the project configuration you want to deploy. The Configuration Details page is displayed.
3. In the Orchestrations section, verify that at least one orchestration in the project configuration is enabled. Edit orchestration settings, as needed.

You cannot edit orchestration settings while a project configuration is running. Stop and undeploy the project configuration to edit configuration settings.

4. In the Properties section, edit configuration properties, as needed.

You cannot edit configuration properties while a project configuration is running. Stop and undeploy the project configuration to edit configuration settings.

5. If the project configuration contains a Database or Web Services endpoint, you must generate assets for these endpoints.
6. Optional: Add a schedule downtime rule.
7. Optional: Assign permissions for the project configuration, which specify which group of users can edit and deploy a project configuration. By default, tenant administrators, environment administrators, and the publisher of a project configuration can edit and deploy a project configuration.
8. If you assign permissions, click Save.
9. In the Summary section, click the Deploy icon  to deploy the project configuration.

Results

The project configuration deploys, the runtime starts to process orchestration jobs, and the status is appropriately updated in the Summary section.

Parent topic: [Managing Projects](#)

[Feedback](#) | [Notices](#)

Editing Project Configuration Properties

Before you begin

You must have administrator or publisher permissions to edit configuration properties.

About this task

You create configuration properties for an integration project in Studio, before you publish the project to an environment in the cloud. When you publish the project, you can specify values for the configuration properties. Configuration properties allow you to move a project configuration from a staging environment to a production environment.

For example, in a project that contains database endpoints, you can create properties for database connection parameters. This allows you to create a project configuration for a test environment connecting to a test database and then use the same project to create another project configuration for a production environment that connects to another database.

Procedure

1. Select the environment tab, where the project configuration is published.
2. From the navigation pane, select Repository > Configurations. The Project Configuration page is displayed.
3. If the project configuration you want to edit is running, stop the project configuration by clicking the  Stop icon in the Actions column. When the Stop Configuration dialog box displays, click one of the following options:
 - o **Finish Jobs** - At the specified time, prevents any new orchestration jobs from starting while allowing current jobs to finish processing. Allow the jobs to end.
 - o **Cancel Jobs** - At the specified time, prevents any new orchestration jobs from starting and stops all currently running jobs. This action immediately stops all jobs.
4. Click the project configuration you want to edit. The Configuration Details page displays.
5. In the Properties section, click Edit to edit configuration property values.
6. Modify the configuration properties.
7. Click Save.

Results

The Configuration Details page displays the updated configuration property values.

Publishing Projects

Before you begin

You must be a tenant administrator, environment administrator, or environment publisher to publish projects.

About this task

Publishing a project uploads a project from Studio to a runtime environment.

Procedure

1. In the Management console, select the Modify tab. The Projects page is displayed.
2. In the Actions column, click the Publish Project icon. A lists displays all the environments in the tenant.
3. Select the environment to which you want to publish the project.

Results

A confirmation displays. The project is available in the environment you selected.

Stopping Project Configurations

About this task

There are two ways to stop a running project configuration:

- **Stop (allows jobs to finish)** - When you click Finish Jobs, prevents any new orchestration jobs from starting while allowing current jobs to finish processing. This action allows the Integration Appliance to end.
- **Stop (cancel running jobs)**- When you click Cancel Jobs, this option prevents any new orchestration jobs from starting and stops all currently running jobs. This action immediately stops all jobs.

Procedure

1. From the Project Configurations page, select a project configuration.
2. In the Actions column, click the Stop icon . The Stop Configuration window is displayed.
3. Click either Finish Jobs or Cancel Jobs to stop the project configuration.

Parent topic: [Managing Projects](#)

Uploading Project Configurations

Before you begin

To upload a project configuration, you must have tenant administrator, environment administrator, or environment publisher permissions.

About this task

When you upload a project configuration, you are publishing a project using a two-stage process. First, you export a project from Studio to an intermediate location. Then from the Management Console, you upload the project to a cloud environment.

Procedure

1. Select the environment tab, to which you want to upload the project configuration.
2. From the Navigation pane, select Repository > Upload Project. The Upload Project Configuration dialog box is displayed.
3. In the Local Project File field, specify the path from which to upload the project. You can click Browse to select a file from your local machine.
4. Specify a project name. The name should not exceed 42 characters and should not contain any restricted characters.
5. Specify a product version number. This field is not populated with the project version you specified in Studio. However as a best practice, you should specify a project version that matches the version you specified in Studio.
6. Click Upload.

Results

The project configuration is displayed in the cloud environment Project Configuration page.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.live.doc/Managing_Projects/uploadingProjectConfigurations.html

Working with Project Configurations

Various views are available for project configurations:

- **All** - Displays the deployment state and status of all project configurations, regardless of the state of the project configuration. You can clone or delete project configurations from this view.
- **Recent** - Displays the deployment state and status of the most recently published or modified project configurations. You can clone or delete project configurations from this view.
- **Favorites** - Displays the deployment state and status of project configurations for which you have permissions. By default, this view is not populated. You must explicitly add project configurations from either the Recent view or All view.

You can access these views from the Dashboard or by selecting the following path in the Navigation pane: Repository > Configurations. The Configuration Filter allows you to choose your view from a drop-down list.

The following table describes information available in the various project configuration views:

Columns in Project Configuration Views	Descriptions
Configuration	Displays published project configurations.
Running	Displays the number of currently running jobs for the project configuration.
Completed	Displays the number of orchestration jobs, for the project configuration, that were completely processed. When orchestration monitoring data is purged, the number of orchestration jobs is reset to 0. For more information about modifying log purging parameters, see the purging help topics.
Errored	Displays the number of orchestration jobs where a runtime error occurred for the project configuration. When orchestration monitoring data is purged, the number of orchestration jobs is reset to 0. For more information about modifying log purging parameters, see the purging help topics.
Total	Displays the total number of orchestration jobs, for the project configuration, that have run. When orchestration monitoring data is purged, the number of orchestration jobs is reset to 0. For more information about modifying log purging parameters, see the purging help topics.

Columns in Project Configuration Views	Descriptions
Actions	<p>Displays the state of project configurations, as well as options for you to delete  or clone  project configurations.</p> <p> Clicking this icon deploys and runs a project configuration.</p> <p> Clicking this icon causes the runtime to suspend the orchestration job processing of the project configuration.</p> <p> Clicking this icon undeploys a project configurations. You must stop the project configuration before you can undeploy the project configuration.</p> <p> Clicking this icon stops the runtime from processing orchestration jobs for the project configuration.</p> <p>When you stop a project configuration, you can choose to have the runtime completely process all currently running jobs or have the runtime cancel all currently running jobs.</p> <p> Only available in All and Recent views. Clicking this icon adds the project configuration to Favorites.</p> <p>When the Management Console displays the project configuration in Favorites, this icon is no longer active next to the project configuration in the All and Recent views.</p> <p> Clicking this icon removes the project configuration from Favorites, but does not delete the project configuration from the environment. You can view the project configuration from the All and Recent views.</p>

About Environment Dashboards

An environment dashboard provides multiple snapshot views of project configurations and jobs, a list of unresolved critical system errors, and an overall project configurations summary, and status of Secure Connectors. The Dashboard also allows you to search for orchestration jobs by job key. The Search box is located in the Results section of the dashboard.

To expand the views of the Critical Alerts and Secure Connector Summary, click the icon in the upper right corner. An expanded view of Project Configuration is available by selecting Repository > Configurations from the navigation pane. An expanded view of Results is available by selecting Repository > Job Log from the navigation pane.

A dashboard is available for each environment in a multi-environment cloud. The information the dashboard displays is specific to its environment.

Choosing a Notification Level

Notification levels define the severity of events that can trigger an alert. When you specify a notification level, an alert is only sent for errors that meet or exceed the level you choose. $i_2^{1/2}$

Note: If you do not receive notifications for events, it might be that you do not have the system log level set to produce entries that would trigger a notification. For example, if you chose the Error level for Deployment, all events that were Error or Critical level in the Deployment system are logged.

You can specify the following notification levels:

Notification Level	Description
Critical	Sends an alert when an error condition causes the a shutdown.
Error	Sends an alert when non-critical issues that must be handled immediately occur.
Warning	Sends an alert when potential error conditions occur.
Info	Sends an alert for informational usage.

Creating Notification Policies

About this task

Notification policies allow you to monitor potential errors in a specific system. When you create a notification policy, the notification policy monitors the system log for the system you specify. When a system log event occurs that meets or exceeds the notification level of a notification policy, an alert is sent to the specified users.

Note: If you do not receive notifications for events, it might be that you do not have the system log level set to produce entries that would trigger a notification or you did not enable the notification policy. For more information about specifying system log settings, see [Specify System Log Settings](#). For more information about enabling email notification policies, see [Enabling Email Notification Policies](#).

Procedure

1. Click the environment for which you will create a notification policy. The Navigation pane is displayed.
2. Select Logs > Notifications. The Notifications page is displayed.
3. Click New Policy. The New Policy dialog box is displayed.
4. Specify a policy name.
5. From the Level Exceeds list, select a level. Alerts are only sent for errors that exceed the level you choose.
6. From the With System list, select the system you want the notification policy to monitor.
7. Specify the email address or addresses of the person or people that will receive the email notification. When you have multiple email addresses, add one email address per line.
8. Click Save.

Results

The new policy displays on the Notifications page. You must enable email notifications before any alerts can be sent. If the Email status displays as (inactive), email notifications are not enabled.

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.live.doc/Monitoring/editingNotificationPolicies.html>

Enabling Email Notification Policies

About this task

When you create an email notification policy, you must enable the email notification policy for alerts to be sent. By default, email notifications are not enabled.

If you enable email notification policies, the settings you specified when you created the email notification determine when an email alert is sent.

Note: If you disable the email notification policy by clearing the Enable Email option, alerts are not delivered for any email notification policy.

Procedure

1. Click the environment for which you will enable an email notification policy. The Navigation pane is displayed.
2. Select Logs > Notifications. The Notifications page is displayed.
3. At the top of the page, click the Email link. The Enable Email option is displayed.
4. Select the Enable Email option.
5. Optional: Provide a email subject line that will qualify the alert sent.
6. Click Save.

Results

The Notifications page is displayed with the new policy and the Email status changes from (Inactive) to (Active). Email notifications will now be sent when an event that triggers the notification policy occurs.

Parent topic: [Monitoring](#)

Searching for Orchestration Jobs

About this task

Job IDs and keys allow you to search for orchestration jobs. You define primary message keys in Studio, when you configure connectors. The primary message key must be a unique value. For example, the purchase order number for a purchase order message. If you do not define a primary key, the runtime uses the job ID, a unique number that the runtime generates, to identify an orchestration job.

From the Management Console, you can search orchestration jobs by job ID. By default, the Management Console searches only for completed orchestration jobs that match the job ID you specify. Use the Advanced Search option to search for all other orchestration jobs.

Procedure

1. From the navigation pane, select Dashboard.
2. In the Results section, enter a job ID in the Key Search field.
3. From your keyboard, press Enter. The completed job with the matching job ID displays.

Parent topic: [Monitoring](#)

Using Advanced Search

About this task

Use the Advanced Search option to further refine your job search. If you enter values for multiple fields in the Advanced Search box, the Management Console uses AND logic to refine the search.

For example, you specify a time range in addition to selecting the errored status. The Management Console searches for all orchestration jobs that had an error within the time range specified.

Note: If you choose to search by date and time, you must specify a start and end date and time.

Procedure

1. From the navigation pane, select Dashboard.
2. In the Results section, select an orchestration. The Orchestration Details page displays all the jobs associated with the orchestration.
3. In the Advanced Search box, specify values for Job ID, Key, Status, Start Date and Time, or End Date and Time as appropriate for your search.
Note: If you choose to search by date and time, you must specify a start and end date and time.
4. Click Search.

Results

The search results are displayed in the table.

[Feedback](#) | [Notices](#)

 Last updated: Friday, February 5, 2016
file:///dcs/markdown/workspace/Transform/out.html

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.live.doc/Monitoring/searchingOrchestrationJobs.html>

Viewing Orchestration Job Logs

The Dashboard displays information about orchestration jobs, including status, timestamp of job events, and key/job ID in multiple tabs:

- **All** - displays orchestration job information for all project configurations.
- **Recent** - displays orchestration job information for the most recently published or modified project configurations.
- **Favorites** - displays orchestration job information for the project configurations displayed in the Favorites filter. Orchestration job information displayed through this filter also displays in the Recent and All filters.

In some cases, the Management Console displays an orchestration job status of Unknown, even though the orchestration job completed successfully. Rebooting the environment, while orchestration jobs are processing, can result in the Unknown status because monitoring data is lost during the reboot. Stop all orchestration jobs before rebooting the environment to avoid an Unknown status.

Click an orchestration job to view the orchestration details for that orchestration. The Orchestration Details page displays all the jobs associated with the orchestration you selected and the status of each individual job. Use the Left and Right arrows (<< , <, >, >>) to view all orchestration jobs.

Parent topic: [Monitoring](#)

Sorting Orchestration Jobs

About this task

You can search orchestration jobs by job ID. To sort orchestration jobs by project configuration name, orchestration name, status, time, or job ID click the appropriate column header.

About Built-In Groups

Built-in groups are predefined groups. In the cloud, in addition to a tenant administrator group, each environment has a built-in administrator, publisher, and user group.

For example: A tenant, named Cumulus, is created for your organization. Within this tenant there are two environments: Development and Production. The following built-in groups would be available:

- admin [cumulus.com]
- admin [Development]
- publisher [Development]
- user [Development]
- admin [Production]
- publisher [Production]
- user [Production]

The same user can be a part of multiple groups. You can assign users to a built-in group or create a new group.

Note: If you grant project configuration permissions to a group, the users in that group will have full access to the project configuration- the user will be able to create new versions of the project configuration, as well as edit and delete the project configuration.

The following list defines the permissions granted to each of the built-in groups:

- **Tenant Administrator Group.** Provides privileges to all environments, users, groups, and projects in a specific tenant. Permits users to create, edit, and delete users and custom groups in the tenant. Users in this group can add and delete users to and from any built-in or custom group in the tenant. Users in this group can view, edit, and delete permissions for all source projects in the tenant.

Users in this group can view all the environments in the tenant and have all the permissions of an environment administrator in each of the tenant environments.

- **Environment Administrator Group.** Provides privileges to all users, groups, and projects in a specific environment. Permits users to create, edit, and delete users and custom groups in a specific environment. Users in this group can add and delete users to and from any built-in or custom group in the environment.

Environment Administrators can also create and deploy project configurations for project that any environment publisher publishes, and view orchestration job details for any project configuration in the environment. With environment administrator group privileges you can edit permissions that publishers for the same environment set for their individual project configurations.

Even though members of the Environment Administrator group have Environment Publisher group and Environment User group privileges, the members of the Environment Administrator Group do not appear in other groups in the same environment until you explicitly add the user.

- **Environment Publisher Group.** Provides project privileges in a specific environment. Permits users to create, deploy, or delete project configurations for any project that they publish in the environment. Users in this group can also start and stop orchestrations and view orchestration job details for project configurations they deployed in the environment. As an environment publisher, you can grant permissions for individual project configurations you create to another user with environment publisher privileges for the same environment.

The members of the Environment Publisher Group are not displayed in the Environment User Group, until you explicitly add the user.

- **Environment User Group.** Permits users to monitor alerts and orchestrations in a specific environment. Users in this group can create and edit projects; however, they cannot publish the project to an environment. You must have Publisher privileges for the specific environment to which you want to publish a project. All users are automatically members of the Environment User group.

In a multi-environment tenant, users in this group only see the environment tab for environments of which they are a member. For example, a tenant has a Development, a Staging, and a Production environment. The tenant administrator or administrator of the Development environment adds a user to the User [Development] group. When the user logs in to the tenant, the user can only see the Development environment, even though the tenant has two other environments.

About Libraries Environments

Libraries Environment is a user profile parameter that specifies the environment from which Studio retrieves connector libraries.

In a multi-environment tenant, each environment can potentially have different versions of connector libraries installed. Setting this parameter points Studio to the libraries you want to use while verifying your projects. This parameter is not as critical if your project does not use an endpoint that requires additional libraries to be installed. See the Connector Release Notes for a complete list of endpoints that require you to install additional libraries.

Note: The environment you select should match the environment of the primary group the user is a member of. For example: If you select the Development environment as the Libraries Environment, you should be a member of groups in the Development environment.

About User Profiles

A user profile provides a summary of user details, such as: name, display name, email, and group memberships. The user profile displayed is for the user currently logged in to the Management Console.

From the User Profile window, you can change the user password and specify libraries environments.

Parent topic: [Permissions](#)

Accessing User Profile Information

Procedure

1. Click your username in the upper right corner of the Management Console. The User Profile window is displayed.
2. Optional: Click Change Password, to change the user password.
3. Optional: Click Change Libraries Environment, to specify the environment from which Studio retrieves connector libraries.
4. Click Save to save any updates to the user profile.
5. Click Close to close the User Profile window.

Assigning Users to Groups

You must have tenant administrator or environment administrator privileges to assign users to groups. Environment administrators can only add users to groups in their specific environment.

You can assign users to groups, when you create or edit a user. You can also assign users to groups, when you create or edit groups.

For more information about assigning users and groups, see [Creating New Users](#) and [Creating New Groups](#).

Changing Your Password

About this task

You can change your own password at anytime. However, to modify another user's password, you must have tenant administrator permissions. Environment administrators cannot change passwords for users in their environment.

For example, you are the administrator for the Development environment. You can change your password, but you cannot change the password for any specific user with permissions to the Development environment.

Procedure

1. Click your username in the upper right-hand corner of the Management Console. The User Profile window is displayed.
2. Click Change Password.
3. Enter values for the Old Password, New Password, and Confirm Password fields.

If you clear the Hide Password Text option, your password displays and is no longer encrypted.

4. Click Save to change your password.

Results

A confirmation message is displayed when the Management Console has successfully saved the new password.

Changing User Passwords

About this task

You can change your own password at anytime. However, to modify another user's password, you must have tenant administrator permissions. Environment administrators cannot change passwords for users in their environment.

For example, you are the administrator for the Development environment. You can change your password, but you cannot change the password for any specific user with permissions to the Development environment.

To change another user's password:

Procedure

1. Log in to the Management Console as the tenant administrator.
2. Select Setup > Users and Groups.
3. Click the name of the user whose password you want to change.
4. In the Edit User window, enter a password and confirm the password.

If you clear the Hide Password Text option, your password displays and is no longer encrypted.

5. Click Save to change your password.

Results

A confirmation message displays when the Management Console has successfully saved the new password.

Creating New Groups

Before you begin

In the cloud, only the tenant admin user can create new groups. In a multi-environment tenant, environment administrators can also create new groups for their specific environment.

On a physical or virtual Integration Appliance, only admin users can create new groups.

Procedure

1. In the Management Console, login as administrator.
2. Select Setup > Users and Groups.
3. In the New Group dialog box, enter a Name and Display Name for the new group.
4. From the Scope list, select the scope of permissions you want to grant the group. You can select to give permissions to the entire tenant or to a specific environment.
5. In the User list, select the users to join the group.

Select the User checkbox to select all the users in the list.

6. Click Save.

Results

In the Groups section of the Users and Groups page, the new group is displayed in alphabetical order.

Parent topic: [Permissions](#)

Creating New Users

Before you begin

In the cloud, only the tenant admin user can create new users. In a multi-environment tenant, environment administrators can also create new users for their specific environment.

On a physical or virtual Integration Appliance, only admin users can create new users.

Procedure

1. In the Management Console, login as administrator.
2. Select Setup > Users and Groups.
3. In the New User window, enter a value for the following fields: Name, Display Name, Email, Password, and Confirm Password.

It is recommended that you add the tenant name to the user name and display name.

For example, if the tenant name is `castiron.com`, then the new user name should be `newuser@castiron.com`. This will help you identify common user names across multiple tenants in the cloud.

If you clear the Hide Password Text option, your password displays and is no longer encrypted.

4. From the Libraries Environment list, select the environment from which the user's projects can retrieve additional libraries and files for endpoints. The environment you select should match the environment of the primary group the user is a member of. For example: If you select the Development environment as the Libraries Environment, you should be a member of groups in the Development environment.
5. In the Groups list, select all the groups to which the new user will have access.
6. Optional: Clear the Active checkbox. If you clear this option, the user cannot log in to the Management Console.
7. Click Save.

Results

In the Users section of the Users and Groups page, the new user is displayed in alphabetical order.

Parent topic: [Permissions](#)

Deleting Groups

Before you begin

In the cloud, only the tenant admin users can delete groups from a cloud environment. In a multi-environment tenant, environment administrators can also delete groups for their specific environment.

On a physical or virtual Integration Appliance, only admin users can delete groups.

Procedure

1. In the Management Console, select Setup > Users and Groups.
2. In the Groups section, select the groups that you want to delete.
3. Click Delete.
4. Click Yes, to confirm that the Management Console should delete the selected groups.

Results

The Management Console refreshes the list of groups.

Granting Project Configuration Permissions

Before you begin

You must have Administrator privileges or be the publisher of a project to grant permissions to other users or groups to create, edit, or delete project configurations.

About this task

Once you grant permissions to a user or group, they can edit or delete the project configuration. By default, permissions to project configurations are granted to only the Administrator Group. If you want to grant permissions to another group you must explicitly do so.

For example, you are a user with publisher rights and belong to the built-in Publisher group. You publish a project. Only the Administrator Group and you have permissions to the project configuration. Members of the Publisher group, of which you are a member, do not have permissions to the project configuration. You must edit the permission on the project configuration to include another group like Publisher.

Procedure

1. Click on a project configuration. The Configuration Details page is displayed.
2. In the Permissions section, select users and groups to grant permissions to.
3. Click Save.

Results

All the users and groups you select now have full access to the project configuration. These users and groups can now create new project configurations, edit the project configuration and any new project configurations they create, and delete the source project.

About Secure Connectors

A Secure Connector facilitates the secure transfer of data between the IBM® WebSphere® Cast Iron® Cloud and an endpoint located behind a firewall. The Secure Connector installer for appliance supports both 32-bit and 64-bit Windows and Linux machines.

To enable a Secure Connector a tenant administrator must complete the following tasks:

- Create a Secure Connector.
- Download the Secure Connector configuration file.
- Launch the Secure Connector installer.
- Install vendor supplied libraries.

Parent topic: [Using Secure Connectors](#)

Secure Connector Minimum Requirements

This topic provides information about minimum system requirements needed to use a Secure Connector.

You can run the Secure Connector on the following operating systems:

- Microsoft Windows 7
- Microsoft Windows 8
- Microsoft Windows 2008
- Linux (RHEL 6.5, Ubuntu 14.04)

Note: For installing Secure Connectors on Linux platform, use xWindows or KDE environment to use the GUI option.

The Secure Connector has the following minimum system requirements:

- 1 GHz CPU
- 2 GB RAM
- Java 1.7

Parent topic: [Using Secure Connectors](#)

Creating Secure Connectors

This topic provides information about creating Secure Connectors.

About this task

Use the Management Console to create a Secure Connector for your environment.

After you create a Secure Connector in the cloud, you must configure a machine behind the firewall to facilitate communication between the Secure Connector and a specific endpoint behind the firewall. Use the Secure Connector installer to configure the machine behind the firewall.

Note: If the endpoint you are creating a Secure Connector for requires additional libraries, use the Management Console to install the libraries before you deploy any project configurations that use the Secure Connector.

Procedure

1. From the Navigation pane of an environment tab, select System > Secure Connector.
2. Click New Secure Connector. The Create Secure Connector dialog box is displayed.
3. Provide a name for the new Secure Connector.
4. Provide a brief description of the Secure Connector.
5. Click Save. The Secure Connector is displayed in the Secure Connector page.

Parent topic: [Using Secure Connectors](#)

[Feedback](#) | [Notices](#)

Downloading Secure Connector Configuration Files

How to download Secure Connector configuration files.

About this task

When you download a configuration file, the configuration file is saved to your default download directory. You can choose to save configuration files to different locations. Regardless of the number of configuration files you download, you can only use one configuration file during the Secure Connector installation process.

Once you select a configuration file to set up a Secure Connector, that configuration file will be used to configure any subsequent Secure Connector. It is not recommended to configure multiple Secure Connectors using the same configuration file. Instead, use a new configuration file or modify the existing configuration file. The Gateway, Listen to Port, and Transmit to Port parameters should have unique values for each Secure Connector.

The Secure Connector configuration file provides the Secure Connector installer with values for the following parameters:

- **Secure Connector Name** - Specify the name of the Secure Connector you created.
- **Tenant ID** - Specify the hexadecimal UUID for the tenant. You can retrieve this information by logging in to the cloud and selecting Setup > Support Information. The Support Information page is displayed. Copy the Identifier column value for the tenant. You can copy the value by selecting the cell value, right-clicking, and selecting copy from the menu.
- **Environment ID** - Specify the hexadecimal UUID for the environment. You can retrieve this information by logging in to the cloud and selecting Setup > Support Information. The Support Information page is displayed. Copy the Identifier column value for the environment where you want the Secure Connector installed. You can copy the value by selecting the cell value, right-clicking, and selecting copy from the menu.
- **Cloud Gateway** - Specify the gateway name.
- **Listen on Port** - Only modify this parameter if another service is using the port specified or you want to run multiple Secure Connectors on the box.
- **Transmit on Port** - Only modify this parameter if another service is using the port specified or you want to run multiple Secure Connectors on the box.
- **Secure Connector Auth Key** - Specify the Auth key from the Secure Connector you created in the cloud.
- **Secure Connector Private Key** - Specify the Auth private key, which you downloaded while creating the Secure Connector in the cloud.

Procedure

1. Log into the Cloud Management Console as the tenant administrator.
2. From the Navigation pane of an environment tab, select System > Secure Connector.
3. In the Secure Connector window, click the Secure Connector that will communicate with an endpoint behind the firewall. The Edit Secure Connector dialog box is displayed.
4. Click Download Secure Connector Configuration and click Download now. The Opening Secure Connector Configuration dialog box is displayed.
5. Choose Save File and click OK. The configuration file is saved to the default download directory of the current user.

Parent topic: [Using Secure Connectors](#)

[Feedback](#) | [Notices](#)

 Last updated: Friday, February 5, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.live.doc/Secure_Connector/downloading_secure_connector_configuration_files.html

Installing Secure Connectors

Provides the procedures to download the Secure Connector installer and install the Secure Connector.

Before you begin

For Windows installations, verify that you do not have an existing version of the Secure Connector installed. If you have a earlier version installed, you can upgrade it to the latest version using the Upgrade option. For more information about upgrading Secure Connectors, see [Upgrading Secure Connectors](#).

For Linux installations, while it is not required, it is good practice to uninstall previous Secure Connector installations.

For Linux machines, install a desktop environment, such as GNOME or KDE, to provide a graphical interface.

About this task

After you create a Secure Connector in the cloud, you must configure a machine behind the firewall to facilitate communication between the Secure Connector and a specific endpoint behind the firewall. Use the Secure Connector installer to configure the machine behind the firewall.

Note: The machine on which you choose to run the installer must have access to the endpoint. You do not have to run the installer on the same machine as the endpoint.

To download the Secure Connector installer:

1. Log on to the Cloud Management Console as the tenant administrator. The Home page is displayed.
2. Click one of the environment tabs, that is, Development, Staging, and Production.
3. From the Navigation pane of the selected environment tab, click System > Secure Connector.
4. In the Secure Connector window, if you have already created a Secure Connector, click the Secure Connector that will communicate with the endpoint behind the firewall. The Edit Secure Connector dialog box is displayed.

Note: If there are no Secure Connectors available in the Secure Connector window, create a new Secure Connector. For more information about creating a Secure Connector, see <creating secure connector>.

5. Click Download Installer and choose the operating system of the machine to which the installer is downloaded: Windows or Linux.
6. Click Save File. The file is saved to the default download directory.

To install the Secure Connector:

1. Launch the Secure Connector installer you downloaded.
 - o windows-secure-connector-installer.exe (for 32-bit Windows machine)
 - o windows-secure-connector-installer_64 (for 64-bit Windows machine)
 - o linux-secure-connector-installer.sh (for 32-bit Linux machine)
 - o linux-secure-connector-installer_64.sh (for 64-bit Linux machine)

The Secure Connector Installer Wizard is displayed.

2. Select the Install option.
3. Click Next then read and accept the licensing agreement.
4. Click Next and choose an installation directory.
5. Click Next. A message window states the location where the target directory will be created.

Note: If an install directory exists, a warning message displays and you must confirm that you want to install and overwrite existing files.
6. Click OK.
7. Set up shortcut options to start, stop, and edit a Secure Connector.
 - a. Select one or both of the following options:
 - Create shortcuts in the Start menu.

- Create additional shortcuts on the desktop.
 - b. Select a program group from which you will access the shortcuts.
 - c. Choose to create shortcuts for the current user or all users.
8. Click Next. The installation progress is displayed.
 9. Select a Secure Connector configuration file. If you have not already downloaded a Secure Connector configuration file, download one now. For more information about how to download Secure Connector configuration files, see [Downloading Secure Connector Configuration Files](#).
 10. Click Next.
 11. For Windows installation, choose to install and run the Secure Connector as a Windows Service. If you choose install the Secure Connector as a Windows Service, you can control the Secure Connector using the Windows Services control panel (recommended). If you choose not to install and run the Secure Connector as a Windows Service, then the Secure Connector is installed as a Windows application. To run the Secure Connector as a Windows Service, you must specify the following service account information:
 - Service Start Mode
 - Service Account Domain
 - Service Account User
 - Service Account Password
 12. Click Next. The installation is complete.
 13. Click Done.

Note: If your endpoint, for example, SAP, requires additional libraries, you must install the additional libraries before you start the Secure Connector. For more information about installing additional libraries, see [Installing Vendor Supplied Libraries for Secure Connectors](#).

file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.live.doc/Secure_Connector/Adding_importing_truststore.html

Installing Vendor Supplied Libraries for Secure Connectors

Certain endpoints require additional libraries to be installed before the Secure Connector can communicate with them. This section provides information about using the Cloud Management Console to install these vendor supplied libraries. For a complete list of connectors that require vendor supplied libraries, open the Update Connector Libraries page in the Cloud Management Console.

About this task

If your integration project uses a connector that requires additional libraries, you must install the additional libraries before you deploy the project configuration. Deploying the project configuration before installing the additional libraries generates runtime errors. For a complete list of connectors that require vendor supplied libraries, open the Update Connector Libraries page. See the following procedure.

If you have a multi-environment tenant, you must install the 3rd party libraries in each environment where you deploy a project configuration with a connector that requires the additional libraries.

For example, you have a tenant with three environments: Development, Staging, and Production. You publish a project configuration for an SAP endpoint in the Development and Production environments. Before you can deploy the project configuration, you must install additional SAP libraries on both the Development and Production environments. For more information about installing SAP libraries, see [Downloading and installing the SAP Jar Files and DLLs](#).

Procedure

1. Click an environment tab.
2. Select System > Connector Libraries to open the Update Connector Libraries page.
3. In the Connector column, select the connector for which you want to install additional files.

Any files that have already been installed display in the Installed Files column.

4. Click the (+) icon and select the library file or files to upload. In the cloud, . jar and .dll are valid library files types. The files you select display in the Files to Add column.
5. Click Update.

The files that display in the Files to Add column are not committed until you click Update. If you click Reset before you click Update, the Cloud Management Console does not add the files you uploaded. If the Cloud Management Console times out before you click Update and commit the added files, repeat the last two steps.

6. In the same environment tab, select: System > Secure Connectors.
7. Click Download Libraries and save the libraries.zip file to your workstation.

8. Unzip the libraries.zip file and find a *.tp-1.0.0.jar for each connector module.
9. Use the .jar files in the libraries.zip to replace the files in the Secure Connector install directory: lib/plugins.
10. Copy all the remaining .zip files to following Secure Connector install directory: lib/thirdparty
11. Restart the Secure Connector by running one of the following files from a command line:
 - o For Windows: runclient_osgi.bat
 - o For Linux: runclient_osgi.sh

Downloading and installing the SAP Jar Files and DLLs

To connect to an SAP system from studio, you must install SAP DLLs and jar files onto your Windows development machine. You must have the SAP login credentials to enter the SAP Support Portal and download the files.

About this task

To download and install the SAP jar files and DLLs:

1. Contact SAP Technical Support to obtain the zip files for the following SAP Components:
 - o **SAP JCo Release 3.0.6 or later version - based on the platform on which studio is running.**
2. Unzip the SAP JCo zip file:
 - o Double-click the sapjdoc30P_6-1000xxxx.zip file.
 - o Use the decompression tool to extract the contents of the compressed file to a temporary directory. This zip file contains another zip file sapjco3-NTintel-3.0.6.zip. Extract this zip also to a temporary directory, for example: C:\temp\sapjco3-NTintel-3.0.6. This directory contains the required libraries sapjco3.jar and sapjco3.dll.
3. Unzip the SAP IDoc JCo zip file:
 - o Double-click the sapjdoc30P_6-1000xxxx.zip file.
 - o Use the decompression tool to extract the contents of the compressed file to a temporary directory, for example, C:\temp\sapjdoc30P_6-1000xxxx. This directory contains the required library sapidoc3.jar.

Procedure

1. Open studio, select Tools > Install Module Providers.
2. When the Add Providers dialog box is displayed, click the plus (+) button present beneath SAP Connector.

A text entry field and a Browse button is displayed.

3. Click Browse, and use the browse dialog box to locate and select the sapjco3.jar file.

4. Click Open to import the jar file contents.
5. Click the next available plus (+) button to add the `sapidoc3.jar` and `sapjco3.dll` files.
6. When the jar file is listed in the Add Providers dialog box, click OK.

Results

A prompt is displayed to restart studio and activate the changes.

What to do next

You can now create SAP endpoints and orchestrations.

Uninstalling Secure Connectors (Windows)

This topic provides information about uninstalling a Secure Connector from a Windows machine.

About this task

The following procedure allows you to uninstall a Secure Connector and all its configuration settings.

Procedure

1. Verify that another program, such as your browser or command shell, does not have any of the Secure Connector directories open.
2. From the Windows Start button, select All Programs > IBM > Cast Iron Secure Connector <connector_name> > Stop Secure Connector.
3. From the Windows Start button, select All Programs > IBM > Cast Iron Secure Connector <connector_name> > Uninstall Secure Connector. The Uninstaller window is displayed.
4. Select Force the deletion of C:\Program Files\IBM\Secure_Connector_<connector_name>.
5. Click Uninstall.
6. When the status bar displays [Finished], you can close the Uninstaller window.

Uninstalling Secure Connectors (Linux)

This topic provides information about uninstalling a Secure Connector from a Linux machine.

Before you begin

You must have root level permissions to uninstall the Secure Connector from a Linux machine.

About this task

You can uninstall the Secure Connector by using a graphical interface, issuing a command line command, or running the Java `uninstall.jar` file. Choose one of the following options to uninstall a Secure Connector and all its configuration settings from a Linux machine.

Uninstalling the Secure Connector using a graphical interface: You must have a desktop environment, such as GNOME or KDE, to successfully uninstall the Secure Connector using this procedure.

1. Verify that another program, such as your browser or command shell, does not have any of the Secure Connector directories open.
2. From the application directory, select IBM > Cast Iron Secure Connector <*connector_name*> > Stop Secure Connector.
3. From the application directory, select IBM > Cast Iron Secure Connector <*connector_name*> > Uninstall Secure Connector.

Uninstalling the Secure Connector from the command prompt:

1. Verify that another program, such as your browser or command shell, does not have any of the Secure Connector directories open.
2. From the command prompt, issue the `./Uninstaller/uninstall.sh` command.

Uninstalling the Secure Connector with .jar file. You must have Java™, version 1.6 or higher installed to successfully uninstall the Secure Connector using this procedure.

1. Verify that another program, such as your browser or command shell, does not have any of the Secure Connector directories open.
2. From the command prompt, enter the `runclient_osgi.sh stop` command.
3. In the directory where you installed the Secure Connector, navigate to the Uninstaller sub-directory to find the `uninstaller.jar` file: `"${JAVA}" -jar "${INSTALL_DIR}/Uninstaller/uninstaller.jar"` where `{JAVA}` is the Java executable and `{INSTALL_DIR}` is the Secure Connector name.

A dialog box is displayed.

4. Select the Force the Deletion option.
5. Click Uninstall.
6. Click Quit.

Results

The Secure Connector is uninstalled. Configuration settings are retained in the home directory.

Starting and Stopping Secure Connectors

Starting and Stopping Secure Connectors topics provide information about starting and stopping Secure Connectors on Windows and Linux machines. For Windows machines, options you chose during installation affect how you can start and stop Secure Connectors. If you installed the Secure Connector as an automatic Windows Service, as recommended, then you can use the Windows Services control panel to stop and start the Secure Connector. If you installed the Secure Connector as a Windows application, then you can start and stop the Secure Connector using Windows Start menu shortcuts or desktop shortcuts. For Linux machines, you can start and stop Secure Connectors by using a graphical interface or by running commands from the command line.

Starting and Stopping Secure Connectors on Windows (Installed as a Windows Service)

This topic provides information about starting and stopping Secure Connectors on Windows machines, where you have a Secure Connector installed as a Windows Service.

About this task

If you installed the Secure Connector as an automatic Windows Service, as recommended, use the Windows Services control panel to stop or restart the Secure Connector.

By default, when a Secure Connector is installed as a Windows Service, the Secure Connector is not configured to interact with the Windows Desktop. However, if the Secure Connector service was installed under a local system account, you can enable an interactive mode that presents system tray icons and a command window when the Secure Connector service is running.

For steps to enable the interactive mode for a Windows service, see [Enabling Interactive Mode for Windows Services](#).

Note: If you use the **Start Secure Connector** Start menu shortcut or desktop shortcut to start a Secure Connector, the Secure Connector starts as a normal application rather than as a service. You must use the Windows Services control panel to start Secure Connectors as a service. You can use either the **Stop Secure Connector** Start menu shortcut or desktop shortcut to stop a Secure Connector.

Starting and stopping Secure Connectors, using the Windows Services control panel:

Procedure

1. Open the Windows Services window : Start > Control Panel > Administrative Tools > Services.
2. Scroll down the list of services to locate the IBM® Secure Connector service.
3. Right-click on the IBM Secure Connector service and select the appropriate command: Start, Stop, Pause, Resume, or Restart.

Enabling Interactive Mode for Windows Services

When the Secure Connector is installed as a Windows Service, enable the interactive mode for the service to view system tray icons and command window.

About this task

By default, when a Secure Connector is installed as a Windows Service, the Secure Connector is not configured to interact with the Windows Desktop. However, if the Secure Connector service was installed under a local system account, you can enable an interactive mode that presents system tray icons and a command window when the Secure Connector service is running.

Procedure

1. Open the Services control panel. For example: Start > Control Panel > Administrative Tools > Services.
2. Select the Cast Iron Secure Connector service.
3. Right-click the service name, and select Properties. The Service Properties window is displayed.
4. Select the Log On tab.
5. Select Local System account and then select Allow service to interact with desktop.
6. Click OK.
7. Click Restart.

Results

When the Cast Iron Secure Connector service is restarted, system tray icons and a command window is displayed.

Note: You can minimize the command window. However, if you close the command window, the Cast Iron Secure Connector service will be stopped and terminated. Closing the command window is the equivalent of stopping the Secure Connector service from the Windows Services control panel.

Starting and Stopping Secure Connectors on Windows (Installed as a Windows Application)

This topic provides information about starting and stopping Secure Connectors on Windows machines, where you have a Secure Connector installed as a Windows application.

About this task

When the Secure Connector is installed on a Windows machine as a Windows application, rather than a Windows Service, you can start and stop the Secure Connector using Windows Start menu shortcuts or desktop shortcuts.

Procedure

1. Start the Secure Connector from either the Windows Start menu shortcut or desktop shortcut.
 - From the Windows Start button, select All Programs > IBM > Cast Iron Secure Connector <connector_name> > Start Secure Connector.
 - From the Windows desktop, click the Start Secure Connector shortcut to start the Secure Connector.
2. Stop the Secure Connector from either the Windows Start menu shortcut or desktop shortcut.

- From the Windows Start button, select All Programs > IBM > Cast Iron Secure Connector <connector_name> > Stop Secure Connector.
- From the Windows desktop, click the Stop Secure Connector shortcut to stop the Secure Connector.

Upgrading Secure Connectors

This topic provides information about upgrading Secure Connectors.

Procedure

1. Create a new Secure Connector.
2. Download the latest version of the Secure Connector installer, based on your operating system. For example, Windows or Linux.
3. On a Windows or Linux machine, launch the Secure Connector installer. The Cast Iron® Secure Connector wizard guides you through the upgrade process.
Note: If you already have a Secure Connector installation that is higher than or same as the latest version, a warning message states that you have an existing installation and alternatively you can upgrade the existing installation.
Note: You must stop the Secure Connector (if already started) before upgrading.
Note: Before you proceed with the Secure Connector upgrade process, ensure that you have:
 - o Stopped the Secure Connector
 - o Taken a manual backup of the certificates (if any) located at `<secure_connector_install_path>/etc/security` or `jre/lib`. You may want to replace/add your certificates after upgrade.
4. Click the Upgrade option. The Select the installed path list box is displayed.
5. Select the Secure Connector installed path, if it is displayed in the list box. Else, click Browse button to select the installed path.
6. Click Next, then read and accept the licensing agreement.
7. Click Next. The installation progress is displayed. A message is displayed stating that the installation has been completed successfully. The path to the installer program is also displayed.
8. Click Done.
9. Start the Secure Connector.

Updating Secure Connector Configuration

This topic provides information about updating Secure Connector configuration.

Procedure

1. Download the new Secure Connector configuration file. For more information, see [Downloading Secure Connector Configuration Files](#).
2. Launch the Secure Connector Configuration wizard. To launch the wizard:
 - a. Windows machine: Go to Start > All Programs > IBM > Cast Iron Secure Connector <connector_name> > Secure Connector Configuration.
 - b. Linux machine: Select <application> > IBM > Cast Iron Secure Connector <connector_name> > Secure Connector Configuration.
3. The Secure Connector configuration wizard guides you through the upgrade process.
4. Click Next. The current Secure Connector Configurations are displayed if the Secure Connector is already configured. If not, browse for the newly downloaded configuration file and click Next.
5. Modify the Secure Connector configuration by completing one of the follow steps:
 - a. Modify the Cloud Gateway, Listen on Port, and Transmit on Port parameters and click Next. Or
 - b. Click the Previous button and select a new Secure Connector file.
 - i. Click Next and verify the configuration settings.
 - ii. Click Next.
6. Specify settings for a proxy server: Proxy Server, Proxy Port, Login ID, Login Password, and Retype Password. These parameters are only required if your network requires that the Secure Connector uses a proxy to connect to the Cast Iron® Cloud Gateway.
7. The Create Vendor Supplied Libraries screen is displayed.
8. Click Add and select the library files to upload. In the appliance, the valid files are .jar, .dll, and .so file types. The files that you select are displayed in the Files to Add column.
9. Click Update.

The files that display in the Files to Add column are not committed until you click Update.

10. Click Next. A dialog box is displayed to confirm the changes made, if you have not clicked the Update button. Click Yes to update changes and proceed further. If you click No to go to the next screen without any changes. Click the Cancel button to stay on the same screen.
11. When you click Yes to proceed further, the `Vendor JAR created/updated successfully` message is displayed.
12. Click OK. A message saying that the installation has completed successfully is displayed.
13. Restart the Secure Connector.

Troubleshooting Secure Connectors

This topic provides potential solutions for issues you have with the Secure Connector.

Secure Connector log files are available for your review. The Log directory is created after the initial start of the Secure Connector. The Log directory is located in the Secure Connector install directory. For example:
C:\Program Files\IBM\Secure_Connector_1.development\logs

- **A port contention error occurs.** A port contention error can occur when two Secure Connectors are configured to use the same port and gateway. To resolve the issue, provide unique values for the Gateway, Listen on Port, and Transmit on Port parameters in each Secure Connector configuration file.
- **Unable to run .jar file to uninstall a Secure Connector.** Verify that the Java path is specified correctly and that you have Java version 1.6x or higher installed on the machine.

About Certificates

Certificates enable secure communication between the Integration Appliance and endpoints located in your intranet and extranet. Use the Management Console to manage certificates.

From the Certificates page, you can generate, import, and update security certificates and security settings.

The following tables provides definitions for certificate terminology.

Certificate Terminology	Definition
-------------------------	------------

Certificate Terminology	Definition
Alias	A string of alphanumeric characters you assign to a KeyStore or TrustStore entry to provide a more user friendly name. Within a KeyStore or TrustStore you can use an alias to refer to the keys and certificates. Note: Aliases are not case sensitive. For example, MyCert and mycert refer to the same entry.
Certificate	A signed credential which identifies an endpoint or organization.
Key Pair	A public key and associated private key.
KeyStore	A Java™ data store that houses private keys and certificates used by a Java SSL endpoint. For example, a local Java endpoint supplies a certificate from its KeyStore as a credential to identify itself to a remote SSL endpoint.
PKI	Public Key Infrastructure is a system for managing encryption keys and identity information. The purpose of the system is to provide standards based system for protecting/securing communications over the internet.
Private Key	A key known only to a single endpoint used to encrypt and/or sign data.
Public Key	A key associated with a private key that can be distributed to anyone.
SSL	Secure Sockets Layer enables secure web communications and permits endpoints to optionally authenticate each other.
TrustStore	A Java data store that houses certificate authority signed certificates. For example, a local Java endpoint utilizes a TrustStore to authenticate the identity (certificate) provided to it by a remote SSL endpoint.

Importing Certificates

About this task

You can import a certificate or certificate chain into the IBM® WebSphere® Cast Iron KeyStore. You can also import trusted Certificate Authority certificates (CA Certs) to the TrustStore.

Procedure

1. In the Key Store section, click Generate. The Generate Self-Signing Certificate dialog box displays.
2. In the Key Store or Trust Store section, click Import. The Import Certificates dialog box is displayed.
3. Specify an alias name. This name is used to identify the imported certificate or certificate chain.
4. Optional: Provide a key password.

The password protects the private key of the key pair associated with the alias. If you do not specify a password, the password defaults to the password protecting the KeyStore.

5. If you are importing a certificate from a trusted site, select the Trusted option.

If you select the Trusted option, the certificate is imported without checking for an existing chain of trust. If you do not select the Trusted option, the KeyStore and TrustStore is checked to ensure a chain of trust exists for the certificate being imported.

6. Choose to import the content from a file or from content in the clipboard that contains the certificate or certificate chain to be imported.

Supported formats include: CER/PEM (RFC 1421), DER, PKCS7, and PKCS12.

7. Click Import.

Results

The certificate is displayed in the Certificates page.

- [Viewing Job Logs](#)
- [Customizing columns in System log and Job log](#)

You can customize the columns displayed in the System log and Job log pages, respectively.

Feedback | Notices

 Last updated: Friday, February 5, 2016
file:///dcs/markdown/workspace/Transform/out.html

Specify System Log Settings

About this task

You can specify the level of details that appears in the system logs. The log level you specify affects alerts for notification policies. Alerts are only sent for events that meet or exceed the log level you specify.

Note: If you do not receive notifications for events, it might be that you do not have the system log level set to produce entries that would trigger a notification.

Procedure

1. In the Navigation pane, select Logs > System Log. The System Log page is displayed.
2. Click Settings. The System Log Settings dialog box is displayed.
3. From the list, select a log level for each system.
4. Click Save.

Results

A confirmation message displays. The system log logs all events that occur at the level you specified or higher for the specific system. For example, if you chose the Error level for Deployment, all events that were Error or Critical level in the Deployment system are logged.

Parent topic: [Working with Logs](#)

Feedback | Notices

 Last updated: Friday, February 5, 2016

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.live.doc/Working_with_Logs/specifyingSystemLogSettings.html

Viewing System Logs

About this task

You can view system logs from the Management Console and use the system log filters to sort through system log entries.

When you upgrade, the Management Console does not persist system logs. To retain system log information, export system logs before you upgrade.

Note: The Management Console displays a maximum of 99,999 system log entries. When the number of system log entries exceeds 99,999, the oldest log entry is deleted from the system log.

Procedure

1. From the navigation pane, select Logs > System Log. The System Log page is displayed.
2. Choose the filter values from the lists at the top of the System Log page.

You can filter the log entries according to the level of severity for the event, the environment system that generated the log event, dates, and resolution state. The filters use AND logic.

Parent topic: [Working with Logs](#)

System Log Content

The system log provides the following information:

System Log Content	Description
Level	Identifies the level of severity of the log event: <ul style="list-style-type: none">• Critical• Error• Warning• Info
System	Identifies the system where the log event occurred.
Message	Text messages that provides details about the log event.
Job	When available displays Job ID information for log events that occur in the Orchestration system.
When	Records the time when the log event occurred.
Resolved On	Provides a time stamp of when you resolved a log event.
Resolved By	Identifies which user resolved a log event.
Resolved	Select this checkbox to acknowledge that you have resolved a log event. When a user resolves a log event, a time stamp documents the date and time the issue was resolved. Information about the user who resolved the log event is tracked in the Resolved By column. You can resolve all the system log issues, by clicking Resolve All. Clear the checkbox next to any log events that are not resolved and the Resolved On and Resolved By values are cleared.

Viewing Job Logs

About this task

You can view job logs from the Cloud Management Console and use the job log filters to sort through job log entries.

Procedure

1. From the navigation pane, select Logs > Job Log. The Job Log page is displayed.
2. Choose the filter values from the lists at the top of the Job Log page.

Customizing columns in System log and Job log

You can customize the columns displayed in the System log and Job log pages, respectively.

About this task

You can customize the columns to be displayed in the System Log and Job Log pages by editing the column display settings. To customize the log page columns, complete the following steps:

Procedure

1. From the navigation pane, select Logs > System Log or Job Log. The System Log page or the Job Log page is displayed.
2. Click Edit Columns. The Log Columns Settings window is displayed.
3. Select the columns that need to be displayed on the System Log or Job Log page. By default, all the columns are selected in the Log Columns Settings window.
4. Click Save. Only those columns selected by you will be displayed in the System Log or Job Log page.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.appliance.doc/About_the_WMC/toc_about_the_wmc.html

About Management Console Settings

From the Settings link, you can manage various user profile, session, and display preferences. The Web Management Console supports only the English language. The Settings link is in the upper right corner of the Management Console.

From the Settings dialog box, you can view and edit the following settings and preferences.

Table 1. User Profile Setting

User Profile Setting	Description
User Name	The name of the user currently logged in.
Display Name	The name that displays on the console and that displays in the logs.

User Profile Setting	Description
Password	Password for the current user: <ul style="list-style-type: none"> • Minimum length is 8 characters • Maximum length is 15 characters • Must contain characters from 3 of the 4 following categories: <ol style="list-style-type: none"> 1. upper-case 2. lower-case 3. numeric 4. punctuation (for example, !, \$, #, %) • Must not contain any 3 character substring of user name • Must not contain any 3 character substring of prior password
Email	Current user email address. Email notifications are sent to this email.
User Groups	User groups for which the user is a member.

Login Policy

When the 5th consecutive login failure occurs for a single user, in any span of time, the user is prohibited from logging-in again for a delay interval of 15 seconds.

For each subsequent login failure, the delay interval doubles until the delay interval capacity is reached. The delay interval capacity is 1 hour. A successful login by the user resets the login failure count and the delay interval for the user.

Table 2. Session Settings

Session Settings	Description
Inactivity Timeout	The amount of inactive time the console waits before logging off the current user. You can choose one of the following timeout intervals: <ul style="list-style-type: none"> • 5 minutes • 15 minutes • 30 minutes • 60 minutes • Never
Dashboard Refresh Interval	The amount of time the console waits before refreshing the view. You can choose one of the following refresh intervals: <ul style="list-style-type: none"> • 15 seconds • 30 seconds • 60 seconds • Off

Table 3. Display Settings

Display Settings	Description

Display Settings	Description
Time Zone	Allows you to specify the time displayed on the console. You can specify one of the following display modes: <ul style="list-style-type: none"> • Local Time (GMT-0800) • Remote Time (GMT) • GMT
Page Size for Jobs Log	Allows you to specify the number of rows of the Jobs log to display on the console. You can choose to display 15, 25, 50, or 100 rows.
Page Size for System Log	Allows you to specify the number of rows of the System log to display on the console. You can choose to display 15, 25, 50, or 100 rows.
Maximum Age for Recent Jobs	Allows you to specify the age of the recent jobs that are displayed on the console. For example, if you choose 1 hour, any job that is older than an hour is not displayed. You can include jobs as old as: 1 hour, 2 hours, 4 hours, 8 hours, 1 day, 2 days, 5 days, or 1 week.
Maximum Age for Recent Configurations	Allows you to specify the age of the recent project configurations that are displayed on the console. For example, if you choose 1 day, any project configuration that is older than a day is not displayed. You can include project configurations as old as: 1 day, 2 days, 5 days, 1 week, 2 weeks, 3 weeks, or 4 weeks.

Navigating the Management Console

The Management Console is a web-based tool that allows you to manage and monitor the various systems and resources of your integration environment. This environment can be a physical Integration Appliance or an environment in the WebSphere® Cast Iron® Cloud.

The navigation pane on the left of the Management Console displays a menu of pages that allow you view, configure, and take actions on various systems and resources.

If you have logged on to the Management Console as an administrator, you can view the reports of:

- **Publish details:** Displays the configurations published, by whom it was published, and the date and time when it was published.
- **Login History:** Displays the login history of the user or users that logged on to the appliance. The login history includes the name of the user, the log in time, and the log out time.

The back and forward buttons on browsers do not allow you to move through the Management Console pages in the order which you opened them. Use the back and forward arrows in the top right corner of the Management Console to move through the Management Console pages in the order you opened them.

The user that is currently logged in is also displayed in the upper right corner. Click Settings > User Profile to open the User Profile window.

Local Staging Database

Local Staging Database topics provide information about using the local staging database in the Web Management Console.

- [About the Local Staging Database](#)
- [Starting the Local Staging Database](#)
- [Stopping the Local Staging Database](#)

[Feedback](#) | [Notices](#)

 Last updated: Friday, February 5, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.appliance.doc/Local_Staging_Database/toc_local_staging_database.html

About the Local Staging Database

In Studio, you can build projects with Data Quality activities that sort and merge data from a source system to help you cleanse and quickly migrate the data to a target system. As the Data Quality activities in a project iteratively process data from a source system--sorting "good" and "bad" data, the Integration Appliance can store the data in a Local Staging Database.

From the WMC, you can view the local database tables and lookup tables to make further changes, as needed, to the processed data. You must have the appropriate permissions to view tables and perform operations on the Local Staging Database.

Important: The Local Staging Database must be started before you can view the Database Viewer in the WMC.

Database Viewer Panes

The Database Viewer is made up of three panes:

Database Objects pane

Located on the left-hand side of the Database Viewer, this pane displays all tables in the Local Staging Database, including fields and rows.

Query pane

Located in the upper-right side of the Database Viewer, this pane provides a workspace for you to validate and submit queries to the Local Staging Database. You can manage each query in a separate tab. You can perform the following operations on each tab:

- Validate Query
- Submit Query
- Clear Query
- Close Tab

Summary pane

Located in the lower-right side of the Database Viewer, this pane contains two tabs: Results and History.

- **Results tab** - Provides a summary of the rows returned from the query.
- **History tab** - Provides a log of events that have occurred on the Local Staging Database. A time stamp marks each event logged. The log of events persists as long as the WMC is open. Once you close the WMC, the History tab is cleared.

Parent topic: [Local Staging Database](#)

 Last updated: Friday, February 5, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.appliance.doc/Local_Staging_Database/aboutLocalStagingDB.html

Starting the Local Staging Database

About this task

From the WMC, you can start and stop the Local Staging Database. You must start the staging database to view or update data. By default, the staging database is in a stopped state. In the stopped state, you cannot view or update the staging database. When you stop the database, all sessions for all users also stop.

Only users with Administrator privileges, granted as being part of the built-in Administrator group, can start, stop, and perform operations on the Local Staging Database. Users with Publisher privileges can only view the database if the Local Staging Database has already been started by a user with Administrator privileges. If the Local Staging Database has not been started, users with Publisher privileges will not be able to view the database. Users that are part of the built-in Users group or with WMC login credentials created in an LDAP Server do not have access to the Local Staging Database.

Procedure

1. From the navigation pane, select System > Staging DB. The Staging DB page is displayed.
2. Click Start Database.

Best Practices for Memory Management

Outlines memory management best practices to maintain a healthy runtime environment and avoid out of memory errors.

An Integration Appliance sets aside a pool of memory to run orchestration jobs. Managing this pool of memory is key to maintaining a healthy runtime environment.

There is a direct relationship between the amount of memory used and garbage collection cycles. Garbage collection is a process that returns memory, held by completed jobs and variable data, back to a pool of memory used by all orchestration jobs. This garbage collection process ensures that the Integration Appliance has a constant supply of free memory that new orchestration jobs can use.

Garbage collection (GC) is a continual process that runs in the background with no effect on orchestration job performance. However, when memory reaches a critical threshold, a more in-depth process known as full garbage collection occurs. The full garbage collection process puts all the running jobs into a sleep state and returns unused memory back to the pool. Because all orchestration jobs stop during a full garbage collection, frequent full garbage collections can affect orchestration performance.

When the GC Activity value on the Resource Utilization Graph spikes at regular intervals, there is most likely a high demand on memory that the Integration Appliance is trying to manage by initiating more frequent full garbage collection cycles. However, high memory usage does not necessarily mean an increase in full garbage collection cycles. For example, a large volume of short running orchestrations results in a larger percentage of memory being used. But the garbage collection cycles, constantly running in the background, most likely return memory back to the pool of memory quickly enough that the overall memory usage is never high enough to trigger a full garbage collection. Full garbage collections stop all orchestrations, so frequent full garbage collections can affect orchestration performance.

Scenarios where high memory usage likely results in frequent full garbage collection cycles include a mix of orchestration types. For example, having multiple, non-persistent, long running orchestrations with numerous variables processing large objects. These types of orchestrations would consume and tie up large amounts of memory that could not quickly be returned to the memory pool.

Note: These types of orchestrations are not recommended by Cast Iron®.

The following table provides a list of best practices that will help you manage memory usage and maintain a healthy runtime environment.

Table 1. Best Practices for Memory Management

Best Practice Principles	Description
Reduce logging levels.	<p>More detailed logging requires more memory to process and store the data and also increases the I/O load on the Integration Appliance disk, which can slow performance. Detailed logging levels are recommended for debugging purposes only and not recommended for production environments, where high volumes of data are processed.</p> <p>The Integration Appliance generates system logs and orchestration job logs.</p> <p>Cast Iron recommends setting the System Log level to "Warning" for all components that are tracked in the system log:</p> <ul style="list-style-type: none"> • Hardware • Resources • Network • Security • Orchestration • Deployment <p>If the number of warnings generated by the various system components is high, memory usage might become an issue. Either resolve the problem that is causing the warnings to be generated or increase the system logging level to "Error". For more information about setting system log levels, see Specify System Log Settings.</p> <p>Orchestration logging levels are specified for each orchestration in a project. Cast Iron recommends setting Logging Levels to "Error Values" for all orchestrations under all projects on the Integration Appliance. For more information about setting orchestration log levels, see Editing Orchestration Settings.</p>
Verify persistence is enabled for all orchestrations.	<p>By default, persistence is enabled for an orchestration and variable data is written to disk instead of memory. Enabling persistence has the added benefit of point-in-time data recovery should a fault occur during runtime.</p> <p>If you disable persistence for an orchestration, data is stored in memory. While disabling persistence can improve performance, as the number of running jobs increases the likelihood of running out of memory also increases. Because of the high risk of running out of memory, proceed with extreme caution when you choose to disable persistence.</p> <p>Note: Turning off persistence reduces the number of orchestration jobs that the Integration Appliance can run simultaneously. The limit is set by the amount of memory available on the Integration Appliance.</p>

Best Practice Principles	Description
Use scheduling capabilities available in the Web Management Console (WMC) and Studio to stagger orchestration jobs.	<p>By scheduling memory intensive jobs to start at different times or to run during off-peak hours, you relieve some of the load on memory, reduce the number of full garbage collections, and potentially improve performance.</p> <p>In Studio, you can use the Schedule Job activity or configure polling intervals for activities in an orchestration to stagger orchestration jobs and maximize resource utilization. You can also create a schedule in the WMC, to control when the Integration Appliance should run an orchestration job. Measure the average execution time of a given orchestration job, so you can optimize job schedules.</p>
Minimize the number of variables used in an orchestration.	The more variables you use in an orchestration, the more memory is required to store the data. This in turn could increase the number of garbage collection cycles and affect performance. Review your orchestrations to see if you can reduce the number of variables used.
Reduce the number of simultaneously running jobs.	<p>In the WMC, you are able to specify the maximum number of simultaneously running jobs for an orchestration. As the number of concurrently running orchestrations increases, so does the percentage of memory usage increase. If you notice memory is getting overloaded, reduce the number of jobs running simultaneously.</p> <p>The effects of reducing the number of simultaneously running jobs is especially impactful for non-persistent, long running orchestrations jobs that contain a large number of variables.</p> <p>Note: These types of orchestrations are not recommended by Cast Iron.</p>
Do not exceed 75% load on memory.	In the WMC Resource Utilization Graph, you can track the percentage of memory used. When the percentage of memory used is approximately 75% or less, the Integration Appliance has capacity to process more orchestrations. When the percentage of memory used exceeds approximately 75%, you will likely notice performance issues as the number of full garbage collections increase.
Limit full garbage collection cycles.	In the WMC Resource Utilization Graph, you can use the GC Activity value to track a percentage of full garbage collections. When this percentage exceeds 50%, you might notice a reduction in the throughput of your orchestrations jobs. Implement the best practices for memory management to reduce memory usage and thus reduce the likelihood of full garbage collection cycles occurring.
Add additional Integration Appliances to your environment.	After implementing the best practices principles, if memory usage continues to be high, it might be time to add another Integration Appliance to your environment.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.appliance.doc/Managing_Integration_Appliances/toc_managing_integration_appliances.html

About Connectors

The Connectors page displays all the connectors that are installed on the Integration Appliance. From the Connectors page you can also see the version number of each installed connector and licensing status for each connector. The Integration Appliance can only process configuration projects that contain endpoints with valid connector licenses. To open the Connectors page, select System > Connectors from the navigation page.

Some connectors require you to install additional libraries, before you can deploy a configuration project. On the Connectors page, click the Update Libraries link to manage these additional connector libraries.

Downloading and installing SAP library files

Before you begin

You must have an SAP User ID and password to enter the SAP Support Portal to download the files.

About this task

In order to connect to an SAP system, you must install SAP libraries onto your development environment.

Note:

If you have older versions of the `librfccm.so` and `libsapjcorfc.so` files in any system directories, you must remove these files. Appliance must use the `libsapjco3.so` file provided with SAP JCo Release 3.0.x.

You must use 64 bit SAP JCo libraries for Cast Iron® version 7.0 and later versions; and 32 bit SAP JCo libraries for Cast Iron version 6.4 and earlier versions.

Procedure

1. Contact SAP Technical Support to obtain the following zip files for the following SAP Components:
 - SAP 32 bit JCo version 3.0.10 or later versions - Linux 32 bit version.
 - SAP Java® IDoc Class Library 3.0.10 or later versions.
2. Extract the contents of the package received from SAP Technical Support and copy it onto a local folder.
3. Log on to the Management Console and select System > Connectors. The Connectors page is displayed.
4. Click Update Libraries. The Update Connector Libraries window is displayed.
5. Select SAP in the Connector column.
6. Click the plus (+) button and repeat the following substeps until you have imported all the jar files you just downloaded.
 - a. Locate one of the jar files you just downloaded (`sapjco3.jar`, `sapidoc3.jar`, and `libsapjco3.so`).
 - b. Click Open to import the jar file. The file is displayed in the Files to Add column.
7. Click Update.

The files that display in the Files to Add column are not committed until you click Update. If you click Reset before you click Update, the Management Console does not add the files you uploaded. If the Management Console times out before you click Update and commit the added files, repeat the last two steps.

Results

You can now run SAP projects.

Configuring Secure Network Communications (SNC) for SAP connector

In Cast Iron version 6.3.0.2 and later versions, you can connect to SAP through the SAP connector by using the SNC feature.

Procedure

1. Upload `libsapcrypto.so` to the same place where SAP JCo JARs are uploaded (for more information, see [Downloading and installing SAP library files](#)) in system library using WMC.
2. Run the shell commands to add the SAP crypto directory to the path variable of the system and to add the system credentials to the `.pse` file.
Note: Shell commands can be run only by the IBM WebSphere Cast Iron L2 or L3 support engineers and share the `.pse` file with IBM Support if required.

Executing Commands

About this task

To run a system control command against the Integration Appliance:

Procedure

1. From the navigation pane, select System > Command. The System Commands page is displayed.
2. From the Choose Command drop-down list, select a command. You can view command details by clicking the drop-down arrow.
3. Click Go.

Parent topic: [Managing Integration Appliances](#)

System Control Commands

You can execute the following commands against a standalone Integration Appliance or an High Availability (HA) Pair. For more information about HA specific commands, see [Working with High Availability Pairs](#).

System Control Commands	Descriptions
Remove Job History	Removes all job history from the Integration Appliance.
Remove Projects & Configurations	Removes all projects, orchestrations, and project configurations from the Integration Appliance.
Remove All Jobs in Progress	Removes all data for currently running projects.
Download Postmortem	Generates and downloads a postmortem file to the location you specify.
Restart	Stops and restarts the Integration Appliance.

System Control Commands	Descriptions
Reboot	Shuts down all services and then reboots the Integration Appliance.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.appliance.doc/Managing_Integration_Appliances/executingCommands.html

Exporting A Repository

About this task

Export the project repository to create a backup before upgrading an Integration Appliance. You can export all project configuration and user settings, which includes: network configurations, users and groups, licenses, job log parameters, log levels, notifications, downtime rules, and passwords, from the WMC to another location.

The Integration Appliance system logs are not exported when you export a repository. So if you import an earlier version of the repository, the system logs still contain events that occurred before the new repository was imported.

You can export a repository with the project configurations running. However, when you import this repository, the project configurations will all be in the undeployed state.

Procedure

1. In the Navigation pane, select Repository > Import/Export. The Import/Export Repository dialog box is displayed.
2. Click Export. The Save As window displays.
3. Specify the location where you would like to save the exported repository.
4. Click Save. The WMC exports a copy of the repository as a .tar.gz file.

Parent topic: [Managing Integration Appliances](#)

[Feedback](#) | [Notices](#)

 Last updated: Friday, February 5, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.appliance.doc/Managing_Integration_Appliances/exportingRepository.html

Importing A Repository

About this task

When you import a repository, the WMC deletes some information held in the existing repository. Exactly which information is deleted depends on which option you select when you import the repository, as explained in this topic. However, the system log is not deleted. Therefore, you could potentially see system log entries from the previous repository. Once you have imported a repository, you cannot roll back to a previous repository. Therefore, it is recommended that you export the existing repository before importing another repository.

You must stop and undeploy all project configurations on the WMC, before you can import a repository. When the WMC successfully imports a repository, all the project configurations are in the undeployed state.

Procedure

1. In the Navigation pane, select Repository > Configurations. The Project Configurations page is displayed.
2. From the Configurations Filter list, select All. All project configurations are displayed.
3. Stop and undeploy all project configurations.
4. In the Navigation pane, select Repository > Import/Export. The Import/Export Repository dialog box is displayed.
5. In the Repository File field, specify the path for the repository that you want to import.
6. Choose an import option:
 - Project and User Settings
Imports all the contents of the repository file you select. All projects are imported in the undeployed state.
 - Project Settings Only
Imports projects, configurations, notification policies, and job logs, from the repository file you select. All projects are imported in the undeployed state.
Note: Any projects, configurations, notification policies and job logs that exist prior to the import will be deleted.
 - User Settings Only
Imports only the user setting information from the repository file you select. User setting information includes: network configurations, users and groups, licenses, job log filter parameters, system log levels, downtime rules and passwords.
7. Click Import. A warning is displayed.
8. Click Import to verify that you would like to proceed.

Results

The Integration Appliance imports the repository and restarts the Integration Appliance. When the import is complete, the WMC login window displays.

Installing Libraries from Other Vendors

About this task

If your integration project uses a connector that requires extra libraries, you must install the additional libraries before you deploy the project configuration. Deploying the project configuration before installing the additional libraries generates run time errors. For a complete list of connectors that require vendor libraries, open the Update Connector Libraries page. See the following procedure.

If you have a multi-environment tenant, you must install the vendor libraries in each environment where you deploy a project configuration with a connector that requires the additional libraries.

For example, you have a tenant with three environments: Development, Staging, and Production. You publish a project configuration for an SAP endpoint in the Development and Production environments. Before you can deploy the project configuration, you must install extra SAP libraries on both the Development and Production environments.

Procedure

1. Click an environment tab.
2. Select System > Upgrade > Upgrade Connector Libraries to open the Update Connector Libraries page.
3. In the Connector column, select the connector for which you want to install additional files.

Any files that have already been installed display in the Installed Files column.

4. Click the plus (+) icon and select the library files to upload. In a Linux system, the valid files are .jar or .so; in a Windows system, the valid files are .jar or .dll. The files that you select are displayed in the Files to Add column.
5. Click Update.

The files that display in the Files to Add column are not committed until you click Update. If you click Reset before you click Update, WMC does not add the files that you have uploaded. If WMC times out before you click Update and commit the added files, repeat the last two steps.

Scheduling Downtime

About this task

Scheduling downtime allows you to perform maintenance on an environment or related system. You can create downtime rules for project configurations that stop or suspend all enabled orchestration jobs in that project configuration for a specified duration of time. The project configuration does not have to be undeployed to create or edit a downtime rule. Downtime rules can occur once or repeat at specific intervals. You must have administrator or publisher permissions to create, edit, or delete a downtime rule.

By default, downtime rules are stored in GMT time zone. If an administrator modifies the system clock from GMT to another time zone, downtime rules are executed at the same absolute time. For example: You create a downtime rule to stop all orchestration between 4:00pm - 4:15pm GMT. The administrator then modifies the system clock to display PDT. Your downtime rule is modified to now stop all orchestration between 8:00am - 8:15am PDT. To execute the downtime rule at 4:00pm - 4:15pm PDT, you must edit the downtime rule. Times differences caused by daylight savings are automatically adjusted.

If the environment is offline when a downtime rule is scheduled to occur, all unexecuted rules are identified and executed in the appropriate order when the environment returns online. After all the backlogged downtime rules are executed, you regain control to modify the deployment state of a project configuration.

Procedure

1. From the Navigation pane, select Repository > Configurations. The Project Configurations page is displayed.
2. Click the project configuration, which contains the downtime rule you want to work with. The Configuration Details page is displayed.
3. In the Scheduled Downtimes section, click New Rule. The New Downtime Rule dialog box is displayed.
4. Select one of the following actions from the drop-down list:
 - **Stop (allows jobs to finish)** - At the specified time, prevents any new orchestration jobs from starting while allowing current jobs to finish processing. This action facilitates a gracefully stop.
 - **Stop (cancel running jobs)** - At the specified time, prevents any new orchestration jobs from starting and stops all currently running jobs. This action immediately stops all jobs.
 - **Suspend** - At the specified time, prevents any new orchestrations from starting and pauses any jobs that are currently running. At the end of the scheduled downtime, the runtime processes the suspended job from the point it paused.
5. Specify the duration of the downtime by specifying a date and time for Start Downtime and End Downtime.
6. (Optional) Select the Repeat option to create a repeat downtime rule.
 - a. Specify a repeat interval (numeric value).
 - b. Specify frequency from the drop-down list: Days, Weeks, Months, or years.
7. Click Save.

Results

The new downtime rule displays in the Scheduled Downtimes section and the Scheduled Downtime counter increases by one.

Parent topic: [Managing Integration Appliances](#)

Edit Downtime Rules

Procedure

1. From the Navigation pane, select Repository > Configurations. The Project Configurations is displayed
2. Click the project configuration, which contains the downtime rule you want to work with. The Configuration Details page is displayed
3. In the Scheduled Downtime section, click the downtime rule you want to edit. The Edit Downtime Rule displays.
4. Select one of the following actions from the drop-down list:
 - o **Stop (allows jobs to finish)** - At the specified time, prevents any new orchestration jobs from starting while allowing current jobs to finish processing. This action facilitates a gracefully stop.
 - o **Stop (cancel running jobs)** - At the specified time, prevents any new orchestration jobs from starting and stops all currently running jobs. This action immediately stops all jobs.
 - o **Suspend** - At the specified time, prevents any new orchestrations from starting and pauses any jobs that are currently running. At the end of the scheduled downtime, the runtime processes the suspended job from the point it paused.
5. Specify the duration of the downtime by specifying a date and time for Start Downtime and End Downtime.
6. Optional: Select the Repeat option to create a repeat downtime rule.
 - a. Specify a repeat interval (numeric value).
 - b. Specify frequency from the drop-down list: Days, Weeks, Months, or years.
7. Click Save.

Deleting Downtime Rules

Procedure

1. From the Navigation pane, select Repository > >Configurations. The Project Configurations page is displayed.
2. Click the project configuration, which contains the downtime rule you want to work with. The Configuration Details page is displayed.
3. In the Scheduled Downtime section, select the downtime rule you want to delete. The Delete Rules confirmation window is displayed.
4. Click Yes.

Results

The downtime rule no longer displays.

Specifying Network Settings

About this task

Network opens Network Settings page.

The iA300 only has one physical port; however, for network configuration purposes, you specify separate IP addresses for data networking and management networking. The iA1000, iA1500, iA2000, iA2500, and iA3000 have two physical ports.

You must have Administrator privileges to specify network configurations. By default, the Integration Appliance uses DHCP to configure network settings. When you choose to use DHCP to configure network settings, the WMC displays the settings in the Network Configuration page. You can edit these settings by clearing the Use DHCP option or selecting the Manual option.

Note: Using DHCP to configure your network settings can result in longer startup times. For faster startup time, select the Manual option and specify a static value.

Procedure

1. In the navigation pane, select Network. The Network Settings page is displayed.
2. Click Edit. The Edit Network Settings wizard is displayed.
3. In the Data Network section, select the Use DHCP option. If you clear this option, the Integration Appliance requires that you specify the IP address, subnet, and broadcast settings.

By default, the Integration Appliance uses DHCP to configure data network settings. To manually configure data network settings, clear the Use DHCP option and enter a valid value for the required settings. The Integration Appliance requires the following management network settings:

- o IP address
 - o Subnet
 - o Broadcast
4. In the Management Network section, select the Use DHCP option. If you clear this option, the Integration Appliance requires that you specify the IP address, subnet, and broadcast settings.

By default, the Integration Appliance uses DHCP to configure management network settings. To manually configure management network settings, clear the Use DHCP option and enter a valid value for the required settings. The Integration Appliance requires the following management network settings:

- o IP address
 - o Subnet
 - o Broadcast
5. Select a Gateway Interface and Gateway Source.
 6. Select an option to set the HostName.
 7. Select an option to set the Domain.
 8. Select an option to set the DNS. When specifying multiple DNS values, use a space to separate the values.
 9. Select an option to set the Time Server.
 10. Click Next to validate settings.
 11. Click Next to apply settings.
 12. Click Finish.
 13. Wait for the Integration Appliance to restart and log in.

Parent topic: [Managing Integration Appliances](#)

Executing a System Command

Procedure

1. In the navigation pane, select System > Commands. The System Command page is displayed.
2. From the Choose Command list, select a command.
3. Click Go.

Parent topic: [Managing Integration Appliances](#)

System Commands

From the Management Console, you can run system commands. Different system commands are available depending on the Integration Appliance configuration (stand-alone vs. high availability pairs) and Integration Appliance state (active or standby). The following table lists all system commands available from the Management Console and notes behavioral differences due to Integration Appliance configuration or state.

Command	Description
Remove job history	The remove job history command removes orchestration monitoring data.
Remove project and configurations	The remove projects and configurations command removes currently deployed project(s) data.
Remove all jobs in progress	The remove all job in progress command removes all currently running project data.
Download postmortem	The download postmortem command exports the postmortem archive to an FTP Server you specify. The Integration Appliance does not require that you specify an export file name; however, as a best practice, you should include the Integration Appliance serial number, date, and timestamp. If you do not specify an export file name, the Integration Appliance exports a file named postmortem.tar.gz. Note: Do not use reserved words in the user name or password.
Restart	Restarts the Integration Appliance routing subsystem.
Reboot	Shuts down all routing services and then reboots the Integration Appliance. If the force parameter is used, reboot begins immediately.

Command	Description
HA Connect	Only available for HA pairs. The ha connect command reconnects an Active and Standby Integration Appliance to create an HA pair that can resume fail-over operations. This command is only available if you disconnected an HA pair by issuing the HA Disconnect command.
HA Disconnect	Only available for HA pairs. The ha disconnect temporarily disconnects an HA pair without causing the Standby machine to takeover the Active machine. This action allows you to perform any necessary hardware or software maintenance on the Standby machine without interrupting orchestration processing. When you choose this action, the Standby machine transitions to an idle state. Reboot the Active machine or execute the Connect action to reestablish communications between an HA pair and resumes data synchronization and fail-over operations. To perform maintenance on an Active machine, use the Switch action. The Active machine becomes the Standby machine, where you can use the Disconnect action and perform Integration Appliance maintenance without interrupting orchestration processing.
HA Switch	Only available for HA pairs. The ha switch command causes the Integration Appliances in an HA pair to switch roles: the Active machine becomes the Standby machine and the Standby machine becomes the Active machine.
Reboot active machine (allow peer takeover)	Only available for HA pairs. The reboot active machine (allow peer takeover) command shuts down all routing services and then reboots the active Integration Appliance in an HA pair. When you reboot the Active Integration Appliance using this command, the Standby Integration Appliance takes over data processing.
Reboot active machine (prevent peer takeover)	Only available for HA pairs. The reboot active machine (prevent peer takeover) command shuts down all routing services and then reboots the Active Integration Appliance in an HA pair. When you reboot the Active Integration Appliance using this command, the Active Integration Appliance stops all data processing and the Standby Integration Appliance does not take over data processing.

Command	Description
Reboot standby machine	Only available for HA pairs. Thereboot standby machine command reboots the Standby Integration Appliance in an HA pair. While the Standby Integration Appliance is rebooting, the Active Integration Appliance continues to process data. After a successful reboot, the Standby Integration Appliance synchronizes with the Active Integration Appliance.

Upgrading a Dell Integration Appliance

This section provides information on using the WMC to upload minor and patch releases to a Dell Integration Appliance. When you upgrade the appliance, you are able to access the latest features of the Cast Iron® operating system. This upgrade process only replaces or adds necessary files, it does not destroy any data.

About this task

Use the Web Management Console (WMC) to upgrade to the latest version of Cast Iron operating system by uploading an upgrade image onto the appliance. Please note that the WMC forces any running projects to be undeployed and stops any active orchestration jobs currently running on the appliance during the upgrade procedure. After the appliance is upgraded, you cannot undo or rollback to the previous version.

Note: Upgrades may also be applied through the Command Line Interface (CLI). See the system update command in the *CLI Reference Guide* for more information about using this option.

Procedure

1. Request the latest patch and download the patch to a location where you can access it. For example:
C:\Desktop
2. Using the WMC, log into the Dell Integration Appliance that you want to upgrade.
3. Select System > Upgrade. The Upgrade page displays.
4. Click the Upgrade Operating System link. The Upgrade Wizard launches.
5. Click Browse to locate the upgrade file.
6. Click Upgrade. The Integration Appliance uploads the upgrade file and starts the upgrade process. When the upgrade is complete, the Integration Appliance automatically reboots.
7. When the reboot is complete, the WMC Login page displays. If the page does not display, click the browser refresh button.

What to do next

Using the WMC, redeploy any projects that were undeployed by this upgrade procedure. Upgrade to a Studio version compatible with the installed Cast Iron operating system. For more information about appliance and Studio compatibility, see the Compatibility section of the *Cast Iron Operating System Release Notes* or the *Cast Iron Studio Release Notes*. For the procedure on upgrading Studio, see *Installing Studio*.

Upgrading a DataPower Integration Appliance

This section provides information on using the WMC to upload minor and patch releases to a Cast Iron® Cast Iron XH40 Integration Appliance. When you upgrade the appliance, you are able to access the latest features of the Cast Iron operating system. The upgrade process only replaces or adds necessary files, it does not destroy any data.

About this task

Use the Web Management Console (WMC) to upgrade to the latest version of Cast Iron operating system by uploading an upgrade image onto the appliance. Please note that the WMC forces any running projects to be undeployed and stops any active orchestration jobs currently running on the appliance during the upgrade procedure. After the appliance is upgraded, you cannot undo or rollback to the previous version.

Note: Upgrades may also be applied through the Command Line Interface (CLI). See the system update command in the *CLI Reference Guide* for more information about using this option.

Procedure

1. Obtain the latest patch, then download the appliance upgrade image file to a location you can access from your Windows workstation, for example: `C:\Desktop`.
2. Use the WMC to log into the Integration Appliance running the Cast Iron operating system.
3. From the Items menu in the WMC, select System > Upgrade. The System Summary window is displayed showing the model, version and serial number.
4. Click Upgrade Operating System. The Upgrade window is displayed.
5. In the text field, specify the path to the appliance upgrade image file or click Browse to locate the upgrade image file.
6. Click Upgrade. In the Upgrade panel, the following message is displayed: `Upload in progress. Please wait.` A progress bar displays the status of the upload. When the upload is complete, the WMC validates the upgrade. If the upgrade is successful, the appliance reboots.
7. Use the WMC to log into the appliance. You may need to click the browser refresh button.

What to do next

Using the WMC, redeploy any projects that were undeployed by this upgrade procedure. Upgrade to a Studio version compatible with the installed Cast Iron operating system. For more information about appliance and

Studio compatibility, see the Compatibility section of the *Cast Iron Operating System Release Notes* or the *Cast Iron Studio Release Notes*. For the procedure on upgrading Studio, see *Installing Studio*.

Working with Network Routes

You can add and delete network routes for the Integration Appliance.

Parent topic: [Managing Integration Appliances](#)

Adding Network Routes

Procedure

1. In the navigation pane, select Network. The Network Settings page is displayed.
2. Click Edit. The Edit Network Settings wizard is displayed.
3. In the Routes section, click New Rule. The New Network Route dialog displays.
4. Specify a destination.
5. Specify a netmask.
6. Choose an interface from the drop-down list.
7. Specify a gateway.
8. Click Save.
9. Click Next to validate settings.
10. Click Next to apply settings.
11. Click Finish.
12. Wait for the Integration Appliance to restart and log in.

Deleting Network Routes

Procedure

1. In the navigation pane, select Network. The Network Settings page is displayed.
2. Click Edit. The Edit Network Settings wizard is displayed.
3. In the Routes section, click Delete. A confirmation window displays.
4. Click Yes.
5. Click Next to validate settings.
6. Click Next to apply settings.
7. Click Finish.
8. Wait for the Integration Appliance to restart and log in.

About Orchestration Settings

Orchestration settings allow you to configure properties for individual orchestrations in a project configuration. For each orchestration you can specify whether the orchestration is enabled, the logging levels, logging behavior, and the maximum number of jobs that the orchestration can simultaneously run.

When a project configuration is undeployed you can edit the following orchestration settings:

Orchestration Settings	Description
Enabled	Indicates whether an orchestration is enabled and can be deployed. At least one orchestration in a project configuration must be enabled to deploy a project configuration. By default, all orchestrations in a project configuration are enabled.

Orchestration Settings	Description
Logging Level	<p>Allows you to specify the level of orchestration details that are logged in the System Logs.</p> <ul style="list-style-type: none"> • None - Orchestration status and activity are not logged. • Initial Values - Only the initial values of orchestration variables are logged. • Initial and Error Values- Both the initial values of orchestration variables and orchestration errors are logged. • Error Values- Only orchestration errors are logged. • Inline - Orchestration job details are logged for suborchestrations inline with the job details of the calling orchestration. • All- The highest level of logging. All orchestration activity is logged.
Log Synchronously	<p>Allows the runtime to synchronize the writing of orchestration events to the orchestration monitoring logs as the orchestration is running.</p> <p>By default, this orchestration setting is disabled and orchestration jobs are not synchronously logged.</p> <p>Note:</p> <p>When you enable this orchestration setting, the time it takes to process an orchestration job increases.</p>
Max Simultaneous Job	<p>Allows you to specify the number of orchestration jobs that can run simultaneously.</p>

Editing Orchestration Settings

Before you begin

To edit orchestration settings, the project configuration must be undeployed.

Tenant administrators, environment administrators (for the environment where the project is published), and publisher of a project can edit its orchestration properties.

About this task

Note: If you grant project configuration permissions to a group, the users in that group will have full access to the project configuration--user will be able to create new versions of the project configuration, as well as edit and delete the project configuration.

Procedure

1. Select the environment tab, where the project configuration is published.
2. From the navigation pane, select Repository > Configurations. The Project Configuration page is displayed.
3. If the project configuration you want to edit is running, stop the project configuration by clicking the  Stop icon in the Actions column. When the Stop Configuration dialog box displays, click one of the following options:
 - o Finish Jobs - At the specified time, prevents any new orchestration jobs from starting while allowing current jobs to finish processing. Allows the jobs to end.
 - o Cancel Jobs - At the specified time, prevents any new orchestration jobs from starting and stops all currently running jobs. This action immediately stops all jobs.
4. Undeploy the project Configuration, by clicking the  Undeploy icon in the Action Column.
5. Click the project configuration you want to edit. The Configuration Details page is displayed.
6. In the Orchestration section, click Edit to edit the orchestration settings. The Edit Orchestration Settings window is displayed.
7. Click Save.
8. Deploy the project configuration to begin processing orchestration jobs.

Results

The updates you made display in the Orchestration section of the Configuration Details page and the runtime processes the orchestration as specified.

Parent topic: [Managing Orchestration](#)

Exporting Orchestration Monitoring Data

About this task

You can export orchestration monitoring data. When you export orchestration monitoring data, you can choose to delete the orchestration monitoring data that you export or choose to persist the orchestration monitoring data on the system.

If you choose to delete the orchestration monitoring data, there is no mechanism to recover the data.

Procedure

1. In the navigation pane, select Logs > Job Logs. The Results page is displayed.
2. Click Export. The Export Jobs window is displayed.
3. Choose one of the following export options:
 - Export and Delete - Exports the monitoring data and deletes the data from the environment.
 - Export - Exports monitoring data and preserves data on the environment.
4. Click Download Now to download the exported log file.
5. Choose to open or save the file. If you choose to save the file, specify a location and click Save. The XML file is saved to the location you specified.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.appliance.doc/Managing_Projects/toc_managing_projects.html

About Assets

The Management Console groups assets by endpoint. Assets must be generated for database and Web Services endpoints that connect to the following orchestration activities:

- Starter database activities.
- Non-starter database activities with the exactly once delivery option specified.
- Provide Services activity.

For each database endpoint, you must specify unique values for configuration properties associated with the database assets before you can deploy a project configuration. Database assets are control tables, buffer tables, sequence tables, or triggers. All starter database activities are managed in one buffer table, while it manages events for each non-starter database activity with the exactly once delivery option specified in individual control tables

A WSDL for the Provide Services activity is generated by the integration environment. From the Management Console, you can save this Web Services asset.

About Naming Projects and Configurations

Project and project configuration names cannot be longer than 42 characters. When you create a project or project configuration avoid using the following list of reserved characters.

Reserved Characters	Description
â€˜ & â€™	ampersand

Reserved Characters	Description
{ } [] < > ' "	any brackets
*	asterisk
\	backslash
^	caret
:	colon
\$	dollar sign
/	forward slash
#	number sign
()	parenthesis
	pipe
.	period
?	question mark
;	semicolon
' '	space
~	tilde

Feedback | Notices

 Last updated: Friday, February 5, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.appliance.doc/Managing_Projects/aboutNamingProjects.html

About Project Configurations

Project configurations allow you to create multiple variations of the same integration project, so you can create and publish one project and deploy it to many different scenarios. Within a project configuration you can specify which orchestrations are enabled, modify configuration properties for endpoints, generate or modify assets, manage scheduled downtime rules, and control permissions for the project configuration.

Each project you publish has a Default project configuration. In the Management Console, you can create additional project configurations. The project name, project version, configuration name, and project state uniquely identify each project configuration.

You must have Administrator privileges or be the publisher of the specific project to create, edit, and delete project configurations. Administrators and publishers can grant users and groups permissions that allow them to create, edit, and delete project configurations.

The Summary section displays the details of the project configuration selected from Repository > Configurations. The summary section includes the project configuration name, status of the configuration, the date and time when the project was last published, the name of the user who published or cloned the project configuration. In addition, the summary page also displays the number of orchestrations, properties, assets, and the scheduled downtimes associated with the configuration.

Note: The name of the user who published or cloned the project configuration is displayed in the following formats:

- `username [groupname]` - indicates that this particular user (`username`) belonging to (`groupname`) is the one who published or cloned the project configuration.
- `username {user does not exist}` - indicates that the user does not exist in the integration appliance.

Enabling and Disabling Orchestrations

The runtime only runs orchestration jobs for enabled orchestration. Before you can deploy a project configuration, the project configuration must contain at least one enabled orchestration. By default, all orchestrations are enabled.

Specifying the orchestration logging level allows you to control the type of orchestration errors that are written to the system logs. The Management Console also allows you to limit the number of jobs that run simultaneously. The number of jobs that run simultaneously can affect performance.

You must have administrator or publisher permissions to specify orchestration properties.

Understanding Configuration Properties

You create these configuration properties for a project in Studio. For more information about creating project properties and specifying a project version, see the Studio online help.

When you publish the project, you can specify values for the configuration properties. The values you specify for the configuration properties determine how the project is deployed. For example, in a project that contains database endpoints, you can create properties for database connection parameters. This allows you to create a project configuration for a test environment connecting to a test database and then use the same project to create another project configuration for a production environment that connects to another database.

You must have administrator or publisher permissions to edit configuration properties in the Management Console.

Modifying Assets

If your project configuration contains a database or WebServices endpoint, you must generate assets before you can deploy the project configuration. If your project does not contain a database or WebServices endpoint, assets are irrelevant to your project configuration.

You must have administrator or publisher permissions to generate or modify assets.

Scheduling Downtimes

Scheduling downtime allows you to perform maintenance. You can create downtime rules for project configurations that stop or suspend all enabled orchestration jobs in that project configuration for a specified duration of time. The project configuration does not have to be undeployed to create or edit a downtime rule. Downtime rules can occur once or repeat at specific intervals.

You must have administrator or publisher permissions to create, edit, or delete a downtime rule.

Editing Project Configuration Permissions

As an administrator or project publisher, you can grant permissions for project configurations to other users and groups. When you grant users or groups permissions to a project configuration they are able to create, edit, and delete the project configuration. By default, permissions to project configurations are granted to only the Administrator Group. If you want to grant permissions to another group you must explicitly do so.

For example, you are a user with publisher rights and belong to the built-in Publisher group. You publish a project. Only the Administrator Group and you have permissions to the project configuration. Members of the Publisher group, of which you are a member, do not have permissions to the project configuration. You must edit the permission on the project configuration to include another group like Publisher. For more information, see [Granting Project Configuration Permissions](#).

About Projects

Projects contain components that the runtime needs to execute an integration scenario: orchestrations, endpoints, maps, and other documents. Use Studio to create and test projects without being connected to an integration environment.

Multiple people can publish multiple projects to the same integration environment. Use Studio to publish projects to an integration environment or export projects to a staging location. You can later use the Management Console to upload the exported project. You must have Administrator or Publisher privileges to publish or upload a project to the integration environment.

When you publish a project from Studio, the Management Console displays the project with default project settings; creating a default project configuration. You can clone this default project configuration to create new project configurations, which you can configure for separate development and production environments.

Use the Studio to create projects and specify endpoint configurations properties and then use the Management Console to specify project configurations and deploy project configurations.

Cloning Project Configurations

Before you begin

You must have Administrator privileges or be the publisher of a project to clone project configurations.

About this task

Project configurations contain properties and assets that you can configure in the Management Console to create multiple variations of the same integration project. When you create a new configuration you can choose to clone an existing project configuration. A cloned project configuration inherits all the configurations from the original project configurations. However, if you edit the original configuration project, the changes are not propagated to the cloned project.

Note: The project configuration you clone does not display on the Favorites view, unless you explicitly add the project configuration to the view.

Procedure

1. From the Navigation pane, select Repository > Configurations. The Project Configurations page is displayed.
2. From the Configuration Filter list, select All. All project configurations is displayed.
3. Locate the project configuration you want to clone.
4. Click the Clone icon . The Create Project Configuration dialog box is displayed.
5. Provide a unique name for the new project configuration.
6. Click OK.

Results

The cloned project configuration displays on the Project Configurations page. The cloned project has all the same project configuration details as the original project configuration.

Copying Projects

About this task

The Management Console allows you to copy a project by assigning a new version number to an existing project.

Procedure

1. Click the Modify tab. The Projects page is displayed.
2. Click the project you want to copy. The Copy Project dialog is displayed.
3. Enter a new project version. The version number can contain a decimal.
4. Click Save.

Results

The copy of the project is displayed in alphabetical order in the Projects page.

Creating Projects From Scratch

About this task

You can create a project from scratch in the cloud.

Procedure

1. Click the Create tab. The Solutions page is displayed.
2. Click Create One From Scratch. The Create Project dialog box is displayed.
3. Specify a unique project name.
4. Click Save. The project is displayed in the Projects page of the Modify tab.

Results

You can now take edit, publish, delete or copy your project. Select the project to view the project details and assign permissions to your project. If you do assign permissions, click Save to save your updates.

Project details include the environment to which the project configuration was published, a timestamp of the last time you published the project, and the current state of the project configuration. For example: deployed.

Creating Projects From a Template

About this task

You can create a project from a template. Templates are stored in the Solutions Repository. All users can create a template solution and upload it to the Solutions Repository.

Note:

Not all templates in the Solutions Repository are certified. The templates that are certified are denoted with a WebSphere® DataPower Cast Iron® logo.

Procedure

1. Click the Create tab. The Solutions page is displayed.
2. Search for a template.
 - a. Select a source endpoint.
 - b. Select a target endpoint.
 - c. Click Search.

You can also select the Keyword Search option to search for a template using a keyword.

3. Choose a template from the solutions that are returned. Template details display.
4. Click Create a project based on this template. Studio Cloud launches and the wizard steps you through the process of creating your project.

Results

Deleting Project Configurations

Before you begin

The publisher of a project configuration, the environment administrator, or tenant administrator can delete project configurations. The publisher of a project configuration can grant permissions that allow other users to delete his project configuration. The environment administrator can grant permissions that allow other users to delete any project configuration in the environment. The tenant administrator can grant permissions that allow other users to delete any project configuration in the tenant.

Project configurations must be undeployed before you can delete them.

About this task

When you delete a project configuration, all monitoring history associated with the project configuration is also deleted.

Procedure

1. Select the environment tab, where the project configuration is published. A list of project configurations is displayed in the Project Configuration section of the Dashboard.
2. Verify that the project configuration you want to delete is undeployed. The state displays in parentheses () at the end of the project configuration name. For example, (undeployed)
3. If the project configuration is in any other state but undeployed, undeploy the project configuration by clicking the Undeploy icon in the Actions column.
4. In the Actions column, click the Delete icon. The Delete Project Configuration dialog box displays.
5. Click Yes.

Results

The project configuration is deleted and no longer available.

Deploying Project Configurations

Before you begin

To deploy or undeploy project configurations, you must have tenant administrator or environment administrator privileges, or be the publisher of the project configuration.

About this task

The type of endpoint in an orchestration determines the steps you must complete to deploy a project configuration. A project configuration must contain at least one enabled orchestration before you can deploy the project configuration. If the orchestration contains a database or Web Services endpoint, you must also generate assets for the endpoints before you can deploy the project configuration.

By default, all the orchestrations in a project configuration are enabled. Therefore, if the orchestrations in a project configuration do not require additional configuration and do not access database or WebServices endpoints, you can deploy your project configuration by clicking the deploy icon next to the project configuration in any of the Project tabs. If your project configuration requires assets or additional configuration, see the following deployment procedure.

Note: A project configuration must be in the stopped state for you to undeploy the project configuration.

Procedure

1. Select the environment tab to which you published your project.
2. In the Project Configuration section, select the project configuration you want to deploy. The Configuration Details page is displayed.
3. In the Orchestrations section, verify that at least one orchestration in the project configuration is enabled. Edit orchestration settings, as needed.

You cannot edit orchestration settings while a project configuration is running. Stop and undeploy the project configuration to edit configuration settings.

4. In the Properties section, edit configuration properties, as needed.

You cannot edit configuration properties while a project configuration is running. Stop and undeploy the project configuration to edit configuration settings.

5. If the project configuration contains a Database or Web Services endpoint, you must generate assets for these endpoints.
6. Optional: Add a schedule downtime rule.
7. Optional: Assign permissions for the project configuration, which specify which group of users can edit and deploy a project configuration. By default, tenant administrators, environment administrators, and the publisher of a project configuration can edit and deploy a project configuration.
8. If you assign permissions, click Save.
9. In the Summary section, click the Deploy icon (▶) to deploy the project configuration.

Results

The project configuration deploys, the runtime starts to process orchestration jobs, and the status is appropriately updated in the Summary section.

Editing Project Configuration Properties

Before you begin

You must have administrator or publisher permissions to edit configuration properties.

About this task

You create configuration properties for an integration project in Studio, before you publish the project to an environment in the cloud. When you publish the project, you can specify values for the configuration properties. Configuration properties allow you to move a project configuration from a staging environment to a production environment.

For example, in a project that contains database endpoints, you can create properties for database connection parameters. This allows you to create a project configuration for a test environment connecting to a test database and then use the same project to create another project configuration for a production environment that connects to another database.

Procedure

1. Select the environment tab, where the project configuration is published.
2. From the navigation pane, select Repository > Configurations. The Project Configuration page is displayed.
3. If the project configuration you want to edit is running, stop the project configuration by clicking the  Stop icon in the Actions column. When the Stop Configuration dialog box displays, click one of the following options:
 - Finish Jobs - At the specified time, prevents any new orchestration jobs from starting while allowing current jobs to finish processing. Allows the jobs to end.
 - Cancel Jobs - At the specified time, prevents any new orchestration jobs from starting and stops all currently running jobs. This action immediately stops all jobs.
4. Click the project configuration you want to edit. The Configuration Details page is displayed.
5. In the Properties section, click Edit to edit configuration property values.
6. Modify the configuration properties.
7. Click Save.

Results

The Configuration Details page displays the updated configuration property values.

About Database Assets

The type of database endpoint you use determines the assets that must be generated. The following table shows the assets that are generated for each supported database:

Note: In Cast Iron, asset tables are created with the identifier size of 30 characters. For asset tables, the format that Cast Iron follows is: CI_CT_<respective-table-name> (for Control Table), and CI_BT_<respective-table-name> (for Buffer Table). So you must use tables with names having a maximum of 24 characters.

Database	Assets Generated
<ul style="list-style-type: none">• DB2® AS/400®• Informix®• Microsoft SQL• Sybase	<ul style="list-style-type: none">• Buffer tables• Control tables• Triggers
Local Staging Database	<ul style="list-style-type: none">• Buffer tables• Control tables• Index tables• Triggers
Oracle	<ul style="list-style-type: none">• Buffer tables• Control tables• Triggers• Sequences

Assets are only generated for starter activities and non-starter activities that specify the Exactly Once delivery option. Assets are not generated for non-starter activities that specify At Least Once or At Most Once delivery options.

Note: Control table names are appended with an activity ID to ensure all assets have unique names. This number does not distinguish multiple endpoints in an orchestration using the same control table.

Parent topic: [Managing Projects](#)

Validating Database Assets

About this task

Before you generate database assets, validate the assets. When you validate an asset, the integration environment verifies whether the buffer table or control table exists in the source database and verifies that table structures are correct.

Note:

Triggers and sequences are not validated .

Procedure

1. In the navigation pane, select Repository > Configurations. The Project Configuration page is displayed.
2. Click the project configuration that requires database assets. The Configuration Details page is displayed.
3. Verify the project configuration is in the undeployed state.
4. In the Assets section, click Database. The Database Assets page is displayed.
5. Select all the assets you want to validate and click Validate.
6. The results returned determine the next step. The following table tells you how to interpret the feedback and how to proceed.
 - o A green check mark - valid
 - o A yellow warning sign = warning

Database Asset Validation Feedback

Exists?	Valid?	Action
valid	valid	The asset exists in the database and the asset structure matches the project configuration you created in Studio.You can now deploy the project configuration.
valid	warning	The asset exists in the database, but the asset structure is incorrect. Check that the database script contains the appropriate columns and that the columns are in the correct order. If there is an error, recreate the asset.
warning	warning	The asset does not exist in the source database table. You must create the asset before you can deploy the project configuration.

Warning: Constraint names ending in a unique ID are generated. However, if the size of the database table name is greater than 18 characters, the constraint name is truncated resulting in a naming conflict. If the database table name is greater than 18 characters, edit the database assets script generated and make the constraint names unique.

Generating Database Assets

About this task

The project configuration must be undeployed before you can validate or generate assets. Validate assets before you generate them.

Procedure

1. In the navigation pane, select Repository > Configurations. The Project Configuration page is displayed.
2. Click the project configuration that requires database assets. The Configuration Details page is displayed.

3. Verify the project configuration is in the undeployed state.
4. In the Assets section, click Database. The Database Assets page is displayed.
5. Select all the assets you want to generate. You can select all the assets by selecting the top-most check box.
6. Click Create.
7. Review and modify the database script as needed.

Publishing Projects

Before you begin

You must be a tenant administrator, environment administrator, or environment publisher to publish projects.

About this task

Publishing a project uploads a project from Studio to a runtime environment.

Procedure

1. In the Management console, select the Modify tab. The Projects page displays.
2. In the Actions column, click the Publish Project icon. A list displays all the environments in the tenant.
3. Select the environment to which you want to publish the project.

Results

A confirmation displays. The project is available in the environment you selected.

Stopping Project Configurations

About this task

There are two ways to stop a running project configuration:

- **Stop (allows jobs to finish)** - When you click Finish Jobs, prevents any new orchestration jobs from starting while allowing current jobs to finish processing. This action allows the Integration Appliance to gracefully stop.
- **Stop (cancel running jobs)**- When you click Cancel Jobs, this option prevents any new orchestration jobs from starting and stops all currently running jobs. This action immediately stops all jobs.

Procedure

1. From the Project Configurations page, select a project configuration.
2. In the Actions column, click the Stop icon . The Stop Configuration window is displayed.
3. Click either Finish Jobs or Cancel Jobs to stop the project configuration.

Uploading Project Configurations

Before you begin

To upload a project configuration to the cloud, you must have tenant administrator, environment administrator, or environment publisher permissions.

About this task

When you upload a project configuration, you are publishing a project using a two-stage process. First, you export a project from Studio to an intermediate location. Then from the Management Console, you upload the project to an Integration Appliance or cloud environment.

Procedure

1. Select the environment tab, to which you want to upload the project configuration.
2. From the Navigation pane, select Repository > Upload Project. The Upload Project Configuration dialog box displays.
3. Enter the path from which to upload the project in the Local Project File field. You can click Browse to select a file from your local machine.
4. Specify a project name. The name should not exceed 42 characters and should not contain any restricted characters.
5. Specify a product version number. This field is not populated with the project version you specified in Studio. However as a best practice, you should specify a project version that matches the version you specified in Studio.
6. Click Upload.

Results

The project configuration displays in the Project Configuration page.

Working with Project Configurations

Various views are available for project configurations:

- **All** - Displays the deployment state and status of all project configurations, regardless of the state of the project configuration. You can clone or delete project configurations from this view.
- **Recent** - Displays the deployment state and status of the most recently published or modified project configurations. You can clone or delete project configurations from this view.
- **Favorites** - Displays the deployment state and status of project configurations for which you have permissions. By default, this view is not populated. You must explicitly add project configurations from either the Recent view or All view.
- **My Configurations** - Displays the deployment state and the status of the project configurations that you have published or cloned (configurations published by the user currently logged on).

You can access these views from the Dashboard or by selecting the following path in the Navigation pane: Repository > Configurations. The Configuration Filter allows you to choose your view from a list.

The following table describes information available in the various project configuration views:

Columns in Project Configuration Views	Descriptions
Configuration	Displays published project configurations.
Running	Displays the number of currently running jobs for the project configuration.
Completed	Displays the number of orchestration jobs, for the project configuration, that were completely processed. When orchestration monitoring data is purged, the number of orchestration jobs is reset to 0. For more information about modifying log purging parameters, see the purging help topics.

Columns in Project Configuration Views	Descriptions
Errored	<p>Displays the number of orchestration jobs where a runtime error occurred for the project configuration.</p> <p>When orchestration monitoring data is purged, the number of orchestration jobs is reset to 0. For more information about modifying log purging parameters, see the purging help topics.</p>
Total	<p>Displays the total number of orchestration jobs, for the project configuration, that have run.</p> <p>When orchestration monitoring data is purged, the number of orchestration jobs is reset to 0. For more information about modifying log purging parameters, see the purging help topics.</p>
Actions	<p>Displays the state of project configurations, as well as options for you to delete  or clone  project configurations.</p> <p> Clicking this icon deploys and runs a project configuration.</p> <p> Clicking this icon causes the runtime to suspend the orchestration job processing of the project configuration.</p> <p> Clicking this icon undeploys a project configurations. You must stop the project configuration before you can undeploy the project configuration.</p> <p> Clicking this icon stops the runtime from processing orchestration jobs for the project configuration.</p> <p>When you stop a project configuration, you can choose to have the runtime completely process all currently running jobs or have the runtime cancel all currently running jobs.</p> <p> Only available in All and Recent views. Clicking this icon adds the project configuration to Favorites.</p> <p>When the Management Console displays the project configuration in Favorites, this icon is no longer active next to the project configuration in the All and Recent views.</p> <p> Clicking this icon removes the project configuration from Favorites, but does not delete the project configuration from the environment. You can view the project configuration from the All and Recent views.</p>

Monitoring

Monitoring topics provide information about creating and managing notifications, viewing hardware status, searching orchestration jobs, and viewing orchestration job logs.

- [About the Web Management Console](#)
- [Choosing a Notification Level](#)

Notification levels define the severity of events that can trigger an alert. When you specify a notification level, an alert is only sent for errors that exceed the level you choose.
- [Creating Notification Policies](#)

Notification policies allow you to monitor potential errors in a specific system.
- [Deleting Notification Policies](#)

You can delete one or more notification policies.
- [Editing Notification Policies](#)
- [Enabling Email Notification Policies](#)
- [Searching for Orchestration Jobs](#)
- [Viewing Hardware Status](#)
- [Viewing Orchestration Job Logs](#)

The Dashboard displays information about orchestration jobs, including status, timestamp of job events, and key/job ID in multiple tabs:
- [SNMP basics](#)

The Simple Network Management Protocol (SNMP) is an Internet standard protocol used primarily in network management systems to monitor network devices for conditions that warrant administrative attention. Devices that typically support SNMP include routers, switches, servers, workstations and printers. This section introduces SNMP basics and provides an overview of Cast Iron MIBs.
- [Setting up an SNMP receiver](#)

You can use the WMC to create notifications for events that happen in runtime components such as orchestrations, security, hardware and others. A delivery mechanism for these notifications is SNMP in which a trap is set for events. To retrieve these events, you must to set up a receiver or manager that is registered with the appliance. Use the procedures in this section to set up an SNMP receiver.
- [Adding a notifications policy](#)

When you add a notifications policy, you inform administrators of alerts, policy violations and the status changes of job executions. Using SNMP traps, the notification system also allows you to send traps to SNMP-enabled third-party applications. Perform the following steps to add a notifications policy and assign it a name.
- [About the Resource Utilization Graph](#)

Describes how to use the data the Resource Utilization graph provides for capacity planning and understanding the health of the runtime environment.
- [Hardware health](#)

Use the information in this section to obtain notifications based on the hardware health of the appliance.
- [Testing the system](#)

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.appliance.doc/Monitoring/toc_monitoring.html

About the Web Management Console

The Web Management Console (WMC) is a web-based management tool that allows you to:

- Manage the Integration Appliance
- Manage integration projects
- Monitor integration projects

You can access the same Integration Appliance from multiple WMCs. However, each WMC can only monitor and manage one Integration Appliance at a time. The tasks you can complete in the WMC depend on the user account you log in with. The WMC has built-in groups, which you can use to further control access to the Integration Appliance. Alternatively, you can specify an LDAP server to manage user and group authentication and authorization.

When you log into an Integration Appliance through the WMC, the Dashboard appears. The Dashboard provides multiple snapshot views of project configurations and jobs, a resource utilization graph, a list of unresolved critical system errors, and an overall project configuration summary. The Dashboard also allows you to search for orchestration jobs by job key. The Search box is located in the Results section of the dashboard.

The WMC displays the name of the current user as well as the date and timestamp set on the Integration Appliance. This date and timestamp do not necessarily represent the local date and time. For example, the Integration Appliance is set to GMT; however, you can log on to this Integration Appliance from a WMC in San Francisco, CA, which is in the PST time zone. Use the Command Line Interface (CLI) to modify the time zone of the Integration Appliance.

Choosing a Notification Level

Notification levels define the severity of events that can trigger an alert. When you specify a notification level, an alert is only sent for errors that exceed the level you choose.

Note: If you do not receive notifications for events, it might be that you do not have the system log level set to produce entries that would trigger a notification. For example, if you chose the Error level for Deployment, all events that were Error or Critical level in the Deployment system are logged.

You can specify the following notification levels:

Notification Level	Description
Critical	Sends an alert when an error condition causes the a shutdown.

Notification Level	Description
Error	Sends an alert when non-critical issues that must be handled immediately occur.
Warning	Sends an alert when potential error conditions occur.
Info	Sends an alert for informational usage.

Creating Notification Policies

Notification policies allow you to monitor potential errors in a specific system.

About this task

When you create a notification policy, the notification policy monitors the system log for the system you specify. When a system log event occurs that meets or exceeds the notification level of a notification policy, an alert is sent to the specified users.

Note: If you do not receive notifications for events, it might be that you do not have the system log level set to produce entries that would trigger a notification or you did not enable the notification policy. For more information about specifying system log settings, see "[Specify System Log Settings](#)". For more information about enabling email notification policies, see "[Enabling Email Notification Policies](#)".

Procedure

1. Click the environment for which you will create a notification policy. The Navigation pane is displayed.
2. Select Logs > Notifications. The Notifications page is displayed.
3. Click New Policy. The New Policy dialog box is displayed.
4. Enter a policy name.
5. From the Level Exceeds list, select a level. Alerts are only sent for errors that exceed the level you choose.
6. From the With System list, select the system you want the notification policy to monitor.
7. Specify the email address or addresses of the person or people that will receive the email notification. When you have multiple email addresses, add one email address per line.
8. Click Save.

Results

The new policy is displayed on the Notifications page. You must enable e-mail notifications before any alerts can be sent. If the email status is displayed as (inactive), email notifications are not enabled.

Deleting Notification Policies

You can delete one or more notification policies.

Procedure

1. Click the environment for which you will delete a notification policy. The Navigation pane is displayed.
2. Select Logs > Notifications. The Notifications page is displayed.
3. Select the check box for the policy you want to delete.

To delete multiple policies, select the top check box. All the policies are selected.

4. Click Delete. The Delete Policies? confirmation window is displayed.
5. Click Yes.

Results

The policy is deleted and no longer displays in the Notifications page.

Editing Notification Policies

Procedure

1. In the Navigation pane, select Logs > Notifications. The Notifications page is displayed.
2. Click a notification policy. The Edit Policy dialog box is displayed.
3. Update the appropriate notification settings.

4. Click Save.

Results

The updated policy is displayed on the Notifications page. You must enable email notifications before any alerts can be sent. If the Email status displays as (inactive), email notifications are not enabled.

Enabling Email Notification Policies

About this task

When you create an email notification policy, you must enable the email notification policy for alerts to be sent. By default, email notifications are not enabled.

If you enable email notification policies, the settings you specified when you created the email notification determine when an email alert is sent.

Note: If you disable the email notification policy by clearing the Enable Email option, alerts are not delivered for any email notification policy.

Procedure

1. Click the environment for which you will enable an email notification policy. The Navigation pane is displayed.
2. Select Logs > Notifications. The Notifications page is displayed.
3. At the top of the page, click the Email link. The Enable Email option is displayed.
4. Click the Enable Email option.
5. Optional: Provide an email subject line that will qualify the alert sent.
6. Click Save.

Results

The Notifications page displays the new policy and Email status changes from (Inactive) to (Active). Email notifications will now be sent when an event that triggers the notification policy occurs.

Searching for Orchestration Jobs

About this task

Job IDs and keys allow you to search for orchestration jobs. You define primary message keys in Studio, when you configure connectors. The primary message key must be a unique value. For example, the purchase order number for a purchase order message. If you do not define a primary key, the runtime uses the job ID, a unique number that the runtime generates, to identify an orchestration job.

From the Management Console, you can search orchestration jobs by job ID. By default, the Management Console searches only for completed orchestration jobs that match the job ID you specify. Use the Advanced Search option to search for all other orchestration jobs.

Procedure

1. From the navigation pane, select Dashboard.
2. In the Results section, enter a job ID in the Key Search field.
3. From your keyboard, press Enter. The completed job with the matching job ID is displayed.

Parent topic: [Monitoring](#)

Using Advanced Search

About this task

Use the Advanced Search option to further refine your job search. If you enter values for multiple fields in the Advanced Search box, the Management Console uses AND logic to refine the search.

For example, you specify a time range in addition to selecting the status that has an error. The Management Console searches for all orchestration jobs that had an error within the time range specified.

Note: If you choose to search by date and time, you must specify a start and end date and time.

Procedure

1. From the navigation pane, select Dashboard.
2. In the Results section, select an orchestration. The Orchestration Details page displays all the jobs associated with the orchestration.
3. In the Advanced Search box, specify values for Job ID, Key, Status, Start Date and Time, or End Date and Time as appropriate for your search.
Note: If you choose to search by date and time, you must specify a start and end date and time.
4. Click Search.

Results

The search results are displayed in the table.

Viewing Hardware Status

The WMC allows you to monitor Integration Appliance resource utilization and hardware health.

Viewing Resource Utilization

To view Integration Appliance CPU usage, memory usage, and disk space usage select System > Hardware Status. The Resource Utilization page is displayed.

The WMC displays a usage percentage for each resource utilization category listed. In cases where a category contains multiple components, like multiple CPUs, the percentage shown is an average of all the components displayed. In the Dashboard, the WMC provides a graphical summary of the Integration Appliance resource utilization data. For more information about interpreting the Resource Utilization graph, see [About the Web Management Console](#).

Viewing Hardware Health

To view status about Integration Appliance hardware components, select System > Hardware Status. The Hardware Health page displays the status of fans, temperature, disks, and network links. A green checkmark indicates that the component is good working order

 Last updated: Friday, February 5, 2016
file:///dcs/markdown/workspace/Transform/out.html

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.appliance.doc/Monitoring/viewingHardwareStatus.html>

Viewing Orchestration Job Logs

The Dashboard displays information about orchestration jobs, including status, timestamp of job events, and key/job ID in multiple tabs:

- **All** - displays orchestration job information for all project configurations.
- **Recent** - displays orchestration job information for the most recently published or modified project configurations.
- **Favorites** - displays orchestration job information for the project configurations displayed in the Favorites filter. Orchestration job information displayed through this filter also displays in the Recent and All filters.

In some cases, the Management Console displays an orchestration job status of `Unknown`, even though the orchestration job completed successfully. Rebooting the environment, while orchestration jobs are processing, can result in the Unknown status because monitoring data is lost during the reboot. Stop all orchestration jobs before rebooting the environment to avoid an Unknown status.

Click an orchestration job to view the orchestration details for that orchestration. The Orchestration Details page displays all the jobs associated with the orchestration you selected and the status of each individual job. Use the Left and Right arrows (<< , <, >, >>) to view all orchestration jobs.

Parent topic: [Monitoring](#)

Sorting Orchestration Jobs

About this task

You can search orchestration jobs by job ID. To sort orchestration jobs by project configuration name, orchestration name, status, time, or job ID click the appropriate column header.

SNMP basics

The Simple Network Management Protocol (SNMP) is an Internet standard protocol used primarily in network management systems to monitor network devices for conditions that warrant administrative attention. Devices that typically support SNMP include routers, switches, servers, workstations and printers. This section introduces SNMP basics and provides an overview of Cast Iron MIBs.

In the lexicon of SNMP, a Cast Iron Integration Appliance is referred to as a "network element" or "managed device," indicating that it is a citizen on a network and available to be managed. Network elements include an *agent* that provides information about the element. Agents perform two key functions. First, they respond to requests from the management system and secondly, send notifications about events on the network element. Asynchronous notifications from agent to manager are referred to as *traps*.

SNMP traps enable an agent to notify the management station of significant events by way of an unsolicited SNMP message. Information provided through polling or traps are defined in Management Information Bases (MIBs). A MIB is a virtual database used for managing the entities in a communications network. MIBs define a hierarchy of objects, with each object having its own Object Identifier (OID). An OID is specified by numbers separated by periods, for example: ".1.3.6.1.2.1.1." A OID is sometimes referred to by a common name. For example, the specific OID .1.3.6.1.2.1.1 can be referred to as "system." The SNMP protocol defines many public MIBs, and also allows for organizations to define custom, application-specific MIBs.

Understanding Cast Iron MIBs

Files downloaded from the Cast Iron WMC have multiple MIB DEFINITIONS = BEGIN - END sections. Each section comprises a MIB with its own hierarchy. To poll for Cast Iron-specific information, use CASTIRON-IA-MIB. Each MIB has a MODULE-IDENTITY that describes the MIB function. A comment section that follows MODULE-IDENTITY provides an overview of the MIB contents and contains an Object Summary that lists the name and OID of every MIB object.

Note: Some tools, such as those provided by NET-SNMP, require each MIB to be split into a single file. For more information on splitting MIBs, see [Setting up an SNMP receiver](#).

A section of the Object Summary from a CASTIRON-IA-MIB follows:

```
-- ciIaProjectSummary          ciia.1.1.1
-- ciIaNbrProjects             ciia.1.1.1.1
-- ciIaNbrRunningOrchs        ciia.1.1.1.2
-- ciIaNbrStoppedOrchs        ciia.1.1.1.3
-- ciIaNbrRunningJobs         ciia.1.1.1.4
-- ciIaNbrCompletedJobs       ciia.1.1.1.5
-- ciIaNbrErroredJobs         ciia.1.1.1.6
```

As shown, an organizational node (in this case, OBJECT-IDENTITY, which is similar to a directory) called ciIaProjectSummary contains general information about projects. Inside that "directory" are specific items (OBJECT-TYPES) containing the number of projects, the number of running and stopped orchestrations and more. To get more information about the meaning of these items, search the file for the name of the item. For example, to get information about ciIaNbrRunningJobs, searching the file for that string turns up the following:

```
ciIaNbrRunningJobs OBJECT-TYPE          -- ciia.1.1.1.4
    SYNTAX Unsigned32
    MAX-ACCESS read-only
    STATUS current
    DESCRIPTION
        "Total number of currently running jobs."
    ::= { ciIaProjectSummary 4 }
```

The key areas are:

- ciIaNbrRunningJobs OBJECT-TYPE - Defines the name of the object. Note that there is a comment at the end giving a shortened form of the OID.
- SYNTAX Unsigned32 - This is an unsigned integer whose value could go up or down.
- MAX-ACCESS read-only - A read-only value. The manager may ask for it but cannot change it.
- DESCRIPTION - Describes the object.

The following example illustrates the data displayed when polling for ProjectSummary information:

```
$ snmpwalk -v 2c -c public -M "+/home/choller/mibs" -m "+CASTIRON-IA-MIB"
flintstone2 ciIaProjectSummary
CASTIRON-IA-MIB::ciIaNbrProjects.0 = Gauge32: 2
CASTIRON-IA-MIB::ciIaNbrRunningOrchs.0 = Gauge32: 0
CASTIRON-IA-MIB::ciIaNbrStoppedOrchs.0 = Gauge32: 14
CASTIRON-IA-MIB::ciIaNbrRunningJobs.0 = Gauge32: 0
```

```

CASTIRON-IA-MIB::ciIaNbrCompletedJobs.0 = Gauge32: 0
CASTIRON-IA-MIB::ciIaNbrErroredJobs.0 = Gauge32: 0

```

The following data is displayed when polling `ciIaProjectTable`:

```

-- ciIaProjectTable                ciia.1.1.2
-- ciIaProjectEntry                ciia.1.1.2.1
-- ciIaProjEntryIndex              ciia.1.1.2.1.1
-- ciIaProjEntryName                ciia.1.1.2.1.2
-- ciIaProjEntryVersion            ciia.1.1.2.1.3
-- ciIaProjEntryConfig              ciia.1.1.2.1.4
-- ciIaProjEntryState              ciia.1.1.2.1.5
-- ciIaProjEntryNbrRunning          ciia.1.1.2.1.6
-- ciIaProjEntryNbrCompleted        ciia.1.1.2.1.7
-- ciIaProjEntryNbrErrored          ciia.1.1.2.1.8
-- ciIaProjEntryTimePublished       ciia.1.1.2.1.9

```

SNMP Tables can be challenging. SNMP tables indicate the name, version, configuration, state and other information about each project on the appliance, similar to a database schema. Each entry item (for example, `ciIaProjEntryName`, `ciIaProjEntryVersion`) describes a column in the table. You can search through the MIB for the string to find more information on each item. Note: Attempting to "walk" the Project table in an iterative fashion may present problems. Instead, always use a tool feature that understands tables when viewing table information. The following example illustrates a "walk" technique. In this case a project was published and then cloned to create a new configuration, resulting in two table rows. As the output indicates, it is difficult to understand which items are associated with specific rows. In this case, you need to view the index (the last piece of the OID) to determine the correct arrangement of items and rows.

```

$ snmpwalk -v 2c -c public -M "+/home/choller/mibs" -m "+CASTIRON-IA-MIB"
flintstone2 ciIaProjectTable
CASTIRON-IA-MIB::ciIaProjEntryName.98304 = STRING: OnlineLicensing
CASTIRON-IA-MIB::ciIaProjEntryName.98305 = STRING: OnlineLicensing
CASTIRON-IA-MIB::ciIaProjEntryVersion.98304 = STRING: 1.0
CASTIRON-IA-MIB::ciIaProjEntryVersion.98305 = STRING: 1.0
CASTIRON-IA-MIB::ciIaProjEntryConfig.98304 = STRING: Default
CASTIRON-IA-MIB::ciIaProjEntryConfig.98305 = STRING: OnlineLicensingClone
CASTIRON-IA-MIB::ciIaProjEntryState.98304 = INTEGER: undeployed(1)
CASTIRON-IA-MIB::ciIaProjEntryState.98305 = INTEGER: undeployed(1)
CASTIRON-IA-MIB::ciIaProjEntryNbrRunning.98304 = Gauge32: 0
CASTIRON-IA-MIB::ciIaProjEntryNbrRunning.98305 = Gauge32: 0
CASTIRON-IA-MIB::ciIaProjEntryNbrCompleted.98304 = Counter32: 0
CASTIRON-IA-MIB::ciIaProjEntryNbrCompleted.98305 = Counter32: 0
CASTIRON-IA-MIB::ciIaProjEntryNbrErrored.98304 = Counter32: 0
CASTIRON-IA-MIB::ciIaProjEntryNbrErrored.98305 = Counter32: 0
CASTIRON-IA-MIB::ciIaProjEntryTimePublished.98304 = STRING: 2009-6-
12,16:36:20.0,+0:0
CASTIRON-IA-MIB::ciIaProjEntryTimePublished.98305 = STRING: 2009-6-
12,16:36:20.0,+0:0

```

When information is mapped using the `snmptable` command, it is displayed more clearly, as shown in the following example:

```

$ snmptable -v 2c -c public -M "+/home/choller/mibs" -m "+CASTIRON-IA-MIB"
flintstone2 ciIaProjectTable
SNMP table: CASTIRON-IA-MIB::ciIaProjectTable

PEN*          PEV PEC          PES          PER COM PEE          PETP
OnlineLicensing 1.0 Default    undeployed   0  0  0    2009-6-
12,16:36:20.0,
+0:0
OnlineLicensing 1.0 OnlineLicensingClone undeployed   0  0  0    2009-6-
12,16:36:20.0,
+0:0

```

*Table Key: PEN=ciIaProjEntryName, PEV=ciIaProjEntryVersion,
PEC=ciIaProjEntryConfig,
PES=ciIaProjEntryState, PER=ciIaProjEntryNbrRunning, COM=ciIaProjEntryNbrCompleted,
PEE=ciIaProjEntryNbrErrored, PETP=ciIaProjEntryTimePublished

Note that these examples use textual names rather than OIDs. Because a function of the MIB is to map between OID and textual name, you should not need to use OIDs on a regular basis.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.appliance.doc/Monitoring/snmp_basics.html

Setting up an SNMP receiver

You can use the WMC to create notifications for events that happen in runtime components such as orchestrations, security, hardware and others. A delivery mechanism for these notifications is SNMP in which a trap is set for events. To retrieve these events, you must to set up a receiver or manager that is registered with the appliance. Use the procedures in this section to set up an SNMP receiver.

About this task

When you set up an SNMP receiver, you download and split the MIBs, create the configuration file, enable notifications, add a notification policy and then test the system:

Procedure

1. Click on **WMC: Logs-> Notifications -> SNMP**.
2. In the dialog box click **Download MIB**.
3. Add the MIBs to the machine you've designated to be the receiver.
4. Run the following script to split the MIBs into logical units. Note: the script assumes the file is in the local directory and that the file you downloaded is named castironsys.mib.

```
#!/bin/bash

sed -ne 's/DEFINITIONS ::= BEGIN.*//p' castironsys.mib |
  while read mib; do
    echo $mib
    sed -ne "^$mib/,/^END/p" castironsys.mib > $mib
  done
```

5. Set up your SNMP manager of choice.
6. Select **WMC: Logs-> Notifications -> SNMP** to enable SNMP notifications. Be sure that the **Enable SNMP** checkbox is checked.
7. Add the receiver hostname.
8. Set the trap community to be **public**. This is defined in /etc/snmp/snmptrapd.conf as the **authCommunity** entry.

9. Click **Save**.

 Last updated: Friday, February 5, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.appliance.doc/Monitoring/set_up_snmp_receiver.html

Adding a notifications policy

When you add a notifications policy, you inform administrators of alerts, policy violations and the status changes of job executions. Using SNMP traps, the notification system also allows you to send traps to SNMP-enabled third-party applications. Perform the following steps to add a notifications policy and assign it a name.

Procedure

1. Click on the **Policies** tab.
2. Click the **New Policy** link at the bottom left of the screen and give the policy a name.
3. In the **Notify When** row, select a level and system. Be sure the **SNMP checkbox** under the **Notify** section is checked.
4. Click **Save**.

Example

The following table shows the system, level and messages delivered via the Uncategorized trap. The Uncategorized trap is named CASTIRON-IA-MIB::ciIaUncategorizedEv, Enterprise 1.3.6.1.4.1.13336.2.2.2.1.1.10, Trap 1.

Table 1.

About the Resource Utilization Graph

Describes how to use the data the Resource Utilization graph provides for capacity planning and understanding the health of the runtime environment.

The Resource Utilization graph tracks the following variables, which you can use to analyze the overall health of the runtime and calculate the available capacity for additional projects and orchestrations:

- % Disk Used
- % Memory Used
- GC Activity
- # Running Jobs

% Disk Used

This variable tracks the percentage of disk space used by orchestration job variables and historical data.

When you run an orchestration job, the runtime uses the disk to store the variable data for that job. When you enable persistence, the stored variable data for jobs allows the Integration Appliance to provide a point-in-time recovery of orchestration jobs should the Integration Appliance encounter a fault that requires restarting the runtime.

The runtime also stores historical data about orchestration jobs, which you can view on the Web Management Console (WMC) Job Log page.

If the amount of disk space available becomes too low, the Integration Appliance generates an alert, which sends a notification to designated users.

% Memory Used

The Integration Appliance has a fixed amount of available memory to run orchestrations. The % Memory Used variable tracks the amount of this fixed memory used by orchestration jobs and the corresponding variable data. When the memory allocated to orchestration jobs and variable data is no longer being used, the memory is returned to the pool of available memory using a process called garbage collection.

There is a direct relationship between the amount of memory used and garbage collection cycles. However, high memory usage does not necessarily mean an increase in full garbage collection cycles.

For more information about factors that affect the amount of memory used, see [Best Practices for Memory Management](#).

GC Activity

Garbage collection is a process that returns memory, held by completed jobs and variable data, back to a pool of memory used by all orchestration jobs. This garbage collection process ensures that the Integration Appliance has a constant supply of free memory to be used by new orchestration jobs.

The GC Activity variable tracks the percentage of full garbage collections that occur in a minute. This percentage is calculated by dividing the number of full garbage collections by 6. Ideally, the GC activity should be at or below 50%, that is 3 full garbage collections per minute. Orchestration performance is severely degraded when 6 or more full garbage collections happen per minute.

For more information about garbage collection and factors that impact garbage collection, see [Best Practices for Memory Management](#).

Running Jobs

Displays the number of jobs currently running on the Integration Appliance.

Parent topic: [Monitoring](#)

Feedback | Notices

 Last updated: Friday, February 5, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.appliance.doc/Monitoring/about_the_resource_utilization_graph.html

Hardware health

Use the information in this section to obtain notifications based on the hardware health of the appliance.

First you must prepare the SNMP Manager to receive Uncategorized traps (CASTIRON-IA-MIB::ciIaUncategorizedEv .1.3.6.1.4.1.13336.2.2.2.1.1.10 #1). Next you configure the SNMP Manager to poll for the following items and generate notifications when the conditions are met:

Table 1.

Parameters to Monitor	Recommended Thresholds	Snmp OID
Garbage Collections	Alert if this value changes quickly (by more than 6 counts in a 1-minute time period).	CASTIRON-IA-MIB::ciIaResNbrGarbageCollects .1.3.6.1.4.1.13336.2.2.2.1.1.2.1.0
Memory Usage	Alert if this value goes over 80% (raw value of 8000).	CASTIRON-IA-MIB::ciIaResPctMemoryUsed .1.3.6.1.4.1.13336.2.2.2.1.1.2.2.0
Disk Usage	Alert if this value goes over 75% (raw value of 7500).	CASTIRON-IA-MIB::ciIaResPctWipFull .1.3.6.1.4.1.13336.2.2.2.1.1.2.3.0

Garbage collections

CASTIRON-IA-MIB::ciIaResNbrGarbageCollects counts the number of garbage collections that have occurred since the system was last restarted. While occasional garbage collections are normal, collections of 6 or more per minute is excessive and indicates that an appliance is overworked and as a result, may experience performance issues.

```
$ snmpwalk -On -v 2c -c public -M +. -m +CASTIRON-IA-MIB pebbles2.sanjose.ibm.com
CASTIRON-IA-MIB::ciIaResNbrGarbageCollects .1.3.6.1.4.1.13336.2.2.2.1.1.2.1.0 =
```

Memory usage

CASTIRON-IA-MIB::ciIaResPctMemoryUsed shows the percentage of total memory in use, expressed in hundredths of a percent. This number is updated after each garbage collection.

```
$ snmpwalk -On -v 2c -c public -M +. -m +CASTIRON-IA-MIB pebbles2.sanjose.ibm.com
CASTIRON-IA-MIB::ciIaResPctMemoryUsed .1.3.6.1.4.1.13336.2.2.2.1.1.2.2.0 =
Gauge32: 1.84
```

Note that this value is provided as an integer (184 in this case), but the MIB causes the SNMP manager to alter its displayed value. Values expressed in hundredths of a percent are *usually* modified automatically. For example in this case, '1234' should be displayed as '12.34'. However, take care to ensure that the SNMP management tool handles this automatically. If it does not, the value will appear as follows:

```
$ snmpwalk -On -v 2c -c public pebbles2.sanjose.ibm.com
.1.3.6.1.4.1.13336.2.2.2.1.1.2.2.1.3.6.1.4.1.13336.2.2.2.1.1.2.2.0 = Gauge32: 184
```

Recommendation: Alert if this value goes over 80% (raw value of 8000).

Disk usage

CASTIRON-IA-MIB::ciIaResPctWipFull indicates the percentage of total Work-in-progress (WIP) disk space in use, expressed in hundredths of a percent. This number is key for predicting job purging activities.

```
$ snmpwalk -On -v 2c -c public -M +. -m +CASTIRON-IA-MIB pebbles2.sanjose.ibm.com
CASTIRON-IA-MIB::ciIaResPctWipFull .1.3.6.1.4.1.13336.2.2.2.1.1.2.3.0 = Gauge32:
6.00
```

Recommendation: Alert if this value goes over 75% (raw value of 7500).

Permissions

Permissions topics provide information about creating user profiles, setting and changing passwords, creating and managing users, and creating and managing groups.

- [About Built-In Groups](#)
Built-in groups are predefined groups. In the cloud, in addition to a tenant administrator group, each environment has a built-in administrator, publisher, and user group.
- [About Libraries Environments](#)
- [About User Profiles](#)
A user profile provides a summary of user details, such as: name, display name, email, and group memberships.
- [Assigning Users to Groups](#)
You must have tenant administrator or environment administrator privileges to assign users to groups. Environment administrators can only add users to groups in their specific environment.
- [Changing Your Password](#)
- [Changing User Passwords](#)
- [Creating New Groups](#)
In the cloud, only the tenant admin user can create new groups. In a multi-environment tenant, environment administrators can also create new groups for their specific environment.
- [Creating New Users](#)
In the cloud, only the tenant admin user can create new users. In a multi-environment tenant, environment administrators can also create new users for their specific environment.
- [Deleting Groups](#)
In the cloud, only the tenant admin users can delete groups from a cloud environment. In a multi-environment tenant, environment administrators can also delete groups for their specific environment.
- [Deleting Users](#)
In the cloud, only the tenant admin user can delete users from a cloud environment. In a multi-environment tenant, environment administrators can also delete users for their specific environment.
- [Granting Project Configuration Permissions](#)
You can grant permissions to a user or a group by editing the project configuration permission. When you grant permissions to a user or group, they can edit or delete the project configuration.
- [Local Staging Database Permissions](#)
Only users with Administrator privileges, granted as being part of the built-in Administrator group, can start, stop, and perform operations on the Local Staging Database.

[Feedback](#) | [Notices](#)

About Built-In Groups

Built-in groups are predefined groups. In the cloud, in addition to a tenant administrator group, each environment has a built-in administrator, publisher, and user group.

For example: A tenant, named Cumulus, is created for your organization. Within this tenant there are two environments: Development and Production. The following built-in groups would be available:

- admin [cumulus.com]
- admin [Development]
- publisher [Development]
- user [Development]
- admin [Production]
- publisher [Production]
- user [Production]

The same user can be a part of multiple groups. You can assign users to a built-in group or create a new group.

Note: If you grant project configuration permissions to a group, the users in that group will have full access to the project configuration--user will be able to create new versions of the project configuration, as well as edit and delete the project configuration.

The following list defines the permissions granted to each of the built-in groups:

- **Tenant Administrator Group.** Provides privileges to all environments, users, groups, and projects in a specific tenant. Permits users to create, edit, and delete users and custom groups in the tenant. Users in this group can add and delete users to and from any built-in or custom group in the tenant. Users in this group can view, edit, and delete permissions for all source projects in the tenant.

Users in this group can view all the environments in the tenant and have all the permissions of an environment administrator in each of the tenant environments.

- **Environment Administrator Group.** Provides privileges to all users, groups, and projects in a specific environment. Permits users to create, edit, and delete users and custom groups in a specific environment. Users in this group can add and delete users to and from any built-in or custom group in the environment.

Environment Administrators can also create and deploy project configurations for project that any environment publisher publishes, and view orchestration job details for any project configuration in the environment. With environment administrator group privileges you can edit permissions that publishers for the same environment set for their individual project configurations.

Even though members of the Environment Administrator group have Environment Publisher group and Environment User group privileges, the members of the Environment Administrator Group are not displayed in other groups in the same environment until you explicitly add the user.

- **Environment Publisher Group.** Provides project privileges in a specific environment. Permits users to create, deploy, or delete project configurations for any project that they publish in the environment. Users in this group can also start and stop orchestrations and view orchestration job details for project configurations they deployed in the environment. As an environment publisher, you can grant

permissions for individual project configurations you create to another user with environment publisher privileges for the same environment.

The members of the Environment Publisher Group do not appear in the Environment User Group, until you explicitly add the user.

- **Environment User Group.** Permits users to monitor alerts and orchestrations in a specific environment. Users in this group can create and edit projects; however, they cannot publish the project to an environment. You must have Publisher privileges for the specific environment to which you want to publish a project. All users are automatically members of the Environment User group.

In a multi-environment tenant, users in this group only see the environment tab for environments of which they are a member. For example, a tenant has a Development, a Staging, and a Production environment. The tenant administrator or administrator of the Development environment adds a user to the User [Development] group. When the user logs in to the tenant, the user can only see the Development environment, even though the tenant has two other environments.

About Libraries Environments

Libraries Environment is a user profile parameter that specifies the environment from which Studio retrieves connector libraries.

In a multi-environment tenant, each environment can potentially have different versions of connector libraries installed. Setting this parameter points Studio to the libraries you want to use while verifying your projects. This parameter is not as critical if your project does not use an endpoint that requires additional libraries to be installed. See the Connector Release Notes[®] for a complete list of endpoints that require you to install additional libraries.

Note: The environment you select should match the environment of the primary group the user is a member of. For example: If you select the Development environment as the Libraries Environment, you should be a member of groups in the Development environment.

About User Profiles

A user profile provides a summary of user details, such as: name, display name, email, and group memberships.

You can access and edit user profile settings from the Settings link in the top right-hand corner of the Management Console. The user profile displayed is for the user currently logged in to the Management Console.

Parent topic: [Permissions](#)

Accessing User Profile Information

Procedure

1. Click the Settings link in the upper right-hand corner of the Management Console. The Settings window is displayed.
2. Optional: For the Display Name setting, click Edit to modify the display name. After you modify the setting, click Save.
3. Optional: For the Password setting, click Edit to modify the user password. After you modify the setting, click Save.
4. Optional: For the Email setting, click Edit to modify the user's email address. After you modify the setting, click Save.
5. Optional: **Cloud:** Click Change Libraries Environment, to specify the environment from which Studio retrieves connector libraries. After you modify the setting, click Save.
6. Click Close to close the Settings window.

Changing Your Password

About this task

You can change your own password at anytime. However, to modify another user's password, you must have tenant administrator permissions. Environment administrators cannot change passwords for users in their environment.

For example, you are the administrator for the Development environment. You can change your password, but you cannot change the password for any specific user with permissions to the Development environment.

Procedure

1. Click the Settings link in the upper right-hand corner of the Management Console. The Settings window is displayed.
2. For the Password setting, click Edit.
3. Enter values for the Old Password, New Password, and Confirm Password fields.

If you clear the Hide Password Text option, your password displays and is no longer encrypted.

4. Click Save to change your password.

Results

A confirmation message displays when the Management Console has successfully saved the new password.

Parent topic: [Permissions](#)

 Last updated: Friday, February 5, 2016

Changing User Passwords

About this task

You can change your own password at anytime. However, to modify another user's password, you must have tenant administrator permissions. Environment administrators cannot change passwords for users in their environment.

For example, you are the administrator for the Development environment. You can change your password, but you cannot change the password for any specific user with permissions to the Development environment.

To change another user's password:

Procedure

1. Log in to the Management Console as the tenant administrator.
2. Select Security > Users and Groups.
3. Click the name of the user whose password you want to change.
4. In the Edit User window, enter a password and confirm the password.

If you clear the Hide Password Text option, your password displays and is no longer encrypted.

5. Click Save to change your password.

Results

A confirmation message displays when the Management Console has successfully saved the new password.

Creating New Groups

In the cloud, only the tenant admin user can create new groups. In a multi-environment tenant, environment administrators can also create new groups for their specific environment.

Before you begin

On a physical or virtual Integration Appliance, only admin users can create new groups.

Procedure

1. In the Management Console, login as administrator.
2. Select Security > Users and Groups.
3. In the Groups section, click New Group.

4. In the New Group dialog box, enter a Name and Display Name for your new group.
5. In the User list, select the users to join the group.

Select the User checkbox to select all the users in the list.

6. Click Save.

Results

In the Groups section of the Users and Groups page, the new group displays in alphabetical order.

Creating New Users

In the cloud, only the tenant admin user can create new users. In a multi-environment tenant, environment administrators can also create new users for their specific environment.

Before you begin

On a physical or virtual Integration Appliance, only admin users can create new users.

Procedure

1. In the Management Console, login as administrator.
2. Select Security > Users and Groups.
3. In the Users section, click New Users.
4. In the New User window, enter a value for the following fields: Name, Display Name, Email, Password, and Confirm Password.

It is recommended that you add the tenant name to the user name and display name.

For example, if the tenant name is `ibm.com`, then the new user name should be `newuser@ibm.com`. This will help you identify common user names across multiple tenants in the cloud.

5. Optional: Clear the Hide Password Text checkbox. If you clear this option, the password you entered displays and is no longer encrypted.
6. In the Groups list, select all the groups to which the new user will have access.
7. Optional: Clear the Active checkbox. If you clear this option, the user cannot log in to the Management Console.
8. **Cloud only:** From the Libraries Environment list, select the environment from which the user's projects can retrieve additional libraries and files for endpoints. The environment you select should match the environment of the primary group the user is a member of. For example: If you select the Development

- environment as the Libraries Environment, you should be a member of groups in the Development environment.
9. Click Save.

Results

In the Users section of the Users and Groups page, the new user displays in alphabetical order.

Parent topic: [Permissions](#)

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.appliance.doc/Permissions/deletingUsers.html>

Granting Project Configuration Permissions

You can grant permissions to a user or a group by editing the project configuration permission. When you grant permissions to a user or group, they can edit or delete the project configuration.

Before you begin

You must have Administrator privileges or you must be the publisher of a project to grant permissions to other users or groups to edit or delete project configurations.

About this task

By default, permissions to project configurations are granted to only the Administrator Group. If you want to grant permissions to another group you must explicitly do so.

For example, you are a user with publisher rights and belong to the built-in Publisher group. You publish a project. Only you, the Administrator Group members, and the members of the Publisher group that you belong to, will have permissions to the project configuration. If you would like to include another group to have

permissions to the project configuration, you must edit the permission on the project configuration to include another group.

To edit permissions:

Procedure

1. Click a project configuration. The Configuration Details page is displayed.
2. In the Permissions section, click Edit under Group or User and select group or groups and user or users to grant permissions to.
3. Click Save.

Note: When permission is given to a group, all the users in that group are granted permission to the project configuration by default. You cannot remove permissions for an individual user from this group. If any user (outside this group) requires access to the project, you can grant permissions to the user by selecting only that user from the user table.

Results

All the users and groups you select now have full access to the project configuration. These users and groups can now edit and delete the project configuration.

Local Staging Database Permissions

Only users with Administrator privileges, granted as being part of the built-in Administrator group, can start, stop, and perform operations on the Local Staging Database.

Users with Publisher privileges can view tables and perform operations on the database, only if the Local Staging Database has already been started by a user with Administrator privileges. If the Local Staging Database has not been started, users with Publisher privileges will not be able to view the database or perform operations on the database.

Users that are part of the built-in Users group or with WMC login credentials created in an LDAP Server do not have access to the Local Staging Database.

About Secure Connectors

A Secure Connector facilitates the secure transfer of data between the IBM® WebSphere® Cast Iron® appliance and an endpoint that is located behind a firewall. The Secure Connector installer for appliance supports both 32-bit and 64-bit Windows and Linux machines.

To enable a Secure Connector, a tenant administrator must complete the following tasks:

- Create a Secure Connector
- Download the Secure Connector configuration file
- Launch the Secure Connector installer
- Install vendor supplied libraries

Parent topic: [Using Secure Connectors](#)

 Last updated: Friday, February 5, 2016

Secure Connector Minimum Requirements

This topic provides information about minimum system requirements needed to use a Secure Connector.

You can run the Secure Connector on the following operating systems:

- Microsoft Windows 7
- Microsoft Windows 8
- Microsoft Windows 2008
- Linux (RHEL 6.5, Ubuntu 14.04)

Note: For installing Secure Connectors on Linux platform, use xWindows or KDE environment to use the GUI option.

The Secure Connector has the following minimum system requirements:

- 1 GHz CPU
- 2 GB RAM
- Java™, 1.7

Creating Secure Connectors

This topic provides information about creating Secure Connectors.

About this task

Use the Web Management Console (WMC) to create a Secure Connector for your environment.

After you create a Secure Connector in the appliance, you must configure a machine behind the firewall to facilitate communication between the Secure Connector and a specific endpoint behind the firewall. Use the Secure Connector installer to configure the machine behind the firewall.

Note: If the endpoint you are creating requires extra libraries for a Secure Connector, use WMC to install the libraries before you deploy any project configurations that use the Secure Connector.

Procedure

1. From the navigation pane of an environment tab, select System > Secure Connectors.
2. Click New Secure Connector. The Create Secure Connector dialog box is displayed.
3. Provide a name for the new Secure Connector.
4. Provide a brief description of the Secure Connector.
5. Click Save. The Secure Connector is displayed in the Secure Connector page.

Downloading the Secure Connector installer:

You can download the Secure Connector installer from the Cast Iron installer CD, Fix Central, or IBM Passport Advantage. You can download for Windows or Linux, 32-bit or 64-bit, based on your requirement.

Parent topic: [Using Secure Connectors](#)

[Feedback](#) | [Notices](#)

 Last updated: Friday, February 5, 2016

file:///dcs/markdown/workspace/Transform/out.html

Downloading Secure Connector Configuration Files

How to download Secure Connector configuration files.

About this task

When you download a configuration file, the configuration file is saved to your default download directory. You can choose to save configuration files to different locations. Regardless of the number of configuration files you download, you can only use one configuration file during the Secure Connector installation process.

When you have selected a configuration file to set up a Secure Connector, that configuration file is used to configure any subsequent Secure Connector. It is not recommended to configure multiple Secure Connectors using the same configuration file. Instead, use a new configuration file or modify the existing configuration file. The Gateway, Listen to Port, and Transmit to Port parameters should have unique values for each Secure Connector.

The Secure Connector configuration file provides the Secure Connector installer with values for the following parameters:

- **Secure Connector Name** - Specify the name of the Secure Connector you created.
- **Tenant ID** - Use the default value provided in the file. It is used for internal communication.
- **Environment ID** - Use the default value provided in the file. It is used for internal communication.
- **Gateway** - Use the default value provided in the file. It is the data network IP on which the appliance is running.
- **Listen on Port** - Only modify this parameter if another service is using the port that is specified or you want to run multiple Secure Connectors on the box.
- **Transmit on Port** - Only modify this parameter if another service is using the port that is specified or you want to run multiple Secure Connectors on the box.
- **Secure Connector Auth Key** - Specify the authentication key from the Secure Connector you created in the appliance.
- **Secure Connector Private Key** - Specify the authentication private key, which you downloaded while creating the Secure Connector in the appliance.

Note: If you are using secure connector on appliance then:

- Ensure that the appliance IP is reachable (you are able to ping) from the machine where the secure connector is installed.
- The ports mentioned below are used internally by the appliance for communication with the Secure Connector. It is recommended that you do not use these ports on the appliance in any of your orchestration activities that involves HTTP Receive Request activity and Web Service activities.
- - 9080
 - 9442
 - 9443
 - 9445

To download the Secure Connector configuration files, complete the following steps:

Procedure

1. Log into the Web Management Console as the tenant administrator.
2. From the Navigation pane of an environment tab, select System > Secure Connector.
3. In the Secure Connector window, click the Secure Connector that will communicate with an endpoint behind the firewall. The Edit Secure Connector dialog box is displayed.
4. Click Download Secure Connector Configuration and click Download now. The Opening Secure Connector Configuration dialog box is displayed.
5. Choose Save File and click OK. The configuration file is saved to the default download directory of the current user.

Installing Secure Connectors

Provides procedures to download the Secure Connector installer and install the Secure Connector.

Before you begin

For Windows installations, verify that you do not have an existing version of the Secure Connector installed. If you have a previous version that is installed, uninstall it before you proceed.

For Linux installations, while it is not required, it is good practice to uninstall previous Secure Connector installations.

For Linux machines, install a desktop environment, such as GNOME or KDE, to provide a graphical interface.

About this task

After you create a Secure Connector in the appliance, you must configure a machine behind the firewall to facilitate communication between the Secure Connector and a specific endpoint behind the firewall. Use the Secure Connector installer to configure the machine behind the firewall.

Note: The machine on which you choose to run the installer must have access to the endpoint. You do not have to run the installer on the same machine as the endpoint.

Note: If you are using secure connector on appliance then:

- Ensure that the appliance IP is reachable (you are able to ping) from the machine where the secure connector is installed.
- The ports mentioned below are used internally by the appliance for communication with the Secure Connector. It is recommended that you do not use these ports on the appliance in any of your orchestration activities that involves HTTP Receive Request activity and Web Service activities.
- - 9080
 - 9442

- o 9443
- o 9445

Downloading the Secure Connector installer:

You can download the Secure Connector installer from the Cast Iron® installer CD, Fix Central, or IBM® Passport Advantage®. You can download for Windows or Linux, 32-bit or 64-bit, based on your requirement.

To install the Secure Connector:

1. Start the Secure Connector installer that you downloaded.
 - o `windows-secure-connector-installer.exe` (for Windows)
 - o `linux-secure-connector-installer.sh` (for Linux)

The Secure Connector Installer wizard is displayed.

2. Click Next then read and accept the licensing agreement.
3. Click Next and choose an installation directory.
4. Click Next. A message window states the location where the target directory is created.

Note: If an installation directory exists, a warning message is displayed and you must confirm that you want to install and overwrite existing files.
5. Click OK.
6. Set up shortcut options to start, stop, and edit a Secure Connector.
 - a. Select one or both of the following options:
 - Create shortcuts in the Start menu.
 - Create additional shortcuts on the desktop.
 - b. Select a program group from which you access the shortcuts.
 - c. Choose to create shortcuts for the current user or all users.
7. Click Next. The installation progress displays.
8. Select a Secure Connector configuration file. If you have not already downloaded a Secure Connector configuration file, download one now. For more information about how to download Secure Connector configuration files, see [Downloading Secure Connector Configuration Files](#).
9. Click Next.
10. For Windows installation, choose to install and run the Secure Connector as a Windows Service. If you choose install the Secure Connector as a Windows Service, you can control the Secure Connector using the Windows Services control panel (recommended). If you choose not to install and run the Secure Connector as a Windows Service, then the Secure Connector is installed as a Windows application. To run the Secure Connector as a Windows Service, you must specify the following service account information:
 - o Service Start Mode
 - o Service Account Domain
 - o Service Account User
 - o Service Account Password
11. Click Next. The Create Vendor Supplied Libraries screen is displayed.
12. Click Add and select the library files to upload. In the appliance, the valid files are `.jar`, `.dll`, and `.so` file types. The files that you select are displayed in the Files to Add column.
13. Click Update.

The files that display in the Files to Add column are not committed until you click Update.

14. Click Next. A dialog box is displayed to confirm the changes made, if you have not clicked the Update button. Click Yes to update changes and proceed further. If you click No to go to the next screen without any changes. Click the Cancel button to stay on the same screen.
15. When you click Yes to proceed further, the `Vendor JAR created/updated successfully` message is displayed.

16. Click OK. A message saying that the installation has completed successfully is displayed.
17. Restart the Secure Connector.

Note: If your endpoint (that is SAP) requires additional libraries, you must install the additional libraries before you start the Secure Connector. For more information about installing additional libraries, see [Installing Vendor Supplied Libraries for Secure Connectors](#).

To run the Secure Connector installer:

1. Start the Secure Connector installer that you downloaded in the Creating a Secure Connector section.
 - `windows-agent-installer.exe` (for Windows)
 - `linux-agent-installer.sh` (for Linux)
2. Accept the licensing agreement and choose an installation directory.
3. Log in to the Web Management Console as the administrator.
4. Select Setup > Support Information. Keep the Support Information page open while configuring the Secure Connector installer parameters. You can cut and paste values from the Support Information page to the appropriate parameter field.
5. Provide values for the following parameters:
 - **Secure Connector Name** - Specify the name of the Secure Connector you created.
 - **Tenant ID** - Use the default value provided in the file. It is used for internal communication.
 - **Environment ID** - Use the default value provided in the file. It is used for internal communication.
 - **Gateway** - Use the default value provided in the file. It is the data network IP on which the appliance is running.
 - **Listen on Port** - Modify this parameter only if another service is using the port that is specified or you want to run multiple Secure Connectors on the box.
 - **Transmit on Port** - Modify this parameter only if another service is using the port specified or you want to run multiple Secure Connectors on the box.
 - **Secure Connector Auth Key** - Specify the authentication key from the Secure Connector you created in the cloud.
 - **Secure Connector Private Key** - Specify the authentication private key, which you downloaded while creating the Secure Connector in the cloud.
6. Open a command prompt and navigate to the Secure Connector installation directory.
7. If your endpoint (that is, SAP) requires additional libraries, you must install the additional libraries before you start the Secure Connector. For more information about installing additional libraries, see [Installing Vendor Libraries on the Secure Connector](#).
8. Start the Secure Connector by running one of the following files at the command prompt:
 - For Windows: `runclient_osgi.bat`
 - For Linux: `runclient_osgi.sh`

Adding or importing certificates to the Secure Connector TrustStore/KeyStore

For Cast Iron connector activities, such as HTTP, FTP, Email, or Web Services (or any other connector) that need to establish connection with the SSL enabled server (HTTPS/FTPS), you must import the corresponding certificates into the TrustStore or KeyStore of the Secure Connector.

Procedure

1. Use the Java keytool utility to import the required certificates to TrustStore(cacerts) or KeyStore(cert) in the path mentioned: `<secure_connector_install_directory>\etc\security`
2. Restart Secure Connector for the changes to take effect.

Parent topic: [Using Secure Connectors](#)

Installing Vendor Supplied Libraries for Secure Connectors

Certain endpoints require additional libraries to be installed before the Secure Connector can communicate with them. This section provides information about using the Web Management Console (WMC) to install these vendor supplied libraries. For a complete list of connectors that require vendor supplied libraries, open the Update Connector Libraries page in WMC.

About this task

If your integration project uses a connector that requires additional libraries, you must install the additional libraries before you deploy the project configuration. Deploying the project configuration before installing the additional libraries generates runtime errors. For a complete list of connectors that require vendor supplied libraries, open the Update Connector Libraries page. See the following procedure.

Procedure

1. Log on to WMC.
2. Select System > Upgrade Connector Libraries .
3. In the Connector column, select the connector for which you want to install additional files.

Any files that have already been installed are displayed in the Installed Files column.

4. Click the plus (+) icon and select the library files to upload. In the appliance, the valid files are .jar and .dll are the valid library file types. The files that you select are displayed in the Files to Add column.
5. Click Update.

The files that display in the Files to Add column are not committed until you click Update. If you click Reset before you click Update, WMC does not add the files you uploaded. If WMC times out before you click Update and commit the added files, repeat the last two steps.

6. In the same environment tab, select: System > Secure Connectors.
7. Click Download Libraries and save the SecureConnector-Default Environment-libraries.zip file to your workstation.
8. Uncompress the SecureConnector-Default Environment-libraries.zip file and find a *.tp-1.0.0.jar for each connector module.
9. Use the .jar files in the SecureConnector-Default Environment-libraries.zip to replace the files in the Secure Connector installation directory: lib/plugins.
10. Copy all the remaining .zip files to the following Secure Connector installation directory: lib/thirdparty
11. Restart the Secure Connector by running one of the following files from a command line:
 - o For Windows: runclient_osgi.bat
 - o For Linux: runclient_osgi.sh

Downloading and installing the SAP libraries

To connect to an SAP system from studio, you must install SAP DLLs and JAR files onto your Windows development machine. You must have the SAP login credentials to enter the SAP Support Portal and download the files.

About this task

To download and install the SAP JAR files and DLLs:

1. Contact SAP Technical Support to obtain the compressed files for the following SAP Components:
 - o **SAP JCo Release 3.0.6 or later version - based on the platform on which studio is running.**

2. Uncompress the SAP JCo compressed file:
 - o Double-click the `sapjdoc30P_6-1000xxxx.zip` file.
 - o Use the decompression tool to extract the contents of the compressed file to a temporary directory. This compressed file contains another compressed file `sapjco3-NTintel-3.0.6.zip`. Extract this compressed file also to a temporary directory, for example: `C:\temp\sapjco3-NTintel-3.0.6`. This directory contains the required libraries `sapjco3.jar` and `sapjco3.dll`.
3. Unzip the SAP IDoc JCo compressed file:
 - o Double-click the `sapjdoc30P_6-1000xxxx.zip` file.
 - o Use the decompression tool to extract the contents of the compressed file to a temporary directory, for example, `C:\temp\sapjdoc30P_6-1000xxxx`. This directory contains the required library `sapidoc3.jar`.

Procedure

1. Open studio, select Tools > Install Module Providers.
2. When the Add Providers dialog box is displayed, click the plus (+) button present beneath SAP Connector.

A text field and a Browse button are displayed.

3. Click Browse, and use the browse dialog box to locate and select the `sapjco3.jar` file.
4. Click Open to import the JAR file contents.
5. Click the next available plus (+) button to add the `sapidoc3.jar` and `sapjco3.dll` files.
6. When the JAR file is listed in the Add Providers dialog box, click OK.

Results

A prompt is displayed to restart studio and activate the changes.

What to do next

You can now create SAP endpoints and orchestrations.

Uninstalling Secure Connectors (Windows)

This topic provides information about uninstalling a Secure Connector from a Windows machine.

About this task

The following procedure allows you to uninstall a Secure Connector and all its configuration settings:

Procedure

1. Verify that another program, such as your browser or command shell, does not have any of the Secure Connector directories open.
2. From the Windows Start button, select All Programs > IBM > Cast Iron Secure Connector <connector_name> > Stop Secure Connector.
3. From the Windows Start button, select All Programs > IBM > Cast Iron Secure Connector <connector_name> > Uninstall Secure Connector. The Uninstaller window is displayed.
4. Select Force the deletion of C:\Program Files\IBM\Secure_Connector_<connector_name>.
5. Click Uninstall.
6. When the status bar displays [Finished], you can close the Uninstaller window.

Uninstalling Secure Connectors (Linux)

This topic provides information about uninstalling a Secure Connector from a Linux machine.

Before you begin

You must have root level permissions to uninstall the Secure Connector from a Linux machine.

About this task

You can uninstall the Secure Connector by using a graphical interface, issuing a command line command, or running the Java[®] `uninstall.jar` file. Choose one of the following options to uninstall a Secure Connector and all its configuration settings from a Linux machine.

Uninstalling the Secure Connector using a graphical interface: You must have a desktop environment, such as GNOME or KDE, to successfully uninstall the Secure Connector using this procedure.

1. Verify that another program, such as your browser or command shell, does not have any of the Secure Connector directories open.
2. From the application directory, select IBM > Cast Iron Secure Connector <connector_name> > Stop Secure Connector.
3. From the application directory, select IBM > Cast Iron Secure Connector <connector_name> > Uninstall Secure Connector.

Uninstalling the Secure Connector from the command prompt:

1. Verify that another program, such as your browser or command shell, does not have any of the Secure Connector directories open.
2. From the command prompt, issue the `./Uninstaller/uninstall.sh` command.

Uninstalling the Secure Connector with .jar file. You must have Java version 1.6 or higher installed to successfully uninstall the Secure Connector using this procedure.

1. Verify that another program, such as your browser or command shell, does not have any of the Secure Connector directories open.
2. From the command prompt, enter the `runclient_osgi.sh stop` command.
3. In the directory where you installed the Secure Connector, navigate to the Uninstaller subdirectory to find the `uninstaller.jar` file: `"${JAVA}" -jar "${INSTALL_DIR}/Uninstaller/uninstaller.jar"` where `{JAVA}` is the Java executable and `{INSTALL_DIR}` is the Secure Connector name.

A dialog box is displayed.

4. Select the Force the Deletion option.
5. Click Uninstall.
6. Click Quit.

Results

The Secure Connector is uninstalled. Configuration settings are retained in the home directory.

Starting and Stopping Secure Connectors

Starting and Stopping Secure Connectors topics provide information about starting and stopping Secure Connectors on Windows and Linux machines. For Windows machines, options you chose during installation affect how you can start and stop Secure Connectors. If you installed the Secure Connector as an automatic Windows Service, as recommended, then you can use the Windows Services control panel to stop and start the Secure Connector. If you installed the Secure Connector as a Windows application, then you can start and stop the Secure Connector using Windows Start menu shortcuts or desktop shortcuts. For Linux machines, you can start and stop Secure Connectors by using a graphical interface or by running commands from the command line.

Starting and Stopping Secure Connectors on Windows (Installed as a Windows Service)

This topic provides information about starting and stopping Secure Connectors on Windows machines, where you have a Secure Connector that is installed as a Windows Service.

About this task

If you installed the Secure Connector as an automatic Windows Service, as recommended, use the Windows Services control panel to stop or restart the Secure Connector.

By default, when a Secure Connector is installed as a Windows Service, the Secure Connector is not configured to interact with the Windows Desktop. However, if the Secure Connector service was installed under a local system account, you can enable an interactive mode that presents system tray icons and a command window when the Secure Connector service is running.

For steps to enable the interactive mode for a Windows service, see [Enabling Interactive Mode for Windows Services](#).

Note: If you use the **Start Secure Connector** Start menu shortcut or desktop shortcut to start a Secure Connector, the Secure Connector starts as a normal application rather than as a service. You must use the Windows Services control panel to start Secure Connectors as a service. You can use either the **Stop Secure Connector** Start menu shortcut or desktop shortcut to stop a Secure Connector.

Starting and stopping Secure Connectors, using the Windows Services control panel:

Procedure

1. Open the Windows Services window: Start > Control Panel > Administrative Tools > Services.
2. Scroll down the list of services to locate the IBM® Secure Connector service.
3. Right-click on the IBM Secure Connector service and select the appropriate command: Start, Stop, Pause, Resume, or Restart.

Enabling Interactive Mode for Windows Services

When the Secure Connector is installed as a Windows Service, enable the interactive mode for the service to view system tray icons and command window.

About this task

By default, when a Secure Connector is installed as a Windows Service, the Secure Connector is not configured to interact with the Windows Desktop. However, if the Secure Connector service was installed under a local system account, you can enable an interactive mode that presents system tray icons and a command window when the Secure Connector service is running.

Procedure

1. Open the Services control panel. For example: Start > Control Panel > Administrative Tools > Services.
2. Select the Cast Iron Secure Connector service.
3. Right-click the service name, and select Properties. The Service Properties window is displayed.
4. Select the Log On tab.
5. Select Local System account and then select Allow service to interact with desktop.
6. Click OK.
7. Click Restart.

Results

When the Cast Iron[®] Secure Connector service is restarted, system tray icons and a command window are displayed.

Note: You can minimize the command window. However, if you close the command window, the Cast Iron Secure Connector service is stopped and terminated. Closing the command window is the equivalent of stopping the Secure Connector service from the Windows Services control panel.

Starting and Stopping Secure Connectors on Windows (Installed as a Windows Application)

This topic provides information about starting and stopping Secure Connectors on Windows machines, where you have a Secure Connector that is installed as a Windows application.

About this task

When the Secure Connector is installed on a Windows machine as a Windows application, rather than a Windows Service, you can start and stop the Secure Connector using Windows Start menu shortcuts or desktop shortcuts.

Procedure

1. Start the Secure Connector from either the Windows Start menu shortcut or desktop shortcut.
 - From the Windows Start button, select All Programs > IBM > Cast Iron Secure Connector <connector_name> > Start Secure Connector.
 - From the Windows desktop, click the Start Secure Connector shortcut to start the Secure Connector.
2. Stop the Secure Connector from either the Windows Start menu shortcut or desktop shortcut.
 - From the Windows Start button, select All Programs > IBM > Cast Iron Secure Connector <connector_name> > Stop Secure Connector.
 - From the Windows desktop, click the Stop Secure Connector shortcut to stop the Secure Connector.

Starting and Stopping Secure Connectors on Linux

This topic provides information about starting and stopping Secure Connectors on Linux machines.

About this task

If you have a desktop environment, such as GNOME or KDE, you can start and stop the Secure Connector using menu shortcuts or desktop shortcuts. You can also start and stop the Secure Connector using the command line.

Procedure

1. Start the Secure Connector from either the menu shortcut, desktop shortcut, or command line. Choose one of the following options:
 - o Select `<application>` > IBM® > Cast Iron® Secure Connector `<connector_name>` > Start Secure Connector.
 - o From the desktop, click the Start Secure Connector shortcut to start the Secure Connector.
 - o From the command prompt, enter `runclient_osgi.sh start .`
2. Stop the Secure Connector from either the menu shortcut, desktop shortcut, or command line. Choose one of the following options:
 - o Select `<application>` > IBM > Cast Iron Secure Connector `<connector_name>` > Stop Secure Connector.
 - o From the desktop, click the Stop Secure Connector shortcut to stop the Secure Connector.
 - o From the command prompt, enter `runclient_osgi.sh stop.`

Upgrading Secure Connectors

This topic provides information about upgrading Secure Connectors.

Procedure

1. Create a new Secure Connector.
2. Download the latest version of the Secure Connector installer, based on your operating system. For example, Windows or Linux.
3. On a Windows or Linux machine, launch the Secure Connector installer. The Cast Iron® Secure Connector wizard guides you through the upgrade process.

Note: If you already have a Secure Connector installation that is higher than or same as the latest version, a warning message states that you have an existing installation and alternatively you can upgrade the existing installation.

Note: You must stop the Secure Connector (if already started) before upgrading.

Note: Before you proceed with the Secure Connector upgrade process, ensure that you have:

 - o Stopped the Secure Connector
 - o Taken a manual backup of the certificates (if any) located at `<secure_connector_install_path>/etc/security` or `jre/lib`. You may want to replace/add your certificates after upgrade.
4. Click the Upgrade option. The Select the installed path list box is displayed.
5. Select the Secure Connector installed path, if it is displayed in the list box. Else, click Browse button to select the installed path.
6. Click Next, then read and accept the licensing agreement.

7. Click Next. The installation progress is displayed. A message is displayed stating that the installation has been completed successfully. The path to the installer program is also displayed.
8. Click Done.
9. Start the Secure Connector.

Updating Secure Connector Configuration

This topic provides information about updating Secure Connector configuration.

Procedure

1. Download the new Secure Connector configuration file. For more information, see [Downloading Secure Connector Configuration Files](#).
2. Launch the Secure Connector Configuration wizard. To launch the wizard:
 - a. Windows machine: Go to Start > All Programs > IBM > Cast Iron Secure Connector <connector_name> > Secure Connector Configuration.
 - b. Linux machine: Select <application> > IBM > Cast Iron Secure Connector <connector_name> > Secure Connector Configuration.
3. The Secure Connector configuration wizard guides you through the upgrade process.
4. Click Next. The current Secure Connector Configurations are displayed if the Secure Connector is already configured. If not, browse for the newly downloaded configuration file and click Next.
5. Modify the Secure Connector configuration by completing one of the follow steps:
 - a. Modify the Cloud Gateway, Listen on Port, and Transmit on Port parameters and click Next. Or
 - b. Click the Previous button and select a new Secure Connector file.
 - i. Click Next and verify the configuration settings.
 - ii. Click Next.
6. Specify settings for a proxy server: Proxy Server, Proxy Port, Login ID, Login Password, and Retype Password. These parameters are only required if your network requires that the Secure Connector uses a proxy to connect to the Cast Iron[®] Cloud Gateway.
7. The Create Vendor Supplied Libraries page is displayed.
8. Click Add and select the library files to upload. In the appliance, the valid files are .jar, .dll, and .so file types. The files that you select are displayed in the Files to Add column.
9. Click Update.

The files that display in the Files to Add column are not committed until you click Update.

10. Click Next. A dialog box is displayed to confirm the changes made, if you have not clicked the Update button. Click Yes to update changes and proceed further. If you click No to go to the next screen without any changes. Click the Cancel button to stay on the same screen.

11. When you click Yes to proceed further, the `Vendor JAR created/updated successfully` message is displayed.
12. Click OK. A message saying that the installation has completed successfully is displayed.
13. Restart the Secure Connector.

Troubleshooting Secure Connectors

This topic provides potential solutions for issues you have with the Secure Connector.

Secure Connector log files are available for review. The Log directory is created after the initial start of the Secure Connector. The Log directory is in the Secure Connector installation directory. For example: C:\Program Files\IBM\Secure_Connector_1.development\logs

- **A port contention error occurs.** A port contention error can occur when two Secure Connectors are configured to use the same port and gateway. To resolve the issue, provide unique values for the Gateway, Listen on Port, and Transmit on Port parameters in each Secure Connector configuration file.
- **Unable to run .jar file to uninstall a Secure Connector.** Verify that the Java™ path is specified correctly and that you have Java version 1.6x or higher installed on the machine.

About Certificates

Certificates enable secure communication between the Integration Appliance and endpoints located in your intranet and extranet. Use the Management Console to manage certificates.

From the Certificates page, you can generate, import, and update security certificates and security settings.

The following tables provides definitions for certificate terminology.

Certificate Terminology	Definition
Alias	A string of alphanumeric characters you assign to a KeyStore or TrustStore entry to provide a more user friendly name. Within a KeyStore or TrustStore you can use an alias to refer to the keys and certificates. Note: Aliases are not case sensitive. For example, MyCert and mycert refer to the same entry.
Certificate	A signed credential which identifies an endpoint or organization.
Key Pair	A public key and associated private key.
KeyStore	A Java™ data store that houses private keys and certificates used by a Java SSL endpoint. For example, a local Java endpoint supplies a certificate from its KeyStore as a credential to identify itself to a remote SSL endpoint.
PKI	Public Key Infrastructure is a system for managing encryption keys and identity information. The purpose of the system is to provide standards based system for protecting/securing communications over the internet.
Private Key	A key known only to a single endpoint used to encrypt and/or sign data.
Public Key	A key associated with a private key that can be distributed to anyone.

Certificate Terminology	Definition
SSL	Secure Sockets Layer enables secure web communications and permits endpoints to optionally authenticate each other.
TrustStore	A Java data store that houses certificate authority signed certificates. For example, a local Java endpoint utilizes a TrustStore to authenticate the identity (certificate) provided to it by a remote SSL endpoint.

Configuring Kerberos

About this task

When the Integration Appliance is exchanging data over a non-secure network, the Kerberos protocol allows the Integration Appliance to authenticate the server with which the Integration Appliance is communicating.

Procedure

1. In the navigation pane, select Security > Kerberos. The Kerberos Configuration page is displayed.
2. Specify the Kerberos Server name.
3. Specify the Kerberos Realm.
4. Click Save.

Clicking Delete clears the settings that you have specified.

Configuring LDAP Mechanism Properties

About this task

If you selected the Use Secure Connection (SASL) security option while enabling an LDAP Server, you must also specify a mechanism policy and configure the mechanism properties.

LDAP mechanism properties and LDAP mechanism policies are further described in the following tables.

Procedure

1. In the navigation pane, select Security > LDAP. The LDAP Configuration page is displayed.
2. In the Security Options section, select Use Secure Connection (SASL).
3. In the Authentication section, click Advanced Settings. Options for Mechanism Policies and Mechanism Properties display.
4. Select the appropriate options and choose the appropriate value from the drop-down list.

Parent topic: [Security](#)

LDAP Mechanism Properties

Mechanism Properties	Description
QOP (Quality of Protection)	<p>Names a property that specifies the quality-of-protection that the LDAP directory server uses. The property contains a comma-separated, ordered list of quality-of-protection values that the client or server supports. The following are valid QOP values:</p> <ul style="list-style-type: none">auth authentication onlyauth-int authentication plus integrity protectionauth-conf authentication plus integrity and confidentiality protection <p>The order of the list specifies the preference order of the client or server. If you do not specify a value, the default QOP is auth.</p>
Cipher Strength	<p>Names the property that specifies the cipher strength that the LDAP directory server uses. The property contains a comma-separated, ordered list of cipher strength values that the client or server supports. The following are valid cipher strength values:</p> <ul style="list-style-type: none">• low• medium• high <p>The order of the list specifies the client or server order of preference. An implementation should allow you to configure the meaning of these values. An application might use the Java[®],[®] Cryptography Extension (JCE) with JCE-aware mechanisms to control the selection of cipher suites that match the strength values.</p> <p>If you do not specify a value, the default cipher strength is low.</p>

Mechanism Properties	Description
Max Buffer Size	Specifies the maximum size of the receive buffer in bytes. If you do not specify a value, the default size is defined by the mechanism. Valid value range is between 0 and 65536.
Mutual Authentication	Names the property that specifies whether the server must authenticate to the client. The property name contains true, if the server must authenticate the to client and contains false otherwise. By default, this value contains false.

LDAP Mechanism Policies

Mechanism Policies	Description
Forward Secrecy	Names the property that specifies whether mechanisms that implement forward secrecy between sessions are required. Forward secrecy means that breaking into one session does not automatically provide information for breaking into future sessions. The property contains true if mechanisms that implement forward secrecy between sessions are required and contains false if such mechanisms are not required. By default, this value contains false.
Client Credentials	Names the property that specifies whether mechanisms that pass client credentials are required. The property contains true if mechanisms that pass client credentials are required and contains false if such mechanisms are not required. By default, this value contains false.
Susceptible to passive attacks	Names the property that specifies whether mechanisms susceptible to simple plain passive attacks, for example: PLAIN, are not permitted. The property contains true if such mechanisms are not permitted and contains false if such mechanisms are permitted. By default, this value contains false.
Susceptible to active attacks	Names the property that specifies whether mechanisms susceptible to active (non-dictionary) attacks are not permitted. The property contains true if mechanisms susceptible to active attacks are not permitted and contains false if such mechanisms are permitted. By default, this value contains false.
Susceptible to dictionary attacks	Names the property that specifies whether mechanisms susceptible to passive dictionary attacks are not permitted. The property contains true if mechanisms susceptible to dictionary attacks are not permitted and contains false if such mechanisms are permitted. By default, this value contains false.
Susceptible to anonymous attacks	Names the property that specifies whether mechanisms that accept anonymous login are not permitted. The property contains true if mechanisms that accept anonymous login are not permitted and contains false if such mechanisms are permitted. By default, this value contains false.

Editing Security Settings

Procedure

1. In the Settings section, click Edit. The Edit Settings dialog box is displayed.
2. Select the certificate to use with the corresponding category. For example, Client SSL, Server SSL over data NIC, or Server SSL over mgmt NIC.
3. Select the VPeer check box if appropriate.
 - o Selecting VPeer means that the integration appliance authenticates the identity of the SSL peer using the certificate provided by the peer.
 - o When selected for the Client SSL category, the integration appliance authenticates the identity of the SSL server using the certificate sent by the server.
 - o When selected for the Server SSL over data NIC category, the integration appliance requires that SSL clients connecting to the integration appliance must send a certificate.
4. Select the VHost check box if appropriate.
 - o Selecting VHost means that the integration appliance verifies that the hostname of the server in an SSL session matches the name contained in the server certificate. This check is designed to prevent a man-in-the-middle (MITM) attack and is described in RFC 2818 *HTTP Over TLS* Section 3.1 *Server Identity*.
 - o The VHost selection is only applicable for the Client SSL category.
 - o The VHost selection is only applicable when VPeer is also selected.
5. Select the cipher strength.
 - o Standard
 - o Strong
6. Click Save.

Enabling an LDAP Directory Server

About this task

From the WMC, you can choose to have an LDAP server handle user authentication and authorization. When you enable an LDAP directory server, the authentications and authorizations of the LDAP directory server override any users, groups, or permissions you specified via the WMC, except for the built-in Admin user. Therefore, with the exception of the Admin user, you can authenticate and authorize users and groups via an LDAP directory server or the WMC, but not both. Regardless if you enable LDAP or not, you can update the Admin user password via the CLI.

Note: LDAP users will not be able to access the staging database.

Procedure

1. In the navigation pane, select Security > LDAP. The LDAP Configuration page is displayed.
2. Select the Enable LDAP option. If you do not select this option, the Integration Appliance uses the built-in groups and users you defined in the WMC to authenticate and authorize users and their access to the WMC.
3. Specify host information.
 - a. Enter the host name and port number of the LDAP directory server.
 - b. Choose a Base DN (Base Distinguished Name) or click Fetch DNs. The WMC fetches the Base DN of all the Directory Information Trees (DITs) from the LDAP directory server. Select the Base DN of the DIT that contains the users you want to authorize.
4. Choose one of the following security options:
 - o **Use Secure Connection (SASL)** - Enables Simple Authentication and Security (SASL) mechanisms supported by the LDAP directory server. This is the most secure option.
 - o **Use Simple Authentication** - Enables simple authentications, but does not encrypt credentials.
 - o **Anonymous Bind** - Enables anonymous binding to the LDAP directory server. This is the least secure option.
5. If you selected the Use Secure Connection (SASL) security option, specify a mechanism and configure the mechanism properties and mechanism policies.
6. If the LDAP directory server requires authentication for a directory search, specify values for the Principal and Password, which are in the Credentials section. When you select the Composed DN Mode authentication mode, this step is not required. However, this step might be required to fetch DNs or mechanisms when the LDAP directory server does not allow anonymous searches.

If you do not specify a password, the WMC attempts to make the initial binding into the LDAP server as an anonymous user and the LDAP server ignores the Principal credential you specified.

7. Choose one of the following authentication modes:
 - o Composed DN Mode
 - o Searched DN Mode
8. Specify the User Container RDN. The authentication mode you specify determines what value you should specify here.
 - o If you selected the Composed DN mode, the User Container RDN is composed of one or more attributes from the user DN. Construct the User Container RDN by walking up the tree from the immediate ancestor of the user to the entry just before the base and adding up the RDN of each entry in the path.

For example, if:

```
User DN = "uid=JohnK,ou=emp,dc=xyz,dc=com"
```

then

```
User Container RDN = "ou=emp"
```

- If you selected the Searched DN mode, the User Container RDN is typically left blank, which causes the LDAP directory server to search the entire DIT starting from the root (Base). Otherwise, the LDAP directory server searches the subtree rooted at the entry having DN = User Container RDN +BaseDN.
9. If you selected the Searched DN Mode, specify the User Search Filter that the LDAP directory server uses to search for the user DN. (required, only if you select the Search DN Mode) This entry accepts LDAP search filter specification and also accepts a user name in the form of \$USERNAME. For example:
 - In MSAD, this entry could be "(samAccountName=\$USERNAME)"
 - In SunOne, this could be "(uid=\$USERNAME)"
 10. Specify the User Principal DN, which specifies the DN of the user that the LDAP directory server binds after the search. You can specify \$USERNAME or \$DN to represent the user name and Distinguished Name. Where \$DN represents (RDN+BaseDN) for the Compose DN Mode and searched DN for Search DN Mode. In most the cases, \$DN is the entry. However, when using SASL in MSAD, you might only need to specify \$USERNAME. For SASL in SunOne, you might only need to specify "dn:\$DN".
 11. Specify Group Mapping Information.
 - a. Specify the Admin Group Filter.
 - b. Specify the Publisher Group Filter.
 - c. Specify the Group Filter.
 12. Click Save.

Importing Certificates

About this task

You can import a certificate or certificate chain into the IBM® WebSphere® Cast Iron® KeyStore. You can also import trusted Certificate Authority certificates (CA Certs) to the TrustStore.

Procedure

1. In the Key Store or Trust Store section, click Import. The Import Certificates dialog box is displayed.
2. Enter an alias name. This name is used to identify the imported certificate or certificate chain.
3. Optional: Enter a key password.

The password protects the private key of the key pair associated with the alias. If you do not specify a password, the password defaults to the password protecting the KeyStore.

4. If you are importing a certificate from a trusted site, select the Trusted option.

If you select the Trusted option, the certificate is imported without checking for an existing chain of trust. If you do not select the Trusted option, the KeyStore and TrustStore options are checked to ensure a chain of trust exists for the certificate being imported.

5. Choose to import the content from a file or from content in the clipboard that contains the certificate or certificate chain to be imported.

When importing into the KeyStore, supported formats include: PKCS12. When importing into the TrustStore, supported formats include CER/PEM (RFC 1421), DER and PKCS7.

6. Click Import.

Results

The certificate displays in the Certificates page.

Parent topic: [Security](#)

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.appliance.doc/Working_with_Logs/aboutArchivedLogs.html

About Archived Logs

Logs can be archived locally or exported to an FTP server. From the WMC, you can download locally archived logs: Logs > Archive Logs.

You can archive or purge orchestration monitoring logs. When you configure parameters to archive orchestration monitoring log files, the Integration Appliance archives the log files before polling for conditions that trigger the Integration Appliance to purge additional orchestration monitoring data. You can archive orchestration monitoring data to a local disk on the Integration Appliance or export the archives to an FTP server. If you do not configure archive settings, the Integration Appliance purges all orchestration monitoring data that meets the default purging trigger conditions.

You can view archived log files by selecting Logs > Archive Logs in the Navigation page. When you export the logs, the Integration Appliance names exported orchestration monitoring logs using the following convention: orcmon_export_<timestamp>.xml.

Parent topic: [Working with Logs](#)

Archiving Orchestration Monitoring Logs Locally

About this task

When you select the Archive Purged Monitor Data to a Local File option and one of the log purging trigger conditions is met, the Integration Appliance exports orchestration monitoring logs to a local disk on the Integration Appliance.

Note: When you archive orchestration monitoring logs locally, you decrease the availability of disk space on the Integration Appliance. As the disk space is filled up, the purging trigger conditions generate archives much quicker.

Procedure

1. From the Navigation pane, select Logs > Job Log. The Results page displays all orchestration monitoring logs.
2. Click Settings. The Job Log Settings dialog is displayed.
3. Click Archive.
4. In the Archive Settings section, select Archive Purged Monitor Data to be a Local File .

5. Select Replace Exported File to replace previously exported orchestration monitoring logs. If you do not select this option, the Integration Appliance cumulatively stores orchestration monitoring logs. This can cause the Integration Appliance to run out of disk space very quickly and prematurely trigger a purge.
6. Click Save.

Results

The Integration Appliance archives Orchestration Monitoring logs locally. You can download locally stored archives by selecting the archive from the Archive list and clicking Download.

Archiving Orchestration Monitoring Logs to an FTP Server

About this task

When you select the Archive Purged Monitor Data to a Local File option and the Transmit Archive to FTP Server option and one of the log purging trigger conditions is met, the Integration Appliance exports orchestration monitoring logs to an FTP server. You can choose to archive all the exported log files on the FTP server or choose to have the latest archive replace the previous archive.

Procedure

1. From the Navigation pane, select Logs > Job Log. The Results page displays all orchestration monitoring logs.
2. Click Settings. The Job Log Settings dialog is displayed.
3. Click Archive.
4. In the Archive Settings section, select Archive Purged Monitor Data to be a Local File .
5. Select Transmit Archive to FTP Server (After a Purge).
6. (Optional) Select Replace Exported File to replace previously exported logs.
7. Specify FTP settings. See the following table below: [Table 1](#) for more information about the FTP settings.
8. Click Save.

Archiving Utilization Data to an FTP Server

About this task

The Integration Appliance collects data about disk usage, memory usage, garbage collection, and the number of running jobs. This resource utilization data can help you analyze the overall health of the runtime and calculate available capacity for additional projects. The Integration Appliance stores this data in a file called maestro.stat and provides an option to archive a snapshot of the data to an FTP server. When you select the appropriate option, all the utilization data available on the Integration Appliance is collected and archived to the specified FTP server.

After an archive file has been created and transmitted to an FTP server, the Integration Appliance continues to aggregate new utilization data to the historic utilization data. Historic utilization data is not purged from the Integration Appliance when an archive is transmitted to an FTP server.

Selecting the Transmit Archive to FTP Server option transmits a snapshot of the utilization data daily at midnight. The following procedure describes how to select the option.

Procedure

1. From the Navigation pane, select Logs > Job Log. The Results page displays all orchestration monitoring logs.
2. Click Settings. The Job Log Settings dialog is displayed.
3. Click Archive.
4. Select Transmit archive utilization data to FTP Server (at midnight) .
5. Specify FTP settings. See the following table below: [Table 1](#) for more information about the FTP settings.
6. Click Save.

FTP Settings

Specifying FTP settings to archive orchestration monitoring logs and utilization data.

Table 1. Job Log FTP Settings

Parameter	Description
Host	Specifies the name of the FTP server, where the exported log files are archived.
Port	Specifies the port number of the FTP server, where the exported log files are archived.
Username	Specifies the user ID that the Integration Appliance uses to log in to the FTP server, where the exported log files are archived.
User Password	Specifies the password that the Integration Appliance uses to log in to the FTP server, where the exported log files are archived.
Hide Password Text	If you clear this option, the password you entered displays in plain text and is no longer encrypted.
Directory	Specifies the FTP directory to which the Integration Appliance exports the log file.

Purging Orchestration Monitoring Logs

You can purge and archive orchestration monitoring logs.

About this task

When the Integration Appliance purges orchestration monitoring data, it can take a few minutes for the Dashboard to display the updated job counts.

By default, an Integration Appliance purges orchestration monitoring logs older than 30 days when any of the following conditions occurs on the Integration Appliance:

- The amount of available disk space falls below 50%.
- One day has passed since the last purge.
- More than 5,000 orchestration jobs have completed.
- More than 1,000 orchestration jobs have contained an error.

Using the WMC, you can configure the job log purging parameters on the Integration Appliance that determine:

- **Trigger Conditions** - What conditions trigger the Integration Appliance to purge orchestration monitoring data.
- **Frequency** - How often to purge orchestration monitoring data.
- **Job Scope** - What type of orchestration monitoring data to purge.

Procedure

1. From the Navigation pane, select Logs > Job Log. The Results page is displayed.
2. Click Settings. The Job Log Settings dialog box is displayed. By default the Purge page is displayed.
3. Specify the parameters as described in the following section.
4. Click Save.

Parent topic: [Working with Logs](#)

Job Log Purging Parameters

Trigger Conditions

The amount of free disk space on the Integration Appliance, the time lapse since the last orchestration monitoring logs were purged, the number of completed jobs, and the number of jobs containing errors are all triggers that can initiate the purging or archiving of orchestration monitoring logs. The Integration Appliance uses "OR" logic and purges orchestration monitoring data when any one of the trigger conditions occurs.

Parameter	Description	Default
-----------	-------------	---------

Parameter	Description	Default
Available disk space	<p>This trigger fires when the percentage of free disk space is less than the specified value. When this trigger fires, the Integration Appliance purges the orchestration monitoring data as you specify in the Job Scope parameters.</p> <p>If the percentage of free disk space is still short of the percentage you specified, the Integration Appliance purges 50% of the remaining orchestration monitoring data until the value is reached.</p> <p>For example, you specify the following values for purging parameters:</p> <ul style="list-style-type: none"> • Available disk space = 40% • Job status = completed • Jobs older than = 30 days <p>If only 10% of the Integration Appliance disk is free, the Available disk space trigger fires and the Integration Appliance purges all completed jobs that are older than 30 days. However, purging this data only frees 10% of the disk space. Since the minimum amount of free disk space is still not satisfied, the Integration Appliance purges an additional 50% of the remaining orchestration monitoring data. The Integration Appliance continues to purge the remaining orchestration monitoring data by 50%, until the minimum available disk space is greater than or equal to the specified value.</p> <p>You can specify a value between 1-100 percent, any value outside a 40-75 percent range results in the Integration Appliance using the default value of 50%.</p> <p>Note: This is a required parameter.</p>	50%
Schedule	<p>This trigger fires when the period since the last purge is greater than the specified day, hours, minutes value.</p> <p>You can more precisely schedule a purge by selecting the Fixed option. When you select the Schedule Fixed option, the schedule you specify overrides the day, hours, minutes value specified since last purge.</p> <p>To schedule a purge:</p> <ol style="list-style-type: none"> 1. Select the Fixed option. 2. Specify the number of days, weeks, or months. 3. In the list, qualify the value by choosing Days, Weeks, or Months. 4. Specify the start date. 	1 day

Parameter	Description	Default
Completed job count	This trigger fires when the number of completed jobs is greater than the specified value. This parameter must be a positive integer value. Note: After the Integration Appliance purges the jobs, the job count is no longer visible from the WMC.	5,000 jobs
Errored job count	This trigger fires when the number of jobs containing errors is greater than the specified value. Errored job count includes any orchestration job in the following states: unknown, cancelled, terminated, or errored. This parameter must be a positive integer value. Note: After the Integration Appliance purges the jobs, the job count is no longer visible from the WMC.	1,000 jobs

Frequency

The frequency determines the interval at which the Integration Appliance checks the set of defined triggers for an actionable condition. You can specify the frequency interval in increments of hours, minutes, and seconds.

By default, this parameter is set to 10 seconds.

Job Scope

Along with specifying trigger conditions and frequency, you must also specify the type of orchestration job data you want to purge. The Integration Appliance uses the values you specify for the Job Status AND the Jobs Older Than parameters OR the values you specify for Job Status AND Jobs Older Than the Most Recent parameters to determine when the Integration Appliance purges data.

Parameter	Description	Default
Job status	This parameter specifies the type of orchestration jobs that the Integration Appliance purges. By default, this parameter is set to ANY, which purges completed and jobs containing errors. You can choose to purge only the completed jobs by specifying COMPLETED.	Any
Jobs older than	This parameter specifies the minimum age of orchestration jobs to purge. The Integration Appliance purges anything older than the amount of time you specify. You can specify the age of an orchestration job in months, days, hours, and minutes.	7 days

Parameter	Description	Default
Jobs older than the most recent	This parameter specifies the number of most recent jobs that the orchestration job must be older than before the Integration Appliance purges data.	1,000 jobs

 Last updated: Friday, February 5, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.appliance.doc/Working_with_Logs/purgingJobLogs.html

Specify System Log Settings

You can specify the level of details that appears in the system logs. The log level you specify affects alerts for notification policies. Alerts are only sent for events that meet or exceed the log level you specify.

About this task

The system log levels are shown in the following table. The Description column provides a description of each level and explains how it corresponds to the Cast Iron Management API log level.

Severity	Description
INFO	Informational messages. (Corresponds the Cast Iron Management API "INFO" log level).
WARNING	Warning messages. (Corresponds to the Cast Iron Management API "WARNING" log level).
ERROR	Serious errors that may need user attention. (Corresponds to the Cast Iron Management API "SEVERE" log level).
CRITICAL	Critical errors requiring user or administrator attention. (Corresponds to the Cast Iron Management API "FATAL" log level).
FINEST	Retrieves all logs at level above FINEST. (Corresponds to the Cast Iron Management API "ALL" log level).

Note: In certain cases, log levels set in the WMC override settings in the Cast Iron Management API. For example, if the WMC logging level for a component is set to FINEST, logs retrieved by the Cast Iron Management API are also set at the FINEST level. Additionally, if the WMC system logging level is set to INFO, logs retrieved by the Cast Iron Management API are also set at INFO.

Note: If you do not receive notifications for events, it might be that you do not have the system log level set high enough to produce entries that would trigger a notification.

Procedure

1. In the Navigation pane, select Logs > System Log. The System Log page is displayed.

2. Click Settings. The System Log Settings dialog box is displayed.
3. From the list, select a log level for each system.
4. Click Save.

Results

A confirmation message is displayed. The system log logs all events that occur at the level you specified or higher for the specific system. For example, if you chose the Error level for Deployment, all events that were Error or Critical level in the Deployment system are logged.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.appliance.doc/Working_with_Logs/specifyingSystemLogSettings.html

Viewing System Logs

You can view system logs from the Management Console and use the system log filters to sort through system log entries.

About this task

When you upgrade, the Management Console does not persist system logs. To retain system log information, export system logs before you upgrade.

Note: The Management Console displays a maximum of 99,999 system log entries. When the number of system log entries exceeds 99,999, the oldest log entry is deleted from the system log.

Procedure

1. From the navigation pane, select Logs > System Log. The System Log page is displayed.
2. Choose the filter values from the lists at the top of the System Log page. You can filter the log entries according to the level of severity for the event, the environment system that generated the log event, dates, and resolution state. The filters use AND logic.

Parent topic: [Working with Logs](#)

System Log Content

The system log provides the following information:

System Log Content	Description
--------------------	-------------

System Log Content	Description
Level	Identifies the level of severity of the log event: <ul style="list-style-type: none"> • Critical • Error • Warning • Info
System	Identifies the system where the log event occurred: <ul style="list-style-type: none"> • Hardware • Resources • Network • Security • Orchestration • Deployment
Message	Text messages that provides details about the log event.
Job	When available displays Job ID information for log events that occur in the Orchestration system.
When	Records the time when the log event occurred.
Resolved On	Provides a time stamp of when you resolved a log event.
Resolved By	Identifies which user resolved a log event.
Resolved	Select this checkbox to acknowledge that you have resolved a log event. When a user resolves a log event, a time stamp documents the date and time the issue was resolved. Information about the user who resolved the log event is tracked in the Resolved By column. You can resolve all the system log issues, by clicking Resolve All. Clear the checkbox next to any log events that are not resolved and the Resolved On and Resolved By values are cleared.

Customizing columns in System log and Job log

You can customize the columns displayed in the System log and Job log pages, respectively.

About this task

You can customize the columns to be displayed in the System Log and Job Log pages by editing the column display settings. To customize the log page columns, complete the following steps:

Procedure

1. From the navigation pane, select Logs > System Log or Job Log. The System Log page or the Job Log page is displayed.
2. Click Edit Columns. The Display Columns window is displayed.
3. Select the columns that need to be displayed on the System Log or Job Log page. By default, all the columns are selected in the Display Columns window.
4. Click Save. Only those columns selected by you will be displayed in the System Log or Job Log page.

Managing Appliances

You can now manage other appliances from the Web Management Console. This feature is helpful when you have multiple appliances; and you can manage these appliances from a single console.

One appliance is designated as the master appliance, which is used to manage other appliances.

The following features are available as part of managing appliances:

- Appliances can be registered and unregistered with the master appliance.
- Resource utilization details of each of the appliances can be viewed from the master appliance. For more information about the Resource Utilization Graph, see [About the Resource Utilization Graph](#).
- Projects that are published, and the status of each project/orchestration on each of the appliances can be viewed from the master appliance.
- Upgrade of each of the registered appliances can be performed from the master appliance.
- Supports both physical and virtual appliances.
- Supports Cast Iron® version 7.0 and earlier versions (6.0.0.x, 6.1.x.x, 6.3.x.x, 6.4.x.x) for managing and monitoring. The earlier version of Cast Iron must be on the required patch level for using this feature.
- Users of the master appliance must have administrator privileges to use this feature.
- This feature is also available when the appliance is configured with high availability.
- [Registering, editing, and unregistering appliances](#)
- [Upgrading Cast Iron appliance](#)
This feature is used to upgrade the Cast Iron appliance by using the upgrade files `vscript2` and `script2` files. The upgrade files are obtained as a part of Cast Iron software or from Fix Central depending on the version (FixPacks/patch/major release) of the appliance.
- [Running commands](#)
- [Managing Project Configurations](#)
The managing multiple appliances feature allow you to manage the life cycle of projects (start, stop,

delete, and clone projects) present in the registered remote appliances. You can modify the life cycle of the projects running on different appliances through the single master appliance. The life cycle includes stop, start, clone, resume, pause, and undeploy. The list of registered appliances are displayed in the appliance filter through which you can select the appliance and modify the life cycle of the projects in the selected appliance.

Registering, editing, and unregistering appliances

About this task

To register a new appliance, complete the following steps:

Procedure

1. Log on to the Web Management Console as an administrator.
2. Select Manage > Appliances.
3. Click Register to register a new appliance. The Register New Appliance window is displayed.
4. In the Register New Appliance window, complete the following details:
 - a. Display Name - Specify a display name that can be used to identify the remote appliance.
 - b. Host Name - Specify the host name or IP address of the remote appliance that you want to register.
 - c. User Name - Specify the user name, with administrator privileges, to communicate with the remote appliance.
 - d. Password - Specify the password for the user name.
 - e. Optional: Description - Specify a brief description for this appliance.
 - f. LDAP - Select this option if the remote appliance is configured for LDAP. Also, provide the LDAP credentials that are used for connecting to the appliance, in the User Name and Password fields.
 - g. Enabled - Select this option if you want to enable the appliance for managing and monitoring. If disabled, the data will not be displayed for this appliance.
5. Click Save.

Note:

- An appliance, which is already registered to a master cannot be made as a master appliance.
- You cannot register an appliance, which is already a master to another master appliance.
- You can register an appliance with multiple master appliances.
- You can register the master appliance to itself for managing and monitoring.

Note:

- A user with the name `masteradmin4ma` is created in the master appliance that indicates that the current appliance is a master appliance.
- A user with the name `slaveadmin4ma` is created in the appliances that are registered in the master appliance.

- Both these users must not be deleted unless you want to unregister the appliance from the master appliance.

Results

A confirmation message is displayed. A new appliance is registered. When the registration is successful, the version of the appliance and the type (physical/virtual) is displayed.

Parent topic: [Managing Appliances](#)

Editing the registered appliance details

About this task

When you click the display name of any of the registered appliances, you can edit the appliance details in the Edit Appliance Details dialog. You can edit the following fields:

- Display Name
- User Name
- Password
- Description
- LDAP
- Enabled

Unregistering an appliance

Procedure

1. From the list of registered appliances, select the appliances to be unregistered.
2. Click the Unregister button. The Delete Appliances confirmation message is displayed.
3. Click Yes to unregister the appliance.

Upgrading Cast Iron appliance

This feature is used to upgrade the Cast Iron[®] appliance by using the upgrade files `vencrypt2` and `scrypt2` files. The upgrade files are obtained as a part of Cast Iron software or from Fix Central depending on the version (FixPacks/patch/major release) of the appliance.

About this task

To upgrade remote appliances, complete the following steps:

Procedure

1. Copy the `vcrpyt2` and/or `scrypt2` file to the workstation from where you can access the appliance from Web Management Console.
2. In WMC, log on to the Integration Appliance and go to Manage > Appliances.
3. Select the appliances that you want to upgrade, from the list of registered appliances.
4. Click the Upgrade Operating System link. The Upgrade Appliances Operating System Wizard is displayed.
5. Browse the `.vcrpyt2` file in the Virtual appliance Upgrade File field, to upgrade the virtual appliance.
6. Browse the `.scrypt2` file in the Physical appliance Upgrade File field, to upgrade the physical appliance.
7. Click Upgrade. All the selected appliances will be upgraded one after the other sequentially.

Results

The results of the upgrade are displayed after all the appliance upgrade is complete. The appliance version is also updated in the registered list of appliances, after the data gets updated.

Note:

- Before making changes like Upgrade/Reboot of appliance, please stop all projects in the runtime. After appliance comes back, starts the projects one-by-one.
- If the master appliance is a part of the upgrade list, it will be upgraded only after the upgrade of the other appliances are complete.
- When the files for both physical appliance and virtual appliance, `scrypt2` and `vcrpyt2`, are browsed, upgrade is based on the type information (physical or virtual) available for the appliance in the table. If the type information is not available (earlier version without an interim fix), then these appliances are skipped from being upgraded.
- When only one file is browsed, that file is used as an input to upgrade all selected appliances, including appliances, which do not have type information (represented by -).

Running commands

About this task

With the help of commands you can manage the operation on a remote Integration Appliance. To run commands on the appliance, complete the following steps:

Procedure

1. Log on to the Web Management Console as an administrator.
2. Select Manage > Commands.
3. Select one of the following commands listed under Execute.

Table 1. Description of commands

Commands	Description
Remove job history	Removes all job records. This is equivalent to the CLI command <code>system clean orchmon</code> .
Remove projects and configurations	Removes all projects, orchestrations, and project configurations. This is equivalent to the CLI command <code>system clean deploy</code> .
Remove all jobs in progress	Removes the currently running project data. This is equivalent to the CLI command <code>system clean running</code> .
Restart	Stops and restarts the Integration Appliance run time. This is equivalent to the CLI command <code>system restart</code> .
Reboot	Shuts down all services, then reboots the Integration Appliance. This is equivalent to the CLI command <code>system reboot</code> .

4. Select the appliance from the list of registered and active appliances and click Submit to run the command on the chosen appliance.

Managing Project Configurations

The managing multiple appliances feature allow you to manage the life cycle of projects (start, stop, delete, and clone projects) present in the registered remote appliances. You can modify the life cycle of the projects running on different appliances through the single master appliance. The life cycle includes stop, start, clone, resume, pause, and undeploy. The list of registered appliances are displayed in the appliance filter through which you can select the appliance and modify the life cycle of the projects in the selected appliance.

Before you begin

You must have Administrator privileges or be the publisher of a project to manage project configurations on remote appliances

About this task

To run, clone, undeploy, stop, pause, or delete project configurations on remote appliances, complete the following steps:

Procedure

1. From the Navigation pane, select Manage > Configurations. The Project Configurations page is displayed.
2. Locate the project configuration you want to manage.
3. Click the following icons as per your requirement:
 -  - to clone a project configuration.
 -  - to run a project configuration.
 -  - to delete a project configuration.
 -  - to stop a project configuration.
 -  - to undeploy a project configuration.
 -  - to pause a project configuration.

 Last updated: Friday, February 5, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.appliance.doc/Managing_Appliances/managingConfigurations.html

About the Command Line Interface

The Cast Iron® Command Line Interface (CLI) is available to administrators to manage the Integration Appliance and to maintain and update its configuration information.

The CLI is preinstalled on the Integration Appliance and is ready to respond to the commands described in this documentation.

Note: The CLI is case sensitive. In general, you must enter commands and keywords using lowercase characters.

Only a user logged in as an administrator can use the CLI. More than one administrator can be logged in to an Integration Appliance at the same time.

Logging into the CLI

You can log in to the CLI on the Integration Appliance through a secure shell (SSH) session, terminal emulation, or telnet. By default, secure management is enabled on the Integration Appliance and you must use secure connections to access the Integration Appliance. Secure connections use the default host key provided with the Integration Appliance at installation.

When using an SSH client or a telnet client to log in to the CLI, the 5th consecutive log-in failure (regardless of which user or any span of time) triggers a lock-out. The lock-out is characterized by a limit of one log in attempt per minute without regard for the user. A successful log-in by any user resets the log-in failure count and ends the lock-out.

Logging out of the CLI

At the command prompt, use the exit command to log out of the CLI. This also closes the terminal emulation or telnet session connection.

Viewing CLI help

In the CLI, you can view a list of command categories by typing `help` or `?`. To view syntax help for the commands in a specific category, enter `Category help`. For example, `net help` or `net ?` lists syntax information for each network command.

Tab completion also guides you through the CLI syntax. From the CLI, you can enter a partial command and press the Tab key. Pressing the Tab key completes the command or provides a list of options to complete the command syntax

Note: Tab completion is sensitive to spaces in the CLI syntax. For example, typing `system show` in the CLI and then pressing the Tab key appears to have no results. Add a space after `show` and press the Tab key to view valid command parameters.

Command conventions

The following conventions are used to illustrate command syntax rules:

Table 1.

Convention	Description
keyword <code><value></code>	Most command parameters combine a keyword and a value. Some parameters might not require a value.
<code><value></code>	Values for parameters are enclosed in angle brackets. In many cases, the text shown indicates the type of information you supply, such as <code><hostname></code> . Values may be explicit, such as <code><yes></code>
<code>[x]</code>	Optional parameters are enclosed in brackets.
<code>{x y z}</code>	Groups of mandatory parameters are enclosed in braces.
<code>x / y / z</code>	Choices are separated by bars, select only one.
<code>x...</code>	Parameters that may occur more than once are followed by an ellipse.

- [Logging into the CLI with an secure shell session connection](#)

Logging into the CLI with an secure shell session connection

By default, secure management is enabled on the Integration Appliance and you must use secure connections to access the Integration Appliance. Secure connections use the default host key provided with the Integration Appliance at installation. You can log in to the CLI on the Integration Appliance by using a secure shell session (SSH).

Procedure

1. In Windows, start an application, for example PuTTY, that performs SSH connections.
2. Enter the *appliance-host-name*.
3. If needed, select SSH as the connection protocol or set other connection parameters offered by the application.
4. Initiate the connection. The login prompt is displayed at first access.
5. Log in to the Integration Appliance with a username and password, which have administrative privileges. The default username and password are:
 - o Login: `admin`
 - o Password: `!n0r1t5@C`

Results

When you log in, the prompt changes to the host name of the Integration Appliance.

If you have not selected a hostname, the prompt defaults to the IP address of the Integration Appliance.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.cli.doc/CLI_log_SSH.html

Logging into the CLI with a Serial Connection

A serial connection allows you to monitor and issue commands against an Integration Appliance from an ASCII terminal or PC running terminal emulation software. To establish a serial connection:

Procedure

1. Connect a console or laptop computer to an Integration Appliance with a serial cable. The serial connection must be between an ASCII terminal or a PC running terminal emulation software to the serial port on the Integration Appliance.
2. Use the included serial cable to connect the terminal or PC to the Serial connector on the Integration Appliance. If the terminal or PC does not have a serial port and has only a USB port, then use a USB-to-serial converter cable (not included).
3. Configure the terminal or PC for standard 9600 8N1 and no flow control operation. 8N1 is a notation for a serial configuration in asynchronous mode, where there are eight (8) data bits, no (N) parity bit, and one (1) stop bit. The terminal emulation suggested for the terminal or PC is VT100.

Results

When you log in to the Integration Appliance, the prompt changes to the host name of the Integration Appliance.

If you have not selected a hostname, the prompt defaults to the IP address of the Integration Appliance.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.cli.doc/CLI_log_hyperterminal.html

Logging into the CLI with a telnet connection

When secure management access is disabled for the Integration Appliance, you can connect to the Integration Appliance via the network through a telnet session.

About this task

Note: By default, secure management access is enabled for the Integration Appliance; therefore, you will not be able to connect to the Integration Appliance using a telnet connection. See the `mgmt secure` command for more information about enabling and disabling secure management access.

Procedure

1. In Windows, select Start > Run.
2. Enter `telnet appliance-host-name`. The login prompt is displayed at first access.
3. Log in to the Integration Appliance with a username and password, which have administrative privileges. The default username and password are:
 - o Login: `admin`
 - o Password: `!n0r1t5@C`

Results

When you log in, the prompt changes to the host name of the Integration Appliance.

If you have not selected a hostname, the prompt defaults to the IP address of the Integration Appliance.

Command Line Interface modes

The mode of an Integration Appliance determines the type of Command Line Interface (CLI) commands that you can use.

An Integration Appliance can be in one of the following modes:

Active

An Integration Appliance in an high availability (HA) pair that is actively processing data is in the Active mode. You can run all CLI commands in this mode. The active Integration Appliance can be in one of the following states:

- Active 1 - The active Integration Appliance is not communicating with its HA peer. If the peer Integration Appliance is rebooting or the R1 and R2 cables are disconnected, this status can occur.
- Active 2 - The active Integration Appliance is communicating with its HA peer.

Idle

An Integration Appliance enters the Idle mode when an error that requires user action occurs. This state indicates that the non-active Integration Appliance is unable to be in either the Active or Standby mode. Only Integration Appliances that are part of an HA pair enter the Idle mode. You can run `diagnet`, `ha`, `netspect`, and `system` commands in this mode.

Standalone

A single Integration Appliance that processes all messages. A standalone Integration Appliance cannot be part of an HA pair. In this mode, you can run all commands except the commands associated with an HA pair.

Standby

An Integration Appliance in an HA pair that monitors the processing of the Active Integration Appliance runs in Standby mode. The Integration Appliance running in Standby mode stays in sync with the Integration Appliance running in the Active mode, ready to take over processing if the Active Integration Appliance goes down. You can run `ha` and `system` commands in this mode.

Unknown

In an HA pair, when an active Integration Appliance does not know the status of the standby Integration Appliance.

Typical HA pair mode combinations

When working with an HA pair, the following mode combinations are typical:

- *ACTIVE_2* and *STANDBY* - The active machine is communicating with its peer and vice versa. The pair is only highly available after the standby peer has synchronized all the data from the active peer.
- *ACTIVE_2* and *IDLE* - The active machine has been disconnected from the peer machine most likely as the result of a user issuing the `ha disconnect` command. Issue the `ha connect` command to restore the HA pair.
- *ACTIVE_1* and *UNKNOWN* - The active machine is not communicating with its peer most likely because the peer is rebooting, powered down, or the cables are disconnected.

Command Line Interface commands

A list of the various command categories available from the Command Line Interface (CLI), and describes the purpose of each command category:

Table 1.

Command Category	Description
Auth Commands	Authorization commands allow you to manage user accounts.
Config Commands	Configuration commands allow you to manage both management and integration configuration for the Integration Appliance.
Debug Commands	Debugging commands allow you to view queues and process stacks.
HA Commands	High availability management commands. These commands are only available with an Integration Appliance high availability (HA) pair.
Mgmt Commands	Management commands allow you to enable and manage security settings.
Net Commands	Network commands allow you to manage network configuration.
Netspect Commands	Network introspection commands allow you to manage network configurations and query the network for DHCP server, DNS server, gateway, and route information.
Stat Commands	Status commands allow you to view Integration Appliance status.
System Commands	System commands allow you to manage the operation of the Integration Appliance, which includes managing licenses for the Integration Appliance and connectors.
Time Commands	Time commands allow you to set or synchronize the date and time on the Integration Appliance.

 Last updated: Friday, February 5, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.cli.doc/CLI_auth_authset.html

The auth set recovery command

The auth set recovery command allows the admin password to be reset from the serial console for the IBM® DataPower Cast Iron® Appliance. The default is on.

If the option is enabled, you can type `resetpass` for the username at the serial login and any non-empty password. Immediately after you login, you will be asked to verify physical access to the machine. To verify that you have physical access to the appliance, you will be asked to unplug and replug the ethernet cable into the MGMT port of the appliance. This verifies that no one is accessing the serial console over a remote port replicator. If you do not have physical access to the appliance, you should set the recovery option to off.

Syntax

```
auth set recovery <on|off>
```

file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.cli.doc/CLI_config_commands.html

The config load command

The config load command loads a management configuration file from an FTP or SFTP server. After the configuration file is loaded on the Integration Appliance, the Integration Appliance automatically reboots.

Do not use reserved words in the user name, host name, or file name. Reserved words include: ftp, sftp, ibm, port, user, and file.

Note: When using SFTP, you must specify a user name. Anonymous logins are not allowed with SFTP.

FTP Syntax

```
config load system ftp <host> [port <number>] [user <username>] file [<path>/]  
<filename>
```

SFTP Syntax

```
config load system sftp <host> [port <number>] user <username> file [<path>/]  
<filename>
```

Parent topic: [Configuration commands](#)

 Last updated: Friday, February 5, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.cli.doc/CLI_config_configload.html

The config save command

The config save command saves a management configuration file to an FTP or SFTP server.

Note: Do not use reserved words in the user name, host name, or file name. Reserved words include: ftp, sftp, ibm, port, user, and file.

FTP Syntax

When saving the configuration file to an FTP server, the Integration Appliance uses anonymous if you omit the user name.

```
config save system ftp <host> [port <number>] [user <username>] file [<path>/]  
<filename>
```

Example: Saves the current system configuration as old_sys_config.cfg to the FTP server running on host tern. The FTP user's login name is Joe.

```
config save system ftp tern user joe file old_sys_config.cfg
```

SFTP Syntax

When saving the configuration file to an SFTP server, you must specify a user name. Anonymous logins are not allowed with SFTP.

```
config save system sftp <host> [port <number>] user <username> file [<path>/]  
<filename>
```

Debugging commands

Debugging commands allow you to view queues and process stacks.

- [The debug postmortem export command](#)
The debug postmortem export command exports the postmortem archive to the FTP or SFTP Server you specify.
- [The debug postmortem generate all command](#)
The debug postmortem generate all command generates an archive of information gathered from Integration Appliance logs, orchestration logs, and transaction stores, that can help debug an Integration Appliance issue.
- [The debug postmortem generate full logs command](#)
The debug postmortem generate full logs command generates a postmortem archive of all the Integration Appliance logs, which includes new logs in addition to archived logs, and possibly several stacks that are generated by previously running the debug show stack command.
- [The debug postmortem generate new logs command](#)
The debug postmortem generate new logs command generates a postmortem archive of all the latest Integration Appliance logs and possibly several stacks that are generated by previously running the debug show stack command.
- [The debug postmortem generate store command](#)
The debug postmortem generate store command is similar to the debug postmortem generate all command, except that the Integration Appliance only generates a postmortem archive of all the Integration Appliance logs and the data in the transactional store.
- [The debug show stacks command](#)
The debug show stacks command displays current runtime stack traces.
- [The debug system command](#)
The debug system command allows you to start and stop the Integration Appliance runtime. When you issue the debug system stop command, all running orchestration jobs are cancelled and the Integration Appliance does not process any new orchestration jobs..
- [The debug tail file command](#)
The debug tail file command displays log file contents as they are added to the log.
- [The debug top command](#)
The debug top file command dynamically displays process status.
- [The debug job command](#)
The debug job command allows you to capture the instruction set and log of a running job.

 Last updated: Friday, February 5, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.cli.doc/CLI_debug_commands.html

The debug postmortem export command

The debug postmortem export command exports the postmortem archive to the FTP or SFTP Server you specify.

The Integration Appliance does not require that you specify an export file name; however, as a best practice, you should include the Integration Appliance serial number, date, and timestamp. If you do not specify an export file name, the Integration Appliance exports a file named postmortem.tar.gz.

Note: Do not use reserved words in the user name, host name, or file name. Reserved words include: ftp, sftp, postmortem, debug, export, ibm, port, user, and file.

FTP Syntax

```
debug postmortem export ftp <hostname> [port <number>][user <user>][file <filename>
]
```

where:

Table 1.

Option	Description
<i>hostname</i>	Specifies the name of the FTP Server.
<i>number</i>	Specifies the port number to use to connect to the FTP Server.
<i>user</i>	Specifies the username used to login to the FTP Server.
<i>filename</i>	Specifies the name of the file storing the postmortem archive.

User Input:

- `debug postmortem export ftp 192.168.1.2 user user1 file logs/B2XXW56_04152005_172341.tgz`
- `debug postmortem export ftp ftpserver.yourcompany.com user user1 file logs/B2XXW56_04152005_172341.tgz`

SFTP Syntax

To export the postmortem using SSH File Transfer Protocol, use the following SFTP syntax.

Note: When exporting a postmortem file to an SFTP server, you must specify a user name. Anonymous logins are not allowed with SFTP.

```
debug postmortem export sftp <hostname> [port <number>] user <user> [file <filename>
]
```

where:

Table 2.

Option	Description
<i>hostname</i>	Specifies the name of the SFTP Server.
<i>number</i>	Specifies the port number to use to connect to the SFTP Server.
<i>user</i>	Specifies the username used to login to the SFTP Server.
<i>filename</i>	Specifies the name of the file storing the postmortem archive.

User Input:

- `debug postmortem export sftp 192.168.1.2 user user1 file logs/B2XXW56_04152005_172341.tgz`
- `debug postmortem export sftp ftpserver.yourcompany.com user user1 file logs/B2XXW56_04152005_172341.tgz`

Exporting Files to IBM Support

Exports a postmortem file to IBM Support.

```
debug postmortem export ibm pmr <pmrnumber>
```

where :

- `pmrnumber` - PMR number open with IBM Support. For example, `debug postmortem export ibm pmr 55555.555.555`

The debug postmortem generate all command

The debug postmortem generate all command generates an archive of information gathered from Integration Appliance logs, orchestration logs, and transaction stores, that can help debug an Integration Appliance issue.

The postmortem archive remains on the Integration Appliance until you reissue the command. When you issue this command, the Integration Appliance generates a new archive that overwrites the previous postmortem archive.

Issue this command before rebooting the Integration Appliance and calling technical support.

Syntax

```
debug postmortem generate all
```

Parent topic: [Debugging commands](#)

High availability commands

High availability (HA) management commands. These commands are only available with an Integration Appliance HA pair.

- [The ha active command](#)
The ha active command orders the idle machine to become active. You can only issue this command if there is no peer, or the peer machine is idle.
- [The ha conncheck command](#)
The ha conncheck command provides information to help diagnose possible connection problems related to a high availability pair. This command is only available in active mode.
- [The ha disconnect command](#)
The ha disconnect command Temporarily disconnects an HA pair without causing the standby machine to takeover the active machine.. This command is only available in active mode.
- [The ha power off standby command](#)
The ha power off standby command powers off the Standby Integration Appliance in a high availability pair. This command is only available in active mode.
- [The ha power on standby command](#)
The ha power on standby command powers on the Standby Integration Appliance in a high availability pair. This command is only available in active mode.
- [The ha reboot command](#)
The ha reboot command completes a system reboot of the Integration Appliance you specify: active or standby. The ha reboot command is only available for use in an HA pair. When you issue the ha reboot standby command, the Standby Integration Appliance reboots, while the Active Integration Appliance continues to process data. When you issue the ha reboot active command, the Active Integration Appliance shuts down all routing services and then reboots. The Standby Integration Appliance does not provide failover capabilities and data is not processed until the Active Integration Appliance is back online. To simulate failover capabilities, switch the modes of the machines in the HA pair using theha switch command “ the Active Integration Appliance (A1) becomes the Standby Integration Appliance (S2) and Standby Integration Appliance (S1) becomes the Active Integration Appliance (A2). After the Integration Appliances in the HA pair have switched modes, issue the ha reboot standby command. S1 continues to process data, while A1 is rebooting.
- [The ha show lastaccess command](#)
The ha show lastaccess command displays the last 10 state transitions on the Integration Appliance. Only available in idle mode.
- [The ha show pairstatus command](#)
The ha show pairstatus command displays status of the high availability pair, providing information about which Integration Appliance is Active and which is Standby. Only available in active mode.
- [The ha switch command](#)
The ha switch command switches the roles of the Integration Appliance in a high availability pair. The Active machine becomes the Standby machine and the standby machine becomes Active. Only available in active mode.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.cli.doc/CLI_ha_conncheck.html

The ha disconnect command

The ha disconnect command Temporarily disconnects an HA pair without causing the standby machine to takeover the active machine.. This command is only available in active mode.

This action allows you to perform any necessary hardware or software maintenance on the Standby machine without interrupting orchestration processing.

When you choose this action, the Standby machine transitions to an idle state. Reboot the active machine or run the connect action to reestablish communications between an HA pair and resumes data synchronization and fail-over operations.

To perform maintenance on an Active machine, run the switch action. The active machine becomes the standby machine, where you can execute the disconnect action and perform Integration Appliance maintenance without interrupting orchestration processing.

Syntax

```
ha disconnect
```

Parent topic: [High availability commands](#)

Management commands

A list of the management (mgmt) commands available.

Note: If you specify community names that require quotation marks, you must use (‘’ double quotation marks.

Table 1.

Command name	Action	Syntax
mgmt kerberos del config	Deletes the Kerberos realm and KDC server configurations.	mgmt kerberos del config
mgmt kerberos set realm	Allows you to specify the Kerberos realm and KDC server configuration settings.	mgmt kerberos set realm<name>kdc<name ipaddress>
mgmt kerberos show config	Displays the Kerberos realm and KDC server configuration settings.	mgmt kerberos show config
mgmt motd	Allows you to set a message of the day that is displayed when a user logs in to the CLI. You can view the message of the day that was set, by choosing the show parameter. Choose the clear parameter and no message of the day is displayed when a user logs in to the CLI.	mgmt motd{set show clear}
mgmt secure	Enables or disables secure access to the Integration Appliance for the management interface. The default option is on, which enables secure management access. When secure management access is enabled (on), you must access the CLI by using SSH (secure shell) and access the Web Management Console (WMC) by using HTTPS. When you disable secure management access, by choosing the off option, you can access the CLI by using telnet and access the WMC by using HTTP. Verify the current security setting by using the mgmt secure setting command	mgmt secure { on off setting}

Command name	Action	Syntax
mgmt snmp set	Allows you to set up or update current SNMP configurations, as well as enable and disable the SNMP MIB2 service. For more information on using SNMP commands, see SNMP basics .	<pre>1. mgmt snmp set { community description location contact } <value> 2. mgmt snmp set { on off }</pre>
mgmt snmp show	Displays current SNMP configuration settings.	<pre>mgmt snmp show { community description location contact all status }</pre>
mgmt ssh add	<p>Adds a public key for the specified host to the SSH Store on the Integration Appliance. If strict SSH key checking is enabled on the Integration Appliance, public keys must reside in the SSH Store for all participating endpoint systems that the Integration Appliance connects to with SFTP.</p> <p>Restart the Integration Appliance after you issue this command.</p> <p>Note: The keytype is a required parameter.</p>	<pre>mgmt ssh add<rsa dsa >host<name ipaddr name, i paddr></pre>
mgmt ssh del	<p>Deletes the public key for the specified host from the SSH Store on the Integration Appliance.</p> <p>Restart the Integration Appliance after you issue this command.</p> <p>Note: The keytype is a required parameter.</p>	<pre>mgmt ssh del host<hostname > host IP address></pre>
mgmt ssh key check	<p>Enables or disables strict SSH key checking.</p> <p>In strict mode, SFTP connectors only connect to participating endpoint systems if the public key for that system matches the public key stored in the SSH Store of the Integration Appliance.</p> <p>In easy mode, SFTP connectors connect to participating endpoint system if either:</p> <ul style="list-style-type: none"> • The public key for that system matches the public key stored in the SSH Store • No public key exists in the SSH Store. If no key exists, the connector loads the current public key from the participating endpoint system to the SSH Store 	<pre>mgmt ssh keycheck<stri ct easy ></pre>
mgmt ssh list	Displays all or a specified host that have public keys in the SSH Store. Public keys in the SSH Store are used with SFTP connectors to ensure secure connections.	<pre>mgmt ssh list[host<nam e host IP address>}</pre>

Co m m a n d n a m e	Action	Syntax
mg mt ssh sho w key che ck	Displays the current setting of SSH key checking: strict or easy.	mgmt ssh show keycheck
mg mt sysl og del con fig	Allows you to delete system log (syslog) configurations.	mgmt syslog del config
mg mt sysl og set re mo te hos t	Allows you to specify the remote host to which logs are sent.	mgmt syslog set remote host<name host IP address>
mg mt sysl og sho w con fig	Displays current system log (syslog) configuration settings.	mgmt syslog show config

[Feedback](#) | [Notices](#)

 Last updated: Friday, February 5, 2016

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.cli.doc/CLI_mgmt_commands.html

Network commands

Network commands that you can use to manage the network configuration.

Table 1.

Command name	Action	Syntax
net add etchost	<p>Adds an entry to the /etc/hosts configuration file in the Integration Appliance.</p> <p>The IP address is typically the management IP address of the appliance. It is best practice to specify a fully qualified host name (for example, <i>myhost.mydept.mycompany.com</i>). Also, although alias is an optional parameter, it is best practice to specify an alias (for example, <i>myhost</i>).</p> <p>Here is an example of a net add etchost command.</p> <pre>net add etchost address 111.222.333.444 hostname myhost.mydept.mycompany.com alias myhost</pre> <p>If an entry was previously added with a host name that is not fully qualified, that entry must first be removed by using the net del etchost command before you add an entry with a fully qualified host name. Verify that the entry was successfully deleted by using the net show etchost command.</p>	<pre>net add etchost address <ip-address> hostname <fully-qualified- hostname> [alias <short-alias-name>]</pre>
net add route address	<p>Adds a static route to the routing table.</p>	<pre>net add route address <destination> mask <netmask> [gateway <gateway>] interface {emgmt edata}</pre>
net del etchost	<p>Removes one or more entries from the /etc/hosts configuration file in the Integration Appliance.</p> <p>Specify the identical parameters that were used when the entry was added by using the net add etchost command. You can verify the details by using the net show etchost command.</p>	<pre>net del etchost address <ip-address> hostname <fully-qualified- hostname> [alias <short-alias-name>]</pre>
net del route address	<p>Removes a static route from the routing table.</p>	<pre>net del route address <ip-address> mask <mask></pre>

Co mm and na me	Action	Syntax
net flus h dhc p	Erases cached DHCP values from the Integration Appliance.	net flush dhcp
net pin g	Queries the specified host to determine if it is responding on the network.	net ping {<ip-address> <nodename>}
net rest art	Saves and applies any new network settings. You must use this command after net set, net add, or net del commands to apply the changes.	net restart
net rest ore	Restores the memory to active or backup settings.	net restore {active backup}
net trac ero ute	Traces the network route to the specified node.	net traceroute <ip-address> <nodename>
net vali dat e	<p>Tests the current in-memory settings and displays any warnings or errors that might prevent the network from operating correctly.</p> <p>When all network settings are acceptable, issuing this command returns the following statement, "Current network settings can be applied."</p> <p>When an invalid setting is entered, issuing this command returns the appropriate warning or error messages. For example,</p> <pre>warning: Route to 9.43.79.4 requires static Data IP address</pre> <pre>error: Gateway 9.9.9.9 is not reachable from emgmt</pre> <p>Current network settings cannot be applied</p>	net validate

For the net set and net show commands, see the following topics:

- [The net set command](#)
Sets the configuration for the network interfaces of the Integration Appliance, DNS server, host name, and default gateway. Choose the net set autohost command to automatically add the hostname/IP address to the Integration Appliance. You can also set the amount of time before reporting a lost carrier.
- [The net show command](#)
This command displays all network configuration for the Integration Appliance. This command can also display specific configuration information for the network interfaces, DNS server, host name, default gateway, routing tables, and socket connections. If you enable the net set autohost command, use the net show autohost to view the current settings of the autohost.

Last updated: Friday, February 5, 2016
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.cli.doc/CLI_network_commands.html

The net set command

Sets the configuration for the network interfaces of the Integration Appliance, DNS server, host name, and default gateway. Choose the net set autohost command to automatically add the hostname/IP address to the Integration Appliance. You can also set the amount of time before reporting a lost carrier.

To improve startup time in networks that do not have a DHCP server, configure all items to either static values or none so the Integration Appliance does not search for a DHCP server.

If you configure any value to be obtained through DHCP, startup time could be delayed as the Integration Appliance tries to locate an available DHCP server.

The network interfaces of the Integration Appliance use these names:

- edata - for the interface that handles all integration data
- emgmt - for the interface that handles management traffic, including both the CLI and the Web Management Console (WMC)

Table 1.

Options	Description
autohost	Allows the Integration Appliance to find its IP address from its own hostname. When you enabled this option and the Integration Appliance cannot find an IP address corresponding to its hostname, either through DNS or an entry you entered manually into the /etc/hosts directory, the Integration Appliance automatically adds an entry into the /etc/hosts directory to allow the CIOS to operate normally. Enable or disable this option through the net set autohost command.
carrier	Specifies the time, in seconds, until a missing ethernet link carrier is reported as an error. Setting the value to zero disables the carrier checking and no errors are reported.

Options	Description
domain	Sets the domain name for this Integration Appliance. The effect is that most queries for names within this domain can use short names relative to the local domain.
gateway	Specifies the gateway and the interface to use for that gateway. The Integration Appliance supports only one default gateway for both management and data traffic (as opposed to one gateway per interface), but additional routes can be added separately.
hostname	Sets the name of the Integration Appliance. This should be the short hostname, without the domain name.
interface	Sets the IP address, Netmask and Broadcast address for the specified interface.
link	Sets the ethernet link to autonegotiate (the default) or to specific values. In most cases autonegotiate is preferable, but setting specific values can sometimes help improve throughput when network conditions are not optimal.
mtu	Sets the Maximum Transmission Unit (MTU) size between a range of (68-9000). The default MTU is 1500.

Options	Description
nameserver	Sets DNS server list (maximum 2).
ntp	Sets the time server.
search	Specifies the search list. If you do not set this option, the search list is the same as the value of the domain setting.

Syntax 1

```
net set autohost [enable|disable ]
```

Syntax 2

```
net set carrier timeout <timeout>
```

Syntax 3

```
net set {domain|search|nameserver|ntp} {dhcp[emgmt|edata]|static <value>|none}
```

Example 1: Set a specific domain name.

```
net set domain static mydomain.com
```

Example 2: Ask a DHCP server on the management NIC for an NTP server.

```
net set ntp dhcp emgmt
```

Example 3: Search for host names in specified domains.

```
net set search static a.mydomain.com b.mydomain.com
```

Example 4: Do not search for host names in other domains.

```
net set search none
```

Syntax 4

```
net set gateway {dhcp {emgmt|edata}|static <ipaddress> {emgmt|edata}|none}
```

Syntax 5

```
net set hostname {dhcp[emgmt|edata]|static <value>}
```

Syntax 6

```
net set interface {emgmt|edata} {dhcp|address <ipaddress> mask <mask> [bcast <bcast>]}
```

Syntax 7

```
net set link {emgmt|edata} {autonegotiate|speed <speed> duplex {half|full}}
```

Syntax 8

```
net set mtu {emgmt|edata} <MTU>
```

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.cli.doc/CLI_network_netset.html

The net show command

This command displays all network configuration for the Integration Appliance. This command can also display specific configuration information for the network interfaces, DNS server, host name, default gateway, routing tables, and socket connections. If you enable the net set autohost command, use the net show autohost to view the current settings of the autohost.

You can issue a collection of network settings changes in memory with the net show command. The Integration Appliance does not persist these changes. The net show command only becomes permanent after you issue a net restart command.

- Active - Displays the network settings for the Integration Appliance that is currently running.
- Memory - Displays the network settings of a staging Integration Appliance that becomes active when you issue the net restart command.
- Backup - Specifies the Integration Appliance that was active before you issued the previous net restart command.

The network interfaces of the Integration Appliance use these names:

- edata - for the interface that handles all integration data
- emgmt - for the interface that handles management traffic, including both the CLI and the Web Management Console

Table 1. . The following table provides descriptions for options available in the various

command syntaxes:

Options	Description
all	Displays all network configuration information for the Integration Appliance.
active	Displays complete network configurations.
autohost	Allows the Integration Appliance to find its IP address from its own hostname. When you enabled this option and the Integration Appliance cannot find an IP address corresponding to its hostname, either through DNS or an entry you entered manually into the /etc/hosts directory, the Integration Appliance automatically adds an entry into the /etc/hosts directory to allow the runtime to operate normally. Enable or disable this option through the net set autohost command.
backup	Displays complete network configurations.
carrier	Specifies the time, in seconds, until a missing ethernet link carrier is reported as an error. Setting the value to zero disables the carrier checking and no errors are reported.
domain	Displays the domain name for this Integration Appliance. The effect is that most queries for names within this domain can use short names relative to the local domain.
etchost	Displays the entries within /etc/hosts.

Options	Description
gateway	Specifies the gateway and the interface to use for that gateway. The Integration Appliance supports only one default gateway for both management and data traffic (as opposed to one gateway per interface), but additional routes can be added separately.
hostname	Displays the name of the Integration Appliance. This should be the short hostname, without the domain name.
interface	Displays the IP address, Netmask and Broadcast address for the specified interface.
link	Sets the ethernet link to autonegotiate (the default) or to specific values. In most cases autonegotiate is preferable, but setting specific values can sometimes help improve throughput when network conditions are not optimal.
memory	Displays complete network configurations.
mtu	Displays Maximum Transmission Unit (MTU) size for data in an IP packet.

O p t i o n s	Description
n a m e s e r v e r	Displays the DNS server list (maximum 2).
n o d e	Displays the IP address for the node.
n t p	Displays the network protocol for clock synchronization between an appliance and network.
r o u t e	Displays active routes.
s e a r c h	Specifies the search list. If you do not set this option, the search list is the same as the value of the domain setting.
s o c k e t s	Displays a list of socket addresses.
s t a t u s	Displays the network status of the Integration Appliance, including the last attempt to start networking, the last time networking started, the last time networking stopped, the reason for last networking stop and the current networking activity.

```
net show {active|memory|backup}
```

Syntax 2

```
net show {hostname|domain|search|nameserver|gateway|ntp} [ all|active|memory|backup]
```

If not specified, the last parameter defaults to active.

Syntax 3

```
net show autohost
```

Syntax 4

```
net show carrier [all|active|memory|backup]
```

Syntax 5

```
net show etchost
```

Syntax 6

```
net show interface {emgmt|edata} [all|active|memory|backup]
```

Syntax 7

```
net show link [all|active|memory|backup]
```

Syntax 8

```
net show node {<ip address>|<hostname> }
```

Syntax 9

```
net show route [active|memory|backup]
```

If not specified, the last parameter defaults to active.

Syntax 10

```
net show sockets
```

Syntax 11

```
net show status
```

Network introspection commands

Network introspection (Netspect) commands allow you to manage network configurations and query the network for DHCP server, DNS server, gateway, and route information.

Note: Do not use reserved words in the user name, host name, or file name. Reserved words include: ftp, sftp, export, ibm, port, user, and file.

Table 1.

Co mm and na me	Action	Syntax
net spe ct arp	Issues an ARP request for the IP address you specify and displays the result of the ARP reply or displays the ARP cache content.	<code>netspect arp <lookup ipv4- address show cache></code>
net spe ct cap ture clea n	Deletes all existing packet capture files.	<code>netspect capture clean</code>
net spe ct cap ture sho w	Displays the captured packets. Issuing this command also stops any running packet capture.	<code>netspect capture show</code>

Command name	Action	Syntax
netspect capture start	<p>Initiates a packet trace and produces a gzip (.gz) file. Packet traces can be useful for debugging network connection errors.</p> <p>Only one packet trace capture can run at a time. The capture continues running until you stop it using <CTRL + C> or until a maximum number of packets is reached.</p> <p>Note: When you start a capture with packet size parameter set to full, <code>pktsize full</code>, fewer packets can be captured.</p> <p>You can transfer packet traces to another host using the <code>netspect export</code> command.</p> <p>Note: Capturing a packet trace overwrites the previous capture.</p>	<pre>netspect capture start [interface <emgmt edata all>] [pktsize <header full>] [find <hostname network>]</pre> <p>where</p> <ul style="list-style-type: none"> • <code>hostname</code> - Captures to/from specified host (nn.nn.nn.nn). • <code>network</code> - Captures to/from certain network in CIDR. <p>Note: If you do not specify <code>emgmt</code> or <code>edata</code> for the interface parameter, the Integration Appliance uses the default value of <code>all</code> and capture starts for both interfaces.</p> <p>Example 1: Capture packet headers on both interfaces.</p> <pre>netspect capture start</pre> <p>Example 2: Capture full packets on <code>edata</code>.</p> <pre>netspect capture start interface edata pktsize full</pre> <p>Example 3: Capture packet headers on <code>edata</code> to/from certain network.</p> <pre>netspect capture start interface edata find 123.12.0.0/24</pre> <p>Example 4: Capture full packets on <code>emgmt</code> to/from certain host.</p> <pre>netspect capture start interface emgmt pktsize full find 123.12.0.123</pre>

Co mm and na me	Action	Syntax
net spe ct con nec t	Using the protocol you specify, this command attempts to open a connection to the network host port and displays the result of the connection attempt. If a connection is established, the connection is closed prior to this command returning.	<pre>netspect connect host <host-id> <protocol> port <port-num></pre> <p>where</p> <ul style="list-style-type: none"> • <code>host-id</code> - The name or IP address of a network host. • <code>protocol</code> - The protocol to use for the connection. Must be "tcp". • <code>port-num</code> - Any valid tcp port number.
net spe ct dhc p	Queries the network for DHCP servers on the network interface you specify. Also displays DHCP server supplied network configuration information, plus the offered IP address and its lease terms.	<pre>netspect dhcp interface <emgmt edata></pre>
net spe ct dns	Queries the system configured DNS server for the specified network host (i.e. perform either a forward lookup: return the IP address for a given host name, or perform a reverse lookup: return a host name for a given IP address), and display the result of the lookup.	<pre>netspect dns lookup host <host-id></pre>

Command name	Action	Syntax
netspect export	Exports a packet capture file to an FTP Server. For more information about capturing packet traces, see the <code>netspect capture start</code> command.	<pre>netspect export <ftp sftp> host <host-id> [port <number>] [user <user>] [file <filename>]</pre> <p>where:</p> <ul style="list-style-type: none"> • <code>host-id</code> - The name or IP address of the network host. • <code>port</code> - A valid port on the specified network host to which to connect. • <code>user</code> - Specifies the username used to log into the host. Note: When using <code>sftp</code>, this parameter must be specified. Anonymous logins are not allowed with <code>sftp</code>. • <code>filename</code> - File path on the destination host. <p>Example 1: <code>netspect export ftp.</code></p> <pre>netspect export ftp host 123.12.12.123</pre> <p>Example 2: <code>netspect export sftp.</code></p> <pre>netspect export sftp host 123.12.12.123 user myname file /home/myname/mycap.gz</pre>
netspect gateways	Queries the gateways and routes for the specified IP protocol family, and reports whether or not the gateway responded to the query/ping. The IP protocol family can be either <code>ipv4</code> , which is the default or <code>ipv6</code> .	<pre>netspect gateways <ip- protocol></pre>
netspect help	Displays help text for the specified <code>netspect</code> command. If a command is not specified, then a help summary for all <code>netspect</code> commands is displayed.	<pre>netspect help <command></pre>
netspect ifconfig	Displays network interface configuration information for the specified interface. If a network interface name is not specified, then interface configuration information is displayed for all network interfaces.	<pre>netspect ifconfig interface <emgmt edata></pre>

Co mm and na me	Action	Syntax
net spe ct ping	Attempts to query the specified network host, and displays the result of the query attempt.	<code>netspect ping host <host-id></code>
net spe ct rou tes	Displays currently configured routes for the specified IP protocol family. The IP protocol family can be either IPv4 (the default if none specified) or IPv6.	<code>netspect routes [<ip- protocol>]</code>
net spe ct sum mar y	Provides a summary of network configuration information.	<code>netspect summary</code>
net spe ct trac ero ute	Attempts to determine the route to the specified network host, and displays the route packets took to get to the specified network host.	<code>netspect traceroute host <host-id></code>

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.cli.doc/CLI_status_commands.html

System commands

System commands allow you to manage the operation of the Integration Appliance, which includes managing licenses for the Integration Appliance and connectors.

Note: Do not use reserved words in the user name, host name, or file name. Reserved words include: ftp, sftp, ibm, port, user, and file.

Table 1.

Com man d nam e	Action	Syntax
sys tem auto rebo ot	Allows you to enable or disable automatic reboot for an Integration Appliance. Note: During a Cast Iron [®] firmware upgrade, the Integration Appliance reboots even if the automatic reboot is disabled.	<code>system autoreboot <on off></code>
sys tem auto rebo ot setti ng	Use the setting parameter to print autoreboot settings.	<code>system autoreboot setting</code>

Command name	Action	Syntax
system clean	<p>Clears the system states of the Integration Appliance. When you issue a <code>system clean all</code> command, the IBM® DataPower® Cast Iron® Appliance may reboot.</p> <p>Running the <code>all</code> option results in the removal of all data and configurations, including High Availability configurations, from disk. The results are equivalent to restoring factory default settings for the appliance. After the reboot, you will be asked to accept the license agreement before logging in to the Web Management Console for the appliance.</p>	<pre>system clean{ [running] [orchmon] [deploy] } all</pre> <p>where:</p> <ul style="list-style-type: none"> • <code>running</code> - Removes currently running project data. • <code>orchmon</code> - Removes orchestration monitoring data. • <code>deploy</code> - Removes all projects and configurations. • <code>all</code> - Resets the appliance to factory default settings.
system persist	<p>Enables or disables the disk cache on the Integration Appliance. The default and recommended setting is <code>system persist on</code>.</p> <p>When persistence is enabled, writes are synchronized to ensure that all requested data is completely written to disk. This behavior helps protect data integrity, particularly when accessing external transactional systems such as databases.</p> <p>When persistence is disabled, on an appliance that supports this feature, performance might be improved. However, there is a risk of losing job progress state.</p>	<pre>system persist { on off }</pre>
system persist setting	<p>Displays the current system persist setting: on or off. Use the <code>system persist</code> command to specify whether the disk cache is enabled or disabled.</p>	<pre>system persist setting</pre>
system poweroff	<p>Shuts down all routing services and then powers off the Integration Appliance. If the <code>force</code> parameter is used, power is cut off immediately.</p>	<pre>system poweroff</pre>

Command name	Action	Syntax
system reboot	<p>Shuts down all routing services and then reboots the Integration Appliance.</p> <p>Note:</p> <ul style="list-style-type: none"> • Before making changes like Upgrade/Reboot of appliance, please stop all projects in the runtime. After appliance comes back, starts the projects one-by-one. • When the system reboots, any network settings that have not been saved are lost. To commit network settings to the Integration Appliance, use the net restart command. 	system reboot
system restart	Restarts the runtime and Web Management Console, without affecting the network connectivity.	system restart
system show platform	Displays information about the Integration Appliance, such as: ROM version, appliance platform, serial number, and MAC addresses.	system show platform
system show status	Available for Standalone Integration Appliances as well as the Active Integration Appliance in an HA pair. Shows whether the following components are up or down: System, Network, and Runtime.	<p>system show status</p> <p>Example output:</p> <pre>Appliance Status ----- System: Up Network: Up Runtime: Up</pre>
system show version	Displays the version of the Cast Iron operating system on the Integration Appliance.	system show version

Command name	Action	Syntax
system update cios image	Updates the Cast Iron Operating System on the Integration Appliance using an image from an FTP Server based file or an SFTP Server based file.	<p>system update cios image from <source></p> <p>where <i>source</i> can specify an FTP Server or an SFTP Server:</p> <ul style="list-style-type: none"> • ftp <hostname> [port <number>] [user <user>] file <filename> • sftp <hostname> [port <number>] user <user> file <filename> • http <hostname> [port <number>] [user <user>] file <filename> • https <hostname> [port <number>] user <user> file <filename> <p>Note: When using sftp, you must specify the user parameter. Anonymous logins are not allowed with sftp.</p>

Time commands

Time commands allow you to set or synchronize the date and time on the Integration Appliance.

Note: To avoid time drift on Virtual Appliances, run NTP on the host and guest. Running NTP sets the system time to UTC. Do not use the time set clock command to reset time on a Virtual Appliance.

Table 1.

Com mand name	Action	Syntax
time set	<p>Sets individual time and date components relative to the time zone you choose. The Integration Appliance restarts after you issue this command using the <code>clock</code> parameter.</p> <p>If you do not know the syntax for a specific time zone, choose the last option and do not specify a value for zone.</p>	<pre>time set { { clock<string> } { zone<zone>} { zone} }</pre> <p>Example 1:</p> <ul style="list-style-type: none"> time set clock<string> User input: time set clock Sat Jan 1 00:00:00 2005 <p>Example 2:</p> <ul style="list-style-type: none"> time set zone<zone> User input: time set zone America/Los_Angeles
time show	Display all time settings or individual time components (the current time, date, or time zone).	time show

About High Availability Pairs

A High Availability (HA) pair is an Integration Appliance configuration that connects two physical Integration Appliances together, allowing them to automatically synchronize data and perform fail-over operations. The machines that make up the HA pair share the same MAC and IP addresses, thus creating a single network identity.

There is one Active and one Standby Integration Appliance in an HA pair. The Integration Appliance that actively processes orchestrations is the Active machine. The Integration Appliance that automatically synchronizes data and performs fail-over operations is the Standby machine. When the machines that make up an HA pair initially connect to each other, they immediately synchronize with each other and determine which machine assumes the active role and which machine assumes the standby role. During the initial synchronization operation, the Active machine can process orchestrations; however, fail-over cannot occur until the HA pair is completely synchronized. Once the HA pair is synchronized, the HA pair persists data and automatically synchronizes this data between the two machines.

When an Active machine failure occurs, the Standby machine initiates a take over procedure, becomes the Active machine, and resumes processing orchestrations exactly where the other machine stopped. The take over process typically takes less than a minute to complete, but DHCP response times can slow the take over process. During the take over procedure, the Standby machine power cycles the Active machine to ensure the Active machine is not still processing orchestrations. Only when the Standby machine can successfully power cycle the failed Active machine does it become the Active machine. If the Standby machine is unable to power cycle the Active machine, the Standby machine goes into an IDLE state.

Examples of failures that can cause an HA fail-over to occur include the following failures:

- Hardware failures generated by CPUs, hard drives, RAM, motherboards, network interfaces, power supplies, and raid-controllers.
- Integration Appliance runtime failures, such as fatal errors during processing.
- Communication failures between the Integration Appliances caused by replication port network interface issues or replication cable issues.

When the Active machine loses contact with the Standby machine, the Active machine stops running orchestrations to prevent an asynchronous data commit and waits to see if the Standby machine initiates the take over procedure. If the Standby machine does not power cycle the Active machine, the Active machine resumes processing orchestrations. When the Standby machine is able to reconnect to the Active machine, the Standby machine synchronizes with the Active machine.

From the WMC, you can monitor an HA pair's status and manipulate the roles of the Integration Appliances in an HA pair.

file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.HAOverview.doc/HA_about_HA.html

About Integration Appliance States

Integration Appliances in a High Availability (HA) pair can be in one of many states. States for Integration Appliances in an HA pair include:

States for Integration Appliances in an HA pair include:

ACTIVE_1

The Active machine cannot communicate with the Standby machine; however, the Active machine continues to process data.

ACTIVE_2

The Active machine is successfully processing data and can communicate with the peer HA machine.

IDLE

Displays when the Active machine or Standby machine encounters a hardware or software problem. An IDLE state helps to ensure data integrity between an HA pair. IDLE is not always an error state.

For example, the Active machine enters an IDLE state when it power cycles and remains in this state until it can verify the state of the Standby machine.

STANDBY

The Standby machine is successfully synchronizing with the Active machine.

TRANSITIONING

Can occur immediately before or after rebooting. Typically, a machine in an HA pair remains in this state after rebooting long enough to perform some initialization, find its peer, and then transition into the appropriate state.

UNKNOWN

Occurs when the peer machine is unavailable. For example, when a Standby machine is powered off, the Active machine states that the state of the peer machine (Standby machine) is UNKNOWN.

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.HAOverview.doc/HA_about_IASStates.html

Requirements for Configuring High Availability Pairs

A High Availability (HA) pair requires a very specific hardware configuration, and the two Integration Appliances must meet certain requirements.

To operate as an HA pair, the two Integration Appliances must meet the following requirements:

- Both Integration Appliances must use the same version of the Cast Iron® Operating System. When you apply a patch to one Integration Appliance, the same patch is automatically applied to the other Integration Appliance in the HA pair.
- The replication interfaces on one machine must be connected by cable to the corresponding interface on the other machine.
- The management network port on each Integration Appliance must be connected to the same subnet.
- The data network port on each Integration Appliance must be connected to the same subnet.

Note: A note regarding High Availability pairs and Hybrid Cloud Integration (HCI) support – If you are using HCI functionality and attempt to convert two Integration Appliances to HA, the HCI function will no longer be supported.

file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.HAOverview.doc/HA_req_HApairs.html

Setting Up a High Availability Pair

About this task

Perform the following steps to set up a High Availability pair.

Procedure

1. If you are using 9005 appliances to set up an HA pair, do the procedures in Step 1a. If you are using 9004 appliances, do the procedures in Step 1b. .

Note: High Availability can only be obtained by connecting homogeneous appliances. Do not attempt to connect dissimilar appliances (such as a 9005 appliance and a 9004 appliance) to one another to attain High Availability

- a. For the 9005 appliance - To create an HA pair, you need a total of six Ethernet cables in addition to the recommended serial console cable. Directly connect the replication interfaces of the two appliances with two Ethernet cables:

```
1 x ethernet cable for emgmt of Appliance A
1 x ethernet cable for emgmt of Appliance B
1 x ethernet cable for edata of Appliance A
1 x ethernet cable for edata of Appliance B
1 x ethernet cable for repl1 between Appliance A and Appliance B
1 x ethernet cable for repl2 between Appliance A and Appliance B
```

Connected as follows:

```
Appliance 1          Appliance 2
Repl 1 <-----> Repl 1
MGMT                MGMT
Data 1              Data 1
Data 2              Data 2
Data 3              Data 3
Repl 2 <-----> Repl 2
```

Connect MGMT and Data 1 for both appliances to the appropriate management and data networks. Data 2 and Data 3 should remain disconnected.

- b. For the 9004 appliance - Note that the network interfaces labelled externally on the Cast Iron appliance are mapped to different interfaces internally:

External Label	Internal designation
MGMT	emgmt
ETH0	r1
ETH2	edata
ETH1	r2

Connect the appliances with two Ethernet cables:

```
Appliance 1          Appliance 2
MGMT (internal:emgmt)  MGMT (internal:emgmt)
ETH0 (internal:r1)    -----> ETH0 (internal:r1)
ETH1 (internal:r2)    -----> ETH1 (internal:r2)
ETH2 (internal:edata)  ETH2 (internal:edata)
```

MGMT (emgmt) and ETH2 (edata) for both appliances should be connected to the appropriate management and data networks.

2. Select an appliance to be the initial Active peer. The second appliance will be the Standby peer.
3. Connect a serial console to the selected Cast Iron appliance. Log in to the Cast Iron command line interface (CLI) on the Active peer appliance as user `admin`. The default admin password is `!n0r1t5@C`. You should get a command prompt similar to: `none/Standalone>`.
4. Configure the management and data networks to use statically assigned IP addresses. From the CLI, you do this by issuing a `net set interface` command followed by `net restart`:

```
appliance name/Standalone> net set interface emgmt address <MGMT IP ADDRESS> mask <MGMT NETMASK> bcast <MGMT BROADCAST>
```

```
appliance name/Standalone> net set interface edata address <DATA IP
```

```
ADDRESS> mask <DATA NETMASK> bcast <DATA BROADCAST>  
appliance name/Standalone> net restart
```

5. To avoid problems, you should upgrade Cast Iron appliances with the latest software version. The software can be located on the IBM Fix Central website at <http://www.ibm.com/support/fixcentral/> and should be downloaded onto a machine that is accessible from the Cast Iron appliance to be upgraded. Upgrade of the Cast Iron software can be done through the Cast Iron Web Management Console (WMC) or alternatively, through commands issued on the command line interface. To check the software level, connect a serial console to the selected Cast Iron appliance, then log in to the Cast Iron command line interface on the Active peer appliance as user `admin`. By default the admin password is `!n0r1t5@C`. Issue the following command to check the software level:

```
none/standalone>system show version
```

If an update is required, issue the update command, providing the `ftp` location and user credentials required. For example:

```
none/standalone>system update cios image from ftp 10.10.17.166 user  
billbloggs file Downloads/fixcentral/castiron/myciupdate
```

The appliance reboots during the upgrade process.

6. Repeat steps 3 and 5 for the Standby appliance. Because the appliance temporarily requires two IP addresses for the duration of the upgrade, you may also need to perform step 4 on the Standby peer. Note: After HA setup is complete, only two IP addresses (one for management and one for data) are required for the HA pair. Any IP addresses used on the Standby peer for this step are discarded upon completion of HA setup and may be used elsewhere in the network environment.
7. Issue the following command on both peers to ensure that they have the same level of software installed and that it is the required software level:

```
none/standalone>system show version
```

8. Configure the Active appliance as HA:

```
none/standalone> system haconfig enable active
```

The appliance reboots and restarts as the Active appliance.

9. Log in to the Active appliance. The command prompt shows the appliance is active:

```
none/Active>  
or  
appliance name/Active>
```

10. Connect a serial console to the selected Standby appliance, then log into the Standby peer and issue the following command to configure it as HA:

```
none/standalone> system haconfig enable standby
```

11. Log back into the Standby appliance. The command prompt shows the appliance is standby:

```
none/Standby>
```

12. On the Active appliance check the status of the HA pair:

```
appliance name/Active>ha show pairstatus
```

The output indicates if the appliances are highly available. For example:

```
appliance name/Active>ha show pairstatus
```

```
Pair Status  
-----
```

```
NOT Highly Available
Local State: ACTIVE_2
Peer State: STANDBY
Sync Status: 74%
```

```
Appliance Services
-----
Network: Up
Runtime: Starting
```

Command complete

In this example, the HA pair is not highly available because synchronization of the disks is only 74% complete. Issue the command again and the status changes:

```
appliance name/Active>ha show pairstatus
```

```
Pair Status
-----
Highly Available
Local State: ACTIVE_2
Peer State: STANDBY
Sync Status: Synced
```

```
Appliance Services
-----
Network: Up
Runtime: Up
```

Command complete

13. After synchronization completes, it is important to ensure that the HA pair can properly switch roles when necessary. Use `ha show pairstatus` to confirm that the pair is Highly Available and that the network and runtime appliance services are reported as up. Identify the serial number of the appliance that is currently active.

```
appliance name/Active> system show version
```

Issue the following command to switch the roles of the HA pair:

```
appliance name/Active> ha switch
```

The Standby peer takes over and becomes Active. (Typically this process requires about 2 minutes). The peer that was previously Active becomes Standby. Use the command `system show version` to view the serial number of the Active appliance and confirm that it has changed. Use the command "`ha show pairstatus`" to verify that the HA pair returns to the Highly Available state.

14. After confirming that the HA pair can switch roles in one direction (for example: Peer A -> Peer B), do Step 13 again to ensure the HA pair can switch roles in the other direction (Peer B -> Peer A).
Note: A note regarding High Availability pairs and Hybrid Cloud Integration (HCI) support – If you are using HCI functionality and attempt to convert two Integration Appliances to HA, the HCI function will no longer be supported.

file:///dcs/markdown/workspace/Transform/out.html

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.HAOverview.doc/HAsetuphapair.html>

Working with High Availability Pairs

High Availability (HA) pairs consist of two Integration Appliances: an Active machine and a Standby machine. This HA pair can then process orchestrations as a single entity.

The Active machine actively processes orchestrations, while the Standby machine automatically synchronizes data with the Active machine in case the Standby machine needs to perform any fail-over operations. When the appropriate scenario occurs, the Active machine and Standby machine can switch roles.

From the WMC, you can change the state or role of the Integration Appliances in an HA pair.

- [Running High Availability Commands](#)
You can run commands against a High Availability (HA) pair from the navigation pane.
- [High Availability Commands](#)
These commands can be run against a High Availability (HA) Pair.

Running High Availability Commands

You can run commands against a High Availability (HA) pair from the navigation pane.

Procedure

1. Select System > Command. The System Commands page is displayed.
2. From the Choose Command drop-down list, select a command. You can view command details by clicking the drop-down arrow.
3. Click Go.

Parent topic: [Working with High Availability Pairs](#)

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.HAOverview.doc/HA_run_commands.html

High Availability Commands

These commands can be run against a High Availability (HA) Pair.

Table 1.

System Control Commands	Description
H A C o n n e c t	Reconnects the Active and Standby Integration Appliance so that they can resume fail-over operations.
H A D i s c o n n e c t	Temporarily disconnects an HA pair without causing the Standby machine to takeover the Active machine. This action allows you to perform any necessary hardware or software maintenance on the Standby machine without interrupting orchestration processing. When you choose this action, the Standby machine transitions to an idle state. Reboot the Active machine or execute the Connect action to reestablish communications between an HA pair and resumes data synchronization and fail-over operations. To perform maintenance on an Active machine, use the Switch action. The Active machine becomes the Standby machine, where you can use the Disconnect action and perform Integration Appliance maintenance without interrupting orchestration processing.
H A S w i t c h	Causes the Integration Appliances in an HA pair to switch roles: the Active machine becomes the Standby machine and the Standby machine becomes the Active machine.

Parent topic: [Working with High Availability Pairs](#)

[Feedback](#) | [Notices](#)

Troubleshooting a High Availability Pair

If both the Active and Standby machines enter an IDLE state, use the CLI to resolve the issue.

Procedure

To resolve an IDLE/IDLE state:

1. From the CLI on both the Active machine and the Standby machine, type `ha show lastaccess`.
2. Determine which Integration Appliance has the most valid set of data. Usually the Integration Appliance with the most recent activity generates the most recent timestamp.
3. Type `ha active` on the Integration Appliance you determine to have the most valid data.

Results

This Integration Appliance is now the Active machine in a HA pair.

If you require specific technical support for high availability pairs, contact IBM Technical Support.

About the virtual appliance

This guide provides information about creating, configuring, backing up and recovering virtual appliances. Virtual appliances run in a virtual environment and are packaged with a guest operating system and optional application software, while integration appliances are physical machines.

Cast Iron® products perform equally well in both the virtual and physical worlds. You can install the Cast Iron Operating System (CIOS) on a single virtual machine running one integration project or on multiple virtual machines running many projects to create a data center infrastructure. For information on creating virtual appliances with CIOS as the guest operating system, see [Deploying an OVF template](#).

Your virtual appliance environment should consist of the following:

- A host machine (desktop computer or server).
- CPU (for example Intel® VT-x or AMD®-V) with virtualization technology enabled. (In some cases, virtualization technology must be enabled through BIOS).
- 60 GB disk space.
- Supported configuration of either 1 CPU, 4 GB RAM or 2 CPU, 8 GB RAM. Ensure that the host has enough physical RAM to run the selected configuration or system performance might be affected.

- VMware® ESX® or ESXi version 5.0 or later. For more information on VMware products and ESX, go to <http://kb.vmware.com/selfservice/microsites/microsite.do> and click *VMware ESX and ESXi Comparison*.
- Cast Iron Hypervisor Edition installation file (in OVA format).
- VMware vCenter® Server, 4.0.0, 258672 (optional).
- VMware VMotion® and VMware High Availability add-ons (optional). When added to your installation, VMware add-ons can manage and balance your workload across virtual machines, find an optimum data center location for a virtual machine and manage OS related failures. Refer to VMware documentation to learn more about add-ons and for tips on setting up your virtual environment.

Note: Shared storage, such as a SAN, is optional. Shared storage is required to enable VMware features such as VMware VMotion and VMware High Availability.

Getting started with the IBM WebSphere Cast Iron Hypervisor Edition

This guide introduces the IBM® WebSphere® Cast Iron® Hypervisor Edition (HVE) and provides an overview of virtualization technology. Virtualization refers to hardware virtualization where a virtual appliance runs in a virtual environment and is packaged with a guest operating system and optional application software.

Virtualization allows you to run several instances of an operating system on the same physical piece of hardware at the same time. Virtualization is accomplished through technology called *hypervisor*. A hypervisor allows many different simultaneously running operating systems to share the same set of physical resources (memory, CPU, disk and network) on one physical server. The physical machine on which the virtualization software runs is the *host* and virtual machines running on the host are *guests*.

Cast Iron products perform equally well in both the virtual and physical worlds. You can install the Cast Iron Operating System (CIOS) on a single virtual machine running one integration project or on multiple virtual machines running many projects to create a data center infrastructure. For information on creating virtual appliances with CIOS as the guest operating system, see [Deploying an OVF template](#).

Requirements

This section outlines the requirements and resources needed to establish a virtual appliance environment. For detailed information on mapping between resources, see [Resource mapping](#).

Requirements:

- A host machine (desktop computer or server).
- CPU (for example Intel® VT-x or AMD®-V) with virtualization technology enabled. (In some cases, virtualization technology must be enabled through BIOS).
- 60GB disk space.
- Supported configuration of either 1 CPU, 4GB RAM or 2 CPU, 8GB RAM. Ensure the host has enough physical RAM to run the selected configuration or system performance may be affected.
- VMware® ESX® or ESXi version 5.0 or later. For more information on VMware products and ESX, go to <http://kb.vmware.com/selfservice/microsites/microsite.do> and click on *VMware ESX and ESXi Comparison*.
- Cast Iron® Hypervisor Edition installation file (in OVA format).
- VMware vCenter® Server, 4.0.0, 258672 (optional).
- VMware VMotion® and VMware High Availability add-ons (optional). When added to your installation, VMware add-ons can manage and balance your workload across virtual machines, find an optimum data center location for a virtual machine and manage OS related failures. Refer to VMware documentation to learn more about add-ons and for tips on setting up your virtual environment.

Note: Shared storage, such as a SAN, is optional. Shared storage is required to enable VMware features such as VMware VMotion and VMware High Availability.

Feedback | Notices

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.VAuserguide.doc/VA_requirements.html

Resource mapping

This section provides information on mapping between virtual and physical resources when provisioning virtual machines.

When you instantiate a new virtual machine to run the Cast Iron HVE, you first must select a size for the virtual machine. As referenced in [Requirements](#), the supported sizes are:

- 1 CPU, 4GB RAM, minimum 60GB disk space. (Standard configuration).
- 2 CPU, 8GB RAM, minimum 60GB disk space. (Enhanced configuration).

The preceding resources sizes refer to the amount of a resource that is visible to a running virtual machine. For the Standard configuration, 1 CPU and 60GB disk space refer to the number of virtual CPUs and the amount of disk space the virtual machine must see. Because virtualization allows many different virtual machines running different operating system instances to share the same physical resources, it's important to size your physical host environment to account for the number of virtual machines you have running.

Memory

In addition to your host environment, it's important to size your physical host to properly account for the amount of memory needed for your running guests. Best practice dictates that your host should have more physical memory than the sum of the memory set up for the simultaneously running guests. For example, if you are trying to size a physical host to run both the Standard and Enhanced configurations, you should pick a host that has $4 + 8 + 2 \Rightarrow$ at least 14GB of RAM. (The extra 2GB of RAM is recommended for the hypervisor processes).

CPU

When mapping virtual CPUs to physical CPUs you should count one physical CPU core per virtual CPU that will be running simultaneously, and leave at least one core as a buffer for the hypervisor processes. For example, if you are trying to size a physical host to run both the Standard and Enhanced configurations, you should pick a host that has $1 + 2 + 1 = 4$ physical CPU cores. Because most physical CPUs are multicore, a physical host with one quad-core CPU is sufficient to run the configurations. Because the Cast Iron HVE uses a 64-bit kernel, your host must have a physical CPU with virtualization technology support available and enabled, (for example, Intel's VT-x or AMD's AMD-V). In some cases, virtualization technology must be enabled through BIOS.

Disk

Disks are typically the cheapest resource in a virtualized environment. Best practices dictate that a virtual machine should preallocate the amount of disk space required onto physical disks so that performance does not suffer when trying to expand disks later. When sizing disks, you should significantly oversize the disks so you can store many suspended virtual machines at the same time and only instantiate the ones needed. For example, if you are trying to size a physical host to run both the Standard and Enhanced configurations, the minimum requirement for disk space is $60 + 60 + 5 = 125$ GB. (The remaining 5GB of space is for the hypervisor software). However, best practice is to get a physical host with significantly larger disks so that you can store more inactive virtual machines as your needs grow.

Upload an appliance patch

By uploading an appliance patch, you can upgrade to the newest version of the Cast Iron[®] operating system and access the latest features.

Before you begin

Important: If you use SAP projects, you must ensure that you install the SAP 64-bit libraries. Remove any SAP 32-bit libraries before you upgrade to WebSphere[®] Cast Iron Hypervisor Edition Version 7. If there are any SAP 32-bit libraries that are installed, you cannot upgrade to WebSphere Cast Iron Hypervisor Edition Version 7.

About this task

Use the Web Management Console (WMC) to upgrade to the latest version of Cast Iron operating system by uploading an upgrade image onto the appliance. This upgrade process only replaces or adds necessary files, it does not destroy any data. Note, the WMC forces any running projects to be undeployed and stops any active orchestration jobs currently running on the appliance during the upgrade procedure. After the appliance is upgraded, you cannot undo or roll back to the previous version.

Note: Upgrades can also be applied through the Command Line Interface (CLI). For more information, see the system update command in the *CLI Reference Guide*.

Procedure

1. Download the WebSphere Cast Iron Hypervisor firmware upgrade file (type = vcrypt2) from Fix Central: <http://www.ibm.com/support/fixcentral/>.
2. Download the appliance upgrade image file to a location you can access from your Windows workstation, for example: C:\Desktop.
3. Use the WMC to log into the appliance that is running the Cast Iron operating system.
4. In the WMC, select Set Up > Install/Upgrade. The Install/Upgrade Appliance and Libraries panel is displayed.
5. In the Upgrade Appliance section, click Install Upgrade. The upgrade wizard is displayed.
6. Click Next.
7. Click Next to check for running projects. If projects are running on the appliance, the upgrade wizard asks for confirmation to stop the projects before proceeding. Click Continue to proceed. If there are no projects running on the appliance, a green check mark is displayed. Click Next.
8. In the text field, either specify the path to the appliance upgrade image file or browse to locate the appliance upgrade image file.
9. Click Next. In the Upgrade panel, the following message is displayed: `Upload in progress. Please wait`. A progress bar displays the status of the upload. When the upload is complete, the WMC validates the upgrade.
10. Verify the patch version number and click Install.
11. A series of dialog boxes are displayed asking for confirmation to stop any running orchestrations. Click OK and OK. The Upgrade Appliance panel displays. After the upgrade completes in about 5 minutes, the appliance reboots and the following message is displayed in the Upgrade Appliance panel: `Installation Successful! Please wait. The Appliance is rebooting.` If a console window to the appliance is open, the rebooting messages are displayed.
12. Use the WMC to log into the appliance. You might need to click the refresh button of the browser.

What to do next

Using the WMC, redeploy any projects that were undeployed by this upgrade procedure. Upgrade to a Studio version compatible with the installed Cast Iron operating system. For more information about appliance and Studio compatibility, see the Compatibility section of the *Cast Iron Operating System Release Notes*® or the *Cast Iron Studio Release Notes*. For the procedure on upgrading Studio, see *Installing Studio*.

Deploying an OVF template

You can deploy an OVF template which creates a virtual machine with the CIOS and VMwareTools installed. After the OVF template is deployed, you can manage the virtual appliance from the vSphere Client Console tab, as you would manage a physical integration appliance through the CLI.

Before you begin

Note: The steps in this section apply to VMware only. Note also that after deploying an OVF template, the vSphere client might display the VMware Tools status as "Not Installed." However, if the OVF template is correctly deployed, VMware Tools are installed on the virtual machine.

Procedure

1. Download a local copy of the CIOS OVA file. It is recommended that you download the OVA to a storage device that is accessible by the host machine, where the virtual machine will reside.
2. In the VMware Infrastructure Client navigation pane, select the virtual machine on which to install the CIOS.
3. Select File > Deploy OVF Template. The Deploy OVF Template Wizard is displayed.
4. Choose an option to deploy the OVF template and specify the location of the OVF template, and click Next.
 - o Deploy from file - Choose this option if the source OVF template is on the local file system.
 - o Deploy from URL - Choose this option to download the OVF template from the Internet and enter a URL
5. Verify the template details that display and click Next.
6. Specify the name and location for the deployed template and click Next.
7. Select a configuration option and click Next.
 - o Standard - 1CPU, 4GB RAM
 - o Enhanced - 2CPU, 8GB RAMThe Host/Cluster page is displayed.
8. Select the host or cluster on which to run the deployed template, and click Next.
9. Select a resource pool, and click Next.
10. Select the datastore to which you want to store the virtual machine files, and click Next.
11. Map the networks used in the OVF template to networks in your inventory, by selecting the drop-down list in the Destination Networks column. Then click Next.
12. Verify the options you have specified and click Finish. The OVF template is deployed to your virtual machine.

What to do next

After you have successfully deployed the OVF template, do not attempt to modify the settings for hard disk 1 or hard disk 2.

[Feedback](#) | [Notices](#)

Configuring to use DHCP addressing

You can configure a virtual machine in a network to use a DHCP server for addressing.

Procedure

1. Using the virtual machine console, log in to the virtual machine with the default user name and password.

- o localhost login: admin
- o Password: !n0r1t5@C

The following prompt displays:

```
localhost>
```

Note: The keyboard mapping of the vSphere Client terminal uses a US layout. If your workstation keyboard uses another layout, your login attempt might fail.

2. Assign the host name and IP address in the DNS server for the following interfaces:
 - o Host name and IP address for the data interface
 - o Host name and IP address for the management interface

The data interface is used by the integration appliance during run time to communicate to endpoints on the network, for example a database server. The management interface is used to communicate with the integration appliance from the WMC.

3. Enter the following settings:

- o MAC address for the data interface
- o Hostname assigned to the data interface in the DNS server
- o MAC address for the management interface
- o Hostname assigned to the management interface in the DNS server
- o Hostname assigned to the BMC interface in the DNS server

4. Apply the network settings: `localhost> net restart`

5. Monitor the status of the system, by repetitively issuing the following command: `localhost> system show status`. As the network settings are applied, the network status transitions through the following states:

- o Up
- o Stopping
- o Starting
- o Up

6. Monitor the state of the network: `localhost> net show status`. The network settings have been applied when status of the Current activity lists `Monitoring network`.

7. Verify the data and management interface network settings, using the following command: `localhost> net show active`

8. Reset any address that is incorrect. If you run `net show all`, the EData display as disabled.

9. Verify the connection to the management interface using the WMC.

Configuring to use static addressing

You can configure a virtual machine in a network to use static addressing.

About this task

Network settings you specify are only committed to the Integration Appliance when you run the `net restart` command. If a system reboot occurs before you commit your network settings, those network settings are lost.

Procedure

1. Using the virtual machine console, log in to the virtual machine with the default user name and password.

- o localhost login: `admin`
- o Password: `!n0r1t5@C`

The following prompt is displayed::

```
localhost>
```

2. Assign the host name and IP address in the DNS server for the following interfaces:

- o Host name and IP address for the data interface
- o Host name and IP address for the management interface

The data interface is used by the integration appliance during run time to communicate to endpoints on the network, for example a database server. The management interface is used to communicate with the integration appliance from the WMC.

3. Set the host name for the management interface: `localhost> net set hostname static appliancehostname`. Once the host machine is restarted at the end of this procedure, the prompt changes to the following setting:

```
hostname>
```

4. Set the DNS domain name: `localhost> net set domain static domain-name`
5. Set the DNS name server: `localhost> net set nameserver static dns-ipaddress`
6. Set the network address for the data interface: `localhost> net set interface edata address ipaddress mask netmask bcast broadcast`
7. Set the network address for the management interface: `localhost> net set interface emgmt address ipaddress mask netmask bcast broadcast`
8. Set the gateway address: `localhost> net set gateway static ip-address emgmt`
9. Disable searching the domain list: `localhost> net set search none`
10. Set the Network timeserver to the appropriate setting for your environment:
 - o If you have a timeserver on your network: `localhost> net set ntp static ntp-address`
 - o If you do not have a timeserver on your network: `localhost> net set ntp none`
11. Review the settings: `localhost> net show memory`
12. Apply the network settings: `localhost> net restart`
13. Monitor the status of the system, by repetitively issuing the following command: `localhost> system show status` As the network settings are applied, the network status transitions through the following states:
 - o Up
 - o Stopping

- o Starting
- o Up

Note: As network settings are applied, you can expect the runtime to be down.

14. Monitor the state of the network: `hostname> net show status` The network settings have been applied when status of the Current activity lists `Monitoring network`.
15. Verify the settings you entered using this command: `hostname> net show active`
16. Reset any address that is incorrect. If you run `net show all`, the EData display as disabled.
17. Log out `hostname> exit` The session closes.

Backing up and recovering virtual appliances

You can purchase the VMware Consolidated Backup add-on to handle a disaster recovery scenario for your virtual environment or you can use the Export/Import functionality of the virtual appliance.

For more information about VMware Consolidated Backup, see the VMware Consolidated Backup Guide.

The following topics describe how to export and import virtual appliance repositories and provide details about which components of the virtual appliance are affected by these operations.

- [Exporting a virtual appliance repository](#)
Export the project repository to create a backup of the virtual appliance. You can export all project configuration and user settings from the WMC to another location. The virtual appliance system logs are not exported when you export a repository.
- [Importing a virtual appliance repository](#)
When you import a repository, the WMC deletes all existing projects, project configurations, and job history. The virtual appliance system logs remain unaffected. Once you have imported a repository, you cannot roll back to a previous repository.

Feedback | Notices

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.VAuserguide.doc/VA_backingupVA.html

Exporting a virtual appliance repository

Export the project repository to create a backup of the virtual appliance. You can export all project configuration and user settings from the WMC to another location. The virtual appliance system logs are not exported when you export a repository.

About this task

You can export a repository with the project configurations running. However, when you import this repository, the project configurations will all be in the undeployed state.

Use the WMC to export a virtual appliance repository.

Note: Encryption of virtual appliance disks utilizes the VMware-assigned UUID of the virtual appliance. As a result, attempting to clone and/or copy a virtual appliance yields a non-functioning clone/copy because such operations yield a new UUID. To create a back-up appliance, create a new virtual appliance with the same configuration (for example: standard or enhanced) and use the CLI command `config save/load` to export/import virtual appliance settings and WMC repository functions. (Be aware, however, that these operations do not export/import data, including variables, stored on the disk or in memory as part of the process of the orchestration).

Note: VMotion remains a valid operation for migrating a virtual appliance to a new host.

Procedure

1. From the Deploy tab, select Export Repository. The File Download window is displayed.
2. Click Save. The Save As window is displayed.
3. Specify the location where you would like to save the exported repository.
4. Click Save. The WMC exports a copy of the repository as a .tar.gz file.

Parent topic: [Backing up and recovering virtual appliances](#)

Feedback | Notices

 Last updated: Thursday, December 17, 2015

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.VAuserguide.doc/VA_exportingVA.html

Importing a virtual appliance repository

When you import a repository, the WMC deletes all existing projects, project configurations, and job history. The virtual appliance system logs remain unaffected. Once you have imported a repository, you cannot roll back to a previous repository.

Before you begin

You must stop and undeploy all project configurations on the WMC before you can import a repository. When the WMC successfully imports a repository, all project configurations are in an undeployed state. You can import repositories from CIOS version 3.7.1 to 6.x.

Note: Before you import a repository from one virtual appliance to another, you must power off the virtual appliance from which you are importing a repository.

About this task

In the steps that follow, you undeploy all projects, then use the WMC to import a virtual appliance repository:

Procedure

1. From the Deploy tab, select Projects. All project configurations are displayed.
2. Verify that all the project configurations are undeployed.
3. If any project is not in the undeployed state, click the project configuration link, then stop and undeploy the project configuration.
4. From the Deploy tab, select Import Repository. The Import Repository page is displayed.
5. Specify the repository file you want to import or click Browse to search for a repository file.
6. Select one of the following import options:
 - Project & User Settings - Imports all the contents of the repository file you select. All projects are imported in the undeployed state.
 - Project Only - Imports only project information from the repository file you select. All projects are imported in the undeployed state.
 - User Settings Only - Imports only the user setting information from the repository file you select. User setting information includes: network configurations, users and groups, licenses, job log parameters, log levels, notifications, downtime rules and passwords.
7. Click Import. A warning is displayed.
8. Click Import to verify that you would like to proceed with the import. The virtual appliance restarts and the WMC login window is displayed when the import is complete.
9. Log into the virtual appliance.
10. From the Deploy tab, select Projects to deploy all appropriate project configurations.

Integration Appliance Monitoring Options

Overview of monitoring options available on the Integration Appliance.

The Integration Appliance logs system events, such as a fan failing or Standby machine assuming the active role in an HA pair. You can view these system events from the Web Management Console (WMC). When system events occur, individual users as well as network management systems can receive notification alerts from the Integration Appliance via email and SNMP traps respectively. Using SNMP, network management systems can also poll an Integration Appliance to actively monitor resources such as disk usage, memory usage, and garbage collection cycles. For more information about systems and notification severity levels you can monitor from the WMC, see the management console online help.

While any user can view the systems events log and monitor disk and memory usage from the WMC, you must create a notification policy to receive alerts from the Integration Appliance. Use the WMC to create a notification policy. Notification policies contain details about which systems to monitor, notification levels to monitor, and notification alert recipients. The Integration Appliance only sends alerts when an event meets or

exceeds the notification level specified in a notification policy. For more information about creating notification policies and notification levels, see the management console online help.

The Cast Iron Notifications Reference provides details about reading and using Cast Iron SNMP MIB and individual messages from each Cast Iron MIB module. The version of SNMP is SNMPv2c.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.notifications_reference.doc/integration_appliance_monitoring_options.html

About the Cast Iron SNMP MIB

An overview of the Cast Iron SNMP MIB and a list of available MIB modules.

As a network element, the Integration Appliance is able to respond to requests from a network management system. The Integration Appliance is also able to send notifications to the network management system about events that occur on the Integration Appliance. This communication between the Integration Appliance and your network management system allows you to use traps to monitor the Integration Appliance.

Whether you choose to receive notification alerts from the Integration Appliance by enabling SNMP traps or you choose to actively monitor Integration Appliance activities like memory usage by polling the Integration Appliance, the Cast Iron MIB provides data structure and defines content type for the information exchange.

When you use the WMC to download the Cast Iron MIB, you are downloading one file that contains multiple MIB definitions. Some SNMP MIB parsers are unable to read a file that contains multiple MIB modules, so you must separate each MIB module into individual files. For more information about generating separate MIB module files, see [Downloading the Cast Iron SNMP MIB](#).

The Cast Iron MIB contains notification messages for the following modules:

- [Downloading the Cast Iron SNMP MIB](#)
Provides information about downloading each MIB module in the Cast Iron SNMP MIB as a separate file.
- [Reading the Cast Iron SNMP MIB](#)
Provides examples of how to read and organize the content of Cast Iron SNMP MIBs.

Downloading the Cast Iron SNMP MIB

Provides information about downloading each MIB module in the Cast Iron SNMP MIB as a separate file.

Use the Web Management Console (WMC) to download the Cast Iron SNMP MIB from an Integration Appliance. For more information about how to use the WMC to download the Cast Iron SNMP MIB, see the management console online help.

The WMC downloads the Cast Iron SNMP MIB as a single text file. This text file is comprised of multiple sections, where each section is a full MIB module. For example, the NetSuite Module is defined in one section and the Salesforce Module is defined in another section.

Note: If your SNMP MIB parser is unable to read a file that contains multiple MIB modules, separate each section (MIB module) into individual files. On Linux, you can use the following script to generate a separate file for each MIB module in the Cast Iron SNMP MIB.

```
#!/bin/bash

sed -ne 's/DEFINITIONS ::= BEGIN.*//p' castironsys.mib |
while read mib; do
echo $mib
sed -ne "/^$mib/,/^END/p" castironsys.mib > $mib
done
```

Reading the Cast Iron SNMP MIB

Provides examples of how to read and organize the content of Cast Iron SNMP MIBs.

Each MIB module has a module-identity, which describes the purpose for the MIB. For example, the NetSuite Module provides access to the NetSuite online service. Each MIB module also contains a comment section that provides a high-level overview of its contents. Content like the Object Summary lists the name and OID of every object in the MIB, much like a table of contents, and allows you to examine the layout and the type of data that is being provided.

In the following example, `ciIaProjectSummary` is an organizational node that contains general information about projects on the Integration Appliance. Like a directory, the `ciIaProjectSummary` organizational node contains object types that provide information about the number of projects, number of running orchestrations, number of stopped orchestrations, number of running jobs, number of completed jobs, and number of errored jobs.

```
-- ciIaProjectSummary          ciia.1.1.1
--   ciIaNbrProjects           ciia.1.1.1.1
--   ciIaNbrRunningOrchs      ciia.1.1.1.2
```

```

--      ciIaNbrStoppedOrchs                ciia.1.1.1.3
--      ciIaNbrRunningJobs                 ciia.1.1.1.4
--      ciIaNbrCompletedJobs              ciia.1.1.1.5
--      ciIaNbrErroredJobs                 ciia.1.1.1.6

```

To get more information about the meaning of one of the objects, search the file for the name of the object. For example, searching for `ciIaNbrRunningJobs` returns the following block of information:

```

ciIaNbrRunningJobs OBJECT-TYPE                -- ciia.1.1.1.4
    SYNTAX Unsigned32
    MAX-ACCESS read-only
    STATUS current
    DESCRIPTION
        "Total number of currently running jobs.
        "
 ::= { ciIaProjectSummary 4 }

```

where:

- **ciIaNbrRunningJobs OBJECT-TYPE** - Defines the name of the object.
Note: Next to the object name, there is a shortened form of the OID (â€œ ciia.1.1.1.4).
- **SYNTAX Unsigned32** - An unsigned integer whose value could go up or down over time.
- **MAX-ACCESS read-only** - A read-only value that the system manager can ask for but cannot change.
- **STATUS** -
- **DESCRIPTION** - Describes the object.

Polling for ProjectSummary information retrieves data that is similar to the following example:

```

$ snmpwalk -v 2c -c public -M "+/home/choller/mibs" -m "+CASTIRON-IA-MIB"
flintstone2 ciIaProjectSummary
CASTIRON-IA-MIB::ciIaNbrProjects.0 = Gauge32: 2
CASTIRON-IA-MIB::ciIaNbrRunningOrchs.0 = Gauge32: 0
CASTIRON-IA-MIB::ciIaNbrStoppedOrchs.0 = Gauge32: 14
CASTIRON-IA-MIB::ciIaNbrRunningJobs.0 = Gauge32: 0
CASTIRON-IA-MIB::ciIaNbrCompletedJobs.0 = Gauge32: 0
CASTIRON-IA-MIB::ciIaNbrErroredJobs.0 = Gauge32: 0

```

`ciIaProjectTable` is another example of an organizational node that contains information about each project on the Integration Appliance. Like a directory, the `ciIaProjectTable` organizational node contains object types that provide information like the project name, project version, project configuration, project state, and so on.

```

--      ciIaProjectTable                    ciia.1.1.2
--      ciIaProjectEntry                    ciia.1.1.2.1
--      ciIaProjEntryIndex                  ciia.1.1.2.1.1
--      ciIaProjEntryName                   ciia.1.1.2.1.2
--      ciIaProjEntryVersion                 ciia.1.1.2.1.3
--      ciIaProjEntryConfig                  ciia.1.1.2.1.4
--      ciIaProjEntryState                   ciia.1.1.2.1.5
--      ciIaProjEntryNbrRunning              ciia.1.1.2.1.6
--      ciIaProjEntryNbrCompleted            ciia.1.1.2.1.7
--      ciIaProjEntryNbrErrored              ciia.1.1.2.1.8
--      ciIaProjEntryTimePublished           ciia.1.1.2.1.9

```

Polling for ProjectTable information retrieves data that is similar to the following example:

```

$ snmpwalk -v 2c -c public -M "+/home/choller/mibs" -m "+CASTIRON-IA-MIB"
flintstone2 ciIaProjectSummary
CASTIRON-IA-MIB::ciIaNbrProjects.0 = Gauge32: 2
CASTIRON-IA-MIB::ciIaNbrRunningOrchs.0 = Gauge32: 0
CASTIRON-IA-MIB::ciIaNbrStoppedOrchs.0 = Gauge32: 14
CASTIRON-IA-MIB::ciIaNbrRunningJobs.0 = Gauge32: 0

```

```
CASTIRON-IA-MIB::ciIaNbrCompletedJobs.0 = Gauge32: 0
CASTIRON-IA-MIB::ciIaNbrErroredJobs.0 = Gauge32: 0
```

The object types are much like columns in a table that store data generated by events that occur on the Integration Appliance. For example, publishing and cloning projects are events that generate ProjectTable data. You can poll the Integration Appliance to retrieve this data. Data for two events: publishing a project and cloning a project are displayed in the following example:

```
$ snmpwalk -v 2c -c public -M "+/home/choller/mibs" -m "+CASTIRON-IA-MIB"
flintstone2 ciIaProjectTable
CASTIRON-IA-MIB::ciIaProjEntryName.98304 = STRING: OnlineLicensing
CASTIRON-IA-MIB::ciIaProjEntryName.98305 = STRING: OnlineLicensing
CASTIRON-IA-MIB::ciIaProjEntryVersion.98304 = STRING: 1.0
CASTIRON-IA-MIB::ciIaProjEntryVersion.98305 = STRING: 1.0
CASTIRON-IA-MIB::ciIaProjEntryConfig.98304 = STRING: Default
CASTIRON-IA-MIB::ciIaProjEntryConfig.98305 = STRING: OnlineLicensingClone
CASTIRON-IA-MIB::ciIaProjEntryState.98304 = INTEGER: undeployed(1)
CASTIRON-IA-MIB::ciIaProjEntryState.98305 = INTEGER: undeployed(1)
CASTIRON-IA-MIB::ciIaProjEntryNbrRunning.98304 = Gauge32: 0
CASTIRON-IA-MIB::ciIaProjEntryNbrRunning.98305 = Gauge32: 0
CASTIRON-IA-MIB::ciIaProjEntryNbrCompleted.98304 = Counter32: 0
CASTIRON-IA-MIB::ciIaProjEntryNbrCompleted.98305 = Counter32: 0
CASTIRON-IA-MIB::ciIaProjEntryNbrErrored.98304 = Counter32: 0
CASTIRON-IA-MIB::ciIaProjEntryNbrErrored.98305 = Counter32: 0
CASTIRON-IA-MIB::ciIaProjEntryTimePublished.98304 = STRING: 2009-6-
12,16:36:20.0,+0:0
CASTIRON-IA-MIB::ciIaProjEntryTimePublished.98305 = STRING: 2009-6-12,16:36
```

As more events occur, the output can become increasingly difficult to read. To generate a more readable output, it is recommended to use the `snmptable` command to display the data in a table format. Data for each event displays as a new row.

```
$ snmptable -v 2c -c public -M "+/home/choller/mibs" -m "+CASTIRON-IA-MIB"
flintstone2 ciIaProjectTable
SNMP table: CASTIRON-IA-MIB::ciIaProjectTable

  ciIaProjEntryName  ciIaProjEntryVersion  ciIaProjEntryConfig  ciIaProjEntryState
ciIaProjEntryNbrRunning  ciIaProjEntryNbrCompleted  ciIaProjEntryNbrErrored
ciIaProjEntryTimePublished
  OnlineLicensing          1.0          Default          undeployed
0          0          0  2009-6-12,16:36:20.0,+0:0
  OnlineLicensing          1.0 OnlineLicensingClone          undeployed
0          0          0  2009-6-12,16:36:20.0,+0:0
```

SNMP Items Available Using SNMP Get

Presents a table of OID trees that you can poll using SNMP Get.

Each entry in the table represents many individual items. Use snmpwalk or another SNMP polling utility to see the complete list. You can poll the following OID trees:

OID	SNMP Name	Notes
.1.3.6.1.2.1.1	SNMPv2-MIB::system	Â
.1.3.6.1.2.1.2	IF-MIB::interfaces	Â
.1.3.6.1.2.1.4	IP-MIB::ip	Â
.1.3.6.1.2.1.5	IP-MIB::icmp	Â
.1.3.6.1.2.1.6	TCP-MIB::tcp	Â
.1.3.6.1.2.1.7	UDP-MIB::udp	Â
.1.3.6.1.2.1.1 1	SNMPv2-MIB::snmp	Â
.1.3.6.1.2.1.2 5.1	HOST-RESOURCES-MIB::hrSystem	Excluding .1.3.6.1.2.1.25.1.3 HOST-RESOURCES-MIB::hrSystemInitialLoadDevice Excluding .1.3.6.1.2.1.25.1.4 HOST-RESOURCES-MIB::hrSystemInitialLoadParameters
.1.3.6.1.2.1.2 5.2	HOST-RESOURCES-MIB::hrStorage	Â
.1.3.6.1.2.1.2 5.3	HOST-RESOURCES-MIB::hrDevice	Â
.1.3.6.1.4.1.2 021.4	UCD-SNMP-MIB::memory	Â
.1.3.6.1.4.1.2 021.10	UCD-SNMP-MIB::laTable	CPU Load Average
.1.3.6.1.4.1.2 021.11	UCD-SNMP-MIB::systemStats	Â
.1.3.6.1.4.1.1 3336	CASTIRON-REGISTRATIONS-MIB::castironsys	See the Cast Iron MIB, particularly CASTIRON-IA-MIB.

Using Traps to Monitor Appliance Health

Recommendations for configuring alerts that monitor appliance health.

When monitoring the health of the Integration Appliance, you can use one or both of the following methods:

- Poll - Actively monitor runtime resource usage including appliance garbage collection cycles, appliance memory usage, and appliance disk usage.
- Trap - Receive notifications indicating hardware situations such as failed fans, high temperatures, or failed disks. For more information about hardware related SNMP traps, see [About the Platform Module](#).

For more information about creating and enabling notification alerts, see the WMC Online Help or the Cast Iron Web Management Console Guide in the IBM WebSphere Cast Iron Information Center.

[Table 1](#) provides recommended thresholds for notifications regarding garbage collection, memory usage, and disk usage.

- **Garbage Collection** - This parameter counts the number of garbage collections that have occurred since the last system restart. Garbage collection that occurs at a rate over the recommended threshold can indicate that the appliance is overworked and might start to experience performance issues.
- **Memory Usage** - This parameter measures the percentage of total memory in use, expressed in hundredths of a percent. This number is updated after each garbage collection.
Note: This value is provided as an integer, but the MIB causes the SNMP Manager to alter its displayed value by a hundredths of a percent. For example: a value of '1234' displays as '12.34!'. The SNMP Management tool should handle this automatically, but verify that it does so.
- **Disk Usage** - This parameter measures the percentage of total work-in-progress (WIP) disk space that is in use, expressed in hundredths of a percent. The percentage of disk usage determines job purging activities for the appliance.

Table 1. Recommended Notification Thresholds

Parameters to Monitor	Recommended Thresholds	SNMP Name and OID
Garbage Collection	Create a notification that triggers an alert if this value changes quickly, by more than 6 counts in a 1-minute time period.	CASTIRON-IA-MIB::ciIaResNbrGarbageCollects .1.3.6.1.4.1.13336.2.2.2.1.1.2.1.0
Memory Usage	Create a notification that triggers an alert if this value goes over 80% (raw value of 8000).	CASTIRON-IA-MIB::ciIaResPctMemoryUsed .1.3.6.1.4.1.13336.2.2.2.1.1.2.2.0
Disk Usage	Create a notifications triggers an alert if this value goes over 75% (raw value of 7500).	CASTIRON-IA-MIB::ciIaResPctWipFull .1.3.6.1.4.1.13336.2.2.2.1.1.2.3.0

Note: The parameters to monitor, described in the table above, are for SNMP polling only.

Archive Module

The Archive Module provides activities that allow creating and reading compressed archives. This section contains details for the messages delivered from the Archive Module.

This topic provides the MIB Name and MIB OID information, in addition to high-level details about each notification in the Archive Module.

MIB Name : *CASTIRON-COMP-ARCHIVE-MIB*

MIB OID : *.1.3.6.1.4.1.13336.2.2.3.4*

The following table provides an alphabetical list of all notifications that can be issued by the Archive Module.

Table 1. Notifications issued by the Archive Module

Notification	Level	System	Description
ArchiveDone	Info	Orchestration	Activity has successfully completed archiving.
ArchiveEntryBlank	Severe	Orchestration	Archive input entry does not have any content.
ArchiverCreated	Info	Orchestration	Activity has successfully created an archiver for archiving.
ErrorIdentifyArchive	Severe	Orchestration	There was an error identifying the archive entry.
ErrorUnZipOperation	Severe	Orchestration	There was an error performing unzip operation.
ErrorZipOperation	Severe	Orchestration	There was an error performing zip operation.
IncorrectParameters	Severe	Orchestration	Parameters provided to the activity are invalid.
InvalidArchiveEntry	Severe	Orchestration	There was an error reading archive entry.
InvalidArchiveFormat	Severe	Orchestration	Activity could not create an archiver for the supplied archiving format. This format might not be supported by the activity.
InvalidBzipEntry	Severe	Orchestration	The bzip entry has more than one entry.
InvalidDateTime	Warning	Orchestration	Error occurred while parsing datetime from archive entries.
InvalidGzipEntry	Severe	Orchestration	The gzip entry has more than one entry.
InvalidNumInArchEntry	Warning	Orchestration	The numeric value in archive entry is not valid.
InvalidUnArchFormat	Severe	Orchestration	Activity could not create an unarchiver for the supplied archiving format. This format might not be supported by the activity.
InvalidUnarchiveInput	Severe	Orchestration	The input to unarchive is invalid.
UnArchiverCreated	Info	Orchestration	Activity has successfully created an unarchiver for unarchiving.
UnarchiveDone	Info	Orchestration	Activity has successfully completed unarchiving.
ValidationError	Severe	Orchestration	The input entries were not successfully validated against the schema.
ValidationFine	Info	Orchestration	The input entries were successfully validated against the schema.

- [Archive Operation Notifications](#)

Provides a comprehensive list of operation notifications sent from the Archive Module.

ErrorUnZipOperation

There was an error performing unzip operation.

Level : *Severe*

Log Message : *Error occurred while unzip operation. Message is: {Message}*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-ARCHIVE-MIB::ciC4oErrorUnZipOperationEv12*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.4.1.2*

SNMP Trap Number : *12*

Variables

The ErrorUnZipOperation message contains the following variables:

Table 1. ErrorUnZipOperation Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer

- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. Message

Textual description of the error.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvMessage

Crypto Service Module

The Crypto Service Module provides activities that allow encrypting and decrypting the binary content. This section contains details for the messages delivered from the Crypto Service Module.

This topic provides the MIB Name and MIB OID information, in addition to high-level details about each notification in the Crypto Service Module.

MIB Name : *CASTIRON-COMP-CRYPTOSERVICE-MIB*

MIB OID : *.1.3.6.1.4.1.13336.2.2.3.26*

The following table provides an alphabetical list of all notifications that can be issued by the Crypto Service Module.

Table 1. Notifications issued by the Crypto Service Module

Notification	Level	System	Description
DecryptDone	Info	Orchestration	Activity completed decrypting the content.
DecryptStarted	Info	Orchestration	Activity started decrypting the content.
EncryptDone	Info	Orchestration	Activity completed encrypting the content.
EncryptStarted	Info	Orchestration	Activity started encrypting the content.
FoundPrivateKey	Info	Orchestration	Crypto Service was successfully able to read the private key from the java key store.
FoundPublicKey	Info	Orchestration	Crypto Service was successfully able to read the public key from the java key store.
IOException	Severe	Orchestration	Activity could not read or write to one of the Input / Output files.
InputEntryCount	Info	Orchestration	Activity successfully filtered specified number of entries.
IntegrityCheckFailed	Info	Orchestration	Message failed integrity check.
IntegrityCheckPassed	Info	Orchestration	Message passed integrity check.
InvalidAlgorithm	Severe	Orchestration	Activity could not find key because of invalid algorithm.
InvalidContent	Severe	Orchestration	The input content cannot be empty.
InvalidDateFormat	Severe	Orchestration	The date format is not valid. Enter date in dd-MM-yyyy format
InvalidFormat	Severe	Orchestration	Activity could not complete due invalid crypto format.
InvalidKeyOrPwd	Severe	Orchestration	Activity could not find a specified key handle in the java keystore with provided name and password.
InvalidKeyStore	Severe	Orchestration	Activity could not find a specified entry in key store.

Notification	Level	System	Description
InvalidKeyhandle	Severe	Orchestration	The input keyhandle cannot be empty.
InvalidPassword	Severe	Orchestration	The input password cannot be empty.
KeystoreEntryExpired	Severe	Orchestration	Activity found specified entry in key store, but its expired.
NoIntegrityCheck	Info	Orchestration	No Message integrity check.
PGPException	Severe	Orchestration	PGP Exception.

Crypto Service Operation Notifications

Provides a comprehensive list of operation notifications sent from the Crypto Service Module.

- [DecryptDone](#)
Activity completed decrypting the content.
- [DecryptStarted](#)
Activity started decrypting the content.
- [EncryptDone](#)
Activity completed encrypting the content.
- [EncryptStarted](#)
Activity started encrypting the content.
- [FoundPrivateKey](#)
Crypto Service was successfully able to read the private key from the java key store.
- [FoundPublicKey](#)
Crypto Service was successfully able to read the public key from the java key store.
- [IOException](#)
Activity could not read or write to one of the Input / Output files.
- [InputEntryCount](#)
Activity successfully filtered specified number of entries.
- [IntegrityCheckFailed](#)
Message failed integrity check.
- [IntegrityCheckPassed](#)
Message passed integrity check.
- [InvalidAlgorithm](#)
Activity could not find key because of invalid algorithm.

- [InvalidContent](#)
The input content cannot be empty.
- [InvalidDateFormat](#)
The date format is not valid. Enter date in dd-MM-yyyy format
- [InvalidFormat](#)
Activity could not complete due invalid crypto format.
- [InvalidKeyOrPwd](#)
Activity could not find a specified key handle in the java keystore with provided name and password.
- [InvalidKeyStore](#)
Activity could not find a specified entry in key store.
- [InvalidKeyhandle](#)
The input keyhandle cannot be empty.
- [InvalidPassword](#)
The input password cannot be empty.
- [KeystoreEntryExpired](#)
Activity found specified entry in key store, but its expired.
- [NoIntegrityCheck](#)
No Message integrity check.
- [PGPException](#)
PGP Exception.

Log Message : *PGP Exception.*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-CRYPTOSERVICE-MIB::ciC26oPGPExceptionEv17*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.26.1.2*

SNMP Trap Number : *17*

Variables

The PGPException message contains the following variables:

Table 1. PGPException Message Variables

<h3>1. SerialNumber</h3>

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

Data Module

The Data Module provides activities for serializing and parsing textual and binary data. This section contains details for the messages delivered from the Data Module.

This topic provides the MIB Name and MIB OID information, in addition to high-level details about each notification in the Data Module.

MIB Name : *CASTIRON-COMP-DATA-MIB*

The following table provides an alphabetical list of all notifications that can be issued by the Data Module.

Table 1. Notifications issued by the Data Module

Notification	Level	System	Description
BadEncoding	Severe	Orchestration	Encoding parameter specified is not supported by the activity.
MissingEncParse	Severe	Orchestration	Encoding parameter was not set and there was no value specified in configuration.
MissingEncSerialize	Severe	Orchestration	Encoding parameter was not set and there was no value specified in configuration.
ParsingError	Severe	Orchestration	Error occurred while parsing the error.
SerializeError	Severe	Orchestration	Error occurred while serializing.
SerializeIOError	Severe	Orchestration	IO Error occurred while serializing.

- [Data Operation Notifications](#)
Provides a comprehensive list of operation notifications sent from the Data Module.

Database Module

The Database Module provides activities for accessing various SQL databases. This section contains details for the messages delivered from the Database Module.

This topic provides the MIB Name and MIB OID information, in addition to high-level details about each notification in the Database Module.

MIB Name : *CASTIRON-COMP-DATABASE-MIB*

MIB OID : *.1.3.6.1.4.1.13336.2.2.3.2*

The following table provides an alphabetical list of all notifications that can be issued by the Database Module.

Table 1. Notifications issued by the Database Module

Notification	Level	System	Description
ActivateError	Severe	Orchestration	A problem occurred while activating the activity.
ConnectionError	Warning	Orchestration	An error occurred while connecting to the database endpoint.
ConnectionRetry	Warning	Orchestration	An error occurred while attempting to connect to the database.
DataSourceHashCode	Info	Orchestration	Information regarding the hash code used to register the datasource.
DataSourceRegistered	Info	Orchestration	Information about the datasource name registered with the system.
DateTimeParseError	Severe	Orchestration	Unable to parse the date and time
DeleteRowsError	Severe	Orchestration	An exception occurred while deleting the row from the control table.
DeleteRowsFailure	Severe	Orchestration	Unable to delete rows from the buffer table.
DeleteSQL	Info	Orchestration	The delete query issued to the buffer table.
DeleteSQLWithId	Info	Orchestration	The delete query, with id, issued to the buffer table.
ErrorDeletePost	Severe	Orchestration	An exception occurred while deleting the row from the control table due to a connection error.
ErrorSingleTableJob	Severe	Orchestration	An exception occurred while processing a SingleTableNotification job
InboundOperationError	Severe	Orchestration	An error occurred while executing the inbound job.
InsertTableStatement	Info	Orchestration	An insert statement was issued to the control table.
JDBCConnectionClose	Warning	Orchestration	An error occurred while closing the connection in the exception path.
MaxRowExceeded	Info	Orchestration	The maximum number of rows for one poll on the table was reached. If this happens frequently, it is advisable to alter the threshold
MethodNotFound	Info	Orchestration	Unable to invoke the method specified in the connection properties.
OperationNameAbsent	Severe	Orchestration	The buffer table contains the operation but there is no activity in the orchestration for that operation. This is not a valid configuration.
OutboundActivateError	Severe	Orchestration	A problem occurred while activating the database outbound activity.

Notification	Level	System	Description
ParamQueryActivate	Severe	Orchestration	An exception occurred while activating the parameterized query activity.
ParamQueryError	Severe	Orchestration	An error occurred while processing the message for the parameterized query activity.
ParameterizedQuery	Info	Orchestration	The query for the parameterized query activity.
PollTblActivateError	Severe	Orchestration	A problem occurred while activating the database poll table activity.
QueryString	Info	Orchestration	The query which was issued for buffer table.
RedeliverSkip	Warning	Orchestration	This row is already delivered to the database and will be skipped now.
SelectStatement	Info	Orchestration	A select statement was issued to the control table to check for duplicate rows.
SetQueryTimeout	Warning	Orchestration	Unable to set the query time out for the database.
StoredProcActivate	Severe	Orchestration	An exception occurred while activating the stored procedure activity.
StoredProcException	Severe	Orchestration	A data error occurred while processing an outbound job in the stored procedure activity.
StoredProcQuery	Info	Orchestration	The stored procedure query issued to the database.
UnexpectedEmptyRows	Warning	Orchestration	An unexpected result returned from the buffer table. Expecting rows to present in result, instead the result is empty.
UpdateQuery	Info	Orchestration	The update query issued to the buffer table for marking rows.

ConnectionError

An error occurred while connecting to the database endpoint.

Level : *Warning*

Log Message : *An error occurred while connecting to the database. The exception is {Message}*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-DATABASE-MIB::ciC2cConnectionErrorEv1*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.2.1.1*

SNMP Trap Number : *1*

Variables

The ConnectionError message contains the following variables:

Table 1. ConnectionError Message Variables

<p>1. SerialNumber</p> <p>The serial number of the appliance sending the trap.</p> <ul style="list-style-type: none">• Type : String• SNMP Object Name : CASTIRON-IA-MIB::ciIaPlatSerialNumber• SNMP OID : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3
<p>2. Severity</p>

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. Message

Textual description of the error.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvMessage
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.2

ConnectionRetry

An error occurred while attempting to connect to the database.

Level : *Warning*

Log Message : *An error occurred while connecting to the database. The exception is {Message} The job is retrying: {RetryAttemptNumber} out of {TotalRetryAttempts} attempts to connect to the database . Another attempt will be made after {IntervalForRetries} secs.*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-DATABASE-MIB::ciC2cConnectionRetryEv2*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.2.1.1*

SNMP Trap Number : 2

Variables

The ConnectionRetry message contains the following variables:

Table 1. ConnectionRetry Message Variables

<p>1. SerialNumber</p> <p>The serial number of the appliance sending the trap.</p> <ul style="list-style-type: none">• Type : String• SNMP Object Name : <i>CASTIRON-IA-MIB::ciIaPlatSerialNumber</i>• SNMP OID : <i>1.3.6.1.4.1.13336.2.2.2.1.1.3.3</i>
<p>2. Severity</p> <p>Severity of the Notification.</p> <ul style="list-style-type: none">• Type : Integer• SNMP Object Name : <i>CASTIRON-REGISTRATIONS-MIB::ciEvSeverity</i>• SNMP OID : <i>1.3.6.1.4.1.13336.2.2.1.2.1</i>
<p>3. JobID</p> <p>The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.</p> <ul style="list-style-type: none">• Type : String• SNMP Object Name : <i>CASTIRON-REGISTRATIONS-MIB::ciEvJobID</i>• SNMP OID : <i>1.3.6.1.4.1.13336.2.2.1.2.4</i>
<p>4. Orchestration</p> <p>Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.</p> <ul style="list-style-type: none">• Type : OID• SNMP Object Name : <i>CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration</i>• SNMP OID : <i>1.3.6.1.4.1.13336.2.2.1.2.3</i>
<p>5. Message</p> <p>Textual description of the error.</p> <ul style="list-style-type: none">• Type : String• SNMP Object Name : <i>CASTIRON-REGISTRATIONS-MIB::ciEvMessage</i>• SNMP OID : <i>.1.3.6.1.4.1.13336.2.2.1.2.2</i>

6. RetryAttemptNumber

The current number of retries.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-DATABASE-MIB::ciC2cEv2RetryAttemptNumber
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.2.1.1.1.2.2

7. TotalRetryAttempts

The specified number of times to attempt connecting to the database before stopping.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-DATABASE-MIB::ciC2cEv2TotalRetryAttempts
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.2.1.1.1.2.3

8. IntervalForRetries

The specified amount of time to wait between attempts to connect to the database.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-DATABASE-MIB::ciC2cEv2IntervalForRetries
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.2.1.1.1.2.4

Database Operation Notifications

Provides a comprehensive list of operation notifications sent from the Database Module.

- [ActivateError](#)
A problem occurred while activating the activity.
- [DataSourceHashCode](#)
Information regarding the hash code used to register the datasource.
- [DataSourceRegistered](#)
Information about the datasource name registered with the system.
- [DateTimeParseError](#)
Unable to parse the date and time
- [DeleteRowsError](#)
An exception occurred while deleting the row from the control table.
- [DeleteRowsFailure](#)
Unable to delete rows from the buffer table.
- [DeleteSQL](#)
The delete query issued to the buffer table.
- [DeleteSQLWithId](#)
The delete query, with id, issued to the buffer table.
- [ErrorDeletePost](#)
An exception occurred while deleting the row from the control table due to a connection error.

- [ErrorSingleTableJob](#)
An exception occurred while processing a SingleTableNotification job
- [InboundOperationError](#)
An error occurred while executing the inbound job.
- [InsertTableStatement](#)
An insert statement was issued to the control table.
- [MaxRowExceeded](#)
The maximum number of rows for one poll on the table was reached. If this happens frequently, it is advisable to alter the threshold
- [MethodNotFound](#)
Unable to invoke the method specified in the connection properties.
- [OperationNameAbsent](#)
The buffer table contains the operation but there is no activity in the orchestration for that operation. This is not a valid configuration.
- [OutboundActivateError](#)
A problem occurred while activating the database outbound activity.
- [ParamQueryActivate](#)
An exception occurred while activating the parameterized query activity.
- [ParamQueryError](#)
An error occurred while processing the message for the parameterized query activity.
- [ParameterizedQuery](#)
The query for the parameterized query activity.
- [PollTblActivateError](#)
A problem occurred while activating the database poll table activity.
- [QueryString](#)
The query which was issued for buffer table.
- [RedeliverSkip](#)
This row is already delivered to the database and will be skipped now.
- [SelectStatement](#)
A select statement was issued to the control table to check for duplicate rows.
- [StoredProcException](#)
A data error occurred while processing an outbound job in the stored procedure activity.
- [StoredProcQuery](#)
The stored procedure query issued to the database.
- [UpdateQuery](#)
The update query issued to the buffer table for marking rows.

Domino Module

The Domino Module provides activities for accessing IBM Lotus Domino servers. This section contains details for the messages delivered from the Domino Module.

This topic provides the MIB Name and MIB OID information, in addition to high-level details about each notification in the Domino Module.

MIB Name : *CASTIRON-COMP-DOMINO-MIB*

MIB OID : *.1.3.6.1.4.1.13336.2.2.3.22*

The following table provides an alphabetical list of all notifications that can be issued by the Domino Module.

Table 1. Notifications issued by the Domino Module

Notification	Level	System	Description
ActivateFailureBlank	Severe	Orchestration	The specified activity name is not executed successfully because the activity name was blank.
ActivateSuccess	Info	Orchestration	The specified activity name is activated successfully.
ActivityCreateSuccess	Info	Orchestration	The specified activity name is created successfully and is ready for invocation.

Notification	Level	System	Description
ActivityFailure	Severe	Orchestration	The specified activity name failed to execute.
ActivitySuccessful	Info	Orchestration	The specified activity name is executed successfully. The response parameter is populated successfully.
ConnectError	Severe	Orchestration	An error occurred while processing the connection parameters sent as part of the request in the activity.
InitializationError	Severe	Orchestration	Exception while initializing Lotus Domino connector.
RetryCount	Info	Orchestration	The specified activity re tried the execution so many times specified above.
RunningInfo	Warning	Orchestration	Encountered few warnings or errors while running Domino activity.
RunningMessages	Warning	Orchestration	Received messages while executing the activity.
SchemaInvoke	Info	Orchestration	The specified activity name is generating schemas.
StopSuccess	Info	Orchestration	The specified activity name is successfully stopped.
UnmarshalError	Severe	Orchestration	An error occurred while reading input connection parameters in the activity.

ActivateFailureBlank

The specified activity name is not executed successfully because the activity name was blank.

Level : *Severe*

Log Message : *{ActivityName} activity execution failed due to {Name} property is blank.*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-DOMINO-MIB::ciC22oActivateFailureBlankEv9*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.22.1.2*

SNMP Trap Number : 9

Variables

The ActivateFailureBlank message contains the following variables:

Table 1. ActivateFailureBlank Message Variables

<p>1. SerialNumber</p> <p>The serial number of the appliance sending the trap.</p> <ul style="list-style-type: none"> • Type : String • SNMP Object Name : CASTIRON-IA-MIB::ciIaPlatSerialNumber • SNMP OID : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3
<p>2. Severity</p>

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. ActivityName

The activity name that failed to activate.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-DOMINO-MIB::ciC22oEv9ActivityName
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.22.1.2.1.9.1

6. Name

The blank activity name caused the activation to fail.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-DOMINO-MIB::ciC22oEv9Name
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.22.1.2.1.9.2

Email Module

The Email Module provides connectivity to POP3 and SMTP mail servers. This section contains details for the messages delivered from the Email Module.

This topic provides the MIB Name and MIB OID information, in addition to high-level details about each notification in the Email Module.

MIB Name : *CASTIRON-COMP-EMAIL-MIB*

MIB OID : *.1.3.6.1.4.1.13336.2.2.3.7*

The following table provides an alphabetical list of all notifications that can be issued by the Email Module.

Table 1. Notifications issued by the Email Module

Notification	Level	System	Description
BodyNull	Severe	Orchestration	The 'body' input parameter from the container is null. This is an error condition.
ConPoolReleaseError	Warning	Orchestration	Error while closing the connection pool.
ConnectError	Severe	Orchestration	The email activity operation failed because a connection to the server could not be established.
ConnectErrorRetry	Warning	Orchestration	The email activity operation failed while trying to connect to the server. This will cause a retry.
ConnectHeaderAbsent	Info	Orchestration	The optional input header - emailConnection - is mapped.
ConnectHeaderPresent	Info	Orchestration	The optional input header - emailConnection - is mapped.
ConnectionPoolReturn	Warning	Orchestration	Error occurred while returning connection to pool.

Notification	Level	System	Description
CouldNotGetHostIP	Warning	Orchestration	Error occurred while getting IP of the router. Continuing activity without the host IP.
DisconnectException	Warning	Orchestration	Error while trying to disconnect from server. Discarding error and continuing the activity.
EmailMatched	Info	Orchestration	Found an email matching From and subject fields specified in configuration.
EmailSent	Info	Orchestration	The activity successfully sent email to the server.
EndpointData	Info	Orchestration	The information regarding the email endpoint data.
IncorrectPort	Warning	Orchestration	The email port needs to be a positive integer. Defaulting to 110 in case its not specified as positive integer.
IncorrectSmtpPort	Warning	Orchestration	The email port needs to be a positive integer. Defaulting to 25 in case its not specified as positive integer.
IncorrectSmtpTimeout	Warning	Orchestration	The connection timeout needs to be a positive integer. Defaulting to 300 seconds in case its not specified as positive integer
IncorrectTimeout	Warning	Orchestration	The connection timeout needs to be a positive integer. Defaulting to 300 seconds in case its not specified as positive integer
InvalidAddressFormat	Warning	Orchestration	The email address in the specified field is in incorrect format.
InvalidEmailID	Warning	Orchestration	The email id specified is not valid.
MailHeaderAbsent	Info	Orchestration	The optional input header - mailheader - is not mapped.
MailHeaderPresent	Info	Orchestration	The optional input header - mailheader - is mapped.
MailsDeleted	Info	Orchestration	The mails processed in the current poll have been deleted from the server.
MailsToBeDeleted	Info	Orchestration	There are some mails to be deleted as they were processed earlier.
MakeConPoolError	Warning	Orchestration	Error while creating the connection.
NewConnectEverytime	Info	Orchestration	The additional property 'smtpNewConnEveryTime' was added to connection pool.
NoEmailMatched	Info	Orchestration	Could not find an email matching From and subject fields specified in configuration.
NoMailOnServer	Info	Orchestration	No mail was found on server.
PatternIncorrect	Severe	Orchestration	Pattern specified in the activity is incorrect.
Pop3ConfigParams	Info	Orchestration	Configuration parameters specified in the activity.
Pop3Connected	Info	Orchestration	The activity was successfully able to connect to the email server.

Notification	Level	System	Description
Pop3DataError	Severe	Orchestration	A pop3 data error occurred while executing the activity.
Pop3InternalError	Severe	Orchestration	Internal error occurred while executing pop3 activity.
Pop3MailSent	Info	Orchestration	Activity has outputted 'mailheader' and 'body' output parameters. Mail marked for deletion from server
Pop3NumMails	Info	Orchestration	Number of mails found on the email server.
Pop3ServerError	Severe	Orchestration	A pop3 command unexpectedly returned an error while executing the activity.
SaveStateError	Warning	Orchestration	Error occurred while trying to save duplist state after disconnect. Will cleanup in next poll.
SetBCCFieldValue	Info	Orchestration	Setting the value of 'BCC' field to specified value
SetCCFieldValue	Info	Orchestration	Setting the value of 'CC' field to specified value
SetFromFieldValue	Info	Orchestration	Setting the value of 'From' field to specified value
SetSubjectFieldValue	Info	Orchestration	Setting the value of the 'Subject' field to the specified value.
SetTimeout	Info	Orchestration	Setting the timeout to specified value.
SetToFieldValue	Info	Orchestration	Setting the value of 'To' field to specified value
SmtpConfigParams	Info	Orchestration	Information regarding configuration parameters specified in email activity.
SmtpConnectFailed	Severe	Orchestration	The email activity operation failed because a connection to the server could not be established.
SmtpConnectRetry	Warning	Orchestration	The email activity operation failed while trying to connect to the server. This will cause a retry.
SmtpConnected	Info	Orchestration	The activity was successfully able to connect to the email server.
SmtpDataError	Severe	Orchestration	Smtp data error occurred while executing the activity.
SmtpDisconnectError	Warning	Orchestration	Error while trying to disconnect from server. Discarding error and continuing the activity.
SmtpEndpointData	Info	Orchestration	The information regarding the email endpoint data.
SmtpInternalError	Severe	Orchestration	Internal error occurred while executing smtp activity.
SmtpSendEmail	Info	Orchestration	The activity is sending email to the server.
SmtpTimeout	Info	Orchestration	Setting the timeout to specified value.
SubjectPatternError	Severe	Orchestration	Subject pattern specified in the activity is incorrect.
ToAndCCEmpty	Severe	Orchestration	There was no valid To, CC, BCC specified in the activity.

Email Connection Notifications

Provides a comprehensive list of connection notifications sent from the Email Module.

- [ConPoolReleaseError](#)
Error while closing the connection pool.
- [ConnectError](#)
The email activity operation failed because a connection to the server could not be established.
- [ConnectErrorRetry](#)
The email activity operation failed while trying to connect to the server. This will cause a retry.
- [ConnectHeaderAbsent](#)
The optional input header - emailConnection - is mapped.
- [ConnectHeaderPresent](#)
The optional input header - emailConnection - is mapped.
- [ConnectionPoolReturn](#)
Error occurred while returning connection to pool.
- [DisconnectException](#)
Error while trying to disconnect from server. Discarding error and continuing the activity.
- [EndpointData](#)
The information regarding the email endpoint data.
- [IncorrectPort](#)
The email port needs to be a positive integer. Defaulting to 110 in case its not specified as positive integer.
- [IncorrectSmtpPort](#)
The email port needs to be a positive integer. Defaulting to 25 in case its not specified as positive integer.
- [IncorrectSmtpTimeout](#)
The connection timeout needs to be a positive integer. Defaulting to 300 seconds in case its not specified as positive integer
- [IncorrectTimeout](#)
The connection timeout needs to be a positive integer. Defaulting to 300 seconds in case its not specified as positive integer
- [MakeConPoolError](#)
Error while creating the connection.
- [NewConnectEverytime](#)
The additional property 'smtpNewConnEveryTime' was added to connection pool.
- [Pop3Connected](#)
The activity was successfully able to connect to the email server.

- [SetTimeout](#)
Setting the timeout to specified value.
- [SmtpConnectFailed](#)
The email activity operation failed because a connection to the server could not be established.
- [SmtpConnectRetry](#)
The email activity operation failed while trying to connect to the server. This will cause a retry.
- [SmtpConnected](#)
The activity was successfully able to connect to the email server.
- [SmtpDisconnectError](#)
Error while trying to disconnect from server. Discarding error and continuing the activity.
- [SmtpEndpointData](#)
The information regarding the email endpoint data.
- [SmtpTimeout](#)
Setting the timeout to specified value.

Level : *Warning*

Log Message : *Error while closing the connection pool. The error is: {Message}*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-EMAIL-MIB::ciC7cConPoolReleaseErrorEv21*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.7.1.1*

SNMP Trap Number : *21*

Variables

The ConPoolReleaseError message contains the following variables:

Table 1. ConPoolReleaseError Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber

- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. Message

Textual description of the error.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvMessage
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.2

ConnectErrorRetry

The email activity operation failed while trying to connect to the server. This will cause a retry.

Level : *Warning*

Log Message : *Unable to connect to server. Error is: {Message}. Attempt {RetryAttemptNumber} of {TotalRetryAttempts}. Will try again in {IntervalForRetries} second(s).*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-EMAIL-MIB::ciC7cConnectErrorRetryEv5*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.7.1.1*

SNMP Trap Number : *5*

Variables

The ConnectErrorRetry message contains the following variables:

Table 1. ConnectErrorRetry Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. Message

Textual description of the error.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvMessage
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.2

6. RetryAttemptNumber

The current number of retries.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-EMAIL-MIB::ciC7cEv5RetryAttemptNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.3.7.1.1.1.5.2

7. TotalRetryAttempts

The specified number of attempts to connect to the server before stopping.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-EMAIL-MIB::ciC7cEv5TotalRetryAttempts
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.3.7.1.1.1.5.3

8. IntervalForRetries

The specified time interval between retries.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-EMAIL-MIB::ciC7cEv5IntervalForRetries
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.3.7.1.1.1.5.4

Email Operation Notifications

Provides a comprehensive list of operation notifications sent from the Email Module.

- [CouldNotGetHostIP](#)
Error occurred while getting IP of the router. Continuing activity without the host IP.
- [EmailMatched](#)
Found an email matching From and subject fields specified in configuration.
- [EmailSent](#)
The activity successfully sent email to the server.
- [InvalidAddressFormat](#)
The email address in the specified field is in incorrect format.
- [InvalidEmailID](#)
The email id specified is not valid.
- [MailHeaderAbsent](#)
The optional input header - mailheader - is not mapped.
- [MailHeaderPresent](#)
The optional input header - mailheader - is mapped.
- [MailsDeleted](#)
The mails processed in the current poll have been deleted from the server.
- [MailsToBeDeleted](#)
There are some mails to be deleted as they were processed earlier.
- [NoEmailMatched](#)
Could not find an email matching From and subject fields specified in configuration.
- [NoMailOnServer](#)
No mail was found on server.
- [PatternIncorrect](#)
Pattern specified in the activity is incorrect.
- [Pop3ConfigParams](#)
Configuration parameters specified in the activity.
- [Pop3DataError](#)
A pop3 data error occurred while executing the activity.
- [Pop3MailSent](#)
Activity has outputted 'mailheader' and 'body' output parameters. Mail marked for deletion from server
- [Pop3NumMails](#)
Number of mails found on the email server.
- [Pop3ServerError](#)
A pop3 command unexpectedly returned an error while executing the activity.
- [SaveStateError](#)
Error occurred while trying to save duplist state after disconnect. Will cleanup in next poll.

- [SetBCCFieldValue](#)
Setting the value of 'BCC' field to specified value
- [SetCCFieldValue](#)
Setting the value of 'CC' field to specified value
- [SetFromFieldValue](#)
Setting the value of 'From' field to specified value
- [SetSubjectFieldValue](#)
Setting the value of the 'Subject' field to the specified value.
- [SetToFieldValue](#)
Setting the value of 'To' field to specified value
- [SmtpConfigParams](#)
Information regarding configuration parameters specified in email activity.
- [SmtpDataError](#)
Smtp data error occurred while executing the activity.
- [SmtpSendEmail](#)
The activity is sending email to the server.
- [SubjectPatternError](#)
Subject pattern specified in the activity is incorrect.

CouldNotGetHostIP

Error occurred while getting IP of the router. Continuing activity without the host IP.

Level : *Warning*

Log Message : *Error while trying to get IP of router. Error is: {Message}. Continuing without getting IP.*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-EMAIL-MIB::ciC7oCouldNotGetHostIPEv20*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.7.1.2*

SNMP Trap Number : *20*

Variables

The CouldNotGetHostIP message contains the following variables:

Table 1. CouldNotGetHostIP Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. Message

Textual description of the error.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvMessage
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.2

SetFromFieldValue

Setting the value of 'From' field to specified value

Level : *Info*

Log Message : *Setting From: "{Value}"*.

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-EMAIL-MIB::ciC7oSetFromFieldValueEv22*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.7.1.2*

SNMP Trap Number : 22

Variables

The SetFromFieldValue message contains the following variables:

Table 1. SetFromFieldValue Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. Value

The value to which From field is set.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-EMAIL-MIB::ciC7oEv22Value
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.3.7.1.2.1.22.1

FTP Module

The FTP Module provides connectivity to remote FTP servers. This section contains details for the messages delivered from the FTP Module.

This topic provides the MIB Name and MIB OID information, in addition to high-level details about each notification in the FTP Module.

MIB Name : *CASTIRON-COMP-FTP-MIB*

MIB OID : *.1.3.6.1.4.1.13336.2.2.3.6*

The following table provides an alphabetical list of all notifications that can be issued by the FTP Module.

Table 1. Notifications issued by the FTP Module

Notification	Level	System	Description
AppendAfter	Info	Orchestration	Response received after issuing an append command to the file on remote server.
AppendBefore	Info	Orchestration	In process of issuing an append command to the file on remote server.
ConnectionFailure	Severe	Orchestration	The FTP operation failed because a connection to the server could not be established.
ConnectionRetry	Warning	Orchestration	The FTP operation failed while trying to connect to the server. This will cause a retry.

Notification	Level	System	Description
DeleteAfter	Info	Orchestration	Response received when a file was deleted from the remote server.
DeleteBefore	Info	Orchestration	In process of deleting a file to the remote server.
DeleteDupListEntry	Info	Orchestration	Duplicate list is at maximum capacity. Removing a file from the duplicate list.
DeleteInfoSummary	Info	Orchestration	A complete summary of delete file activity configuration.
DirChangeAfter	Info	Orchestration	Changed to the specified directory on remote server.
DirChangeBefore	Info	Orchestration	Changing directory on the remote server.
DuplicateFile	Info	Orchestration	The file was previously processed by FTP poll activity.
EncodingError	Severe	Orchestration	The data encoding specified is not supported by FTP activity.
EndpointInfoSummary	Info	Orchestration	A complete summary of endpoint information specified.
FileNotMoved	Warning	Orchestration	File was not moved from original location as there is already another file in the destination location and overwrite option is false.
FileProcessed	Info	Orchestration	The file is processed by FTP activity and is left in place.
FileProcessingError	Warning	Orchestration	Error occurred while processing the file.
FtpPatternConversion	Warning	Orchestration	In the versions greater than 3.6 FTP use different style of pattern. If project is published from studio version before that, FTP will automatically change the pattern to new style.
GetAfter	Info	Orchestration	Response received when a file was downloaded to the remote server.
GetBefore	Info	Orchestration	In process of downloading a file to the remote server.
GetInfoSummary	Info	Orchestration	A complete summary of get file activity configuration.
InternalException	Severe	Orchestration	A internal error occurred while executing FTP activity.
ListAfter	Info	Orchestration	Response received when the directory was listed on the remote server.
ListBefore	Info	Orchestration	In process of listing a directory on the remote server.
ListFileSummary	Info	Orchestration	A complete summary of list file activity configuration.
NListAfter	Info	Orchestration	Response received when the directory was name listed on the remote server.
NListBefore	Info	Orchestration	In process of name listing a directory on the remote server.
OperationError	Severe	Orchestration	FTP activity was unable to perform operation on FTP server.

Notification	Level	System	Description
PutAfter	Info	Orchestration	Response received when a file was uploaded to the remote server.
PutBefore	Info	Orchestration	In process of uploading a file to the remote server.
PutDuplicateFileName	Severe	Orchestration	File with same name exists on the specified server location. Configuration specified not to overwrite, so erroring out.
PutEmptyFileName	Severe	Orchestration	The file name specified in put activity is empty.
PutInfoSummary	Info	Orchestration	A complete summary of put file activity configuration.
RenameAfter	Info	Orchestration	Response received when a file was renamed to the remote server.
RenameBefore	Info	Orchestration	In process of renaming a file to the remote server.
RenameDupError	Severe	Orchestration	Rename operation errored as file with same name already exists.
RenameInfoSummary	Info	Orchestration	A complete summary of get file activity configuration.
SshFingerprintInfo	Info	Orchestration	SSH finger print information for communication with FTP server.
SshModeInfo	Info	Orchestration	SSH mode information for communication with FTP server.
TimeStampError	Warning	Orchestration	The timestamp command is not supported by the FTP server. Continuing the FTP activity operation using default timestamp.
TimestampCommand	Warning	Orchestration	The timestamp command is not supported by the FTP server. Continuing the FTP activity operation.
UnableToDelete	Warning	Orchestration	Error occurred while deleting file from the specified location.
UnableToMove	Warning	Orchestration	Error occurred while moving file to destination location.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.notifications_reference.doc/ftp/ftp_connection_notifications_list.html

ConnectionFailure

The FTP operation failed because a connection to the server could not be established.

Level : *Severe*

Log Message : *Unable to connect to the server "{ServerName}" after {NumberOfRetryAttempts} attempts. Error is: {Message}*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-FTP-MIB::ciC6cConnectionFailureEv1*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.6.1.1*

SNMP Trap Number : *1*

Variables

The ConnectionFailure message contains the following variables:

Table 1. ConnectionFailure Message Variables

1. **SerialNumber**

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. ServerName

The server name to which connection failed.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-FTP-MIB::ciC6cEv1ServerName
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.6.1.1.1.1.1

6. NumberOfRetryAttempts

The total number of attempted retries.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-FTP-MIB::ciC6cEv1NumberOfRetryAttempts
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.6.1.1.1.1.2

7. Message

Textual description of the error.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvMessage
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.1.2.2

ConnectionRetry

The FTP operation failed while trying to connect to the server. This will cause a retry.

Level : *Warning*

Log Message : *Unable to connect to the server "{ServerName}". Error is: {Message} Attempt {RetryAttemptNumber} of {TotalRetryAttempts}. Will try again in {IntervalForRetries} second(s).*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-FTP-MIB::ciC6cConnectionRetryEv2*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.6.1.1*

SNMP Trap Number : 2

Variables

The ConnectionRetry message contains the following variables:

Table 1. ConnectionRetry Message Variables

<p>1. SerialNumber</p> <p>The serial number of the appliance sending the trap.</p> <ul style="list-style-type: none"> • Type : String • SNMP Object Name : CASTIRON-IA-MIB::ciIaPlatSerialNumber • SNMP OID : 1.3.6.1.4.1.13336.2.2.1.1.3.3
<p>2. Severity</p> <p>Severity of the Notification.</p> <ul style="list-style-type: none"> • Type : Integer • SNMP Object Name : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity • SNMP OID : 1.3.6.1.4.1.13336.2.2.1.2.1
<p>3. JobID</p> <p>The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.</p> <ul style="list-style-type: none"> • Type : String • SNMP Object Name : CASTIRON-REGISTRATIONS-MIB::ciEvJobID • SNMP OID : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. ServerName

The server name to which connection failed.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-FTP-MIB::ciC6cEv2ServerName
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.3.6.1.1.1.2.1

6. Message

Textual description of the error.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvMessage
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.2

7. RetryAttemptNumber

The current number of retries.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-FTP-MIB::ciC6cEv2RetryAttemptNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.3.6.1.1.1.2.3

8. TotalRetryAttempts

The specified number of attempts to connect to the server before stopping.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-FTP-MIB::ciC6cEv2TotalRetryAttempts
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.3.6.1.1.1.2.4

9. IntervalForRetries

The specified time interval between retries.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-FTP-MIB::ciC6cEv2IntervalForRetries
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.3.6.1.1.1.2.5

Parent topic: [FTP Connection Notifications](#)

FTP Operation Notifications

Provides a comprehensive list of operation notifications sent from the FTP Module.

- [AppendAfter](#)
Response received after issuing an append command to the file on remote server.
- [AppendBefore](#)
In process of issuing an append command to the file on remote server.
- [DeleteAfter](#)
Response received when a file was deleted from the remote server.
- [DeleteBefore](#)
In process of deleting a file to the remote server.
- [DeleteDupListEntry](#)
Duplicate list is at maximum capacity. Removing a file from the duplicate list.
- [DeleteInfoSummary](#)
A complete summary of delete file activity configuration.
- [DirChangeAfter](#)
Changed to the specified directory on remote server.
- [DirChangeBefore](#)
Changing directory on the remote server.
- [DuplicateFile](#)
The file was previously processed by FTP poll activity.
- [EndpointInfoSummary](#)
A complete summary of endpoint information specified.
- [FileNotMoved](#)
File was not moved from original location as there is already another file in the destination location and overwrite option is false.
- [FileProcessed](#)
The file is processed by FTP activity and is left in place.
- [FileProcessingError](#)
Error occurred while processing the file.
- [FtpPatternConversion](#)
In the versions greater than 3.6 FTP use different style of pattern. If project is published from studio version before that, FTP will automatically change the pattern to new style.
- [GetAfter](#)
Response received when a file was downloaded to the remote server.
- [GetBefore](#)
In process of downloading a file to the remote server.
- [GetInfoSummary](#)
A complete summary of get file activity configuration.
- [ListAfter](#)
Response received when the directory was listed on the remote server.
- [ListBefore](#)
In process of listing a directory on the remote server.
- [ListFileSummary](#)
A complete summary of list file activity configuration.

- [NListAfter](#)
Response received when the directory was name listed on the remote server.
- [NListBefore](#)
In process of name listing a directory on the remote server.
- [OperationError](#)
FTP activity was unable to perform operation on FTP server.
- [PutAfter](#)
Response received when a file was uploaded to the remote server.
- [PutBefore](#)
In process of uploading a file to the remote server.
- [PutDuplicateFileName](#)
File with same name exists on the specified server location. Configuration specified not to overwrite, so erroring out.
- [PutEmptyFileName](#)
The file name specified in put activity is empty.
- [PutInfoSummary](#)
A complete summary of put file activity configuration.
- [RenameAfter](#)
Response received when a file was renamed to the remote server.
- [RenameBefore](#)
In process of renaming a file to the remote server.
- [RenameDupError](#)
Rename operation errored as file with same name already exists.
- [RenameInfoSummary](#)
A complete summary of get file activity configuration.
- [SshFingerprintInfo](#)
SSH finger print information for communication with FTP server.
- [SshModeInfo](#)
SSH mode information for communication with FTP server.
- [TimeStampError](#)
The timestamp command is not supported by the FTP server. Continuing the FTP activity operation using default timestamp.
- [TimestampCommand](#)
The timestamp command is not supported by the FTP server. Continuing the FTP activity operation.
- [UnableToDelete](#)
Error occurred while deleting file from the specified location.
- [UnableToMove](#)
Error occurred while moving file to destination location.

HTTP Module

The HTTP Module provides HTTP/HTTPS client and server facilities. This section contains details for the messages delivered from the HTTP Module.

This topic provides the MIB Name and MIB OID information, in addition to high-level details about each notification in the HTTP Module.

MIB Name : *CASTIRON-COMP-HTTP-MIB*

MIB OID : *.1.3.6.1.4.1.13336.2.2.3.1*

The following table provides an alphabetical list of all notifications that can be issued by the HTTP Module.

Table 1. Notifications issued by the HTTP Module

Notification	Level	System	Description
AcceptEncodingType	Info	Orchestration	The type of Accept-Encoding in the request-header field.
ClientConMgrTimeout	Info	Orchestration	Setting the client connection manager timeout value. This is configurable on the JConsole.

Notification	Level	System	Description
ClientIdleTimeout	Info	Orchestration	The amount of idle time for the connection after which the connection can be reclaimed. This is configurable from the JConsole.
ClientMaxTotalConn	Info	Orchestration	Setting the client connection manager maximum number of connections from the JConsole.
ClientReclaimPeriod	Info	Orchestration	The number of seconds to wait before the reclaim thread is run to reclaim an idle connection. This is set from the JConsole.
CommonHandlerError	Severe	Orchestration	An error occurred handling the request received by the activity. Possible reasons are I/O or operation exceptions.
CompressFormat	Info	Orchestration	Indicates the type of Content-Encoding in the response from the server.
ConnectionRetry	Warning	Orchestration	The send request operation failed while trying to connect to the server. This will cause a retry.
ContentEncodingType	Info	Orchestration	The type of Content-Encoding used in the header in the outgoing request.
DecompressedEncoding	Info	Orchestration	Content-Encoding of the incoming request to the receive activity.
EndpointInformation	Info	Orchestration	Request for endpoint information.
GeneralRequestFailed	Severe	Orchestration	The send request failed while executing the activity.
HttpListenerStop	Info	Orchestration	Information regarding the stopping of a listener on a specific port.
HttpLoopBackValues	Info	Orchestration	Loopback port values set by the user, on the JConsole, and persisted in the sysconf.
IdleConTimeoutStart	Info	Orchestration	The idle connection timeout thread is enabled.
IdleConTimeoutStop	Info	Orchestration	The idle connection thread is disabled.
IncomingContentEnc	Info	Orchestration	The Content-Encoding type in the request header received by the receive activity
LoopBackInitialize	Info	Orchestration	Loopback values for initializing the MBean. It is set on the JConsole.
ReadConnectionParam	Info	Orchestration	The input connection parameter is not mapped by the user.
ReadInputHeaders	Info	Orchestration	The input parameter header is not mapped by the user.
ReceiveActivate	Severe	Orchestration	The receive activity failed to activate.
ReceiveDeActivate	Severe	Orchestration	The receive activity failed to stop.
ReceiveIOError	Severe	Orchestration	An I/O error occurred while the receive activity processed the request. Possible cause might be a broken connection.

Notification	Level	System	Description
ReceiveInternalError	Severe	Orchestration	An error occurred while the receive activity processed the request.
ReceiveOperationError	Severe	Orchestration	An error occurred while processing the request received by the receive activity due to an unsupported Accept-Charset encoding.
ReceiveResponseBody	Info	Orchestration	The response sent by the receive activity to a request.
ReceiveSendReplyError	Severe	Orchestration	A connection problem caused an error while sending the response from the receive activity.
ReceiveURIPortInfo	Info	Orchestration	Information regarding the URI and Port where the server is listening.
RegisterKeyStore	Severe	Orchestration	An error occurred while registering the key store.
ReplyCompressFormat	Info	Orchestration	The Content-Encoding used by the send reply activity.
ReplyConnectionError	Severe	Orchestration	An error occurred while sending the response. Probable cause is a connection error.
ReplyGeneralError	Severe	Orchestration	An internal error occurred while sending the reply from the receive activity.
ReplyHandlerNull	Severe	Orchestration	Connection handler stored in the receive activity and retrieved by the reply activity is null. This is an internal error and likely caused by an out of memory error or an appliance reboot while executing an activity.
ReplyUnMarshalHeader	Severe	Orchestration	An error occurred while reading input headers in the reply activity.
ReplyUnknownError	Severe	Orchestration	An unknown exception occurred while sending the response to the client.
RequestActivate	Severe	Orchestration	The request activity failed to activate.
RequestIgnoredHeader	Info	Orchestration	The header was ignored because it is not a supported type. Supported types are gzip, deflate or compress.
RequestParamsDetails	Info	Orchestration	Parameter details, including URL and method, used for the post activity
ResponseBodyBinary	Info	Orchestration	The response body is binary.
ResponseBodyNotBinary	Info	Orchestration	The response body is not binary.
ResponseDefinition	Info	Orchestration	Response definition received from the server for the performed post.
SendRequestConnection	Severe	Orchestration	The send request operation failed because a connection to the server could not be established.
SendRequestOperation	Severe	Orchestration	The Send Request operation failed either while starting the activity or while executing it. Caused by an I/O or operation exception.
ServerResponseCode	Info	Orchestration	Post response code received from the server.

Notification	Level	System	Description
SockCollectorFinish	Info	Orchestration	Information about the completion status of the Socket Janitor. The Socket Janitor is configured on the JConsole.
SockCollectorRunInfo	Info	Orchestration	Information about this run of the Socket Janitor. The Socket Janitor is configured on the JConsole.
SockCollectorSched	Info	Orchestration	Sets the frequency for garbage collection by the Socket Janitor. It is set on the JConsole.
StaleConnectionCheck	Info	Orchestration	Specifies if the stale connection check should be run on the connection manager. This is set (True or False) from the JConsole.
UnSupportedMedia	Warning	Orchestration	Request is an unsupported media type.
UnsolicitedEncoding	Severe	Orchestration	The server reply contains Content-Encoding which is not acceptable by the client.
UnsupportedEncoding	Severe	Orchestration	The Content-Encoding in the request header is not supported by the receive activity.

HTTP Connection Notifications

Provides a comprehensive list of connection notifications sent from the HTTP Module.

- [ClientConMgrTimeout](#)
Setting the client connection manager timeout value. This is configurable on the JConsole.
- [ClientIdleTimeout](#)
The amount of idle time for the connection after which the connection can be reclaimed. This is configurable from the JConsole.
- [ClientMaxTotalConn](#)
Setting the client connection manager maximum number of connections from the JConsole.
- [ClientReclaimPeriod](#)
The number of seconds to wait before the reclaim thread is run to reclaim an idle connection. This is set

from the JConsole.

- [ConnectionRetry](#)
The send request operation failed while trying to connect to the server. This will cause a retry.
- [EndpointInformation](#)
Request for endpoint information.
- [HttpLoopBackValues](#)
Loopback port values set by the user, on the JConsole, and persisted in the sysconf.
- [ReadConnectionParam](#)
The input connection parameter is not mapped by the user.
- [ReceiveActivate](#)
The receive activity failed to activate.
- [ReceiveDeActivate](#)
The receive activity failed to stop.
- [ReceiveIOError](#)
An I/O error occurred while the receive activity processed the request. Possible cause might be a broken connection.
- [ReceiveSendReplyError](#)
A connection problem caused an error while sending the response from the receive activity.
- [ReplyConnectionError](#)
An error occurred while sending the response. Probable cause is a connection error.
- [SendRequestConnection](#)
The send request operation failed because a connection to the server could not be established.
- [StaleConnectionCheck](#)
Specifies if the stale connection check should be run on the connection manager. This is set (True or False) from the JConsole.

StaleConnectionCheck

Specifies if the stale connection check should be run on the connection manager. This is set (True or False) from the JConsole.

Level : *Info*

Log Message : *Setting the stale connection check at {StaleConnection}.*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-HTTP-MIB::ciC1cStaleConnectionCheckEv15*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.1.1.1*

SNMP Trap Number : *15*

Variables

The StaleConnectionCheck message contains the following variables:

Table 1. StaleConnectionCheck Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. StaleConnection

Value (True or False) of stale connection check.

- **Type** : Boolean
- **SNMP Object Name** : CASTIRON-COMP-HTTP-MIB::ciC1cEv15StaleConnection
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.3.1.1.1.1.15.1

HTTP Operation Notifications

Provides a comprehensive list of operation notifications sent from the HTTP Module.

- [AcceptEncodingType](#)
The type of Accept-Encoding in the request-header field.
- [CommonHandlerError](#)
An error occurred handling the request received by the activity. Possible reasons are I/O or operation exceptions.
- [CompressFormat](#)
Indicates the type of Content-Encoding in the response from the server.
- [ContentEncodingType](#)
The type of Content-Encoding used in the header in the outgoing request.
- [DecompressedEncoding](#)
Content-Encoding of the incoming request to the receive activity.
- [HttpListenerStop](#)
Information regarding the stopping of a listener on a specific port.
- [IncomingContentEnc](#)
The Content-Encoding type in the request header received by the receive activity
- [ReadInputHeaders](#)
The input parameter header is not mapped by the user.
- [ReceiveOperationError](#)
An error occurred while processing the request received by the receive activity due to an unsupported Accept-Charset encoding.
- [ReceiveResponseBody](#)
The response sent by the receive activity to a request.
- [ReceiveURIPortInfo](#)
Information regarding the URI and Port where the server is listening.
- [RegisterKeyStore](#)
An error occurred while registering the key store.
- [ReplyCompressFormat](#)
The Content-Encoding used by the send reply activity.
- [ReplyUnMarshalHeader](#)
An error occurred while reading input headers in the reply activity.
- [RequestActivate](#)
The request activity failed to activate.
- [RequestIgnoredHeader](#)
The header was ignored because it is not a supported type. Supported types are gzip, deflate or compress.
- [RequestParamsDetails](#)
Parameter details, including URL and method, used for the post activity
- [ResponseBodyBinary](#)
The response body is binary.
- [ResponseBodyNotBinary](#)
The response body is not binary.
- [ResponseDefinition](#)
Response definition received from the server for the performed post.
- [SendRequestOperation](#)
The Send Request operation failed either while starting the activity or while executing it. Caused by an I/O or operation exception.
- [ServerResponseCode](#)
Post response code received from the server.
- [UnsupportedMedia](#)
Request is an unsupported media type.
- [UnsolicitedEncoding](#)
The server reply contains Content-Encoding which is not acceptable by the client.

- [UnsupportedEncoding](#)
The Content-Encoding in the request header is not supported by the receive activity.

HTTP Internal Notifications

Provides a comprehensive list of internal notifications sent from the HTTP Module.

- [GeneralRequestFailed](#)
The send request failed while executing the activity.
- [IdleConTimeoutStart](#)
The idle connection timeout thread is enabled.
- [IdleConTimeoutStop](#)
The idle connection thread is disabled.
- [LoopBackInitialize](#)
Loopback values for initializing the MBean. It is set on the JConsole.
- [ReceiveInternalError](#)
An error occurred while the receive activity processed the request.
- [ReplyGeneralError](#)
An internal error occurred while sending the reply from the receive activity.
- [ReplyHandlerNull](#)
Connection handler stored in the receive activity and retrieved by the reply activity is null. This is an internal error and likely caused by an out of memory error or an appliance reboot while executing an activity.
- [ReplyUnknownError](#)
An unknown exception occurred while sending the response to the client.
- [SockCollectorFinish](#)
Information about the completion status of the Socket Janitor. The Socket Janitor is configured on the JConsole.
- [SockCollectorRunInfo](#)
Information about this run of the Socket Janitor. The Socket Janitor is configured on the JConsole.
- [SockCollectorSched](#)
Sets the frequency for garbage collection by the Socket Janitor. It is set on the JConsole.

ReceiveInternalError

An error occurred while the receive activity processed the request.

Level : *Severe*

Log Message : *An error occurred while processing the request. Exception: {Message}*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-HTTP-MIB::ciC1iReceiveInternalErrorEv3*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.1.1.3*

SNMP Trap Number : 3

Variables

The ReceiveInternalError message contains the following variables:

Table 1. ReceiveInternalError Message Variables

<p>1. SerialNumber</p> <p>The serial number of the appliance sending the trap.</p> <ul style="list-style-type: none">• Type : String• SNMP Object Name : CASTIRON-IA-MIB::ciIaPlatSerialNumber• SNMP OID : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

ReplyGeneralError

An internal error occurred while sending the reply from the receive activity.

Level : *Severe*

Log Message : *A general error occurred while sending the response. Exception: {Message}*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-HTTP-MIB::ciC1iReplyGeneralErrorEv2*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.1.1.3*

SNMP Trap Number : 2

Variables

The ReplyGeneralError message contains the following variables:

Table 1. ReplyGeneralError Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. Message

Textual description of the error.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvMessage
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.1.2.2

JD Edwards Module

JD Edwards Module. This section contains details for the messages delivered from the JD Edwards Module.

This topic provides the MIB Name and MIB OID information, in addition to high-level details about each notification in the JD Edwards Module.

MIB Name : *CASTIRON-COMP-JDE-MIB*

MIB OID : *.1.3.6.1.4.1.13336.2.2.3.15*

The following table provides an alphabetical list of all notifications that can be issued by the JD Edwards Module.

Table 1. Notifications issued by the JD Edwards Module

Notification	Level	System	Description
ActivateSuccessful	Info	Orchestration	JDE activity was activated successfully.
ActivateUnSuccessful	Info	Orchestration	The activity which was not activated successfully. Activity activated, will try to establish connectivity at activity execute time.
ActivityError	Severe	Orchestration	The specified activity was not successful.
ActivitySuccessful	Info	Orchestration	The specified activity was successful.
ClassesMissing	Severe	Orchestration	JDE is missing classes required to start the activity. Please install the libraries from the WMC.
CloseConnectionError	Severe	Orchestration	Error occurred while closing the connection to JDE.
ConnectException	Warning	Orchestration	Error while connecting to JDE.
ConnectPoolRelease	Warning	Orchestration	There was an error while closing the connection pool.
CreateSchemaError	Severe	Orchestration	Error occurred while creating request schema for the business function.
DataStructureError	Severe	Orchestration	Error occurred while creating a schema for the business function name.
DisconnectException	Warning	Orchestration	Error while disconnecting from JDE.

Notification	Level	System	Description
GetConnectionError	Severe	Orchestration	Error occurred while creating a connection to JDE.
JDEConnectError	Severe	Orchestration	The JDE operation failed because a connection to the server could not be established.
JDEInternalerror	Severe	Orchestration	Error occurred while processing the request.
JDERetryError	Warning	Orchestration	The JDE operation failed while trying to connect to the server. This will cause a retry.
MakeConnectionError	Warning	Orchestration	There was an error while creating a connection to destination.
NumberFormatError	Warning	Orchestration	There was an error due to invalid port number.
ResourceCleanError	Severe	Orchestration	Error occurred while closing the statement or result set in database.
ResponseSchemaError	Severe	Orchestration	Error occurred while creating response schema for the business function.
SetUpInfo	Warning	Orchestration	JDE activity got warning or error messages while setting up the specified activity.
UnSupportedEncoding	Severe	Orchestration	Error while processing unsupported encoding.

ActivateUnSuccessful

The activity which was not activated successfully. Activity activated, will try to establish connectivity at activity execute time.

Level : *Info*

Log Message : *Error connecting to JDE system while activating activity {ActivityName}, error is: {Message}. Activity activated, will try to establish connectivity at activity execute time*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-JDE-MIB::ciC15cActivateUnSuccessfulEv1*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.15.1.1*

SNMP Trap Number : *1*

Variables

The ActivateUnSuccessful message contains the following variables:

Table 1. ActivateUnSuccessful Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber

- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. ActivityName

The activity which was activated successfully.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-JDE-MIB::ciC15cEv1ActivityName
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.3.15.1.1.1.1.1

6. Message

Textual description of the error.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvMessage

JD Edwards Operation Notifications

Provides a comprehensive list of operation notifications sent from the JD Edwards Module.

- [ActivateSuccessful](#)
JDE activity was activated successfully.
- [ActivityError](#)
The specified activity was not successful.
- [ActivitySuccessful](#)
The specified activity was successful.

- [ClassesMissing](#)
JDE is missing classes required to start the activity. Please install the libraries from the WMC.
- [CreateSchemaError](#)
Error occurred while creating request schema for the business function.
- [DataStructureError](#)
Error occurred while creating a schema for the business function name.
- [NumberFormatError](#)
There was an error due to invalid port number.
- [ResourceCleanError](#)
Error occurred while closing the statement or result set in database.
- [ResponseSchemaError](#)
Error occurred while creating response schema for the business function.
- [SetUpInfo](#)
JDE activity got warning or error messages while setting up the specified activity.
- [UnsupportedEncoding](#)
Error while processing unsupported encoding.

CreateSchemaError

Error occurred while creating request schema for the business function.

Level : *Severe*

Log Message : *Exception while creating request schema for the business function {FunctionName}, function code {FunctionCode}, module code {ModuleCode}. The exception is {Message}*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-JDE-MIB::ciC15oCreateSchemaErrorEv8*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.15.1.2*

SNMP Trap Number : *8*

Variables

The CreateSchemaError message contains the following variables:

Table 1. CreateSchemaError Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity

- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. FunctionName

The name of function for which error occurred.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-JDE-MIB::ciC15oEv8FunctionName
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.15.1.2.1.8.1

6. FunctionCode

The code of function for which error occurred.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-JDE-MIB::ciC15oEv8FunctionCode
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.15.1.2.1.8.2

7. ModuleCode

The code of module for which error occurred.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-JDE-MIB::ciC15oEv8ModuleCode
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.15.1.2.1.8.3

8. Message

Textual description of the error.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvMessage
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.1.2.2

JMS Module

JMS Module. This section contains details for the messages delivered from the JMS Module.

This topic provides the MIB Name and MIB OID information, in addition to high-level details about each notification in the JMS Module.

MIB Name : *CASTIRON-COMP-JMS-MIB*

MIB OID : *.1.3.6.1.4.1.13336.2.2.3.8*

The following table provides an alphabetical list of all notifications that can be issued by the JMS Module.

Table 1. Notifications issued by the JMS Module

Notification	Level	System	Description
ConnectionPoolError	Warning	Orchestration	Error occurred while returning connection to the pool. Continuing the activity.
FactoryUnknownError	Severe	Orchestration	Unknown exception while looking up the connection factory
FirstID	Warning	Orchestration	The appliance is in recovery mode and the first message specified is not matching the id specified of delivered message. Messages in the queue is tampered and will impact the delivery of messages
GetConnectRetry	Warning	Orchestration	The JMS operation failed while trying to connect to the server. This will cause a retry.
GetMarshallError	Severe	Orchestration	Error occurred while marshalling the JMS message.
JMSError	Severe	Orchestration	Error occurred while getting message from the provider.
LibraryNotInstalled	Severe	Orchestration	This error may be due to JMS Provider library being not installed on the appliance. Please install the JMS provider library using Web management console.
MakeConnectError	Severe	Orchestration	Error occurred while creating the connection to destination.
NamingException	Severe	Orchestration	Naming exception occurred while getting message from destination.

Notification	Level	System	Description
NoMessage	Info	Orchestration	There is no message to be retrieved from the destination specified.
PollMessageError	Severe	Orchestration	Error occurred while getting a message from queue.
PollMessageRetry	Warning	Orchestration	The JMS operation failed while trying to connect to the server. This will cause a retry.
PoolFactoryError	Severe	Orchestration	Error occurred while looking up for connection factory.
PoolReleaseError	Severe	Orchestration	Error occurred while closing the connection pool.
PooledConnException	Warning	Orchestration	A JMS Connection exception occurred while the connection was in the idle pool. This can occur if the JMS provider terminates the connection ungracefully.
RecoveryInfo	Info	Orchestration	The activity is recovering and its skipping message with specified id as its already delivered.
RecoveryInfo	Info	Orchestration	The JMS connector is in recovery mode.
RestartError	Severe	Orchestration	Error occurred while trying to restart the subscriber on the specified topic.
SendConnectRerty	Warning	Orchestration	The JMS operation failed while trying to connect to the server. This will cause a retry.
SendMarshalError	Severe	Orchestration	Error occurred while unmarshalling the JMS message.
SendMessageError	Severe	Orchestration	Error occurred while sending message.
SendNamingException	Severe	Orchestration	Naming exception occurred while sending message to destination.
SubscriberConfigError	Severe	Orchestration	Error occurred while configuring the subscriber activity.
SubscriberConnect	Severe	Orchestration	The JMS operation failed while trying to connect to the server.
SubscriberError	Severe	Orchestration	Error occurred while subscribing the message. This message should be re-delivered manually from the Provider.
SubscriberNameError	Severe	Orchestration	Naming exception occurred while configuring the subscriber activity.
SubscriberStartInfo	Info	Orchestration	Subscriber started successfully for the specified topic.
UnsubscribeError	Warning	Orchestration	Error occurred while unsubscribing on the topic.

- [JMS Connection Notifications](#)
Provides a comprehensive list of connection notifications sent from the JMS Module.
- [JMS Operation Notifications](#)
Provides a comprehensive list of operation notifications sent from the JMS Module.
- [JMS Internal Notifications](#)
Provides a comprehensive list of internal notifications sent from the JMS Module.

JMS Connection Notifications

Provides a comprehensive list of connection notifications sent from the JMS Module.

- [ConnectionPoolError](#)
Error occurred while returning connection to the pool. Continuing the activity.
- [FactoryUnknownError](#)
Unknown exception while looking up the connection factory
- [GetConnectRetry](#)
The JMS operation failed while trying to connect to the server. This will cause a retry.
- [MakeConnectError](#)
Error occurred while creating the connection to destination.
- [PollMessageRetry](#)
The JMS operation failed while trying to connect to the server. This will cause a retry.
- [PoolFactoryError](#)
Error occurred while looking up for connection factory.
- [PoolReleaseError](#)
Error occurred while closing the connection pool.
- [PooledConnException](#)
A JMS Connection exception occurred while the connection was in the idle pool. This can occur if the JMS provider terminates the connection ungracefully.
- [RecoveryInfo](#)
The JMS connector is in recovery mode.
- [RestartError](#)
Error occurred while trying to restart the subscriber on the specified topic.
- [SendConnectRerty](#)
The JMS operation failed while trying to connect to the server. This will cause a retry.
- [SubscriberConnect](#)
The JMS operation failed while trying to connect to the server.

FactoryUnknownError

Unknown exception while looking up the connection factory

Level : *Severe*

Log Message : *Exception while looking up the connection factory {Message}. The exception is unknown error message from Provider. One of the reason for the error is If the provider is ActiveMQ and the binding file name or path is not correct.*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-JMS-MIB::ciC8cFactoryUnknownErrorEv11*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.8.1.1*

SNMP Trap Number : *11*

Variables

The FactoryUnknownError message contains the following variables:

Table 1. FactoryUnknownError Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. Message

Textual description of the error.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvMessage
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.2

SendConnectRerty

The JMS operation failed while trying to connect to the server. This will cause a retry.

Level : *Warning*

Log Message : *Connection exception while sending message. The error code is {ErrorCode} and exception is {ErrorMessage}. The job is retrying {RetryAttemptNumber} out of {TotalRetryAttempts} attempt to connect to JMS provider. The next attempt will be after {IntervalForRetries} secs.*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-JMS-MIB::ciC8cSendConnectRertyEv2*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.8.1.1*

SNMP Trap Number : *2*

Variables

The SendConnectRerty message contains the following variables:

Table 1. SendConnectRerty Message Variables

<p>1. SerialNumber</p> <p>The serial number of the appliance sending the trap.</p> <ul style="list-style-type: none">• Type : String• SNMP Object Name : CASTIRON-IA-MIB::ciIaPlatSerialNumber• SNMP OID : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3
<p>2. Severity</p> <p>Severity of the Notification.</p> <ul style="list-style-type: none">• Type : Integer• SNMP Object Name : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity• SNMP OID : 1.3.6.1.4.1.13336.2.2.1.2.1
<p>3. JobID</p>

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. ErrorCode

The error code specified in the error message

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-JMS-MIB::ciC8cEv2ErrorCode
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.8.1.1.1.2.1

6. ErrorMessage

The error message specified in the error message

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-JMS-MIB::ciC8cEv2ErrorMessage
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.8.1.1.1.2.2

7. RetryAttemptNumber

The current number of retries.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-JMS-MIB::ciC8cEv2RetryAttemptNumber
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.8.1.1.1.2.3

8. TotalRetryAttempts

The specified number of attempts to connect to the server before stopping.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-JMS-MIB::ciC8cEv2TotalRetryAttempts
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.8.1.1.1.2.4

9. IntervalForRetries

The specified time interval between retries.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-JMS-MIB::ciC8cEv2IntervalForRetries
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.8.1.1.1.2.5

JMS Operation Notifications

Provides a comprehensive list of operation notifications sent from the JMS Module.

- [FirstID](#)
The appliance is in recovery mode and the first message specified is not matching the id specified of delivered message. Messages in the queue is tampered and will impact the delivery of messages
- [NamingException](#)
Naming exception occurred while getting message from destination.
- [NoMessage](#)
There is no message to be retrieved from the destination specified.

- [RecoveryInfo](#)
The activity is recovering and its skipping message with specified id as its already delivered.
- [SendMessageError](#)
Error occurred while sending message.
- [SendNamingException](#)
Naming exception occurred while sending message to destination.
- [SubscriberConfigError](#)
Error occurred while configuring the subscriber activity.
- [SubscriberError](#)
Error occurred while subscribing the message. This message should be re-delivered manually from the Provider.
- [SubscriberNameError](#)
Naming exception occurred while configuring the subscriber activity.
- [SubscriberStartInfo](#)
Subscriber started successfully for the specified topic.
- [UnsubscribeError](#)
Error occurred while unsubscribing on the topic.

JSON Module

The JSON Module provides activities for generating and parsing JSON content. This section contains details for the messages delivered from the JSON Module.

This topic provides the MIB Name and MIB OID information, in addition to high-level details about each notification in the JSON Module.

MIB Name : *CASTIRON-COMP-JSON-MIB*

MIB OID : *.1.3.6.1.4.1.13336.2.2.3.21*

The following table provides an alphabetical list of all notifications that can be issued by the JSON Module.

Table 1. Notifications issued by the JSON Module

Notification	Level	System	Description
JSONParseError	Severe	Orchestration	There was an error while parsing the JSON.
JSONSerializeError	Severe	Orchestration	There was an error while serializing the JSON.
TransformError	Severe	Orchestration	There was an error while transforming the JSON.

- [JSON Operation Notifications](#)
Provides a comprehensive list of operation notifications sent from the JSON Module.

JSONParseError

There was an error while parsing the JSON.

Level : *Severe*

Log Message : *Failed to parse JSON, error was: {ErrorMessage}*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-JSON-MIB::ciC21oJSONParseErrorEv1*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.21.1.2*

SNMP Trap Number : *1*

Variables

The JSONParseError message contains the following variables:

Table 1. JSONParseError Message Variables

1. SerialNumber
The serial number of the appliance sending the trap. <ul style="list-style-type: none">• Type : String• SNMP Object Name : CASTIRON-IA-MIB::ciIaPlatSerialNumber• SNMP OID : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3
2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. ErrorMessage

The error message returned while parsing the JSON.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-JSON-MIB::ciC21oEv1ErrorMessage
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.3.21.1.2.1.1.1

The MIME Module provides activities for creating and parsing Multipurpose Internet Mail Extensions. This section contains details for the messages delivered from the MIME Module.

This topic provides the MIB Name and MIB OID information, in addition to high-level details about each notification in the MIME Module.

MIB Name : *CASTIRON-COMP-MIME-MIB*

MIB OID : *.1.3.6.1.4.1.13336.2.2.3.10*

The following table provides an alphabetical list of all notifications that can be issued by the MIME Module.

Table 1. Notifications issued by the MIME Module

Notification	Level	System	Description
AttachmentNumber	Info	Orchestration	Activity is processing the specified attachment number.
AttachmentsFound	Info	Orchestration	The activity found specified number of attachments.
AutoGeneratedBody	Info	Orchestration	No boundary value was specified for multiple parts attachment. Using auto-generated boundary.
BoundaryAbsent	Info	Orchestration	Boundary attribute not set in input parameter 'mimeheader'. Input body being set as entityBody in first entity of 'parts' output parameter.
BoundaryInfo	Info	Orchestration	Boundary of mime attachment is as specified.
BoundaryMoreThan70	Warning	Orchestration	Boundary delimiters longer than 70 characters. Ignoring the specified boundary value. Using auto-generated boundary.
BoundarySpecified	Info	Orchestration	Activity found boundary in mime message.
DefaultContentType	Info	Orchestration	Activity did not find any content type specified. Setting content type to text/plain.
EmptyParts	Severe	Orchestration	The input parameter - parts - is empty and there is no data to serialize.
FoundBoundary	Info	Orchestration	Activity found boundary parameter in the mime message.
HeaderAbsent	Severe	Orchestration	Empty input parameter 'mimeheader'. was found. Activity cannot parse data.
InputBodyNull	Severe	Orchestration	Input parameter body from container is NULL. This is due to internal exception.
MainAndSubType	Severe	Orchestration	The main and sub type found in content type.
MainType	Info	Orchestration	Main type specified in the serialize activity.
MimeHeaderMapped	Info	Orchestration	Optional input parameter 'mimeheader' is mapped.
MimeHeaderNotMapped	Info	Orchestration	Optional input parameter 'mimeheader' was not mapped in the activity.
NoAttachments	Severe	Orchestration	Activity did not find any attachments to serialize.
NoBoundaryFound	Warning	Orchestration	Boundary was specified in header but no boundary found in the body. Returning single body.

Notification	Level	System	Description
NoPartBody	Info	Orchestration	This part does not have any body. Setting blank body.
NumberOfParts	Info	Orchestration	The number of parts found in the mime message.
ParseActivityDone	Info	Orchestration	The activity has outputted parts output parameter.
ParseException	Severe	Orchestration	Error occurred while parsing the data.
SerialActivityDone	Info	Orchestration	The activity is done outputting mimeheader and body output parameters.
SerializeException	Severe	Orchestration	Error occurred while serializing the data.
SubType	Info	Orchestration	Sub Type found in content type of the message.
TransferEncChanged	Warning	Orchestration	The attachment body has lines greater than 998 characters in length. Changing the Content-Transfer-Encoding to binary.
TransferEncLimit	Severe	Orchestration	Entities of type specified cannot have any other Content-Transfer-Encoding apart from 7bit.
TransferEncMissing	Warning	Orchestration	Content-Transfer-Encoding value is missing for specified attachment number . Guessing based on Content-Type and charset values.
TransferEncodingError	Severe	Orchestration	Content-Transfer-Encoding specified in Composite media type cannot be any other apart from 7bit, 8bit or binary.
TransferEncodingValue	Info	Orchestration	Activity found Content-Transfer-Encoding.

- [MIME Operation Notifications](#)

TransferEncodingValue

Activity found Content-Transfer-Encoding.

Level : *Info*

Log Message : *Got Content-Transfer-Encoding: {ContentTransfer}.*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-MIME-MIB::ciC10oTransferEncodingValueEv24*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.10.1.2*

SNMP Trap Number : *24*

Variables

The TransferEncodingValue message contains the following variables:

Table 1. TransferEncodingValue Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. ContentTransfer

Content Transfer Encoding found in the message.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-MIME-MIB::ciC10oEv24ContentTransfer
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.3.10.1.2.1.24.1

The Maestro Module represents the internal operation of the Cast Iron runtime. This section contains details for the messages delivered from the Maestro Module.

This topic provides the MIB Name and MIB OID information, in addition to high-level details about each notification in the Maestro Module.

MIB Name : *CASTIRON-COMP-MAESTRO-MIB*

MIB OID : *.1.3.6.1.4.1.13336.2.2.3.20*

The following table provides an alphabetical list of all notifications that can be issued by the Maestro Module.

Table 1. Notifications issued by the Maestro Module

Notification	Level	System	Description
AbandonedJobs	Warning	Orchestration	A timeout occurred while waiting for jobs to stop and some jobs were abandoned.
ActInvalidLicense (Deprecated)	Severe	Orchestration	Deprecated.
ActivityFailedError	Severe	Orchestration	Encountered fault of specified type, please see rest of the log for more information.
AlreadyDeployed	Severe	Orchestration	The specified orchestration is already deployed.
CallContext	Severe	Orchestration	Maestro is not able to create call context.
CallContextDestroy	Info	Orchestration	Call context created but task never started.
CatchExpression	Severe	Orchestration	Unable to parse the catch expression.
CleanUpFailed	Warning	Orchestration	Failed to clean up the activity.
CloseInputStream	Warning	Orchestration	Could not close input stream.
CloseOutputStream	Warning	Orchestration	Could not close output stream.
CloseReader	Warning	Orchestration	Could not close reader.
CloseWriter	Warning	Orchestration	Could not close writer.
DeactivateFailed	Severe	Orchestration	Maestro failed to deactivate the specified activity.
DebugFailed	Severe	Orchestration	Debugger operation failed.
DeleteObject	Warning	Orchestration	Could not clean up object with ID.
DestroyFailed	Severe	Orchestration	Maestro failed to destroy the specified activity.
EnqueueFailed	Severe	Orchestration	Unable to enqueue the orchestration.
EntryPath	Severe	Orchestration	Could not find an entry point for the specified activity in the compiled orchestration.
ErrorMap	Severe	Orchestration	Error in map activity.
ErrorTwoPhase	Severe	Orchestration	Activity could not be converted to Two phase activity.
ExecuteError	Severe	Orchestration	Unable to execute the orchestration.
FaultInfo	Severe	Orchestration	Could not initialize FaultInfo.
ForEach	Severe	Orchestration	Error occurred in for each activity.

Notification	Level	System	Description
IOError	Warning	Orchestration	Internal error occurred because of Input/Output error.
InitializeJobInfo	Severe	Orchestration	Could not initialize job info.
InputMap	Severe	Orchestration	No input maps are there for required input parameter.
InputMapXPath	Severe	Orchestration	Could not perform input map expression.
InputMapXSLT	Severe	Orchestration	Could not perform input map XSLT.
InvokeError	Severe	Orchestration	Error occurred in module.
KeyLog	Info	Orchestration	Logged key with specified name and value.
LargeInputParam	Warning	Orchestration	Specified input parameter is over the limit and is too large to log.
LargeNonpersistentVar	Severe	Orchestration	Specified variable is too large for a non-persistent orchestration.
LargeOutputParam	Warning	Orchestration	Specified output parameter is over the limit and is too large to log.
LargeTotalVarSize	Severe	Orchestration	This job cannot be run during low-memory conditions.
LargeVariable	Warning	Orchestration	Specified variable is over the limit and is too large to log.
LicenseExpireImminent (Deprecated)	Severe	Orchestration	Deprecated.
LicenseExpireSoon (Deprecated)	Warning	Orchestration	Deprecated.
LicenseExpired (Deprecated)	Severe	Orchestration	Deprecated.
LicenseInvalid (Deprecated)	Severe	Orchestration	Deprecated.
LoaderCancel	Severe	Orchestration	Cancel of job with specified ID of specified orchestration.
LoaderDelete	Severe	Orchestration	Delete of specified orchestration failed.
LoaderDeploy	Severe	Orchestration	Deployment of specified orchestration failed.
LoaderPublish	Severe	Orchestration	Publish of specified configuration failed.
LoaderStart	Severe	Orchestration	Start of the specified orchestration failed.
LoaderStop	Severe	Orchestration	Stop of the specified orchestration failed.
LoaderSuspend	Severe	Orchestration	Suspend of the specified orchestration failed.
LoaderunDeploy	Severe	Orchestration	Undeploy of specified orchestration failed.
MBeanRegister	Severe	Orchestration	Could not register specified object with MBean server.
MBeanUnregister	Severe	Orchestration	Could not unregister specified object with MBean server.

Notification	Level	System	Description
MaxSeqNum	Warning	Orchestration	Exceeded maximum number of activity events for a job.
ModuleConfig	Severe	Orchestration	Could not read module configuration.
MonitorQuery	Severe	Orchestration	Could not query for monitor data.
MonitorVariable	Warning	Orchestration	Could not log monitor variable.
MonitorVariables	Warning	Orchestration	Could not log monitor variables.
MontiorEvents	Severe	Orchestration	Could not log monitor events.
MultipleActFactory	Severe	Orchestration	Activity Factory with specified name and version has multiple registrations, and hence not loading it.
NoActivityFactory	Severe	Orchestration	Activity Factory with specified name and version not registered.
NotDeployed	Severe	Orchestration	Orchestration not deployed.
NotDocParameter	Severe	Orchestration	Specified parameter is not an XML document.
NotDocVariable	Severe	Orchestration	Specified variable is not an XML document.
NotStopped	Severe	Orchestration	Could not undeploy as the orchestration is not stopped.
NotSuspend	Severe	Orchestration	Could not suspend as the orchestration is not running.
NullParam	Severe	Orchestration	Specified parameter is null.
NullVariable	Severe	Orchestration	Specified variable is null.
OSGISyntaxError	Severe	Orchestration	Invalid OSGI query syntax provided.
OrchCompileError	Severe	Orchestration	Unable to compile the specified orchestration.
OutputMap	Severe	Orchestration	Could not perform output map.
OutputMapXPath	Severe	Orchestration	Could not perform output map expression.
OutputMapXSLT	Severe	Orchestration	Could not perform output map transform.
ParamIndex	Warning	Orchestration	Parameter at specified index is already set.
ProgramDestroy	Severe	Orchestration	Program in non terminal state being destroyed.
ProgramStart	Severe	Orchestration	Cannot start an orchestration that is in transient state.
SocketNoReply	Warning	Orchestration	Could not receive socket reply.
SplitError	Severe	Orchestration	Error occurred in split activity.
SwitchExpEmpty	Severe	Orchestration	The condition provided for if-then activity and case label is empty.
SwitchExpression	Severe	Orchestration	Unable to parse the if-then expression.
TaskCancelled	Warning	Orchestration	Caught exception while cancelling job.
TaskEnd	Info	Orchestration	Ended job for specified orchestration.
TaskFound	Severe	Orchestration	Found task with specified state on undeploy.

Notification	Level	System	Description
TaskRemove	Severe	Orchestration	Unable to remove the task.
TaskStart	Info	Orchestration	Started job for specified orchestration.
TaskState	Severe	Orchestration	Unable to set the task state.
TaskStateTransition	Severe	Orchestration	Invalid task state transition happened, hence marking the job as faulted.
TaskStatusChanged	Info	Orchestration	Job status changed.
TooManyWaitingJobs	Severe	Orchestration	A job was aborted due to a large number of waiting jobs.
UnCaughtError	Severe	Orchestration	Uncaught Internal error occurred.
UnexpectedError	Severe	Orchestration	Unexpected Internal error occurred.
VariableNull	Warning	Orchestration	Specified variable is null.
WhileExpEmpty	Severe	Orchestration	The condition provided for while activity is empty.
WhileExpression	Severe	Orchestration	Unable to parse while expression with specified condition.
WrongActFactory	Severe	Orchestration	Activity factory with specified name and version returned wrong class.

Maestro Operation Notifications

Provides a comprehensive list of operation notifications sent from the Maestro Module.

- [AbandonedJobs](#)
A timeout occurred while waiting for jobs to stop and some jobs were abandoned.
- [ActInvalidLicense \(Deprecated\)](#)
Activity Factory with specified name and version had a licensing failure.
- [ActivityFailedError](#)
Encountered fault of specified type, please see rest of the log for more information.
- [AlreadyDeployed](#)
The specified orchestration is already deployed.

- [CallContext](#)
Maestro is not able to create call context.
- [CallContextDestroy](#)
Call context created but task never started.
- [CatchExpression](#)
Unable to parse the catch expression.
- [CleanUpFailed](#)
Failed to clean up the activity.
- [CloseInputStream](#)
Could not close input stream.
- [CloseOutputStream](#)
Could not close output stream.
- [CloseReader](#)
Could not close reader.
- [CloseWriter](#)
Could not close writer.
- [DeactivateFailed](#)
Maestro failed to deactivate the specified activity.
- [DebugFailed](#)
Debugger operation failed.
- [DeleteObject](#)
Could not clean up object with ID.
- [DestroyFailed](#)
Maestro failed to destroy the specified activity.
- [EnqueueFailed](#)
Unable to enqueue the orchestration.
- [EntryPath](#)
Could not find an entry point for the specified activity in the compiled orchestration.
- [ErrorMap](#)
Error in map activity.
- [ErrorTwoPhase](#)
Activity could not be converted to Two phase activity.
- [ExecuteError](#)
Unable to execute the orchestration.
- [FaultInfo](#)
Could not initialize FaultInfo.
- [ForEach](#)
Error occurred in for each activity.
- [InitializeJobInfo](#)
Could not initialize job info.
- [InputMap](#)
No input maps are there for required input parameter.
- [InputMapXPath](#)
Could not perform input map expression.
- [InputMapXSLT](#)
Could not perform input map XSLT.
- [InvokeError](#)
Error occurred in module.
- [KeyLog](#)
Logged key with specified name and value.
- [LargeInputParam](#)
Specified input parameter is over the limit and is too large to log.

- [LargeNonpersistentVar](#)
Specified variable is too large for a non-persistent orchestration.
- [LargeOutputParam](#)
Specified output parameter is over the limit and is too large to log.
- [LargeTotalVarSize](#)
This job cannot be run during low-memory conditions.
- [LargeVariable](#)
Specified variable is over the limit and is too large to log.
- [LicenseExpireImminent \(Deprecated\)](#)
Imminent license expiration for specified bundle - expires on specified date - Please renew the license now to avoid service interruption.
- [LicenseExpireSoon \(Deprecated\)](#)
License for specified bundle name expires soon. Please renew the license to avoid service interruption.
- [LicenseExpired \(Deprecated\)](#)
License has expired. Please renew the license now to avoid service interruption.
- [LicenseInvalid \(Deprecated\)](#)
License for specified bundle name is invalid.
- [LoaderCancel](#)
Cancel of job with specified ID of specified orchestration.
- [LoaderDelete](#)
Delete of specified orchestration failed.
- [LoaderDeploy](#)
Deployment of specified orchestration failed.
- [LoaderPublish](#)
Publish of specified configuration failed.
- [LoaderStart](#)
Start of the specified orchestration failed.
- [LoaderStop](#)
Stop of the specified orchestration failed.
- [LoaderSuspend](#)
Suspend of the specified orchestration failed.
- [LoaderunDeploy](#)
Undeploy of specified orchestration failed.
- [MBeanRegister](#)
Could not register specified object with MBean server.
- [MBeanUnregister](#)
Could not unregister specified object with MBean server.
- [MaxSeqNum](#)
Exceeded maximum number of activity events for a job.
- [ModuleConfig](#)
Could not read module configuration.
- [MonitorQuery](#)
Could not query for monitor data.
- [MonitorVariable](#)
Could not log monitor variable.
- [MonitorVariables](#)
Could not log monitor variables.
- [MontiorEvents](#)
Could not log monitor events.
- [MultipleActFactory](#)
Activity Factory with specified name and version has multiple registrations, and hence not loading it.
- [NoActivityFactory](#)
Activity Factory with specified name and version not registered.

- [NotDeployed](#)
Orchestration not deployed.
- [NotDocParameter](#)
Specified parameter is not an XML document.
- [NotDocVariable](#)
Specified variable is not an XML document.
- [NotStopped](#)
Could not undeploy as the orchestration is not stopped.
- [NotSuspend](#)
Could not suspend as the orchestration is not running.
- [NullParam](#)
Specified parameter is null.
- [NullVariable](#)
Specified variable is null.
- [OSGISyntaxError](#)
Invalid OSGI query syntax provided.
- [OrchCompileError](#)
Unable to compile the specified orchestration.
- [OutputMap](#)
Could not perform output map.
- [OutputMapXPath](#)
Could not perform output map expression.
- [OutputMapXSLT](#)
Could not perform output map transform.
- [ParamIndex](#)
Parameter at specified index is already set.
- [ProgramDestroy](#)
Program in non terminal state being destroyed.
- [ProgramStart](#)
Cannot start an orchestration that is in transient state.
- [SocketNoReply](#)
Could not receive socket reply.
- [SplitError](#)
Error occurred in split activity.
- [SwitchExpEmpty](#)
The condition provided for if-then activity and case label is empty.
- [SwitchExpression](#)
Unable to parse the if-then expression.
- [TaskCancelled](#)
Caught exception while cancelling job.
- [TaskEnd](#)
Ended job for specified orchestration.
- [TaskFound](#)
Found task with specified state on undeploy.
- [TaskRemove](#)
Unable to remove the task.
- [TaskStart](#)
Started job for specified orchestration.
- [TaskState](#)
Unable to set the task state.
- [TaskStateTransition](#)
Invalid task state transition happened, hence marking the job as faulted.

- [TaskStatusChanged](#)
Job status changed.
- [TooManyWaitingJobs](#)
A job was aborted due to a large number of waiting jobs.
- [VariableNull](#)
Specified variable is null.
- [WhileExpEmpty](#)
The condition provided for while activity is empty.
- [WhileExpression](#)
Unable to parse while expression with specified condition.
- [WrongActFactory](#)
Activity factory with specified name and version returned wrong class.

AbandonedJobs

A timeout occurred while waiting for jobs to stop and some jobs were abandoned.

Level : *Warning*

Log Message : *Timeout waiting for jobs to stop, number of jobs abandoned: {NumberOfAbandonedJobs}*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-MAESTRO-MIB::ciC20oAbandonedJobsEv87*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.20.1.2*

SNMP Trap Number : *87*

Variables

The AbandonedJobs message contains the following variables:

Table 1. AbandonedJobs Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. NumberOfAbandonedJobs

The number of abandoned jobs.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-MAESTRO-MIB::ciC20oEv87NumberOfAbandonedJobs
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.3.20.1.2.1.87.1

ActivityFailedError

Encountered fault of specified type, please see rest of the log for more information.

Level : *Severe*

Log Message : *Encountered fault of type {FaultType}, please see rest of the log for more information*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-MAESTRO-MIB::ciC20oActivityFailedErrorEv3*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.20.1.2*

SNMP Trap Number : 3

Variables

The ActivityFailedError message contains the following variables:

Table 1. ActivityFailedError Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. FaultType

The fault type encountered.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-MAESTRO-MIB::ciC20oEv3FaultType
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.3.20.1.2.1.3.1

InputMapXPath

Could not perform input map expression.

Level : *Severe*

Log Message : *Could not perform input map expression: {ExpressionName}*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-MAESTRO-MIB::ciC20oInputMapXPathEv14*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.20.1.2*

SNMP Trap Number : *14*

Variables

The InputMapXPath message contains the following variables:

Table 1. InputMapXPath Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber

- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. ExpressionName

The name of the expression.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-MAESTRO-MIB::ciC20oEv14ExpressionName
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.3.20.1.2.1.14.1

LoaderunDeploy

Undeploy of specified orchestration failed.

Level : *Severe*

Log Message : *Undeploy of Orchestration {OrchName} failed: {Message}.*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-MAESTRO-MIB::ciC20oLoaderunDeployEv21*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.20.1.2*

SNMP Trap Number : *21*

Variables

The LoaderunDeploy message contains the following variables:

Table 1. LoaderunDeploy Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. OrchName

The orchestration name for which undeploy failed.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-MAESTRO-MIB::ciC20oEv21OrchName
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.20.1.2.1.21.1

6. Message

Textual description of the error.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvMessage
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.1.2.2

NotDeployed

Orchestration not deployed.

Level : *Severe*

Log Message : *Orchestration not deployed: {OrchName}*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-MAESTRO-MIB::ciC20oNotDeployedEv39*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.20.1.2*

SNMP Trap Number : *39*

Variables

The NotDeployed message contains the following variables:

Table 1. NotDeployed Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. OrchName

The name of the orchestration not deployed.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-MAESTRO-MIB::ciC20oEv39OrchName
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.20.1.2.1.39.1

IOError

Internal error occurred because of Input/Output error.

Level : *Warning*

Log Message : *Internal error: {Message}*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-MAESTRO-MIB::ciC20iIOErrorEv3*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.20.1.3*

SNMP Trap Number : 3

Variables

The IOError message contains the following variables:

Table 1. IOError Message Variables

<p>1. SerialNumber</p> <p>The serial number of the appliance sending the trap.</p> <ul style="list-style-type: none">• Type : String• SNMP Object Name : CASTIRON-IA-MIB::ciIaPlatSerialNumber• SNMP OID : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3
<p>2. Severity</p> <p>Severity of the Notification.</p> <ul style="list-style-type: none">• Type : Integer• SNMP Object Name : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity• SNMP OID : 1.3.6.1.4.1.13336.2.2.1.2.1
<p>3. JobID</p> <p>The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.</p> <ul style="list-style-type: none">• Type : String• SNMP Object Name : CASTIRON-REGISTRATIONS-MIB::ciEvJobID• SNMP OID : 1.3.6.1.4.1.13336.2.2.1.2.4
<p>4. Orchestration</p> <p>Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.</p> <ul style="list-style-type: none">• Type : OID• SNMP Object Name : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration• SNMP OID : 1.3.6.1.4.1.13336.2.2.1.2.3

UnexpectedError

Unexpected Internal error occurred.

Level : *Severe*

Log Message : *Internal error: {Message}*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-MAESTRO-MIB::ciC20iUnexpectedErrorEv2*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.20.1.3*

SNMP Trap Number : 2

Variables

The UnexpectedError message contains the following variables:

Table 1. UnexpectedError Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. Message

Textual description of the error.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvMessage
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.2

NetSuite Module

The NetSuite Module provides access to the NetSuite online service. This section contains details for the messages delivered from the NetSuite Module.

This topic provides the MIB Name and MIB OID information, in addition to high-level details about each notification in the NetSuite Module.

MIB Name : *CASTIRON-COMP-NETSUITE-MIB*

MIB OID : *.1.3.6.1.4.1.13336.2.2.3.11*

The following table provides an alphabetical list of all notifications that can be issued by the NetSuite Module.

Table 1. Notifications issued by the NetSuite Module

Notification	Level	System	Description
ConnectionFailed	Severe	Orchestration	The NetSuite operation failed because a connection to the server could not be established.
ConnectionPoolError	Warning	Orchestration	Error occurred while returning connection to pool. Continuing the activity.
ConnectionRetry	Warning	Orchestration	The NetSuite operation failed while trying to connect to the server. The operation will be retried.
CustomFieldError	Severe	Orchestration	Error occurred and returned specified soap fault while getting custom fields for the recordType.
IOError	Severe	Orchestration	Unexpected IO error occurred while performing operation with NetSuite.
SoapError	Severe	Orchestration	Error occurred while creating SOAP message.
StreamError	Severe	Orchestration	Unexpected IO exception occurred while streaming the message.
TransformationError	Severe	Orchestration	An error occurred while processing a message for NetSuite.
UnknownError	Severe	Orchestration	Unknown error while invoking an operation on NetSuite.

- [NetSuite Connection Notifications](#)
Provides a comprehensive list of connection notifications sent from the NetSuite Module.
- [NetSuite Operation Notifications](#)
Provides a comprehensive list of operation notifications sent from the NetSuite Module.
- [NetSuite Internal Notifications](#)
Provides a comprehensive list of internal notifications sent from the NetSuite Module.

ConnectionRetry

The NetSuite operation failed while trying to connect to the server. The operation will be retried.

Level : *Warning*

Log Message : *Unable to connect to NetSuite. Error is: {Message}. Attempt {RetryAttemptNumber} of {TotalRetryAttempts}. Will try again in {IntervalForRetries} second(s).*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-NETSUITE-MIB::ciC11cConnectionRetryEv1*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.11.1.1*

SNMP Trap Number : *1*

Variables

The ConnectionRetry message contains the following variables:

Table 1. ConnectionRetry Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. Message

Textual description of the error.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvMessage
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.2

6. RetryAttemptNumber

The current number of retries.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-NETSUITE-MIB::ciC11cEv1RetryAttemptNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.3.11.1.1.1.1.2

7. TotalRetryAttempts

The specified number of attempts to connect to the server before stopping.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-NETSUITE-MIB::ciC11cEv1TotalRetryAttempts
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.3.11.1.1.1.1.3

8. IntervalForRetries

The specified time interval between retries.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-NETSUITE-MIB::ciC11cEv1IntervalForRetries

- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.11.1.1.1.1.4

SoapError

Error occurred while creating SOAP message.

Level : *Severe*

Log Message : *Exception while creating soap message. The exception is: {Message}*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-NETSUITE-MIB::ciC11iSoapErrorEv2*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.11.1.3*

SNMP Trap Number : 2

Variables

The SoapError message contains the following variables:

Table 1. SoapError Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber

- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. Message

Textual description of the error.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvMessage
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.2

PeopleSoft Module

The PeopleSoft Module provides access to Oracle's PeopleSoft applications. This section contains details for the messages delivered from the PeopleSoft Module.

This topic provides the MIB Name and MIB OID information, in addition to high-level details about each notification in the PeopleSoft Module.

MIB Name : *CASTIRON-COMP-PEOPLESOFT-MIB*

MIB OID : *1.3.6.1.4.1.13336.2.2.3.9*

The following table provides an alphabetical list of all notifications that can be issued by the PeopleSoft Module.

Table 1. Notifications issued by the PeopleSoft Module

Notification	Level	System	Description
ActivateFailureBlank	Severe	Orchestration	Activity could not be started as the specified name was blank.

Notification	Level	System	Description
ActivateSuccess	Info	Orchestration	Activity name specified was successfully activated.
ActivateUnsuccessful	Info	Orchestration	Error occurred while connecting to PeopleSoft system while activating activity. Activity activated, will try to establish connectivity at activity execute time.
ActivityFailure	Severe	Orchestration	Activity name specified failed to execute.
ActivitySuccessful	Info	Orchestration	Activity name specified executed successfully. The response output parameter was successfully generated.
ConfigURI	Info	Orchestration	Information regarding the URI and Port where the PeopleSoft Receive is listening.
ConnectionError	Severe	Orchestration	The peoplesoft operation failed because a connection to the server could not be established.
ConnectionPoolError	Warning	Orchestration	Error occurred while returning connection to the pool. Continuing the activity.
ConnectionRetry	Warning	Orchestration	The peoplesoft operation failed while trying to connect to the server. This will cause a retry.
CreateOnlyKeys	Warning	Orchestration	Only Create Keys was specified and no other properties were specified. Create might not have created the record.
DataLengthMore	Warning	Orchestration	The data set for specified field name has length exceeding the field length. This may cause loss of data.
DeleteFail	Warning	Orchestration	The activity failed to delete specified item number.
GetNoReturn	Info	Orchestration	Activity name specified could not find any record.
ItemNumberBlank	Warning	Orchestration	Item number returned is empty.
MakeConnectError	Warning	Orchestration	Error occurred while creating the connection to destination.
MessageNameVersion	Severe	Orchestration	Message name and version got does not match that set in activity.
MissingLibraries	Severe	Orchestration	Peoplesoft activity is missing required libraries. Please install them from WMC.
NoOperationOnRecord	Warning	Orchestration	Activity could not find any record to do specified operation on it.
OutOfRange	Warning	Orchestration	Activity is trying to delete an item which is out of range.
PoolReleaseError	Warning	Orchestration	Error occurred while closing the connection pool.
ReceiveActivate	Severe	Orchestration	Error occurred while activating PeopleSoft Receive.
ReceiveDeActivate	Severe	Orchestration	Error occurred while deactivating PeopleSoft Receive.
ReceiveError	Severe	Orchestration	Peoplesoft receive activity was unsuccessful in receiving the request.

Notification	Level	System	Description
ReceiveGeneralError	Severe	Orchestration	Error occurred while sending the response from PeopleSoft Receive.
ReceiveIOError	Severe	Orchestration	IO Error occurred while processing request in PeopleSoft Receive.
ReceiveInfo	Info	Orchestration	Got document from specified host with specified name and version.
ReceiveProcess	Severe	Orchestration	Error occurred while processing request in PeopleSoft Receive.
ReceiveSuccessful	Info	Orchestration	Peoplesoft receive activity successfully received the request.
RunningInfo	Warning	Orchestration	Faced few warnings or errors while running Peoplesoft activity.
RunningMessages	Warning	Orchestration	Received messages while executing the activity.
SetupInfo	Warning	Orchestration	Faced few warnings or errors while setting up Peoplesoft activity.

ActivateUnsuccessful

Error occurred while connecting to PeopleSoft system while activating activity. Activity activated, will try to establish connectivity at activity execute time.

Level : *Info*

Log Message : *Error connecting to PeopleSoft system while activating activity {ActivityName}, error is: {Message}. Activity activated, will try to establish connectivity at activity execute time*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-PEOPLESOFT-MIB::ciC9cActivateUnsuccessfulEv1*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.9.1.1*

SNMP Trap Number : *1*

Variables

The ActivateUnsuccessful message contains the following variables:

Table 1. ActivateUnsuccessful Message Variables

<p>1. SerialNumber</p> <p>The serial number of the appliance sending the trap.</p> <ul style="list-style-type: none"> • Type : String • SNMP Object Name : CASTIRON-IA-MIB::ciIaPlatSerialNumber • SNMP OID : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3
--

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. ActivityName

The activity name which failed to connect to Peoplesoft system.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-PEOPLESOFT-MIB::ciC9cEv1ActivityName
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.9.1.1.1.1.1

6. Message

Textual description of the error.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvMessage
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.1.2.2

PeopleSoft Operation Notifications

Provides a comprehensive list of operation notifications sent from the PeopleSoft Module.

- [ActivateFailureBlank](#)
Activity could not be started as the specified name was blank.
- [ActivateSuccess](#)
Activity name specified was successfully activated.
- [ActivityFailure](#)
Activity name specified failed to execute.
- [ActivitySuccessful](#)
Activity name specified executed successfully. The response output parameter was successfully

- generated.
- [ConfigURI](#)
Information regarding the URI and Port where the PeopleSoft Receive is listening.
 - [CreateOnlyKeys](#)
Only Create Keys was specified and no other properties were specified. Create might not have created the record.
 - [DataLengthMore](#)
The data set for specified field name has length exceeding the field length. This may cause loss of data.
 - [DeleteFail](#)
The activity failed to delete specified item number.
 - [GetNoReturn](#)
Activity name specified could not find any record.
 - [ItemNumberBlank](#)
Item number returned is empty.
 - [MessageNameVersion](#)
Message name and version got does not match that set in activity.
 - [NoOperationOnRecord](#)
Activity could not find any record to do specified operation on it.
 - [OutOfRange](#)
Activity is trying to delete an item which is out of range.
 - [ReceiveError](#)
Peoplesoft receive activity was unsuccessful in receiving the request.
 - [ReceiveGeneralError](#)
Error occurred while sending the response from PeopleSoft Receive.
 - [ReceiveInfo](#)
Got document from specified host with specified name and version.
 - [ReceiveProcess](#)
Error occurred while processing request in PeopleSoft Receive.
 - [ReceiveSuccessful](#)
Peoplesoft receive activity successfully received the request.
 - [RunningInfo](#)
Faced few warnings or errors while running Peoplesoft activity.
 - [RunningMessages](#)
Received messages while executing the activity.

Log Message : *Data being set for field named {FieldName} has length {DataLength}, where as field has length {FieldLength}. There may be loss of data.*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-PEOPLESOFT-MIB::ciC9oDataLengthMoreEv12*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.9.1.2*

SNMP Trap Number : *12*

Variables

The DataLengthMore message contains the following variables:

Table 1. DataLengthMore Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. FieldName

Name of the field for which data has been set.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-PEOPLESOFT-MIB::ciC9oEv12FieldName
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.9.1.2.1.12.1

6. DataLength

Length of the data which has been set for this field.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-PEOPLESOFT-MIB::ciC9oEv12DataLength
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.9.1.2.1.12.2

7. FieldLength

Length of the field for which data has been set.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-PEOPLESOFT-MIB::ciC9oEv12FieldLength
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.9.1.2.1.12.3

ReceiveProcess

Error occurred while processing request in PeopleSoft Receive.

Level : *Severe*

Log Message : *Error while processing request in PeopleSoft Receive. The error is: {Message}*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-PEOPLESOFT-MIB::ciC9oReceiveProcessEv18*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.9.1.2*

SNMP Trap Number : *18*

Variables

The ReceiveProcess message contains the following variables:

Table 1. ReceiveProcess Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. Message

Textual description of the error.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvMessage
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.2

Platform Module

The Platform module provides notifications for elements generally not associated with projects or the runtime such as hardware, network, security, and resources. This section contains details for the messages delivered from the Platform Module.

This topic provides the MIB Name and MIB OID information, in addition to high-level details about each notification in the Platform Module.

MIB Name : *CASTIRON-COMP-PLATFORM-MIB*

MIB OID : .1.3.6.1.4.1.13336.2.2.3.23

The following table provides an alphabetical list of all notifications that can be issued by the Platform Module.

Table 1. Notifications issued by the Platform Module

Notification	Level	System	Description
AccessViolation	Info	Security	An authenticated user attempted to access a section of the Cast Iron product which would require additional authorization.
AuthFailure	Severe	Security	An attempt to authenticate with the appliance failed.
AuthLogOut	Info	Security	Event showing logging out of the user.
AuthSuccess	Info	Security	Attempt to authenticate with the appliance was successful.
DiskUsageCritOk	Info	Resources	Disk space usage is below the critical threshold.
DiskUsageCritical	Severe	Resources	Disk space usage has exceeded the critical threshold.

Notification	Level	System	Description
DiskUsageWarnOk	Info	Resources	Disk space usage is below the warning threshold.
DiskUsageWarning	Warning	Resources	Disk space usage has exceeded the warning threshold.
FanFailed	Severe	Hardware	A cooling fan is not operating correctly.
FanRestored	Info	Hardware	A cooling fan has resumed proper operation.
GrantRole	Info	Security	grant new role created.
GroupCreated	Info	Security	New group created.
GroupDeleted	Info	Security	Group deleted.
HighAvailFailover	Info	Hardware	The High Availability failover feature has taken effect; failover is complete.
HighAvailNotReady	Warning	Hardware	The HA system is not Highly Available.
HighAvailReady	Info	Hardware	The HA system is Highly Available.
HighAvailVersionError	Severe	Resources	The version of CIOS running on Standby does not match that running on Active.
IntrusionInform	Warning	Hardware	The appliance case has been opened.
IntrusionSevere	Severe	Hardware	The appliance case has been opened, which could result in system failure. Please contact Cast Iron Support.
LargeFileWarning	Warning	Resources	Large file taking up space on heavily loaded disk.
NetworkAutohost	Warning	Network	The Autohost feature has added the appliance's hostname and IP address to /etc/hosts.
NetworkInvalidRoute	Warning	Network	Could not add a requested network route.
NetworkLinkDown	Warning	Network	The network link is down (offline).
NetworkLinkUp	Info	Network	The network link is up (online).
OrcmonArchiveError	Severe	Resources	Job log archive error.
OrcmonDatabaseError	Severe	Resources	Job log database error.
OrcmonDiskFull	Warning	Resources	Normal job log purging did not clear enough disk space. Purging half of all job logs in attempt to recover disk space.
OrcmonDiskFullNoPurge	Severe	Resources	Failed to purge any job logs to recover disk space.
OrcmonDiskTrigger	Info	Resources	Job log purge was initiated due to an available disk space trigger.
OrcmonExportCdError	Severe	Resources	Could not upload the job log archive file to the FTP server: Could not cd to the destination directory.
OrcmonExportError	Severe	Resources	Failure uploading archive file to FTP server.
OrcmonExportFTP	Info	Resources	Exporting archive file to FTP server.
OrcmonExportLocal	Info	Resources	Exporting job log data to a local archive file.

Notification	Level	System	Description
OrcmonExportStoreErr	Severe	Resources	Failure uploading archive file to FTP server: Could not store file.
OrcmonExportedJobs	Info	Resources	Exported jobs from the job log.
OrcmonPurgeByCompl	Info	Resources	Job log purge has been triggered based on the number of stored completed jobs.
OrcmonPurgeByErrored	Info	Resources	Job log purge has been triggered based on the number of stored errored jobs.
OrcmonPurgeByTime	Info	Resources	Job log purge has been triggered based on the amount of time since the last purge.
OrcmonPurgeByTimeNP	Info	Resources	Job log purge has been triggered based on the amount of time since collection began.
OrcmonPurgeFailed	Severe	Resources	Job log purge/archive failed.
PowerInterrupted	Warning	Hardware	A power module has reported that it does not have power.
PowerRestored	Info	Hardware	A power module has reported that power has been restored.
RaidArrayDegraded	Severe	Hardware	The RAID array on the appliance is degraded.
RaidArrayOffline	Severe	Hardware	The RAID array on the appliance is offline. Please contact Cast Iron Support.
RaidArrayOptimal	Info	Hardware	The RAID array on the appliance is optimal.
RaidDiskFailed	Severe	Hardware	A disk on the appliance has failed.
RaidDiskOnline	Info	Hardware	A disk on the appliance is now online and working properly.
RaidDiskRebuilding	Info	Hardware	A disk on the appliance is rebuilding.
RevokeRole	Info	Security	User role revoked.
SwapUsageCritOk	Info	Resources	Swap space usage is below the critical threshold.
SwapUsageCritical	Severe	Resources	Swap space usage has exceeded the critical threshold.
SwapUsageWarnOk	Info	Resources	Swap space usage is below the warning threshold.
SwapUsageWarning	Warning	Resources	Swap space usage has exceeded the warning threshold.
SystemInitComplete	Info	Hardware	The appliance is finished initializing after reboot.
SystemInitStarted	Info	Hardware	The appliance is initializing after being shut down or rebooted.
SystemRecoveryReboot	Warning	Hardware	Operational failure was detected. System is rebooting to recover.
SystemRecoveryRestart	Warning	Hardware	Operational failure was detected. System is restarting to recover.

Notification	Level	System	Description
TemperatureOutOfRange	Severe	Hardware	A monitored temperature within the appliance is too high, which could lead to future failures.
TemperatureRestored	Info	Hardware	A temperature which was previously out of range (too hot) has come back into range
UpdateStatus	Info	Security	Update user status as active or inactive.
UpdateUser	Info	Security	Update display name of a user.
UpgradeComplete	Info	Hardware	The Cast Iron firmware was successfully upgraded.
UpgradeFailed	Severe	Hardware	The attempt to upgrade the Cast Iron firmware has failed.
UserCreated	Info	Security	New user created.
UserDeleted	Info	Security	User deleted.

Platform Hardware Notifications

Provides a comprehensive list of hardware notifications sent from the Platform Module.

- [FanFailed](#)
A cooling fan is not operating correctly.
- [FanRestored](#)
A cooling fan has resumed proper operation.
- [HighAvailFailover](#)
The High Availability failover feature has taken effect; failover is complete.
- [HighAvailNotReady](#)
The HA system is not Highly Available.
- [HighAvailReady](#)
The HA system is Highly Available.

- [IntrusionInform](#)
The appliance case has been opened.
- [IntrusionSevere](#)
The appliance case has been opened, which could result in system failure. Please contact Cast Iron Support.
- [PowerInterrupted](#)
A power module has reported that it does not have power.
- [PowerRestored](#)
A power module has reported that power has been restored.
- [RaidArrayDegraded](#)
The RAID array on the appliance is degraded.
- [RaidArrayOffline](#)
The RAID array on the appliance is offline. Please contact Cast Iron Support.
- [RaidArrayOptimal](#)
The RAID array on the appliance is optimal.
- [RaidDiskFailed](#)
A disk on the appliance has failed.
- [RaidDiskOnline](#)
A disk on the appliance is now online and working properly.
- [RaidDiskRebuilding](#)
A disk on the appliance is rebuilding.
- [SystemInitComplete](#)
The appliance is finished initializing after reboot.
- [SystemInitStarted](#)
The appliance is initializing after being shut down or rebooted.
- [SystemRecoveryReboot](#)
Operational failure was detected. System is rebooting to recover.
- [SystemRecoveryRestart](#)
Operational failure was detected. System is restarting to recover.
- [TemperatureOutOfRange](#)
A monitored temperature within the appliance is too high, which could lead to future failures.
- [TemperatureRestored](#)
A temperature which was previously out of range (too hot) has come back into range
- [UpgradeComplete](#)
The Cast Iron firmware was successfully upgraded.
- [UpgradeFailed](#)
The attempt to upgrade the Cast Iron firmware has failed.

FanFailed

A cooling fan is not operating correctly.

The most likely cause is that the fan has become disconnected or has failed. The recommended action is to 1) confirm the appliance with the corresponding AffectedAppliance serial number has an indicator LED (usually orange), 2) confirm the fan is properly connected, and 3) contact Cast Iron Support for assistance replacing the fan.

Level : *Severe*

Log Message : *Fan {FanID} on appliance {AffectedAppliance} is not functional. Current={CurrentSpeed} RPM. Minimum={MinimumSpeed} RPM.*

System : *Hardware*

SNMP Name : *CASTIRON-COMP-PLATFORM-MIB::ciC23hFanFailedEv1*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.23.1.4*

SNMP Trap Number : *1*

Variables

The FanFailed message contains the following variables:

Table 1. FanFailed Message Variables

<p>1. SerialNumber</p> <p>The serial number of the appliance sending the trap.</p> <ul style="list-style-type: none">• Type : String• SNMP Object Name : CASTIRON-IA-MIB::ciIaPlatSerialNumber• SNMP OID : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3
<p>2. Severity</p> <p>Severity of the Notification.</p> <ul style="list-style-type: none">• Type : Integer• SNMP Object Name : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity• SNMP OID : 1.3.6.1.4.1.13336.2.2.1.2.1
<p>3. FanID</p> <p>Identifier associated with the failed fan.</p> <ul style="list-style-type: none">• Type : String• SNMP Object Name : CASTIRON-COMP-PLATFORM-MIB::ciC23hEv1FanID• SNMP OID : .1.3.6.1.4.1.13336.2.2.3.23.1.4.1.1.1
<p>4. AffectedAppliance</p> <p>Serial number of the affected appliance. In some cases this could be different than the serial number of the appliance sending a notification, particularly in the case of High Availability pairs where the Active peer could send a notification on behalf of the Standby peer.</p> <ul style="list-style-type: none">• Type : String

- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvAffectedAppliance
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.1.2.5

5. CurrentSpeed

Current speed of the fan in RPM.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-PLATFORM-MIB::ciC23hEv1CurrentSpeed
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.23.1.4.1.1.3

FanRestored

A cooling fan has resumed proper operation.

This notification may occur if a fan previously failed, but has since been repaired or reconnected.

Level : *Info*

Log Message : *Fan {FanID} on appliance {AffectedAppliance} is functional. Current={CurrentSpeed} RPM.
Minimum={MinimumSpeed} RPM.*

System : *Hardware*

SNMP Name : *CASTIRON-COMP-PLATFORM-MIB::ciC23hFanRestoredEv2*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.23.1.4*

SNMP Trap Number : *2*

Variables

The FanRestored message contains the following variables:

Table 1. FanRestored Message Variables

<p>1. SerialNumber</p> <p>The serial number of the appliance sending the trap.</p> <ul style="list-style-type: none"> • Type : String • SNMP Object Name : CASTIRON-IA-MIB::ciIaPlatSerialNumber • SNMP OID : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

HighAvailFailover

The High Availability failover feature has taken effect; failover is complete.

HA systems may "fail over" to the Standby appliance based on user request or based on the needs of the system. This notification is sent when the procedure has completed, regardless of the reason that the failover occurred.

Level : *Info*

Log Message : *The High Availability peer {AffectedAppliance} has successfully taken over.*

System : *Hardware*

SNMP Name : *CASTIRON-COMP-PLATFORM-MIB::ciC23hHighAvailFailoverEv15*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.23.1.4*

SNMP Trap Number : *15*

Variables

The HighAvailFailover message contains the following variables:

Table 1. HighAvailFailover Message Variables

<p>1. SerialNumber</p> <p>The serial number of the appliance sending the trap.</p> <ul style="list-style-type: none"> • Type : String • SNMP Object Name : CASTIRON-IA-MIB::ciIaPlatSerialNumber • SNMP OID : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

RaidDiskOnline

A disk on the appliance is now online and working properly.

This notification is typically sent when a disk has completed rebuilding and comes online, providing hardware redundancy.

Level : *Info*

Log Message : *The RAID disk {DiskID} on appliance {AffectedAppliance} is online.*

System : *Hardware*

SNMP Name : *CASTIRON-COMP-PLATFORM-MIB::ciC23hRaidDiskOnlineEv14*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.23.1.4*

SNMP Trap Number : *14*

Variables

The RaidDiskOnline message contains the following variables:

Table 1. RaidDiskOnline Message Variables

<p>1. SerialNumber</p> <p>The serial number of the appliance sending the trap.</p> <ul style="list-style-type: none"> • Type : String • SNMP Object Name : CASTIRON-IA-MIB::ciIaPlatSerialNumber • SNMP OID : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3
<p>2. Severity</p> <p>Severity of the Notification.</p> <ul style="list-style-type: none"> • Type : Integer • SNMP Object Name : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity • SNMP OID : 1.3.6.1.4.1.13336.2.2.1.2.1
<p>3. DiskID</p> <p>Identifier associated with the associated disk.</p> <ul style="list-style-type: none"> • Type : Integer • SNMP Object Name : CASTIRON-COMP-PLATFORM-MIB::ciC23hEv14DiskID

- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.23.1.4.1.14.1

4. AffectedAppliance

Serial number of the affected appliance. In some cases this could be different than the serial number of the appliance sending a notification, particularly in the case of High Availability pairs where the Active peer could send a notification on behalf of the Standby peer.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvAffectedAppliance
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.1.2.5

RaidDiskRebuilding

A disk on the appliance is rebuilding.

A rebuilding disk actively copies data from the online disk. While in this state, system performance may be affected and the RAID Array state is usually "Degraded". System performance and the RAID Array state should return to normal when rebuilding has completed.

Level : *Info*

Log Message : *The RAID disk {DiskID} on appliance {AffectedAppliance} is rebuilding.*

System : *Hardware*

SNMP Name : *CASTIRON-COMP-PLATFORM-MIB::ciC23hRaidDiskRebuildingEv13*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.23.1.4*

SNMP Trap Number : *13*

Variables

The RaidDiskRebuilding message contains the following variables:

Table 1. RaidDiskRebuilding Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String

- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. DiskID

Identifier associated with the associated disk.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-PLATFORM-MIB::ciC23hEv13DiskID
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.23.1.4.1.13.1

4. AffectedAppliance

Serial number of the affected appliance. In some cases this could be different than the serial number of the appliance sending a notification, particularly in the case of High Availability pairs where the Active peer could send a notification on behalf of the Standby peer.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvAffectedAppliance
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.1.2.5

SystemRecoveryReboot

Operational failure was detected. System is rebooting to recover.

The Cast Iron appliance continually monitors the health of components within the system. If a component has a momentary failure, the system may choose to reboot to recover from the situation. In the case of a recurring error, further reboots are not used until an hour has passed; instead the runtime is restarted. See the CLI command "system autoreboot" for information about controlling this behavior.

Level : *Warning*

Log Message : *Operational failure was detected on appliance {AffectedAppliance}. System is rebooting to recover. Uptime {Days} days, {Hours}:{Minutes}.*

System : *Hardware*

SNMP Name : *CASTIRON-COMP-PLATFORM-MIB::ciC23hSystemRecoveryRebootEv18*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.23.1.4*

SNMP Trap Number : *18*

Variables

The SystemRecoveryReboot message contains the following variables:

Table 1. SystemRecoveryReboot Message Variables

<p>1. SerialNumber</p> <p>The serial number of the appliance sending the trap.</p> <ul style="list-style-type: none">• Type : String• SNMP Object Name : CASTIRON-IA-MIB::ciIaPlatSerialNumber• SNMP OID : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

Platform Network Notifications

Provides a comprehensive list of network notifications sent from the Platform Module.

- [NetworkAutohost](#)
The Autohost feature has added the appliance's hostname and IP address to /etc/hosts.
- [NetworkInvalidRoute](#)
Could not add a requested network route.
- [NetworkLinkDown](#)
The network link is down (offline).
- [NetworkLinkUp](#)
The network link is up (online).

rm_network_notifications_list.html)

NetworkAutohost

The Autohost feature has added the appliance's hostname and IP address to `/etc/hosts`.

The appliance requires the ability to resolve its own hostname to an IP address. The mapping is validated each time the appliance's network subsystem is started, and may be determined by DNS lookup or from an entry which was manually added via the CLI. If the appliance cannot determine the mapping this way, the autohost feature automatically adds a "best-guess" entry. While this automatic entry may work in many circumstances, it is not guaranteed to allow proper appliance operation in all environments. This notification may indicate a misconfiguration in the network. Therefore it is recommended that the user examine the appliance's network configuration and either enter the appliance's IP address and hostame to DNS, or manually add an entry to `/etc/hosts` by using the CLI command "net add etchost".

Level : *Warning*

Log Message : *Automatically added entry to /etc/hosts with hostname {Hostname} and IP address {IPAddress}.*

System : *Network*

SNMP Name : *CASTIRON-COMP-PLATFORM-MIB::ciC23nNetworkAutohostEv3*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.23.1.5*

SNMP Trap Number : *3*

Variables

The NetworkAutohost message contains the following variables:

Table 1. NetworkAutohost Message Variables

<p>1. SerialNumber</p> <p>The serial number of the appliance sending the trap.</p> <ul style="list-style-type: none">• Type : String• SNMP Object Name : CASTIRON-IA-MIB::ciIaPlatSerialNumber• SNMP OID : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3
<p>2. Severity</p> <p>Severity of the Notification.</p>

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. Hostname

Hostname of the appliance as added to /etc/hosts.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-PLATFORM-MIB::ciC23nEv3Hostname
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.23.1.5.1.3.1

4. IPAddress

IP Address of the appliance as added to /etc/hosts.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-PLATFORM-MIB::ciC23nEv3IPAddress
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.23.1.5.1.3.2

NetworkInvalidRoute

Could not add a requested network route.

One of the requested custom routes could not be added. Please check the network configuration, paying particular attention to the gateway IP address and the ethernet link.

Level : *Warning*

Log Message : *Could not add route to {DestinationIP} on {LinkName}.*

System : *Network*

SNMP Name : *CASTIRON-COMP-PLATFORM-MIB::ciC23nNetworkInvalidRouteEv4*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.23.1.5*

SNMP Trap Number : *4*

Variables

The NetworkInvalidRoute message contains the following variables:

Table 1. NetworkInvalidRoute Message Variables

<p>1. SerialNumber</p> <p>The serial number of the appliance sending the trap.</p> <ul style="list-style-type: none">• Type : String• SNMP Object Name : CASTIRON-IA-MIB::ciIaPlatSerialNumber• SNMP OID : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3
<p>2. Severity</p> <p>Severity of the Notification.</p> <ul style="list-style-type: none">• Type : Integer• SNMP Object Name : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity• SNMP OID : 1.3.6.1.4.1.13336.2.2.1.2.1
<p>3. DestinationIP</p> <p>IP address or netmask defining the requested route.</p> <ul style="list-style-type: none">• Type : String• SNMP Object Name : CASTIRON-COMP-PLATFORM-MIB::ciC23nEv4DestinationIP• SNMP OID : .1.3.6.1.4.1.13336.2.2.3.23.1.5.1.4.1
<p>4. LinkName</p> <p>Name of the network link.</p> <ul style="list-style-type: none">• Type : String• SNMP Object Name : CASTIRON-COMP-PLATFORM-MIB::ciC23nEv4LinkName• SNMP OID : .1.3.6.1.4.1.13336.2.2.3.23.1.5.1.4.2

Platform Resources Notifications

Provides a comprehensive list of resources notifications sent from the Platform Module.

- [DiskUsageCritOk](#)
Disk space usage is below the critical threshold.
- [DiskUsageCritical](#)
Disk space usage has exceeded the critical threshold.
- [DiskUsageWarnOk](#)
Disk space usage is below the warning threshold.
- [DiskUsageWarning](#)
Disk space usage has exceeded the warning threshold.
- [HighAvailVersionError](#)
The version of CIOS running on Standby does not match that running on Active.
- [LargeFileWarning](#)
Large file taking up space on heavily loaded disk.
- [OrcmonArchiveError](#)
Job log archive error.
- [OrcmonDatabaseError](#)
Job log database error.
- [OrcmonDiskFull](#)
Normal job log purging did not clear enough disk space. Purging half of all job logs in attempt to recover disk space.
- [OrcmonDiskFullNoPurge](#)
Failed to purge any job logs to recover disk space.
- [OrcmonDiskTrigger](#)
Job log purge was initiated due to an available disk space trigger.
- [OrcmonExportCdError](#)
Could not upload the job log archive file to the FTP server: Could not cd to the destination directory.
- [OrcmonExportError](#)
Failure uploading archive file to FTP server.

- [OrcmonExportFTP](#)
Exporting archive file to FTP server.
- [OrcmonExportLocal](#)
Exporting job log data to a local archive file.
- [OrcmonExportStoreErr](#)
Failure uploading archive file to FTP server: Could not store file.
- [OrcmonExportedJobs](#)
Exported jobs from the job log.
- [OrcmonPurgeByCompl](#)
Job log purge has been triggered based on the number of stored completed jobs.
- [OrcmonPurgeByErrored](#)
Job log purge has been triggered based on the number of stored errored jobs.
- [OrcmonPurgeByTime](#)
Job log purge has been triggered based on the amount of time since the last purge.
- [OrcmonPurgeByTimeNP](#)
Job log purge has been triggered based on the amount of time since collection began.
- [OrcmonPurgeFailed](#)
Job log purge/archive failed.
- [SwapUsageCritOk](#)
Swap space usage is below the critical threshold.
- [SwapUsageCritical](#)
Swap space usage has exceeded the critical threshold.
- [SwapUsageWarnOk](#)
Swap space usage is below the warning threshold.
- [SwapUsageWarning](#)
Swap space usage has exceeded the warning threshold.

Platform Security Notifications

Provides a comprehensive list of security notifications sent from the Platform Module.

- [AccessViolation](#)
An authenticated user attempted to access a section of the Cast Iron product which would require additional authorization.
- [AuthFailure](#)
An attempt to authenticate with the appliance failed.
- [AuthLogOut](#)
Event showing logging out of the user.
- [AuthSuccess](#)
Attempt to authenticate with the appliance was successful.
- [GrantRole](#)
grant new role created.
- [GroupCreated](#)
New group created.
- [GroupDeleted](#)
Group deleted.

- [RevokeRole](#)
User role revoked.
- [UpdateStatus](#)
Update user status as active or inactive.
- [UpdateUser](#)
Update display name of a user.
- [UserCreated](#)
New user created.
- [UserDeleted](#)
User deleted.

SAP Module

The SAP Module provides activities to access SAP servers. This section contains details for the messages delivered from the SAP Module.

This topic provides the MIB Name and MIB OID information, in addition to high-level details about each notification in the SAP Module.

MIB Name : *CASTIRON-COMP-SAP-MIB*

MIB OID : *.1.3.6.1.4.1.13336.2.2.3.19*

The following table provides an alphabetical list of all notifications that can be issued by the SAP Module.

Table 1. Notifications issued by the SAP Module

Notification	Level	System	Description
AddingServerInfo	Info	Orchestration	Adding server gateway.
BAPIActivationError	Severe	Orchestration	Error occurred while activating the BAPI activity.
BAPIParseError	Severe	Orchestration	Error occurred while parsing schema for the specified BAPI.
BAPIReturnError	Severe	Orchestration	Error returned by specified BAPI in the type field.
CompleteFunctionExec	Info	Orchestration	This is the name of the function which is executed by the BAPI or RFC activity
ConnectError	Severe	Orchestration	The SAP operation failed because a connection to the server could not be established.
ConnectRetry	Warning	Orchestration	The SAP operation failed while trying to connect to the server. This will cause a retry.
ConnectionPoolError	Severe	Orchestration	Connection Pool returned null connection.
CreateTID	Info	Orchestration	Creating a specified TID in the TID manager.
CreateTrcDirFailed	Warning	Orchestration	Exception while setting the log directory for SAP trace files. The trace files generated by sap will be created on default location.
FuncRetStructNotFound	Info	Orchestration	This is to report that activity is not able to find the return structure for the function
FunctionLookup	Info	Orchestration	This is marking the start of finding the meta data of the BAPI or RFC activity in the SAP Repository
FunctionLookupComp	Info	Orchestration	This is marking the completion of finding the meta data of the BAPI or RFC activity in the SAP Repository
GatewayCommWarning	Warning	Orchestration	Error occurred, while communicating to SAP Gateway.

Notification	Level	System	Description
GatewayRegisterError	Info	Orchestration	Server gateway specified already exists.
GatewayRemoveInfo	Info	Orchestration	Removing server gateway.
IDOCExtensionError	Severe	Orchestration	IDOC contains more than one type of IDOC extension type.
IDOCSentInfo	Info	Orchestration	IDOC with specified TID was sent to SAP.
IDOCTypeError	Severe	Orchestration	Received IDOC contains more than one type of IDOC type.
InitializationError	Severe	Orchestration	Error occurred while initializing the send IDOC activity.
InvalidRFCName	Severe	Orchestration	Unable to find specified RFC name.
InvalidTIDError	Severe	Orchestration	TID was not set in the task context.
ListenerInstanceInfo	Info	Orchestration	SAP listener instance was started for SAP gateway.
ListenerStartInfo	Info	Orchestration	SAP listener started again for specified host.
ListenerStopWarning	Warning	Orchestration	Error occurred while stopping the listener for specified host.
NoHandlerError	Warning	Orchestration	Received an IDOC for specified IDOC type and no activity was registered to process it. Ignoring the IDOC.
NoSegmentWarning	Warning	Orchestration	The specified IDOC number contains no data segment.
NonReturnStruct	Severe	Orchestration	No return structure returned by the specified BAPI.
ParseError	Severe	Orchestration	Error occurred while parsing schema for the RFC.
PoolAddInfo	Info	Orchestration	Adding Connection pool with the specified name.
PoolExistInfo	Info	Orchestration	Connection pool with specified name already exists.
ProcessDocError	Severe	Orchestration	Error occurred while processing the IDOC.
RFCActivationError	Severe	Orchestration	Error occurred while activating the RFC activity.
ReceiveTIDNotFound	Severe	Orchestration	Specified TID was not found in TID manager.
RemoveInfo	Info	Orchestration	Removing connection pool with specified name.
RollbackWarning	Warning	Orchestration	Error occurred while rolling back the transaction. Ignoring and continuing the activity.
SAPActivityError	Severe	Orchestration	Error occurred while processing SAP activity.
SAPValidationError	Severe	Orchestration	Input data was not valid for specified RFC. The items specified were invalid.
SapLibNotFound	Severe	Orchestration	Sap activity is not able to activate because the sap provided libraries are not installed.
SendIDOCActivation	Severe	Orchestration	Error occurred while activating the Send IDOC activity.

Notification	Level	System	Description
SendIDOCCreateInfo	Info	Orchestration	Created the specified TID for starting a transaction in send IDOC activity.
SendIDOCValidation	Severe	Orchestration	Input data was not valid for IDOC. The specified item(s) were invalid.
SerializingError	Severe	Orchestration	Error occurred while creating IDOC from input parameter.
StartFunctionExec	Info	Orchestration	This is the name of the function which is going to be executed by the BAPI or RFC activity
StartWarning	Info	Orchestration	Error occurred while starting the server.
TIDCheck	Info	Orchestration	SAP TIP check for specified ID is requested by SAP.
TIDCommit	Info	Orchestration	SAP TID has been committed by SAP.
TIDCommitUnknown	Severe	Orchestration	SAP attempting to confirm an unknown or uncommitted TID.
TIDCommittedInfo	Info	Orchestration	Specified TID was committed to SAP.
TIDCommittingInfo	Info	Orchestration	Committing TID to SAP.
TIDConfirmed	Info	Orchestration	SAP TID has been confirmed and deleted from the TID manager.
TIDRollback	Info	Orchestration	SAP TID has been rolled back.
TIDSentInfo	Info	Orchestration	Sending the IDOC with specified TID to SAP.
TIDUnknown	Severe	Orchestration	SAP has requested rollback for unknown TID.
TransactionalError	Severe	Orchestration	Unable to find the BAPI transaction RFCs.
UnicodeGateway	Info	Orchestration	The unicode instance property is set through JCONSOLE.
ValidationError	Severe	Orchestration	Error occurred while validating the input data.
ValidationInfo	Info	Orchestration	Validation is on/off for the specified field value.

ConnectError

The SAP operation failed because a connection to the server could not be established.

Level : *Severe*

Log Message : *Unable to connect to the SAP server after {NumberOfRetryAttempts} attempts. Error is: Error Group {ErrorGroup}, Error Key {ErrorKey}, Error Message {Message}*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-SAP-MIB::ciC19cConnectErrorEv1*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.19.1.1*

SNMP Trap Number : *1*

Variables

The ConnectError message contains the following variables:

Table 1. ConnectError Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. NumberOfRetryAttempts

The total number of attempted retries.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-SAP-MIB::ciC19cEv1NumberOfRetryAttempts
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.3.19.1.1.1.1.1

6. ErrorGroup

The group mentioned in the error.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-SAP-MIB::ciC19cEv1ErrorGroup
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.3.19.1.1.1.1.2

7. ErrorKey

The key mentioned in the error.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-SAP-MIB::ciC19cEv1ErrorKey
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.3.19.1.1.1.1.3

8. Message

Textual description of the error.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvMessage
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.1.2.2

ConnectRetry

The SAP operation failed while trying to connect to the server. This will cause a retry.

Level : *Warning*

Log Message : *Unable to connect to the SAP server. Error is: Error Group: {ErrorGroup} Error Key {ErrorKey} Error Message {Message}. Attempt {RetryAttemptNumber} of {TotalRetryAttempts}. Will try again in {RetryAttemptNumber} second(s).*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-SAP-MIB::ciC19cConnectRetryEv2*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.19.1.1*

SNMP Trap Number : 2

Variables

The ConnectRetry message contains the following variables:

Table 1. ConnectRetry Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. ErrorGroup

The group mentioned in the error.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-SAP-MIB::ciC19cEv2ErrorGroup
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.19.1.1.1.2.1

6. ErrorKey

The key mentioned in the error.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-SAP-MIB::ciC19cEv2ErrorKey
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.19.1.1.1.2.2

7. Message

Textual description of the error.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvMessage
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.1.2.2

8. RetryAttemptNumber

The current number of retries.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-SAP-MIB::ciC19cEv2RetryAttemptNumber
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.19.1.1.1.2.4

9. TotalRetryAttempts

The specified number of attempts to connect to the server before stopping.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-SAP-MIB::ciC19cEv2TotalRetryAttempts

PoolAddInfo

Adding Connection pool with the specified name.

Level : *Info*

Log Message : *Adding Connection Pool with name {PoolName}*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-SAP-MIB::ciC19cPoolAddInfoEv4*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.19.1.1*

SNMP Trap Number : *4*

Variables

The PoolAddInfo message contains the following variables:

Table 1. PoolAddInfo Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. PoolName

Adding the connection pool .

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-SAP-MIB::ciC19cEv4PoolName
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.19.1.1.1.4.1

SAP Operation Notifications

Provides a comprehensive list of operation notifications sent from the SAP Module.

- [AddingServerInfo](#)
Adding server gateway.
- [BAPIActivationError](#)
Error occurred while activating the BAPI activity.
- [BAPIParseError](#)
Error occurred while parsing schema for the specified BAPI.
- [BAPIReturnError](#)
Error returned by specified BAPI in the type field.
- [CompleteFunctionExec](#)
This is the name of the function which is executed by the BAPI or RFC activity
- [CreateTID](#)
Creating a specified TID in the TID manager.
- [CreateTrcDirFailed](#)
Exception while setting the log directory for SAP trace files. The trace files generated by sap will be created on default location.

- [FuncRetStructNotFound](#)
This is to report that activity is not able to find the return structure for the function
- [FunctionLookup](#)
This is marking the start of finding the meta data of the BAPI or RFC activity in the SAP Repository
- [FunctionLookupComp](#)
This is marking the completion of finding the meta data of the BAPI or RFC activity in the SAP Repository
- [GatewayCommWarning](#)
Error occurred, while communicating to SAP Gateway.
- [GatewayRegisterError](#)
Server gateway specified already exists.
- [GatewayRemoveInfo](#)
Removing server gateway.
- [IDOCExtensionError](#)
IDOC contains more than one type of IDOC extension type.
- [IDOCSentInfo](#)
IDOC with specified TID was sent to SAP.
- [IDOCTypeError](#)
Received IDOC contains more than one type of IDOC type.
- [InvalidRFCName](#)
Unable to find specified RFC name.
- [ListenerInstanceInfo](#)
SAP listener instance was started for SAP gateway.
- [ListenerStartInfo](#)
SAP listener started again for specified host.
- [ListenerStopWarning](#)
Error occurred while stopping the listener for specified host.
- [NoHandlerError](#)
Received an IDOC for specified IDOC type and no activity was registered to process it. Ignoring the IDOC.
- [NoSegmentWarning](#)
The specified IDOC number contains no data segment.
- [NonReturnStruct](#)
No return structure returned by the specified BAPI.
- [ParseError](#)
Error occurred while parsing schema for the RFC.
- [ProcessDocError](#)
Error occurred while processing the IDOC.
- [RFCActivationError](#)
Error occurred while activating the RFC activity.
- [ReceiveTIDNotFound](#)
Specified TID was not found in TID manager.
- [RollbackWarning](#)
Error occurred while rolling back the transaction. Ignoring and continuing the activity.
- [SAPActivityError](#)
Error occurred while processing SAP activity.
- [SAPValidationError](#)
Input data was not valid for specified RFC. The items specified were invalid.
- [SapLibNotFound](#)
Sap activity is not able to activate because the sap provided libraries are not installed.
- [SendIDOCActivation](#)
Error occurred while activating the Send IDOC activity.
- [SendIDOCCreateInfo](#)
Created the specified TID for starting a transaction in send IDOC activity.

- [SendIDOCValidation](#)
Input data was not valid for IDOC. The specified item(s) were invalid.
- [StartFunctionExec](#)
This is the name of the function which is going to be executed by the BAPI or RFC activity
- [StartWarning](#)
Error occurred while starting the server.
- [TIDCheck](#)
SAP TIP check for specified ID is requested by SAP.
- [TIDCommit](#)
SAP TID has been committed by SAP.
- [TIDCommitUnknown](#)
SAP attempting to confirm an unknown or uncommitted TID.
- [TIDCommittedInfo](#)
Specified TID was committed to SAP.
- [TIDCommittingInfo](#)
Committing TID to SAP.
- [TIDConfirmed](#)
SAP TID has been confirmed and deleted from the TID manager.
- [TIDRollback](#)
SAP TID has been rolled back.
- [TIDSentInfo](#)
Sending the IDOC with specified TID to SAP.
- [TIDUnknown](#)
SAP has requested rollback for unknown TID.
- [TransactionalError](#)
Unable to find the BAPI transaction RFCs.
- [UnicodeGateway](#)
The unicode instance property is set through JCONSOLE.
- [ValidationError](#)
Error occurred while validating the input data.
- [ValidationInfo](#)
Validation is on/off for the specified field value.

ListenerInstanceInfo

SAP listener instance was started for SAP gateway.

Level : *Info*

Log Message : *SAP Listener instance {InstanceNumber} started for SAP Gateway(host {HostName}, ProgramId {ProgramID}, Service {Service}).*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-SAP-MIB::ciC19oListenerInstanceInfoEv34*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.19.1.2*

SNMP Trap Number : *34*

Variables

The ListenerInstanceInfo message contains the following variables:

Table 1. ListenerInstanceInfo Message Variables

1. SerialNumber
The serial number of the appliance sending the trap. <ul style="list-style-type: none">• Type : String• SNMP Object Name : CASTIRON-IA-MIB::ciIaPlatSerialNumber• SNMP OID : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3
2. Severity
Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. InstanceNumber

The instance number which was started.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-SAP-MIB::ciC19oEv34InstanceNumber
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.19.1.2.1.34.1

6. HostName

The host name for which instance was started.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-SAP-MIB::ciC19oEv34HostName
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.19.1.2.1.34.2

7. ProgramID

The program ID for which instance was started.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-SAP-MIB::ciC19oEv34ProgramID
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.19.1.2.1.34.3

8. Service

The service name for which instance was started.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-SAP-MIB::ciC19oEv34Service
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.19.1.2.1.34.4

TIDCommit

SAP TID has been committed by SAP.

Level : *Info*

Log Message : *SAP TID {TID} has been committed by SAP.*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-SAP-MIB::ciC19oTIDCommitEv9*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.19.1.2*

SNMP Trap Number : 9

Variables

The TIDCommit message contains the following variables:

Table 1. TIDCommit Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. TID

TID which has been committed.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-SAP-MIB::ciC19oEv9TID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.3.19.1.2.1.9.1

ValidationInfo

Validation is on/off for the specified field value.

Level : *Info*

Log Message : *Validation is {ValidationStatus} for {Value}*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-SAP-MIB::ciC19oValidationInfoEv21*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.19.1.2*

SNMP Trap Number : *21*

Variables

The ValidationInfo message contains the following variables:

Table 1. ValidationInfo Message Variables

<p>1. SerialNumber</p> <p>The serial number of the appliance sending the trap.</p> <ul style="list-style-type: none"> • Type : String • SNMP Object Name : CASTIRON-IA-MIB::ciIaPlatSerialNumber • SNMP OID : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3
<p>2. Severity</p> <p>Severity of the Notification.</p> <ul style="list-style-type: none"> • Type : Integer • SNMP Object Name : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity • SNMP OID : 1.3.6.1.4.1.13336.2.2.1.2.1
<p>3. JobID</p>

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. ValidationStatus

The validation status either on or off.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-SAP-MIB::ciC19oEv21ValidationStatus
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.19.1.2.1.21.1

6. Value

The value which is validated.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-SAP-MIB::ciC19oEv21Value
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.19.1.2.1.21.2

STS Module

The SAML STS Module This section contains details for the messages delivered from the STS Module.

This topic provides the MIB Name and MIB OID information, in addition to high-level details about each notification in the STS Module.

MIB Name : *CASTIRON-COMP-STS-MIB*

MIB OID : *.1.3.6.1.4.1.13336.2.2.3.27*

The following table provides an alphabetical list of all notifications that can be issued by the STS Module.

Table 1. Notifications issued by the STS Module

Notification	Level	System	Description
ActivationFailed	Severe	Orchestration	Activation of Get SAML 2.0 token failed
AssertionEmpty	Severe	Orchestration	Received empty response from Security Token Service. Cannot get the SAML Assertion.
InputBodyConsidered	Info	Orchestration	RequestSecuirtyToken from Map Inputs is sent as request body because data sent in Map Inputs holds higher priority than in Configure Panel

Notification	Level	System	Description
RequestLocation	Info	Orchestration	Location of request being sent to Security Token Service
UriDeprecated	Warning	Orchestration	Security Token Service Module has deprecated the input parameter httpheaders/uri. The specified value will be ignored.

- [STS Operation Notifications](#)

Salesforce.com Module

The Salesforce.com Module provides access to the Salesforce.com online service. This section contains details for the messages delivered from the Salesforce.com Module.

This topic provides the MIB Name and MIB OID information, in addition to high-level details about each notification in the Salesforce.com Module.

MIB Name : *CASTIRON-COMP-SFDC-MIB*

MIB OID : *.1.3.6.1.4.1.13336.2.2.3.3*

The following table provides an alphabetical list of all notifications that can be issued by the Salesforce.com Module.

Table 1. Notifications issued by the Salesforce.com Module

Notification	Level	System	Description
ActivateError	Severe	Orchestration	There was a problem in activating the activity.
ActivityOutput	Info	Orchestration	The activity has completed its operation and outputted param objects in output parameter.
BatchPollStart	Info	Orchestration	Starting a batch poll for index range specified.

Notification	Level	System	Description
ConnectFailed	Severe	Orchestration	The Salesforce.com operation failed because a connection to the server could not be established. This happened cause of reasons other than connectivity issues.
ConnectionFailed	Severe	Orchestration	The Salesforce.com operation failed because a connection to the server could not be established.
ConnectionRetry	Warning	Orchestration	The Salesforce.com operation failed while trying to connect to the server. This will cause a retry.
ConnectionTryAgain	Info	Orchestration	Not able to connect to Salesforce endpoint. Trying to establish a new session.
EndpointNull	Severe	Orchestration	The endpoint object provided to Salesforce.com activity is null.
ExecuteError	Severe	Orchestration	An error occurred while executing the activity.
ExecuteProblem	Severe	Orchestration	An error occurred while executing the query.
InitializeProblem	Warning	Orchestration	Error from Salesforce.com while initializing activity. Trying to ignore error and proceed.
InputParamMapped	Info	Orchestration	The optional input parameter in the activity is mapped.
InputParamNotMapped	Info	Orchestration	The optional input parameter in the activity is not mapped.
InvalidQuery	Severe	Orchestration	The query provided to Salesforce.com was invalid.
InvalidSFDCField	Severe	Orchestration	The field is invalid in Salesforce.com.
InvalidSFDCObject	Severe	Orchestration	The object is invalid in Salesforce.com
LargeData	Severe	Orchestration	The activity was not able to get data as id limit has exceeded.
LargeDataError	Severe	Orchestration	An error occurred due to large data which activity cannot handle.
LoginFailure	Severe	Orchestration	Failure while performing a login into Salesforce.com.
MarshalError	Severe	Orchestration	An error occurred while writing output parameters in the activity.
MetadataError	Severe	Orchestration	Unable to obtain meta data from Salesforce.com.
MetadataObjectError	Severe	Orchestration	Unable to obtain meta data for the object from Salesforce.com.
NoDatafound	Info	Orchestration	No data was found by the activity in the interval specified.
OptionalInputError	Severe	Orchestration	Salesforce session timed out. The session was not created as optional connection input parameter was not mapped.
ParameterOutput	Info	Orchestration	The activity has completed its operation and outputted objects in output parameter.

Notification	Level	System	Description
ParameterResults	Info	Orchestration	The activity has completed its operation and outputted result objects in output parameter.
PollActivateError	Severe	Orchestration	The poll activity failed to activate.
PollOutput	Info	Orchestration	The number of objects outputted for a batch poll.
PollReturnedNothing	Info	Orchestration	The poll activity did not return any ids for specified interval.
PollReturnedResults	Info	Orchestration	Poll activity returned these number of ids for interval specified.
SessionInvalid	Info	Orchestration	Salesforce session timed out and activity is establishing a new session.
SfdcErrorInternal	Severe	Orchestration	An internal error occurred in Salesforce.com connector.
ShortPoll	Info	Orchestration	The current time is less than 1 minute past last polling time, so activity is skipping the poll at this interval.
StillRun	Info	Orchestration	There is a problem in connectivity and messages will be picked up from this time when connectivity is established.
TimeTooClose	Info	Orchestration	The end time specified is less than 1 minute past start time. Setting the interval to 1 minute and getting the data.
UnexpectedSFDCFault	Severe	Orchestration	Salesforce.com returned an unexpected fault that is not declared in the method signature.
UnmarshalError	Severe	Orchestration	An error occurred while reading input parameters in the activity.

Salesforce.com Connection Notifications

Provides a comprehensive list of connection notifications sent from the Salesforce.com Module.

- [ConnectionFailed](#)
The Salesforce.com operation failed because a connection to the server could not be established.
- [ConnectionRetry](#)
The Salesforce.com operation failed while trying to connect to the server. This will cause a retry.
- [ConnectionTryAgain](#)
Not able to connect to Salesforce endpoint. Trying to establish a new session.
- [LoginFailure](#)
Failure while performing a login into Salesforce.com.
- [OptionalInputError](#)
Salesforce session timed out. The session was not created as optional connection input parameter was not mapped.
- [SessionInvalid](#)
Salesforce session timed out and activity is establishing a new session.
- [StillRun](#)
There is a problem in connectivity and messages will be picked up from this time when connectivity is established.

ConnectionFailed

The Salesforce.com operation failed because a connection to the server could not be established.

Level : *Severe*

Log Message : *Unable to connect to Salesforce.com after {NumberOfRetryAttempts} attempts. Error is: {Message}.*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-SFDC-MIB::ciC3cConnectionFailedEv4*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.3.1.1*

SNMP Trap Number : *4*

Variables

The ConnectionFailed message contains the following variables:

Table 1. ConnectionFailed Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. NumberOfRetryAttempts

The total number of attempted retries.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-SFDC-MIB::ciC3cEv4NumberOfRetryAttempts
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.3.1.1.1.4.1

6. Message

Textual description of the error.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvMessage
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.1.2.2

Parent topic: [Salesforce.com Connection Notifications](#)

ConnectionRetry

The Salesforce.com operation failed while trying to connect to the server. This will cause a retry.

Level : *Warning*

Log Message : *Unable to connect to Salesforce.com. Error is: {Message}. Attempt {RetryAttemptNumber} of {TotalRetryAttempts}. Will try again in {IntervalForRetries} second(s).*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-SFDC-MIB::ciC3cConnectionRetryEv3*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.3.1.1*

SNMP Trap Number : 3

Variables

The ConnectionRetry message contains the following variables:

Table 1. ConnectionRetry Message Variables

<p>1. SerialNumber</p> <p>The serial number of the appliance sending the trap.</p> <ul style="list-style-type: none">• Type : String• SNMP Object Name : CASTIRON-IA-MIB::ciIaPlatSerialNumber• SNMP OID : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3
<p>2. Severity</p> <p>Severity of the Notification.</p> <ul style="list-style-type: none">• Type : Integer• SNMP Object Name : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity• SNMP OID : 1.3.6.1.4.1.13336.2.2.1.2.1
<p>3. JobID</p> <p>The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.</p> <ul style="list-style-type: none">• Type : String• SNMP Object Name : CASTIRON-REGISTRATIONS-MIB::ciEvJobID• SNMP OID : 1.3.6.1.4.1.13336.2.2.1.2.4
<p>4. Orchestration</p>

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. Message

Textual description of the error.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvMessage
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.1.2.2

6. RetryAttemptNumber

The current number of retries.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-SFDC-MIB::ciC3cEv3RetryAttemptNumber
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.3.1.1.1.3.2

7. TotalRetryAttempts

The specified number of attempts to connect to the server before stopping.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-SFDC-MIB::ciC3cEv3TotalRetryAttempts
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.3.1.1.1.3.3

8. IntervalForRetries

The specified time interval between retries.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-SFDC-MIB::ciC3cEv3IntervalForRetries
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.3.1.1.1.3.4

Salesforce.com Operation Notifications

Provides a comprehensive list of operation notifications sent from the Salesforce.com Module.

- [ActivateError](#)
There was a problem in activating the activity.
- [ActivityOutput](#)
The activity has completed its operation and outputted param objects in output parameter.
- [BatchPollStart](#)
Starting a batch poll for index range specified.
- [ConnectFailed](#)
The Salesforce.com operation failed because a connection to the server could not be established. This happened cause of reasons other than connectivity issues.
- [ExecuteError](#)
An error occurred while executing the activity.
- [ExecuteProblem](#)
An error occurred while executing the query.
- [InitializeProblem](#)
Error from Salesforce.com while initializing activity. Trying to ignore error and proceed.
- [InputParamMapped](#)
The optional input parameter in the activity is mapped.
- [InputParamNotMapped](#)
The optional input parameter in the activity is not mapped.
- [InvalidQuery](#)
The query provided to Salesforce.com was invalid.
- [InvalidSFDCField](#)
The field is invalid in Salesforce.com.
- [InvalidSFDCObject](#)
The object is invalid in Salesforce.com

- [LargeData](#)
The activity was not able to get data as id limit has exceeded.
- [LargeDataError](#)
An error occurred due to large data which activity cannot handle.
- [MetadataError](#)
Unable to obtain meta data from Salesforce.com.
- [MetadataObjectError](#)
Unable to obtain meta data for the object from Salesforce.com.
- [NoDatafound](#)
No data was found by the activity in the interval specified.
- [ParameterOutput](#)
The activity has completed its operation and outputted objects in output parameter.
- [ParameterResults](#)
The activity has completed its operation and outputted result objects in output parameter.
- [PollActivateError](#)
The poll activity failed to activate.
- [PollOutput](#)
The number of objects outputted for a batch poll.
- [PollReturnedNothing](#)
The poll activity did not return any ids for specified interval.
- [PollReturnedResults](#)
Poll activity returned these number of ids for interval specified.
- [ShortPoll](#)
The current time is less than 1 minute past last polling time, so activity is skipping the poll at this interval.
- [TimeTooClose](#)
The end time specified is less than 1 minute past start time. Setting the interval to 1 minute and getting the data.
- [UnexpectedSFDCFault](#)
Salesforce.com returned an unexpected fault that is not declared in the method signature.

PollReturnedResults

Poll activity returned these number of ids for interval specified.

Level : *Info*

Log Message : *Poll returned {NumberOfIds} ids for interval starting from {PollStartTime} to {PollEndTime}.*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-SFDC-MIB::ciC3oPollReturnedResultsEv12*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.3.1.2*

SNMP Trap Number : *12*

Variables

The PollReturnedResults message contains the following variables:

Table 1. PollReturnedResults Message Variables

<p>1. SerialNumber</p> <p>The serial number of the appliance sending the trap.</p> <ul style="list-style-type: none">• Type : String• SNMP Object Name : <i>CASTIRON-IA-MIB::ciIaPlatSerialNumber</i>• SNMP OID : <i>1.3.6.1.4.1.13336.2.2.2.1.1.3.3</i>
<p>2. Severity</p> <p>Severity of the Notification.</p> <ul style="list-style-type: none">• Type : Integer• SNMP Object Name : <i>CASTIRON-REGISTRATIONS-MIB::ciEvSeverity</i>• SNMP OID : <i>1.3.6.1.4.1.13336.2.2.1.2.1</i>
<p>3. JobID</p> <p>The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.</p> <ul style="list-style-type: none">• Type : String• SNMP Object Name : <i>CASTIRON-REGISTRATIONS-MIB::ciEvJobID</i>• SNMP OID : <i>1.3.6.1.4.1.13336.2.2.1.2.4</i>
<p>4. Orchestration</p> <p>Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.</p> <ul style="list-style-type: none">• Type : OID• SNMP Object Name : <i>CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration</i>• SNMP OID : <i>1.3.6.1.4.1.13336.2.2.1.2.3</i>
<p>5. NumberOfIds</p> <p>The number of ids returned by the poll.</p> <ul style="list-style-type: none">• Type : Integer• SNMP Object Name : <i>CASTIRON-COMP-SFDC-MIB::ciC3oEv12NumberOfIds</i>• SNMP OID : <i>.1.3.6.1.4.1.13336.2.2.3.3.1.2.1.12.1</i>
<p>6. PollStartTime</p>

The start time for the poll.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-SFDC-MIB::ciC3oEv12PollStartTime
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.3.1.2.1.12.2

7. PollEndTime

The end time for the poll.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-SFDC-MIB::ciC3oEv12PollEndTime
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.3.1.2.1.12.3

Scheduler Module

The Scheduler Module allows jobs to be started on a regular basis. This section contains details for the messages delivered from the Scheduler Module.

This topic provides the MIB Name and MIB OID information, in addition to high-level details about each notification in the Scheduler Module.

MIB Name : *CASTIRON-COMP-SCHEDULER-MIB*

MIB OID : .1.3.6.1.4.1.13336.2.2.3.5

The following table provides an alphabetical list of all notifications that can be issued by the Scheduler Module.

Table 1. Notifications issued by the Scheduler Module

Notification	Level	System	Description
ActivityException	Severe	Orchestration	There was an error running scheduler activity.
SchedulerUnknownType	Warning	Orchestration	The group configured in the activity is unknown.
SchedulerWarning	Warning	Orchestration	There was an error in scheduler activity. Continuing to schedule further jobs.

- [Scheduler Operation Notifications](#)
Provides a comprehensive list of operation notifications sent from the Scheduler Module.

SchedulerWarning

There was an error in scheduler activity. Continuing to schedule further jobs.

Level : *Warning*

Log Message : *Got exception in "Schedule Job" activity: {Message}. Continuing to schedule jobs.*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-SCHEDULER-MIB::ciC5oSchedularWarningEv3*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.5.1.2*

SNMP Trap Number : *3*

Variables

The SchedulerWarning message contains the following variables:

Table 1. SchedulerWarning Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String

- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. Message

Description of error occurred.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-SCHEDULER-MIB::ciC5oEv3Message
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.5.1.2.1.3.1

Siebel Module

The Siebel Module provides access to Oracle's Siebel CRM. This section contains details for the messages delivered from the Siebel Module.

This topic provides the MIB Name and MIB OID information, in addition to high-level details about each notification in the Siebel Module.

MIB Name : *CASTIRON-COMP-SIEBEL-MIB*

MIB OID : *.1.3.6.1.4.1.13336.2.2.3.17*

The following table provides an alphabetical list of all notifications that can be issued by the Siebel Module.

Table 1. Notifications issued by the Siebel Module

Notification	Level	System	Description
ActivateError	Severe	Orchestration	Error occurred while activating the specified activity.
ConfigURI	Severe	Orchestration	Specified activity name is listening on the specified uri and port.
ConnectError	Severe	Orchestration	The invoke operation failed because a connection to the server could not be established.
ConnectionPoolError	Warning	Orchestration	Error occurred while setting up connection pool for specified activity.
ConnectionRetry	Warning	Orchestration	The invoke operation failed while trying to connect to the server. This will cause a retry.
DataException	Severe	Orchestration	Data error occurred while executing the activity.
GeneralError	Severe	Orchestration	General error occurred while sending the response.
IOError	Severe	Orchestration	IO error occurred while processing request.
InternalError	Severe	Orchestration	Internal error occurred while processing request.
InvokeActivate	Warning	Orchestration	Error in setup of repository/connection-pool in activate of specified activity. Setup will be done at activity execution time.
InvokeDeactivateError	Warning	Orchestration	Error occurred while deactivating the specified activity.
InvokeException	Severe	Orchestration	Error occurred while executing the activity.
InvokeSuccessful	Info	Orchestration	Activity has successfully executed activity and outputted output parameter RESPONSE.
MissingLibraries	Severe	Orchestration	Config file jas.ini needs to be present before the JD Edwards Invoke activity can be run. Please upload jas.ini file and run again.
ReceiveDeactivateErr	Severe	Orchestration	Error occurred while deactivating the specified activity.
ReceiveError	Severe	Orchestration	Error occurred while receiving in the specified activity name.
ReceiveSuccessful	Info	Orchestration	Receive activity successfully received request and outputted output parameter RESPONSE.
RepositoryError	Warning	Orchestration	Error occurred while setting up repository for specified activity.

Notification	Level	System	Description
UnSupportedEncoding	Severe	Orchestration	Error occurred while processing unsupported encoding.

- [Siebel Connection Notifications](#)
Provides a comprehensive list of connection notifications sent from the Siebel Module.
- [Siebel Operation Notifications](#)
Provides a comprehensive list of operation notifications sent from the Siebel Module.
- [Siebel Internal Notifications](#)
Provides a comprehensive list of internal notifications sent from the Siebel Module.

ConnectionRetry

The invoke operation failed while trying to connect to the server. This will cause a retry.

Level : *Warning*

Log Message : *Unable to connect to server. Error is: {Message}. Attempt {RetryAttemptNumber} of {TotalRetryAttempts}. Will try again in {IntervalForRetries} second(s).*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-SIEBEL-MIB::ciC17cConnectionRetryEv2*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.17.1.1*

SNMP Trap Number : *2*

Variables

The ConnectionRetry message contains the following variables:

Table 1. ConnectionRetry Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. Message

Textual description of the error.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvMessage
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.2

6. RetryAttemptNumber

The current number of retries.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-SIEBEL-MIB::ciC17cEv2RetryAttemptNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.3.17.1.1.1.2.2

7. TotalRetryAttempts

The specified number of attempts to connect to the server before stopping.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-SIEBEL-MIB::ciC17cEv2TotalRetryAttempts
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.3.17.1.1.1.2.3

8. IntervalForRetries

The specified time interval between retries.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-SIEBEL-MIB::ciC17cEv2IntervalForRetries
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.3.17.1.1.1.2.4

InvokeActivate

Error in setup of repository/connection-pool in activate of specified activity. Setup will be done at activity execution time.

Level : *Warning*

Log Message : *Error in setup of repository/connection-pool in activate of {ActivityName}. Setup to be done at activity execution time. The error is: {Message}*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-SIEBEL-MIB::ciC17oInvokeActivateEv3*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.17.1.2*

SNMP Trap Number : 3

Variables

The InvokeActivate message contains the following variables:

Table 1. InvokeActivate Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. ActivityName

Activity name which caused the error.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-SIEBEL-MIB::ciC17oEv3ActivityName
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.17.1.2.1.3.1

6. Message

Textual description of the error.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvMessage
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.1.2.2

Web Service Module

The Web Service Module provides activities to act as a Web Service client or server. This section contains details for the messages delivered from the Web Service Module.

This topic provides the MIB Name and MIB OID information, in addition to high-level details about each notification in the Web Service Module.

MIB Name : *CASTIRON-COMP-WS-MIB*

The following table provides an alphabetical list of all notifications that can be issued by the Web Service Module.

Table 1. Notifications issued by the Web Service Module

Notification	Level	System	Description
AlreadyRegistered	Severe	Orchestration	The URI/port is already registered by the Web Service activity.
CleanUpMessage	Severe	Orchestration	Unable to process the request. Additional information about the error can be found on the Web Management Console.
ConnectFailed	Severe	Orchestration	The webservice operation failed because a connection to the server could not be established.
ConnectRetry	Warning	Orchestration	The webservice operation failed while trying to connect to the server. This will cause a retry.
DataMessageAccepted	Info	Orchestration	SOAP message has been accepted by the Integration Appliance.
MissingProtocol	Warning	Orchestration	Please put the protocol used in front of input parameter location.
NotRegistered	Severe	Orchestration	The URI/port has not been registered by the Web Service activity.
OperationNameNull	Severe	Orchestration	Operation name must not be null or empty.
TaskContextError	Severe	Orchestration	Error occurred while processing Web Service activity due to lost task context.
TransportInfo	Info	Orchestration	The provide activity is started on local transport for the URI.
UriDeprecated	Warning	Orchestration	Web Service Module has deprecated the input parameter httpheaders/uri. The specified value will be ignored.
WSFaultString	Severe	Orchestration	The fault string returned by the WebService activity.
WebServiceException	Severe	Orchestration	Error occurred while processing Web Service activity.

WebSphere MQ Module

The WebSphere MQ module provides activities for communicating with IBM WebSphere MQ servers. This section contains details for the messages delivered from the WebSphere MQ Module.

This topic provides the MIB Name and MIB OID information, in addition to high-level details about each notification in the WebSphere MQ Module.

MIB Name : *CASTIRON-COMP-MQ-MIB*

MIB OID : *.1.3.6.1.4.1.13336.2.2.3.13*

The following table provides an alphabetical list of all notifications that can be issued by the WebSphere MQ Module.

Table 1. Notifications issued by the WebSphere MQ Module

Notification	Level	System	Description
ConnectRetry	Warning	Orchestration	The MQ operation failed while trying to connect to the server. This will cause a retry.
ConnectionError	Severe	Orchestration	The MQ operation failed because a connection to the server could not be established.
DetailsOpen	Info	Orchestration	Opening the queue with set all privileges as specified.
DuplicateFound	Info	Orchestration	Discarding the duplicate message found in get activity.
FormatError	Severe	Orchestration	The message format field specified is invalid. Supported formats are MQSTR, MQHRF2, and no format.
FormatWarning	Warning	Orchestration	Activity expected string data (MQFMT_STRING), but the message is of another format.
GetFailure	Severe	Orchestration	The get activity was not able to get messages from queue.
InputParamNull	Severe	Orchestration	The input parameter specified is of zero length.
InternalFailure	Severe	Orchestration	There was an internal error in MQ activity.
MQConnectionInfo	Info	Orchestration	The complete information about MQ Endpoint details.
MQMDFormatError	Severe	Orchestration	MQMD header input parameter format is incorrect.

Notification	Level	System	Description
MQProtocolWarning	Warning	Orchestration	Received warning from queue manager with specified MQ reason code.
MQPutDetails	Info	Orchestration	Putting in queue with set all privileges as specified.
MQPutFailure	Severe	Orchestration	MQ was unable to put message on queue due to specified error code.
MQRFHHeaderError	Severe	Orchestration	MQRFH2 header input parameter format is incorrect.
MessageDelievered	Info	Orchestration	The MQ message was successfully delivered to the specified queue.
MessageRetrieved	Info	Orchestration	Retrieved a message from the queue.
NoMessage	Info	Orchestration	There is no message available on the queue.
NoMessageFailure	Severe	Orchestration	The MQ operation failed as there was no message on queue on server.
NoMessageRetry	Warning	Orchestration	The MQ operation failed as there was no message on queue on server. This will cause a retry.
PollFailure	Severe	Orchestration	The poll activity was not able to get messages from queue.
RFHFormatError	Severe	Orchestration	Error encountered unmarshaling the MQRFH2 header.
ReasonCode	Info	Orchestration	The reason code for the MQ exception caught.

ConnectRetry

The MQ operation failed while trying to connect to the server. This will cause a retry.

Level : *Warning*

Log Message : *Unable to connect to the Queue Manager "{QueueManager}". MQ returned error code "{ErrorCode}". Attempt {RetryAttemptNumber} of {TotalRetryAttempts}. Will try again in {IntervalForRetries} second(s).*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-MQ-MIB::ciC13cConnectRetryEv2*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.13.1.1*

SNMP Trap Number : 2

Variables

The ConnectRetry message contains the following variables:

Table 1. ConnectRetry Message Variables

<p>1. SerialNumber</p> <p>The serial number of the appliance sending the trap.</p> <ul style="list-style-type: none"> • Type : String • SNMP Object Name : CASTIRON-IA-MIB::ciIaPlatSerialNumber • SNMP OID : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3
<p>2. Severity</p> <p>Severity of the Notification.</p> <ul style="list-style-type: none"> • Type : Integer • SNMP Object Name : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity • SNMP OID : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. QueueManager

The name of the queue manager which activity was not able to connect.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-MQ-MIB::ciC13cEv2QueueManager
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.3.13.1.1.1.2.1

6. ErrorCode

The error code returned by the MQ server.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-MQ-MIB::ciC13cEv2ErrorCode
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.3.13.1.1.1.2.2

7. RetryAttemptNumber

The current number of retries.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-MQ-MIB::ciC13cEv2RetryAttemptNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.3.13.1.1.1.2.3

8. TotalRetryAttempts

The specified number of attempts to connect to the server before stopping.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-MQ-MIB::ciC13cEv2TotalRetryAttempts
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.3.13.1.1.1.2.4

9. IntervalForRetries

The specified time interval between retries.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-MQ-MIB::ciC13cEv2IntervalForRetries

- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.13.1.1.1.2.5

WebSphere MQ Operation Notifications

Provides a comprehensive list of operation notifications sent from the WebSphere MQ Module.

- [DetailsOpen](#)
Opening the queue with set all privileges as specified.
- [DuplicateFound](#)
Discarding the duplicate message found in get activity.
- [FormatError](#)
The message format field specified is invalid. Supported formats are MQSTR, MQHRF2, and no format.
- [FormatWarning](#)
Activity expected string data (MQFMT_STRING), but the message is of another format.
- [GetFailure](#)
The get activity was not able to get messages from queue.
- [MQMDFormatError](#)
MQMD header input parameter format is incorrect.
- [MQProtocolWarning](#)
Received warning from queue manager with specified MQ reason code.
- [MQPutDetails](#)
Putting in queue with set all privileges as specified.
- [MQPutFailure](#)
MQ was unable to put message on queue due to specified error code.
- [MQRFHHeaderError](#)
MQRFH2 header input parameter format is incorrect.
- [MessageDelievered](#)
The MQ message was successfully delivered to the specified queue.
- [MessageRetrieved](#)
Retrieved a message from the queue.
- [NoMessage](#)
There is no message available on the queue.
- [NoMessageFailure](#)
The MQ operation failed as there was no message on queue on server.
- [NoMessageRetry](#)
The MQ operation failed as there was no message on queue on server. This will cause a retry.
- [PollFailure](#)
The poll activity was not able to get messages from queue.
- [RFHFormatError](#)
Error encountered unmarshaling the MQRFH2 header.
- [ReasonCode](#)
The reason code for the MQ exception caught.

MQRFHHeaderError

MQRFH2 header input parameter format is incorrect.

Level : *Severe*

Log Message : *MQRFH2 header input parameter format is incorrect.*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-MQ-MIB::ciC13oMQRFHHeaderErrorEv11*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.13.1.2*

SNMP Trap Number : *11*

Variables

The MQRFHHeaderError message contains the following variables:

Table 1. MQRFHHeaderError Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. Header

The header specified.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-MQ-MIB::ciC13oEv11Header
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.13.1.2.1.11.1

WebSphere MQ Internal Notifications

Provides a comprehensive list of internal notifications sent from the WebSphere MQ Module.

- [InputParamNull](#)
The input parameter specified is of zero length.
- [InternalFailure](#)
There was an internal error in MQ activity.

Parent topic: [WebSphere MQ Module](#)

InputParamNull

The input parameter specified is of zero length.

Level : *Severe*

Log Message : *The input parameter "{InputParam}" is zero length.*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-MQ-MIB::ciC13iInputParamNullEv1*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.13.1.3*

SNMP Trap Number : *1*

Variables

The InputParamNull message contains the following variables:

Table 1. InputParamNull Message Variables

<p>1. SerialNumber</p> <p>The serial number of the appliance sending the trap.</p> <ul style="list-style-type: none"> • Type : String • SNMP Object Name : CASTIRON-IA-MIB::ciIaPlatSerialNumber • SNMP OID : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3
<p>2. Severity</p> <p>Severity of the Notification.</p> <ul style="list-style-type: none"> • Type : Integer • SNMP Object Name : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity • SNMP OID : 1.3.6.1.4.1.13336.2.2.1.2.1
<p>3. JobID</p> <p>The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.</p> <ul style="list-style-type: none"> • Type : String • SNMP Object Name : CASTIRON-REGISTRATIONS-MIB::ciEvJobID • SNMP OID : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. InputParam

The input parameter that was specified.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-MQ-MIB::ciC13iEv1InputParam
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.13.1.3.1.1.1

InternalFailure

There was an internal error in MQ activity.

Level : *Severe*

Log Message : *An internal error occurred: {Message}.*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-MQ-MIB::ciC13iInternalFailureEv2*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.13.1.3*

SNMP Trap Number : 2

Variables

The InternalFailure message contains the following variables:

Table 1. InternalFailure Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. Message

Textual description of the error.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvMessage
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.2

Workday Module

The Workday Module provides activities to act as a Workday client. This section contains details for the messages delivered from the Workday Module.

This topic provides the MIB Name and MIB OID information, in addition to high-level details about each notification in the Workday Module.

MIB Name : *CASTIRON-COMP-WD-MIB*

MIB OID : *.1.3.6.1.4.1.13336.2.2.3.24*

The following table provides an alphabetical list of all notifications that can be issued by the Workday Module.

Table 1. Notifications issued by the Workday Module

Notification	Level	System	Description
AlreadyRegistered	Severe	Orchestration	The URI/port is already registered by the Workday activity.
CleanUpMessage	Severe	Orchestration	Unable to process the request. Additional information about the error can be found on the Web Management Console.
ConnectFailed	Severe	Orchestration	The workday operation failed because a connection to the server could not be established.
ConnectRetry	Warning	Orchestration	The workday operation failed while trying to connect to the server. This will cause a retry.
DataMessageAccepted	Info	Orchestration	SOAP message has been accepted by the Integration Appliance.
MissingProtocol	Warning	Orchestration	Please put the protocol used in front of input parameter location.
NotRegistered	Severe	Orchestration	The URI/port has not been registered by the Workday activity.
OperationNameNull	Severe	Orchestration	Operation name must not be null or empty.
TaskContextError	Severe	Orchestration	Error occurred while processing Workday activity due to lost task context.
TransportInfo	Info	Orchestration	The provide activity is started on local transport for the URI.
UriDeprecated	Warning	Orchestration	Workday Module has deprecated the input parameter httpheaders/uri. The specified value will be ignored.
WDFaultString	Severe	Orchestration	The fault string returned by the Workday activity.
WorkdayException	Severe	Orchestration	Error occurred while processing Workday activity.

ConnectFailed

The workday operation failed because a connection to the server could not be established.

Level : *Severe*

Log Message : *Error sending SOAP request to location: {LocationName}. Error is: {Message}*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-WD-MIB::ciC24cConnectFailedEv2*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.24.1.1*

SNMP Trap Number : *2*

Variables

The ConnectFailed message contains the following variables:

Table 1. ConnectFailed Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. LocationName

The specified location which was not being able to connect.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-WD-MIB::ciC24cEv2LocationName
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.24.1.1.1.2.1

6. Message

Textual description of the error.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvMessage
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.1.2.2

Parent topic: [Workday Connection Notifications](#)

ConnectRetry

The workday operation failed while trying to connect to the server. This will cause a retry.

Level : *Warning*

Log Message : *Unable to send the SOAP request to {LocationName}. Error is: {Message}. Attempt {RetryAttemptNumber} of {TotalRetryAttempts}. Will retry again in {IntervalForRetries} second(s).*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-WD-MIB::ciC24cConnectRetryEv1*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.24.1.1*

SNMP Trap Number : *1*

Variables

The ConnectRetry message contains the following variables:

Table 1. ConnectRetry Message Variables

<p>1. SerialNumber</p> <p>The serial number of the appliance sending the trap.</p> <ul style="list-style-type: none">• Type : String• SNMP Object Name : CASTIRON-IA-MIB::ciIaPlatSerialNumber• SNMP OID : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3
<p>2. Severity</p> <p>Severity of the Notification.</p> <ul style="list-style-type: none">• Type : Integer• SNMP Object Name : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity• SNMP OID : 1.3.6.1.4.1.13336.2.2.1.2.1
<p>3. JobID</p> <p>The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.</p> <ul style="list-style-type: none">• Type : String• SNMP Object Name : CASTIRON-REGISTRATIONS-MIB::ciEvJobID• SNMP OID : 1.3.6.1.4.1.13336.2.2.1.2.4
<p>4. Orchestration</p>

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. LocationName

The specified location which was not being able to connect.

- **Type** : String
- **SNMP Object Name** : CASTIRON-COMP-WD-MIB::ciC24cEv1LocationName
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.24.1.1.1.1.1

6. Message

Textual description of the error.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvMessage
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.1.2.2

7. RetryAttemptNumber

The current number of retries.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-WD-MIB::ciC24cEv1RetryAttemptNumber
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.24.1.1.1.1.3

8. TotalRetryAttempts

The specified number of attempts to connect to the server before stopping.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-WD-MIB::ciC24cEv1TotalRetryAttempts
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.24.1.1.1.1.4

9. IntervalForRetries

The specified time interval between retries.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-COMP-WD-MIB::ciC24cEv1IntervalForRetries
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.3.24.1.1.1.1.5

XML Module

The XML Module provides activities for generating and parsing XML content. This section contains details for the messages delivered from the XML Module.

This topic provides the MIB Name and MIB OID information, in addition to high-level details about each notification in the XML Module.

MIB Name : *CASTIRON-COMP-XML-MIB*

MIB OID : *.1.3.6.1.4.1.13336.2.2.3.12*

The following table provides an alphabetical list of all notifications that can be issued by the XML Module.

Table 1. Notifications issued by the XML Module

Notification	Level	System	Description
TransformError	Severe	Orchestration	There was an error while transforming the XML.
ValidateInitialize	Severe	Orchestration	There was an error while initializing the validate activity.
XMLParseError	Severe	Orchestration	There was an error while parsing the XML.
XMLQueryError	Severe	Orchestration	There was an error while querying the XML.
XMLSerializeError	Severe	Orchestration	There was an error while serializing the XML.

XMLQueryError

There was an error while querying the XML.

Level : *Severe*

Log Message : *Failed to query XML, error was: {Message}*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-XML-MIB::ciC12oXMLQueryErrorEv2*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.12.1.2*

SNMP Trap Number : *2*

Variables

The XMLQueryError message contains the following variables:

Table 1. XMLQueryError Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. Message

Textual description of the error.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvMessage
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.2

XMLSerializeError

There was an error while serializing the XML.

Level : *Severe*

Log Message : *Failed to serialize XML, error was: {Message}*

System : *Orchestration*

SNMP Name : *CASTIRON-COMP-XML-MIB::ciC12oXMLSerializeErrorEv3*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.3.12.1.2*

SNMP Trap Number : 3

Variables

The XMLSerializeError message contains the following variables:

Table 1. XMLSerializeError Message Variables

<p>1. SerialNumber</p> <p>The serial number of the appliance sending the trap.</p> <ul style="list-style-type: none">• Type : String• SNMP Object Name : CASTIRON-IA-MIB::ciIaPlatSerialNumber• SNMP OID : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3
<p>2. Severity</p> <p>Severity of the Notification.</p> <ul style="list-style-type: none">• Type : Integer• SNMP Object Name : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity• SNMP OID : 1.3.6.1.4.1.13336.2.2.1.2.1
<p>3. JobID</p> <p>The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.</p> <ul style="list-style-type: none">• Type : String• SNMP Object Name : CASTIRON-REGISTRATIONS-MIB::ciEvJobID• SNMP OID : 1.3.6.1.4.1.13336.2.2.1.2.4
<p>4. Orchestration</p> <p>Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.</p> <ul style="list-style-type: none">• Type : OID• SNMP Object Name : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration• SNMP OID : 1.3.6.1.4.1.13336.2.2.1.2.3

5. Message

Textual description of the error.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvMessage
- **SNMP OID** : .1.3.6.1.4.1.13336.2.2.1.2.2

Uncategorized Notifications

This topic provides details about messages that have not formally been categorized in an existing module.

These notifications are used for events which have not yet been assigned their own OID. Use the information specified in the Message variable to identify individual notifications.

SNMP Name : *CASTIRON-IA-MIB::ciIaUncategorizedEv*

SNMP Enterprise : *.1.3.6.1.4.1.13336.2.2.1.1.10*

SNMP Trap Number : *1*

Variables

The uncategorized message contains the following variables:

Table 1. Uncategorized Message Variables

1. SerialNumber

The serial number of the appliance sending the trap.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaPlatSerialNumber
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.3.3

2. Severity

Severity of the Notification.

- **Type** : Integer
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvSeverity
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.1

3. JobID

The ID of the job being run when an error occurred. If the error is unrelated to a specific job, this field is blank.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvJobID
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.4

4. Orchestration

Reference to an entry in the Orchestration table containing information about the orchestration associated with this event.

- **Type** : OID
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvOrchestration
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.3

5. Message

Textual description of the error. See the table below for a list of descriptions.

- **Type** : String
- **SNMP Object Name** : CASTIRON-REGISTRATIONS-MIB::ciEvMessage
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.1.2.2

6. LoggerName

Name of the logger used to send the notification. See table below.

- **Type** : String
- **SNMP Object Name** : CASTIRON-IA-MIB::ciIaEvLoggerName
- **SNMP OID** : 1.3.6.1.4.1.13336.2.2.2.1.1.10.1.1

Uncategorized Messages

This table lists the most commonly encountered uncategorized notifications. When one of these notifications is categorized, a replacement value is provided and the message remains in the uncategorized messages list for reference purposes.

Table 2. Uncategorized Messages

Severity	System	LoggerName	Message	Replacement
Severe	Orchestration	com.approuter.module.platform	Fan is not functional. Fan: {0} Current Speed: {1} rpm Min Required Speed: {2} rpm Max Allowed Speed: {3} rpm Machine ID: {4}	FanFailed

Log Message Reference

Alphabetized list of all log messages, with links to the details.

Message	Module	Level	Notification
A connection error occurred while sending the receive activity response. Exception: {Message}	HTTP	Severe	ReceiveSendReplyError
A connection error occurred while sending the response. Error is {Message}	HTTP	Severe	ReplyConnectionError
A general error occurred while sending the response. Exception: {Message}	HTTP	Severe	ReplyGeneralError
A select statement was issued to control table {TableName} to check for duplicate rows.	Database	Info	SelectStatement
About to execute function {FunctionName}	SAP	Info	StartFunctionExec
Access Violation by user: {Username}. Target: {Target}. Action Performed: {Action}.	Platform	Info	AccessViolation
Activation of Get SAML 2.0 token failed	STS	Severe	ActivationFailed
Activity could not be converted into TwoPhase activity	Mastero	Severe	ErrorTwoPhase

Message	Module	Level	Notification
Activity could not get activated. Error is: {Message}	Sal esf orc e.c om	S e v e r e	Activat eError
Activity expected string data (MQFMT_STRING), but the message is of format "{Format}".	We bS phe re MQ	W a r n i n g	Format Warnin g
Activity failed as data to get is larger than activity can handle. Error is: {Message}	Sal esf orc e.c om	S e v e r e	LargeD ataErr or
Activity {ActivityName} activated successfully	JD Ed war ds	I n f o	Activat eSucc essful
Activity {ActivityName} activated successfully	Peo ple Sof t	I n f o	Activat eSucc ess
Activity {ActivityName} activated successfully.	Do min o	I n f o	Activat eSucc ess
Activity {ActivityName} could not find any record	Peo ple Sof t	I n f o	GetNo Return
Activity {ActivityName} is stopped successfully.	Do min o	I n f o	StopSu ccess

Message	Module	Level	Notification
Activity {ActivityName} not started as {Name} is blank	PeopleSoft	Severe	ActivateFailureBlank
ActivityFactory (name - {ActivityName}, version - {ActivityVersion}) not registered	Master	Severe	NoActivityFactory
ActivityFactory (name - {ActivityName},version - {ActivityVersion}) has multiple registrations, not loading	Master	Severe	MultipleActFactory
ActivityFactory (name - {ActivityName},version - {ActivityVersion}) returned wrong class {ActivityClass}	Master	Severe	WrongActFactory
Adding Connection Pool with name {PoolName}	SAP	Info	PoolAddInfo
Adding Server Gateway {GatewayName}.	SAP	Info	AddingServerInfo
Additional property {PropertyName} set to {PropertyValue} so setup connection pool.	Email	Info	NewConnectEventTime
An I/O error occurred while processing the request. Exception: {Message}	HTTP	Severe	ReceiveIOError

Message	Module	Level	Notification
An error occurred handling a receive request. Exception: {Message}	HTTP	Severe	CommonHandlerError
An error occurred while archiving job logs. The error message is: {Message}	Platform	Severe	OrcmonArchiveError
An error occurred while closing the connection in the exception path. The exception is {Message}	Database	Warning	JDBCConnectionClose
An error occurred while connecting to the database. The exception is {Message}	Database	Warning	ConnectionError
An error occurred while connecting to the database. The exception is {Message} The job is retrying: {RetryAttemptNumber} out of {TotalRetryAttempts} attempts to connect to the database . Another attempt will be made after {IntervalForRetries} secs.	Database	Warning	ConnectionRetry
An error occurred while executing a query on the job log database. The error message is: {Message}	Platform	Severe	OrcmonDatabaseError

Message	Module	Level	Notification
An error occurred while processing the message for the parameterized query activity at row number {RowNumber}. The error is: {Message}	Database	Severe	Param Query Error
An error occurred while processing the request. Exception: {Message}	HTTP	Severe	ReceiveInternalError
An error occurred while reading headers. Exception: {Message}	HTTP	Severe	ReplyUnmarshalHeader
An error occurred while setting the key store. Exception: {Message}	HTTP	Severe	RegisterKeyStore
An error occurred while trying to execute activity {ActivityName}. Error is: {Message}	Domaino	Severe	ActivityFailure
An error occurred while trying to process an unsupported Accept-Charset encoding. Exception: {Message}	HTTP	Severe	ReceiveOperationError
An exception occurred while activating the activity. The exception is :{Message}	HTTP	Severe	RequestActivate

Message	Module	Level	Notification
An exception occurred while activating the parameterized query activity. The exception is: {Message}	Database	Severe	Param Query Activate
An exception occurred while activating the stored procedure activity. The exception is: {Message}	Database	Severe	Stored ProcActivate
An exception occurred while deleting the row from the control table. The exception is {Message}	Database	Severe	ErrorDeletePost
An exception occurred while deleting the row from the control table. The exception is: {Message}	Database	Severe	Delete RowsError
An exception occurred while processing a SingleTableNotification job. Data error at row number {RowNumber} of table {TableName}. The Error is {Message}	Database	Severe	ErrorSingleTableJob
An exception occurred while processing an outbound job in the stored procedure activity. Data error at row number: {RowNumber}. The error is {Message}	Database	Severe	Stored ProcException
An exception occurred while processing the inbound job: {Message}	Database	Severe	InboundOperationError

Message	Module	Level	Notification
An insert statement was issued to the control table. {TableName}	Database	Info	InsertTableStatement
An internal error occurred: {Message}.	WebSphere MQ	Severe	InternalFailure
An unexpected result returned from the buffer table. Expecting rows to be present in the result, instead the result is empty.	Database	Warning	UnexpectedEmptyRows
An unknown exception occurred while sending the response to the client. Exception: {Message}	HTTP	Severe	ReplyUnknownError
Append data to file "{FileName}" completed with return code {ResponseCode}.	FTP	Info	AppendAfter
Appending data to file "{FileName}".	FTP	Info	AppendBefore
Archiver created successfully, now performing archiving.	Archive	Info	ArchiverCreated
Archiving done successfully.	Archive	Info	ArchiveDone

Message	Module	Level	Notification
Attempt to upgrade Cast Iron firmware on appliance {AffectedAppliance} from version {OldVersion} to version {NewVersion} failed: {Message}.	Platform	Severe	UpgradeFailed
Authentication failure for user {Username}, from host {Host}.	Platform	Severe	AuthFailure
Authentication success for user {UserName}, from host {Host} with session id {SessionId}.	Platform	Info	AuthSuccess
Automatically added entry to /etc/hosts with hostname {Hostname} and IP address {IPAddress}.	Platform	Warning	NetworkAutohost
Automatically converting old style FTP filename pattern from "{OldStylePattern}" to "{NewStylePattern}". Please republish project from Studio version 3.6 or later to eliminate this warning.	FTP	Warning	FtpPatternConversion
Binding parameters supplied are invalid.	Archive	Severe	IncorrectParameters
Boundary attribute not set in input parameter 'mimeheader'. Input body being set as entityBody in first entity of 'parts' output parameter.	MIME	Info	BoundaryAbsent

Message	Module	Level	Notification
Boundary delimiters longer than 70 characters. Ignoring the specified boundary value. Using auto-generated boundary.	MI ME	Warning	BoundaryMoreThan70
Boundary is: \"{Boundary}\".	MI ME	Info	BoundaryInfo
Boundary specified in header but no boundary found in the body. Returning single body.	MI ME	Warning	NoBoundaryFound
Call context created but task never started; destroying task {TaskID}	Mastero	Info	CallContextDestroy
Call to function {FunctionName} is complete	SAP	Info	CompleteFunctionExec
Cancel of job {JobID} of Orchestration {OrchName} failed: {Message}.	Mastero	Severe	LoaderCancel
Cannot complete this job due to low memory, please try redeploying this orchestration	Mastero	Severe	LargeTotalVarSize
Cannot start an orchestration that is in transient state: {State}	Mastero	Severe	ProgramStart

Message	Module	Level	Notification
Caught exception while canceling job: {Message}	Mastero	Warning	TaskCancelled
Changed directory to "{DirectoryName}" completed with return code {ResponseCode}.	FTP	Info	DirChangeAfter
Changing to directory "{DirectoryName}".	FTP	Info	DirChangeBefore
Committing TID {TID}.	SAP	Info	TIDCommittingInfo
Completed activity and spewed out sessionInfo and {NameOfOutputParam} output parameter.	Sal esf orc e.c om	Info	ActivityOutput
Completed activity and spewed out sessionInfo output parameter and {NumberOfObjects} objects in output parameter {NameOfOutputParam}.	Sal esf orc e.c om	Info	ParameterOutput
Completed activity and spewed out sessionInfo output parameter and {NumberOfResults} result objects in output parameter {NameOfOutputParam}.	Sal esf orc e.c om	Info	ParameterResults
Composite media type {MediaType} cannot have any other Content-Transfer-Encoding apart from 7bit, 8bit or binary.	MI ME	Severe	TransferEncodingError

Message	Module	Level	Notification
Config Parameters: From: \"{From}\", To: \"{To}\", CC: \"{CC}\", BCC: \"{BCC}\", Subject: \"{Subject}\".	Email	Info	SmtPConfigParams
Config parameters: From Pattern: \"{FromPattern}\", Subject Pattern: \"{SubjectPattern}\".	Email	Info	Pop3COnfigParams
Connected to the POP3 server.	Email	Info	Pop3COnnected
Connected to the SMTP server.	Email	Info	SmtPCOnnected
Connection Pool {PoolName} already exists, Using existing definition.	SAP	Info	PoolExistInfo
Connection error while executing activity {ActivityName}. The error is: {Message}. Attempt {RetryAttemptNumber} of {TotalRetryAttempts}. Will try again in {IntervalForRetries} second(s)	JDEwards	Warning	JDERetryError
Connection error while executing activity {ActivityName}. The error is: {Message}. Attempt {RetryAttemptNumber} of {TotalRetryAttempts}. Will try again in {IntervalForRetries} second(s)	PeopleSoft	Warning	ConnectionRetry
Connection exception in the subscriber. The exception is {Message}. Going to restart the subscriber after the {IntervalForRestart} secs	JMS	Severe	SubscriberConnect

Message	Module	Level	Notification
Connection exception while getting message from the provider. The error code is {ErrorCode} and message is {ErrorMessage}. The job is retrying {RetryAttemptNumber}, out of {TotalRetryAttempts} attempts to connect to JMS provider. The next attempt will be after {IntervalForRetries} seconds.	JMS	Warning	GetConnectRetry
Connection exception while polling message. The exception is {Message}. The job is retrying {RetryAttemptNumber} out of {TotalRetryAttempts} attempt to connect to JMS provider. The next attempt will be after {IntervalForRetries} secs.	JMS	Warning	PollMessageRetry
Connection exception while sending message. The error code is {ErrorCode} and exception is {ErrorMessage}. The job is retrying {RetryAttemptNumber} out of {TotalRetryAttempts} attempt to connect to JMS provider. The next attempt will be after {IntervalForRetries} secs.	JMS	Warning	SendConnectRerty
Connection handler retrieved from the call context is Null!	HTTP	Severe	ReplyHandlerNull
Content-Encoding header received: {ContentEncodingHeader}	HTTP	Info	IncomingContentEnc
Content-Transfer-Encoding value for attachment {AttachmentNumber} is {EncodingValue} while the attachment body has lines greater than 998 characters in length. Changing the Content-Transfer-Encoding to binary.	MIME	Warning	TransferEncChanged

Message	Module	Level	Notification
Content-Transfer-Encoding value missing for attachment number {AttachmentNumber}. Guessing based on Content-Type and charset values.	MI ME	Warning	TransferEnc Missing
Content-type not found. Taking default Content-Type as text/plain.	MI ME	Info	DefaultContentType
Could not add route to {DestinationIP} on {LinkName}.	Platform	Warning	NetworkInvalidRoute
Could not clean up object with ID {ObjectID}, will try later	Master	Warning	DeleteObject
Could not close output stream	Master	Warning	CloseOutputStream
Could not close reader	Master	Warning	CloseInputStream

Message	Module	Level	Notification
Could not close reader	Maestro	Warning	CloseReader
Could not close writer	Maestro	Warning	CloseWriter
Could not delete file "{FileName}" after processing. Error is {Message}	FTP	Warning	UnableToDelete
Could not execute query to preload lookup cache	Data Quality	Warning	BadPreloadQuery
Could not find an Archiver for supplied archive type: {FormatName}	Archive	Severe	InvalidArchiveFormat
Could not find an entry point for the activity: [{ActivityName}] in the compiled orchestration	Maestro	Severe	EntryPath

Message	Module	Level	Notification
Could not get data for date range, because id limit exceeded	Salesforce.com	Severe	LargeData
Could not initialize FaultInfo	Mastero	Severe	FaultInfo
Could not initialize JobInfo	Mastero	Severe	InitializeJobInfo
Could not log monitor events	Mastero	Severe	MonitorEvents
Could not log monitor variable "{VariableName}"	Mastero	Warning	MonitorVariable
Could not log monitor variables	Mastero	Warning	MonitorVariables

Message	Module	Level	Notification
Could not move file "{FileName}" after processing. Error is {Message}	FTP	Warning	Unable To Move
Could not perform input map expression: {ExpressionName}	Master	Severe	Input MapXP ath
Could not perform input map transform: {Message}	Master	Severe	Input MapXSLT
Could not perform output map expression: {Message}	Master	Severe	Output MapXP ath
Could not perform output map transform: {Message}	Master	Severe	Output MapXSLT
Could not perform output map: {Message}	Master	Severe	Output Map
Could not query for monitor data	Master	Severe	MonitorQuery

Message	Module	Level	Notification
Could not read the module configuration: {Message}	Master	Severe	ModuleConfig
Could not receive socket reply	Master	Warning	SocketNoReply
Could not register {ObjectName} with mbean server	Master	Severe	MBeanRegister
Could not suspend, orchestration not running: {OrchName}	Master	Severe	NotSuspend
Could not undeploy, orchestration not stopped, state is {State}: {OrchName}	Master	Severe	NotStopped
Could not unregister {ObjectName} with mbean server	Master	Severe	MBeanUnregister
Created a new TID {TID} for starting a transaction in send IDOC activity.	SAP	Info	SendIDOCCreateInfo

Message	Module	Level	Notification

Introduction

About WebSphere DataPower Cast Iron Management API Guide

The Management API guide is written for developers and IT personnel who want to manage Integration Appliance and the Cloud by using applications or scripts.

This guide assumes that you have an intermediate level of expertise in integration projects and some experience in supporting and managing an IT environment.

Integration Appliance and Cloud documentation

To view PDF documents, download Adobe Reader version 5 or higher from Adobe Systems Inc., see <http://www.adobe.com>.

You can access documentation from the Documentation CD.

The documentation set includes the following books:

Command Line Interface Reference

Reference information about commands available from the Command Line Interface (CLI).

Getting Started Guide

An overview of Integration Appliance and Studio, and summary information about using Studio to create integration projects that run on the Integration Appliance

HA Overview Guide

A high-level overview about High Availability (HA) pairs. This guide includes information about HA pair states, configuration requirements, commands, and troubleshooting issues.

Management API Guide

Information for the Management API for the Cloud and Integration Appliances.

Documentation conventions

The following table describes the conventions that are used in this document.

Convention	Description
<code><Hostname> command</code>	Examples of using commands are shown in this document in this format.
<code>enter exactly as shown</code>	Procedures might also include instructions on what you should enter for particular fields, prompts, or commands. Information in this font must be typed exactly as shown.
<code>net set interface dataaddress <port-address></code>	Placeholders are shown between angle brackets (<>) and generally indicate the type of information you should supply in the command.
Menu > Submenu	Instructions that use menu commands use the greater than symbol (>) to indicate submenus, for example, "click Configuration > Notifications".

Other resources

In addition to the product information, IBM® provides these other resources:

- Online help

- Information centers
- Knowledge Base
- Product Support

Online help

Online help is accessible from Studio and the Web Management Console.

IBM website

You can access the IBM Corporation website at: <http://www.ibm.com>.

The site contains information about the IBM Corporation, its background, and products. The site also provides contact information for sales and technical support.

Contacting IBM support

IBM support provides assistance with product defects. Before contacting IBM support, the following criteria must be met:

- Your company has an active maintenance contract.
- You are authorized to submit problems.

Submit the problem in one of two ways:

- Electronically through the Service Request (SR) problem submission tool. You must sign in with your IBM ID and password.
- Telephone. Refer to the directory of worldwide contacts in the IBM Software Support Handbook for the appropriate software support phone number to call.

Overview of the Management API guide

An overview of the Management API. The API provides management capabilities for Clouds and Integration Appliances.

The Management API is implemented as a web service. This web service provides a way to manage WebSphere® DataPower Cast Iron® Appliances (Integration Appliances) and WebSphere Cast Iron Cloud (Cloud) projects through your applications or scripts.

The API provides Integration Appliance and Cloud management in the following areas:

Deployment

Provides operations to create, get, and delete configurations, rules, and projects. You can start, pause, stop, and cancel jobs. You can import or export repositories.

Security

Provides operations to create, get, list, and delete users, roles, and permissions. You can log in and log out by using the security WSDL.

Staging

Checks whether the staging database is started and starts or stops the staging database. (Applies to appliances only.)

System Administration

Sets or gets the appliance name or network configuration. You can also run system commands or get system information. (Applies to appliances only.)

Job Monitoring

Searches for job, gets job count, and gets job details. You can also set and get job monitoring properties.

Logs and Notifications

Saves, gets, and deletes notification policies. You can also get and set email and SNMP endpoints, set and get log levels, and get log count.

The Management API complies with the following web services standards:

- Web Services Interoperability Organization (WS-I) Basic Profile 1.0
- SOAP 1.1
- Web Services Description Language (WSDL) 1.1
- XML Schema 1.1

You can create client applications that call web services operations to manage and monitor Integration Appliances and Cloud projects. Communication between the client application and the Integration Appliance or Cloud project is accomplished by using HTTP or HTTPS.

The Management API is defined in WSDL files. Client applications call web services operations by sending SOAP messages. SOAP messages are formatted in XML and so are programming language neutral.

Examples of SOAP messages

This section provides examples of logging in, getting a user and logging out using the Management API - Security WSDL.

The following code is an example of a SOAP request to log in.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:sec="http://www.approuter.com/schemas/2008/1/security">
  <soapenv:Header/>
  <soapenv:Body>
    <sec:login>
      <sec:username>webuser@mycompany.com</sec:username>
      <sec:password>D3nu9noB</sec:password>
    </sec:login>
  </soapenv:Body>
</soapenv:Envelope>
```

The following code is an example of a SOAP reply to the request to log in.

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:loginResponse xmlns:ns2="http://www.approuter.com/schemas/2008/1/
security" xmlns:ns3="http://www.approuter.com/schema/router/1000/security/03">
      <ns2:sessionId>8F059BEEA3611033D27773A95404641</ns2:sessionId>
    </ns2:loginResponse>
  </S:Body>
</S:Envelope>
```

The *sessionId* is required to perform other SOAP operations after you log in to an Integration Appliance or the Cloud.

The following code is an example of a SOAP request to get a user.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:sec="http://www.approuter.com/schemas/2008/1/security">
  <soapenv:Header>
    <sec:sessionId>8F059BEEA3611033D277773A95404641</sec:sessionId>
  </soapenv:Header>
  <soapenv:Body>
    <sec:getUser>
      <sec:username>webuser</sec:username>
    </sec:getUser>
  </soapenv:Body>
</soapenv:Envelope>
```

The following code is an example of a SOAP response to the request to get a user.

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:getUserResponse xmlns:ns2="http://www.approuter.com/schemas/2008/1/
security" xmlns:ns3="http://www.approuter.com/schema/router/1000/security/03">
      <ns2:user>
        <ns3:id>8F059BEEA3611033D277773A95404641</ns3:id>
        <ns3:name>webuser</ns3:name>
        <ns3:encPasswd>{SHA}clO20r2ZJMJcDrNwXQzhWB8YcdI=</ns3:encPasswd>
        <ns3:displayName>WebServiceUser</ns3:displayName>
        <ns3:isActive>true</ns3:isActive>
        <ns3:isMutable>true</ns3:isMutable>
        <ns3:isVisible>true</ns3:isVisible>
        <ns3:email>webuser@mycompany.com</ns3:email>
        <ns3:createdTime>2010-03-02T22:11:32.935Z</ns3:createdTime>
        <ns3:failedLoginCount>0</ns3:failedLoginCount>
        <ns3:scopeId>B47EAECF6AD14AA028B4EA038CB742D0</ns3:scopeId>
        <ns3:scopeType>Tenant</ns3:scopeType>
      </ns2:user>
    </ns2:getUserResponse>
  </S:Body>
</S:Envelope>
```

The following code is an example of a SOAP request to logout.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:sec="http://www.approuter.com/schemas/2008/1/security">
  <soapenv:Header>
    <sec:sessionId>8F059BEEA3611033D277773A95404641</sec:sessionId>
  </soapenv:Header>
  <soapenv:Body>
    <sec:logout/>
  </soapenv:Body>
</soapenv:Envelope>
```

Cloud examples

The following examples apply to the Cloud only.

The previous examples used SOAP operations that ran in a tenant in the Cloud or an Integration Appliance. To run operations in environments within a tenant in the Cloud, you use the `setCurrentScope` operation to set the scope to the environment where you want to run SOAP operations.

The following example sets the scope to the development environment and then starts a project located in the development environment.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:sec="http://www.approuter.com/schemas/2008/1/security">
  <soapenv:Header>
    <sec:sessionId>63Y93HD6D856EB5812EB71216C3547W7</sec:sessionId>
  </soapenv:Header>
  <soapenv:Body>
    <sec:setCurrentScope>
      <sec:scopeName>Development</sec:scopeName>
    </sec:setCurrentScope>
  </soapenv:Body>
</soapenv:Envelope>
```

The following example is the SOAP response to the request.

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:setCurrentScopeResponse xmlns:ns2="http://www.approuter.com/
schemas/2008/1/security" xmlns:ns3="http://www.approuter.com/schema/
router/1000/security/03">
      <ns2:success>true</ns2:success>
    </ns2:setCurrentScopeResponse>
  </S:Body>
</S:Envelope>
```

The following example is a SOAP request to start a configuration in the development environment.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:dep="http://www.approuter.com/schemas/2008/1/deployment">
  <soapenv:Header>
    <dep:sessionId>63Y93HD6D856EB5812EB71216C3547W7</dep:sessionId>
  </soapenv:Header>
  <soapenv:Body>
    <dep:start>
      <dep:projectName>HTTP_363i</dep:projectName>
      <dep:version>1.0</dep:version>
      <dep:configName>HTTP_363j</dep:configName>
    </dep:start>
  </soapenv:Body>
</soapenv:Envelope>
```

The following example is the SOAP response to the request.

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:startResponse xmlns:ns2="http://www.approuter.com/schemas/2008/1/
deployment" xmlns:ns3="http://www.approuter.com/schemas/2008/1/deployment/
types" xmlns:ns4="http://www.approuter.com/schema/router/1000/security/03"
xmlns:ns5="http://www.approuter.com/schemas/2008/1/util/types">
      <ns2:success>true</ns2:success>
    </ns2:startResponse>
  </S:Body>
</S:Envelope>
```

WSDL files

Client-side web services use the WSDL file to create stubs that enable client-side applications to interact with an Integration Appliance or Cloud project.

The WSDL files specify the operations that a client application can use to install, manage, and monitor an Integration Appliance or Cloud project.

The Management API is defined in six WSDL files:

- security.wsdl
- staging.wsdl
- deployment.wsdl
- system.wsdl
- orcmon.wsdl
- lognotif.wsdl

You can download the WSDL files from the following locations for an Integration Appliance:

- Security: <https://<appliance>/ws/security?wsdl>
- Staging: <https://<appliance>/ws/staging?wsdl>
- Deployment: <https://<appliance>/ws/deployment?wsdl>
- System: <https://<appliance>/ws/system?wsdl>
- Orcmon: <https://<appliance>/ws/orcmon?wsdl>
- Lognotif: <https://<appliance>/ws/lognotif?wsdl>

You can download the WSDL files from the following locations for the Cloud:

- Security: <https://cloud2.castiron.com/ws/security?wsdl>
- Staging: <https://cloud2.castiron.com/ws/staging?wsdl>
- Deployment: <https://cloud2.castiron.com/ws/deployment?wsdl>
- System: <https://cloud2.castiron.com/ws/system?wsdl>
- Orcmon: <https://cloud2.castiron.com/ws/orcmon?wsdl>
- Lognotif: <https://cloud2.castiron.com/ws/lognotif?wsdl>

E

environment

In the Cloud, an environment is a subdivision of a tenant. A typical tenant contains development, staging, and production environments. An environment has its own administrators, users, roles, and role groups. After a project is completed in the Modify tab, it is published to an environment where it can be deployed, tested, and run. The administrator role of an environment can assign users to roles and roleGroups. In addition, the administrator role can create, deploy, run, clone, and delete projects and configurations in the environment.

[TOP](#)

R

role

Role is a way to provide users with a pre-defined set of permissions. When an administrator assigns a role to a user the user is able to access all of the projects to which the role is has permissions. The user can also perform all of the actions for which the role has permissions. In the Cloud, the user gets access to any tenants and environments to which the role has permissions.

roleGroup

Use to combine roles into a single entity which can then be assigned to users. A user assigned to a roleGroup inherits all of the access and permissions that the roles in the roleGroup are given.

[TOP](#)

S

scope

In the Cloud, scope refers to either a tenant or an environment within a tenant. You use setCurrentScope to set the scope to where you want to run SOAP operations. Scope applies to the Cloud only.

[TOP](#)

T

tenant

The Cloud is a multi-tenant cloud as opposed to a single-tenant cloud. Each tenant can be divided into environments such as development, staging, and production. The administrator role of the tenant can assign users to environments, roles, and roleGroups. In addition, the administrator role can create, deploy, run, clone, and delete projects and configurations in the tenant and environments within the tenant.

[TOP](#)

Security

Information about the security WSDL.

The security WSDL provides operations to create, get, list and delete users, roles, and permissions. You log in and log out by using the security WSDL.

addRoleToRoleGroup

Adds the specified role as a member to the specified group.

Applies to Clouds and Integration Appliances.

Parameters:

role

The name of the role.

group

The name of the group to which the role is to be added.

Returns:

True if the role is successfully added to the group.

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.doc/ci00006.html>

changePassword

Changes the password for the specified username.

Parameters:

username

The username for which the password is to be changed.

oldPassword

The old password for the username.

newPassword

The new password for the username.

Returns:

True if the password was successfully changed.

Examples:

The following example is a SOAP request to change the password for a user.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:sec="http://www.approuter.com/schemas/2008/1/security">
  <soapenv:Header>
    <sec:sessionId>B0097A43C5527FA552C3DDBA7EF74CE9</sec:sessionId>
  </soapenv:Header>
  <soapenv:Body>
    <sec:changePassword>
      <sec:username>webman</sec:username>
      <sec:oldPassword>Oldpw12g</sec:oldPassword>
      <sec:newPassword>Newpw24e</sec:newPassword>
    </sec:changePassword>
  </soapenv:Body>
</soapenv:Envelope>
```

The following example is the SOAP response to the request.

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:changePasswordResponse xmlns:ns2="http://www.approuter.com/
schemas/2008/1/security" xmlns:ns3="http://www.approuter.com/schema/
router/1000/security/03">
      <ns2:success>true</ns2:success>
    </ns2:changePasswordResponse>
  </S:Body>
</S:Envelope>
```

clearPrivileges

Clears privileges for the specified target, such as a user.

Applies to Clouds and Integration Appliances.

Parameter:

target

The specified target.

Returns:

True if the privileges are cleared for the specified target.

Examples:

The following code is an example of a SOAP request to create a user.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:sec="http://www.approuter.com/schemas/2008/1/security">
  <soapenv:Header>
    <sec:sessionId>B87CDEE24C7AE5EE4B1C00158EBC483D</sec:sessionId>
  </soapenv:Header>

createRole

Creates a role.

Applies to Clouds and Integration Appliances.

Parameters:

role

The specified roleName for the role that you want created.

displayName

The name to be displayed in the WMC.

email

The email address for the role.

Returns:

True if the role is created.

Examples:

The following example is a SOAP request to create a role. The input for the request is the session ID.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:sec="http://www.approuter.com/schemas/2008/1/security">

deleteRole

Deletes a specified role.

Applies to Clouds and Integration Appliances.

Parameter:

role

The specified roleName to delete.

Returns:

True if the role is deleted.

Examples:

The following example is a SOAP request to delete a role.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:sec="http://www.approuter.com/schemas/2008/1/security">
  <soapenv:Header>
    <sec:sessionId>B0097A43C5527FA552C3DDBA7EF74CE9</sec:sessionId>
  </soapenv:Header>
  <soapenv:Body>
    <sec:deleteRole>
      <sec:role>jobmonitor</sec:role>
    </sec:deleteRole>
  </soapenv:Body>
</soapenv:Envelope>
```

The following example is the SOAP response to the request.

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:deleteRoleResponse xmlns:ns2="http://www.approuter.com/
schemas/2008/1/security" xmlns:ns3="http://www.approuter.com/schema/
router/1000/security/03">
      <ns2:success>true</ns2:success>
    </ns2:deleteRoleResponse>
  </S:Body>
</S:Envelope>
```

deleteUser

Deletes the user with the specified username.

Applies to Clouds and Integration Appliances.

Parameter:

username

The user to delete from the tenant, environment, or project.

Returns:

True if the user was successfully deleted.

Examples:

The following example is a SOAP request to delete a user.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:sec="http://www.approuter.com/schemas/2008/1/security">
  <soapenv:Header>
    <sec:sessionId>BAB25F1A2A1ADCC0BB0D455D41354509</sec:sessionId>
  </soapenv:Header>
  <soapenv:Body>
    <sec:deleteUser>
      <sec:username>webman</sec:username>
    </sec:deleteUser>
  </soapenv:Body>
</soapenv:Envelope>
```

The following example is the SOAP reply to the request.

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:deleteUserResponse xmlns:ns2="http://www.approuter.com/
schemas/2008/1/security" xmlns:ns3="http://www.approuter.com/schema/
router/1000/security/03">
      <ns2:success>true</ns2:success>
    </ns2:deleteUserResponse>
  </S:Body>
</S:Envelope>
```

disableUser

Disables a username. A disabled username cannot authenticate.

Applies to Clouds and Integration Appliances.

Parameter:

username

The username to disable.

Returns:

True if the user was successfully disabled.

Examples:

The following example is a SOAP request to disable a user.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:sec="http://www.approuter.com/schemas/2008/1/security">

enableUser

Enables a user. An enabled user can authenticate.

Applies to Clouds and Integration Appliances.

Parameter:

username

The user to enable.

Returns:

True if the user was successfully enabled.

Examples:

The following example is a SOAP request to enable a user.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:sec="http://www.approuter.com/schemas/2008/1/security">
  <soapenv:Header>

filterUsers

Filters users.

Applies to Clouds and Integration Appliances.

Parameter:

filter

The filter to run against a list of users.

Returns:

The users.

Examples:

The following example is a SOAP request to filter users that begin with a w.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:sec="http://www.approuter.com/schemas/2008/1/security">

getGrantedRoles

Returns a list of all the roles explicitly granted to the specified user.

Applies to Clouds and Integration Appliances.

Parameter:

username
The specified user.

Returns:
The list of roles granted to the specified user.

getImpliedRoles

Returns a list of all roles to which the specified user is a member. The list might contain roles that might not have been explicitly granted to the user, but are indirectly implied due to group memberships.

Applies to Clouds and Integration Appliances.

Parameter:

username
The specified user.

Returns:
The role names.

getRole

Gets the specified role.

Applies to Clouds and Integration Appliances.

Parameter:

role

The specified role to return.

Returns:

The specified role

Examples:

The following example is a SOAP request to get a role.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:sec="http://www.approuter.com/schemas/2008/1/security">
  <soapenv:Header>
    <sec:sessionId>BC77BA76E338CFA6B0063218A0AE4656</sec:sessionId>
  </soapenv:Header>
  <soapenv:Body>
    <sec:getRole>
      <sec:name>publisher@A347B0C49C8CFA462D4F28A4C05B47C2</sec:name>
    </sec:getRole>
  </soapenv:Body>
</soapenv:Envelope>
```

The following example is the SOAP response to the request.

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:getRoleResponse xmlns:ns2="http://www.approuter.com/schemas/2008/1/
security" xmlns:ns3="http://www.approuter.com/schema/router/1000/security/03">
      <ns2:group>
        <ns3:id>903273B869AC8CA9D99F4C8448694680</ns3:id>
        <ns3:name>publisher@A347B0C49C8CFA462D4F28A4C05B47C2</ns3:name>
        <ns3:displayName>Publisher Group</ns3:displayName>
        <ns3:isActive>true</ns3:isActive>
        <ns3:isMutable>false</ns3:isMutable>
        <ns3:isVisible>true</ns3:isVisible>
        <ns3:createdTime>2010-04-10T00:08:23Z</ns3:createdTime>
        <ns3:scopeId>A347B0C49C8CFA462D4F28A4C05B47C2</ns3:scopeId>
        <ns3:scopeType>Environment</ns3:scopeType>
        <ns3:groupType>Publisher</ns3:groupType>
      </ns2:group>
    </ns2:getRoleResponse>
  </S:Body>
</S:Envelope>
```

For each role the following information is returned:

id

The ID for the role.

name

The name of the role.

displayName

The name displayed in the WMC for the role.

isActive

True or false depending on whether the role is active.

isMutable

True or false. True means that the object can be updated.

isVisible

True or false. True means that the object is visible in the WMC.

email

The email address for the role.

createdTime

The date and time the role was created. The time is compliant with ISO 8601.

scopeId

The ID of the scope where the role is found. (Cloud only.)

scopeType

The type of scope, either tenant or environment. (Cloud only.)

groupType

The type of group to which the role belongs. If you create your own group, it is a custom group. For information about the built-in groups, see [WMC Help > Permissions > About Built-in Groups](#).

  <soapenv:Body>
    <sec:getRoleById>
      <sec:id>8F52644BBA2491693D440F2FA12A4B3D</sec:id>
    </sec:getRoleById>
  </soapenv:Body>
</soapenv:Envelope>
```

The following example is a SOAP response to the request.

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:getRoleByIdResponse xmlns:ns2="http://www.approuter.com/
schemas/2008/1/security"
xmlns:ns3="http://www.approuter.com/schema/
router/1000/security/03">
      <ns2:group>
        <ns3:id>8F52644BBA2491693D440F2FA12A4B3D</ns3:id>
        <ns3:name>securitymonitor</ns3:name>
        <ns3:displayName>monitor</ns3:displayName>
        <ns3:isActive>true</ns3:isActive>
        <ns3:isMutable>true</ns3:isMutable>
        <ns3:isVisible>true</ns3:isVisible>
        <ns3:email>security@mycompany.com</ns3:email>
        <ns3:createdTime>2010-03-23T19:14:30.066Z</ns3:createdTime>
        <ns3:scopeId>A6EFAF24DB7168A4206F605CA6E14B1D</ns3:scopeId>
        <ns3:scopeType>Tenant</ns3:scopeType>
        <ns3:groupType>Custom</ns3:groupType>
      </ns2:group>
    </ns2:getRoleByIdResponse>
  </S:Body>
</S:Envelope>
```

For each role the following information is returned:

id

The ID for the role.

name

The name of the role.

displayName

The name displayed in the WMC for the role.

isActive

True or false depending on whether the role is active.

isMutable

True or false. True means that the object can be updated.

isVisible

True or false. True means that the object is visible in the WMC.

email

The email address for the role.

createdTime

The date and time the role was created. The time is compliant with ISO 8601.

scopeId

The ID of the scope where the role is found. (Cloud only.)

scopeType

The type of scope, either tenant or environment. (Cloud only.)

groupType

The type of group to which the role belongs.

      </ns2:roles>
    </ns2:getRolesResponse>
  </S:Body>
</S:Envelope>

```

```
</S:Body>  
</S:Envelope>
```

For each role the following is returned:

id

The ID for the role.

name

The name of the role.

displayName

The name displayed in the WMC for the role.

isActive

True or false depending on whether the role is active.

isMutable

True or false. True means that the object can be updated.

isVisible

True or false. True means that the object is visible in the WMC.

email

The email address for the role.

createdTime

The date and time the role was created. The time is compliant with ISO 8601.

scopeId

The ID of the scope where the role is found. (Cloud only.)

scopeType

The type of scope, either tenant or environment. (Cloud only.)

groupType

The type of group to which the role belongs.

getScope

Gets the specified scope in the specified parent scope.

Applies to Clouds only.

Parameters:

scopeType

The type of scope, which is either tenant or environment.

name

The name of the scope.

parentScopeId

The ID of the parent scope.

Returns:

The specified scope.

Examples:

The following example is a SOAP request to get the specified scope in the specified parent scope.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:sec="http://www.approuter.com/schemas/2008/1/security">
  <soapenv:Header>
    <sec:sessionId>AA91E56114D36B296D82660639B6482F</sec:sessionId>
  </soapenv:Header>
  <soapenv:Body>
    <sec:getScope>
      <sec:scopeType>ENV</sec:scopeType>
      <sec:name>Staging</sec:name>
      <sec:parentScopeId>88673D5DF2583806B037576D94F34BBA</
sec:parentScopeId>
    </sec:getScope>
  </soapenv:Body>
</soapenv:Envelope>
```

The following example is the SOAP response to the request.

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:getScopeResponse xmlns:ns2="http://www.approuter.com/
schemas/2008/1/security" xmlns:ns3="http://www.approuter.com/schema/
router/1000/security/03">
      <ns2:scope>
        <active>true</active>
        <displayName>Staging</displayName>
        <id>A51EDD44BE6C10B2D1335A9D634D407D</id>
        <index>1</index>
        <name>Staging</name>
        <parentId>88673D5DF2583806B037576D94F34BBA</parentId>
        <type>ENV</type>
      </ns2:scope>
    </ns2:getScopeResponse>
  </S:Body>
</S:Envelope>
```

getScopeById

Gets the scope as specified by the ID.

Applies to Clouds only.

Parameter:

scopeID

The ID for the scope.

Returns:

The scope as specified by the ID.

Examples:

The following code is an example of a SOAP request to get a scope by its ID.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:sec="http://www.approuter.com/schemas/2008/1/security">
  <soapenv:Header>
    <sec:sessionId>B60EA6425F8FCB16BB6E96063D09408E</sec:sessionId>
  </soapenv:Header>
  <soapenv:Body>
    <sec:getScopeById>
      <sec:scopeId>9378E8C3C5E5DCACA77D9F7B6BE24B98</sec:scopeId>
    </sec:getScopeById>
  </soapenv:Body>
</soapenv:Envelope>
```

The following example is the SOAP response to the request.

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:getScopeByIdResponse xmlns:ns2="http://www.approuter.com/
schemas/2008/1/security" xmlns:ns3="http://www.approuter.com/schema/
router/1000/security/03">
      <ns2:scope>
        <active>true</active>
        <category>enterprise</category>
        <displayName>mycompany.com</displayName>
        <id>9378E8C3C5E5DCACA77D9F7B6BE24B98</id>
        <index>0</index>
        <name>castiron.com</name>
        <parentId>00000000000000000000000000000000</parentId>
        <type>TENANT</type>
      </ns2:scope>
    </ns2:getScopeByIdResponse>
  </S:Body>
</S:Envelope>
```

getScopesByParentId

Using the ID of the parent scope, returns a list of all the child scopes.

Applies to Clouds only.

Parameter:

parentScopeId

The ID for the parent scope.

Returns:

A list of child scopes.

Examples:

The following example is a SOAP request to get scopes by using the ID of the parent scope.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:sec="http://www.approuter.com/
schemas/2008/1/security">
  <soapenv:Header>
    <sec:sessionId>B0097A43C5527FA552C3DDBA7EF74CE9</sec:sessionId>
  </soapenv:Header>
  <soapenv:Body>
    <sec:getScopesByParentId>
      <sec:parentScopeId>BB173AE61484BD7359D8910789EA4E88</
      sec:parentScopeId>
    </sec:getScopesByParentId>
  </soapenv:Body>
</soapenv:Envelope>
```

The following example is the SOAP response to the request. The parent scope is a tenant and the child scopes are the environments in the tenant.

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:getScopesByParentIdResponse xmlns:ns2="http://www.approuter.com/
schemas/2008/1/security"
xmlns:ns3="http://www.approuter.com/schema/
router/1000/security/03">
      <ns2:scopes>
        <active>true</active>
        <displayName>Staging</displayName>
        <id>9203C78275503796DB49CB5E6CF34111</id>
        <index>1</index>
        <name>Staging</name>
        <parentId>BB173AE61484BD7359D8910789EA4E88</parentId>
        <type>ENV</type>
      </ns2:scopes>
      <ns2:scopes>
        <active>true</active>
        <displayName>Development</displayName>
        <id>A26D2319BAE05E9513117949CF274A09</id>
        <index>0</index>
        <name>Development</name>
        <parentId>BB173AE61484BD7359D8910789EA4E88</parentId>
        <type>ENV</type>
      </ns2:scopes>
    </ns2:scopes>
  </S:Body>
</S:Envelope>
```

```
<active>true</active>
<displayName>Production</displayName>
<id>B56005332F3E41A3F1456F5F40594A06</id>
<index>2</index>
<name>Production</name>
<parentId>BB173AE61484BD7359D8910789EA4E88</parentId>
<type>ENV</type>
</ns2:scopes>
</ns2:getScopesByParentIdResponse>
</S:Body>
</S:Envelope>
```

For each child scope, the following information is returned:

active

True or false. True means that the scope is active.

displayName

The name displayed in the WMC for the role.

id

The ID for the child scope.

index

The position in the index of the child scope.

name

The name of the child scope.

parentId

The ID of the parent scope.

type

The type of scope.

  <soapenv:Body>
    <sec:getUser>
      <sec:username>webman</sec:username>
    </sec:getUser>
  </soapenv:Body>
</soapenv:Envelope>
```

The following example is the SOAP response to the request.

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:getUserResponse xmlns:ns2="http://www.approuter.com/schemas/2008/1/
security" xmlns:ns3="http://www.approuter.com/schema/router/1000/security/03">
      <ns2:user>
        <ns3:id>965AAB3FED8D3CCBBE4DC8EE0E2944EA</ns3:id>
        <ns3:name>webman</ns3:name>
        <ns3:encPasswd>{SHA}c1020r2ZJMJcDrNwXQzhWB8YcdI=</ns3:encPasswd>
        <ns3:displayName>WebServiceUser</ns3:displayName>
        <ns3:isActive>true</ns3:isActive>
        <ns3:isMutable>true</ns3:isMutable>
        <ns3:isVisible>true</ns3:isVisible>
        <ns3:email>webman@mycompany.com</ns3:email>
        <ns3:createdTime>2010-03-02T22:11:32.935Z</ns3:createdTime>
        <ns3:failedLoginCount>0</ns3:failedLoginCount>
        <ns3:scopeId>B47EAECF6AD14AA028B4EA038CB742D0</ns3:scopeId>
        <ns3:scopeType>Tenant</ns3:scopeType>
      </ns2:user>
    </ns2:getUserResponse>
  </S:Body>
</S:Envelope>
```

For each user the following information is returned:

id

The ID for the user.

name

The name for the user.

encPasswd

The SHA encoded password for the user.

displayName

The name displayed in the WMC for the role.

isActive

True if the user is logged in, false if not.

isMutable

True or false. True means that the object can be updated, false if not.

isVisible

True or false. True means that the object is visible in the WMC, false if not.

email

The email address for the user.

createdTime

The date and time the user was created.

failedLoginCount

The number of failed attempts to log in by using this name. After five failures, the username is blocked for 15 seconds. For each successive failure, the blocked time is doubled (15 - 30 - 60 - 120).

scopeId

The scope ID for the scope where the user is located. Does not apply for Integration Appliances.

scopeType

The type of scope, either tenant or environment. Does not apply for Integration Appliances.

</ns2:users>
</ns2:getUsersResponse>
</S:Body>
</S:Envelope>

```

For each user the following information is returned:

id

The ID for the user.

name

The name for the user.

encPasswd

The SHA encoded password for the user.

displayName

The name displayed in the WMC for the user.

isActive

True or false depending on whether the user is logged in.

isMutable

True or false. True means that the object can be updated, false if not.

isVisible

True or false. True means that the object is visible in the WMC, false if not.

email

The email address for the user.

createdTime

The date and time the user was created.

failedLoginCount

The number of failed attempts to log in to the tenant by using this name. After five failures, the username is blocked for 15 seconds. For each successive failure, the blocked time is doubled.

scopeId

The scope ID for the scope where the user is located. Applies to Clouds only.

scopeType

The type of scope, either tenant or environment. Applies to Clouds only.

isRealmUser

Returns true if the specified user belongs to the realm that corresponds to the session ID.

Applies to Clouds and Integration Appliances.

Parameter:

username
The specified user.

Returns:
True if the user belongs to the realm.

Examples:

The following example is a SOAP request to check if the specified user belongs to the realm.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:sec="http://www.approuter.com/schemas/2008/1/security">
  <soapenv:Header>
    <sec:sessionId>A85C21BB99E816D48800C90B2C5547D4</sec:sessionId>
  </soapenv:Header>
  <soapenv:Body>
    <sec:isRealmUser>
      <sec:username>admin@mycompany.com</sec:username>
    </sec:isRealmUser>
  </soapenv:Body>
</soapenv:Envelope>
```

The following example is the SOAP response to the request.

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:isRealmUserResponse xmlns:ns2="http://www.approuter.com/
schemas/2008/1/security" xmlns:ns3="http://www.approuter.com/schema/
router/1000/security/03">
      <ns2:isRealmUser>true</ns2:isRealmUser>
    </ns2:isRealmUserResponse>
  </S:Body>
</S:Envelope>
```

isUserEnabled

Checks to see if the specified username is enabled. An enabled user is authenticated.

Applies to Clouds and Integration Appliances.

Parameter:

username
The username to be checked.

Returns:
True if the specified username is enabled.

Examples:

The following example is a SOAP request to check if the specified user is enabled.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:sec="http://www.approuter.com/schemas/2008/1/security">
  <soapenv:Header>
    <sec:sessionId>A85C21BB99E816D48800C90B2C5547D4</sec:sessionId>
  </soapenv:Header>
  <soapenv:Body>
    <sec:isUserEnabled>
      <sec:username>webman</sec:username>
    </sec:isUserEnabled>
  </soapenv:Body>
</soapenv:Envelope>
```

The following example is the SOAP response to the request.

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:isUserEnabledResponse xmlns:ns2="http://www.approuter.com/
schemas/2008/1/security" xmlns:ns3="http://www.approuter.com/schema/
router/1000/security/03">
      <ns2:isUserEnabled>true</ns2:isUserEnabled>
    </ns2:isUserEnabledResponse>
  </S:Body>
</S:Envelope>
```

listGrantableRoles

Returns a list of roles that can be granted (excludes conditional roles).

Applies to Clouds and Integration Appliances.

Returns:

The list of roles.

Examples:

The following example is a SOAP request to list the grantable roles.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:sec="http://www.approuter.com/schemas/2008/1/security">
  <soapenv:Header>

listPrivileges

Returns a list of privileges for the specified targets and action.

Applies to Clouds and Integration Appliances.

Parameters:

targets

The specified targets.

action

The specified action.

Returns:

The list of privileges.

listRoles

Gets a list of all the role names.

Applies to Clouds and Integration Appliances.

Returns:

The role names.

Examples:

The following example is a SOAP request to get the role names.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:sec="http://www.approuter.com/schemas/2008/1/security">

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.doc/ci00044.html>

listUsers

Returns a list of all users.

Applies to Clouds and Integration Appliances.

Returns:

A list of all users.

Examples:

The following example is a SOAP request for the list of users.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:sec="http://www.approuter.com/schemas/2008/1/security">
  <soapenv:Header>
    <sec:sessionId>8F059BEEA3611033D277773A95404641</sec:sessionId>
  </soapenv:Header>
```

```
<soapenv:Body>
  <sec:listUsers/>
</soapenv:Body>
</soapenv:Envelope>
```

The following example is the SOAP reply to the request for the list of users:

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:listUsersResponse xmlns:ns2="http://www.approuter.com/
schemas/2008/1/security" xmlns:ns3="http://www.approuter.com/schema/
router/1000/security/03">
      <ns2:users>foo@mycompany.com</ns2:users>
      <ns2:users>httpclient@mycompany.com</ns2:users>
      <ns2:users>admin@mycompany.com</ns2:users>
      <ns2:users>webman@mycompany.com</ns2:users>
      <ns2:users>support@mycompany.com</ns2:users>
    </ns2:listUsersResponse>
  </S:Body>
</S:Envelope>
```

Feedback | Notices

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.doc/ci00045.html>

login

Logs in to an Integration Appliance or a Cloud.

Parameters:

username

The user ID that you use to log in to an Integration Appliance or Cloud.

password

The password for username.

Returns:

The session ID.

Examples:

The following code is an example of a SOAP request that you can use to log in to the web service:

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:sec="http://www.approuter.com/schemas/2008/1/security">
  <soapenv:Header/>
  <soapenv:Body>
    <sec:login>
      <sec:username>webman@mycompany.com</sec:username>
      <sec:password>My6word3S</sec:password>
```

```
</sec:login>
</soapenv:Body>
</soapenv:Envelope>
```

The password must be at least eight characters long and contain a combination of three of the following characters:

- Alphabet characters
- Uppercase alphabet characters
- Numbers
- Special characters

The following code is an example of a SOAP response to a successful login request:

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:loginResponse xmlns:ns2="http://www.approuter.com/schemas/2008/1/
security" xmlns:ns3="http://www.approuter.com/schema/router/1000/security/03">
      <ns2:sessionId>8F059BWEA3611033D27773A95404641</ns2:sessionId>
    </ns2:loginResponse>
  </S:Body>
</S:Envelope>
```

The session ID is required to run the other operations in the Management API after logging in.

setCurrentScope

Sets the current scope for this thread.

Applies to Clouds only.

Returns:

True if the current scope was set.

Examples:

The following example is a SOAP request to set the current scope.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:sec="http://www.approuter.com/schemas/2008/1/security">
  <soapenv:Header>

updateUser

Updates a user.

Applies to Clouds and Integration Appliances.

Parameters:

username

The user name for the tenant associated with the session ID.

displayName

The name to display in the WMC.

email

The email address for the username.

Returns:

True if the user was successfully updated.

Examples:

The following example is a SOAP request to update a user. The input for the request is the session ID and the username. The email address is being updated in this example.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:sec="http://www.approuter.com/schemas/2008/1/security">

cancelJob

Cancels the specified job group.

Applies to Clouds and Integration Appliances.

Parameters:

projectName

The name of the project.

Version

The version number for the project.

configName

The name used to identify a configuration, such as Default.

jobId

The ID for the job.

Together projectName, Version, and configName uniquely identify a configuration.

You can obtain the jobId by first running the searchJobs operation (orcmon.wsdl).

[Feedback](#) | [Notices](#)

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.doc/ci00093.html>

cloneConfiguration

Clones the specified configuration.

Applies to Clouds and Integration Appliances.

Parameters:

projectName

The name of the specified project.

version

The version number for the specified project.

oldConfigName

The name of the configuration being cloned.

newConfigName

The name of the cloned configuration.

Returns:

The cloned configuration.

Examples:

The following code is an example of a SOAP request to clone a configuration.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:dep="http://www.approuter.com/schemas/2008/1/deployment">
  <soapenv:Header>
    <dep:sessionId>855BE295392375C8551C8B98D6EA4774</dep:sessionId>
  </soapenv:Header>
  <soapenv:Body>
    <dep:cloneConfiguration>
      <dep:projectName>GenericProject_1_Cloud</dep:projectName>
      <dep:version>1.0</dep:version>
      <dep:oldConfigName>GenericProject_2_Cloud</dep:oldConfigName>
      <dep:newConfigName>GenericProject_3_Cloud</dep:newConfigName>
    </dep:cloneConfiguration>
  </soapenv:Body>
</soapenv:Envelope>
```

The following example is the SOAP response to the request.

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:cloneConfigurationResponse xmlns:ns2="http://www.approuter.com/
schemas/2008/1/deployment" xmlns:ns3="http://www.approuter.com/schemas/2008/1/
deployment/types" xmlns:ns4="http://www.approuter.com/schema/router/1000/
security/03" xmlns:ns5="http://www.approuter.com/schemas/2008/1/util/types">
      <ns2:success>true</ns2:success>
    </ns2:cloneConfigurationResponse>
  </S:Body>
</S:Envelope>
```

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.doc/ci00094.html>

createAssets

Creates assets by using the specified script.

The endpoint is specified as a project URL, such as project-url:// Endpoints/TargetDB. The module ID is typically either <http://www.approuter.com/module/webservice/> or <http://www.approuter.com/module/database/>

Database assets must be enclosed as specified in the following table.

Database	Enclosure
DB2® AS/400®	" "
Informix®	[]
Microsoft SQL	[]
Oracle	" "
Sybase	" "

The following table lists the assets that can be created for the databases.

Database	Asset
DB2 As/400, Informix, Microsoft, Sybase	Applies to Clouds, Integration Appliances. Buffer tables, control tables, and triggers.
Local Staging Database	Buffer tables, control table, index tables, and triggers
Oracle	Buffer tables, control tables, sequences, and triggers

Applies to Clouds and Integration Appliances.

Parameters:

projectName

The name of the specified project.

version

The version number for the specified project.

configName

The configuration name for the specified project.

ModuleID

The module ID for the assets.

endpointUrl

The endpoint URL for the assets.

propNames
The names of the property assets.

username
The user ID for the endpoint.

password
The password for the endpoint.

assetType
The type of asset.

script
The script to run against the endpoint.

Together projectName, version, and configName uniquely identify a configuration.

Returns:
Success or failure.

[Feedback](#) | [Notices](#)

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.doc/ci00095.html>

createConfiguration

Creates the specified configuration.

Applies to Clouds and Integration Appliances.

Parameters:

projectName
The name of the specified project.

version
The version number for the specified project.

configName
The configuration name for the specified project.

Together projectName, version, and configName uniquely identify a configuration.

Returns:
The specified configuration.

Examples:

The following example is a SOAP request to create a configuration.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:dep="http://www.approuter.com/schemas/2008/1/deployment">
  <soapenv:Header>
    <dep:sessionId>85EBDCE6FF0685C296D79CD55D86405F</dep:sessionId>
  </soapenv:Header>
  <soapenv:Body>
    <dep:createConfiguration>
      <dep:projectName>HTTP_363i</dep:projectName>
      <dep:version>1.0</dep:version>
      <dep:configName>HTTP_363W</dep:configName>
    </dep:createConfiguration>
  </soapenv:Body>
</soapenv:Envelope>
```

The following example is the SOAP response to the request.

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:createConfigurationResponse xmlns:ns2="http://www.approuter.com/
schemas/2008/1/deployment" xmlns:ns3="http://www.approuter.com/schemas/2008/1/
deployment/types" xmlns:ns4="http://www.approuter.com/schema/router/1000/
security/03" xmlns:ns5="http://www.approuter.com/schemas/2008/1/util/types">
      <ns2:success>true</ns2:success>
    </ns2:createConfigurationResponse>
  </S:Body>
</S:Envelope>
```

createRepeatingRule

Creates a repeating rule for downtime for the specified configuration.

Applies to Clouds and Integration Appliances.

Parameters:

projectName

The name of the specified project.

version

The version number for the specified project.

configName

The configuration name for the specified project.

stopDate

The date the configuration is to be stopped.

restartDate

The date the configuration is to be restarted.

downtimeType

The type or reason for the downtime.

repeat

Specifies that the downtime rule be repeated.

repeatInterval

Specifies the amount of time between repeats of the downtime rule.

Together projectName, version, and configName uniquely identify a configuration.

Returns:

The new repeating rule for the specified configuration.

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.doc/ci00097.html>

createRule

Creates a downtime rule for the specified configuration.

Applies to Clouds and Integration Appliances.

Parameters:

projectName

The name of the specified project.

version

The version number for the specified project.

configName

The configuration name for the specified project.

stopDate

The date the configuration is to be stopped.

restartDate

The date the configuration is to be restarted.

downtimeType

The type or reason for the downtime.

Together projectName, version, and configName uniquely identify a configuration.

Returns:

The new downtime rule for the specified configuration.

Examples:

The following code is an example of a SOAP request to create a rule. Dates must conform to ISO 8601.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:dep="http://www.approuter.com/schemas/2008/1/deployment">
  <soapenv:Header>
    <dep:sessionId>8FDBC8ED7A014272714D23D14794473A</dep:sessionId>
  </soapenv:Header>
  <soapenv:Body>
    <dep:createRule>
      <dep:projectName>GenericProject_1_Cloud</dep:projectName>
      <dep:version>1.0</dep:version>
      <dep:configName>Default</dep:configName>
      <dep:stopDate>2010-04-17T07:00:00.066Z</dep:stopDate>
      <dep:restartDate>2010-04-17T08:00:00.066Z</dep:restartDate>
      <dep:downtimeType>stop</dep:downtimeType>
    </dep:createRule>
  </soapenv:Body>
</soapenv:Envelope>
```

The following example is the SOAP response to the request.

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:createRuleResponse xmlns:ns2="http://www.approuter.com/
schemas/2008/1/deployment" xmlns:ns3="http://www.approuter.com/schemas/2008/1/
deployment/types" xmlns:ns4="http://www.approuter.com/schema/router/1000/
security/03" xmlns:ns5="http://www.approuter.com/schemas/2008/1/util/types">
      <ns2:ruleId>2</ns2:ruleId>
    </ns2:createRuleResponse>
  </S:Body>
</S:Envelope>
```

Feedback | Notices

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.doc/ci00098.html>

createRuleTZ

Creates a downtime rule for the specified configuration, which includes timezone as well.

Applies to Clouds and Integration Appliances.

Parameters:

projectName
The name of the specified project.

version

The version number for the specified project.

configName

The configuration name for the specified project.

stopDate

The date the configuration is to be stopped.

restartDate

The date the configuration is to be restarted.

downtimeType

The type or reason for the downtime. The values for this property are `stop`, `stopAndCancel`, and `suspend`

Stop (allows jobs to finish) - At the specified time, this action prevents a new orchestration job from starting, while allowing the current jobs to finish processing. This action allows all jobs to end.

Stop (cancel running jobs) - At the specified time, this action prevents a new orchestration job from starting and stops all jobs that are currently running. This action immediately stops all jobs.

Suspend - At the specified time, prevents any new orchestrations from starting and pauses any jobs that are currently running. At the end of the scheduled downtime, the runtime processes the suspended job from the point it paused.

Together `projectName`, `version`, and `configName` uniquely identify a configuration.

Returns:

The new downtime rule for the specified configuration.

Examples:

The following code is an example of a SOAP request to create a rule. Dates must conform to ISO 8601.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:dep="http://www.approuter.com/schemas/2008/1/deployment">
  <soapenv:Header>

  </soapenv:Header>
  <soapenv:Body>
    <dep:createRuleTZ>
      <dep:projectName>GenericProject_1_Cloud</dep:projectName>
      <dep:version>1.0</dep:version>
      <dep:configName>Default</dep:configName>
      <dep:stopDate>2010-04-17T07:00:00.066Z</dep:stopDate>
      <dep:restartDate>2010-04-17T08:00:00.066Z</dep:restartDate>
      <dep:downtimeType>stop</dep:downtimeType>
      <dep:timeZone>PDT</dep:timeZone>
    </dep:createRuleTZ>
  </soapenv:Body>
</soapenv:Envelope>
```

The following example is the SOAP response to the request.

```
<:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:createRuleTZResponse
xmlns:ns5="http://www.approuter.com/schemas/2008/1/util/types"
xmlns:ns4="http://www.approuter.com/schema/router/1000/security/03"
```

```
xmlns:ns3="http://www.approuter.com/schemas/2008/1/deployment/types"
xmlns:ns2="http://www.approuter.com/schemas/2008/1/deployment">

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.doc/ci00106.html>

getAssetGroupDisplayString

Gets the asset display string for the specified configuration, endpoint, and property names.

The endpoint is specified as a project URL, such as project-url://Endpoints/TargetDB. The module ID is typically either [http:// www.approuter.com/module/webservice/](http://www.approuter.com/module/webservice/) or <http://www.approuter.com/module/database/>

Applies to Clouds and Integration Appliances.

Parameters:

projectName

The name of the specified project.

version

The version number for the specified project.

configName

The configuration name for the specified project.

ModuleID

The module ID for the assets.

endpointUrl

The endpoint URL for the assets.

propNames

The names of the property assets.

Together projectName, version, and configName uniquely identify a configuration.

Returns:

The asset display string.

[Feedback](#) | [Notices](#)

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.doc/ci00107.html>

getAssetGroupScript

Gets the asset script for the given configuration, endpoint, and property names.

The endpoint is specified as a project URL, such as project-url://Endpoints/TargetDB. The module ID is typically either <http://www.approuter.com/module/webservice/> or <http://www.approuter.com/module/database/>

Applies to Clouds and Integration Appliances.

Parameters:

projectName

The name of the specified project.

version

The version number for the specified project.

configName

The configuration name for the specified project.

ModuleID

The module ID for the assets.

endpointUrl

The endpoint URL for the assets.

propNames

The names of the property assets.

Together projectName, version, and configName uniquely identify a configuration.

Returns:

The asset script.

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

getAssetGroupWarnings

Gets the asset warnings for the specified configuration, endpoint, and property names.

The endpoint is specified as a project URL, such as `project-url://Endpoints/TargetDB`. The module ID is typically either `http://www.approuter.com/module/webservice/` or `http://www.approuter.com/module/database/`

Applies to Clouds and Integration Appliances.

Parameters:

`projectName`

The name of the specified project.

`version`

The version number for the specified project.

`configName`

The configuration name for the specified project.

`ModuleID`

The module ID for the assets.

`endpointUrl`

The endpoint URL for the assets.

`propNames`

The names of the property assets.

Together `projectName`, `version`, and `configName` uniquely identify a configuration.

Returns:

The asset warnings.

[Feedback](#) | [Notices](#)

<file:///dcs/markdown/workspace/Transform/out.html>

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.doc/ci00109.html>

getAssetProperties

Gets the asset property values for the specified configuration and endpoint.

The endpoint is specified as a project URL, for example `project-url://Endpoints/TargetDB`. The module ID is typically either `http://www.approuter.com/module/webservice/` or `http://www.approuter.com/module/database/`

Applies to Clouds and Integration Appliances.

Parameters:

projectName

The name of the specified project.

version

The version number for the specified project.

configName

The configuration name for the specified project.

ModuleID

The module ID for the assets.

endpointUrl

The endpoint URL for the assets.

Together projectName, version, and configName uniquely identify a configuration.

Returns:

The values for the asset properties.

getAssetPropertiesBindings

Gets the asset properties for the specified configuration, endpoint, and property names.

The endpoint is specified as a project URL, such as project-url://Endpoints/TargetDB. The module ID is typically either [http:// www.approuter.com/module/webservice/](http://www.approuter.com/module/webservice/) or <http://www.approuter.com/module/database/>

Applies to Clouds and Integration Appliances.

Parameters:

projectName

The name of the specified project.

version

The version number for the specified project.

configName

The configuration name for the specified project.

ModuleID

The module ID for the assets.

endpointUrl

The endpoint URL for the assets.

propNames

The names of the property assets.

Together projectName, version, and configName uniquely identify a configuration.

Returns:

The asset properties.

getConfiguration

Gets the specified project.

Applies to Clouds and Integration Appliances.

Parameters:

projectName

The name of the specified project.

Version

The version number for the specified project.

Returns:

The specified project.

Examples:

The following example is a SOAP request to get a specified project:

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:dep="http://www.approuter.com/schemas/2008/1/deployment">
  <soapenv:Header>
    <dep:sessionId>85EBDCE6FF0685C296D79CD55D86405F</dep:sessionId>
  </soapenv:Header>
  <soapenv:Body>
    <dep:getConfiguration>
      <dep:projectName>HTTP_363i</dep:projectName>
      <dep:version>1.0</dep:version>
      <dep:configName>HTTP_363j</dep:configName>
    </dep:getConfiguration>
  </soapenv:Body>
</soapenv:Envelope>
```

```
</soapenv:Body>
</soapenv:Envelope>
```

The following example is the SOAP response to the request.

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:getConfigurationResponse xmlns:ns2="http://www.approuter.com/

getConfigurationGroups

Gets the display names for the groups with permission for the given configuration.

Applies to Clouds and Integration Appliances.

Parameters:

projectName

The name of the specified project.

version

The version number for the specified project.

configName

The configuration name for the specified project.

Together projectName, version, and configName uniquely identify a configuration.

Returns:

The group display names.

Examples:

The following example is a SOAP request to get configuration groups with permission for the specified configuration.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:dep="http://www.approuter.com/schemas/2008/1/deployment">
  <soapenv:Header>
    <dep:sessionId>AACA96757B36C2B4582C811197EE43C0</dep:sessionId>
  </soapenv:Header>
  <soapenv:Body>
    <dep:getConfigurationGroups>
      <dep:projectName>HTTP_363i</dep:projectName>
      <dep:version>1.0</dep:version>
      <dep:configName>HTTP_363j</dep:configName>
    </dep:getConfigurationGroups>
  </soapenv:Body>
</soapenv:Envelope>
```

The following example is the SOAP reply to the request.

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:getConfigurationGroupsResponse xmlns:ns2="http://www.approuter.com/

getRule

Gets the downtime rule for the specified downtime rule ID.

Applies to Clouds and Integration Appliances.

Parameters:

ruleId

The specified downtime rule ID.

Returns:

The downtime rule.

Examples:

The following code is an example of a SOAP request to get a rule.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:dep="http://www.approuter.com/schemas/2008/1/deployment">
  <soapenv:Header>
    <dep:sessionId>8FDBC8ED7A014272714D23D14794473A</dep:sessionId>
  </soapenv:Header>
  <soapenv:Body>
    <dep:getRule>
      <dep:ruleId>2</dep:ruleId>
    </dep:getRule>
  </soapenv:Body>
</soapenv:Envelope>
```

The following example is the SOAP response to the request.

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:getRuleResponse xmlns:ns2="http://www.approuter.com/schemas/2008/1/
deployment" xmlns:ns3="http://www.approuter.com/schemas/2008/1/deployment/

getRules

Gets the downtime rules for the specified configuration.

Applies to Clouds and Integration Appliances.

Parameters:

projectName

The name of the specified project.

Version

The version number for the specified project.

configName

The configuration name for the specified project.

Together projectName, version, and configName uniquely identify a configuration.

Returns:

The downtime rules for the specified configuration.

Examples:

The following code is an example of a SOAP request to get rules.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"

getUserConfiguration

Gets the specified configuration for the specified user.

Applies to Clouds and Integration Appliances.

Parameters:

userName

The name of the specified user.

projectName

The name of the specified project.

version

The version number for the specified project.

configName

The configuration name for the specified project.

Together projectName, version, and configName uniquely identify a configuration.

Returns:

file:///dcs/markdown/workspace/Transform/out.html

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.doc/ci00119.html>

publishProject

Publishes the given project and creates a default configuration.

Applies to Clouds and Integration Appliances.

Parameters:

projectName

The name of the specified project.

version

The version number for the specified project.

content

The project in a compressed file (a .par file).

Returns:

Success or failure.

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.doc/ci00120.html>

resume

Resumes the specified configuration

Applies to Clouds and Integration Appliances.

Parameters:

projectName

The name of the specified project.

version

The version number for the specified project.

configName

The configuration name for the specified project.

Together projectName, version, and configName uniquely identify a configuration.

Returns:

Success or failure.

Examples:

The following example is a SOAP request to resume running a configuration that was paused.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:dep="http://www.approuter.com/schemas/2008/1/deployment">
  <soapenv:Header>
    <dep:sessionId>85EBDCE6FF0685C296D79CD55D86405F</dep:sessionId>
  </soapenv:Header>
  <soapenv:Body>
    <dep:resume>
      <dep:projectName>HTTP_363i</dep:projectName>
      <dep:version>1.0</dep:version>
      <dep:configName>HTTP_363j</dep:configName>
    </dep:resume>
  </soapenv:Body>
</soapenv:Envelope>
```

The following example is the SOAP response to the request.

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:resumeResponse xmlns:ns2="http://www.approuter.com/schemas/2008/1/
deployment" xmlns:ns3="http://www.approuter.com/schemas/2008/1/deployment/
types" xmlns:ns4="http://www.approuter.com/schema/router/1000/security/03"
xmlns:ns5="http://www.approuter.com/schemas/2008/1/util/types">
      <ns2:success>true</ns2:success>
    </ns2:resumeResponse>
  </S:Body>
</S:Envelope>
```

saveOrchestrationValues

Saves the specified values for the specified orchestration.

Applies to Clouds and Integration Appliances.

Parameters:

projectName

The name of the specified project.

version

The version number for the specified project.

configName

The configuration name for the specified project.

values

The specified values to save for the specified orchestration.

Together projectName, version, and configName uniquely identify a configuration.

Returns:

Success or failure.

Examples:

The following example is a SOAP request to save the values for the specified orchestration.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:dep="http://www.approuter.com/schemas/2008/1/deployment">
  <soapenv:Header>
    <dep:sessionId>AACA96757B36C2B4582C811197EE43C0</dep:sessionId>
  </soapenv:Header>
  <soapenv:Body>
    <dep:saveOrchestrationValues>
      <dep:projectName>HTTP_363i</dep:projectName>
      <dep:version>1.0</dep:version>
      <dep:configName>HTTP_363j</dep:configName>
      <dep:values>
        <enabled>true</enabled>
        <syncLoggingEnabled>false</syncLoggingEnabled>
        <loggingLevel>errorValues</loggingLevel>
        <maxJobs>1</maxJobs>
        <orchestrationRelativeurl>orchestrationRelativeurl>project-url://
        Orchestrations/
        Receive</orchestrationRelativeurl>
        <state>stopped</state>
      </dep:values>
    </dep:saveOrchestrationValues>
  </soapenv:Body>
</soapenv:Envelope>
```

The following example is the SOAP reply to the request.

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:saveOrchestrationValuesResponse xmlns:ns2="http://
    www.approuter.com/schemas/2008/1/deployment" xmlns:ns3="http://
    www.approuter.com/schemas/2008/1/deployment/types" xmlns:ns4="http://
    www.approuter.com/schema/router/1000/security/03" xmlns:ns5="http://
    www.approuter.com/schemas/2008/1/util/types">
      <ns2:success>true</ns2:success>
    </ns2:saveOrchestrationValuesResponse>
  </S:Body>
</S:Envelope>
```

saveProperties

Saves the specified properties for the specified configuration.

Applies to Clouds and Integration Appliances.

Parameters:

projectName

The name of the specified project.

Version

The version number for the specified project.

configName

The configuration name for the specified project.

properties

The specified properties to save for the specified configuration.

Together projectName, version, and configName uniquely identify a configuration.

 Last updated: Thursday, December 17, 2015

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.doc/ci00123.html>

setConfigurationGroups

Sets the groups with permission for the specified project.

Applies to Clouds and Integration Appliances.

Parameters:

projectName

The name of the specified project.

version

The version number for the specified project.

configName
The configuration name for the specified project.

groupIds
The IDs for the groups.

Together **projectName**, **version**, and **configName** uniquely identify a configuration.

Returns:
Success or failure.

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.doc/ci00124.html>

start

Starts the specified configuration.

Applies to Clouds and Integration Appliances.

Parameters:

projectName
The name of the specified project.

version
The version number for the specified project.

configName
The configuration name for the specified project.

Together **projectName**, **version**, and **configName** uniquely identify a configuration.

Returns:
Success or failure.

Examples:

The following example is a SOAP request to start a configuration.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:dep="http://www.approuter.com/schemas/2008/1/deployment">
  <soapenv:Header>
    <dep:sessionId>85EBDCE6FF0685C296D79CD55D86405F</dep:sessionId>
  </soapenv:Header>
  <soapenv:Body>
    <dep:start>
      <dep:projectName>HTTP_363i</dep:projectName>
      <dep:version>1.0</dep:version>
    </dep:start>
  </soapenv:Body>
</soapenv:Envelope>
```

```
<dep:configName>HTTP_363j</dep:configName>
</dep:start>
</soapenv:Body>
</soapenv:Envelope>
```

The following example is the SOAP response to the request.

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:startResponse xmlns:ns2="http://www.approuter.com/schemas/2008/1/

stopAndCancel

Stops and cancels all the jobs for the specified configuration.

Applies to Clouds and Integration Appliances.

Parameters:

projectName
The name of the specified project.

version
The version number for the specified project.

configName
The configuration name for the specified project.

Together projectName, version, and configName uniquely identify a configuration.

Returns:
Success or failure.

Examples:

The following example is a SOAP request to stop and cancel the configuration.

suspend

Suspends the specified configuration.

Applies to Clouds and Integration Appliances.

Parameters:

projectName

The name of the specified project.

version

The version number for the specified project.

configName

The configuration name for the specified project.

Together projectName, version, and configName uniquely identify a configuration.

Returns:
Success or failure.

Examples:

Orcmon

Information about the orcmon WSDL.

Using the orcmon WSDL, you can search for jobs, get a job count, and get job details. You can also set and get job monitoring properties.

This section contains the following topics:

- [getJobCount](#)
- [getJobDetails](#)
- [getMonitoringProperties](#)
- [purgeJobs](#)
- [searchJobs](#)
- [setMonitoringProperties](#)

Feedback | Notices

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.doc/ci00130.html>

getJobCount

Returns the number of jobs that have the specified parameters.

Applies to Clouds and Integration Appliances.

Parameters:

projectName

The name of the project that contains the configuration where the jobs run.

version

The version number of the project.

configName

The name of the configuration that contains the orchestration where the jobs run. For the default configuration, this value should be 'Default'.

orchName

The name of the orchestration where the jobs run.

jobId (optional)

The ID of the jobs for which a count is returned.

jobKey (optional)

The job key for the jobs for which a count is returned.

minStartDate

The earliest date that the jobs started.

maxStartDate

The latest date that the jobs started.

status

The status of the jobs.

â€“Setting status as negative gets all status.

“Setting specific status value gets jobs with that status:

- SUCCESS = 0
- ERRORED = 1
- RUNNING = 2
- CANCELLING = 3
- TERMINATED = 4
- CANCELLED = 5
- SUSPENDED = 6
- CRASHED = 7
- SUSPENDING = 8
- UNKNOWN = 101

Returns:

The number of jobs.

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.doc/ci00131.html>

getJobDetails

Returns the details for the job with the specified parameters.

Applies to Clouds and Integration Appliances.

Parameters:

projectName

The name of the project that contains the configuration where the job runs.

version

The version number of the project.

configName

The name of the configuration that contains the orchestration where the job runs.

orchName

The name of the orchestration where the job runs.

jobId

The ID of the job for which the details are returned.

Returns:

The job details for the job that has the specified parameters.

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.doc/ci00132.html>

getMonitoringProperties

Gets the properties for managing orchestration monitoring data.

Applies to Integration Appliances only.

Returns:

The monitoring properties.

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.doc/ci00133.html>

purgeJobs

Purges jobs that have the specified parameters.

Applies to Integration Appliances only.

Parameters:

projectName

The name of the project that contains the configuration where the jobs run.

version

The version number of the project.

configName

The name of the configuration that contains the orchestration where the jobs run.

orchName

The name of the orchestration where the jobs run.

jobId

The ID of the job to be purged.

jobKey

The job key for the jobs to be purged.

minStartDate

The earliest date that the jobs started.

maxStartDate

The latest date that the jobs started.

status

The status of the jobs.

exportJobs

Whether to return the purged jobs - true or false.

Returns:

The purged jobs if exportJobs is set to true.

searchJobs

Returns the jobs that have the specified parameters.

Applies to Clouds and Integration Appliances.

Parameters:

projectName

The name of the project that contains the configuration where the jobs run.

version

The version number of the project.

configName

The name of the configuration that contains the orchestration where the jobs run.

orchName

The name of the orchestration where the jobs run.

jobId

The ID of the jobs to be returned.

jobKey

The job key for the jobs to be returned.

minStartDate

The earliest date that the jobs started.

maxStartDate

The latest date that the jobs started.

status

The status of the jobs.

page

0-based page numbering.

pageSize

The number of lines per page.

Returns:

The jobs that have the specified parameters.

Examples:

The following code is an example of a SOAP request to search jobs.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:orc="http://www.approuter.com/schemas/2008/1/orcmon">
  <soapenv:Header>

Lognotif

Information about the lognotif WSDL.

Using the lognotif WSDL, you can save, get, and delete notification policies. You can also get and set email and SNMP endpoints, set and get log levels, and get a log count.

This section contains the following topics:

- [createNotificationPolicy](#)
- [deleteNotificationPolicy](#)
- [getEmailEndpoint](#)
- [getLogCount](#)
- [getLogLevel](#)
- [getNotificationPolicies](#)
- [getNotificationPolicy](#)
- [getSnmpEndpoint](#)
- [searchLogs](#)
- [setEmailEndpoint](#)

createNotificationPolicy

Creates and saves a notification policy.

Applies to Clouds and Integration Appliances.

Parameter:

policy

The name of the policy.

Returns:

The notification policy ID of the policy was successfully created. If not successful, returns a -1.

Examples:

The following example is a SOAP request to create a notification policy.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:log="http://www.approuter.com/schemas/2008/1/lognotif">
  <soapenv:Header>
    <log:sessionId>910D9A7B441C97AC2FCC54E3F1274AA7</log:sessionId>
  </soapenv:Header>
  <soapenv:Body>
    <log:createNotificationPolicy>
      <log:name>TestNotif</log:name>
      <log:logComponent>orchestration</log:logComponent>
      <log:logLevel>error</log:logLevel>
      <log:emailAddresses>user@mydomain.com</log:emailAddresses>
      <log:isSnmp>>false</log:isSnmp>
    </log:createNotificationPolicy>
  </soapenv:Body>
</soapenv:Envelope>
```

The following example is the SOAP response to the request.

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:createNotificationPolicyResponse xmlns:ns2="http://
www.approuter.com/schemas/2008/1/lognotif" xmlns:ns3="http://
www.approuter.com/schemas/2008/1/lognotif/types">
      <ns2:policyId>688128</ns2:policyId>
    </ns2:createNotificationPolicyResponse>
  </S:Body>
</S:Envelope>
```

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.doc/ci00138.html>

deleteNotificationPolicy

Deletes a notification policy.

Applies to Clouds and Integration Appliances.

Parameter:

policyId
The specified ID for the notification policy to be deleted.

Returns:
Success or failure.

Examples:

The following is a SOAP request to delete the notification policy with the specified ID.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:log="http://www.approuter.com/schemas/2008/1/lognotif">
  <soapenv:Header>
    <log:sessionId>910D9A7B441C97AC2FCC54E3F1274AA7</log:sessionId>
  </soapenv:Header>
  <soapenv:Body>
    <log:deleteNotificationPolicy>
      <log:policyId>688128</log:policyId>
    </log:deleteNotificationPolicy>
  </soapenv:Body>
</soapenv:Envelope>
```

The following is the SOAP response to the request.

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:deleteNotificationPolicyResponse xmlns:ns2="http://
```

```
www.approuter.com/schemas/2008/1/lognotif" xmlns:ns3="http://
www.approuter.com/schemas/2008/1/lognotif/types">
  <ns2:success>true</ns2:success>
</ns2:deleteNotificationPolicyResponse>
</S:Body>
</S:Envelope>
```

getEmailEndpoint

Gets the email endpoint for notifications based on the session ID.

Applies to Integration Appliances only.

Returns:

The email endpoint.

Examples:

The following example is a SOAP request to get an email endpoint.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:log="http://www.approuter.com/schemas/2008/1/lognotif">
  <soapenv:Header>

  </soapenv:Header>
  <soapenv:Body>
    <log:getEmailEndpoint/>
  </soapenv:Body>
</soapenv:Envelope>
```

The following example is the SOAP response to the request.

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:getEmailEndpointResponse xmlns:ns2="http://www.approuter.com/
schemas/2008/1/lognotif" xmlns:ns3="http://www.approuter.com/schemas/2008/1/
lognotif/types">
      <ns2:emailEndpoint>
        <ns3:active>true</ns3:active>
        <ns3:credentials>
          <ns3:password>test</ns3:password>
          <ns3:user>test</ns3:user>
        </ns3:credentials>
        <ns3:host>hq-exch-01</ns3:host>
        <ns3:port>123</ns3:port>
        <ns3:sender>user@mydomain.com</ns3:sender>
        <ns3:subject>Notification</ns3:subject>
      </ns2:emailEndpoint>
    </ns2:getEmailEndpointResponse>
```

```
</S:Body>  
</S:Envelope>
```

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.doc/ci00140.html>

getLogCount

Gets the number of logs for the specified parameters.

Applies to Clouds and Integration Appliances.

Parameters:

logComponent

The specified component for which logs are generated.

logLevel

The level of logging to be done for the specified component.

maxDaysOld

The maximum number of days to go back to get logs. Use 1 for no maximum.

status

The specified status of logs to be included in the count. The default values are:

- All
- Resolved
- Unresolved

Returns:

The number of logs that match the specified parameters.

Examples:

The following example is a SOAP request to get a log count.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"  
xmlns:log="http://www.approuter.com/schemas/2008/1/lognotif">  
  <soapenv:Header>  
    <log:sessionId>910D9A7B441C97AC2FCC54E3F1274AA7</log:sessionId>  
  </soapenv:Header>  
  <soapenv:Body>  
    <log:getLogCount>  
      <log:logComponent>orchestration</log:logComponent>  
      <log:logLevel>error</log:logLevel>  
      <log:maxDaysOld>3</log:maxDaysOld>  
      <log:status>all</log:status>  
    </log:getLogCount>
```

```
</soapenv:Body>
</soapenv:Envelope>
```

The following is the SOAP response to the request.

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:getLogCountResponse xmlns:ns2="http://www.approuter.com/
schemas/2008/1/lognotif" xmlns:ns3="http://www.approuter.com/schemas/2008/1/
lognotif/types">
      <ns2:logCount>8</ns2:logCount>
    </ns2:getLogCountResponse>
  </S:Body>
</S:Envelope>
```

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.doc/ci00141.html>

getLogLevel

Gets the log level for the specified log component.

The default log levels are:

- All. (Note: The actual level of logs retrieved for the All level is determined by the logging level set in the WMC. For more information, see "Specify System Log Settings" in the WMC).
- Fatal
- Severe
- Warning
- Info

Applies to Clouds and Integration Appliances.

Parameter

logComponent
The specified component for which logs are generated.

Returns:
The log level for the specified component.

Examples

The following example is a SOAP request to get the log level for orchestrations.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:log="http://www.approuter.com/schemas/2008/1/lognotif">
  <soapenv:Header>
    <log:sessionId>AD2E025868AC1392A44E6E27E4594EF9</log:sessionId>
```

```
</soapenv:Header>
<soapenv:Body>
  <log:getLogLevel>
    <log:logComponent>orchestration</log:logComponent>
  </log:getLogLevel>
</soapenv:Body>
</soapenv:Envelope>
```

The following is the SOAP reply to the request.

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns3:getLogLevelResponse xmlns:ns2="http://www.approuter.com/
schemas/2008/1/lognotif/types" xmlns:ns3="http://www.approuter.com/
schemas/2008/1/lognotif">
      <ns3:logLevel>warning</ns3:logLevel>
    </ns3:getLogLevelResponse>
  </S:Body>
</S:Envelope>
```

getNotificationPolicy

Gets the notification policy that is using the specified notification policy ID.

Applies to Clouds and Integration Appliances.

Parameter:

policyId
The specified ID for the notification policy.

Returns:
The notification policy.

Examples:

The following example is a SOAP request to get a notification.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:log="http://www.approuter.com/schemas/2008/1/lognotif">

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.doc/ci00145.html>

searchLogs

Gets the logs for the specified parameters.

Applies to Clouds and Integration Appliances.

Parameters:

logComponent

The specified component for which logs are generated. **logComponent** is one of:

- hardware
- resources
- network
- security
- orchestration
- deployment
- all

logLevel

The level of logging to be done for the specified component. **logLevel** is one of:

- critical
- error
- warning
- info
- all

maxDaysOld

The maximum number of days to go back to get logs. Use -1 for no maximum.

status

The specified status of logs to be included in the search. **status** is one of:

- resolved
- unresolved
- all

page

Uses 0-based page numbering. Log pagination starts with zero. Maximum size of page should be documented as 2,147,483,647.

pageSize

Specifies the size of the log pages that are returned. Maximum size of pageSize should be documented as 2,147,483,647.

Returns:

The logs that match the specified parameters.

Examples:

The following example is a SOAP request to search the logs for logs that match the specified parameters.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:log="http://www.approuter.com/schemas/2008/1/lognotif">
  <soapenv:Header>
    <log:sessionId>AD2E025868AC1392A44E6E27E4594EF9</log:sessionId>
  </soapenv:Header>
  <soapenv:Body>
    <log:searchLogs>
      <log:logComponent>orchestration</log:logComponent>
      <log:logLevel>error</log:logLevel>
      <log:maxDaysOld>6</log:maxDaysOld>
      <log:status>all</log:status>
      <log:page>1</log:page>
      <log:pageSize>5</log:pageSize>
    </log:searchLogs>
  </soapenv:Body>
</soapenv:Envelope>
```

The following example is the SOAP reply to the request.

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>

System

Information about the system WSDL.

The system WSDL applies to Integration Appliances only. Using system WSDL you can set or get an appliance name or network configuration. You can also run system commands or get system information.

This section contains the following topics:

- [downloadPostmortem](#)
- [executeCommand](#)
- [getApplianceName](#)
- [getNetworkConfiguration](#)
- [getResourceUtilizationData](#)
- [setApplianceName](#)
- [setNetworkConfiguration](#)

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.doc/ci00148.html>

downloadPostmortem

Downloads the postmortem file.

Use the information in this file to resolve Integration Appliance issues.

Applies to Integration Appliances only.

Returns:

The postmortem file.

Feedback | Notices

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.doc/ci00149.html>

executeCommand

Runs the specified system command.

Applies to Integration Appliances only.

Parameter:

command
The specified system command to run.

Returns:

Success or failure.

Enums:

The system commands are defined as enumerated constants.

The following table lists the system commands.

Command	Description
removeJobHistory	Removes job histories from the Integration Appliance.
removeProjects	Removes projects from the Integration Appliance.
removeRunningJobs	Stops and removes running jobs from the Integration Appliance.
generatePostmortem	Generates an archive of information gathered from Integration Appliance logs, orchestration logs, and transaction stores. Use this information to debug Integration Appliance issues. Run this command before rebooting the Integration Appliance.
restart	Restarts the Integration Appliance routing subsystem.
reboot	Shuts down all routing services and then reboots the Integration Appliance.

getApplianceName

Gets the appliance name.

Applies to Integration Appliances only.

Returns:

The appliance name.

Examples:

The following code is an example of a SOAP request to get the Integration Appliance name.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:sys="http://www.approuter.com/schemas/2008/1/system">
  <soapenv:Header>
    <sys:sessionId>91997FBCE89093792D40DEF8FDB345DD</sys:sessionId>
  </soapenv:Header>
  <soapenv:Body>
    <sys:getApplianceName/>
  </soapenv:Body>
</soapenv:Envelope>
```

The following example is the SOAP response to the request.

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns3:getApplianceNameResponse xmlns:ns2="http://www.approuter.com/
schemas/router/1000/NetConfig02.xsd" xmlns:ns3="http://www.approuter.com/
schemas/2008/1/system" xmlns:ns4="http://www.approuter.com/schemas/2008/1/
util/types">
      <ns3:applianceName>TheIntegrator</ns3:applianceName>
    </ns3:getApplianceNameResponse>
  </S:Body>
</S:Envelope>
```

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.doc/ci00151.html>

getNetworkConfiguration

Returns the status of the current network configuration.

Applies to Integration Appliances only.

Returns:

The network status.

Examples:

The following code is an example of a SOAP request to get the network configuration.

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
xmlns:sys="http://www.approuter.com/schemas/2008/1/system">
  <soapenv:Header>
    <sys:sessionId>91997FBCE89093792D40DEF8FDB345DD</sys:sessionId>
  </soapenv:Header>
  <soapenv:Body>
    <sys:getNetworkConfiguration/>
  </soapenv:Body>
</soapenv:Envelope>
```

The following example is the SOAP response to the request.

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns3:getNetworkConfigurationResponse xmlns:ns2="http://

<http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.api.doc/ci00158.html>

Introduction

The IBM® Cast Iron® Connector Development Kit (CDK) Developer's Guide is for developers who want to use the Cast Iron Studio (Studio) development platform to develop and deploy plug-in connectors that extract data from application systems or other data sources..

Connectors enhance the core functionality of Studio by exposing the API of an external application to the Cast Iron development platform. API's extend the scripting engine with new libraries and object types and publishes notification events from the external system to a Cast Iron physical or virtual integration appliance. Cast Iron appliances support connecting to endpoints of many types including FTP, SFTP, HTTP, HTTPS, Email (SMTP, POP), SAP, MQ, Web Services and many commercial database systems.

Each connector has an associated XML descriptor file that allows the connector to be used in Studio at design time. XML schema definition (XSD) files define the elements and attributes of the XML file.

The Cast Iron development platform features a CDK Connector Wizard that guides you through the development process. Studio provides an intuitive drag-and-drop interface that can dramatically shorten your development time.

This guide provides an overview of connectors, introduces the Cast Iron development platform components and supplies the step-by-step procedures you require to develop and deploy your own connectors.

Prerequisites

Much of the work involved in developing a connector takes place inside Studio, meaning that you should have a working knowledge of Studio and the Cast Iron products. You should also be familiar with the following languages and file formats:

- Extensible Markup Language (XML)
- Web Services Description Language (WSDL)
- Extensible Stylesheet Language Transformations (XSLT)

Note: For many activities, Studio supports a "discovery" process to determine the structure of parameters sent to, or received from an endpoint. If your input activity will be discovered at design time, you must utilize an abstract WSDL or schema element type. Declaring an element as abstract requires the use of a substitution group. If an abstract version is not available, you must modify your WSDL file or schema. Your abstract file is then substituted for the actual data type at design time. For more information on abstract files, see [Using the Add Activities window](#).

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.cdk.doc/cdk_intro.html

Design considerations

The recent explosive growth of application-oriented software delivered as a service over the Web makes implementing effective guidelines for your project critically important. Careful planning of design activities can help ensure the success of your project.

Before you start your development, carefully consider the following guidelines:

- Task and user analysis - Consider what tasks you want to your end-users to perform before you start your project. Using the elements supplied by your schema files and the configuration properties of your XML file, you can control the level of access your users have to Studio and its functions. For example, by defining an endpoint for your users, you can limit or increase the number of activities they can add to their orchestrations. It's also important to understand *how* your end-users perform their tasks. Providing them with information in the order they are likely to require it will help your project integrate smoothly and will result in a unified user experience.
- Naming conventions - Sometimes, when working on a project with tight deadlines, it's tempting to label the components of an application hurriedly. For example, when designing your endpoint panel, you may be inclined to define a 'type' field quickly so that you can move on to more important functional tasks. However, the benefits of intuitive naming practices are often not evident until later, when users are confronted with arbitrary and confusing naming schemes. Remember, once deployed, your connector will be used again and again, so be sure to utilize logical, consistent and intuitive naming conventions.

Before you begin

Before you begin your project, collect the following information. Having it accessible will make your development process go more smoothly:

- Connection fields - Be prepared to specify the connection field details you'll need to connect to your endpoints, such as name and type.
- Input activities - Determine which of your input activities will be discovered dynamically at design time and which will be static.
- Input and output data types - Be prepared to indicate which input and output data types will be supported by each of your activities.

How this guide is organized

This document is designed to get you started on your development project with a minimum of delay. Chapter One introduces the CDK Connector Wizard and provides the procedures you need to get your project underway. However, if you prefer to familiarize yourself with the CDK development platform before starting your development, take a few minutes to review the information in Chapter Four [CDK Components](#) before you begin.

This guide is organized into the following sections.

- [Getting started with the CDK Connector Wizard](#)

Introduces the CDK Connector Wizard and provides step-by-step instructions for building your connector.

- [Test and debug](#)

Provides procedures for testing and debugging your connector.

- [Exporting and importing a connector project](#)

Provides information on how to export or import connector projects.

- [Cast Iron CDK components](#)

Provides an overview of the Studio development platform and introduces the CDK components.

- [FAQ](#)

Provides some answers to frequently asked questions.

- [Getting help](#)

Provides information on IBM resources and tells you how to get help.

[Feedback](#) | [Notices](#)

Getting started with the CDK Connector Wizard

The CDK Connector Wizard guides you through the development process by presenting you with a series of three windows into which you enter basic details about your connector. The Wizard then generates orchestrations that you can test, certify and deploy to Studio.

Procedure

1. Start Studio.
2. Select **File** -> **New Connector Project**.

Results

The Wizard opens in the Studio workspace and the Connector Information window is displayed.

What to do next

In the next phase, you work with the Connector Information window to add basic information about your connector.

[Feedback](#) | [Notices](#)

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.cdk.doc/cdk_wizard.html

Connector Information window

During this phase, you add general information about your connector, such as name, version and description into the Connector Information window and add the WSDL or schema file that is used for your connector activity.

About this task

The Connector Information window is where you enter basic details about your connector project. The Connector Information window looks like:
Figure 1. Connector Information window

Connector Information

Provide Connector Name, Version and Description

Provide Basic Connector Detail

Name: Description:

Version:

Add WSDL Or Schema Files

Add WSDL/Schema:

Add Schema or WSDL file

Procedure

1. In the Name text field, enter a name for your connector.
 Note: Due to the practical restrictions of NCName, characters in the Name text field cannot contain symbol characters such as ;, @, \$, %, &, /, +, ,, ;, whitespace characters or different parenthesis. Additionally, characters in the Name text field cannot begin with a number, dot or minus character although they can appear later in an NCName.
2. In the Description text field, enter a description for your connector.
3. In the Version text field, enter a version number for your connector.
4. To add a WSDL or a schema file, click on the **Browse** button and navigate to the file you want. The selected file displays in the Add WSDL/Schema Files field.
 Note: If your input activity will be discovered dynamically at design time, you must provide a WSDL or schema containing an abstract type for this step. For information on abstract files, see [Using the Add Activities window](#).
5. Click **Next**.

Results

The Add Connection Fields window is displayed.

What to do next

In the next phase, you work with the Add Connection Fields window to specify endpoint connection properties.

Feedback | Notices

Last updated: Thursday, December 17, 2015
 file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.cdk.doc/cdk_connectinfowindow.html

Using the Add Connection Fields window

The Add Connection Fields window is where you specify the endpoint connection parameters that are exposed to your users. Your users will use these values to connect to their endpoints.

About this task

During this design phase, you add the connection fields and corresponding details needed to connect to endpoints. The Add Connection Fields window looks like:

Figure 1. Add Connection Fields window

Procedure

1. Click the **plus icon (+)**. A blank connection field is displayed in the Add Endpoint Connection Fields panel.
2. In the Add Endpoint Connection Fields panel, enter the field type, for example: Password, to specify the password associated with a username. To begin editing, double click on a row in the Connection Field Name cell to activate it, then enter your information. When you are done, press **Enter**. The field type information is displayed in the Name field.
3. In the Endpoint Connection Fields Details panel, click on the **Type** and **Format** drop-down menus and select the categories that correspond to the information you entered in the Add Endpoint Connection Fields panel. In the Add Endpoint Connection Fields panel, enter the field type, for example: Password, to specify the password associated with a username.
4. Repeat these steps to add additional connection fields. After you have added the additional fields, click **Next**.

Results

The Add Activities window is displayed.

What to do next

In the next phase, you work with the Add Activities window to define your connector activities.

📅 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.cdk.doc/cdk_addconnectfieldswindow.html

Using the Add Activities window

The Add Activities window is where you create and define your connector activities and enter input and output data information.

About this task

During this phase, you specify if your input data will be discovered statically or dynamically at design time. For example, if your data will be discovered at design time, a **Create** activity can be used to create different object types such as Account, Contact or User. The input to the **Create** activity will vary depending on which object you want to create. In this situation, **Create** is considered to be a *browseable* activity, where input differs depending on the object you want to generate.

Note: If you want your input activity to be discoverable at design time, you must provide an abstract WSDL or schema type. An abstract WSDL or schema type describes web services in implementation-neutral terms, as opposed to a concrete WSDL or schema type that defines how an endpoint implementing a service is exposed on a network. [Figure 1](#) shows an example of a WSDL with an abstract type definition:

Figure 1. WSDL with abstract definition

```

<DescribeObjectResponse baseType="sObject"
  baseTypeNS="urn:subject.partner.soap.sforce.com" name="sObject"
  typeNS="urn:subject.enterprise.soap.sforce.com" xmlns="http://www.approuter.com/schemas/edk/api/"
  xmlns:con="http://www.approuter.com/schemas/edk/config/" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <object label="result" maxCount="1" minCount="1" name="result"
    used="true">
    <con:field configurable="true" label="StreetNumber"
      maxCount="1" minCount="1" name="StreetNumber" used="true">
      <con:type>string</con:type>
    </con:field>
    <con:field configurable="true" label="StreetName" maxCount="1"
      minCount="1" name="StreetName" used="true">
      <con:type>string</con:type>
    </con:field>
    <con:field configurable="true" label="Zip" maxCount="1"
      minCount="1" name="Zip" used="true">
      <con:type>string</con:type>
    </con:field>
    <con:field configurable="true" label="Id" maxCount="1"
      minCount="1" name="Id" used="true">
      <con:type>boolean</con:type>
    </con:field>
  </object>
  <responseObject label="result" maxCount="1" minCount="1"
    name="result" used="true">
    <con:field configurable="true" label="AccountNumber"
      maxCount="1" minCount="1" name="AccountNumber" used="true">
      <con:type>string</con:type>
    </con:field>
    <con:field configurable="true" label="Name" maxCount="1"
      minCount="1" name="Name" used="true">
      <con:type>string</con:type>
    </con:field>
    <con:field configurable="true" label="Website" maxCount="1"
      minCount="1" name="Website" used="true">
      <con:type>string</con:type>
    </con:field>
    <con:field configurable="true" label="Id" maxCount="1"
      minCount="1" name="Id" used="true">
      <con:type>boolean</con:type>
    </con:field>
  </responseObject>
</DescribeObjectResponse>

```

Abstract type name and namespace

Derived type name and namespace

Substitute Activity Input node

Derived type name and namespace

The Add Activities window looks like:
Figure 2. Add Activities window

Add Activities

Activities Added To This Window Are Displayed In Studio Activity Panel Under Folder: **SampleCDKStarter**

Double-click to edit the activity cell. Press ENTER to complete editing.

Activity Name	Starter Activity
activity0	<input type="checkbox"/>

Add/Delete connector activity

Select this check box to indicate that this activity is a starter activity.

Activity Details

Name: activity0

Dynamic Input/Output Requirement

Input/Output Parameter Requires Dynamic Discovery

Input is Discovered Dynamically
 Output is Discovered Dynamically
 Both Input/Output are Discovered Dynamically

Select Input/Output Data

Automatically generate dynamic type extending XML anyType

Input Type: Select Input

Output Type: Select Output

Select if Input/Output parameter requires dynamic discovery.

Provide details about the Activity selected in the table above.

Provide Input/Output types for the activity.

This option is activated when the "Input/Output Parameter Requires Dynamic Discovery" check box is selected. Select Input, Output, or both, to automatically generate an abstract schema.

Procedure

1. Click the **plus (+) icon**. A blank text field is displayed in the Add Connector Activities panel.
2. In the Add Connector Activities panel, add the new activity name. To begin editing, double click on a row in the Activity Name cell to activate it, then enter your information. When you are done, press **Enter**.
Note: Due to the practical restrictions of NCName, characters in the Name text field cannot contain symbol characters such as ;, @, \$, %, &, /, +, ,, ;, whitespace characters or different parenthesis. Additionally, characters in the Name text field cannot begin with a number, dot or minus character although they can appear later in an NCName.
3. In the Add Connector Activities panel, select the Starter Activity check box to indicate if the selected activity is a starter activity.
4. In the Dynamic Input/Output Requirement panel, specify if the input parameter, output parameter or both require dynamic discovery. If you want your input activity to be discoverable at design time, you must provide an abstract schema type.
5. If a parameter or parameters require dynamic discovery, in the Select Input/Output Data panel, use the **Select Input** or **Select Output** buttons to select input and/or output data for each activity. **Note:** Do not assign a specific input data type to more than one activity.
Note: Starter Activity only has output types. Therefore, you are allowed to select only the Output Type in the Activity Details section.
6. Repeat these steps for each new activity.
7. When you are done, click **Next**.

Results

The Final Summary window is displayed.

What to do next

View your results in the Final Summary window.

Final Summary window

At the conclusion of the development phase, the Final Summary window alerts you that you're ready to complete the generated orchestrations and export the project to a connector repository.

The Final Summary window confirms that your connector activities have been generated successfully. The Final Summary window looks like:

Figure 1. Final Summary window

Feedback | Notices

 Last updated: Thursday, December 17, 2015
 file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.cdk.doc/cdk_finalsummary.html

Completing your orchestrations

You complete your orchestrations so you can export them into Studio. In addition to your connector orchestrations, you must also complete orchestrations for the Cast Iron connector interfaces.

About this task

After your development work is complete, perform the following procedure to complete your connector orchestrations. In [Cast Iron connector interfaces](#) you are introduced to the Cast Iron TestConnection, ListObjects and DescribeObjects connector interfaces and provided with procedures for completing orchestrations for each.

In the steps that follow, you complete your connector orchestrations by reading input data from the Web Services Provide Service activity, adding logic and then responding using the Send Reply output activity. The Provide Service activity supplies a web service that can be started from an outside client. During run time, the Send Reply activity returns a response to the client.

Procedure

1. In the Project toolbox tab, select an orchestration, for example CreateObjects. The orchestration is displayed in the Studio workspace.
2. In the orchestration, click on the **Provide Service** activity. The Map Outputs panel is displayed.
3. In the Map Outputs panel, click on **body**. The node type window is displayed showing the input data.
4. Using the information in the node type window, map the body data and use the data to create the object in your endpoint.
5. Select **Orchestration** -> **Validate**.

Note: The orchestration generated for **Starter Activity** has Provide Service and Invoke Service activities. As a part of implementing the **Starter Activity**, fetch the required data and pass the values to the pregenerated Invoke Service Activity, in the end. The Invoke Service activity must be the last activity in the orchestration. Also, populate the optional parameter `location` to the `callbackURL` received as a part of the `ConnectionFields` header of the pregenerated Provide Service Activity.

Results

The Validation Results window is displayed, showing the results of the validation.

What to do next

Complete orchestrations for the Cast Iron TestConnection, ListObjects and DescribeObjects connector interfaces.

[Feedback](#) | [Notices](#)

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.cdk.doc/cdk_completeorchestration.html

Cast Iron connector interfaces

Cast Iron connectors use three standard interfaces that you implement as orchestrations: TestConnection, ListObjects and DescribeObjects.

Orchestration templates for the TestConnection, ListObjects and DescribeObjects interfaces are automatically created by the Wizard during the Add Activities phase. You must complete the orchestrations based on your individual connector requirements. This section introduces the TestConnection, ListObjects and DescribeObjects interfaces. In [Completing the connector interface orchestrations](#), you complete an orchestration for each.

TestConnection

The TestConnection interface reflects the values you added to the Connection Information window and is used by your connector to establish an endpoint connection. After a connection is made, the connection status is returned as a boolean operator.

ListObjects

The ListObjects interface reflects the values you added to the Add Activities window and returns a list of all objects supported by a specific connector activity. For example a Salesforce create operation might support

such objects as Account, Customer, Contact, Opportunity and User, among others. The return list should correspond to a ListObjects Reply Activity schema. Below is an example of a ListObjects response in XML format:

```
<ListObjectsResponse
xmlns="http://www.approuter.com/schemas/cdk/api/">
<objectType
label="Customer"
xmlns="http://www.approuter.com/schemas/cdk/api/">Account</objectType>
<objectType
label="Account Object"
xmlns="http://www.approuter.com/schemas/cdk/api/">Customer</objectType>
<objectType
label="Customer details"
xmlns="http://www.approuter.com/schemas/cdk/api/">Contact</objectType>
<objectType
label="Opportunity details"
xmlns="http://www.approuter.com/schemas/cdk/api/">Opportunity</objectType>
<objectType
label="User details"
xmlns="http://www.approuter.com/schemas/cdk/api/">User</objectType>
</ListObjectsResponse>
```

DescribeObjects

The DescribeObjects interface provides the input and output that enables your users to successfully work with an object exposed through a connector activity. For example if a Salesforce create operation is selected, the input schema is discovered dynamically based on an object selected from ListObjects. Here is an example of a response returned by DescribeObjects:

```
<DescribeObjectResponse baseType="sObject"
baseTypeNS="urn:object.partner.soap.sforce.com"
name="create" typeNS="http://example.com/stockquote"
xmlns="http://www.approuter.com/schemas/cdk/api/"
xmlns:con="http://www.approuter.com/schemas/cdk/config/"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
<object label="createInput" maxCount="1" minCount="1" name="createInput"
used="true">
<con:field configurable="true" label="ObjectName" maxCount="1"
minCount="1" name="ObjectName" used="true">
<con:type>string</con:type>
</con:field>
<con:field configurable="true" label="FirstName" maxCount="1"
minCount="1" name="FirstName" used="true">
<con:type>string</con:type>
</con:field>
<con:field configurable="true" label="LastName" maxCount="1"
minCount="1" name="LastName" used="true">
<con:type>string</con:type>
</con:field>
<con:field configurable="true" label="Phone" maxCount="1"
minCount="1" name="Phone" used="true">
<con:type>string</con:type>
</con:field>
</object>
<responseObject label="createOutput" maxCount="1"
minCount="1" name="createOutput" used="true">
<con:field configurable="true" label="Id" maxCount="1"
minCount="1" name="Id" used="true">
<con:type>string</con:type>
</con:field>
<con:field configurable="true" label="ObjectName" maxCount="1"
```

```

        minCount="1" name="ObjectName" used="true">
        <con:type>string</con:type>
    </con:field>
    <con:field configurable="true" label="Status" maxCount="1"
        minCount="1" name="Status" used="true">
        <con:type>string</con:type>
    </con:field>
</responseObject>
</DescribeObjectResponse>

```

Dynamic schema discovery

The DescribeObjects schema discovery feature lets you dynamically discover a schema at runtime. The schema is imported into your orchestration when any connector activity uses a schema element as input or output. If previously imported schemas need to be discovered using `complexType QName` and substituted dynamically as input or output activities, set the attributes in DescribeObject response as shown in the following schema:

```

< xsd:schema targetNamespace = " urn.sample.stock
" xmlns:xsd = "http://www.w3.org/2001/XMLSchema" >
< xsd:element name = "TradePriceRequest" >
< xsd:complexType >
< xsd:all >
< xsd:element name = "tickerSymbol" type = "xsd:string" />
</ xsd:all >
</ xsd:complexType >
</ xsd:element >
< xsd:complexType name = "ciObject" ></ xsd:complexType >
< xsd:complexType name = " tradingPartner " >
< xsd:sequence >
< xsd:element name = "partnerName" type = "xsd:string" />
</ xsd:sequence >
</ xsd:complexType >

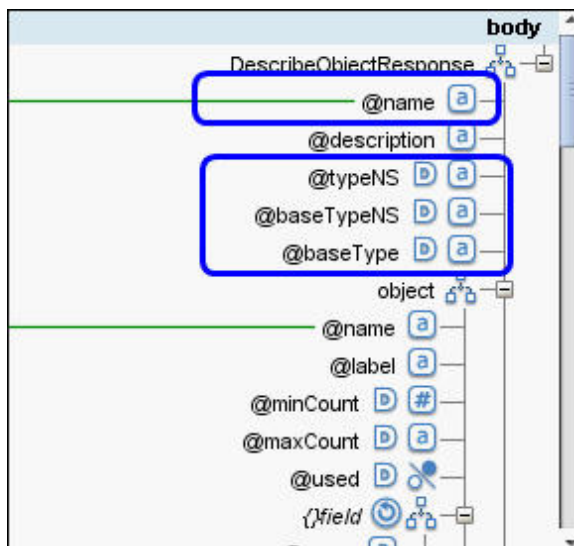

```

For example, to substitute the `complexType tradingPartner` in the preceding schema, set the information to discover the schema and substitute it dynamically as shown in the following example:

```

DescribeObject Response value to
@name -> tradingPartner [complexType name to be discovered]
@typeNS -> url.sample.stock [complexType namespace ]
@baseType -> http://www.approuter.com/schemas/cdk/api/ [CDK default]
@baseType -> cObject [CDK default]

```

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.cdk.doc/cdk_connectorinterfaces.html

Completing the connector interface orchestrations

During this phase, you add business logic to the Cast Iron TestConnection, ListObjects and DescribeObjects orchestrations.

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.cdk.doc/cdk_completetestlistdescribe.html

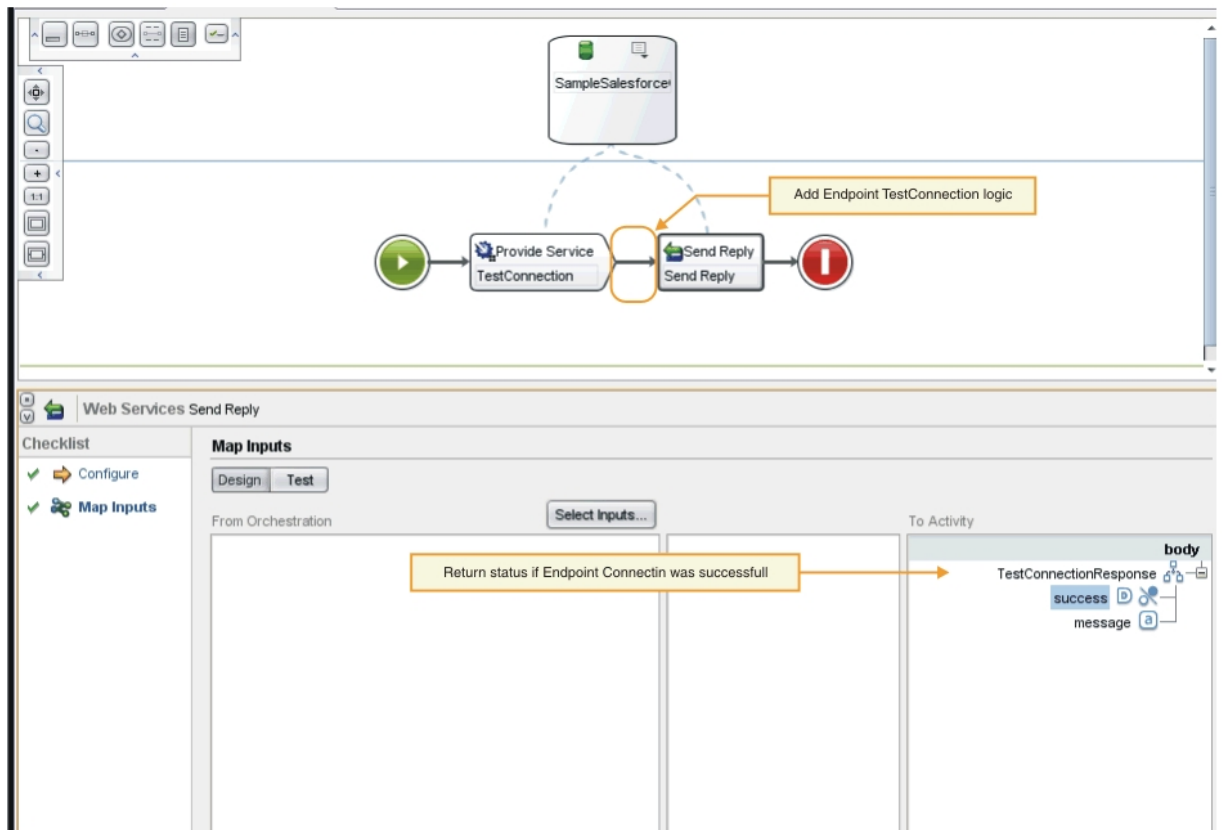

Completing the TestConnection orchestration

In the following steps, you map values to object types and invoke orchestration activities to test your endpoint connections.

Procedure

1. In the Studio Project toolbox tab, click on the **TestConnection** orchestration. The orchestration is displayed in the Studio workspace.
2. In the orchestration, add the logic needed to connect to your endpoint, as shown in [Figure 1](#).
3. In the orchestration, click on the **Send Reply** activity. The inputs are displayed in the From Orchestration panel.

Figure 1. TestConnection

4. Map the values displayed in the From Orchestration panel to the object types in the To Activity panel. You are now ready to test the orchestration.
5. In the orchestration, right-click on the **Provide Service** activity. The Verify Activity menu is displayed.
6. In the Verify Activity menu, select **Invoke Service**. The Invoke Service window is displayed.
7. In the Invoke Service window, enter the header and body data and click **Execute** to start the test. To view the test activity, click the **Show Response** button. When the test is completed, the results are displayed in the Verify toolbox tab.
8. If the connection is successful, the test response will show a "true" value. To complete the orchestration, map "true" to the **success** field of the TestConnectionResponse parameter in the To Activity panel.

What to do next

If your connector activity is discoverable at design time, complete the procedures in [Completing the ListObjects orchestration](#). If your connector activity is not discoverable, you can move ahead to [Completing the DescribeObjects orchestration](#).

Feedback | Notices

Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.cdk.doc/cdk_completingtestconnection.htm

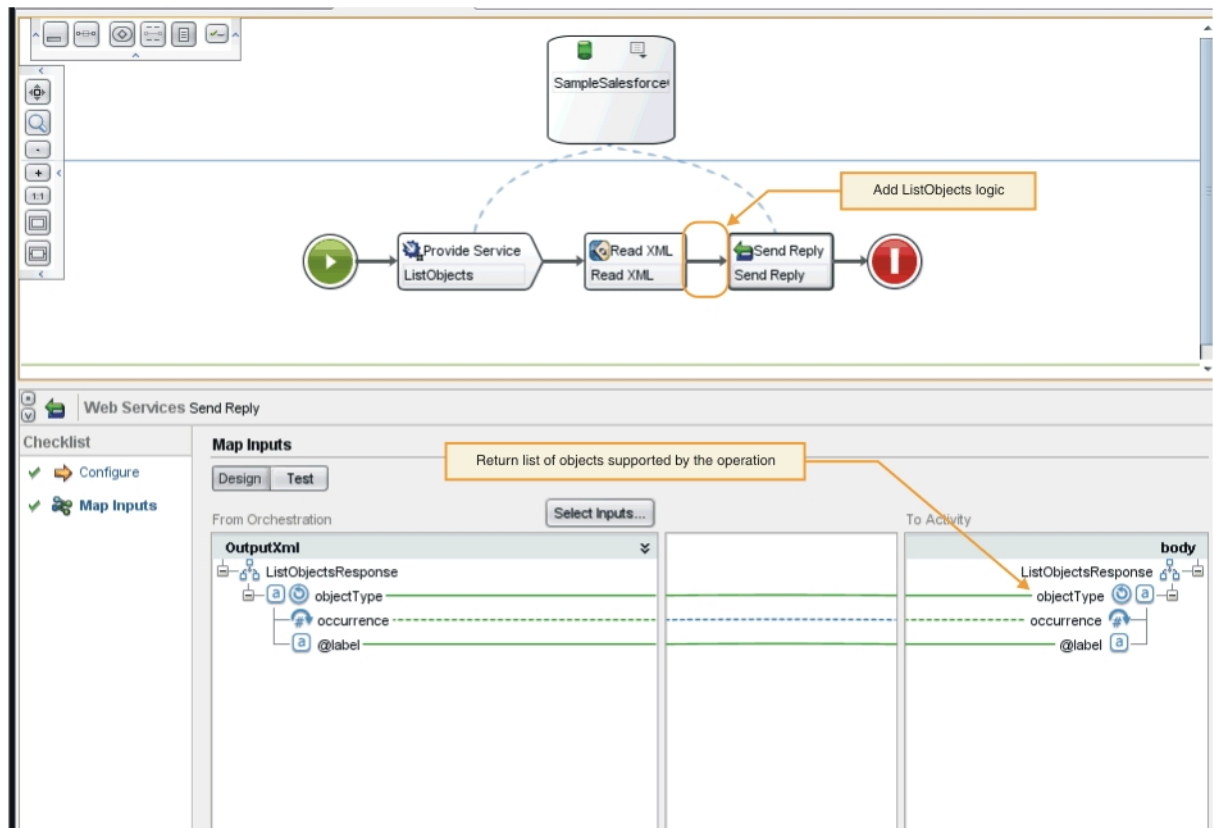

Completing the ListObjects orchestration

In the steps that follow, you add business logic to your ListObjects orchestration, map values to object types and invoke orchestration activities to test your endpoint connections. Only complete the procedures in this section if your orchestration activity is discoverable at design time.

Procedure

1. In the Studio Project toolbox tab, click on the **ListObjects** orchestration. The orchestration is displayed in the Studio workspace.
2. In the ListObjects orchestration, add your logic as shown in [Figure 1](#). A list of objects supported by the connector for the provided endpoint are displayed in the To Activity panel.

Figure 1. ListObjects

3. In the orchestration, select the **Send Reply** activity. The inputs are displayed in the From Orchestration panel.
4. In the From Orchestration panel, click on an activity. A list of objects supported by the operation is displayed in the To Activity panel.
5. Map the values displayed in the From Orchestration panel to the object types in the To Activity panel under ListObjectsResponse, as shown in [Figure 1](#). You are now ready to test the orchestration.
6. In the orchestration, right-click on the **Provide Service** activity. The Verify Activity menu is displayed.
7. In the Verify Activity menu, select **Invoke Service**. The Invoke Service window is displayed.
8. In the Invoke Service window, enter the header and body data and click **Execute** to start the test. To view the test activity, click the **Show Response** button.

Results

When the test is completed, the results are displayed in the Verify toolbox tab. If errors are present, make the necessary corrections, then re-run the unit test.

What to do next

Complete the DescribeObjects orchestration.

Feedback | Notices

Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.cdk.doc/cdk_completetest_describe_list.html

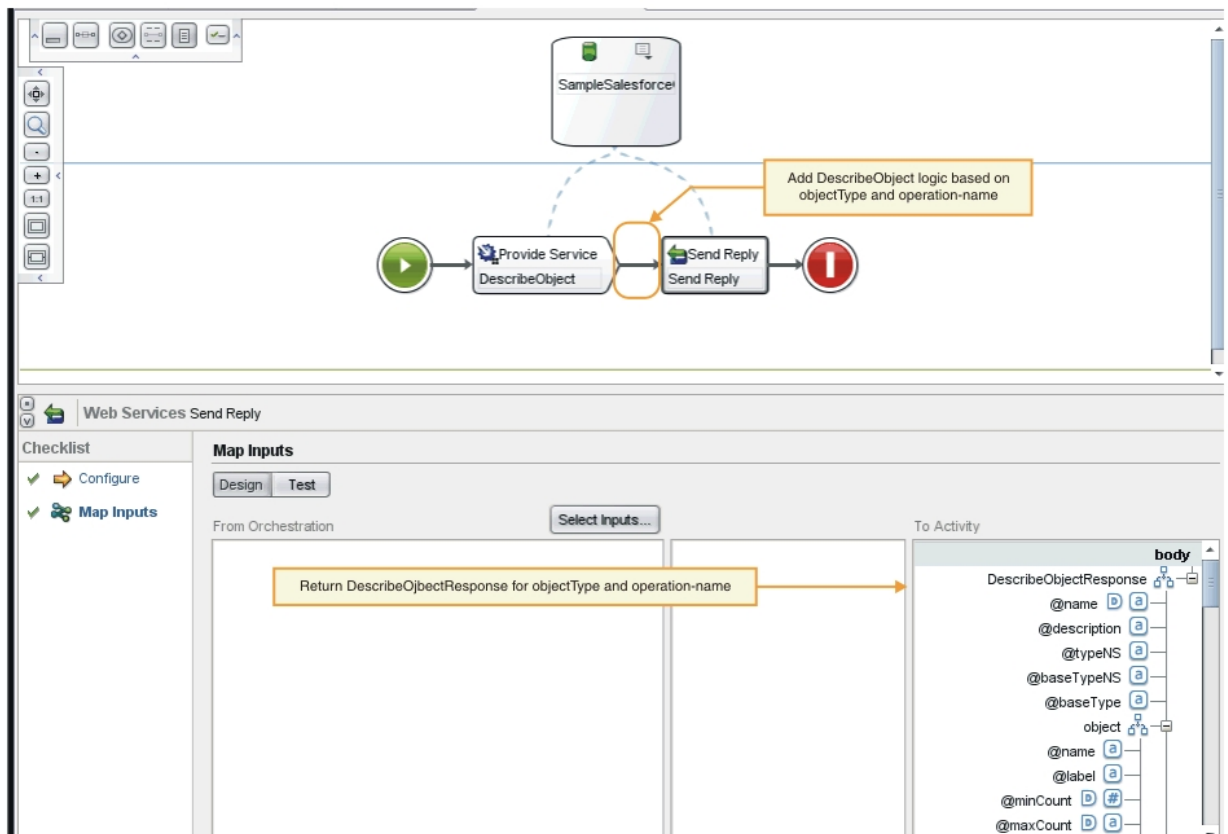

Completing the DescribeObjects orchestration

To complete the DescribeObjects orchestration, you map outputs to input data, transform the object metadata to XML format to conform to the `ci-connector-api.xsd` file, then test the orchestration.

Procedure

1. In the Studio Project toolbox tab, click on the **DescribeObjects** orchestration. The orchestration is displayed in the Studio workspace.
2. In the orchestration, click on the **Provide Service** activity. The Map Outputs panel is displayed.
3. In the Map Outputs panel, click on **body**. The node type window is displayed showing the input data.
4. Add logic to the orchestration based on `object` and `operation_name`, as shown in [Figure 1](#) to obtain the object metadata.

Figure 1. DescribeObjects

5. Transform the object metadata to XML format to conform to the `ci-connector-api.xsd` file described in [Cast Iron CDK schema files](#). After the metadata is transformed to XML, your schema looks like this:

```

< DescribeObjectResponse
baseType = "sObject"
baseTypeNS = "urn:object.partner.soap.sforce.com"
name = "create"
typeNS = "http://example.com/stockquote"
xmlns = "http://www.approuter.com/schemas/cdk/api/"
xmlns:con = "http://www.approuter.com/schemas/cdk/config/"
xmlns:xsi = "http://www.w3.org/2001/XMLSchema-instance" >
< object
label = "createInput"
maxCount = "1"
minCount = "1"
name = "createInput"
used = "true" >
< con:field
configurable = "true"
label = "ObjectName"
maxCount = "1"
minCount = "1"
name = "ObjectName"
used = "true" >
< con:type > string </ con:type >
</ con:field >
< con:field
configurable = "true"
label = "FirstName"

maxCount = "1"
minCount = "1"
name = "LastName"
used = "true" >
< con:type > string </ con:type >
</ con:field >
< con:field
configurable = "true"
label = "Phone"
maxCount = "1"
minCount = "1"
name = "Phone"
used = "true" >
< con:type > string </ con:type >
</ con:field >
</ object >
< responseObject
label = "createOutput"
maxCount = "1"
minCount = "1"
name = "createOutput"
used = "true" >
< con:field
configurable = "true"
label = "Id"
maxCount = "1"
minCount = "1"
name = "Id"
used = "true" >

```

```

< con:type > string </ con:type >
</ con:field >
< con:field
configurable = "true"
label = "ObjectName"
maxCount = "1"
minCount = "1"
name = "ObjectName"
used = "true" >
< con:type > string </ con:type >
</ con:field >
< con:field
configurable = "true"
label = "Status"
maxCount = "1"
minCount = "1"
name = "Status"
used = "true" >
< con:type > string </ con:type >
</ con:field >
</ responseObject >
</ DescribeObjectResponse >

```

6. In the DescribeObjects orchestration, select the **Send Reply** activity. The Map Inputs panel is displayed.
7. In the Map Inputs panel, map the generated XML to the DescribeObjectResponse parameter in the To Activity panel. You are now ready to test the orchestration.
8. In the orchestration, right-click on the **Provide Service** activity. The Verify Activity menu is displayed.
9. In the Verify Activity menu, select **Invoke Service**. The Invoke Service window is displayed.
10. In the Invoke Service window, enter the header and body data and click **Execute** to start the test. To view the test activity, click the **Show Response** button.

Results

When the test is completed, the results are displayed in the Verify toolbox tab. If errors are present, make the necessary corrections, then re-run the unit test.

What to do next

In the next phase, you learn how to publish your connector project to a local repository.

Feedback | Notices

 Last updated: Thursday, December 17, 2015
file:///dcs/markdown/workspace/Transform/out.html

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.cdk.doc/cdk_completingdescribeobjects.html

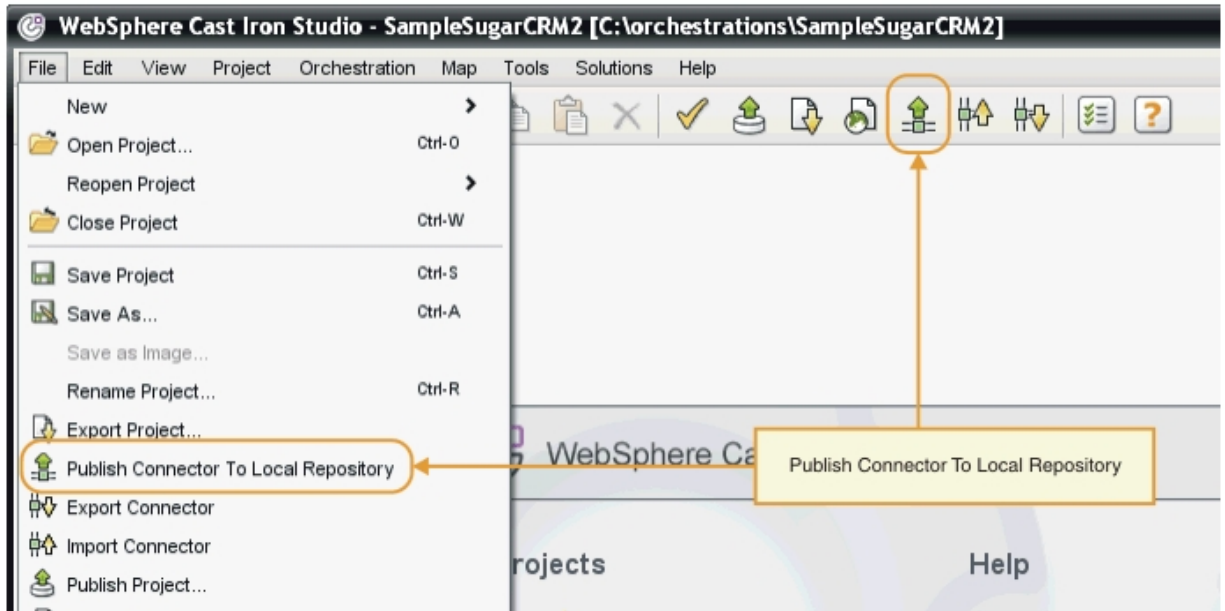

Publishing to a local repository

During this phase, Studio validates your orchestrations. If validation is successful, you can publish your connector to a repository on your local computer for testing and debugging.

Procedure

1. Select **File -> Publish Connector to Local Repository** or click the **Publish** toolbar icon as shown in [Figure 1](#). Studio validates the orchestrations. If validation is successful, the connector is published to the connector repository at `<user_home>/castiron/connector-repository`. If the validation fails, error messages are displayed. Correct the problems and re-publish.
2. Restart Studio. Your connector activities are displayed in the Studio Activities toolbox tab and are available for use.

Figure 1. Publish connector to a local repository

After the conclusion of your development work, your connector and connector activities are displayed in the Studio Activities toolbox tab, as shown in [Figure 2](#).

Figure 2. Connector and connector activities displayed in Studio Activities toolbox tab.

Note: Do not attempt to deploy a connector project directly to an appliance, as this will result in an error. For best results, only deploy connector projects that are displayed as endpoints inside Studio.

What to do next

In the next section, you perform runtime validation and test your endpoints.

Feedback | Notices

Test and debug

Studio provides several facilities to test your connector components. During the test and debug phase, you perform runtime validations that test your connector and diagnose configuration or data errors. All outbound endpoints should be tested.

When you test your connector, the Studio build process checks that your XML file is well-formed and validates it against your schema files. It then generates outbound mappings, creates and sends an outbound message, receives a response and executes the inbound mappings. The CDK performs two types of tests:

- Unit testing
- Integration testing

Unit testing your connector components

Unit testing is key to the success of any development project and is basically a pass/fail test that verifies that components of your connector perform as expected.

About this task

During this phase, you perform a unit test that simulates the communication between a client and a web service that is exposed as a Web Service Provide activity.

Procedure

1. In the Projects toolbox tab, select an orchestration. The orchestration is displayed in the Studio workspace.
2. In the orchestration, right-click on the **Provide Service** activity. The Verify Activity menu is displayed.
3. In the Verify Activity menu, select **Invoke Service**. The Invoke Service window is displayed, as shown in [Figure 1](#).
4. In the Invoke Service window, enter the header and body data and click **Execute** to start the test. To view the test activity, click the **Show Response** button.

Figure 1. Invoke Service window

Note: Be cautious when using the Reset button. It erases the existing content in the Invoke Service window and repopulates it with web service template information. Only click Reset when you want to start over with unit testing.

Results

When the test is completed, the results are displayed in the Verify toolbox tab. If errors are present, make the necessary corrections, then re-run the unit test.

What to do next

Perform integration testing to determine if your connector components are performing properly.

Integration testing your connector services and activities

During integration testing, you validate that your connector services, messages and interfaces are performing properly.

Procedure

1. In the Projects toolbox tab, select an orchestration. The orchestration is displayed in the Studio workspace.
2. In the Activities toolbox tab, select an activity and drag and drop it into your orchestration.
3. In the Studio workspace, click on the activity. The activity is highlighted.
4. In the Checklist panel, click **Pick Endpoint**. The Pick Endpoint panel is displayed.
5. In the Pick Endpoint panel, click **New**. The Create Endpoint panel is displayed.
6. In the Create Endpoint panel, enter the connection information and click **TestConnection**.
7. If the connection is successful, click **OK**.
8. In the Checklist panel, click **Configure**. The Configure panel is displayed.
9. Optional: In the Configure panel, click **Browse** to search for browseable activity. (This step is not necessary for non-browseable activity). The ListObject dialog window is displayed.
10. In the ListObjects dialog window, select a schema to become the input for the selected activity.
11. Complete the input and output mapping.
12. Test the orchestration. If you wish to view the processor activity, check the **Show CDK Connector Activity Logs** option in the Studio Preferences window, as shown in [Figure 1](#).

Figure 1. Preferences window

Results

Processor activity and final test results are displayed in the Studio Verify toolbox tab.

What to do next

In the next section, you learn how to export and import connector projects.

Exporting and importing a connector project

Once you have created and tested your connector, you can export it to an external location so it can be used by others. You can also import a connector archive file into Studio.

You export and import connector projects using the Studio menus or by clicking on the Export or Import toolbar icons.

Note: Do not attempt to deploy a connector project directly to an appliance, as this will result in an error. For best results, only deploy connector projects that are displayed as endpoints inside Studio.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.cdk.doc/cdk_exporting_importing.html

Exporting your connector project

When you export your completed connector from Studio to an external location, it can be loaded and used by others. Exported connectors are packaged as standard .zip files.

About this task

You use Studio menu options or the toolbar to export your connector. If you don't specify a directory, your exported connector project is placed in a subdirectory of your project directory. If you choose to export to an archive file, the project is packaged in a .zip archive beneath your project directory.

Procedure

1. Select **File** -> **Export Connector** or click on the **Export Connector** toolbar icon. The File dialog window is displayed showing a list of available connectors.
2. In the File dialog window, select your connector and click **OK**. The Save dialog window is displayed.
3. In the Save dialog window, browse for a location to export your project, then click **Save**.

Results

Your connector is exported as a standard .zip archive.

What to do next

In the next section, you learn how to import a connector project.

http://pic.dhe.ibm.com/infocenter/wci/v7r0m0/topic/com.ibm.wci.cdk.doc/cdk_exportyourconnectorproject.html

Importing a connector project

You can use Studio to import a connector project that has been developed as a standard compressed file archive.

About this task

You use Studio menu options or the toolbar to import a connector into Studio.

Procedure

1. Select **File** -> **Import Connector** or click on the **Import Connector** toolbar icon. The File dialog window is displayed.
2. In the File dialog window, select a connector and click **OK**.

Results

The connector is imported into Studio as a .zip archive.

What to do next

In the next section, an overview of the CDK components is presented.

Cast Iron CDK components

The Connector Developer Kit contains four major components which work together to comprise the CDK development platform.

Figure 1 shows the components and illustrates their relationship to Studio:

Figure 1. CDK components

Cast Iron CDK schema files

XML schema files provide the syntax and define how elements and attributes are represented in XML files. You import the Cast Iron CDK schema files into your Studio development environment, then create your endpoints and connections by dragging schema elements from the **Project** toolbox tab into your orchestration.

The CDK schema files are:

ci-connector-config.xsd - This file is used by Studio and the deployment engine to define the basic configuration options available to your connector. Plug-in metadata is stored as elements in your XML file and once configured, the endpoint properties define what your end-users see and the activities they are exposed to. Here is the `ci-connector-config.xsd` file:

```

Cast Iron CDK XML file

Your XML file defines what activities your plug-in performs. Every activity in your XML file must be mapped to an operation defined in the WSDL file.

XML has emerged as the universal language for representing and transmitting structured data that is independent of programming language, software platform, and hardware. For your development project, you can use any text editor or a XML-compliant authoring tool to create your XML file. Your file must conform to the rules of your schema files or your plug-in will fail.

Cast Iron CDK WSDL file

A WSDL file is an XML-format file that defines network services as a set of endpoints. WSDL files describe how to access a web service and specify what operations that service performs. WSDL's are usually developed by a web service provider and may be made available through a UDDI (Universal Description, Discovery and Integration) registry.

At the outset of your project, you must import a WS-I (Web Service Interoperability)-compliant WSDL file into your development platform so your development environment can generate the objects needed to build client web service applications. Web service API's provide a set of objects or WSDL-type definitions and a set Web service operations.

Cast Iron CDK .par file

Your plug-in is packaged as a .par file. Your .par is a standard .zip file that you rename and import into Studio.

The .par file contains your plug-in. It is exported from your Studio project and is where you implement the interface operations that enable you to identify and inventory objects contained in your plug-in. When your .par is delivered, it automatically expands into a directory for your plug-in.

FAQ

Below are some frequently asked questions that can help solve problems that may arise during your development process.

Q. How do I determine if my input activity is discoverable at design time?

- **A.** If input to the activity varies based on object type, you should select discoverable and use an abstract WDSL or schema element type for input.

Q. My schema or WSDL does not contain an abstract element type. How do I add that to my file?

- **A.** WSDL's and schema's provide a mechanism to force substitution for a particular element or type. To add an abstract element to your file, add the following `complexType` element to your WSDL or schema:
`complexType name="MyObject."` Be sure you define it in the same namespace as your input types.

Q. Can I modify an existing connector?

- **A.** As long as the connector was built using the CDK Connector Wizard, you can update it by simply launching the Wizard and adding new activities to it or by revising existing activities.

Q. I have existing project. Can I run the Wizard on top of it and use the orchestrations to expose the connector activities?

- **A.** Yes. You can run the Wizard on top of existing projects, but be sure your activity names do not conflict with existing orchestration names.

Q. My connector is not displayed in Studio. Why?

- **A.** Many errors can be corrected by simply checking for errors. Check the log file under `Studio_Install_dir` for failures.

This section tells you how to get information on IBM and its products and how to reach sales and technical support personnel.

You can access the IBM Corporation web site at: <http://www.ibm.com>.

The site contains information about the IBM Corporation, its background, and products. The site also provides contact information for sales and technical support.

Before contacting IBM Support, verify that you have met the following criteria:

- Your company has an active maintenance contract.
- You are authorized to submit problems.
- You have the appliance serial number.
- You have the customer number that was used to purchase the appliance.

You can submit a software problem report to IBM in one of two ways:

1. Use the service request (SR) problem submission web page. You will need to sign in with your IBM user ID and password.
2. Contact IBM via telephone. Refer to this directory of worldwide contacts in the IBM Software Support Handbook for the appropriate software support phone number.
